WELL-*Room*, of a *Boat*, denotes the place in the bottom where the water lies, between the cieling and the platform of the ftern-fheets, from whence it is thrown out into the fea with a fcoop. Falconer.

WELL-*Water*. See WATER.

WELLAND, in *Geography*, a river of England, which paffes by Stamford, Market Deeping, Spalding, &c. and empties itfelf into the German fea, in what is called "The Wafh," between the counties of Lincoln and Norfolk.—Alfo, a river of Canada, which runs into the Niagara, between lake Erie and lake Ontario.

WELLE CORONDE, *Sandy Cinnamon*, a name given by the Ceylonefe to a fpecies of cinnamon, which feels hard and gritty between the teeth, as if it were full of particles of fand, though in reality there is no fand among it.

The bark of this tree comes off very eafily: but it is not fo fit to roll up into quills as the right cinnamon, for it is more rigid and ftubborn, and apt to burft open. It is of a fharp but bitterifh tafte. The roots of all the cinnamon trees yield more or lefs camphor, but this as fmall a quantity as any of them. Phil. Tranf. N° 409.

WELLES, in *Geography*. See WELLS.

WELLESCHIN, a town of Bohemia, in the circle of Bechin; 10 miles S. of Budweifs.

WELLESMITZA, a town of Servia, on the Danube; 10 miles S.E. of Orfova.

WELLFLEET, a townfhip of Maffachufetts, in the county of Barnftaple, containing 1402 inhabitants, with a large harbour near Cape Cod. The inhabitants own 25 veffels, from 30 to 100 tons, employed in the whale, cod, mackarel, and oyfter fifhing; 60 miles by water S.E. of Bofton.

WELLFLEET *Bay*, a bay of the ftate of Maffachufetts, on the E. fide of Cape Cod Bay.

WELLIA TAGERA, *H. M.* in *Botany*, a filiquous plant of Malabar, with a pentapetalous flower, and long flat pods, with tranfverfe partitions between the contained feeds. It grows to the ordinary height of a man, with a ftem as big as a man's arm, and is tranfplanted into gardens only on account of its beauty. It is an evergreen.

All the parts of this plant, the root excepted, are exhibited, with an addition of cummin, white fugar, and milk, againft a virulent gonorrhœa. The leaves boiled in cow's milk, or ufed in baths, expel the gout. The bark, triturated with fugar and water, is proper for the diabetes. The bark of the root, and green faffron mixed with milk, give relief under the nodous gout, called by the Malabarians *fonida badda*. Raii Hift. Plant.

WELLIBALDSBURG, ST., in *Geography*, a town and citadel of Bavaria, in the bifhopric of Aichftat, near Aichftat.

WELLIN, a town of Bohemia, in the circle of Koniggratz; 16 miles S.W. of Biezow.

WELLINGBOROUGH, a market-town in the hundred of Hamfordfhoe, and county of Northampton, England, is principally fituated on a red fand-ftone rock, of which material the houfes are generally built. The town is difpofed along the flope of a hill, nearly a mile to the north of the river Nen, 11 miles N.E. by E. from the county-town, and 68 miles N.N.W. from London. It appears to have been of fome note in the Saxon times, when a great part of it was deftroyed by the Danes. After the Norman Conqueft, it occurs among the numerous poffeffions annexed to the abbey of Croyland, in Lincolnfhire; and at the fuit of the monks of that houfe, was conftituted a market-town, by a charter from king John. In July 1738, it is ftated, that about eight hundred dwelling-houfes, befides outhoufes, &c. were confumed by fire. A new town has been raifed, and now affumes a much more refpectable appearance than before the conflagration. The church is a fpacious edifice, having at its weft end a tower, furmounted by a fpire: the roofs of the aifles, chancel, and chantry chapel, are decorated with various carved work; and on each fide of the chancel are three ftalls fimilar to thofe in cathedral choirs: the eaftern window is richly ornamented with tracery, and fculpture in ftone. This church had a guild to the honour of the Bleffed Virgin; the revenues of which fraternity were, in the fecond year of Edward VI., appropriated to the erection and endowment of a free grammar-fchool. Here are alfo a large charity-fchool, and two meeting-houfes for the public worfhip of Independent Diffenters. A weekly market is held on Wednefdays; and three fairs annually. The chief fource of traffic is corn, the market for which is greatly improved by the decay of that of Higham-Ferrers, at four miles diftance. Here is alfo a confiderable manufacture of lace; as alfo of tammies, harrateens, and other worfted ftuffs. In the population return of the year 1811, the inhabitants of this parifh are enumerated as 3999, occupying 749 houfes. About half a mile north-weft of the town, in an open field, is a chalybeate fpring, called Red-well, formerly much celebrated for its medicinal virtues: in the year 1626, king Charles and his queen refided here a whole feafon, for the benefit of drinking the water, pure from the fource.—Beauties of England and Wales, vol. xi. Northamptonfhire; by the Rev. J. Evans, and J. Britton, F.S.A. Bridges's Hiftory of Northamptonfhire, 2 vols. fol. 1791.

WELLINGTON, a large market-town in the hundred of Kingfbury Weft, and county of Somerfet, England, is fituated on the borders of Devonfhire, at the diftance of 20 miles W.S.W. from Somerton, and 149 miles in the fame bearing from London. The earlieft hiftorical account of it commences with the reign of Alfred, who beftowed the manor on Affer, who had been tutor to feveral of his children, and was afterwards advanced to the fee of Sherborne, and died poffeffed of that dignity, in the year 883. After his death, the king granted the manor to the firft bifhop of Wells, for the fupport of the epifcopal honours of himfelf and his fucceffors. It continued annexed to that fee, till the reign of Edward VI., when it became the property of the duke of Somerfet by purchafe from bifhop Barlow. The town confifts of four ftreets, the principal of which, called the High-ftreet, is very wide and fpacious; the houfes are in general well built and commodious. It is a place of confiderable trade: the chief articles manufactured here are, ferges, druggets, and pottery. A weekly market, on Thurfdays, is well fupplied with all kinds of provifions; and two fairs are annually held. According to the population return of the year 1811, the parifh contained 755 houfes, and 3874 inhabitants, of whom 565 families were ftated to be employed in trade and manufacture. The church is a fpacious ftructure, confifting of a nave, chancel, two aifles, and two fmall chapels. At the weft end is a fine embattled tower, a hundred feet in height, decorated with twelve pinnacles of excellent workmanfhip. In the fouth chapel is a magnificent tomb in honour of fir John Popham, lord chief juftice of England, in the reign of queen Elizabeth. On the table of this monument are the effigies of fir John and his lady, under an arched canopy, richly ornamented with the family arms, rofes, paintings, and obelifks. The whole is fupported by eight columns of black marble, five feet high, with Corinthian capitals, green and gilt. Sir John was a munificent patron to Wellington: among

among other benefactions, he erected an hofpital for fix men and fix women, being old and infirm; two children were alfo to be educated here. This edifice is ftill ftanding: fir John endowed it with an eftate in land, which is vefted in governors, and properly applied.—Beauties of England and Wales, vol. xiii. Somerfetfhire. Collinfon's Hiftory of Somerfetfhire, 3 vols. 4to. 1791.

Wellington, a fmall market-town in the Wellington divifion of the hundred of Bradford, and county of Salop, England, is fituated near the Wrekin-hill, at the diftance of 12 miles E. by S. from Shrewfbury, and 151 miles N.W. from London. It is neatly built, and contains many good houfes. The market, which is held on Thurfdays, is well fupplied, and much frequented; and here are three annual fairs. The church, which has been lately rebuilt, is fupported on caft-iron pillars, and the window-frames are of the fame material, which gives a lightnefs to the edifice: one of the frames is fifteen feet in height. Near the church is a very refpectable charity-fchool. In this town and its vicinity, at the commencement of the civil war, king Charles, then on his march to Shrewfbury, muftered his forces, and after iffuing orders for the obfervance of ftrict difcipline, made a folemn proteftation that he would defend the eftablifhed religion, govern by law, and preferve the liberty of the fubject; and that if he conquered he would uphold the privileges of parliament. The parifh of Wellington includes, befides the town, fix townfhips. The return of the year 1811 ftates the population to be 8213; the number of houfes 1724. The chief employment of the inhabitants is in the coal-works; here are alfo fome mines of iron-ore. About two miles fouthward from the town is the Wrekin, a ftupendous mountain 1100 feet in height. Through the adjacent country runs the Roman road called the Watling-ftreet.

Beneath the Wrekin, and adjoining the road leading to Shrewfbury, is Orleton, the feat of William Cludde, efq. of an ancient family in this county. The manfion at prefent has a modern appearance, but is of very great antiquity, and till of late was enclofed with walls and a gate-houfe, and was furrounded by a moat.—Beauties of England and Wales, vol. xiii. Salop; by J. Nightingale, and R. Rylance, 1811.

WELLINKOVEN, a town of Germany, in the county of Mark; 6 miles W. of Schwiert.

WELLOE, (The,) a rock in the Englifh channel, near the coaft of Cornwall; 9 miles S.E. of Penzance. N. lat. 5°. W. long. 5° 14′.

WELLS, William Charles, F.R.S., I. and E., licentiate of the Royal College of Phyficians, London, and one of the phyficians to St. Thomas's Hofpital, in *Biography*, was the fon of parents who left Scotland and fettled in Carolina, in 1753, and born in Charleftown, South Carolina, in May 1757. Few lives have been more diverfified by incident and more fedulouſly devoted to literary and fcientific purfuits, and therefore more entitled to notice in our biographical fketches than the fubject of this article. Before he had attained the age of feven years, he was fent to a confiderable grammar-fchool at Dumfries, where he remained nearly two years and a half; and in the autumn of the year 1770 he removed to Edinburgh, and attended feveral of the lower claffes of the univerfity. At this early age he had the good fortune to become acquainted with Mr. David Hume and fir William Miller, now known by the title of lord Glenlee, whofe friendfhip he afterwards cultivated and valued, and whofe kind offices he gratefully acknowledged. In 1771 he returned to Charleftown, and was apprenticed, in the medical profeffion, to Dr. Alexander Garden, whofe name is well known among naturalifts; and during three years of the time he was with this gentleman, he purfued his ftudies with fuch diligence, that he acquired perhaps more knowledge than in any three fubfequent years of his life. Soon after the commencement of the American war, in 1775, he came to London. The occafion of his removal was his refufal, from confcientious motives, to fign a paper denominated "The Affociation," which was drawn up in order to unite the people in a refiftance to the claims of the Britifh government. At the commencement of the winter of that year he went to Edinburgh, and entered upon his medical ftudies, with the view of taking a degree. To his former two friends, with whom he had kept up a regular correfpondence, he had now the happinefs of adding a third, no lefs intimate and conftant than the others, the prefent Dr. Robertfon Barclay. Having purfued his ftudies for three winters, and paffed his preparatory trials in the fummer of 1778, he left Edinburgh without graduating, and returned to London, where he attended a courfe of Dr. William Hunter's lectures, and became a furgeon's pupil at Bartholomew's hofpital. In 1779 he went to Holland as furgeon to a Scotch regiment, in the fervice of the United Provinces; but receiving offenfive treatment from the commanding officer, he refigned his commiffion, and challenged the aggreffor, under the unjuft charge of military infubordination, for which an attempt was made to punifh him; but without receiving the fatisfaction which he demanded, he went to Leyden in the beginning of the year 1780, and there prepared an inaugural thefis on the fubject of "Cold," which was publifhed at Edinburgh in the clofe of that year, on occafion of his taking the degree of doctor in medicine. At this time he commenced his acquaintance with Dr. Lifter, a gentleman no lefs diftinguifhed for his integrity and liberality than for his fkill in his profeffion; and it redounds in no fmall degree to the honour of Dr. Wells, that their friendfhip continued without interruption till his death. Nor was it lefs honourable to both thefe gentlemen, that they were introduced to an acquaintance with each other by their common friend Dr. James Currie, the author of "Medical Reports," and the biographer of Burns; whofe premature death was lamented by all who knew him, and were duly apprized of the eminent rank which he occupied in the medical profeffion. In the beginning of the year 1782 Dr. Wells vifited Carolina, then in the poffeffion of the king's troops, for the purpofe of arranging the affairs of his family; and whilft he was there, he fuftained a variety of offices, feemingly very incompatible with each other, and which no perfon deftitute of his verfatile talents and peculiar activity could have fatisfactorily performed. He was an officer in a corps of volunteers, a printer, a bookfeller, and a merchant, a truftee for the management of the affairs of fome of his father's friends in England, and on one occafion a judge-advocate. In December 1782, when the king's troops were obliged to evacuate Charleftown, he removed to St. Auguftine, in Eaft Florida, and there edited the firft weekly newfpaper that had been publifhed in that country, having brought with him a printing-prefs, which had been taken to pieces for the convenience of carriage, and which he contrived, with the affiftance only of a negro-carpenter, to refit for ufe. During his refidence in Florida, he became captain of a corps of volunteers, and manager of a company of officers, who had agreed to act plays for the relief of the pooreft of the loyal refugees from Carolina and Georgia, and occafionally an actor himfelf. In 1784 he removed from St. Auguftine to London, and becoming acquainted with Dr. Baillie, commenced an intimate, fteady, and affectionate friendfhip, the benefits of which he experienced till his death. Having fpent three months at Paris in the year 1785, he returned to London in the

the autumn of that year, and settled as a physician in this city. His father had resided in London from the commencement of the American war, and had amassed a fortune of 20,000*l.*; but by misfortunes in trade his circumstances were now embarrassed, so that Dr. Wells, at the outset of his profession, was obliged to raise money by loans, amounting to 600*l.* For the first few years after settling in London he scarcely took a fee, and after having been engaged for ten years in the exercise of his profession, his receipts from every source did not amount to 250*l. per annum.* However in the next five years he was able to pay part of his debt, and before his death he had the satisfaction of having paid the whole of it, both principal and interest; and it should be mentioned to his honour, that when his income was very limited, he allowed an annuity of 20*l.* to a poor relation.

In 1788 he was admitted a licentiate of the Royal College of Physicians in London; and he took part with those who asserted their eligibility and right of admission to the class of fellows. After the decision of this claim in the court of king's bench, he applied in 1797 for examination, so that if he were found to be fit, he might be returned a fellow. But this application was unavailing; and yet about four years before his death the president of the college sent him a message, expressing a wish to know if he had any desire to become a fellow; to which he replied in the negative. In 1790 he was appointed a physician to the Finsbury Dispensary, in which connection he remained till the year 1798. In 1793 he was chosen a fellow of the Royal Society; and in 1800 he became physician of St. Thomas's hospital, having been assistant physician from the year 1798. In the year 1800 he was seized with a slight fit of apoplexy; but by adopting a very abstemious mode of living, he escaped any subsequent attack. From this time, however, his health declined.

In 1812 he commenced some experiments on dew, and after he had an opportunity of pursuing them, he wrote an "Essay" on the subject, which was published in August 1814, the year in which he was admitted into the Royal Society of Edinburgh; and in 1816 the Royal Society of London adjudged to him the honour of the gold and silver medals of count Rumford's donation for this essay. Although from the year 1814 to the commencement of his last illness his health was in some respects improved, he was afflicted with painful and threatening symptoms. These symptoms became gradually more alarming; and though in his last illness some hopes were entertained by his medical friends, Dr. Baillie and Dr. Lister, of his recovery, yet on the 8th of August he was suddenly seized, while he was sitting up, with the sensation of a tremulous motion in the chest, which he referred to the heat, from which time his illness intermitted. "After this," says his biographer, "an expectation was entertained of his recovery. His life was continued until the evening of the 18th of September 1817; and until the near approach of its termination, his mind was clear and active, and his spirits calm and cheerful."

Our limits will merely allow our enumerating his principal publications. Of his political papers we shall only mention one, which was written in 1781, by the desire of the commandant of the garrison of Charlestown, general Nesbit Balfour. The object of this paper was to shew, by military usage, and the nature of the case, that persons in the American service who, after having been taken prisoners and sent to their homes under their military paroles, and who appeared again in arms against the British government, subjected themselves to the punishment of death. This paper was frequently published in the newspapers, and it is probable that it was owing to this publication that general Balfour and lord Moira thought themselves justified in putting to death a colonel Haynes, the propriety of which act was afterwards a subject of debate in the British parliament. The philosophical pieces of Dr. Wells were the following: *viz.* "An Essay upon single Vision with Two Eyes," 1792, (see VISION, in the Addenda); "Two Letters, in reply to Dr. Darwin's Remarks in his Zoonomia upon what Dr. Wells had written in his Essay upon Vision, on the apparent Rotation of Bodies which takes place during the Giddiness occasioned by turning ourselves quickly and frequently round," 1794, contained in the Gentleman's Magazine for September and October; "A Paper upon the Influence which incites the Muscles to contract in Mr. Galvani's Experiments," 1795; "Experiments upon the Colour of the Blood," 1797; "Some Experiments and Observations on Vision," 1811; all published in the Philosophical Transactions. "An Essay upon Dew," 1811. In this essay the author has introduced new facts and ingenious observations, of which we shall give some account in our additions to the article DEW. "An Answer to Remarks in the Quarterly Review upon the Essay on Dew," and "An Answer to Mr. Prevost's Queries respecting the Explanation of Mr. B. Prevost's Experiments on Dew," 1815; "A Letter to Lord Kenyon relative to the Conduct of the Royal College of Physicians of London, posterior to the Decision of the Court of King's Bench, in the Case of Dr. Stanger;" "A short Letter on the Condensation of Water upon Glass," 1816; which three last appeared in Dr. Thomson's Annals of Philosophy. "Some Biographical Sketches by Dr. Wells" appeared in the Gentleman's Magazine.

Almost all his writings upon medical subjects are contained in the second and third volumes of the Transactions of a Society for the Promotion of medical and chirurgical Knowledge: and their subjects are,—erysipelas; the entire want of hair in the human body; the dropsy, which succeeds scarlet fever; aneurism of the aorta attended with ulceration of the œsophagus and wind-pipe; epilepsy and hemiplegia, apparently produced by a sharp projection from the inner table of the skull; tetanus; aneurism of the aorta, communicating with the pulmonary artery; enlargement of the cæcum and colon; gangrene of the cellular membrane between the muscles and skin of the neck and chest; rheumatism of the heart; red matter and serum of the blood in the urine of dropsy, which has not originated in scarlet fever; and observations on pulmonary consumption and intermittent fever, chiefly as diseases opposed to each other, &c.; to which may be added, a case of aphonia spasmodica, in the second volume of Medical Communications. His manuscript papers were directed to be destroyed, with the exception of one, relating to the difference of colour and form between the white and negro races of men, which will be published.

The literary productions of Dr. Wells have sufficiently established his reputation as a learned and skilful physician, as an acute and inventive philosopher, and as a perspicuous, vigorous, and elegant writer; and it is said, that those who knew him personally estimated him much more highly than persons who were acquainted only with his writings. His mental powers were strong, acute, comprehensive, and versatile; and he was capable of the most close and long-continued attention, and of directing this attention at pleasure. Although he was not eminently distinguished as a classical scholar, or as a deep mathematician, he had read some of the Greek and most of the Latin classics with great attention; wrote Latin with facility and correctness; and made himself mafter of the elementary books of the inferior branches of the mathematics. He was well acquainted with natural philofophy, and particularly optics, and alfo with the facts of modern chemiftry; he was an acute metaphyfician, and intimately verfed in the theories of morals and politics, in ancient and modern hiftory, commerce, and political economy; he had fuccefsfully ftudied belles lettres, and was familiar with the beft writers in the Englifh language; and his own ftyle was pure, perfpicuous, and occafionally forcible and elegant. In converfation he was inftructive and interefting; and in active life prompt and decifive, and at the fame time prudent and cautious. In his habits and manners, he was indefatigable in his application; frugal, and yet as far as his circumftances would allow liberal; high-minded, but fenfible of obligation and grateful for kindnefs; refentful, yet placable; irafcible even on trivial occafions, but exercifing felf-command under great provocations when the importance of circumftances and propriety required it; indignant at infolence and oppreffion, and regardlefs of all perfonal confequences in expreffing his refentment, but fubmiffive to the appointments of heaven, and calm and cheerful under the fufferings which flowed from them. "A fenfe of duty," fays his biographer, "was the paramount feeling of his mind, to which other paffions gave way, and which danger and difficulty ferved only to make more active and vigorous." Such is the tribute which has been evidently dictated by a friend; and yet we have reafon for being affured that it is, upon the whole, fuch as the merit of Dr. Wells juftly claimed. Gent. Mag. for November 1817.

Wells, in *Geography*, a city of Somerfetfhire, England, is fituated in the hundred of Wells-forum, at the diftance of 18 miles from Bath, 21 miles from Briftol, and 121 miles W. by S. from London. It is faid to owe its origin to a remarkable fpring called St. Andrew's well, the waters of which were fuppofed to poffefs extraordinary medicinal properties. Thefe are recorded to have been higly beneficial to Ina, king of the Weft Saxons, whofe religious zeal therefore prompted him to found a collegiate church here in the year 704, and which he dedicated to the above faint. This church was converted into a cathedral in the year 905, when three new bifhoprics were conftituted by order of king Edward the elder, and Wells was then made an epifcopal fee. This was afterwards transferred to Bath by bifhop Villala, about the end of the eleventh century, who built a palace there, and affumed the title of bifhop of Bath. Great contentions foon arofe between the two chapters of Bath and Wells, refpecting the right of election to the epifcopal office. The matter being referred to the arbitration of the bifhop himfelf, it was determined that his fucceffors fhould take their title from both churches; that an equal number of delegates from both chapters fhould enjoy the privilege of voting, and that the inftallation fhould take place in both cathedrals. This regulation, which was made by bifhop Robert, about the year 1135, continued until the reign of Henry VIII., when an act of parliament was paffed for vefting the power of election folely in the dean and chapter of Wells. Henceforward the cathedral and epifcopal feat have been fixed at Wells, but the title of the bifhop is of "Bath and Wells." To the pious zeal of its bifhops, the city is indebted for that truly interefting ftructure, its cathedral church. The building of king Ina having, in the courfe of four centuries, fallen into a dilapidated ftate, was about the year 1150 rebuilt on a much larger fcale by its bifhop. In 1239 it received confiderable additions by bifhop Joceline, who altered, or fitted up the choir, and made other improvements; the fouth-weft tower was added by bifhop Harewell, and other contributors, in 1366; in 1415 the northweft tower was raifed by bifhop Bubwith; and finally, the chapel of the Virgin Mary was added by bifhop Beckington, about the year 1445. Other parts of this interefting fabric were erected and adorned by other prelates, but the precife time of thefe alterations is not recorded. The cathedral, as it now appears, confifts of a nave, with two aifles, a tranfept, and choir, alfo with fide-aifles; at the eaftern extremity of the choir is a fmaller tranfept, and the chapel of the Virgin; on the north fide is a porch, alfo a covered paffage to the chapter-houfe and deanery. Over the interfection of the nave and tranfept is a large quadrangular tower, 160 feet in height, refting on four broad arches, and at the weft end are two other towers. The length of the nave is 190 feet; of the choir to the altar, 108; and of the chapel of the Virgin, 52 feet. The whole fabric exhibits fpecimens of the different ftyles of architecture which prevailed between the twelfth and fifteenth centuries; but the moft interefting part is the weft front, certainly one of the moft impofing examples of architectural and fculptural workmanfhip in the kingdom. It is adorned with a great number of niches and canopies, with ftatues of the apoftles, popes, princes, bifhops, &c. It is divided into five portions in height by bold buttreffes, and four decided compartments, horizontally. In the centre is a large entrance door-way to the nave, over which are three tall lancet-fhaped windows; above thefe is a pyramidal façade to the gable of the roof, crowned with pinnacles, and adorned with numerous niches, ftatues, &c. The buttreffes are likewife covered with panelling, tabernacles, and ftatues. The interior of the church is full of intereft and beauty. Its nave confifts of nine clustered columns on each fide, fupporting pointed arches, over which is a triforium, or open gallery. A third ftory above this difplays a feries of windows, which, with the other arches, are moftly of the lancet-fhape. The columns, crofs-fpringers under the roof, and the whole architecture of this part of the church, difplay the ftyle of the early part of the thirteenth century. In the nave are two elegant monumental chapels, or oratories, to the refpective memories of bifhops Bubwith and Knight. Adjoining the latter is a curious ftone pulpit. At the interfection of the nave with the tranfepts is a large central tower, which refts on four folid piers, or cluftered columns, fuftaining four arches, and over which are inverted arches. The choir is richly ornamented, and lighted by fix highly pointed windows on each fide, and a large eaftern window over the communion-table. Behind the latter are three open arches to the lady chapel, which is fingular in form, decoration, and character. Immediately behind the altar is a circular arrangement of columns, eaft of which is an abfis, forming a half octagon. The whole is furrounded by large windows, with painted glafs. In this part of the church are feveral curious and interefting monuments. North of the great tranfept is the chapter-houfe, an octangular apartment, in the centre of which is a lofty cluftered column, from which diverge feveral ribs.

Southward from the cathedral is the epifcopal palace, which has more the appearance of a fortified caftle than of the refidence of a bifhop. It is furrounded by a wet moat, an embattled wall, flanked with femicircular turrets, with a venerable gate-houfe on the north fide. The deanery-houfe is a fpacious quadrangular building; and here are good houfes for the prebendaries. The eftablifhment of the cathedral confifts of a bifhop, a dean, twenty-feven prebendaries, nineteen minor canons, a precentor, treafurer, chancellor, and three archdeacons; a number which few other cathedrals have.

The city of Wells is feated in a valley, furrounded by lofty hills, and has fome fpacious ftreets. It was firft made a free borough in the reign of Henry II., by the intereft of Joceline, its bifhop. It afterwards received a charter from king John, by which it was provided with a weekly market; by queen Elizabeth's charter, the corporation confifts of a mayor, recorder, feven mafters, and fixteen common-council men. Wells has fent two members to parliament from the earlieft period: the right of election is in the mayor, mafters, burgeffes, and freemen. The voters are about five hundred; the mayor is the returning officer. By the return to the population act of the year 1811, the number of houfes is ftated to be 930; of inhabitants 5156. Six annual fairs are held here; and markets on Wednefdays and Saturdays. The corporation have a fpacious town-hall for the difpatch of their bufinefs; where alfo the affizes are held. Under this hall is an hofpital, founded by bifhop Bubwith, for the maintenance of thirty poor men and women. Here are feveral other alms-houfes, particularly thofe endowed by Nathaniel Steel and fon, for thirty-two men and women, who are allowed three fhillings each *per* week, with a great-coat for the men, and a gown for the women, once in two years. A charity-fchool was alfo erected here for twenty boys and twenty girls, in the year 1714.

Near the village of Wookey, which is fituated about two miles north-weft from Wells, is a remarkable cavern, called Wookey Hole. In its front is an affemblage of vaft rocks, which rife to the height of at leaft two hundred feet, almoft covered with trees and plants fpringing out of the fiffures. On the left fide of a deep ravine is a natural terrace, which leads to the mouth of the cavern, and through the middle of it runs a clear rapid rivulet, that rufhes out of an arch thirty feet in height, and forty in breadth, impetuoufly making its way over an irregular bed of rocks. Hence, an opening not more than fix feet high, conducts into a fpacious vault, eighty feet in height, entirely covered with ftalactites. Near this is a fimilar, though fmaller vault; and beyond them, a low paffage leads to a fpace nearly circular, and about one hundred and twenty feet in diameter, with a vaulted roof forty feet in height. Near this area is what the vulgar call the Witch's Brewhoufe, where a great number of fingular configurations of ftalactite are obfervable, to which correfpondent appellations have been given, fuch as the boiler, furnace, &c. To the left is what is called the hall, which is very lofty, the centre of the roof being at leaft one hundred feet above the ground. The whole length of the cavern is fuppofed to be fix hundred feet.—Collinfon's Hiftory of Somerfetfhire, 3 vols. 4to. Maton's Obfervations on the Weftern Counties, 1797. Davis's Concife Hiftory of the Cathedral Church of Wells, 1809.

Wells, a townfhip of New York, in Montgomery county, erected in 1805 from the N. part of Northampton and Mayfield, bounded N. by Franklin county, E. by Effex, Wafhington, and a fmall part of Saratoga county, S. by Northampton and Mayfield, and W. by Johnftown, about fifty-five miles long and eight miles wide. The country is rough and mountainous, and the foil light, fandy, and barren. It has numerous lakes and ponds, which abound with trout and other cold-blooded fifh, affording good food as well as fport for the angler. Pezeeke lake bears the name of an Indian, and lake Pleafant is a pleafant lake, with a fine beach of white fand.

Wells, a fea-port town of England, in the county of Norfolk, with a harbour at the mouth of a fmall river, of difficult accefs, on account of the fhifting fands at the entrance. The chief trade is in corn, malt, and coals; and of late an oyfter-fifhery has been eftablifhed: it has no market. The population in 1811 was 2683. Near on the W. of Wells is Holkham-hall, the magnificent feat of T. W. Coke, efq. M.P. Wells lies 118 miles N.E. from London.—Alfo, a town of Weft Florida, fituated on the W. fide of St. Andrew's bay. N. lat. 30° 25′. W. long. 85° 50′.—Alfo, a town of America, in the diftrict of Maine, and county of York, at the bottom of a bay to which it gives name, between Capes Porpoife and Neddik, containing 4489 inhabitants; 20 miles S.W. of Portland. N. lat. 43° 20′. W. long. 70° 32′.—Alfo, a town of Vermont, in the county of Rutland, containing 1040 inhabitants; 10 miles S.W. of Rutland.

Wells, a river of Vermont, which runs into the Connecticut.

Wells's *Creek*, a river of Kentucky, which runs into the Ohio, N. lat. 38° 47′. W. long. 84° 27′.

Wells's *Falls*, a cataract in the river Delaware; 13 miles N.W. of Trenton.

Wells's *Paffage*, an inlet on the weft coaft of North America, branching off from Broughton's Archipelago.

WELMICH, or Welmenach, a town of Germany, in the circle of the Lower Rhine, on the right bank of the Rhine; 1 mile from St. Goar.

WELMINA, a town of Bohemia, in the circle of Leitmeritz; 5 miles W. of Leitmeritz.

WELOVAR, a town of Croatia; 16 miles S.E. of Creutz.

WELP, a town of Bohemia, in the circle of Koniggratz; 3 miles S.E. of Toplitz.

WELPSHOLTZ, a town of Germany, in the county of Mansfield, memorable on account of a victory which Lothario, duke of Saxony, obtained over Henry V. in the year 1115.

WELS, a town of Auftria, on the river Traun. This is fuppofed to have been an ancient town of the Norici, and by the Romans called *Ovilara*, or *Ovilaba*. Others fay it was built by the emperor Valerian after his expedition againft the Scythians in Pannonia. The emperor Maximilian I. died here; 11 miles S.S.W. of Lintz. N. lat. 48° 10′. E. long. 14°.

WELSBACH, a river of Thuringia, which runs into the Unftrutt, near Thomafbruck.

WELSCHBILLIG, a town of France, in the department of the Sarre; 18 miles N.N.E. of Luxemburg.

WELSCHBIRKEN, a town of Bohemia, in the circle of Prachatitz; 6 miles N.N.W. of Prachatitz.

WELSE, a river of Brandenburg, which runs into the Oder, near Vierraden.

WELSH Glaive, or Bill, in *Military Antiquities*, a kind of bill, fometimes reckoned among the pole-axes, which was formerly much in ufe.

WELSHPOOL, anciently Trallwng, a large and populous market-town, partly in the hundred of Pool and partly in that of Cawrfe, in the county of Montgomery, North Wales, is fituated on the bank of the river Severn, 8 miles N. from the county-town, and 169 miles N.W. by W. from London. It confifts of one long and fpacious ftreet, with another fmaller, croffing it at right angles, and feveral other collateral branches of leffer dimenfions; and is the largeft and beft-built town in the county. From the manners and language of the inhabitants, it has every appearance of an Englifh town; the Welfh being fpoken here by few perfons. An air of urbanity and opulence pervades the place, chiefly owing to the intercommunication with the more polifhed parts of the kingdom, and to the extenfive trade in flannels; great quantities of which are manufactured here, and ftill greater brought from the hill countries. This being the principal mart for that article, a market is held on every alternate Monday for the fole purpofe of expofing it to fale. A weekly market is alfo held on Mondays for provifions; and here are fix annual fairs for horfes, fheep, and cattle. The Severn becomes navigable at a fmall diftance below the town, at a place called the Pool-ftake; and a branch of the Ellefmere canal running near, tends to facilitate carriage by water conveyance. Among the recent improvements made in the town, is the county-hall, erected at the expence of a few private gentlemen. This ftructure, with a colonnade and pilafters of ftone in front, confifts of upper apartments for the adminiftration of juftice, and of lower ones for the accommodation of trade. Beneath is a fpacious place, appropriated as a corn-market; a feparate fpace for the fale of mifcellaneous articles; and an ample court for holding the affizes or great feffions. On the fecond floor is the county-hall room; and a handfome room adjoining is fitted up for the ufe of the grand jury. The church, though in the pointed ftyle, is apparently of no very remote antiquity. It ftands fingularly at the bottom of a hill, and is fo low, that the ground of the cemetery almoft equals the height of the building. Among the facramental utenfils is a chalice of pure gold, brought from Guinea on the coaft of Africa, containing a wine quart: it bears a Latin infcription, ftating that its intrinfic value was 168*l.*, and that it was prefented to the church in the year 1562 by Thomas Davies, fome time governor-general of the Englifh colonies on the weftern coaft of Africa. Welfh-Pool has a very ancient corporation: its original charter was granted by one of the princes of Powys Land, about the end of the eleventh century; the prefent was a grant from Charles II., by virtue of which the town is governed by two bailiffs, a high fteward, recorder, and town-clerk; under whom are two ferjeants at mace. The population of the parifh, which includes nine adjoining townfhips, was in the year 1811 returned to parliament as 2779; the number of houfes as 578. Formerly the town contributed with the borough of Montgomery in fending a member to parliament; but was disfranchifed of this privilege in the year 1728. There are fome encampments in this parifh, one of which is faid to have been the Britifh camp of Caractacus, on the fummit of the Bryddin-hill, where the laft remains of ancient Britifh liberty were loft by the furrender of that brave fovereign: on the centre of this mountain a column was erected, to perpetuate the memory of admiral Rodney's celebrated victory over the French fleet in the Weft Indies, April 12. 1782.

About a mile to the fouthward of Welfh-Pool, is Powys Caftle, formerly the chief manfion of the Convinian Welfh princes of Powys, and now the refidence of the earl of Powys. This venerable pile, fituated in a well wooded park, is built in the ancient ftyle of domeftic architecture, participating of the caftle and manfion. The entrance is by a gateway between two maffy circular towers, into the area or court, round which the apartments range. Several other towers are ftill ftanding, flanked with femicircular baftions. In front, two immenfe terraces, rifing one above another, form the afcent, by means of a vaft flight of fteps. The interior exhibits little worthy of notice, excepting the principal gallery, meafuring 117 feet in length, which was originally much longer; but in the modernizing plan a large room has been taken from it. The park is formed of fpacious lawns, and fwelling hills; the oak, beech, and chefnut, diverfify the views in rich variety; and highly contribute to render the place interefting to the lovers of foreft fcenery. It is, however, to be regretted, that this venerable caftle is verging to decay: the buildings are in a ftate of dilapidation; the gardens and grounds are neglected; and the pride and ornament of the park removing, for the fake of the timber: fo that at no very diftant period, the beauty and magnificence of Powys may be no more.—Beauties of England and Wales, vol. xvii. North Wales. By Rev. J. Evans, 1812.

WELSTEIN, a town of France, in the department of Mont Tonnerre; 7 miles E.S.E. of Creutznach.

WELSUN, a town of the duchy of Guelderland; 6 miles W. of Hattem.

WELT-ROOT, in *Agriculture*, a term that fignifies the dying away or falling off of wheat-crops, in fome cafes, in the winter or early fpring feafons. It has been fuppofed to occur the moft frequently where the wheat-crops have been put in on clover leys. Some incline to think that it depends upon the want of a fufficient degree of clofenefs and firmnefs in the foils on the beds of mould into which the crops have been put; as where they lie too open and in too porous a ftate, due nourifhment and fupport is not fupplied to the young wheat plants from below, that, of courfe, they do not form their roots in a proper manner. See TREADING.

The term is alfo applied to an operation in the harvefting of grain. See ROOT-*Welt*.

WELTENBURG, in *Geography*, a town of Bavaria, on the right fide of the Danube; 20 miles E.N.E. of Ingoldftadt.

WELTERSBURG, a town of Germany, in the county of Leiningen; 1 mile S. of Wefterburg.

WELTZENEN, a town of the duchy of Weftphalia; 5 miles N. of Werl.

WELWARN, a town of Bohemia, in the circle of Schlan; 8 miles N.E. of Schlan. N. lat. 50° 18′. E. long. 14° 24′.

WELWIN, a village of England, in the county of Herts, where the general maffacre of the Danes is faid to have begun in 1012. In this place, Dr. Young, who was the rector, wrote his celebrated Night Thoughts. Here is a chalybeate fpring; 25 miles N. of London.

WELZHEIM, or WELZEN, a town of Wurtemburg, and capital of a lordfhip to which it gives name, on the Lein; 20 miles E. of Stuttgart.

WEM, a market-town of Whitchurch divifion of the north part of the hundred of Bradford, in the county of Salop, England, is fituated near the fource of the river Roden, at the diftance of 7 miles S. from the town of Whitchurch, 10 miles N.E. from Shrewfbury, and 172 miles N.W. from London. From its fituation Horfley infers, that it is the fcite of the ancient Rutunium. The manor was formerly in the poffeffion of the earls of Arundel, but on the attainder of earl Philip, in the reign of queen Elizabeth, it fell to the crown; and James II. conferred it on the lord chancellor Jefferies, of infamous memory, who had the eftate, and was created baron of Wem. On his death, the title defcended to his fon; but on his deceafe, which occurred fhortly after, it became extinct. The town of Wem confifts of one large ftreet, with a few fmaller ones. By the population return of the year 1811, the number of houfes was ftated to be 297, and the inhabitants 1395. A weekly market is held on Thurfdays, and three fairs annually. The church, a rectory of the real value of about 500*l. per annum*, is a handfome edifice, with a lofty tower, and a fine chancel. A free-fchool was founded and liberally endowed by fir Thomas Adams, who was born in this town in the year 1586, and was elected lord mayor of London in 1645. He was an inflexible adherent to king Charles I. in his troubles, and

continued

continued his attachment to Charles II. while in exile, to whom he is ſaid to have made a remittance of 10,000*l*. On the eve of the Reſtoration he was deputed by the corporation of London to go with general Monk to Breda, to conduct the king to England. The munificence and charities of ſir Thomas were exemplary: among other memorials, is an Arabic profeſſorſhip founded by him in the univerſity of Cambridge. He died February 24. 1667, in the 81ſt year of his age. Near this town, in 1640, was born William Wycherley, a celebrated dramatic writer, who died January 1. 1715. In the ſame houſe which gave him birth, was alſo born John Ireland, author of the "Illuſtrations of Hogarth," and otherwiſe well known in the literary world.—Beauties of England and Wales, vol. xiii. Shropſhire. By Rylance, and J. Nightingale, 1811.

WEMBDINGEN, a town of Bavaria; 10 miles E. of Nordlingen. N. lat. 48° 51′. E. long. 10° 40′.

WEMBERG, a town of Bavaria, in the landgraviate of Leuchtenberg; 6 miles S.W. of Leuchtenberg.

WEMDALEN, a town of Sweden, in Hardjeadalen; 107 miles W.N.W. of Sundſwall.

WEMISTITZ, a town of Moravia, in the circle of Znaym; 4 miles S.W. of Krumau.

WEMMERBY, a town of Sweden, in the province of Smaland; 50 miles N. of Calmar.

WEMO, a town of Sweden, in the government of Abo; 22 miles N.W. of Abo.

WEMYSS, a ſea-port town of Scotland, in the county of Fife, on the N. ſide of the Frith of Forth; a burgh of barony governed by bailies and a council: it has a good harbour, and ſeveral veſſels belong to it, chiefly employed in the carrying trade. Coals and ſalt are the only exports; 4 miles N.E. of Kirkcaldy. N. lat. 56° 9′. W. long. 3° 4′.

Wemyss, *Eaſter*, a town of Scotland, in the county of Fife, on the coaſt, but without a ſafe harbour: here are the ruins of a caſtle uſually called Macduff's Caſtle, ſaid to have been built by Macduff, who was created earl of Fife, in 1057, by Malcolm Canmure; 5 miles N.E. of Kirkcaldy.

WEN, in *Surgery*, an encyſted ſwelling, the particular nature of which is deſcribed in the article Tumours. See alſo Atheroma, Meliceris, and Steatoma, which are technical names applied to the three principal varieties of encyſted tumours. Scarpo's obſervations on encyſted ſwellings of the eye-lids, will be found in another place. See Eye-lid.

Wen, in *Animals*, a fleſhy ſubſtance growing out of any part of an animal's body, and which not unfrequently proceeds from blows, bruiſes, ſtrains, and other ſlight accidents of the ſame nature, moſt commonly beginning or taking its origin in the ſkin of ſome part, and gradually enlarging by a continual accumulation in the diſeaſed part, until by time it becomes of a very conſiderable ſize in ſome caſes.

Enlargements of this nature are ſeldom painful, and in many inſtances they are of ſeveral years duration before they ever reach any great magnitude; becoming quite indolent and ſomewhat like the natural fleſh, having rarely any other ſenſible effect than that of cauſing a deformity and weight in the parts where they happen to be ſituated. The ſubſtance of them is, for the moſt part, of a ſort of fleſhy and often ſpongy nature, though, in ſome caſes, there is a kind of ſpongineſs mixed with a degree of hardneſs, and occaſionally a ſcirrhous or cancerous diſpoſition accompanies them, eſpecially when they take place in the neighbourhood of parts which are of the more glandulous kind.

In moſt real caſes of this nature, the wen is contained in a ſort of cyſt or bag, which ariſes from the injured veſſels of the part, and is formed as it ſlowly advances; and which incloſes the whole ſubſtance, augmenting in thickneſs as well as ſize as it increaſes.

In the removal and cure of caſes of this ſort when they make their appearance on any part of an animal's body, trials ſhould firſt be made to diſſolve and diſperſe them by proper means, ſuch as camphorated ſpirituous and mercurial applications: and where this cannot be accompliſhed, as is often the caſe, the uſe of the knife or cauſtic muſt be had recourſe to for the purpoſe of taking them off or deſtroying them. In circumſtances where the wens are of the pendulous ſort, and hang only by a ſmall neck root, they may frequently be eaſily and conveniently removed by the uſe of a ligature of the ſame kind as is employed in taking up large blood-veſſels, applying it ſo as that it may be capable of being gradually made tighter as there may be occaſion, until the ſubſtance drops off; the part being afterwards dreſſed and healed by the common digeſtive ointment or cerate. Bathing and waſhing the part frequently with the tincture for wounds is alſo, in ſome caſes, of great utility. See Tumour, and Wound, in *Animals*.

However, in caſes where wens have large broad-bottom root parts which are of a knotty ſtringy nature, the cure, if practicable, is to be attempted by extirpation, or the uſe of rather mild cauſtics, dreſſing the parts as in the caſe of wounds. It is ſometimes the beſt and ſafeſt practice, however, to meddle as little as poſſible with wens of this ſort.

When enlargements of the wenny kind take place on the legs and heels of animals, as is often the caſe in the horſe, in the more ſimple kinds of them, the cure may be ſometimes effected by the uſe of applications ſuch as hot vinegar and alum; but in caſe bloody matter be extravaſated, ſuppuration ſhould be promoted by the uſe of ſtimulant ointments and waſhes, and the parts be opened when proper by means of a lancet in a ſuitable depending ſituation, the openings being dreſſed by the wound ointment and tincture.

In theſe wenny enlargements, the contents are of different kinds, ſometimes watery, and at others of a ſuety or thick paſty nature; which, if care be not taken to digeſt well out, together with the cyſt, will not unfrequently collect and fill again. In ſome inſtances, the ſhorteſt method would be to extirpate them by means of the knife, which, when well performed, and the ſkin properly preſerved, would leave little deformity. However, ſome of theſe ſorts of enlargements are beſt let alone, as thoſe of the watery kind in particular, which will wear away inſenſibly in many inſtances, without any application except a little camphorated mercurial ointment.

Wens *of Pearl*. See Pearl.

WENBACH, in *Geography*, a river of France, which runs into the Rhine, 3 miles above Druſenheim.

WENCESLAUS, or Winceslaus, in *Biography*, the ſon and ſucceſſor of Charles IV., whom he ſucceeded as emperor of Germany and king of Bohemia, in his 17th year. In the progreſs of his life, he became notorious both for cruelty and debauchery, and for the moſt extravagant profuſion, for the means of which he had recourſe to the moſt flagitious conduct.

His extravagance, however, became at length ſo intolerable, that the Bohemians, in 1396, with the advice of his

his brother Sigifmund, king of Bohemia, put him into confinement; from which he contrived to efcape, and again to affume the royal authority. But as he purfued the fame conduct, his brother Sigifmund, at the requeft of the people, depofed him, and he was declared regent. Wenceflaus, after having been confined fucceffively in various prifons, made his efcape from one of the towers of Vienna, and returning to Prague, recovered his kingdom. After a fecond marriage, his extravagance involved him in new difficulties, fo that, in order to his difembarraffment, he was under a neceffity of felling his imperial rights to John Galeazo, who had feized the fovereignty of Milan, and other cities of Lombardy dependant on the empire. The princes of the empire became indignant, and affembled a diet in 1400, in which they formally depofed him. Profeffing himfelf happy at this event, which would afford him leifure to pay attention to the government of his kingdom, he held the crown of Bohemia for 19 years longer, more tolerable in his vices, though ftill unreclaimed from them. The difturbances of Bohemia, occafioned by the preaching of John Hufs, occurred in his time, and he took pains to compofe them. At length, whilft he was fitting at dinner, he received intelligence of a fudden tumult at Prague, which occafioned a paroxyfm of rage, that was followed by an apoplexy, which terminated his life in 1419, at the age of 58. Mod. Un. Hift. Moreri.

WENDEL, in *Geography*, a town of Sweden, in Upland; 15 miles N. of Upfal.

WENDELEN, a town of Sweden, in Harjeadalen; 18 miles S.E. of Langafchants.

WENDELL, a townfhip of Maffachufetts; 90 miles N.W. of Bofton.—Alfo, a townfhip of New Hampfhire, in the county of Chefhire, containing 447 inhabitants; 30 miles N.W. of Concord.

WENDELSTEIN, a town of Germany, in the principality of Anfpach; 8 miles S. of Nuremberg. N. lat. 48° 18′. E. long. 11° 4′.—Alfo, a town and ruined citadel of Thuringia; 6 miles S.W. of Querfurt.

WENDEN, a town of the duchy of Weftphalia; 4 miles S. of Olpe.—Alfo, a town of Pruffia, in the province of Bartenland; 6 miles N. of Raftenburg.

WENDIA, in *Botany*, a new umbelliferous genus, thus named by profeffor Hoffmann, in honour of Dr. Wendt, profeffor of Phyfic at Erlang, counfellor to the Elector Palatine, and fucceffor to the great Schreber in the diftinguifhed fituation of Prefident of the Imperial Academy *Naturæ Curioforum*. He is celebrated for the numerous obfervations which he has publifhed, refpecting medicinal plants, and for his zeal in the promotion of botanical ftudies in general.—Hoffm. Gen. Plant. Umbellif. v. 1. 136. t. 1. B. f. 8, *a*, *b*.—Clafs and order, *Pentandria Digynia*. Nat. Ord. *Umbellatæ*, Linn. *Umbelliferæ*, Juff.

Gen. Ch. *Cal. General involucrum* none; *partial* of a few fhort, unequal, lanceolate or linear, deciduous leaves. *Perianth* of five unequal teeth, two of them, in the radiant florets, twice as large as the reft, ovate, acute. *Cor. Univerfal* irregular; flowers of the radius perfect, fertile, except a few males which are interfperfed: *partial* of five petals, with long claws; the outer ones in the radius very large, the middle one divided almoft half way down into two divaricated, linear-oblong, obtufe, flightly falcate, equal lobes; lateral ones rather fmaller, unequally cloven, falcate, one lobe three or four times the length of the other; inner ones much the fmalleft, about equal to the petals of the difk, two-lobed from their incurvation, their point ovato-lanceolate, acute, channelled. *Stam.* Filaments five, fimple, equal, fpreading, the length of the fmaller petals longer than the petals in the flowers of the difk; anthers nearly ovate, two-lobed. *Pift.* Germen oval, compreffed, ftriated, hairy; ftyles two, erect, at length widely fpreading, tapering, their bafe conical, winged with a membranous crifped border running down from each ftyle; ftigmas capitate, obtufe, at length fomewhat globular. *Peric.* Fruit almoft perfectly fmooth, obovate, nearly orbicular, compreffed, bordered, ftriated and ftriped, entire at the edges. *Seeds* two, uniform, emarginate, crowned, in the terminal notch, with the conical, winged, feffile bafe of the two deflexed permanent ftyles: dorfal ribs three, flender, flightly elevated, converging at each end; marginal ones two, parallel: ftripes four, defcending from the top of the feed between the ribs, obtufe, club-fhaped, brownifh, not half the length of the feed: border convex, terminating in a thin, flat, fharp edge, which is channelled externally, emarginate at the bottom.

Eff. Ch. General involucrum none; partial obfolete. Flowers radiant. Calyx unequally toothed. Fruit nearly orbicular, compreffed, notched, with three ribs, and four fhort intermediate ftripes; crowned with the ftyles, whofe bafe is winged.

Obf. The want of a general involucrum, and the flightnefs of the partial one, added to the more orbicular form of the feeds, and their fmoothnefs, appear to afford the chief marks of diftinction between this genus and HERACLEUM, (fee that article,) from which we fhould be rather unwilling to feparate it, any more than *Sphondylium*.

The only fpecies mentioned by the author is,

1. W. *Chorodanum*. Long-leaved Wendia. Hoffm. n. 1. (Heracleum longifolium; Marfch. à Bieberft. Taur. Caucaf. v. 1. 223, excluding all the fynonyms.)—Native of the graffy declivities, furrounding the Caucafian mineral waters of Nartfana, flowering in July. The *root* is biennial. *Leaflets* two pair with an odd one. General and partial *involucrum* fcarcely difcernible. *Flowers* fnow-white; thofe of the *radius* remarkably unequal. *Seeds* when bruifed agreeably fragrant. The author of the Flora Taurico-Caucafica fays, he thinks this more akin to *Heracleum Sphondylium*, with which Crantz and Lamarck unite it, than to the *anguftifolium* of Jacquin, to which it is referred by Willdenow. The latter, however, proves to be a different plant, and it is probable that Willdenow had no knowledge of Hoffmann's *Wendia*, any more than Jacquin, Crantz, or Lamarck, all their obfervations referring to the real *H. longifolium* of Fl. Auftriac. t. 174.—The fpecific name, χοροδανον, is an old fynonym of the *Sphondylium*, or Cow-parfnep.

WENDING, at *Sea*, a term for bringing a fhip's head about, and feems only to be a corruption from *winding*. They fay, *How wends the fhip?*

WENDLANDIA, in *Botany*, owes its name, though not its diftinction as a genus to the late profeffor Willdenow, who dedicated it to the author of that diftinction, Mr. John Chriftopher Wendland, curator of the royal garden at Herrenhaufen, "a moft acute botanift, and highly meritorious writer." His name appears in the *Sertum Hannoveranum* of the very eminent profeffor Schrader, as the delineator and engraver of the plates of that work. Thefe difplay great botanical fkill and attention.—Willd. Sp. Pl. v. 2. 275. Purfh 252. ("Androphylax; Wendland Obf. 37.")—Clafs and order, *Hexandria Hexagynia*. Nat. Ord. *Menifperma*, Juff.

Eff. Ch. *Calyx* of fix leaves. Petals fix, fucculent. Styles reclining. Capfules fix, of one cell. Seeds folitary.

1. W. *populifolia*. Poplar-leaved Wendlandia. Willd. n. 1.

n. 1. Purſh n. 1. (Meniſpermum carolinum; Linn. Sp. Pl. 1468. Willd. Sp. Pl. v. 4. 825. Ait. Hort. Kew. v. 5. 404. M. folio hederaceo; Dill. Elth. 223. t. 178. Androphylax ſcandens; "Wendl. Obſ. 38. Hort. 3. t. 16." Cocculus carolinus; De Cand. Syſt. v. 1. 524.)—Found in hedges and woods, from Carolina to Florida, flowering in June and July. *Stem* ſhrubby. *Flowers* very ſmall, greeniſh-white. *Berries* red. *Purſh.* Hardy in the gardens of Europe, where M. De Candolle ſays it is very frequent, flowering in Auguſt. *Stem* twining, with round *branches*, ſtriated and downy when young. *Leaves* alternate, heart-ſhaped, or broadly ovate, entire, tipped with a ſmall point, rarely three-lobed; an inch and a half or two inches long, with three or five radiating ribs; downy beneath. *Footſtalks* round, downy, about an inch in length. *Flower-ſtalks* axillary; thoſe of the male flowers, (which are generally, not always, diſtinct from the female,) racemoſe, ſimple; thoſe of the female three-cleft.

Profeſſor De Candolle has referred this plant to his genus *Cocculus*, ſeparated from MENISPERMUM, (ſee that article,) on account of the flowers being three-cleft, not four-cleft, to uſe the Linnæan language; and the ſtamens only ſix, inſtead of from ſixteen to twenty. We cannot but heſitate to adopt a genus ſo circumſtanced, and therefore ſhall ſay little concerning the name, which its antiquity can hardly authorize. We regret to perceive that our learned friend ſeems inclined to make antiquity paramount to every other conſideration in nomenclature; thus aſſuming a principle ſubverſive of all his own authority, which otherwiſe might be of ſufficient weight to render the moſt important ſervice to this branch of botany. We hope he will ſoon perceive, that ſenſe and learning are as applicable to it as to any other part of the ſcience, and full as neceſſary to preſerve the whole from ruin.

If the name of *Cocculus* ſhould be diſcarded, though the genus be retained, ſtill that of *Wendlandia* can ſcarcely take its place; there being ſeveral others, good or bad, certain or uncertain, which have a prior claim on the ſcore of antiquity. With theſe we will not here encumber our paper. The reader may find them in De Candolle.

WENDLING, in *Geography*, a town of Auſtria; 3 miles W. of Tauffkirchen.

WENDLINGEN, a town of Wurtemberg, on the river Lauter, near the Neckar; 12 miles S.E. of Stuttgart. N. lat. 48° 38′. E. long. 9° 27′.

WENDOVER, an ancient borough and market-town in the hundred of Ayleſbury, and county of Buckingham, England, is ſituated in Ayleſbury Vale at the diſtance of 24 miles S.E. by S. from the county-town, and 35 miles N.W. by W. from London. It conſiſts principally of brick houſes: the inhabitants derive their chief ſupport from lace-making; but as a branch of the Grand Junction Canal has been recently conveyed to the town, it will probably advance in importance. The earlieſt charter for a market at this place is dated in 1403. A ſubſequent charter of the year 1464 confirms the market, and grants two fairs, which are ſtill held. This borough ſent members to parliament in the 28th of Edward I., and again in the 1ſt and 2d of Edward II.; after which the privilege was diſcontinued for above three hundred years: when in the 21ſt of James I. Mr. Hakeville, a barriſter of Lincoln's-Inn, diſcovered, by a ſearch among the parliament writs in the tower, that members had been formerly ſent. A petition was accordingly preferred for the reſtoration of the ancient franchiſe; and though ſtrenuouſly oppoſed by the court, the commons decided in favour of the borough. The right of election is veſted in all the houſekeepers not receiving alms. The voters are not however more than 130, moſt of whom occupy the burgage houſes rent free. The celebrated John Hampden repreſented this borough in five parliaments. In the population return of the year 1811, Wendover is ſtated to contain 283 houſes, and 1481 inhabitants. The pariſh-church ſtands a quarter of a mile from the town, but contains nothing worthy of particular notice. Near the town is a large reſervoir of water, which covers about ſeventy acres: it was made for the ſupply of the canal.—Beauties of England and Wales, vol. i. Buckinghamſhire; by J. Britton, and E. W. Brayley, 1801. Lyſons's Magna Britannia, vol. i. Buckinghamſhire, 1806.

WENFORD, a town of Sweden, in Weſt Bothnia; 25 miles N.W. of Umea.

WENG, a town of the duchy of Stiria; 10 miles N.N.E. of Rottenmann.

WENGIA, a town of Sweden, in Weſt Gothland; 32 miles E.N.E. of Gothenburg.

WENHAM, a townſhip of Maſſachuſetts, in the county of Eſſex, containing 554 inhabitants; 21 miles E.N.E. of Boſton.

WENHOFDORF, a town of Auſtria; 5 miles N.W. of Schwannaſtatt.

WENJAN, a town of Sweden, in Dalecarlia; 44 miles W.N.W. of Fahlun.

WENIGZELL, a town of the duchy of Stiria; 11 miles W.S.W. of Fridberg.

WENINGS, a town of Germany, in the county of Iſenburg; 4 miles N.W. of Birſtein.

WENLOCK, GREAT, or MUCH, a borough and market-town in the hundred of Wenlock, and county of Salop, England, is ſituated 14 miles S.E. from Shrewſbury, and 147 miles N.W. from London. It is but poorly built, and conſiſts of only two ſtreets, but contains an ancient corporation, and is ſaid to have ſent members to parliament, by a writ from Edward IV. in 1478, when it ſent one member; but now, jointly with Broſeley and Little Wenlock, it returns two. The free burgeſſes, who are the electors, amount to one hundred and ten. By a charter from Charles I., the corporation conſiſts of a bailiff, recorder, two juſtices of the peace, and twelve capital burgeſſes. The whole number of the inhabitants, by the population return of the year 1811, is enumerated as 2079, occupying 494 houſes. Four annual fairs are held here; and a weekly market on Mondays. In the reign of Richard II., Wenlock was as famous for copper-mines, as it is now for quarries of limeſtone. The pariſh-church bears ſome marks of Norman architecture. A large round arch ſeparates the nave from the chancel: at the weſt end is a ſquare tower, with circular headed windows, from which riſes a ſlender ſpire of wood, covered with lead. The interior is well fitted up: on the right of the altar are ſome niches; but there is no monument of ſufficient antiquity or ſculpture to attract the notice of the antiquary. Wenlock owes its celebrity principally to the remains of an ancient abbey, which was ſubſequently converted to a priory for Clugniac monks. This houſe was founded about the year 680, by St. Milburga, daughter of Merward, and niece of Wulphere, king of Mercia: ſhe preſided as abbeſs, and died about the year 716. The Daniſh ravagers are ſaid to have reduced this nunnery to a ſtate of utter deſolation, in which it lay until Leofric was appointed to the earldom of Mercia. Soon after the year 1017, that earl, at the inſtance of his pious conſort the lady Godiva, reſtored it; but with ſo little ſucceſs, that, according to Malmſbury, it was found an heap of ruins, by Roger de Montgomerie, the firſt Norman earl of Shrewſbury, who rebuilt it in 1080, and filled it with monks from Clugni.

It

It is certain that none of the exifting remains are older than his time; and thefe are confined to the chapter-houfe; for not a veftige is now to be traced of the pillars of the choir, which are known to have been circular, maffive, and Norman. The parifh-church was indeed rebuilding at, or juft before the time when Malmfbury wrote (about 1127); for it was on the occafion of commencing the building of the new church, that the difcovery was made of the body of St. Milburga, whofe facred relics are faid to have effected many miraculous cures. The parifh-church ftill retains evident marks of having been erected at a period confiftent with this narrative: but no part of the priory, except what has been already mentioned, can lay claim to any fuch antiquity. The remains of the patron faint appear to have been transferred from the church of the parifh to that of the priory, and perhaps fome new works erected with the treafures which poured in from their fortunate difcovery; for when Gervafe Paganel refolved to build a priory at Dudley, which he appears to have done early in the reign of king Stephen, "he placed his deed of gift with his own hand upon the altar of St. Milburga of Wenlock, in prefence of all the convent, to whofe protection he committed his new foundation." Indeed the priory of St. Milburga was in fuch high repute for fanctity of life and ftrictnefs of difcipline during this century, that in 1164 it furnifhed a colony of monks for the abbey of Paifley in Clydefdale. The number of monks maintained within the priory was forty, and the fame appears to have been about the original number of ftalls in the chapter-houfe: though in 1374, when an inquiry was inftituted into the ftate of the alien priories, it was found to contain only feventeen monks. The priory was furrendered January 31. 1539-40, when a penfion of 80*l.* *per annum* was fettled upon the prior, John Creffage, and the manor-houfe of Madeley was affigned for his refidence. The revenues of the monaftery, according to Dugdale, amounted, at the time of the diffolution, to 401*l.* 0*s.* 7¼*d.* The fcite was granted by Henry VIII. to one Auguftino de Auguftinis, who fold it, in 1545, to Thomas Lawley, efq., who made it his refidence, and in whofe defcendants it continued, till Robert Bertie, efq., fon of his great-granddaughter Urfula Lawley, by fir Robert Bertie, K.B., fold it to the family of Gage. Lord vifcount Gage alienated it to fir John Wynn, bart., who devifed this with his other great eftates, to his kinfman fir Watkin Williams, bart., who thereupon affumed the name of the teftator: he was grandfather of fir Watkin Williams Wynn, bart., the prefent proprietor of thefe venerable ruins.

Few of our Englifh monaftic remains, perhaps, are capable of affording more inftruction and amufement to the lovers of ecclefiaftical architecture, than thofe of Wenlock. The ruins are feated in a low marfhy bottom, fouthward of the ancient borough, and adjoining the eaft end of the parifh church-yard. The chief entrance to the monaftery, from the town, was by a gate on the north fide of the precinct, which appears to have been flanked with two plain fquare towers, one of which is ftanding. The moft prominent features of the prefent buildings, are the lofty and extenfive remains of the priory church, which have happily efcaped the ravages of time. From thefe it is apparent that this facred edifice partook of the mixed characters of the round and the pointed arch. Its magnificence fully correfponded with the opulence of the foundation, and was not furpaffed by many of the ftately churches of the mitred abbeys. The plan of the church was cruciform, with a central tower, but probably without towers at the weft end. The extreme length was 401 feet; that of the tranfept 166; the nave 156; the fpace under the fteeple 39; the choir 156; and the chapel of the Virgin Mary 48. A fragment of the fouth angle of the weft front is ornamented with three tiers of fmall arches: a window below is finifhed with a plain round arch. The great weft window is now no more, but from the remains of one of its impofts, which is a taper-cluftered pilafter, bound midway with rings, its form may be conjectured to have confifted of three lofty lancet arches. Three pointed arches on the fouth fide of the nave are perfect, and reft on ftrong octagonal pillars with plain capitals. Over thefe commences a fecond divifion, feparated by an horizontal ftring-courfe; this comprifes a beautiful triforium, or open gallery, formed by lancet arches in couplets. Above thefe is a third compartment, from which rifes a feries of pointed clereftory windows, now mutilated, but evidently in the fame ftyle with the arches of the gallery beneath. A confiderable fragment of the north, and the whole of the fouth wing of the tranfept are ftanding, both in a ftyle coeval with the nave. The latter, a very beautiful ruin, is compofed of three pointed arches on each fide, refting on cluftered columns, with plain but well-executed capitals. The bafes of the four grand piers, which fupported the fteeple over the interfection of the nave, tranfept, and choir, may be traced nearly buried in rubbifh; and evident veftiges of cluftered fhafts indicate that they fuftained pointed arches. Of the choir, fcarcely a wreck remains, yet within thefe few years, the lower members of fix pillars, of plain and maffy Norman architecture, might be difcerned. Further eaftward appears the foundation of the Virgin Mary's chapel, confifting of excellent mafonry, with feveral deep bafement mouldings. On the eaftern fide of the quadrangle was the chapter-houfe, a parallelogram of fixty feet by thirty, of which a very large portion is ftanding; and a more rare difplay of Norman architecture of the eleventh century can hardly be produced. The north fide is almoft entire. A few paces fouth-eaftward of the chapter-houfe are the remains of a fecond quadrangle, the buildings of which, on two fides, are nearly entire. Thofe on the eaftern fide, it is prefumed, belonged to the lodge of the prior, and, at the diffolution, were preferved for a manfion-houfe by the firft lay poffeffors of the monaftery. This confifts of a long range of two ftories, not very lofty, with a highly pitched and tiled roof. Along the whole front runs an elegant cloifter, 100 feet in extent, compofed of a feries of narrow arches in couplets, with trefoil heads, and ftrengthened at frequent intervals with flender fhelving buttreffes. The eaftern front of the houfe is adorned with ranges of rather fingular windows, which have acute triangular heads, and are arranged in couplets united by very flender buttreffes.—Beauties of England and Wales, vol. xiii. Shropfhire; by R. Rylance, 1811. Architectural Antiquities of Great Britain, vol. iv.; by J. Britton, F.S.A. 1814.

WENLOCK, or *Winlock*, a town of Vermont; 90 miles N. of Windfor.

WENLOCK, *Little*, a town of England, in Shropfhire; 8 miles N. of Much Wenlock.

WENMAN, one of the Gallipago iflands, in the Pacific Ocean.

WENNE, a river of Weftphalia, which runs into the Roer, 3 miles below Everfberg.

WENNEL, a river of North Wales, which runs into the Conway, near Llanrwft.

WENNER LAKE, the largeft lake of Sweden, in Weft Gothland; nearly 90 miles long, and 40 wide. This lake is ftored with great plenty of fifh. Twenty-four rivers empty themfelves into the Wenner lake, yet none flows out of it but the large river called Gotha Elbe, by which outlet

let it discharges itself into the sea. There are several islands in this lake. In the year 1744, the diet resolved to make the passage from the Wenner lake and the Gotha Elbe to Gotheborg, and from thence to Orebro, navigable. See CANAL *of Trolhætta*.

WENNERSBORG, a town of Sweden, in West Gothland, at the south-west extremity of Wenner lake. This town was once a fortress, but at present an open town. It is the staple for all the iron sent from the province of Warmeland to Gotheborg; 15 miles E. of Uddevalla. N. lat. 58° 26′. E. long. 12° 9′.

WENOOA-ETTE. See OTAKOOTAIA.

WENSBECK, a river of England, which rises in Northumberland, passes by Morpeth, and runs into the German sea, N. lat. 55° 13′.

WENSYSSEL, a town of North Jutland, anciently the see of a bishop, removed to Aalborg; 18 miles N.W. of Aalborg.

WENT, a river of England, in the county of York, which runs into the Don.

WENTHUSEN, a town of Westphalia, in the bishopric of Hildesheim; 5 miles E. of Hildesheim.

WENTSCHEN, a river of Prussia, which forms a communication between lake Spirding and lake Wentschen. —Also, a lake of Prussia; 20 miles S.E. of Bartenstein.

WENTSUM, a river of Norfolk, which runs into the Yare, below Norwich.

WENTWORTH, THOMAS, in *Biography*, Earl of Strafford, was born at London in 1593, and having finished his education at St. John's college, Cambridge, travelled abroad, and continued more than a year in France. Soon after his return he was knighted, and married the eldest daughter of Francis Clifford, earl of Cumberland. By the death of his father in 1614, he became possessed of a patrimony of 6000*l.* a year, which was considerably incumbered by a provision for seven brothers and four sisters, with the title of a baronet. Upon his entrance into public life he was nominated Custos Rotulorum of the West Riding of Yorkshire. In 1621 he was returned as a member of parliament for the county of York, and during two sessions conducted himself with circumspection and moderation. In opposition to the king's assumption of unwarrantable authority, and of his assertion that the privileges of the commons were enjoyed merely by his permission, Wentworth urged the house explicitly to declare that these privileges were their right by inheritance. In 1622 he lost his wife, and in 1625 contracted a second marriage with a daughter of Holles, earl of Clare, a young lady distinguished for beauty and accomplishments; and in this year he was returned for his county to the first parliament of Charles I. At this time he was a zealous opposer of the arbitrary measures that marked the commencement of this unfortunate reign; but as he was deemed a person of considerable importance and influence, the minister thought proper to make efforts for conciliating his attachment and support. As he was prevented from obtaining a seat in the new parliament which was convoked, by being nominated sheriff in his county, he silently submitted to this arbitrary act, and took no part in the contention that subsisted between the court and the house of commons. Buckingham, the tenure of whose power was becoming precarious, made overtures to Wentworth, and though they parted upon the best terms after a conference, he received a mandate for resigning the office of Custos Rotulorum to sir John Savile, whom he had succeeded on his dismission. This conduct on the part of the favourite was attended with some aggravating circumstances, and very much incensed him; but he still expressed sentiments of unchanged loyalty. Nevertheless he refused to pay his contribution to the forced loan imposed without the intervention of parliament, and for his opposition to the measure he was first imprisoned in the Marshalsea, and afterwards confined to a range of two miles round the town of Dartford. When a new parliament was summoned, in 1628, this restriction terminated, and he took his seat for Yorkshire. In this season of competition between the advocates of an arbitrary and those of a limited monarchy, Wentworth took a decided and conspicuous part with persons of the latter description, and was one of the most active promoters of the famous Petition of Right. By the measures which he then adopted and pursued, he shewed that he was worthy the purchase of the crown, nor had he virtue sufficient to withstand the temptations by which he was assailed. These were a peerage, and future promotion to the office of president of the council of York, or court of the north. He agreed to the proposed terms; and in July 1628 was created baron Wentworth, Newmarsh, and Oversley, by a patent gratifying his vanity by recognizing his claim to an alliance with the blood-royal, through Margaret, grandmother of Henry VII. Soon after he was advanced to the dignity of a viscount, admitted to the privy-council, and on the resignation of lord Scrope nominated lord-president of the north, with enlarged jurisdiction and powers, the exercise of which afterwards exceeded or directly violated the common law, and overwhelmed the country with oppression and arbitrary dominion. From this time Wentworth may be regarded as a minister and statesman, whose influence at court was in a little while freed from controul by the assassination of Buckingham, and in a popular assembly by the dissolution of parliament. Devoted to the faithful and diligent service of the crown, he obtained the confidence and support of government; and thus elevated, he manifested a haughtiness and imperiousness of temper which augmented the unpopularity resulting from a desertion of his former principles and party. Having cultivated an intimate friendship with archbishop Laud, who had succeeded Buckingham in his influence over the king's mind, he was recommended by this prelate for the direction of affairs in Ireland; the peculiar circumstances of which were thought to require the vigour and decision of Wentworth's character. Accordingly his commission as lord-deputy of Ireland was dated in 1632, though he did not remove to that country till July in the following year. The objects which he proposed in the administration of that kingdom were to render the royal authority uncontrollable, to improve the revenues, so as to render them adequate to its own expenditure, and to afford a surplus for the English treasury, and upon the whole, to derive from it every possible advantage to the monarchy. He stipulated also for the uncontrolled exercise of his own authority. Of the various measures which he pursued in his government of Ireland, our limits will not allow us to give a minute and correct detail; but for an account of these we must refer to the history of that period. His talents and industry were unquestionable, and he certainly improved the state of the country in a variety of respects; but in accomplishing some beneficial purposes he was arbitrary and tyrannical, and chargeable with severe and vindictive proceedings, which made him unpopular both there and in England; and which probably induced the king to mortify him by refusing his request of an earldom. In 1636 he visited the English court, and made a speech before the king and the committee for Irish affairs, in which he gave a minute detail of his various measures by which he had promoted the good of that kingdom and the interest of his majesty, artfully apologizing at the same time for the infirmities of his

his temper. As a farther evidence of his merits with the court, he took notice of his zeal in fupporting the impofition of fhip-money in the exercife of his office as prefident of the council of York; and thus he prepared the way for renewing his petition for an earldom, which, notwithftanding his earneftnefs to obtain it, was again refufed. Thus mortified, he refumed his government with ample powers, and purfued meafures fimilar to thofe which had given fo great offence. His indefatigable application to bufinefs, and the irritation occafioned by the complaints and clamours of thofe who had reafon to be diffatisfied with his conduct, fubjected him to fome fevere paroxyfms of the gout. In 1637 he advifed the king not to engage in a war with Spain, and he thus incurred the lafting enmity of the queen, who wifhed for it, as favourable to the intereft of France. In the court conteft between England and Scotland, Wentworth was both an advifer and actor. After the failure of the king's firft expedition againft Scotland, he fent for the lord-deputy of Ireland, who arrived in November 1639. He advifed the immediate renewal of hoftilities, and the fummoning of a parliament to provide fupplies; and in order to fecure his continued attachment and affiftance, he obtained the earldom which he had once and again fought in vain. In January 1640 he was created earl of Strafford, decorated with the garter, and his ftyle of lord-deputy of Ireland was changed into that of lord-lieutenant, which had been dormant from the time of the earl of Effex. Upon his return to Ireland he obtained four fubfidies, and levied 8000 men for reinforcing the royal army. Afterwards the office of commander-in-chief devolved upon him; but though the Scots prevailed, and the northern counties were furrendered to the enemy, Strafford ftill recommended ftrong and arbitrary meafures. His credit at court, however, was now declining, and the king was obliged by his neceffities to call a parliament, which proved eventually to be the "long parliament." Strafford, perceiving his own perilous fituation, requefted leave to retire to his government; but the king refufed to comply, and encouraged him by a folemn promife that "not a hair of his head fhould be touched by the parliament." The fequel fhewed that Strafford's apprehenfions were well-founded; for on November the 18th, 1640, Pym, in the name of the commons of England, appeared with the charge of high treafon at the bar of the houfe of lords; and Strafford was fequeftered from parliament and imprifoned. The fallen minifter was now become the object of accufation in the three kingdoms; but the defertion and hatred of Ireland moft deeply affected him. The articles of accufation againft him were at firft nine, but in the courfe of three months they were multiplied into twenty-eight. The principal object of his accufer was to fix upon him the charge of "having attempted to fubvert the fundamental laws of the country." Againft this charge he defended himfelf with wonderful felf-poffeffion and powers of reafoning. It became neceffary, therefore, to change the original impeachment into the arbitrary mode of proceeding by a bill of attainder, in purfuing which procefs it was only neceffary to pafs an enactment of his having been guilty of high treafon, and having incurred its punifhment. The bill paffed the houfe with no more than fifty-nine diffentient voices; but among thefe were thofe of fome of the firmeft friends of the legal liberty of their country, who thought the principles of juftice fhamefully violated; and in the houfe of lords the bill was carried more by intimidation than conviction. Hopes were ftill entertained from the king's promife, and his attachment to a faithful fervant. But firmnefs was not one of the king's diftinguifhing virtues. His interference to ftop the progrefs of the bill in the houfe of lords had failed; and he even recurred to the plea of confcientious fcruples. But his counfellors urged the danger of refifting the torrent of popular fury; the prelates, Juxon excepted, acted the part of cafuifts; and Strafford himfelf terminated the ftruggle by a letter, in which he perfuaded the king for his own fafety to ratify the bill, thus concluding it, "my confent fhall more acquit you to God than all the world can do befides. To a willing man there is no injury." Love of life, however, feems to have induced him to have placed confidence in the king's promifes: for when fecretary Carleton informed him of his majefty's final compliance with his folicitations, he lifted up his eyes to heaven, and with his hand on his heart, exclaimed, "Put not your truft in princes, nor in the fons of men: for in them there is no falvation!" Strafford, between his condemnation and execution, employed himfelf in adminiftering confolation and advice to his diftreffed family, and making intereft for their protection. On the final day, as he was quitting the tower, he looked up to the windows of Laud's apartment, and obtaining a view of him, received his fervent bleffing, which he returned with "farewell my lord! God protect your innocence!" At the fcaffold he made an addrefs to the people, expreffing entire refignation to his fate, and afferting the good intention of his actions, however they might have been mifreprefented; and then, taking leave of his accompanying friends, with a pathetic recollection of his widowed wife and orphan children, he calmly laid his head on the block, and giving a fignal, received the fingle ftroke that deprived him of life. He fell in the forty-ninth year of his age, lamented by fome, admired perhaps by more, and leaving a memorable, though not a fpotlefs name. The parliament, not long after his death, mitigated the fentence as far as it affected his children; and in the fucceeding reign his attainder was reverfed, and his heir was reftored to his eftate and honours." Lord Strafford was thrice married, and left an only fon and feveral daughters. Biog. Brit. Whitelock's Mem. The Hiftories of the Period.

Wentworth, in *Geography*, a townfhip of England, in the Weft Riding of Yorkfhire, with about 1000 inhabitants; near it is Wentworth-Houfe, a feat of earl Fitzwilliam; 5 miles N.W. of Rotheram.—Alfo, a townfhip of New Hampfhire, in the county of Grafton, containing 645 inhabitants; 3 miles S.E. of Oxford.

WENTZBURG, a town of the duchy of Warfaw; 40 miles E. of Gnefna.

WEOBLEY, an ancient borough and market-town in the hundred of Stretford, and county of Hereford, England, is fituated 11 miles N.W. by N. from the city of Hereford, and 141 miles N.W. by W. from London. Anciently it formed part of the barony of the Lacies, from whom, by a female, it was conveyed in marriage to the Verdons, who, by that alliance, were for fome time hereditary conftables of Ireland. It afterwards paffed through various families to the Devereux, earls of Effex, and formed their principal lordfhip. On the fouth fide of the town ftood an old caftle, which was taken from the emprefs Maud by king Stephen. Leland mentions it as "a goodly and fine building, but fomewhat in decay." Weobly fent members to all the feven parliaments of Edward I.; the privilege was afterwards difcontinued till the year 1640, when it was reftored by order of the houfe of commons. The right of voting is poffeffed by the owners of the ancient burgage houfes, refident at the time of election, or by the inhabitants of fuch houfes who have been refident forty days. The number of voters is about forty-five: the returning officers are the conftables, in whom the government of the town is vefted. The church is fpacious, and

and contains ſome ancient monumental chapels, in which ſome of the Verdon family appear to have been interred. The population of the pariſh, as returned under the act of 1811, amounted to 626; the number of houſes to 160. A ſmall weekly market is held on Thurſdays; and here are two annual fairs.—Beauties of England and Wales, vol. vi. Herefordſhire, by J. Britton and E. W. Brayley, 1805.

WEPFER, John-James, in *Biography*, an eminent phyſician, was born in 1620 at Schaffhauſen, educated at Straſburg and Baſil, and after viſits to ſeveral univerſities in Italy, took the degree of doctor at Baſil, and ſettled in his native place. His reputation was extenſive in Switzerland and Germany, and he attained, by his diſſections and experiments, a high rank among thoſe who have contributed to improve medical ſcience. In 1658 he publiſhed a celebrated work, entitled "Obſervationes Anatomicæ ex Cadaveribus eorum quos ſuſtulit Apoplexia, cum Exercitatione de ejus loco affecto," 8vo., often reprinted, and in ſome editions with the title "Hiſtoria Apoplecticarum." In his "De dubiis Anatomicis Epiſtola," 1664, 8vo., he aſſerts the entire glandular ſtructure of the liver, prior to Malpighi. Another valuable work is entitled "Cicutæ Aquaticæ Hiſtoria et Noxæ," 1679, 4to.

His conſtitution was injured by attendance at an advanced age on the duke of Wurtemburg, and the Imperial army under his command; and he was carried off by a dropſy in 1695. His papers were publiſhed by two of his grandſons, in a work entitled "Obſervationes Medico-Practicæ de affectibus Capitis internis et externis," 1727, 4to. To the Ephemerides Naturæ Curioſorum, of which ſociety he was a member, he communicated ſeveral valuable papers. Haller. Eloy.

WEPOLON, in *Zoology*, the Ceyloneſe name of an Eaſt Indian ſerpent, of a very long and ſlender body, and in ſome degree reſembling a piece of cane.

WERAY, in *Geography*, a river of Wales, which runs into the Iriſh ſea, 7 miles S. of Aberyſtwith.

WERBEN, a town of Brandenburg, in the Old Mark, at the conflux of the Havel and the Elbe. This town was built by Henry the Fowler, on the ruins of the ancient Caſtellum Vari; 33 miles N.N.W. of Brandenburg. N. lat. 52° 53′. E. long. 29° 44′.—Alſo, a town of Pomerania; 9 miles S.S.W. of Stargard.

WERBERG, a town of Weſtphalia, in the biſhopric of Fulda; 12 miles S.S.E. of Fulda.

WERBKA, a town of Ruſſian Poland, in the palatinate of Braclaw; 36 miles S. of Braclaw.

WERD, a town of Carinthia, on a lake to which it gives name; 8 miles W. of Clagenfurt.

WERDA, a town of Saxony, in the Vogtland; 6 miles N.E. of Oelnitz.

WERDAU, a town of Saxony, in the circle of Erzgebirg; 6 miles W. of Zwickau.

WERDEL, St., a town of France, in the department of the Sorre; 40 miles S.E. of Treves. N. lat. 49° 30′. E. long. 7° 11′.

WERDEN, a town of Germany, in the county of Mark, on the Roer; 11 miles N.E. of Duſſeldorp. N. lat. 51° 18′. E. long. 6° 55′.

WERDENA, a town of Pruſſian Lithuania; 18 miles N.N.W. of Tilſit.

WERDENBERG, a town of Switzerland, and capital of a bailiwick, in the canton of Glarus, which was formerly governed by counts of its own, who were at one time very powerful. In the year 1485, it was purchaſed by the canton of Lucerne; and, after changing owners, in the years 1493 and 1498, was purchaſed by the canton of Glarus, in the year 1519, and has remained ever ſince annexed to that canton, though the inhabitants have ſeveral times been mutinous and revolted. The town is fortified; 11 miles S.S.E. of Appenzell.

WERDENFELS, a town and caſtle of Bavaria, which gives name to a county in the biſhopric of Freyſing; 20 miles S. of Weilhaim.

WERDER, a town of Brandenburg, in the Middle Mark, on an iſland formed by the Havel; 4 miles W. of Potzdam.—Alſo, a diſtrict of Pomerania, between the two branches of the Viſtula, about 20 miles long, and 12 in its mean breadth.

WERDING, a town of Auſtria; 4 miles N.N.W. of Schwannaſtadt.

WERDT, or Wert. See Weert.

WERE, or Wear, a river of England, which riſes in Northumberland, croſſes the county of Durham, and runs into the ſea at Sunderland; anciently called "Vedra."

Were, a river of England, which riſes near Warminſter, in Wiltſhire, and runs into the Avon, near Trowbridge.

Were. See Weir.

Were, *Wera*, in our old *Law-Books*, ſignifies as much as *æſtimatio capitis*, or *pretium hominis;* that is, ſo much as was anciently paid for killing a man.

When ſuch crimes were puniſhed with pecuniary mulcts, not death, the price was ſet on every man's head, according to his condition and quality. *Were ſuum*, id eſt, *pretium ſuæ redemptionis*, his ranſom.

WERELADA, among our Saxon anceſtors, the denying of a homicide on oath, in order to be quit of the fine, or forfeiture, called *were*.

Where a man was ſlain, the price at which he was valued was to be paid to the king, and his relations: for, in the time of the Saxons, the killing of a man was not puniſhed by death, but by a pecuniary mulct, called *wera*.

If the party denied the fact, he was to purge himſelf, by the oaths of ſeveral perſons, according to his degree and quality. If the guilt amounted to four pounds, he was to have eighteen jurors on his father's ſide, and four on his mother's: if to twenty-four pounds, he was to have ſixty jurors; and this was called *werelada*. *Homicidium wera ſolvatur, aut werelada negetur.*

WEREGILD, Weregeld, in our *Ancient Cuſtoms*, the price of a man's head: *pretium ſeu valor hominis occiſi, homicidii pretium;* which was paid partly to the king for the loſs of his ſubject, partly to the lord whoſe vaſſal he was, and partly to the next of kin.

This was a cuſtom derived to us, in common with other northern nations, from our anceſtors, the ancient Germans; among whom, according to Tacitus (De Mor. Germ. cap. 21.), *luitur homicidium certo armentorum ac pecorum numero; recipitque ſatisfactionem univerſa domus.*

In the ſame manner, by the Iriſh brehon law, in caſe of murder, the brehon, or judge, compounded between the murderer and the friends of the deceaſed, who proſecuted him, by cauſing the malefactor to give unto them, or to the child or wife of him that was ſlain, a recompence, which they called *eriach*. And thus we find in our Saxon laws, particularly thoſe of king Athelſtan, the ſeveral weregilds for homicide, eſtabliſhed in progreſſive order, from the death of the ceorl, or peaſant, up to that of the king himſelf. And in the laws of king Henry I. we have an account what other offences were then redeemable by weregild, and what were not ſo. The proceſs called *appeal* had probably its rife in the times when weregild was in ufe. Blackft. Comm. vol. iv.

The weregild of an archbifhop, and of an earl, was 15,000 thrifmas; that of a bifhop, or alderman, 8000; that of a general, or governor, 4000; that of a prieft, or thane, 2000; that of a king, 30,000: half was to be paid to his kindred, and the other half to the public. The weregild of a ceorl was 266 thrifmas.

WEREMOUTH, Bishop's, in *Geography*, a parifh of England, in the county of Durham, on the river Were, with 7060 inhabitants; 12 miles N.N.E. of Durham. This parifh is now incorporated in the town of Sunderland. See Sunderland.

Weremouth, *Monk's*, a parifh of England, in the county of Durham, at the mouth of the river Were, oppofite Sunderland, with 5355 inhabitants.

WEREN, a river of Wurzburg, which runs into the Maine, 6 miles below Carolftadt.

WERFEN, a town and fortrefs of the archbifhopric of Salzburg, on the Salza, with a caftle, memorable for having been the retreat of the archbifhop of Salzburg, whom the duke of Bavaria had driven from his capital for having married; 15 miles N.W. of Radftadt.

WERGELA, or Guergela, a town of Africa, in Biledulgerid; 300 miles S. of Algiers. N. lat. 31° 45'. E. long. 4° 10'.

WERINAMA, a town on the fouth coaft of the ifland of Ceram. S. lat. 3° 15'. E. long. 130° 18'.

WERING, or Woringen, a town of France, in the department of the Roer; 2 miles S. of Zons.

WERK. See Wark.

WERL, a town of the duchy of Weftphalia; 13 miles W.S.W. of Lippftadt. N. lat. 51° 33'. E. long. 7° 58'.

WERM, or Worm, a river of France, which runs into the Roer, near Waffemberg.

WERMSDORF, a town of Saxony, in the circle of Leipfic; 36 miles N.W. of Drefden.—Alfo, a town of Bavaria, in the principality of Aichftatt; 4 miles N. of Aichftatt.

WERNBERG, a town of Bavaria; 3 miles N. of Pfreimbt.

WERNBURG, a town of Saxony, in the circle of Neuftadt; 3 miles N.E. of Rahnis.

WERNE, a town of Germany, in the bifhopric of Munfter; 19 miles S. of Munfter. N. lat. 51° 38'. E. long. 7° 48'.

WERNECK, a town of the duchy of Wurzburg, on the Weren; 5 miles S.W. of Schweinfurt.

WERNER, Abraham Gottlob, in *Biography*, a celebrated mineralogift, and profeffor of mineralogy at Freyburg, in Saxony, was born on the 25th of September 1750. His father was infpector of an iron-work in Upper Lufatia, and at an early period intended to educate his fon for the fame employment. The firft fcanty rudiments of his education were received at a fchool at Bunfleur. He was afterwards fent to the Mineralogical Academy at Freyburg, and from thence to the univerfity of Leipfic, where he applied himfelf to the ftudy of natural hiftory and jurifprudence; but the former he found more attractive, and it was here that he employed himfelf in defining the external characters of minerals, for which he was endowed by nature with a fingular quicknefs of perception. At this place, he publifhed, in 1774, his work on the external characters of minerals, which was confidered as the bafis of his oryctognoftic or mineralogical fyftem. (See Systems *of Mineralogy*.) It has been tranflated into various languages, but Werner could never be perfuaded to publifh a new and enlarged edition. "In this work," fays profeffor Jamefon, "he gave the firft example of the true method of defcribing mineral fpecies. In thefe defcriptions, all the characters prefented by the *fpecies fuite* are detailed with a certain degree of minutenefs, and in a determinate order; fo that we have a complete picture of it, and are furnifhed with characters that diftinguifh it from all known fpecies, and from every mineral that may hereafter be difcovered." It cannot be denied, that previous to this time, the defcriptive language of mineralogifts had been much too indefinite to convey accurate information, or to enable mineralogifts in diftant countries to underftand each other. Soon after this publication, Werner was invited to have the care of the cabinet of natural hiftory at Freyburg, and to read lectures on mineralogy.

This fituation, fo well fuited to the peculiar ftudies in which he was engaged, offered abundant materials for the exercife of his talent for obfervation and claffification. In 1780 he publifhed the firft part of a tranflation of Cronftedt's Mineralogy. In his annotations on this work, he gave the firft fketch of his mineralogical fyftem, and publifhed many defcriptions in conformity with the methods propofed in his treatife on external characters. In this fyftem, we find earthy minerals divided into four genera, filiceous, argillaceous, talcaceous, and calcareous; and thefe fubdivided into fpecies, fub-fpecies, and kinds.

In 1791 he publifhed a catalogue of the great mineral collection of Pabft Von Obaine, captain-general of the Saxon mines. In this work, he gave a tabular view of the whole mineralogical fyftem, in which the arrangement of genus, fpecies, fub-fpecies, and kinds, is continued; feveral additions are made to the external characters, and the arrangement of the fpecies is in fome inftances changed, owing to more extended obfervations. Werner, befides his lectures on mineralogy, alfo delivered lectures on the art of mining, which he is faid to have rendered extremely intelligible by his fimplification of the machinery, and by drawings and figures. His fyftem of geognofy, or geology, was delivered in his lectures, but never publifhed by himfelf. (For fome account of this fyftem, fee Geology, and Systems *of Geology*.) "In lecturing," fays a writer in the Literary Gazette of Leipfic, "he ufed to abandon himfelf (as he was accuftomed to fay) to his mineralogical name, and when his fpirit hovered over the waters and the ftrata, he often became animated with lofty enthufiafm." He caufed his lectures to be written out by his approved fcholars, and by revifing them himfelf made them his own in manufcript. Many parts of thefe lectures have been publifhed in different countries by his pupils. Werner alfo publifhed fome mineralogical papers in the Miner's Journal; and in 1791 appeared his new theory of the formation of metallic veins. This work was tranflated into French by Daubuiffon, and into Englifh in 1809.

Werner was appointed counfellor of the mines in Saxony in 1792, and had a great fhare in the direction of the Mineralogical Academy, and in the adminiftration for public works.

The cabinet of minerals collected by Werner was unrivalled for its completenefs and arrangement, confifting of 100,000 fpecimens. This he fold for 40,000 crowns, referving the intereft of 33,000 as an annuity to himfelf and his fifter, who had no children; and at her death, to be paid annually to the Mineralogical Academy of Freyburg.

This illuftrious mineralogift died Auguft 1817, greatly regretted by all thofe who were perfonally acquainted with him, to whom he was endeared by the fimplicity of his manners,

manners, the cheerfulnefs and benevolence of his difpofition, his integrity and difinterefted devotion to fcience. Werner was never married. His favourite purfuit next to mineralogy appears to have been the ftudy of antiquities, one branch of it, the numifmatology of the ancients, had, during the laft eight years of his life, engaged much of his attention ; and he had formed a collection of 6000 Greek and Roman coins, which enabled him to make refearches into the different mixtures of the metals and the arts of adulteration ; and to make the fubject more clear, he arranged entire feries of falfe coins. He was alfo attached to the ftudy of medicine, and had made a humorous table of difeafes from infancy to old age ; and among his peculiarities may be mentioned his defire of offering medical advice to his friends, and his habit of judging of his own fituation, which he often thought precarious. He was greatly averfe to the ufe of vinegar and milk, but a determined beef-eater : in other refpects he lived temperately, drank but little wine, and was anxioufly careful about warm-clothing and rooms, a caution not well fuited to the habits of a geologift. Werner had travelled little from his own country ; his vifit to Paris appears to have been the only diftant excurfion he ever made from Saxony.

Werner may juftly be faid to have contributed more to extend and improve the practical knowledge of mineralogy, than any one who had preceded him. His method of obferving and defcribing the external appearances of minerals, has been introduced by his pupils, with fome modifications, into various parts of the world, and has given a new and more definite form to the fcience. It has indeed been objected to the method of Werner, that confifting principally in the claffification of minerals according to their external characters ; and in the defcription and arrangement of thefe characters, it may be regarded rather as an empiric art, than a fcience. But in the mineral kingdom thofe definite characters are wanting, which ferve to diftinguifh the genera and fpecies in the other departments of natural hiftory ; and he who can but relieve this difficulty, and enable the ftudent moft eafily to gain a knowledge of minerals under all thefe varying forms, is entitled to the higheft praife. This palm may be pre-eminently given to Werner ; and whoever has juftly appreciated his labours will never ftop to inquire, whether his method fhould rank among the fciences or the arts. Mr. Kirwan was the firft who introduced a knowledge of the Wernerian mineralogy into this country ; but for a more complete knowledge of it, we are indebted to profeffor Jamefon, in his Syftem of Mineralogy, firft publifhed in 1804, and in the fecond edition of 1817.

As a geologift, we cannot allow to Werner the fame degree of unmixed praife. His fyftem of geognofie was formed on obfervations made on a very limited portion of the earth's furface in his own vicinity ; and he has laid down a fucceffion of rock-formations as univerfally fpread over the globe, becaufe thefe rocks occurred in this order in a particular part of Saxony. Subfequent obfervations have, however, demonftrated, that even at a little diftance from Freyburg, many of the fuppofed univerfal rock-formations are not to be found, and that other rocks fupply their place. The reader may confult a defcription of the Saxon Erzgebirge by M. Bonnard, in the Journal des Mines for 1815, to convince himfelf of this. It is, we confider, fortunate for Mr. Werner's fame as a geologift, that no work of his on the fubject has appeared, except the " New Theory of Veins." This for fome time enjoyed a certain degree of celebrity from the name of the author ; but the new information which it contains is very fcanty, and the theory which it fupports fo inadequate to explain the phenomena, and fo much at variance with facts, that it was in a great part abandoned by many of the warm admirers of Werner, even fome years before his death. It will now fcarcely meet with a fupporter among thofe who have any practical knowledge of mineral-veins. Mr. Werner contended for the aqueous formation of almoft every kind of rock, even pumice-ftone and obfidian he maintained were the products of water ; and when he was repeatedly invited to vifit the volcanic diftricts of Italy, and the ancient volcanoes of France, he declined an examination which might have greatly endangered his own theory. The followers of Werner as a geologift reft his fame not on his local obfervations, but on his attempt to generalize his obfervations, in order to form a theory which fhould explain the ftructure of the earth and the mode of its formation. Indeed fuch was their admiration, that they would not admit his fyftem to be a theory, but confidered it as an expofition of demonftrated facts. " This great geognoft," fays Mr. Jamefon, " after many years of the moft arduous inveftigations, conducted with an accuracy and acutenefs of which we have few examples, difcovered the manner in which the cruft of the earth is conftructed. Having made this great difcovery he, after deep reflection, and in conformity with the ftrict rules of induction, drew moft interefting conclufions as to the manner in which the folid mafs of the earth may have been formed. It is a fplendid fpecimen of inveftigation, the moft perfect in its kind ever prefented to the world. (Jamefon's Mineralogy, firft edition, vol. i. p. 22.) We believe there are few perfons who will not now admit that the admiration and praife here beftowed were difproportioned to the object, whether we regard the merit of Mr. Werner's obfervations for accuracy as a geologift, or the conformity of his theory with exifting appearances.

The method of inveftigation purfued by Werner in attempting to trace the rocks in a diftrict in fucceffion, from the loweft or fundamental rock to the uppermoft ftratum, and marking the limits of each rock where it terminates on the furface, was confidered by his followers as entirely his own, and was called by them the *method of the Wernerian geognofie*. But this method had been known and practifed in England long before we were acquainted with the name of Werner ; indeed it is the only one which preceding geologifts could practically adopt in furveying a country. On a fmaller fcale, it had been practifed by all intelligent coal-viewers ; and it had been exhibited on a larger fcale by Mr. Whitehurft, in the defcriptions and plates which he has given in his " Theory of the Earth." Sauffure followed no fyftem ; yet wherever the order of fucceffion was apparent, he has not failed to inform us. But the country which he inveftigated, (Switzerland,) prefents enormous maffes, frequently in much apparent confufion, the order of fucceffion being hid by debris or by glaciers. In other inftances, whole mountains compofed of different rocks appear to have been formed cotemporaneoufly. Sauffure, who had no theory of any regular order of fucceffion to fupport, has fimply defcribed facts as they exift. Our own countryman, William Smith, had been long employed in tracing the limits and order of fucceffion of the ftrata in the midland and eaftern counties of England, before the Wernerian geognofie was known either in England or Scotland.

The originality of the Wernerian geognofie confifted more in the invention of a new language adapted to fupport a theory, than in the difcovery of a new and practical method of inveftigation. The language is highly objectionable in many refpects, as the terms are founded on the premature affumption of the relative ages and modes of formation

of

of different rocks; — facts which are far from being yet clearly afcertained.

Whatever may be the defects of the Wernerian fyftem as given us by his fcholars, and however premature many of the generalizations may have been, it was of ufe by directing the attention of obfervers in various parts to an examination of its accordance with facts. Though the different rocks which Mr. Werner has defcribed as univerfal formations neither occur invariably in the order of fucceffion which he has defcribed, nor are univerfally fpread over the earth's furface; yet there is a certain fimilarity between the geological arrangement of diftant countries when viewed on a large fcale, which indicates that fimilar proceffes of formation had taken place, and nearly in the fame order in remote parts of the globe; but we are far from knowing whether thefe proceffes were univerfal and fimultaneous, or local and fucceffive.

In the above obfervations, which it is our impartial duty as biographers to ftate, we have not the remoteft wifh to undervalue the real merits of this eminent mineralogift. His theoretical errors arofe naturally from the infant ftate of geology when he commenced his labours; and his overweaning attachment to opinions too haftily formed, was an infirmity which he fhared in common with many eminent philofophers. His errors will pafs away with time, but his more ufeful labours will remain a durable monument of his talents and perfevering refearch.

WERNERITE, in *Mineralogy*, a mineral regarded by Werner as a fubfpecies of fcapolite, but which has been claffed by other mineralogifts as a diftinct fpecies, to which they have given this name, in honour of the profeffor at Freyburg. The name has been applied to foliated fcapolite, compact fcapolite, and to a mineral which is called Bergmannite by Stevens and Jamefon. (See Scapolite.) Wernerite occurs maffive and cryftallized in octohedral prifms, with four-fided pyramidal terminations. The ftructure is imperfectly lamellar, with joints on two directions, at right angles to each other. The colour is greenifh-grey, with a pearly or refinous luftre, more or lefs fhining; it is tranflucent. Wernerite is fofter than felfpar, yielding to the knife; its fpecific gravity is 3.6. It melts with intumefcence into a white enamel.

This mineral is rare: it has been found at Arendal, in Norway; in the mines of Northbo and Ultrica, in Sweden; and at Campo-Longo, in Switzerland. The conftituent parts are,

Silex - - - - - -	40
Alumine - - - - - -	34
Lime - - - - - -	16
Oxyd of iron - - - - -	8
Oxyd of manganefe - - - -	1.5

WERNERSDORF, in *Geography*, a town of Pomerelia, on the Nogat; 7 miles S.W. of Marienburg.

WERNEUCHEN, a town of Brandenburg, in the Middle Mark; 6 miles E.S.E. of Bernau.

WERNFELS, a town of Bavaria, in the bifhopric of Aichftadt; 4 miles N.W. of Spalt.

WERNHAUSEN, a town of the county of Henneberg; 4 miles N. of Wafungen.

WERNIGERODE, a county of Upper Saxony, bounded on the north by the principality of Halberftadt, on the eaft and fouth by the principality of Blankenburg, and on the weft by the Harz foreft; about twelve miles in length, and eight in breadth. One part is mountainous, and the other level. Amongft the mountains, the moft diftinguifhed of all is the Great Brocken, or Blockfberg, which is one of the higheft; or, according to fome, the very higheft mountain in all Germany. On its fummit fcarce any fmall fhrubs grow, much lefs trees; and the fnow remains frequently there till midfummer, and in fome of the northern parts even yet longer. The levels are very fertile in all kinds of grain, pulfe, turnips, flax, culinary herbs, and other vegetables and fruits. The mountains afford very valuable plants, with berries of various kinds, particularly crown berries, of which great quantities are preferved; game and wild fowl are plentiful. In 1807, it was annexed to the new kingdom of Weftphalia. The inhabitants are Lutherans.

Wernigerode, a town of Weftphalia, and capital of a county of the fame name, fituated on a fmall river, and confifting of three parts: "The Old Town," containing two churches, and about 430 houfes, with a houfe belonging to the county; "The New Town," containing one church, and about 200 houfes; and the fuburbs, called "Nofchenrode," which contain one church, and 150 houfes. On a high mountain, directly above the town, is the caftle, in which the counts' family archives are kept. The principal bufinefs of the town confifts in agriculture, brewing, diftilling, and manufactures of cloth and ftuffs; 12 miles S.W. of Halberftadt. N. lat. 51° 53'. E. long. 10° 52'.

WERNITZ, a river of Germany, which rifes about 5 miles S. from Rotenburg, paffes by Dinkelfbuhl, Waffertrudingen, Oettingen, &c. and runs into the Danube, near Donauwert.

WERNSDORF, a town of Bohemia, in the circle of Saetz; 3 miles N.W. of Kadan.

WERNSTADT, a town of Bohemia, in the circle of Leitmeritz; 10 miles W. of Leypa.

WERO, an ifland near the coaft of Norway. N. lat. 67° 43. E. long. 9° 10'.

WERPE, a river of Germany, which joins the Sieg, near its fource.

WERRA, a river of Germany, which rifes in the principality of Coburg, paffes by Eisfeld, Hildburghaufen, Meinungen, Saltzungen, Vach, Bercka, Gerftungen, Creutzberg, Trefurt, Wanfried, Allendorf, &c. and joining the Fulda at Munden, forms the Wefer.

Werra, a department of the kingdom of Weftphalia, compofed of Upper Heffe, with the principality of Herffeld; with a population of 254,000 fouls. Marburg is the capital.

WERREAR, a circar or diftrict of Hindooftan, lying on the right bank of the Puddar, which feparates it from Guzerat, eaft of Cutch.

WERSALA, a fmall ifland near the coaft of Finland, at the entrance into the gulf of Bothnia. N. lat. 60° 46'. E. long. 31° 6'.

WERSEN, a town of Germany, in the county of Tecklenburg; 8 miles N.E. of Tecklenburg.

WERSHOCK, in *Menfuration*, a long meafure in Ruffia; 16 werfhocks being equal to an arfheen, or 28 Englifh inches; fo that 9 arfheens are = 7 Englifh yards, and 4 werfhocks = 7 Englifh inches.

WERST, or Wurst. See Verst.

WERT, in *Geography*. See Weert.

WERTACH, a river of Bavaria, which runs into the Lech, a little below Augfburg.

WERTENSTEIN, a town of Switzerland, in the canton of Lucerne; 6 miles W. of Lucerne.

WERTER See, a lake of the duchy of Carinthia; 2 miles W. of Clagenfurt.

WERTH, a town of the bifhopric of Ratifbon; 11 miles N.W. of Straubing.

WERTHA,

WERTHA, a river of Bavaria, which runs into the Lech, near Augfburg.

WERTHEIM, a county of Germany, fituated between the electorate of Mentz, and the bifhopric of Wurzburg, watered by the Maine, which here receives the Tauber. The ancient counts became extinct in the year 1556. It was afterwards divided among feveral princes, befides feveral fiefs of the empire, Bohemia, Wurzburg, and Fulda.—Alfo, a town of Germany, and capital of a county to which it gives name, at the conflux of the Maine and Tauber. The magiftrates are principally Calvinifts, but the Roman Catholics and Lutherans have a church in common; 42 miles E.N.E. of Manheim. N. lat. 49° 49′. E. long. 9° 35′.—Alfo, a town of Germany; 22 miles E. of Frankfort on the Maine.

WERTHER, a town of Weftphalia, in the county of Ravenfberg; 5 miles N.N.W. of Bielefeld.

WERTINGEN, a town of Bavaria; 14 miles N.N.W. of Augfburg.

WERVICK, or WARWICK, or *Verwick*, a town of France, in the department of the Lys, on the Lys; 3 miles S.W. of Menin.

WESCHNITZ, a river of France, which runs into the Rhine, oppofite Worms.

WESCHOLOUEN, a town of Pruffia, in Natangen; 12 miles W. of Marggrabowa.

WESE, a river of France, which runs into the Ourt, a little above Chiny.

WESEL, a town of France, in the department of the Roer; transferred in January, 1808, from the duchy of Cleves, on the Rhine. This town was formerly imperial, and governed by its own laws, under the protection of the elector of Brandenburg; 17 miles E.S.E. of Cleves. N. lat. 51° 38′. E. long. 6° 38′.

WESEL, or *Ober Wefel*, a town of France, in the department of the Rhine and Mofelle; 20 miles S. of Coblentz.

WESEL *Bay*, a bay on the fouth coaft of the ifland of Java. S. lat. 8° 21′. E. long. 113° 42′.

WESELICH, or WEISLING, a town of France, in the department of the Roer; 7 miles S.S.E. of Cologn.

WESEN, a town of Switzerland, in the county of Gafter; 7 miles S. of Utznach.—Alfo, a town of Holland, in the department of Guelderland; 4 miles S. of Hattem.

WESENBERG, a town of the duchy of Mecklenburg; 42 miles N. of Spandau.

WESENSTEIN, a town of Saxony; 8 miles S.S.E. of Drefden.

WESEP, a town of Holland, on the Vecht; well fortified towards the eaft. The great bufinefs of the inhabitants is to carry frefh water from hence out of the Vecht to Amfterdam, for brewing and other ufes, for which traffic they have a particular kind of barges; 4 miles S.E. of Amfterdam.

WESER, a river of Germany, formed by the union of the Werra and Fulda, which paffes by Hameln, Rinteln, Minden, Nienburg, Hoya, Bremen, &c. and runs into the German fea, about N. lat. 53° 48′. E. long. 8°.

WESER, a department of the new kingdom of Weftphalia, compofed of the bifhopric of Ofnaburg, and part of the county of Schauenburg; the number of inhabitants is 33,400. Ofnaburg is the capital.

WESLEY, JOHN, in *Biography*, one of the principal founders of Methodifm, was the fon of a clergyman, who, educated under a father who was ejected for nonconformity, became a zealous high-churchman, and compofed the fpeech delivered by Sacheverel before the houfe of lords. John was born at Epworth, in Lincolnfhire, of which his father was rector, in June 1703. Educated under pious parents, he was religioufly difpofed from his youth. From the Charter-houfe, where he received his fchool-education, he was removed to Chrift-church college, Oxford; and after taking his firft degree, was elected, in 1724, fellow of Lincoln college, and, in 1726, proceeded to the degree of M.A. At this time he was reputed as a good claffical fcholar, and particularly converfant with dialectics. He was alfo a poet of no mean talents. Soon after his election to a fellowfhip, he became Greek lecturer and moderator of the claffes, and undertook the inftruction of pupils. In 1725 he was ordained by bifhop Potter. During fome years of his refidence at Oxford, he was much efteemed on account of his own character and conduct, and for his attention to difcipline and good morals. Upon the perufal of fome devotional books, and more efpecially Law's "Serious Call," he became diffident as to his own religious ftate, and determined to pay ftricter regard to what he conceived to be the effentials of a holy life. In 1729 he affociated with a felect number of collegians, who met and read together, firft the claffics on week-days, and on Sundays only divinity; but afterwards their meetings became exclufively religious. They vifited the prifoners and fick poor, converfed together on the ftate of their minds, obferved the ancient fafts of the church, and communicated every week. This fociety, which confifted of fifteen members, attracted notice on account of the ftrictnefs of their manners and deportment; and became the objects of ridicule to fome young men in the univerfity, who denominated them Sacramentarians, the Godly club, and METHODISTS. (See the article.) Some of the feniors of the colleges were alarmed by an introduction of fanaticifm; and others encouraged them to proceed, and they received the approbation of the bifhop of Oxford. Wefley, after his ordination, fettled as affiftant to his father at Epworth, who being defirous of retaining this church preferment in his family, wifhed him to feek intereft for obtaining it; but his attachment to Oxford, and to the fociety which had been there formed, prevailed over every other confideration. In procefs of time he formed a purpofe of going to Georgia, as a miffionary; and accordingly he embarked for this province in the year 1735. The profpect of fuccefs in this miffion feemed at firft to be favourable; but feveral circumftances occurred which changed his views, and induced him to leave Georgia, after a refidence of one year and nine months. Thefe circumftances, as fome perfons have related them, reflect no great honour on Wefley's difpofition and character. It appears, however, upon the whole, more efpecially when we confider Whitefield's fuccefs in the fame part of the world, that he was lefs qualified for a miffionary than his fellow-labourer. After his return to England, he felt diffatisfied about his own ftate, and entertained fufpicions of the reality of his own converfion, though he had undertaken to convert others. Prepared for a fudden converfion, it actually happened at a place and time, and in a manner, which he has recorded. According to his own account, this memorable event is referred to the 24th day of May, in the year 1738, at a quarter before nine in the evening, when fome perfon at a fociety in Alderfgate-ftreet was reading Luther's preface to the epiftle to the Romans. "He felt his heart ftrangely warmed. He felt that he trufted in Chrift alone for falvation; and an affurance was given to him, that Chrift had taken away his fins, and faved him from the law of fin and death." Thefe feelings of affurance, however, were blended with occafional mifgivings; and it feems that, in his cafe, enthufiafm could not inftantaneoufly overpower his philofophical reafonings. His cafe is far from being fingular in the hiftory of perfons of the fame defcription. About this time

time he took a journey to Germany, in order to derive a further confirmation of his faith from intercourfe with congenial fpirits at the head-quarters of the Moravians, at Hernhuth. (See UNITAS *Fratrum*.) After his return to England, in September 1738, he entered on his courfe of labours; and preached or exhorted, frequently three or four times a day, in prifons and other places of the metropolis, as well as in various parts of the country, where the fervour of his zeal bore proportion to the degree of obloquy which he incurred. His difcourfes produced wonderful effects, and occafioned in the hearers fwoonings, exclamations, convulfions, &c. which have been often the accompaniments of violent emotions. At Briftol, where he had been preceded by Whitfield, he collected large crowds of attendants in the open air. But it was now defirable that a building fhould be erected for the accommodation of the followers of thefe popular preachers. In May 1739, the firft ftone of fuch an edifice was laid at Briftol; and with this building commenced the abfolute and unlimited power which Wefley exercifed over his followers. "The direction of the work was firft committed to eleven feoffees of his nomination; but as it became neceffary for him to engage for the payment of the workmen, and to collect money for this purpofe, he vifited London, and upon confulting Whitfield and others, he was told, that they would do nothing in the matter, unlefs he would difcharge the feoffees, and take the whole bufinefs into his own hands. They gave various reafons for this determination; but one," fays Wefley, "was enough, *viz.* that fuch feoffees would always have it in their power to controul me; and if I preached not as they liked, turn me out of the room that I had built." He, therefore, affembled the feoffees, and with their confent cancelled the inftruments made before, and took the whole management into his own hands; and this precedent he ever after followed, fo that all the numerous meetings of his clafs of Methodifts were either vefted in him, or in truftees who were bound to give admiffion into the pulpit either to him, or to fuch preachers as he fhall appoint. Unable to affociate clergymen in the profecution of his plan, which feems to have been his firft defign, he determined to employ lay-preachers as itinerants to the different focieties; and of their talents he formed fome judgment by their performances at the meetings for prayer and mere private exhortation. Referving to himfelf the nomination of his preachers, his authority was extended as his focieties were multiplied. For the ufe of thefe focieties, he and his brother Charles drew up a fet of rules for the direction of their moral and religious conduct, which are faid to have been formed upon the pureft model of primitive Chriftianity. A circumftance occurred which threatened injury to the caufe of Methodifm; but it eventually contributed to its extenfion, and to the eftablifhment of Wefley without a rival at the head of his own body. Whitfield had imbibed a predilection for the doctrines of the Puritan divines, which were in general Calviniftic. Wefley's opinions were Arminian; fo that it was impoffible for thefe two leaders of feparate tenets to unite. "The differences between them turned upon the three points, unconditional election, irrefiftible grace, and final perfeverance, concerning which topics their notions varied fo much, that Whitfield plainly told his brother reformer, that they preached two different gofpels, and that he would not only refufe to give him the right hand of fellowfhip, but was refolved publicly to preach againft him and his brother wherefoever he preached at all." Although they afterwards fpoke of each other with efteem, yet their feparation was entire and lafting.

The fyftem of difcipline formed by Wefley was admirably contrived both for gaining profelytes, and for extending and making permanent his own influence. As he did not profefs to eftablifh a new or diftinct fect, he did not interfere with the regular worfhip either of the eftablifhment or of Diffenters, fo that he and his preachers robbed no other minifters of their hearers; and they availed themfelves of thofe feafons, which gave perfons that were defirous of attending leifure for this purpofe. That he might not be charged with drawing people away from the eftablifhed church, or other focieties of Chriftians, he did not adminifter the facrament of the Lord's Supper in his own chapels, but recommended attendance for this purpofe in the eftablifhed church. (See METHODISTS.) The plan of itinerancy was a political meafure in the fyftem of Mr. Wefley, as variety ferves to excite curiofity, and to increafe the number of his followers. It feems alfo to relieve preachers and hearers, when the ftock of the former is fmall; and it alfo prevents thefe miffionaries, if they may be fo called, from forming permanent connections in any place whither they are fent, and of acquiring an influence, which would be inconfiftent with the fupremacy of the chief. In order to maintain an union between the members of this body, and to exercife a degree of vigilant infpection with regard to their conduct, Wefley has divided each fociety into companies of ten or fifteen, called claffes, to each of which belongs a leader, whofe bufinefs it was every week to fee every perfon of his clafs, and to inquire into his religious ftate. Many of thefe companies were divided into fmaller parties, called bands, in which the married and fingle men, and the married and fingle women, were ranged apart, and they were directed to maintain a confidential intercourfe with regard to their character and ftate with each other. From thefe bands again were formed felect bands, confifting of thofe who had attained to perfection. Of his love-feafts, &c. we have given an account under METHODISTS. Stewards were appointed to receive contributions, which the loweft members were expected to pay, however fmall the fums, and to fuperintend the temporal concerns of the focieties. In order to preferve a connection between the preachers, as well as to maintain their ultimate fubordination to him, Wefley found it ufeful to fummon annually a confiderable body of them, in order to take counfel with him, and with one another, concerning the general affairs of the focieties. Thefe affemblies were called "Conferences;" and the great number of them at which Wefley had to prefide was a principal means of confolidating the whole frame of the fociety, and maintaining his permanent authority over every part. Wefley and his firft followers had many difficulties with which to contend; but their conftancy and fortitude, and the apparently beneficial effects of their endeavours in reforming fome of the moft abandoned members of the community, enabled them ultimately to triumph over all oppofition, and to purfue their labours without moleftation. On account of his fanaticifm and enthufiafm he has fuffered ridicule and reproach; and fome have even fufpected his fincerity in the details which he has given of the extraordinary manifeftations of light that have been communicated to him, and the no lefs extraordinary interpofitions of Providence in his favour; alleging that he poffeffed a degree of underftanding which could not be deluded, and, therefore, charging him with a defign of deluding others, in order to ferve his own purpofes. But thefe are harfh reflections, the juftice of which we cannot be induced eafily to allow. About the year 1759, Wefley, who had long been the eulogift of a fingle life, thought proper to marry a rich widow, whofe fortune he fettled wholly upon herfelf; but this connection proved an occafion of infelicity,

felicity, and therefore they ſeparated. She died in 1781. Weſley ſeems to have adopted his father's high-church principles, and he perſevered in avowing his connection with the eſtabliſhed church, and in preventing, as far as poſſible, a ſeparation between his followers and the profeſſors of the eſtabliſhed religion. During the American war he was a zealous advocate for the meaſures of government, and he inculcated the duty of ſubmiſſion to the tranſ-Atlantic Methodiſts. With this view he publiſhed a pamphlet, entitled "A Calm Addreſs to the American Colonies," which was widely diſſeminated; and though ſome of his followers were diſpleaſed, others were ſupporters of the authority of Great Britain; whilſt, on the other hand, the Methodiſts in the connection of Mr. Whitefield were generally on the ſide of American independence. When the conteſt terminated, it became a matter of ſome importance to determine what kind of connection ſhould ſubſiſt between the American Methodiſts and their Britiſh brethren. Mr. Weſley was induced for this purpoſe to take a ſtep, which appeared to be a renunciation of the principle of an epiſcopal church. By his own authority he ordained, with impoſition of hands, ſeveral preachers who were embarking for America, and conſecrated a biſhop for the Methodiſt epiſcopal church in that country, who, on his arrival, conſecrated another, and ordained ſeveral as preſbyters. He alſo aſſumed the ſame authority with reſpect to Scotland; "Setting apart," as he ſays, "three preachers in 1785 to adminiſter in that country the ſacraments of baptiſm and the Lord's ſupper." In ſelf-defence he alleged, that he had been for ſeveral years convinced by lord King's account of the primitive church, that biſhops and preſbyters are the ſame order, and have the ſame right to ordain; but that he declined exerciſing this right in ordaining his travelling preachers, becauſe he did not wiſh to violate the eſtabliſhed order of the national church to which he belonged. By theſe meaſures he offended many in his own connection, and particularly his brother Charles; and it is ſaid, that before his death he repented of his proceedings, and uſed all his endeavours to counteract the tendency which he then perceived to a final ſeparation from the church.

In a very advanced age, Weſley retained his ability of bearing the fatigue which attended his numerous and extenſive labours; and theſe were continued till within a week of his death, which happened on March 2d, 1791, in the 88th year of his age.

In Weſley's countenance mildneſs and cheerfulneſs were blended with gravity, and in old age it was ſingularly venerable. "In his manners," ſays one of his biographers, "he was ſocial, polite, converſible, and pleaſant, without any of the gloom and auſterity common in the leader of a ſect. In the pulpit he was uſually ſhort and clear, argumentative and ſedate, often entertaining, but never attempting the eloquence of the paſſions. His ſtyle in writing was of a ſimilar caſt; he expreſſed himſelf with facility and preciſion, and even in controverſy ſeldom elevated his tone beyond a temperate medium. He was placable towards his enemies, charitable, and in pecuniary matters extremely diſintereſted. His greateſt failing was a love of power, which rendered him impatient of contradiction with regard to every thing that concerned his adminiſtration as head of his ſociety; yet it is certain that he could not have brought his plans to effect, without a conſiderable ſhare of abſolute authority. It muſt alſo be admitted, that he had much of the politician in his character, and could employ artifice when uſeful for his purpoſes. That he was thoroughly perſuaded of the truth of the ſyſtem he taught, and had at heart the beſt intereſts of mankind, it would be uncandid and unwarrantable to queſtion; and he will be a memorable perſon as long as the fabric which he ſo much contributed to raiſe ſhall endure." Lives of J. Weſley, by Hampſon, Coke, and Whitehead. Gen. Biog. See METHODISTS.

WESLINGBUHREN, in *Geography*, a town and duchy of Holſtein, ſituated near the coaſt of the North ſea; 53 miles N.W. of Hamburg.

WESOWKA, a town of Poland, in Volhynia; 60 miles N.N.E. of Zytomiers.

WESSEL, JOHN, in *Biography*, an eminent philoſopher and divine, was born at Groningen about the year 1409, or 1419; and purſued his ſtudies with incredible ardour both at Zwoll and at Cologne. At the latter place his orthodoxy was ſuſpected, as he propoſed difficulties which his maſters could not ſolve. He taught philoſophy for ſome time at Heidelberg, and after viſiting ſeveral univerſities, went to Paris, where the diſputes ran high between the Realiſts, Formaliſts, and Nominaliſts. He fluctuated between the opinions of theſe different ſects. He predicted the decline of the doctrines of Thomas Aquinas, Bonaventure, and other diſputants of that claſs; and intimated his apprehenſion that they would be exploded by all true Chriſtian divines, and that the irrefragable doctors themſelves would be little regarded. His reputation procured for him the eſteem of Francis delle Rovere, general of the Friars Minors, whom he accompanied to the court of Baſil, and with whom he returned to Paris, where he reſided many years. When his patron was made pope, under the name of Sixtus IV., he paid him a viſit at Rome, and being told that his holineſs would grant him whatſoever he aſked, he limited his requeſt to a Hebrew and a Greek bible from the Vatican. "You ſhall have them," ſaid the pontiff; "but, ſimple man that you are! why did not you aſk a biſhopric?" "Becauſe (anſwered Weſſel) I do not want one;" a reply on which Dr. Jortin has beſtowed juſt applauſe.

This worthy perſon died at Groningen in 1489. On his death-bed he lamented to a friend that he had been diſtreſſed with doubts concerning the truth of the Chriſtian religion; but at his friend's ſecond viſit, he told him with great ſatiſfaction that his doubts were all diſſipated. So extraordinary was his learning, that he was diſtinguiſhed by the appellation of the "Light of the World;" and ſuch was his ſpirit of free enquiry, that his name is enrolled in the Proteſtant Catalogue of Witneſſes of the Truth. Of his liberal opinions ſome were, "that the pope might err—that erring he ought to be reſiſted—that his commands are obligatory only as far as they are conformable to the word of God—and that his excommunications are leſs to be feared than the diſapprobation of the loweſt worthy and learned man." We need not wonder then that the monks ſhould have committed all the manuſcripts found in his ſtudy to the flames. Such as eſcaped conflagration were printed collectively at Groningen in 1614, and at Amſterdam in 1617. Part of them had been previouſly printed at Leipſic in 1522, under the title of "Farrago Rerum Theologicarum," with a preface by Martin Luther. Bayle. Moſheim. Brucker by Enfield.

WESSELY, in *Geography*, a town of Moravia, in the circle of Hradiſch; 5 miles N.N.E. of Straſnitz.—Alſo, a town of Bohemia, in the circle of Bechin; 5 miles S. of Sobieſlaw.—Alſo, a town of Moravia, in the circle of Brunn; 36 miles N.W. of Brunn.

WESSEM, or WESSUM, a town of France, in the department of the Lower Meuſe; 4 miles S.S.W. of Ruremond.

WESSEN, a town of Auſtria; 9 miles N.W. of Efferding.

WESSNITZ. See WEISSENITZ.

WEST, Gilbert, in *Biography*, the fon of the Rev. Dr. Weft, prebendary of Winchefter, and of a fifter of fir Richard Temple, afterwards lord Cobham, was born in 1706, and educated for the church at Eton and Chriftchurch, in Oxford; but preferring a military life, he ferved in the army till he received an appointment in the office of lord Townfhend, fecretary of ftate, with whom he accompanied king George I. to Hanover. In early life he entertained doubts concerning the Chriftian religion, which were inftilled into him and his coufin Lyttelton by lord Cobham. In 1729 he was appointed a clerk-extraordinary of the privy council; and foon after, being married, he fettled at Wickham in Kent. His income was not large, but it was fufficient to entertain his friends Pitt and Lyttelton, who often vifited him for literary recreation at Wickham. As a poet, he was known in 1742 by a piece on a dramatic plan, intitled "The Inftitution of the Order of the Garter," diftinguifhed by pure and elevated morality, and containing paffages of elegant fancy and fplendid diction. Weft's "Obfervations on the Refurrection of Chrift," publifhed in 1747, engaged the particular attention of the public, and even induced the univerfity of Oxford to confer upon the author the degree of doctor of laws. This work was fo well executed, that we may well regret his not having lived to have completed his defign by another work on the evidence of the truth of the New Teftament. In 1752 the circumftances of our author were improved by fucceeding, when Mr. Pitt became paymafter-general, to one of the lucrative clerkfhips of the privy council, and his obtaining the place of treafurer to Chelfea hofpital. In 1755 he loft an only fon, and in the following year his life was terminated by a paralytic ftroke, March 1756, at the age of fifty. "Mr. Weft was a gentleman in manners, agreeable in converfation, and lively though ferious. He was regular in the performance of family devotion and in attendance on public worfhip, and was particularly attached to Dr. Clarke as a preacher."

The other works of Mr. Weft were, "Tranflations of the Odes of Pindar, with a Differtation on the Olympic Games;" "Tranflations from the Argonautics of Apollonius Rhodius, and the Tragopodagra of Lucian;" "The Abufe of Travelling;" and "Education:" poems in the imitation of the ftanza and manner of Spenfer; "Iphigenia in Tauris," from Euripides;" and "Original Poems on Various Occafions." Several of thefe pieces were printed in the collections of Dodfley and Pearch, and alfo in three diftinct volumes, 12mo. 1766; and entitle the author, fays his biographer, to a refpectable rank among the minor poets. Johnfon's Lives. Nichols's Lit. Anecd. Gen. Biog.

West, *Occidens*, *Occafus*, in *Cofmography*, one of the cardinal points of the horizon; diametrically oppofite to the eaft.

Weft is ftrictly defined, the interfection of the prime vertical with the horizon, on that fide in which the fun fets.

To draw a true weft line, fee Meridian.

West, in *Aftronomy*, is chiefly ufed for the place, in or towards which the fun and ftars fink under the horizon. Thus we fay, the Sun, Mars, &c. are in the weft.

The point in which the fun fets when in the equator, is particularly called the *equinoctial weft*, or *point of true weft*.

West, and *Weftern*, in *Geography*, are applied to certain countries, &c. fituated towards the point of fun-fetting with refpect to certain others.

Thus, the empire of Rome, anciently, and of Germany, at prefent, is called the *empire of the Weft*, or *weftern empire*, in oppofition to that of Conftantinople, which is called the *empire of the Eaft*.

The Latin or Roman church is called the *weftern church*; in oppofition to the Greek church.

The French, Spaniards, Italians, &c. are called *weftern nations*, in refpect to the Afiatics; and America, the *Weft Indies*, in refpect of the Eaft Indies.

West-*Afhton Water*, is a chalybeate water, refembling that of Holt. See Phil. Tranf. N° 461. fect. 20.

West *Wind* is alfo called *Zephyrus*, and *Favonius*. See Wind.

West *Saxonlage*, or the law of the Weft Saxons. See Law.

West *India Companies*. See Company, &c.

West *Dial*. See Dial.

West, *Mooring for*. See Mooring.

West, in *Geography*, a townfhip of Pennfylvania, in the county of Huntingdon, with 1698 inhabitants.

West *Bay*, a bay of the South Pacific ocean, in Cook's Straits, between the two iflands of New Zealand.

West *Bay*, a bay of the Englifh Channel, on the coaft of the counties of Dorfet and Devon, of vaft extent. It begins weft of Portland, and ends at Berry Point near Torbay, according to fome; according to others, from Portland to Lyme or Exmouth. The tide is current here nine hours; high water at ten o'clock at new and full moon; an E.S.E. moon makes full fea. The fea off the coaft is reckoned the moft dangerous part of the Channel, efpecially on the weft, where fhips, not aware of the currents, are embayed and driven afhore on the beach. When fhips are fo deeply embayed, that there is no poffibility of getting off, efpecially at the beginning of the ebb, they may run boldly on the beach, and the mariners are to remain aboard for five or fix feas, but may then ftep on fhore with fafety; but if they leave the fhip inftantly it is dangerous and fatal: lighthoufes have been ferviceable for preventing thefe accidents. Where fhips that come from the weft neglect to keep a good offing, or are taken fhort by contrary winds, and cannot weather the highland at Portland, but are driven between the ifland and the main-land, they perifh without remedy; and it has been obferved, that more Dutch veffels are loft here than any other, almoft every year, efpecially in winter, which is thought to be owing to an obftinate adherence to old charts, and not allowing for the true variation of the compafs. When the variation is W. the true channel courfe is W. by S. from Dungenefs to the Cafkets; Portland Bill and the Cafkets are 15 leagues afunder nearly in a meridian. Dr. Halley obferves, that the navigation up and down the Channel is an E. variation: W.S.W. is the true courfe. The Channel between Portland and the Cafkets is 40 fathoms deep, and in fair weather one may fee in that depth the land on both fides: the nearer England the fhoalier, the nearer the Cafkets the deeper.

West *Bay*, a bay at the weftern extremity of lake Superior. N. lat. 46° 45′. W. long. 91° 45′.—Alfo, a bay on the N.W. coaft of Virgin-Gorda, in the Weft Indies. N. lat. 18° 23′. W. long. 62° 48′.

West *Bethlehem*, a townfhip of Pennfylvania, in the county of Wafhington, containing 1849 inhabitants.

West *Boylfton*, a town of Maffachufetts, in the county of Worcefter, containing 632 inhabitants.

West *Bradford*, a townfhip of Pennfylvania, in the county of Chefter, with 1219 inhabitants.

West *Buffaloe*, a townfhip of Pennfylvania, in the county of Northumberland, containing 2523 inhabitants.

West *Caln*, a townfhip of Pennfylvania, in the county of Chefter, with 1003 inhabitants.

West *Cambridge*, a town of Maffachufetts, in the county of Middlefex, containing 971 inhabitants.

West *Cape*, a cape on the W. coaſt of Tavai-poe-nam-moo, the ſouthernmoſt iſland of New Zealand. S. lat. 45° 54′. W. long. 193° 17′.

West *Cappel*, a town of Holland, in the iſland of Walcheren; 6 miles N.W. of Middleburg.

West *Cheſter*, a county of New York, containing 30,272 inhabitants.

The following ſtatiſtical table is founded upon the cenſus of 1810.

Towns.	Population.	Sen. Electors.
Bedford	2,374	241
Cortlandt	3,054	182
Eaſt-Cheſter	1,039	96
Greenſburgh	1,862	137
Harriſon	1,119	66
Mamaroneek	496	28
Mount-Pleaſant	3,119	218
New-Caſtle	1,291	72
New-Rochelle	996	78
North-Caſtle	1,366	119
North-Salem	1,204	102
Pelham	267	19
Poundridge	1,249	124
Rye	1,278	85
Scarſdale	259	15
Somers	1,782	142
South-Salem	1,566	186
Weſt-Cheſter	1,969	105
White Plains	693	68
Yonkers	1,365	93
York-town	1,924	142
	30,272	2,318

It ſends three members to the houſe of aſſembly. It is ſituated on the E. ſide of the Hudſon, N. of New York county; bounded N. by Dutcheſs county, E. by the ſtate of Connecticut, S. by Long iſland ſound and Eaſt river, W. by Haerlem river and the Hudſon; or by New York county, the ſtate of New Jerſey, and the county of Rockland. Its area is about 480 ſquare miles, or 307,200 acres, ſituated between 40° 47′ and 41° 22′ N. lat.; 3° and 32′ E. long. from New York.

West *Cheſter*, a poſt-townſhip of New York, at the S.W. extremity of Weſt Cheſter county, on Eaſt river; 12 miles from New York. Its medial extent from N. to S. may be 4 miles, and from E. to W. about 5, with an area of 20 ſquare miles. It is a valuable tract of land, ſomewhat ſtony, with a large proportion of clayey loam, which, with good huſbandry, may be rendered productive. Weſt Cheſter village, ſituated at the head of the navigation on Weſt Cheſter creek, contains about 25 dwellings, an epiſcopal church, a Friends' meeting-houſe, a ſchool-houſe, a griſt-mill, and about 200 inhabitants. Adjoining to it are a bed of marble and an extenſive common. In the townſhip are ſeveral manufactories, griſt-mills, three houſes for worſhip, one for Friends, one for Epiſcopalians, and one for Dutch Lutherans, and ſix ſchool-houſes, and many elegant country-ſeats. For its population, &c. ſee the preceding article.

West *Cheſter Borough*, a townſhip of Pennſylvania, in the county of Cheſter, containing 471 inhabitants.

West *Creek*, a river of New Jerſey, which runs into the Delaware bay, N. lat. 39° 14′. W. long. 74° 57′.

West *Fallowfield*, a townſhip of Pennſylvania, in the county of Cheſter, containing 1157 inhabitants.

West *Gothland*, or *Weſtrogothia*. See Gothland.

West *Harbour*, a bay on the S. coaſt of Jamaica, formed by a peninſula, called Portland Ridge. N. lat. 17° 48′. W. long. 77°.

West *Indies*, in *Geography* and *Commerce*, comprehends all the iſlands that lie in the Caribbæan ſea, between North and South America; and alſo a few of the neighbouring ſettlements on the continent. (See *Weſt* Indies.) The larger iſlands, or greater Antilles, are, Jamaica, belonging to the Engliſh, Cuba (Spaniſh), Porto Rico (Spaniſh), and St. Domingo (French and Spaniſh). The ſmaller iſlands, or leſſer Antilles, called alſo the Caribbee iſlands, are divided into *leeward* and *windward* iſlands. The former are Tortola, the Saints, Barbuda, Antigua, St. Kitt's, Nevis, Montſerrat, and Dominica (Engliſh), Guadaloupe and Marigalante (French), St. Euſtatia and Martin (Dutch), St. Thomas, Santa Cruz, and St. John (Daniſh), and St. Bartholomew (Swediſh). The latter are, Barbadoes, St. Vincent, Grenada, and Tobago (Engliſh), Martinico and St. Lucia (French). The iſlands on the coaſt of Terra Firma are, Trinidad and Margarita (Spaniſh), Curaſſoa and Bonaire (Dutch). The ſettlements on the continent of South America are, Demerara, Berbice, Eſſequibo, and Surinam (Dutch). In ſpecifying the monies, coins, currencies, and exchanges of the Weſt Indies, we ſhall avail ourſelves of the arrangement of Dr. Kelly in his valuable work, and claſs the iſlands under the five general heads of Engliſh, French, Daniſh, Dutch, and Spaniſh; premiſing, that though the ſeveral iſlands and ſettlements, which we have already enumerated, are ſubject to various political changes, they neverthelefs, for the moſt part, retain the weights, meaſures, and denominations of money belonging to the European nations by which they have been colonized.

In the *Engliſh* iſlands, accounts are kept in pounds, ſhillings, and pence currency; the Weſt India currency being an imaginary money, which varies conſiderably in its proportion to ſterling, ſo that it is in ſome places reckoned at 140, and in others 200, for 100*l.* Engliſh, more or leſs. The principal coin circulating in the Weſt Indies is the Spaniſh dollar, and this ſeems to be the ſtandard by which the value of all other monies is regulated; and with regard to the proportion between ſterling and currency, it ſhould be obſerved, that although it has been declared by different authorities, yet it is chiefly regulated by the courſe of exchange with London. Of the *Engliſh* iſlands, the firſt we ſhall take notice of is Jamaica. The currency of this iſland is 140*l.*, and its proportion to ſterling is as 7 to 5; ſo that 1*l.* ſterling is = 28*s.* currency, and 1*l.* currency = 14*s.* $3\frac{3}{7}$*d.* ſterling. The price of the dollar is 6*s.* 8*d.* currency.

The gold coins current in this iſland, with their value in currency, appear in the following Table.

		Weight		Jamaica Currency.		
		dwt.	gr.	*l.*	*s.*	*d.*
Spaniſh	Doubloon	17	8	5	0	0
	Two piſtole piece	8	16	2	10	0
	Piſtole	4	8	1	5	0
	Half piſtole	2	4	0	12	6
Portugueſe	Johanes (called joe)	18	12	5	10	0
	Half joe	9	6	2	15	0
	Quarter joe	4	15	1	7	6
	Moidore	6	22	2	0	0
	Half moidore	3	11	1	0	0
Engliſh	Guinea	5	8	1	12	6
	Half guinea	2	16	0	16	3
	Seven-ſhilling piece	1	19	0	10	10

The

The deduction for every grain of deficiency of weight is 3*d.* currency.

The silver coins of Jamaica are dollars, with their halves, quarters, eighths, and sixteenths, passing for 6*s.* 8*d.*, 3*s.* 4*d.*, 1*s.* 8*d.*, 10*d.*, and 5*d.* currency. Besides, here are *bits* or *bitts*, being Spanish reals, and passing for $7\frac{1}{2}$*d.* currency; so that 10 bits and 5*d.* currency make a dollar, and 1 bit is worth $5\frac{5}{13}$*d.* sterling. *Pistereens*, or two-bit pieces, which are Spanish pecetas, pass for 1*s.* 3*d.* currency, and are worth $10\frac{2}{7}$*d.* sterling. English shillings and sixpences occasionally pass as pistereens and bits. From the above statement it appears, that the intrinsic par of the currency of Jamaica with respect to sterling is as follows; the calculations being made according to the mint price of gold and silver in England:

		l.	*s.*	*d.*	
According to the	English gold coins, 100*l.* sterling =	154	15	0	currency.
	Spanish ditto - - - - -	156	13	2	
	Portuguese ditto - - - -	155	0	0	
	Dollar - - - - - -	154	11	9	

By a law of the Jamaica assembly, the exchange with England was fixed at 40 *per cent.*; but it has considerably varied: bills being sometimes at a premium of 20 *per cent.* above the legal exchange, and seldom under 10: dollars occasionally bear a premium of 3 or 4 *per cent.*

The currency of *Barbadoes* is sometimes reckoned at 135, and sometimes at 140, for 100*l.* sterling; but it has never been settled by legal authority. The value of the coins has been established by proclamation, and according to these values the par is above 140.

The gold coins current here, with their legal value, are shewn in the following Table.

				Barbadoes Currency.		
		dwt.	gr.	*l.*	*s.*	*d.*
Spanish	Doubloon - -	17	8	4	10	0
	Two-pistole piece -	8	16	2	5	0
	Pistole - - -	4	8	1	2	6
	Half pistole - -	2	4	0	11	3
Portuguese	Johanes (called joe) -	18	10	5	0	0
	Half joe - -	9	5	2	10	0
	Quarter joe - -	4	14	1	5	0
	Moidore - -	6	21	1	17	6
	Half moidore -	3	10	0	18	9
English	Guinea - - -	5	8	1	10	0
	Half guinea - -	2	16	0	15	0
	Seven-shilling piece -	1	19	0	10	0

N.B.—The deduction for light coin is $2\frac{3}{4}$*d.* currency for every grain of deficiency.

The current silver coins are dollars, with halves, quarters, eighths, and sixteenths, passing for 6*s.* 3*d.*, 3*s.* $1\frac{1}{2}$*d.*, 1*s.* $6\frac{3}{4}$*d.*, $9\frac{1}{2}$*d.*, and $4\frac{3}{4}$*d.* currency. Also bits, which are Spanish reals, and which pass for $7\frac{1}{2}$*d.* currency; thus, 10 bits make 1 dollar, and 1 bit is worth $5\frac{1}{3}$*d.* sterling. Pistereens, or two-bit pieces, which are Spanish pecetas, pass for 1*s.* 3*d.* currency. There are also French bits, called *crimbal*, or *isle du vent bits*, which pass for $7\frac{1}{2}$*d.* currency.

The Barbadoes currency compared with sterling is,

		l.	*s.*	*d.*	
According to the	English coins, 100*l.* sterling =	142	17	2	currency.
	Spanish ditto - - -	141	0	0	
	Portuguese ditto - - -	140	13	7	
	Dollar ditto - - - -	144	19	6	

In the English leeward islands the dollar is reckoned at 9*s.*, and this rate is generally called the leeward currency.

A small circular piece cut out of the centre of the dollar, about one-twelfth of its value, in order to prevent its exportation, is allowed to pass for one-eighth, and is stamped by authority with the initials of the island.

The dollar, thus cut, passes for 8*s.* 3*d.* currency; it is called the "cut dollar," by way of distinction from the whole or "round dollar." The piece taken out is sometimes called the "bit," and sometimes the "moco," which moco is, in some places, one-fourth of the dollar, and in others one-eighth. In these islands there are small copper coins, called stampes, dogs, and half dogs, valued as in the following Table.

				Leeward Currency.		
				l.	*s.*	*d.*
2 Half dogs	- make	1 Dog -	=	0	0	$1\frac{1}{2}$
$1\frac{1}{2}$ Dog - -	-	1 Stampe -	=	0	0	$2\frac{1}{4}$
6 Dogs or 4 stampes	-	1 Bit - -	=	0	0	9
$1\frac{1}{2}$ Bit - -	-	1 Moco -	=	0	1	$1\frac{1}{2}$
11 Bits - -	-	1 Cut dollar	=	0	8	3
12 Bits or 8 mocos	-	1 Round dollar	=	0	9	0
5 Round dollars -	-	1 Guinea -	=	2	5	0
8 Cut dollars -	-	1 Joe - -	=	3	6	0
16 Round dollars -	-	1 Doubloon	=	7	4	0

For a deficiency of weight, an allowance is made of $4\frac{1}{2}$*d.* currency for English grain. The exchange with London is generally about 200 *per cent.*

In the English *windward* islands the currencies are nearly the same as the former, allowing for some local regulations and customs.

In the French islands accounts are kept by the French settlers in livres, sols, and deniers; and by the English (particularly in exchanges) in pounds, shillings, and pence currency; the livre and shilling being of the same value.

The currency is the same as that of the English leeward and windward islands: but the names of the coins are different; the dog being called the *noir*, the stampe the *tempé*, the bit the *escalin*, and the dollar the *gourde*.

The value of the coins appears in the following Table.

				Leeward Currency.		
	liv.	sol.	den.	*l.*	*s.*	*d.*
The noir, or dog - - -	0	2	6	0	0	$1\frac{1}{2}$
The tempé, or stampe - -	0	3	9	0	0	$2\frac{1}{4}$
The trois tempés - - -	0	11	3	0	0	$6\frac{3}{4}$
The escalin, or bit - - -	0	15	0	0	0	9
The trois petites pieces - -	1	2	6	0	1	$1\frac{1}{2}$
The piece de trente sols, or pistereen	1	10	0	0	1	6
The moco - - - -	2	5	0	0	2	9
The gourde or dollar - -	9	0	0	0	9	0
The ecu of six livres - - -	9	17	6	0	9	$10\frac{1}{2}$
The Louis d'or - - -	40	10	0	2	0	6
Guinea - - - - -	45	0	0	2	5	0
Napoleon of 40 francs - -	66	13	4	3	6	8
Doubloon - - - -	144	0	0	7	4	0

The following gold coins are taken by weight.

Portugal pieces, at - - - - 22 livres *per* gros
Counterfeit ditto, coined in America, at 20 ditto *per* gros
French and Spanish coins deficient in weight, at - - - - 19*l.* 15*s.* *per* gros
English ditto at 8 livres, 8 sols *per* dwt., that is, 7 sols *per* English grain.

In

In the French part of St. Domingo, or Hayti, accounts are moftly kept in dollars and cents, as in the United States. The monies in circulation here are nearly the fame as in the leeward iflands. Dollars are valued at 4*s.* 6*d.* fterling, with halves and quarters in proportion: 11 efcalins pafs for 1 dollar, and 1 efcalin is reckoned at 9 cents. Doubloons pafs for 16 dollars; joes for 8 ditto; French crowns for 1 dollar 9 cents, and the half-crowns in proportion; French pieces of 5 francs pafs for 9 efcalins, or 81 cents.

In the *Dutch* colonies of St. Euftatia, St. Martin, Curaçoa, accounts are kept in pieces of eight; that is, piaftres current of 8 reals or fchillings, each real being fubdivided into 6 ftivers.

The piaftre gourde or Spanifh dollar paffes for 11 reals or bits; and thus the current piaftre is worth 3*s.* 5*d.* fterling, reckoning the dollar at 4*s.* 8*d.* fterling.

The joe paffes here for 11 piaftres current; the Spanifh fingle piftole for 4½ piaftres, more or lefs; the other Spanifh and Portuguefe gold coins in proportion.

In the fettlements of Surinam, Berbice, Demerary, and Effequibo, accounts are kept in guilders of 20 ftivers; the ftiver being divided by fome into 8 duits, and by others into 12 pennings.

All the coins of Holland circulate here, and are moftly reckoned at 20 *per cent.* above their value in Dutch currency.

The following is their general rate, as well as that of other monies.

		gdrs.	ftiv.			gdrs.	ftiv.
10 Dubbelties	=	1	0	Spanifh dollar	=	3	0
The bit -	=	0	5	Ducatoon -	=	3	3
Seftehalf -	=	0	5½	Gold ducat	=	6	6
Schilling -	=	0	6	Guinea -	=	14	10
Guilder -	=	1	4	Ryder -	=	16	16
Dalder -	=	1	10	Joe - -	=	22	0
Rixdollar -	=	3	0	Doubloon -	=	42 to 44	

The chief circulating medium here is paper, iffued by government.

In 1809 a new filver coinage was minted at the Tower of London for thefe colonies, confifting of pieces of 3, 2, 1, ½, and ¼ guilders. The larger piece weighs 15 dwt.; and is 1 oz. 6 dwt. worfe than Englifh ftandard. Its value therefore is, 3*s.* 5*d.* fterling, or computing it as the dollar is now rated in the Weft Indies (*i. e.* at 4*s.* 8*d.*), its value is 3*s.* 8¼*d.*, and the fmaller pieces in proportion. They are marked on the reverfe, COLONIES OF ESSEQUIBO AND DEMERARY TOKEN; and the king's head is on the obverfe.

The exchange with London fhould be about 12 guilders for 1*l.* fterling, but it varies confiderably above this, even to 20 guilders and upwards.

In the *Danifh* iflands accounts are kept in piaftres or rixdollars current (called alfo pieces of eight), fubdivided into 8 fchillings or bits, and each bit into 6 ftivers: accounts are alfo kept in dollars of 100 cents, as in America. The filver coins ftruck for the Danifh iflands are quadruple, double, and fingle bits, and pieces of 1 and 3 ftivers. The Spanifh dollar paffes for 12½ bits, and each bit for 6¼ ftivers. The leeward currency is ufed in the Danifh iflands in the purchafe or negociation of bills on England: gold is valued at 1 dollar *per* dwt. or 4½*d.* currency *per* Englifh grain.

The monies, coins, weights, and meafures of the Spanifh iflands are the fame as thofe in Spanifh America, or Mexico; accounts being kept in pefos or dollars of 8 reals, fubdivided into 16 parts, and alfo into 34 maravedis de Plata Mexicanos. The gold coins are doubloons of 8 efcudos d'oro, worth 15 pefos; halves and quarters in proportion. The filver coins are, pefos Mexicanos or dollars, with halves and quarters, called pecetas Mexicanas; alfo eighths and reals, and fixteenths, in due proportion.

Trinidad, having been for many years in the poffeffion of the Englifh, has adopted the denominations of money of the Englifh iflands. Accounts therefore are here kept in pounds, fhillings, and pence leeward currency; and alfo in dollars and bits, the bit being the 9th part of a dollar.

There are here filver pieces of half bits and quarter bits.

The Spanifh, Portuguefe, and Englifh gold coins pafs as follows in Trinidad.

	dwt.	gr.	dol.	bits.	Leeward Currency. *l.*	*s.*	*d.*
Doubloon -	17	8	15	8	7	4	0
Half ditto -	8	16	7	8½	3	12	0
Piftole - -	4	8	3	8¾	1	16	0
Half ditto -	2	4	2	0	0	18	0
Joe - - -	7	12	6	8	3	2	0
Guinea -	5	8	4	8	2	4	0
Half ditto -	2	16	2	4	1	2	0
One-third ditto	1	19	1	5¾	0	14	8

Gold here is valued at 8*s.* 3*d.* currency *per* dwt. or 4⅛*d.* *per* grain.

The weights and meafures here are the fame as in England, except that the cwt. is reckoned only 100 lbs. avoirdupois.

The monies and currency of St. Bartholomew ifland are the fame with thofe of the other leeward iflands.

The regulations to which the Weft India exchanges are fubject are as follow. When bills drawn in the Weft Indies on London are not duly honoured, they are returned to the drawer, with the following charges.

	Damages.	Intereft *per* Annum.	Time how charged.
Jamaica	8 *per cent.*	6 *per cent.*	from date of the bill.
Barbadoes	10 ditto	6 ditto	from the time of prefentation with proteft.
Grenada	10 ditto	6 ditto	from the bill falling due.
St. Vincent	10 ditto	8 ditto	ditto.
Tobago	10 ditto	8 ditto	ditto.
Trinidad	10 ditto	6 ditto	from date of the proteft.
Dominica	10 ditto	6 ditto	ditto.
Nevis -	10 ditto	8 ditto	ditto.
Montferrat	10 ditto	8 ditto	ditto.
Antigua -	10 ditto	8 ditto	ditto.
St. Kitt's	10 ditto	8 ditto	ditto.
Tortola -	10 ditto	8 ditto	ditto.
Demerara, Effequibo, Berbice, Surinam	25 ditto	6 ditto	from date of prefentation.
St. Thomas, St. John, Santa Cruz	10 ditto	10 ditto	from date of the proteft.

There are occafionally other charges befides the above, fuch ſuch as poſtage, notarial expences, and difference of exchange.

If a bill, drawn in the Weſt Indies on any part of Great Britain, be noted for non-acceptance, the holder may oblige the drawer, by legal proceſs, to give ſecurity in the iſland for the amount, without waiting for the bill being proteſted for non-payment. See Kelly's Cambiſt, vol. i.

WEST *Iſland*, in *Geography*, one of the ſmaller Philippine iſlands, near the ſouth coaſt of Mindoro. N. lat. 12° 18'. E. long. 121° 12'.—Alſo, a ſmall iſland at the eaſt entrance of the ſtraits of Sunda. S. lat. 5° 27'. E. long. 106° 20'.—Alſo, a ſmall iſland in the Eaſt Indian ſea, near the ſouth coaſt of Cumbava. WEST *River*, or *Wantaſtic*, a river of Vermont, which runs into the Connecticut, N. lat. 42° 50'. W. long. 73° 31'.

WEST *River Mountain*, a mountain of New Hampſhire, near Weſt river.

WEST *Town*, a townſhip of Pennſylvania, in the county of Cheſter, with 790 inhabitants.

WEST *Wain*, the weſt ſhore of Hudſon's bay.

WESTBROUGH, a town of Maſſachuſetts, incorporated in 1717, in the county of Worceſter, containing 1048 inhabitants; 33 miles W. of Boſton.

WESTBURY, a market-town and borough in the hundred of the ſame name, and county of Wilts, England, is ſituated at the diſtance of 24 miles N.W. by W. from Saliſbury, and 97 miles W. by S. from London. Nothing is known with certainty of its hiſtory, till the reign of Edward I., when it was conſtituted a corporate town by charter, under the juriſdiction of a mayor, recorder, and twelve capital burgeſſes. Weſtbury ſends two members to parliament, and has done ſo regularly ſince the 27th year of Henry VI., who renewed its charter of incorporation, and beſtowed upon it the additional privilege of being repreſented in the national councils. The right of election is in the holders of burgage tenures, being reſident within the borough, and not receiving alms: the mayor is the returning officer. The town conſiſts principally of one long ſtreet, running nearly in a direction north and ſouth. According to the population return of the year 1811, it contained 351 houſes, and 1790 inhabitants, who were chiefly engaged in the manufacture of woollens. A market is held weekly on Fridays; and two fairs annually, when there is uſually a large ſupply of cattle, horſes, ſheep, pigs, cheeſe, &c. The borough and hundred of Weſtbury form only one pariſh: for the former, a court-leet is held by the mayor in November annually; and for the latter, one in May by the ſteward of the lord of the manor, at which two high conſtables are appointed for ſecuring the public peace. The only public buildings in this town which demand particular notice, are the town-hall and the church. The hall is a convenient edifice, in which the borough-courts are held: it is ſituated near the centre of the town, and is alſo appropriated in part as a wool-hall. The church is a large ancient ſtructure of ſtone, with a tower in the middle. In it are ſeveral monuments in honour of perſons of conſiderable note.

About a mile to the ſouth of Weſtbury is the village of Leigh, commonly called Weſtbury-Leigh; ſuppoſed by ſeveral antiquaries to be the place deſignated in Aſſer by the word Æggles, where king Alfred encamped on the night previous to the battle of Ethandune.

Heywood houſe, ſituated about two miles due north from Weſtbury, was built in the reign of king James I., by James, lord Ley, afterwards created earl of Marlborough. It was long poſſeſſed by the family of Phipps; but is now the property and ſeat of Abraham Ludlow, eſq.—Beauties of England and Wales, vol. xv. Wiltſhire. By J. Britton, F.S.A. 1814.

WESTBURY, a village in the hundred of Ford, and county of Salop, England, ſituated 8 miles W. by S. from Shrewſbury. In this village is a reſpectable free-ſchool; and in the church, among other monuments, is one raiſed to the memory of general Severne, who inherited Wallop-hall, in this pariſh. About two miles S.W. of Weſtbury is Cawſe, or Caux-Caſtle, which is ſuppoſed to have been erected by Roger Corbett, who held of earl Roger de Montgomery a tract of land conſiſting of thirty-nine manors. It is conjectured that he gave the above name to this his capital ſeat, in alluſion to a caſtle in the Pays de Caux, in Normandy. As he and his ſon probably joined with Robert de Beleſme in his rebellion, the caſtle is ſuppoſed to have been forfeited to Henry I., who gave it to Paris Fitz-John, from whom it was taken by the Welſh. It was reſtored to the original lords, and in the firſt of king John a weekly market was obtained for it, at the inſtance of Robert Corbett. Its proximity to the Welſh frontiers rendered its tenure uncertain, and we find that it was again ſeized by the Welſh, and reſtored by Henry III. In the reign of Edward III., the male line of the family becoming extinct, the caſtle was transferred, by marriage of a daughter of the houſe, to the Staffords, earls of Stafford; on the execution of the laſt of whom, Edward, duke of Buckingham, it was forfeited to the crown, but was reſtored to his ſon Edward. It was alienated in the reign of Elizabeth to Robert Harcourt, from whom it deſcended to lord viſcount Weymouth. The ſcite of this caſtle is perhaps one of the moſt lofty and commanding in the whole range of the Salopian frontier. It is an inſulated ridge, riſing abruptly from a deep ravine on one ſide, and ſloping towards a vaſt valley, bounded by the Stiper-ſtones on the other. The keep-mount is ſingularly ſteep and towering; it muſt have been aſcended by ſteps, or by a winding path, but no traces of either at preſent remain: part of a well is ſtill diſtinguiſhable;

tinguifhable ; the caftle itfelf is nearly deftroyed. Parts of one of the entrance-gateways, evidently of a more recent date than the original caftle, are ftill to be difcerned.—Beauties of England and Wales, vol. xiii. Shropfhire. By R. Rylance, 1811.

Westbury, a townfhip of Lower Canada, on the river St. Francis.

WESTENBERG, a town of the marggravate of Anfpach ; 6 miles N.E. of Anfpach.

WESTENSEE, a lake of the duchy of Holftein ; 8 miles E. of Rendfburg.—Alfo, a town of the duchy of Holftein, on the fide of the lake of the fame name ; 8 miles S.E. of Rendfburg.

WESTERBURG, a town of Germany, which gives name to a lordfhip, fituated on the Wefterwald. The lords of Wefterburg fucceeded the counts of Leiningen. They are counts of Leiningen and lords of Wefterburg ; 16 miles W.N.W. of Weilburg.

WESTERHAM, a market-town in the hundred of Wefterham and Eden-bridge, lathe of Sutton, and county of Kent, England, is fituated near the confines of the county towards Surrey, at the diftance of 5 miles W. from Seven-Oaks, and 22 miles S.E. by S. from London. The manor was given by Edward I. to the abbey at Weftminfter, for the performance of certain religious fervices for the repofe of the foul of queen Eleanor. He alfo granted feveral privileges to the abbot, which were confirmed by Edward III., who alfo gave permiffion to hold a weekly market at Wefterham, which is ftill continued. After the diffolution, Henry VIII. conveyed thefe eftates to fir John Grefham, younger brother of fir Thomas Grefham, the founder of the Royal Exchange : and his defcendant, fir Marmaduke Grefham, fold this manor to the Wardes of Squerries, a refpectable feat in this parifh, near the weft end of the town ; and John Warde, efq. is now the owner. Wefterham is ftated, in the population return of 1811, to contain 272 houfes, and 1437 inhabitants. The market is now held on Wednefday ; and here are two annual fairs. The church, a fpacious edifice, contains a great variety of fepulchral memorials ; among which is a neat cenotaph in commemoration of major-general James Wolfe, a native of this town, who was flain before Quebec in 1759. This town alfo gave birth to Dr. Benjamin Hoadley, who, in the laft century, was fucceffively bifhop of Bangor, Hereford, Salifbury, and Winchefter.

Some fingular land-flips are recorded by Hafted, as having happened at different periods in this parifh. The firft which is mentioned occurred in 1596, near Oakham-hill, about a mile and a half fouthward from the town ; where about nine acres of ground continued in motion for eleven days ; fome parts finking into pits, and others rifing into hills. A fimilar occurrence took place in 1756, at Toy's-hill, about a mile and a half to the eaft of the town, where a field of two acres and a half underwent confiderable alterations of furface, from an almoft imperceptible motion.—Beauties of England and Wales, vol. viii. Kent. By E. W. Brayley, 1808. Hafted's Hiftory of Kent, 1778.

WESTERHAUSEN, a town of the bifhopric of Halberftadt ; 3 miles E. of Regenftein.

WESTERLEY, a town of America, in Rhode ifland ; 30 miles S.S.W. of Providence.

WESTERLOO, a town of France, in the department of the Two Nethes ; 15 miles E.N.E. of Malines.

WESTERMO, a town of Sweden, in Sudermanland ; 62 miles W. of Stockholm.

WESTERN *Amplitude*, *Church*, *Horizon*, and *Ocean*. See the feveral articles.

Western, in *Geography*, a town of the ftate of Maffachufetts, in the county of Worcefter, containing 1014 inhabitants ; 20 miles W. of Worcefter.

Western *Iflands*. See Azores.

Western *Iflands*. See Hebrides.

Western *Reef*, rocks in the Spanifh Main, near the Mofquito fhore. N. lat. 14° 42′. W. long. 82° 25′.

WESTERNACH, a river of Bavaria, which runs into the Mindel, 2 miles N. of Mindelheim.

WESTEROS, or Westesas, or *Weftern Arofia*, fo called to diftinguifh it from Oftra Aros, or Eaftern Arofia, the ancient name of Upfala, a town of Sweden, and capital of Weftmannland, fituated on a fmall river clofe to the lake Mæler. This is efteemed by the native writers a place of high antiquity ; and they derive its appellation, by a fanciful etymology, from the river Ar, and Os, a mouth, and fuppofe it alluded to by Tacitus, and by Jornandes the Gothic hiftorian. However this be, the name occurs in the earlieft times of Swedifh hiftory. Wefteros carries on a confiderable commerce with Stockholm acrofs the lake Mæler ; particularly in copper and iron from the mines, which abound in the province of Weftmannland. It is a large ftraggling town, compofed of wooden houfes, and contains the ruins of an ancient palace, formerly inhabited by the kings of Sweden. It is a bifhop's fee ; and the cathedral, which is built with brick, is celebrated for the tower, efteemed the higheft in the kingdom ; the lower part of this tower is fquare, and fupports an octagon fpire, covered with copper. Within this cathedral is the tomb of Eric XIV. Wefteros has often fuffered much by fire, particularly in 1714. It is 36 miles W.S.W. from Upfal. N. lat. 59° 36′. E. long. 16° 30′.

Westeros, a townfhip of New York, in Oneida county, bounded N. by Boonville, E. by Steuben, S. by Floyd and Rome, W. by Lee, which was erected from the W. part in 1811. It is watered by fmall head waters of Mohawk river, and has plenty of mill-feats. The foil, furface, and products, are fimilar to thofe of Steuben and the adjoining towns. In 1810, the population was 2416, and the number of electors was 275. The lands are well cultivated and productive. The inhabitants are rich, and are clothed in houfehold manufacture.

WESTERWALD, a diftrict of Germany, in the north part of Wetteraw, or Wetteravia.

Westerwald *Earth*, a kind of earth mentioned by Agricola, of a whitifh-yellow colour, of a like nature to the terra Silefiaca, but preferable to it, as yielding more falt. He tells us, that it diffolves filver fo much better than other menftrua, as to render it potable, and capable of being prepared into a ufeful medicine in cephalic cafes. Boyle's Works, vol. i. p. 501.

WESTERWYCK, in *Geography*, a fea-port of Sweden, in the province of Smaland, fituated in a bay of the Baltic. This bay is called Sparefund ; and near it is a cuftom-houfe, where all homeward and outward bound fhips are fearched. Wefterwyck formerly ftood two Swedifh miles higher up in the country, on the fpot where the market-town of Gammelly now ftands. It has a good harbour, a commodious quay, and a cloth manufacture, and carries a brifk trade in fhip timber, and all forts of naval ftores ; 68 miles N. of Calmar. N. lat. 57° 45′. E. long. 16° 24′.

WESTEY, a townfhip of Ohio, in the county of Wafhington, containing 172 inhabitants.

WESTFIELD, a river of Maffachufetts, which runs into the Connecticut, 4 miles S. of Springfield.—Alfo, a town of the ftate of Maffachufetts, in the county of Hampfhire, containing 2130 inhabitants ; 6 miles W. of Springfield.

field.—Alſo, a poſt-town of New York, on the eaſt ſide of lake George; 6 miles S. of Ticonderoga.—Alſo, a townſhip of New York, in Richmond county, in Staten iſland. At its ſouthern extremity in the S.W. is a ferry of three-quarters of a mile to Amboy, in New Jerſey. It has one church near the centre, and well cultivated land. The whole population in 1810 was 1444, and the number of electors 139.—Alſo, a town of Vermont, in the county of Orleans, containing 149 inhabitants.—Alſo, a town of New Jerſey, in the county of Eſſex, containing 2152 inhabitants; 8 miles W. of Elizabethtown.

WESTFORD, a town of Vermont, in Chittenden county, containing 866 inhabitants.—Alſo, a poſt-town of Maſſachuſetts, in the county of Middleſex, containing 1330 inhabitants; 28 miles N.W. of Boſton.—Alſo, a townſhip of New York, in Otſego county; 8 miles S.E. of Cooperſtown, erected in 1808 from the N.W. part of Worceſter. Its ſurface is broken by hills and valleys, but has much rich mould in the valleys. The hills are adapted to grazing, and it has many tracts of meadow land. Its timber conſiſts of maple, beech, aſh, elm, baſs-wood, and pine; and the whole is irrigated abundantly by ſprings and brooks. In 1810 the whole population conſiſted of 1215 perſons, and the number of electors was 73, and that of taxable inhabitants 177.

WESTGATE Bay, a bay of the Thames, on the coaſt of Kent, W. of Margate.

WEST GREENWICH, a town of Rhode iſland, in the county of Kent, with 1619 inhabitants.

WESTHAM, a town of Virginia; 4 miles N.W. of Richmond.

WESTHAMPTON, a poſt-town of New York, in the ſouth-eaſt part of Long iſland.—Alſo, a townſhip of Maſſachuſetts, in the county of Hampſhire, containing 793 inhabitants; 7 miles W. of Northampton.

WEST HANOVER, a townſhip of Pennſylvania, in the county of Dauphin, containing 2461 inhabitants.

WESTHAVEN, a townſhip of Connecticut; 3 miles W.S.W. of Newhaven.

WESTHOFEN, a town of France, in the department of Mont Tonnerre; 5 miles N.N.W. of Worms.—Alſo, a town of France, in the department of the Lower Rhine; 12 miles W. of Straſburg.

WESTHOVEN, a town of Germany, in the county of Mark, at the foot of a mountain near the Roer; once the domain of the celebrated Witikind, and poſſeſſed of conſiderable privileges; 4 miles S.W. of Schwiert.—Alſo, a town of Vermont, in the county of Rutland, containing 679 inhabitants.

WESTING, in *Navigation*, the ſame with departure.

WESTLAND, in *Geography*, a town of Ohio, in the county of Guernſey, with 250 inhabitants.

WESTMAES, a town of the iſland of Beyerland; 12 miles W. of Dort.

WESTMAN, or Westmonia, an iſland in the North ſea, near the coaſt of Iceland. N. lat. 63° 20′. W. long. 20° 28′.

The Weſtman iſlands ſuffered very much about the commencement of the ſeventeenth century, by the piracies of the Algerines; almoſt their whole population being deſtroyed or carried into captivity. In 1627 a large body of Algerine pirates landed on various parts of the ſouthern coaſt of Iceland; and not ſatisfied with the booty they obtained, murdered between forty and fifty of the inhabitants, and carried off nearly four hundred priſoners of both ſexes. Theſe unfortunate captives, tranſported to Algiers, were expoſed there to ſo much wretchedneſs, that nine years afterwards, when the king of Denmark obtained their liberty by ranſom, only thirty-ſeven out of the whole number were found to be ſurviving; of theſe, thirteen ſucceeded in reaching their native land. A prieſt named Olaus Egilſon, a captive, and releaſed in 1629, left a MS. relation of this event, which has been ſince publiſhed in Daniſh.

Westman, a town on the W. coaſt of the iſland of Stromoe.

WEST MANCHESTER, a townſhip of Pennſylvania, in the county of York, containing 978 inhabitants.

WESTMANNLAND, or Westmania, a province of Sweden, bounded on the north by Dalecarlia, on the eaſt by Upland, on the ſouth by Sudermanland, Nericia, and the Mæler lake, and on the W. by Warmeland; about 110 miles in length, and 80 in breadth where wideſt. The ſoil is fertile, and conſiſts moſtly of arable lands, with meadows, paſtures, and very fine woods in proportion; and it is reckoned the moſt famous province in the kingdom for mines. The iron trade carried on by the inhabitants of Weſtmannland, is the moſt conſiderable in all Sweden: the quantity of iron exported annually from Weſteros, Arboga, and Kioping, is very large. The ſouth part of the province chiefly conſiſts of arable and meadow lands, and ſupplies the inhabitants of the mine diſtricts with corn; and the northern parts abound in mine-works, and fine woods. Weſtmannland is well watered, both with rivers and lakes, which yield a vaſt plenty of fiſh; and the Mæler lake is a great advantage to its commerce, as it opens a paſſage from this province to Stockholm. The chief ſubſiſtence of the inhabitants is derived from agriculture and the mines, breeding of cattle and fiſhing. The wood, hammer-mills, &c. alſo employ a great many hands.

WEST MARLBOROUGH, a townſhip of Pennſylvania, in the county of Cheſter, containing 917 inhabitants.

WESTMEATH, a county of Ireland, which formerly was a part of the kingdom of Meath, but on the diviſion into counties was ſeparated from it, and both now form a part of the province of Leinſter. It has Cavan on the N., Meath on the E., the King's county on the S., Roſcommon, from which it is ſeparated by the Shannon, and Longford on the W. Its greateſt extent from E. to W. is 33 Iriſh (42 Engliſh) miles, and from N. to S. 27 Iriſh (34 Engliſh) miles. Its area meaſures 231,538 acres, or 361 ſquare miles Iriſh, equal to 371,979 acres, or 577 ſquare miles Engliſh meaſure. The number of pariſhes is 62, of which 21 have churches, and all but three are in the dioceſe of Meath. The population was computed by Dr. Beaufort to be 69,000. No part of this country is embarraſſed with mountains, but a great number of acres are rendered unproductive by large lakes and extenſive bogs; yet the convenience of fuel, the abundance of gravelly hills, and the variety of proſpects which ariſe from theſe beautiful lakes, and the undulating form of the ſurface, render it a very pleaſant and healthful country. The ſoil is in general light, but in ſome places deep and rich; and though there is more of it kept under graſs than employed in tillage, yet the plough is by no means neglected; for after ſupplying the home conſumption, the farmers of this county largely contribute to the exportation of oats from Drogheda. The Royal Canal from Dublin to Tarmonbury, on the Shannon, was to paſs through this county, and it has been carried as far as Mullingar; but the difficulties into which the company has fallen make it doubtful when the original deſign will be completed. Weſtmeath is remarkably well watered. Beſides the Shannon, which forms part of its weſtern boundary, the Inny and Broſna, two rivers of conſiderable extent, paſs through its lakes, and inſulate the greater part of it. The Inny riſes in the county of Cavan, and firſt enters Lough Shelin, which ſeparates that county

from

from Weftmeath; then in its courfe paffing through the loughs Derveragh and Iron, it is at length loft in that vaft expanfe of the Shannon, called Lough Ree, or the Royal Lake. The Brofna, rifing in Lough Iron, flows from it to Lough Hoyle, after quitting which it paffes the town of Mullingar; it then expands into Lough Ennel, and when again contracted, flowing by the town of Kilbeggan, it enters the King's county, through which it proceeds to the Shannon. As Weftmeath is nearly central, fo its ftreams flow in both directions. Thofe which have been already mentioned, joining the Shannon, are mixed with the Atlantic ocean; whilft other fmall ftreams, being collected in the river Dele, take an eaftern direction, and being united with the Boyne, flow to the Irifh fea.

Befides Lough Shelin on the north, and Lough Ree on the weftern boundary, there are fix confiderable lakes in this county, and feveral fmall ones. Thefe are well ftored with fifh of various kinds, and afford a number of beautiful profpects; yet it is to be regretted that fo many acres fhould be almoft an unprofitable wafte. The fifh found in thefe lakes are, perch, pike, bream, tench, trout, and very fine eels. The trout are often of ten pounds weight, and as red as a falmon. Such is the abundance, that Mr. Young tells us that a child with packthread and a crooked pin is able to catch perch enough in an hour to fupport a family for a day. This territory once belonged to Mortimer, earl of March, who married the daughter and heirefs of Lionel, duke of Clarence, third fon of Edward III. This nobleman refided much in Ireland, and was probably induced by the beauties of the fituation to build a palace at Fahatty, on the banks of Lough Derveragh, one of the fineft of thefe lakes, the remains of which were faid above a century ago to retain "the lineaments and footfteps of ancient ftate and magnificence." When Richard II. was depofed by Henry of Lancafter, Mortimer was the next in fucceffion to the throne, and he found it neceffary to conceal himfelf, which he did by retiring to Fahatty. By a marriage with his daughter, Richard, duke of York, fucceeded to his Irifh property, and to his right of fucceffion. This nobleman refided in Ireland for fome years as lord-lieutenant, before circumftances enabled him to urge his claim to the crown, which, after a long and bloody civil war, was obtained by his fon. The attachment of the fettlers in Ireland to this family was fhewn in the reign of Henry VII., by their readily embracing the caufe of Simnel and Warbeck.

Mullingar is the fhire town of Weftmeath; but Athlone is a place of more confequence. For an account of thefe, and of Kinnegad, Kilbeggan, Fore, &c. fee their refpective articles in this work. Weftmeath has three reprefentatives in the imperial parliament, two for the county, and one for the borough of Athlone.—Beaufort, Young, Collectanea, &c.

WESTMINSTER, a fpacious, populous, and important city of the county of Middlefex, England, is fituated on the north bank of the river Thames, and conftitutes the weftern extremity of the metropolis. Although in every refpect, local pofition alone excepted, independent of London, Weftminfter conftitutes a moft effential portion of the great metropolis of the Britifh empire. The line of demarcation between thefe two cities has long indeed, by the rapid increafe of buildings, ceafed to be perceptible to general obfervation; but it is not the lefs real and efficient. The inhabitants of Weftminfter, it is true, confider themfelves, in a general fenfe, as belonging to London; but for the purpofe of internal difcrimination, they confine the term Weftminfter to its original fignification, the fcite and the environs of the prefent collegiate, formerly the abbey-church of St. Peter. Confidering the city in this reftricted fenfe, and St. Peter's church as the centre, the latitude of Weftminfter is 51° 29′ 52″ N., and the longitude 0° 7′ 32″ W., from the meridian of the royal obfervatory in Greenwich-park. St. Peter's church bears from St. Paul's in London W.S.W. 2900 yards, or above one mile and five furlongs. The form of Weftminfter, in its prefent extended ftate, is triangular, having the bafe along the line of Oxford-ftreet, which feparates it from Marybourne on the north; and the vertex on the Thames, where the buildings terminate at Millbank on the fouth. The bafe, from Tyburn turnpike, at the weftern extremity of Oxford-ftreet, to the vicinity of Chancery-lane, at Lincoln's-inn, meafures nearly two miles. The fide on the weft from that turnpike to the vertex on Millbank, is alfo about two miles. The remaining fide on the eaft, in a right line from the vertex to Chancery-lane, is one mile and fix furlongs. The ground occupied by the buildings of the city and liberties therefore contains one fquare mile and a half, or about one thoufand acres. Weftminfter and London come into contact at Temple-bar, the boundary of the former city commencing at the Thames on the weft of the Temple-buildings, and running north to Lincoln's-inn. There quitting London, it turns weftward to the eaftern extremity of Oxford-ftreet, excluding the church and parifh of St. Giles-in-the-Fields, which belong to the county of Middlefex.

General View of Weftminfter.—From the extent of ground occupied by the city and liberties, and from the general population, amounting, by the enumeration of 1811, to 162,085 perfons, Weftminfter would, in another pofition, be fully entitled to rank high among the fecondary capitals of Europe. In common language, the great aggregate of Weftminfter is termed a city; bu tthat term belongs only in ftrictnefs to the immediate environs of St. Peter's church, while all the other parts of the community are fpread over the diftrict or liberties belonging to the monaftic eftablifhment, of which that church was a principal member. The city is of great antiquity, in the fenfe in which antiquity is eftimated in Britain; but the occupation of the liberties is of comparatively late date. This portion of Weftminfter may alfo be diftinguifhed, as to its age, into the old and the new towns, by a line running north from Charing-crofs up St. Martin's-lane into Crown-ftreet, Soho-fquare, and terminating near St. Giles's church, at the eaftern end of Oxford-ftreet. On the eaft of this line lies the old town, and on the weft fpreads out the new. The diftribution of the ftreets, and the conftruction of the buildings of the city, fufficiently indicate their early origin; an obfervation not unfuitable to the extremities of the old town. The new town, on the other hand, having been formed when better notions of diftribution and arrangement began to prevail, poffeffes a high proportion of all the advantages which fuch notions were calculated to produce. The abbey-church of St. Peter is diftant from the limits of London at Temple-bar, by the prefent ftreets along the Strand and Whitehall, about 2400 yards, or one mile and three furlongs; but from Temple-bar to the extremity of the Strand, at Charing-crofs, is only 1500 yards, or feven furlongs. The origin of this ftreet is manifeft from its name, having been only a road along the ftrand, or bank of the Thames, leading through the village of Charing to Weftminfter. Without keeping however precifely along the margin of the water, the road, owing to the fteep fall of the bank, was carried forward at fuch a diftance as to permit fpacious houfes and gardens to be formed on the flope between it and the river. The refidence of the court, in early times, was frequently in the Tower of London, or at fome place at a diftance from the capital; but under Henry III., who reigned

reigned from 1216 to 1272, the court ufually refided in Weftminfter. The courts of juftice, which had before accompanied the king in his motions, were, by his confirmation of *Magna Charta* in 1225, made ftationary in Weftminfter, where the parliament alfo generally met. For the convenience of attendance on the king, the courts of juftice, and the parliament, for the enjoyment alfo of good open air, and an agreeable profpect, many of the nobles, and efpecially of the bifhops, erected palaces along the banks of the river. Perfons of inferior ftation, whofe chief dependance for bufinefs and fubfiftence refted on thofe great men, were neceffarily induced to fix their abode in their vicinity. In this way, a chain of dwellings, of various forts, was progreffively raifed between the cities of London and Weftminfter, and united both with the intervening village of Charing. The fituations of thofe palaces, or inns, as they were called, are preferved to the prefent day, in the fucceffion of ftreets retaining their names, which communicate from the Strand on both fides, efpecially to the river. Thus, for inftance, from Temple-bar we come to ftreets bearing the names of Effex, Arundel, Norfolk, Surry, Somerfet, Savoy, Beaufort, Cecil, Salifbury, Durham, York, &c., all calling up perfonages memorable in former times; but of the houfes to which thofe names belonged, no veftige, if we except the fragments of the palace of the Savoy, and the prefent Northumberland-houfe, can now be faid to remain. The oppofite fide of the Strand being cut off from the ufe and the view of the Thames, was of courfe little frequented; but Exeter-change ftill indicates the refidence of the celebrated Cecil, lord Burleigh, whofe fon Thomas became earl of Exeter. Bedford and Southampton ftreets declare the origin of their names. As late as in the year 1353, when Edward III. was on the throne, the Strand was an open highway, croffed and cut up by water-courfes from the higher grounds. It was then repaired, but not before great complaints had been made: for in the petition of the perfons who lived near the palace of Weftminfter to Edward II., "the footway from Temple-bar to the palace" is ftated to be fo bad, that "the feet of horfes, and rich and poor men, received conftant damage, efpecially in the rainy feafon; the footway being interrupted by thickets and bufhes." From Temple-bar to the palace of Savoy, the Strand feems to have been paved, or properly made about 1385, in the reign of Richard II.: but the paving went no further till the latter part of Elizabeth's reign; and in the 35th of Henry VIII. the road was ftated to be "full of pits and floughs, very perilous and noifome." In the year 1533 the Strand took the form of a ftreet, bordered on each fide with houfes and gardens; among which was Covent-garden, corruptedly fo called from the garden of the convent, or abbey of Weftminfter, to which it belonged. Charing was ftill a detached village; St. Martin's church ftood literally in the fields; and St. Giles's, alfo furnamed in the fields, ftood in a diftant hamlet in the country. Such, however, was the increafe of the town in the end of Elizabeth's reign, that in 1600 St. Martin's-lane was built on both fides; and although St. Giles's church ftill ftood detached, the great weft road, now called Holborn, (properly Old-bourne, from the name of a fmall brook running along it,) was formed into a ftreet all the way into London at Fleet-ditch. Covent-garden and Lincoln's-inn-fields were partially built on, as were Drury-lane and Long-acre, and principally inhabited by the gentry. The village of Charing was long before this time, or in 1292, adorned with a crofs by Edward I., being the laft fpot where the body of his queen refted on the way to Weftminfter. In 1647 it was removed, and in part employed in pavement at Whitehall; but foon after the Reftoration, its place was filled, as it now is, by a ftatue of Charles I. on horfeback. From Charing to Weftminfter, the bank of the Thames was occupied by the refidences of royal, or other diftinguifhed perfonages. Firft was a palace for the king of Scotland, when he came to court to attend the parliament, of which, on account of lands he held in England, he was confidered a member. An ancient painting, formerly in the college of arms in London, reprefented Edward I. fitting in parliament, having on his right-hand Alexander III., king of Scotland; and on his left, Llewellyn, prince of Wales. The palace has long been effaced, but its fcite is ftill called Scotland-yard. To this fucceeded in pofition the palace of Whitehall, which will be noticed in another place. The church of St. Martin ftands within the limits of the old quarter, but its parifh originally extended over the whole of the new quarter of Weftminfter; and out of it, as buildings increafed, the parifhes of St. Paul, Covent-garden, St. James, St. Anne, and St. George, have fucceffively been formed.

Among the various improvements lately introduced into the ftreets of Weftminfter, muft be reckoned the fubftitution of gas-lights for oil-lamps, now much in ufe in fhops as well as without doors. The gas, or vapour, is extracted, by a fpecies of diftillation, from pit-coal. Purified from the incombuftible aerial fubftances with which it is extricated from the coal, by tranfmiffion through a body of water, the inflammable or carburetted hydrogen gas is conveyed by pipes, like water, to the places where it is wanted. By the admiffion of flame to the orifice of the pipe, the gas takes fire, producing together with a ftrong heat, a lively light of peculiar force and brilliancy. The coals from which, in London and Weftminfter, the gas is obtained with the greateft effect, are the Lancafhire cannel, and the Scotch fplint coals. Newcaftle coal is found to be much lefs pure, but from its cheapnefs is now moftly ufed.

Origin and Hiftory of Weftminfter.—Much learning and more fancy have been employed in devifing an etymology for the name of London; but the name of Weftminfter is too obvious to afford exercife for the fkill or the ingenuity of the philologift or the antiquary. The Saxon terms compofing the latter name evidently refer to the church of St. Paul, in London, in the eaft. Stowe indeed, and fome later writers, carry the reference to a monaftery, not far from the Tower of London, called the Eaft-minfter. But that eftablifhment was founded only by Edward III., in the middle of the fourteenth century, long pofterior to that of Weftminfter, and could not therefore have given origin to the latter inftitution. The hiftory of Weftminfter is founded on, and clofely interwoven with that of the monaftery of St. Peter: for to the exiftence and importance of the latter, the rife, progrefs, and profperity of the former muft be attributed.

The fcite of the church and monaftery of St. Peter was in early times an ifland, inclofed by the main channel of the Thames on the eaft, and by a collateral branch of that river on the weft. Hiftory furnifhes no information concerning the limits or the extent of this infulated tract; but by a careful examination of the ground, even under all its alterations, the courfe of the collateral branch may ftill be difcovered. This branch feems to have broken off from the Thames to the eaft of Chelfea hofpital, to have paffed northward, along the natural hollow in which the water ftill flows to fupply Chelfea water-works, and thence over a fhort interval, now covered with the houfes of Pimlico, into the depreffion occupied by the canal in St. James's park, acrofs the fcite of Whitehall into the Thames. In this cafe the ifland was in length from S.W. to to N.E. about one mile and three-quarters, and in breadth in the middle about half that diftance. Of this fpacious tract, by far the greateft portion muft, in former times, have been regularly overflowed by each returning tide of the river; as it would be at the prefent time, were not the embankments bordering the Thames carefully preferved. The age of thefe mounds is unknown; but to no others than the heads of the monaftery to whom the ifland belonged can their formation be reafonably afcribed; and to them is Weftminfter therefore indebted for the many advantages derived from the lands refcued from inundation. The embankments muft have been conftructed, and the ground within them well improved in 1386: for in that year abbot Litlington died in the manor-houfe of *Neyte*, fituated within that fpace. So defirable was that fituation, that the duke of Lancafter, ftyling himfelf king of Caftille, had requefted leave to refide in the houfe during the fitting of a parliament. The name of this place ftill furvives, although abfurdly corrupted into *Neat-houfes*. In an authentic charter, dated in 785, Offa, king of Mercia, grants certain lands to the monaftery of St. Peter: its fituation is defcribed to be in "Torneia in loco terribili ad Weftmunfter." In the writings of Sulcardus, a monk of this monaftery who wrote in the eleventh century, the name is Thorneia. Both thefe names are fuppofed to be formed from the Saxon *Thorn-ey*, the ifle of thorns and briars, expreffing the wild uncultivated ftate of the "terrible fpot" noticed by Offa. Forbidding as fuch a fituation now would be, it bore a different afpect in ancient times; for it poffeffed alike fecurity from attack, and feclufion from the world. To the religious eftablifhment on Thorney, the rife, progrefs, and profperity of Weftminfter are to be afcribed; but the origin and the date of that eftablifhment itfelf are involved in obfcurity. The probability, however, is, that it was founded by Sebert, king of the Eaft Saxons, who died in 616. That it had in 785 acquired celebrity, is evident from the charter before-mentioned, granted by Offa. From Sebert's time the monaftery feems to have been only a priory; but by Offa it was changed to an abbey, of which the abbots arofe, in the courfe of a few years, to the higheft dignity of which their rank was fufceptible. To demonftrate more fully his attachment to the patron of the abbey, St. Peter, Offa in it depofited his coronation-robes and regalia. From this circumftance, perhaps, as much as from fubfequent papal authority, St. Peter's church afterwards became, and ftill is ufed for the inauguration of the Englifh fovereigns; and to the dean, as fucceffor of the abbot, are intrufted many of the implements and ornaments employed in that important function, which was firft there performed on William the Conqueror, in 1066. After fuffering feverely in common with other works of the fame character, by the ravages of the Danes, the abbey was reftored by Edgar, who began to reign in 957, on the inftigation of Dunftan, who removed thither, probably from Glaftonbury, twelve monks of the order of St. Benedict. It is neverthelefs to Edward the Confeffor that the inftitution is principally indebted for its fplendour. Sulcardus informs us that Edward had vowed to go to Rome, there to exprefs his pious gratitude to heaven for his unexpected eftablifhment on the Englifh throne. The many inconveniences, however, by which the performance of this engagement muft have been attended, induced him to fubftitute in its ftead fome other mode of teftifying his thankfulnefs. He therefore undertook to rebuild the church and monaftery of St. Peter in a magnificent manner, and endow them with ample revenues. Of the ftructure itfelf we only know from Matthew Paris, that "it was conftructed in a new kind of arrangement, from which many perfons in erecting churches took a pattern, and ftrove to imitate it." Speaking of the fame edifice, fir Chriftopher Wren refers to an account printed from an ancient manufcript. This account he tranflates into language proper for builders, in this way. "The principal area or nave of the church being raifed high, and vaulted with fquare and uniform ribs, is turned circular to the eaft. This on each fide is ftrongly fortified with a double vaulting of the aifles in two ftories, with their pillars and arches. The crofs-building, contrived to contain the choir in the middle, and the better to fupport the lofty tower, rofe with a plainer and lower vaulting; which tower then fpreading with artificial winding-ftairs, was continued with plain walls to its timber-roof, which was well covered with lead." The ftriking novelty in this ftructure was probably the introduction of an imitation of a crofs in the plan: for the earlier Saxon churches are fuppofed to have had no tranfepts. The grants of lands, and of relics, beftowed by Edward on his new foundation, were ample beyond all precedent. He likewife invefted it with peculiar privileges, exempting it from all fecular fervices and authority, even from epifcopal fuperintendance. But this laft exemption brought on each new abbot the trouble and expence of a journey to Rome, to be confirmed by his holinefs in perfon. Edward died on the 5th of January, 1066, having furvived but a few days the fplendid ceremony of the confecration of the new ftructure. From thefe privileges, afterwards extended to a confiderable fpace connected with the abbey, may be traced in a great meafure the prefent civil conftitution of Weftminfter. While Laurence was abbot in 1163, in the reign of Henry II., the power was obtained from pope Alexander III. for his ufing the mitre, ring, and gloves, diftinguifhing marks of epifcopal dignity. But this privilege became, in the fequel, of ftill higher importance; for mitred abbots came to fit in parliament as well as bifhops, and to enjoy every honour to which bifhops, as lords of parliament, were entitled. Laurence dying before the papal approbation of the meafure was formally announced, his fucceffor Walter was the firft abbot of Weftminfter who actually enjoyed the honours of the mitre. The reign of Henry III., of great importance in the hiftory of England in general, is not lefs fo to that of Weftminfter abbey in particular. In it the greater part of the edifice was rebuilt, in the lofty elegant ftyle by which it is chiefly characterized; a ftyle which about that time began to be adopted in ecclefiaftical buildings throughout Europe. As early as 1220, although then only a youth, Henry laid the firft ftone of the chapel of the Virgin, which was afterwards fuperfeded by the gorgeous ftructure of Henry VII.; but it was not until 1245 that he directed the church to be enlarged, and the tower, with the eaftern part, to be conftructed anew. In 1269 the building was opened for divine fervice, and the body of Edward the Confeffor was depofited in a fplendid fhrine erected behind the high altar.

The abbey of Weftminfter is entitled to the peculiar veneration of every friend of literature, of fcience, and of civil and religious liberty; for within its bounds was erected the firft apparatus for printing books employed in this ifland. William Caxton, a mercer of London, during a long refidence on the continent as agent for the affairs of his company, and in 1464 as minifter from Edward IV. to the duke of Burgundy, became acquainted with the art of printing, then very recently practifed in Lower Germany. In 1471 he printed at Cologne a work which he had tranflated from the French into Englifh; and returning home in the following year, he, under the patronage of the abbot of Weftminfter, commenced printing in the almonry, or eleemofynary adjoining to the abbey. In March 1474 appeared his book on the "Game at Chefs," which may be regarded as the firft production of the Englifh prefs. (See PRINTING.) The honour of being the firft protector of printing in England has been frequently affigned to John Iflip: but this muft be erroneous; for he became a monk only in 1480, and arofe to be abbot only in 1500. To one of his predeceffors, therefore, to Efteney, elected in 1474, or rather to Millyng, elected in 1469, is the introduction of printing to be attributed. The abbacy of Iflip is however memorable on another account. In it was founded, on the 24th of January, 1502-3, the celebrated chapel of Henry VII. Having obtained the crown as heir to Henry VI., he refolved to erect a fumptuous monument for his remains, in the expectation of his canonization. The firft part of the project was carried into effect: but the court of Rome requiring a greater fum for compliance with his folicitation than the prudent Henry of Richmond cared to beftow, the laft part of the project was relinquifhed. Weftminfter-abbey was now on the eve of great alterations. The fchemes of Henry VIII. began to be put in practice. On the 16th of January, 1539-40, a furrender of the whole eftablifhment was executed by abbot Benfon of Bofton, and twenty-four of the monks. The annual revenue is ftated to have then been nearly 4000*l*.; a fum of great real value, when the pound of beef was regulated at one halfpenny, and that of veal and mutton at three farthings.

Prior to the diffolution of the monafteries, Henry had refolved to convert fome of them into epifcopal fees, to be endowed with a portion of the lands or the revenues which that diffolution would place at his difpofal. Of the projected fees, Weftminfter was to be one; and on the 17th of December, 1540, the abbey-church was, by letters patent, conftituted a cathedral, with a bifhop, a dean, twelve prebendaries, and other inferior officers. The new bifhop was Thomas Thirleby, then dean of the chapel-royal. The late abbot Benfon was, for his ready compliance with Henry's wifhes in the change of the abbey, appointed dean of the new cathedral: certain monks became prebendaries, minor canons, and ftudents in the univerfity: the others were difmiffed with penfions, decreafing from ten pounds down to five marks. The abbatial manfion was converted into a palace for the bifhop, whofe annual revenue is varioufly ftated from fix hundred to eight hundred pounds. The diocefe included the whole county of Middlefex, with the exception of Fulham, the rural refidence of the bifhops of London. The endowment of the dean and chapter was not completed till the 5th of Auguft 1542, when lands, in various parts of the kingdom, were affigned, of the yearly value of 2598*l*., out of which, however, the fum of 400*l*. was to be paid for the falaries of five profeffors of divinity, law, phyfic, Hebrew, and Greek, in each of the univerfities. A farther fum of 166*l*. 13*s*. 4*d*. was to fupport 20 ftudents in the univerfities; and two mafters, with 40 grammar fcholars, were to be maintained in the fchool of Weftminfter. The new bifhopric was, however, but of fhort duration; for on the 29th of March 1550, bifhop Thirleby was required to furrender it to Edward VI., and it was foon afterwards reunited to that of London. Part of the poffeffions of St. Peter's cathedral were appropriated to the repairs of St. Paul's in London; whence arofe the proverb of "robbing Peter to pay Paul." In the edict for fuppreffing the fee of Weftminfter, no mention was made of the eftablifhment of a dean and prebendaries, &c.; it became confequently a queftion whether they were to be continued. To remove all doubt on this head, an act paffed in parliament, declaring the church ftill to remain a cathedral, with the former eftablifhment, but within the diocefe of London. On the acceffion of Mary to the throne, the reftoration of the monaftery to its priftine condition was carried into effect. The abbot, John Fackenham, furviving Mary, was the only ecclefiaftic of his rank who fat in the firft parliament of Elizabeth in 1558; and he took the loweft place on the bifhops' bench. But on the 21ft of May 1560, the monks were again difplaced, and the church again rendered collegiate, on a bafis very fimilar to that which had been eftablifhed by her father, Henry VIII. The laft dean of Elizabeth's appointment was the learned Lancelot Andrews, afterwards bifhop of Winchefter, dean of the chapel-royal, and a fpecial favourite of James I. Since the reftoration by Elizabeth, if we exclude the general diforganization of fimilar inftitutions, in confequence of the internal diforders which commenced in the reign of Charles I., the collegiate eftablifhment of the abbey-church of Weftminfter has undergone no material alteration.

Abbey-Church.—Such is briefly the hiftory of the religious eftablifhment on Thorney, to which modern Weftminfter is indebted for its origin and profperity. Of this eftablifhment, the church remains in a great meafure entire: the buildings appropriated for the abbot and the monks have undergone great alterations; but their general arrangement may ftill be traced, and they are ftill allotted for the refidence of the perfons attached to the fervice of the church and the dependent fchool. For a fully detailed defcription of this celebrated church, of its architectural beauties and defects, of the fepulchral monuments it contains, of the ceremonies performed within its walls, and for a recapitulation of the important tranfactions connected with its hiftory, recourfe muft be had to the various works publifhed fpecially on the fubject. This church is a diftinguifhed fpecimen of that mode of architecture, commonly but abfurdly ftyled Gothic, a term which, however improper, moft writers ftill continue to employ, though no fpecific ftyle or clafs of building is defined by it. Erected in the 13th century, when buildings in this ftyle of architecture were well underftood, and fkilfully conftructed, it would doubtlefs have poffeffed, if not the fpacioufnefs, at leaft the light and airy and elegant appearance for which fuch ftructures are generally remarkable. But by the introduction of fepulchral monuments, elevated above the level of the choir, many of them magnificent indeed in themfelves, but certainly mifplaced as far as regards the internal arrangement of the building, that attractive appearance muft very early, perhaps from the beginning, have been injured. Owing to thofe encroachments, it has been neceffary to bring forward the prefent choir much beyond its ufual ftation, not only intercepting the tranfepts, but advancing a confiderable way into the nave, or body of the church. The building confifts of a nave and two fide aifles, feparated by ranges of tall, flender, clustered columns, fupporting the roof raifed to a great elevation, ftill further increafed in appearance by the narrownefs of the fpace between the columns. The length of the whole edifice within the walls is 360 feet, the breadth of the nave and aifles 72 feet, the length of the crofs or tranfept 195. The infertion of St. Edward's chapel in the choir is particularly unfavourable; for that important divifion of the building was from the beginning very fhort: nor is it eafy to difcover the reafon of this deviation from general ufage. On entering the great weftern door, the whole body of the church difplays itfelf to view in a very ftriking manner. Loftinefs, lightnefs, and elegance, are its marking features; but thefe features are much obfcured, and diftracted by the numerous difcordant monuments, which fill up the open fpaces, and cover the walls. The nave is feparated from the choir by a fcreen; and eaft of the latter is a chapel, raifed raised above the level of the pavement, appropriated to the shrine of Edward the Confessor, but also occupied by several monuments to royal and noble persons. At the east end of this is a sumptuous architectural chantry to the memory of Henry V. Still more to the east is the splendid and interesting chapel, called Henry the Seventh's, because begun by him, and founded for his mausoleum. On the north and south sides of the choir are aisles, and also some small chapels, dedicated to different saints.

From the time of Henry VII. little was done, although very requisite, to the exterior of Westminster church, till that of George II., when many parts of it were coated over with stone, and otherwise repaired at the public expence. Some time before this, the two towers at the west end were completed from designs of sir Christopher Wren, as they now appear. In covering the outside of the church, the rich sculpture, and the statues which formerly adorned the buttresses, could not be restored. Those parts seem now, therefore, unsuited to the highly ornamented building to which they are attached : nor do the western towers assimilate with the style of the fabric to which they belong. The paintings in the great west window were executed in 1735 : the window in the south transept was also renewed in 1705. In the interior of the church, the pillars dividing the nave from the side aisles guide the eye to the fine painted window at the extremity of the choir, which, in former times, when the altar-piece was low, must have had a fine effect in giving a lighter air to that part of the building. The altar-piece was brought hither by queen Anne in 1706 : it had formerly belonged to Whitehall chapel. The marble columns of the Corinthian order, however elegant in themselves, but ill accord with the style of the structure around them ; an incongruity but too often sanctioned in other edifices of the same kind in England. In front of the communion-table is still to be seen, although woefully mutilated, a curious Mosaic pavement of lapis lazuli, porphyry, jasper, serpentine, touch-stone, &c. placed there by abbot Ware in 1272, who brought it from the continent, where he procured the materials during a mission to Rome. The black and white lozenged marble pavement of the choir was the gift of the celebrated Dr. Busby, master of the school annexed to the church. In the centre of Edward the Confessor's chapel, stands the mutilated body of the shrine, containing, in a wooden case, the ashes of St. Edward ; and around the sides of the chapel are ranged the monuments of several kings, queens, and princesses, from Henry III. to Elizabeth, the daughter of Henry VII. ; all of which are extremely curious and interesting. In this chapel are preserved the chairs, one very ancient, the other made for the last queen Mary, in which our kings and queens are seated within the choir at their coronation. In the frame of that used by the king is the fatal stone, to the position of which the sovereignty of Scotland, or rather of the Scotch nation, was attached.

The choir of the church, in the form of a semi-octagon, was surrounded by eight chapels, now reduced to seven, by the appropriation of the central chapel to be the porch of that of Henry VII.

The cross-aisles or transepts of the church, as well as the nave, have long been consecrated to the interment of persons in various ways distinguished in the world. The south transept has only an eastern aisle, the west being occupied by part of the cloisters. This transept, named Poets'-corner, contains many interesting memorials of men whose genius and talents in science, literature, and the arts, entitle them to the honourable recollection of posterity. Of these monuments, many are highly interesting as memorials of eminent characters, and others as specimens of the sculptor's art. No small number of them, however, and those not the least sumptuous and obtrusive, are entitled to no regard on either account, being vast masses of marble devoid of beauty and taste. It is, however, to be remembered, that to be "numbered among the illustrious dead," within the walls of the abbey-church of Westminster, now is and long has been purely a question of finance with the officers attached to the foundation.

Chapel of Henry VII.—In ancient cathedrals and other churches of considerable extent, it was the practice to appropriate to the peculiar service of the Virgin, the chapel situated immediately behind the high altar, and in the eastern recess of the building. Such a chapel originally belonged to the abbey-church ; and on its scite with some adjoining space, under the same patronage, but now best known by his own name, Henry VII. constructed his magnificent and admirable chapel. When we contemplate this most curious specimen of English architecture, and consider the expence which must have been encountered to complete it, we are utterly unable, on any rational grounds, to reconcile its erection with the acknowledged disposition and character of the founder. In perusing the history of nations, we must be struck with the frequent recurrence of this fact, that men of all degrees, particularly of the highest, have acted on the vain supposition, that, by a single ostentatious act of beneficence or munificence, not unfrequently posthumous, they could acquire immortal fame, and even secure the favour of heaven, however unworthily they may have performed their duty in life. Of this fact, the chapel of Henry VII. stands a memorable example ; for in no one act of his life and reign, did that prince give evidence of any one of those feelings from which the construction of this superb structure could be expected to proceed. Of benevolence, however, in a certain sense, no sovereign ever had a better conception than Henry. The vast sums he exacted under this specious title, far exceeded the demands for which they were required : he accordingly amassed great wealth, and at his death his treasury was enormously rich. Towards his end, Henry, sensible of a mis-spent reign, endeavoured to atone for his offences by various charitable works, by bestowing a large sum on King's-college chapel in Cambridge, and in particular by founding, erecting, and endowing his chapel in Westminster. From the elegance and richness of the design, and from the skill and labour necessary to complete it, we are warranted to conclude that the most eminent artists and artificers of the country were employed. The first stone of the new chapel was laid by the hands of abbot John Islip, and other persons of the court, in the presence of Henry, on the 24th of January 1502-3. How much of the work was executed at the king's death, on the 21st of April 1509, is unknown ; but most probably the masonry must have been nearly, if not altogether, completed. Towards the finishing of the whole, Henry left, in the hands of the abbot, 5000*l.* with provision for more if required. The superb tomb for the king is particularly described in his will ; but a different plan was followed, and the work was finished by his son Henry VIII. The ground-plan of the building consists of a body nearly a square, terminated at the east end by a semicircular part, composed of five sides of an octagon. The extreme length of the whole chapel, including the porch, is 134 feet, and the corresponding breadth 82 feet 6 inches. On viewing the exterior of the building, we are struck by the apparent slightness of the work ; for instead of walls, the principal weight and quantity of the whole rests on a few detached piers and lateral buttresses. This peculiar character of

ancient

ancient ecclefiaftical buildings, manifefts great fcience and fkill in the architects; for to raife lofty walls, and poife ponderous wide-fpreading roofs on piers and columns, requires the niceft geometrical accuracy. The fides are fupported by five octagonal piers; thofe of the femicircular end are united to wedge-fhaped maffes, entering fo far into the chapel, as to correfpond with the pillars feparating the aifles from the nave. The interftices between the external piers are filled by windows of a peculiar plan and great delicacy of workmanfhip. The roof over the nave refts on perpendicular walls, fupported by very flender internal pillars, and is ftrengthened all around by flying buttreffes or femi-arches from the external piers. Within, the chapel is divided by two ranges of pillars into a nave 33 feet 6 inches in width, and fide-aifles each 11 feet 3 inches wide. The internal roof is executed in ftone, with pendants and numerous ribs. By the advance of the piers in the circular part, that end is formed into five fmall chapels or oratories; but the fide-aifles in their original had no feparation from the nave, except the ranges of pillars. They are now, however, unfortunately cut off by a row of ftalls on each fide, on the line of the pillars, and fhooting up with their fretted and frittered canopies as high as the roof of the aifles. What tends to heighten the deformity of thefe ftalls, is the number of gaudy flags of the knights of the Bath, who are inftalled in this chapel, fufpended all around, at once concealing many beautiful parts of the architecture and fculpture, and utterly at variance with the elegance and the defign of the edifice. The entrance to the chapel is by a flight of fteps to a magnificent gateway, but from its fituation dark in itfelf, and darkening the extremity of the adjoining church. The chief object within the chapel is the tomb of the founder, inclofed by a fcreen of gilt brafs: it is a piece of admirable workmanfhip, executed by Torregiano of Florence, a rival of Michael Angelo. There alfo, ftill in oppofition, lie the jealous and vindictive Elizabeth and her unfortunate victim Mary Stuart. Thus in a corner of the abbey-church, a few feet only of earth now feparate the once formidable political antagonifts William Pitt and Charles James Fox. The bronze figure of Margaret Tudor, mother of Henry VII., is one of the fineft pieces of fculpture in the whole building. In viewing this chapel, two fubjects always excite regret; the fituation in which it ftands, and the materials of which the exterior is conftructed. Attached to the end of the abbey-church, with which its mode of conftruction has but a very diftant relation; although in itfelf, if furnifhed with a fuitable frontifpiece, worthy to be a feparate and independent work, it now finks into a mere appendage. The exterior furface of the chapel is in many parts corroded and confumed; and moft of the fculpture is now quite defaced. Some years ago parliament voted a confiderable fum of money, to be annually applied to defray the expence of new-cafing the whole edifice with Bath ftone, and the work has been carried on under the directions of Mr. T. Gayfere, with fcrupulous attention to the form and manner of the original workmanfhip. Beneath the chapel is the vault prepared on the death of Caroline, queen of George II. in 1737, and containing the remains of feveral members of the prefent royal family. The cloifter of the abbey, ftill fufficiently entire, and containing numerous fepulchral infcriptions, communicates with the ancient chapter-houfe, which is of octagonal form, and the roof is fupported by a branching central column. It was erected, according to Matthew of Weftminfter, in 1250, by Henry III. This building, which, till the time of Edward VI., ferved as a houfe for the commons of England, is now employed to preferve public records; amongft them, the celebrated *Liber de Wintonia*, as it was called by the compilers, or *Domefday-book*, as it was not unaptly named by thofe perfons whom it regarded. This work, the moft ancient and venerable record, or ftatiftical account, as we now fpeak, of which this or any other country can boaft, was completed about 1086, in the end of the reign of William the Conqueror. (See Domesday-*Book.*) In the fame chapter-houfe are alfo preferved the recorded proceedings of the notorious ftar-chamber, fo called from the ftar-like ornaments of the roof.

School.—The cloifter alfo communicates with the celebrated fchool of Weftminfter, which was refounded by Elizabeth in 1590, with an eftablifhment for the claffical inftruction of forty boys. After a certain time, the fcholars, if duly qualified, are felected alternately for their refpective inftitutions, by the dean of Chrift-church, Oxford, and the mafter of Trinity college, Cambridge. Befides the youths on the foundation, from three to four hundred, others ufually receive their education in the fchool, at the expence of their refpective parents.

Parifh Churches of Weftminfter.—The city and liberties are now diftributed into ten parifhes. Within the city are St. Margaret's and St. John the evangelift's; within the liberties, St. Martin's, St. James's, St. George's, St. Anne's, St. Paul's, St. Clement's, St. Mary's, and the Savoy. St. Margaret's, the original church of the city, is a fimple plain ftructure. It is handfomely fitted up to accommodate the commons of the kingdom on certain folemn occafions; as the choir of the neighbouring abbey-church is allotted to the peers of parliament. One peculiar ornament of St. Margaret's church is a magnificent painted window reprefenting the crucifixion. This very interefting piece was executed in Holland as a prefent for Henry VII. St. John's church, belonging to a parifh formed out of St. Margaret's, furnifhes an admirable example of what imagination, unreftrained by judgment and tafte, can produce. It ought however to be known, that Mr. Archer, and not fir John Vanburgh, who has been oftener blamed than underftood, was the architect of this fabric. St. Martin's and St. George's churches are remarkable for their noble porticoes; but both are fo unfortunately, not to fay abfurdly fituated, that it is impoffible to have a view of them in any way fatisfactory. St. Paul's, Covent-garden, is noted for its fimplicity, and its plain, heavy, Tufcan portico. In erecting the latter at the *eaft* end of the church, where it can be feen, Inigo Jones effayed a bold deviation from eftablifhed practice; but to change the interior diftribution of parts was perhaps beyond his power. The portico therefore ftands where no entrance can be opened, for there within ftands the communion-table; and the entrance is opened at the *weft* end, where there fhould be, but is not, a portico. The church of St. Mary, like that of St. Clement, is ftrangely placed in the midft of the Strand, a moft public and noify ftreet; and inftead of poffeffing the fimple dignity of a Chriftian temple, feems rather a model contrived to fhew the fkill of the architect in comprifing the greateft quantity of ornament devoid of utility, within the narroweft bounds. But Mr. Gibbs the architect followed his inftructions in adorning an edifice to be fo oftentatioufly exhibited. He had befides but juft returned from Italy, where fimilar ftructures abound. It is no wonder, therefore, that, in both the interior and the exterior of the New church of St. Mary, he was led to imitate the buildings he might, as a mere ftudent of architectural defign, long have admired.

Befides the churches and chapels of the eftablifhment, Weftminfter contains places of worfhip for Chriftians of all denominations, and of profeffions the moft contradictory, from the myfterious Swedenborgian, who maintains the fole

and

and abfolute *divinity*, to the fimple Unitarian, who afferts the pure *humanity* of the great founder of the Chriftian religion. French, Swifs, Dutch, and German Proteftants, have proper places where the fervice is performed in their own languages. The Society of Friends or Quakers have a refpectable place of affembly in St. Martin's-lane; and various chapels are open for the members of the church of Rome. In Denmark-court, in the Strand, is a well-frequented Jewifh fynagogue.

Civil and Political State of Weftminfter.—The firft dwellings conftructed around the monaftery in Thorney, ftood on the lands of the eftablifhment, which confequently had full authority to govern the inhabitants. Thefe were rapidly increafed in numbers by the privilege of fanctuary granted to the abbey for offenders; but the great caufes of the growth, population, and importance of Weftminfter, were the refidence there of the kings, and the tranfaction of all public bufinefs within its precincts. Although the Strand, Whitehall, and a few other parts were inhabited, at the elevation of the abbacy into an epifcopal fee in 1540, yet the quarter only immediately inclofing the cathedral church was honoured with the title of city. The whole of this quarter was included in the original and ancient parifh of St. Margaret; but in order to accommodate the increafed body of inhabitants, efpecially in the fouthern parts, a new parifh was formed out of the old in 1728, and named after St. John the evangelift. All the other quarters of the prefent Weftminfter, erected on the liberties of the abbey, are contained within the following eight parifhes, arranged in the order of their eftablifhment. St. Clement's Danes, St. Martin's in the Fields, and St. Mary's in the Strand, all of uncertain antiquity. St. John the Baptift's, in the Savoy, alfo ancient, St. Paul's, Covent-garden, St. James's, St. Anne's, Soho, and St. George's, Hanover-fquare; the laft four all formed within the laft 200 years. In defignating Weftminfter in the aggregate, the city and the liberties are neceffarily mentioned; but in no refpect does any diftinctive rank, right, or privilege exift between the inhabitants of thofe different quarters, who are all equally citizens and members of the fame community. On the public change of religion, and the converfion of the abbey of St. Peter into a collegiate eftablifhment of a dean and chapter in 1560, the latter were placed, as to all their civil rights and authority, in the fituation poffeffed by their predeceffors; but the fanctuary was, with all other fimilar privileges, fuppreffed in the 21ft year of James I. The dean and chapter of St. Peter's have, therefore, continued ever fince to be the fupreme magiftrates and adminiftrators of the inhabitants of the city and liberties of Weftminfter. Since the Reformation, however, the exercife of all civil powers has always been vefted in lay perfons, elected or confirmed by the dean and chapter. Of this fingular and anomalous fyftem of government, which, how applicable foever to the original, feems wholly unfuitable to the modern Weftminfter, the following are the principal members, as fettled by an act of the year 1585:—The firft is the high-fteward, ufually a refident nobleman of diftinction (the prefent is the duke of Northumberland), who is elected by the chapter of St. Peter's; the dean acting as high-fteward during and previoufly to the election. By this principal officer a deputy fteward is nominated; but his appointment muft be confirmed by the dean and chapter. This deputy acts as a fheriff, holding the court-leet with the other magiftrates: he is always chairman of the quarter-feffions of Weftminfter, which are independent of thofe of Middlefex. Next in rank is the high-bailiff, nominated on the other hand by the dean and chapter, but confirmed by the high-fteward. He is the returning officer in the election of the reprefentatives in parliament for the city and liberties; and to him all the other bailiffs are fubordinate. He fummons juries, and has a right to all fines, forfeitures, and ftrays, within his jurifdiction: he alfo, on due requifition, calls together and is prefent in affemblies of the electors, for the purpofe of petitioning parliament or the crown, or of tranfacting any other public bufinefs in which they are all concerned. The high-conftable, chofen at a court-leet of the magiftrates, has all the other conftables under his fuperintendance. In addition to thefe officers, fixteen houfeholders, ftyled burgeffes, are chofen, with their affiftants out of the different parifhes. Thefe refemble the aldermen and common-council of London, each having a particular ward or diftrict under his infpection; and of their number two head burgeffes are chofen, who, at the court-leet, fit next to the high-bailiff. The inhabitants of Weftminfter form no corporation, nor do they poffefs as fuch any exclufive privileges; neither do any companies of trade or profeffion exift within the jurifdiction. The various courts of juftice belonging peculiarly to Weftminfter are, 1. The court of the duchy of Lancafter, a fupreme court of record, held in Somerfet-place, for deciding by the chancellor of the duchy all matters of law or equity concerning the eftates belonging to the county-palatine of Lancafter. 2. The quarter-feffions of the peace, a court of record, held by the juftices of the peace at the Guild-hall, near the abbey-church, for all trefpaffes, &c. committed within the city and liberties. 3. The court-leet, held by the dean, or his fteward, for choofing parochial officers, preventing and removing nuifances, &c. 4. Courts of requefts, or of confcience, as they are called, for deciding without appeal by commiffioners, all pleas for debt under forty fhillings. 5. Courts of petty-feffions, held every lawful day at the offices in Bow-ftreet, Marlborough-ftreet, and Queen-fquare, for matters of police, mifdemeanor, or offence. 6. To thefe muft be added the court of St. Martin-le-grand, in London, but belonging to Weftminfter. The jurifdiction of the dean and chapter of St. Peter's, widely extended as the liberties are, is not confined to their bounds. In the very heart of London, under the walls as it were of St. Paul's, is the precinct, as it is termed, of St. Martin-le-grand, an integral part of Weftminfter, and wholly independent of London. This precinct took its name from a collegiate church founded in 1056, dedicated to St. Martin and qualified *le-grand*, on account of the great privilege of fanctuary conferred on it. By Henry VII. it was beftowed on the abbey of St. Peter; but on the furrender to Edward VI. it was pulled down, and houfes were built on the ground. Being let out to ftrangers not freemen of London, they claimed the privileges before enjoyed by the canons of the fuppreffed inftitution. Thofe claims produced many contefts which were never definitively fettled; and the exemption of St. Martin's precinct from the jurifdiction of London feems now to be eftablifhed, rather by long-continued ufage than by any regular or authoritative declaration of right. This fmall precinct (a term in London fignifying fpecifically a fubdivifion of a ward) confifts of one fhort ftreet of its own name, leading north from the eaft end of Newgate-ftreet to the beginning of Alderfgate-ftreet, and a few lanes and courts on each fide. In this precinct perfons not freemen of London, exercife their feveral trades or profeffions without controul; the inhabitants alfo concur in the election of reprefentatives for Weftminfter, in the fame way with thofe who actually dwell within that city. A very material change is now (1818) in progrefs in St. Martin-le-grand. The chief office of the general poft, domeftic and foreign, fituated in Lombard-ftreet, in London,

don, has long ceafed to be either central in pofition or commodious in diftribution, for the prodigious bufinefs tranfacted in it. After many attempts, chiefly on the part of the inhabitants of the weft end of the town, where many of the principal men of bufinefs refide, parliamentary fanction has at laft been obtained for the erection of a new poft-office, properly adapted, in fituation and internal arrangement, to the purpofes of the eftablifhment. The fituation felected is in St. Martin-le-grand; and the neceffary preparations in removing houfes and clearing the ground, have made confiderable progrefs. The expence of this enterprife muft be great; but the edifice may be rendered highly ornamental as well as ufeful to the metropolis. Mr. Kay is the architect. The jurifdiction of the dean and chapter of Weftminfter extends alfo over fome places in Effex, on that account independent of the diocefan bifhop of London, and even of the metropolitan of Canterbury; for while the Roman Catholic religion prevailed, the abbey was immediately under the pope. If the jurifdiction of the abbey thus extended over places remote from its bounds, it on the other hand comprehended within its bounds, a diftrict exempt from its jurifdiction. This is what is commonly called "the liberties, or the duchy of Lancafter." The diftrict comprehends all the fouth fide of the Strand, from the Temple to Cecil-ftreet, with nearly the fame extent on the north fide. The palace and diftrict of the Savoy having been a part of the poffeffions of the houfe of Lancafter, which were feparated from the crown by Henry IV., that part of the Strand belonging to the Savoy became a diftrict or liberty of itfelf. It has a fupreme court under the chancellor of the duchy of Lancafter, as already mentioned; and formerly no inhabitant of this diftrict voted for the reprefentatives of Weftminfter. But at the election in March 1795, thofe of the duchy-liberties who lived within the parifhes of St. Mary in the Strand, and St. Martin's in the Fields, were admitted to give their fuffrages. Until after the diffolution of the abbey, Weftminfter fent no reprefentatives to parliament; being virtually reprefented by the abbot, who fat with the bifhops in the houfe of peers. In the records of the laft parliament of Henry VIII. no mention appears of any fummons or returns relative to Weftminfter, Peterborough, or any other abbey-town. The firft parliament of Edward VI., therefore, is, that in which the members for Weftminfter began to take their place. The two reprefentatives of the city and liberties are elected by the inhabitant houfeholders, or thofe paying fcot and lot, who are now eftimated at about 17,000; the number being confiderably increafed by the enlargement before-mentioned in 1795. The elective franchife being thus widely diffufed among all ranks of the inhabitants, and the popular favour being commonly in the inverfe proportion of that of the court, one if not both of the reprefentatives of Weftminfter may generally be expected to be decidedly hoftile to the meafures of the exifting adminiftration. So well is this underftood by minifters, that, to have at leaft one member favourable to their views, they have frequently encouraged fome diftinguifhed naval commander to offer his fervices to the electors.

Having for many years been the ordinary refidence of the fovereign, Weftminfter has of courfe contained the principal departments of every branch of legiflative and executive adminiftration. The parliament, originally ambulatory and attached to the perfon of the king, was rendered ftable in Weftminfter on the confirmation of Magna Charta by Henry III. in 1216. Long before that period, the royal palace was erected adjoining to the abbey; and as in thofe early times juftice was often adminiftered by the king in perfon, or in his prefence, the various courts of judges were of courfe eftablifhed in or near his refidence. When the palace of Weftminfter ceafed to be occupied by the monarch, and Henry VIII., in 1512, tranfported his court to Whitehall, the parliament and the judges ftill retained their original ftation; but the executive branches of adminiftration, relative to financial and military affairs, accompanied the court. Hence we fee thofe departments all eftablifhed in what is ftill called Whitehall; although the king has long ceafed to refide in that quarter, and that a very fmall portion of the old palace is either occupied by public offices, or even in exiftence. Hence alfo it is that all public acts of government are dated from Whitehall. From the prodigious multiplication and fubdivifion of all public affairs relative to juftice, finance, and military and naval operations, the details of various branches have neceffarily been carried on in other convenient quarters of the metropolis. Such are the Temple, Lincoln's-Inn, Guildhall, the Bank, the Cuftom-houfe, the Excife-office, the Tower, &c.; ftill it is in Weftminfter alone that the general arrangement of the whole is conducted

Public Buildings.—Of the ancient refidence of the kings of England in the vicinity of the abbey of Weftminfter, the name, the general pofition, and a few mutilated apartments, are all now remaining. According to a furvey and plan of the whole buildings and veftiges of this palace, it extended along the bank of the Thames from north to fouth, and then turned weftward near to the buildings of the abbey. Of the general arrangement, it is impoffible to difcover more than that the walls and foundations feem to have been all parallel to the correfponding walls of the prefent great hall, the only part ftill remaining in its original ftate. Compofed of parts erected at different periods, no balance or fymmetry of plan feems to have been regarded in their diftribution.

Weftminfter Hall, memorable in itfelf as a building, as the fcene of many important tranfactions, and for the ufes to which it is applied, was erected by William Rufus, or William II., about 1097, as an appendage to the old palace, or a part of a new project. Having fuffered much from accidental fires, as well as from the lapfe of time, the hall, juft three centuries after its conftruction, was completely reftored by Richard II., who heightened the walls, altered the windows, adding a new roof, and built a ftately gateway. The hall is a vaft parallelogram, ftanding north and fouth, in length, within the walls, 249 feet, and in breadth 66 feet, not 74, as is generally ftated. The walls, although maffive and plain, are externally ftrengthened by buttreffes. The roof, rifing to a high pitch, is ingenioufly and firmly conftructed, not of Irifh oak, as ufually faid, but of chefnut brought from Normandy. This room is faid to be of greater magnitude without pillars than any other known. In this hall parliaments have been held; Richard II. was depofed in it in 1399, and for many ages it has been employed in the coronation-feafts of the fovereigns. In it affembled the court for the trial of Charles I., in January 1649. It is ftill the place of inquiry, before the houfe of peers, into the conduct of perfons impeached by the houfe of commons. In the middle of the right or weft fide of the hall, is an opening into the court of common pleas. The fouth end of the hall is occupied by wooden ftructures, to contain on the right-hand the court of chancery, and on the left the court of king's bench; fo called becaufe the king in ancient times actually fat, as he is at prefent afferted, by what is ftyled a legal fiction, actually to fit, on the bench to adminifter juftice. Between thefe two courts ftairs conduct to the apartments occupied by the two houfes of parliament. That employed by the peers was towards the fouth end of the old palace; but on account of the additional number of 32 peers entitled

tled to ſeats on the union with Ireland, over and above the unexampled augmentation of the peerage in the preſent reign, their meetings were transferred to what was the court of requeſts; ſo called becauſe the maſters of the court, in ancient times, received the requeſts or petitions of the people, and gave their opinions on the ſubjects. This room, conſiderably larger than the former, is alſo within the old palace; and is now ornamented with the celebrated tapeſtry, repreſenting the diſcomfiture of the Spaniſh Armada, or fleet and army, deſtined for the invaſion of England in 1588. At the upper end of the room is the throne, a highly enriched arm-chair; and at the lower end is an open ſpace, termed the bar. The commons of England, when they formed a ſeparate body from the peers, were, by an agreement with the abbot of St. Peter's, allowed to meet in the chapter-houſe already mentioned. But when, at the Reformation, the eſtabliſhment of the collegiate chapel of St. Stephen in the old palace was ſuppreſſed, to that place their meetings were transferred by Edward VI. This chapel, originally conſtructed by king Stephen, was rebuilt by Edward III. in 1347. The commons, before the union with Ireland, were accommodated within the chapel; but their number being by that meaſure augmented from 558 to 658 members, it became neceſſary to enlarge the place of aſſembly. At the eaſt, or upper end of the room, is the ſpeaker's chair; before it is the table with the clerks, and at the bottom is the bar. The ſeats for the members riſe one behind another, as in a theatre. Thoſe on the floor, on the ſpeaker's right-hand, are called the treaſury-benches, and occupied by the members of adminiſtration: the bench in front is uſually occupied by the leading members of the oppoſition. St. Stephen's chapel, highly adorned by Edward III., ſuffered greatly by its firſt adaptation for the commons; but much more by the late alterations. By removing the wainſcot, a great part of the ancient decorations was diſcloſed, and a very important fact in the hiſtory of the fine arts was, for the firſt time, aſcertained. On the 11th of Auguſt, 1800, was diſcovered a ſeries of ſculpture and painting, the latter exhibiting portraits, ſcripture-ſcenes, and other decorations, intereſting in themſelves, and peculiarly ſo as ſpecimens of the ſtate of the arts, as they exiſted nearly five hundred years ago. It has been uſual to aſcribe to John Van Eyck, of Bruges, in Flanders, the invention of painting in oil-colours, in 1410. This opinion has, however, of late years, been much invalidated; by the diſcovery in St. Stephen's chapel it is completely overthrown. From original records of the expences incurred in the conſtruction and decoration of that building, it now appears that the renovation was begun in the fourth year of Edward III., or about 1329, and not in 1347, as ſtated by Stowe and others: that the painters had not begun in 1345, but were at work in 1350, and ceaſed to be mentioned in 1364: that thoſe who painted on glaſs had begun in 1350, and finiſhed in 1352: that the paintings were unqueſtionably in oil: and that, of ſeventy-ſix painters employed in the chapel, the whole, with the exception perhaps of two, and they not the maſters, were natives of England. From theſe authentic documents it is therefore fully aſcertained, that *pictures*, in the uſual ſenſe of the term (not *houſe-painting*), in *oil* were executed in Weſtminſter palace in 1350, or ſixty years before Van Eyck's ſuppoſed diſcovery of the art. But the ſame genuine records go ſtill farther back: they prove oil to have been employed in painting pictures in the chapel before the rebuilding by Edward III.; that is, in the 20th year of Edward I., or in 1272, which was one hundred and eighteen years prior to Van Eyck. (See PAINTING.) Under the old houſe of lords are the cellars which were prepared for the famous powder-plot, of the 5th of November, 1605.

Whitehall Palace.—This royal manſion occupied a conſiderable ſpace on the bank of the Thames, including Privy-Garden, and extending to Scotland Yard, ſtretching out in breadth from the river quite acroſs the ſtreet ſtill called Whitehall into St. James's-park. It was originally the property of Hubert de Burgh, earl of Kent, and grand juſticiary of England under Henry III. The ſituation was low and marſhy, owing to the concourſe of the branch on the weſt of Thorney iſland with the main channel of the Thames. In 1248 the palace belonged to the archbiſhops of York, who poſſeſſed it until, on the fall of cardinal archbiſhop Wolſey, it was, in 1529, ſeized, with his characteriſtic love of juſtice, by the inſatiable Henry VIII. Poſſeſſion being obtained, many alterations were made in the building, of which a portion, commonly called the Cock-pit, adjoining to the Treaſury, ſtill exiſts. Falling into decay, James I. reſolved to rebuild Whitehall in a ſuitable manner; and for ſuch a deſign the ſpacious ground between the Thames and the park, and commanding both, offered every facility excepting that of elevation of ground, without a proper degree of which dignity is hardly attainable in architecture. Of the magnificent, although in many parts faulty, project of Inigo Jones, prepared for the intended work, one portion only was executed. This is the Banqueting-houſe, ſo called from its ſucceeding, in deſtination as in ſcite, to a part of the old palace appropriated to royal entertainments. The preſent edifice, one of the few ſpecimens of noble and regular architecture in the metropolis, conſiſts of two ſtories, on a ruſtic baſement, ornamented with Ionic and Corinthian columns and pilaſters. This edifice, containing ſeven windows on a floor, was only one of the angular pavilions of the intended grand ſtructure. It is ſufficiently enriched, but not overloaded with ornament; and being conſtructed on a ſcale of very large dimenſions in the parts, had the whole, even with all the defects of the project, been carried into effect, no ſovereign in Europe could have exhibited a place of reſidence to be compared with that of the king of Great Britain. Magnitude of parts was in that project held to be indiſpenſable for grandeur of effect. The interior of the Banqueting-houſe has long been converted into a royal, and lately into a military chapel; *adorned*, as is ſtill moſt incongruouſly imagined, with trophies of war. The ceiling is peculiarly worthy of obſervation, being the production of the ſplendid pencil of Rubens; exhibiting the allegorical hiſtory of his patron, James I. This maſterly performance ought to have diſſuaded the adviſers of George I. from converting the room into a place of Chriſtian worſhip; for "its contents are in no way akin to devotion; and the workmanſhip is ſo very extraordinary, that, in beholding it, the ſpectator muſt either poſſeſs an uncommon meaſure of zeal, or be utterly deſtitute of ſkill and taſte, who can attend to any thing beſides." From a window of the Banqueting-houſe the unfortunate Charles I., unfortunate in living in times when the art of managing parliaments was either unknown, or perhaps thought unworthy of a prince, paſſed to the ſcaffold erected in the public ſtreet in the front of his own palace. In a court behind the building ſtands one of the ſmall number of public ſtatues of the metropolis meriting examination. It is the work of Gubbins, and exhibits James II., indicating, as he would do in his deſtined ſituation, with an air and attitude full of expreſſion, the ſpot where his father ſuffered. At no great diſtance, on the former ſcite of the croſs in the village of Charing, is erected another fine equeſtrian figure of Charles himſelf.

St. James's Palace.—That the fovereign of the Britifh empire was far lefs fuitably lodged in his capital than are numbers of his fubjects, has by foreigners been often remarked, and by natives been fometimes converted into a compliment to the fovereign and to the nation. But the fact is, that St. James's palace was in its origin an hofpital, of part of which Henry VIII. availed himfelf to conftruct the prefent buildings, as an appendage to the palace of Whitehall, with which it was connected by St. James's park. Having been allotted for the refidence of the princefs, afterwards queen Anne, and her hufband George of Denmark, St. James's has ever fince continued to be occupied for court or ftate purpofes. The buildings are neither grand nor regular: the front, overlooking the park, has alone a certain air of dignity: and the ftate apartments, although they contain nothing peculiarly magnificent in the furniture or the decorations, are commodious and handfome.

Connected with this palace is the park of the fame name, ornamented with a long canal in the middle, and with broad walks, feparated by rows of trees on the fides, the only fpecies of improvement of which its flat fituation is well fufceptible. Near the centre of the canal, a wooden bridge, in the Chinefe ftyle, has been built acrofs the water. On the north-weft of St. James's-park is an open fpace, called the Green-park, capable, from its elevation and variety of ground, of much greater improvement: but its principal recommendation is that, being in fact a wide extended green field, it furnifhes a delightful promenade in all directions, and welcome relief from the hard pavement of the ftreets.

Buckingham-Houfe.—This edifice, now fettled on the prefent queen in lieu of Somerfet-houfe, and hence called the Queen's palace, poffeffes peculiar attraction, as much from its very favourable fituation, as from its hiftory. It was built by John Sheffield, duke of Buckingham, about the year 1700, and its gardens were adorned with terraces, canals, &c. The building is of brick, and moft of the apartments are fmall. In this palace for feveral years were held his majefty's levees, while his health permitted his appearance. Annexed to the palace are an octagon and other apartments, containing the king's library, rich in various works of value, particularly in early editions of books. Interior views of the chief rooms, with an ample hiftory of this edifice, &c. are given in Pyne's Hiftory of the Royal Palaces.

Carlton Houfe, the refidence for a number of years of the prince of Wales, regent of the united kingdom, as formerly of the princefs dowager of Wales, his majefty's mother, occupies a fituation in between Pall-Mall and St. James's park. The chief front towards the ftreet prefents the fingular incongruity of a lofty and highly enriched Corinthian portico, giving entrance into a low rufticated edifice. Between the houfe and the ftreet is a court-yard, bounded by a low wall, fuftaining an open colonnade, with an entablature. The interior has undergone many changes, and is fitted up in the moft coftly and fumptuous manner. The library, confervatory, and the armoury, are very fine and fplendid. The work juft referred to contains feveral beautiful prints of the different rooms; alfo a particular account of the houfe and its contents.

The ancient palace of *Somerfet-houfe* has now difappeared, being fuperfeded by the magnificent ftructures compofing Somerfet-place. Of the Savoy a few portions ftill exift, but much changed from their original deftination; and in a few years, perhaps, even the whole may be effaced.

The plan of Somerfet-place, as formed by fir William Chambers, was to comprehend within one vaft edifice proper apartments for tranfacting many branches of the national bufinefs; and to this purpofe, incomplete as it is, it is now applied. Befides thefe departments, Somerfet-place contains handfome fuites of rooms for the Royal and Antiquarian Societies, and for the Royal Academy of the Fine Arts. The front towards the Strand, of regular architecture, is fpacious and lofty; but, on the whole, having the air, as in fact it is, of the entrance to a ftructure of great extent and magnificence. The front confifts of nine arcades on the ground-floor, the three in the middle forming the entrance, by three colonnades fupported on coupled columns. Above the bafement is a range of ten Corinthian femi-columns extending over two ranges of windows. Above the three centre windows rifes an attic, with ftatues. The whole is, however, a very great work, and cannot fail, when beheld from the river, or the new bridge adjoining, to have a powerful effect on the fpectator. Situated on a rapid defcent to the river, the labour and expence of raifing the fquare to the level of the ftreet has been prodigious; and the fkill fhewn in conftructing the whole edifice well merits admiration.

Part of the old palace of Whitehall, as already noticed, may be traced in the building ufually called the Treafury; but that part which faces the parade in the Park is comparatively modern, and conftructed in a ftyle announcing ftrength as well as dignity and accommodation for bufinefs. Clofe to this edifice ftands that called the Horfe-Guards, becaufe a party of that clafs of troops daily do duty there. Conftructed on a plan and elevation intended to recal the idea of an antique fortrefs, it contains the chief departments of bufinefs comprehended under the title of the War-Office. The neighbouring office of Admiralty, fpacious and lofty, is greatly indebted to the fkreen erected by the Adams, by which the enormous portico is brought to bear apparently fome degree of proportion to the building.

The theatres of Drury-lane, Covent-garden, the Haymarket, and Opera-houfe, have been all noticed in the defcription of London. See LONDON.

At no great diftance from the magnificent pile of Somerfet-place, and fimilarly fituated over the Thames, ftands an extenfive range of buildings called the *Adelphi*. The erection of thefe, a vaft enterprife for private individuals, is the work of the celebrated architects, Meffrs. Adam. The terrace, which commands the river and furrounding buildings, and the ftreets and buildings, are elevated on arcades rifing from the edge of the water, adapted for warehoufes, and opening into roads leading up to the Strand. In the Adelphi is a handfome edifice, belonging to the Society for the Encouragement of Arts, Manufactures, and Commerce. The great hall exhibits a feries of paintings, unique in modern times, by James Barry. An eftablifhment of a peculiar character has lately begun to appear on the bank of the Thames, a fhort way above the extreme buildings of Weftminfter. This is the *Penitentiary*, defigned for the punifhment, employment, and reformation of offenders of fecondary criminality. When, by the emancipation of the Britifh colonies in North America, tranfportation of offenders to that country neceffarily terminated, the plan was adopted of removing them, to contribute to the colonization of the newly-acquired territories in the Afiatic feas. The fyftem, however, when applied to cafes of limited expatriation, being highly objectionable, the fcheme of the rifing eftablifhment has been approved, and its execution begun. The criminals are confined in circular buildings, fo conftructed that the overfeers may, from a central fituation, unfeen, obferve every room. The edifice will, when complete, form externally a hexagon, con-

confifting of fix of thefe circular divifions; the whole encompaffed with a wall, inclofing 18 acres of ground, and calculated to contain altogether from 1000 to 1200 prifoners. Some of them are already placed, and the beneficial effects of the inftitution on their general conduct has already been very perceptible. As a part of Middlefex, the proper prifons for criminals are thofe belonging to the county; but in Tothill-fields is a bridewell for the detention and temporary punifhment of petty offenders, under the charge of the magiftrates of the city and liberties. The charitable eftablifhments of Weftminfter for the education and maintenance of youth and the confolation of age, for the relief of difeafe and accidental calamity, are much more numerous and ufeful than fplendid. St. George's and the Middlefex hofpital, (not, however, properly within the town,) the Weftminfter infirmary, &c. are excellent inftitutions, fuperintended by medical gentlemen of the higheft profeffional reputation. Of the diftinguifhed private manfions of noblemen and others, it is impoffible here to do more than point out a few of the moft remarkable. Among thefe are Northumberland-houfe, the only refidence now remaining of our ancient nobility in the Strand; the duke of Marlborough's in Pall-Mall, erected by the nation for the great duke John; the duke of Norfolk's, St. James's fquare; earl Spencer's in St. James's place; Burlington-houfe; the duke of Devonfhire's and earl of Egremont's in Piccadilly; the marquis of Lanfdowne's in Berkeley-fquare; the earl of Chefterfield's in South Audley-ftreet; earl Grofvenor's in Upper Grofvenor-ftreet; the marquis of Anglefey's in Burlington-ftreet; the marquis of Stafford's, Cleveland-houfe. Thefe are fome of the beft, as far as the exterior is concerned; but many others might be noticed highly deferving of attention, particularly for the admirable paintings by the beft mafters with which they are enriched.

Bridges.—It is a remarkable fact, that, great and important as Weftminfter is, until the conftruction of the noble bridge of its own name, of 15 arches, and in total length 1223 feet, completed in 1750, it poffeffed no other mode of communication acrofs the Thames than by ferries, or by the embarraffed circuit of London-bridge. The opening of Blackfriar's-bridge was certainly a great accommodation for an extended portion of the town; but ftill fomething more was wanted, in a fpace between thofe bridges of no lefs than 3100 yards, or one mile and three quarters, of a moft populous and active metropolis. About mid-way of this interval was opened, on the 18th July, 1817, a new bridge, leading from the Strand between the Savoy and Somerfet-place, called the *Strand* or *Waterloo* bridge: it is a ftructure of a novel defcription in this country. The idea of it is not, however, new, having been frequently fuggefted, particularly by Gwyn in 1766. (For a particular defcription of this bridge, and the dimenfions of its various parts, we refer to the article WATERLOO.) The road-way is ftrictly horizontal on the level of the ftreet in the Strand, but much above the furface of the Surrey fhore, to which it defcends by a long and gentle flope. Each pier, as in Blackfriar's-bridge, is externally ornamented with two Tufcan columns fupporting a fquare projection. The bridge was opened on the anniverfary of the horrible carnage of Waterloo, and from this event it has been attempted to give it a name. In this cafe, however, as in that of what was formerly ftyled Pitt's-bridge, in London, in 1760, the public, unable to difcover even the moft diftant relation between the ftructures and the propofed appellations, know them only, as they muft naturally do, by their fituation, as Blackfriar's and the Strand bridges. This admirable work does great honour to the engineer and architect Mr. John Rennie, and to the judgment of the managers of the enterprife; and is, all circumftances of pofition, form, and materials confidered, without a parallel in Europe. Befides the Strand-bridge, another of a different kind has lately been conftructed over the Thames, juft a mile above Weftminfter-bridge, leading over from Tothill-fields to Vauxhall, and thence properly named *Vauxhall*-bridge. The architect, Mr. Walker, has divided the breadth of the river into nine apertures, covered by frames of caft-iron, refting on ftone piers. The road is not horizontal, but forms two gently inclined planes, meeting in a very obtufe angle in the middle. The length of this light and elegant bridge is 809 feet. A third bridge, not indeed immediately connected with Weftminfter, but of great importance to the metropolis, is now in progrefs. This is the Southwark-bridge, commencing between that portion of the town and the city of London, on the line of Queen-ftreet and King-ftreet to Guildhall. This extraordinary ftructure, defigned alfo by Mr. Rennie, confifts of three grand arches of caft-iron, in fegments of very large circles: the centre arch 240 feet in fpan, and the two others of 210 feet, each. To enable the reader to form a comparative idea of the bridges now mentioned, the following dimenfions of fome other remarkable bridges are fubjoined. London-bridge, (fee BRIDGE,) confifts of 19 very unequal arches; Southwark-bridge (the iron part), 730 feet long, and of three arches; Blackfriar's-bridge, 995 feet long, of nine arches; Strand-bridge, 1280 feet long, of nine arches; Weftminfter-bridge, 1223 feet long, of 15 arches; Vauxhall-bridge, 809 feet long, of nine arches. On the continent, the moft remarkable ftructures of this defcription are the celebrated horizontal bridge over the river Loire, at Tours, in the weft of France, in length 1335, and confifting of 15 elliptic arches; the bridge over the Moldaw, at Prague, in Bohemia, 1700 feet long. Thefe, however, are all far outdone by the antique bridge over the Rhone, at St. Efprit, in the fouth of France, confifting of a multitude of fmall arches, fupporting a very narrow road-way, extending in all nearly to 3000 feet. This bridge has the peculiarity, that, inftead of being ftraight, it is compofed of two lines forming an obtufe angle, turned againft the current, as if the better to withftand its violence.

Literary and fcientific Inftitutions.—Thefe have already been noticed in the article LONDON, to which the reader is referred. It will always be a peculiar honour for the Britifh nation in general, and to the metropolis in particular, that, with very few exceptions indeed, all thofe valuable inftitutions for the promotion of learning, fcience, and the arts, which add fo much fplendour to the capital, owe their origin, their maintenance, and their reputation, to the voluntary exertions, perfonal and pecuniary, of private individuals. The two principal exceptions in London and Weftminfter are the *Britifh Mufeum*, and the *Academy of Painting, Sculpture, and Architecture;* but from their nature, without public aid, neither of thefe inftitutions might ever have been eftablifhed. (See MUSEUM.) The Britifh Mufeum is in regular and rapid progrefs, in the acquifition of ftores of high importance in the departments of natural hiftory, literature, and art, to which it is devoted. The *Elgin marbles*, or the venerable monuments of Grecian fculpture, refcued by the earl of Elgin, during his embaffy at the Ottoman porte, from barbaric neglect and deftruction, in their original pofition in Athens, are objects of attraction and importance unparalleled in Weftern Europe. Of the Britifh Mufeum, in general, it is but juftice to obferve, that, in no fimilar eftablifhment, can more attention be fhewn to facilitate the refearches, literary or fcientific perfons, of all who refort to the treafures it contains.

The population of Weftminfter very fenfibly fluctuates, according to the feafon of the year. From October to July, while the parliament is affembled, the courts of law are fitting, and the places of amufement are open, the town is fully inhabited. During the other months, even thofe whofe bufinefs is ftill tranfacted in town retire to their villas or quarters, in the furrounding villages and country. A hundred years ago, the inhabitants were computed, but furely overrated, at 130,000: by the laft returns to parliament in 1811, they amounted to 62,085, occupying 17,555 houfes.

The books examined for the foregoing account, and to which the reader is referred for more minute particulars, are, Antiquities of Weftminfter; the literary part by J. S. Hawkins, efq.; plates from drawings by J. T. Smith; 1 vol. 4to. 1807. The Hiftory of Henry VII.'s Chapel, by J. Britton, with plan, views, elevations, &c.; in vol. ii. of Architectural Antiquities of Great Britain. The Hiftory and Antiquities of the Abbey Church of St. Peter at Weftminfter, 4to. 1818, &c., by E. W. Brayley; with numerous plates from drawings by J. P. Neale. The Hiftory of the Abbey Church of St. Peter's, Weftminfter, its Antiquities, and Monuments; in 2 vols. 4to., with 63 engravings; publifhed by Mr. Ackermann. An Inquiry into the Time of the firft Foundation of Weftminfter Abbey, &c., by R. Widmore, 4to. 1743. Alfo, The Hiftory, &c. of the Abbey Church, by the fame author, 1751. Weftmonafterium, or the Hiftory and Antiquities of the Abbey Church of St. Peter, Weftminfter, by John Dart; 2 vols. fol. 1723. The general hiftories have been already referred to in the article LONDON.

WESTMINSTER, a town of Maffachufetts, in the county of Worcefter, containing 1419 inhabitants; 55 miles N.W. of Bofton.—Alfo, a poft-town of Vermont, in the county of Windham, containing 1925 inhabitants; 18 miles N. of Brattleborough.—Alfo, a town of Maryland, with a poft-office; 26 miles N.W. of Baltimore.

WESTMINSTER-*Hall*, an ifland in the ftraits of Magellan, fituated to the N.E. of Cape Pillar. S. lat. 52° 34'. W. long. 76° 16'.—Alfo, an ifland in the Mergui Archipelago. N. lat. 10° 42'.

WESTMORE, a town of the ftate of Vermont, in Effex county, containing 71 inhabitants; 65 miles N. of Norwich.

WESTMORELAND, WESTMORLAND, or *Weftmereland*, a northern county of England, furrounded by parts of Durham and Yorkfhire to the N., N.E., and E.; by Lancafhire to the S. and to the S.W.; and by Cumberland on the W. and N.W. The greater part of the boundary line is artificial; but at the S. and S.W., rivers and lakes conftitute natural lines of demarcation. This diftrict is fuppofed to have derived its name from being a weftern moorifh country; perhaps it was the land of the moors or lakes in the weft. It formed a part of the territory of the *Brigantes* in that diftrict occupied, according to Richard of Cirencefter, by the *Voluntii* and the *Siftuntii*. The *Brigantes* were the principal inhabitants of the Roman province *Maxima Cæfarienfis;* and during the heptarchy were included in the extenfive kingdom of Northumberland. In the time of Edward the Confeffor, this kingdom was divided into fix fhires, of which one was called "*Appulbifchire*, to which belonged the land of Weftmoreland." In this divifion, however, Kendal and its diftrict were not included; for long after the Norman Conqueft, they were reckoned to belong to the hundred of Lonfdale, in Lancafhire. Of the Roman eftablifhments in Weftmoreland, many noticeable veftiges are to be found in ftations, forts, roads, infcriptions, and other remains. Among the ftations, or towns, may be mentioned *Amboglana*, a name fuppofed to be ftill preferved in Amblefide, at the N. end of Windermere; but Horfley places *Dictis* at that town. At any rate, bricks, urns, coins, and other relics, fufficiently prove it to have been occupied by the Romans. *Verteræ*, another Roman ftation, was fituated where now ftands Brough-under-Stanmore, a name announcing an ancient fortification. *Aballaba* feemed naturally to have given rife to the modern name of Appleby; but no Roman remains have ever been found at that place, although it be undoubtedly of confiderable antiquity. *Galacum* is by Camden placed at Whellep; but by later writers near Appleby. *Brovacum* is probably Brougham caftle, near Penrith. This ftation has often been confounded with *Brovonacæ*, of which remains exift in Kirkbythore. This ftation Whellep or Whelp caftle lies in the middle of the village, and is commonly called High Burwens. It occupies an advantageous pofition; the extent from weft to eaft is about 160 yards. The foundations of the vallum are very plain. Among the infcriptions found in it is one *Fortunæ Servatricæ*. A branch of the great Roman road, called the Watling-ftreet, paffed through the county from Stanemore to Brougham caftle; and until the modern turnpike-road was made, the former was very confpicuous almoft all the way. Between Brough and Kirkby, parts of it are ftill to be obferved; keeping, as was the practice of the Romans, a ftraight courfe, regardlefs of difficulties. This road meafured about fix yards in width, and is defcribed to have been formed, in many places, by three courfes of large fquare ftones. Near the northern border of the county, and not far from Kirkbythore, is a large encampment, attributed to the Romans, and meafuring about 300 yards in length, by 150 in breadth. It is reprefented as having twelve entrances, with baftions to each; but this is improbable. Some topographers defcribe a few of the antiquities of the county as of Celtic, or Druidical origin; particularly "a fort of Druidical place of worfhip near Shap." Maybrough caftle, and Arthur's Round Table, near Penrith, are referred to the Britifh era. There are alfo feveral cairns, or heaps of loofe ftones, in the county. At Kirkbythore, a Roman road, called the Maiden-way, branched off, and paffing over the lower end of Crofs-fell, terminated at Caervorran, in Northumberland. Roman infcriptions have been found in various parts of the county. One in particular was difcovered at Kirkbythore, infcribed *Deo Belatucadro*, a local divinity probably of the original Britons. In 1739, at the fame place, was found a ftone infcribed *Jovi Serapi*. In the manor of Milbourne was found an altar to *Silvanus*, within a round fort furrounded by deep ditches, called Green-caftle. This county is divided into the two baronies of Kendal and Weftmoreland, the latter of which is occafionally called the barony of Appleby; and thefe again fubdivided into the four wards of Eaft, Weft, Kendal, and Kirkby Lonfdale. In ancient times, the Kendal barony was deemed part of the county of Lancafter. In the Domefday furvey, an account is taken of fome places in the barony of Kendal, with fome neighbouring property in Lancafhire and Yorkfhire; but the Weftmoreland diftrict is unnoticed in that record, and thence fuppofed to have been uninhabited and wafte at the time of the Conqueft. The Kendal barony is in the diocefe of Chefter, and confifts of two rural deanries; whereas the other barony is within the diocefe of Carlifle, and confifts of

 one

one rural deanry. The whole county contains only thirty-two parishes. According to the census of 1811, these contained 9064 houses, and 45,922 inhabitants.

The general appearance of Westmoreland is marked with some of the strongest features in nature; immense tracts of mountains, beautiful but contracted valleys, extensive lakes, and large rocky districts, which contain many high, steep, and bulging crags. The county is not only encircled with mountains, but the greatest part of its interior surface is swelled into hills. A long range of heavy-looking hills bounds the eastern side of the county; in front of which is an extensive tract of tolerably level ground. The rest of Westmoreland is almost wholly hill and dale. The farm-houses and those of the small villages, covered with blue slate and whitened with lime, are seated about the bases of the hills, with their small irregular fields spreading up the sides of the mountains, and almost universally divided with stone-walls. This last circumstance gives the country a naked appearance; but the numerous tracts of woodland interspersed tend to enliven the scene. Every dell or hollow has its little brook, and the smallest of these are plentifully supplied with fish. Several low heathy commons are seen towards the eastern side of Westmoreland; and the western part is characterised by high rugged prominences, and even some rocky plains, small coppices, and a large extent of low flat peat-moss; on the north, the fine woods about Lowther add a striking feature to the landscape. Such are the brief but general outlines of the picture: we proceed to particularise some of its peculiar characteristics, the most prominent of which are its *Mountains*. These are provincially called fells, of which the following are the most noted.

Farlton-knot, near the borders of Lancashire, is a very protuberant lime-stone rock; from the Kendal road, near Burton, it is said to have very much the appearance of the rock of Gibraltar.

Whitbarrow-scar is also a very high rock, and in some parts presents a perpendicular face of solid lime-stone. It rises its grizzly front between Milnthorp and Cartmel. The high road leads along its base, whence it presents a grand, and in some places a tremendous aspect.

Langdale-pikes, in the western corner of the county, are conical hills of great height, with pyramidal rocky tops, and are situated in the interior parts of a very mountainous district; their sides and bases are verdant, and have formerly been covered with wood.

Hill-bell is also a high conical-topped mountain, about four miles east from Ambleside.

Harter-fell, High-street, and Kidsey-pike, are stupendous heights, within a few miles of the southern end of Hawswater. From the top of High-street, thirteen lakes, and the sea in several directions, may be seen.

The chain of hills on the east, which is continued north and south through other counties, presents a heavy and regular appearance; and they have mostly mossy and heathy tops, except two or three conical green hills opposite Appleby. They are in general picturesque; some with abrupt declivities, or rocky fronts, form high precipices, or in bulging shattered crags project over the vales in a frightful manner; while others shew smooth, verdant, and swelling surfaces, beautifully spotted with flocks of sheep and herds of cattle.

There are few Caves in Westmoreland; one, however, is to be found at Dun-fell, bordering on Cumberland, and is of considerable extent. So intricate are the different passages and chambers of this capacious cave, that the Rev. William Richardson is said to have been seven hours in examining its varied parts. He describes the roof in some parts to resemble pointed arches, in others flat surfaces: he found in some places the *stalactites*, and pieces of *rhomboidal spar*. He travelled nearly two miles in a right line, and discovered evident marks of some of the chambers having been filled with water. The highest part of the vault is rather more than 25 yards; the breadth in some places about 150 yards; in other parts there was scarcely height sufficient to creep through the hollow. Some other visitors have mentioned the astonishing lustre of the spar with which these vaults are encrusted. Nicholson and Burn, in their "History of Westmoreland," mention three pits, one of which is generally considered unfathomable. In the season of salmon smelts, these pits abound with those smelts, when they are to be seen also in the river Kent, which induces a belief that they arrive from thence in subterraneous passages.

Rivers.—Although the rivers or streams, (provincially called becks,) are numerous, they are but small, and mostly rise within this district. Only three of these are sufficiently important to retain their original names from their sources to the sea. These are, the Eden, the Lune, and the Kent, or Ken. The first springs in Mallerstang, and runs north, and having received in its course, besides many lesser streams, the conjoined rivers of Lowther and Eamont, enters Cumberland, which county it traverses in its course to the sea, at Rowcliff. The Lune, or Lun, hath its source in Ravenstonedale, and passing to the south, through a fine vale, to which it gives name, enters the county of Lancaster, formerly called Loncaster. The Ken, or Kent, has its origin in Kent-mere, and runs through a valley, called Kendale; passes the town of Kendal, and empties itself in the sea at Cartmel bay. The different rivulets from the eastern district empty themselves into the Eden, which, during its course through this county, receives its principal supplies. An irregular line, drawn east and west through the centre of Westmoreland, divides the direction of its several rivers: those on the north falling into the Eden, either before or at its entrance into Cumberland, except two or three small branches of the Tees, which rise on the eastern ridge of hills on the borders of the county of Durham. The rivers on the southern parts take a contrary direction, and enter the sea at different places.

The Lowther has its source in the Moors, above Wetsladdale, and passing Rosgill-hall, there unites with Swindale-beck, which rises near the slate-quarries; with the augmentation of a few other streams, it joins the Eamont.

The Eamont emerges from Ulls-water, and forms a boundary to parts of this county and Cumberland; and after being augmented by the waters of the Lowther river, which descends from the centre of the county, it joins the Eden as it enters Cumberland.

The Loyne, or Lune, has been described in a previous volume of this work, under LANCASHIRE.

The Crake, a brook or rivulet, descending in several heads from a variety of dells on the side of Brackenthwaite-fell, passes through a very extensive peat-moss to the Ken, just before its influx to the sea.

The Winter, or Winster-beck, forms the boundary between the lower part of Westmoreland and Lancashire. It rises on the hills about two miles east from Windermere lake, and directs its course southwards, when it discharges itself in an estuary of the sea.

The Trout-beck is a brook issuing from the mountain High-street, and unites itself with Windermere lake.

Rothay springs on the borders of Cumberland, among a number of high mountains; it runs several miles westward, and receives various streams in its progress to Grasmere.

Lakes.—Westmoreland is deservedly celebrated for its fine

fine lakes. Among thefe, Windermere, or Winandermere, and Ulls-water, merit particular attention for fize, and for the picturefque beauty of the fcenery which furrounds them. They may be, and are by competent judges, regarded as unequalled in the kingdom.

Winandermere is a large lake of about ten miles and a half in length, by a breadth of from one to two miles; including an area, or fheet of water, of nearly 4534 acres. Its depth is in one place 23 fathoms, in a fecond 29, and in a third 31 fathoms. Four mountain ftreams, or rivers, fupply this lake, and it is fingular that its waters fcarcely ever appear to be augmented or decreafed. "Even in the moft violent rains, when the country is drenched in water, when every rill is fwelled into a river, and the mountains pour down floods through new channels, the lake maintains the fame equal temper; and though it may fpread a few yards over its lower fhores, (which is the utmoft it does,) yet its increafe is feldom the object of obfervation; nor does the feverity of the greateft drought make any confiderable alteration in its bounds." In this lake are thirteen iflands, the largeft of which is now called Curwen's ifland. It contains about 27 acres of land, which are laid out in pleafure-gardens, walks, &c. around a very handfome manfion belonging to Mr. Curwen.

Ulls-water, part of which is known by the name of Oufemere, is a large and long lake, fituated at the north-weftern extremity of the county, and partly in Cumberland. Next to Windermere, it is the largeft fheet of water in this part of England. It covers an area of about nine miles in length from N.E. to S.W. by two in the broadeft part, though the general width rarely exceeds a mile. Its fides are very irriguous, and from its fhores the mountains rife in various bold, picturefque, and romantic forms; occafionally ftarting abruptly from the lake, and in other places afcending by gradual flopes. Towards the fouth-weftern end the mountains are on the grandeft fcale. On the northern and weftern fides the fcenery is moftly rocky and woody. In fome places its waters are from 29 to 35 fathoms deep. It abounds with trout, perch, fkellies, and eels; alfo fome char, and a large fpecies of trout, fome of which have been caught of ten pounds weight. In its higheft part are a few fmall rocky iflands.

Haws-water, in beauty and extent, ranks next. This lake is fituated between Shap and Ulls-water, in a mountainous diftrict; it is about three miles in length, and in breadth from a quarter to half a mile. The hills on the eaft fide are high and rocky, and partially covered with wood. Thofe on the weft are alfo high, but have a portion of low cultivated ground along the margin, which is divided into fmall farms. The narroweft part of this lake is faid to be fifty fathoms deep.

Grafmere lake is a fmall but beautiful fheet of water, about a mile in length, and nearly half a mile broad, having its margin indented with numerous fmall bays with lofty and rocky eminences. Its fituation is a few miles north of Amblefide. Near its centre is a fmall green ifland. The poet Gray defcribes this lake and its fcenery in terms of high panegyric. "After paffing the romantic mountain of Helm-Crag," he fays, "opens one of the fweeteft landfcapes that art ever attempted to imitate. The bofom of the mountains here, fpreading into a broad bafon, difcovers in the midft Grafmere-water; its margin is hollowed into fmall bays with bold eminences, fome of rock, fome of turf, that half conceal and vary the figure of the little lake they command. From the fhore a low promontory pufhes itfelf far into the water, and on it ftands a white village, with the parifh-church rifing in the midft of it."

South of this, in the fame vale, is Rydal-water, a fmall lake nearly a mile in length, and interfperfed with wooded iflands. Its water is fhallow, and abounds with reeds.

On an elevated fituation, nearly two miles weft from Amblefide, is a fmall lake called Elter-water.

Broad-water is a fmall lake half a mile long, and a quarter of a mile broad, fituated a few miles above Ulls-water.

Kentmere-tarn, a piece of water upwards of a mile long, and nearly half a mile broad, is fituated in Kentmere-dale.

Skeggles-water, a very fmall lake, three miles north-eaft of Kentmere-tarn, is embofomed in the mountains of Longfleddale.

Sumbiggin-tarn, and Whin-fell-tarn, are fmall pieces of water; the former four or five miles eaft from Orton, well fupplied with eels and a red trout, refembling char; and the latter about five miles north-eaft from Kendal.

The *foil* of Weftmoreland is moftly dry and gravelly; but in the eaft and north, fand and hazel-mould are found. Clay prevails on a few farms towards the Eden and the eaftern hills; and a moift foil appears in fome northern diftricts. Peat-mofs abounds on the tops of fome high mountains, confifting of a dry foil upon a hard blue rock, provincially called *rag*. The foil that lies upon a ftratum of lime-ftone is efteemed the moft profitable.

The Roads in Weftmoreland, from the rocky nature of the country, are very firm and good. They are generally formed to wind gradually round the fides of the hills and along the vales, in fuch a manner, that the declivities of the former are moftly avoided. The principal roads leading through this county are thofe from Scotland and Cumberland to London, and the fouthern parts of England. Thefe roads are united through Cumberland, but divide near Penrith, on the confines of Weftmoreland: one turns eaftwards, over Stainmoore, and through the centre of Yorkfhire, to London, &c.; the other proceeds directly fouth, through Kendal, Lancafter, &c. to Manchefter, Liverpool, Wales, the weftern counties of England, and alfo to London. A branch from this road goes through Kirkby-Lonfdale to the manufacturing towns in the Weft Riding of Yorkfhire, and other fouthern diftricts.

Before the rebellion of 1715, the public roads of this county were almoft impaffable; but in that year the government planned feveral new roads: very little, however, was done to them before the more ferious infurrection of 1745. This event impelled the government to direct fome effectual repairs to be made. In 1774 an act of parliament was obtained to make a turnpike-road from Bowes to Brough. In this year, the firft ftage-coach from London to Glafgow was eftablifhed to run this road. A mail began to travel through Kendal, &c. from London in 1786. Since which time the great roads have been kept in very good repair.

With the exception of fome trifling veins of lead ore, few minerals have been found in the eaftern part of this county. Coal is obtained only in the fouth-eaftern extremity of Weftmoreland, except an inferior quality called *crow-coal*, procured in the neighbourhood of Shap.

The county affords various forts of valuable ftone; particularly lime-ftone, marble, gypfum, blue flate, and free-ftone. There is great abundance of lime-ftone, except among the weftern hills.

Marble of a beautiful kind was difcovered a few years ago on the banks of the river Kent, near Kendal, and has been worked with fuccefs. The fame vein has alfo been found on the oppofite fide of the river.

Blue flate of various forts is dug from the rocky hills on the

the weftern fide of the county; though great quantities are ufed in the country, yet much of the better fort is fent to London, Liverpool, Hull, and other large fea-ports. Beds of lime-ftone are generally incumbent on beds of flate.

The buildings of Weftmoreland are diftinguifhed for their neat appearance. The houfes are moftly built with lime-ftone, or blue rag; thatched roofs are common, but flate is more generally ufed. In farm buildings, the barn is ufually built upon the cow-houfe and ftable, a method which requires the flope of a hill, as carts are carried along a level on one fide into the barn. As very little corn or hay is ftacked without, the barns are neceffarily very fpacious. There are many noblemen's and gentlemen's feats in this county; and alfo fome pleafant villas which ornament the borders of the lakes.

The commerce of Weftmoreland is not extenfive. Its exports are chiefly a coarfe woollen cloth, ftockings, flates, tanned hides, gunpowder, hoops, charcoal, hams, wool, fheep, and cattle.

The manufactures of the county confift of filk and worfted waiftcoat-pieces, knit worfted ftockings, flannels, tanned leather, and gunpowder.

Formerly the whole county was governed by military tenure, *i. e.* by homage, fealty, and cornage, "which laft drew after it wardfhip, marriage, and relief; and the fervice of this tenure was military fervice." Cornage appears to have been peculiar to the border-fervice againft the Scots. Cornage, horngeld, and noutgeld, were probably fynonymous, and implied annual payments of horned cattle, to provifion the garrifons. The lord's rent was called white-rent, probably from its being paid in filver. Scutage, or fervice of the fhield, was another compenfation in money, inftead of perfonal fervice againft the Scots.

Some veins of *copper* ore have been found and worked in different parts of the county; but the product has not been found fufficient to defray the expence of workmanfhip. Before the year 1704, great quantities of *lead* were found near Hartley. Some mines at Dunfell have proved very productive of this metal for many years, but latterly there has not been much ore found. At Dufton are fome rich and productive lead mines, belonging to the earl of Thanet. There are fome confiderable mines at Greenfide, near Paterdale, and at feveral other places in the county. This metal is obtained in various quantities.

Crofs-fell, the higheft of the chain of mountains which extend along the eaftern frontiers of the county of Weftmoreland and Cumberland, is faid by Robinfon, in his Natural Hiftory of the County, to have been formerly called Fiend's-fell, from evil fpirits which are faid in former times to have haunted its fummit, and continued their haunts and nocturnal vagaries upon it until St. Auftin, as is reported, erected a crofs, and built an altar upon it, whereon he offered the Holy Eucharift, by which he countercharmed thofe hellifh fiends, and difturbed their haunts. Since that time it has been named Crofs-fell; and unto this time there is a heap of ftones on the fummit, which bears the name of Crofs-fell.

Upon this and the adjoining mountains occurs the phenomenon, called the Helm-wind; which, in fpite of St. Auftin's charms, continues its vagaries on its ancient haunts. It is peculiar to this diftrict, and the confines of Lancafhire and Yorkfhire, about Ingleborrow, Pendle, and Penigent. It alfo occurs on Wildboar-fell, in Ravenftonedale; and is moft prevalent in the months from October to April. The appearances attending it are a whitifh cloud hanging half way down the mountains, but keeping an exact parallelifm with every plane, depreffion, and elevation of their tops, which it covers as with a helmet. Above this appears the blue fky, and then a white cloud, called the helm-bar, from an idea that it repreffes the fury of the ftorm: it continues in a tremulous agitated motion till it difperfes; and then the hurricane iffues forth, roaring along the fides of the hills, and frequently extending two or three miles from their fides. The following are the heights of the principal mountains, as afcertained by Mr. Dalton. Helvellyn is 1070 yards high. A deep drift of fnow was feen on this mountain on the 12th of July, 1812. Bowfell and Rydal-head are each 1030 yards in height. The High-ftreet is 912 yards high. On its fummit are annual horfe-races, and other fports, on the 10th of July, to which every one brings the fheep that have ftrayed into their heathing-ground, for their owners to challenge.

It appears that different grammar-fchools were eftablifhed in this county previous to the diffolution. Edward VI. was patron of the fchool at Kendal; and queen Elizabeth founded fchools at Appleby, Kirkby Stephen, and Kirkby Lonfdale. From thefe feminaries many learned men have been diftributed over England, fome of whom have obtained eminence in the literary world. They have alfo contributed towards the eftablifhment of other public fchools in the county. Seminaries are, therefore, eftablifhed in nearly every village in Weftmoreland.—The Hiftory and Antiquities of the Counties of Weftmoreland and Cumberland, by Jofeph Nicholfon, efq. and Richard Burn, LL.D. 2 vols. 4to. 1778. An Effay towards a Natural Hiftory of Weftmoreland and Cumberland, by the Rev. Thomas Robinfon, 8vo. 1709. General View of the Agriculture of the County, by Andrew Pringle, 4to. 1794. Obfervations relative chiefly to Picturefque Beauty of the Mountains and Lakes of Weftmoreland and Cumberland, by the Rev. William Gilpin, 2 vols. 8vo. 1788. A Survey of the Lakes, by James Clarke, folio.

Westmoreland, a poft-townfhip of New York, in Oneida county; 10 miles W. of Utica, and 107 miles from Albany. Its waters are fmall; its furface very level, but the foil is very rich and fertile. It has a church for Congregationalifts, and a competent number of common fchools. In 1810, the population was 1135, and the fenatorial electors were 141.—Alfo, a county of Pennfylvania, containing 26,392 inhabitants, of whom 20 are flaves.—Alfo, a county of Virginia, containing 8102 inhabitants, of whom 4080 are flaves.—Alfo, a townfhip of New Hampfhire, in the county of Chefhire, on the E. bank of the Connecticut, containing 1937 inhabitants; 5 miles N. of Chefterfield.

WEST NANTMILL, a townfhip of Pennfylvania, in the county of Chefter, with 1188 inhabitants.

WEST NORTHERN LIBERTIES, a town of Pennfylvania, in the county of Philadelphia, containing 9795 inhabitants.—Alfo, a townfhip of the fame, containing 168 inhabitants.

WEST NOTTINGHAM, a townfhip of Pennfylvania, in the county of Chefter, with 642 inhabitants.

WESTOE, a townfhip of Durham, with 2900 inhabitants; 2 miles S. of Shields.

WESTON, a townfhip of Connecticut, in the county of Fairfield, with 2618 inhabitants; S. of Fairfield.—Alfo, a town of Vermont, in the county of Windfor, containing 629 inhabitants; 30 miles N.N.E. of Bennington.—Alfo, a town of the ftate of Maffachufetts, in the county of Middlefex, containing 1008 inhabitants; 12 miles W. of Bofton.

WEST PENNSBOROUGH, a townfhip of Pennfylvania, in the county of Cumberland, with 1264 inhabitants.

WESTPHALIA, a circle of Germany, bounded on the

the N. by the Dutch ſtates, on the W. by the Netherlands, and elſewhere by the circles of the Rhine, Upper and Lower. The ancient Saxons were divided into Weſtphalians, Angrians, and Eaſtphalians. The people inhabiting between the Weſer and the Rhine, were called *Weſtphalians*, and the tract of country inhabited by them, has from thence been called *Weſtphalia*. The duchy of that name, in the electoral circle of the Rhine, conſtituted a part of this country; but the circle of Weſtphalia compriſed alſo under it other countries, which never belonged to the above-mentioned Weſtphalia. And thus we muſt carefully diſtinguiſh from each other the three denominations, which are, the circle of Weſtphalia, Weſtphalia itſelf, and the duchy of that name. Formerly, not only certain ſtates were reckoned in this circle, which at preſent no longer belong to it, as Utrecht, Guelderland, Zutphen, the biſhopric and city of Cambray; but in other reſpects, alſo, the ancient and the modern liſts of the countries of the Weſtphalian circle differ greatly from each. The following appeared to be ſtates of the Weſtphalian circle before the peace of Luneville, *viz.* the biſhoprics of Paderborn, Munſter, Liege, and Oſnabruck; the duchy of Verden; the principality of Minden; the abbeys of Corvey, Stablo, Werden, Cornelius Munſter, Eſſen, Thorn, and Hervorden; the duchy of Cleves, with the county of Mark; the duchies of Juliers and Berg, Naſſau Siegen, and Naſſau Dillenburg; the principalities of Eaſt Frieſland and Meurs; the counties of Sayn, Wied-Runkel, Schauenburg, Oldenburg, Delmenhorſt, Lippe, Bentheim, Tecklenburg, Hoya, Virnenburg, Diepholz, Spiegelberg, Rietberg, Pyrmont, Gronsfeld, Reckheim; the ſigniories of Anhalt and Winneburg; the county of Holzapfel; the ſigniories of Witten, Blankenheim, Geroldſtein, Gehmen, Gimborn and Neuſtadt, Wickerad, Mylendonk, and Reichenſtein; the county of Kerpen and Lommerſum; the ſigniory of Schleiden, and the county of Hallermund, to which in the matricula are reckoned moreover to belong the ſigniories of Dyck, Severn, Kniphauſen, Keyl, Mechernick, Eyſs, Schlenacken, Wylre, Richold, Dreyz, and Schonau, together with the cities of Cologne, Aix-la-Chapelle, and Dortmund. The ſummoning princes, and directors of the circle, were the biſhop of Munſter, and with him alternately the electors of Brandenburg and Palatine, as dukes of Cleves and Juliers, both of whom in this directory enjoyed together but one voice. The diets of the circle were uſually appointed at Cologne. The archives belonging to it were kept at Duſſeldorf. The contribution of this circle in men and money, to the aids of the empire, was made equal to the contributions of Upper and Lower Saxony, Burgundy, and Swabia, and rated at ſomewhat more than the ninth, but leſs than the tenth part of the whole ſum granted by the empire. With reſpect to religion, this circle was one of the mixed. Indeed the Catholic ſtates uſed to nominate two, and the Proteſtant alſo the like number of aſſeſſors, to aſſiſt at the Imperial and chamber court of the empire. By the peace of Luneville, all that part of the circle which lay on the left bank of the Rhine, was ceded to France.

Westphalia, (*Duchy of*,) a country of Germany, bounded on the N. by the biſhopric of Munſter and county of Lippe, on the E. by Paderborn, Waldeck, and Heſſe; on the S. by Witgenſtein, Naſſau, and Berg; and on the W. by Berg and Mark; about forty miles in extent from N. to S. and thirty-two from E. to W. Agreeably to its natural ſituation, this county is divided into three parts. The firſt of theſe, called the *Hellwege*, is low, and produces plenty of corn and other neceſſaries, with a ſufficient breed of cattle and ſalt-ſprings. The ſecond is the *Haarſtrank*, which ſtands ſomewhat higher, between *Hellwege* and the *Sunderland*, and has indeed a good, but not ſo fruitful a ſoil as the *Hellwege*. The third is the *Sunderland*, commonly called the *Surland*, or *Saurland*, which conſiſts of hills and vales. This tract indeed is neither of great, nor even a ſufficient fertility in corn; but, on the other hand, it has fine woods and meadows, together with a good breed of cattle, game, and fiſh, in particular trout, as alſo plenty of iron ore, calamy, lead, copper, ſilver, and gold. The principal rivers are, the Ruhr, the Lenne, the Dimel, and Lippe. The duchy of Weſtphalia contains in it thirty-five towns. Henry, duke of Bavaria and Saxony, being put under the ban by the emperor Frederic I. in the year 1180, the latter made a donation of the duchy of Weſtphalia, as alſo a part of the duchy of Engern, which belonged to the former, to the archbiſhopric of Cologne, and inveſted therewith the archbiſhop Philip; concerning which donation, in the ſame year, a record, or inſtrument, was executed at Gelnhauſen, and the ſaid donation confirmed afterwards in the year 1200, by the emperor Otho IV., as alſo in the year 1204, by the emperor Philip. In the year 1368, Godfrey, the laſt duke of Arenſberg, and his conſort Anne, ceded the county of Arenſberg to the archbiſhopric of Cologne; and, in the year 1371, the emperor Charles IV. inveſted the archbiſhop Frederic therewith. The county was afterwards added to the ſhare of the duchy of Engern. The archbiſhops and electors of Cologne governed this duchy, till the year 1442, by marſhals, but afterward under the direction of an electoral bailiff. Brilon is the capital. In 1802, the duchy of Weſtphalia was given to the prince of Heſſe Darmſtadt.

Westphalia, a kingdom formed of ſeveral principalities, taken from the king of Pruſſia, after the battle of Friedland, and acceded to at the peace of Tilſit. Weſtphalia is divided into eight departments. 1. That of the Elbe; conſiſting of the greater part of the duchy of Magdeburg, with the Old Mark of Brandenburg. Its population is 253,000 ſouls: the chief place Magdeburg. 2. That of Fulda: the chief place Caſſel. It is compoſed of a part of Lower Heſſe, of the countries of Paderborn, Corvey, Minden, &c. Its population 239,502 inhabitants. 3. That of the Harz: chief place Heiligenſtadt. It conſiſts of Eichsfeld, of the cities of Mulhauſen and Nordhauſen, of the principalities of Hohenſtein, Grubenhagen, Blankenburg, &c. Its population is 210,989 ſouls. 4. That of the Leine: chief place Gottingen. It is compoſed of a part of the principality of Grubenhagen, and of the countries of Hildeſheim, Brunſwick, and Heſſe. Its population is 145,537 ſouls. 5. That of the Ocher: chief place Brunſwick. It is compoſed of the greater part of the duchy of Wolfenbuttel, and the biſhopric of Hildeſheim. Its population is 267,878 ſouls. 6. That of Saal: chief place Halberſtadt. It is compoſed of the principalities of Halberſtadt, Wernigerode, Quedlinburg, &c. The population is 206,222 ſouls. 7. That of the Werra: the chief place Marburg. It conſiſts of Upper Heſſe, the Hersfeld, &c. The population is 254,000 ſouls. 8. That of the Weſer: the chief place Oſnabruck. It conſiſts of the biſhopric of Oſnabruck, a part of Schaumburg; and its population is 334,000 ſouls.

Westphalia-*Ham*. See Ham.

WESTPOND Plantation, in *Geography*, a town of the diſtrict of Maine, in the county of Kennebeck, containing 481 inhabitants.

WESTPORT, a townſhip of Maſſachuſetts, in the county of Briſtol, incorporated in 1787, with 2585 inhabitants; 60 miles S. of Boſton.

Westport, a sea-port and post-town of Ireland, in the county of Mayo, situated on a beautiful bay, wooded to the water's edge, in the S.E. angle of that large haven called Clew bay, founded by the late marquis of Sligo, whose residence was within half a mile of it. Westport is a neat regular well-built town, 123 miles W.N.W. from Dublin, and $8\frac{1}{2}$ S.W. from Castlebar. The following account, extracted from a late report to the Linen Board by Peter Bernard, esq. shews what judicious indulgence and liberal protection on the part of a landlord, assisted by the exertions of an industrious individual, may do. Were the example universally imitated, many squalid and decayed villages would quickly assume a more comfortable and exhilarating aspect. "The establishment and success of the linen manufacture in Westport, is due to the persevering attention of the marquis of Sligo and Robert Patten, esq. The latter, most fortunately for the neighbourhood, settled here in the year 1787; at that period Westport was a very inconsiderable town, containing but few houses, and its general market attended only by two or three hundred persons; now it is a beautiful well-built town, with 3700 industrious inhabitants, and many gentlemen of the highest respectability residing in it. Its market at present (1817) is attended by from 4000 to 5000 persons, whose manners, appearance, and dress, bespeak most strongly the happy effects of a well-regulated system of industry." "The first linen-market was held in 1790. For the first five years it produced only eight webs *per* week, and Mr. Patten was the only buyer; but he, by giving fair and liberal encouragement to the weavers, gradually but firmly advanced the trade, which now stands on a foundation not likely to be shaken. An accession of settlers from Ulster in the years 1797, 98, and 99, who brought their looms, some capital, and their accustomed habits of industry, completed what Mr. Patten had so fortunately begun." At present the market is held every Thursday in a spacious linen-hall built by the marquis of Sligo, where the goods are measured by a machine. The linens are all seven-eighths of three different qualities, and are all brought to market in a brown state. There are sold weekly about 200 webs, the value of which is estimated at above 20,000*l.* *per annum*. There are about 150 weavers and about 20 buyers, two of whom have bleach-greens at Westport. Mr. Patten has also successfully introduced at Westport the provision and corn-trade, and also the oil business, which is carried on to a considerable extent, and gives employment in the season to a great number of fishermen and boats. In March and April a number of fish appear off the coast, which, from their appearing only on a sunny day, the inhabitants call *sun-fish*, though they differ from the fish usually so called. The fishermen strike these with harpoons, then cut out the liver, and abandon the rest of the fish, the liver being sufficient to load one boat of four tons burden. A large fish yields eight barrels of oil and two of sediment. This trade amounts to some thousands annually, and Mr. Patten's house has often bought in one year near 3000*l.* worth. The oil is esteemed as good as spermaceti oil, and is particularly well-suited for lamps, as it has no offensive smell. The price of the present day is five shillings *per* gallon; the dregs are used by tanners. Bernard's Report to the Linen Board in 1817.

WESTRAY, one of the Orkney islands, terminating the cluster on the N.W. quarter, is situated 20 miles N. from Kirkwall, and 347 miles in the same bearing from Edinburgh. Its shape bears some resemblance to that of a cross; of which the longer part extends about eight miles, the arms or transverse part not more than five, and comprehends in the whole about fourteen square miles. The island comprises two parishes, St. Mary's and Cross Kirk; and in the population return of the year 1811 was stated to contain 248 houses, and 1396 inhabitants. The only manufacture is that of kelp, of which are produced on an average 300 tons annually. Much corn is raised, but of an indifferent quality; the grass is excellent for the dairy, and for the pasturage of black cattle; and the boisterous seas which surround the island afford great plenty of fish, of a very superior kind. On the east and south are two bays; but the only harbour that can be depended on is on the north-east, and this is fit for small vessels only: formerly it received ships of much greater burthen; but from the blowing of the sand the water has become so shallow, they are now compelled to anchor in a more open road. In two extensive plains near the sea-side, one on the south, the other on the north part of the island, a multitude of graves have been discovered, all formed in nearly the same manner; and, though tradition is silent, they were probably formed after a sanguinary conflict at some remote period: some of these graves, on the north side, have been opened, and were found to contain skeletons in a reclining posture, with weapons, domestic utensils, and several other articles, the use of which could not be ascertained.—Beauties of Scotland, vol. v. Orkneys, 1808. Carlisle's Topographical Dictionary of Scotland, 1813.

WESTRINGIA, in *Botany*, was so named by the author of the present article, in honour of Dr. John Peter Westring, physician to the king of Sweden, member of the Royal Society of Stockholm, and author of several learned papers on the *Lichen* tribe, published in the Transactions of that body. He has also published seven numbers in 8vo. on the dyeing properties of many Swedish lichens, comprehending a full history of the modes of applying them to use, and accompanied with most elaborate and complete coloured figures, drawn by the celebrated professor Acharius himself. —Sm. in Stockh. Transf. for 1797, 171. Tracts relating to Nat. Hist. 277. Mart. Mill. Dict. v. 4. Brown Prodr. Nov. Holl. v. 1. 501. Ait. Hort. Kew. v. 3. 372.—Class and order, *Didynamia Gymnospermia*. Nat. Ord. *Verticillatæ*, Linn. *Labiatæ*, Juss. Brown.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, tubular, somewhat bell-shaped, with five sides and five prominent angles, but no furrows, divided about half way down into five equal, erect, lanceolate, beardless segments, permanent. *Cor.* of one petal, ringent, twice as long as the calyx: tube the length of the calyx, hairy in the throat: limb two-lipped; the upper lip flat, erect, divided, rather the longest; lower in three oblong, equal, spreading, entire segments. *Stam.* Filaments four, shorter than the limb, divaricated, the two upper ones longest; anthers of the two upper stamens roundish, halved, those of the two lower deeply divided, imperfect. *Pist.* Germen in the bottom of the calyx, four-lobed; style thread-shaped, the length of the longer stamens; stigma small, cloven, acute. *Peric.* none, except the hardened calyx. *Seeds* four, obovate, naked.

Eff. Ch. Calyx five-cleft half way down, five-sided. Upper lip of the corolla flat, cloven; lower in three deep equal segments. Stamens distant; the two upper with halved anthers; two lower with divided abortive ones.

A genus of New Holland shrubs, chiefly from the colder parts of that country, having the appearance of our rosemary, destitute of glands, but mostly downy. *Leaves* whorled, entire. *Flowers* axillary, solitary, on short stalks, with a pair of *bracteas* close to the *calyx*. *Corolla* white, sometimes dotted with purple or violet. One species only was, for a long time, known to us, but Mr. Brown has ascerafcertained feven more, one of which, it feems, was brought home by the famous old navigator Dampier, and is preferved in the Sherardian herbarium at Oxford, if we remember right. They all very much refemble each other in habit, and prove the genus to be perfectly natural, though it has been confounded with *Cunila* by fome very eminent botanifts.

1. W. *rofmariniformis*. Rofemary-leaved Weftringia. Sm. in Stockh. Tranf. for 1797, 175. t. 8. f. 2. Tracts 282. t. 3. Brown n. 1. Ait. n. 1. Donn. Cant. ed. 5. 141. (W. rofmarinacea; Andr. Repof. t. 214. Cunila fruticofa; Willd. Sp. Pl. v. 1. 122.)—Leaves four in a whorl, lanceolate, revolute; fhining and nearly fmooth above; filky beneath. Calyx filky; its teeth longer than the tube.—Native of New South Wales, near Port Jackfon, from whence fpecimens and feeds were fent by Dr. John White, in 1791. The *ftem* is fhrubby, feveral feet high, very much branched; *branches* either oppofite, or four together, fquare, filky with white clofe hairs, denfely leafy. *Leaves* fpreading, an inch or fomewhat lefs in length, acute, fingle-ribbed, entire; dark green, and polifhed above; white with filky hairs beneath. *Footftalks* broad and very fhort, filky, without *ftipulas*. *Flowers* about the upper part of the branches, fhorter than the leaves; their *corolla* fpreading nearly an inch, white, dotted about the mouth with violet fpots. *Anthers* violet. The *calyx* is filky on the outfide of the tube, its fegments naked with revolute margins; they appear to us variable in length. The plant is flightly bitter, not aromatic; nor have the *flowers* any fcent.

2. W. *Dampieri*. Dampier's Weftringia. Br. n. 2. Ait. n. 2.—" Leaves four in a whorl, linear, ftrongly revolute; nearly fmooth above; hoary and opaque beneath. Calyx hoary and opaque; its teeth half the length of the tube."—Gathered by Mr. Brown on the fouthern coaft of New Holland. Sent to Kew in 1803, by Mr. Peter Good. It flowers in the greenhoufe, from May to July. *Aiton*.

3. W. *rigida*. Rigid Weftringia. Br. n. 3.—" Leaves three in a whorl, linear-lanceolate, divaricated, fharp-pointed, revolute; fmoothifh above; hoary beneath. Calyx hoary; its teeth half the length of the tube."—Difcovered by Mr. Brown, in the fouth part of New Holland.

4. W. *cinerea*. Grey Weftringia. Br. n. 4.—" Leaves three in a whorl, linear, fpreading, pointed, revolute, hoary on both fides. Calyx hoary; its teeth fcarcely a quarter the length of the tube."—This was found by Mr. Brown, in the fame country as the laft fpecies.

5. W. *anguftifolia*. Narrow-leaved Weftringia. Br. n. 5.—" Leaves three in a whorl, linear, fpreading, revolute; roughifh on the upper fide; hoary beneath. Calyx hoary; its teeth half the length of the tube."—Found by Mr. Brown, in the ifland of Van Diemen.

6. W. *longifolia*. Long-leaved Weftringia. Br. n. 6.—Leaves three in a whorl, linear, revolute; rough with minute points on the upper fide; flightly hairy beneath. Calyx fomewhat hairy; its teeth equal to the tube.—Gathered near Port Jackfon by Mr. Brown. We have fpecimens, gathered in that country by Dr. White, which anfwer to the fpecific character, except that the back of their *leaves*, as well as the *calyx*, are rather hoary than, as Mr. Brown fays, green, and the *leaves* are four, or even five, in a whorl. The *corolla* is externally downy; but this laft character is, perhaps, not peculiar to the prefent fpecies.

7. W. *glabra*. Smooth Weftringia. Br. n. 7.—" Leaves three in a whorl, linear-lanceolate, flat, fmooth on both fides, as well as the calyx."—Gathered by Mr. Brown, in the tropical part of New Holland.

8. W. *rubiæfolia*. Madder-leaved Weftringia. Br. n. 8.—" Leaves four in a whorl, elliptic-lanceolate, nearly flat, very fmooth and fhining. Calyx nearly fmooth."—Found in the ifland of Van Diemen, by Mr. Brown.

The two laft fpecies feem to differ remarkably from all the foregoing, in the flatnefs and fmoothnefs of their *leaves*.

WESTRIZ, in *Geography*, a river of the duchy of Stiria, which runs into the Luffnitz, near Furftenfeld.

WESTS, a town of Virginia; 4 miles S.W. of Leefburg.

WEST SALEM, a townfhip of Pennfylvania, in Mercer county, with 660 inhabitants.

WEST SOUTHWARK, a town of Pennfylvania, in the county of Philadelphia, containing 6443 inhabitants.

WEST SPRINGFIELD, a town of Maffachufetts, in the county of Hampfhire, containing 3109 inhabitants.

WEST STOCKBRIDGE, a town of Maffachufetts, in the county of Berkfhire, containing 1049 inhabitants.

WEST WHITELAND, a townfhip of Pennfylvania, with 636 inhabitants.

WEST WINDSOR, a town of New Jerfey, in the county of Middlefex, containing 1714 inhabitants.

WET AIR. See MOISTURE.

WET *Couch*, a term ufed by the maltfters for one of the principal articles of malt-making.

In the making of malt, the ufual way is to foak the grain in water two or three days, till it becomes plump and fwelled, and the water is brown; the water is then drained away, and the barley is removed to a floor, where it is thrown into a wet couch, that is, an even heap of about two feet thick.

In this heap the barley fpontaneoufly heats, and begins to grow, fhooting out firft the radicle, and, if fuffered to continue growing, foon after the blade; but at the eruption of the radicle, the procefs is to be ftopped fhort, by fpreading the wet couch thin over the floor, and turning it once every four or five hours for two days, laying it thicker each time; after this it is thrown into a large heap, and there fuffered to grow hot of itfelf, and afterwards fpread abroad again and cooled, and then thrown upon the kiln to be dried crifp, without fcorching. Shaw's Lectures, p. 186.

WET *Dock*. See DOCK.

WET-*Glover*, a dreffer of the fkins of fheep, lambs, goats, &c. which are flender, thin, and gentle.

WETA, or WINDAU, in *Geography*, a river of the duchy of Courland, which runs into the Baltic, a little below Windau.

WETERFELD, a town of Bavaria, on the Regen; 21 miles N.E. of Ratifbon.

WETHER-GETTER, among *Sheep-Farmers*. See RAM.

WETHER-*Sheep*, in *Rural Economy*, a term applied by ftock-farmers to a caftrated male fheep of more than one year old; but before that time it is called a wedder-lamb. The wedders of the improved breeds of fheep, efpecially thofe of the new Leicefter fort, are much more early than the old kinds. See SHEEP.

WETHERBY, in *Geography*, a market-town in the upper divifion of the wapentake of Claro, Weft Riding of the county of York, England, is fituated on the river Wharfe, 7 miles N.W. from Tadcafter, about the fame diftance S.E. from Knarefborough, and 194 miles N.N.W. from London. The courfe of the river forms an angle, whofe fides are each about one mile in length; at the point of this angle the town is feated. It affords nothing worthy of notice, but a handfome bridge croffing the Wharfe. Above this bridge the river forms a beautiful cafcade, by falling

falling in a ſheet of water over a high dam erected for the convenience of the mills. Over this caſcade, the ſalmon, in their way up the river from the ſea, are ſeen to leap with wonderful dexterity. Wetherby has a weekly market on Thurſdays, and three annual fairs. In the population return of the year 1811, the town is ſtated to contain 1140 inhabitants, occupying 243 houſes. In the time of William the Conqueror, this manor was poſſeſſed by two Norman lords, William de Percy and Erneis de Burun. It was afterwards given to the knights templars; and, together with all their eſtates in England, was forfeited on the abolition of their order, in the year 1312. In the civil war of Charles I. this town was garriſoned by ſir Thomas Fairfax, who, in 1642, repulſed ſir Thomas Glenham, in two different attacks. A little below the town is St. Helen's Ford, where the Roman military-way croſſed the Wharfe. Within a mile of the town is Wetherby Grange, the ſeat of Richard Thompſon, eſq. In the park is an heronry, a thing rather uncommon in this part of the country. The herons build their neſts in the tops of the higheſt trees; but ſeldom take the trouble, when they can get them ready made by the rooks, whom they expel, and enlarge and line the neſts, driving away the original poſſeſſors, ſhould they happen to renew their fruitleſs claims.

About two miles to the weſt of Wetherby, is Stockeld park, the ſeat of William Middleton, eſq. His anceſtors deſcended from Hypolitus de Brame, lord of Middleton, who lived in the reign of Henry II. Not far from the houſe, and near the high road, is a rock of a very ſingular ſhape, 65 feet in circumference, and 30 feet high, ſtanding on the margin of a lake.—Hargrove's Hiſtory of Knareſborough, 1809. Beauties of England and Wales, vol. xvi. Yorkſhire. By J. Bigland, 1812.

WETHERSFIELD, a town of Connecticut, in the county of Hartford, containing 3961 inhabitants.

WETMORE's Island, a ſmall iſland on the coaſt of Maſſachuſetts, at the mouth of the river Penobſcot.

WETSTEIN, John James, in *Biography*, was born at Baſle in 1693, and made ſuch proficiency in his early ſtudies, that he was fit to be admitted into the univerſity at the age of eleven years. In his 20th year he was ordained miniſter, on which occaſion he maintained a diſputation on the various readings of the New Teſtament, in which he defended the authenticity and integrity of the text. To this courſe of ſtudy he was ſeduloufly devoted, and in order to explain the words and phraſes of the New Teſtament, he carefully read the Greek authors, both ſacred and profane; and he alſo conſulted the Rabbinical writings, for the purpoſe of acquainting himſelf with the opinions and cuſtoms of the Jews. Richly furniſhed with this kind of knowledge, he ſet out, in 1714, on a literary tour to Zurich, Berne, and Geneva. From the latter place he proceeded through Lyons to Paris, where he became acquainted with Montfaucon, Courayer, and other eminent men; and he alſo viſited England, where he was particularly noticed by the celebrated Bentley, and diligently ſearched for MSS. of the New Teſtament. During his ſtay in this country, he was made chaplain to a regiment of Swiſs troops, and having obtained leave of abſence, viſited Paris, in order to collate a particular MS., and, after three months, joined the regiment at Bois-le-duc. Having afterwards viſited Holland and Germany, he returned to Baſle in 1717, and became deacon to the church of St. Leonard, which office he held with diſtinguiſhed approbation for nine years. In purſuance of his main object, he correſponded with Bentley on the ſubject of various readings; but he was interrupted in his plan by a violent diſpute with a divine of Baſle, who had been his intimate friend, occaſioned by his publication of a ſpecimen of his various readings in 1718. In the progreſs of this diſpute, the clergy took a part, and preſented a petition to the council, requeſting that Wetſtein's edition of the New Teſtament might be prohibited; alleging, amongſt other objections, that it favoured of Socinianiſm. His Prolegomena, however, were printed in 1730, and a new accuſation was preferred to the council againſt the author. This kind of clamour proving ineffectual, his enemies engaged ſome of his pupils to appear as witneſſes againſt him; and they produced extracts of his lectures from the MS. copies of theſe pupils to ſupport their accuſation. The reſult of theſe diſhonourable proceedings was a ſuſpenſion of his functions in 1729, and this was ſoon followed by his total depoſition. This conduct of the clergy was aggravated by a variety of miſrepreſentations; the miniſters of Mulhauſen, Neufchatel, Vallangen, and Geneva, expreſſed their diſapprobation of theſe meaſures; and forty heads of families in the pariſh of St. Leonard preſented a petition for obtaining Wetſtein's re-eſtabliſhment. But as this interpoſition on his behalf was unſucceſsful, he left his native country, and removed to Amſterdam, where the Remonſtrants elected him profeſſor of philoſophy in the room of Le Clerc, requiring, at the ſame time, that he ſhould juſtify himſelf, either by a public apology, or before the council at Baſle. Adopting the latter method, he returned to Switzerland, and in the preſence of thirteen commiſſioners, choſen from the council and body of the profeſſors, he ſhewed that the extracts furniſhed by his pupils were not worthy of credit; that the witneſſes had ſworn nothing that could prove the accuſation alleged againſt him; and that the acts of the divines contradicted each other. The council, in March 1732, annulled the decree of condemnation, and reſtored him to the full exerciſe of his functions. The Remonſtrants at Amſterdam were ſatisfied, and in 1733 he took poſſeſſion of his office, the duties of which he faithfully diſcharged till his death. His character being re-eſtabliſhed at Baſle, he was elected in 1744 profeſſor of the Greek language; but the Remonſtrants, in order to retain him, nominated him profeſſor of eccleſiaſtical hiſtory, and made an addition to his ſalary. Amidſt the labours of the offices, which he ſuſtained with great honour to himſelf and benefit to his pupils, he proceeded in collecting and arranging his various readings of the New Teſtament; grudging no expence, and availing himſelf of every opportunity that occurred in collating various MSS. Encouraged by a great number of learned men in England, Holland, and Germany, he at length publiſhed his firſt volume in 1751, and the ſecond in the following year; and in order to preclude every objection, he printed the text from that commonly received, and the various readings at the bottom. To the whole he ſubjoined a commentary, comprehending all the remarks with which he had been furniſhed by the Hebrew, Greek, and Roman writers whom he had conſulted. His attachment to received principles is evinced by his mode of explaining ſeveral paſſages, and particularly thoſe which related to the divinity of Jeſus Chriſt. To his New Teſtament he added two epiſtles of St. Clement, now firſt publiſhed, with a Latin verſion, and a diſſertation on their authenticity. His literary reputation being now eſtabliſhed, he was made a foreign aſſociate of the Academy of Sciences at Berlin, in 1752; and in the following year elected a fellow of the Royal Society in London. Although Wetſtein's conſtitution was vigorous, his inceſſant labour accelerated the infirmities of age; and he was ſeized with a numbneſs and coldneſs in his right leg, which threatened a gangrene, and all attempts to check the progreſs of this malady were ineffectual; ſo that it terminated his valuable life in March 1754, in the 61ſt year of his age. He beheld the approaches of death with tranquillity and reſignation. Wetſtein was ſocial, and fond of innocent amuſements, though ſtudious. He was an excellent Greek ſcholar, poſſeſſed a retentive memory, and ſpoke ſeveral modern languages. He was affable even to ſtrangers, and kind and condeſcending to his pupils. His benevolence comprehended all of every nation and communion, and he was prompt in communicating aſſiſtance and advice to all who applied to him. His character has been amply vindicated from invidious and degrading charges by Krighout, in his "Memoria Wetſteniana Vindicata," 4to. Formey's Elog. Gen. Biog.

WETTELSHEIM, in *Geography*, a town of Germany, in the principality of Anſpach; 4 miles N.W. of Treuchtlingen.

WETTENHAUSEN, a princely abbey, founded in the tenth century; 20 miles W. of Augſburg.

WETTER, a town of Germany, in the county of Mark; 6 miles S.W. of Schwiert.—Alſo, a town of Germany, in the principality of Heſſe; 6 miles N.W. of Marburg. N. lat. 50° 54′. E. long. 8° 45′.—Alſo, a river of Germany, which riſes in the county of Solms, and runs into the Nidda, at Aſſenheim.

WETTER *Iſland*, an iſland in the Eaſt Indian ſea, about 90 miles in circumference, of an irregular form. S. lat. 7° 24′. E. long. 126° 40′.

WETTER *Lake*, a lake of Sweden, in Eaſt Gothland, ſixty-five miles long, and from ten to ſixteen wide. This lake has but one outlet by the river Motala, though above forty little ſtreams diſcharge themſelves into it. This lake lies much higher than either the Baltic or the North ſea, and is deep and clear, but very boiſterous in winter. It is ſuppoſed certainly to prognoſticate the approach of ſtormy weather. As this lake, like all inland pieces of water, ſurrounded with hills or mountains, is ſubject to ſudden ſtorms in the ſtilleſt weather, ſuperſtition and credulity cooperating, as in other caſes, have been buſy in explaining and admitting cauſes for this phenomenon; and accordingly it has been reported and credited, that theſe ſudden ſtorms are occaſioned by a ſubterraneous communication with the lake of Conſtance in Switzerland. It is ſaid, that by a regular ſeries of correſpondence and obſervation it was found, that when the waters of one lake aroſe, thoſe of the other fell in the ſame proportion; and frequently the waters of the Wetter were violently agitated without the leaſt wind, or any apparent cauſe, until information arrived that at the ſame time the lake of Conſtance had been diſturbed by a tempeſt. The whole is ſuppoſed to be a fable grounded on ſome antiquated tradition. See WADSTENA.

WETTERAU, or WETTERAVIA, a country of Germany, ſituated between the county of Heſſe and the river Maine, which takes its name from the river Wetter. It contains the counties of Siegen, Schaumburg, Dillenburg, Dietz, Hadamar, Weilburg, Idſtein, Hanau, Solms, Weſterburg, Iſenburg, Sayn, Witgenſtein, Hohenſtein, Cronberg, and Waldeck, the lordſhips of Weid, and the imperial towns of Wetzlar, Friedberg, and Gelnhauſen. The northern part is called Weſterwald.

WETTERINGEN, a town of Germany, in the biſhopric of Munſter; 7 miles S.W. of Rheine.

WETTING, a town of Weſtphalia, in the duchy of Magdeburg, on the Saal, the principal place of a bailiwick, which was formerly a county, in the year 1283 granted to the cathedral of Magdeburg. In the neighbourhood are ſome coal-mines; 34 miles S. of Magdeburg. N. lat. 51° 37′. E. long. 12° 3′.

WETTINGEN, a town of Switzerland, and principal place of a bailiwick, in the county of Baden, on the Limmat, with a celebrated wooden bridge of one arch over the river, executed by the ſame perſon who built the bridge over the Rhine, at Schaffhauſen; 1 mile S. of Baden.

WETZ, a river of Germany, which runs into the Lahn, near Wetzlar.—Alſo, a town of Germany, in the principality of Solms Braunfels; 5 miles S. of Wetzlar.

WETZLAR, an imperial town of Germany, in the circle of the Upper Rhine, ſituated on the Lahn. The Roman Catholics, the Lutherans, and the Calviniſts, have each a church; 45 miles E. of Coblentz. N. lat. 50° 34′. E. long. 8° 33′.

WEVELSBURG, a town and citadel of Weſtphalia, in the biſhopric of Paderborn; 8 miles S. of Paderborn.

WEVER, a river of England, in the county of Cheſter, which runs into the Dee, 7 miles N. of Cheſter.—Alſo, a river of England, in the county of Devon, which runs into the Culm, near Bradninch.

WEVERHAM, a townſhip of England, in Cheſhire; 3 miles W. of Northwich.

WEVERY, a river of Wales, which runs into the Wye, near Builth.

WEWER, or WEVER, a town of Weſtphalia, in the biſhopric of Paderborn; 22 miles S.S.W. of Paderborn.

WEWURTZE, a river of Lithuania, which runs into the Minnic, 3 miles S. of Proeculs.

WEXEL, a mountain of Stiria; 4 miles N.W. of Fridberg.

WEXFORD, a county of Ireland, in the ſouth-eaſt part of it, which has St. George's Channel on the E. and S., the counties of Waterford, Kilkenny, and Carlow, on the W., and that of Wicklow on the N. It extends from N. to S. 44 Iriſh miles, and from E. to W. 25; being 56 Engliſh miles in length, by 32 in breadth. It contains 342,900 acres, or 535 ſquare miles Iriſh, equal to 550,888 acres, or 695 ſquare miles in Engliſh meaſure. The number of pariſhes 142, having 41 churches, all of which, except two pariſhes with one church, are in the dioceſe of Farns. The population was eſtimated by Dr. Beaufort at about 115,000. Wexford forms almoſt a peninſula, being ſeparated from Waterford and Kilkenny by the haven of Waterford, and the deep and navigable river Barrow, and from the counties of Carlow and Wicklow by formidable ranges of mountains, which admit of few paſſes. Being ſituated next to the principality of Wales, and nearly oppoſite to the mouth of the Britiſh Channel, it preſented great advantages to the Engliſh invaders of Ireland in the reign of Henry II.; who, after their firſt victories over the natives, ſelected this county, from its natural ſtrength, for the reſidence of the firſt coloniſts. The inhabitants of the baronies of Bargie and Forth are ſuppoſed to retain traces of their deſcent from theſe ſettlers. (See BARGIE.) Wexford cannot be called hilly or mountainous, except on the frontiers of Carlow and Wicklow. Yet it contains a great deal of coarſe cold land, and ſtiff clay ſoil, which the want of lime-ſtone renders it difficult and expenſive to improve. The baronies of Bargie and Forth, being of a lighter ſoil, are well tilled, and produce large quantities of barley. The river Slaney croſſes the county from Newtown Barry to Wexford, receiving the Bann from the northward, and affords a perpetual variety of picturеſque and romantic views among its wooded and winding banks. This river is navigable to Enniſcorthy. The linen manufacture has made no progreſs in this county, but there is a manufacture of coarſe woollens. The chief towns are Wexford, New Roſs, and Enniſcorthy, of which an account is given

given under their names. Wexford has been notorious for the events which took place in it during the rebellion of 1798. In it the misguided populace was succesfsful for some time, and the massacres at Scullabogue, and at the bridge of Wexford, afford a melancholy proof of what may be expected from an ignorant and almost barbarous peasantry, when they have the ascendancy. Their leaders were unable to controul them, and if the king's troops had not been succesfsful, there would have been no bounds to their exterminating phrensy. Before the Union, Wexford had eighteen members, but these have been reduced to four, two for the county, and one each for the towns of Wexford and New Ross. Beaufort.

Wexford, a sea-port and post-town, and also the assize town of the county of the same name, in Ireland, at the mouth of the river Slaney. It was originally built by the Danes, who named it Wesford, and it was formerly considered a place of strength, being enclosed by very thick walls, some of which are still remaining. There are some handsome buildings; on the scite of the old castle the barracks are erected, commanding an extensive view of the harbour. The church, situated in the main street, is an elegant modern structure. The market and court-house are likewise new edifices; but the chief ornament of Wexford is its wooden bridge, thrown over an arm of the sea, 2100 feet long, where insurmountable difficulties baffled all efforts to form a stone bridge. This bridge is a favourite promenade, and is as delightfully calculated for a pleasant recreation, as it constitutes an useful communication. The harbour, though spacious, is shallow, and formed by two necks of land, between which there is an entrance about half a mile broad, which was formerly defended by two forts, erected at the extremity of each isthmus. The mouth of the harbour is choked with a bar, and therefore no vessel drawing more than twelve feet water can pass to the town. Provisions of all kinds are very plentiful and cheap here, particularly the finest wild fowl. The chief export is corn, principally barley and malt. Wexford was taken from the Danes by the English invaders, after a siege of four days, in 1170; it was besieged and stormed by Cromwell in 1649; and on being evacuated by the king's troops, it was taken possession of by the rebels in 1798. The shocking murder of the loyal inhabitants, when 97 unoffending victims suffered at the bridge, has been already alluded to. There are seven parishes, but they are all united, and have only one church in common. Wexford is 67 miles S. by W. from Dublin. Carlisle. Traveller's Guide.

WEXIO, a town of Sweden, in the province of Smaland, situated on the Helga lake: the see of a bishop, and residence of the provincial governor; 46 miles N.N.W. of Carlscrona. N. lat. 56° 52′. E. long. 14° 44′.

WEY, a river of England, which runs into the Thames at Weybridge. This river is made navigable to Guilford and Godalmin, and a canal has lately been made from it to Basingstoke, in Hampshire.—Also, a river of England, which runs into the sea at Weymouth.

Wey. See Weigh.

WEYBER, in *Geography*, a lake of Bavaria; 3 miles W.N.W. of Kempten.

WEYBRIDGE, a considerable village in the hundred of Elmbridge, and county of Surrey, England, is situated on the river Wey, whence it derives its name, not far from its conflux with the Thames, at the distance of 12 miles N.E. by N. from Guildford, and 20 miles S.W. by W. from London. It contains some respectable houses, among which is a large edifice, called Holstein-house, from having been the residence of a prince of Holstein, when on a visit to England; it has for some years been used as a printing-office. The church is a small, but neat structure, having a nave and south aisle, at the west end of which is the vault of the earl of Portmore's family, built up about four feet above the level of the pavement, inclosed with iron rails, but without any inscription. The population return of the year 1811 states the parish of Weybridge to contain 167 houses, and 918 inhabitants.

In this parish is Oatlands, the seat of his royal highness the duke of York. This domain came into the possession of Henry VIII. by an exchange with the family of Rede, for the manor of Tandridge, in the same county. It was settled by Charles I. on his queen Henrietta Maria for her life; and their youngest son, called Henry of Oatlands, was born here. At the Restoration the queen dowager was again put in possession of the estate; and after her death Charles II. granted it to the earl of St. Alban's. In the next century it descended to the earl of Lincoln, afterwards duke of Newcastle, who fixed his residence here, enlarged the park, and made considerable plantations. In the park is a large piece of water, formed by springs which rise in it. Between the house and garden is a grotto, divided into three apartments, in one of which is a bath, supplied by a small spring, dripping through the rock; at the end of it is a copy of the Venus de Medicis, as if going to bathe.

The duke of York purchased this estate of the duke of Newcastle, together with the manors and parks of Byfleet and Weybridge, which he held by leases from the crown. In 1800 two acts were passed for inclosing the common fields and wastes, under which the duke obtained by allotments and purchases about 1000 acres of the waste, so that the domain now comprises about 3000 acres. The mansion was burned down while the duke was in Flanders, in 1793. The present house was then erected, from designs by Mr. John Carter; and in 1804 an act was passed for granting to the duke so much of this estate as was held of the crown.

In a small park in this vicinity is Ham, an old mansion, formerly the residence of the countess of Dorchester, mistress of James II. It is now uninhabited, and in a ruinous condition. Near it are many large cedars; one, in particular, measures, at five feet from the ground, about thirteen feet in circumference, and runs up straight to a great height. —History and Antiquities of Surrey. By the Rev. John Manning, and William Bray, esq. 3 vols. folio. Beauties of England and Wales, vol. xiv. Surrey. By F. Shoberl.

Weybridge, a township of the state of Vermont, in the county of Addison, separated from Newhaven by the Otter Creek, containing 750 inhabitants.

WEYDA, a town of Saxony, in the circle of Neustadt, on the Elster; 11 miles E.N.E. of Neustadt. N. lat. 50° 42′. E. long. 12° 1′.—Also, a river of Saxony, which runs into the Elster, 2 miles N. of Weyda.

WEYDEN. See Weiden.

WEYDENAU, a town of Silesia, in the principality of Neisse; 8 miles S.W. of Neisse. N. lat. 50° 12′. E. long. 17° 2′.

WEYDENEN, a town of Prussian Lithuania; 3 miles W.S.W. of Pilkallen.

WEYDENHAYN, a town of Saxony, in the margravate of Meissen; 7 miles W. of Torgau.

WEYER, a town of Austria; 2 miles N.E. of Gmunden.—Also, a town of the duchy of Stiria; 6 miles S. of Pruck.

WEYEREN, a town of Austria; 6 miles W. of Gmunden.

WEYERS,

WEYERS, a town of Weftphalia, in the bifhopric of Fulda; 8 miles E.S.E. of Fulda.

WEYERSHEIM, a town of France, in the department of the Lower Rhine; 6 miles S. of Haguenau.

WEYHER, a town of Auftria; 6 miles W. of Bavarian Waidhoven.

WEYHILL, a village of England, in the county of Hants, celebrated for the great annual fair held here for the fale of fheep, hops, &c.; 3 miles W. of Andover.

WEYL, or WYL, a town of Switzerland, belonging to the abbey of St. Gal, and principal place of a bailiwick; 14 miles S.S.W. of Conftance.

WEYLANOO, a town of Hindooftan, in Guzerat, on the coaft; 20 miles S.E. of Puttan Sumnaut.

WEYMOUTH, or WAYMOUTH, a borough and market-town in the hundred of Uggefcombe, Dorchefter divifion of the county of Dorfet, England, is fituated on the fouthern coaft of England, at the extremity of a beautiful bay, which forms nearly a femicircle, making a fweep of about two miles. The town is 8 miles S. by W. diftant from Dorchefter, and 128 miles S.W. by W. from London. It received its name from the mouth of the little river Wey, near which it ftands, and communicates with Melcombe Regis, to which it is united by a bridge erected in 1770. That the fcite of Weymouth was known to the Romans is probable from feveral circumftances; and Mr. Baxter fuppofes it to have been the Clavinio, which is mentioned in the anonymous Ravennas. In the Saxon ages, however, it is exprefsly named in a Saxon charter ftill extant, by which king Ethelred gave a certain portion of land, called by the inhabitants Weymouth (or Wick), near the ifle of Portland, to his faithful minifter Atfere. In the reign of Edward III. the town had become of fome importance, the inhabitants being ordered, together with thofe of Melcombe and Lyme, to fend a certain quota of fhips for the king's expedition to Gafcony. In the 21ft year of that reign, Weymouth (for Melcombe is not mentioned, though perhaps included) furnifhed the king with 20 fhips, and 264 mariners, at the fiege of Calais, according to the roll of his fleet preferved in a manufcript in the Cottonian Library. In the year 1471, Margaret of Anjou, with her fon, prince Edward, landed here from France, in order to reftore her hufband to the throne. In 1507, king Philip of Caftile, with his queen, were driven on this coaft, and having run into the port, were detained by fir Thomas Trenchard, till an interview took place between the Englifh and Spanifh monarchs, from which the former derived fome advantages. In 1588, Weymouth contributed fix fhips to oppofe the Armada, one of which was of 120 tons burthen. During the civil war of Charles I., this town was alternately garrifoned and befieged by the king, and by the parliament's forces. In 1649 the corporation petitioned parliament for an indemnification for the loffes they had fuftained in the war, and a relief from the burthen of maintaining the garrifon; but their requeft does not appear to have been granted, as a letter was foon afterwards received concerning the "refractorinefs of the magiftrates." The manors of Portland and Wike, with the ports of *Waimuth* and Melcombe, and the liberties attached to them, were granted by charter of Henry I. to the monks of St. Swithun, Winton; and Henry II. confirmed the port of *Waimue* and the whole land of Melcombe to that eftablifhment, with additional privileges. Weymouth and Melcombe are (as has been obferved under MELCOMBE *Regis*) fo frequently joined in defcents and ancient grants, that fome difficulty occurs in feparating them with precifion. Weymouth is the more ancient borough; though neither fent members to parliament till the reign of Edward II., fince which time each of them returned two. Melcombe, being part of the demefne of the crown, and poffeffing fome peculiar privileges, is principally noticed in fucceeding charters. The rivalfhip which fubfifted for centuries between the two boroughs arofe, in the reign of Elizabeth, to fuch a height, that it was judged expedient to unite them; and an act was paffed in her 13th year (afterwards confirmed by James I.), by which they were incorporated, and directed hereafter to be called "The united Town and Borough of Weymouth and Melcombe Regis;" the government being vefted in a mayor, recorder, two bailiffs, an indefinite number of aldermen, and twenty-four capital burgeffes: and they now poffefs, as one borough, the peculiar right, with the metropolis, of fending four members to parliament. The reprefentatives are elected by the freeholders of Weymouth or Melcombe, whether inhabitants or otherwife. The number of voters is about two hundred. Thefe electors have alfo votes for the county members. Leland fays, "The tounlet of Waymouth lyith ftrait agayn Milton (Melcombe) on the other fide of the haven, and at this place the water of the haven is but a fmaul brede, and the trajectus is by a bote or a rope bent over the haven; fo that in the ferry-bote they ufe no oars. Waighmouth has certain liberties and priviledges, but there is no mair in it. Ther is a kay and wharf for fhippes. By this town on a hill is a chapel of eafe. The paroche church is a mil off." The chapel mentioned by Leland was remarkable for its elevated fituation; having, according to Coker's furvey of this county, an afcent of eighty ftone fteps. It was of confiderable antiquity, as appears by a patent of Henry VI., granting a licence to found a guild in the chapel of St. Nicholas, in the borough of Weymouth, by the name of the mafter and wardens of the fraternity or guild of St. George, in Weymouth. This chapel was demolifhed in the civil war: the fcite is ftill called Chapel Hays, and is now ufed as a bowling-green. Weymouth, fince the time of Elizabeth, had, from a variety of caufes, been gradually going to decay. The removal of the wool-ftaple to Poole, the lofs of the Newfoundland trade, the havoc made by the civil wars, damages by fire, want of public fpirit, and other circumftances, had concurred to produce this effect; and till it began to acquire celebrity as a watering place, it was little more than an inconfiderable fifhing-town. The late Ralph Allen, efq. of Bath, about the year 1763, firft contributed to bring Weymouth into repute. Having received great benefit from bathing there, he proclaimed its falubrity to the extenfive circle of his acquaintance; and his encomium being exceeded by the real beauties of the fituation, it foon began to be the refort of the firft company from all parts of the kingdom. The reputation thus acquired was extended by the late duke of Gloucefter, who, having derived confiderable advantage himfelf, provided a refidence for the accommodation of the royal family; and their majefties, accompanied by the three elder princeffes, in the year 1789, made their firft vifit to this place. His majefty experienced its beneficial effects, and became fo attached to the fpot, that he has repeatedly honoured it with his prefence. The advantages arifing from thefe vifits have proved of the greateft confequence to the town, which has rapidly augmented in fize and importance, from the vaft concourfe of people by which it is now frequented. The chief objects of curiofity to ftrangers, are the Efplanade and the Bay. The Efplanade, a fine level piece of fand, which, but a fhort time ago, was nothing but a receptacle for all the rubbifh of the town, is now converted into one of the moft charming promenades in England, and adorned by a range of handfome edifices.

This

This public walk is half a mile in length, and about thirty feet in breadth. The bay, where the company bathe, makes a ſemicircular ſweep of nearly two miles, and is protected from winds by the ſurrounding hills, which render the ſea perfectly ſecure. As ſoon as Weymouth became a place of faſhionable reſort, the expediency of public amuſements was perceived; and Mr. Sproule of Bath offered propoſals for erecting a ſet of aſſembly-rooms, with an hotel, and other neceſſary appendages. The propoſitions were acceded to; and about the year 1772, a building, 600 feet in length, and 250 in width, was erected on a vacant ſpot adjoining the town, at the expence of 6000*l.*, which was defrayed by ſubſcriptions in ſhares of 100*l.* each. The Royal Aſſembly Room is a lofty, light, and ſpacious building, in which upwards of an hundred couples may dance with eaſe and pleaſure. The theatre has been recently fitted up in a ſtyle of elegance that does equal credit to the manager and the architect. The boxes are capable of containing 300 ſpectators; and the mode in which they are decorated is little inferior to the London theatres. On the quay is a moſt convenient hot ſalt-water bath. The bridge has been rebuilt in the Chineſe ſtyle. The church is a low ſtructure, occupying the ſcite of an ancient chapel belonging to the church at Radipole, of which pariſh this was originally a part, but in the reign of James I. was made a ſeparate juriſdiction; within it is a fine altar-piece, repreſenting the Laſt Supper, for which ſir James Thornhill, who executed and preſented it to the town, is ſaid to have refuſed 700*l.* Eaſt of the church are ſome buildings that are connected with a Dominican priory, founded here about the commencement of the fifteenth century. Theſe are now parcelled out in tenements; and the chapel belonging to the priory is uſed as a malt-houſe. The Quakers and Independants have each a meeting-houſe here. The number of houſes in Weymouth, as returned under the population act of 1811, was 447; of inhabitants 1747. Markets are held on Tueſday and Friday; and here are three annual fairs.

Several ſmall forts have at various periods been erected to defend the town and harbour. On a high cliff, about a mile from the town, are the ruins of Sandisfoot caſtle, a fortreſs erected by Henry VIII. about the year 1539, when he expected the Papal ſee to excite an invaſion of this country. Leland denominates it, "a right goodly and warlyke caſtle, having one open barbicane." Its form was a parallelogram, the greateſt length running from north to ſouth. The walls, which were moſtly caſed with ſquared Portland ſtone, were lofty and very ſtrong: in ſome places, the thickneſs was not leſs than ſeven yards.—Hutchin's Hiſtory of Dorſetſhire, 3 vols. folio. Beauties of England and Wales, vol. iv. Dorſetſhire. By J. Britton, and E.W. Brayley, 1804.

Weymouth, a town of New Jerſey, in the county of Glouceſter, containing 1029 inhabitants.

Weymouth, or Wassagusset, a town of the ſtate of Maſſachuſetts, in the county of Norfolk, containing 1889 inhabitants. This is ſaid to be one of the oldeſt towns in the ſtate. It lies on the coaſt, and has ſome ſmall veſſels employed in fiſhing. The cheeſe made in its environs is much eſteemed; 5 miles S. of Boſton.

Weymouth *Bay*, a bay on the N.E. coaſt of New Holland, to the N.W. of Cape Weymouth.

WEYPERT, a town of Bohemia, in the circle of Saatz; 25 miles N.W. of Saatz. N. lat. 50° 25′. E. long. 13°.

WEYS, a river of Auſtria, which runs into the Danube, a little to the E. of Ips.

WEZE, a river of France, which runs into the Meuſe at Liege.

WHALE, in *Aſtronomy*, one of the conſtellations. See Cetus.

Whale, *Cete*, in the Linnæan ſyſtem of *Zoology*, the ſeventh order in the claſs of *mammalia*. For the characters and diſtribution of this order, ſee Cete.

For the diſcriminating characters of the genus of *balæna*, or whale, and a general account of its ſpecies, ſee Balæna.

The common whale, or *balæna myſticetus* of Linnæus, with its variations, &c. is deſcribed under the article Mysticetus. Ariſtotle is ſaid to have given it the name of *myſticetus*, μυςικῆτος, or *bearded* whale, from its having in its mouth hairs inſtead of teeth.

In old time the whale ſeems never to have been taken on our coaſts, but when it was accidentally flung on ſhore: it was then deemed a *royal fiſh*; and the king and queen divided the ſpoil; the king aſſerting his right to the head, and the queen to the tail. The reaſon of this whimſical diviſion, as aſſigned by our ancient records, was to furniſh the queen's wardrobe with whale-bone.

The anatomy of the bones of the whale has been ſo little underſtood, that there have been many very great errors in regard to ſuch of them as have been at times found foſſile, or buried in the earth among the teeth of elephants, and the remains of teſtaceous and other animals. The moſt frequent and moſt ridiculous of all the wrong opinions about theſe, is their having originally belonged to creatures of the human ſpecies; yet many, even among the more intelligent part of the world, have taken them for the remains of giants. The vertebræ of a whale have been miſtaken for thoſe of a giant, and a part of its fins for a hand, and ſo of the reſt. While the world, more ready to ſpread the marvel, than to enquire into the truth, have made computations of the height of the man to whom bones of that ſize muſt have belonged, and from their proportion in regard to thoſe of the common human ſize, have found the giant who poſſeſſed them muſt have been 90 or 100 feet high; much leſs pains in comparative anatomy would have taught them, that they never could have belonged to any human body at all. Mem. Acad. Par. 1727.

Whale, *Beaked*, *Bottle-head*, or *Nebbe-haul*, *Balæna Roſtrata*, the ſmall whale, with taper ſnout, and adipoſe back fin, or with very long and acute beak or ſnout. The head, upper part of the back, fins, and tail, are of a dark or blueiſh-brown; and the ſides and abdomen are of a beautiful white, with a ſlight tinge of pale roſe or fleſh colour; and marked for more than half the length of the animal by numerous longitudinal plaits or furrows: the eyes are ſmall, as is alſo the head, and the ſnout is more elongated than in any other ſpecies, tapering gradually to the extremity, which is ſlightly pointed; the back fin is ſmall, and ſituated at no great diſtance from the tail; the pectoral fins are ſmall and narrow, and the tail is divided into two longiſh and pointed lobes. This is of a more elegant form than thoſe of the larger ſpecies. Theſe fiſh ſometimes, but rarely, grow to the length of twenty-five feet; they make little noiſe in blowing, are very tame, come very near the ſhips, and will accompany them a great way.

Whale, *Fin-back*, *Balæna Phyſalus* of Linnæus, called alſo *fin-fiſh*. See Physalus.

Whale, *Pike-headed*, *Balæna Boops* of Linnæus, is a ſpecies which takes its name from the ſhape of its noſe, which is narrower and ſharper-pointed than that of other whales. The length of one taken on the coaſt of Scotland, obſerved by ſir Robert Sibbald, was forty-ſix feet, and its greateſt circumference twenty; but it ſometimes exceeds this length. From the ſkinny flap at the root of the tongue, as well as from

from the inteftines, the Greenlanders prepare windows. See Boops.

Whale, *Round-lipped*, or *Broad-nofed*, or *Under-jawed*, *Balæna Mufculus* of Linnæus, is characterifed by having the lower lip broader than the upper, and of a femicircular form. See Musculus.

Whale, *Bunched*, *Balæna Gibbofa* of Linnæus, with one or more gibbous excrefcences on the back, and without dorfal fins: the knotenfifch oder knobbelfifch of Anderfon and Crantz. This fpecies is a native of the Northern feas, and though not much known, is faid to be of the fame general form with the great whale, but of fmaller fize, and having its back furnifhed with one or more tubercles. The variety with a fingle tubercle is found about the coafts of New England; the other with fix tubercles along the back is fuppofed to fwarm about the coafts of Greenland. Their whale-bone is faid to be of a pale or whitifh colour.

Whale *Spermaceti*. See Cachalot, Physeter, and Spermaceti.

See on the fubjects of the preceding articles, Pontopiddan's Nat. Hift. of Norway, vol. ii. p. 118, &c. Crantz's Hift. of Greenland, vol. i. p. 106, &c. Pennant's Brit. Zool. vol. iii. p. 50, &c. Phil. Tranf. abr. vol. viii. p. 424, &c. Shaw's Zoology, vol. ii.

Whale-*Blubber*, in *Agriculture*, the fat oily refufe matter left in making the oil from that fifh. It is a material which has been ufed as a manure in fome cafes with fuccefs, efpecially when employed in mixture with clayey loam, fandy loam, or any other common earthy or mouldy fubftances. Thefe matters fhould be blended together in fuch a manner, it is faid by the writer of the "Elements of Agricultural Chemiftry," as to expofe a large furface to the action of the air, the oxygen of which produces foluble matter from them. It is obferved, too, that lord Somerville made ufe of this oily fubftance with great fuccefs on his farm, in the county of Surrey; in which cafe it was made into a large heap with foil, and retained its powers of fertilizing for feveral fucceffive years.

It is noticed, that carbon and hydrogen abounding fo much in this as well as other oily fubftances, fully account for their effects; and that their durability is eafily explained from the very gradual manner in which they change by the action of the air and water on them, as muft obvioufly be the cafe.

This fatty material, in this fort of union with earthy matters, may confequently be a very beneficial application in many cafes of tillage-land, efpecially where the fuperficial bed of mould or foil is rather of the thin kind. It may alfo be very ufeful as a top-dreffing to grafs-land, particularly where the fward is thin, tender, and not well fet with graffy herbage, as tending not only to promote the growth of the crops, but the clofenefs and firmnefs of the furface fwardy covering. See Manure, and Oil *Compoft*.

It fhould therefore be preferved and procured as much as poffible for thefe ufes and applications.

Whale-*Bone*, a commodity procured from the whifkers of the whale, ufed as a ftiffening in ftays, fans, bufks, fcreens, &c. See Whale *fupra*.

Frederick Martens has particularly defcribed the whalebone and the method of procuring it in his "Voyage to Spitzbergen." Within the mouth of the fifh is the whale-bone, hairy as a horfe's hair, and hanging down from both fides, all about his tongue. In fome whales the whale-bone is bent like a fcymitar, and in others like a half-moon. The fmalleft whale-bone is before in his mouth, and behind towards his throat; and the middlemoft is the largeft and the longeft, being fometimes about two or three men's length. On one fide, all in a row, there are 250 pieces of whale-bone, and as many on the other, containing in all 500; and there are ftill many more, for the cutters let the leaft of all remain, becaufe they cannot eafily come at it to cut it out, on account of the meeting of the two lips, where the fpace is very narrow. The whale-bone is in a flat row, one piece by the other, fomewhat bending within, and towards the lips every where like a half-moon. It is broad at the top, where it fticks faft to the upper lip, every where overgrown with hard white finews towards the root, fo that between two pieces of whale-bone you may put your hand. Thefe white finews are of an agreeable fmell, break very eafily, and may be boiled and eaten. Where the whale-bone is the broadeft, as underneath by the root, there groweth fmall whale-bone, the other being greater. The fmall whale-bone, as Mr. Martens fuppofes, does not grow bigger; from one end to the other it is equally thick, and full of long jacks, like horfe's hair. The whale-bone is underneath narrow and pointed, and all overgrown with hair, that it may not hurt that which is young; but without the whale-bone has a cavity, for it is turned like a gutter, in which the water runs, where it lies the one over the other, like the fhields or plates of craw-fifh, or the pantiles of an houfe, that lie one over the other; for otherwife it might eafily wound or hurt the under lip. To cut the whale-bone out is a particular operation, and many iron tools are ufed for this purpofe. Some whale-bone is of a brown, black, or yellow colour, with ftreaks of feveral colours. The whale-bones of fome whales are blue and light-blue, which latter are fuppofed to come from young whales.

Whale-*Fins*, a name improperly given to whale-bone.

Whale-*Fifhery*. See Fishery.

Whale *Oil*. See Oil.

Mr. Parkes (Effays, vol. i.) obferves, that the dealer in Greenland whale oil might alfo increafe the profits of his trade very much, by preparing his oil for fale when the weather is fuitable for the operation. This kind of oil is always purified by paffing it through large flannel bags, which retain the impurities, and fuffer the finer parts to percolate through them. When the oil has undergone this treatment, it is called *bagged* oil, and is then deemed fit for fale. At a low temperature, a confiderable quantity even of this latter kind would concrete, and might be feparated by fimilar means; whereas in a warm atmofphere this diffolves, and, being lefs inflammable, very much injures the oil for burning.

By proper attention to this circumftance, all the oil which is defigned for burning might be very much improved, and the portion thus feparated from it, would be worth more to the foap manufacturer for making yellow foap, than fimilar oil which had not undergone this procefs.

This intelligent chemift conceives, that an oil-merchant would do well always to bag different oils in different feafons; though many experiments might be neceffary before it could be afcertained what was the exact temperature at which the refpective kinds would moft copioufly depofit this feculence. After obferving that in feveral parts of Germany, and particularly in the neighbourhood of Gottenburgh, ammonia is prepared from the dregs which remain after the expreffion of train-oil, he fuggefts that whale-blubber might be employed for the diftillation of ammonia. Madder, he fays, might be devifed for correcting its offenfive fmell, and rendering it very productive of volatile alkali. See Ammonia.

Whale *Bank*, in *Geography*, a fifhing-bank on the coaft of Newfoundland, 60 miles long, and 21 wide; 90 miles S. of Cape Mary. N. lat. 45°. W. long. 53° 50′.

Whale *Cove*, a bay of the Atlantic, on the north coaft of the ifland of Manan, near the coaft of Maine.

WHALE *Fish Island*, an island on the coast of Guiana, at the mouth of the river Essequibo.

WHALE *Island*, a small island in the North sea. N. lat. 69° 14′. W. long. 134°.—Also, a small island near the north-west coast of Borneo. N. lat. 4° 10′. E. long. 112° 21′.

WHALE *Islands*, small islands in Portsmouth harbour. N. lat. 50° 48′. W. long. 1° 5′.

WHALE *Point*, the south-east cape of an island in the straits of Magellan; 6 miles S.S.W. of Passage Point.

WHALE *Rock*, an under-water rock at the entrance of the Bay of Islands, on which the Endeavour struck in 1769; 4 miles S.E. of Point Pocock.

WHALE *Sound*, a channel in the straits of Magellan, between an island and the coast of Terra del Fuego.

WHALFIRTH VOE, a bay on the west coast of the island of Yell. N. lat. 60° 58′. W. long. 1° 25′.

WHAME, in *Natural History*, the name given by the people of some parts of England to the burrel-fly, or wringle-tail, a species of bee-fly very troublesome to horses.

WHANG-HO, in *Geography*. See HOANG-HO.

WHAPLODE, a township of Lincolnshire; 2 miles S. of Holbeach.

WHAPPING'S CREEK. See WAPPING'S *Creek*.

WHARF, a perpendicular building of wood or stone, raised on the shore of a road or harbour, for the convenience of landing or discharging a vessel, by means of cranes, tackles, capsterns, &c. See *Artificial* PORTS.

The fee paid for the landing of goods on a wharf, or for shipping them off, is called *wharfage*. And the person who has the oversight or direction of the wharf, receives wharfage, &c. is called the *wharfinger*.

There are two legal denominations of wharfs, *viz.* legal quays and sufferance wharfs.

Legal quays are certain wharfs in all sea-ports, at which all goods are required, by the 1 Eliz. c. 11., to be landed and shipped (except at Hull); and they were set out for that purpose by commission out of the court of exchequer, in the reign of Charles II. and subsequent princes. Others have been legalized by act of parliament; as the London docks, by 39 & 40 Geo. III. c. 47.; West India docks, by 39 & 40 Geo. III. c. 69. and 42 Geo. III. c. 113; East India docks, by 43 Geo. III. c. 126. and 46 Geo. III. c. 113. (See DOCKS.) Hull, by 14 Geo. III. c. 56. and 42 Geo. III. c. 191.; Milford, by 30 Geo. III. c. 55.; Bristol, by 48 Geo. III. c. 11.

In some ports, certain wharfs are deemed to be legal quays by immemorial practice, though not set out by commission, or legalized by act of parliament; such as Chepstow, Gloucester, &c.

Sufferance wharfs are places where certain goods may be landed and shipped; such as hemp, flax, raff, and other bulky goods; likewise goods carried coastwise, in Great Britain, by special sufferance granted by the crown for that purpose.

The constituting limits to the ports and legal quays is part of the royal prerogative. Lord Hale's Treatise. *Vide* Hargrave's Tracts.

WHARF also, in a *canal*, denotes that wider part of it where boats lie while loading or unloading.

WHARFAGE, in *Commerce*, certain rates paid for landing and shipping goods from the quays.

WHARFE, or WHERFE, in *Geography*, a river of England, in the county of York, which runs into the Ouse, 7 miles below York.

WHARFINGER, the proprietor or farmer of the quays where goods are shipped and landed.

By the 26 Geo. III. c. 40. no goods entitled to drawback or bounty on exportation are to be shipped in Great Britain, but by wharfingers licensed by the commissioners of the customs; and in docked lighters. And they are to give bonds not to be concerned in illegally landing, relanding, or shipping goods. They are also liable to certain penalties at conniving or knowing of any fraudulent transaction, or landing goods at improper places and times, by 1 Eliz. c. 11., and 13 & 14 Cha. II. c. 11.

WHARTON, HENRY, in *Biography*, an English divine of the Established Church, was born in 1664, at Worstead, in Norfolk, where his father was vicar; and in his sixteenth year admitted a pensioner of Gonville and Caius college at Cambridge, where he assiduously pursued the study of various branches of literature, and particularly of mathematics, under Isaac Newton, Lucasian professor. After taking the degree of B.A. with great reputation, he assisted Dr. Cave in his "Historia Literaria," contributing almost the whole of the appendix of the three last centuries. In 1687 he took orders, and his degree of M.A. in the following year. He had various literary occupations, chiefly in writing or editing treatises against Popery; until he took priest's orders, when he was presented first to the vicarage of Minster in the isle of Thanet, and in 1689 to the rectory of Chartham. By the advice of Dr. Lloyd, bishop of St. Asaph, he undertook the work which gave some celebrity to his name, intitled "Anglia Sacra, sive Collectio Historiarum, partim antiquitus, partim recenter Scriptarum, de Archiepiscopis et Episcopis Angliæ à prima Fidei Christianæ susceptione ad Annum 1540," 2 vols. fol. London, 1691. An additional part was published after his death in 1695, under the title of "Historia de Episcopis et Decanis Londinensibus; necnon de Episcopis et Decanis Assavensibus (St. Asaph); à prima Sedis utriusque Fundatione ad Annum 1540," 8vo. The author's "Anglia Sacra" was the result of great industry and labour, and evinces the author's zeal for the church to which he belonged; but it is chargeable with incorrectness. In 1692 he published "A Defence of Pluralities;" in the following year he edited some ancient theological pieces; and, under the name of Anthony Harmer, published "A Specimen of some Errors and Defects in the History of the Reformation of the Church of England, by Gilbert Burnet, D.D.," a work which excited the indignation of the author, and caused him to mention Wharton with asperity in the introduction to the third volume of that work. The last publication of Wharton was "The History of the Troubles and Trial of Archbishop Laud;" to which were added Laud's diary, and some other pieces. He also edited the Life of Cardinal Pole, by Bacatelli, together with some animadversions on Strype's Memorials of Archbishop Cranmer. Although his constitution was strong, he closed his life, in consequence of intense application, somewhat prematurely, in March 1694-5, in the 31st year of his age, leaving several MSS., some of which were afterwards printed, as also two volumes of sermons. He was interred in Westminster-abbey. Biog. Brit.

WHARTON, PHILIP, *Duke of*, the son of the marquis of Wharton, who was a firm supporter of the Revolution and Hanover succession, was born in 1699; and after having exhibited talents which commanded notice, when he was 13 or 14 years of age, in the course of his education under domestic tutors, contracted a premature marriage with the daughter of major-general Holmes, and thus disappointed his father's views, and hastened his death in 1715. In the beginning of 1716, Philip set out on his travels, proposing to finish his education at Geneva; but the young marquis, having contracted a taste for gaiety and expence, was difgufted with the manners of that place, and leaving his governor there, proceeded to Lyons, and wrote to the Pretender at Avignon, accompanying his letter with the prefent of a fine horfe. The Pretender was highly gratified, and receiving the marquis at his court, decorated him with the title of the duke of Northumberland. At Paris he paid his refpects to the dowager-queen of James II., and received notice and good advice from the Englifh ambaffador, lord Stair. About the end of 1716 he returned to England, and going over to Ireland, where he poffeffed a peerage, he was admitted to take his feat in the houfe of lords of that kingdom. Here, deferting the principles and connection which he had lately formed, he defended the eftablifhed government with all the powers of his reafoning and eloquence; in confequence of which he was advanced to a dukedom, by the ftyle of duke of Wharton, in the county of Weftmoreland. Upon coming to age, he took his feat in the Englifh houfe of lords, where he diftinguifhed himfelf by an abandonment of his lately avowed principles, in the defence of bifhop Atterbury; and he alfo publifhed a virulent oppofition paper, intitled "The True Briton." But fuch was his boundlefs extravagance, that his eftate was vefted, by a decree of chancery, in the hands of truftees, who allowed him an annuity of 1200*l*. Having only this pittance, he determined to live abroad, and to enter into the fervice of the Pretender. Having vifited Vienna and Madrid, he formed an acquaintance at the latter place with a young lady of Irifh extraction, who was maid of honour to the queen of Spain, and married her; his duchefs having died in 1726, without leaving any iffue. From Rome, where he appeared under the title of the duke of Northumberland, and decorated with a blue ribband and garter, he returned to Spain, and obtained permiffion from the king to go as a volunteer to Gibraltar, which was then under fiege by the Spaniards. When this fiege broke up, he vifited the Spanifh court, and was nominated by the king "colonel-aggregate" of one of the Irifh regiments. Difcouraged in his wifhes to be actively employed in the fervice of the Pretender, he went to Paris, and with fingular effrontery paid a public vifit to the Englifh ambaffador, Horace Walpole; informing him, upon taking leave, that he was going to dine with the bifhop of Rochefter, though it had been made criminal to hold any communication with that exiled perfon. At this time a bill of indictment for high treafon was preferred againft him in England, for having appeared in arms againft his majefty's fortrefs at Gibraltar; but a wifh to reclaim him induced fir Robert Walpole to fend two friends to offer him his re-eftablifhment and the poffeffion of his eftate, if he would only fue for pardon. This he refufed to do, confenting only to accept a pardon if freely granted him. His allowance from home was difcontinued, and he was overwhelmed with debts abroad. From Rouen, where he had for fome time refided, he removed to Paris, living meanly, and providing for himfelf by various difhonourable expedients. Having obtained a fmall fum, when all his refources had failed, he took his duchefs with him, and went by water to Bilboa. From thence he proceeded to join his regiment, fubjecting his duchefs to extreme diftrefs, in which fhe was occafionally relieved by the bounty of the duke of Ormond, who was himfelf an exile. In 1730 his health declined, and he amufed himfelf in compofing a tragedy, on the ftory of Mary queen of Scots; but his end was approaching. In his way to a mineral fpring, in the mountains of Catalonia, where he had once obtained relief, he was obliged to ftop at a fmall village, when his condition was fo pitiably deftitute, that the fathers of a Bernardine convent took compaffion upon him, and brought him to their houfe, where by attention and cordials his life was prolonged for about a week. At length, without a friend or acquaintance to clofe his eyes, having performed the laft duties of penitent devotion, he expired on May 31, 1731, in the 32d year of his age, and was interred the next day after the manner of a poor monk. Pope has recorded his character, in the firft epiftle of his Moral Effays, in the following beautiful lines:

> "Thus with each gift of nature and of art,
> And wanting nothing but an honeft heart;
> Grown all to all, from no one vice exempt,
> And moft contemptible to fhun contempt;
> His paffion ftill, to covet general praife;
> His life, to forfeit it a thoufand ways;
> A conftant bounty which no friend has made;
> An angel tongue which no man can perfuade;
> A fool, with more of wit than half mankind;
> Too rafh for thought, for action too refin'd;
> A tyrant to the wife his heart approves;
> A rebel to the very king he loves;
> He dies, fad outcaft of each church and ftate,
> And, harder ftill! flagitious, yet not great."

Wharton was one of the warmeft patrons of Young, who dedicated to him his moft celebrated tragedy "The Revenge," and gave him the credit of having fuggefted the moft beautiful incident in that compofition. Biog. Brit. Pope's Works. Johnfon's Lives of the Poets.

WHARTON, THOMAS, a phyfician and anatomift, was born in Yorkfhire, in 1610, and educated at Pembroke-hall, Cambridge. Before the civil wars he refided in Trinity college, Oxford, as private tutor to a natural fon of lord Sunderland. Upon the commencement of the war, he removed to London, and engaged in the practice of phyfic. After the furrender of Oxford to the parliament in 1646, he returned to Trinity college, and was created M.D. by the recommendation of general Fairfax. Returning again to London, he became a member and cenfor of the college of phyficians, and acquired confiderable practice and reputation. In 1652 he read lectures before the college on the fubject of the glands; but labouring, as other anatomifts of that day did, under a fcarcity of human fubjects, he was under a neceffity of availing himfelf of animal diffection. In his work, intitled "Adenographia, five Glandularum totius Corporis Defcriptio," 1656, 8vo., his defcriptions are almoft wholly taken from brute animals, and therefore cannot ftand the teft of modern accuracy. Neverthelefs he revived and improved the knowledge of the falivary ducts on the fide of the tongue, to which he affixed his own name; and he furnifhes ufeful obfervations on the difeafes of the glands. He died in 1673. Haller. Gen. Biog.

WHARTON, in *Geography*, a townfhip of Pennfylvania, with 922 inhabitants; 30 miles S. of Pittfburgh.

WHATLY, a town of Maffachufetts, with 891 inhabitants; 10 miles N. of Northampton.

WHATOGA, a town of United America, in the Tennafee ftate; 40 miles S. of Knoxville.

WHEAT, in *Botany*. See TRITICUM.

WHEAT, in *Agriculture*, a well-known valuable grain, much cultivated and grown in many parts of this as well as moft other countries, as being the principal fort of corn from which bread is made. It is not now well known from what country wheat was firft introduced into this; but it has lately been fuggefted as probable, by fir Jofeph Banks, in confequence of having a fmall paper of feeds, on which were written *Hill wheat*, put into his hands, the feeds contained in which were found to be fcarcely larger than thofe of our wild graffes; though, when nicely examined, they perfectly

perfectly resembled grains of wheat, and which on being sown in a garden very unexpectedly proved to be wheat of the spring kind, and the usual size, the grains of which being nearly, if not wholly, as large as those of the ordinary wheat of the above sort, that the packet and seeds came either from the peninsula, or from the hilly country, far within land from Bengal, as that province itself is a flat alluvial tract of land, entirely level. That as this hill wheat is, however, no doubt, it is supposed, known to some persons who are now either in India, or who have lately returned from thence into this country, it is certainly a matter of some importance to know what information they can give on the subject of it, especially whether this wheat be a cultivated, or a wild plant; as we shall, it is said, if the latter be the case, ascertain two of the greatest desiderata of cultivators; as those of the country where wheat grows spontaneously, and the nature of the grain in its original state, when unassisted by the fostering hand of man.

It is by no means improbable, from the nature and habits of wheat, that it may have come originally from the hilly country of the east, and been rendered hardy by time and cultivation in this and most other parts of the world.

Wheat is a kind of grain of which there are two different species, in cultivation as crops, in the climate of this country; as the common *smooth* or *polled* wheat, and the cone *rough* or *bearded* wheat. Of the first of these sorts, which is by much the most cultivated in this kingdom, as being the most suited to the nature and quality of the largest extent of the soils or lands in it, and as affording the finest kind of flour, there are numerous varieties that are differently preferred in different situations; and the latter species, which is often termed *rivet* wheat, and which has also several varieties that differ little except in the colour of the chaff and the form of the ears, though it does not afford the finest sort of flour, as yielding the largest quantity of produce on stiff moist clayey lands, and as being less subject to injury and disease from wetness on such soils, as well as less liable to lodge from its firmness of stem, is frequently cultivated and grown on such sorts of land.

It has been observed by an able and intelligent cultivator in the county of Kent, Mr. Boys, that the number of sorts of this grain is annually increasing by importation from foreign countries. But that the *old* sorts are the *brown* and *yellow lammas*, the *white straw*, *Fulham*, and the *white* or *egg-shell*. That the *brown lammas* was the kind chiefly cultivated in that county till within these twenty or thirty years; but that it has now given way to a variety of new kinds, as well as some of the other old sorts: experiment has, however, shewn it to be the least productive of the several sorts. It is the common *brown-strawed wheat* that grows with a long jointed ear, the chaff of a dark brown colour, the straw long and apt to fall, the hull or bran thin, the flour very white, and the corn mellow in grinding, for which reason it is esteemed by the millers as the best of the *old* sorts for their use; and that the *yellow lammas* resembles the *brown*, in every respect, except that the colour of the grain is of a yellow hue, and the chaff of a somewhat lighter colour than the others. A red lammas with a red straw, red ear, and red kernel, is noticed by Young as being reckoned by many farmers the best of all the sorts hitherto known, as yielding the finest and whitest flour. The first of these writers states, that the *white-strawed wheat* takes its name from the colour of its ear, and in other counties has the title of the *Kentish white straw*. That it sends out a greater number of stems from the stool or plant than the other sorts, and in that way is often a very thick crop on the land. That the straw is generally somewhat shorter than that of many other sorts, and not quite so liable to fall in rainy seasons. That it is on these accounts much sown in the eastern parts of that county; but that from its dull colour, its having a thick bran, and often grinding very steely, it is not much approved by the millers of the district. It is remarked, that the *Fulham* sort produces a white straw, which grows short and coarse; but that it is very productive, particularly on poor land: the grain is however coarse, and the bran thick, which circumstances render it the least valuable to the millers of any of the sorts described above. And that the *white* or *egg-shell* wheat is known by its producing a white straw, a smooth white chaff, and very white grain: the bran of which is very thick, but the flour remarkably white. It works mellow in grinding, is very early ripe, and so free in the ear as to blow out in windy weather, which is a disadvantage.

It is noticed, that of the *new* sorts of wheat in that county, as the *hoary white*, the *nonpareil*, the *pilbeam*, the *square ear*, the *hoary brown*, and the *hoary white*, called by some the *velvet-eared*, the last is by far the most valuable, as being very productive, and the best for the miller's use. It has the straw white and short, the chaff covered with a thick fine down, somewhat of a brownish hue; the grain remarkably small, and of a dull white colour, the bran very thin, so that the grain in some cases is almost transparent when held up to the light. It grinds very mellow, and makes a beautiful fine white flour. But from the quantity of the down upon the chaff, and its small ears binding up very close in the sheaf, it is apt in a rainy season to vegetate too freely in the field; on which account it is not so proper to cultivate in a moist climate, and in small inclosures that are not open to the influence of the sun and winds. That the nonpareil is a sort said to have been brought into this country from America: it has a bright straw, with a brown ear; and the grain is very white, large, and plump. It is very productive on all soils, thrashes very free, and yields in that operation the greater part of its chaff; thereby producing a great quantity of horse-meat. It grinds very mellow, and is well esteemed by the millers in most districts. And that the *pilbeam* is a brown wheat growing very stiff, and is generally thick on the land. The grain is small and plump, somewhat of a yellow-brown. It is accounted very productive on rich lands, and is a valuable kind to mix with others, but will not of itself make good bread, from its not fermenting or working properly in that operation. In regard to the *square-eared wheat*, that it is a very productive sort, but is apt to drop out in the field, before it is ripe, and in gales of wind, on which account it is not so much cultivated. And that the *hoary brown* is but lately introduced, consequently little known at present. And the *hoary white* sort, which has a white straw, ear, and grain, is in much the same situation. That the *Clarke-wheat*, which has a red blossom, chaff, and straw, but white grain, is much cultivated in Sussex. That the *hedge wheat* is also white and very productive. And that the *velvet wheat* is distinct from the hoary white, but is white, not weighty, yet affording much flour, being very thin in the skin.

There are also different varieties of cone or bearded wheat, a sort which is named from the form of the ear, as has been seen above. That of the *rivet wheat*, there are two sorts, the white and the brown, neither of which are much cultivated in Kent. They both ripen late in the season, and are so coarse and steely, as to be unfit for making bread, unless mixed with a large proportion of a better sort of flour. They, however, produce very abundant crops on strong wet lands, as has been noticed. It is remarked, too, by Mr. Young, to be a productive sort on very poor, wet, cold

cold land, though a coarfe grain, felling at an inferior price in the markets. And the bearded or rivet kind of wheat is likewife thought, by fome cultivators, to be the moft adapted to fuch kinds of rich lands as have been newly broken up, and where there may be danger of the crop lodging from too great luxuriance, as it poffeffes the property of a greater firmnefs of ftraw or ftem than the common kinds, as fuggefted above.

The white and the red are the forts the moft efteemed in general among the polled kind; the former affording the whiteft flour, but the latter has the greater produce in moft cafes.

It is obferved, that of the feveral forts of wheat that are in cultivation in the county of Suffex, the velvet-eared is preferred in the weald part of it, as having by much the thinneft fkin: they there call it *ftuffed*. It weighs on the average from fifty-nine to fixty pounds the bufhel. It is faid by the beft judges that the *white ftuff* on good land anfwers beft, as being the moft faleable: but that on poor land, fubject to poppies, the ftrong-ftrawed fort that overpowers this weed fhould certainly be fown.

There is a fort of wheat that obtains much on the Down parts, which is what they call Clark wheat. It is not bearded; has a red bloffom, red chaff, and red ftraw; white grain, as already feen; the fample coarfe, being in price under the fineft forts. It is, however, a great yielder, and requires to be cut forward.

The *Chidham white* or hedge wheat is much in cultivation, being introduced by Mr. Woods of this diftrict. Upon trial it is found to be a very fine fort: it is white, of a very fine berry, and remarkably long in the ftraw. It is now much grown in many of the fouthern as well as northern counties.

In the county of Effex, according to the Corrected Report on the Agriculture of that diftrict, Mr. Kemp of Hedingham compared wheat from Italy, from Scotland, and from Dantzic; the laft by far the beft, and next the Scotch; but the Italian was full of fmut in fpite of every attention in brining and liming; and fowing it a fecond time with ftill more precaution, the refult was the fame.

About Burnham, fome cultivate a fort of wheat from Italy, which they approve of much; the ftraw is remarkably ftout and ftiff. They cultivate alfo a fort called the *Sopfodite*; red grain, red chaff, and purple ftraw; this is a very good fort. The Taunton Dean, too, is beautiful, but will not bear rough weather. For two years paft the Hamburgh white, with white grain, and white chaff, has been a fafhionable fort; the white American fort is alfo ufed.

The forts moft ufually fown about Kelvedon are the *burrel red chaff*, and red grain; and the *white rough;* white chaff, and white grain, the chaff rough: this fort ftands the weather well, and does not fhell eafily; but is rather difficult to thrafh. About Langenhoe they generally fow white wheat on heavy land, and rarely rivets, *rough chaff*, *York white*, alfo *American red*. Some other of the above forts are likewife in ufe.

It is remarked that a few years ago, as a perfon at Bradfield was walking through his wheat-fields when the corn was in full bloffom, he was ftruck with the variety of hues, or colours, which the bloffoms affumed: at firft he conceived it might be owing to the different ftages of forwardnefs in the bloffom; but on particular examination and more mature reflection concluded that they were certain figns of a fpecific difference in the quality of the wheat: impreffed with this idea, he felected the ears of different hues, and particularly marked eleven diftinct numbers; noting very minutely their characteriftic qualities and appearances in the field. Thefe he gathered and kept feparate when ripe, and planted them apart from each other in his garden; the fame characteriftic difference was obferved to continue upon the feveral numbers when growing in the garden as was obferved in the field the preceding fummer, and are as below.

Firft year in the garden culture.—No. 1. A ftiff ftraw, thick ear, the rows or chefts in which fet clofer than in any other.

2. Dark ftraw, full blade, and large open ear.

3. A large long ear, ripened late, and well fet.

4. Full foliage, and a long open ear.

5. Straight handfome ftraw, large well-fet ears, flag or leaf fmall.

6. Red rufty leaf before fpindling, red ftraw with little leaf at harveft and fmaller ears than any.

7. Very like No. 6. in ftraw, the ears fmall, but well fet.

8. Straw leafy at harveft, of a good colour, well eared and handfome.

9, 10. Straw full of flag or leaf at harveft, ears fet wide.

11. Very like No. 5.

Second year in the garden culture.—No. 1. Short upright ftiff ftraw, thick well-fet ears, and later by four or five days than any of the others.

2. Very dark ftraw, upon which there remained a full dark blade at harveft; long open ears.

3. Strong leafy ftraw, of a good colour, with a thick long ear, well fet, rather later than Nos. 5, 8, and 11.

4. Thick leafy brown ftraw, with a fmall ear.

5, 8, 11. Short handfome bright leafy ftraw, ears long, thick and well fet.

6. Long ftraw with a good deal of flag, ears ill fet and open.

7. Straw handfome, but fmall ears, and fubject to root-falling.

9, 10. Long weak ftraw, very leafy, and fubject to root-falling.

It is noticed on thefe, that the lemon-coloured bloffom was obferved to attend Nos. 5, 8, and 11; but the colour of Nos. 1 and 3. was not particularly remembered. Thefe are the numbers which had been preferved, Nos. 5, 8, and 11, coming to the fickle about a week earlier than Nos. 1 and 3, the produce of which, when compared with the rejected numbers, is an excefs of from fix to eight bufhels *per* acre, and weighing about three pounds more to the bufhel.

At Bradwell, it is obferved, a crop of *Windfor* wheat was had, white grain, white ftraw, and white chaff, which was a moft beautiful fample; the ftrength of the ftraw middling.

That of all the different forts of wheat Mr. Hardy has tried on his farm, the beft has been the white egg-fhell, and this is the fort moft cultivated in Foulnefs ifland.

That the *red American* is a fort which yields remarkably well with fome; it is much approved in Merfea ifle. Some have had the beft fuccefs with it. But Mr. Strutt, at Terling, fowed a barrel of remarkably beautiful wheat from New York, in part of a field, the reft of which was fown with Englifh wheat, and the American was fo blighted in the ear as to produce a poor and miferable grain both in quality and quantity. He fowed it again, and the refult was the fame, and repeated the experiment the third time, the refult again the fame, though the adjoining Englifh wheat in all the three years produced a fair crop free from all blight. The *habit* of this wheat, therefore, was not, it is faid, changed in three years fowing.

That the *rough chaff*, a white chaff and white grain, with

a velvet

a velvet ear; is found about Burnham to be an excellent ſort; for there they are ſubject to ſtrong eaſterly winds, and it does not ſhell eaſily. But ſome, however, do not like it on heavy land, as it has not ſtraw enough; and think that it ſhould ſtand till ripe, or it will not thraſh well.

And about Hallingburg Riſe, and indeed through all the diſtrict of the Roodings, they find the *rivet* ſort a very uſeful wheat, which is very general, and is found to yield on that heavy ſoil much better crops than any common ſort; but on lighter ſoils the Kentiſh red.

In Norfolk about Reddleſworth they have an opinion that *red wheat* will not anſwer on black ſand, white ſucceeding to much better advantage. But at Winborough red is only ſown by Mr. Salter, the white ſorts not anſwering ſo well on the heavy ſoils: it is termed the *old red*. Some prefer the *red chaff*, or red wheat to the white, as being leſs liable to grow at harveſt; white however is a better ſample, and produces a better price.

In Hertfordſhire the rivet or bearded ſort is the common ſort on the clays and ſtrong loams about Sawbridgworth, on which it yields more abundantly than the red and white wheats, four or five quarters *per* acre not being uncommon in favourable years. And a ſort termed *polled rivets* is alſo very productive, one hundred grains having been ſeen in an ear.

About St. Alban's, *Day's ſtout*, which has the ears growing with four ſets of kernels, is much ſown: alſo about Hitchen, where it was diſcovered by a poor labourer who gathered a few ears. It is ſaid to yield well. It is ſuppoſed to be the *pirks* of Ellis. The *red lammas* and *Luſwell*, brought from Cambridgeſhire, are likewiſe much ſown. On the Albury clays the rivets are grown, yielding largely, but ſubject to mildew, and ſelling badly with indifferent ſtraw. They have a *blue* and *white* ſort; the latter is preferred.

In moſt other counties, the ſame ſorts of wheat are likewiſe cultivated and grown with ſome other varieties.

In addition to theſe, there is, however, another ſpecies or ſort of this grain, which is now much cultivated in ſome caſes, as that which is known by the name of ſpring-wheat. This is a ſort of wheat that is capable of being put into the ground at the ſame time with other grain crops, in the early ſpring months. The cultivation of it has been long practiſed, in ſome degree, in both the northern and ſouthern parts of the iſland; but of late a much greater attention has been beſtowed upon it, and at preſent it is raiſed and grown to conſiderable extent in different diſtricts and places, as in the fens of Lincolnſhire and Cambridgeſhire, in many parts of Oxfordſhire, in ſome inſtances in Berkſhire, in Hertfordſhire, where it is found to anſwer well, and in moſt of the other ſouthern counties, as well as in many parts of the north of England, and even in the lower parts of Scotland.

The common autumn or winter ſort of this grain is in general moſt ſuited to the heavier deſcriptions of mellow ſoils, which do not retain too much moiſture. They ſhould however be of a fertile quality, and capable of affording a fine ſurface mould, for the reception of the grain. But good crops may be raiſed on the lighter ſorts; though the introduction of it on ſuch kinds of land, has been ſuggeſted as diſadvantageous from their being ſo much more adapted to the raiſing of other kinds of crops.

The cone, bearded, or rivet ſorts of ſuch wheat are the moſt proper for the heavier, more moiſt, and leſs broken down and reduced kinds of land that have been more lately put in cultivation, on which very weighty crops are not unfrequently produced.

All theſe ſorts of wheat are grown to the moſt advantage and with the greateſt ſucceſs, where the bottom in the land is ſomewhat inclined to be firm and cloſe.

In regard to the ſpring ſort of this grain, it would ſeem to be capable of being cultivated on the ſtrong and heavy, as well as on the lighter ſorts of land; but that it is the moſt calculated for the latter, where the vegetation and growth are rapid, particularly ſuch fenny lands as have a firm turf-earthy bottom. In theſe it riſes in a very quick manner, and they are not by any means well ſuited for the winter ſorts of wheat from their lightneſs, rendering them liable to be thrown out in that ſeaſon.

Preparation of the Land.—Wheat is a crop that is uſually grown after the land has been prepared by repeated ploughing and harrowing or ſummer fallowing; but which is often capable of being raiſed after different kinds of green crops, as well as thoſe of the root and other ſorts with equal or more advantage. In ſome caſes, flax and hemp alſo afford a good preparation for this grain; but ſome conſider beans as the moſt favourable preparation: and experiment has ſhewn tares, and clover, to be nearly equal to them in this intention. In the county of Norfolk, wheat almoſt conſtantly ſucceeds clover, except where pea or bean crops are interpoſed, the land being ſcarcely ever fallowed with this view, except in the inſtances of what are termed *baſtard ſummer tills*. It has indeed been well obſerved, that if there is one practice in huſbandry proved by modern improvement to be worſe than another, it is that of ſowing wheat on fallows; it is therefore only ſtated on this point, that in ſome counties the fallows are ploughed juſt before harveſt on to two-bout ridges ready to plough and ſow under the furrow in the ſpraining method, a ſeedſman to every plough which reverſes the ridges. In others they lay their lands into ten or twelve furrow-ſtitches or ridges, and ſow ſome under the furrow, ſome under the harrow. That the ridges vary exceedingly, according to their wetneſs; and that in Kent they have by means of the turn-wreſt plough, no lands at all, but a whole field, one even ſurface. It would be uſeleſs to expatiate on the circumſtances of fallow-wheat which ought no where to be found. If fallows be or are thought neceſſary, let them be ſown for barley or oats, or with any thing but wheat. However, in whatever manner or after whatever kind of crop this ſort of grain may be cultivated, the ſoil ſhould conſtantly undergo that ſort of preparation that may be ſufficient, according to the particular circumſtances of the land, to bring it into a ſtate of conſiderable fineneſs of mould, eſpecially in the more ſuperficial parts, and thereby prevent as much as poſſible the riſing of weeds; for it has been well noticed by a late writer, that whoever has attended to the progreſs of this ſort of crop, in ſuch lands as have been well broken down and reduced, and in ſuch as have been left in a lumpy crude ſtate at the time of ſowing, will have found the difference to be very conſiderable. But it may be noticed, that when this kind of crop is taken after clover, the land ſeldom undergoes more than one ploughing, which is moſtly given immediately before the ſeed is ſown. However, as the graſſy matter, in many caſes where this mode is adopted, is extremely apt to riſe and injure the crops in the more early ſtages of their growth, it may be better to follow the practice adopted in ſome diſtricts of uſing a ſkim-coultered plough, as by this contrivance the remains of the clover weeds, and graſſy material on the ſurface, may be cut or ſkimmed off, and turned into the bottom of the furrows, where they are immediately covered with the looſe mould from below to ſuch a depth, that little or no inconvenience can be ſuſtained by them, while the land is thus rendered more clean, and capable of being harrowed in a more perfect manner than where the common plough only is employed.

ployed. Befides, perhaps, a better bed of mould is turned up in this way for the feed to vegetate in, provided the furrow is not made of too great a depth and breadth, and remain fome time before it is fown; which fhould conftantly be attended to by the agriculturift in preparing this fort of ground for wheat-crops. But it is the cuftom of fome counties, as of Norfolk and Warwick, where the land is often continued for nearly two years in a ftate of clover, to break them up in the latter end of June; in the fecond, giving two, and fometimes three ploughings. Where the fituation is favourable, and the weather turns out fuitable for reducing the foil to a proper ftate of tilth, this may be an advantageous practice, as by fuch means great benefit may be obtained by cutting the grafs in the beginning of the feafon, in which it is to be ploughed up; but where circumftances of fo favourable a nature do not occur, fuch a method of preparation muft be lefs beneficial than that of giving only one ploughing. In the preparation of a clover ley for wheat, Mr. Ducket has noticed a fingular experiment and practice. He had a field in which wheat rarely efcaped being greatly root-fallen; not to lofe fowing it with that grain, and at the fame time to guard againft the experienced malady, he fcarified it repeatedly, till he had torn up the clover, and alfo produced tilth enough for drilling it in; then he collected the clover fragments, and carted them into the farm-yard to make dung, and drilled the field; the wheat having a firm bottom in an unftirred foil, efcaped the difeafe, and yielded an ample produce. The clover bulb, which would have fecured the dreaded loofenefs of foil, had it been turned down, made a large quantity of dung, and therefore was not loft to the farm, though the particular field was deprived of it. And it has been ftated on the authority of a cultivator of much experience, that in cafes where the clover-crops have been fuch as to leave the land in a foul condition in refpect to weeds, it would be highly improper to fow them with this fort of grain, as from its remaining for fuch a great length of time upon the ground they may be liable to have their feeds perfectly evolved, and brought into a ftate of vegetation. In fuch cafes, it has been fuggefted as more advantageous to have recourfe to fuch fort of crops as may require the operation of hoeing during the time they are upon the ground. The putting in of wheat after pea-crops, is a practice that may probably be purfued with the moft propriety and fuccefs in thofe diftricts that are, from the nature of their fituation, fufficiently early to admit of the land being fully cleaned and prepared by repeated ploughings and harrowings, after fuch crops have been removed, before the proper time of fowing fuch grain. But where they are fo late as only to allow of the land being prepared by one ploughing before the period of fowing, it is fuppofed by fome to be an extremely hazardous practice to attempt the culture of wheat after fuch crops; as unlefs the ground be in a high ftate of tilth, there is little chance of a good crop being produced. This is the opinion of the writer of the work on modern agriculture; but the Norfolk farmers are in the conftant habit of fetting or finking in wheat upon a pea-ftubble with a fingle ploughing, and confider it a very fafe and excellent hufbandry. The pea-crop ought, however, to have been kept clean; and after it is harvefted, the haulm harrowed off. They never plough a bean-ftubble there more than once. In fome counties, it is the conftant practice to cultivate beans and wheat alternately on the fame land for fome time. This is the cafe on the ftronger kinds of foil in the county of Kent, on which it is found to anfwer in a very advantageous manner; and where wheat is only occafionally fown after fuch crops, it is often found an ufeful practice; but in all fuch cafes the beans fhould be cultivated in drills at from twenty to thirty inches diftance, in order that they may admit of being hand and horfe hoed in the moft perfect manner. If this method has been followed, and the bufinefs of hoeing during the growth of the crops effectually performed, the land may be fufficiently prepared for the fucceeding wheat-crops by one ploughing, as the foil from being thus kept clean, and in high tilth, can fcarcely fail of affording a good produce. It has been remarked, that where the farmer has a bean-ftubble intended to be fown with wheat, he fhould give it the due tillage as early as poffible, which fhould be regulated by the foil, as on fome it may be better to truft the fkim fcufflers and fcarifiers than the plough. That where the land is very clean, the great fkim of the ifle of Thanet is capable of cutting through every thing, and loofening the furface fufficiently to enable the harrows to render it as fine as poffible, being picked and burned by women. Where not fo clean, the Kentifh broodfhare may be more effective. In other cafes, the fcuffler may be fufficient for the purpofe. It is noticed that in this cafe, when the farmer has got the furface to his mind, he is to confider whether or not he fhould plough it, which is advifeable if the foil be of a firm folid tenacious quality, and if he does not intend to drill the wheat: if he fhould plough fuch a foil he may not have any apprehenfion of root-fallen wheat, that is, failing roots, from a loofe bottom; but he will bring up a new furface that may drill with difficulty, whereas that which has received the influences of the crop, atmofphere, and of his late operations, will be in exactly the right temper for the drill to work in. If the foil is of a more loofe friable quality, and he fhould plough down the fine furface he has gained, he will give the wheat too loofe a bottom, and he will run the chance of a root-fallen crop. In all fuch cafes, or in any that have a tendency to this circumftance, he fhould determine not to plough at all, but drill directly; a method in which he faves tillage, and has the probability of a better produce.

This is rather a new practice on ftrong land, but fuch fuccefs has been feen in it as leaves no reafon for doubting the foundnefs of its principles. It was done by Mr. Ducket on a fandy foil for years, and with great effect. It fhould be remembered, that whatever other circumftances may influence the growth of this grain, it loves a firm bottom to root in, and rarely flourifhes to advantage where it is loofe and crumbly; nor will a depth of fuch mould do, if the under ftratum, in which it will attempt to fix its roots, be from its quality of a repellent nature. The beft bafis is the cultivable earth, firm from not having been lately difturbed. Thefe obfervations, as being quite practical, are certainly deferving of the farmer's attention. Where the diftrict is early, and the land is preferved in good order by proper modes of cropping, wheat may be grown after beans, whether cultivated in the drill or broad-caft fyftem, with fuccefs, as there may be fufficient time to give the neceffary preparation before the time of fowing, which cannot be done where they are late, and there is only time for one ploughing. But in other fituations it is found advantageous when this crop is to be grown after either peas, beans, or tares, to plough the land in as light or fhallow a manner as poffible, and then harrow and take out the roots and weeds, fo that they may be confumed on the ground in heaps; the field being after this formed into proper ridges for the reception of the feed by ploughing again a few inches deeper than the firft. And in fome cafes, it is even harrowed after the fecond ploughing, and ploughed a third time for the putting in of the grain.

Wheat, too, may fometimes be cultivated after turnip-crops to advantage on the heavier turnip-foils, particularly

 where

where they have been kept clean from weeds by repeated hoeings, and fed off upon the land at fuch early periods as to admit of the ground being prepared by once ploughing, in a light manner. In cafes where this kind of crop is intended to be cultivated after potatoes, which, from their having a great tendency to lighten the foil as well as to exhauft it, fhould never be done on the lighter forts of land in backward fituations, or under any circumftances where a fufficient proportion of manure has not been applied for the potatoe-crops, one light ploughing immediately before the feed may be in moft cafes an adequate preparation ; as where proper attention has been beftowed in the culture of fuch crops, the foil is generally left in a fufficiently fine condition for the purpofe. It has been remarked, that the caufe of wheat not fucceeding well after potatoe-crops, in many inftances, is, that, befides the land being rendered too light and porous by the growth and cultivation that are requifite for them, the wheat is more expofed to the injurious attacks of the grub, earth-worm, and other infects ; and in fome expofed fituations, from the feed-time being too long protracted, the practice becomes obvioufly improper. In growing the crop after thofe of hemp and flax, as weeds are apt to rife, it is always proper that the land fhould be ploughed over two or three times, in order that a fine ftate of tilth may be produced. The cuftom of giving but one earth after fuch forts of crops, can feldom or ever enfure full returns of this grain. It has been remarked in " Practical Agriculture," on the beft authority, that experience has fhewn, in the moft clear and fatisfactory manner, that this fort of crop fhould never, when it can be avoided, be grown after other kinds of grain-crops, as rye, barley, or oats ; and that the manure fhould not be applied to it, but for fuch crops as may precede it. That where the contrary is practifed, the crop is not only liable to be injured by the rampant growth of weeds, but from its being more apt to be difeafed.

On the whole, it may be obferved, that whatever the nature or ftate of the ground may be, or the kinds of crops that precede this fort of grain, it would appear that the preparation for it fhould always be fuch as has a tendency to reduce the parts of the foil to a pretty fine ftate, as under fuch circumftances the growth of the crops is not only more regular and perfect, but from the even and compact ftate in which the furface is left, it is more fit for affording fupport and protection to the roots of the wheat-plants, as allowing them to fpread and extend themfelves with greater readinefs in the fine mouldy earth thus provided, as well as by its falling down more clofely about them. It has, however, been contended by fome cultivators, that a rough cloddy ftate of the furface-part of the land is the moft proper fituation of it for the reception of this kind of crop, as the young wheat-plants are thereby better guarded and fecured againft the effects of the fevere cold that often takes place in the winter feafon. It is probable, however, that cold is feldom hurtful, in any great degree, to winter wheat-crops, except when accompanied with too much moifture, or where fudden frofts and thaws have the effect of rendering the furface parts of the foil fo light and open, as to be incapable of affording proper fupport to the roots of the young wheat-plants.

In Berkfhire they prepare the land for wheat chiefly in three different ways, as by fummer fallowing, and manuring with yard-dung, compoft, rags, foot, and chalk in fome cafes ; by folding on it with fheep in cafes where the ground is not of too deep and wet a nature ; and by putting it in on the back of clover-leys, after one or two crops of grafs by one or more ploughings.

It is thought by fome, however, that manuring for beans or other crops is a much better practice when followed by wheat, than the old cuftom of fallowing and manuring for this crop, which renders the land too light, and confequently fubject to blight.

The farmers in Oxfordfhire prepare for wheat by different numbers of ploughings, as the circumftances of the land may be ; but the layers are moftly ploughed in a fhallow manner, as wheat loves a firm bottom to root in, and which, in fandy land, cannot be too tight. Too loofe a bottom is apt to caufe a root-fallen crop.

An equally careful preparation of the foil is neceffary for the fpring fort of this grain, though fewer ploughings will often be fufficient.

Time of fowing.—In regard to the proper period of fowing this fort of crop, it may, the author of Modern Hufbandry obferves, be ufeful to remark, that the earlier the autumnal fowings can be put into the foil, the greater chance the young plants will have of being well eftablifhed before the frofts take place, which has been feen to be a circumftance on which the welfare of the crop in a great meafure depends. Befides, the ftate of the land and that of the feafon are much more proper for the procefs of vegetation, when the crop is put in at an early period, than when it is delayed till a late one ; the ftate of the weather in the latter cafe often admitting of only a very languid and imperfect growth till the fpring, by which the crop muft be expofed to much danger from various caufes. Indeed experience has abundantly fhewn that late fown wheats feldom fucceed fo well, or afford fuch plentiful crops as thofe that are put in early. But when fown too early there may notwithftanding be danger of the crop running too much to ftraw, and confequently of the grain proving light in the ear. From the beginning of September to the middle, or even the end of October, may probably be confidered as the moft favourable period for this bufinefs. This is indeed confirmed by the eftablifhed practice of the moft correct farmers in almoft every diftrict of the kingdom where this fort of grain is grown. If fown earlier, efpecially on the heavy kinds of foils, the land is for the moft part in too hard and lumpy a ftate to allow of the feed being properly covered by the harrow ; and in the lighter ones in too dry a condition for the grain to vegetate in a proper manner : and when delayed later, the ground in one cafe is apt to become too wet and clofe by the falling of the autumnal rains, and in the other too loofe and porous from the action of the froft upon it. It is remarked by the writer juft mentioned, that more than four-fifths of the whole of this fort of grain is fown between the middle of the firft and the end of the laft of the above months. Mr. Young thinks September the beft feafon for cold backward wet foils, and October for thofe of the more dry and warm kinds, after there has been a plentiful rain. There are, however, circumftances, it is farther obferved, on the authority of the Synopfis of Hufbandry, that may render the times of fowing different from the above ; as where the foils are of the rich fertile, loamy, chalky, or gravelly kinds, it may be better to defer it in many inftances to a confiderably later period ; as when fuch warm forts of land are cropped too early, they are apt, it is faid, to pufh the plants forward in fuch a rapid manner, that they become weak and fpindling in the early fpring months, and at the fame time the crops are more liable to be infefted with weeds, on account of the feafon being then more favourable to their growth. But that the practice of putting in crops of this fort fo late as the latter end of November and beginning of December, frequently depends on the crops that precede them not being capable, from the latenefs of of the fituation, or other caufes, of being taken off fo early as that the land may be made for the wheat-crop in the proper time. This is often the cafe after peas, beans, tares, turnips, and other fimilar crops. In thefe cafes, on the lighter forts of foils, and where drill culture is employed, it may often be an advifeable practice to fow in the fpring, as by fuch a delay the ground may be brought into a more perfect ftate of preparation than could be the cafe in fowing it fo late in the winter.

It is indeed remarked in the Corrected Report on Agriculture for Middlefex, that thofe perfons who fow wheat in autumn lofe the great advantage of a previous crop of turnips, both as to deftroying the weeds and manuring the land; and that they create the labour of either hoeing, harrowing, or otherwife tampering with the weeds and young wheat in the following fpring. That a wet feed-time fometimes renders it impoffible for the farmer of a clayey foil to fow his ufual quantity of wheat in autumn; this fhould not induce him to fow his grain when the land is too wet for the occafion, but rather let him wait till the firft favourable opportunity in the months of February or March, by which time froft will have rendered the land mellow, and then he fhould fow the refidue of his wheat; as the probability is great that wheat fown on a mellow foil, in a dry February, will be more productive than if it had been fown on the fame land, in an adhefive ftate, during a wet November.

That autumnal-fown wheat precludes cultivation for one entire year, which, apart from all other circumftances, gives great encouragement to the growth of weeds; but that in order to appreciate the great mifchief done by fowing wheat in that feafon, its connection with the ufual courfe of crops muft be taken into confideration. For inftance, firft, in the ancient, and ftill very common courfe of fallow, wheat, oats, there is feldom any ploughing from the fowing of the wheat until the fowing of the oats, which is one year and a half; fecondly, in the courfe of wheat, clover, fpring corn, or pulfe, there are two years together in which the plough cannot poffibly be put into the ground; thirdly, in the valuable courfe of turnips, barley, clover, and wheat, the plough is fhut out of the ground for two years and a half. That thefe three cafes include moft of the arable land in Britain, and they demonftrate the prodigious encouragement which fuch courfes give to the growth of weeds. On the contrary, wheat fown in the fpring occupies the ground only half a year; and that when that is placed in a fucceffion with winter tares and turnips every two years, the weeds have not time to grow in fuch a manner as to do any material injury. There is no period in fuch a courfe of more than fix months in fummer, or eight in the winter, free from the operation of the plough. This degree of tilth keeps the land free of weeds, and, in that manner, preferves it from being exhaufted by them; and, by giving the green and root crops to fheep and other cattle, on the land, it becomes doubly manured every other year, which cannot fail to force the growth of the wheat as though it were growing in a hot-bed.

It certainly is not in every poffible cafe advifeable to refrain from fowing wheat in the autumn, in order to fow it in the fpring. A dry feed-time is of fo much importance to the occupiers of adhefive and fenny foils, that they fhould not let any fuch time pafs without fowing their grain. In the cafe of a dry autumn, which is the fame thing as a fine feed-time, the farmers fhould fow all fuch land as is then ready, and thereby enfure the important points of a good feed-bed for their grain, and againft the danger of a wet fpring. On the other hand, the more rain that falls in autumn, the better chance there is of having a dry fpring; and confequently in every wet autumn the wheat-fowing fhould be poftponed until the fpring. The proof of the fuccefs of one inftance of this kind may enable farmers to judge what is capable of being effected, even in an unfavourable fituation, by patience in wet feafons, and exertion in fuch as are dry. A large wheat-farmer, near Haddington, in Scotland, owing to a wet autumn, delayed fowing his wheat until after the 19th day of February, between that time and the middle of March, feeding one hundred and forty-five acres with wheat, principally the Effex white and Egyptian red. The harveft in this cafe was about ten days later than ufual, and the crop yielded from twenty-four to forty Winchefter bufhels on the acre, which weighed nearly fixty-two pounds each. On examination, the wheat was found a firft-rate fample.

Such a fuccefsful cafe of raifing fine wheat from the feed fown in the fpring may afford reafon for putting it in at that feafon in many cafes. Such a practice has never been known to fail, by the writer, when performed early, and on land in good heart. The advantages of the practice are faid to be many, and very confiderable.

When the fowing is to be done later than the above periods in the fpring, the true fummer wheat is always to be ufed.

The exact periods at which this fort of grain may be put into the ground in different cafes with the greateft chance of fuccefs, under different circumftances of foil and climate, have not hitherto, however, fo far as we know, been fully afcertained and fhewn by any correct trials; but the above periods of autumn fowing are in very common ufe by the beft farmers.

In the counties of Effex, Suffex, Hertford, Oxford, and many others, moft of the beft farmers are in favour of early fowing; but more to the eaft it is done fomewhat later. In Berkfhire they fow their light lands early, and thofe that are rich at a later period.

The fpring fort of wheat may be fown from about the middle of March to the end of the following month, in moft parts towards the fouth; but moft probably the fooner it is put in after that period of the above month, as the ftate of the feafon will permit, the better it will be in the crop or produce.

Seed.—In refpect to the proportion of feed that is neceffary in different cafes, it muft depend upon and be regulated by a variety of different circumftances, but in general from two to three bufhels, according to the ftate of the foil, the nature of the climate, and the period in which it is put into the ground, may be the moft fuitable proportion for foils of a medium ftate of fertility, under the broad-caft method of hufbandry; but where the drill fyftem of culture is practifed, a confiderable lefs quantity may be fufficient for the purpofe. In the drilling and dibbling methods of fowing, however, which are unqueftionably the beft where they are performed with correctnefs, fix pecks of feed are fufficient; in the latter mode two rows being put in on a flag, care being taken to have the land rolled after having been ploughed a fortnight or more, and the feed dibbled in to a fufficient depth, without fcattering, covering it in by bufh harrowing.

Where the lands have a known difpofition to mildew, a larger proportion of feed fhould be given, whatever the time or feafon in which it is put in may be. Much lefs feed is alfo neceffary in early than late fowings. It is remarked that on the rich foils of Gloucefterfhire, the quantity generally fown is about feven pecks, while in Yorkfhire it is from eight to twelve. Where the lands are in a fuitable ftate of tillage for receiving crops of this grain, ten pecks have been advifed by a practical writer as the medium proportion; but

but much larger quantities are frequently fown in the northern parts of the kingdom. It is obvious, however, that where fuch large proportions of feed are made ufe of, the plants muft be liable to be drawn up too much, and the crops in confequence to become weak and imperfectly fed, as well as fmaller in the fize of the ears. There may be alfo difadvantages from making ufe of too fmall proportions of feed, from the ground not being properly covered with plants; but where care is taken in the after-culture of the crops, lefs danger is probably to be apprehended from this than the other extreme, as a great number of plants will be fupplied by the tillering or fhooting out of new ftems from the joints about the furface, in confequence of the mould being laid up againft them.

In Hertfordfhire, in the broad-caft method, from two to three bufhels are ufually fown. But in the county of Norfolk they fow broad-caft, from two to two and a half bufhels; and in the drilling and dibbling methods, from five to fix or feven pecks.

In Effex they fow broad-caft about two and a half bufhels; and in the drilling and dibbling modes, from feven to ten or more pecks.

In Suffex they fow a large quantity of feed, fome four bufhels on ley land, and three upon tilth; others three and a half: but when this crop fucceeds peas, only three, if it be early, but if late, more. The medium quantity is about three.

In Berkfhire commonly from two and a half to three in the broad-caft fowings of this crop.

And in Oxfordfhire from two to two and a half, and fometimes three.

In the fowing of the fpring fort of this grain, the quantity made ufe of is various. Some, for a full crop, fow fourteen pecks to the acre, but with grafs-feeds only nine. Eight pecks have produced an abundant crop in fome cafes, on the fame portion of land. Others advife two bufhels to the acre; and fay that the earlier it is fown the lefs feed will be required. Sometimes three bufhels are fown upon the acre. However, from two and a half to three bufhels on the acre may be confidered as the moft proper quantity. In the dibbling method, four pecks and a half have been found fufficient for an acre and a half.

The broad-caft practice of putting this fort of crop into the ground is the moft common on the heavier kinds of wheat-lands, as thofe of the clayey and loamy forts, the feed being harrowed well in by a rather light harrow. But in the lighter forts of wheat-lands, the drilling method is often practifed when they are clean, and fufficiently mellow and mouldy on the furface. Sometimes, too, the feed is put in partly by the plough, and partly by the harrow. In fome diftricts it is ploughed in on the fallows, and harrowed in on clover. The clover-leys are alfo occafionally ploughed in fome cafes, and have the feed fcuffled in, and folded upon by fheep. See SOWING, SEED, &c. Alfo UNDER-FURROW *Sowing*.

Some farmers prefer a ftale furrow for fowing wheat upon, while others are in favour of the contrary practice. A ftale furrow is probably, however, the beft in many cafes. See STALE-*Furrow*.

Preparing feed-wheat for fowing is practifed in many cafes and places in different modes and manners. See PICKLING, STEEPING, &c. Alfo WHEAT-*Seed, Liming of*.

The depth of putting the feed in fhould not probably be more than from one to two or three inches.

In fome parts of Oxfordfhire the laft is the ufual depth, and the farmers are generally friendly to depofiting the feed to a fhallow depth.

It is alfo the practice with many farmers in thefe different diftricts to change their feed-wheat frequently.

In the county of Suffex, an intelligent and fpirited farmer has found by long and attentive experience that a change of feed-wheat is of effential importance to the cultivator, as that feed which has been repeatedly fown over the fame ground at length degenerates, and the produce each fucceeding year becomes inferior in quality; on which account, wheat that is apt to run to ftraw is fown on ley-land, and the Hertfordfhire white fort on pea-ftubbles.

In other diftricts the practice is thought by the beft farmers to be always proper; and that the feed-wheat fhould be brought from a colder foil or fort of land than that on which it is to be fown. See *Change of* SEED, and SEED.

As foon as the feed has been put into the land, it fhould conftantly be laid as dry as poffible by the conftruction of proper drains and water-furrows, fo as in all feafons to keep the water from ftagnating upon it. See WATER-*Furrowing*.

It has been lately fuggefted as a beneficial practice to have the feed-wheat well trodden in at the time of fowing it by fheep, or ftill heavier ftock, on heavy as well as light foils; as by this means the young plants are prevented from dying away in the winter, from the land lying too light and hollow. But more facts are wanting to eftablifh the utility of this method of practice in different cafes. See TREADING *Wheat in*, and PLOUGH.

Although under the prefent practice and management in the cultivation of wheat, the autumn or winter fort muft always neceffarily occupy a large extent of the heavier kinds of wheat-lands in this country, and be raifed in the manner that has been directed above; yet in a number of cafes the true fpring fort may be cultivated, grown, and had recourfe to with great advantage, fuccefs, and benefit. But in all fuch culture, the real fummer fort muft always be employed, for though the winter kind may be put into the ground with advantage in many cafes fo late as after the middle of February, as has been feen above, it is better to have this real fort for later fpring fowing, as it poffeffes many properties highly neceffary for the purpofe. By fome it has been fuppofed that it would interfere with winter wheat, and that it may be difficult to find proper courfes for introducing it in. However, this fort of wheat fhould principally be cultivated and grown on foils or lands, and in climates which are not well fuited for winter wheat, or in cafes where that fort is particularly liable to mildew. But though it may not be fuited for univerfal application, it is moft likely to fucceed in the lighter, the fenny, and the fofter forts of foil, where the winter wheat is apt to be thrown out of the earth by frofty feafons. In fuch cafes the courfes might be turnips, or rape, according to the nature of the land, fpring wheat, clover, and oats, or fome fuch rotations, as in fuch, if after the clover or other grafs, the land be paftured for one year, the oat-crops will be certain, and abundantly productive.

The preparation in fome cafes might be the rendering the land fine and clean by one or more ploughing and proper harrowing, and in others by ploughing and burning, and fowing cole and other feeds and crops, for being fed off by fheep, or in fome other fuch ways.

In this manner large crops have been raifed in many different inftances, as thirty Winchefter bufhels, or more, on the acre, which were ripe and ready at the fame time with the other fpring-fown grain. It is a wheat which is faid to yield

yield as much flour in any given quantity as other wheats, and which does not appear to be fubject to any difeafe, nor to have any difadvantages attending the cultivation of it. It does not require more manure than barley or beans, nor does it exhauft the land more. It anfwers extremely well for laying down with clover, in which cafe the clover-feed fhould be fown and harrowed in with the laft harrowing for the wheat, and the ufual quantity of grafs-feeds fown. It is to be preferred to all other forts of corn for raifing crops of grafs-feeds; owing to the fmall quantity of leaf which it bears, and which is of fhort duration, as it fades and falls down almoft as foon as it has attained its full fize: more air is thus admitted to promote the growth of the clover, or other grafs; and the admiffion of more air may alfo contribute to prevent the mildew with which this fort of wheat is fo rarely affected.

There is a further advantage ftated to arife in the cultivation of this fort of wheat in fome cafes, which is, that on various foils, and in fome feafons, it often happens that the autumnal-fown crop of wheat may be feen to fail and to go off in patches, from the injury of the wire-worms, or other caufes. Confequently, that in the beginning of April, by raking fpring wheat into the vacant places, as alfo where the wheat-plants may appear weak and thin fet, the uniformity of the crop may be reftored, and the fpring wheat be ready for the fickle quite as early as the autumnal fown. And that, although fuch a mixed crop would render its produce highly improper for feed; for the miller's ufe it would afford no objection.

The remarks that are given below are the refult of much experience and practice in the cultivation of this fort of wheat. It is found that crops of this kind are ready to cut quite as early as the autumnal-fown wheat in fimilar foils and fituations. That it is highly probable that the fuccefs of this fort of wheat on clover ley may be found to depend more on the coming feafon than autumnal-fown wheat; as if the following feafon fhould prove dry, the crop would be more hazardous in the former than in the latter. In a dry fummer it would feem that this wheat would have a better chance upon land that has been longer upon tillage than upon clover ley. That turnip and rape fallows, where the foil is not too light, feem highly proper for fpring wheat. That pea and bean fallows may alfo in many inftances prove eligible for fpring wheat; and efpecially after having been ploughed early in the autumn, and benefited by the winter's rains and froft. That when the fpring wheat is harrowed in, at the laft light harrowing, clover-feeds, &c. may be fown, the ground will moftly be well fet, and the feeds profper equal to any in other cafes. That in the application of top-dreffings for this fort of wheat, it may feem, that in a long-continued dry feafon, the moft eligible way would be by applying them at the fame time when the wheat is fown. Only once lightly harrowing after may fuffice. But that, in a moift and continued rainy feafon, top-dreffing would probably prove to act more powerfully by being fown upon the furface of the foil; becaufe top-dreffings are moft particularly calculated to invigorate the coronal roots of the wheat-plants, and thereby to caufe them to tiller well. And that, when top-dreffings are fown on the furface of the foil, the beft time of applying them, it may feem, would be when the wheat is grown to the height of three or four inches; becaufe if laid on before the blades of the corn-crop afford a kind of fhelter, the finer particles thereof are liable either to be exhaled by the fun, or blown away by high winds, which frequently occur at that feafon. Moift and fhowery weather, at that critical period, will always be found of the higheft importance; therefore, the farmer would do well by having due attention to the ftate of the weather when employed on this bufinefs. And that, as a crop of this fort of wheat is fo much more valuable than any other kind of fpring-fown corn, there are good grounds for fuppofing that top-dreffings cannot any other way be more beneficially employed.

Trials with this fort of wheat in other unfavourable cafes of poor wet cold land likewife fhew that this fort of grain may be had recourfe to with confiderable fuccefs in different cafes. That five quarters *per* acre have been had on rich good land in perfect cultivation of excellent wheat of this kind, when put into the foil fo late as the 4th of May. It is evident, that this fort of wheat has a rapid growth, being equally forward at harveft with the autumn-fown crops. That on the whole it feems probable, from the fuccefs that has attended this kind of culture in the fen, in the fouthern and the more northern diftricts of the kingdom, that it may be advantageoufly introduced in many different fituations and circumftances of arable land.

We have already confidered the hiftory, nature, qualities, and many other properties and circumftances in relation to this fort of grain. See SPRING-*Wheat*.

Culture while growing.—In the culture of wheat after it has been put into the foil, there may be fome difference, according as it has been fown, according to the preparation of the land, or other circumftances. But in all cafes it fhould be kept perfectly clean and free from weeds, either by the horfe or hand hoe, as weeds not only injure the crop in its growth, but leffen the value of its fample when brought to the market. And befides, the ftirring of the mould on the furface amongft the plants may frequently be ufeful in other ways, in addition to that of preventing the growth of feed-weeds; for as in the heavy kinds of foils that are moft adapted to this grain, the more fuperficial parts are liable to become fo hard and baked as not to be eafily penetrated by the new-formed or coronal roots of the plants in the early fpring months, efpecially when they are very dry, and have been preceded by much wet; loofening of the earth, by any means whatever, muft of courfe be of great utility. This effect is generally fhewn to have taken place by the appearance and progrefs of the crop, which becomes of an unhealthy yellow colour, and advances but little in its growth. In fuch cafes it has been fuggefted that harrowing once or oftener in a place may be of much fervice in the early fpring months. Where the crops are thin, and of feeble growth, this operation may produce beneficial effects, by affording a fort of earthing up to the weak plants, and thereby promote a more vigorous growth, at the fame time that a number of new fhoots are fent off from the joints thus covered, and the crop in confequence rendered more full and abundant; and where the grain is too thick upon the ground, it may alfo be of utility by drawing out and deftroying many of the plants. It has likewife been fufpected by Dr. Darwin, that many of the root-fibres, by being torn in the operation, may prevent the over luxuriance of the ftem and leaves, and by that means promote the more early fructification of the grain.

It has been obferved by a late writer, that the practice of fcarifying the young drilled wheat-crops fhould conftantly be performed in an effectual manner, and not later than March: but that fome have not fuppofed it to be fo very beneficial, from not performing it at the proper time. Mr. Cook has, it is faid, contrived two implements for this ufe, a fixed harrow and fcarifier; the former executing its work merely by common tines or teeth, having three rows, which, by by varying its poſition diagonally, one, two, or three of them may be brought to act in the ſpace of nine inches, without injury to the rows of wheat-plants. If two, they may, it is ſaid, be drawn in a breadth of three inches; if three, in a ſpace of four inches, and theſe ſpaces widened at pleaſure, but ſtill ſo as to keep quite clear of the rows of wheat; and that by loading the harrow, the teeth are forced to a proper depth. Further, that the ſcarifier has teeth of various breadths; but for working at this ſeaſon, between nine and twelve-inch rows, the narroweſt are to be preferred. By the action of theſe tools the ſurface mould is, it is remarked, looſened, and the air admitted, being performed to the depth of two inches with ſafety, and without mould being raiſed ſo as to cover or bury the plants, the earth being only looſened, and not diſplaced. By theſe contrivances much work can be accompliſhed in a very ſhort time. This proceſs is alſo uſeful againſt the attacks of the worms. They horſe and hand hoe their wheat-crops repeatedly in Eſſex, and with great advantage, though very expenſive.

But the drilled and dibbled crops, where this method is not employed, particularly in the latter mode, where only one row is placed on a flag, muſt be hand-hoed in the intervals, which ſhould be done the firſt time in the beginning of the above month, and a ſecond time towards the end of it, or a little later. Some likewiſe do it to the broad-caſt wheats, but this has been ſuppoſed injurious by many. The buſineſs of thiſtling the wheat-crops ſhould alſo be carefully performed in May, or in the very early part of the following month, in all caſes where it may be neceſſary. The practice of rolling ſhould alſo be employed without either having recourſe to the harrow, or after it has been uſed, being highly beneficial where the ſurface is cloddy, and the operation is executed when the ground poſſeſſes a medium degree of moiſture, as well by forcing the roots of the wheat into the earth, as by cauſing the new ſtems to riſe. And in thin light ſoils, when this ſort of grain is cultivated upon them, much benefit may alſo be produced in this way, by the roots of the plants being prevented from being ſo eaſily looſened and thrown out of the ground. And the ſame practice is recommended as generally uſeful by ſome where clover or graſs-ſeeds are ſown with wheat-crops, as a means of rendering the vegetation more ſecure and perfect.

In Berkſhire, wheat-crops by the beſt farmers are hoed every where, and ſometimes hand-weeded, the former on ſtrong ſoils often twice.

By good cultivators in ſome parts of Oxfordſhire, too, all the wheat-crops are hand-hoed in February or March, and weeded afterwards.

And in Suſſex, the practice moſt commonly adopted is to hand-hoe wheat in the ſpring, ſometimes only once, but frequently twice, as the nature of the preceding crop may have been. By ſome, however, hand-hoeing wheat is diſapproved of, they never hoe white corn, having given it up, from a conviction that the crops were never benefited by the practice; but, on the contrary, that miſchief was always done by it. On which, it is obſerved, that ſhould the practice ſometimes be right, and ſometimes wrong; or right on ſome ſoils, and wrong on others, theſe contrary facts may probably depend on the ſpring roots, which are ſaid to ſtrike into the air, and enter the ground at ſome ſmall diſtance from the ſtem. If a hand-hoeing be given juſt before the appearance of thoſe roots, it may, on a bounden ſurface, prepare for their eaſy entrance; but if given afterwards, it is probable the effect would be miſchievous, would retard the progreſs of the plant, and force it to do its work over again, perhaps at a worſe ſeaſon. If this be the caſe, the benefit which reſults from hitting the time exactly, may by no means equal the probability of miſchief upon a ſcale of any extent; in which the right time can ſcarcely be taken for the whole of a crop. It has been heard declared, too, by excellent farmers, that if a perſon would pay for the hoeing of their wheat, they would not permit the operation, being convinced that it does more harm than good.

It has alſo been recommended, in ſuch caſes where the land is not in a ſufficient ſtate of fertility or preparation to bring the crops to perfection, to make uſe of top-dreſſings. Subſtances of both the ſolid and fluid kinds have been made uſe of for this purpoſe; the firſt conſiſt chiefly of the dung of different ſorts of birds, after being brought into a powdery ſtate, bone-duſt, ſoot, peat-aſhes, and various ſaline matters. The latter are principally the drainings of dung-hills, and other ſimilar liquid materials. The former ſhould be thinly ſown over the crops with as much evenneſs as poſſible, as early in the ſpring as horſes can be admitted upon the land without injury; and if it can be done when the weather is inclined to be moiſt, it is the better; a roller may then be paſſed over the crop with advantage. Where the latter ſubſtances are made uſe of, care ſhould always be taken that the plants be not injured by having too large a quantity applied to them. In this practice, the expence ſhould be a primary conſideration, and ſmall trials firſt made where dungs are not to be uſed. The proper ſeaſon for performing the buſineſs is the beginning of February. See Manure, and Top-*Dreſſing*.

It has been ſuggeſted, too, that the method of tranſplanting wheat may be had recourſe to in particular caſes, with beneficial conſequences, as where there are ſome parts of ſuch crops too thickly ſet upon the ground, while others are too thin, irregular, or patchy; as by thinning and ſetting out the plants of ſuch overabundant parts, among thoſe that are deficient, much ſervice may be done to each of them. The firſt will be rendered more capable of admitting the operation of the hoe, and thereby of ſupplying more abundant nouriſhment for the luxuriant vegetation of the plants, and the latter be ſupplied with the proper number of plants, which could not be accompliſhed in any other way. And it has been ſtated, that when raiſed in the garden, one acre would be capable of affording ſets for an hundred, when planted, after being properly divided at the diſtance of nine inches from each other; and that as the buſineſs of tranſplanting is to be performed in the ſpring, it is ſuppoſed that crops of this grain may be raiſed in this manner on lands that poſſeſs a greater degree of moiſture than is ſuited to the healthy growth of wheat in general. Beſides, clean crops may be produced in this way with much greater certainty, as where the ground is ploughed over juſt before the plants are ſet out, the grain may riſe much quicker from the plants than the weeds from their ſeeds, and the crop in this way overpower ſuch noxious plants. Advantages of other kinds have been ſtated by different writers, as the reſult of this mode of raiſing wheat-crops. It is a practice, which, as well as that of dibbling, has been had recourſe to with ſucceſs, both in Norfolk and Eſſex.

The cuſtom of feeding down wheat-crops, where too forward or luxuriant in the early ſpring months, by means of ſheep, is a practice that has been contended to be beneficial in many caſes. The good effects, in ſuch inſtances, according to Dr. Darwin, are ſuppoſed to ariſe from the removal of the upright central ſtems, by which means different new lateral ſtems or root ſcions are ſent off or brought

brought forward with more vigour, by the acquifition of a larger proportion of nutritious matter from the joints in confequence, that muft otherwife have been exhaufted in fupporting the central ftems. It is, however, a method which has been found by experience to be the moft ufeful on fuch ftrong and fertile lands as are apt to produce a larger proportion of ftraw than can be properly fupported. In which cafes, advantage has been faid to be derived by feeding off the blade at two or more fucceffive times; but in effecting the bufinefs, great care is neceffary to fee that the whole is completed before the crop begins to fpindle, otherwife more injury than good may be produced. And on the lighter and poor defcriptions of foils, the practice muft be employed with great caution, as on fuch lands the growth of the crops may be fo retarded, as to become weak and fpindly. Befides, on thofe lands where they are very light, and the crops thin, injury may frequently be done by many of the plants being pulled up, on account of the clofenefs of the bite of the fheep. They fhould, therefore, never be fuffered to remain upon the crops when the weather is wet, and the furface of the ground much loofened, or after fudden frofts and thaws; as in fuch cafes much harm may be done by the plants being pulled up and deftroyed.

The treading of the animals may, however, be of great fervice in all the light forts of wheat-land, and where the crops are thin; as by it the earth will not only be preffed more clofely about the roots of the plants, but the ftems in many inftances fo forced into the ground and covered up, that new fhoots will be fent off laterally, and the crops be thus rendered more full on the land. But where the foils are very ftiff and adhefive, the growth of the crops may be checked and retarded by the practice, and of courfe the fhoots thus caufed become weak, affording only fmall ears and light grain. Obfervations and experiments have convinced a writer in the Bath Papers, that wheat ought not to be fed down with fheep, unlefs it be very rank in January; and that fuch crops fhould only be fed as were fown early. And it has been fuggefted, that though this practice has much fimilarity to that employed in gardening, of ftopping the growth of the main ftems of fome forts of plants, as thofe of the cucumber and melon kinds, by rubbing off or cutting away the central buds, in order to expedite their fruiting; yet in wheat-crops, where the principal ftems are eaten down, except when they are early, and of very luxuriant growth, the ears of the new fhoots may not have time to perfect the feed, and of courfe become light and fhrivelled in the grain, and the new ftems from their weaknefs be more apt to fall down and be lodged. Thefe are circumftances that have been frequently obferved to occur by Mr. Tull, in the feeding down of wheat-crops by means of fheep. And that the fame philofophical obferver fuppofes, that in the culture of wheat-crops, the moft beneficial method is that of promoting, as much as poffible, the time of bloffoming, while that of ripening is protracted, as it is for the farinaceous refervoir of nutriment, depofited in the cotyledon of the new feed, in order to fupport the growth of the *corculum*, or frefh embryon, that the plant is cultivated; which farinaceous depofition is effected in the interval between the bloffoming and ripening of the corn, either before the impregnation of the pericarp or feed-veffel, or afterwards; and the weight and plumpnefs of the rain are thus augmented.

The practice of feeding down young wheats by fheep may, therefore, be often hurtful, by retarding the period of bloffoming, as well as by reftricting the growth of the ftems of the wheat-plants.

Sheep have likewife been employed on young wheat-crops in other views, as it has been remarked, that as the coronal parts of the roots of fuch crops are liable to be laid bare and expofed for fome inches in length about the furface of the earth, during fevere frofty winters, the turning in fheep upon them in fuch circumftances when the ground is moift, and keeping them in motion, may tend to prefs them into the loofe foil, and in that way produce new roots, as well as afford covering and protection to fuch as have been denudated. And, it is added, that fome farmers who contend that much advantage is derived from it, turn fheep upon the crops where danger is apprehended from worms, flugs, and other infects; in order that by keeping them conftantly in motion, fuch animals may either be wholly deftroyed, or fo fixed in the furface mould as to caufe their more gradual death. There is a very great variety of thefe animals, which are fuppofed injurious to wheat as well as other crops; and for the deftruction of which, lime, foot, and other faline matters, have been had recourfe to with fuppofed advantage. See Grub, Soot, &c.

Wheat-crops are fuppofed to be much injured from different forts of vegetable difeafes, as the *Blight*, *Blaft*, *Mildew*, *Smut*, &c. &c. See thefe different heads.

In the Effex Report it is mentioned, that a difeafe which had not before been noticed or heard of, was met with at Copdock in that diftrict, which is called the *purples*. The ears affected are perceived at once by their colour, a dirty brown mixed with green, as if part was ripe, with fome chefts quite green: they feel nearly, but not quite, like blighted or abortive ears, which are brown, while the ears in general of the crop are of a bright red or white; when rubbed in the hand, as if to get the grain, no wheat is found, but apparently the fmall grains of a flattened indented globular form, and of a darkifh purple, greenifh or dark hue. It has not the fmalleft refemblance in appearance or fcent to fmutty grains or bladders, and is certainly a diftinct diftemper. In many of thefe purpled ears are found fome grains of good wheat. In order to difcover if all the ears from the fame root were affected on trial, in many inftances they were found all fimilar from every root. It is very fingular that no account that is recollected fhould have been given of fuch a ftrange malady, and fo diftinct from all others. Smutty ears were found in the fame field, under all the common circumftances of that diftemper. In Kent, it is faid, this diftemper is called *cockle-eared*.

It has likewife been noticed, that particular ftates of the weather have confiderable influence on wheat-crops, at particular periods of their growth. As when the feafon is fufficiently dry, there is feldom much injury done to them during the winter months, however fevere they may be in other refpects, nor in thofe of the fummer, provided the weather is not too moift about the time of blooming, as where that is the cafe the crops are moftly deficient in their produce.

And feveral forts of weeds are injurious to wheat-crops, where they have been fown upon lands in an imperfect ftate of preparation, as *charlock* on the light calcareous foils; the *corn poppy*, on thofe of the chalky kind, as well as *cockle*, *white-darnel*, *puck-needle*, and *couch:* likewife *colt's-foot* on the rather heavy kinds of lands. See thefe different heads, and Weed and Weeding.

This fort of crop is fhewn to be ripe and ready for the reaper by its ftraw turning of a yellow colour, its ears beginning to bend in the neck and hang down, there being no greennefs in the middle of them, and the grain becoming hard and plump. It is remarked, in the Effex Report on Agricul-

Agriculture, that ſome do not like to cut wheat green, except it be the American white, which is brittle, and muſt be cut early, to prevent a loſs of ears. It rarely lays. In Rochford hundred they do not cut till the wheat is ripe; but ſome few reap while it is yet green. It is, however, obſerved by a good farmer, that moſt rough chaff wheats, if they do not ſtand till fully ripe, will not threſh well.

It is ſtated, too, in the Norfolk Report on Agriculture, that Mr. Parmenter, miller at Ayleſham, a conſiderable farmer alſo, and a very intelligent man, remarked that the farmers let their wheat ſtand too long before cutting. They are apt to have a notion, that when millers give this opinion, it is ſpeaking for their own intereſt; but he cuts his own wheat before it is ripe, and would do ſo on the largeſt ſcale, if he was not a miller. The quality is far ſuperior, and the corn juſt as good. And Mr. M. Hill prefers cutting green, and never yet commenced harveſt but he wiſhed he had begun three days ſooner.

In the firſt of theſe Reports on Agriculture, a practice termed *fagging* is noticed as being for the firſt time met with. When the wheat-crops are very heavy, with broad luxuriant leaves, men with ſickles move regularly through it, ſtrike off many of them, for lightening the top, as a preſervative againſt being beaten down by rain. It ſhould be done carefully, or damage may enſue. See REAPING, HARVESTING *of Grain*, STACKING, and THRESHING.

Produce.—In reſpect to the quantity of wheat produced upon an acre, it muſt vary conſiderably, according to the circumſtances of ſoil and preparation, as well as the ſtate of the ſeaſon; for it has been found that in ſome years the yield is under twenty, while in others it is upwards of thirty buſhels the acre, the ſoil and culture being in every reſpect the ſame. And the average return of this crop throughout the whole of the kingdom, is probably not more than from three to three and a half quarters. And Mr. Donaldſon has, indeed, ſtated it at not more than three quarters the acre. The greateſt crop of wheat, of which the author of the Report on Agriculture for Middleſex has any account, is, it is obſerved, fixty-eight buſhels *per* acre; the leaſt about twelve. The medium between theſe extremes is forty, which, it is conceived, would be the average of land highly conditioned. But the average produce of Britain does not, it is imagined, exceed one-half of this quantity, and yet, it is thought, that wheat is as certain a crop as any that is cultivated. It is obſerved, that the yield of ſeveral years varies the proportion which wheat bears to the ſtraw in a very great degree, but that the average is about twelve buſhels of wheat to each load of ſtraw, weighing eleven hundred weight two quarters and eight pounds. It has been aſſerted, and probably with truth, that the ſtraw of autumnal-ſown wheat is more harſh, and leſs agreeable to cattle, than the ſtraw of that which is ſown in the ſpring. The weight of wheat by the buſhel differs very much in different caſes; but in moſt ſtrong land diſtricts it is uſually about ſixty-two or three pounds to that quantity.

The yield of wheat is the greateſt at the time of reaping, and becomes ſucceſſively leſs and leſs the longer it is kept, ſo as ultimately, in many caſes, to be a diſadvantage to the farmer of not leſs than nearly one ſhilling in the buſhel.

It may be noticed, that it is neceſſary, with the view of aſcertaining the goodneſs of a ſample of wheat, to determine by the eye whether the berry be perfectly fed or full, plump and bright, and whether there be any adulteration proceeding from ſprouted grains, ſmut, or the ſeeds of weeds; and by the ſmell, whether there be any improper impregnation, and whether it has been too much heated in the mow or upon the kiln; and finally by the feel to decide if the grain be ſufficiently dry, as when much loaded with moiſture, it is improper for the uſes of the miller and baker. In caſes where a ſample handles coarſe, rough, and does not ſlip readily in the hand, it may be concluded not to be in a condition either for grinding or laying up for keeping.

Wheat is uſually ſold by the farmers to the dealers for being made into flour; and, in ſome caſes, as ſeed-wheat for other diſtricts, which is very advantageous, as the price in that way is moſtly higher. The dealers, who convert it into flour, diſpoſe of that to the different conſumers, and the refuſe part, as the pollard, to other perſons for the food of horſes, ſheep, hogs, and other animals.

WHEAT, *Brining of*. See BRINING.

WHEAT, *Bruſh*, that ſort of wheat-crop which is grown after oats, barley, or any other ſuch kinds of grain, on light ſoils of the ſandy and other ſimilar ſorts.

Bruſh-wheat crops are common in many of the more northern parts of this country, but the practice of putting wheat-crops in, in this way, is by no means to be much recommended, as they ſeldom anſwer any great purpoſe.

WHEAT, *Buck*. See BUCK-*Wheat*.

WHEAT, *Buck*, in *Botany*. See POLYGONUM *Fagopyrum*.

WHEAT, *Cow*, in *Botany* and *Agriculture*. See MELAMPYRUM, and COW-*Wheat*.

WHEAT, *Croſſing of*, the practice of putting into the ſoil in ſowing two different ſorts of this grain of good qualities, in order to raiſe a new variety of a ſtill better kind. The practice of croſſing in this manner has been found to anſwer perfectly, not only in this caſe, but in thoſe of peas, apple-trees, &c. by Mr. Knight. In his trials, in years when almoſt the whole wheat-crops of the country were blighted, the varieties procured by croſſing alone eſcaped, though raiſed on different ſorts of land, and in very different ſituations and circumſtances. See SEED, and VARIETIES.

WHEAT *Fallow*, that ſort of complete naked fallow on which wheat is ſown. See FALLOW, and FALLOWING.

WHEAT *Graſs*, a ſort of graſs met with in land of ſome kinds. In the trials made on graſſes at Woburn, the qualities of it ſtand as below.

	Oz.	Lbs.	Oz.
From a rich ſandy loam, the produce at the time of flowering was on the acre - - - - - -	196020 =	12251	4
Weight of the graſs when dry -	78408 =	4900	8
Weight loſt by the produce of the ſame extent of ground in drying		7350	12
The produce of the ſame ſpace of land in nutritive matter - -	7657 =	478	9
In the creeping rooted wheat-graſs, the produce from a light clayey loam, at the time of flowering, was on the acre - - - -	196020 =	12251	4
Weight of the graſs raiſed on the ſame ſpace when dry - - -	78408 =	4900	8
Weight loſt by the produce of the acre in drying - - -		7850	12
The ſame extent of land afforded in nutritive matter - - -	612510 =	38213	10

Sixty-four drachms of the roots afforded of nutritive matter 5.3 dr. The proportional value of the roots is therefore to that of the graſs, as 23 to 8.

WHEAT, *Grinding and converting of, into Flour, &c.*, the art and means of reducing it into this ſtate, in which there are much nicety and difficulty in ſome caſes, eſpecially with the thinner-ſkinned ſorts of this grain.

It

It is ſtated by the writer of the work on Agricultural Chemiſtry, that in this country the difficulty of grinding thin-ſkinned wheat is in ſome meaſure an objection ; but that this difficulty is eaſily overcome by moiſtening the corn. And on the authority of John Jeffery, eſq., the conſul-general at Liſbon, the following obſervations on the ſubject are given, as tranſmitted by ſir Joſeph Banks. In order to grind hard corn of this ſort with the mill-ſtones uſed in this country, the wheat muſt be well ſcreened, then ſprinkled with water at the miller's diſcretion, and laid in heaps, being frequently turned and thoroughly mixed together, which will ſoften the huſk ſo as to make it ſeparate from the flour in grinding, and, of courſe, give the flour a brighter colour ; otherwiſe the flinty quality of the wheat, and the thinneſs of the ſkin, will prevent its ſeparation, and will render the flour unfit for making into bread.

The writer has been informed by a miller of conſiderable experience, and who works his mills entirely with the ſtones from this country or Ireland, that he frequently prepares the hard Barbary corn of this kind by immerſing it in water in cloſe wicker baſkets, and then ſpreading it thinly on a floor to dry ; much depends on the judgment and ſkill of the miller in preparing the corn for the mill according to its relative quality. It is obſerved, however, that it is not from this previous proceſs of wetting the corn that the weight in the flour of hard corn is increaſed ; but from its natural quality it imbibes conſiderably more water in making it into bread. The mill-ſtones muſt not be cut too deep, but the furrows very fine, and picked in the uſual way.

The mills ſhould work with leſs velocity in grinding hard corn than with ſoft, and be ſet to work at firſt with ſoft corn, until the mill ceaſes to work well ; then put on the hard corn. Hard wheat always ſells at a higher price in the market than ſoft wheat, on an average of from ten to fifteen *per cent.* ; as it produces more flour in proportion, and leſs bran than the ſoft corn.

Flour made from hard wheat is more eſteemed than what is made from ſoft corn ; and both ſorts are applied to every purpoſe.

The flour of hard wheat is in general ſuperior to that made from ſoft ; and there is no difference in the proceſs of making them into bread : but the flour from hard wheat will imbibe and retain more water in making into bread, and will conſequently produce more weight of bread. It is the practice in Liſbon, and which it is thought would be adviſeable to adopt in this country, to make bread with flour of hard and ſoft wheat, which, by being mixed, will make the bread much better. As the moſt flinty wheats are capable of being readily and eaſily ground by theſe means, much advantage may ariſe from the mixing of the flour of the thin-ſkinned wheats with thoſe of the thicker-ſkinned kinds in the forming of bread, as well as in preventing the objections to the cultivation and growth of the former, on account of their ſteely quality, and grinding hard and with inconvenience. By theſe means many of the well-harveſted and well-kept wheats of this country will be found to be equal to thoſe of any other, for moſt purpoſes to which the flour is uſually put. See Spring-*Wheat*, and Wheat. Alſo Vegetables.

In the Middleſex Corrected Report on Agriculture, it is ſtated, that the beſt flour is moſtly uſed by the paſtry-cooks, and the makers of fine biſcuits, and the inferior ſorts in the making of bread. That theſe have often the worſe kinds of damaged foreign wheats, and other materials, mixed with them in grinding them into flour. And that, if the bread conſumed in the metropolis was prepared from the wheat of this country, unmixed with the leaner produce of other nations, the trial detailed below would ſhew with accuracy the quantity of bread that could be made from a Wincheſter buſhel of that grain.

One buſhel of the wheat of this country, which weighed ſixty-one pounds, was taken. It was then ground, and the meal weighed $60\frac{3}{4}$ lbs. ; which, on being dreſſed, produced $46\frac{3}{4}$ lbs. of flour, of the ſort called ſeconds, which alone is uſed for the making of bread throughout the greater part of this country ; and of pollard and bran $12\frac{3}{4}$ lbs., which quantity was bolted, and it produced in ſharps 3 lbs., which being ſifted produced in good ſecond flour $1\frac{1}{2}$ lb.

	lbs.	lbs.
The whole quantity of bread-flour obtained from the buſhel of wheat, weighed - - - -		48
Fine pollard - - - -	$4\frac{1}{4}$	
Coarſe pollard - - - -	4	
Bran - - - - -	$2\frac{3}{4}$

The whole together - -		59
To which add the loſs of weight in manufacturing the buſhel of wheat - - - - -		2
Produces the original weight -		61

The ſack of marketable flour is by law obliged to weigh 240 lbs., which is exactly the produce of five buſhels of ſuch wheat ; and the ſack of flour is conſtantly ſuppoſed to make eighty quartern loaves of bread ; and conſequently ſixteen of ſuch loaves are made from each buſhel of ſuch wheat. It is admitted, however, that two or three loaves more than the above quantity can be made from the ſack of flour, when it is the genuine produce of good wheat ; that is, in the proportion of about ſixteen and a half loaves from each buſhel of ſound grain, and, it may be preſumed, ſixteen from a buſhel of medium corn. The expence of making the ſack of flour into bread, and diſpoſing of it, is about 8*s*.

Wheat, *Indian*. See Maize.

Wheat, *Mildew in*. See Mildew.

Wheat, *Muſt of*, is, according to the ingenious Mr. Hatchett, a taint produced by damp upon the aylaceous part of the grain, or ſtarch ; and he conceives, that this taint is, in moſt caſes, ſuperficial. He propoſes the following as a ſucceſsful method of removing it.

The wheat muſt be put into a veſſel capable of holding at leaſt three times the quantity, and the veſſel filled with boiling water ; and the grain ſhould then be occaſionally ſtirred, and the hollow decayed grains, which float, may be removed. When the water has become cold, or in about half an hour, it is drawn off. Then rince the corn with cold water, and having completely drained it, ſpread it thinly on the floor of a kiln, and thus thoroughly dry it, ſtirring and turning it frequently during this part of the proceſs. Phil. Tranſ. for 1817, part i.

Wheat *Rickſtand*. See Staddle, and Stand.

Wheat, *Root-fallen* or *Welten*, that ſort of wheat-crop in which the roots are thrown out of the ground by its lightneſs or poroſity, as cauſed by froſts or other means. See Wheat, and Welt-*Root*.

Wheat, *Ruſt in*. See Rust.

Wheat-*Seed*, *Liming of*, the practice of drying moiſtened corn of this ſort by means of powdery lime. It is the cuſtom in ſome places to make it wet over-night, with ſalt or other water, and to duſt it over with the lime the next morning before it is ſown, mixing it well together in the operation. By the lime, however, thus remaining ſo ſhort a time on the grain before ſowing, it has no time to penetrate into

into the corn; whereas, by moistening the wheat, and leaving it until the succeeding morning well limed, the lime has a greater power, it is supposed, in destroying the smut-powder, than when it remains on it only for half an hour, and is then mostly rubbed off the corn. Half a bushel of the strongest lime is sufficient for a quarter of wheat, when sifted over and mixed well with it.

In this last mode of drying seed-wheat with lime, it is found to be very efficient in preventing the crops from being diseased in some districts. See STEEPING *Seed*.

As there is an uncertainty whether the effect in this practice is to be ascribed to the washing of the grain or the lime, some merely moisten the corn for the purpose of making the lime adhere to it; while others are extremely attentive to the liquor made use of and the washing of the seed, and simply make use of the lime for drying it for sowing. Lime is, however, considered as a great preventative of disease in the grain by many. It should always be used while fresh and newly slacked.

WHEAT, *Setting of*, the practice of putting it into the soil by the hand. In many parts of the vale of the county of Gloucester, they set wheat by the hand and line; but the difficulty of getting on with the work at the proper season, when on a large scale, in consequence of the want of hands, operates against the more general introduction of this practice. When wheat is set by the hand in this way, not more than three pecks of seed are made use of. On clover-leys wheat is often put in by the hand in small channels made across the beds, which have been formed by the plough to the width of half a ley, dropping the seed into them, and leaving a distance of about seven inches between the different channels. This mode is said to be good for late work; and the expence to be about seven shillings the acre, the seed being usually about six pecks. In some other districts the setting of wheat is said to be practised with much success and advantage; but it is probably too tedious and expensive a mode to be had recourse to on any large extent of wheat cultivation. See DIBBLING, and SETTING *of Wheat*.

WHEAT, *Spring*. See SPRING-*Wheat*, and WHEAT.

WHEAT, *Smyrna*, a peculiar kind of wheat that has an extremely large ear, with many lesser or collateral ears coming all round the bottom of the great one.

As this is the largest of all sorts of wheat, so it will dispense with the nourishment of a garden, without being overfed, and requires more nourishment than common husbandry in the large way can give it. In the common way its ears grow not much larger than those of our common wheat.

This sort of wheat seems, of all others, the most proper for the new method of horse-hoeing husbandry, as that method seems capable of giving as much nourishment as the farmer pleases, by often repeating the hoeing. Next to this, the white-cone wheat is best for this sort of husbandry; then the grey-cone wheat.

WHEAT-*Stubble, Cutting and Collecting of*, the useful practice of mowing and raking together the strong stubbles of wheat-crops, and stacking them up in or near the farm-yards as additional litter, and for other purposes. It should always be done as soon as possible after the wheat has been taken from the fields. See STUBBLE.

WHEAT, *Tillering of*, the throwing out of new shoots, stems, or stalks, from about the roots, so as to increase the thickness of the crops on the grounds. It takes place much more extensively in the autumnal and winter sown wheats than those of the spring sowings. See TILLER, and WHEAT.

WHEAT, *Transplantation of*, the practice of putting into the ground the young plants of wheat that have been raised in other places, or which stand too thick on the land. It is observed in the Middlesex Report on Agriculture, that it is well calculated for increasing the quantity of corn produced from a single grain, and that it may be resorted to for the sake of curiosity when the cultivator has procured a small quantity of some new and very valuable variety of seed; but that a farmer should never extend it to his field culture.

There would be much loss in labour and in other ways, it is supposed, by this practice, and nothing be gained by it. See TRANSPLANTING, and WHEAT.

WHEAT, *White-cone*, a term used by our husbandmen, to express a peculiar kind of wheat, which is very strong, and has a large ear.

It is the best kind for sowing in fields subject to the blight; for the stalks of it being, for the most part, solid or full of pith, like a rush, not hollow, like those of common wheat; the insects that cause the blight, seizing on the stalks of other wheat, do this no injury, even though they should attack it; the stalks of this kind being often found full of the black specks, which are always the marks of that insect having been there, and yet the ear full, and the grain good.

This wheat makes very good bread, if the miller does not grind it too small, or the baker make his dough too hard, it requiring to be somewhat larger than other wheat-flour, and somewhat softer in the dough. A bushel of white-cone wheat will make considerably more bread than a bushel of Lammas wheat; but it gives it a somewhat yellowish cast.

WHEAT-*Bird*, in *Ornithology*, a name given by the people of Virginia to a species of bird, which, after the time of the sowing of the wheat in that country, made its appearance annually at the season of its beginning to ripen, and was never seen there before. See MIGRATION *of Birds*.

WHEAT-*Ear*, the English name of the common œnanthe, or *motacilla œnanthe* of Linnæus, called also the *white-tail* and the *fallow-finch*. See MOTACILLA *Œnanthe*.

WHEATEN-BREAD. See THEORY *of Bread*, and WHEAT, *Grinding of*, &c.

WHEATFIELD, in *Geography*, a township of Pennsylvania, in the county of Indiana, with 1475 inhabitants.

WHEATLY, FRANCIS, in *Biography*, was born in London in 1747, and received his first instruction as an artist in Shipley's drawing-school. Whilst young he received several premiums from the Society for the Encouragement of Arts, &c. He does not appear to have had any particular instructor in painting, but by his own industry and ingenuity contrived to obtain some knowledge of it; and having formed an intimacy with Mr. Mortimer, whom he assisted in painting the ceiling at Brockett-hall, by that circumstance obtained considerable improvements. He had great employment in painting small whole-length portraits, to which he added landscape back-grounds with considerable taste. After practising some years in London, he went to Ireland, and was much employed in Dublin, where he painted a large picture of the Irish house of commons, with portraits of the most considerable political characters, by which he acquired great reputation. On his return to London he painted a picture of the soldiery attacking the rioters in 1780, which was well engraved by Heath.

About this time he appears to have changed his practice, and painted rural and domestic subjects in a manner which evidently exhibits them to have been the offspring of the natural bent of his mind. He was engaged in the Shakspeare Gallery, but failed to excite interest: neither his talent nor his style was suited to the character of the subjects given to him. In the slighter subjects of common life he was at home, and he touched them and composed them in a most agreeable manner, and with a very pleasing tone of colour;

colour: thefe he executed with rapidity, and, as he always fold them, he acquired fufficient money to indulge a natural propenfity to the pleafures of the table. Hence he became a martyr to the gout, and died of that difeafe in 1801, at the age of 54. He was elected an academician in 1791.

WHEE, Whey, *Whie*, or *Qui*, in *Rural Economy*, a term ufed to fignify a young heifer, or heifer-calf, in different places and parts of the country.

WHEEANG, or Whang, a provincial term made ufe of to fignify a thong or ftrap of leather for the harnefs or geer of farm-teams, or other domeftic purpofes.

WHEEL, Rota, in *Mechanics*, a fimple machine, confifting of a round piece of wood, metal, or other matter, which revolves on an axis.

For an account of the *wheel* and *axle*, as a mechanical power, fee Axis *in Peritrochio*, and Mechanical *Powers*.

The wheel is one of the principal mechanic powers. It has place in moft engines: in effect, it is of an affemblage of wheels that moft of our chief engines are compofed. Witnefs clocks, mills, &c.

Its form is various, according to the motion it is to have, and the ufe it is to anfwer. By this it is diftinguifhed into *fimple* and *dented*.

Wheels, *Simple*, are thofe whofe circumference and axis are uniform, and which are ufed fingly, and not combined. Such are the wheels of carriages, which are to have a double motion; the one circular about their axis; the other rectilinear, by which they advance along the road, &c. which two motions they appear to have; though, in effect, they have but one: it being impoffible the fame thing fhould move, or be agitated, two different ways at the fame time.

This one is a fpiral motion; as is eafily feen, by fixing a piece of chalk on the face of a wheel, fo as that it may draw a line on a wall, as the wheel moves. The line it here traces is a juft fpiral, and ftill the more curve, as the chalk is fixed nearer the axis.

The fact, however, has been difputed; and it has been alleged, that nothing is more eafy than for any one, who will take the trouble to make the experiment, to prove its falfehood. Place the chalk on the face of the wheel, as directed, and you will find that, fo far from its defcribing a juft fpiral, and that ftill the more curve as the chalk is fixed nearer the axis, the chalk, if placed on the periphery of the wheel, will defcribe a cycloid, and the nearer it is placed to the axis, the nearer will the line it defcribes approach to the ftraight line which is defcribed by the axis itfelf. Moreover, it is not true, nor pretended to be fo, that the fame thing moves two ways at once in the rectilinear and circular motion of wheels. The local motion, or motion of the whole wheel, is rectilinear only; that of the parts of the wheel circular. Nor can this latter motion with any propriety be called that of the wheel, unlefs the fame thing could alfo move quick and flow at the fame time, which the different parts of the wheel, in revolving round its axis, evidently do. Jacob's Obf. on the Structure and Draught of Wheel-Carriages, 1773, p. 28, &c.

For a very nice phenomenon, in the motion of thefe wheels, fee Rota *Ariftotelica*.

We fhall add, that, in wheels of this kind, the height fhould always be proportioned to the ftature of the animal that draws or moves them. The rule is, that the load and the axis of the wheels be of the fame height with the power that moves them; otherwife the axis being higher than the beaft, part of the load will lie upon him; or, if it be lower, he pulls to difadvantage, and muft exert a greater force. Though Stevinus, Dr. Wallis, &c. fhew, that, to draw a vehicle, &c. over wafte uneven places, it were beft to fix the traces to the wheels fomewhat lower than the horfe's breaft. See Wheels *of Coaches*, &c.

The power of thefe wheels refults from the differences of the radii of the axis, and circumference. The canon is this: "As the radius of the axis is to that of the circumference, fo is any power to the weight it can fuftain hereby."

This is alfo the rule in the axis in peritrochio; and, in effect, the wheel, and the axis in peritrochio, are the fame thing; only, in theory, it is ufually called by the latter name, and in practice by the former.

Wheels, *Dented*, are thofe either whofe circumference, or axis, is cut into teeth, by which they are capable of moving and acting on one another, and of being combined together.

The ufe of thefe is very confpicuous in clocks, jacks, &c.

The power of the dented wheel depends on the fame principle as that of the fimple one. It is only that to the fimple axis in peritrochio, which a compound lever is to a fimple lever.

Its doctrine is comprifed in the following canon; *viz.* "The ratio of the power to the weight," in order for that to be equivalent to this, "muft be compounded of the ratios of the diameter of the axis of the laft wheel to the diameter of the firft; and of the ratio of the number of revolutions of the laft wheel, to thofe of the firft, in the fame time." But this doctrine will deferve a more particular explanation.

1. Then, if the weight be multipled into the product of the radii of the axes, and that product be divided by the product of the radii of the wheels, the power required to fuftain the weight will be found. Suppofe, *e. gr.* the weight A (*Plate* XL. *fig.* 83. *Mechanics*,) = 6000 pounds, B C = 6 inches, C D = 34 inches, E F = 5 inches, E G = 35 inches, H I = 4 inches, H K = 27 inches: then will B C × E F × H I = 120; and C D × E G × H K = 32130. Hence the power required to fuftain the weight, will be 6000 × 120 ÷ 32130 = 22$\frac{1}{2}$ very nearly; a fmall addition to which will raife it.

2. If the power be multiplied into the product of the radii of the wheels, and the factum be divided by the product of the radii of the axes; the quotient will be the weight which the power is able to fuftain. Thus, if the power be 22$\frac{1}{2}$ pounds; the weight will be 6000 pounds.

3. A power and weight being given, to find the number of wheels, and in each wheel the ratio of the radius of the axis, to the radius of the wheel; fo as that the power, being applied perpendicularly to the periphery of the laft wheel, may fuftain the given weight.

Divide the weight by the power; refolve the quotient into the factors which produce it. Then will the number of factors be the number of wheels; and the radii of the axes will be to the radii of the wheels, as unity to the feveral wheels. Suppofe, *e. gr.* a weight of 3000 pounds, and a power of 60, the quotient of the former by the latter is 500, which refolves into thefe factors, 4. 5. 5. 5. Four wheels are, therefore, to be made; in one of which, the radius of the axis is to the radius of the wheel, as 1 to 4; in the reft, as 1 to 5.

4. If a power move a weight by means of two wheels, the revolutions of the flower wheel are to thofe of the fwifter, as the periphery of the fwifter axis is to the periphery of the wheel that catches on it.

Hence, 1. The revolutions are as the radius of the axis F E to the radius of the wheel D C. 2. Since the number

ber of teeth in the axis F D, is to the number of teeth in the circumference of the wheel M, as the circumference of that to the circumference of this; the revolutions of the flower wheel M, are to the revolutions of the fwifter N, as the number of teeth in the axis to the number of teeth in the wheel M, which it catches.

5. If the factum of the radii of the wheels G E, D C, be multiplied into the number of revolutions of the floweft wheel, M, and the product be divided by the factum of the radii of the axes which catch into them, G H, D E, &c. the quotient will be the number of revolutions of the fwifteft wheel O. *E. gr.* If G E = 8, D C = 12, G H = 4, D E = 3, and the revolution of the wheel M be 1; the number of revolutions of the wheel O will be 8.

6. If a power move a weight by means of divers wheels, the fpace paffed over by the weight, is to the fpace of the power, as the power to the weight. Hence, the greater the power, the quicker is the weight moved; and *vice verfâ*.

7. The fpaces paffed over by the weight and the power, are in a ratio compounded of the revolutions of the floweft wheel, to the revolution of the fwifteft; and of the periphery of the axis of that, to the periphery of this. Hence, fince the fpaces of the weight and the power are reciprocally as the fuftaining power is to the weight; the power that fuftains a weight will be to the weight, in a ratio compounded of the revolutions of the floweft wheel, to thofe of the fwifteft, and of the periphery of the axis of that, to the periphery of this.

8. The periphery of the axis of the floweft wheel, with the periphery of the fwifteft wheel, being given; as alfo the ratio of the revolutions of the one, to thofe of the other; to find the fpace which the power is to pafs over, while the weight goes any given length.

Multiply the periphery of the axis of the floweft wheel into the antecedent term of the ratio, and the periphery of the fwifteft wheel into the confequent term; and to thefe two products, and the given fpace of the weight, find a fourth proportional: this will be the fpace of the power. Suppofe, *e. gr.* the ratio of the revolutions of the floweft wheel, to thofe of the fwifteft, to be as 2 to 7, and the fpace of the weight 30 feet; and let the periphery of the axis of the floweft wheel be to that of the fwifteft, as 3 to 8: the fpace of the power will be found 280. For $2 \times 3 : 7 \times 8 :: 30 : 280$.

9. The ratio of the peripheries of the fwifteft wheel, and of the axis of the floweft; together with the ratio of their revolutions, and the weight, being given: to find the power able to fuftain it.

Multiply both the antecedents and the confequents, of the given ratios into each other, and to the product of the antecedents, the product of the confequents, and the given weight, find a fourth proportional: that will be the power required. Suppofe, *e. gr.* the ratio of the peripheries 8 : 3; that of the revolutions 7 : 2, and the weight 2000; the power will be found $214\frac{2}{7}$. For $7 \times 8 : 2 \times 3 :: 2000 : 214\frac{2}{7}$. After the fame manner may the weight be found; the power, and the ratio of the peripheries, &c. being given.

10. The revolutions the fwifteft wheel is to perform while the floweft makes one revolution, being given; together with the fpace the weight is to be raifed, and the periphery of the floweft wheel; to find the time that will be fpent in raifing it.

Say, As the periphery of the axis of the floweft wheel is to the given fpace of the weight; fo is the given number of revolutions of the fwifteft wheel to a fourth proportional: which will be the number of revolutions performed while the weight reaches the given height. Then, by experiment, determine the number of revolutions the fwifteft wheel performs in an hour; and, by this, divide the fourth proportional found before. The quotient will be the time fpent in raifing the weight. Wolf. Elem. Math. tom. ii. p. 214, &c.

Wheels *of a Clock*, &c. are the crown wheel, contrate wheel, great wheel, fecond wheel, third wheel, ftriking wheel, detent wheel, &c. See Clock and Watch.

Wheels *of Coaches*, *Waggons*, &c. With refpect to thefe, the following particulars are collected from the experiments and reafonings of Camus, Defaguliers, Beighton, Fergufon, Brewfter, &c.

1. The ufe of wheels, in the draught of carriages, is two-fold; *viz.* that of diminifhing, or of more eafily overcoming the refiftance arifing from the friction of the carriage, and that of more readily furmounting obftacles, which form angular prominences on the plane over which they are drawn, and which muft be either depreffed by the weight of the carriage, or render it neceffary for the carriage, with its load, to be lifted over them. They ferve in their firft ufe to transfer the friction from the under furface of the carriage, and the plane fupporting it, to the furfaces of the axle and nave of the wheel. The common method of accounting for this advantage is by faying, that the refiftance, arifing from friction in planes of equal afperity, increafes with the velocity of the motion; fo that this velocity muft be compared with that of the power neceffary to move the machine, and overcome the friction; and it is obvious, at the fame time, that the velocity of a circular motion diminifhes gradually from the circumference to the centre. See Friction.

But to this pofition it has been objected, that the illuftration is not applicable to the cafe: for, granting that, in the friction of fledges or flat furfaces, the refiftance increafes in proportion to the velocity of their motion, this is not a parallel cafe with that of a circular furface rolling over a flat plane. On the contrary, the velocity of motion, in the outer furface of a wheel, is greater than that of its nave, moving under the axle; while at fuch outer furface there is little or no friction at all; whereas at the nave, moving much flower, there is much more. Indeed, the friction, which the wheel would have againft its fupporting plane, if it did not turn round its axis, is by its turning round transferred almoft wholly to the axis and nave; whofe circular motion is notwithftanding fo much flower. It is, indeed, notorious, that the great friction of the wheels of carriages lies between the axle and nave; and how then can it be properly afferted, that fuch friction is diminifhed at the axle, as the velocity of the circular motion is there diminifhed? Accordingly it has been alleged by a late writer, that friction is not diminifhed by the ufe of wheels, but merely transferred from the outer furface of the wheel to its nave and axle; and that in the cafe of a wheel rolling along the ground, the fpokes act only as fingle levers, to overcome the friction of the periphery againft the plane of its fupport, the prominences, conftituting the roughnefs of the plane over which it moves, being the fulcra upon which they turn, and not the common centre of thefe fpokes, as others have maintained, who fay that the wheel acts, in overcoming friction, as an axis in peritrochio. However, in obviating the friction of the wheels in loaded carriages, their fpokes act as double levers, refting on a fulcrum at each end. See the author's method of illuftrating and evincing thefe principles, in Jacob's Obf. on Wheel-Carriages, p. 23, &c.

If carriages were to move along fmooth horizontal planes, wheels would be useful only in overcoming friction; but as they are drawn along roads covered with loose stones, indented with cavities, they are farther useful in serving to depress, or raise the carriage over the one, and in raising it out of the other.

2. The wheels of all carriages ought to be exactly round; and the fellies should be at right angles to the naves, according to the inclination of the spokes, *i. e.* the plane of the curvature of the wheel should cut the nave at right angles, though it need not pass through the place where the spokes are inserted into the nave.

3. The spokes, according to Mr. Ferguson and most other writers on mechanics, should be inclined to the naves, so that the wheels may be dishing or concave. If, indeed, the wheels were always to go upon smooth and level ground, it would be best to make the spokes perpendicular to the naves, or at right angles with the axles; because they would then bear the weight of the load perpendicularly, which is the strongest way for the wood. But because the ground is generally uneven, one wheel often falls into a cavity or rut, when the other does not, and then it bears much more of the weight than the other does; in which case dishing wheels are best, because the spokes become perpendicular in the rut, and therefore have the greatest strength when the obliquity of the road throws most of its weight upon them; whilst those on the high ground have less weight to bear, and therefore need not be at their full strength. Besides, by this form of the wheels, the base of the carriage is extended, and it is thus prevented from being easily overturned, and the fellies are hindered from rubbing against the load or the sides of the cart. Dr. Brewster, however, is of opinion, that the disadvantages of concave wheels overbalance their advantages. Mr. Anstice also, in his "Treatise on Wheel-Carriages," whilst he recommends concave wheels, candidly allows, that some disadvantages attend this construction of them; for the carriage thus takes up more room on the road, so that it is more unmanageable; and when it moves upon plane ground the spokes not only do not bear perpendicularly, by which means their strength is lessened, but the friction upon the nave and axle is made unequal, and so much the more as they are the more dished. Dr. Brewster farther shews, that they are more expensive, more injurious to the roads, more liable to be broken by accidents, and less durable in general, than those wheels in which the spokes are perpendicular to the naves. From these and other considerations, our author is decidedly of opinion, that if wheels are to be composed of naves, spokes, and fellies, the rim should be cylindrical, and the spokes perpendicular to the naves; whereas in concave wheels, the rims are uniformly made conical, which subjects them to a variety of disadvantages. Every cone that is put in motion upon a plane surface will revolve round its vertex, and if force is employed to confine it to a straight line, the smaller parts of the cone will be dragged along the ground, and the friction greatly increased. Now when a cart moves upon conical wheels, one part of the cone rolls while the other is dragged along, and though confined to a rectilineal direction by external force, their natural tendency to revolve round their vertex occasions a great and continued friction upon the linch-pin, the shoulder of the axle-tree, and the sides of deep ruts.

Dr. Brewster has made some farther observations on the construction of certain parts of the wheels. The iron plates, he says, of which the rims are composed, should never be less than three inches in breadth, as narrower rims sink deep into the ground, and therefore injure the roads and fatigue the horses. See the sequel of this article.

4. The axles of the wheels ought to be perfectly straight, and at right angles to the shafts, or to the pole. When the axles are straight, the rims of the wheels will be parallel to each other, and then they will move the easiest, because they will be at liberty to go on straight forwards. But in the usual way of practice, the axles are bent downwards at their ends; which brings the sides of the wheels next the ground nearer to one another than their higher sides are; and this not only makes the wheels to drag sideways as they go along, and gives the load a much greater power of crushing them than when they are parallel to each other, but also endangers the overturning of the carriage when any wheel falls into a hole or rut, or when the carriage goes on a road which has one side lower than the other, as along the side of a hill. Thus, in the hind view of a waggon or cart, let A E and B F (*Plate* XL. *fig.* 9. *Mechanics*) be the great wheels parallel to each other, on their straight axle K, and H C I the carriage loaded with heavy goods from C to G. Then as the carriage goes on in the oblique road A *a* B, the centre of gravity of the whole machine and load will be at C; and the line of direction C *d* D falling within the wheel B F, the carriage will not overset. But if the wheels be inclined to each other at the ground, as A E and B F are (*fig.* 10.), and the machine be loaded as before from C to G, the line of direction C *d* D falls without the wheel B F, and the whole machine tumbles over. When it is loaded with heavy goods which lie low, it may travel safely upon an oblique road, so long as the centre of gravity is at C (*fig.* 9.), and the line of direction C *d* D falls within the wheels; but if it be loaded high with lighter goods from C to L (*fig.* 11.), the centre of gravity is raised from C to K, which shews the line of direction K *k* without the lowest edge of the wheel B F, and then the load oversets the waggon. Mr. Beighton has offered several reasons to prove, that the axles of wheels ought not to be straight: for which we must refer to Desaguliers' Exp. Phil. vol. ii. Appendix, p. 540, &c. Moreover, if the axle were not at right angles to the pole or shaft, but this was on one side, then the coach or carriage would be drawn on one side, and almost all the weight would bear upon one horse. With some mechanics, it is a practice to bend the ends of the axle-trees forwards, and thus make the wheels wider behind than before. Mr. H. Beighton maintains, that wheels in this position are more favourable for turning; since, when the wheels are parallel, the outermost would press against the linch-pin, and the innermost would rub against the shoulder of the axle-tree. In rectilineal motions, however, these converging wheels occasion a great deal of friction, both on the axle and the ground, and must therefore be more disadvantageous than parallel ones. This fact is allowed by Mr. Beighton: but he seems to found his opinion upon this principle; that as the roads are seldom straight lines, the wheels should be more adapted to a curvilineal than to a rectilineal motion.

5. Large wheels are always more advantageous for rolling than small ones, in any case, or upon any ground whatever. If we consider wheels with regard to their friction upon the axles, it is evident, that small wheels must turn as much oftener round than the large ones, as their circumferences are less; and, therefore, a wheel which is twice as large as another will have twice the advantage in respect of the friction, the holes of the naves and axles, and the weights upon them, being equal. Again, if we consider the wheels as they sink into the earth, or fall into holes, the bearing of the great wheel being double that of the small one, it would sink but half so deep; and if the small wheel should meet with a hole of the same diameter with itself, it would wholly sink in, whilst only a segment less than half of the great wheel

wheel would fall in: the fame thing would alfo happen in marfhy ground, where the fmall wheel would fink wholly in the fame hole which the great one would fink into but in part. The large wheel would alfo have the advantage of a fmall one in rifing over eminences or rubs that occurred; fo that the former would go over rubs much higher than the latter; and indeed over any eminences, provided their height be not equal to its femidiameter. Defaguliers has reduced this matter to a mathematical calculation, in his Exp. Phil. vol. i. p. 171, &c.

A late writer has alfo proved, that a wheel of eight feet diameter has fomewhat more than twice the advantage in overcoming obftacles of a wheel of two feet; and he found, in practice, that if it requires a certain power to draw a carriage of a certain weight over a certain obftacle, with wheels of any determinate diameter, it will require wheels of four times that diameter, to draw the fame carriage over the fame obftacle with half that power. This writer alfo obferves, that, in the draught of carriages afcending inclined planes, the moving power acts not only againft the vis inertiæ, which is always equal to the abfolute gravity of the load, but alfo againft its relative gravity, which increafes with the inclination of the plane; and with refpect to carriages raifed on wheels, it is to be obferved, that the higher the axle is removed from the plane, the farther is the centre of gravity removed out of the perpendicular line of fupport; fo that the lower the wheel, the lefs is the relative gravity of the carriage. Hence he infers, that fuppofing the friction of two carriages of equal weight, but of different fized wheels, to be equal, the low-wheeled one would be drawn up hill, on a fmooth plane, much more eafily than the high-wheeled one; though on a fmooth, horizontal plane, the latter would be drawn more eafily than the former. On the contrary, in going down hill, the high-wheeled carriage will be urged forward, by its relative gravity, more than the low-wheeled one. Jacob, ubi fupra, p. 63, &c.

It appears, therefore, that the larger wheels are, the more advantageous they are in proportion, provided that they are not more than five or fix feet in diameter; for when they exceed thefe dimenfions, they become heavy; or if they are made light, their ftrength is proportionably diminifhed, and the fpokes, being long, are more liable to break: befides, horfes applied to fuch wheels, would be incapable of exerting their utmoft ftrength, by having the axles higher than their breafts, fo that they would draw downwards; as in fmall wheels the draught is made more difficult, by the horfes drawing upwards.

It is obferved by Dr. Brewfter, in the appendix to his edition of "Fergufon's Mechanics," that when the wheels of carriages either move upon a level furface, or overcome obftacles which impede their progrefs, they act as mechanical powers, and may be reduced to levers of the firft kind. In order to elucidate this remark, which is of great importance in the prefent difcuffion, let A be the centre, and B C N the circumference of a wheel 6 feet in diameter, and let the impelling power P, which is attached to the extremity of a rope A D P, paffing over the pulley D, act in the horizontal direction A D. Then, if the wheel is not affected by friction, it will be put in motion upon the level furface M B, when the power P is infinitely fmall. For fince the whole weight of the wheel refts on the ground at the point B, which is the fulcrum of the lever A B, the diftance of the weight from the centre of motion will be nothing, and therefore the mechanical energy of the fmalleft power P, acting at the point A, with a length of lever A B, will be infinitely great when compared with the refiftance of the weight to be raifed; and this will be the cafe, however fmall the lever A B, and however great be the weight of the wheel. But as the wheels of carriages are conftantly meeting with impediments, let C be an obftacle fix inches high, which the wheel is to furmount. Then the fpoke A C will reprefent the lever, C its fulcrum, A D the direction of the power; and if the wheel weighs 100 pounds, we may reprefent it by a weight W, fixed to the wheel's centre A, or to the extremity of the lever C A, and acting in the perpendicular direction A B, in oppofition to the power P. Now the mechanical energy of the weight W to pull the lever round its fulcrum in the direction A E, is reprefented by C E, while the mechanical energy of an equal weight P to pull it in the oppofite direction A F, is reprefented by C F; an equilibrium, therefore, will be produced, if the power P is to the weight W as C E to C F, or as the fine is to the cofine of an angle, whofe verfed fine is equal to the height of the obftacle to be furmounted; for E B, the height of the mound C, is the verfed fine of the angle B A C, and C E is the fine, and C F the cofine of the fame angle. In the prefent cafe, where E B is fix inches, and A B three feet, E B, the verfed fine, will be 1666, &c. when A B is 1000; and, confequently, the angle B A C will be 33° 33′, and C E will be to E F, as 52 to 83, or as 66 to 100. A weight P, therefore, of 66 pounds, acting in a horizontal direction, will balance a wheel fix feet diameter, and 100 pounds in weight, upon an obftacle fix inches high; and a fmall additional power will enable it to furmount that obftacle. But if the direction, A D, of the power, be inclined to the horizon, fo that the point D may rife towards H, the line F C, which reprefents the mechanical energy of P, will gradually increafe, till D A has reached the pofition H A, perpendicular to A C, where its mechanical energy, which is now a maximum, is reprefented by A C, the radius of the wheel; and fince E C is to C A as 53 to 1000, a little more than 53 pounds will be fufficient for enabling the wheel to overcome the obftacle.

Proceeding in this way, it will be found, fays our author, that the power of wheels to furmount eminences increafes with their diameter, and is directly proportional to it, when their weight remains the fame, and when the direction of the power is perpendicular to the lever which acts againft the obftacle. Hence we fee the great advantages which are to be derived from large wheels, and the difadvantages which attend fmall ones. There are fome circumftances, however, which confine us within certain limits in the ufe of large wheels. When the radius A B of the wheel is greater than D M, the height of the pulley, or of that part of the horfe to which the rope or pole D A is attached, the direction of the power, or the line of traction A D, will be oblique to the horizon as A *d*, and the mechanical energy of the power will be only A *e*, whereas it was reprefented by A E when the line of traction was in the horizontal line D A. Whenever the radius of the wheel, therefore, exceeds four feet and a half, the height of that part of the horfe to which the traces fhould be attached, the line of traction A D will incline to the horizon, and by declining from the perpendicular A H, its mechanical effort will be diminifhed; and fince the load refts upon an inclined plane, the trams or poles of the cart will rub againft the flanks of the horfe, even in level roads, and ftill more feverely in defcending ground. Notwithftanding this diminution of force, however, arifing from the unavoidable obliquity of the impelling power, wheels exceeding four and a half feet radius have ftill the advantage of fmaller ones; but their power to overcome refiftances does not increafe fo faft as before. Hitherto we have fuppofed the weight of the large and fmall wheels to be the fame, but

 it

it is evident that when we augment their diameter we add greatly to their weight; and by thus increafing the load, we fenfibly diminifh their power.

From thefe remarks, we fee the fuperiority of great wheels to fmall ones, and the particular circumftances which fuggeft the propriety of making the wheels of carriages lefs than four feet and a half radius. But even this fize is too great; and it may be fafely afferted that they fhould never exceed fix feet in diameter, nor ever be lefs than three feet and a half.

6. Carriages with four wheels, as waggons or coaches, are much more advantageous than carriages with two wheels, as carts and chaifes; for in applying horfes to a carriage with two wheels, it is plain that the tiller carries part of the weight, in whatfoever manner it be kept in equilibrio upon the axle. In going down a hill, the weight bears upon the horfe; and in going up a hill, the weight falls the other way, and lifts the horfe, by which means part of his force is loft. Befides, as the wheels fink into the holes in the road, fometimes on one fide, fometimes on the other, the fhafts ftrike againft the tiller's flanks, which is the deftruction of many horfes. Add to this, that when one of the wheels finks into a hole or rut, half the weight will fall that way, whereby the carriage will be in danger of being overturned.

7. It would be much more advantageous to make the four wheels of a coach or waggon large, and nearly of a height, than to make the fore-wheels of only half the diameter of the hind-wheels, as is ufual in many places. The fore-wheels of carriages have commonly been made of a lefs fize than the hind ones, both on account of turning fhort, and to avoid cutting the braces. Crane-necks have alfo been invented for turning yet fhorter, and the fore-wheels have been lowered, fo as to go quite under the bend of the crane-neck. See an account of an ingenious contrivance for this purpofe, under PERCH.

Some carriers and coachmen have, indeed, abfurdly alleged, that when the fore-wheels are much lower than the hind ones, they ferve to pufh them on. However, many difadvantages attend this conftruction. A confiderable force is loft that would be effectual, if they were large: the carriage would go much more eafily, if the fore-wheels were as high as the hind-ones; and the higher the better, becaufe their motion would be fo much the flower on their axles, and confequently the friction proportionably diminifhed. The jolting and uneafy motion occafioned by low wheels, has induced perfons to contrive fprings, in order to prevent it. But nothing can be more inconfiftent, even with this end, than the common method of fixing the braces to the bottom of the body of a carriage. In confequence of this practice, the centre of gravity of the fufpended body is fo high above the centre of its motion, that it is liable to be continually agitated by the jolting of the carriage, and its danger of overturning increafed: whereas if, inftead of practifing this method, the body were fufpended as near as poffible to its centre of gravity, the agitation of the carriage, as well as its danger of overturning, would be in a great meafure avoided.

The effect of the fufpenfion of a carriage on fprings is to equalize its motion, by caufing every change to be more gradually communicated to it, by means of the flexibility of the fprings, and by confuming a certain portion of every fudden impulfe in generating a degree of rotatory motion. This rotatory motion depends on the oblique pofition of the ftraps fufpending the carriage, which prevents its fwinging in a parallel direction; fuch a vibration as would take place if the ftraps were parallel, would be too extenfive, unlefs they were very fhort, and then the motion would be fomewhat rougher. The obliquity of the ftraps tends alfo in fome meafure to retain the carriage in a horizontal pofition: for if they were parallel, both being vertical, the lower one would have to fupport the greater portion of the weight, at leaft according to the common mode of fixing them to the bottom of the carriage; the fpring, therefore, being flexible, it would be ftill further depreffed. But when the ftraps are oblique, the upper one affumes always the more vertical pofition, and confequently bears more of the load; for when a body of any kind is fupported by two oblique forces, their horizontal thrufts muft be equal, otherwife the body would move laterally; and in order that the horizontal portions of the forces may be equal, the more inclined to the horizon muft be the greater: the upper fpring will, therefore, be a little depreffed, and the carriage will remain more nearly horizontal than if the fprings were parallel. The reafon for dividing the fprings into feparate plates has already been explained: the beam of the carriage, that unites the wheels, fupplies the ftrength neceffary for forming the communication between the axles: if the body of the carriage itfelf were to perform this office, the fprings would require to be fo ftrong that they could have little or no effect in equalizing the motion, and we fhould have a waggon inftead of a coach. The eafe with which a carriage moves, depends not only on the elafticity of the fprings, but alfo on the fmall degree of ftability of the equilibrium, of which we may judge in fome meafure, by tracing the path which the centre of gravity muft defcribe, when the carriage fwings.

There is an inconvenience which attends the ufual method of loading carriages; for when a carriage is loaded equally heavy on both axles, the fore-axle muft endure as much more friction, and confequently wear out as much fooner than the hind-axle, as the fore-wheels are lefs than the hind ones. However, the carriers commonly put the heavier part of the load upon the fore-axle of the waggons; which not only makes the friction greateft where it ought to be leaft, but alfo preffeth the fore-wheels deeper into the ground than the hind-wheels, although the fore-wheels, being lefs than the hind ones, are with fo much the greater difficulty drawn out of a hole, or over an obftacle, even fuppofing the weights on their axles were equal; for the difficulty, with equal weights, will be as the depth of the hole, or height of the obftacle, is to the femi-diameter of the wheel. Moreover, fince a fmall wheel will often fink to the bottom of a hole, in which a great wheel will go but a very little way, the fmall wheels ought to be loaded with lefs weight than the great ones; and then the heavier part of the load would be lefs jolted upward and dnwnward, and the horfes tired fo much the lefs, as their draught raifed their load to lefs heights. When the waggon-road, indeed, is much up-hill, there may be danger in loading the hind-part much heavier than the fore-part; for then the weight would over-hang the hind axle, efpecially if the load be high, and endanger tilting up the fore-wheels from the ground. In this cafe, the fafeft way would be to load it equally heavy on both axles; and then as much more of the weight would be thrown upon the hind axle than upon the fore one, as the ground rifes from a level below the carriage. But as this feldom happens, a fmall temporary weight might be laid upon the pole between the horfes, which would overbalance the danger.

From Mr. Ferguson's obfervations on the centre of gravity, it is evident, that if the axle-tree of a two-wheeled carriage paffes through the centre of gravity of the load, the carriage will be in equilibrio in every pofition in which it can be placed with refpect to the axle-tree; and in in going up and down hill, the whole load will be ſuſtained by the wheels, and will have no tendency either to preſs the horſe to the ground, or to raiſe him from it. But if the centre of gravity is far above the axle-tree, as it muſt neceſſarily be according to the preſent conſtruction of wheel-carriages, a great part of the load will be thrown on the back of the horſes from the wheels, when going down a ſteep road, and thus tend to accelerate the motion of the carriage, which the animal is ſtriving to prevent: while in aſcending ſteep roads a part of the load will be thrown behind the wheels, and tend to raiſe the horſe from the ground, when there is the greateſt neceſſity for ſome weight on his back, to enable him to fix his feet on the earth, and overcome the great reſiſtance which is occaſioned by the ſteepneſs of the road. On the contrary, if the centre of gravity is below the axle, the horſe will be preſſed to the ground in going up-hill, and lifted from it when going down. In all theſe caſes, therefore, where the centre of gravity is either in the axle-tree, or directly above or below it, the horſe will bear no part of the load in level ground. In ſome ſituations, the animal will be lifted from the ground when there is the greateſt neceſſity for his being preſſed to it, and he will ſometimes bear a great proportion of the load when he ſhould rather be relieved from it.

The only way of remedying theſe evils, ſays Dr. Brewſter, is to aſſign ſuch a poſition to the centre of gravity, that the horſe may bear ſome portion of the load when he muſt exert great force againſt it, that is, in level ground, and when he is aſcending ſteep roads; for no animal can pull with its greateſt effort, unleſs it is preſſed to the ground. Now, this may in ſome meaſure be effected in the following manner:—Let B C N (*Plate* XL. *fig.* 12.) be the wheel of a cart, A D one of the ſhafts, D that part of it where the cart is ſuſpended on the back of the horſe, and A the axle-tree; then if the centre of gravity of the load is placed at *m*, a point equidiſtant from the two wheels, but below the line D A, and before the axle-tree, the horſe will bear a certain weight on level ground, a greater weight when he is going up-hill, and has more occaſion for it, and a leſs weight when he is going down-hill, and does not require to be preſſed to the ground. All this will be evident from the figure, when we recollect that if the ſhaft D A is horizontal, the centre of gravity will preſs more upon the point of ſuſpenſion D the nearer it comes to it; or the preſſure upon D, or the horſe's back, will be proportional to the diſtance of the centre of gravity from A. If *m* therefore be the centre of gravity, *b* A will repreſent its preſſure upon D, when the ſhaft D A is horizontal. When the cart is aſcending a ſteep road, A H will be the poſition of the ſhaft, the centre of gravity will be raiſed to *a*, and *a* A will be the preſſure upon D. But if the cart is going down hill, A C will be the poſition of the ſhaft, the centre of gravity will be depreſſed to *n*, and *c* A will repreſent the preſſure upon the horſe's back. The weight ſuſtained by the horſe, therefore, is properly regulated by placing the centre of gravity at *m*. We have ſtill, however, to determine the proper length of *b a* and *b m*, the diſtance of the centre of gravity from the axle, and from the horizontal line D A; but as theſe depend upon the nature and inclination of the roads, upon the length of the ſhaft D A, which varies with the ſize of the horſe, on the magnitude of the load, and on other variable circumſtances, it would be impoſſible to fix their value. If the load, along with the cart, weighs four hundred pounds, if the diſtance D A be eight feet, and if the horſe ſhould bear fifty pounds of the weight, then *b* A ought to be one foot, which being one-eighth of D A, will make the preſſure upon D exactly fifty pounds. If the road ſlopes four inches in one foot, *b m* muſt be four inches, or the angle *b* A *m* ſhould be equal to the inclination of the road, for then the point *m* will riſe to *a* when aſcending ſuch a road, and will preſs with its greateſt force on the back of the horſe.

When carts are not conſtructed in this manner, we may, in ſome degree, obtain the ſame end by judiciouſly diſpoſing the load. Let us ſuppoſe that the centre of gravity is at O when the cart is loaded with homogeneous materials, ſuch as ſand, lime, &c. then if the load is to conſiſt of heterogeneous ſubſtances, or bodies of different weight, we ſhould place the heavieſt at the bottom, and neareſt the front, which will not only lower the point O, but will bring it forward, and nearer the proper poſition *m*. Part of the load, too, might be ſuſpended below the fore-part of the carriage in dry weather, and the centre of gravity would approach ſtill nearer the point *m*. When the point *m* is thus depreſſed, the weight on the horſe is not only judiciouſly regulated, but the cart will be prevented from overturning, and in rugged roads the weight ſuſtained by each wheel will be in a great degree equalized.

In loading four-wheeled carriages, great care ſhould be taken not to throw much of the load upon the fore-wheels, as they would otherwiſe be forced deep into the ground, and require great force to pull them forward. In ſome modern carriages, this is very little attended to. The coachman's ſeat is ſometimes enlarged ſo as to hold two perſons, and all the baggage is generally placed in the front, directly above the wheels. By this means the greateſt part of the load is upon the ſmall wheels, and the draught becomes doubly ſevere for the poor animals, who muſt thus unneceſſarily ſuffer for the ignorance and folly of man.

There is another great diſadvantage attending ſmall fore-wheels; *viz.* that as their axle is below the level of the horſe's breaſts, the horſes not only have the loaded carriage to draw along, but alſo part of its weight to bear, which tires them ſooner, and makes them grow much ſtiffer in their hams, than they would be if they drew on a level with the fore-axle; and for this reaſon, coach-horſes ſoon become unfit for riding. So that on all accounts it is plain, that the fore-wheels of all carriages ought to be ſo high as to have their axles even with the breaſts of the horſes; which would not only give them a fair draught, but likewiſe cauſe the machine to be drawn by a leſs degree of power.

Mr. Beighton diſputes the propriety of fixing the line of traction on a level with the breaſt of a horſe, and ſays it is contrary to reaſon and experience. Horſes, he ſays, have little or no power to draw, but what they have from their weight; otherwiſe they could take no hold of the ground, and then they muſt ſlip, and draw nothing. Common experience alſo teaches, that if a horſe is to convey a certain weight, he ought, that he may draw the better, to have a proportional weight on his back or ſhoulders. Beſides, when a horſe draws hard, he bends forward, and brings his breaſt near the ground; and then, if the wheels are high, he is pulling the carriage againſt the ground. A horſe tackled in a waggon will draw two or three ton, becauſe the point or line of traction is below his breaſt, by reaſon of the wheels being low. And it is very common to ſee, when one horſe is drawing a heavy load, his fore-feet will riſe from the ground; and he will nearly ſtand on end; in which caſe it is uſual to add a weight on his back, to keep his fore-part down, by a perſon mounting on him, which will enable him to draw that load, without which he before could not move. The great ſtreſs, or main buſineſs of drawing, ſays this ingenious writer, is to overcome obſtacles; for on level plains the drawing is but little, and then the horſe's back need be preſſed but with a ſmall weight. Moſt or all of theſe obſtacles may be confidered as inclined planes. In order to draw the wheel A B (*Plate* XL. *Mechanics*, *fig.* 13.) over the obftacle D, M. de Camus, agreeably to the principles above laid down, would have the horfe draw in the line H C; whereas Mr. Beighton fays, fince the obftacle is D, and the tangent of the earth, or line of the floor, is at B, and the line to be moved in is B D, an inclined plane; the eafieft pofition of drawing, to get the wheel over D, is to draw in the pofition of that inclined plane B T, or its parallel C *b*. As all the radii of a wheel are equal, the pulling at the centre is the fame as a balance in equilibrio; *viz.* there is the fame force at A as at B. But in the cafe of drawing in the horizontal line H C, when the obftacle is at D, the whole force which the horfe has for drawing is by the fhort end of the brachium $= e$ D, againft the force or weight of the long end of the brachium f D $= c$ C, which muft be very difadvantageous; therefore, he fays, the line of traction fhould be *b* C. Defag. Exp. Phil. vol. ii. App. p. 542, &c.

Whilft M. Camus maintained that the line of traction fhould be an horizontal line, or always parallel to the ground on which the carriage is moving, becaufe the horfe can exert his greateft ftrength in this direction, and becaufe the line of draught, being perpendicular to the vertical fpoke of the wheel, acts with the largeft poffible lever, M. Couplet, confidering that the roads are never perfectly level, and that the wheels are conftantly furmounting fmall eminences, even in the beft roads, recommends the line of traction to be oblique to the horizon. It is, however, to M. Deparcieux (Sur le Tirage des Chevaux, Mem. Acad. Roy., 1760.), that we are principally indebted for juft ideas on this fubject. He has fhewn in the moft fatisfactory manner that animals draw by their weight, and not by the force of their mufcles. In four-footed animals, the hinder feet are the fulcrum of the lever by which their weight acts againft the load; and when the animal pulls hard, it depreffes its cheft, and thus increafes the lever of its weight, and diminifhes the lever by which the load refifts its effects. Thus in *Plate* XL. *Mechanics*, *fig.* 12, let P be the load, D A the line of traction, and let us fuppofe F C to be the hinder leg of the horfe, A F part of its body, A its cheft or centre of gravity, and C E the level road. Then A F C will reprefent the crooked lever by which the horfe acts, which is equivalent to the ftraight one A C. But when the horfe's weight acts downwards at A, round C as a centre, fo as to drag forward the rope A D, and raife the load P, C E will reprefent the power of the lever in this pofition, or the lever of the horfe's weight, and C F the lever by which it is refifted by the load, or the lever of refiftance. Now, if the horfe lowers its centre of gravity A, which it always does when it pulls hard, it is evident that C E, the lever of its weight, will be increafed, while C F, the lever of its refiftance, will be diminifhed, for the line of traction A D will approach nearer to C E. Hence we may fee the great benefit which may be derived from large horfes, for the lever A C neceffarily increafes with their fize, and their power is always proportioned to the length of this lever, their weight remaining the fame. Large horfes, therefore, and other animals, will draw more than fmall ones, even though they have lefs mufcular force, and are unable to carry fuch a heavy burden. The force of the mufcles tends only to make the horfe carry continually forward his centre of gravity; or, in other words, the weight of the animal produces the draught, and the play and force of its mufcles ferve to continue it.

From thefe remarks, then, according to Dr. Brewfter's ftatement, we may deduce the proper pofition of the line of traction. When the line of traction is horizontal, as A D, the lever of refiftance is C F; but if this line is oblique to the horizon, as A *d*, the lever of refiftance is diminifhed to C *f*, while the lever of the horfe's weight remains the fame. Hence it appears, that inclined traces are much more advantageous than horizontal ones, as they uniformly diminifh the refiftance to be overcome. Deparcieux, however, has inveftigated experimentally the moft favourable angle of inclination, and found, that when the angle D A F, made by the trace A *d*, and a horizontal line, is fourteen or fifteen degrees, the horfes pulled with the greateft facility and force. This value of the angle of draught will require the height of the fpring-tree bar, to which the traces are attached in four-wheeled carriages, to be one-half of the height of that part of the horfe's breaft to that with which the fore end of the traces is connected.

This height is about four feet fix inches, and therefore the height of the fpring-tree bar fhould be only two feet three inches, whereas it is generally three feet.

8. The utility of broad wheels, in amending and preferving the roads, has been fo long and generally acknowledged, as to have occafioned fevera lacts of the legiflature to enforce their ufe. See TURNPIKE.

Several excellent and well-devifed experiments have not long ago been inftituted by Boulard and Margueron, which have fatisfactorily evinced the diftinguifhing advantage of broad wheels. See a Memoir prefented to the Academy of Lyons, in the Journal de Phyfique, tom. xix. p. 424.

Neverthelefs, the proprietors and drivers of carriages feem to be convinced by experience, that a narrow-wheeled carriage is more eafily and fpeedily drawn by the fame number of horfes than a broad-wheeled one of the fame burthen. And though government allowed them to draw with more horfes, and carry greater loads than ufual, they were perfuaded with difficulty to comply with the requifition of legiflature; and methods have been ufed to evade it. Their principal objection has been, that as a broad wheel muft touch the ground in many more points than a narrow wheel, the friction muft of courfe be fo much the greater; not confidering, that if the whole weight of the waggon, and load in it, bears upon many points, each fuftains a proportionable lefs degree of weight and friction than when it bears only upon a few points; fo that what is wanting in one is made up in the other, and, therefore, will be juft equal under equal degrees of weight, as appears by the following plain and eafy experiment propofed by Mr. Ferguson.

Let one end of a piece of packthread be faftened to a brick, and the other end to a common fcale for holding weights; then having laid the brick edgeways on a table, and letting the fcale hang under the edge of the table, put as much weight into the fcale as will juft draw the brick along the table. Then taking the brick to its former place, lay it flat on the table, and leave it to be acted upon by the fame weight in the fcale as before, which will draw it along with the fame eafe as when it lay upon its edge. In the former cafe, the brick may be confidered as a narrow wheel on the ground; and in the latter as a broad wheel. And fince the brick is drawn along with equal eafe, whether its broad fide or narrow edge touches the table, it fhews that a broad wheel might be drawn along the ground with the fame eafe as a narrow one, fuppofing them equally heavy, even though they fhould drag, and not roll as they go along. Befides, as narrow wheels are always finking into the ground, efpecially when the heavieft part of the load lies upon them, they muft be confidered as conftantly going up hill, even on level ground; and their edges muft fuftain much friction by rubbing

rubbing againſt the ſides of the ruts made by them. But both theſe inconveniences are avoided by broad wheels; which, inſtead of cutting and ploughing up the roads, roll them ſmooth, and harden them: though, after all, it muſt be confeſſed, that they will not do in ſtiff, clayey croſs roads; becauſe they would ſoon gather up as much clay as would be almoſt equal to the weight of an ordinary load; and alſo in paſſing along roads abounding with looſe ſtones and other obſtacles, which a narrow wheel may avoid paſſing over, and a broad one muſt ſurmount, the broad-wheel carriage will certainly be drawn leſs eaſily and leſs ſpeedily than a narrow-wheeled one, though not on account of any additional friction ariſing from the preſſure of the weight on a greater quantity of ſurface. Broad wheels are likewiſe more liable to an inequality of preſſure between the axle and box than narrow ones, and conſequently to a greater wear and tear.

Jacob's Obſ. on the Structure and Draught of Wheel-Carriages, 1773, p. 81, &c. See on the ſubject of the preceding article, Deſag. Ex. Phil. vol. i. p. 201, &c. Ferguſon's Lect. p. 56, &c. 4to., and Appendix by Brewſter. Martin's Phil. Brit. vol. i. p. 229, &c.

We ſhall here ſubjoin ſome additional remarks on wheels and axles for carriages. The eſſential qualities of wheels are ſtrength and durability, and it is deſirable that they ſhould be as light as is conſiſtent with ſtrength: for quick travelling carriages lightneſs is very neceſſary.

Wheels to four-wheel carriages ſhould be made as near of a height as the conſtruction and appearance will admit; and if not required for heavy work, the lighter they are made the better. The fixtures from whence the draught is taken ſhould be placed rather above the centre of the largeſt wheel, for advantage of draught.

The members of a wheel are of three deſcriptions; *viz.* the nave, or ſtock, which is the central piece; the ſpokes, or radii; and the fellies, or circumference. The nave or ſtock is made of elm, in which all the ſpokes are fixed, and in which the axletree-box, or wheel-box, is confined, to receive the axle-arms on which the wheel revolves. The ſpokes are ſtraight timbers made of oak, firmly tennoned in the nave, in the direction of radials, to ſupport the fellies, or wheel-rim. The fellies are made of aſh, or beech, and form the rim of the wheel; the whole circumference is uſually divided into ſhort lengths, in the proportion of one length to every two ſpokes. When the fellies are fixed on the ſpokes, the iron band, or tire, which maintains the wear, is nailed on in lengths, and keeps the fellies together. The diameters of wheels regulate the number of ſpokes and fellies they are to contain: for the larger the circumference of the wheel is, the greater is the number of ſpokes required in proportion; for they ſhould not in any wheel be more than fifteen inches diſtant on the fellies, or circumference.

The uſual height or diameter of wheels for coaches and travelling carriages extends to five feet eight inches, and are divided into four proportions. Thoſe which contain from eight to fourteen ſpokes, and only half that number of fellies, are called eights, tens, twelves, or fourteens, which are the number of ſpokes in ſuch wheels, or of fellies in a pair of wheels. The height which regulates the number is, for an eight-ſpoke wheel, not to exceed three feet two inches; for a ten, four feet ſix inches; for a twelve, five feet four inches; for a fourteen, five feet eight inches.

Theſe are the extreme heights for the different numbers of ſpokes to each wheel, which ſhould be rather more than leſs, in particular for the fore-wheel of a four-wheel carriage, which receives more ſtreſs than the hind one; and the coachmaker's rule is, when the hind-wheels are of that height to require fourteen ſpokes, the fore one, if under the neceſſary height before ſtated, ſhould have twelve; never allowing the fore-wheels to have but two ſpokes leſs than what is needful for the hind ones.

There are three deſcriptions of wheels; *viz.* the ſtraked, the hooped, and the patent rim: the differences of theſe are only in the rims.

The ſtraked wheel is made with the fellies in ſeparate lengths or pieces, which are joined together at the ends by dowels; that is, a round pin which enters part into one piece and part into the other, being cloſely fitted into holes made in each. The iron with which it is plated is called the ſtrake, and is put on in pieces of the ſame length as the pieces of the fellies, and faſtened by nails; the joints of the iron are made to fall over the middle of the pieces of wood ſo as to unite them firmly together. The hooped wheel is ſurrounded by a hoop of iron in one entire piece. The patent wheel is made with a hoop of wood in one entire piece, by boiling or ſoftening the wood until it can be bent into a circle; this is ſurrounded by a hoop of iron in an entire piece, and faſtened by nuts and rivets.

According to the uſual method of conſtructing ſtraked wheels, their peripheries are compoſed of a number of pieces or fellies joined together; but theſe are weak, and ſubject to ſeveral inconveniences. As the joints are the weakeſt parts of the wheel, they are moſt liable to yield inward; for which reaſon the wheelwrights leave them higher than the other parts of the rim, in conſequence of which the wheel is not exactly round withinſide the circle of the rim. Beſides, the fellies being ſegments of a circle, ſawed or hewn out of ſtraight wood, they are on this account rendered ſo brittle, from the croſs direction of the grain near the joints, that they are with difficulty kept together, even though almoſt twice the quantity of timber be employed that would otherwiſe be neceſſary. The ſtrength of ſuch a wheel depends on the thickneſs of the iron tire or rim that ſurrounds it, and hence the carriage is loaded with an uſeleſs weight, both of wood and iron. To obviate theſe inconveniences, Mr. Viny invented the proceſs for bending timber into a circular form, practiſed for ſome time by Meſſrs. Jacob and Viny, and is now continued by others. In wheels made of timber thus bent, the rim conſiſts either of a ſingle piece of wood, or two fellies only, and is caſed with a ſingle hoop of iron. By this mode of conſtruction, the grain of the wood is kept parallel throughout, ſo that the periphery of the wheel is every where equally ſtrong; its thickneſs is conſiderably leſſened, inſomuch that though little more than half the uſual quantity of timber is employed, the wheel is of itſelf ſtrong enough to ſuſtain the common burthen laid on ſuch wheels, without the aſſiſtance of iron tires, which are only applied to them as a ſafe-guard, to preſerve the wood from the injuries to which it would otherwiſe be neceſſarily expoſed from the roads; and hence a leſs quantity of iron is ſufficient, and even that will be fairly worn out before it becomes uſeleſs. Beſides, the wheel is rendered much lighter, and at the ſame time much ſtronger and more durable, than wheels conſtructed of detached pieces of wood and iron, in the uſual manner. Theſe patent wheels are very ſuperior to the common ſort, in their neat light appearance, and in the length of time they wear, as two ſets of the former will wear as long as three of the latter: their preſervation depends very much on the hoops that the wheels are rimmed with. Some perſons ſtill prefer the common ſort of wheels, on account of their being more eaſily repaired than the hoop-wheel; but though the repairing of the latter is more difficult, they are much leſs ſubject to need it.

As the rims of wheels wear ſooneſt at their edges, they ſhould

ſhould be made thinner in the middle, and faſtened to the fellies with nails of ſuch a kind, that their heads may not riſe above the ſurface of the rim. The fellies on which the rims are fixed ſhould, in carriages, be three inches and a quarter deep, and in waggons four inches. The naves ſhould be thickeſt at the place where the ſpokes are inſerted, and the holes in which the ſpokes are placed ſhould not be bored quite through, as the greaſe upon the axle-tree would inſinuate itſelf between the ſpoke and the nave, and prevent that cloſe adheſion which is neceſſary to the ſtrength of the wheel.

The track in which the wheels of every carriage are to run is generally the ſame, except when intended for particular roads, where waggons and other heavy carriages are principally uſed, and leave very deep ruts, in which light carriages muſt likewiſe run, or be liable to accident, and are alſo ſure to be heavy in draught. All four-wheel carriages ſhould have the hind and fore wheels regulated to roll in the ſame track. The ordinary width of the wheels is four feet eight or ten inches; that of waggons or carts generally meaſure five feet two inches; chaiſe-wheels, as being principally intended for the country, are adapted to this width. It is immaterial to what width wheels are ſet if uſed for running upon ſtones; but on marſhy roads, if their exactneſs is not attended to, the draught is conſiderably increaſed. We have ſeen a carriage of which the iron axle-tree is made in two pieces, overlapping each other in the middle where they are joined, and ſecured by proper bands to the wood-work of the carriage, ſo as to admit of ſliding in the direction of the axle-tree. Theſe parts are cut with teeth like racks, and a pinion is applied between them; ſo that by turning this pinion round, the two parts of the axle-tree are made to ſlide one upon the other; and the wheels which are fitted upon the two extreme ends of the axle-tree can at pleaſure be fixed at greater or leſs diſtance, as the roads require.

The different heights of hind and fore wheels make alſo a difference in the length of their axle-trees, agreeable to the proportion they bear to one another; the fore-wheel has the longeſt axle-tree by one or two inches between the ſhoulders.

The nave of the wheel is pierced through the centre, with a large hole to introduce the box, or iron tube, for the axle-arm, as this tends to weaken the wood. It has been frequently propoſed to make metal naves, or centre-pieces for wheels, which ſhould contain the box for the axis, and the mortiſes for the ſpokes of the wheel all caſt of one piece of metal. Meſſrs. Dodſon and Skidmore had a patent for this in 1799. The objection to it is, that, if the wood of the ſpokes ſhrinks, they become looſe in the mortiſes, whereas a wooden nave ſhrinks at the ſame time with the ſpoke. This defect has been ſince remedied by making the metal wheel-ſtock in two parts; one with receſſes, or ſockets, to contain the ſpokes, and the other a flat plate to faſten againſt the former with ſcrew-bolts, and preſs the ſpokes into their cavities. Mr. Plucknet had a patent for a metal wheel-ſtock of this kind in 1805, which anſwered extremely well for carts, waggons, and artillery. The ſpokes were made to fill up all the ſpace in the nave or ſtock, ſo that each ſpoke touched its neighbour. The metal ſtock was only a flat circular plate, or flanch, projecting from the box which received the axle, and another flat plate fitted upon it, and bound againſt the former by ſcrew-bolts, one paſſing through each arm; theſe rendered the wheel very ſtrong.

Mr. Wilks took a patent in 1813 for a metal ſtock, in which there are complete cells for each ſpoke, and the cells are dove-tailed; that is, they are made larger at the central part than at the outſide, to prevent them from drawing out, and they are firmly preſſed into the dove-tails by the ſcrew-bolts which confine the moveable plate.

Wheels for railway-waggons are made of caſt-iron, and uſually all in one piece; but this is objectionable, becauſe the unequal contraction of the arms and rim of the wheel in cooling, after the wheel is caſt, puts the different parts on a ſtrain, and they frequently break without any adequate force. It is better to caſt the rim in one piece and the arms in another, and put them together with ſcrew-bolts, or rivets. Mr. Hawks had a patent for this in 1807. In this way, the rims may be replaced when worn out.

The Axle-trees for Wheels of Carriages.—The ſtrong iron bar which extends acroſs beneath the wood-work of the carriage, is called the axle-tree; the round parts at each end, on which the wheels run, are called the axle-arms; and the part or ſtem between them, which is fixed beneath the wood-work of the carriage, is alſo called the axle-tree. In the form of the latter parts there are but two ſorts, the one made flat, and called a bedded axle-tree, it being ſunk all its length in the under ſide of the timbers of the carriage; the other is made of an octagon form, and flat only at the ends where they are bedded.

The axle-arms on which the wheels turn ſhould be made perfectly round, and ſomewhat ſtronger at the ſhoulder than at the extreme end, which is ſcrewed to receive a nut, through which and the axle-tree the linch-pin paſſes, to keep all tight. The nuts are made with a collar at the face; and a temporary collar, or waſher, is driven on the back of the arms, which form two ſhoulders for the wheel to wear againſt, and helps to preſerve the greaſe from running out, and to prevent dirt from getting in.

As the axle-trees are the principal or only ſupport of the carriage, every attention and care ſhould be fixed in the ſelection of good iron; and to ſee that they be well wrought, and of ſufficient ſtrength, rather going to the extreme of ſtrength, than riſking the life of the paſſenger by the overſetting of the carriage, which moſtly happens when an axle-tree breaks.

By the bend of the axle-trees, the wheels are regulated to any width at bottom, to ſuit the track of the roads in which they are to run, and are confined in the carriage by means of clips, hoops, and bolts. The ſhape of the axle-tree between the ſhoulders varies according to the ſituation they are placed in, or the form of the timber of the carriage with which they are united; thoſe are the moſt firm that are flat, bedded in the timber. Axle-tree boxes for wheels are of various kinds; thoſe which are frequently called long-pipe, or wheel-boxes, are long tubes fitted accurately to the arms of the axle-trees, and ſecurely fixed in the wheel-ſtocks, or naves; they are uſually made of wrought ſheet-iron of a ſubſtance proportioned to the weight of the carriage; their uſe is to contain a ſupply of greaſe, and to prevent the effects of friction, whereby the wheels are much aſſiſted in their motion. Theſe are now uſed inſtead of the old caſt-iron boxes, which for quick travelling-carriages are totally out of uſe, being found injurious to the axle-trees, by cutting them at thoſe parts they wear againſt, ſo as to occaſion a frequent lining of the arms; but with the wrought metal boxes this is ſeldom neceſſary.

There are many ſorts of axle-trees and boxes invented various ways, with a view of attaining the following advantages; *viz.* To contain a longer ſupply of greaſe or oil, to be more durable, to ſecure the wheels, and to leſſen the draught. Thoſe are all certainly great advantages, and though the expence is great, the utility of either of them muſt be more than adequate to it, and merits more general notice.

Some of thefe inventors even pretend that all thefe advantages are combined in one axle-tree; but the generality extend to the advantage only of retaining a fupply of oil, and remaining perfect to a confiderable length of time. The common fort of axle-tree and box, which is moft generally ufed, is fimple and cheap in comparifon with the others.

Common Axle-tree.—The arms of the axle-tree are made round, but rather of a conical form, ftrongeft at the back or fhoulders, tapering to the linch end, which is fcrewed for a nut, and alfo has a fmall hole for a linch-pin, which prevents the nut from coming off: at the body-end is a wafher or collar for the back of the wheel-ftock to wear againft. The box is made of fheet-iron, proportioned in fubftance to the weight or fize of the axle-tree, having the edges of the plate, of which it is formed, welded in a ridge which projects on the outfide; this fecures the box in the nave of the wheel, and prevents it turning round therein.

The nut which fcrews on the end of the axle-arm has a broad face to lie flat againft the wheel, and is tapped or fcrewed to receive the fcrew-end of the axle-tree. Each of thofe nuts muft turn on the fcrew the fame way the wheel goes, and muft have a notch for the linch-pin to pafs through, for the purpofe of fecuring the nut from turning off.

The box is what, of the axle-tree, wears moft, and is frequently obliged to be refitted to the arms; otherwife they give to the wheel while in ufe an unfteady motion, and foon exhauft their ftock of greafe.

Thofe that are well fitted will contain their fupply for about one week with regular ufe, or a journey of one hundred miles. They wear at the rate of one fet of boxes to every two fets of wheels, and require in that time to be twice or thrice taken out of the wheels and refitted to the axle-tree arms.

Axle-trees with Friction-Wheels.—Thefe were invented by Mr. Garnet, at leaft the beft kind, which are made in a very ingenious manner. The wheel-box is made much larger than the axle-tree, in fuch manner that the fpace all round between them may receive a number of rollers which fill it up. (See a defcription in the article MILL-*Work.*) Mr. Garnet had a patent in 1784, and for fome years manufactured great numbers; but being very expenfive, they fell into difufe, although very complete. This invention has been lately revived by Mr. Panter.

The Patent Anti-Attrition Axle-tree and Box.—The propofed advantages of this axle-tree are, eafe of draft by diminution of friction; the retention of oil to fupply a month's ufe; the eafe with which it is replenifhed without taking off the wheels; the great fecurity for the wheels, which it prevents from coming off, and the carriage from overturning, if even the arm of the axle-tree fhould break; and their durability, and even improvement by wear. Thofe axle-trees, if made with the fecuring-collar, for the wheels need no nut or linch-pin, as is generally ufed, but the wheel may be taken off and put on as eafily as thofe on the common principle.

Thefe axle-arms are reduced at the bottom from a perfect round, and grooved, to receive two fmall rollers, on which the weight of the carriage is borne, and which greatly facilitates the motion, in the fame manner as blocks of ftone or timber, which require to be removed by the affiftance of rollers. Thefe rollers form the outer circumference of the axle-trees at bottom, which are reduced to give a bearing only on them. A circular box or ciftern is provided to contain a fupply of oil; it is clofely fitted to the back of the inner end of the wheel-ftock, and fixed by three bolts. The oil is here contained within three circular receffes, and oozes through fmall channels on the arm of the axle-tree, which it feeds for a confiderable time. This oil-box is made of caft-metal, and has a cap projecting behind over the axle-tree, which prevents the dirt from getting into the box. This axle-tree is alfo provided with what is called the wheel-fecurity, or ftrap-wafher. It is an iron collar, fitted on the external part of the wheel-ftock, and confined between the refervoir and ftock, lying as it were in a groove, fo that the collar cannot come off. This collar has two lugs or ftraps extending backwards fome diftance along that part of the axle-tree which is bedded in the wood-work, where it is fixed by a nut-fcrew. By means of this ftrap-wafher, the wheel is fecured to the bedded part of the axle-tree; and fhould the axle-arm within the wheel break, the wheel will continue to act.

The cap of this axle-tree is alfo fixed on the outfide part of the wheel-ftocks; by the fame three bolts which faften the oil-box, and by means of a fcrew-plug in the cap, the axle-tree and refervoir are replenifhed with oil. The box is of the fame form as the common box, only made of a very hard durable metal, of a confiderable thicknefs, and is made in proportion to the weight of the carriage.

Collinge's Patent Cylinder Axle-tree and Box.—Thefe axle-trees have been a confiderable time in ufe, and their advantages have been proved in the length of time they wear, in the filent and fteady motion they preferve to the wheels, in the advantage of retaining the oil to profecute a journey of two thoufand miles without being once replenifhed; and laftly, they are very durable, and but little fubject to be out of order.

The axle-tree arm is made as perfectly cylindrical as poffible, and of a peculiar hard fubftance; the middle of the cylinder is reduced, to contain the oil neceffary to feed the axle-trees; fo that the two bearings are at the two ends of the axle, which has an internal fhoulder, againft which the inner end of the wheel-box takes its bearings. Behind this fhoulder is a deep groove for a wafher to preferve the oil, and prevent noife in its ufe; alfo a rim, or hollow box, on the collar of the axle-tree, which overlaps part of the inner end of the wheel-ftock to keep out dirt, and anfwer the ufe of a cuttoo. The extreme end of the arm is double-fcrewed, to receive two nuts for fecuring the wheel: the one fcrew turns the way of the wheel; the other the reverfe, and is meant as an additional fecurity.

The box is made of a very hard metal, nicely polifhed, and fitted to the arms, having a circular recefs all round at the end neareft the carriage, for containing there a fupply of oil. The box is longer than the part which bears on the axle; and the projecting part beyond the bearing at each end is bored out larger than the arm. The back projection fits clofe to the rim of the collar, which it covers: the fore one projects outwards beyond the furface of the wheel-ftock, and is fcrewed on the infide to receive the fcrew of the cap.

There are many other patents for axle-trees to wheels; but as few of them have come into ufe, we fhall only notice Meffrs. Flight and Brook's patent axles. The axle is fixed faft to the nave of the wheel, by paffing through it. This axle turns round within the wheel-box; whereas in others the wheel-box turns round upon the axle.

The axle is cylindrical, and is received into a cylindrical box or tube in the end of the iron axle-tree, which is firmly bolted to the underfide of the timber of the carriage. To hold the axle in its place, and prevent it from drawing out of the box, the end of the axle is reduced to a knob or button, which adheres to the end of the axle by a fmall neck.

neck. This button is fitted and received into a focket, in which it can freely turn round, but cannot draw out endways. It is made in a piece of metal, which is cylindrical on the outfide, and of the fame fize as the axle. It is made in two halves, which feparate longitudinally to introduce or take out the button at the end of the axle; but when the two halves are put together, the focket-piece forms as it were a continuation of the axle. When the axle is put into the box with this focket-piece at the end of it, the two halves of the focket will be confined together, fo that they cannot feparate; and to prevent them from drawing out of the box, a fcrew-bolt is put through the box, and paffes through both halves of the focket: this holds the focket and the axle in their places.

Mr. Ackermann has recently obtained a patent (1818) for a valuable improvement in the application of the fore-wheels to four-wheeled carriages. In our article COACH-*Making*, vol. viii. we have defcribed thofe methods which were then known of applying the fore-wheels, fo as to make a four-wheel carriage turn with fafety, and in a fmall fpace. See alfo PERCH.

Mr. Ackermann's improvement effects this in the moft perfect manner. Each of the fore axle-trees is connected with the carriage by means of a vertical axle, formed in the fame piece with the horizontal axle, and upon which the wheel turns, the two axles being fituated at right angles to each other. Thefe vertical axles are fitted into fockets, formed at the two extremities of a crofs beam of the frame of the carriage, which is called the fore-fpring tranfom. Upon thefe axles, as centres of motion, the axle-arms and wheels can be turned about horizontally, in order to place them obliquely to the direction of the hinder-wheels when the carriage is required to turn; but each axle turns upon a feparate centre of motion, and thefe centres are very near to their refpective wheels, being at the extremities of the crofs-beam or tranfom; hence the fore-wheels do not change their place upon the ground when they are placed obliquely.

In a common carriage, the axles of the two fore-wheels are both fixed to one piece of timber, called the axle-bed, which is placed beneath the fore-tranfom, and united to it by a vertical pin called the perch-bolt, paffing through the middle of the axle-bed. On this pin, as a centre, the axle-bed is turned round. When the wheels are to be placed obliquely, it is evident, that, in fo turning upon a fingle centre, one wheel muft advance forwards, and the other muft retreat backwards, fo as to diminifh the bearing of the carriage-wheels on the ground in a lateral direction, and at the fame time the horfes are pulling in that direction which tends to overturn the carriage. Another inconvenience is, that one of the wheels will touch the perch of the carriage, if placed very oblique.

In the new improvement, two feparate centres of motion being ufed, and thefe being removed from each other as far as poffible, many defirable properties are attained.

To give the oblique direction to the wheels, each vertical axle has a lever proceeding backwards from it; and thefe two levers are united together by a connecting-bar, which obliges both axles to move at the fame time with a fympathetic action. The pole of the carriage is united to the piece, called the futchel, in the ufual manner; and the futchel is united to the fpring-tranfom by a perch-bolt, in the ufual pofition; alfo the hinder end of the futchel is jointed to the middle of the connecting-bar, between the two levers of the vertical axles. The connecting-bar likewife anfwers the purpofe of a fway-bar.

When the horfes move to one fide, the pole and futchel turn upon the perch-bolt, as a lever upon a centre of motion; and the extreme end of the futchel acts upon both vertical axles at once by means of the connecting-bar, fo as to place both of the fore-wheels in an oblique direction. This is the invention of M. Lankenfperger of Munich.

WHEEL, *Ariftotle's*. See ROTA *Ariftotelica*.

WHEEL, *Blowing*, a machine contrived by Dr. Defaguliers for drawing out the foul air of any place, or for forcing in frefh, or doing both fucceffively, without opening doors or windows. See Phil. Tranf. N° 437.

The intention of this machine is the fame as that of Dr. Hales's ventilator, but not fo effectual, nor fo convenient. See Defagul. Courfe of Exper. Philof. vol. ii. p. 563. 568.

This wheel is alfo called a *centrifugal wheel*, becaufe it drives the air with a centrifugal force.

WHEELS, *Bufhes or Boxes of*, the infide metal linings of the naves. See WHEEL.

WHEEL, *Cutting Roller*, in *Agriculture*, a tool of the cutting and reducing fort, ufed for the purpofe of working over crops in fome cafes. In Oxfordfhire a cutting roller of this fort has been invented, which is compofed of twelve wheels, two inches and a half in thicknefs; and between each of them is a fpace of two inches and a half. They are three feet in diameter. It is a load in working fo as to be fufficient exertion for a ftrong team to draw it: it is paffed over wheat after it has been fown, or after it is come up; and if dry, crofs and crofs. It has alfo been ufed in the fpring upon wheat; it leaves the furface rough in a fort of diamond forms, which is found very beneficial in fome of the wheat-lands of that diftrict. It is alfo capable of being ufed in breaking down the furface of ftiff tillage-land in many other cafes and circumftances.

WHEEL, *Draining*, a wheel conftructed for the purpofe of cutting or making drains. Wheels differently formed are ufed for this fort of work. In Effex they employ workmen who make ufe of a caft-iron wheel which weighs about four hundred weight, and which is four feet in diameter; the cutting edge or extreme circumference of the wheel being half an inch in thicknefs, which increafes in this way as it approaches towards the nave or centre; and will, at fifteen inches deep, fcour out or cut a drain half an inch wide at the bottom, and four inches wide at the top. The wheel is fo placed in a frame, that it may be loaded at pleafure, and be made to pafs to a greater or lefs depth, as the nature of the land may be.

The writer of the Middlefex Report on Agriculture advifes the ufe of a common fix-inch cart-wheel, on the felly of which, all round, a fort of ridge-formed addition of wood is to be fixed, and a rim of iron of a triangular fhape faftened to the wood. A wheel of this kind put on the axle of a cart, in the ufual way, will, of courfe, reft on the edge of the rim of iron; and which, on driving the horfe forward, will make a fmall indent or depreffion in the ground merely by the revolution of it; but in order to make it prefs down to the depth of fix or eight inches, that fide of the cart fhould be loaded with ftones, iron ballaft, or any other heavy material that may happen to be at hand, until the whole of the parts, if neceffary, fink into the foil. It would however be as well, or better, it is faid, if the rim parts added to the wheel were in one piece of caft-iron; as the increafed weight of it would enable it to cut or fink without the aid of ballaft, or with lefs than ufual. The cart fhould then be drawn along in fuch a manner, that the cutting or depreffing wheel may revolve where the drains are intended to be made. In land that is in ridges and furrows, it will fometimes be neceffary to draw the wheel along every furrow.

furrow. When the ground is without ridge and furrow, the wheel ſhould be drawn over it in parallel lines, five or ten yards diſtant from each other. The wheel on the other end of the axle is a common ſix-inch wheel, ſupporting only the empty ſide of the cart, conſequently will not cut or depreſs the ground.

The advantage of this contrivance is, that it makes an indent or depreſſion in the ſurface ſoil of ſoft wet clayey graſs-lands, ſufficient to carry off the water during the ſame winter, by preſſing down the ſward and herbage without deſtroying it. In the following ſpring, theſe drains will be nearly grown up, and clothed with graſs; conſequently, there will be nothing taken from the paſturage or the ſcythe. It is neceſſary to obſerve, that the wheel muſt be drawn over the ground every year on the approach of winter. With it, and two old horſes, a ſtout boy or man may, it is ſaid, drain from ten to twenty acres in eight hours.

It may be found very uſeful in the graſs and hay land diſtricts about the metropolis and other places. See SURFACE *Draining*.

WHEEL, *Meaſuring*. See PERAMBULATOR.

WHEEL, *Orffyreus's*. See ORFFYREUS.

WHEEL, *Perſian*. See PERSIAN.

WHEEL-*Ploughs*, in *Agriculture*, all ſuch ploughs as are conſtructed with wheels. See PLOUGH.

WHEEL, *Potter's*, is a round board attached to a lathe, and capable of being moved by it, either rapidly or more ſlowly, as occaſion may require. This round board moves in a horizontal poſition; and when in uſe, the clay which is to be faſhioned is fixed on the centre of it; and it is put in motion either by a perſon who conſtantly attends it when at work, or by means of a treadle which is moved by the foot of the workman himſelf.

As the clay revolves upon this machine, the workman either models it by his fingers, or forms it, by means of an inſtrument which he holds in his hand, into any kind of circular ſhape that he may deſire; and when the object is to make a number of veſſels exactly ſimilar to each other, the ſize is generally determined by a gauge fixed without the circumference of the revolving wheel, but projecting over it in ſuch a manner that, whenever the yielding clay is ſpread out until it touch this gauge, the artiſt knows that the article which he is making has attained the exact figure which he intends.

The potter's wheel has lately been much improved by adapting a ſtrap to it, which paſſes over a large taper cylinder of wood, and by means of which the artiſt is enabled to increaſe or diminiſh the rapidity of the motion at pleaſure. This contrivance is known to mechanics by the name of the *cone pulley*. Parkes's Eſſays, vol. iii. See POTTERY.

WHEELS, *Tires of*, the iron hoops or bars which are put round the outſides of the felly-parts of them.

WHEEL, *Water*. See WATER.

WHEEL is alſo a name of a kind of puniſhment, which great criminals are put to in divers countries.

In France, their aſſaſſins, parricides, and robbers on the highway, were condemned to the wheel; *i.e.* had their bones firſt broken with an iron bar on a ſcaffold, and then to be expoſed and left to expire on the circumference of a wheel. In Germany, they broke their bones firſt on the wheel itſelf.

This cruel puniſhment was unknown to the ancients; as is obſerved by Cujas. It is not certain who was the inventor. Its firſt introduction was in Germany. It was, indeed, but rarely practiſed any where elſe, till the time of Francis I. of France; who, by an edict of the year 1534, appointed it to be inflicted on robbers on the highway. Richelet dates the edict in the year 1538, and quotes Brodæus, Miſcell. lib. ii. cap. 10.

WHEEL, in the *Military Art*, is the word of command, when a battalion or ſquadron is to alter its front, either one way, or the other.

To wheel to the right, the man in the right angle is to turn very ſlowly, and every one to wheel from the left to the right, regarding him as their centre; and *vice verſâ*, when they are to *wheel to the left*.

When a diviſion of men are on the march, if the word be, *wheel to the right*, or *to the left*; then the right or left-hand man keeps his ground, turning only on his heel, and the reſt of the rank move about quick, till they make an even line with the ſaid right or left-hand man.

Squadrons of horſe wheel after much the ſame manner.

In wheeling, the circle is conceived to be divided into four parts; whence wheeling to the right or left reſpects only a quarter of a circle; and wheeling to the right or left about, refers to half of the circle. In performing this motion, each man moves more quickly or ſlowly, according to his diſtance from the right to the left. See BATTALION.

WHEEL, or *Catherine-Wheel*, in *Architecture*, frequently occurs in the upper part of the north and ſouth tranſepts of our ancient cathedrals, being divided by mullions, like the ſpokes of a wheel: it reſembles the engine of torture ſaid to have been prepared by the tyrant Maximin to tear the fleſh of St. Catherine of Alexandria. The French, who have generally placed a large wheel of this ſort by way of a weſtern window to their cathedrals, call it *Roſe du Portail*.

WHEEL-*Animals*, *Brachionus*, in *Zoology*, a genus of animalcules, which have an apparatus of arms for taking their prey. (See BRACHIONUS.) This apparatus has been ſuppoſed, by microſcopical writers, to be a kind of wheels. This is one of the ſmaller animalcules; and is deſcribed by Dr. Hill to be, when at reſt, of a plain ſmooth body, conic figure, obtuſe at the poſterior extremity, and open at the anterior, of a duſky olive colour, and ſemi-tranſparent. When in motion it protrudes from the open extremity a part of its naked body, to the whole of which this outer conic body ſeems to be but a caſe or ſheath; from the end of this exerted part of the body, it thruſts out two protuberances, which give it the appearance of a double head; and in each of theſe is diſcovered an apparatus in continual motion, appearing to be a rotatory one, though really a vibratory one very quickly repeated. Each of theſe protruded bodies has ſix arms inſerted into it, which it continually ſhuts and opens over one another. Each of the arms is furniſhed with a double ſeries of fibres at its edge, which, being expanded, cauſe it to ſpread to conſiderable breadth. There are ſeveral ſpecies of this genus.

The wheel animal, deſcribed by Mr. Baker, has two ſeeming wheels, with a great many teeth or notches coming from its head, and turning round as it were on an axis. On the leaſt touch, this animalcule draws its wheel into its body into the ſheath; but when every thing is quiet, throws them out and works them again.

In order to find theſe animalcules, chooſe ſuch roots of duck-weed as are long, and proceed from ſtrong old plants, for the young roots ſeldom afford any; they ſhould not be covered with that rough matter which is frequently found about them, nor any way tending to decay, as they will often be.

In the water found remaining in the leaden pipes, or gutters on the tops of houſes, there are alſo found great numbers

numbers of thefe wheel-animals. Thefe are of a different fpecies from the former; and when the water dries away, they contract their bodies into a globular or oval figure, and are then of a reddifh colour, and remain mixed with the dirt, growing together in a lump as hard as clay. This, whenever it is put in water, in half an hour's time difcovers the animals' living again, and as brifk as ever; and they have been found to be living in this manner, after the matter had been kept dry twenty months.

It fhould feem from this, that as the water dries up, their pores become fhut in the manner of thofe of fuch animals as remain torpid for the winter; and that when they find water come on again from rain, they then unfold themfelves, and live and feed as long as it lafts. Baker's Microfcope.

Wheel-*Barometer*. See Barometer.

Wheel-*Boats* denote a fort of boats with wheels, to be ufed alternately on the water and upon inclined planes or rail-ways.

Wheel-*Fire*, among *Chemifts*, a fire ufed for calcining metallic fubftances; properly called *ignis rotæ*.

It is a fire which only encompaffes the crucible, coppel, or melting-pot, around the fides, without touching it in any part.

Wheel-*Shaped*, in *Botany*, a term exclufively appropriated to the *corolla*. See Rotata.

WHEELER, among *Brickmakers*. See Brick.

Wheeler, in *Geography*, a river of Wales, which runs into the Clyde, 3 miles N. of Denbigh.

WHEELING, a poft-town of Virginia, at the union of Wheeling Creek with the Ohio; 54 miles S.W. of Pittfburgh.—Alfo, a townfhip of Ohio, in the county of Belmont, with 656 inhabitants.

Wheeling *Creek*, a river of Virginia, which runs into the Ohio, N. lat. 39° 56'. W. long. 80° 45'.

Wheeling *Planks* are ftout planks which the navigators or workmen upon a canal make ufe of to wheel upon.

WHEELOCK, in *Geography*, a townfhip of Vermont, in the county of Caledonia, containing 963 inhabitants; 60 miles N. of Windfor.—Alfo, a river of Chefhire, which runs into the Dane.

WHEELWRIGHT Gut, a creek on the north-weft coaft of the ifland of St. Chriftopher, with a bar before its entrance.

WHEEZING and Blowing, in *Animals*, a fort of affection in the breathing, efpecially in horfes, in which they draw their breath with difficulty and noife.

The generality of people make this and purfinefs, in horfes, the fame diftemper; but the more judicious always diftinguifh it, as wholly different from that. Purfinefs proceeds always from a ftuffing or oppreffion of the lungs; but this wheezing is only owing to the narrownefs of the paffage between the bones and griftles of the nofe.

The horfes that are moft of all afflicted with this diftemper do not want wind; for notwithftanding that they wheeze exceffively when they are exercifed, yet all the time their flanks are not moved, but kept in the fame condition that they were when the creature ftood ftill. The dealers call this fort of horfes blowers, and though there is no real harm in the thing, it is a difagreeable quality, and few people will choofe them that have much fervice for them.

There are fome horfes which have a natural defect in their breathing, which makes it at all times attended with fome difficulty, but not with the wheezing before mentioned; thefe are called thick-winded horfes.

People who are careful in the buying of horfes, will purchafe neither of thefe kinds; but there is this caution to be obferved in regard to this defect, that it often feems to be in horfes where it really is not. When a horfe has been kept a long time in the ftable without exercife, he will at the firft riding be out of breath, and fetch it in a difficult and painful manner, though he be neither a blower nor thick-winded; but all this will go off with a little exercife.

There are fome temporary wheezers and blowers among horfes: thefe at times rattle, and make a great noife through their nofes in taking breath; but the complaint goes off and returns. This is only occafioned by a great quantity of phlegm, for their flanks do not redouble with it at the worft of times, nor have they any cough with it; fo that there is no danger of their being purfy.

It is probable, that in thefe cafes there is, for the moft part, fome fort of fpafm or conftriction in the chefts of the animals, as they are much relieved in moft inftances by the ufe of warm mafhes, and by having their fodder made moift.

How far remedies that remove fpafm might be ufeful has not yet been fully tried, either in thefe or other forts of animals.

WHELDY-AHAD Lake, in *Geography*, a lake of North America. N. lat. 61° 40'. W. long. 103° 30'.

WHELERA, in *Botany*, was fo named by Schreber, in memory of the celebrated Englifh traveller and botanift, fir George Wheler, Bart. F.R.S. who died in 1724, aged 74. His "Journey into Greece," however faulty in the plates, is a book of the firft authority.—Schreb. Gen. 725.—Clafs and order, *Polygamia Monœcia*, Schreb.; rather *Pentandria Monogynia*. Nat. Ord. *Sapotæ*, Juff.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, in five deep, roundifh, erect, permanent fegments, fhorter than the corolla. *Cor.* of one petal, bell-fhaped, fpreading, in five deep, ovate, acute fegments. Nectary fomewhat pitcher-fhaped, in the bottom of the flower. *Stam.* Filaments five, awl-fhaped, rather longer than the corolla; anthers roundifh. There are five other filaments, alternate with the former, and fimilar to them, but fhorter, and deftitute of anthers. *Pift.* Germen fuperior, conical, villous; ftyle thread-fhaped, twice the length of the corolla; ftigma fimple. *Peric.* Drupa roundifh. *Seed.* Nut large, ovate, of one, two, or three cells.

Some flowers, on the fame plant, want the piftil, others the ftamens.

This is Schreber's generic defcription, from which we learn, without difficulty, the natural order of the plant. But it is one of thofe genera, like his Villaria, (fee that article,) which cannot be determined without an examination of the author's herbarium. Such alfo are his Meyera, already defcribed; his Wolfia, and Xystris, which will occur hereafter. We truft fome botanift, who may have the opportunity of clearing up thefe, the only important obfcurities in Schreber's claffical work, will favour the world with an explanation of them. Spartina is in the fame predicament, except that profeffor Schrader appears to be acquainted with it. See that article.

WHELKS, *Buccina*, in *Natural Hiftory*. See Shells, and Trumpet-*Shell*.

WHELPS. See Hound.

Whelps, in a *Ship*. See Capstan.

WHENNUIA, in *Geography*, a fmall ifland among thofe called the Society iflands, near Otaha.

WHERLICOTES, a fort of open chariots, of the ancient Britons' invention, ufed by perfons of quality before the invention of coaches.

WHERN,

WHERN, in *Natural Hiſtory*, a name given by ſome of our miners to a kind of ſtone found in ſtrata, but of the hardneſs and fineneſs of flint. It is called alſo *chert* and *nicomia*.

WHERRY. See VESSEL, BOAT, &c.

WHERRY, in *Rural Economy*, a provincial term applied to a liquor made from the pulp of crabs after the verjuice is expreſſed. It has not unfrequently the name of crab-wherry. See VERJUICE.

WHERWELL, in *Geography*, a village of England, in the county of Hants. Here was formerly a convent of nuns, founded by Elfrida, widow of king Edgar, to expiate the murder of her firſt huſband, Ethelwolf, and her ſon-in-law, prince Edward; 4 miles S. of Andover.

WHET-SLATE, or WHETSTONE-SLATE, and HONE, French *novaculite*, and *ſchiſte coticule*, in *Mineralogy*, a variety of ſlate uſed for ſharpening iron and ſteel inſtruments. (See SLATE.) The light green coloured variety from the Levant is conſidered as the moſt valuable. It is brought in maſſes to Marſeilles, and is there cut into pieces of various ſizes, and afterwards ground with ſand or ſand-ſtone, and then poliſhed with pumice and tripoli. Theſe whet-ſtones or hones ſhould be kept in damp places, for when much expoſed to the ſun, they become too hard and dry for many purpoſes. The powder of whet-ſlate is uſed for cutting and poliſhing metals, and is by artiſts conſidered as a variety of emery. It is neceſſary to the perfection of hones, that they ſhould contain no intermixed ſubſtances, ſuch as quartz, &c. (Jameſon's Mineralogy, ſecond edition, vol. i.) Whet-ſlate, approaching in appearance to foreign hones, occurs in the upper part of Long Sleddale, in Weſtmoreland; and at Howth, in Dublin bay.

WHET-STONE, in *Rural Economy*, the ſoft ſtone uſually made uſe of in ſharpening edge-tools of different kinds.

WHEWER, in *Ornithology*, a name uſed in ſome parts of England for the common wigeon. See DUCK.

WHEY, the ſerum, or watery part of milk.

In many diſorders of the human body, where the ſtomach will not bear milk, or when it is not proper, for other reaſons, whey may be given with great ſucceſs.

We have a diſſertation of Fred. Hoffmann on this ſubject, De Saluberrima ſeri Lactis Virtute. Oper. tom. vi. p. 9. This author recommends a particular kind of ſerum or whey, made by evaporating milk to a dryneſs, and mixing the reſiduum with water. See MILK.

There are various methods of making whey, vulgarly known. That with oranges is very agreeable, and much recommended by Dr. Cheyne, in his Nat. Method of curing Diſeaſes.

WHEY, in *Rural Economy*, a term applied to the ſerous part of milk, from which the curd has been ſeparated. There are two ſorts or colours of whey, the green and white; the latter is by much the richer, and that which chiefly affords the butter of this kind. See DAIRYING.

WHEY, *Alum*, *Serum Aluminoſum*, a whey made with alum; in the proportion of two drachms of alum to one pint of cow's milk boiled.

This whey is beneficial in an immoderate flow of the menſes, and in a diabetes, or exceſſive diſcharge of urine. The doſe is two, three, or four ounces, as the ſtomach will bear it, three times a day.

WHEY-*Butter*, that which is made from the cream of whey. It is commonly made in abundance in the dairy diſtricts after cheeſe-making begins. See DAIRYING.

WHEY-*Cream*, that which is collected from off the whey and made into butter of this ſort. A dairy cow uſually affords eight or ten ounces of it weekly in ſome dairies. See DAIRYING.

WHEY, *Muſtard*, is made by boiling of bruiſed muſtard-ſeed, an ounce and a half, in milk and water, of each a pint, till the curd is perfectly ſeparated, and ſtraining the whey through a cloth. This, ſays Dr. Buchan, is the moſt elegant, and by no means the leaſt efficacious method of exhibiting muſtard: it warms and invigorates the habit, and promotes the different ſecretions. Hence, in the low ſtate of nervous fevers, it will often ſupply the place of wine: it is alſo of uſe in the chronic rheumatiſm, palſy, dropſy, &c. The doſe is a tea-cupful four or five times a day, which may be ſweetened with a little ſugar.

WHEY, *Scalding of*, the heating of it and pouring it over the curd in making cheeſe.

WHEY, *Scorbutic*, is made by boiling half a pint of the ſcorbutic juices, in a quart of cow's milk. The ſcorbutic plants are, bitter oranges, brook-lime, garden ſcurvy-graſs, and water-creſſes.

WHEY *Springy Cheeſe*, the eyey ſpongy cheeſe of this ſort, cauſed by being improperly made.

WHEY-*Tub*, the veſſel in which the whey ſtands for yielding the cream, &c.

WHICHCOTE, BENJAMIN, in *Biography*, an eminent divine of the Engliſh church, was born in March 1609-10, of an ancient family at Whichcote-hall, in Shropſhire; and having finiſhed his education at Emanuel college, Cambridge, in 1626, he paſſed through the common degrees, and became fellow of his college in 1633, and a diſtinguiſhed tutor. In 1636 he took orders, and eſtabliſhed a lecture at Trinity church, in Cambridge, and continued it for nearly twenty years. It was his great object to ſubſtitute a ſpirit of ſober and rational piety in the univerſity, inſtead of the enthuſiaſm and fanaticiſm which then prevailed; nor were his efforts for this purpoſe unavailing. Being married, and having ſettled on a living in Somerſetſhire, his connection with the univerſity was for ſome time interrupted; but in 1644 he returned to it, as the ſucceſſor of Dr. Samuel Collins, the ejected provoſt of King's college, allowing to him part of the emoluments that belonged to this office. In 1649 he took the degree of D.D., and was preſented to the rectory of Milton, in Cambridgeſhire. He is repreſented by biſhop Burnet as a friend to liberty of conſcience, and in order to promote rational and ſublime ideas of religion, he adviſed the ſtudents to peruſe the ancient philoſophers, eſpecially Plato, Cicero, and Plotinus. At the Reſtoration he was deprived of his provoſtſhip, and removing to London, he was choſen miniſter of St. Anne's, Blackfriars, in 1662. Afterwards, when his church was burnt down, he retired to Milton, but he was recalled to London to the vicarage of St. Lawrence, Jewry, by preſentation from the crown; and he ſerved this church with great reputation till his death in 1683.

After his death, a volume of his "Select Sermons," 8vo. 1698, was publiſhed, with a preface by lord Shafteſbury, author of the "Characteriſtics," by whom they were valued, becauſe the author recognized that ſenſe of the beauty of virtue which is the foundation of his moral ſyſtem. Two more volumes were afterwards publiſhed by Dr. Jeffery, archdeacon of Norwich, who, in 1703, preſented to the public "Moral and Religious Aphoriſms collected from Dr. Whichcote's MS. Papers." A fourth volume was publiſhed by Dr. S. Clarke in 1707, and reprinted in 1753 by Dr. Salter, with large additions, and eight letters between the author and ſome of his friends on important ſubjects.

These feveral publications affigned to Dr. Whichcote a high rank among the rational divines of this country, and particularly at the period in which he lived. Biog. Brit.

WHICKS, in *Agriculture*, a term fometimes applied to young plants of the white-thorn kind, as well as to couch-grafs. See QUICKS and COUCH.

WHIDAH, in *Geography*, a kingdom of Africa, on the Slave Coaft; extending about ten miles along the coaft, and about feven miles into the land. Europeans who have been in Whidah fpeak of the country with rapture, and extol it as one of the moft beautiful in the world. The trees are ftraight, tall, and difpofed in the moft regular order, which prefent to the eye fine long groves and avenues, clear of all brufh-wood and weeds. The verdure of the meadows, the richnefs of the fields, clothed with three different kinds of corn, beans, roots, and fruits, and the multitude of houfes, form a moft delightful profpect. A perpetual fpring and autumn fucceed each other; for no fooner has the hufbandman cut his corn, than he again ploughs and fows the ground; yet it is not worn out; the next crop puts forth with the fame vigour as the former, as if nature here were inexhauftible. Certain it is, that the kingdom of Whidah is fo populous, that one fingle village contains as many inhabitants as feveral entire kingdoms on the coaft of Guinea; and yet they ftand fo clofe, that one is amazed how the moft fertile land on earth can fupply the number of people contained in fo fmall a compafs. One may compare the whole kingdom to a great city, divided by gardens, lawns, and groves, inftead of ftreets, the villages in Whidah not being a mufket-fhot diftant from each other. Some are the king's, fome the viceroy's villages, and others are built and peopled by particular private families. The former are the largeft and beft built; but the latter the beft cultivated, if there be any difference in a country fo uniformly rich and beautiful. Notwithftanding the fmall extent of this kingdom, it is divided into twenty-fix provinces, which take their names from the capital towns. Thofe fmall ftates are diftributed among the chief lords of the kingdom, and become hereditary in their families. The king of Whidah, who is only their chief, prefides particularly in the province of Sabi, or Xabier, which is the principal province of the kingdom, as the city of the fame name is the capital of the whole. Bujis, which the French by corruption call bauges, pafs frequently for money at their fairs in the country: this is a fmall white fhell, of the fize and fhape of an olive. In the kingdom of Whidah and Ardra, thefe bujis ferve equally for drefs and money, for ornament and ufe. They pierce each fhell with an iron made for that purpofe; forty of them they ftring upon a cord, which they call *fcuze*, and the Portuguefe *toquos*: five of thefe ftrings compofe what the Portuguefe call a *gallinha*, and the Negroes a *fore*. By thefe the exchange of gold-duft is rated, and the price of flaves determined. The Europeans, the nobility of Whidah, and all the rich negroes, are carried, when they go abroad, in hammocs, or palanquins, on the fhoulders of flaves. The natives of Whidah are in general tall, well made, ftraight, and robuft. Their complexion is black, but not fo gloffy as that of the people on the Gold Coaft, and ftill lefs than thofe of Senegal and the river Gambia. They excel all other negroes in induftry and vigilance. Idlenefs is the favourite vice of the Africans in general; here, on the contrary, both fexes are fo laborious and diligent, that they never defift till they have finifhed their undertaking; carrying the fame fpirit of perfeverance into every action of their life. Befides agriculture, from which none but the king and a few perfons of the firft diftinction are exempted, they employ themfelves in feveral kinds of manufactures: they fpin cotton-yarn, weave fine cotton cloths, make calabaffes, wooden veffels, plates, and difhes; likewife affagayes, and fmiths'-work in greater perfection than any other people on the coaft. Whilft the men are thus employed, the women brew pito, and drefs provifions, which, with their hufbands' merchandize, they carry for fale to market. As to religion, Bofman is of opinion, that the piety of this country is founded upon no other principles than thofe of intereft and fuperftition. In the latter, they exceed all other nations; for allowing, fays he, the ancient heathens to value themfelves upon thirty thoufand deities, I dare venture to affirm that the natives of Whidah may lay juft claim to four times that number. However, he believes that they have a faint idea of the one true God, to whom they attribute omnipotence and ubiquity. One of their principal fetiches, or deities, is the fnake, which they invoke in extreme wet, dry, or barren feafons, on all occafions relating to their government, civil policy, and cattle; in a word, on all the great difficulties and occurrences of life. This fnake has a large round head, beautiful piercing eyes, a fhort pointed tongue, refembling a dart: its pace flow and folemn, except when it feizes on its prey, then quick and rapid; its tail fharp and fhort, its fkin of an elegant fmoothnefs, adorned with beautiful colours, upon a light-grey ground. It is amazingly tame and familiar, permitting itfelf to be approached, and even handled: they have a mortal antipathy to all venomous ferpents: they attack them wherever they find them, as if they had pleafure in delivering mankind from their poifon. The Europeans find no difficulty in familiarizing themfelves to thefe inoffenfive animals, with which they play without any dread or apprehenfion of danger. There is no fear of miftaking them for the poifonous ferpents, the colour and fize fufficiently diftinguifhing them. The negroes entertain a notion that the firft progenitor of this race of fnakes is ftill living, and growing to an enormous bulk. When the Englifh firft fettled in Whidah, the captain having unfhipped his goods on fhore, the failors found at night one of thofe fnakes in their magazine, which they ignorantly killed, and threw upon the bank, without dreaming of any bad confequences. The negroes, who foon difcovered the facrilege, and had it confirmed by the acknowledgment of the Englifh mariners, were not long in avenging the horrid impiety, by a method no lefs horrible. All the inhabitants of the province affembled; they attacked the Englifh, maffacred them all to a man, and confumed their bodies and goods in the fire they had fet to the warehoufe. Animals of all kinds are punifhed with death for injuring a fnake. In 1697, a hog having had the prefumption to deftroy one of thefe deities, an order was iffued for a general flaughter of fwine throughout the kingdom, and the deftruction of the whole race was hardly prevented by the interpofition of the king.

WHIDAH, a town of Africa, in the country of Whidah. N. lat. 6° 25′. E. long. 1° 24′.

WHIDBY'S ISLAND, an ifland in the Gulf of Georgia, near the weft coaft of America; about 36 miles long, and from 2 to 6 broad: fo named from Mr. Whidby, an officer under captain Vancouver. N. lat. 48° 10′. E. long. 237° 40′.

WHIDDY, an ifland in Bantry bay, in the county of Cork, Ireland, about 2 miles from the town of Bantry. It is a pleafant ifland of a triangular form, and the foil is excellent.

WHIFF, in *Ichthyology*, the name of a fort of flounder.

WHIFFLER *of a Company*, in London, a young freeman,

man, who goes before, and waits on the company, on occafions of public folemnities.

WHIG, in *Rural Economy*, a term provincially applied to acidulated whey, which is fometimes mixed with butter-milk and fweet herbs, to give it a flavour, when it becomes a good cooling fummer beverage.

WHIGS, a party or faction in England, oppofite to the Tories.

The origin of the names of thefe two mighty factions is very obfcure. If fome little trivial circumftance or adventure, which efcapes the knowledge of mankind, gives name to a party, which afterwards becomes famous, pofterity labours in vain to find the original of fuch a name: it fearches the fources, forms conjectures, invents reafons, and fometimes, indeed, meets the truth, but always without knowing it affuredly.

Thus, in France, the Calvinifts are called Huguenots; yet nobody was ever able certainly to affign the caufe of that appellation.

Whig is a Scottifh, and, fome fay too, an Irifh word, literally fignifying *whey*. *Tory* is another Irifh word, fignifying a *robber* or *highwayman*.

Under the reign of king Charles II., while his brother, then duke of York, was obliged to retire into Scotland, there were two parties formed in that country. That of the duke was ftrongeft, perfecuted the other, and frequently reduced them to fly into the mountains and woods; where thofe unhappy fugitives had often no other fubfiftence for a long time but cows' milk. Hence they called thefe their adverfaries *tories*, q. d. *robbers*; and the tories, upbraiding them with their unhappinefs, from the milk on which they lived, called them *whigs*. From Scotland, the two names came over with the duke into England.

Others give a different origin and etymology of the two words, for which fee TORIES.

Bifhop Burnet gives another etymology of the term *whigs*. The fouth-weft counties of Scotland, he fays, are fupplied with corn from Leith; and from a word *whiggam*, ufed by the carriers in driving their horfes, all that drove were called *whiggamoors*, and by contraction *whigs*.

He adds, that in the year 1648, after the news of the defeat of duke Hamilton, who was charged with being a confederate with the malignants, or royal party, in England, the minifters animated their people to rife, and march to Edinburgh: who came up, marching each at the head of his parifh, with an unheard-of fury, praying and preaching all the way as they came. The marquis of Argyle and his party came and headed them. This was called the *whiggamoor's* inroad; and ever after, all that oppofed the court were contemptuoufly called *whigs*: and from Scotland the term was brought into England. Burnet's Hift. of his Own Times, vol. i. p. 43.

For the diftinguifhing principles and characters of the whigs, fee TORIES.

WHIMBRAL. See SCOLOPAX *Guarauna*, and PHÆOPUS.

WHIMSEY, WATER, a machine confifting of a refervoir, or bucket of water, employed for raifing another bucket, filled with coals or other materials, by means of a rope or chain, coiled round a cylinder or drum, or two drums of different fizes. When the bucket of water in this machine has reached the bottom of the pit or well, a valve is opened by ftriking againft a pin, and lets out the water. In a machine of this kind, ufed in the duke of Bridgewater's coal-works, the water defcends thirty yards, and raifes a fmaller quantity of coals from a depth of fixty. In fuch cafes, fuppofing the action to be fingle, and the ftream of water to be unemployed during the defcent of the refervoir, a confiderable preponderance may be advantageoufly employed in giving velocity to the weights, provided that the machinery be not liable to injury from their impulfe.

WHIN, in *Botany*. See GORSE.

WHIN, in *Agriculture*, a term fometimes applied to furze; which, when cut in the fap and bruifed in a proper way by flails, or in other modes, makes an excellent green food in winter for horfes, which eat and thrive on it well. It is alfo ufeful in fome meafure to fheep-ftock, as well as to bees. Its encroaches on land may be eafily and readily prevented by proper means being taken for the purpofe. See FURZE.

WHIN, in *Gardening*. See ULEX.

WHIN-*Afhes*, in *Agriculture* and *Planting*, the afhes produced in burning whins; which have lately been found of great benefit in planting young trees, as well as on land for other purpofes, promoting their growth in a very high degree. If the land to be planted be fuitable, they are advifed to be carefully fpread and ploughed in, if of quantity fufficient, over the whole field, otherwife only on the wet or colder fpots or parts of it. But if the ground be fuch that it will not admit of ploughing, the afhes fhould be mixed up with part of the beft furface mould, to keep them from blowing abroad; and in the procefs of pitting, a little of this compoft fhould be intimately mixed with the mould of each pit; previoufly diftributing it in fmall heaps at convenient diftances for facilitating the operation: and this extra trouble will be amply repaid by the progrefs the plants will make in confequence.

WHIN-*Axe*, in *Agriculture*, an inftrument employed for extirpating whins from land in many cafes. It is an implement that has one end like a common axe, with four inches of face; and the other like an adze, alfo with four inches of face; whereby the perfon ufing it, continuing in the fame pofition by fimply turning it in the hand, can make cuts at right angles with one another, as circumftances may require. The head of the tool may be about eight inches in length, weighing from three to four pounds; and the handle, of afh, about four feet long.

WHIN, *Petty*, a name given to a fpecies of *ononis*, or reftharrow.

WHIN, *Petty*, in *Gardening*. See GENISTA.

WHINCHAT, in *Ornithology*, the Englifh name of the *motacilla rubetra* of Linnæus.

It is of the common fize of the water-wagtail. Its head, neck, and back, are of a reddifh-brown, with regular rows of black fpots. Over each eye is a narrow white ftroke, and beneath that a broad bed of black, extending from the bill to the hind part of the head; the breaft is of a reddifh-yellow; the belly paler; the quill-feathers are brown, edged with a yellowifh-brown; the upper part of the wing is marked with two white fpots; the lower part of the tail is white, the two middle feathers excepted, which are wholly black; the upper part of the other is of the fame colour.

The colours are very uncertain in this bird, and it often much refembles the ftone-chatter; but may always, by an accurate obferver, be diftinguifhed from that bird by the white fpots in its wings, by the whitenefs of the under part of its tail, and the white lines on its head

The colours of the female are much lefs agreeable than thofe of the male; in lieu of the white and black marks on the cheeks is one broad pale brown one; and the white on the wings is in much lefs quantity than that of the male.

In the north of England, the whinchat is a bird of paf-

fage;

fage ; in the fouth he continues the whole year. Ray and Pennant.

WHINE, a hunting term, ufed in refpect of the cry of an otter.

WHINEBACH, in *Geography*, a town of Africa, on the Gold Coaft. N. lat. 5° 30′. W. long. 1° 30′.

WHIN-STONE, in *Geology*, the provincial name given, in many parts of England and Scotland, to bafaltic rocks ; it is alfo applied by miners to defignate every kind of dark-coloured and hard unftratified rock, which refifts the point of the pick. Many geologifts in this country clafs all bafaltic or trap rocks under the term whin-ftone. See TRAP.

The fubftance which fills very large mineral veins is generally dark bafalt, or green-ftone ; hence thefe veins are moft frequently called whin-dykes. Thefe veins being harder than moft of the rocks which they interfect, remain when the furface on each fide of them is wafhed away, forming enormous walls extending into the fea, or rifing above the level of the country in various parts of their courfe, and may often be traced for many leagues. They occur in the counties of Northumberland and Durham, and on the coafts of Scotland ; and when broken down, they form reefs of rock or iflands. The Farn iflands, off the coaft of Northumberland, are parts of a bafaltic dyke. When whin-dykes crofs rivers, they form ledges of rock conftituting fords ; or, if very abrupt, they hold up the water on one fide and form cafcades. The Cleveland bafalt, or whin-dyke, defcribed in Mr. Bakewell's Introduction to Geology, (fee VEINS, *Mineral*,) has been traced from the coaft of Yorkfhire feventy miles into the weftern part of Durham.

Under the article *Mineral* VEINS, we have obferved, that when whin-dykes interfect coal ftrata, they produce a change in the fubftance of the coal, and alfo of the other ftrata, fimilar to what might have been expected from a ftream of melted lava ; and we have recently obferved a fimilar effect produced on primitive rocks of gneifs, in the vicinity of Aberdeen, by contact with a powerful whin-dyke. The whin-ftone is alfo changed near its contact with the gneifs into a reddifh horn-ftone. In other parts, it is a dark granular bafalt or green-ftone. The gneifs has loft its characteriftic ftructure, and becomes porphyritic when near the whin-dyke. Between whin-dykes and the rocks which they interfect, there is fometimes a feam of foft argillaceous earth interpofed, which is wafhed out when they are near the fea-coaft, leaving the whin-ftone like a wall placed between two perpendicular precipices. Sometimes the internal part of a whin-dyke will be compofed of foft iron-clay ; in other inftances, the dyke will be compofed of folid blocks or prifms of bafalt feparated by fimilar clay. In fome whin-dykes, the fubftance which fills them appears a compact and folid mafs of whin-ftone, which, however, will divide into four, five, or fix-fided prifms, arranged horizontally.

Thefe are perfectly fimilar to the perpendicular bafaltic columns in ftructure, differing only in their pofition. There is a dyke traverfing the bafaltic ftrata of the Giant's Caufeway, on the coaft of Antrim, in which this peculiarity of ftructure is remarkably difplayed. It interfects beds of columnar bafalt, in which the columns are arranged with great regularity, and are perpendicular to the horizon ; but the whole dyke is compofed of fmall prifms of bafalt placed horizontally, or at right angles with the former. Some of thefe prifms do not exceed an inch in diameter, others are much larger : they are for the moft part extremely regular, and are articulated or jointed.

It has been fuppofed with much probability, that the different arrangement of the columnar ftructure in the beds and in the dyke, is to be attributed to the different circumftances under which they were folidified. If the beds have once flowed as lava under the furface of the ocean, the bafalt would begin to cool and cryftallize from the upper and lower furface. That this has probably been the cafe may be inferred from thefe beds refting on ftrata that contain marine organic remains, and which muft, therefore, have been formed under the bed of the ocean.

The perpendicular dykes interfecting rocks already formed would begin to cool from the fides with which they were in contact, and the procefs would proceed laterally.

In fome inftances, we find whin-dykes principally compofed of globular maffes of ftone feparated by a large quantity of foft clay, and the globular maffes are incrufted with ochreous clay : probably the whole of the clay in fuch dykes has been formed from the decompofition of the bafaltic maffes by the action of water percolating them.

Whin-ftone dykes prefent fo many analogies with volcanic rocks in their compofition, and the effects which they produce on the ftrata that they pafs through, that we are led to refer their origin to the action of fubterranean fire cracking the upper rocks and ftrata, and forcing the melted matter into the rent. Under the article VOLCANO, we have ftated many inftances of vaft rents made in the earth, and filled by eruptions of lava ; thefe rents fo filled with lava may be confidered as whin-dykes of recent formation. This is further confirmed by the obfervations of M. Cordier, (fee VOLCANIC *Products*,) who has fhewn that the fubftance which fills both are effentially the fame, being principally compofed of felfpar and augite, with iron-fand and olivine. Whin-ftone not only occupies the cavities of perpendicular dykes ; but it appears to have been, in many inftances, found laterally between the regular ftrata, producing fingular contortions and diflocations, and almoft always effecting a change in the fubftance of the rock with which it comes in contact. Sometimes it produces a change in the form of the bed or ftratum which it has paffed through, breaking it into diftinct maffes, or bending it in different directions, or enveloping large parts of it in the bafalt or whin-ftone. Of this a remarkable inftance is defcribed in the third volume of the Tranfactions of the Geological Society, occurring on the north coaft of Ireland, in the county of Antrim. (See *Plate* IV. *fig.* 4. *Geology*.) *a a a* reprefents a bed of chalk fingularly bent, and completely enveloped in the bafalt which forms a part of the bafaltic range extending from the Giant's Caufeway.

The beds of chalk and the other ftrata on this coaft are frequently interfected by whin-dykes, and a moft remarkable change is obferved in the ftructure of the chalk in the vicinity of thefe dykes. In immediate contact with the whin-ftone, and to a confiderable diftance on each fide, the chalk is converted into marble, having the granular texture of primitive lime-ftone, or what the French call calcaire faccaroide, from its refemblance to the grain of loaf-fugar, (fee *Plate* IV. *fig.* 5. *Geology*,) which reprefents two adjoining whin-dykes *a b*, interfecting the chalk *c c c* ; the dyke *a* is thirty feet in width, the dyke *b* twenty feet, and the intervening mafs of chalk twenty feet. The mafs of chalk between the two large dykes is interfected in a zigzag direction by a fmaller dyke. To a certain diftance from the whin-ftone, the chalk is perfectly cryftalline, but it gradually approaches to the character of the chalk at a greater diftance from the dyke. In various parts of the world we obferve trap or whin-ftone occurring in apparently regular beds, either covering ftratified rocks, or interpofed between them ; fuch have been called by the Wernerian geologifts flœtz trap-rocks, and their occurrence in this pofition has been urged as an argument for the aqueous formation of ſuch rocks. But it is well known to practical miners, that theſe beds are much more variable in their thickneſs than the regular ſtrata, ſometimes meaſuring twenty, thirty, or forty feet or more; and in other parts, the ſame bed will diminiſh to a few feet, or entirely terminate. In the iſle of Skye, according to the deſcription of Dr. Macculloch, in the third and fourth volumes of the Tranſactions of the Geological Society, the whin-ſtone is ſpread over the regular ſtrata in beds, or forms detached conical caps. It is alſo to be ſeen interpoſed between the ſtrata, and may be traced for more than a mile in continuous regular beds; but, ſays Dr. Macculloch, "there are no inſtances but where the alternating beds of trap detach veins or dykes from the lower to the upper beds; or the trap, quitting the interval between two given beds of lime-ſtone or ſand-ſtone, makes its way acroſs the one immediately above or below, and then proceeds with a regularity as great between ſome other pair of proximate ſtrata." And he adds, "I have no doubt, could ſuch extenſive expoſure of the ſtrata be oftener procured, all the inſtances of ſuppoſed alternating trap with regular ſtratified rocks would prove ſimilar to the above." Theſe obſervations, which might be confirmed by numerous other inſtances, tend to prove, that whin-dykes, and many of the interpoſed ſtrata of whin-ſtone, are of poſterior formation to the rocks in which they occur, and have been forced between the ſtrata in a fluid ſtate, and ſubſequently conſolidated. The whin-dykes, or perpendicular veins, are the channels through which the baſalt flowed up; but by ſuperincumbent preſſure, it has been driven laterally at different elevations. As beds of whin-ſtone occur in different rocks, it is probable, and almoſt certain, that they have had different epochs of formation; and of courſe ſome of the beds of whin-ſtone, which are covered by ſtratified rocks containing many organic remains, may have flowed as beds of lava under the ocean, and have been again covered with other ſtrata, on which again a ſecond torrent of lava burſting from below may have flown and formed an upper bed. It is well known that the beds of toad-ſtone in Derbyſhire, which are interpoſed between the mountain lime-ſtone of that diſtrict, cut off the metallic veins; but they are found again on ſinking through the toad-ſtone into the lower lime-ſtone. This ſtone, which varies from a hard, compact whin-ſtone or trap, to a ſoft amygdaloidal wacke, (ſee Toad-*Stone* and Wacke,) is ſuppoſed, by Mr. Whitehurſt, to have flowed between the beds of lime-ſtone after the formation of metallic veins; and, could we admit the hypotheſis, it would ſatisfactorily explain the cauſe of their diſappearance in the toad-ſtone. But though there are many inſtances of the vein entirely diſappearing in the latter rock, there are others in which a narrow vein paſſes through the toad-ſtone, though it is never productive of ore, being filled with calcareous ſpar, and a few particles only of galine. The occurrence of theſe veins in the toad-ſtone proves that this rock was not found between the lime-ſtone after the formation of metallic veins. Some ſofter whin-ſtone rocks, of the ſpecies called by mineralogiſts wacke, (ſee Wacke,) contain cavities lined, or partly filled with zeolites, agates, or calcareous ſpar; and ſome of theſe rocks envelope marine organic remains, particularly a rock of this kind near Berkley in Glouceſterſhire. The Euganean mountains are compoſed of a ſimilar rock, and alſo contain marine remains. Theſe rocks have probably been formed by muddy eruptions of ſubmarine volcanoes, ſimilar to what take place from ſome of the American volcanoes at the preſent time; and it is not improbable but that theſe two modes of formation may have given riſe to that diverſity which we obſerve in rocks of this claſs, the ſofter and more earthy being the products of aqueous and muddy eruptions, and the harder and more cryſtalline the products of igneous fuſion. See Trap, and Volcanic *Products*.

WHIP, or Whip-Staff, in a *Ship*, a piece of timber in form of a ſtrong ſtaff, faſtened into the helm, for the ſteerſman, in ſmall ſhips, to hold in his hand; thereby to move the rudder, and direct the ſhip.

Whip denotes alſo a ſort of ſmall tackle, formed by the communication of a rope either with a ſingle immoveable block, or with two blocks, one of which is fixed, and the other moveable. It is generally uſed to hoiſt light bodies, as empty caſks, &c. out of a ſhip's hold, which is accordingly called whipping them up. Falconer.

To whip is to tie a piece of pack-thread, ſpun-yarn, &c. about the end of a rope, to prevent it from being untwiſted and unlooſened.

Whip, in *Rural Economy*, the laſh attached to flexible rods or other ſubſtances and contrivances, for the purpoſe of driving teams.

Whip-*Grafting*, in *Gardening*, a particular mode of performing the operation. A ſort of root-whip-grafting is adviſed by Agricola, in which a graft or ſcion is taken from a young tree, and a ſmall piece of the root of another tree of the ſame kind, or like it; or otherwiſe, pieces of roots cut off from other trees in tranſplanting: theſe are whip-grafted together, taking care that the two but ends of the graft and root be united, and that the rind of the root join that of the graft; then plant the root with the part of the ſcion under-ground. See Grafting, and Stocks, *Apple-grafting in*.

Whip-*Poor-Will*. See Caprimulgus *Virginianus*.

Whip-*Rein*, in *Agriculture*, a term uſed to ſignify a rein formed of cord or leather, by which a plough or other ſort of team is directed in working. See Rein

Whip-*Rein-Plough*, a term applied to a ſmall plough, drawn by two horſes, or oxen, which are guided and directed by proper reins of this ſort, and ſo made as to ſerve the ploughman in the way of a whip, in driving them while he holds the plough.

Whip-*Saw*. See *Whip*-Saw.

WHIPLADE, in *Huſbandry*, a term uſed by the farmers in ſome places for a particular ſort of cart, whoſe hinder part is made up of boards after the manner of a dung-cart, having alſo a head of boards, and ſhambles over the thills; this head being ſo as either to be taken out or left in. The cart may be indifferently uſed to carry dung or other things; dung when the head is in, and corn, &c. when it is taken out.

WHIPPANY, in *Geography*, a town of New Jerſey; 20 miles W.N.W. of New York.

WHIPPER. See Fishing.

WHIPPING, a term uſed by *Anglers*, when they faſten a line to the hook or rod.

The word is alſo taken for the caſting in of the hook, and drawing it gently on the water.

Whipping, in *Law*, denotes an ignominious puniſhment inflicted on perſons guilty of petty larceny, &c.

Whipping *Wheat*, in *Agriculture*, a term applied to the practice in ſome of the northern diſtricts, by which the wheat-crops are laſhed or whipped out on a wooden or wattled frame-work contrived for the purpoſe. The former is conſtructed by nailing two or more thick boards in a ſlanting manner, to the height of about two and a half, or three feet, on a ſort of frame of ſuitable ſtrength, ſupported by legs, having the upper part a little rounded, and made ſmooth. This, which is termed the whipping or laſhing frame, is placed

placed in ſome convenient ſituation, ſo as to prevent the grain from flying about during the operation, which is then begun. Where the latter contrivance is made uſe of, the frame is woven with ſtrong ſticks, in the manner of a hurdle, being placed in the ſame ſituation when uſed.

The proceſs is performed by taking large handfuls of the corn in the ſtraw by the butt end, and ſtriking the top or ear-ends over the upper part of the frame, ſo as to force out the grain from the ears of the top part, without breaking the ſtraw, which in this way becomes much better for thatch, and at the ſame time the grain is leſs injured than by the flail method of threſhing it out. The butt parts of the ſtraw are ſometimes afterwards thraſhed over, in order to get out any wheat that may have been left in the ſhort ears. This is an excellent mode of providing ſeed-wheat, as the fineſt grain is chiefly procured.

And it is ſuggeſted, too, as a particularly good method in caſes where wheat is infected with the ſmut, as during the operation of threſhing, the flail breaks the ſmut-balls, and reduces them to a powdery ſtate, which cauſes the good wheat to have a blacker appearance than would otherwiſe be the caſe when ground. It may likewiſe be uſed to advantage with other ſorts of grain in ſome caſes.

The above is alſo a term ſometimes applied in the northern diſtricts, to the practice of ſtriking it over a ſtone or other ſuch contrivance, in order to get out the grain, and leave the ſtraw in an unbroken ſtate. In this way it is ſometimes termed laſhing. It is an excellent practice in getting out this ſort of grain in many points of view, when on a ſmall ſcale, but it is not well ſuited to large concerns. See THRESHING.

WHIPPLE-TREE, a term uſed to ſignify the bar or wooden part of the contrivance by which a horſe or team is attached to a plough, harrow, or any other ſort of implement of theſe kinds. They are of different ſizes and forms, according to the nature of the teams and other circumſtances. See SWINGLE-*Tree*, *Indented*.

WHIPSTITCH, a term not unfrequently uſed in ploughing to ſignify a ſort of half-ploughing, or what in many places is termed *raftering*. It is principally made uſe of for keeping the land more dry and healthy in the winter ſeaſon. See RAFTERING.

WHIPSTITCHING, the practice of working tillage-land in ſomewhat the raftering manner. It is a method often employed for turning up ſtubbles of the wheat and other kinds in the winter time, inſtead of making a fallow. The beſt mode of doing it in this intention is firſt to make what is called a whipſtitch, rafter, or ſort of half-ploughing of the land; and that when come back again to the ſame furrow, to turn them both over; the top parts of both furrows being thus turned in the middle, which leaves the ſpace of four inches betwixt each furrow: then ploughing the land acroſs the old furrows. If land lies ever ſo wet in winter, by ploughing in this manner, it may be kept dry and in a healthy ſtate. It is neceſſary, too, to ſtrike up the old furrows every day before leaving the ground; and to let the main drains be kept well open to receive the water from the furrows in the land: by this means, the froſt will be admitted four inches deeper than in the caſe of a flat fallow-work.

This mode of tillage is that which is ſometimes called double whipſtitching in ſome diſtricts and places.

Some prefer it before all other methods for winter-tillage, as it brings the land into much better condition for cultivation than twice fallowing.

WHIPT SYLLABUB. See SYLLABUB.

WHIRL-POOL, an eddy, vortex, or gulf, where the water is continually turning round. See GULPH, EDDY, VORTEX, &c.

Theſe in rivers are very common, from various accidents, and are uſually very trivial, and of little conſequence. In the ſea they are more rare, but more dangerous. Sibbald has related the effects of a remarkable marine whirlpool among the Orcades, which would prove very dangerous to ſtrangers, though it is of no conſequence to the people who are uſed to it. This is not fixed to any particular place, but appears in various parts of the limits of the ſea among thoſe iſlands. Wherever it appears, it is very furious, and boats, &c. would inevitably be drawn in and periſh with it; but the people who navigate them are prepared for it, and always carry an empty veſſel, a log of wood, or large bundle of ſtraw, or ſome ſuch thing, in the boat with them; as ſoon as they perceive the whirlpool, they toſs this within its vortex, keeping themſelves out; this ſubſtance, whatever it be, is immediately received in the centre, and carried under water; and as ſoon as this is done, the ſurface of the place where the whirl-pool was becomes ſmooth, and they row over it with ſafety; and in about an hour they ſee the vortex begin again in ſome other place, uſually at about a mile diſtant from the firſt. Sibbald's Prodr. Hiſt. Scotl.

WHIRLIGIG, in *Military Antiquities*, an inſtrument of puniſhment formerly much uſed for trifling offences, committed by petit ſutlers, Jews, brawling women, and ſuch perſons. This was a kind of circular wooden cage, which turned on a pivot; and when ſet in motion, whirled round with ſuch an amazing velocity, that the delinquent became extremely ſick, and commonly made diſcharges through every operation of the body.

WHIRLING-TABLE, a machine contrived for exhibiting and demonſtrating the principal laws of gravitation, and of the planetary motions in curvilinear orbits. A A (*Plate* XXI. *fig.* 13. *Aſtronomy*) is a ſtrong frame of wood, B a winch fixed on the axis C of the wheel D, round which is the catgut-ſtring F, which alſo goes round the ſmall wheels G and K, croſſing between them and the great wheel D. On the upper end of the axis of the wheel G, above the frame, is fixed the round board *d*, to which may be occaſionally fixed the bearer M S X. On the axis of the wheel H is fixed the bearer N T Z, and when the winch B is turned, the wheels and bearers are put into a whirling motion. Each bearer has two wires, W X and Y Z, fixed and ſcrewed tight into them at the ends by nuts on the outſide; and when the nuts are unſcrewed, the wires may be drawn out in order to change the balls U, V, which ſlide upon the wires by means of braſs loops fixed into the balls, and preventing their touching the wood below them. Through each ball there paſſes a ſilk line, which is fixed to it at any length from the centre of the bearer to its end by a nut-ſcrew at the top of the ball; the ſhank of the ſcrew going into the centre of the ball, and preſſing the line againſt the under ſide of the hole which it goes through. The line goes from the ball, and under a ſmall pulley fixed in the middle of the bearer; then up through a ſocket in the round plate (S and T) in the middle of each bearer; then through a ſlit in the middle of a ſquare top (O and P) of each tower, and going over a ſmall pulley on the top comes down again the ſame way, and is at laſt faſtened to the upper end of the ſocket fixed in the middle of the round plate above-mentioned. Each of theſe plates, S and T, has four round holes near their edges, by which they ſlide up and down upon the wires which make the corner of each tower. The balls and plates being thus connected, each by its particular line, it is plain that if the balls be drawn outward, or towards the ends M and N of their reſpective bearers,

bearers, the round plates S and T will be drawn up to the top of their reſpective towers O and P.

There are ſeveral braſs weights, ſome of two, ſome of three, and others of four ounces, to be occaſionally put within the towers O and P, upon the round plates S and T; each weight having a round hole in the middle of it, for going upon the ſockets or axes of the plates, and being ſlit from the edge to the hole, that it may ſlip over the line which comes from each ball to its reſpective plate.

For a ſpecimen of the experiments which may be made with this machine, we ſhall ſubjoin the following.

1. Removing the bearer M X, put the loop of the line *b*, to which the ivory ball *a* is faſtened, over a pin in the centre of the board *d*, and turn the winch B; and the ball will not immediately begin to move with the board, but, on account of its inactivity, endeavour to remain in its ſtate of reſt. But when the ball has acquired the ſame velocity with the board, it will remain upon the ſame part of the board, having no relative motion upon it. However, if the board be ſuddenly ſtopped, the ball will continue to revolve upon it, until the friction thereof ſtops its motion; ſo that matter reſiſts every change of ſtate, from that of reſt to that of motion, and *vice verſâ*.

2. Put a longer cord to this ball; let it down through the hollow axis of the bearer M X and wheel G, and fix a weight to the end of the cord below the machine; and this weight, if left at liberty, will draw the ball from the edge of the whirling-board to its centre. Draw off the ball a little from its centre, and turn the winch; then the ball will go round and round with the board, and gradually fly farther from the centre, raiſing up the weight below the machine; and thus it appears that all bodies revolving in circles, have a tendency to fly off from theſe circles, and muſt be retained in them by ſome power proceeding from or tending to the centre of motion. Stop the machine, and the ball will continue to revolve for ſome time upon the board; but as the friction gradually ſtops its motion, the weight acting upon it will bring it nearer and nearer to the centre in every revolution, till it brings it quite thither. Hence it appears, that if the planets met with any reſiſtance in going round the ſun, its attractive power would bring them nearer and nearer to it in every revolution, till they fell into it.

3. Take hold of the cord below the machine with one hand, and with the other throw the ball upon the round board as it were at right angles to the cord, and it will revolve upon the board. Then, obſerving the velocity of its motion, pull the cord below the machine, and thus bring the ball nearer the centre of the board, and the ball will be ſeen to revolve with an increaſing velocity, as it approaches the centre: and thus the planets which are neareſt the ſun perform quicker revolutions than thoſe which are more remote, and move with greater velocity in every part of their reſpective circles.

4. Remove the ball *a*, and apply the bearer M X, whoſe centre of motion is in its middle at *w*, directly over the centre of the whirling-board *d*. Then put two balls (V and U) of equal weights upon their bearing wires, and having fixed them at equal diſtances from their reſpective centres of motion *w* and *x* upon their ſilk cords, by the ſcrew-nuts, put equal weights in the towers O and P. Laſtly, put the catgut-ſtrings E and F upon the grooves G and H of the ſmall wheels, which, being of equal diameters, will give equal velocities to the bearers above, when the winch B is turned; and the balls U and V will fly off toward M and N, and raiſe the weights in the towers at the ſame inſtant. This ſhews, that when bodies of equal quantities of matter revolve in equal circles with equal velocities, their centrifugal forces are equal.

5. Take away theſe equal balls, and put a ball of ſix ounces into the bearer M X, at a ſixth part of the diſtance wz from the centre, and put a ball of one ounce into the oppoſite bearer, at the whole diſtance $xy = wz$; and fix the balls at theſe diſtances on their cords, by the ſcrew-nuts at the top: then the ball U, which is ſix times as heavy as the ball V, will be at only a ſixth part of the diſtance from its centre of motion; and conſequently will revolve in a circle of only a ſixth part of the circumference of the circle in which V revolves. Let equal weights be put into the towers, and the winch be turned; which (as the catgut-ſtring is on equal wheels below) will cauſe the balls to revolve in equal times: but V will move ſix times as faſt as U, becauſe it revolves in a circle of ſix times its radius, and both the weights in the towers will riſe at once. Hence it appears, that the centrifugal forces of revolving bodies are in direct proportion to their quantities of matter multiplied into their reſpective velocities, or into their diſtances from the centres of their reſpective circles.

If theſe two balls be fixed at equal diſtances from their reſpective centres of motion, they will move with equal velocities; and if the tower O has ſix times as much weight put into it as the tower P has, the balls will raiſe their weights exactly at the ſame moment: *i. e.* the ball U, being ſix times as heavy as the ball V, has ſix times as much centrifugal force in deſcribing an equal circle with an equal velocity.

6. Let two balls, U and V, of equal weights be fixed on their cords at equal diſtances from their reſpective centres of motion *w* and *x*; and let the catgut-ſtring E be put round the wheel K (whoſe circumference is only half that of the wheel H or G) and over the pulley *s* to keep it tight, and let four times as much weight be put into the tower P, as in the tower O. Then turn the winch B, and the ball V will revolve twice as faſt as the ball U in a circle of the ſame diameter, becauſe they are equi-diſtant from the centres of the circles in which they revolve; and the weights in the towers will both riſe at the ſame inſtant, which ſhews that a double velocity in the ſame circle will exactly balance a quadruple power of attraction in the centre of the circle: for the weights in the towers may be conſidered as the attractive forces in the centres, acting upon the revolving balls; which, moving in equal circles, are as if they both moved in the ſame circle. Whence it appears, that if bodies of equal weights revolve in equal circles with unequal velocities, their centrifugal forces are as the ſquares of the velocities.

7. The catgut-ſtring remaining as before, let the diſtance of the ball V from the centre *x* be equal to 2 of the diviſions on its bearer; and the diſtance of the ball U from the centre *w* be 3 and a ſixth part; the balls themſelves being equally heavy, and V making two revolutions by turning the winch, whilſt U makes one; ſo that if we ſuppoſe the ball V to revolve in one moment, the ball U will revolve in two moments, the ſquares of which are 1 and 4: therefore, the ſquare of the period of V is contained 4 times in the ſquare of the period of U. But the diſtance of V is 2, the cube of which is 8, and the diſtance of U is $3\frac{1}{6}$, the cube of which is 32 very nearly, in which 8 is contained 4 times: and therefore the ſquares of the periods of V and U are to one another as the cubes of their diſtances from *x* and *w*, the centres of their reſpective circles. And if the weight in the tower O be 4 ounces, equal to the ſquare of 2, the diſtance of V from the centre *x*; and the weight in the tower P be 10 ounces, nearly equal to the ſquare of $3\frac{1}{6}$, the

 diſtance

diſtance of U from w; it will be found, upon turning the machine by the winch, that the balls U and V will raiſe their reſpective weights at very nearly the ſame inſtant of time. This experiment confirms the famous propoſition of Kepler, *viz.* that the ſquares of the periodical times of the planets round the ſun are in proportion as the cubes of their diſtances from him; and that the ſun's attraction is inverſely as the ſquare of the diſtance from his centre.

8. Take off the ſtring E from the wheels D and H, and let the ſtring F remain upon the wheels D and G; take away alſo the bearer M X from the whirling-board *d*, and inſtead of it put on the machine A B (*Plate* XXI. *fig.* 14. *Aſtronomy*), fixing it to the centre of the board by the pins *c* and *d*, ſo that the end *e f* may riſe above the board to an angle of 30 or 40 degrees. On the upper part of this machine, there are two glaſs tubes *a* and *b*, cloſe ſtopped at both ends; each tube being about three-quarters full of water. In the tube *a* is a little quickſilver, which naturally falls down to the end *a* in the water; and in the tube *b* is a ſmall cork, floating on the top of the water, and ſmall enough to riſe or fall in the tube. While the board *b* with this machine upon it continues at reſt, the quickſilver lies at the bottom of the tube *a*, and the cork floats on the water near the top of the tube *b*. But, upon turning the winch and moving the machine, the contents of each tube will fly off towards the uppermoſt ends, which are fartheſt from the centre of motion: the heavieſt with the greateſt force. Conſequently, the quickſilver in the tube *a* will fly off quite to the end *f*, occupying its bulk of ſpace and excluding the water, which is lighter than itſelf: but the water in the tube *b*, flying off to its higher end *e*, will exclude the cork from that place, and cauſe it to deſcend toward the loweſt end of the tube; for the heavier body, having the greater centrifugal force, will poſſeſs the upper part of the tube, and the lighter body will keep between the heavier and the lower part.

This experiment demonſtrates the abſurdity of the Carteſian doctrine of vortices: for, if the planet be more denſe or heavy than its bulk of the vortex, it will fly off in it farther and farther from the ſun; if leſs denſe, it will come down to the loweſt part of the vortex, at the ſun: and the whole vortex itſelf, unleſs prevented by ſome obſtacle, would fly quite off, together with the planets.

9. If a body be ſo placed upon the whirling-board of the machine (*fig.* 13.) that the centre of gravity of the body be directly over the centre of the board, and the board be moved ever ſo rapidly by the winch B, the body will turn round with the board, without moving from its middle; for, as all parts of the body are in equilibrio round its centre of gravity, and the centre of gravity is at reſt in the centre of motion, the centrifugal force of all parts of the body will be equal at equal diſtances from its centre of motion, and therefore the body will remain in its place. But if the centre of gravity be placed ever ſo little out of the centre of motion, and the machine be turned ſwiftly round, the body will fly off towards that ſide of the board on which its centre of gravity lies. Then, if the wire C (*fig.* 15.) with its little ball B be taken away from the ſemi-globe A, and the flat ſide *e f* of the ſemi-globe be laid upon the whirling-board, ſo that their centres may coincide; if then the board be turned ever ſo quickly by the winch, the ſemi-globe will remain where it was placed: but if the wire C be ſcrewed into the ſemi-globe at *d*, the whole becomes one body, whoſe centre of gravity is at or near *d*. Fix the pin *c* in the centre of the whirling-board, and let the deep groove *b* cut in the flat ſide of the ſemi-globe be put upon the pin, ſo that the pin may be in the centre of A (ſee *fig.* 16. where the groove is repreſented at *b*), and let the board be turned by the winch, which will carry the little ball B (*fig.* 15.) with its wire C, and the ſemi-globe A, round the centre pin *c i*; and then, the centrifugal force of the little ball B, weighing one ounce, will be ſo great as to draw off the ſemi-globe A, weighing two pounds, until the end of the groove at *e* ſtrikes againſt the pin *c*, and ſo prevents A from going any farther: otherwiſe, the centrifugal force of B would have been great enough to have carried A quite off the whirling-board. Hence we ſee, that if the ſun were placed in the centre of the orbits of the planets, it could not poſſibly remain there; for the centrifugal forces of the planets would carry them quite off, and the ſun with them; eſpecially when ſeveral of them happened to be in one quarter of the heavens. For the ſun and planets are as much connected by the mutual attraction ſubſiſting between them, as the bodies A and B are by the wire C fixed into them both. And even if there were but one planet in the whole heavens to go round ever ſo large a ſun in the centre of its orbit, its centrifugal force would ſoon carry off both itſelf and the ſun: for the greateſt body placed in any part of free ſpace could be eaſily moved; becauſe, if there were no other body to attract it, it would have no weight or gravity of itſelf, and conſequently, though it could have no tendency of itſelf to remove from that part of ſpace, yet it might be very eaſily moved by any other ſubſtance.

10. As the centrifugal force of the light body B will not allow the heavy body A to remain in the centre of motion, even though it be twenty-four times as heavy as B; let the ball A (*fig.* 17.) weighing ſix ounces be connected by the wire C with the ball B, weighing one ounce; and let the fork E be fixed into the centre of the whirling-board; then, hang the balls upon the fork by the wire C in ſuch a manner, that they may exactly balance each other, which will be when the centre of gravity between them, in the wire at *d*, is ſupported by the fork. And this centre of gravity is as much nearer to the centre of the ball A than to the centre of B, as A is heavier than B; allowing for the weight of the wire on each ſide of the fork. Then, let the machine be moved, and the balls A and B will go round their common centre of gravity *d*, keeping their balance, becauſe either will not allow the other to fly off with it. For, ſuppoſing the ball B to be only one ounce in weight, and the ball A to be ſix ounces; then, if the wire C were equally heavy on each ſide of the fork, the centre of gravity *d* would be ſix times as far from the centre of B, as from the centre of A, and conſequently B will revolve with a velocity ſix times as great as A does; which will give B ſix times as much centrifugal force as any ſingle ounce of A has: but then, as B is only one ounce, and A ſix ounces, the whole centrifugal force of A will exactly balance that of B; and therefore each body will detain the other, ſo as to make it keep in its circle.

Hence it appears, that the ſun and planets muſt all move round the common centre of gravity of the whole ſyſtem, in order to preſerve that juſt balance which takes place among them.

11. Take away the forks and balls from the whirling-board, and place the trough A B (*fig.* 18.) thereon, fixing its centre to that of the board by the pin H. In this trough are two balls D and E of unequal weights, connected by a wire *f*, and made to ſlide eaſily upon the wire C ſtretched from end to end of the trough, and made faſt by nut-ſcrews on the outſide of the ends. Place theſe balls on the wire C, ſo that their common centre of gravity *g* may be directly over the centre of the whirling-board. Then, turn the machine by the winch ever ſo ſwiftly, and the trough

trough and balls will go round their centre of gravity, ſo as neither of them will fly off; becauſe, on account of the equilibrium, each ball detains the other with an equal force acting againſt it. But if the ball E be drawn a little more towards the end of the trough at A, it will remove the centre of gravity towards that end from the centre of motion; and then, upon turning the machine, the little ball E will fly off, and ſtrike with a conſiderable force againſt the end A, and draw the great ball B into the middle of the trough. Or, if the great ball D be drawn towards the end B of the trough, ſo that the centre of gravity may be a little towards that end from the centre of motion, and the machine be turned by the winch, the great ball D will fly off, and ſtrike violently againſt the end B of the trough, and will bring the little ball E into the middle of it. If the trough be not made very ſtrong, the ball D will break through it.

12. Mr. Ferguſon has explained the reaſon why the tides riſe at the ſame time on oppoſite ſides of the earth, and conſequently in oppoſite directions, by the following new experiment on the whirling-table. For this purpoſe, let *a b c d* (*fig.* 19.) repreſent the earth, with its ſide *c* turned toward the moon, which will then attract the water ſo as to raiſe them from *c* to *g*: and in order to ſhew that they will riſe as high at the ſame time on the oppoſite ſide from *a* to *e*; let a plate A B (*fig.* 20.) be fixed upon one end of the flat bar D C, with ſuch a circle drawn upon it as *a b c d* (*fig.* 19.) to repreſent the round figure of the earth and ſea; and an ellipſe as *e f g h* to repreſent the ſwelling of the tide at *e* and *g*, occaſioned by the influence of the moon. Over this plate A B ſuſpend the three ivory balls *e*, *f*, *g*, by the ſilk lines *h*, *i*, *k*, faſtened to the tops of the crooked wires H, I, K, ſo that the ball at *e* may hang freely over the ſide of the circle *c*, which is fartheſt from the moon M at the other end of the bar; the ball at *f* over the centre, and the ball at *g* over the ſide of the circle *g*, which is neareſt the moon. The ball *f* may repreſent the centre of the earth, the ball *g* water on the ſide next the moon, and the ball *e* water on the oppoſite ſide. On the back of the moon M is fixed a ſhort bar N parallel to the horizon, and there are three holes in it above the little weights *p*, *q*, *r*. A ſilk thread *o* is tied to the line *k*, cloſe above the ball *g*, and paſſing by one ſide of the moon M goes through a hole in the bar N, and has the weight *p* hung to it. Such another thread *n* is tied to the line *i*, cloſe above the ball *f*, and paſſing through the centre of the moon M and middle of the bar N, has the weight *q* hung to it, which is lighter than the weight *p*. A third thread *m* is tied to the line *h*, cloſe above the ball *e*, and paſſing by the other ſide of the moon M, through the bar N, has the weight *r* hung to it, which is lighter than the weight *q*. The uſe of theſe three unequal weights is to repreſent the moon's unequal attraction at different diſtances from her; ſo that if they are left at liberty, they will draw all the three balls towards the moon with different degrees of force, and cauſe them to appear as in *fig.* 21, in which caſe they are evidently farther from each other than if they hung freely by the perpendicular lines *h*, *i*, *k*. Hence it appears, that as the moon attracts the ſide of the earth which is neareſt her with a greater degree of force than ſhe does the centre of the earth, ſhe will draw the water on that ſide more than the centre, and cauſe it to riſe on that ſide; and as ſhe draws the centre more than the oppoſite ſide, the centre will recede farther from the ſurface of the water on that oppoſite ſide, and leave it as high there as ſhe raiſed it on the ſide next her. For, as the centre will be in the middle between the tops of the oppoſite elevations, they muſt of courſe be equally high on both ſides at the ſame time.

However, upon the ſuppoſition, the earth and moon would ſoon come together; and this would be the caſe, if they had not a motion round their common centre of gravity, to produce a degree of centrifugal force, ſufficient to balance their mutual attraction. Such motion they have; for as the moon revolves in her orbit every month at the diſtance of 240,000 miles from the earth's centre, and of 234,000 miles from the centre of gravity of the earth and moon, the earth alſo goes round the ſame centre of gravity every month at the diſtance of 6000 miles from it, *i. e.* from it to the centre of the earth. But the diameter of the earth being, in round numbers, 8000 miles, its ſide next the moon is only 2000 miles from the common centre of gravity of the earth and moon, its centre 6000 miles from it; and its fartheſt ſide from the moon 10,000 miles. Conſequently the centrifugal forces of theſe parts are as 2000, 6000, and 10,000; *i. e.* the centrifugal force of any ſide of the earth, when it is turned from the moon, is five times as great as when it is turned toward the moon. And as the moon's attraction, expreſſed by the number 6000, at the earth's centre, keeps the earth from flying out of this monthly circle, it muſt be greater than the centrifugal force of the waters on the ſide next her; and conſequently, her greater degree of attraction on that ſide is ſufficient to raiſe them; but as her attraction on the oppoſite ſide is leſs than the centrifugal force of the water there, the exceſs of this force is ſufficient to raiſe the water juſt as high on the oppoſite ſide.

To prove this experimentally, let the bar D C with its furniture be fixed on the whirling-board of the machine, (*fig.* 14.) by puſhing the pin P into the centre of the board; which pin is the centre of gravity of the whole bar with its three balls *e*, *f*, *g*, and moon M. Now, if the whirling-board and bar be turned ſlowly round by the winch, till the ball *f* hangs over the centre of the circle, as in *fig.* 22, the ball *g* will be kept towards the moon by the heavieſt weight *p* (*fig.* 20.), and the ball *e*, on account of its greater centrifugal force, and the leſs weight *r*, will fly off as far to the other ſide, as in *fig.* 22. And thus, whilſt the machine is kept turning, the balls *e* and *g* will hang over the ends of the ellipſe *l f k*. So that the centrifugal force of the ball *e* will exceed the moon's attraction juſt as much as her attraction exceeds the centrifugal force of the ball *g*, whilſt her attraction juſt balances the centrifugal force of the ball *f*, and makes it keep in its circle. Hence it is evident, that the tides muſt riſe to equal heights at the ſame time on oppoſite ſides of the earth. See Ferguſon's Lectures on Mechanics, lect. 2, and Deſag. Ex. Phil. vol. i. lect. 5.

WHIRL-WIND, a wind that riſes ſuddenly, and is exceedingly rapid and impetuous when riſen, but is ſoon ſpent. In this caſe, the guſts of wind proceed from different quarters at the ſame time, and meet in a certain place, where the air acquires a circular, or rotatory, or ſcrew-like motion, either aſcending or deſcending, as it were, round an axis, which axis is ſometimes ſtationary, and at other times moves on in a particular direction. This phenomenon, called a whirl-wind, gives a whirling motion to duſt, ſand, water, part of a cloud, and ſometimes even to bodies of great weight and bulk; carrying them either upwards or downwards, and laſtly, ſcattering them about in different directions.

There are divers ſorts of whirl-winds, diſtinguiſhed by their peculiar names: as, the *preſter*, *typho*, *turbo*, *exhydria*, and *ecnephias*.

The

The *prester* is a violent wind breaking forth with flashes of lightning. This is rarely observed; scarcely ever without the *ecnephias*. Seneca says, it is a *typho*, or *turbo*, kindled or ignited in the air.

The *ecnephias* is a sudden and impetuous wind, breaking out of some cloud; frequent in the Ethiopic sea, particularly about the Cape of Good Hope. The seamen call them *travados*.

The *exhydria* is a wind bursting out of a cloud, with a great quantity of water. This only seems to differ, in degree, from the *ecnephias*, which is frequently attended with showers.

A *typho*, or *vortex*, most properly called a *whirl-wind*, or *hurricane*, is an impetuous wind, turning rapidly every way, and sweeping all round the place. It frequently descends from on high. The Indians call it *orancan;* the Turks, &c. *oliphant*. It is frequent in the Eastern ocean, chiefly about Siam, China, &c. and renders the navigation of those parts exceedingly dangerous.

Dr. Franklin, in his Physical and Meteorological Observations, read to the Royal Society in 1756, supposes a whirl-wind and a water-spout to proceed from the same cause; their only difference being, that the latter passes over the water and the former over the land. This opinion is corroborated by the observations of M. de la Pryme, and many others, who have remarked the appearances and effects of both to be the same. They have both a progressive as well as a circular motion; they generally rise after calms and great heats, and occur most frequently in the warmer latitudes: the wind blows every way from a large surrounding space both to the water-spout and whirl-wind; and a water-spout has, by its progressive motion, passed from the sea to the land, and produced all the phenomena and effects of a whirl-wind: so that there is no reason to doubt their being meteors arising from the same general cause, and explicable upon the same principles, furnished by electrical experiments and discoveries. See HURRICANE, and *Water-Spout*.

For Dr. Franklin's ingenious method of accounting for both these phenomena, see his Letters and Papers, &c. vol. i. p. 191, &c. p. 216, &c.

WHISKET, or WISKET, in *Rural Economy*, a term often used provincially to signify a basket, especially in the northern counties. See BASKET.

WHISKY, a term signifying *water*, and applied in the Highlands and islands of Scotland and in Ireland to strong water or distilled liquor. The spirit drank in the North is drawn from barley, and is said to be preferable to any English malt-brandy: it is strong, but not pungent, and free from the empyreumatic taste or smell.

WHISPERING. See HEARING, ATTENTION, &c.

WHISPERING-*Places*, such as *domes* and *galleries*, depend on this principle, that the voice being applied to one end of an arch, easily passes by repeated reflections to the other.

Thus, let A B C (*Plate* XV. *Pneumatics*, *fig*. 8.) represent the segment of a sphere; and suppose a low voice uttered at D, the vibrations extending themselves every way, some of them will impinge upon the points E, E, &c. and thence be reflected to the points F, F, &c. thence to G, G, &c. till at last they meet in C; where, by their union, they cause a much stronger sound than in any part of the segment whatever, even at D the point whence they first proceeded.

Accordingly, all the contrivance in a whispering-place is, that near the person who whispers there be a smooth wall, arched either cylindrically, or elliptically; in which case he will be heard distinctly by another person, who places his ear pretty near the wall on the opposite side. A circular arch will do, but not so well. It is demonstrated by all the writers on CONICS (which see), that if from any point in the circumference of an ellipse two lines be drawn to the foci, those lines make equal angles with one curve at that point. Consequently, the sound which is produced in one focus of an elliptical chamber, and is reflected from the wall to the other focus, makes all the angles of incidence equal to the angles of reflection respectively. Hence that focus is the place where the sound is best heard.

Places famed for the conveyance of whispers are, the prison of Dionysius at Syracuse, which increased a soft whisper to a loud noise; the clap of one's hand to the sound of a cannon, &c.; the aqueducts of Claudius, which carried a voice sixteen miles; and divers others enumerated by Kircher in his Phonurgia.

The most considerable in England are, the dome of St. Paul's, London, where the ticking of a watch may be heard from side to side; and a very easy whisper be sent all round the dome: this Dr. Derham found to hold not only in the gallery below, but above upon the scaffold, where a whisper would be carried over one's head round the top of the arch, though there be a large opening in the middle of it into the upper part of the dome: and the famous whispering-place in Gloucester cathedral, which is no other than a gallery at the east end of the choir, leading from one side of it to the other. It consists of five angles and six sides, the middlemost of which is a naked window; yet two whisperers there hear each other at the distance of twenty-five yards. See Birch's Hist. of the Royal Society, vol. i. p. 120. See ECHO.

WHIST, or WHISK, a well-known game at cards. Mr. T. Matthews, one of the last and most approved writers on the game of whist, has published (1816) a tenth edition of his "Advice to the Young Whist Player, &c." in which he has comprised, under the detail of 108 maxims, such instructions as are necessary to be observed by those who wish to play this game with skill and success. It would far exceed our limits, if we attempted to follow him in this detail; and an abridgment, if it were practicable, would be of little use; nor indeed is it necessary, as those who are desirous of acquiring a knowledge of the minutiæ of the game will consult the author, whose "Advice" may be easily and cheaply procured. We shall, however, select some of those instructions that are the most important, and subjoin those laws of the game that serve to prevent or settle disputes among players.

The following maxims comprehend those instructions that relate to leads, to which we have annexed some other directions that are immediately connected with them. It is highly necessary, says Mr. M., to be correct in leads. When a good player plays an eight, and then a seven, it may be known that he leads from a weak hand; and the contrary, when he plays the seven first: the case is the same with a tray or a deuce.

Good players never lead a nine or ten, but for one of these reasons:

1st. From a sequence up to the king.

2d. From nine, ten, knave, and king.

3d. When the best of a weak suit not exceeding three in number.

1. The safest leads are those that are furnished by sequences of three or more cards; in which case the player is advised to lead the highest, and to put on the lowest to his partner's lead, and to put the highest on his adversary's; and with a tierce to the king and several others, to begin with

with the knave. If he has no fequences, he is inftructed to lead from his moft numerous fuit; if ftrong in trumps, to lead rather from one headed by a king than a queen; but with three or four fmall trumps, Mr. Matthews prefers leading from a fingle card to a long weak fuit. But the players of the old fchool never lead from a fingle card without fix trumps. In fome cafes, Mr. M. obferves, this may be occafionally done with very great, though not certain, advantage; *e. g.* when A has four fmall trumps, ace, queen, &c. of the fecond fuit; king, knave, &c. of a third; and a fingle card of the fourth. To lead from three cards, unlefs in fequences, is bad play, and only proper when you have reafon to think it is your partner's fuit, and then lead off the higheft. Unlefs, fays Mr. M., you have a ftrong fuit yourfelf, or have reafon to fuppofe that your partner has one, do not trump out unlefs you have fix trumps. It is generally right to return your partner's lead in trumps, unlefs he leads a nine or ten, called an equivocal card, becaufe it is led with propriety, both from ftrong and weak fuits.

2. With ace, king, knave, and three fmall trumps, play the ace and king; with only two, the king, and wait for the fineffe of the knave. In other fuits, without great ftrength in trumps, or with the hopes of a particular point, do not wait for the fineffe.

3. Ace, king, and five others, lead the ace in all fuits. With four or lefs, the loweft, if trumps. In other fuits always the ace, unlefs all the trumps remaining are with you and your partner; in this cafe, a fmall one.

Mr. M. advifes not to lead trumps merely becaufe an honour is turned up on your left, nor to be deterred from it if on your right-hand; either, he fays, is proper, if the circumftances of your hand require trumps to be led; but neither otherwife.

It is equally advantageous to lead up to an ace as through an ace; not fo much fo to a king, and difadvantageous to the queen turned up.

When cards are nearly equal, fays this author, the point to which all the manœuvres of good whift players tend, is to eftablifh a long fuit, and to preferve the laft trump, to bring it into play, and to fruftrate the fame play of their adverfaries. With an honour (or even a ten), with three other trumps, by well managing them, you have a right to expect fuccefs. In this cafe, do not over-trump your right-hand adverfary early in the hand; but throw away a lofing card, by which, there remaining but twelve trumps, your own hand is ftrengthened, and your partner has the tenace, in any fuit that is led; whereas, had you over-ruffed, you would have given up the whole game, to fecure one trick. But there are reafons for breaking this rule:—1ft. If your left-hand adverfary has fhewn a decided great hand in trumps, (in which cafe make your tricks while you can,) or 2d. If your partner decidedly means to force you,—to underftand if this is the cafe, you are to obferve, if your partner plays the winning or lofing card of the fuit you have refufed. If the former, it is by no means clear he means to force you, and you play your own game. If the latter, you are to fuppofe him ftrong in trumps, and depend on this, to protect your long fuit: a due reflection on this will convince you of the value of that maxim, which enjoins you never to play a ftrong game with a weak hand, or *vice verfâ.*

It is difficult to judge when to lead trumps. The following fituations will affift the beginner to reafon, and in general direct him properly:

1ft. With fix trumps, on fuppofition your partner has a ftrong fuit.

2d. If ftrong in other fuits, though weak in trumps yourfelf.

3d. If your adverfaries are playing from weak fuits.

4th. If your adverfaries are at the point of eight, and you have no honour, or probability of making a trump by a ruff.

With king, queen, ten, &c. in all fuits, lead the king; but if it paffes, do not purfue the lead, as certain the ace is in your partner's hand, as it is often kept up, but change your lead, and wait for the return from your partner when you have the fineffe of the ten, if neceffary.

King, queen, and five others, in all fuits, the king. With four or lefs in trumps, lead the loweft. In other fuits, always the king, unlefs you have the two only remaining trumps, if fo you may play a fmall one.

King, knave, ten, &c. in all fuits, lead the ten. King, knave, and two or more fmall ones, the loweft.

You fhould not lead from king, knave, and a fmall one, unlefs it is clearly your partner's fuit, in which cafes play off your king and knave.

Queen, knave, nine, and others, lead the queen. Queen, knave, with one other, the queen. Queen, knave, with two more, the loweft. Queen, ten, and two others, the loweft. Queen, and three fmall ones, the loweft. Queen, or knave, with only two, the queen, or knave.

The trump card fometimes occafions a deviation from thefe rules. A has the ace or king, with fequence from the ten downwards, of the fuit of which his left-hand adverfary turns up knave, or queen—A fhould lead the ten. If the knave or queen be put on, you have a fineffe on the return with the nine; if not, your partner, with an honour, will pafs it, and it is either way advantageous.

That which is denominated under-play, is returning the loweft of your left-hand adverfary's lead, though you have the higheft in your hand, with a view of your partner's making the third beft, if he has it, and ftill retaining the commanding card in your hand.

To explain this further, fuppofe A fourth player, has ace and king of his left-hand adverfary's lead; to under-play, he wins the trick with the ace, and returns the fmall one, which will generally fucceed, if the leader has not the fecond and third in his own hand. You will fee by this, if you lead from a king, &c. and your right-hand adverfary, after winning with a ten or knave, return it, you have no chance to make your king, but by putting it on.

The following is another fituation to under-play; A remains with the firft, third, and fourth cards of a fuit, of which he has reafon to fuppofe his left-hand adverfary has the fecond guarded; by playing the fourth, it is often paffed, and A makes every trick in the fuit.

When it is at your option to be 8 or 9, it is material always to choofe the former fcore. When at eight, with two honours, look at your adverfary's fcore, and confider if there is a probability they fhould fave their lurch, or win the game, notwithftanding your partner holds a third honour; if not you fhould not call, as it gives a decided advantage againft you in playing for tricks.

Laws of Whift.—1. If a card is turned up in dealing, the adverfe party on naming it may call a new deal, unlefs they have looked at or touched the cards, fo as to have occafioned it; but if any card except the laft is faced, it is undoubtedly a new deal.

2. Should any card-player have but twelve cards, and the others their proper number, the deal is good, and he who has the twelve cards pays for any renounce he may have

have made; but if either have fourteen cards, the deal is loſt.

3. If the dealer does not turn up the laſt card, the deal is loſt. But if the card is ſhewn, and falls on its face by accident afterwards, the deal in this caſe ſhall ſtand good.

4. The dealer ſhould leave the laſt card on the table till he has played; after which nobody can aſk for it, though they may inquire what is trumps at any time. Should he leave it on the table after the firſt round, it may be called, as if ſhewn by accident.

5. Every perſon has a right before he plays to call on the players to place their cards before them, which is, in other words, to aſk who played them. It is therefore a quibble to ſay they have no right to make that demand.

6. The partner who reminds his partner to call after the trump is turned up, forfeits a point.

7. If one of the players omit playing to a trick, and remains with a card too many, it is at the option of the adverſaries to call a new deal.

8. If A plays out of his turn to his partner's lead, the laſt player may play before the firſt: if to his adverſary's, his partner may be compelled to, or prevented from winning the trick at their option.

9. Miſtakes relative to tricks may be rectified at any time during the game, whether called or not. Alſo honours, if proved to have been called in time, though not ſcored; but they cannot be claimed after the trump is turned up.

10. If one party calls at any ſcore but eight, the adverſaries may, after conſulting, call a new deal; the ſame, if one calls without two, or the other anſwers without one honour.

11. If any player calls after he has played, the adverſaries may call a new deal; but not conſult together.

12. Whoever calls, having only one honour in his hand, ſhould forfeit in proportion to any advantage that actually does or may poſſibly accrue from the fault. If it ſhould prevent the adverſaries from calling, after the hand is played out, the honours ſhall take place of the tricks.

13. If any perſon plays out of his turn, the adverſaries have the option to call that card at any time, or direct the player whoſe turn it was, to play any ſuit they chooſe.

14. If A, ſuppoſing that he has won a trick, leads again before his partner has played to it, the adverſaries may oblige his partner to win it, if he can.

15. Any player may call a card from his adverſary, if he names it, and proves the ſeparation. Should he name a wrong one, he may have his beſt or worſt card called of any ſuit played during the deal.

16. Cards thrown down cannot be taken up again; but may be called by the adverſaries. They may be ſhewn down by the player, if ſure of every trick.

17. There are in fact four penalties on a revoke, which take place of every other ſcore. The adverſaries may take three tricks from the party revoking, or three from their ſcore, or add three to their own; and if there ſtill ſhould remain enough to make the party revoking game, they cannot win it, but remain at nine.

There is often judgment required in taking the penalties of a revoke. Before the ſcore is advanced, if the party revoking has won nine tricks, the leaſt conſideration will ſhew, that the adverſaries ſhould take three of them, for if they add three to their own ſcore, they ſtill leave the odd trick to the former; but if the revoking party be at eight, it is better for the adverſary to ſcore three points, as the odd trick leaves the former at nine, which is in every reſpect a worſe point than eight. On other occaſions, it is only to calculate how the different ſcores will remain after each mode of taking the penalty; and it will be obvious which will be the moſt advantageous—never loſing ſight of the points of the game; *i. e.* ſcoring eight or five yourſelf, or prevent your adverſary from doing ſo.

18. A revoke is not eſtabliſhed before the party revoking has played again, or the trick been turned and quitted; but the adverſaries, at their option, may call from the higheſt or loweſt of the ſuit at the time, or the card ſhewn at any time during the deal.

19. If a revoke is claimed, the adverſaries forfeit the penalties of a revoke, if they mix the cards before it is determined.

20. No revoke can be claimed after the cards are cut for the next deal.

21. A caſe having occurred in which A played out of his turn, and B, his partner, was directed to play a trump; but B had another ſuit, and three or four cards were played before it was diſcovered that B had a trump in his hand: it was decided, that the cards ſhould be taken up again, and a trump led by B as directed.

22. A caſe occurred in which A called at eight, but his partner did not anſwer, though he had an honour, becauſe he had a bet on the odd trick. The adverſaries contended that the deal ſhould not ſtand; and reference being made to Mr. M., he decided that the game was fairly won, becauſe there could be no poſſible advantage made of the circumſtance as far as related to the game, though it might as to the trick, if that had been the caſe referred; and their caſe produced the following law: *viz.* No one is obliged to anſwer to his partner's call, even though he has the other two honours in his hand.

23. No player, having three honours in his hand, can be precluded from taking advantage of them at any time previous to his playing a card. This law was grounded on the following caſe; *viz.* A at the ſcore of eight, on gradually opening his hand, ſaw two honours in it immediately, and told his partner of it, who did not anſwer: but A continuing to look over his cards found a third honour, and ſhewed them down. It was contended that he had no right to do this, as Mr. M. thought improperly, upon which he propoſed the above-mentioned law. We here ſubjoin a maxim connected with this caſe.

When at eight, with two honours, look at your adverſary's ſcore, and conſider if there is a probability they ſhould ſave their lurch, or win the game, notwithſtanding your partner holds a third honour; if not you ſhould not call, as it gives a decided advantage againſt you in playing for tricks.

24. Whoever ſhall by word or geſture manifeſtly diſcover his approval or diſapprobation of his partner's mode of play, or aſk any queſtions but ſuch as are ſpecifically allowed by the exiſting laws of whiſt, the adverſary ſhall either add a point to his own ſcore, or deduct one from the party ſo tranſgreſſing, at his option.

25. It is now ſettled, that either of the players may inſiſt on the cards being placed at any time previous to their being put together. It is alſo ſettled, that where a bet is made, that either of the parties ſcores two, the bet is won by honours, though the adverſary has won the game by cards—ſuppoſing it betted that A makes two points, if B, his

his adverfary, being at feven, makes three by cards, if A has two by honours, he ftill wins his bet.

The odds of this game are calculated according to the points, and with the deal, in the following manner:

1 love	- -	10 to 9
2 love	- -	10 to 8
	&c. &c.	

Except that 9 is confidered as fomething worfe than 8. It is 3 to 1 in favour of the firft game. The odd trick has been always fuppofed in favour of the leader; but Mr. M. is of opinion, that this is an error, as the dealer has the advantage in this, as in every other fcore.

We fhall here fubjoin an explanation of two terms that are univerfally ufed, but not generally underftood, *viz.* *tenace* and *fineffe*.

"The principle of the *tenace* is fimple. If A has the ace and queen of a fuit, and B, his adverfary, has the king and knave, the leaft confideration will fhew that if A leads, B wins a trick, and *vice verfâ* of courfe; in every fituation it is the mutual plan of players by leading a lofing card to put it into the adverfary's hand to oblige him to lead that fuit, whereby you preferve the tenace. So far is eafily comprehended; but it requires attention with practice to apply the principle, fo obvious in the fuperior, to the inferior cards, or fee that the fame tenace operates occafionally with the feven and five, as the ace and queen, and is productive of the fame advantage. A, laft player, remains with the ace and queen of a fuit not played, the laft trump, and a lofing card: B, his left-hand adverfary, leads a forcing card. *Query*—How is A to play? *Anfwer*—If three tricks win the game, or any particular point, he is not to ruff, but throw away his lofing card, becaufe his left-hand adverfary being then obliged to lead to his fuit, he remains tenace, and muft make his ace and queen. But upon a fuppofition that making the four tricks gains him the rubber, he fhould then take the force, as in thefe fituations you are juftified in giving up the tenace for an equal chance of making any material point.

"The *fineffe* has a near affinity to the tenace, except that the latter is equally the object where two, and the former only where there are four players. A has the ace and queen of a fuit led by his partner, now the dulleft beginner will fee it proper to put on the queen; and this is called fineffing it, and the intention is obvioufly to prevent the king from making, if in the hand of his right-hand adverfary. Should it not be there, it is evident you neither gain nor lofe by making the fineffe; but few players carry this idea down to the inferior cards, or fee that a trick might be made by a judicious fineffe, againft an eight, as a king; but to know exactly when this fhould be done, requires more fkill than in the more obvious cafes, united with memory and obfervation. Another cafe of fineffe even againft two cards frequently occurs, and the reafon on reflection is felf-evident.

"A leads the ten of a fuit, of which his partner has the ace, knave, and a fmall one; B fhould fineffe or let the ten pafs, even though he knows the king or queen are in his left-hand adverfary's hand, becaufe he preferves the tenace and probably makes two tricks; whereas, had he put on his ace, he could make but one—in fhort, tenace is the game of pofition, and fineffe, the art of placing yourfelf in the moft advantageous one." Matthews's Advice, &c. ed. 10. 1816.

M. de Moivre has folved this problem: To find the odds that any two of the partners, that are pitched upon, have not the four honours? M. de Moivre concludes from this folution,

1. That it is 27 to 2, nearly, that the dealers have not the four honours.

2. That it is 23 to 1, nearly, that the eldeft have not the four honours.

3. That it is 8 to 1, nearly, that neither one fide nor the other have the four honours.

4. That it is 13 to 7, nearly, that the two dealers do not reckon honours.

5. That it is 20 to 7, nearly, that the two eldeft do not reckon honours.

6. That it is 25 to 16, nearly, that either one fide or the other do reckon honours, or that the honours are not equally divided.

The fame learned author alfo determines, that the odds for the partners who have eight of the game, if dealers, againft thofe who have nine, is nearly as 17 to 11. But if thofe who have eight of the game are eldeft, the odds will be nearly as 95 to 77. And that without confidering whether thofe who have eight are dealers, or eldeft, there is one time with another the odds of fomewhat lefs than 7 to 5; and very nearly that of 25 to 18.

It is a queftion likewife belonging to this game, what the probability is that a player has a given number of trumps dealt him; particularly, it has been often taken as an equal wager, that the dealer has at leaft four trumps. M. de Moivre has computed the following tables; fhewing for the dealer, as well as the other gamefters, what the probability is of taking precifely any affigned number of trumps in one deal. And thence by a continual addition of the numbers, or of fuch part of them as is neceffary, it is eafily found what the probability is of taking at leaft that number.

Chances of the Dealer to have befides the Card turned up.	Trumps.	Chances of any other Gamefter to have precifely.

48906	X.	603174
468	XI.	8892
1	XII.	39
Sum = 158753389900 is the common denominator; being the combinations of 12 cards in 51.		476260169700 = fum, is the common denominator; being the combinations of 13 in 51.

By the help of thefe tables feveral ufeful queftions may be refolved; as, 1. If it is afked, what is the probability that the dealer has precifely III trumps, befides the trump card? The anfwer, by Table I., is $\frac{4662}{15875}$; and the probability of his having fome other number of trumps is

$\frac{11213}{15875}$. But if the queſtion had been, what is the probability that ſome other gameſter, the eldeſt hand for inſtance, has preciſely IV trumps? The anſwer, Table II., is $\frac{104898}{476260}$.

2. To find the chance of the dealer's not having fewer than IV trumps: add his chances to take o, I, II, which are 39108, 201127, 419592; and their ſum 659827 taken from the denominator 1587534, and the remainder made its numerator, the probability of the dealer having IV or more trumps will be $\frac{927707}{1587534} = \frac{329}{563}$, a little above $\frac{7}{12}$. The wager, therefore, that the dealer has not IV trumps, is ſo far from equal, that whoever lays it throws away above $\frac{1}{5}$ of his ſtake.

But if the wager is that the dealer has not V trumps, then 466213 (the chances of his having III beſides the trump card) is to be added to the chances for o, I, II; which will make the chance of him who lays this wager to be nearly $\frac{317}{455}$; and that of his adverſary $\frac{138}{455}$.

And hence, if wagers are laid that the dealer has not IV trumps, and has not V trumps, alternately; the advantage of him who lays in this manner will be nearly $11\frac{1}{4}$ *per cent.* of his ſtakes.

3. To find the odds of laying that the eldeſt hand has at leaſt III, and at leaſt IV trumps, alternately; the numerator of the one expectation is (by Table II.) 31501119, and of the other 17514720, to the denominator 47626017; whence the advantage of the bet will be $\frac{15}{514}$, or three *per cent.* nearly.

Again, if it is laid that the trumps in the dealer's hand ſhall be either I, II, III, or VI; the diſadvantage of this bet will be only 15*s.* 4*d.* or about $\frac{3}{4}$ *per cent.*

In like manner, the odds of any propoſed bet of this kind may be computed: and from the numbers in the tables, and their combinations, different bets may be found which ſhall approach to the ratio of equality; or if they differ from it, other bets may be aſſigned, which, repeated a certain number of times, ſhall balance that difference.

4. And if the bet includes any other condition beſides the number of trumps, ſuch as the quality of one or more of them; then proper regard is to be had to that reſtriction.

Let the wager be that the eldeſt has IV trumps dealt him; and that two of them ſhall be the ace and king. The probability of his having IV trumps preciſely is, by Table II., $\frac{104898}{476200}$: and the different fours in 12 cards are $\frac{12}{1} \times \frac{11}{2} \times \frac{10}{3} \times \frac{9}{4}$. But becauſe 2 out of the 12 trumps are ſpecified, all the combinations of 4 in 12 that are favourable to the wager, are reduced to the different twos that are found in the remaining 10 cards, which are $\frac{10}{3} \times \frac{9}{2}$. And this number is to the former as 1 to 11: the probability, therefore, is reduced by this reſtriction to $\frac{1}{11}$, of what elſe it had been: that is, it is reduced from near $\frac{1}{5}$ to about $\frac{1}{52}$. De Moivre's Doctrine of Chances, p. 172, &c. ed. 3d.

WHISTLE, Boatswain's. See Call.

Whistle-*Fiſh*, a name given by the people of Cornwall to a ſpecies of gadus, with only two fins on the back, otherwiſe called *muſtela fluviatilis*. See Gadus, and Mustela.

WHISTON, William, M.A. in *Biography*, an Engliſh divine and mathematician, was the ſon of the rector of Norton near Twycroſs, in Leiceſterſhire, and born in the year 1667. He finiſhed his education as a ſizer at Clare-hall, Cambridge, applying with great diligence to the ſtudy of mathematics, and compoſing devout meditations correſponding to the early bent of his diſpoſition. Having alſo received the degree of B.A. in 1690, and being elected fellow of his college, he took pupils; and in 1693 became M.A. and entered into holy orders. Soon afterwards he declined the office of tutor, and was appointed chaplain to Dr. More, biſhop of Norwich. His acquaintance with ſir Iſaac Newton commenced in 1694, and produced a change in his philoſophical ſyſtem, from that of Des Cartes to that of Newton. On the principles of this philoſophy, he publiſhed, in 1696, his "Theory of the Earth," which was refuted by Keill. Having been preſented by his patron, the biſhop, to the living of Loweſtoft in Suffolk, he reſigned his chaplainſhip, and in order fully to diſcharge his religious duties procured the aſſiſtance of a curate. Of his invincible and moral ſcrupulous integrity, he gave an early inſtance by refuſing his vote to a perſon who ſolicited a fellowſhip of Clare-hall, and who had abandoned the bacchanalian party with which he was connected, and which he apprehended to be the moſt powerful, and promiſed future ſobriety; and giving this reaſon for his refuſal: "Sir, you have confeſſed that you ſacrificed your integrity to your preferment, and thereby have made it impoſſible for me to ſerve you." Being obliged to vacate his fellowſhip by marriage, ſir Iſaac Newton nominated him his deputy as profeſſor of mathematics, allowing him all the profits of the office; and in 1703 he ſurrendered to him the profeſſorſhip itſelf. Upon this acceſſion, he reſigned his living, ſettled at Cambridge, and was appointed by Dr. More, biſhop of Ely, catechetical lecturer of St. Clement's. Having already publiſhed "A Short View of the Chronology of the Old Teſtament, and the Harmony of the Four Evangeliſts," and "Tacquet's Euclid," he preſented to the public in 1706 his "Eſſay on the Revelation of St. John;" and in the following year he preached the Boyle's lecture ſermon on the ſubject of the "Accompliſhment of Scripture Prophecies." In the year 1706 he began to entertain doubts concerning the divinity of Chriſt, and in the proſecution of his inquiries he was led to adopt Arian opinions, which were further confirmed by the peruſal of the "Apoſtolical Conſtitutions," reckoned ſpurious by moſt writers, but pronounced by Whiſton to be "the moſt ſacred of the canonical books of the New Teſtament." In 1708 he offered an "Eſſay on the Apoſtolical Conſtitutions" to be printed at the Univerſity preſs, but it was rejected; however, in 1709, he publiſhed ſermons and eſſays ſupporting theſe opinions. His invincible perſeverance cauſed him to be deprived

deprived of the catechetical lecture, and at the same time he declined receiving the salary which the bishop wished to continue. His situation at the University became very precarious, and in October 1710 he was expelled from it, in conformity to a statute against maintaining doctrines contrary to the established religion. In the following year he also lost his professorship; and having no further employment at Cambridge, he removed to London, and published an account of the proceedings against him, and also books in defence of his sentiments, which he retained without regarding any worldly considerations. His purposes were fixed, and he declared to two friends, who wished him to pay some attention to his present welfare, "you may as well persuade the sun to come down from the firmament, as turn me from this my resolution." Hoadly and Clarke remonstrated; but all their pleas were unavailing. All his future prospects seemed now to depend on his knowledge of mathematics, and accordingly in 1710 he published his "Prælectiones Physicæ-Mathematicæ; five Philosophia Clarissimi Newtoni Mathematica illustrata." At this time Addison and Steele, and several other persons, exerted themselves in procuring a subscription to his astronomical lectures. But at the close of this year he published the "Historical Preface" to a proposed work on Primitive Christianity, which subjected him to the inquisitorial animadversion of the lower house of convocation. Escaping, however, the apprehended consequences of their interference, he persisted in his course, and in 1711 printed this work which he had announced, and which had occasioned an alarm, in 4 vols. 8vo. The convocation, not sufficiently informed with regard to the extent of their power in cases of heresy, addressed the queen in order to obtain the opinion of the judges, who disagreed upon the subject, and no further measures were pursued by this body. However, in 1713, Whiston was prosecuted in the spiritual court; and as he did not appear to its citation, he was declared contumacious. Difficulties occurring on the part of the lay-judges, the business was deferred, and the prosecution was terminated by an act of grace in 1715. Whiston was at this time a professed member of the established church, and attended its worship, till at length he was refused admission to the sacrament; and therefore he opened an assembly for worship at his own house, and used a liturgy of his own composing. He also established a weekly meeting for the promotion of primitive Christianity, which subsisted for two years. Whilst he was thus occasionally engaged, he devoted himself to mathematical and philosophical pursuits; and in concert with Mr. Ditton, who was his colleague in his lectures, published a project for discovering the longitude at sea. But as their speculations were of no use, it will be sufficient to observe, that he published at last a method of ascertaining the longitude by observations of the eclipses of Jupiter's satellites, with tables of such eclipses for four years from the year 1738.

His zeal in religious discussions and projects remained unabated; and, among other publications in 1716 and the two following years, appeared several pieces founded on the supposed genuineness and authority of the apostolical constitutions. In 1719 he published a letter addressed to Finch, earl of Nottingham, on the "Eternity of the Son of God and his Holy Spirit," which received an answer from his lordship, that induced the clergy and universities to return him public thanks, and which caused Whiston's exclusion from the Royal Society, when he was proposed as a candidate in 1720. Sir Isaac Newton, it is said, who was of a very timid temper, took measures for defeating his election. As he was of opinion that the Jews would be speedily restored to their native land, he procured models of the tabernacle of Moses and the temple of Jerusalem, upon which he read public lectures. In 1741 he undertook a survey of the coasts of England, in order to fix the longitude of places, and a chart to this purpose was published in 1745. It was in the year 1747 that he discontinued his attendance on the service of the church of England, and joined a Baptist church, in which connection he continued. In 1749 he published two volumes of memoirs of his own life, to which a third was added in 1750. Having attained to the 85th year of his age, he died at London in 1752, and was interred at Lyndon, where his daughter was married, and where a handsome tomb was erected in honour of his memory. "Fancy," says one of his biographers, "predominating over judgment, a warm head and honest heart, enthusiastic fervour, and disregard to common forms and worldly consequences, were the leading features of his character." He never hesitated in giving his opinion to all persons on all subjects, freely and without discrimination. Being once asked, in the presence of Addison, Pope, Walpole, Craggs, and others, "whether a secretary of state could be an honest man consistently with the duties of his station?" He gave his opinion that it would be of advantage to such an officer to speak openly what he knew, and declare his intentions without disguise. Mr. Craggs replied, "It might answer for a fortnight, but no longer." "Did you never, Mr. Secretary," returned Whiston, "try it for a fortnight?" When queen Caroline, who honoured Whiston's integrity, and was fond of his conversation, desired him to acquaint her what was particularly found fault with by censurers on her conduct; he replied, that her habit of talking at chapel was mentioned with disapprobation. She promised amendment, and wished him to point out any other faults. "When your majesty," said he, "has amended this, I will tell you of the next." A catalogue is given of Whiston's writings, which are very numerous, at the close of his "Memoirs of Dr. Clarke." He has also given a valuable "English Translation of Josephus," with plans, notes, and illustrations, to which are prefixed eight dissertations. Biog. Brit. Memoirs of his Own Life.

WHITAKER, John, B.D. a divine of the established church, was born at Manchester, about the year 1735, and educated at Oxford, where he became fellow of Corpus-Christi college, taking the degree of M.A. in 1759, and of B.D. in 1767. His first work, *viz.* "The History of Manchester," appeared in 1771, 4to., in which he takes occasion to give a view of the state of the kingdom in general. This work, abounding in literary research and ingenious conjecture, gave reputation to the writer, and was followed in the same year by "The Genuine History of the Britons asserted." However, it is said that Mr. Whitaker's imagination in the progress of his years misled his judgment, of which he gave evidence in the second volume of his "History of Manchester," printed in 1775, though he still maintained his character for deep and learned investigation. As a clergyman, he became morning-preacher of Berkeley chapel, London, in 1773, from which situation he was soon after removed; and he resented his removal with the natural warmth of his temper. Such was his orthodoxy, that he declined accepting a valuable living that was offered to him by an Unitarian patron. In 1778 he succeeded, as fellow of his college, to the rectory of Ruan-Lanyhorne in Cornwall, where his contest about tithes was the occasion of much uneasiness to him. When mutual conciliation took place between him and his parishioners, he published in 1783 a course of Sermons on Death, Judgment, Heaven,

 and

and Hell, which were rendered peculiarly impreſſive by the fervid eloquence with which he treated the ſubject, naturally awful and intereſting. In 1787 he publiſhed his "Mary Queen of Scots vindicated," 3 vols. 8vo., in which he ſurpaſſed former writers in the zeal with which he vindicated this unfortunate queen, and criminated her enemies, Elizabeth, Cecil, Morton, and Murray. He alſo preſented to the public the fruit of his learned reſearch in "The Courſe of Hannibal over the Alps aſcertained," 2 vols. 8vo. 1794; and in 1795 he advanced the higheſt monarchical principles in his work, entitled "The real Origin of Government," and alſo his orthodoxy in his "Origin of Arianiſm," zealouſly defending his ſentiments in both theſe reſpects by contributions to the Engliſh and Jacobin Reviews, and Britiſh Critic. At length a paralytic ſtroke warned him of his approaching end, and after a gradual decline he imperceptibly cloſed life at his rectory in October 1808, at the age of 73, leaving a widow and two daughters. Gen. Biog.

WHITBREAD, SAMUEL, an eminent brewer, claims a place in a work devoted to the record and promotion of the arts and ſciences, on account of the talents which he diſplayed and the character which he maintained in his advancement from ſmall beginnings, to the poſſeſſion of a fortune, that ſet him on a level with ſome of the firſt nobility of the country. The family from which he ſprung belonged to the claſs of yeomanry, in the county of Bedford, which poſſeſſed ſome ſmall property, and aſſociated with that deſcription of moderate diſſenters, who occaſionally conformed to the Church of England. Born in the village of Cardington near Bedford, about the year 1720, and educated probably with a view to trade, for which his family deſigned him, he was bound apprentice at a ſuitable age, for the term of ſeven years, to an opulent brewer in London; and after the expiration of that period, he remained for ſome time unſettled, as he was cautious in commencing buſineſs on his own account. At length, however, actuated by the laudable ambition of tracing the footſteps of thoſe, who, in a ſimilar department, had riſen to opulence and rank, he determined to make trial for himſelf, how far induſtry and activity, aided by economy, would avail to his ſucceſs. Having diſpoſed of his own patrimony, which could not have been very conſiderable, and deriving aſſiſtance from perſons of opulence, who were encouraged to repoſe confidence in him by his known diſpoſition and habits, he laid the foundation of a ſuperſtructure of fortune and reputation, which has had few parallels in the hiſtory of commerce. Simple in his manners, he was accuſtomed to appear at the corn-market in Mark-lane with a white apron, as the emblem of his occupation; and liberal in his diſpoſition, he contrived to ſecure the attachment and active ſervices of thoſe with whom he was connected in his domeſtic arrangements, and in the conduct of his buſineſs. He well knew that by making thoſe whom he employed partakers of his bounty, he gave them a kind of intereſt in his proſperity; and therefore on ſettling the annual balance of his accounts, he diſtributed amongſt them donations, correſponding to their reſpective ranks and ſervices. Whilſt he gave 500*l.* to a confidential clerk, he extended his bounty even to the horſe-feeders, to each of whom he uſually gave 5*l.*

Advancing with ſure, but rapid progreſs, his brew-houſe in Chiſwell-ſtreet became a ſpacious quadrangle, conſiſting of an ample dwelling-houſe, work-houſes, ſtoves, cellars, and every other kind of convenience both for habitation and buſineſs; while the ſtock, the plant, the dray-horſes that would have mounted a regiment of cavalry, the caſks, &c. might in proceſs of time be eſtimated at nearly half a million of pounds ſterling. To this immenſe property, we might add a floating capital amounting to from 80 to 100,000*l.* ſerving to ſupply the demand of malt, hops, oats, &c. as well as the payment of clerks and ſervants. Thus by the direction and ſuperintendance of a ſingle individual, with the co-operation of a number of coadjutors in various ranks of ſubordination, the brew-houſe in Chiſwell-ſtreet became the firſt eſtabliſhment of the kind, not only in London, but in Europe, depending for its ſubſiſtence and ſingular proſperity on the approved quality of the article which it furniſhed. To the founder and principal proprietor, it became a mine of wealth, and an immenſe ſource of ſupply for purchaſes of land and houſes, donations and bequeſts, that have given diſtinguiſhed celebrity to the name of Whitbread. It is needleſs to recount the various eſtates which he purchaſed in his native county; we ſhall content ourſelves with mentioning merely the Torrington manors and eſtates, for which he paid the ſum of 120,000*l.*, beſides 5000*l.* as a preſent to alderman Skinner the auctioneer, when the negotiation reſpecting it was completed. Of his benefactions and bequeſts to various objects of public utility and of private charity, it will be ſufficient to ſay, that they indicated the liberality of his diſpoſition, and the amplitude of the means which he derived from his ſingular proſperity. Mr. Whitbread was twice married; by his firſt wife he had ſeveral children: but his ſecond wife, who was daughter of the firſt earl, and ſiſter of the firſt marquis Cornwallis, and to whom he was married Auguſt 12, 1769, died December 27, 1770. He was for ſome years one of the repreſentatives of the town of Bedford, and afterwards returned for the borough of Steyning. For the abolition of the ſlave-trade, he was a ſteady and ardent advocate; and as ſuch he generouſly undertook from his private purſe to make good all injuries that might be ſuffered by thoſe who attended to give their teſtimony for this purpoſe. With this expreſſion of benevolence he cloſed a life, during the progreſs of which he had amaſſed landed and chattel property to an immenſe amount, without any of thoſe penurious habits, which have been in many inſtances the means of accumulating large fortunes, and of enabling thoſe to die rich who have lived meanly and miſerably. His death happened June 11th, 1796.

In 1799 his ſon, the ſubject of the next article, erected a ſplendid monument to his father's memory, in the church of Cardington; which monument was the laſt, and has been thought by ſome perſons to be the beſt work of the late J. Bacon, R.A. The principal figure repreſents a dying man, ſupported by religion, in the form of a female, who points to the glory of heaven as a reward for his good actions; while the figure of benevolence, in a reclining poſture, is weeping at his feet.

WHITBREAD, SAMUEL, a diſtinguiſhed ſenator, was the ſon of the preceding by his firſt wife, and born in the year 1758. Deſtined to the inheritance of a large fortune, and poſſeſſing talents which by due cultivation would qualify him for a conſpicuous ſtation in public life, his father ſpared no expence in his education. At a proper age he was ſent to Eton, where he alſo enjoyed the benefit of private tuition, and where he commenced an intimate acquaintance with Mr. W. H. Lambton, afterwards M.P. for the city of Durham, and Mr. now earl Grey, with whoſe family he became connected by a double alliance. From Eton he removed to Chriſtchurch college, Oxford, and from thence to St. John's college, Cambridge, where he finiſhed his education, and was graduated B. A. Mr. Whitbread ſenior, ſagacious in diſcerning the early dawnings of his ſon's future celebrity, liberally offered him all the advantages which might be derived from foreign travel, and felected for his tutor and companion the prefent archdeacon Coxe, well known by a variety of valuable publications. Having travelled together through France, Germany, and Switzerland, they afterwards feparated with profeffions of mutual regard. Mr. Whitbread, foon after his return, formed, in 1788, a matrimonial connection with Mifs Grey, the fifter of his Eton affociate, who afterwards, by the advancement of her father, general fir Charles Grey, to an earldom, became lady Elizabeth Whitbread: his fifter alfo, in procefs of time, married the prefent fir George Grey, bart. then a captain in the navy. Having acquired every neceffary qualification for occupying a feat in the great council of the nation, and interefted by an ample fortune either in poffeffion or in profpect, as well as by genuine fentiments of patriotifm, in its deliberations and refolutions, Mr. Whitbread offered himfelf, on the diffolution of parliament in 1790, as a candidate for Bedford, a borough which had been reprefented by his father, who at the fame time offered himfelf for the borough of Steyning. Both elections were contefted; but both father and fon finally obtained their refpective feats. Mr. Whitbread, junior, commenced his political career in parliament with an animated fpeech againft the unconftitutional doctrine of "confidence," affumed on the part of minifters, who claimed an entire reliance on their wifdom and integrity. The occafion of this claim was a propofed war againft Ruffia, for which the minifter (Mr. Pitt) urged the houfe of commons to vote money, without previous and fatisfactory information of the neceffity, and much lefs of the juftice or policy of this war, the object of which was the reftoration of Oczakow to the Turks. The meafure was unpopular; and though the minifter obtained a majority, when the queftion was debated, he thought it moft prudent to give up his object, and a pacification enfued, which prevented much calamity to the nation. About this time the abolition of the flave-trade occupied the public attention, and this was a meafure to which the member for Bedford had always avowed himfelf a fteady and zealous friend. In parliament he fupported it not only by his vote, but by a difplay of eloquence which commanded univerfal applaufe. As an active magiftrate, he directed his particular attention to the occurrences that took place in confequence of the fcarcity in the year 1795; and in devifing means of relief, he propofed that as the magiftrates were empowered to fix a *maximum* of wages, fo far as refpects the hufbandman, a *minimum* fhould be alfo preferved by law, in order thus to eftablifh a more accurate proportion between the price of labour and that of the means of fubfiftence. With this view he introduced into the houfe a bill, which was approved by Mr. Fox and many other members; but as it was oppofed by Mr. Pitt, his efforts were unavailing. The minifter was no lefs unfuccefsful in his plan for amending the poor laws, and meliorating the condition of the peafantry and working clafs. His plan indeed was much more extenfive and complicated than that of Mr. Whitbread, which was fimply calculated to enable the labourer to maintain himfelf by his wages, without the degrading as well as difpiriting neceffity of feeking parochial relief.

The fubject of this article was an undifguifed and uniform oppofer of the French war in 1793, becaufe he thought it to be unneceffary and unjuft; and yet he was a zealous advocate for meafures of felf-defence againft the fecret machinations and open attacks of a powerful and vindictive enemy. Accordingly he condemned the negligence of minifters, on occafion of the French attempt at invafion in 1797, by means of a fquadron which appeared off Bantry bay, and moved the houfe for a committee of inquiry into their conduct. His motion was evaded by the previous queftion. In every ftage of the conteft with France, and under every varying form of its government, he was anxious for peace, and an advocate for treating with its rulers in order to terminate hoftilities, and to put a ftop to the wafte of national treafure and the effufion of human blood. His opinion on the conduct of minifters in the profecution of this war, and their reluctance to enter into treaty for terminating it, was explicitly avowed in an eloquent fpeech, which he delivered on occafion of a motion by Mr. Dundas (then fecretary of ftate) for an addrefs to the throne in 1800, for the purpofe of approving the conduct of his majefty's government. Anxious, however, as he was for peace, becaufe he difapproved the war from its commencement, and becaufe he thought it effential to the true intereft of the country, he was no lefs folicitous to maintain the honour of the nation in obtaining it. No man in this refpect was a more nobleminded patriot than himfelf; and if he confented to make any facrifice, it was becaufe he thought it abfolutely neceffary to the permanent profperity of his native country. Whilft he claimed and exercifed the privilege of pronouncing his own opinion of public men and political meafures, he was a zealous advocate for the liberty of others, and interpofed with his moft vigorous exertions for the refcue of thofe who fuffered imprifonment at home or exile to Botany bay, for too freely and imprudently divulging their opinions. During the fhort interval of the adminiftration of Mr. Addington, (the prefent lord Sidmouth,) who fucceeded Mr. Pitt in the year 1801, and made peace with Buonaparte, feveral popular meafures were adopted, in which Mr. Whitbread cordially concurred; and in the year 1805 he diftinguifhed himfelf as the public accufer of Mr. Dundas (created lord Melville) for malverfations that had occurred, whilft he had occupied the poft of treafurer of the navy. His charges againft this nobleman were founded on a report of the commiffioners of public accounts, from which it appeared that, during the exercife of his office, this noble lord had violated the law, by conniving at mal-practices and participating in unwarrantable emoluments; and that he was refponfible for deficiencies amounting to 697,500*l*. Thefe charges alfo implicated Meff. Trotter, Wilfon, and Sprott; and the former in particular, who was paymafter of the navy department under lord Melville, and had taken out large fums of money on his own private account. In the inveftigation of this bufinefs, it was difcovered, that the fums officially depofited in the Bank had been withdrawn, lodged with private bankers, and applied to other purpofes befides thofe that were properly naval. Mr. Whitbread founded on feveral facts which he ftated, a variety of refolutions which impeached the fidelity and honour of his lordfhip. To his motion relative to this bufinefs, Mr. Pitt moved an amendment, which was negatived by a majority of one (217 to 216), in confequence of the vote of the fpeaker. In confequence of thefe proceedings, the vifcount refigned his office at the Admiralty-Board, and his name was expunged from the lift of privy-counfellors. Upon the fudden demife of the premier, and a coalition between lord Grenville and Mr. Fox, the two latter came into office; and Mr. Erfkine, being raifed to the peerage, and appointed lord high chancellor, was deftined to prefide at lord Melville's trial. This nobleman having made his defence within the bar of the houfe of commons was replied to by the member for Bedford; and an impeachment being agreed upon, proceedings commenced in Weftminfter-hall, April 29th, 1806. The refult, after a fhort trial, was the acquittal of his lordfhip by a majority, from all the charges alleged againft him. Notwithftanding the unexpected termination of this trial, neither the friends nor the enemies of the ſuppoſed delinquent attached any blame to the public accuſer; but he was allowed to have conducted the buſineſs aſſigned to him with a dignity and propriety ſuitable to its delicacy and importance. In the caſe of lord Melville, as well as in that of Mr. Pitt, he knew how to diſtinguiſh between the man and the miniſter; and to pay a juſt tribute to the talents and diſpoſitions of the former, whilſt he criminated and condemned the latter. Having differed with Mr. Pitt with regard to his political meaſures almoſt through the whole of his public life, he took the opportunity which the trial of lord Melville afforded him of paying a juſt tribute of reſpect to his abilities and virtues, when his premature death muſt have vindicated the eulogiſt from the ſlighteſt ſuſpicion of inſincerity and adulation.

Of the new adminiſtration, he was a ſteady ſupporter; but though he had at an early period enliſted himſelf under the banners of Mr. Fox, and the earl Grey, his ſchool-aſſociate and brother-in-law, who was one of its diſtinguiſhed members: he was their friend as miniſters, not from perſonal and ſelfiſh motives, but from a conviction of his judgment that their principles and views were moſt favourable to the liberty and welfare of the Britiſh empire. Indeed he was regarded by many as an impracticable man, becauſe in all great queſtions he was influenced by principle more than by any private and party attachment. What were his ſentiments of the coalition miniſtry, and what were the grounds of the ſupport which he afforded them, he had an opportunity of ſtating in the moſt explicit manner. At this time ſir Francis Burdett offered himſelf a candidate for the county of Middleſex, and tranſmitted a circular letter to Mr. W., who had voted for him twice before, ſoliciting his ſupport. This letter contained reflections on the coalition miniſtry, which led the ſubject of this article to decline giving his vote for ſir Francis, and alſo to expreſs his ſentiments of the coaleſcing parties, which had been ſeverely cenſured. "I have ſupported the preſent adminiſtration," ſays Mr. W., "from a conviction that they were united upon principles of real public utility, and for the purpoſe of carrying into execution plans of great national improvement, both in our foreign and domeſtic circumſtances; and I cannot abandon them, becauſe in a ſituation more difficult than that in which any of their predeceſſors have ever ſtood, they have not been able to effect what I believe to have been neareſt the hearts of them all—I mean a peace with France; ſeeing ſuch a peace could not have been obtained on terms conſiſtent with national honour, and becauſe time has not ſufficed to mature and execute the ſchemes of internal improvement, which they have manifeſted their determination to purſue," &c. Having ſtated ſome other opinions with regard to the union of parties, in which he ſeems to have diſagreed with ſir Francis, he concludes: "Theſe radical differences render it impoſſible for me to aſſiſt you in becoming a member of parliament. Different opinions may be maintained conſiſtently with mutual and entire perſonal reſpect; ſuch as I unfeignedly profeſs towards you. The determination you have taken to avoid the expence of conveyance and decorations ſo conſpicuous at your former elections, does you honour; and I wiſh ſuch an example could be followed by all other candidates," &c. The publication of this correſpondence threatened a very undeſirable termination; but it was happily prevented by the interpoſition of friends.

During this period, Mr. Whitbread took an active part in public affairs, and diſtinguiſhed himſelf on a variety of occaſions, guarding on the one hand with vigilant jealouſy againſt an undue exertion of the royal prerogative, and on the other againſt its infringement by the democratical part of the conſtitution. In February 1807, he renewed his attention to the exiſting ſyſtem of poor laws, as it was his wiſh and inceſſant endeavour to improve it, and in ſo doing to render the peaſantry happier, better, and leſs dependent. It was alſo an object, which he conceived to be of eſſential importance, to controul the ſeveral branches of public expenditure, and thus to relieve the diſtreſſes of the country. Much depended, he well knew, on peace with France, and to this deſideratum his views and efforts were conſtantly directed. But he was almoſt ready to deſpair of this deſirable event, "from the awful moment that death cloſed the ſcene upon the enlightened ſtateſman (Mr. Fox) who had firſt commenced the negociation." When the Grenville adminiſtration was obliged to retire, and a new parliament was convoked by their ſucceſſors, he publiſhed a ſpirited addreſs to his conſtituents, in which he ſtated the meaſures which had been projected and wholly completed or commenced during the exiſtence of the late miniſtry, and the part which he had taken in the deliberations of the preceding parliament, cloſing with theſe memorable words: "I court your inquiry, and if you are ſatisfied in the reſult of it, I hope for your votes in the preſent election. If you do me the honour again to return me, I ſhall indeed be proud of it, and I will again endeavour to do my duty." The next important object of his attention was the education of the poor, as intimately connected with their morals and religion; but unable to obtain a legiſlative ſanction to his plan, he was under a neceſſity of recurring to individual exertions and private ſubſcription. During the important debates that occurred in 1809, with regard to the orders in council, he concurred with thoſe who condemned this meaſure, and contributed firſt to their ſuſpenſion, and at length to their utter diſcontinuance. With regard to the ſituation of Spain, he was one of thoſe who cenſured the conduct of the French government, and who wiſhed the natives to be ſtimulated to new exertions in behalf of the independence of their native country. "In 1809," ſays one of his biographers, "he took an active part in the inquiry and examination into the conduct of the royal duke who preſided over the army, and although he found much to blame on that occaſion, yet, at a future ſeaſon, he ſeized the firſt opportunity to afford his teſtimony in behalf of his royal highneſs, whoſe adminiſtration as commander-in-chief had contributed not a little to the happy and glorious termination of the late conteſt. That event did not prevent him, however, after the overthrow of Buonaparte's government, from blaming the conduct of the Congreſs, and expoſing the ambitious views of ſome of the ſovereigns, particularly in reſpect to Saxony. On the return of the emperor from his exile in the iſland of Elba, the member for Bedford ſtrongly and emphatically cenſured the declaration of the allies, more eſpecially that part of it which ſeemed to recommend the deteſtable principle of aſſaſſination. He alſo loudly inſiſted both on the impolicy and injuſtice of a new war, on the ground that the executive power of the enemy was veſted in the hands of any one particular perſon. But above all things he proteſted againſt the forcible reſtoration of the Bourbons by a foreign force, and the aſſumed right of dictating a government to France. Yet he moſt cordially joined in a vote of national gratitude to the duke of Wellington, for the memorable victory at Waterloo, although he at the ſame time boldly avowed that events had not altered his ſentiments in reſpect to the pretended juſtice of the original conteſt."

In the variety of his perſonal and domeſtic concerns, in his attendance on parliamentary duties, and in his efforts for eſtabliſhing and promoting inſtitutions of public utility, and more eſpecially ſuch as pertained to the inſtruction

inſtruction of the poor, Mr. Whitbread was aſſiduous and indefatigable; and whilſt he was overwhelmed by a multiplicity of occupations, he voluntarily undertook a more Herculean labour than any other, which was the arrangement of the perplexed concerns of Drury-lane theatre. With every moment of his time thus occupied, and his mental powers unremittingly exerted, it is no wonder that his health ſhould decline, and that his mind itſelf, though naturally vigorous and ardent, ſhould be impaired by exceſs and intenſeneſs of application. The conſequence that might have been apprehended unhappily occurred, and the world was prematurely deprived of the benefit of his valuable ſervices. "His countenance changed; he became drowſy, lethargic, and irritable; and he even ſuppoſed himſelf to have fallen into contempt." Theſe indications of corporeal and mental decay were alas! too ſoon ſucceeded by that fatal cataſtrophe, which occurred on Thurſday, July 6, 1815. "An inqueſt having been ſummoned by Mr. Gell, the coroner, met at eight o'clock the ſame evening, at the houſe of the deceaſed, No. 35, Dover-ſtreet, Piccadilly, and having entered his ſtudy, beheld Mr. Whitbread lying on his back, his arms and legs extended, with a deep inciſion on his throat from ear to ear, a ſmall part in the front of the throat excepted. A looking-glaſs was oppoſite to him; his apparel and the floor were covered with blood; and the fatal razor was found at ſome diſtance!"

The verdict of the jury was as follows:—"That the deceaſed Samuel Whitbread, eſq. died by his own hand; but that he was in a deranged ſtate of mind at the time the fatal act was committed." His principles and character have been juſtly delineated by one of his biographers, and we ſhall ſelect ſuch particulars as are conſiſtent with our contracted limits. "In politics he was a whig; yet a whig of the old ſchool; one who wiſhed to balance the royal power, by means of a due influence of the popular branch: but at the ſame time firmly and ſtedfaſtly to uphold both. Accordingly, he was always a ſtrenuous, conſtant, and uniform advocate for a reform of the houſe of commons: but this great meaſure was grounded on the ancient and acknowledged baſes; not on the viſionary plans of annual parliaments and univerſal ſuffrage! As a patriot, he wiſhed for the happineſs and proſperity of his country; but theſe, he deemed moſt likely to be acquired, and moſt permanently enjoyed by cultivating the arts of peace; advancing the commerce; cheriſhing the manufactures; and encouraging the agriculture of his native land. Wars might indeed be popular, ſucceſsful, glorious; but it was alſo incumbent and imperative that they ſhould be both juſt and neceſſary. It was his firm opinion, that economy was to the full as proper for a ſtate as for a private family: he was always, therefore, a decided friend of order, regularity, and good management. He hated jobs; he viewed placemen, courtiers, and contractors, with a jealous eye; and he diſliked both unneceſſary and exceſſive penſions, not only on account of the ſums thus perverted from the public revenue; but alſo from their obvious tendency to produce meanneſs, ſycophancy, and dependance.

"Mr. Whitbread was a ſtrenuous advocate for national education, or inſtruction on a great ſcale. But finding himſelf unable to obtain a national ſanction to this meaſure, he contented himſelf with his aſſiſtance and ſupport as a private individual.

"He was an encourager of the fine arts; and always deſirous that they ſhould enjoy protection and applauſe."—"To agriculture, as a ſcience calculated to advance the beſt intereſts of the nation, he paid particular attention."—"Horticulture alſo engaged his notice, and the gardens, and lawns, and groves of Southwell, might have all been exhibited as ſo many perfect ſpecimens of care, neatneſs, and propriety.

"Although always doubtful of the juſtice of the late war, he never heſitated for a ſingle moment as to the propriety of arming and defending his native country againſt the menaces and attacks of her enemies. He himſelf raiſed and commanded a body of ſturdy yeomanry; and while he thus excited a martial ardour in his neighbourhood, he forgot not to enforce his favourite plan of fitting men, by means of education, for their reſpective ſituations in life. On this occaſion, he inſtituted a ſchool for the benefit of the noncommiſſioned officers; and contributed by all the means in his power to render it effectual.

"An only ſon, born and matured with the expectations of great opulence; it is but little ſurpriſing if he occaſionally diſplayed a certain degree of haughtineſs in his demeanour. Indeed it cannot be denied, that at times he appeared ſomewhat harſh and overbearing; but on the other hand, he muſt be allowed to have been admirably fitted for command; and was ſeldom known to exceed the bounds of moderation, but when he combated the injuſtice of power, aſſailed the inſolence of office, or endeavoured to expoſe ſucceſsful guilt to ſhame and to puniſhment.

"His heart conſtantly glowed with all the ſocial affections. He was zealous in his friendſhips; while his enmities were tranſient and ſhort-lived. His ear was ever ready to liſten to the tale of the oppreſſed: his purſe always open to ſuccour thoſe who had been reduced to diſtreſs by unexpected calamities. At length, after having lived and acted during the ſtormy politics of the French revolutionary conteſt, he was ſuddenly cut off, at a period when his ſervices might have proved highly advantageous to his country; when the deceitful calm of peace ſeemed pregnant with greater and more formidable dangers than thoſe ariſing out of a long, wide-ſpreading, expenſive, and deſtructive warfare!

"On the 11th July, 1815, when the marquis of Taviſtock, on moving for a new writ for the borough of Bedford, deſcanted on the character, worth, and talents of the late member, his encomium was liſtened to amidſt the loud cheerings of both ſides of the houſe of commons:

"'Accuſtomed to defend his opinions with warmth and earneſtneſs,' ſaid he, 'the energies of his ample and comprehenſive mind, would never permit the leaſt approach to tameneſs or indifference. But no particle of animoſity ever found a place in his breaſt, and he never carried his political enmities beyond the threſhold of this houſe. It was his uniform practice to do juſtice to the motives of his political opponents; and I am happy to feel, that the ſame juſtice is done to his motives by them. To thoſe who were more immediately acquainted with his exalted character; who knew the directneſs of his mind, his zeal for truth, his unſhaken love of his country, the ardour and boldneſs of a diſpoſition incapable of diſmay, his unaffected humanity, and his other various and excellent qualities, his loſs is irreparable. But moſt of all, will it be felt by the indigent in his neighbourhood. Truly might he be called the poor man's friend. Only thoſe who, like myſelf, have had the opportunity of obſerving his conduct nearly can be aware of his unabated zeal, in promoting the happineſs of all around him. His eloquent appeals to the houſe in favour of the unfortunate, will adorn the pages of the future hiſtorian; while at the preſent moment, they afford a ſubject of melancholy retroſpect to thoſe who have formerly dwelt with delight on the benevolence of a heart that always beat, and on the vigour of an intellect which was always employed for the benefit of his fellow-creatures!'"

He left behind him by lady Elizabeth, his mourning widow, two fons and two daughters.

The following memorandum of Mr. Whitbread's fudden death was written immediately after the lamentable event was afcertained, in the title-page of a very ancient edition of Cicero's "Paradoxa," by a friend who highly refpected the ftern virtues both of his public and his private character:—

SAMUEL WHITBREAD, armiger;

Vir illuftris ifte, quem omnes liberales brevi in tempore appellabunt

ANGLICUM CATONEM,

E terra fuit ereptus die fexto Julii, anno Chrifti 1815.

Ann. Biog. and Obit. for 1817.

WHITBURN, in *Geography*, a townfhip of England, in the county of Durham; 4 miles N. of Sunderland.

WHITBY, DANIEL, a learned divine of the church of England, was born at Rufhden, in Northamptonfhire, in 1638, and admitted to Trinity college, Oxford, in 1653, where he took the degree of M.A. in 1660, and became fellow of his college in 1664, in which year he firft appeared as a writer againft popery. In 1668 he was appointed chaplain to Dr. Seth Ward, bifhop of Salifbury, and collated to a prebend in his church. In 1672 he took the degree of D.D., and about this time was made rector of St. Edmund's parifh in Salifbury. From this time he became a confiderable writer in the popifh controverfy, publifhing "A Difcourfe concerning the Idolatry of the Church of Rome," 1674; "The Abfurdity and Idolatry of Hoft-Worfhip proved," 1679; "The Fallibility of the Roman Church demonftrated," 1687; and "A Treatife of Traditions," in two parts, 1689. He alfo expreffed, in common with feveral other liberal perfons at this period, his wifhes for an union of all Proteftants, in a piece publifhed in 1683, and intitled "The Proteftant Reconciler; humbly pleading for Condefcenfion to Diffenting Brethren in Things indifferent and unneceffary, for the Sake of Peace, &c." This publication was too liberal for the times, and called forth a hoft of adverfaries. But the moft formidable attack was that of the famous Oxford decree, which paffed a cenfure on the following propofitions contained in it; *viz.* "It is not lawful for fuperiors to impofe any thing in the worfhip of God that is not antecedently neceffary:"—"The duty of not offending a weak brother is inconfiftent with all human authority of making laws concerning indifferent things;" which propofitions were denominated in the decree falfe, impious and feditious doctrines; and the book was burnt in the quadrangle of the univerfity fchools. But it was ftill more humiliating to the author to be required by his patron, the bifhop, to declare his forrow for having written the work, and to renounce by name the two preceding propofitions. This conduct was very unworthy of a Chriftian bifhop, and fixes a permanent ftigma on the memory of Ward. It reminds us of the Inquifition and Galileo. (See GALILEO.) Dr. Whitby, actuated probably by a defire to conciliate his adverfaries, or urged to adopt this meafure, publifhed in the fame year a fecond part of the book, in which he ftrongly preffes the diffenting laity to join in full communion with the eftablifhed church, and replies to all the objections of the Non-conformifts againft the lawfulnefs of their complying with its rites and ceremonies.

No man could more fincerely rejoice in the Revolution than Whitby, nor more cordially welcome the emancipation of Britifh fubjects from all kinds of tyranny. Accordingly he publifhed two tracts in favour of the oath of allegiance required on the acceffion of king William; and in one of thefe tracts he maintains the principle in the Englifh government of an original contract between the prince and the people.

His capital work, however, was the refult of fifteen years' ftudy, and is intitled "A Paraphrafe and Commentary on the New Teftament," 2 vols. fol. printed in 1703, feveral times reprinted, and held in high eftimation by biblical ftudents. To the edition of 1710 he annexed a Latin appendix, containing an examination of Dr. Mill's various readings, under an apprehenfion that they might prove injurious to the authority of Scripture. This great work of Dr. Whitby was followed by feveral tracts on theological fubjects, in which he feems to value himfelf on that freedom of difcuffion which, with new times, he was allowed to indulge, more efpecially as he occafionally ftrays beyond the fixed boundaries of what has been called orthodoxy. Among thefe tracts were, "The Neceffity and Ufefulnefs of the Chriftian Revelation;" "A Difcourfe concerning the true Import of the Words Election and Reprobation;" "The Extent of Chrift's Redemption;" "The Grace of God;" "The Liberty of the Will;" "The Perfeverance or Defectibility of the Saints;" "Four Difcourfes on Election and Reprobation;" "A Treatife on Original Sin," in Latin, in which he denies that the imputation of Adam's fin to his pofterity has any fair ground in Scripture. Upon the publication of Dr. Clarke's "Scripture Doctrine of the Trinity," Dr. Whitby adopted his opinion, and wrote a Latin treatife, intended to prove that the controverfies refpecting the Trinity could not with certainty be determined from fathers, councils, or Catholic tradition. In connection with this fubject of controverfy, he publifhed "A Diffuafive from Inquiry into the Doctrine of the Trinity; or, the Difficulties and Difcouragements which attend the Study of that Doctrine." In the Bangorian controverfy, he was one of the auxiliaries of Dr. Hoadly, and printed feveral tracts. He alfo publifhed feveral fermons. But his laft work, which did not appear till after his death, was "The laft Thoughts of Dr. Whitby, containing his Corrections of feveral Paffages in his Commentary on the New Teftament; to which are added Five Difcourfes; publifhed by his exprefs Order." In the preface to this work, written at the clofe of a long life of learned and laborious inquiry, the author fays, "when he wrote his Commentaries, he went on too haftily in the common beaten road of other reputed *orthodox* divines; conceiving firft, that the Father, Son, and Holy Ghoft, in one complex notion, were one and the fame God, by virtue of the fame *individual* effence communicated from the Father; which confufed notion (he adds) he is now fully convinced to be a thing impoffible, and full of grofs abfurdities." A fhort illnefs clofed the life of this eminent biblical fcholar, on March 24, 1725–6, at the age of 88. He is reprefented by a biographer as a man of great fimplicity of character, fingularly ignorant of worldly affairs, entirely devoted to his ftudies, but affable, pious, and charitable. He preferved a tenacious memory to the laft, but through a defect of fight was obliged to employ an amanuenfis. Biog. Brit.

WHITBY, in *Geography*, is a confiderable fea-port town of the North-Riding of Yorkfhire, England, fituated between Flamborough-head and the entrance of the river Tees. Confidering the ruins of the ancient abbey as the principal object of the town, the latitude of Whitby is 54° 29′ 24″ N., and the longitude 0° 35′ 59″ W. from the meridian of Greenwich. It is 47 miles N.E. of York, and

246 miles from London. The town is placed at the mouth of the ſmall river Eſk, which divides it into two unequal parts. The direction of the river, running nearly due north towards the ſea, determines that of the town, which extends along its banks. Theſe banks riſe almoſt ſuddenly from the river on both ſides; particularly on the eaſt, ſo as to leave but a very narrow ſtretch of level ground at the bottom, of which, indeed, a great part has, at different times, been gained from the bed of the river. This narrow ſpace is literally covered with houſes; but the town aſcends the ſteep banks on both ſides, and thus preſents a romantic appearance, eſpecially when viewed from the ſea; the whole ſurmounted by the old weather-beaten church, on the verge of the eaſtern cliff, and the venerable remains of the abbey behind. The eaſtern half of the town extends about three-quarters of a mile; but the breadth where greateſt does not exceed 150 yards. The weſtern diviſion is the largeſt, the moſt compact, and the moſt elegant. Although now of importance, Whitby was but inconſiderable in trade and population, until towards the beginning of the laſt century. Its origin may, however, be carried back to the foundation of the celebrated monaſtery in the ſeventh century. That the Romans, or the original Britons, had any eſtabliſhment at Whitby, we have no grounds to affirm; although the opening of the river into the ſea muſt have afforded a convenient ſtation for fiſhing and navigation; of which, had the Romans been a commercial people, they would doubtleſs have availed themſelves, eſpecially on a tract of coaſt ſo little furniſhed with harbours adapted to their ſhipping. On this part of the coaſt may, perhaps, be placed the bay mentioned by Ptolemy, under the romanized name *Dunum Sinus*, of which the moſt commodious inlet was the mouth of the river, now, by a peculiar appropriation of a generic Britiſh name for water, called the Eſk. After the eſtabliſhment of the monaſtery of St. Hilda in the ſeventh century, the vicinity began to be inhabited. Under her ſucceſſor Ælfleda, daughter of Oſwy, the port had ſome ſhare of ſhipping; for, in 684, the abbeſs took a voyage, with ſome monks of the abbey, to the iſle of Coquet, on the coaſt of modern Northumberland, to have an interview with St. Cuthbert. Suffering and again reſtored with the abbey, after the devaſtation by the Danes in 867, Whitby obtained its preſent name, ſignifying the White town. It was alſo from the monaſtery occaſionally called Preſteby, or Prieſttown. Although unnoticed in Domeſday-book, Whitby, prior to 1189, had become of ſuch importance, that the abbot erected it into a borough, with the cuſtomary privileges. Thoſe privileges were ſoon after confirmed by a royal charter; and had no unfair means been employed to ſet them aſide, Whitby might now have been a royal borough. But the liberties of Whitby were of ſhort duration: the monks repented of their liberality to the town, and Peter, the ſucceeding abbot, in 1200, procured from king John a repeal of the charter of his predeceſſor. About the year 1538, Whitby is deſcribed by Leland as a "great fiſchar toune;" and nothing more is added by Camden, who mentions the place fifty years later. For many years after the diſſolution of the abbey, the veſſels of the port were few and ſmall; and the trade was inconſiderable until the eſtabliſhment of the alum-works at Guiſborough, at the cloſe of Elizabeth's reign. A ſpirit of emulation being excited by the ſucceſs of thoſe works, a ſimilar eſtabliſhment was formed in 1615 at Sand's-end, within three miles of the town. The vicinity of Whitby abounding with the alum-mineral, other undertakings of the ſame kind were begun. Hence two important branches of induſtry were formed in the town; the one to ſupply the alum-works with coal, the other to export the alum to diſtant parts. From theſe beginnings, the trade of Whitby increaſed; the ſchemes of the inhabitants were enlarged; the number of ſhipping was augmented; and new ſhips were conſtructed, for which timber was drawn from the oak-woods of the vicinity. In this manner, the trade and navigation of the town grew up to ſuch a height, that, in the beginning of the preſent century, Whitby was the ſeventh in rank for tonnage among the ports of England. In 1816, the number of veſſels belonging to the town was 280, carrying 46,341 tons, and navigated by 2674 ſeamen. Beſides the carrying of coal, with the alum trade, and a ſhare of foreign commerce, the number of veſſels fitted out from Whitby for the Greenland whale-fiſhery, begun in 1753, was, in 1800, next to that of thoſe ſailing from London. As early as the middle of the 16th century, ſmall wooden piers were conſtructed at the mouth of the Eſk, for the protection of the fiſhing-craft: but in 1632 ſtone piers were begun, through the exertions of ſir Hugh Cholmley, who, by the favour of the earl of Strafford, his relation, obtained a general contribution over England in aid of the work, when nearly 500*l.* were collected. The navigation of Whitby becoming of importance, acts of parliament were obtained, in 1702 and 1723, for conſtructing a pier, which now extends above two hundred yards from the cliff on the eaſt ſide of the harbour, weſtward to the channel of the Eſk. By this work, ſecurity was obtained for the town as well as the ſhipping, both of which were greatly expoſed to north-eaſterly winds. Another pier, on the weſt ſide, was afterwards added, running out about an equal diſtance towards the ſea. By ſubſequent additions and improvements, the harbour has been eſſentially benefited. The weſt pier, now carried out to the length of three hundred and forty yards, is conſtructed with large blocks of ſquared ſtone, and terminates in a circular head, with embraſures for a battery. Within the piers, veſſels to the number of five hundred may lie, but all on the ground at low water. The harbour is divided into the outer and the inner by a drawbridge, ſo conſtructed as to allow ſhips of two hundred tons to paſs through. In the latter, which is capacious and ſecure, on both ſides of the river are conſtructed ſeveral dry docks, and other accommodations for ſhip-building. The veſſels built for the coal-trade are particularly valued for their ſtrength and durability. One built in 1724 was loſt on the Lincolnſhire coaſt in 1810, but did not go to pieces: another, wrecked a few years ago, was above one hundred years old. In neap-tides the water riſes from ten to twelve feet at the entrance of the harbour; but in ordinary ſpring-tides the depth extends from fifteen to eighteen feet. In the equinoctial gales, the depth of water is ſometimes increaſed to twenty-three or twenty-four feet. The trade of the port of Whitby is but ſmall in proportion to its ſhipping, as many of the largeſt veſſels are employed in time of war as tranſports, and at other times by the merchants of London, and of other ports. The trade of the town is, however, conſiderable for its ſituation, in a country abounding with moors, where few manufactures are carried on. The alum-works in the environs are of great antiquity, and may not improbably be carried back to the Roman times. But the firſt work eſtabliſhed in Britain, in later times, was begun by ſir Thomas Chaloner in 1595, on his eſtate at Belman-rock, near Guiſborough, twenty miles to the weſtward of Whitby. Since that period, alum-mineral has been extracted in various other places, particularly at Sand's-end, three miles weſt from Whitby, where the work is ſtill in a proſperous ſtate. Until the year 1789, the alkaline lees employed

Printed by A. Strahan,
New-Street-Square, London.

employed in the manufacture were prepared from kelp, or sea-weed, burnt on the shore: but since that period kelp has been gradually superseded by black-ashes, made from the refuse of soap-boilers' lees. The average annual quantity of alum manufactured in the Whitby district, for the last twelve years, was 2840 tons; but in 1816 the quantity was 3155 tons. Little alum is now exported, nearly the whole being sent to London. The number of persons, including artificers and boys, belonging to the works, is about 600. (See ALUM.) Thin seams of coal have, for upwards of seventy years, been wrought in the environs of Whitby, but of a very inferior quality, and used only in the interior parts of the country.

Whitby contains no public building of note. The town-hall, erected by the late Mr. Cholmley, is a heavy pile of the Tuscan order. The poor-house, extensive, and judiciously managed, affords a comfortable refuge for the distressed, and tends to diminish the heavy burthen of the parish-rates. A dispensary, liberally supported, for distributing advice and medicines to the poor, was established in 1780. The parish-church stands near the top of a hill, on the east side of the town, a little to the northward of the ruins of the abbey, accessible from the bottom by an inconvenient ascent of 190 stone steps. The architecture of the edifice was originally what is absurdly styled Gothic; but it has gone through so many alterations, that little of its ancient appearance now remains. The church-yard is excessively crowded with grave-stones; but the sea-air of Whitby is so destructive of stones, that inscriptions are soon effaced. For the use of the numerous inhabitants, a spacious chapel of ease has been erected in the lower part of the town; and for the country part of the parish, which is of great extent, three others have been built. That at Sleights, four miles from the town, is a handsome edifice. Roman Catholics, Quakers, and various other classes of dissenters, have their respective places of worship in the town. According to the parliamentary returns of 1811, the houses of this town were 1393, and the inhabitants 6969: but in the spring of 1816, the population was found, by a careful inquiry, to have increased to 10,203. The inhabitants of the country part of the parish were then estimated at 1477 persons.

The town of Whitby is close, irregular, and unpleasant; but the environs are romantic and beautiful. These are embellished with the country-residences of the opulent inhabitants, mostly erected on commanding situations: the most interesting object of all, however, is the celebrated Abbey, of great antiquity, having been originally founded in the year 655. Before the sanguinary but decisive battle of Leeds, on the banks of the Oire, in which he utterly overthrew and slew his invading foe, Penda, king of the Mercians, Oswy, king of the Northumbrians, vowed, if successful, to erect and endow a monastery, and to consecrate to the service of religion in it his daughter Ælfleda, then scarcely a year old. In discharge of this engagement, he founded the monastery of Streoneshalh, of the Benedictine order; with this peculiarity, that it was to contain both monks and nuns, all under the government of St. Hilda, the first abbess. It is, nevertheless, probable, that the introduction of the monks, by which the institution became in all respects similar to that of the celebrated abbey of Fontevraud, in the west of France, did not take place till several years after its establishment. The monastery was began in 657, and dedicated to St. Peter; but such was the veneration entertained for St. Hilda, that it was always called by her name, and to her was the foundation usually ascribed. While Hilda was abbess, the synod of Whitby was held in 664, in which, notwithstanding her opposition, strengthened by that of Colman, the festival of Easter was directed to be celebrated at the time adopted by the sovereign pontiff, instead of that which had been in general observance in Britain. Dying in 680, Hilda's place as abbess was filled by Oswy's daughter, Ælfleda. Till the year 867, the abbey continued to prosper; but it was then overthrown by the sons of Lodbrog the Dane. In this state it remained until after the Norman Conquest: the lands in the neighbourhood were granted to Hugh, the first earl of Chester, from whom they passed to William de Percy, ancestor of the Percys of Northumberland. By him the monastery was restored from its ruins under a prior; but in the reign of Henry I. it was again raised to the rank of an abbey. Although pillaged by a Norwegian fleet in the time of abbot Richard, who died in 1175, its revenues at the dissolution, under Henry VIII., amounted to 505*l.* 9*s.* 1*d.* At this epoch, the scite and lands, partly by grant and partly by purchase, became the property of sir Richard Cholmley, a descendant of the family of Cholmondeley, in Cheshire.

Of Whitby-abbey, the ruins of the church alone remain; but by these, which are still considerable and conspicuously picturesque, it appears to have been a magnificent structure. The exterior length of the church, which is built in the usual form of a cross, is 310 feet; the breadth at the west end, including the buttresses, is 84 feet; the length of the cross 153 feet. The church probably occupies the scite of the Saxon building erected before the Conquest; but of it, nor even of the edifice constructed immediately after the revival of the monastery, no vestige now remains. The present structure is of different ages, and exhibits different styles of architecture. The eastern part, or choir, evidently the oldest, was probably built by Richard de Burgh, who was abbot from 1148 to 1175, and who rebuilt the chapter-house. The lower part of the tower, and most of the pillars, which are all clustered, were perhaps erected at the same time: but the north transept and the upper part of the tower are of a later date. The ornaments of the windows in those parts, the beautiful range of niches on the walls within, the tracery of the circular window in the north end, &c. seem to indicate the work of the close of the 13th or the beginning of the 14th century. The west front is the latest part of the whole, probably of the time of Edward III., or in the end of the 14th century.

The alum-rocks in the vicinity of Whitby are not less curious than valuable, from the variety of petrified substances they contain. Besides the usual petrifactions of shells and other marine bodies, parts of the human skeleton have been occasionally discovered. In the early part of the last century, Dr. Woodward, the celebrated naturalist, dug up on the scar, or cliff, on the east side of the harbour, the petrified arm and hand of a man, having all the bones and joints very visible. About 1743 was found, in the alum-rock, the complete skeleton of a man; but it was broken to pieces by taking from the bed. A similar discovery is said to have been made about nine years ago; but the skeleton was broken without any scientific person having examined it. In 1758, the bones of a crocodile, as they were imagined to be, were drawn from the rock, and transmitted to the Royal Society, by whom an account of them was published in the 50th volume of the Philosophical Transactions. About four years afterwards, the skeleton of a horse was found in the alum-works at Salt-wick, thirty yards under the surface. Ammonites, or cornua-ammonis, vulgarly called snake-stones, abound, with other testaceous petrifactions, in the aluminous schistus in the vicinity of Whitby;

Whitby; on which account, probably, the town has chofen three ammonites for its arms.

Robin-Hood's Bay, fix miles fouth-eaft from Whitby, is a noted fifhing-ftation, frequented for protection by many a veffel paffing along that extended tract of inhofpitable fhore. Among the country-feats in the vicinity of Whitby, which are not numerous, is Mulgrave caftle, the manfion of the earl of Mulgrave, fituated five miles weftward from the town, on a lofty eminence, commanding a moft extenfive profpect both by land and fea. Near to the fouthward ftand the remains of the ancient baronial caftle of Mulgrave. Manifeft evidences of Roman occupation are to be feen in various parts of the furrounding country. The Roman road from *Eboracum* (York), northwards by the vicinity of New Malton, (perhaps the *Derventio* of Antonine,) and apparently terminating at Durnfley, near the fea, three miles W. from Whitby, is in many places very perceptible. Along its courfe ftill remain traces of Roman encampments, of which the camps at Cawthorn, 19 miles S.W. from Whitby, fuppofed to be the *Delgovitia* of Antonine, are very perfect. Thefe works are noticed in general Roy's "Military Antiquities of the Romans in Britain;" but much more particularly in "The Hiftory of Whitby and Streonefhalh-abbey, with a Statiftical Survey of the Vicinity," by the Rev. George Young, in 2 vols. 8vo. Whitby, 1817.

WHITCHURCH, a populous market-town in the north part of the hundred of North Bradford, and county of Salop, England, at the northern extremity of the county, is fituated 20 miles N. by E. from Shrewfbury, and 160 miles N.W. by N. from London. The church, the chief object of notice, feated on the top of the hill over the town, is a fpacious modern ftructure, erected in 1722, with a fquare tower 108 feet in height. Two recumbent ftone figures are preferved from the ruins of the old church; of which one reprefents the celebrated John Talbot, the firft earl of Shrewfbury, and marfhal of the realm of France in the reign of Henry VI.: he was called the Englifh Achilles, and was greatly renowned in the wars of France. Shakfpeare, in his play of Henry VI., defcribes Talbot as a moft formidable and magnificent character: "the terror of the French:—the fcare-crow that affrights their children:—whofe grifly countenance made others fly:—none durft come near him for fear of fudden death." Another effigy reprefents Chriftopher Talbot, fourth fon of John Talbot, fecond earl of Shrewfbury, and who was rector of Whitchurch and archdeacon of Chefter. The rectory of this parifh is one of the richeft in the county. The caftle has long been in ruins. Whitchurch has a very refpectable free-fchool, in which many perfons of eminence have been educated. Here are alfo meeting-houfes for Proteftant diffenters, a charity-fchool for children of both fexes, and fix alms-houfes for aged women, endowed by Mr. Samuel Higginfon. A weekly market is held on Friday; and here are two annual fairs. The town is a place of much public refort during the horfe-races which are occafionally held here. Among the natives of Whitchurch, was diftinguifhed the celebrated linguift Abraham Whelock, who tranflated the New Teftament into Perfian, and affifted Dr. Brian Walton in the compilation of his polyglot Bible. Whelock publifhed alfo an edition of the writings of the venerable Bede. He died in 1654. The population return of the year 1811 ftates the town of Whitchurch to contain 552 houfes, and 2589 inhabitants: but the parifh comprehends, befides the town, thirteen townfhips. The whole population is returned as 5332; the number of houfes as 1107.

About nine miles to the northward of Whitchurch is Hawkftone-park, long the refidence of the ancient family of the Hills, and a place celebrated for its natural and artificial beauties and curiofities. The manfion, an elegant modern building fituated on the north fide of a romantic hill, is adorned with a lofty portico of the Compofite order. With the beauty of the exterior of the edifice, the interior fully correfponds: the chapel and the faloon are particularly elegant, and the latter is ornamented with valuable paintings. The grounds around the manfion are particularly interefting for their affemblage of naturally romantic fcenes, to which art has greatly contributed. The grotto, the view from the cliff, called Paoli's-point, the retreat, or hermitage, St. Francis's cave, the Swifs bridge, the terrace, the obelifk, and the widely-extended profpect it prefents over the furrounding country, the tower, the artificial river, the cottage, or whim, are among the many attractive features of Hawkftone-park, which owes much of its embellifhment to the tafte and munificence of the late fir Richard Hill, bart. The beautiful and romantic fcenery of this noble place is fully detailed in T. Rodenhurft's "Defcription of Hawkftone."—Beauties of England and Wales, vol. xiii. Shropfhire; by R. Rylance, 1811.

WHITCHURCH, a fmall but ancient borough and market-town in the upper half hundred of Evingar, Kingsclere divifion of Hampfhire, England, is fituated on the borders of Chute Foreft, at the diftance of 13 miles N. from Winchefter, 24 miles N. by E. from Southampton, and 57 miles W.S.W. from London. It poffeffes the rights of a borough by prefcription; and has fent two members to parliament fince the twenty-feventh year of queen Elizabeth. The borough is the joint property of lord Sidney and lord Middleton; the freeholds, which give the right of voting, being conveyed by them to their refpective friends for the purpofe of performing the ceremony of an election. The freeholders are nominally about feventy, but the real electors are faid to be appointed and influenced by the noblemen before-mentioned. The government of the town is vefted in a mayor, annually chofen at the court-leet of the dean and chapter of Winchefter, to whom the manor belongs. The town, though fmall, is remarkable for a variety of religious fects; there being, befides the church, places of worfhip for the Independents, Anabaptifts, Quakers, Methodifts, and Sandimanians. A market is held weekly on Friday, and three fairs annually. The population of the parifh, as afcertained by the return of the year 1811, was 1407; the number of houfes 281: the labouring claffes are chiefly employed in woollen manufactures, and in agriculture.

Adjoining to the weftern end of Whitchurch is one of the entrances to the earl of Portfmouth's diftinguifhed refidence, Hurftbourne-park. Of late years the park has been much enlarged. The grounds contain confiderable diverfity of furface and fcenery; and the converfion of a fmall ftream into a broad piece of water, has tended very much to improve the place. In the old part of the park, trees have attained a fize much beyond what might be expected from the chalk and flint which conftitute fo great a portion of the foil of North Hampfhire. An old manfion-houfe ftood in the bottom near the prefent parifh-church and village: but the late lord Portfmouth pulled it down and erected the prefent building in a much more eligible and healthy fituation. It ftands on elevated ground, commanding extended and varied profpects, particularly to the fouth and the north. This manfion, erected by Mr. Meadows from the defigns of James Wyatt, efq. confifts of a centre and two correfpondent wings connected to it by colonnades. The eaftern wing contains the library and a chapel, and in

 the

the weftern are apartments for fervants. In the library were preferved a confiderable body of the MSS. on various matters, philofophical and theological, of the illuftrious Newton. They came into the poffeffion of this family in confequence of the marriage of John, vifcount Lymington, (fon of the firft earl of Portfmouth,) in 1740, with Catharine Conduit, great niece and coheirefs of fir Ifaac. Thofe papers were examined by the late learned bifhop (then doctor) Horfley, while preparing his edition of Newton's works. See Newton, *Sir Ifaac.*

A little to the eaftward of Whitchurch, near the London road, is Freefolk, noted for the paper-mills belonging to John Portal Bridges, efq. where the paper for the notes of the bank of England has been manufactured ever fince the reign of George I. At Laverftock is the feat of William Portal, efq.; and in the adjoining parifh of Overton is a handfome new houfe, the feat of —— Jarvis, efq. In the village a filk-mill has been eftablifhed. In various fpots at no great diftance from Whitchurch, are ftill vifible evidences of Roman occupation. The great fofs-way, a Roman road leading from Sorbiodunum, or Old Sarum, to Vindonum, or Silchefter, paffes acrofs the downs two miles to the northward of the town. Near the courfe of this way, at Egbury, a Roman encampment, forming an irregular quadrangle, may be eafily traced, the rampart in moft parts is ftill lofty; the longeft fide meafures about 300 yards. On feveral eminences within the extent of a few miles from Whitchurch are circular or ring-pofts, commonly called beacons; but evidently military ftations of the ancient inhabitants of the country, to which they could refort, and on which they could fecure their families and property, in the event of hoftile affault from domeftic or foreign foes.—Beauties of England and Wales, vol. vi. Hampfhire; by J. Britton, F.S.A. and E. W. Brayley.

WHITE, Gilbert, M.A. in *Biography*, an agreeable writer of natural hiftory, was born at Selborne in Hampfhire in 1720, and completed his education at Oriel college, Oxford, of which he was elected fellow in 1744. In 1746 he took the degree of M.A., and in 1752 became one of the fenior proctors of the Univerfity. Unambitious in his temper, and fond of rural fcenery, he fixed his refidence in his native village, and devoted his time to literary purfuits, and particularly to the inveftigation of thofe fubjects of natural hiftory, which furnifhed him with leffons of piety and benevolence. The refult of his obfervations was communicated to the public in his " Natural Hiftory and Antiquities of Selborne," 1789, 4to.; the firft and principal part of which confifted of letters addreffed to Mr. Pennant, and affords a variety of remarks, chiefly in the zoological departments, peculiarly amufing and no lefs inftructive: and the fecond part treats of the antiquities of the place. Highly efteemed by all who knew him, he died in 1793; but after his deceafe, the natural hiftory of his work was publifhed feparately in 2 vols. 8vo. 1802, with the addition of mifcellaneous obfervations, and a Naturalift's Calendar, extracted from his papers, and of parallel remarks communicated by W. Markwick, efq., an accurate obferver of nature in the county of Suffex. Gen. Biog.

White, Joseph, Regius profeffor of Hebrew, and Laudian profeffor of Arabic, in the univerfity of Oxford, was born in Gloucefterfhire in 1746, and being of humble origin, but devoted to reading whilft he was purfuing his father's occupation as a weaver, attracted the notice of a neighbouring gentleman, who fent him to Wadham college, Oxford. Having graduated M.A. in 1773, and chofen fellow of his college, he directed the main bent of his ftudies to the oriental languages, under the advice of Dr. Moore, afterwards archbifhop of Canterbury. Such was his proficiency in this department of literature, that in 1775 he was elected Laudian profeffor of Arabic, on which occafion he delivered and printed an oration on the utility of that language in theological ftudies. By the recommendation of bifhop Lowth, he was appointed editor of the Philoxenian Syriac verfion of the four gofpels, which he publifhed in 1778. About this time he was nominated one of the king's preachers at Whitehall; and in a fermon preached before the univerfity of Oxford, he recommended a revifal of the Englifh tranflation of the Old Teftament. In 1780 he publifhed a " Specimen of the Civil and Military Inftitutes of Timour," tranflated from a Perfian verfion of the Mogul original, written by the conqueror himfelf. He alfo added a fpecimen of Perfian poetry, and recommended the ftudy of this language. Thefe Inftitutes having been tranflated entire by major Davy, were publifhed from the Clarendon prefs in 1783, under the infpection of profeffor White, who annexed a preface, indexes, and geographical notes.

As Bampton lecturer, to which office he was appointed in 1781, he preached a courfe of fermons before the univerfity, which were printed in 1784, and much admired for their learning and eloquence. The general defign of thefe fermons was to evince the excellence of the Chriftian religion, on a comparifon with that of Mahomet. (See Alcoran.) It was difcovered, however, fomewhat to the difgrace of the profeffor, that he had derived very confiderable affiftance in the compofition of thefe fermons from the mafterly pen of Mr. Badcock, who had been a diffenting minifter at South Molton, and afterwards conformed to the church, and that feveral of them were actually written by him. It was alfo known, that Dr. Parr, from his ample ftore of Greek literature, had furnifhed the materials that had been wrought up into two of thefe fermons. Thefe facts were inveftigated and afcertained; and the charge againft the profeffor was fufficiently fubftantiated, and it was founded, not fo much on his want of ability for fuch productions, as on his indolence, and on certain habits unfavourable to ftudy. His reputation, however, as a defender of Chriftianity was acknowledged, and he was prefented to a prebend of Gloucefter, and foon after was graduated D.D. About the year 1790 he married, and accepted a college-living in Suffolk. In this fituation he profecuted his ftudies, and having fet up a prefs in his houfe, and furnifhed himfelf with oriental types, he and his wife performed the bufinefs of compofitors, and a man and maidfervant that of the prefs. Hence originated his " Ægyptiaca," relating to the antiquities of Egypt; and an edition, with a verfion, of an account of that country by an Arabian writer named Abdollatif. In 1799 Dr. White publifhed from the Clarendon prefs his " Diateffaron," or the harmony of the four evangelifts, in Greek, a work ufeful to biblical ftudents. He died in 1814, at the age of 68. Gen. Biog.

White, one of the colours of natural bodies.

White is not fo properly faid to be any one colour, as a compofition of all the colours; it being demonftrated by fir Ifaac Newton, that thofe bodies only appear white, which reflect all the kinds of coloured rays alike, and that the light of the fun is only white, becaufe it confifts of all colours.

From the multitude of rings of colours, which appear upon compreffing two prifms, or object-glaffes of telefcopes together, it is manifeft, that thefe do fo interfere and mingle with one another at laft, as, after eight or nine reflections, to dilute one another wholly; and conftitute an even and uniform whitenefs: whence, as well as from other experiments, it appears that whitenefs is certainly a mixture of all colours; and that the light which conveys it to the eye is a mixture of rays endued with all thofe colours.

The fame author fhews, that whitenefs, if it be moft ftrong and luminous, is to be reckoned of the firft order of colours; but if lefs, as a mixture of the colours of feveral orders: of the former fort, he reckons white metals; and of the latter, the whitenefs of froth, paper, linen, and moft other white fubftances. And as the white of the firft order is the ftrongeft that can be made by plates of tranfparent fubftances, fo it ought to be ftronger in the denfer fubftances of metals, than in the rarer ones of air, water, and glafs.

Gold or copper mixed either by fufion or amalgamation with a very little mercury, with filver, tin, or regulus of antimony, become white; which fhews, both that the particles of white metals have much more furface, and therefore are fmaller than thofe of gold or copper; and alfo, that they are fo opake, as not to fuffer the particles of gold or copper to fhine through them. And as that author doubts not, but that the colours of gold and copper are of the fecond or third order, therefore the particles of white metals cannot be much bigger than is requifite to make them reflect the white of the firft order. See COLOUR, and *Colours from* METALS.

Hevelius affirms it as a thing moft certain, that, in the northern countries, animals, as hares, foxes, bears, &c. become white in the winter time; and in fummer refume their natural colours.

Black bodies are found to take heat fooner than white ones; by reafon the former abforb or imbibe rays of all kinds and colours, and the latter reflect all.

Thus, black paper is fooner put into a flame, by a burning glafs, than white; and hence black cloths, hung up by the dyers in the fun, dry fooner than white ones. See BLACK.

WHITE *of the Eye*, denotes the firft tunic or coat of the eye, called *albuginea* and *conjunctiva*, becaufe it ferves to bind together or inclofe the reft. See ADNATA, and EYE.

WHITE *Ale*, in *Rural Economy*, a liquor of the malt kind, which is faid to be prepared fomewhat in the following manner. Twenty gallons of malt are mafhed with the fame quantity of boiling water; when after ftanding the ufual time, the wort is drawn off, and fix eggs, four pounds of flour, a quarter of a pound of falt, and a quart of *grout*, are well beaten up together, and mixed with the above quantity of wort, which, after ftanding twelve hours, is put into a cafk, and is ready for ufe the day afterwards.

It is obferved by the writer of the Devonfhire Corrected Report on Agriculture, who has fupplied the above account, that this liquor is almoft exclufively confined to the neighbourhood of Kingfbridge, in that county; and that it is a beverage which poffeffes a very intoxicating quality, and which is much admired by thofe who drink not merely to quench thirft. A myftery, it is faid, hangs over the ingredient called grout, and the fecret is faid to be confined to one family in the above diftrict only. No difficulty, however, it is fuppofed, could arife in afcertaining its component parts, by fubmitting a certain portion of it to the teft of chemical examination. It is plain, it is faid, that this liquor is of confiderable antiquity, from the *terrier* of the advowfon of Dodbrook, which exprefsly calls for the tithe of white ale.

This mild pleafant liquor may eafily be made in other places.

WHITE *Antimony Ore*, in *Mineralogy*, *Antimoine Oxydé*, Hauy, generally occurs diffeminated and cryftallized in veins along with other ores of antimony on primitive rocks. See ANTIMONY.

WHITE *Arfenic*, and *Afhes*. See the fubftantives.

WHITE *Bait*, in *Ichthyology*. See CLUPEA.

WHITE *Beam*. See CRATÆGUS.

WHITE *Bear*. See POLAR *Bear*.

WHITE *Brant*, the *Anas Hyperborea*. See DUCK.

WHITE *Bug*, in *Gardening*, an infect of the bug kind, which is often very troublefome and hurtful in vineries, peach-houfes, and other fuch forts of houfes for fruit-trees.

It is obferved in the firft volume of the "Memoirs of the Caledonian Horticultural Society," that the caufe of this infect fo frequently making its appearance in thefe houfes, is much owing to the neglect in not wafhing the trees properly every day with the engine in many cafes. That when a vinery is much overrun with it, in order to its removal, all the old bark fhould be ftript from off the vines, and all the fhoots and trellis be properly fponged over with black foap and warm water. The writer always makes it a rule, at the time of the winter-pruning, to take off the outer bark, whether infefted with them or not, as thefe bugs lodge between the old and new bark. That in regard to peach-trees, which are infefted in this way with the white bug, they fhould be fponged all over in the fame manner in the winter feafon; and if any bugs fhould appear in the fpring, it is a good way, it is faid, to tie pieces of mat round the ftems and large branches of the trees; as about thefe parts thefe infects take fhelter from the heat of the fun. Once every day thefe portions of mat fhould be taken off, and thrown away out of the houfes. That foon after forcing is begun, the female of thefe bugs will be obferved to be much larger than the male, at which time fhe conftantly goes into fome hollow of the trees or bark, and depofits her ova or eggs moftly in fome thoufands. Thefe are eafily capable of being difcovered, and may be picked out of fuch hollows or crevices by means of a large pin, or fmall piece of fharpened ftick; which is an effectual way of getting quit of them, and of preventing their future increafe. See WASHING *Fruit-Trees*.

WHITE *Campion*, in *Agriculture*, a pernicious perennial weed in corn lands, paftures, and hedges, which is often difficult to deftroy, except by good fummer tillage of the ground. See WEED, and WEEDING.

WHITE *Caterpillar*, or *Borer*, in *Gardening*, a very deftructive fort of infect of this kind, but which is not fo numerous as thofe of the other kinds, nor does it attack and deftroy the fame parts of goofeberry-bufhes, though equally injurious on others. It is of comparatively a fmall fize too, in relation to thofe of the other forts, the black and green, that infeft thefe bufhes; the former of which, the large or black, may be obferved, it is faid in a paper in the Horticultural Tranfactions of Scotland, lying during the winter months in large clufters on the under parts, and in the crevices of the bufhes of thefe forts; and that even in the month of February they have been found in that ftate. But that in the courfe of eight or ten days after that, if the weather be favourable, they will creep up the bufhes in the day-time, feed on the young buds, and return to their neft during the night. That whenever leaves appear upon the bufhes, they feed upon them until they arrive at maturity, which is generally about the month of June; after which they creep down upon the under fides of the branches, where they lodge until the cruft or fhell is formed over them. That in July they become moths, and lay their ova or eggs on the under fides of the leaves and of the bark. That the produce

produce of thefe ova or eggs, which come into life during the month of September, feed on the leaves fo long as they continue green, and afterwards collect and gather together in clufters on the under fides of the branches, and in the cracks and openings of the bark, where they abide all the winter, as has been already feen. Confequently that winter is the moft proper time for attacking and deftroying this fort of thefe infects with fuccefs, as their deftruction is then moft effectually and completely accomplifhed by merely the fimple operation of fprinkling and pouring a quantity of boiling hot water over and upon them, from a watering-pan or pot, by which no injury, it is faid, will thereby be done to the bufhes or goofeberry fruit-fhrubs.

That the latter or green fort are in the fhelly ftate in February, when they lie about an inch under the ground. That in the following month they come out fmall flies, and immediately lay their ova or eggs on the veins and under fides of the leaves. That thefe ova or eggs produce young caterpillars in the month of May, which feed on the leaves of the bufhes until June or the fucceeding month, when they caft off a blackifh kind of fkin, and afterwards crawl down from the bufhes into the earth, where a fort of cruft or fhell grows over them, and in that ftate they continue until the following April.

The only method which this writer has hitherto found effectual in deftroying this fort of thefe goofeberry-caterpillars, is firft to dig the ground all around the bufhes very deep during the winter feafon, by which means the greater part of them are either deftroyed, or buried too deep ever to rife to the furface : or, fecondly, in the month of April, when the flies make their appearance, to pick off all the leaves on which any ova or eggs are to be difcovered, which is a tedious operation, but may be performed by children. If any of the infects fhould efcape both thefe operations, they will, it is faid, be difcernible as foon as they come into life, by their eating holes through the leaves, and may then be eafily deftroyed, without the leaft injury to the bufhes or fruit.

That this white kind bores the berry, and caufes it to drop off from the bufh. That they preferve themfelves during the winter feafon in the chryfalis ftate, about an inch under ground, and become flies nearly at the fame time with the latter of the above kinds. That they lay their ova or eggs on the bloffoms, and that thefe eggs produce young caterpillars in May, which feed on the berries until they are full grown, and then creep down into the earth, where they remain for the winter in the fhell ftate.

This fort of thefe caterpillars, too, may be beft deftroyed in the winter feafon, by having the land well and deeply dug all about the goofeberry-bufhes at that time of the year, and by preventing them from climbing up the ftems of the plants in the early fpring feafon, for the purpofe of laying their eggs, by every poffible means that can be devifed and reforted to by the gardener.

Thefe are the beft and moft effectual methods that have yet been difcovered by this writer, for the deftruction of this and the two other forts of goofeberry-caterpillars. For though many other modes of doing it have been tried, none have been found fo certain and complete as thefe ; and they have this advantage and confideration to recommend them, that they injure neither the bufh nor the fruit. That the fame thing cannot be faid either of tobacco-liquor, fnuff, or foap-fuds, all which render the fruit conftantly bitter and ill-tafted ; and which, whatever may be the effect that they may have upon the fmaller kind of caterpillars, it is certain, the writer thinks, that they have none upon the larger kinds, and that foot, lime, and lime-water, do not affect any fort of caterpillar whatever, as the writer has fufficiently proved by repeated experiments with fuch fubftances.

WHITE *Centaury*, in *Agriculture*, an annual weed in woods and other fuch places ; of which animals in general are not fond. It is faid to form the bafis of the famous Portland powder for the gout. See WEED.

WHITE *Cinnamon*. See CINNAMON.

WHITE *Clover*, in *Agriculture*, a well-known plant of the clover kind, which is perennial, and confequently lafts a number of years in the foil or land. It is faid to require a deep free foil to bring it to any degree of luxuriant growth. Confequently but little of the land in many diftricts fuits it ; but it is fometimes fown with the common clover in about half the quantity. In the Berkfhire Report on Agriculture, it is ftated, that it is frequently confounded with the Dutch clover, that it affects a light foil, that it is much improved by rolling, and that it yields a very fweet hay when mixed with red clover, rye-grafs, and nonfuch. That fheep are not very fond of it ; and this is, probably, one reafon why it is lefs cultivated than it deferves to be. It appears, it is faid, to be the Irifh fhamrock ; and that the powdered flowers of this clover being made into bread, were eaten by the natives of the fifter ifland before the introduction of potatoes. It may be noticed, too, that it is capable of bearing flooding, which the red clover is not, and this is a very great advantage in its favour.

It is remarked alfo, that the real Dutch clover is not unfrequently fown with other graffes, in a larger or fmaller proportion, as the farmer may think proper. That in fome places of the above county it is the common practice to fow of broad clover eight pounds, yellow trefoil, or hop clover, four pounds, and of Dutch or white clover, two pounds, to the acre. If it be fown alone, about eight or nine pounds will be fufficient. It is getting into high eftimation in the neighbourhood of Bray, in the above diftrict, and in other places, and is fometimes called honey-fuckle grafs, from the fweetnefs of its fmell. That to all forts of cattle it forms an agreeable pafture, and efpecially to fheep, which thrive on it prodigioufly. Even fwine will fatten on this grafs, the feed of which was imported from Flanders for fome time after it began to be cultivated in this country, though it appears to be an indigenous plant. It has the excellent property of never wearing out by being clofe fed. See TRIFOLIUM *Repens*, and HYBRIDUM. Alfo CLOVER.

White clover is faid, in the Gloucefterfhire Agricultural Report, to be injurious to cow-ftock, by *hoving* them when in abundance after rain in paftures.

WHITE *Colours*, in *Painting*, comprehend the following ; *viz.* FLAKE-*White*, *White*-LEAD or CERUSSE, calcined or burnt *Harts*-HORN, the perfection of which depends upon its whitenefs and firmnefs, diftinguifhable both by fight and touch, PEARL-*White*, TROY-*White*, and EGG-*Shell White*. (See the feveral articles.) The moft delicate and perfect white in ufe, in its application to the purpofes of painting in water-colours, is the artificial fulphate of barytes. According to Mr. Parkes (Eff. vol. ii.), it was firft recommended and brought forward by Mr. Hume, of Long-Acre, who has long fupplied the public with it under the name of "Permanent White." The fame ingenious practical chemift fays, that he knows of nothing fo well calculated as this for marking bottles in a chemical laboratory, where the gafes foon deftroy the ink of common labels, and render them illegible. It is equally ufeful for marking jars, bottles, or boxes, which muft be kept in a damp cellar, for it is not only imperifhable in fuch fituations, but preferves its extreme whitenefs, and confequently the diftinctnefs of the characters. We learn alfo from fir Humphrey Davy's

Davy's "Elements of Chemical Philofophy," that the combination of barytes and carbonic acid, made artificially by pouring a folution of carbonate of ammonia into a folution of nitrate of barytes, forms alfo a pigment of a very white colour.

WHITE *Colours*, in *Dyeing*. See COLOUR.

WHITE *Copper Ore*, in *Mineralogy*, is one of the rareft ores of copper, and has frequently been confounded with copper pyrites, and other ores of that metal. (See COPPER *Ores*.) Its colour is between filver-white and bronze-yellow; it occurs maffive and diffeminated; it has a metallic luftre. The fracture is fine-grained and uneven; it yields eafily to the knife. The fpecific gravity of this ore is 4.5. It contains about 40 *per cent*. of copper mixed with iron, arfenic, and fulphur.

WHITE *Copperas*, *Cordage*, *Eagle*, and *Egg-Shell*. See the fubftantives.

WHITE *Cofs-Lettuce for Hogs*, in *Agriculture*, the ufe of it in feeding thefe animals. A trial of it in this way is ftated to have been made in Suffex, which is particularly deferving of attention: the weaning of young pigs, without much milk and fome corn, is often a difficult bufinefs; but if this fort of lettuce will do it, which feems to be the cafe, no farmer fhould ever be without a rood, or half an acre of this fort of crop for this ufe.

In this trial, four ounces of this fort of lettuce-feed were fown very thick over two perches of ground in the beginning of March. A crop of potatoes was in rows at three feet diftance; between which a double row of thefe lettuces was planted in May; both crops being afterwards kept clean by hand-hoeing. In the June following, they were begun to be ufed for three fows with little pigs, which were kept on thefe lettuces for fix weeks; but thefe fows had wafh in addition: the pigs were then weaned a fortnight earlier than ufual; and after the weaning, the great ufe of the lettuces was found, for the pigs did admirably well upon them, until they all were gone in the middle of Auguft. They were then fed as ufual, with cabbage, turnip-tops, and other fuch vegetable matters, but fell off at once for want of the lettuces. See LACTUCA, and LETTUCE.

WHITE *Crops*, a term applied to all forts of grain-crops, as wheat, rye, barley, oats, and fome others, in contradiftinction to thofe of the green and culmiferous kinds, fuch as cabbages, turnips, rape, tares, beans, and fome others of a fimilar nature.

WHITE *Darnel*, a very troublefome and prolific weed among corn-crops, efpecially of the wheat kind. See WEED, &c.

WHITE *Enamel*. See ENAMEL, and ENAMELLING.

WHITE *Face*, or *Blaze*, in the *Manege*, a white mark upon a horfe, defcending from the forehead almoft to the nofe. It is called in French *chanfrin blanc*.

WHITE *Film*, or *Blindnefs*, a difeafe in fheep, which is occafioned by a white film growing over their eyes, in confequence of fome fort of inflammation, as arifing from different caufes, taking place in them.

The appearances by which it is fhewn to be prefent are, according to fome, that the animal cannot bear the light, that the white part of the eye is red and inflamed, and that it waters a great deal. That this ftate is fucceeded by a fort of membrane or coat formed by the inflamed veffels, which firft covers the white, but gradually extends over the eye, until total blindnefs is the confequence. That this is noticed to be the cafe, when in folding, the fheep run againft dykes, or any other fuch obftacles, and ftart when they approach them; that they do not follow the flock, and that they frequently ftumble. That when the eye is infpected, it is generally found, that a blue flough covers the whole of the eye, without any intermixture of red veffels. That in the worft cafes, the coloured and tranfparent part of the eye becomes of a reddifh-white; by which time, the film on the eye has acquired confiderable thicknefs and hardnefs. That the inflammation is produced in various ways, and by various means; as during the fummer feafon by the reflection of heat and light in very funny and dry weather, as it is found to be more frequent when the hilly fheep-walks become fcorched, and on hard rocky foils, than on the dark-coloured hills which are covered with heather. Others fuppofe, that the difeafe is fometimes caufed by the pollen or duft of flowers irritating the eyes of the fheep, when blown into them, in confiderable quantities, by the wind. That in the winter, the blindnefs is caufed and occurs when the days are very funny, and the evenings frofty and cold; or when the fheep have been long buried under fnow, and the ground is ftill white and glaring when they get out.

But by ftill others, the blindnefs in fheep is believed to arife from a caufe wholly different from any of thefe. That it is induced by a continued fatigue for a length of time, which is capable of bringing it on at any feafon of the year. Thus, fheep that are long and hard driven, or fuch as are daily dragged from one part of the ground to another, ewes that are *cild*, or old, and roughly handled and ufed by the women in milking, during the operation, where that practice is in ufe, and hog-fheep which are tired by driving through fnow, in order to preferve their fubfiftence, are all liable to this affection of the eyes. That their eyes at firft become fore, and emit a fort of ropy humour; after which a white film fettles over them, and if they continue to be fatigued, it grows thicker, the eyes appearing perfectly white; in which cafes, they are faid to be proportionably longer in getting better. The difeafe, too, may proceed from many other caufes of different kinds, as all fuch as tend to caufe local inflammation in the parts, as cold, moifture, and many others of the fame fort.

In the cure of the difeafe, where it is fufpected to arife from the irritating powdery matter of flowers, the fheep fhould be immediately removed to other proper paftures for a time, until the danger from that caufe is over; and in cafes of fnow-blindnefs of this kind, it is always proper to bring them down, as foon as poffible, from the high fnowy walks, where they occupy them, to the bare grounds below.

The inflamed veffels on the white of the eye, efpecially thofe next the nofe, are alfo fometimes advifed to be cut with a lancet or fharp penknife every fecond morning; while the eyes are to be kept defended againft the light, by a fhade tied over the head, or a piece of crape over the eyes. The eyes may likewife be bathed two or three times a-day, with a folution of half a drachm of fugar of lead, or of two drachms of alum, and the fame quantity of white vitriol, in a pint of foft-water. At the fame time purgatives may be given internally, fuch as two ounces of fome purging falts, or, what is better, a fcruple of calomel, once a day for four or five times. When, by thefe means, the inflammation is got the better of, but the flough ftill remains, a little ointment, compofed of eight parts of fome mild unctuous fubftance, and one of red precipitate of mercury, made fine by rubbing, may be infinuated into the eyes every morning; or a little finely powdered cryftal and loaf fugar be blown into them twice in the day.

With fome, it is at firft the practice to bleed the fheep below the eyes, and to let fome of the blood run into each of them; but it is fuppofed that care will infallibly cure the difeafe in a fpace of time proportioned to the debility that has

has induced the complaint without any thing elfe. The beft and moft proper means of cure in thefe cafes are, in the firft place, local or general bleeding, then the ufe of fome fuch folutions and internal remedies as the above, after fome time having recourfe to ftronger wafhes and powders of the fame nature, with fmall quantities of opium, and keeping the animals all the while as much as poffible from the light, and the glare of the ground. (See a paper in the third volume of the Tranfactions of the Highland Society of Scotland.) It is obferved, that certain parcels of fheep are very liable to blindnefs of this fort, and that although it is not a fatal difeafe in itfelf, it frequently occafions confiderable lofs by the fheep drowning themfelves, or breaking their necks in falling down precipices and other fuch places.

White *Flag*, *Flake*, and *Froft*. See the fubftantives.

White *Foot*, in the *Manege*, called in French *balzana*, is a white mark that happens in the feet of a great many horfes, both before and behind, from the fetlock to the coffin. The horfes thus marked are either tramelled, crofs-tramelled, or white all four. Some horfemen place an unlucky fatality in the white of the far foot behind. See Chausse' *Trop haut*, and Tramelled.

White *Friars*, a name common to feveral orders of monks, from their being clothed in a white habit.

Such are, the regular canons of St. Auguftine, the Premonftratenfes, and Bernardines. See Carmelites.

White *Glafs*. See Glass.

White-*Hart Silver*, *candidi cervi argentum*, a tribute or mulct paid into the exchequer, out of certain lands in or near the foreft of White-hart, in Dorfetfhire; which was continued from Henry III.'s time, who firft impofed it upon Thomas de la Linde, and others, for killing a beautiful white hart, which that king had purpofely fpared in hunting.

White *Hellebore*. See Hellebore.

White *Honeyfuckle*, in *Agriculture*, a term often applied to the white clover. It is ftated, in the Agricultural Report for the County of Gloucefter, to be a plant which is brought forward by manure and fheep-ftock, and a proof of good land, at leaft of land in a high ftate of cultivation; and that, on this account, it has, when it abounds in dairy paftures, a tendency to raife the quality of the milk, and make the cheefe hove or heave which is made from it. See Dairying, and White *Clover*.

White *Horfe-Fifh*, in *Ichthyology*, a common Englifh name for the raia afpera noftras of Willughby, and the raia fullonica of Rondeletius and Linnæus. Its back is rough and fpiny; the nofe is fhort and fharp; at the corner of each eye are a few fpines; the nictitating membrane is fringed; the teeth are fmall and fharp: on the upper part of the pectoral fins are three rows of fpines pointing toward the back, and crooked, like thofe of the fuller's inftrument; whence its name *fullonica* and *fuller*. On the tail are three rows of ftrong fpines: the tail is flender, and rather longer than the body. The colour of the upper part of the body is cinereous, ufually marked with many black fpots; the lower part white. This fifh grows to a fize equal to that of the fkate. Pennant.

White *Jafper*, in *Mineralogy*, or agate jafper, has a pale yellowifh-white colour, and fometimes occurs reddifh-white. It is opaque, and has fmall imperfectly conchoidal fractures. See Jasper.

White *Land*, in *Agriculture*, a tough clayey foil, naturally of a fomewhat whitifh hue when dry, efpecially when it has lain fome time untilled, but becoming blackifh after rain: this appears of a light greyifh colour when turned up by the plough, and flides off from the plough-fhare with eafe, and with a fmooth gloffy furface. It has often a yellowifh hue with the grey, and is often veined with large parcels of a blue marly earth. See *Clay* Soil.

White *Lead* is a fort of ruft of lead, or lead diffolved with vinegar; much ufed by painters. See Lead, and Cerusse.

White *Leaf*. See Cratægus.

White *Line*, among *Printers*, a void fpace, greater than ufual, left between two lines. See Printing.

White *Line*, in *Anatomy*. See Linea *Alba*.

White *Linen* is cloth of hemp, or flax, bleached by divers leys, and waterings on the ground.

White *Manganefe*, in *Mineralogy*, manganefe oxydé carbonaté, Hauy. Red manganefe ore of fome mineralogifts. This ore occurs of various colours, from yellowifh-white to rofe-red. See *Ores of* Manganese.

White *Meats* include milk, butter, cheefe, white pots, cuftards, and other foods confifting of milk, or eggs. Some add, alfo, fifh, veal, and chickens.

White *Mortar*. See Mortar.

White *Muft-Apple*, in *Rural Economy*, a very fine cider-fruit in field fruit-grounds. This, with the fox-whelp, redftreak, and fome others, are fine old fruits, but which are now going off, and afford the beft cider, when mixed in the mill: the proportions in which they are to be ufed have never, however, been defined, but depend probably a good deal on the quantity to be ground at the fame time.

White *Muftard*, in *Agriculture*, a fort of plant which is often cultivated in the field for the ufe of the feed in different places.

The beft fort of foil for it is that of the light loam, which fhould be well broken down and reduced by ploughing and harrowing. Some, on frefh broken up land, make a winter fallow for this crop.

It is moftly put in after a wheat-crop, but may fucceed others where the land is clean and well prepared. In Kent, they ftrike furrows about eleven or twelve inches apart, and then fow the feed, two or three gallons to the acre, in the month of March.

The culture of it while growing is to hoe it, and keep it free from weeds, to fet it out in the way of turnips, not too thick on the ground, as that draws up the plants weak. The crop is reaped about July. In fome cafes, it is laid in gavels or handfuls upon the ftubble, in the fame manner as cole-feed. It is ufually threfhed out on a fail-cloth in the field.

The produce differs from eight to twenty bufhels the acre.

It is a ticklifh fort of crop, as one frofty morning will kill it, and it is liable to be injured and eaten by the black caterpillar; but when it turns out well is very profitable.

It is faid not to exhauft the land much, which is greatly in its favour.

White *Nebbed-Crow*, a term provincially applied to the rook in fome cafes.

White *Order*. See Order.

White *Paper* is that intended for writing, printing, &c. in contradiftinction to *brown paper*, *marbled paper*, *blotting paper*, &c.

White, *Pearl*. See Pearl.

White *Pepper*. See Pepper.

White *Poplar*, in *Agriculture*, a tree of the poplar kind, in which the wood is foft, but convertible to various ufes in hufbandry, as it grows quickly and bears cropping well. It is beft grown in low fituations, where the foil is of a clayey nature. It is fometimes called the abele tree.

WHITE *Poppy*, a plant fometimes cultivated in the garden and the field for the ufe of the opium which is obtained from its juice by means of evaporation. It might be largely cultivated in many fituations with great advantage, as it contains this fubftance or principle in great abundance. See PAPAVER *Album*.

WHITE *Porcelain*. See PORCELAIN.

WHITE *Pot*, denotes milk or cream baked with the yolks of eggs, fine bread, fugar, and fpice, in an earthen pot.

The cooks furnifh us with a variety of difhes under this form and denomination: fuch are, Norfolk white-pot, Weftminfter white-pot, rice white-pot, &c.

WHITE *Pottery*. See POTTERY.

WHITE *Precipitate*. See *Carbonate of* MERCURY.

WHITE *Pyrites*, in *Mineralogy*; Fr. fulfuré blanc, Hauy. The colour of this ore when pure is of a tin-white colour, paffing into brafs-yellow and fteel-grey. It occurs in fmall octohedral cryftals varioufly modified, alfo ftalactitical and botryoidal. It is hard, brittle, and eafily frangible. It melts before the blow-pipe, giving out a fulphureous vapour; it then acts on the magnetic needle. It decompofes much eafier than common pyrites. It contains 46 parts of iron and 54 of fulphur. See PYRITES.

WHITE *Rent*, in *Rural Economy*, a rent or duty of 8*d*. payable yearly, by every tinner in the counties of Devon and Cornwall, to the duke of the latter, as lord of the foil. See BLANCH *Fermè*.

WHITE *Salt* is common or fea-falt dried and calcined by the fire, fo as not to leave any moifture therein. The chemifts call it *decrepitated falt*.

There are fome falts naturally white, and others that need to be whitened, either by diffolving and purifying them in fair water, which is afterwards evaporated; or by means of fire; or by the fun. See SALT.

WHITE *Salt*, a term applied to the fine purified falt, in contradiftinction to that of the rock kind. The former is faid in Chefhire to form a much more important object in the way of commerce than the latter. See SALT.

WHITE *Sauce*, a fort of fauce made of blanched almonds, and the breaft of a capon, pounded together with cloves, cinnamon, &c. We alfo hear of white broth, which is a fort of broth enriched with fack and fpices, having blanched almonds fcraped into it, and the whole thickened with the yolks of eggs, &c.

WHITE *Scour*. See SCOUR.

WHITE *Silver Ore*, in *Mineralogy*, an ore of filver always affociated with lead and antimony. (See SILVER *Ores*.) Dark white filver contains, according to Klaproth, 9.25 parts in the hundred of filver. Light white filver ore contains 20.40, affociated with the fame minerals as the dark ore, but in different proportions.

WHITE *Soap*. See SOAP.

WHITE, *Spanifh*, is a kind of fucus ufed by the ladies to whiten their complexion, and hide the defects of it, called alfo *magiftery of bifmuth*.

The ufe of this, as well as of ceruffes, is pernicious; and fhould be particularly avoided during the taking of any fulphureous water, which may change the complexion quite black. Indeed, all phlogiftic vapours, and even the fun itfelf, tend to give both the magiftery of bifmuth and ceruffe a yellow colour: an obfervation which ferves to explain a paffage in Martial, where a cerufed lady is faid to fear the fun.

"Cretata timet Fabulla, nimbum,
Cerufata timet Sabella, folem.
Ep. lib. ii. Ep. 41.

WHITE, *Spanifh*, is alfo a name given to troy white.

WHITE *Spurs*. See SPUR, and ESQUIRE.

WHITE *Star*, and *Sugar*. See the fubftantives.

WHITE *Stone*, in *Geology*; *Weifs ftein*, Werner; *Eurite* of fome French geologifts; a rock enumerated by Werner as a diftinct fpecies among the primary rocks. It is effentially compofed of felfpar, but contains mica and other minerals. We think it may fairly be doubted whether white-ftone ought to be confidered as a diftinct fpecies of rock, or only as an occafional mode in which gneifs and granite fometimes occur. According to the account given by M. Bonnard of the Saxon Erzgeberge, in the Journal des Mines, 1815, the gneifs of that diftrict often lofes its mica, and paffes into a rock effentially the fame as white-ftone or eurite. In other inftances, the granite, by lofing a great part of its mica and quartz, paffes into the fame rock, ftill retaining the geological pofition of granite, and including immenfe beds of granite within it. The north-weftern acclivity of the Saxon Erzgeberge is almoft entirely compofed of white-ftone, including maffes of granite, from a few feet to fome miles in extent. This rock forms the bafis on which the other rocks are placed. Bonnard gives the following defcription of white-ftone or eurite in the above diftrict:—It is compofed of very fine granular felfpar, which is fometimes compact, of a whitifh-grey or yellowifh-grey colour; the mica is brownifh. It occurs in layers, and is fometimes fiffile when the mica is abundant. In this cafe, the felfpar is almoft as friable as dolomite. When the felfpar is compact, and the mica more rare, the rock nearly lofes its fiffile property. This rock contains fappare and other minerals diffeminated. The rock on which it refts is unknown, as the white-ftone ferves as a bafis for the gneifs and other rocks. In the greater part of the diftrict a granitic rock occurs in the white-ftone, which is fometimes a true granite and fometimes a granular eurite. This granite is compofed of felfpar, which is rarely of a red colour, but often brown, which is alfo generally the colour of the mica; the proportion of the quartz is variable, and fometimes is entirely wanting. In the few places where the two rocks can be feen together, the granite appears not only to alternate with the eurite, but to pafs into it; or rather the two rocks may be faid to pafs infenfibly into each other, both in the fmall and large maffes. The grain of the granite is often very fine; but near Penig it contains cryftals of felfpar of a foot in cubic fize. The only beds which occur in the white-ftone are of ferpentine; thefe are in the upper part of it, and dip to the north. There have been no metallic veins difcovered in the white-ftone rock. From the above defcription, there can be little doubt that white-ftone ought, when viewed geologically on a large fcale, to be confidered only as a particular form of granite arifing from the diminution of the quartz and mica. The circumftances, whatever they may have been, which firft difpofed the granite to folidify, permitted the conftituent parts to arrange themfelves in different proportions in various parts of the mafs. Thus in extenfive granite formations, nothing is more frequent than to fee the quartz and felfpar collected in large maffes nearly pure, or with a very fmall admixture of the other component parts; and in the white-ftone of Saxony precifely the fame facts are exhibited on a larger fcale. See ROCKS, STRATA, and SYSTEMS *of Geology*.

WHITE *Styre Apple*, in *Rural Economy*, a rich cider-fruit in field orchards. It is faid to be the boaft of the foreft diftrict in Gloucefterfhire, and that under proper management, it affords a cider fo rich and ftrong, that it is often valued equally with foreign wine, and fold at extravagant prices.

WHITE-*Swelling*, in *Surgery*. When a difeafe is attended with great varieties, not only with regard to its progrefs and fymptoms, but alfo its caufe, and the diforder which it produces in the parts which are the feat of it, there is as much difficulty in fixing upon a name that will convey an exact idea of it, as in offering a definition or defcription of it applicable to all the cafes which may prefent themfelves to the attentive obferver. Such are the circumftances of the difeafe of which we are about to fpeak in the prefent article. Surgeons have given it a variety of appellations, derived from fome one particular fymptom with which it is accompanied. Thus, it has been called *white-fwelling*, (a name which is ftill moft generally adopted,) becaufe the fkin which covers it retains its natural colour, and exhibits no appearance of inflammation. It is alfo fometimes termed *fungus articuli*, on account of its foftnefs and elafticity, which allow it readily to yield to preffure, but make it rife up again immediately when the compreffion is difcontinued, like the fungous excrefcences which grow upon the oak. The diforder is likewife often named by foreign writers the *lymphatic tumour*, or *ferous fwelling of the articulations*, in confequence of the great quantity of thick lymph which appears to be effufed in the cellular fubftance around the ligaments, and upon the ligaments themfelves. Sometimes the difeafe is called *fpina ventofa*. (See that article.) The cafe is occafionally denominated a *falfe anchylofis*, becaufe the difeafe caufes more or lefs interruption of the motions of the joint. Laftly, the diftemper is often called a *rheumatic*, or *fcrofulous difeafe of a joint*, according as rheumatifm, or fcrofula, is fufpected of being concerned in its origin.

White-fwellings are ufually defined to be chronic enlargements of the joints; circumfcribed; without any alteration in the colour of the fkin; fometimes hard, and refifting the preffure of the fingers; fometimes lefs firm, elaftic, yielding to preffure, and afterwards rifing up again in the manner of a fungus, which grows upon certain trees; fometimes fo foft as to prefent a deceitful feel of fluctuation, although there is no fluid in the part. In particular inftances, thefe fwellings are indolent; but, moft frequently, they are attended with great pain, efpecially when the joint is moved, fo that the patient either cannot exercife the limb at all, or does it at the expence of confiderable fuffering, and with imperfection and difficulty. The difeafe has its feat in the ligaments, cellular fubftance, fynovial glands, cartilages, and even the bones. All thefe parts, however, are not affected in every inftance; and fometimes the diftemper commences in the bones; fometimes in the cartilages and ligaments, according to the peculiarity in the nature of the cafe. The foregoing definition is obvioufly merely an enumeration of the principal fymptoms of white-fwellings, and is far from giving an exact idea of a difeafe which prefents fo many varieties in different individuals, that there are fcarcely two patients to be met with in whom the complaint follows precifely the fame courfe, or exhibits altogether fimilar phenomena.

There is no joint which may not be attacked by this inveterate difeafe; but experience proves, that the ginglymoid articulations are more frequently affected than the orbicular. We are, however, to except from this remark the articulation between the femur and os innominatum, in which the difeafe is very common, and often called by the French furgeons *fpontaneous diflocation of the femur*, becaufe the cafe generally terminates in a difplacement of the head of the thigh-bone. (See HIP-*Joint*, *Difeafe of*.) Amongft the ginglymoid joints, the knee is oftener affected than any other. Then come the joints of the elbow, foot, and hand. White-fwellings attack the fmall joints, like thofe of the fingers and toes, with far lefs frequency.

White-fwellings may occur at every period of life; but they are more common in infancy and youth than in adults and old fubjects. It is conceived alfo by fome writers, that thefe cafes begin more frequently in autumn and winter, or when the atmofphere is damp and variable, than in the other feafons. But the difeafe is on the whole fo common in this climate, that it muft be difficult to eftablifh the truth of the foregoing conjecture.

The difeafe fometimes begins with a more or lefs acute pain in the articulation, ufually extending along the fafciæ and tendons of the neighbouring mufcles. Sometimes the pain is of a dull kind, being fuperficial, feated in the foft parts, and reaching all round the joint. On other occafions, it is acute, deeply fituated, and confined to a fmall fpace, which is moftly the very centre of the articulation. In particular examples, the fwelling of the joint fucceeds a pain which has been experienced in another part of the body, and fuddenly ceafed. Sometimes the difeafe begins in fo unexpected a manner, that the patient, who went to bed perfectly well, rifes in the morning with a ftiff painful knee. Cafes of the latter kind are generally rheumatic.

Whatever may be the manner in which the complaint originates, and whatever the circumftances which precede the attack, it always comes on in the form of a tumour, which prefents the following characters:—The fwelling feldom reaches all round the articulation; but is almoft always limited to a more or lefs extenfive portion of the circumference of the part. In the knee, it occurs above the patella, and alfo below this bone, at the fides of the ligament, which connects it with the tibia. In the elbow, it chiefly occupies the fides of the joint, efpecially the inner fide. In the ankle, it takes place below and behind the malleoli. Laftly, in the fingers, it commonly affects the whole circumference of the difeafed joint. Such fwelling is circumfcribed, immoveable, and more or lefs hard and elaftic, not retaining the impreffion of the finger, as in œdema (fee ŒDEMA), but generally communicating, when handled, a fenfation of foftnefs, which leads to a fufpicion of the prefence of a fluid, when none in reality exifts. The fwelling is more or lefs painful, efpecially when compreffed. Sometimes, however, it is indolent; the heat of the part is not increafed, and the integuments continue of their natural colour. The motion of the joint is impeded, and if the patient will not abftain from moving the part, he is put to excruciating pain. There are fome white-fwellings of the knee, in which the leg is fixed in the extended pofture; but, moft commonly, the limb is bent, even in a confiderable degree, and when an endeavour is made to ftraighten it, great fuffering is excited. In white-fwellings of the elbow, the fore-arm is conftantly obferved in a ftate of flexion. In thofe of the wrift, the hand has a ftrong propenfity to fall into the bent pofition; and in order to prevent this occurrence, and hinder an incomplete luxation of the carpus from taking place backwards, the furgeon is fometimes obliged to fupport the hand upon a fplint.

The conftant flexion of the limb produces a confiderable retraction of the flexor mufcles and their tendons, together with a rigidity which can be felt through the integuments, which are raifed up by the finews fo affected. The total lofs of exercife always arifing from this ftate of the mufcles and tendons, generally foon renders the joint ftiff and motionlefs, fo that it frequently has the appearance of being in a ftate of real and complete anchylofis. See ANCHYLOSIS.

The ſwelling may remain a long while in the condition which has been deſcribed; it may even ceaſe to be painful; and it may cauſe only a ſerious weakneſs of the knee, and more or leſs difficulty in walking. But moſt commonly it continues to make uninterrupted progreſs; or, if its advances ſhould happen to be checked, and the diſeaſe be for a time ſtationary, it frequently occurs, that, in conſequence of a fall, a bruiſe, or even without any external cauſe, and, as it were ſpontaneouſly, the complaint afterwards increaſes again. The articulation ſwells more and more, and, if it be the knee which is affected, the hollow of the ham alſo ſwells up and becomes effaced. The pain likewiſe augments, being felt ſometimes at one point of the circumference of the joint, ſometimes at another; occaſionally in the ham, and, in other examples, in the very cavity of the articulation. There are, however, ſome patients who ſeem to ſuffer little or no pain of any conſequence. The hardneſs of the tumour is ſubject to great variety. The older the diſeaſe is, the more conſiderable is in general the degree of induration. Yet there are certain white-ſwellings which are extremely hard, although they have not exiſted a long while; and other caſes which are very ſoft, notwithſtanding they are of long ſtanding. Boyer thinks, that this difference depends upon the ſeat of the diſeaſe, which is ſometimes in the bones; ſometimes in the ligaments and ſurrounding cellular membrane. The ſkin which covers the ſwelling grows thin, pale, and ſhining; the cutaneous veins become dilated and varicoſe; and the muſcles of the leg waſte and dwindle away, ſo that the ſize of this part of the limb is ſtrikingly diminiſhed. Sometimes, however, it is affected with œdema, and has the appearance of being enlarged. The lower part of the thigh alſo frequently undergoes a very conſiderable diminution. This waſting of the limb above and below the diſeaſe, makes the joint alſo ſeem much more ſwelled than it is in reality. Sometimes the lymphatic glands in the groin become enlarged and hardened; and when the diſeaſe makes much progreſs, the bones are frequently ſoftened and carious, and the cartilages deſtroyed. Laſtly, abſceſſes, more or leſs conſiderable, are formed in different parts of the tumour; and their formation is attended with a great deal of acute pain, inflammation, and fever. Theſe abſceſſes are more or leſs deeply ſituated, and often communicate with the interior of the joint. When they burſt, or are opened, a large quantity of matter is diſcharged, which is hardly ever of healthy conſiſtence, being moſtly a ſero-purulent yellowiſh fluid, ſomewhat reſembling turbid whey, and containing flakes of albumen. Sometimes, however, it preſents very nearly the appearances of healthy pus; but it ſoon changes into a thin fetid ſanies of very bad quality. Its diſcharge, although very conſiderable, is followed by ſcarcely any perceptible diminution in the ſize of the ſwelling. The openings by which it eſcapes ſometimes ſoon cloſe, and freſh collections of matter enſue which burſt of themſelves, and then heal up like the former; but, in general, the apertures, inſtead of healing, become converted into incurable fiſtulæ.

Mr. Brodie has paid conſiderable attention to the ſeveral diſeaſes of the joints, which uſually go under the name of white-ſwelling. In particular, he has carefully examined the morbid appearances which are found upon diſſection; and his obſervations have led him to propoſe a claſſification of theſe diſeaſes.

1. The firſt caſe which Mr. Brodie deſcribes is, *inflammation of the ſynovial membrane*, which may occur as a ſymptom of a conſtitutional diſeaſe, where the ſyſtem is affected with rheumatiſm; where mercury has been improperly exhibited, or in large quantities; or where there is general debility from any other cauſe. But, in theſe caſes, the inflammation is ſeldom ſevere; it occaſions an effuſion of fluid into the joint, but rarely terminates in the extravaſation of coagulating lymph, or thickening of the inflamed membrane. Sometimes it leaves one joint to attack another; or, it ſuddenly ſubſides without another joint becoming affected.

At other times, ſays Mr. Brodie, the inflammation occurs as a local affection produced by a ſprain, the application of cold, or ariſing from no evident cauſe. It is then, for the moſt part, more ſevere, and of longer duration; it leaves the joint with its functions more or leſs impaired, and occaſionally terminates in its total deſtruction. In itſelf, it is a ſerious diſeaſe; but it is often confounded, under the general name of white-ſwelling, with other diſeaſes ſtill more ſerious. In ſome caſes, it aſſumes the form of an acute; but in the greater number of inſtances, it has that of a chronic inflammation.

When the caſe is acute, the ſkin is in general red, and the joint tender and painful. The pain, which is not confined to any particular point, and aggravated by motion of the limb, is ſoon followed by ſwelling. The patient is alſo affected with inflammatory fever. In a few days, the diſeaſe either ſubſides altogether, or aſſumes the chronic form.

According to Mr. Brodie, when the inflammation is chronic, the pain and tenderneſs are leſs, ſo that the patient is able to walk about, and often without experiencing any ſevere diſtreſs. There is no fever, and the ſkin retains its natural colour. The ſwelling alſo increaſes leſs rapidly than in acute caſes. Theſe ſymptoms are generally rendered worſe by expoſure to cold and exertions. In the firſt inſtance, the ſwelling of the joint ariſes entirely from a preternatural quantity of ſynovia. But when the inflammation has exiſted ſome time, the fluid is not ſo plainly perceptible, becauſe the ſynovial membrane is now thickened, which likewiſe augments the ſtiffneſs of the articulation. The ſhape of the ſwelling is not that of the articulating ends of the bones, but ariſes chiefly from the diſtended ſtate of the ſynovial membrane, and hence depends in a great meaſure on the ſituation of the ligaments and tendons, which reſiſt it in certain directions. Thus, when the knee is affected, the ſwelling is principally obſervable in the ſame places where it occurs in caſes of hydrops articuli.

After the inflammation of the ſynovial membrane has ſubſided, the fluid is abſorbed, and, in ſome inſtances, the joint recovers its natural figure and mobility; but in the majority of caſes, the ſtiffneſs and ſwelling continue. Whenever the patient is expoſed to cold, or exerciſes the limb much, the pain returns, and the ſwelling is increaſed. Such caſes are of frequent occurrence, and, as Mr. Brodie obſerves, they form a large proportion of thoſe diſeaſes which are called white-ſwellings.

Long-continued and neglected inflammation of the ſynovial membrane ſometimes terminates in the formation of an abſceſs in the joint, in ulceration of the cartilages, and deſtruction of the articular ſurfaces. Medico-Chir. Tranſ. vol. v. p. 240, &c.

2. The ſame gentleman has favoured the public with a very circumſtantial hiſtory of another deſcription of caſes, where the diſeaſe originates in the ſynovial membrane, which loſes its natural organization, and becomes converted into a thick pulpy ſubſtance of a light brown colour, interſected by white membranous lines, and from one-fourth to one-half of an inch, or more, in thickneſs. As this diſeaſe advances, it involves all the parts of which the joint is compoſed, producing ulceration of the cartilages, caries of the

 bones,

bones, wasting of the ligaments, and abscesses in different places. The complaint has invariably proved slow in its progress, and sometimes has remained nearly in an indolent state for many months, or even for one or two years; but Mr. Brodie informs us, that he has never met with an instance in which a real amendment was produced, much less a cure. (See Medico-Chir. Trans. vol. iv. p. 220, &c.) Mr. Brodie also remarks, that the above-described affection of the synovial membrane is rarely met with, except in the knee, and that it generally takes place in young persons under, or not much above the age of puberty. In the origin of this disease, there is a slight degree of stiffness and tumefaction, without pain, and producing only the most trifling inconvenience. These symptoms gradually increase, so that, at last, the joint scarcely admits of the smallest motion, the stiffness being greater than what is the usual result of common inflammation. The form of the swelling bears some resemblance to that in cases of inflammation of the synovial membrane; but it is less regular. The swelling is soft and elastic, and gives to the hand a sensation as if it contained fluid. If only one hand be employed in making the examination, the deception may be complete, and the most experienced surgeon may be led to suppose that there is fluid in the joint when there is none; but if both hands be employed, one on each side, the absence of fluid is distinguished by the want of fluctuation.

"The patient experiences little or no pain, until abscesses begin to form, and the cartilages ulcerate; and even then the pain is not so severe as where the ulceration of the cartilages occurs as a primary disease, and the abscesses heal more readily, and discharge a smaller quantity of pus than in cases of this last description. At this period, the patient becomes affected with hectic fever, loses his flesh, and gradually sinks, unless the limb be removed by an operation." See Brodie's Obs. in Medico-Chir. Trans. vol. v. p. 251, &c.

3. Another form of white-swelling described by the same writer, is that which is more particularly characterized by ulceration of the articular cartilages. This change occurs in the advanced stage of several diseases of the joints, and it also exists in many instances as a primary affection, in the early stage of which the bones, synovial membrane, and ligaments, are in a natural state; but which, if neglected, ultimately occasions the entire destruction of the articulation. When ulceration of the cartilages occurs in the superficial joints, it constitutes one of the diseases which have been known by the name of white-swelling. From cases which Mr. Brodie has seen, he is led to conclude, that when it takes place in the hip it is this disease, which has been variously designated by writers, the "*morbus coxarius*," the "*disease of the hip-joint*," the "*scrofulous hip*," the "*scrofulous caries of the hip-joint*," &c. At least, Mr. Brodie conceives, that it is to this disease such names have been principally applied, though he acknowledges that there are probably other morbid affections which have been confounded with it. (Op. Cit. vol. iv. p. 236.) The ulceration of the articular cartilages takes place as a primary disease, chiefly in children or adults under the middle age. "Of sixty-eight persons affected with this disease, fifty-six (according to Mr. Brodie) were under thirty years of age: the youngest was an infant of about twelve months; the oldest was a woman of sixty." As the knee is more frequently affected with inflammation of the synovial membrane, so is the hip more liable than other joints to ulceration of the cartilaginous surfaces. In general, the disease is confined to a single joint; but it is not very unusual to find two or three joints affected in the same individual, either at the same time or in succession. Sometimes the patient traces the beginning of his symptoms to a local injury, or to his having been exposed to cold; but, for the most part, no cause can be assigned for the complaint. See Medico-Chir. Trans. vol. vi. p. 319.

For a description of the disorder as it occurs in the hip, the reader is referred to the article HIP-*Joint, Disease of*. At present, we shall merely notice the symptoms which, according to the investigations of Mr. Brodie, particularly characterize ulceration of the cartilages of the knee. They differ from the symptoms of inflammation of the synovial membrane, by the pain being slight in the beginning, and gradually becoming very intense, which is the reverse of what happens in the latter affection. The pain also in the commencement is unattended with any evident swelling, which never comes on in less than four or five weeks, and often not till after several months. It is not to be inferred, however, that every slight pain of the joint unaccompanied with swelling, must of course arise from ulceration of the cartilages. But, says Mr. Brodie, when the pain continues to increase, and at last is very severe; when it is aggravated by the motion of the bones on each other; and when, after a time, a slight tumefaction of the joint takes place, we may conclude that the disease consists in such ulceration. The swelling arises from a slight inflammation of the cellular membrane on the outside of the joint; it has the form of the articulating ends of the bones; and for the most part it appears greater than it really is, in consequence of the muscles being wasted. No fluctuation is perceptible, as where the synovial membrane is inflamed; nor is there the peculiar elasticity, which exists, where the synovial membrane has undergone a morbid alteration of its structure.

Mr. Brodie, however, has explained, that, in some cases, the swelling has a different shape, and communicates the feel of a fluctuation. This happens when inflammation of the synovial membrane, attended with a collection of the synovia of the joint, or abscesses in the surrounding soft parts, or in the articulation itself, occur as secondary diseases. When there has been considerable destruction of the soft parts from abscesses and ulceration, the head of the tibia may become dislocated and drawn towards the ham. See Medico-Chir. Trans. vol. vi. p. 326, &c.

4. There is another species of white-swelling which is peculiarly different from others, in being attended with ulceration of the synovial membrane. As, however, it does not appear to us to need a description in a work not expressly devoted to surgery, we shall only add, that the reader may find Mr. Brodie's account of the case in the Medico-Chir. Transactions. Those white-swellings which are reputed to be scrofulous, form a subject, however, on which we cannot be silent. In the scrofulous diseases of the joints, the bones are primarily affected, in consequence of which ulceration takes place in the cartilages covering their articular surfaces. The cartilages being ulcerated, the subsequent progress of the disease is, according to Mr. Brodie, the same as where this ulceration takes place in the first instance.

It has been a very prevalent opinion, that, in cases of white-swelling, the heads of the bones are always enlarged. Mr. Russell is, perhaps, the first writer who expressed an opposite sentiment, and he absolutely declares, that he had never heard nor known of an instance, in which the tibia was enlarged from an attack of white-swelling. (On Diseases of the Knee, p. 37.) We believe, that a regular expansion of the heads of the bones, in cafes of white-fwelling, is far from being an ufual occurrence, although it may fometimes happen. It is frequent, however, to meet with a fort of enlargement, which arifes from fpiculæ of bony matter, depofited on the outfide of the tibia, ulna, &c., which alteration is materially different from a regular expanfion of the heads of thofe bones. We have, however, lately feen an inftance, in which the upper head of the ulna is confiderably increafed in fize by a regular kind of expanfion. The preparation is in Mr. Abernethy's mufeum; and a few other fpecimens have, we believe, been occafionally noticed. Yet, as a general fact, we may ftill remark, that an enlargement of the heads of the bones in the difeafes called white-fwelling, is far from being the ufual ftate of things. The change which the head of the tibia undergoes in many cafes, is firft a partial abforption of the phofphate of lime throughout its texture, while a foft kind of matter is fecreted into its fubftance. In a more advanced ftage, and, indeed, in that ftage which moft frequently takes place before the limb is amputated, there are deep excavations in the head of the bone, arifing from caries, and its ftructure is now fo foftened, that when a probe is preffed againft the carious part, it readily penetrates deeply into the bone.

Mr. Brodie alfo joins in the opinion, that the morbid affection has its origin in the bones, "which," he fays, "become preternaturally vafcular, and contain a lefs than ufual quantity of earth, while, at firft, a tranfparent fluid, and afterwards a yellowifh cheefy fubftance, is depofited in their cancelli. From the difeafed bone, veffels, carrying red blood, fhoot into the cartilage, which afterwards ulcerates in fpots, the ulceration beginning on that furface which is connected to the bone." Med. Chir. Tranf. vol. iv. p. 272.

With refpect to the expanfion of the heads of the bones, we ought to have mentioned, that the late Mr. Crowther entirely difbelieved the reality of the occurrence, and every body knows, that he paid very confiderable attention to the fubject. (See Pract. Obf. on White-Swelling, &c. edit. 2. p. 14.) The event, however, fhould have been defcribed as unufual, and not as never happening, fince, as we have already ftated, a few fpecimens of fuch a change have now been collected.

Mr. Ruffell has particularly noticed how much the foft parts frequently contribute to the fwelling: "the great mafs of the fwelling," he obferves, "appears to arife from an affection of the parts exterior to the cavity of the joint, and which, befides an enlargement in fize, feem alfo to have undergone a material change in ftructure. There is a larger than natural proportion of a vifcid fluid, intermixed with the cellular fubftance; and the cellular fubftance itfelf has become thicker, fofter, and of a lefs firm confiftence than in a ftate of health." (On the Morbid Affections of the Knee, p. 30.) The manner in which the foft parts are affected is alfo defcribed by Mr. Brodie. "Inflammation takes place of the cellular membrane, external to the joint. Serum, and afterwards coagulable lymph, are effufed; and hence arifes a puffy elaftic fwelling in the early and an œdematous fwelling in an advanced ftage of the difeafe. Scrofula attacks only thofe bones, or portions of bones, which have a fpongy texture, as the extremities of the cylindrical bones, and the bones of the carpus and tarfus; and hence the joints become affected from their contiguity to the parts which are the original feat of the difeafe." Med. Chir. Tranf. vol. iv. p. 273.

All white-fwellings which make confiderable progrefs, and occafion fevere pain, long confinement, abfceffes, &c. unavoidably bring on that impairment of the general health, which is well known by the name of hectic fever. The patient gradually lofes his appetite and natural reft and fleep; his pulfe is fmall and frequent; an obftinate debilitating diarrhœa, and profufe nocturnal fweats, enfue. Such complaints are fooner or later followed by diffolution, unlefs the conftitution be relieved in time, either by the amendment or removal of the difeafed part. In different patients, however, the courfe of the difeafe, and its effects upon the fyftem, vary confiderably in relation to the rapidity with which they occur.

Rheumatic white-fwellings are very diftinct difeafes from the fcrofulous diftemper of the large joints. In the firft, the pain is faid never to occur without being attended with fwelling. Scrofulous white-fwellings, on the other hand, are always preceded by a pain, which is particularly confined to one point of the articulation. In rheumatic cafes, the pain is more general and diffufed over the whole joint.

It feems probable, that all cafes in which the ftructure of the bones is found quite undifeafed, and in which all the mafs of difeafe appears to be confined to the foft parts, are not fcrofulous white-fwellings. Few perfons who have attained the age of five-and-twenty, without having had the leaft fymptom of fcrofula, ever experience, after this period of life, a firft attack of the white-fwelling of the ftrumous kind. All cafes, in which the internal ftructure of the heads of the bones becomes foftened, are probably fcrofulous.

Mr. Ruffell has noticed the frequent enlargement of the lymphatic glands in the groin, in confequence of the irritation of the difeafe when in the knee; but, he juftly adds, that this fecondary affection never proves long troublefome.

When the bones are difeafed, the head of the tibia always fuffers more than the condyles of the thigh-bone. (*Ruffell.*) The articular furface of the femur fometimes has not a fingle rough or carious point, notwithftanding that of the tibia may have fuffered a great deal. The cartilaginous coverings of the heads of the bones are generally eroded firft at their edges; and in the knee, the cartilage of the tibia is always more affected than that covering the condyles of the thigh-bone. Indeed, when white-fwellings have their origin in the bones, and the knee is the feat of the diforder, there is fome ground for fuppofing that it is in the tibia that the morbid mifchief firft commences.

The ligaments of the knee are occafionally fo much weakened or deftroyed by this terrible malady, that the tibia and fibula become more or lefs diflocated backward, and drawn towards the tuberofity of the ifchium, by the powerful action of the flexor mufcles of the leg.

We have feen a curious fpecies of white-fwelling, in which the leg could be moved to each fide a very confiderable diftance, both when the knee was extended and bent. Such a ftate implies a preternatural loofenefs of the ligaments of the articulation.

Scrofulous white-fwellings, no doubt, are under the influence of a particular kind of conftitution, termed a fcrofulous or ftrumous habit. In this fort of temperament, every caufe capable of exciting inflammation, or any morbid and irritable ftate of a large joint, may bring on fuch diforder as may end in the fevere difeafe of which we are now fpeaking.

In a man of a found conftitution, an irritation of the kind alluded to might only induce common healthy inflammation of the affected joint.

In fcrofulous habits, it alfo feems probable, that irritation

tion of a joint is much more eaſily produced than in other conſtitutions; and no one can doubt, that when once excited in the former claſs of ſubjects, it is much more dangerous and difficult of removal than in other patients.

The doctrine of particular white-ſwellings being ſcrofulous diſeaſes, is ſupported by many weighty reaſons, the opinions of the moſt accurate obſervers, and the evidence of daily experience. Wiſeman (book iv. ch. 4.) calls the ſpina ventoſa a ſpecies of ſcrofula, and tells us, that infants and children are generally the ſubjects of this diſeaſe. The diſorder is ſaid by Severinus to be exceedingly frequent in young ſubjects. Petrus de Marchettis has obſerved both male and female ſubjects affected with what are called ſtrumous diſeaſes of the joints, as late as the age of five-and-twenty; but not afterwards, unleſs they had ſuffered from ſcrofula before that period of life, and had not been completely cured. R. Lowerus alſo entertains a ſimilar opinion. Even though a few perſons may have ſcrofulous diſeaſes of the joints, for the firſt time, after the age of twenty-five, this occurrence, like the firſt attack of ſcrofula after this period, muſt be conſidered as extremely uncommon.

Another argument in favour of the doctrine, which ſets down particular kinds of white-ſwellings as ſcrofulous, is founded on the hereditary nature of ſuch forms of diſeaſe.

Numerous continental ſurgeons, particularly Petit and Brambilla, have noticed how very ſubject the Engliſh are both to ſcrofula and white-ſwellings of the joints. We every day ſee, that young perſons afflicted with the preſent diſeaſe, are generally manifeſtly ſcrofulous, or have once been ſo. Very often enlarged lymphatic glands in the neck denote this fatal peculiarity of conſtitution; very often the patients are known to have deſcended from parents who had ſtrumous diſorders. Crowther.

Beſides the general emblems of a ſcrofulous conſtitution, we may often obſerve a ſhining, coagulated flaky ſubſtance, like white of egg, blended with the contents of ſuch abſceſſes as occur in the progreſs of the diſeaſe. This kind of matter is almoſt peculiar to ſcrofulous abſceſſes, and forms another argument in ſupport of the foregoing obſervations relative to the ſhare which ſcrofula frequently has in the origin and courſe of many white-ſwellings. Cooper's Dict. of Practical Surgery.

The cauſes of white-ſwellings are divided by ſurgical writers into external and internal. Amongſt the former are reckoned mechanical injuries of the joints, ſuch as wounds, contuſions, ſprains, immoderate exerciſe in cold damp weather, reſiding continually in a low humid ſituation, &c. It is certain, however, that theſe tumours are ſeldom produced altogether by external cauſes; and even when their formation has been preceded by ſome external violence, this is rather to be regarded only as the determining cauſe of the diſeaſe, while the real cauſe in this, as well as in other caſes where the complaint begins ſpontaneouſly, is of an internal kind. Rheumatiſm and ſcrofula are the ordinary cauſes of white-ſwellings; and it may be alleged, without riſk of error, that more than three-fourths of theſe tumours are owing to theſe conſtitutional diſeaſes. Thoſe white-ſwellings which attack ſtrong plethoric ſubjects of adult age, commonly depend upon rheumatiſm; while other caſes which happen in children, are almoſt always cauſed by ſcrofula. It is well known that rheumatiſm is particularly diſpoſed to make its attack upon the large joints, and that it eſpecially affects the ligaments and neighbouring cellular ſubſtance, which it thickens and hardens, by cauſing an effuſion of coagulable lymph. Hence, ſays Boyer, in ſuch white-ſwellings as ariſe from rheumatiſm, theſe parts alone are found diſeaſed in the early ſtage of the complaint. Traité des Mal. Chir. t. iv. p. 501.

With reſpect to ſcrofula, every ſurgeon is aware that it frequently attacks the heads of the bones, particularly in children, occaſioning thoſe morbid changes which we have already endeavoured to deſcribe. We have likewiſe mentioned what is now generally admitted, that in white-ſwellings originating from ſcrofula, the diſeaſe commences in the bones, the ſoft parts becoming affected only ſecondarily. The contrary is ſaid to happen in all rheumatic caſes, the diſeaſe beginning in the ſoft parts, and only affecting the bones in a ſubſequent advanced ſtage of the complaint.

The prognoſis in caſes of white-ſwelling is, generally ſpeaking, unfavourable; but it is more or leſs ſo, according to the cauſe of the diſeaſe, its duration, the accompanying ſymptoms, the patient's conſtitution, &c. White-ſwellings ariſing from rheumatiſm are the leaſt alarming, eſpecially when they are recent. The progreſs of the complaint may then be often ſtopped, and ſometimes a perfect cure accompliſhed. In this kind of caſe, the joint ſometimes returns to its natural ſtate, and regains the power of freely performing every motion; while in other inſtances, it continues affected with a greater or leſſer degree of ſtiffneſs. White-ſwellings, which appear to depend altogether upon an external cauſe, in perſons in other reſpects healthy and ſound, may terminate well. The worſt white-ſwellings of all are thoſe which originate from ſcrofula; for they are very ſeldom cured, and when they do admit of amendment, the joint is always left in a ſtate of anchyloſis.

Whatever may be the cauſe of white-ſwellings, when they are of long ſtanding, ſeverely painful, the bones ſoftened and rendered carious, the cartilages ulcerated, the articulation filled with ſanious matter, and abſceſſes have formed, the openings of which continue fiſtulous, and emit a more or leſs abundant quantity of a thin fetid diſcharge, the diſeaſe is in general incurable. In this caſe, the violence of the pain, the hectic fever, the profuſe ſweats, and colliquative diarrhœa, plunge the patient into a ſtate of maraſmus, and ſoon carry him off, unleſs an attempt be made to ſave him by the timely performance of amputation. Yet, as Boyer obſerves, in ſome few caſes of this hopeleſs deſcription, nature, ſkilfully aſſiſted by art, has been known to ſubdue the diſeaſe. The ſuppuration then gradually diminiſhes and aſſumes a better quality, the ſlow fever, nocturnal perſpirations, and weakening diarrhœa, entirely ceaſe, the appetite returns, digeſtion is well performed, the ſtrength is reſtored, and the patient gets well with an anchyloſis. But ſuch fortunate caſes are extremely uncommon, and they do not juſtify us in leaving the diſeaſe to nature, inſtead of amputating the limb. Traité des Mal. Chir. t. iv. p. 505. 507.

Of all the diſeaſes which fall under the care of the ſurgeon, there is not one in which a greater variety of remedies has been propoſed than in white-ſwellings. Yet, notwithſtanding the numerous means which are occaſionally tried, the practitioner frequently has the mortification of finding, not only that he cannot accompliſh a radical cure, but that he cannot even palliate the complaint, moderate its violence, or retard its progreſs.

The ſurgeon, in order to be methodical, ſhould adapt the treatment to the particular form of the diſeaſe and its different ſtates. But, in every inſtance, perfect reſt of the limb is abſolutely indiſpenſable, as exerciſe always has the effect of keeping up pain and irritation, and doing harm, whatever may be the ſpecies of the diſeaſe.

Rheu-

Rheumatic white-ſwellings being invariably accompanied, at their commencement, with an inflammatory character, there can be no doubt, that, at this period of the complaint, the great indication is to take ſuch meaſures as are beſt calculated to leſſen and ſubdue inflammation; and bleeding is what ſhould firſt be practiſed. When the patient is ſtrong, robuſt, and much fever exiſts, he may be bled once or twice in the arm; but, in other caſes, we are to be content with drawing blood from the part affected with leeches, or by cupping. If leeches be uſed, they ſhould be applied to both ſides of the joint, and eight or ten ounces of blood ought to be thus taken away. The application of theſe animals ſhould alſo be repeated at proper intervals, more or leſs frequently, according to the violence of the ſymptoms, and the ſtrength of the patient. In caſes of this deſcription, drawing blood from the diſeaſed part itſelf is found to be much more efficacious than general blood-letting, which weakens the patient without proportionately leſſening the ſwelling of the joint.

Bliſters are another means, as efficacious as topical bleeding. Boyer recommends beginning with the application of a ſmall one to the front of the joint, where the leeches have not been put; and he ſays, that it ſhould be kept open, until the bites of the leeches are healed on one ſide of the articulation, where a ſecond bliſter is then to be applied. As ſoon as this is nearly healed, we are next adviſed to lay a third bliſter on the oppoſite ſide of the joint. By thus continually changing the ſituation of the bliſter from one ſide of the articulation to another, a permanent counter-irritation is kept up, which, ſays Boyer, in all deeply-ſeated inflammations, eſpecially thoſe which proceed from rheumatiſm, is much more effectual, than carefully maintaining a diſcharge from a ſingle bliſter.

In conjunction with the foregoing means, the limb ſhould be kept moderately and uniformly warm by covering it with flannel; a low diet is to be obſerved, cooling beverages preſcribed, and the action of the bowels regulated by clyſters. Thus, the ſeverity of the pain may generally be leſſened, and the inflammation diminiſhed. If the pain, however, ſhould ſtill continue to be violent, Boyer recommends the uſe of topical anodyne and narcotic applications. He ſtates, that, in this circumſtance, he has often employed with ſucceſs opiate and camphorated liniments; fomentations compoſed of a ſolution of the extract of opium in water; a ſtrong decoction of poppies, &c. He thinks, however, that ſuch applications ſhould never be uſed, unleſs the pain be very ſevere.

When the inflammatory ſtage is over, topical reſolvent remedies are to be employed, and their effect is to be promoted by exhibiting mild opening medicines at ſuitable intervals. The moſt effectual reſolvent applications, and thoſe which are moſt commonly tried in theſe caſes, are, dry frictions with a piece of flannel, impregnated with the vapour of benzoin, liniments containing ammonia and camphor, ammoniacal plaſters, ſoap-liniment, lotions of vinegar, ſpirit of wine, and the muriate of ammonia, &c. Mr. B. Bell had a very high opinion of the good effects of rubbing the joint with camphorated mercurial ointment; but Boyer affirms, that he has often tried the laſt application, and that his experience leads him to impute whatever benefit ariſes from its employment, chiefly to the frictions, which redden and promote the circulation in the ſkin.

By a perſeverance in the judicious uſe of the means above ſpecified, rheumatic white-ſwellings may ſometimes be cured; but it often happens, that, after the pain and ſwelling have ſubſided, the joint remains quite ſtiff and motionleſs, and every attempt to move it cauſes conſiderable ſuffering. In the majority of caſes, ſuch ſtiffneſs depends almoſt entirely upon the retraction of the muſcles, tendons, and ligaments, and demands the ſame treatment as a falſe anchyloſis. See Anchylosis.

When the diſeaſe reſiſts the foregoing treatment, and is of long ſtanding, the cure is more difficult, inaſmuch as the thickening of the ligaments, and the effuſion of a ſero-albuminous fluid into the cellular ſubſtance around them, are more conſiderable, and the bones and cartilages are likewiſe at the ſame time affected. In this circumſtance, if there be any hope of cure, the ſurgeon muſt have recourſe to more powerful means, which we ſhall mention in ſpeaking of the treatment of other deſcriptions of white-ſwelling.

In white-ſwellings, ariſing from an external cauſe, ſuch as blows, falls, &c. we muſt firſt leſſen the inflammation by general and local bleeding, low diet, cooling aperient beverages, fomentations, and emollient anodyne poultices. Afterwards, when the pain and tenſion have ſubſided, reſolvent applications are to be uſed, and the patient is not to be allowed to move the limb, as long as there is any danger of a renewal of the pain and irritation by exerciſe.

Scrofulous white-ſwellings in an early ſtage preſent different indications, according to the circumſtances with which they are accompanied. A fall, or blow upon a joint, being ſometimes the exciting cauſe of theſe tumours, any accident of this kind in a perſon evidently diſpoſed to ſcrofula demands the utmoſt attention and care. No means ſhould be neglected which are at all likely to leſſen the pain and irritation in the affected joint, and in particular the limb ought to be kept perfectly quiet for a long time. Scrofulous white-ſwellings frequently come on, as it were, ſpontaneouſly, without the concurrence of any external accident, and their attack is attended with a dull, ſometimes an acute pain in the very cavity of the joint, which at firſt is not affected with any manifeſt degree of ſwelling. In this circumſtance, the ſurgeon muſt endeavour to prevent the progreſs of the diſeaſe by enjoining the patient to refrain from moving the joint, and by directing the employment of ſoothing local applications, which are afterwards to be ſucceeded by bliſters, or an iſſue.

In the caſes of white-ſwelling, which appear from Mr. Brodie's account to depend principally upon inflammation of the ſynovial membrane, the acute ſtage of the diſeaſe is to be treated by general and local bleeding, aperient medicines, cold topical applications, or fomentations, and emollient poultices. When the affection has become chronic, this gentleman recommends perfect reſt, and leeches, or cupping, followed by the application of a large bliſter. Under this treatment, he ſays, "the pain is relieved, and, in a few days, the ſwelling, as far as it depends upon the fluid collected in the cavity of the joint, is much diminiſhed. Even where the tumour is ſolid, ariſing from the effuſion of coagulating lymph, it will in a great meaſure ſubſide, and ſometimes be entirely diſperſed, provided the lymph has not yet become organized. A ſingle bliſter often produces marked good effects; but, it is generally neceſſary to repeat both the bliſter and the blood-letting ſeveral times." Mr. Brodie conſiders the repeated application of bliſters more efficacious, than a ſingle bliſter kept open with the ſavine cerate. When the inflammation has been much ſubdued, he thinks moderate exerciſe of the joint rather beneficial, and commends the uſe of a ſtimulating liniment, compoſed of ℥iſs of olive oil, and ℥ſs of ſulphuric acid. This application, when too irritating, is to be weakened by an additional quantity of oil, and it is not to be uſed before in-

flammation

flammation is fubdued, left it aggravate the difeafe. Iffues and fetons, which are ufeful in ulceration of the cartilages, Mr. Brodie deems ufelefs in the prefent difeafe. Plafters of gum ammoniac, and others of a fimilar nature, are of little efficacy while inflammation exifts, but afterwards they are of ufe in guarding the joint from the influence of external cold, and preventing a relapfe. For the removal of a moderate degree of fwelling and ftiffnefs, left by the paft inflammation, Mr. Brodie entertains a favourable opinion of exercife of the limb, and friction with camphorated mercurial ointment, or by the hand with finely powdered ftarch. When the friction, however, produces inflammation again, it is to be difcontinued, and leeches applied. When the fwelling and ftiffnefs are confiderable, Mr. Brodie has never feen friction do much good, and, as it is in fuch cafes particularly apt to bring on inflammation again, it is to be employed with much caution. According to the fame author, friction is more efficacious, where the ftiffnefs of a joint depends on a contracted ftate of the mufcles, or tendons of the limb, or on thefe being glued to each other, or the furrounding parts, than where it is the confequence of difeafe of the joint itfelf. In fome cafes, the pumping of warm water on the part, from a height of feveral feet, as practifed at fome of the watering places, is beneficial; but in this plan, the fame cautions are neceffary, as in the employment of friction.

With regard to the cafes which Mr. Brodie defcribes as depending upon a total lofs of the natural ftructure of the fynovial membrane, which is converted into a pulpy fubftance, one-quarter, or one-half, of an inch in thicknefs, are, according to this gentleman, quite incurable, and they at length terminate in ulceration of the cartilages, abfceffes, &c. Hence, when the health begins to fuffer, he confiders amputation proper. See Medico-Chir. Tranf. vol. v.

When white-fwellings are accompanied with ulceration of the cartilages, all motion of the joint is extremely hurtful. Indeed, as Mr. Brodie well obferves, keeping the limb in a ftate of perfect quietude is a very important, if not the moft important circumftance to be attended to in the treatment. According to the fame writer, it is in thefe cafes, in which ulceration of the cartilage occurs as a primary difeafe, that cauftic iffues are ufually productive of fingular benefit; but he deems them of little ufe in any other difeafes of the joints. He thinks fetons, and blifters kept open with the favine cerate, may alfo be ufed with advantage in the fame defcription of cafes. Bleeding can only be proper, when, from the bad effects of exercife, the articular furfaces are inflamed, and pain and fever prevail. Mr. Brodie affures us, that the warm-bath relieves the fymptoms in the early ftage, if it does not ftop the progrefs of the difeafe; but he condemns plafters of gum ammoniac, embrocations, liniments, and frictions, as either ufelefs or hurtful. Op. Cit. vol. vi.

The pumping of warm water upon difeafed joints is a method which is at prefent very frequently adopted, as fome conceive, with decidedly beneficial effects. The plan is not altogether modern. Le Dran, and feveral other old practitioners, recommend throwing warm water upon difeafed joints, and they prove the advantages of this treatment by a relation of many fuccefsful cafes. In order to derive the greateft poffible good from the plan, the water fhould be as warm as the patient can bear it, and it ought to fall upon the part from a height of feven or eight feet. The fize of the ftream muft alfo vary according to the degree of fenfibility in the tumour. When the pain is acute, the end of the pipe muft be clofed with a piece of tin, perforated by many holes, like the fpout of a watering-pot. But when the pain is inconfiderable, the pipe may terminate in a fingle opening, the diameter of which fhould vary from half an inch to an inch, according to circumftances. The application is fometimes to be continued nearly an hour, and when it is finifhed, the patient ought to go to bed, and the joint be covered with bladders filled with water as hot as the patient can bear. Boyer recommends the application of the bladders to be perfevered in for the fpace of two hours, after which they are to be removed, and perfpiration from the part promoted by covering it with warm cloths, or flannels. In the evening, the bladders are to be repeated for fome hours. The dafhing of warm water againft the difeafed joint is to be practifed every day, or every other day, according as the patient can bear the plan, without too much fatigue or inconvenience. This treatment, fays baron Boyer, is proper in all kinds of white-fwellings, and in every ftage of the difeafe; but it is much the moft ufeful in thofe cafes in which the foft parts alone are affected, and at an early period, before the complaint has made great progrefs. Favourable effects may be expected from this method, when, after each application of the water, the part affected perfpires copioufly, when it grows gradually fofter, and when, after a certain number of trials, the fwelling begins to diminifh. Under thefe circumftances, the plan is to be continued and repeated very often, as a long perfeverance in it has frequently produced extraordinary cures. When none of the above-defcribed changes happen, little benefit can be hoped for from the method; but ftill the patient fhould not abandon it, before its inefficacy has been proved by adequate trials.

When there is no fuitable apparatus for applying the warm water, it may be injected againft the part with a large fyringe, which has a pipe about half an inch in diameter, made with four or five holes, for the difcharge of the fluid. The injections may be rendered more or lefs active, by propelling the water with more or lefs force.

Thefe affufions operate only by the heat and ftrength of the current of water. Boyer ftates, that their activity may be augmented by adding to the fluid a quantity of the muriate of foda or muriate of ammonia, or fome potaffa or foda; and he thinks it ftill better to employ a fulphuretted mineral water, either natural or factitious. The activity of the affufions may alfo be increafed by heating the water to a high temperature, letting it fall from a confiderable height, and making the ftream large. It is a plan, fays baron Boyer, adapted to thofe white-fwellings which are fituated in the foft parts on the outfide of the joints; and which are indolent, and unattended with much pain. When thefe active affufions are applied to white-fwellings which are painful, and which affect the bones, they often increafe the patient's fufferings, and accelerate the progrefs of the difeafe. See Traité des Mal. Chir. tom. iv. p. 512, &c.

Of late years, furgeons have frequently made trial of dry-rubbing, as it is termed, or friction of the joint, performed with the hand, for feveral hours a day, with the mere application of a little powdered ftarch, or hair-powder, in order to prevent the part from being chafed. It is a method which was firft practifed to a confiderable extent at Oxford, and with great fuccefs. Many poor women there earned a livelihood by rubbing difeafed joints at the rate of fixpence *per* hour. Indeed, there can be no doubt, that, in indolent rheumatic white-fwellings, fimple friction often removes the fwelling in an expeditious manner, as well as the ftiffnefs of the affected joint. The plan, however, will not effect a cure in fcrofulous cafes; nor can it be adopted without manifeft harm

harm in any examples, in which the difeafe is either in an inflamed or irritable ftate.

In chronic cafes, the fwelling may alfo be leffened, and the complaint fometimes much benefited by preffure, made either with ftrips of adhefive plafter, or with bandages. This method will not do much good in inftances where the bones are difeafed, nor is it applicable to cafes which are irritable, or attended with heat and inflammation.

For fcrofulous white-fwellings, furgery cannot yet be faid to have difcovered any effectual or certain means of relief; and thefe melancholy difeafes frequently compel the patient to fubmit to amputation, as the only thing by which a long train of fufferings can be arrefted, and the term of life extended. The common plan of treating fcrofulous white-fwellings is, by topical bleeding, fomentations, and cold applications, when they are attended with much pain, heat, and irritation; and by iffues, fetons, and blifters, in other periods of the difeafe. The cautery and moxa have alfo been much employed abroad; and, as every body knows, they were favourite and powerful remedies in the hands of the ancients. In this country, the ufe of actual fire in furgery is nearly, if not quite, exploded, on the ground that its employment is attended with an appearance of cruelty, and that iffues, made with cauftic, are equally efficacious. Pouteau, an eminent French furgeon, will ever be famous for having revived in his own country all the ancient partiality to burning irons. He recommended their ufe for all white-fwellings without difcrimination; and the accounts which he has left of the fuccefs of the practice are furprifing, if not incredible. In fact, they are in all probability great exaggerations; for we find that baron Boyer, one of the moft eminent furgeons at Paris at the prefent time, decidedly declares his opinion, that Pouteau's defcriptions of the efficacy of the actual cautery in the cure of white-fwellings do not correfpond with the refults of modern experience. Boyer himfelf gives a preference to the moxa, which is a cone of cotton, burnt upon the difeafed part, fo as to produce an efchar. We confefs, that to us this plan feems to have no material difference from the cautery; and, what is it but the application of actual fire in another form? Indeed, one cannot help thinking, that Boyer decries the cautery, only for the purpofe of afterwards recommending the moxa, which is now a more fafhionable means employed in French furgery. It is curious to find Boyer particularly forbidding the ufe of iffues, and the moxa in cafes of white-fwelling, where the bones and cartilages are difeafed; the very cafes in which Mr. Brodie, in common with the generality of furgeons in England, exprefsly recommends either iffues or perpetual blifters. Boyer has never feen much good arife from iffues in any cafes, although, as he affirms, he has made extenfive trial of them. The time alfo when he thinks the moxa ufeful, is in that ftage of the complaint which intervenes between the prevalence of inflammatory fymptoms, and the commencement of difeafe in the bones and cartilages. Sometimes, however, the diforder certainly has its very origin in the bones themfelves.

The late Mr. Crowther introduced the plan of keeping open blifters with the favine cerate, which is a method frequently attended with great fuccefs in chronic white-fwellings, and fometimes appears to check the progrefs of the fcrofulous form of the difeafe. Blifters may be kept open with this ointment a long time, and with lefs pain, than what proceeds from the ufe of the unguentum lyttæ, and other ftimulating dreffings. It alfo occafions no rifk of bringing on ftrangury, or inflammation of the bladder and urinary organs, like the ufe of ointments containing cantharides. In our opinion, Mr. Crowther had much merit in making known the eligible qualities of the favine cerate; and, we believe, no better application for keeping up a difcharge from blifters will ever be found out. Sometimes, however, the repeated application of blifters has more effect upon white-fwellings, than a fingle blifter kept open. This is a circumftance which the practical furgeon ought conftantly to remember.

We might enlarge this article with obfervations on iffues and fetons, which are frequently employed in thefe cafes; but it would be fuperfluous, as they have been already defcribed in other parts of the work. See Issue, and Seton.

It may be fuppofed, that fcrofulous white-fwellings will require the exhibition of the remedies ufually adminiftered in cafes of fcrofula. (See Scrofula.) Boyer, and fome other writers declare, that this is actually the cafe. We have never feen thefe remedies, however, do any good to difeafed joints, if we except fea-air, fea-bathing, and the ufe of fea-water lotions and poultices, which fometimes prove ufeful.

After all, we muft acknowledge that white-fwellings, we mean particularly the inftances accompanied with ulceration of the cartilages, and difeafe of the heads of the bones, are cafes which too generally baffle the utmoft fkill, and render a formidable operation unavoidable.

White *Tail.* See Motacilla *Œnanthe.*

White *Tartar.* See Tartar.

White *Thorn.* See Cratægus.

White *Thorn*, or *Hawthorn.* See Hedge, and Quickset-*Hedge.*

White *Thorn Layer*, a term applied to fuch plants of the white thorn kind as are laid down in hedges to grow, in the operation of plafhing. Alfo to the young roots of this thorn ufed in raifing this fort of hedges. See Plashing *Hedges.*

White-*Throat*, in *Ornithology*, the name of a fmall bird, very common in our gardens and hedges, and feeming to have been defcribed under the name of *fpipola* by Aldrovandus and fome others, though moft approaching to the *ficedula* clafs.

Its beak is black above, and whitifh below; its feet of a yellowifh-brown; its neck and back are of a brownifh-grey; its head more grey than either, and the upper part of the throat white, the reft reddifh; its breaft and belly are alfo a little reddifh; but in the female, the breaft is perfectly white. The edges of the long wing-feathers are fome whitifh and others brownifh, and the tail is variegated with black and white, and fome grey or afh-colour intermixed. It is extremely common in our gardens and orchards in fummer, and feeds on flies, fpiders, and other infects, but leaves us in winter. It builds in bufhes, at a fmall height from the ground, with ftubble and horfe-hair, and lays five brownifh-green eggs, with black fpots. Its note is continually repeated, and often attended with odd motions of the wings: it is harfh and difpleafing. This bird is fhy and wild, and feems of a pugnacious difpofition. Ray and Pennant. See Motacilla *Sylvia.*

White *Trefoil*, in *Agriculture*, is faid, in the third volume of the Effays of the Highland Society of Scotland, to be a humble but fweet plant, which delights in a dry found field, properly cleaned and limed; and is alone the delight of fheep. But that a mixture of it, and of the feeds of rye and rib grafs, conftitutes one of the beft fheep-paftures that can be formed by the induftry of man. That this fort of grafs is likewife perennial, and that it enriches inftead of impoverifhing the foil or land. This has generally been noticed

noticed to be the moſt abundant plant in ſuch rich improved paſtures; but that it has ſeldom been ſeen in lands remarkable for inducing the rot among ſheep. See Rot, Sheep, and White *Clover*.

White, *Troy*. See Troy-*White*.

White *Varniſh*, and *Vitriol*. See the ſubſtantives.

White *Vitriol*, in *Mineralogy*, a natural ſalt or ore of zinc. (See Zinc, and Zinc *Ores*.) This ore is a ſulphate of that metal, but is frequently combined with a ſmall portion of manganeſe. It is ſuppoſed to be formed naturally by the decompoſition of blende or ſulphuret of zinc.

White-*Waſhing*, *Roughcaſt*. See Wash *for*, &c.

White *Water*, a diſeaſe in *Sheep*, of the dangerous ſtomachic kind. It is ſaid to be cauſed by their feeding on rich ſucculent food in cold froſty ſeaſons, or at other times, and by many other ſuch cauſes; and is probably an affection of the inflammatory kind.

It is remarked in the Glouceſter Report on Agriculture, that the white water is a deſtructive diſorder on the Cotſwolds; uſually comes on with rapidity, and ſometimes terminates with death in three hours. It is ſuppoſed to be owing to their licking up the white froſt on their green food in ſpring and autumn. Folding at night on bare ground, giving them dry meat in the morning, and keeping them from the turnips till the froſt is gone, is the obvious mode of prevention, if the foregoing cauſe be well founded. If, however, the diſorder be owing to gorging themſelves with watery food, ſuch as turnips, it is probable that to keep them moving, without ſuffering them to reſt long, nor ſwell with what they have eaten, will carry off the beginning complaint; and even if the white froſt has been the occaſion, this is the beſt remedy that reaſoning ſuggeſts; and it is ſaid to be the practice of the ſhepherds in Northumberland, in the management of ſheep under this complaint.

It is probable that ſpeedy evacuation, both by bleeding and purging, may be found uſeful in this diſeaſe, and afterwards the uſe of ſtomachic remedies.

It is found to chiefly attack the young healthy ſheep. See Water, *Red and Black*.

White *Water-Lily*, in *Gardening*, a moſt beautiful plant of this country, which is capable of being propagated in artificial and ornamental pieces of water in gardens and pleaſure-grounds, merely by tranſplanting the bulbous roots of it in the winter ſeaſon. It is perennial in its nature.

White *Wax* is yellow wax blanched, and purified by the ſun and dew. See Wax.

White *upon White*, in the *Porcelain Manufactory*, a name given by the Engliſh merchants to a particular china-ware, which is formed of three different white ſubſtances, the body being of one, the flowers of another, and the varniſh which covers theſe of a third. See Hoache.

White *Wine* is that of a clear, bright, tranſparent colour, bordering on white. It is thus called to diſtinguiſh it from the red wines, or clarets.

The generality of white wines are made from white grapes; though there are ſome from black ones, only the ſkins are carefully kept from tinging them. See Wine.

Whites, the popular name of a diſorder incident to women. See Fluor *Albus*.

White, in *Geography*, a county of Weſt Tennaſſee, with 4028 inhabitants, including 283 ſlaves.

White *Bay*, a bay on the eaſt coaſt of Newfoundland. N. lat. 50° 10′. W. long. 56° 25′.—Alſo, a bay on the eaſt coaſt of Kerguelen's Land, ſouth of Point Pringle, ſo called from ſome white ſpots of land or rocks. In the bottom are ſeveral ſmaller bays or coves. S. lat. 47° 53′. E. long. 69° 15′.

White *Bear Lake*, a lake of North America, ſaid to be the moſt northerly of thoſe lakes which ſupply the Miſſiſſippi. It is about 60 miles in circumference. N. lat. 46° 50′. W. long. 95° 30′.

White *Cliff*, or *Culver Cliff*, a cape of the eaſt coaſt of the Iſle of Wight. North of it is a bay called White Cliff Bay. N. lat. 50° 39′. W. long. 0° 56′.

White *Deer*, a townſhip of Pennſylvania, in North Cumberland county, on the Suſquehanna, with 1132 inhabitants.

White *Flag Bay*, a bay on the weſt coaſt of the iſland of St. Chriſtopher; 2 miles N. of Sandy Point.

White *Head*, a cape of Ireland, on the coaſt of Antrim, at the entrance into Belfaſt Lough, a little to the ſouth of Black Head.

White *Hills*, a fiſhing-town of Scotland, in the county of Bamff, ſituated in a creek; 2 miles N. of Bamff.

White-*Horſe Vale*, a vale of Berkſhire, ſo called from the figure of a horſe in a galloping poſture, cut in the ſide of a chalky hill, as is ſuppoſed in memory of a great victory gained by Alfred over the Danes in the year 871. The ſcouring the horſe is an annual feſtival, and celebrated by rural games. On the top of the hill is a large Roman intrenchment, called Uffington caſtle, or Woolſton caſtle. There is likewiſe another camp in the neighbourhood, with the burial place of the Daniſh chief, incloſed by ſtones ſet on edge, a cromlech, and ſeveral barrows.

White *Horſes*, cliffs on the ſouth coaſt of Jamaica; 20 miles E.S.E. of Kingſton.

White-*Houſe Bay*, a bay on the weſt coaſt of the iſland of St. Chriſtopher, a little to the north of Guana Point.

White *Inlet*, or *Boca de Ratones*, an inlet on the eaſt coaſt of Eaſt Florida. N. lat. 26°. W. long. 80° 20′.

White *Iſland*, an iſland in the South Pacific ocean, near the eaſt coaſt of New Zealand, north of Cape Run-away. S. lat. 37° 31′. W. long. 182° 36′.—Alſo, a ſmall iſland in the Atlantic, near the S.E. coaſt of Nova Scotia. N. lat. 44° 55′. W. long. 61° 56′.

White *Iſland*, or *Burnt Iſland*, a ſmall iſland in the Arabian Gulf, near the coaſt of Adel. N. lat. 11° 8′. E. long. 64° 55′.

White, *Iſle of*. See *Iſle of* Wight.

White *Keys River*, a river of Africa, which runs into the Indian ſea, S. lat. 30° 35′.

White *Mountains*, mountains of New Hampſhire, peculiarly applied to the higheſt part of a ridge, which extends N.E. and S.W.: the whole circumference at leaſt fifty miles. The height of theſe mountains above an adjacent meadow is reckoned, from obſervations made by the Rev. Mr. Cutler, of Ipſwich, in 1784, to be about 5500 feet, and the meadow 3500 feet above the level of the ſea. The ſnow and ice cover them nine or ten months in the year, during which time they exhibit that bright appearance from which they are denominated the White Mountains. From this ſummit, in clear weather, is exhibited a view extending ſixty or ſeventy miles in every direction: although they are more than ſeventy miles within land, they are ſeen many leagues off at ſea, and appear like an exceedingly bright cloud in the horizon. Theſe immenſe heights, being copiouſly repleniſhed with water, afford a variety of caſcades. Three of the largeſt rivers in New England receive a great part of their waters from theſe mountains. Amanooſuck and Iſrael rivers, two principal branches of the Connecticut, fall from their weſtern ſides. Peabody river, a branch of the Amoriſcogen, falls from the north-eaſt ſide, and almoſt

the

the whole of the Saco descends from the southern side. The highest summit of these mountains is in about 44° N. lat.

WHITE *Oak Creek*, a river of North Carolina, which runs into the Atlantic, N. lat. 34° 39′. W. long. 77° 26′.

WHITE *Oak Mountains*, mountains in the west part of North Carolina. N. lat. 36° 10′. W. long. 82° 30′.

WHITE *Point*, a cape on the coast of Cape Breton, near Louisburg.—Also, a cape on the south coast of Jamaica; 20 miles E. of Port Royal.—Also, a cape on the north coast of the island of Cumbava. S. lat. 8° 15′. E. long. 118° 51′.

WHITE *River*, a river of Louisiana, formerly thought to be a stream of inconsiderable magnitude, but now known to be one of the most considerable in the western country, and likely to become of still greater importance. It rises in the Black Mountains, which separate the waters of the Arkansas from those of the Missouri and Mississippi. Several of its branches interlock with those of the Osage river, the Maramak, and the St. Francis. It is navigable about 1200 miles, without any considerable interruption; 800 of which may be made with barges, and the rest with canoes or smaller boats. Its waters are clear and limpid, its current gentle, and even in the driest season, plentifully supplied from the numerous and excellent springs which are every where found. It also receives many considerable rivers in its course, the largest of which is Black river. The country which it waters is described by those who have traversed it as generally well wooded, and abounding in springs and rivulets: the soil is rich, though hilly; and it is said, that on the borders of this river a country may be chosen, at least 100 miles square, not surpassed by the best parts of Kentucky, and one of the best for settlements in the western world. This river is situated on the S.W. side of the Missouri, and is 300 miles wide at its mouth.

WHITE *River*, a river of Guadaloupe.—Also, a river of America, which runs into the Connecticut, 4 miles east of Norwich.—Also, a river of Jamaica, which runs into the sea, 4 miles W. of Morant bay.—Also, a river of Indiana, in the county of Koog, which rises about N. lat. 40° 45′, and W. long. 85° 5′, and runs into the Wabash, N. lat. 38° 19′, and W. long. 88° 20′.—Also, a river of America, which runs into lake Michigan, N. lat. 43° 40′. W. long. 85° 35′. —Also, a river of Vermont, which runs into the Connecticut, N. lat. 43° 38′. W. long. 72° 16′.

WHITE *Rock*, a rocky islet in the East Indian sea, near the south coast of Java.

WHITE *Rocks*, a range of buildings, accommodated for smelting-houses, about a mile from Swansea, in the county of Glamorgan, situated on the river.

WHITE'*s Bay*, a bay on the coast of Newfoundland. N. lat. 50° 17′. W. long. 56° 15′.

WHITEBURN, a town of Scotland, in the county of Linlithgow; 21 miles W. of Edinburgh.

WHITECLAY CREEK, a hundred of Delaware, in Newcastle county, with 1701 inhabitants.

WHITEFIELD, GEORGE, in *Biography*, one of the founders of Methodism, (see METHODISTS,) was the son of an innkeeper at Gloucester, where he was born in 1714, and where he received the rudiments of literature, so as to be sufficiently qualified for his father's business, for which he was designed. Accordingly he commenced it as drawer at the Bell-inn. At school he is said to have been distinguished by a retentive memory and good elocution. Of his early years, he gives a very unfavourable account, so that there was nothing about him but a fitness to be damned, with occasional gleams of grace that afforded some indication of his future destination. About the age of 18, he was admitted a servitor at Pembroke college, Oxford, and associated with those young persons whose dispositions and habits resembled his own, and whose conversation and manners contributed to cherish that religious enthusiasm to which he was strongly addicted. As soon as Dr. Benson, bishop of Gloucester, received information concerning the state of his mind and the course of his general conduct, he made him an offer of ordination, when he was about 21 years of age, and he was accordingly ordained a deacon in 1736. Upon his return to Oxford, after preaching his first sermon at Gloucester, he took the degree of bachelor, and diligently employed himself in communicating instruction to the poor and the prisoners. During the two following years, he acquired a great degree of popularity by his public services in London, Bath, Bristol, and other places; collecting large auditories, and interesting the attention of his hearers. His voice was strong and musical, his pronunciation clear and distinct, his imagination was lively, and his feelings were warm; and to these natural powers of eloquence we may add his selection of subjects, which were adapted to rouse the inconsiderate, and to comfort those that were awakened to a sense of their guilt and danger: so that we need not wonder that he should command a numerous audience. Upon receiving information that the province of Georgia was likely to open to him an extensive field of usefulness, he determined to visit it, and in May 1738, arrived at Savannah. Here he met with much greater success than his predecessor Wesley; and in order to supply the defect of education which he was concerned to observe in this province, he resolved to found an orphan-house, and in 1739 returned to England in order to collect money for this purpose. In England few of his clerical brethren were disposed to take much notice of him; nevertheless, his original patron, the bishop of Gloucester, gave him priest's orders: but upon afterwards visiting London, none of the churches into which he obtained admission were large enough to accommodate the crowds of people that assembled to hear him. It was about this time that he commenced his practice of preaching in the open fields, and the first scene of his exhibition in this way seems to have been Kingswood, near Bristol, where he collected thousands, chiefly of colliers, who without doubt derived benefit from his discourses. He also preached at Bristol in the open air, when he was refused access to the pulpits of the churches; and he likewise pursued the same practice in Moorfields and Kennington-common, near London, where, amidst the immense multitude that attended him, some persons occasionally treated him with rudeness, but the greater number were commanded by his peculiar power of address into respectful attention. Having succeeded beyond his expectations in soliciting contributions for his projected orphan-house in Georgia, he returned to America in August 1739; and in the following January laid the foundation of the building at Savannah. He then extended his tour as far as Boston, preaching to immense crowds, and collecting considerable sums for the completion of his design; and upon his return to Savannah he found his orphan family comfortably settled in their house; and in January 1741, he embarked for England. His absence had occasioned a declension among his followers; some other circumstances, besides the intermission of his personal labours amongst them, might probably have contributed to produce this effect. Whilst he was in America he had written, as he himself acknowledges, "two well-meant but injudicious letters against England's two great favourites, the Whole Duty of Man, and archbishop Tillotson, who, I said, knew no more of religion than Mahomet." His society had suffered from the influence of the Moravians. Mr. Wesley

 had

had preached and printed in favour of perfection and universal redemption, and against the doctrine of election. He had written a reply, but he acknowledges that he had used expressions that were too strong in reference to absolute reprobation, which had offended numbers of his spiritual children. His worldly circumstances were embarrassed, and he owed 1000*l.* for the orphan-house, and some of his bills were returned. He had some enemies who circulated reflections on his integrity in the contract of this business; but they were never justified, and his state of secular affairs at his death affords a strong presumption that they were groundless. Dr. Franklin, who lived upon the spot, bears testimony to his honesty. At this time, a separation had taken place between him and Wesley, and this had occasioned a decrease of his auditors. However, his zeal and perseverance overcame these difficulties. In order to counteract Wesley's popularity, he built a shed near his chapel in Moorfields, which he called the Tabernacle; and in process of time this rose from a mean beginning to be a spacious edifice; and he also renewed his field-preaching. At this time, he paid his first visit to Scotland; and though he was a clergyman of the church of England, which excited some prejudice against him, he was invited into the churches, and preached to large congregations, and made collections for his orphans. On his return by Wales, he married a Mrs. James, a widow lady of Abergavenny. His zeal for doing good, and for making proselytes, induced him, in the spring of 1742, to engage in a contest with the idle people who had booths in Moorfields, and where they frequented for their amusement on holidays. On Whitmonday he collected a party of his attendants, and resorted to the spot with a view of conducting a religious service. Although he was much disturbed in this effusion of his piety and zeal, the result, as he says, was so much in his favour, that he received 1000 notes from persons under conviction; and soon after more than 300 were admitted into the society in one day. In 1748 he returned from a third voyage to America; and then commenced his acquaintance with the countess of Huntingdon, who appointed him her chaplain, and excited the curiosity of some persons of rank to hear him: among these were the earl of Chesterfield and lord Bolingbroke. About this period, it is said, his sentiments became more rational; for on his third visit to Scotland, it was announced to a synod assembled at Glasgow to investigate certain charges against his opinions, that with regard to certain points which were considered as objectionable, his sentiments had been altered for upwards of two years; and that he now seldom preached a sermon without guarding his hearers against impressions, and admonishing them that a holy life is the best evidence of a state of grace. From this time, he was fully employed by a visit to Ireland, two more voyages to America, and his English circuits, till the year 1756, when his chapel in Tottenham-court-road was erected. His labours were incessant for many years; but at length, on a seventh visit to America, he was seized with an asthmatic complaint at Newbury-port, New England, which terminated his life in September 1770, near the completion of his fifty-sixth year.

With regard to his general character, we shall close this article with the reflections of a judicious and candid biographer. "That he had much enthusiasm and fanaticism in his composition is sufficiently evident from his own journal and letters; but whether these were accompanied, as they not unfrequently are, with craft and artifice, is a disputable point. There are, in his narratives, obvious marks of a disposition to represent himself as under the special protection of Providence, and to magnify trifling incidents into little less than miracles in his favour; and much of what is commonly called cant is apparent in his confessions and humiliations. Yet that he was a hypocrite acting a part will scarcely be believed by any one who looks at his course of life during 34 years. He has been charged with dishonesty and immorality; yet as it is certain that he obtained the esteem of many persons of worth, it may be concluded that such accusations were destitute of proof. His intellectual qualities were well suited to the task he undertook; and if in the pulpit he occasionally intermixed buffoonery with his vehemence, the latter was not less effectual on that account. His learning and literary talents were mean, and he is a writer only for his own sect." He published, at intervals, sermons, tracts, and letters, which, after his death, were collected in six vols. 8vo. Middleton's Biog. Evangel. Mosh. Eccl. Hist. Gen. Biog.

Whitefield, in *Geography*, a town of America, in the district of Maine, and county of Lincoln, having 995 inhabitants.—Also, a town of New Hampshire, in the county of Cowes, having 51 inhabitants.—Also, a town of North Carolina; 40 miles W. of Newbern.

Whitefield, or *Wheatfield*, a township of Pennsylvania; 156 miles W. of Philadelphia.

WHITEHALL, formerly called Skenesborough, a post-township of Washington county, in the state of New York, at the head of lake Champlain, about 65 miles N.E. from Albany: in medial length about 10 miles from N. to S., and 7 wide; first erected in 1788, with its present limits. The soil is a stiff clay, and adapted to grass. Wood-creek and Pawlet river unite in this town, and afford facility to navigation and trade, as well as mill-seats. Marble, limestone, and iron-ore, and also a mineral spring, are found in this township. It has 1 Congregational, 1 Presbyterian, 1 Baptist, and 1 Methodist congregation, and a competent number of common schools; 2 grist-mills, 2 saw-mills, a fulling-mill, and carding-machine.—Also, an incorporated post-village at the N. end, with considerable trade, situated principally on the W. bank of Wood-creek, at its entrance into lake Champlain; 71 miles N.E. from Albany. About a quarter of a mile from the village is a handsome Presbyterian church, founded by the donation of John Williams, esq. of Salem, who endowed it with a parsonage of 60 acres of land. The whole population, by the census of 1810, was 2119, with 178 electors.—Also, a township of Pennsylvania, in Northampton county, with 2551 inhabitants; 61 miles N. of Philadelphia.

WHITEHAVEN, a sea-port and market-town in Allerdale ward, in the county of Cumberland, England, is situated between two hills at the northern extremity of a narrow vale, at the distance of 40 miles S.W. from Carlisle, and 305 miles N.W. from London. The rise, progress, and increasing importance of this now rich and flourishing town, strikingly display the effects of trade, industry, and enterprise. From an obscure hamlet, it has advanced, within less than two centuries, to considerable magnitude and commercial importance; and, both in extent and population, by far exceeds the capital of the county. In the year 1566, it consisted only of six fishermen's cabins; in 1633, of nine or ten thatched cottages; but in 1693, its buildings were sufficiently numerous for 2222 inhabitants, and have been progressively increasing; till, in the year 1811, the population was returned to parliament as 10,106, occupying 1940 houses. The increase of shipping has been proportionate: in 1685, the whole number of vessels belonging to this port was 46, carrying 1871 tons; they have since gradually increased to 230; the quantity of tonnage is nearly 74,000 tons. The honour of raising this town to its present importance must be attributed to the Lowther family.

family. Sir John Lowther, about the beginning of the reign of Charles I., purchafed the lands of the diffolved monaftery of St. Bees for his fecond fon, fir Chriftopher, who, as coals about that period came into general ufe, conceived the idea of improving his poffeffions by opening fome collieries. No effectual progrefs was, however, made till after the Reftoration, when another fir John Lowther, who had fucceeded to the eftate, formed a plan for working the mines on a very extenfive fcale. To obviate all oppofition to his operations, he procured a gift of all the ungranted lands within the diftrict, and alfo of the whole fea-coaft for two miles northward, between high and low water mark. He then directed his attention to the port, which was fmall and inconvenient; and, by his judicious fchemes, laid the foundation of the prefent haven. Subfequent improvements have been made, particularly during the reign of George II., when an act was paffed to perfect and keep it in repair, by a tonnage on fhipping. The mines are faid to be the deepeft in England, and extend a confiderable way under the fea: one has been carried 1000 yards out from the fhore, at the depth of 112 fathoms under the water. Moft of the coal exported from this haven is conveyed to Ireland; the quantity raifed annually, on the average, is about 90,000 chaldrons. (See COAL.) The creek on which Whitehaven is built is fo deeply feated, that the adjacent lands overlook it on every fide. The approach from the north is fingular, as the heights are fo much above the town, that only the roofs of the houfes can be feen till near the entrance, which, on this point, is through an archway of red free-ftone. The town itfelf is one of the moft refpectable in all the northern counties; the ftreets being regular and fpacious, and croffing each other at right angles; the houfes in general are well built, and even the tradefmen's fhops exhibit a degree of elegance. Here are three chapels, plain convenient ftructures: they were all erected by fubfcription of the inhabitants, aided by the benevolence of the Lowther family. St. Nicholas's chapel was built in 1693; Trinity, in 1715; St. James's, in 1752. The latter is neatly fitted up; the roof and galleries are fupported by ranges of pillars. Befides the eftablifhed chapels, here are three meeting-houfes for Methodifts, two for Prefbyterians, and one for each of the following fects, Anabaptifts, Roman Catholics, Glaffites, and Sandemanians. The principal manufactures are thofe of cordage and fail-cloth; the latter was only eftablifhed in 1786, but already gives employment to feveral hundred workmen, though much of the bufinefs is executed by machinery of great power. A fair is held annually, and there are three weekly markets. The caftle, as it is called, adjoining the eaft fide of the town, one of the feats of the earl of Lonfdale, is a large quadrangular building, chiefly erected by the late earl, and containing fome good paintings.

St. Bees, in which parifh Whitehaven is fituated, derives its origin from a religious houfe founded here by Bega, an Irifh faint, about the year 650. On her death, a church was erected to her honour; but both thefe eftablifhments having been deftroyed by the Danes, they were replaced, in the reign of Henry I., by a new foundation for Benedictine monks. The church built at this period had the form of a crofs, and great part of it yet remains. The eaft end is unroofed, and in ruins; the nave is fitted up as the parifh church; and the crofs-aifle is ufed as a burial-place. The whole is of a red free-ftone. In this village a free-fchool was founded by a bequeft of archbifhop Grindall, in the year 1587, under a charter of queen Elizabeth. The endowments were increafed by James I., and have been fince further augmented by various benefactions.—Beauties of England and Wales, vol. iii. Cumberland, by J. Britton and E. W. Brayley, 1802. Magna Britannia, Cumberland, by Meffrs. Lyfons, 4to. 1816.

WHITEHEAD, WILLIAM, in *Biography*, an Englifh poet, was born at Cambridge in 1714–5, educated at Winchefter fchool, where from his talent in writing verfe he acquired the notice of Pope; and upon his return to Cambridge, obtained a fcholarfhip of Clare-hall. As a poet, Whitehead's higheft ambition was to refemble the manner of Pope; and of his proficiency he gave a fpecimen in his "Epiftle on the Danger of writing Verfe," 1741. In the following year he was elected fellow of Clare-hall, and purfued his ftudies with a view to the church; but his poetical talents produced a change in his circumftances and in his purpofe. Being recommended to the earl of Jerfey as a proper tutor for his eldeft fon, he removed in 1745 to the earl's houfe in London, where his treatment was in the higheft degree liberal. Having leifure for indulging his tafte for literary purfuits, he turned his attention to dramatic compofition, and produced a tragedy, entitled "The Roman Father," which was exhibited with applaufe upon the ftage in Drury-lane in 1750. In 1754 he publifhed another, the title of which was "Creufa," which was alfo favourably received. With the profits arifing from thefe two performances he very honourably difcharged the debts of his father, who had died infolvent. In this year he accompanied his pupil, vifcount Villiers, and vifcount Nuneham, fon of earl Harcourt, on their travels, which continued more than two years; and on his return he publifhed an "Ode to the Tiber," and fix elegiac epiftles, which were much applauded. Lady Jerfey, during his abfence, had procured for him the appointment of fecretary and regifter to the order of the Bath; and in 1757, on the death of Cibber, he fucceeded to the laureat, which he rendered refpectable; though in the difcharge of the cuftomary duties of the office, he did not efcape abufe, and efpecially that of Churchill, whofe popular fatire almoft overwhelmed the reputation of the laureat. Lady Jerfey, in confideration of his fervices as governor to her fon, invited him to take up his refidence in her houfe, where he paffed fourteen years, frequently vifiting lord Harcourt, much refpected by his noble hofts and his former pupils. He ftill amufed himfelf by prefenting to the public occafional productions, one of which was a comedy of the moral or fentimental clafs, entitled "The School for Lovers." After paffing through life tranquilly and pleafantly, and maintaining an eftimable character, he died fuddenly, April 1785, in his 70th year. Of his works two volumes were publifhed by himfelf, and to thefe a third was added by Mr. Mafon, who prefixed memoirs of his life and writings, to which we refer. Gen. Biog.

WHITEHEAD, GEORGE, an eminent perfon among the Quakers, was born in 1636 at Sunbigg, in Weftmoreland. Attaching himfelf early in life to this fociety, and engaging in the propagation of its doctrine, he partook of the fufferings which, in that age, were the ordinary lot of its active members; and was once, fimply for having preached at Nayland, in Suffolk, feverely whipped by order of two juftices as a vagabond; a proceeding which ferved, as might have been expected, to increafe the difpofition of the people to hear him. Soon after the Reftoration of the monarchy, the Quakers were made the exprefs fubjects of a law, the precurfor of others of like nature, which impofed on their profeffion and worfhip penalties extending to banifhment. In the progrefs of the bill through the houfe of commons, Whitehead, with three other Quakers, was admitted to the bar of the houfe, and heard in defence of the fociety. They pleaded its caufe with the freedom of confcious innocence,

cence, and the meeknefs of men prepared to fuffer, but pleaded in vain :—the bill paffed, and two out of the four, who had thus advocated the rights of confcience, prefently fell victims to the force by which confcience was deliberately oppreffed, dying in a crowded unhealthy prifon, to which they were dragged from their peaceable religious meetings. Whitehead, who was imprifoned with them, furvived to be liberated.

In the year 1672, when Charles II. iffued his declaration for fufpending the penal ftatutes againft non-conformifts, Whitehead folicited and obtained an order under the great feal for the difcharge of about four hundred Quakers, many of whom had been for years under clofe confinement. He records, with expreffions of satisfaction, the circumftance that fome other diffenters alfo partook at this time of the benefit of his exertions. On feveral other occafions he was concerned in applications on the Quakers' behalf to Charles II. and James II. And after the Revolution, when the Toleration Bill was before parliament, he was particularly ferviceable to his friends in that matter; as likewife in taking a part in thofe reprefentations, which procured the acceptance of their affirmation in lieu of an oath. A profeffion of faith being propofed for infertion in the above act, in terms which to the Quakers would not have been quite fatisfactory, Whitehead and his coadjutors propofed the following, as their own belief on the points to which it relates, and which was adopted as a teft for the fociety accordingly, *viz.* "I profefs faith in God the Father, and in Jefus Chrift his Eternal Son the true God, and in the Holy Spirit, one God, bleffed for evermore; and do acknowledge the holy fcriptures of the Old and New Teftament to be given by divine infpiration."

Whitehead lived the greater part of his time in or near London, which accounts for his being one of thofe Quakers ufually concerned in applications to the government. He was well efteemed by his brethren, whom he continued to edify by his miniftry and example to the end, dying, after a fhort confinement, by infirmity, at the age of 86. Befides feveral writings chiefly controverfial, heleft fome memoirs of his life, which were printed in one volume, 8vo. in 1725.

Whitehead, in *Geography*, an ifland in the Atlantic, near the coaft of Maine. N. lat. 44° 43′. W. long. 67° 40′.—Alfo, a cape of Ireland, at the north-eaft of the bay of Carrickfergus, in the county of Antrim.

WHITEHORN, a royal borough and market-town in the diftrict of Machers, and fhire of Wigtown, Scotland, is fituated on the weftern fide of the bay of Wigtown, at the diftance of 116 miles S.S.W. from Edinburgh. It is a place of great antiquity, having been the Roman ftation Leucophibia, or Candida-Cafa of Bede, and the capital of the Novantes, who poffeffed all Galloway beyond the river Dee; and it was fo early the feat of religion, that, according to Pinkerton, the bifhopric of Galloway, or Whitehorn, is the oldeft in Scotland. The cathedral, of which there are now fcarcely any remains, was founded in the fourth century by St. Ninian. A priory of the Premonftratenfian order was alfo early founded here, and richly endowed by Fergus, lord of Galloway. The borough now confifts chiefly of one large well-built ftreet, extending from north to fouth, interfected by feveral fmaller. A rivulet, over which is a neat bridge, runs acrofs the main ftreet. Near the centre of the town is a refpectable hall for public meetings, adorned with turrets and a fpire, and furnifhed with a fet of bells. Whitehorn is governed by a provoft, two baillies, and fifteen counfellors; and unites with the boroughs of New Galloway, Wigtown, and Stranraer, in fending a reprefentative to the imperial parliament. A weekly market is well fupplied. The tanning of leather has been carried on feveral years to a confiderable extent, and fome cotton manufactures have been commenced. The parifh of Whitehorn extends eight miles in length and four in breadth, and occupies that extremity of the peninfula of the fhire of Wigtown which is formed by the bays of Wigtown and Luce. The foil is in general fertile, and the farms well cultivated. Here are many extenfive plantations in a flourifhing condition; confiderable quarries of variegated marble and ftrong flate; and promifing appearances of lead and copper mines, but none have as yet been worked. The extent of fea-coaft is about nine miles. The ifle of Whitehorn, included in the parifh, has a fafe harbour, and a village containing 350 inhabitants. According to the return of the year 1811, the population of the whole parifh was 1935.—Beauties of Scotland, vol. ii. Wigtownfhire. Carlifle's Topographical Dictionary of Scotland, vol. ii. 1813.

Whitehorn, a fmall ifland of Scotland, near the fouth-eaft coaft of the county of Wigtown. N. lat. 54° 46′. W. long. 4° 27′.

WHITEHURST, John, in *Biography*, was born at Congleton, in Chefhire, in 1713, and brought up to the trade of his father, who was a watch-maker. At the age of 21 years he vifited Dublin, in order to acquaint himfelf with the conftructioo of a curious clock; but being difappointed, he engaged in bufinefs for himfelf at Derby, about two or three years after his return, where he diftinguifhed himfelf by a variety of ingenious pieces of mechanifm; and he thus eftablifhed a reputation, which caufed him to be confulted by all perfons who wifhed to avail themfelves of fuperior fkill in mechanics, pneumatics, and hydraulics. In 1775 he was appointed, without any folicitation on his own part, ftamper of the money weights; which office required his removal to London, where he fpent the remainder of his days, and where his houfe was the refort of fcientific men of various defcriptions. In 1778 he publifhed his "Inquiry into the original State and Formation of the Earth," of which an enlarged and improved edition appeared in 1786, and a third in 1792. In May 1779 he was elected a fellow of the Royal Society. In 1783 he vifited Ireland, to examine the Giant's Caufeway, and the northern parts of the ifland; and the refult of his inquiries was annexed to his work above-mentioned. In the courfe of his journey he erected an engine for raifing water from a well to the fummit of a hill, in a bleaching-ground at Tullidoi, in the county of Tyrone. It is worked by a current of water, and is of very curious conftruction. In 1787 he publifhed "An Attempt towards obtaining invariable Meafures of Length, Capacity, and Weight, from the Menfuration of Time." (See Standard.) Mr. Whitehurft, having been for fome time fubject to the gout, was at length carried off by a paroxyfm of it in the ftomach, in February 1788, in the 75th year of his age, at his houfe in Bolt-court, Fleet-ftreet. As a man of fcience, he was much refpected by all who knew him; but he was ftill more eftimable on account of his moral qualities. In his drefs he was plain, temperate in his diet, and in his general intercourfe with mankind eafy of accefs, benevolent in his difpofition, and obliging in his manners. His papers on Chimneys, Ventilation, and Garden-ftoves, were collected and publifhed in 1794 by Dr. Willan. His papers in the Philofophical Tranfactions, printed afterwards in the collection of his works in 1792, were the following: *viz.* "Thermometrical Obfervations at Derby," in vol. lvii.; "An Account of a Machine for raifing Water at Oulton in Chefhire," vol. lxv.; and "Experiments

periments on ignited Subſtances," vol. lxvi. Hutton's Math. Dict.

WHITEKIRK, in *Geography*, a pariſh and village of Scotland, in the county of Haddington; 4 miles S.E. of North Berwick.

WHITELAND, West. See West *Whiteland*.

WHITELICK, a town of the ſtate of Kentucky; 13 miles S. of Stamford.

WHITELOCK, Bulstrode, in *Biography*, a lawyer and ſtateſman, was born in London in the year 1605, and finiſhed his education as a gentleman-commoner of St. John's college, Oxford. Being deſtined for the profeſſion of the law, he purſued the ſtudy of it under the direction of his father, ſir James Whitelock, who was one of the juſtices of the King's Bench. As he had a taſte for the fine arts, he was nominated as one of the chief managers of the royal maſque preſented by the inns of court to Charles I. and his queen in 1633, of which he has given a florid deſcription. He became ſoon diſtinguiſhed in his profeſſion at the bar, and was frequently conſulted by Hampden, when he was under proſecution for reſiſting the impoſition of ſhip-money. In 1640 he was elected as a repreſentative for Marlow in the Long parliament; and though his principles were favourable to the meaſures which then engaged the public attention, he concurred with Selden and others in deprecating a reſort to arms; but when the houſe had determined for war, he accepted the poſt of deputy-lieutenant for the counties of Oxford and Buckingham, and appeared at the head of a gallant company of horſe raiſed among his neighbours. Neverthelefs he was always averſe from a civil conteſt; and in January 1642–3, he was one of the commiſſioners appointed to treat of peace with the king at Oxford; and in 1644 he was one of thoſe who preſented to the king propoſitions of peace agreed upon in parliament; and the king's anſwer was, at his majeſty's requeſt, drawn up by him and Holles, for which they were accuſed of high treaſon by parliament, but extricated themſelves with honour. As a member of the aſſembly at Weſtminſter for ſettling the form of church government, he avowed himſelf in oppoſition to the divine right of preſbytery. He alſo oppoſed the power of excommunication aſſumed by the Preſbyterians; being always, like Selden, an enemy to violent exertions of church power by any party; and he was an invariable advocate of legal rights, and an oppoſer of arbitrary power, aſſumed or exerciſed in either houſe of parliament. When he became ſuſpected by the parliamentary leaders, he joined the army-party, and oppoſed the meaſure of diſbanding the troops, which was propoſed by ſome of his former aſſociates. When it was determined to bring the king to trial, he was nominated as one of the committee for drawing up the charge; but this was a buſineſs in which he did not chooſe to engage. However, he had no objection againſt taking an active part under the new government, and he was nominated in February 1648–9 one of the council of ſtate. In ſome other inſtances he incurred the charge of inconſiſtency, as he complied with meaſures which he did not approve. To Cromwell he was ſo agreeable, that he was one of the four members of parliament appointed to meet him after his famous victory at Worceſter in 1651. Whitelock avowed himſelf ſteadily attached to monarchy, as a part of the ſtate which could not be diſpenſed with, and as interwoven with the laws of the country; and he therefore ſuggeſted, that the late king's eldeſt or ſecond ſon ſhould be ſent for, and enter into terms for ſecuring the liberties of the nation. Upon the diſſolution of parliament by Cromwell, though he had previouſly reſiſted the attempts of the army to govern without the parliament, he obſequiouſly performed the functions of his office under the new eſtabliſhment. The uſurper, however, regarded him with diſtruſt, and would not admit him into his firſt or little parliament. His commiſſion of the ſeals was ſuperſeded by the ſuppreſſion of the court of chancery; and he was therefore glad to be occupied in a ſtation which would not require his interference in party conteſts, which was that of ambaſſador from England to queen Chriſtina of Sweden. Upon his departure, Cromwell aſſumed the title and authority of lord protector, and iſſued his inſtrument of government, which Mr. Whitelock had concurred in preparing, and which was afterwards found by Cromwell incompatible with his uſurpation. Having concluded an advantageous treaty with queen Chriſtina, who received him in November 1653 with diſtinction, he returned to his own country, and reſumed the office of commiſſioner of the great ſeal, upon the reſtoration of the court of chancery; and he was returned as a repreſentative for three counties in Cromwell's ſecond parliament. Upon Cromwell's regulation and limitation of the court of chancery, he again reſigned the cuſtody of the ſeal; and as ſome compenſation for his loſs, he was appointed a commiſſioner of the treaſury. He was free and faithful in giving ſalutary advice to the Protector, and nevertheleſs retained his confidence. Declining the office of ambaſſador to Sweden, which was offered him, he acted as one of the commiſſioners to treat with the Swediſh ambaſſador in England. He was returned for Buckinghamſhire in Cromwell's third parliament, and officiated for ſome time as ſpeaker. Although he would not preſent to parliament the "Humble Petition and Advice," which was intended to empower Cromwell to aſſume a higher title than that of Protector, he was chairman of the committee for conferring with him about it; and he concurred in the requeſt that he would adopt the royal title. Whitelock contracted ſo decidedly in Cromwell's intereſt, that he was one of thoſe who were called by him to the upper houſe; but he declined being governor of Dunkirk, and alſo the honour of being created a viſcount. During the ſhort protectorate of Richard, Whitelock acted as one of the keepers of the great ſeal; and when the army ſet up a republican government, he was nominated one of the council of ſtate; and as its preſident, he joined in all the meaſures that were adopted for upholding the tottering frame of government, on the principle that if no legal authority was acknowledged, the ſword alone would probably govern. When Monk propoſed to reſtore the remains of the Long parliament, Whitelock took a commiſſion from the committee of ſafety for raiſing a regiment of horſe, and urged Lambert to march againſt that leader. But the deſign failing, and the parliament meeting, he juſt appeared in purſuance of the ſpeaker's ſummons; and as he had reaſon for ſuſpecting a deſign to apprehend him, he returned to a friend's houſe in the country, and ſent the great ſeal by his wife to the ſpeaker;—and thus terminated his public life. Upon the Reſtoration, he had the good fortune to eſcape a bill of pains and penalties in the houſe of commons, only by the negative of a ſmall majority. After having paſſed fifteen years in retirement, chiefly at Chilton-park in Wiltſhire, he there died in January 1676; leaving a numerous family, after having been twice married.

Poſſeſſed of conſiderable abilities, and of diſtinguiſhed talents for buſineſs, he would have claimed a more general and cordial reſpect, if he had not been a temporizer in his public conduct. His principles of government appear, however, to have been good, and in his temper he was averſe from every kind of violence and injuſtice. He was a well-wiſher to the law and conſtitution, and ſupported them as far as it was conſiſtent with his intereſt and ſafety. In all private

private concerns he maintained an estimable character for probity and honour. After his death an anonymous editor, in 1682, published his "Memorials of the English Affairs; or, an historical Account of what passed from the Beginning of the Reign of King Charles I. to King Charles II. his happy Restoration," fol.; an improved edition of which appeared in 1732. From his MSS. were published in 1709, "Memorials of the English Affairs from the supposed Expedition of Brute to this Island, to the End of the Reign of King James I.," a chronological epitome of history for his own use. In 1766 Dr. Charles Morton, secretary to the Royal Society, published "Whitelock's Notes upon the King's Writ for choosing Members of Parliament, 13 Car. II. being Disquisitions on the Government of England by King, Lords, and Commons," 2 vols. 4to. The same editor also published in 1772, "A Journal of the Swedish Embassy in the Years 1653 and 1654, from the Commonwealth of England, Scotland, and Ireland; written by the Ambassador the Lord Commissioner Whitelock; with an Appendix of original Papers," 2 vols. 4to. Biog. Brit. Gen. Biog.

The commissioner, amid all his grave affairs, found leisure to cultivate music, of which he was very fond; and seems to have interested himself in all the remarkable performances of his time. During the happy days of Charles I., masques were so frequent at court and elsewhere, that in 1633 no less than five masques were performed at different places before the king and queen. See Masque.

A very circumstantial account of one of these, "The Triumphs of Peace," has been left to his family by the commissioner himself, which was in the possession of the late Dr. Morton of the British Museum. The musical part of this performance seems to have been wholly assigned by the benchers at the Temple to commissioner Whitelock. For in his narrative he says, "I made choice of Mr. Symon Ives, an honest and able musician, of excellent skill in the art, and of Mr. Lawes, to compose all the aiers, lessons, and songs for the masque, and to be masters of all the musicke under me." See Ives, and Lawes, William.

The commissioner, besides being a performer, was a bit of a composer; as he says with great triumph at the latter end of his narrative: "I was so conversant with the musitians, and so willing to gaine their favour, especially at this time, that I composed an aier myselfe, with the assistance of Mr. Ives, and called it 'Whitelocke's Coranto;' which being cried up, was first played publiquely, by the Blackefryar's musicke, who were then esteemed the best of common musitians in London. Whenever I came to that house (as I did sometimes in those dayes), though not often, to see a play, the musitians would presently play 'Whitelocke's Coranto;' and it was so often called for, that they would have it played twice or thrice in an afternoon. The queen hearing it, would not be persuaded that it was made by an Englishman, bicause she said it was fuller of life and spirit than the English aiers use to be; butt she honoured the 'Coranto' and the maker of it with her majestyes royall commendation. It grew to that request, that all the common musitians in this towne, and all over the kingdome, gott the composition of it, and played it publiquely in all places, for above thirtie years after."

Among other moral reflections, addressed to his family, on such vanities as he had been describing, lord commissioner Whitelock adds: "Yet I am farre from discommending the knowledge of this art (music), and exercise of this recreation for a diversion, and so as you spend not too much of your time in it, that I advise you in this as in other accomplishments, that you indeavour to gett to some perfection, as I did, and it will be the more ornament aud delight to you."

The lord commissioner inserts his aier, in order to preserve it for the use of his family, if any of them should delight in it. This "Coranto" may be seen in Burney's Hist. Mus. vol. iii.; and the whole narrative of the masque, entitled "The Triumph of Peace," from "Whitelock's Labours remembered in the Annales of his Life, written for the Use of his Children," MS.

WHITEMARSH, in *Geography*, a township of Pennsylvania, in the county of Montgomery, with 1328 inhabitants; 15 miles N.W. of Philadelphia.

WHITEN Head, a cape on the north coast of Scotland. N. lat. 58° 37′. W. long. 4° 22′.

WHITENESS, a town of the island of Shetland; 6 miles N.W. of Lerwick.

WHITENING *of Bones*, for a skeleton. See Bone.

Whitening *of Cloth*. See Bleaching.

Whitening *of Hair*. See Hair.

Whitening *of Wax*. See Wax.

WHITEPAINE, in *Geography*, a town of Pennsylvania, in the county of Montgomery, with 955 inhabitants; 20 miles N.W. of Philadelphia.

WHITE-PLAINS, a post-township and half-shire town of West Chester county, in New York; 30 miles from New York, and 140 S. of Albany. The whole area of this town is about $8\frac{1}{2}$ square miles; and its population, in 1810, was 693, with 68 electors, and 109 taxable inhabitants. The village of White-plains is pleasantly situated on a fine plain, three-quarters of a mile E. of Bronx creek, and contains a court-house, prison, and a handsome collection of houses. The American troops were defeated in this place, by the British under general Howe, in the year 1776.

WHITESAND Bay, a bay on the W. coast of England, in the county of Cornwall, a little to the N. of the Land's End. N. lat. 50° 6′. W. long. 5° 34′.—Also, a bay on the W. coast of Wales; 1 mile N.W. of St. David's.

WHITESEA, a large gulf of the North Frozen sea, on the N. coast of Russia, bounded on the N.E. and S. by the government of Olonetz, in the vicinity of Archangel, extending from N. to S. within the land, from 69° to 63° of N. lat., and containing a number of small islands.

WHITESTOWN, the principal town and half shire of the county of Oneida, in the state of New York, situated on the Mohawk river, 95 miles N.W. of Albany; including Utica, and having three post-offices. Its form is irregular, and area about 40 square miles. In January, 1785, Mr. Hugh White, from Connecticut, with a young family, became the first settler. In 1788 the town of German Flats was divided, and a new town erected, and named Whitestown, in honour of Mr. White. In 1798 the county of Oneida was established, by a subdivision of Herkimer, and Whitestown included within this county. By subsequent divisions, Whitestown was reduced to a medial measure of 9 miles by 8. It is situated immediately on the great thoroughfare between Albany and the Western lakes; between Canada and the principal commercial sea-ports of the American states on the Atlantic ocean. This town contains three large post-villages, Utica incorporated, Whitesborough, and New Hartford. Whitestown, including these villages, is unrivalled, in the United States, with regard to wealth, population, trade, and improvements, among inland towns of such recent settlement; and none in this state, of the same area, affords so great a population. It has seven principal churches; one Episcopal, three Presbyterian, two Baptist, in one of which the service is performed

formed in the Welſh language, and one of Welſh Independents, beſides ſome ſmaller houſes dedicated to the ſame purpoſe. Here are three grammar-ſchools, one in each village, and many common ſchools. It has alſo a cotton manufactory. This town has been gradually enlarged and embelliſhed. Its population, by the cenſus of 1810, is 4912, with 533 ſenatorial electors.

WHITEWATER, a townſhip of Ohio, in Henieton county, with 910 inhabitants.—Alſo, a river of Scotland, which runs into the Eſk, in the county of Forfar.

WHITGIFT, John, in *Biography*, an Engliſh prelate, was born at Great Grimſby, Lincolnſhire, in 1530, and in 1548 entered at Queen's college, Cambridge, from which he removed to Pembroke-hall, where he enjoyed the tuition of John Bradford, afterwards one of the Proteſtant martyrs. In 1555 he became a fellow of Peter-houſe, and in 1557 commenced M.A. Upon the viſitation of the univerſity by cardinal Pole, about this time, for the purpoſe of purging it of reputed heretics, Whitgift dreaded the ſearch; but by favour of the vice-chancellor eſcaped, and remained in the univerſity. Upon the acceſſion of queen Elizabeth, he entered into orders in 1560, and obtained preferment from Dr. Cox, biſhop of Ely. In 1563 he was appointed Margaret profeſſor of divinity, and chaplain to the queen in 1565. Continuing in the univerſity, and maintaining the character of a good preacher and vigorous diſciplinarian, his ſalary as profeſſor was advanced, and a licence was granted him to preach in any part of the realm. In 1567 he was made maſter of Pembroke-hall, and ſoon after regius profeſſor of divinity. He next became maſter of Trinity college, and graduated D.D.; and on his appointment to keep the commencement-act, he choſe for his theſis "The Pope is the Antichriſt." In 1570 he formed a body of ſtatutes for the univerſity; in conſequence of which the heads of houſes gained new powers, by the exerciſe of which he deprived Cartwright, an eminent Calviniſtic divine, of his Margaret profeſſorſhip. In 1571 he was vice-chancellor of the univerſity, in the exerciſe of which office he manifeſted ſo much zeal for the eſtabliſhed church, that the queen conferred upon him the deanery of Lincoln, beſides other dignities and honours. He alſo expelled Cartwright from his fellowſhip, and carried on a controverſy with that divine and other Puritans in general. In 1577 he was advanced to the ſee of Worceſter, and the office of vice-preſident of the council for the marches of Wales. Upon his advancement to the prelacy, he reſigned his maſterſhip of Trinity college, and devoted himſelf to the duties of his new office, taking care to improve its revenues; and in the exerciſe of a power, which he obtained from the crown by the intereſt of lord Burleigh, to beſtow the prebends of his church on his own friends according to his own ſelection. His zeal, however, againſt popiſh recuſants, which was thus recompenſed, and which he exerciſed without due diſcrimination in the execution of his office as vice-preſident of Wales, involved him in diſputes with the other judges, and offended the preſident, ſir Henry Sydney, ſo that on his return from Ireland, where he was lord-deputy, he diſcharged Whitgift from his poſt. As he occupied new ſtations, his reputation as a man of buſineſs increaſed; and in 1582 he was nominated by the archbiſhop of Canterbury, Grindal, chief commiſſioner for ſettling diſputes in the dioceſes of Lichfield and of Hereford. Grindal's remiſſneſs in executing the laws againſt the non-conforming clergy diſpleaſed the queen, and cauſed her to ſuſpend him from his functions; and on his death in 1583, Whitgift, who had ſecured her favour by his zeal for the church and hoſtility to the Puritans, was appointed to ſucceed him. He did not diſappoint her expectations; but engaged her to iſſue a new eccleſiaſtical commiſſion, more arbitrary and poſſeſſing more extenſive authority than any former one. Its juriſdiction extended over the whole kingdom, and comprehended all orders of men; and as Hume deſcribes it, "every circumſtance of its authority, and all its methods of proceeding, were contrary to the cleareſt principles of law and natural equity." "In a word," ſays he, "this court was a real *inquiſition*, attended with all the iniquities, as well as cruelties, inſeparable from that tribunal." The meaſures of Whitgift were in uniſon with the conſtitution and ſpirit of this commiſſion; and the council itſelf interpoſed to moderate them. In reply to the remonſtrance of the council in favour of ſome miniſters of Ely, who had been ſuſpended for refuſing to anſwer interrogatories, he ſaid, "Rather than grant them liberty to preach, he would chooſe to die, or live in priſon all the days of his life." To the queen he recommended "ſuppreſſing" the diſcipline propoſed by the Puritans, "rather than confuting it by writing;" and he adviſed that a reſtraint ſhould be laid upon the liberty of the preſs at Cambridge. It is no wonder that by ſuch conduct he ſhould become the object of great averſion to the puritanical party. Accordingly he was very acrimoniouſly attacked in a pamphlet, entitled "Martyn Marprelate," in which he was compared to the moſt ambitious and tyrannical churchmen of former times. Whitgift, however, blended with the violence of his temper ſome degree of kindneſs and good humour. This was manifeſted in his conduct towards Cartwright. In his charities he was munificent, and in his mode of living hoſpitable, as well as ſplendid and oſtentatious. In 1595 he laid the foundation of a hoſpital at Croydon, on which very large ſums were expended. He maintained ſeveral ſtudents at the univerſity, and entertained for many years at his palace ſeveral refugee divines, that had been recommended to him by Beza and others. His houſe, it is ſaid, was as much an academy for martial exerciſes as a ſchool for letters. "On his progreſſes he was attended by a numerous and ſplendid train; and at his firſt journey into Kent he rode into Dover with one hundred of his own ſervants in livery, of whom forty were gentlemen wearing gold chains. On feſtival days he was ſerved with great ſolemnity, ſometimes on the knee; and public worſhip in his chapels was performed with every circumſtance of religious pomp. This external grandeur exalted the church of England in the eyes of foreigners, who had been led to imagine that the Reformation in this country had degraded the eccleſiaſtical eſtabliſhment as much as it had done in ſome others."

Upon the acceſſion of king James, Whitgift felt ſome alarm under the apprehenſion of ſome changes in the liturgy; and it has been ſuppoſed that his agitated ſtate of mind concurred with the debility of age, and the operation of ſome other cauſes, in producing the paralytic attack which terminated his life in February 1603–4. A monument was erected to his memory at Croydon, where he was interred. Whitgift was neither a man of learning, the Latin language bounding his claſſical literature, nor a profound theologian. He was principally diſtinguiſhed by his vigour and activity as a man of buſineſs. As a preacher he was popular; and this talent in which he excelled laid the foundation of his advancement. Biog. Brit. Hume's Hiſt. Gen. Biog.

WHITING, in *Ichthyology*, the Engliſh name of a common fiſh of the aſellus kind, commonly diſtinguiſhed by the writers in ichthyology by the name of *aſellus mollis*, though by ſome called *aſellus albus* and *merlangus*.

The whiting, or gadus merlangus of Linnæus, is a fiſh of an elegant form; the upper jaw is the longeſt; the eyes are large, the noſe ſharp, and the teeth of the upper jaw long,

long, appearing above the lower when closed: the first dorsal fin has fifteen rays, the second eighteen, and the last twenty. The colour of the head and back is a pale brown; the lateral line white and crooked; the belly and sides silvery; the last streaked lengthways with yellow.

Whitings appear in large shoals in our seas in the spring, keeping at the distance of about half a mile to that of three miles from the shore. They are the most delicate and wholesome of any of the genus; and seldom grow to more than ten or twelve inches in length. Pennant.

No whiting is to be taken in the Thames or Medway of less size than six inches from the eye to the end of the tail, or at any time except from Michaelmas-day to Ember week. (30 Geo. II. cap. 21.) Nor under six inches any where else. 1 Geo. I. stat. 2. cap. 18.

Whiting-*Pollack*. See Gadus *Pollachius*, and Pollack.

Whiting-*Pout*. See Pouting, and Gadus *Barbatus*.

Whiting, in *Geography*, a township of Vermont, in the county of Addison, with 565 inhabitants; 25 miles N. of Rutland.

Whiting *Bay*, a small bay of the county of Waterford, Ireland, a little E. of Youghal bay.

WHITLEY, a township of Pennsylvania, in Greene county, with 1264 inhabitants.

WHITLOW, in *Surgery*, called also by surgeons *paronychia*, *panaritium*, *onychia*, &c. is an inflammation affecting one or more of the phalanges of the fingers, and generally terminating in an abscess. These are the parts which are the usual situation of the complaint; but sometimes a disease, which is precisely similar, makes its attack upon the toes. It is likewise to be understood, that in severe cases, the disorder extends itself to many other parts besides the finger, the matter making its way upward higher than the wrist. Thus, as Callisen justly observes, the skin, cellular substance, sheath of the flexor tendons, and less commonly that of the extensors, the tendons themselves, the annular and capsular ligaments, the periosteum, the very texture of the finger-bones, and the pulpy substance underneath the nail, are all parts to which a whitlow may extend its mischievous consequences.

From what has been already observed, it must be plain that whitlows differ very much in their degree of violence, and in their depth and extent. Hence, surgical authors usually describe four or five varieties of the complaint. The division adopted by Callisen comprehends five cases; namely, the *cutaneous* or *superficial paronychia*, the *subcutaneous paronychia*, the *paronychia of the tendons*, or *theca*, the *paronychia of the periosteum*, and the *subungual paronychia*, or *that situated underneath the nail*.

The *cutaneous paronychia* begins with a superficial inflammatory redness of the finger, and, as early as the second or third day from the commencement of the attack, the cuticle of the part affected becomes raised in the form of vesicles, which contain a limpid serum, but sometimes a bloody fluid. (Callisen, vol. i. p. 294.) Mr. Pearson describes the cutaneous paronychia as being seated at the end of the finger, immediately below the cuticle, and as sometimes surrounding the finger and root of the nail. The skin, he says, is very little discoloured. The case speedily advances to suppuration; and when this process is completed, the cuticle appears almost transparent. After the contents of this little abscess are evacuated, the ulcer seldom demands any particular attention. Principles of Surgery, p. 88. edit. 2.

The *subcutaneous paronychia* makes its appearance in the form of an inflammatory tumour, attended with a great deal of acute pain. The symptoms, however, are not alarming, nor do they generally extend beyond the inflamed finger. In severe examples, the whole hand is more or less affected with pain and tension, and uneasiness is felt all up the arm. The severity of the pain, in such cases, frequently prevents sleep, and the whole system is thrown into some disorder. The attack of this kind of whitlow is attended with a more acute and throbbing pain than that of the cutaneous paronychia, suppuration proceeds more slowly, and matter is frequently formed under the nail. The disease is particularly situated in the cellular membrane under the cutis.

The *more deeply-seated kinds of whitlow* are those affecting the sheath of the flexor tendons and the periosteum, which parts, indeed, by reason of their vicinity to each other, are often both attacked together. The disease commences with an intense, burning, shooting, throbbing pain in the finger, accompanied with severe febrile symptoms. At first, no swelling whatsoever can be perceived in the part affected; but afterwards a slight œdematous tumour follows, which gradually assumes an inflammatory appearance, and the tumefaction spreads from the finger to the hand, and forearm, and even to the axilla. On the inner side of the arm, red hard streaks may also frequently be observed, which are inflamed absorbent vessels tending to the axillary glands, which are themselves sometimes enlarged and very painful. The pain of the whitlow is particularly felt shooting up from the affected finger to the inner condyle of the humerus, and thence to the arm-pit. Delirium, and other alarming symptoms, occasionally attend these worst descriptions of whitlows, which are alleged to have proved sometimes fatal. The matter, which is small in quantity, is either collected within the sheath of one of the tendons, or it is under the periosteum in contact with the bone, which is generally found in a carious state; and sometimes the superincumbent integuments suffer sphacelation. See Pearson's Principles, p. 90.

The *subungual paronychia*, or that which especially occurs under the nail, commences with inflammatory symptoms, which are, however, much less urgent and dangerous than those of the preceding case; and the situation of the disease renders its nature quite obvious.

The usual exciting causes of whitlows are various external injuries, as pricks, contusions, &c. The lodgement of a thorn or splinter in the part, is another frequent cause of these abscesses. They are, however, much more common in young healthy persons than in others; and they appear in many instances to occur spontaneously, that is to say, without our being able to assign any manifest cause for them. There is one particular sort of whitlow, which Mr. Pearson has thought proper to call *venereal*, as will be presently noticed.

With regard to the prognosis in ordinary examples of the complaint, it may be laid down that the cutaneous and subcutaneous paronychiæ are in general unattended with danger. But those whitlows which are formed within the theca of the flexor tendon, if they be not relieved by the timely interference of surgery, very often produce abscesses, extending up the hand and arm, in the course of the corresponding tendon and muscle, which parts become so altered and diseased, that their functions are permanently injured, and the bones of the finger destroyed by necrosis. When also the periosteum is affected, the matter lying underneath, or closely upon it, the neighbouring phalanx of the finger generally perishes. Whitlows beneath the nail frequently occasion a loss and separation of the part.

The indications in the treatment of whitlows are;

1. To endeavour to produce an early resolution of the inflammation; but as this attempt seldom succeeds, and the case almost proceeds to suppuration,

2. The

2. The great defideratum is to difcharge the matter as foon after its formation as poffible.

3. The laft thing is to heal the wound.

With refpect to the firft indication, experience proves, that the inflammation, in a very early ftage of the complaint, may fometimes be difperfed by the adoption of ordinary antiphlogiftic treatment. Here topical bleeding, efpecially the prompt and repeated application of leeches to the painful part feveral times in the day, is highly commendable; and the inflamed finger and hand may be covered with a cold, difcutient, faturnine lotion, together with which means fome writers advife the whole limb to be bound with a circular roller. Others fpeak highly of the good effects of an early immerfion of the affected finger in very warm water, or in lotions made of alcohol, vinegar, oil of turpentine, &c. and ufed as hot as can be borne. Callifen ftates, that he has alfo frequently obferved great benefit arife from the affufion of fuch lotions on the part. He even afferts, that the pain and more deeply-feated inflammation of the finger may be fometimes checked by applying cauftic or a blifter to the integuments. When the patient's fufferings are very great, the exhibition of opium is indifpenfable after bleeding has been duly practifed. The fame writer alfo affirms, that electricity has been found ufeful at the very commencement of a whitlow.

When two days elapfe without any probability of refolution taking place, fuppuration ought to be promoted by the immediate and continued ufe of emollient poultices and fomentations. Nor fhould the furgeon wait for the abfcefs to point, but make an opening with lefs lofs of time, in proportion as the cafe becomes worfe. In examples where the pain is exceedingly violent, the incifion fhould not be deferred beyond the fourth day from the beginning of the pain. The opening ought alfo to be made at the part which was firft painful, and thence the cut fhould be continued longitudinally, and as deeply as the fituation of the matter. The lancet, indeed, if requifite, muft be introduced down to the bone, by which means a fmall quantity of deeply-feated confined matter may frequently be voided, and the pain and progrefs of the difeafe at once ftopped. Even when no matter is difcharged from the opening, an early incifion fometimes fpeedily relieves very fevere cafes of whitlow; probably (as Callifen obferves) on the principle of removing tenfion, and occafioning hemorrhage from the part. In thofe inftances, in which an incifion has not been practifed in due time, and the matter under the tendinous theca has fpread extenfively up the hand and arm, it is fometimes neceffary to make the opening free and ample, without injuring, however, the annular ligament. The difcharge of the abfcefs, and the evacuation of blood from the incifion, are followed by almoft immediate relief. When the matter is lodged under the periofteum, the bone is moftly found affected with necrofis. In cafes of this defcription, there are fome practitioners who prefer the removal of the difeafed phalanx, to awaiting a tedious and uncertain cure by the proceffes of nature. Callifen, however, informs us, that he has often feen the dead portion of the bone exfoliate, leaving the reft in a ftate of prefervation.

When a whitlow under the nail cannot be difperfed, the matter fhould be let out by an opening, practifed through the tranfparent part of the nail, or by the fide of it. Some furgeons adopt the plan of fcraping the nail, fo as to render it as thin as poffible, before they cut through it, which is an ingenious and commendable method. See Callifen's Syft. Chir. Hod. t. i. p. 293. 295.

In the fifth volume of the Medico-Chirurgical Tranfactions, Mr. Wardrop has defcribed a very inveterate and troublefome fpecies of whitlow, which, from its malignant character, he has called the *onychia maligna.* "The commencement of this difeafe is marked by a degree of fwelling, of a deep red colour, in the foft parts at the root of the nail. An oozing of a thin ichor afterwards takes place at the cleft, formed between the root of the nail and foft parts, and at laft the foft parts begin to ulcerate. The ulcer appears on the circular edge of the foft parts at the root of the nail; it is accompanied with a good deal of fwelling, and the fkin, particularly that adjacent to the ulcer, has a deep purple colour. The appearance of the ulcer is very unhealthy, the edges being thin and acute, and its furface covered with a dull yellow, or brown-coloured lymph, and attended with an ichorous and very fetid difcharge. The growth of the nail is interrupted, it lofes its natural colour, and at fome places appears to have but little connection with the foft parts. In this ftate (fays Mr. Wardrop), I have feen the difeafe continue for feveral years, fo that the toe or finger became a deformed bulbous mafs. The pain is fometimes very acute; but the difeafe is more commonly indolent, and accompanied with little uneafinefs. This difeafe affects both the toes and the fingers. I have only obferved it on the great toe, and more frequently on the thumb, than any of the fingers. It occurs, too, chiefly in young people; but I have alfo feen adults affected with it."

With regard to the treatment of the fpecies of whitlow named by Mr. Wardrop *onychia maligna*, all local applications have in many inftances proved quite ineffectual, and the part been amputated. The only local treatment which Mr. Wardrop has ever feen relieve this complaint has been the evulfion of the nail, and afterwards the occafional application of efcharotics to the ulcerated furface. We have feen a fimilar plan occafionally fucceed, and the applications which appeared to anfwer beft were, arfenical lotions, Plunket's cauftic, or a very ftrong folution of the nitrate of filver. Nothing, however, will avail till the nail is removed, and its total feparation fometimes takes up a good deal of time, unlefs the patient fubmit to the great pain of having it cut away.

Mr. Wardrop tried with fuccefs the exhibition of mercury in four cafes of the onychia maligna. The medicine was given in fmall dofes at firft, and afterwards increafed, fo as to affect the gums in about twelve or fourteen days. The fores in general foon affumed a healing appearance when the fyftem was in this ftate, and the bulbous fwelling gradually difappeared. Wardrop in Medico-Chir. Tranf. vol. v. p. 135, &c.

Mr. Pearfon has publifhed an account of a peculiar fort of whitlow, to which he affixes the epithet *venereal.* He obferves, that it generally appears in the form of a fmooth, foft, unrefifting tumour, of a dark red colour, and is fituated in the cellular membrane about the root of the nail. It is attended with an inconfiderable degree of pain in the incipient ftate; but as fuppuration advances, the pain increafes in feverity. The progrefs of the abfcefs to maturation is generally flow, and is feldom completed.

When the matter is evacuated, the nail is generally found to be loofe, and a very foul but exquifitely fenfible ulcer is expofed; and confiderable floughs of cellular membrane, &c. come away, fo as to render the fore fometimes very deep. The difcoloured and tumid ftate of the fkin commonly extends along the finger, confiderably beyond the margin of the ulcer. In fuch cafes, the integuments of the finger become remarkably thickened, and the cellular membrane is fo firmly condenfed, as not to permit the fkin to glide over the fubjacent parts. The bone is not ufually found in a carious ftate.

According to the fame author, this fpecies of whitlow is more frequently feen among the lower clafs of people, when they labour under lues venerea, than in the higher ranks of life. It does not appear to be connected with any particular ftate of the difeafe, nor is it confined to one fex more than the other. In the Lock Hofpital, it is faid to occur in the proportion of one patient in five hundred.

In adopting the name of *venereal paronychia*, Mr. Pearfon informs us, that it is not with the defign of implying that the cafe is a true venereal abfcefs, the matter of which is capable of communicating fyphilis to a found perfon. Its progrefs and cure, he obferves, feem to be unconnected with the increafed or diminifhed action of the venereal poifon in the conftitution, and to be alfo uninfluenced by the operation of mercury. Mr. Pearfon confiders the venereal difeafe as a remote caufe, which gives occafion to the appearance of this as well as of feveral other difeafes, which are widely different from its own fpecific nature.

In the incipient ftate of the venereal whitlow, when no fevere fymptoms are prefent, Mr. Pearfon thinks it beft to ufe no external applications, and merely cover the part with a bit of fine rag. The difeafe will then often gradually difappear of itfelf, without coming to fuppuration. When matter is formed, Mr. Pearfon fays, the abfcefs may be permitted to burft fpontaneoufly. Every fpecies of dreffing will frequently be found to give great pain, and difagree with the fore. The fame writer, however, ftates, that one application, compofed of equal parts of the balfam of copaiva and tinctura thebaica, may fometimes be ufed with a good effect. The principal object is to keep the patient as eafy as poffible, by the internal ufe of opium, until the floughs are feparated, and the ulcer becomes clean. It may then be treated as a common fore: Peruvian bark will alfo be generally proper. In the thickened difeafed ftate of the integuments, Mr. Pearfon condemns amputation, as being likely to produce a ftump, which will change into a fore, refembling that for which the operation was performed. See Pearfon's Principles of Surgery, edit. 2.

It is not at all clear to us, that Mr. Wardrop's cafe, which he terms the onychia maligna, is not actually the fame difeafe as what Mr. Pearfon has named the venereal whitlow. The only doubt arifes from the former gentleman's recommending the exhibition of mercury as a means of cure; while the latter declares, that the complaint is quite uninfluenced by the operation of this medicine. We confefs, that although fome hundreds of cafes of very bad whitlows have fallen under our obfervation, we have never met with any inftance in which the cure feemed to require mercury.

Whitlow *in the Feet of Sheep*, in *Rural Economy*, a difeafe that takes place in the latter end of fummer, and which is more frequent among the long than the fhort fort of fheep. It but feldom happens in clean fheep-walks, though it is very troublefome on foft, dirty, pafture-lands. It is frequently occafioned in the milking feafon, by the boughts or folds being dirty, and by the fheep being confined in the old houfes. It is of the inflammatory nature, and commonly affects the fore-feet, but fometimes all four. The outer part of the hoof is the ufual feat of the difeafe, and from the cleft a fharp fetid humour exudes, fometimes engendering maggots, and corroding the flefh, nay even the bone. All around the hoof there is an inflammation, which turns black, and this part fometimes drops off. It is a very painful affection, fo much fo, that the animal often crawls. As the weather gets more cold, it commonly becomes better, but it ftill walks in a lame manner.

On the appearance of the difeafe the foot is to be examined, and the difeafed part opened to let out the acrid matter. It is then to be wafhed well, and dreffed with mercurial ointment and fulphur in mixture, or tar with red precipitate, binding it up with a flannel bandage, to preferve it warm and clean. In cafe it does not take on fuppuration, but degenerates into a foul and tedious ulcer, fuch applications as fpirit of turpentine and fulphuric acid may be proper. And in all cafes the fheep fhould be kept in a clean, eafy, dry pafture, until it becomes well. See Foot-*Rot*.

Whitlow-*Grafs*, or *Mountain Knot-Grafs*, in *Botany*. See Paronychia, or Illecebrum.

Whitlow-*Grafs* is alfo a name given to fome fpecies of draba.

Whitlow-*Grafs*, *Rue-leaved*, a fpecies of faxifrage.

WHITSTABLE, in *Geography*, a village and fea-port of England, in Kent, near the mouth of the Swale. Here is a confiderable oyfter-fifhery, which employs upwards of 70 boats. Some colliers likewife bring hither coals for Canterbury and the neighbourhood; 7 miles N. of Canterbury. N. lat. 51° 22'. E. long. 1° 2'.

WHITSUN Island, an ifland in the South Pacific ocean, difcovered by captain Wallis on Whitfun-eve, in the year 1767, about four miles long and three wide, furrounded by a reef. The boat's crew got fome cocoa-nuts, and fome fcurvy-grafs: they met with none of the inhabitants, but fome huts and feveral canoes building. No anchoring place for the fhip could be difcovered. S. lat. 19° 26'. W. long. 137° 56'.

Whitsun, or *Whitfunday Ifland*, or *Pentecoft*, one of the New Hebrides, in the South Pacific ocean, about thirty miles in length, and eight in breadth. S. lat. 15° 44'. E. long. 168° 20'. See *New* Hebrides.

Whitsun *Farthings*. See Pentecostals.

WHITSUNDAY'S Passage, in *Geography*, a ftrait fo called by captain Cook, from the day on which he failed through it, in 1770; between Cumberland ifland and the coaft of New Holland.

WHITSUNTIDE, the fiftieth day after Eafter.

The feafon properly called *Pentecoft*, is popularly called *Whitfuntide*; fome fay, becaufe in the primitive church, thofe who were newly baptized came to church between Eafter and Pentecoft, in *white* garments.

Whitsuntide *Bay*, in *Geography*, a bay on the north coaft of the ifland of Kodiack, weft of Cape Whitfunday.

WHIT-TAWER, in *Rural Economy*, a provincial term applied to a collar-maker for team-horfes.

WHITTINGHAM, in *Geography*, a town of Vermont, in the county of Windham, with 1248 inhabitants; 16 miles E. of Bennington.

WHITTLE, a provincial name applied to a fort of pocket or fheathed knife.

WHITTLEBURY Forest, in *Geography*, a royal foreft of England, in Northamptonfhire.

WHITTLESEA Mere, a lake of England, in the county of Huntingdon, formed by a branch of the river Nen, fituated to the S.E. of Peterborough.

WHITTLESEY, or Whittlesea, a town in the north part of the hundred of Witchford, Ifle of Ely, and county of Cambridge, England, is fituated on the confines of Northamptonfhire and Lincolnfhire, at the diftance of 10 miles W.S.W. from the town of March, and 5 miles E. by N. from Peterborough. It contains two parifhes, St. Mary's and St. Andrew's; but their boundaries cannot be diftinctly diſtinctly aſcertained, and they are ſo far conſolidated, that, though in ſeparate patronage, the two livings are generally held by the ſame perſon ; and only one regiſter of births and burials is kept for both. Whittleſey formerly had a market ; but when or by whom granted, there are no exiſting records. The market-day was Friday ; but it has long been gradually falling into diſuſe, and ſince the year 1788 has been wholly diſcontinued. An annual fair for horſes is ſtill held. Each pariſh has a church, in which are various ſepulchral memorials of ancient families. St. Andrew's church was given to the monks of Ely in the twelfth century, by Nigellus, ſecond biſhop of that ſee, for the purpoſe of augmenting their library, or, as it is expreſſed by an hiſtorian of that time, "making books for the library." At the weſt end of St. Mary's church is a very handſome tower, ſurmounted by a tall and elegant ſpire, which from its height conſtitutes a very conſpicuous object from diſtant parts of this flat country. The tower is much ornamented with niches, pinnacles, and quaterfoils ; and each angle of the octangular ſpire, which connects with the angular pinnacles of the tower by flying buttreſſes, is adorned with foliated crockets. There is in the town a charity-ſchool for the inſtruction of twenty-ſeven children, and ſeveral almshouſes.

Whittleſey, excluſive of the town, is divided into five diſtricts, named Eltry, Cotes, Eldernal, Willow-hall, and Glaſſmoor. At Eldernal was a chapel, conſecrated in 1525, but long ſince dilapidated. At Glaſſmoor were found, about the year 1742, ſeveral Roman lamps made of the red ware. The population of the whole, in the return of the year 1811, is ſtated to be 4248, occupying 729 houſes. Lyſons's Magna Britannia, vol. ii. Cambridgeſhire, 1808.

WHITTON, a town of England, in Lincolnſhire, on the ſide of the Humber ; 15 miles N.N.W. of Glamford Briggs.

WHOLAGUNGE, a town of Hindooſtan, in Oude ; 12 miles N.E. of Fyzabad.

WHOLDYACHUCK, a lake of North America. N. lat. 60° 20′. W. long. 109° 30′.

WHOLE, Totum, in *Arithmetic*, &c. See Part, Division, Partition, &c.

Whole, in *Logic*, is diſtinguiſhed into four kinds ; *viz.* a *metaphyſical*, when the eſſence of a thing is ſaid to conſiſt of two parts, the genus and the difference ; *mathematical* or *integral*, when the ſeveral parts which go to make up the whole are really diſtinct from one another, and each of them may ſubſiſt apart ; *phyſical* or *eſſential*, uſually denoting and including the two eſſential parts of man, body and ſoul, but more properly including all the eſſential modes, attributes, or properties, contained in the comprehenſion of any idea ; and *logical*, called alſo *univerſal*, the parts of which are all the particular ideas to which this univerſal nature extends. Watts's Logic, p. 117.

Whole *Blood*, *Meaſure*, *Number*, and *Sine*. See the ſubſtantives.

Whole *Milk-Cheeſe*, in *Rural Economy*, a term uſed to ſignify ſuch cheeſes as are made from the whole meal of milk, in contradiſtinction to thoſe which are made from a part of it only. It is obſerved in the Glouceſter Report on Agriculture, that coward-cheeſe ought to be made of the whole meal of milk ; but in a dairy of twenty cows, it is not unuſual to ſet by a pan, of about ſeven or eight gallons, till the next milking, which is then ſkimmed, and added to the new meal, from which a ſimilar quantity is taken as before. The cream thus laid by is made into milk-butter. Coward-cheeſes are either thin, about eight to the hundred ; or thick, generally called double Glouceſter, about four to the hundred, or even larger. The latter are made in May, June, and July, principally, and even as long as graſs continues good in ſome dairies.

It is noticed, too, in the ſame ſort of report for the county of Peebles, in Scotland, that in the ſheep-farms there, where ſheep's-milk cheeſe is made, the whole of that ſort of milk is ſeldom employed ; but that the whole of the cow's milk upon the farm is mixed with the ſheep's milk. That the butter, during this period, being ill-taſted, is kept for mixing with the tar for ſmearing the ſheep ; and the milk is afterwards made into cheeſe. There are, in conſequence, very few farms where cheeſe is made of entire ſheep's milk ; and that, from the various proportions of the admixture of cow's milk, there are few articles in commerce paſſing under one common denomination, of which the qualities are ſo various as thoſe of ſheep's-milk cheeſe. See Dairying, and Cheese.

Whole-*Moulding*. The impropriety of continuing whole-moulding in the conſtruction of ſhips, has been pointed out in the article Ship-building : but as it is at preſent continued in the formation of boats ; therefore, how far whole-moulding may be uſed in the conſtruction of boats, we ſhall endeavour to explain by introducing a boat, which might be whole-moulded from the ſtem to the ſtern-poſt, if part of the midſhip-bend was approved of for the ſhape of the tranſom ; but as there can be no neceſſity that it ſhould be ſo far whole-moulded, we ſhall omit it to the ſtern-poſt, but extend it quite forward to the ſtem.

The length, ſtem, and ſtern-poſt, being determined on in *Plate Ship*, *fig.* 1, the next thing is the ſtation of the midſhip-frame, which is not of material conſequence, only let it be before the middle of the boat. Then ſet off all the ſtations of the timbers afore and abaft the midſhip-bend.

The height in the midſhips being given, draw the ſheer-line, or top of the gunwale, ſo that it may have an agreeable appearance. The line below it ſhews the breadth of the ſheer-ſtrake, and the ticked line above it ſhews the upper edge of the waſh-board.

The next thing is the riſing-line, which requires ſome experience to determine at once, ſo as to anſwer every purpoſe ; for not only the form of the midſhip-bend, but likewiſe the deſign of the boat muſt be kept in mind, to know how far we may venture to lift the riſing-line afore and abaft, without occaſioning any hindrance to her ſtowage.

Having determined the height of the riſing-line, diſpoſe of the main height of breadth-line at the midſhip-bend, at ſuch height as will beſt ſuit the intended form of the midſhip-bend, and continue it from thence forward and aft, parallel to the riſing-line ; for ſo far as the boat is to be whole-moulded, the main height-of-breadth and riſing-line muſt be parallel to each other in the direction of the ſquare timbers.

In the half-breadth plan, *fig.* 2, ſquare down from the ſheer-plan, *fig.* 1, when the height-of-breadth line croſſes the fore part of the rabbet of the ſtem, and the aft part of the rabbet of the ſtern-poſt, or aft-ſide of the tranſom. But as this line riſes above the tranſom abaft, obſerve where the top of the ſide croſſes the aft part of the tranſom, and draw it parallel down from any of the ſtations of the timbers. Alſo ſquare down the ſtation of the midſhip-bend.

Set off from the middle-line, A B, *fig.* 2, the half-thickneſs of the ſtem, and from thence ſweep an arch to the

thickneſs

thickneſs of the board uſed for the bottom, the back of which arch will give the ending of the fore part of the main-half-breadth line. Then ſet off the half-breadth to the outſide of the timber at the midſhip-bend, and draw C D parallel to A B. Determine the breadth of the tranſom at the top of the ſide, and ſet off the half-breadth on the line for the aft-ſide of the tranſom.

Thus we have three ſpots, one at the aft-ſide of the tranſom, one at the midſhip-bend, and one at the ſtem, through which draw an unlimited curve; obſerving to make it faint about half the length of the boat in midſhips, and to form the bow by part of a circle.

To form the Midſhip-bend.—Draw the horizontal line A B (*fig.* 3.), and erect a perpendicular in the middle; then take the half-breadth of the boat at the midſhip-bend, in *fig.* 2, and ſet it off on each ſide the middle-line, and erect the perpendicular C D. Take the height from the line A B, *fig.* 1. (which is the upper edge of the rabbet of the keel) to the riſing-line, and to the height-of-breadth line at the midſhip-bend; and ſet off above the line A B on the perpendicular C D, *fig.* 2, and draw the lines marked M B, and "Riſing."

The diſtance from the riſing-line to the height-of-breadth line, is the radius of the circle intended for the midſhip-bend; which diſtance, ſet off from the point where the half-breadth line interſects the ſide perpendicular, *c*, on the height-of-breadth line, will give the centre for the ſweep of the midſhip-bend; then ſweep an arch from the interſection of the perpendicular *c* to the interſection of the riſing-line.

From the middle-line ſet off the half-breadth of the keel on the line A B, and draw a ſtraight line from the ſide of the keel to the back of the arch of the midſhip-bend: let the top of the ſide above the height-of-breadth line be perpendicular, complete the other ſide of the middle-line the ſame from perpendicular D.

To form the ſquare Timbers of the Fore-Body.—Take the diſtance from the line A B, *fig.* 1. to the riſing-line at timber A B, &c. as far forward as timber I, and ſet them off, and draw lines parallel to the line A B, *fig.* 3, from the middle-line towards the line *c*.

Then take the diſtance from the line A B, *fig.* 1, to the height-of-breadth line at each ſeparate timber, and draw them as before in *fig.* 3. parallel to A B.

Then take the half-breadth of each timber, A B, &c. in *fig.* 2, and apply each ſeparate diſtance from the middle-line in *fig.* 3, on the lines of their correſponding names for the height-of-breadth, and there make a ſpot.

Make a mould agreeable to the ſhape of the midſhip-bend, the lower part to agree with the riſing-line of the midſhip-bend, and extend as far beyond the middle-line as is neceſſary.

Croſs the height-of-breadth on the mould, and the middle-line, when it lies well with the midſhip-bend.

Take the diſtance from the line C D, *fig.* 2. to the main-breadth line at timber A B, &c. and ſet them off from the middle-line on the lower ſide of the mould, towards perpendicular *c*, which ſhews the narrowing of each timber more than the midſhip-bend.

From the height-of-breadth line in *fig.* 1. take the diſtance to the top of the ſheer-ſtrake at each of the above timbers, and ſet them off above the main-breadth, on the mould, which gives the heads of all the timbers in the fore-body.

The lower edge of the mould is ſuppoſed to be the height of the riſing-line from the timbers.

Then apply the lower edge of the mould on each riſing-line, *fig.* 3, and move it till each letter on the lower edge of the mould agrees with the middle-line, and the main-breadth on the mould agrees with its correſponding height-of-breadth line. Then draw the form of the mould from the head of the timber to the middle-line, as ticked in *fig.* 3, and draw a ſtraight line from the ſide of the keel, at the upper edge of the rabbet, to touch the outſide of the curve formed by the mould, except where the rabbet of the keel and ſtem riſes, as at F, G, H, I.

Set off the half-thickneſs of the keel from the middle-line, *fig.* 3, and take the height from the line A B, *fig.* 1. to the lower edge of the rabbet at each timber, and ſet it from the line A B, *fig.* 3, on the line for the half-thickneſs of the keel or ſtem; then with compaſſes ſet to the thickneſs of the bottom plank, ſweep an arch; from the upper ſide of which draw a ſtraight line to the back of each curve of the mould, which will finiſh completely the heels of the timbers.

The ſame method muſt be obſerved in the after-body towards perpendicular D, *fig.* 3, applying the midſhip-bend mould in the ſame manner as directed in the fore-body, making uſe of the mould as far aft as timber 12.

The after-ſquare timber is 9; therefore, to 9 may be finiſhed the heels of the timbers, by drawing a ſtraight line from the back of the whole-moulding curve to the back of the ſweep at the rabbet of the keel.

In whole-moulding, but few moulds are neceſſary to be made to mould all the timbers. Thus the floor-mould is to be made to the midſhip-bend in *fig.* 3, a little above the diagonal line, *a b* or *a c*, which is to be the heads of the floors, and let the lower part of the mould correſpond well with the riſing of the midſhip-bend, as is ſhewn in *fig.* 4.

When the mould lies well, as in *fig.* 3, mark the middle-line on the lower edge of the mould, and the head of the floor on the outer edge. Make the inſide of the mould to its proper ſcantling, and let the upper edge correſpond well with the cutting-down of the inſide of the midſhip-floors; which cutting-down is ſo marked in *fig.* 1.

Then in *fig.* 2. take the diſtance of each timber from the line C D to the main-half-breadth line, and ſet them off on the lower edge of the mould, from the middle-line of the midſhip-bend towards the outer end of the mould, which is the middle-line for each floor.

Now fix the lower edge of the mould in *fig.* 3. on each riſing-height, in the ſame manner as the timbers were got in by whole-moulding; and when each mark on the mould is well with the middle-line, and on its proper riſing, deſcribe on the outer edge of the mould the heads of the floors, or the diagonal line *a b*, or *a c*.

Or, as in *fig.* 4, ſquare the middle-lines of each timber, and then take the half-breadths of each floor from *fig.* 3. and ſet them off ſquare from each middle-line in *fig.* 4, to interſect the edge of the mould.

The lower Futtock-Mould, fig. 5, is made to the riſing-height of the midſhip-bend, and from thence to the top of the ſheer; but need not be made ſo long at the heel as the floor-mould. The inſide is made to the ſcantling, and the croſſing of the middle-line and the floor-head, on the lower futtock-mould, is done in the ſame manner as on the floor-mould; or the beſt way is to lay the floor-mould on the lower futtock-mould, and croſs it by the floor-mould. When the lower futtock-mould is laid in its place to the midſhip-bend in *fig.* 3, then mark the main-breadth on the mould, which is the main-breadth for all the timbers. Then take the diſtance in *fig.* 1. from the main-breadth line to the top of the ſheer at each timber, and ſet it off on the mould, from the main-breadth

breadth upward, which is the heads of all the timbers; and then the crofling of the lower futtock-mould is finifhed.

To crofs the rifing Square.—When the boat is whole-moulded, the floors and lower futtocks are generally moulded by the ufe of the rifing-fquare; which is fo called, becaufe when the fquare is properly placed to mould any timber, one fide of the fquare correfponds with the rifing of that timber. When the timbers are moulded by the outfide of the mould, and the heels by the rifing-fquare, (which gives the upper edge of the rabbet of the keel, or bearding-line,) then there is a batton, called a cutting-down batton, with the heights of all the floors, from the upper edge of the rabbet of the keel to the cutting-down line; which gives the cutting-down or infide of all the floors.

To make the rifing-fquare, let one fide of the fquare be of fufficient breadth to receive the rifing and the cutting-down, as may be feen by the fquare E.

When moulding the floors, or lower futtocks, the lower fide of the mould is the rifing of the timber; and confequently the edge of the fquare, which is to be applied to the under fide of the mould, is alfo the fame.

Then to mark or crofs the fquare, take the diftance from the rifing-line in *fig.* 1. to the upper edge of the rabbet of the keel, or bearding-line, at each timber; and fet them off from that edge of the fquare which is to be applied to the mould, on the other edge of the fquare, and clofe to the edge, drawing a margin to put the letters or figures under them. Then take the diftance in *fig.* 1. from the rifing-line to the cutting-down line, at the timbers, where the cutting-down is below the rifing, and fet them off from the edge of the fquare that is to be applied to the mould on the other edge of the fquare, but within the rifings, as may be feen on the fquare. The other timbers, from 3 to B, where the cutting-down is above the rifing, may be marked on the moulds.

From the edge of the fquare where the rifings are placed, fet off on the other edge of the fquare the half-thicknefs of the keel, which call the middle-line; and then the fquare is ready for moulding.

To mould the Floors.—The beft way for moulding the floors for a whole-moulded boat, is to make two moulds, agreeable to the former directions, made and croffed both alike, but the fides reverfed. Then lay one on the other, the fame as in *fig.* 4, keeping the lower edges in a ftraight line, and mooring them till the correfponding middle-lines on the moulds agree. The moulds in *fig.* 4. are fixed at 9, but the middle-lines on the lower mould cannot be feen; therefore, before the moulds are put together, it is beft to mark (in chalk) on the edges of the mould the middle-lines of the timber. When the moulds are placed, fix the middle-line, marked on the edge of the fquare, to the middle-line on the mould of the timber, and the other edge of the fquare will reprefent the fide of the keel.

Then apply a ftraight batton to the rifing of 9, on the edge of the fquare, and alfo to the outfide of the floor-mould. This will give the moulding of the outfide of the floors, except timber 9, which is fomewhat hollow. Then fquare the cutting-down for 9, acrofs to the edge of the fquare, and draw a ftraight line to touch the infide of the mould.

In the fame manner mould the other arm of the floor, by canting the fquare. But the rifing and cutting-down fhould be marked on both fides.

Before the moulds are moved, mark the heads and firmarks, if any, as a guide to fix the lower futtock when put in its place, if it fhould not run down to the fide of the keel.

To mould the lower Futtocks.—The lower futtock-mould is *fig.* 5, which is made in the fame manner as the floor-mould, but continued as high as the top of the fheer. The upper part being ftraight and perpendicular, and the mould made to the fcantling, there is no difference between moulding one fide of the floors and moulding the lower futtocks.

The fame method of fixing the fquare for the moulding of the floors will ferve to mould the lower futtocks, as on the fquare in the plate, where the middle-line on the fquare is put to the middle-line on the lower futtock-mould for G. A ftraight batton applied to the rifing for G, on the fquare, and to the back of the lower futtock-mould, gives the moulding of the outfide of the lower futtock; and the cutting-down for G on the fquare brought to the edge of the fquare, a ftraight batton from thence to the infide of the mould will alfo be the infide of the lower futtock.

Mark the firmark, or floor-head, in the fame manner as the floors, in order to place the lower futtock to its proper height at the fide of the floors, in cafe they fhould not be required to run down to the fide of the keel.

Likewife mark the main-breadth, and the head for G, before the mould is moved.

That there is no difference between the floors and the lower futtocks in ufing the rifing-fquare, may be feen more clearly in *fig.* 4, where the floor-mould is continued up to the top of the fide, which makes the lower futtock-mould; fo that the form of the lower futtock is feen, as well as the floor.

The two floor-moulds may be made to ferve for all the floors, by putting the fore-body on one fide of the mould, and the after-body on the other; but obferve to crofs one mould oppofite to the other, fo that when it is canted over, it fhall then be proper to mould with.

Two rifing-fquares are fometimes ufed; one for the fore-body, and the other for the after-body; becaufe the fquares muft be croffed alike on both fides, to mould the arms of the floors, and likewife to mould the lower futtock for both fides of the boat. Or, inftead of this, the fore-body may be put on one fide of the fquare, and the after-body on the other. When the fquare is wanted on the oppofite fide, chalk on the edge of the fquare the rifing and the cutting-down for the timber to be moulded, and then cant the fquare.

Two lower futtock-moulds may alfo be made, or crofs the fore-body on one fide of the mould, and the after-body on the other. In order to mould a timber for that fide of the fhip where the firmarks are at the under fide of the mould, chalk the firmarks for the timber wanted on the edge of the mould; or make two margins on the edge of the mould, referving one for the fore-body, and the other for the after-body, and reverfed on the oppofite fide.

The lower futtocks for boats generally run about half way between the floor-head and the fide of the keel; but if it were a hoy, or fmall veffel that was whole-moulded, the lower futtocks might then be required to run to the fide of the keel, or dead-wood; wherefore, it is proper to fhew the moulding of them down to the fide of the keel.

Various are the methods ufed by different artificers in moulding the lower futtocks; and it is evident that the method which has been practifed moft will appear the beft.

Some will make no ufe of the fquare, but mark the heels of the lower futtocks on the mould, and provide a batton, marked the fame as the fquare; the lower end of the batton being long enough to mould the outfide of the foremoft and aftermoft timbers; and the upper end of the batton being long enough to mould the infide of the midfhip-timber.

Mark a firmark acrofs the batton, fuppofed to reprefent the fide of the fquare, which muft always be fitted well to the lower edge of the mould; from which firmark, fuppofed to be the rifing for all the timbers, fet off clofe to the edge of the batton the heels of all the timbers in the fore-body, or the diftance in *fig.* 1. from the rifing-line to the upper edge of the rabbet of the keel, or bearding-line.

Then draw a margin for the cutting-down of the timbers, and take the diftance in *fig.* 1. from the rifing-line of each timber to the cutting-down, and fet them off on the batton for the cutting-down, as much above or below the firmark on the batton as the cutting-down is above or below the rifing at each timber.

On the other fide of the batton may be put the after-body.

In fome boats or veffels, where the rifing and cutting-down are farther afunder at the midfhip-bend, then the batton will be as ufeful as the fquare; but inftead of the middle-lines being marked on the lower futtock-mould, it will be better to mark the fide of the keel, or where the keels of the lower futtocks are intended to be, for the better applying the batton.

If the heels of the lower futtocks do not run down to the fide of the keel, it will alter the rifings on the batton; the heels being marked on the mould fhort of the fide of the keel.

The proper heels of the lower futtocks fhould be marked on the mould, though moulded by the fquare; for then the edge of the fquare might be put to the proper mark on the mould for the heels of the timbers.

The middle-lines marked on the lower futtock-mould in the *Plate*, were intended only to fhew that the method of moulding the floors and lower futtocks were alike. The fquare is the beft to mould the floors, becaufe the middle-lines are the propereft to be marked on the floor-mould.

What has been faid may fuffice to fhew that whole-moulding may, in fome meafure, be ufed, and yet form a pleafing draught, much more fo than that of the boat in *fig.* 1, if lefs ftowage were fufficient to anfwer the purpofe for which fhe is defigned.

WHOLESOME Ship, in the *Sea Language*, one that will try, hull, and ride well, without rolling or labouring in the fea. A long fhip that draws much water may try, hull, and ride well; but if fhe draws little water, fhe may try and ride well, but never hull well; and a fhort fhip that draws much water may hull well, but neither ride nor try well; and fuch is called an *unwholefome* fhip.

WHORE. See Courtesan, Harlot, Concubine, &c.

WHORL, in *Botany*. See Verticillus.

WHORLBAT, or Hurlbat, a kind of gauntlet, or leathern ftrap, loaden with plumbets; ufed by the ancient Romans in their folemn games and exercifes; and by them called *ceftus*.

WHORLED Plants. See Verticillatæ.

WHORLES *of Flowers*, among *Herbalifts*, are rows of leffer flowers, fet at certain diftances about the main ftalk or fpike, as in penny-royal, &c.

WHORTLE-Berry, Bilberry, or *Cranberry*, in *Botany*. See Vaccinium.

The whortle-berry, with one flower upon each footftalk, oval-fawed leaves, which fall off in winter, and an angular ftalk, called *black whorts*, or *bilberries*, grows very common upon large wild heaths, in many parts of England, but is never cultivated in gardens, it being with great difficulty tranfplanted; nor will it thrive long when moved thither. The fruit is gathered by the poor inhabitants of thofe villages which are fituated in the neighbourhood of their growth, and carried to the market-towns. Thefe are by fome eaten with cream or milk; they are alfo put into tarts, and much efteemed by people in the North, but they are feldom brought to London.

The fhrub on which thefe grow rifes about two feet high, having many ftems, which are garnifhed with oblong leaves, fhaped like thofe of the box-tree, but fomewhat longer, and a little fawed on their edges. The flowers are fhaped like thofe of the arbutus, or ftrawberry-tree, of a greenifh-white colour, changing to a dark red toward the top. The fruit is about the fize of large juniper-berries, and of a deep purple colour, having a flue upon it when untouched, like the blue plums, which is rubbed off with handling.

The whortle-berry with nodding bunches of flowers terminating the branches, and oval leaves which are entire, turned back and punctured on their under fide, called *vitis idæa*, and *red whorts*, is an ever-green fhrub, feldom rifing above fix or eight inches high, with leaves like thofe of the dwarf-box, which grows upon moors in feveral parts of the North, but is not capable of being eafily tranfplanted: the berries are red, and have a more agreeable acid flavour than thofe of the firft fort.

The whortle-berries with oval, entire, reflexed leaves, and naked, flender, creeping ftalks, called *mofs-berries*, *moor-berries*, and *cran-berries*, produce branches fmall as thread, and trailing upon the moffy bogs, which are garnifhed with leaves refembling thofe of thyme, with the upper furface of a fhining green, and white underneath. The berries, which grow upon long flender foot-ftalks, fucceeding the flowers, are round, red, and fpotted, of a fharp acid flavour, and much efteemed for tarts, or eaten with milk or cream. This is a native of bogs, and cannot be propagated upon dry land.

There are feveral other fpecies of this genus, fome of which are natives of Spain and Portugal, others of Germany and Hungary, and feveral of the northern parts of America; from whence thofe large fruits are brought to England which are ufed by the paftry-cooks of London, during the winter feafon, for tarts. But as all thefe forts grow naturally in fwamps and bogs, they are not eafily tranfplanted into gardens in their native country, fo as to thrive or produce fruit; therefore, there can be little hope of cultivating them to advantage. Miller.

Whortle-*Berry*, *African*, a fpecies of Royena.

Whortle-*Berry*, *Bear's*. See Uva *Urfi*.

WHUR, in *Falconry*, denotes the fluttering of partridges or pheafants as they rife.

WHY-EA-TEA, in *Geography*, a bay on the eaft coaft of Owhyhee. N. lat. 19° 44′. E. long. 204° 54′.

WHYMEA Bay, a bay on the north coaft of the ifland of Woahoo. N. lat. 21° 38′. E. long. 202° 51′.

Whymea *Road*, a road on the fouth-weft coaft of the ifland of Attowai. Captain Vancouver fays, this bay is much confined in refpect to fafe anchorage.

WHYTE, Robert, in *Biography*, an excellent compofer of church-fervices in the ftyle of Paleftrina, which, however, he could not imitate, as he was anterior to him, and a great mafter of harmony before the productions of this chief of the Roman fchool were publifhed, or at leaft circulated, in other parts of Europe. Whyte was dead in 1581, when his Latin Full Anthems and Services were beautifully tranfcribed in a fet of books, ftill preferved at Oxford;

Oxford; as we find by a diftich at the end of a prayer, in five parts, upon a plain fong: "Precamur Sancte Domine."

Maxima mufarum noftrarum gloria Whyte
Tu peris; æternum fed tua mufa manet.

Whyte preceded Tallis and Bird, and died before their fame was well eftablifhed. His works feem never to have been printed; but in the library of Chrift-church, Oxford, a fufficient number of them has been preferved in the Aldrich collection, to excite not only wonder, but indignation, at the little notice that has been taken of them by mufical writers. Morley, indeed, has given him a place in the lift of compofers at the end of his Introduction, and ranks him, with Orlando di Laffo, among *excellent men*, who had ventured to begin a compofition with a fourth and fixth; he likewife places him with Fairfax, Taverner, Shepherd, Mundy, Parfons, and Bird, "famous Englifhmen who have been nothing inferior to the beft compofers on the continent." And no mufician had then appeared who better deferved to be celebrated for knowledge of harmony, and clearnefs of ftyle, than Robert Whyte, as is manifefted in Burney's Hift. of Muf. vol. iii. by an anthem for five voices.

But befides this mafterly compofition, and a great number of others, to Latin words, which we fcored from the Chrift-church books, and which were probably produced at the latter end of Henry VIII.'s reign, or during the time of queen Mary, when the Romifh religion was ftill in ufe, we are in poffeffion of a fmall MS., which, by the writing and orthography, feems of the 16th century, entitled "Mr. Robert Whyte, his Bitts, of three Parte Songes, in Partition: with Ditties, 11; withoute Ditties, 16." Thefe are fhort fugues or intonations in moft of the eight ecclefiaftical modes, in which the harmony is extremely pure, and the anfwer to each fubject of fugue brought in with great fcience and regularity. Burney.

WHYTHORNE, Thomas, gentleman, in *Mufical Hiftory*, author of a book of fongs, printed by John Daye, in 1571, under the following title: "Songes of three, fower, and five voyces, compofed and made by Thomas Whythorne, gentleman, the which fonges be of fundrie fortes, that is to fay, fome long, fome fhort, fome hard, fome eafie to be fonge, and fome between both; alfo fome folemne, and fome pleafaunt or mery: fo that according to the fkil of the fingers (not being mufitians), and difpofition or delite of the hearers, they may here find fonges to their contentation and liking."

Our fecular vocal mufic, during the firft years of Elizabeth's reign, feems to have been much inferior to that of the church, if any judgment can be fairly formed of it from this book, publifhed before the fongs of Bird had appeared, and of which both the words and the mufic are alike truly barbarous. But we have, in our own time, mufic-books publifhed in England every day without genius or fcience to recommend them. And it is not certain that Whythorne's fongs were ever in much public favour. Now, if it fhould happen that one of thefe, by efcaping the broom of Time, fhould reach pofterity, and fall into the hands of fome future antiquary, critic, or hiftorian, who fhould condemn *all* the compofitions of the prefent age by *one*, that had, perhaps, been never performed or heard of by contemporary judges and lovers of good mufic, the fentence would furely be very unjuft.

WHYTT, Robert, F.R.S. in *Biography*, a diftinguifhed phyfician, was born at Edinburgh in 1714, educated at St. Andrew's, and ftudied phyfic firft at Edinburgh, and afterwards at London, Paris, and Leyden. He fettled in his profeffion at Edinburgh, where he became a fellow, then prefident of the college of phyficians, and in 1746 chairman of the inftitutions of medicine in the univerfity. As a medical practitioner and teacher, and alfo as a writer, he acquired celebrity. The firft of his publications was an "Effay on the Vital and other Involuntary Motions of Animals," 1751, in which he advances a theory different from that of Stahl, as he attributes thefe motions not to the foul, acting to a forefeen end, but to the power of ftimulus. In 1755 he publifhed "Phyfiological Effays, containing an Inquiry into the Caufes which promote the Circulation of the Fluids in the very fmall Veffels of Animals; with Obfervations on the Senfibility and Irritability of the Parts of Man and other Animals." Here he fuppofes that the action of the heart is not fufficient to propel the blood through the minuteft veffels, but that it is affifted by an ofcillatory motion of the veffels themfelves. Of this work, an enlarged edition appeared in 1761. His other works are, "An Effay on the Virtues of Lime-water in the Cure of the Stone," 1752; "Obfervations on the Nature, Caufe, and Cure of thofe Diforders which are commonly called Nervous, Hypochondriac, and Hyfteric," 1764; and fome papers in the Edinburgh "Effays and Obfervations, Phyfical and Literary." A pofthumous work appeared, entitled "Obfervations on the Dropfy of the Brain." Having long laboured under a complication of chronic complaints, he died in 1766. His fon publifhed an edition of all his works in 1768, 4to. under the infpection of fir John Pringle. Haller Bib. Anat. Gen. Biog.

WIA, in *Geography*, one of the fmall weftern iflands of Scotland, a little to the fouth of Benbecula. N. lat. 57° 22′. W. long. 7° 11′.—Alfo, one of the fmall Weftern iflands, near the eaft coaft of Barray. N. lat. 56° 58′. W. long. 7° 22′.—Alfo, a fmall ifland near the weft coaft of Skye. N. lat. 57° 21′. W. long. 6° 27′.

WIAMPA, or Winita, or *Sinpa*, a town of Africa, on the Gold Coaft, in the diftrict of Agonna.

WIANDOTS. See Wyandots.

WIAPOCO, or Little Wia, one of the navigable mouths of the Oroonoko.

WIBALDUS, in *Biography*, a perfon of note in the 12th century, defcended from a noble family in the bifhopric of Liege, completed his ftudies at Liege, and became a teacher firft at Vaffo, and afterwards at Stablo. In 1130 he was elected abbot; and in 1136 he accompanied the emperor Lotharius on his expedition to Italy, by whom he was employed in feveral important departments, and fixed as abbot in the monaftery of mount Caffino. But he quitted this monaftery in the following year, and returned to Germany. In 1146 he became abbot of the monaftery of Corvei on the Wefer, in which he was confirmed by king Conrad, to whom he was no lefs an object of confidence than he had been to Lotharius. He was no lefs a favourite with Frederic I., who had fent him twice as ambaffador to Conftantinople; but on his return from his laft miffion thither, he terminated his life at Buleltia, in Paphlagonia, in confequence, as it is faid, of poifon, which had been given to him in the month of July, 1158. His Letters, mixed with fome other works, one volume of which only remains, throw confiderable light on the ftate of fociety at that time, and on the ecclefiaftical hiftory of Germany. Gen. Biog.

WIBLINGEN, in *Geography*, a town of Bavaria, with a Benedictine abbey, near the conflux of the Iler with the Danube; 3 miles S.S.W. of Ulm.

WIBORGIA, in *Botany*. See Viborgia.

WIBURG, in *Geography*. See VIBORG.

WIBY, a town of Sweden, in the province of Nericia; 18 miles S.W. of Orebro.

WIC, denotes a place on the fea-fhore, or on the bank of a river. Though in the original Saxon, it more properly fignifies a *ftreet*, *village*, or *dwelling-place*; as alfo a *caftle*. See WYKE.

We often meet with *wic* in the Saxon writers, as a termination of the name of a town which had a complete name without it: as, *Lunden-wic*, that is, London-town; which fignifies no more than *London*. In the Saxon Annals, it is mentioned, that king Ethelbert made Melitus bifhop of *Lunden-wic*.

So, Ipfwich is written in fome old charters, *vill de Gippo*, and fometimes *villa de Gippo wico*; which is no variation, but the fame thing; for *Gipps* is the complete name, and the *Gipp-wic* is Gipps-town.

WICCAKAW, in *Geography*, a town of the ftate of Georgia; 22 miles N.N.W. of Oakfufkee.

WICHRA, a river of Saxony, which rifes three miles N. of Waldenburg, and runs into the Pleifs, 2 miles N. of Borna.

WICHTIS, a town of Sweden, in the province of Nyland; 27 miles N.N.W. of Helfingfors.

WICHTRACH, a town of Switzerland, in the canton of Berne; 12 miles S.S.E. of Berne.

WICK, a royal borough, market-town, and the county-town of the fhire of Caithnefs, Scotland, is fituated at the entrance of the fmall river Wick, the eftuary of which forms a good harbour, at the diftance of 279 miles N. from Edinburgh. The town is fmall, and the ftreets narrow and confined; but there are feveral refpectable buildings to ornament the place. The church is an old, dark, and ill-conftructed edifice. A weekly market is held on Fridays, and is well fupplied. The chief fources of commerce and induftry are the fifheries, which are profecuted with great attention and fuccefs. The town and borough-lands of Wick were anciently part of the earldom of Caithnefs: on the petition of George, then earl, a charter was granted by James VI. of Scotland, Sept. 24, 1589, erecting the town of Wick into a royal borough, under the fuperiority of that nobleman. In 1672 the whole earldom of Caithnefs was difpofed of to John Campbell, afterwards created earl Breadalbane, by whofe fucceffors it was fold to the family of Sinclair, in whom the fuperiority is ftill vefted. In 1716 the convention of royal boroughs fixed the fett or government of the borough of Wick. By this fett, the old magiftrates nominate two perfons, out of whom a provoft and two baillies are to be chofen by the free burgeffes: the provoft and two baillies fo elected have the right of choofing feven counfellors, a treafurer, and a dean of guild. Wick, in conjunction with the boroughs of Dingwall, Dornock, Kirkwall, and Tain, fends one member to parliament. The parifh of Wick is twenty miles long and ten broad; and in the population return of the year 1811 is ftated to contain 5080 inhabitants. Carlifle's Topographical Dictionary of Scotland, 4to. 2 vols. 1813. Gazetteer of Scotland, 1806. Beauties of Scotland, vol. v. Caithnefsfhire.

WICK, a river of Scotland, which runs into the Northern ocean, at Wick, in the county of Caithnefs.

WICKER, a twig of the ofier fhrub, fingle or wrought.

WICKER-*Bafket*, in *Rural Economy*, any fort of bafket which is made of wicker-work, or the plaited or twifted twigs of the willow, or other fuch kinds of young fhoots. See BASKET.

A fort of wicker-bafket or braid, too, is made ufe of in grafting in field, orchard, or fruit grounds. It is obferved in the Gloucefterfhire Report on Agriculture, that the grafts are fecured immediately after the compoft is put on, with "braids." Thefe are open wicker-bafkets in the form of an inverted cone, fitting the ftock below the place to which the compoft extends, and rifing about two feet high, and expanding at the top to nearly the fame diameter. This contrivance ferves not only to guard the grafts in their early ftate, but alfo to keep the fhoots to a proper compact form of growth. The practice chiefly prevails on the banks of the Severn, where the ofier (*falix viminalis*) is grown in great abundance.

In hop-grounds likewife large wicker-bafkets are employed for picking the hops into. See HOP.

And wicker-work of the bafket kind is made ufe of for many other purpofes of different forts.

WICKER-*Tree*, a name given by the Englifh to a tree, common in China, and defcribed by Kircher and others. It is, as it were, a rope twifted by nature, about an inch thick, and creeps along the earth often for above a hundred paces together, much embarraffing the way, but ferving for cables of fhips, feats, hurdles, beds, mats, and various other neceffary ufes It endures no vermin, and is much valued for being cool and refrefhing in the hot feafons.

WICKER-*Work*, in *Agriculture*, a fort of bafket-work on a large fcale, ufed for defending land from water of the fea or other kinds. It is obferved by Mr. Loudon, in his work on "Country Refidences," that in fome very fandy fhores, defences of the embankment kind may be made of wicker-work; and that three or four rows of paling may be made of different heights, and the intervals between them be filled with furze, brufhwood, ftraw, or any other fuch materials. It is thought that thefe materials would retain the fand as the tide paffed through among them; and that in a very fhort time a defence or fort of embankment would be formed of the fhelving kind, which fhould then be planted with the upright fea lime-grafs, in order to bind it. See EMBANKMENT, and WATER, *Sea*, *Defending Land from*. Alfo UPRIGHT *Sea Lyme-Grafs*, and ELYMUS *Arenarius*.

WICKERAD, in *Geography*, a town of France, in the department of the Roer. It gave name to a lordfhip, furrounded by the duchy of Juliers; 3 miles N.E. of Erkelens.

WICKET, of the French *guichet*, a little door within a gate; or a hole in a door, through which to view what paffes without.

WICKFORD, in *Geography*, a town of Rhode ifland, with a poft-office; 10 miles N.W. of Newport.

WICKHAM, commonly called *Market-Wickham*, to diftinguifh it from two other places of the fame name in the county, is a village and parifh in the hundred of Wilford, and county of Suffolk, England. It has been a place of much greater confequence than it is at prefent, and had a weekly market and town-hall, where the quarter-feffions were held. The fpiritual courts for the archdeaconry of Suffolk are ftill held here. The parifh-church, being built on a hill, conftitutes a land-mark for veffels failing by the coaft. From the tower, a fpectator may fee nearly fifty other churches. An aifle, or chapel, on the fouth fide of the church, was built by Walter Fulburn, of this parifh, who died, and was buried within its walls, in 1489. The rectories of Wickham, Pettiftree, and Bing, all in the hundred of Wilford, were bequeathed in 1718 by Mr. John Pemberton for charitable ufes. According to the population report of 1811, this parifh contained 133 houfes, and 906 inhabitants. It is 12½ miles N.E. of Ipfwich, and

and 81 in the ſame direction from London. The market, which was formerly held on Saturdays, has long been diſcontinued.—Beauties of England and Wales, vol. xiv. Suffolk, by F. Shoberl.

Wickham *Breaux*, and Wickham *Streyth*, the names of two other pariſhes in Suffolk, England.

WICKLIFFISTS, or Wickliffites, in *Eccleſiaſtical Hiſtory*, a religious ſect, who had their riſe in England in the 14th century, and their name from their leader *John Wickliffe*.

Wickliffe, of whoſe opinions we give ſome account in his biographical article, (ſee Wicliff,) denied that biſhops were of a different order from prieſts, and that by virtue of their office they had any power to do what prieſts have not; and that in the apoſtolic times the two orders ſubſiſting in the church were thoſe of prieſt and deacon. With regard to tithes, he obſerves, that we do not read in the Goſpel where Chriſt paid tithes, or commanded any man ſo to do; and that if they were due by God's commandment, there ſhould be every where in Chriſtendom one manner of tithing; and that thoſe things which are due to prieſts ſhould be given freely, without exaction or conſtraining. In oppoſition to the papal claims of ſupremacy and dominion, he maintained that the grants of emperors may be reſumed; that St. Peter and his ſucceſſors have no rights conferred upon them of civil or political dominion; that the perſons of the clergy and the goods of the church are not exempted from the civil powers; and that bulls of abſolution or excommunication are conditional and not abſolute, and depend for their effects on the diſpoſition and character of thoſe to whom they pertain.

Wickliffe defines hereſy to be error maintained againſt holy writ, and that in life and converſation, as well as in opinion. He ventured to affirm, that children who die without baptiſm may be ſaved; that this rite does not confer grace, but only ſignify that which was before given; and he denied that all ſins are aboliſhed by baptiſm. But in theſe and ſome other points, occurring in his various works, which were publiſhed at different times, he is not always perfectly conſiſtent; but in all matters of principal importance he is uniform.

He left many followers in England and other countries, who were called Wickliffites and Lollards, and who held their opinions in private without making any public profeſſion of them; though they were generally known by their diſparaging the ſuperſtitious clergy, whoſe corruptions were ſo notorious, and their cruelty ſo enraged, that it was no wonder the people were much prejudiced againſt them. Wherever they could be found, they were terribly perſecuted by the inquiſitors, and other inſtruments of papal vengeance.—Lewis's Hiſtory, &c. 8vo. paſſim. Moſh. Eccl. Hiſt. vol. iii. 8vo. Burnet's Hiſt. Reform. vol. i. p. 23.

WICKLOW, in *Geography*, a maritime county of Ireland, on the eaſt coaſt, having the county of Dublin on the north, the Iriſh ſea on the eaſt, the counties of Kildare, Dublin, and Carlow, on the weſt, and that of Wexford on the ſouth. Its extent from north to ſouth is 32 Iriſh ($40\frac{1}{2}$ Engliſh) miles; from eaſt to weſt, 26 Iriſh (33 Engliſh) miles; and the ſuperficial contents are 311,600 acres, or 486 ſquare miles, equal to 500,600 acres, or 780 ſquare miles Engliſh. Mr. Radcliffe, according to the county map, ſtates the ſuperficial contents at 305,404 Iriſh acres. There are 58 pariſhes, which have 20 churches, moſtly in the archbiſhopric of Dublin. Dr. Beaufort ſtates the population at 58,000. "A great part of Wicklow is rendered unfit for habitation, and incapable of culture, by mountains intermixed with rocks and bogs. However, though the heart of the county be a cheerleſs waſte, the hills on the eaſt and weſt ſides, and eſpecially along the coaſt, are from ſix to eight miles in breadth, being many of them well wooded, and intermixed with profitable and ſmiling valleys, form a delightful and various ſcenery. They are crowded with gentlemen's ſeats, and are not without ſmall towns and villages." This was Dr. Beaufort's account in 1792. In 1801, captain Frazer publiſhed a ſtatiſtical account for the Dublin Society. This gentleman laments, that "the Wicklow farmers foul the land by repeated corn-crops, and ſeldom or never lay it down to graſs with ſeeds." He deplores "the total neglect of the improvement of the breed of animals for ſtock and labour;" and under the head of ploughs he remarks, "the common plough in uſe in this diſtrict is the ſwing-plough; it is ſeldom, however, formed on any ſcientific principles, and is generally very clumſy, and ill-adapted for making clean or regular work." In 1812, however, when the Rev. Thomas Radcliffe publiſhed a Report of the Agriculture and Live-Stock of the County of Wicklow, a very great change had taken place. A few extracts from this intereſting publication will furniſh the reader with the moſt authentic information on the ſtate of this county, and of what has been effected by the exertions of the Farming Society of Ireland, its own local Farming Society, and the encouragement as well as example of good landlords.

The climate of the county is, in general, mild; but on the eaſtern ſide, along the ſea-coaſt, is peculiarly warm, and favourable to vegetation; inſomuch that there is almoſt a perpetual ſpring; and land of an apparently light quality is known to produce crops equal, if not ſuperior, to thoſe on the richeſt ſoils in other parts of Ireland. The crops commonly cultivated are, potatoes, wheat, barley, and oats. With reſpect to potatoes, the valuable ſyſtem of drilling is almoſt univerſally adopted. The quantity of wheat is inconſiderable: it is generally taken after the potatoe-crop, ſometimes after another white crop, or upon the lea; but the periodical fallow for wheat is fortunately unheard of. The barley-crop is taken after potatoes or turnips, and, like the wheat, is ſown under the plough. The oat-crop, by the common practice, is taken upon the lea; but if upon ſtubble-ground, it is ſown under the plough. The crops are not exceeded in quantity or quality in any part of Ireland. Green crops are not in much uſe among the tenantry. The manure in this county, beſides dung, conſiſts of brown, blue, and white marl, lime and lime-ſtone gravel. In the greateſt part of this county, the implements of the beſt conſtruction are in very general uſe; ſuch as the Scotch plough, as recommended and ſupplied by the Farming Society, the Scotch harrow, the Scotch cart, drill-machines, and even the threſhing-machine. Moſt of the improved breeds of cattle have been introduced into this county; but Wicklow cannot be conſidered as a breeding county. The dairies are numerous; but, on a contracted ſcale, averaging from eight to ſixteen cows, and almoſt uniformly engaged in the feeding of veal for the Dublin market. In the northern part of the county, much of the milk is conſumed in fattening early lamb. The county of Wicklow, though not to be claſſed as a breeding county with reſpect to cattle, is very extenſively ſo with reſpect to ſheep, its vaſt tracts of mountain ſupplying a wholeſome, though not an exuberant, paſture to that animal. The breed of this county is the mountain kind; and the number of breeding ewes may be ſtated at 20,000. The South Down are the favourites with the gentlemen; and many flocks of the native mountain have been croſſed with South Down. The Merino ſheep have alſo been ſucceſsfully introduced. The cotton manufacture is carried on with spirit at Stratford-upon-Slaney. The woollen manufacture is chiefly limited to the flannel-trade. This, however, is carried on largely, and is a source of fair profit and industrious occupation. It prevails on the property of earl Fitzwilliam, and the Flannel-hall at Rathdrum was built at his lordship's expence. The average annual sale is about 5000 pieces of 120 yards each.

The romantic beauties of this county have been often described. The vicinity to Dublin makes them easily accessible, and few travellers omit to visit them. The antiquities of Glendalough have been noticed in the proper place, under that name. The mineralogy of Wicklow has been noticed in Dr. Fetton's valuable Notes on the Mineralogy of the Neighbourhood of Dublin; and on this head Mr. Griffith's Report on the Mountain District of Wicklow should also be consulted. This uncultivated district has many peculiarities, which consist chiefly in the facility of access by means of roads; the vicinity of highly improved lands and industrious inhabitants; the frequent occurrence of beds of lime-stone, gravel, and marl; the best manure for the amelioration of mountain soils; and the uncommon mildness of the climate. These uncultivated lands occupy about 200,000 Irish acres, of which about 60,000 consist of black bog; the remainder is moory soil, generally covered by coarse sedgy grass, or grass intermixed with heath. In this district, many rivers have their sources. The Liffey, with its tributary streams, takes a circular course through the county of Kildare, and falls into the bay of Dublin; the Slaney runs southward to the county of Wicklow; the Fartrey disembogues itself at Wicklow; and the Ovoca at Arklow. (For an account of the Cronebane mines, see CRONEBANE.) At Croghan Kinshela, in the southern part of the county, a quantity of native gold has been extracted by washing from the alluvial soil, of which an account, by Messrs. Mills and Weaver, may be found in the Transactions of the Dublin Society. Near 600 ounces of gold, worth above 2000*l*., were extracted; but the vein could not be discovered, and the search for it was given up. Oxyd of tin was found in the same stream. The county of Wicklow has no large town, and has only the two members for the county to represent it in parliament. — Frazer's Survey. Beaufort's Memoir. Radcliffe's Report. Griffith's Report, &c.

WICKLOW, the assize-town of the preceding county, which is also a post-town. It is pleasantly situated on a small harbour, and near a beautiful strand abounding in fine pebbles, which is called the Murrough. The ale of Wicklow has been long celebrated in Dublin. It is 24 miles S.S.E. from Dublin.

WICKWA, a small lake of Canada, at the eastern extremity of Lake St. John.

WICKWAR, anciently WICKEN, a market-town in the hundred of Grombald's Ash, in the county of Gloucester, England, is situated 19 miles S.W. from Gloucester, and 108 miles W. from London, and consists of one long street. The town is incorporated and governed by a mayor and twelve aldermen. It has a weekly market on Monday, and two yearly fairs. In it two courts are held; one for the borough, and another for the tything, or foreign, which have separate constables. The clothing manufacture, which once flourished here, has long been on the decline; but the lower classes are still employed in spinning for the clothiers of other places. Wickwar contains a well-endowed free grammar-school, which was founded in 1684. The church, a handsome building on an eminence, consists of a nave and north aisle. The rectory is valued in the king's books at 18*l*. The resident population in 1801 was 764; in 1811 it had increased to 805.—Hist. of the County of Gloucester, by the Rev. Thomas Rudge, B.D. Gloucester, 1803, 2 vols. 8vo.

WICLIFF, DE WYCLIF, WICLEF, or WICKLIFFE, JOHN, in *Biography*, the earliest reformer of religion from Popery, was born about the year 1324 in Yorkshire, near the river Tees, in a parish whence he takes his name. He was educated at Oxford, first as a commoner of Queen's college, and then at Merton college, peculiarly celebrated at that period for its learned members. His industry and talents soon raised him to distinction; and he is said to have committed to memory the most abstruse parts of Aristotle, and to have excelled in his acquaintance with the subtleties of the school divinity. He was also eminently skilled in civil and canon law, and in the law of the land. But the study which led to his future fame was that of the Scriptures; to which he added a diligent perusal of the Latin fathers, and of the writings of the English divines, Robert Grosthead and Richard Fitz-Ralph. In his treatise "Of the Last Age of the Church," at the early period of the year 1356, he remonstrated against some Popish corruptions; and in 1360 he was active in opposing the encroachments of the Mendicant Friars, who interfered with the jurisdiction and statutes of the university, and took all opportunities of enticing the students from the colleges into their convents. In the following year, such was the credit he had acquired by his conduct and writings, he was appointed master of Baliol college, and was presented to a living in Lincolnshire. At this time he was held in such esteem by archbishop Simon Islip, that in 1365 he constituted him warden of Canterbury college, which he had just founded; but on occasion of a dispute between the regular and secular priests, Wickliffe and the three secular fellows were rejected; and on an appeal to Rome, the sentence against Wickliffe was confirmed in 1370. His reputation in the university was not at all diminished by his exclusion. In 1372 he took the degree of D.D., and read lectures, which gained him such applause, that whatever he said was regarded as an oracle. The impostures of the monks were the objects to which his first attacks were particularly directed; and the circumstances of the times favoured his design. The court of Rome was now enforcing by menaces its demands on king Edward III. of the homage and tribute to the see of Rome, which had been ingloriously stipulated by king John; and the parliament had determined to support the king in his refusal. A monk appeared as an advocate on behalf of the claims of Rome; and Wickliffe's reply caused him to be favourably regarded at court, and procured for him the patronage of the king's son, John of Gaunt, duke of Lancaster. In 1374 Wickliffe was joined in an embassy to Bruges, the object of which was to confer with the papal nuncios concerning the liberties of the English church, on which the usurpations of Rome had made unwarrantable encroachments. In the same year the king presented him to the valuable rectory of Lutterworth, in Leicestershire; and in the following year he was installed in a prebend of the collegiate church of Westbury, in Gloucestershire. Wickliffe, by his foreign mission, had an opportunity of acquainting himself with the corruption and tyranny of the court of Rome; and both his lectures and conversations were amplified with invectives against the pope. Whilst he defended the authority of the crown and the privileges of the nobles against all ecclesiastical encroachments, he censured vice and corruption in all ranks of society. This conduct, though it raised his reputation among the people, excited a host of enemies, who selected from his writings nineteen articles, which they deemed heretical, and which, as ſuch, they tranſmitted to Gregory XI. In 1377 this pontiff returned three bulls addreſſed to the archbiſhop of Canterbury and the biſhop of London, ordering the ſeizure and impriſonment of Wickliffe; or, if this meaſure failed, his citation to the court of Rome; and alſo a requiſition to the king and government to aſſiſt in extirpating the errors which he had propagated. Edward died before the bulls arrived; and the duke of Lancaſter, uncle to the young king, had great influence in the adminiſtration. When Wickliffe, therefore, was cited to appear at St. Paul's church before the two prelates, poſſeſſing plenitude of power, he thought it neceſſary to ſecure himſelf by the protection of that powerful patron. On the appointed day he appeared at St. Paul's, in the midſt of a vaſt concourſe of people, and accompanied by the duke of Lancaſter, and lord Henry Percy, earl-marſhal. The biſhop of London was very indignant, and angry words paſſed between him and the two lords; ſo that the whole aſſembly was tumultuous, and nothing was done. Wickliffe afterwards appeared before the two prelates in Lambeth palace, and delivered an explanation of the articles objected againſt him. The Londoners, who were apprehenſive that he might be ſeverely treated, flocked in crowds to the palace; and a meſſenger from the queen forbade the delegates to proceed to a definitive ſentence. Gregory ſoon after died, and his commiſſion expiring with him, Wickliffe eſcaped, but not without a ſevere illneſs, which was the conſequence of his anxiety and fatigue. His ſpirits, however, were unbroken, and he was firm in maintaining opinions which the friars, by all the efforts of intimidation, urged him to renounce.

Upon his recovery, he preſented to the parliament, in 1379, a paper againſt the tyranny and uſurpations of Rome; and he alſo drew up ſome free remarks on the papal ſupremacy and infallibility. But his moſt effectual attack on the corruption of religion was his tranſlation of the Bible into Engliſh. This occupied many of the laſt years of his life, and remains a valuable relic of the age in which it was performed, and a permanent memorial of the talents and induſtry of the perſon by whom it was accompliſhed. (See *Engliſh* BIBLES.) By way of preparation for his Bible, he publiſhed a treatiſe "Of the Truth of the Scripture," in which, as well as in a prologue or preface to his tranſlation, he held, long before any of our other reformers or advocates for the ſufficiency of Scripture, that this is the law of Chriſt, and the faith of the church; that all truth is contained in it; and that every diſputation which has not its origin thence is profane. "The truth of the faith," ſays he, "ſhines the more by how much the more it is known—nor are thoſe heretics to be heard who fancy that ſeculars ought not to know the law of God, but that it is ſufficient for them to know what prieſts and prelates tell them by word of mouth; for the Scripture is the faith of the church, and the more it is known in an orthodox ſenſe the better; therefore, as ſecular men ought to know the faith, ſo it is to be taught men in whatſoever language is beſt known to them. Beſides, ſince the truth of the faith is clearer and more exact in the Scripture than the prieſts know how to expreſs it—it ſeems uſeful that the faithful ſhould themſelves ſearch out and diſcover the ſenſe of the faith, by having the Scriptures in a language which they underſtand.—The laws which the prelates make are not to be received as matters of faith; nor are we to believe their words or diſcourſes any farther or otherwiſe than they are founded on the Scripture;"—with much more to the ſame purpoſe, and in the ſame admirable ſtrain. In this preface, and ſeveral other publications and treatiſes ſtill in manuſcript, he reflected ſeverely on the corruptions of the clergy, condemned the worſhip of ſaints and images, the doctrine of indulgences, pilgrimages to particular ſhrines, and confeſſion; and alſo denied the corporal preſence of Chriſt in the ſacrament, inveighed againſt the wanton exerciſe of the papal power, and oppoſed the making of the belief of the pope's being head of the church an article of faith and ſalvation, cenſured the celibacy of the clergy, forced vows of chaſtity, expoſed various errors and irregularities in the hierarchy and diſcipline of the church, and earneſtly exhorted all people to the ſtudy of the Scriptures.

In his lectures of 1381, he attacked the Popiſh doctrine of tranſubſtantiation, concerning which he laid down this fundamental propoſition; *viz.* that the ſubſtance of bread and wine ſtill remained in the ſacramental elements after their conſecration, and that the hoſt is only typically to be regarded as the body of Chriſt; and he deduced from it ſixteen concluſions. This attack alarmed the church, which regarded tranſubſtantiation as the moſt ſacred tenet of the Romiſh religion, and the chancellor of Oxford pronounced a condemnation of theſe concluſions. Wickliffe appealed from this ſentence to the king; but he found himſelf deſerted by his protector, the duke of Lancaſter, who had no further occaſion for his ſervices, or who could not avail himſelf for any political purpoſe of his theological diſcuſſions. Thus circumſtanced, he found himſelf in danger; his reſolution failed him, and he humbled himſelf by making a confeſſion at Oxford, before the archbiſhop and ſix biſhops, with other clergy, who had already condemned ſome of his tenets as erroneous and heretical. In this confeſſion, he admitted the real preſence of Chriſt's body in the ſacrament, with ſome explanations and reaſons which were not ſatisfactory to his perſecutors. It has been ſaid that he made a public recantation of the opinions with which he was charged; but of this no ſufficient evidence appears. The next ſtep in their proceedings againſt him was a royal letter, procured by the archbiſhop, addreſſed to the chancellor and proctors, and directing them to expel from the univerſity and town of Oxford all who ſhould harbour Wickliffe or his followers, or hold any communication with them. Theſe proceedings obliged him to withdraw, and to retire to his rectory at Lutterworth, where he continued to preach reformation in religion, and finiſhed his tranſlation of the Scriptures. Some have ſaid that king Richard baniſhed him out of England; but if that were the caſe, it was only a temporary exile, and he returned in ſafety to Lutterworth. In 1383 he had a paralytic ſtroke, which furniſhed him with an apology for not appearing to a citation of pope Urban VI.; and this was ſucceeded by a ſecond attack, which terminated his life on the laſt day of December 1384. His remains, however, did not eſcape the vengeance of his enemies many years after his death; for the council of Conſtance in 1415, not content with condemning many propoſitions in his works, and declaring that he died an obſtinate heretic, with impotent malignity ordered his bones to be dug up and thrown upon a dunghill. This ſentence was executed in 1428, in conſequence of a mandate from the pope, by Flemming, biſhop of Lincoln, who cauſed his remains to be diſinterred and burnt, and the aſhes to be thrown into a brook. "Thus," ſays Fuller, the church hiſtorian, in a figurative ſtrain juſtified by fact, "this brook hath conveyed his aſhes into Avon, Avon into Severn, Severn into the narrow ſeas, they into the main ocean; and thus the aſhes of Wickliffe are the emblem of his doctrine, which now is diſperſed all the world over." His doctrine not only ſurvived theſe impotent attempts to extinguiſh it, but was perpetuated and diffuſed by his followers, who were called Lollards; and "this germ of reformation," as one of his biographers ſays, "broke forth into complete expanſion, when the ſeaſon for that great change was fully come." Of his general character, it will be ſufficient to ſay, "that he was confeſſedly learned for his age, and was an acute reaſoner. In ſhort, notwithſtanding certain errors and imperfections, he may be regarded as a perſon of extraordinary merit and qualifications, who is entitled to honourable remembrance from every foe to eccleſiaſtical tyranny and impoſture;" and we may add that he advanced principles which have not yet produced their full effect.

The number of tracts he wrote and publiſhed, both in Latin and Engliſh, is very conſiderable. From two large volumes of his works, entitled "Aletheia, *i. e.* Truth," and a third under the title of "Trialogus," John Huſs is ſaid to have derived moſt of his doctrines. We have a full and complete "Hiſtory of the Life and Sufferings, and various Writings of Wickliffe," both printed and MS., publiſhed in 8vo., at London, in the year 1720, by Mr. John Lewis; who alſo publiſhed, in 1731, "Wickliffe's Engliſh Tranſlation of the New Teſtament from the Latin Verſion, called the Vulgate." This tranſlation is enriched with a learned preface by the editor, in which he enlarges upon the life, actions, and ſufferings of this eminent reformer. Biog. Brit. Moſh. Eccl. Hiſt. Neal's Hiſt. of the Puritans. Gen. Biog. For an account of his diſtinguiſhing tenets, and thoſe of his followers, ſee WICKLIFFISTS and LOLLARDS.

WICOMICO, in *Geography*, a river which riſes in the ſtate of Delaware, enters the ſtate of Maryland, and paſſes into Fiſhing bay, on the eaſt ſide of the Cheſapeak, N. lat. 38° 16′. W. long. 75° 57′.

WICOMOCO, a river of Virginia, which runs into the Cheſapeak, N. lat. 37° 55′. W. long. 76° 25′.

WICQUEFORT, ABRAHAM, in *Biography*, was born at Amſterdam in 1598, and having left his own country for France at an early age, he was nominated reſident for the elector of Brandenburg at the French court, and held the office for thirty-two years. But being ſuſpected by cardinal Mazarin of communicating ſecrets to his correſpondents in Holland with regard to the amours of Lewis XIV., he was ordered, in 1658, to leave the kingdom; but in the mean time he was arreſted, and confined in the Baſtille. At length, in 1659, he was releaſed and diſmiſſed. However, in three months the cardinal recalled him, and ſettled on him a penſion. On occaſion of the war between France and Holland in 1672, he returned to his own country, and was protected by John de Witt, who employed him in writing a hiſtory of Holland to his own time. In 1676 he was arreſted and condemned to perpetual impriſonment, under an accuſation of carrying on a ſecret correſpondence with the enemies of the ſtate; and after having been confined for three years, he made his eſcape by the contrivance of one of his daughters. He then ſought refuge at the court of Zell, from which he returned to Holland in 1681, where he lived without moleſtation, but without recovering the places of which he had been deprived. In the following year, 1682, he died. The work on account of which Wicquefort is beſt known, is entitled "L'Ambaſſadeur et ſes Fonctions," firſt printed at the Hague in 2 vols. 4to. 1681, and often reprinted. He holds in high eſtimation the privileges of the order to which he belonged, as we may infer from his cenſure of Cromwell's ſpirited act of juſtice in executing the brother of the Portugueſe ambaſſador for a murder: nevertheleſs he inculcates ſound morality with regard to the conduct of diplomatiſts in the countries to which they are ſent. His other works are, "Memoires touchant les Ambaſſadeurs et les Miniſtres;" one volume of his "Hiſtory of the Dutch Republic," which appeared in French at the Hague in 1719, fol.; and tranſlations into French of the accounts of different embaſſies, and alſo of voyages and travels. Moreri. Gen. Biog.

WICRANGLE, in *Ornithology*, an Engliſh name for the mattageſs, or greater butcher-bird, the *lanius cinereus major* of authors.

WICRANTUM, in *Natural Hiſtory*, a name given by the people of the Eaſt Indies to certain foſſile bodies, of the nature of the pyrites, of the ſize of peas, and formed into variouſly angular figures.

They look black and gloſſy, and much of the nature of blende, or mock-lead; but when put into the fire, they ſhew us by their ſmell that they contain ſulphur. They are found in the diamond-mines.

The natives firſt powder them; and then mixing them with the juices of certain plants, they dry them, and then calcine them again. Theſe proceſſes they repeat at leaſt ſixty times; but the firſt calcinations are made with a mixture of divers urines, as that of the horſe, the camel, the cow, and the like.

After this tedious preparation, they are given in coughs and colds, and are ſaid to be a remedy even in conſumptions.

WICZENIECZ, in *Geography*, a town of Poland, in Podolia; 6 miles N.W. of Kaminiec.

WIDAWA, a town of the duchy of Warſaw; 22 miles S.W. of Siradia.

WIDDAU, a river of Germany, which joins the Rodau at Rotenburg, in the county of Verden.

WIDDY, in *Agriculture*. See WITHY.

WIDE, is uſed in ſome places to denote a ſmall vale, and alſo a wide piece of water, or pond.

WIDE-*Eared*, in the *Manege*, is applied to a horſe, when the root, or lower part of his ear is placed too low, and the ear itſelf is too large. The French uſe the term *oreillard* for ſuch a horſe.

WIDE *Bay*, in *Geography*, a bay on the eaſt coaſt of New Holland, between Double Iſland Point and Indian Head.

WIDE *Mouth Bay*, a bay of England, on the N.W. coaſt of Cornwall. N. lat. 50° 46′. W. long. 5° 19′.

WIDEKINDI, or WIDICHINDI, JOHN, in *Biography*, a Swediſh hiſtorian, was born in the province of Weſtmanland, about the year 1620, and ſtudied at Upſal, where he delivered an oration in 1654, on occaſion of queen Chriſtina's acceſſion to the throne; and by her recommendation he was appointed hiſtoriographer of the kingdom. In 1676 he propoſed printing his "Hiſtory of Guſtavus Adolphus," and meaſures were taken for this purpoſe; but he died at Stockholm in 1678, before the work was executed. The firſt part of this hiſtory was publiſhed in 1691, fol.; but as it much offended both the Danes and Ruſſians, it was ſuppreſſed by the king's command. It is not known whether he completed the work in MS.; but the part publiſhed is written in a dull, heavy ſtyle, and it has been careleſsly printed. The author, however, was a man of learning, well acquainted with hiſtory, and reckoned a good Latin poet. He poſſeſſed an excellent library, and was much reſpected by king Charles Guſtavus, who called him his philoſopher. The moſt important of his works, a catalogue of which is given in "Schefferi Svecia Litterata," is the "Hiſtory of the Ruſſian War," written both in Latin and Swediſh, 1672, 4to. Gen. Biog.

WIDERDRIESS, in *Geography*, a town of the duchy of Stiria; 2 miles S. of Windiſch Gratz.

WIDJITZE, a town of Bohemia, in the circle of Czaflau; 8 miles W. of Czaflau.

WIDMINNEN, a town of Pruffia; 14 miles N.W. of Lick.

WIDOW, Vidua, a woman that has loft her hufband. Some alfo ufe the term *widower*, for a man who has loft his wife. Marriage with a widow is a kind of bigamy in the eye of the canon law.

The widow of a freeman of London may ufe her hufband's trade as long as fhe continues a widow.

Mr. Kerfeboom has given us a table, fhewing how long four hundred and thirty-two widows lived, and finds, that at a medium, each lived fourteen years. Phil. Tranf. N° 468, fect. 3.

It appears that, in Germany, the number of widows dying annually is four times the number of widowers: thus, in Drefden alone, the number of widows who died in four years was 584; the number of widowers 149: *i. e.* 4 to 1. At Wittenberg, during 11 years, 98 widowers died, and 376 widows. At Gotha, during 20 years, 210 widowers died, and 760 widows. And as widows are certainly, one with another, feveral years younger than widowers, it may be concluded that the number of the former in life together could not be lefs than five times the latter.

Thus alfo, in 1770, the number of widows in life, derived from the whole body of profeffors and minifters in Scotland, was 380; but the number of widowers among them has, one year with another, been fcarcely 90; *i. e.* not fo much as a quarter of the number of widows. Price's Obferv. on Rev. Paym. eff. 4.

Thefe facts cannot be accounted for without admitting the greater mortality of males. See Marriage, and Mortality.

There have been many fchemes eftablifhed for providing annuities for widows, for an account of feveral of which, fee Price's Obferv. &c. chap. ii. fect. 1, 2, 3.

Among the ancient Greeks, widows had the care of the eternal fire of Vefta committed to them; which charge among the Romans could be performed by virgins only, who from their office were called veftals. See Vestal.

Widow *of the King*, was fhe, who, after her hufband's death, being the king's tenant in capite, was driven to recover her dower by the writ *De dote affignanda;* and could not marry again without the king's confent.

Widow *Bench*, in the county of Suffex, is that fhare which a widow is allowed of her hufband's eftate, befides her jointure.

Widow'*s Chamber*, a name given in London to the apparel and furniture of the bed-chamber of the widow of a freeman, to which fhe is entitled.

Widow-*Wail*, in *Botany*. See Cneorum.

WIDURIS, in *Natural Hiftory*, the name of a ftone found in Java, Malabar, and fome other places, and defcribed by Rumphius. Some fpecies of this are all over of a fine white; others are of a dufky colour, with ftreaks of white; the fimply white ones are femi-pellucid, and look very like the white of an egg. Some alfo have called this the *hyalops*, or *achates vitreæ perfpicuitatis*.

WIECK. See Week.

WIED, in *Geography*, a county of Germany, fituated to the north of Treves, in the year 1560, divided into two parts: the Lower County, or New Wied, or Wied New Wied; and the Upper County, or Wied Runkel. Both had feats in the college of Weftphalia counts.

Wied, *New*. See Neuwied.

Wied, or *Old Wied*, a town of Germany, in the county of New Wied; 9 miles N. of Coblentz.

WIEDENBRUCK, a town of Weftphalia, in the bifhopric of Ofnabruck; 32 miles S.S.E. of Ofnabruck. N. lat. 51° 45′. E. long. 8° 18′.

WIEDERAU, a town of Saxony; 5 miles N. of Liebenwerda.

WIEDERSBERG, a town of Saxony, in the Vogtland; 8 miles W.S.W. of Oelfnitz.

WIEDERSPACH, a town of Germany, in the margravate of Anfpach; 6 miles W. of Anfpach.

WIEGANDSTHAL, or Wiegenthal, a town of Upper Lufatia; 11 miles S. of Lauban.

WIEHE, a town of Thuringia; 26 miles N.N.E. of Erfurt. N. lat. 51° 18′. E. long. 11° 35′.

WIELAND, Christopher Martin, in *Biography*, was the fon of a Proteftant clergyman at Biberach, in Swabia, where he was born in September 1733. Educated by his father, he began at the early age of thirteen to diftinguifh himfelf by his Latin and German poems; and he purfued his education at Magdeburg and at Erfurt. Upon his return home he became affectionately attached to Sophia de Guterman, afterwards known by her works under the name of Mad. de la Roche. In the year 1750 he ftudied jurifprudence at Tubingen; but his time was chiefly devoted to the writing of verfes, fo that in 1752 he publifhed a didactic poem in fix cantos, entitled "The Nature of Things;" "Ante-Ovid, or the Art of Love;" and "Moral Letters and Tales." He alfo began an epic poem, on the fubject of Arminius, the firft five cantos of which he fent to the famous Swifs poet Bodmer; and he was thus led to vifit Switzerland, and to cultivate a friendfhip with this celebrated poet, and to refide for fome time in his houfe at Zurich. In this retired and tranquil fituation, he applied with great diligence to the ftudy of the belles lettres, and acquainted himfelf with the principal modern languages, fuch as Englifh, French, and Italian, to which he afterwards added the Spanifh and Portuguefe. He alfo read Plato with great attention, and wrote feveral works, among which were the "Trial of Abraham," and "Letters of the Dead." After a refidence of feven or eight years in Switzerland, he quitted this country, having formed his tafte on the models of Euripides, Xenophon, and Shaftfbury, whofe writings he had diligently ftudied; and in 1758 he publifhed his "Arafpes and Panthea," a work which manifefts the afcendency which judgment and moral fentiment had acquired over his imagination. Upon his return in 1760 to his native city, he was appointed a director of the chancery, which office he held till the year 1769, referving, however, fome leifure moments for the compofition of his philofophical romance, entitled "Agathon," and his beautiful didactic poem "Mufarion." About this time he became intimately acquainted with count Stadion, a nobleman who lived with fplendour near Biberach, who had cultivated a tafte for literature, and who poffeffed an excellent library. He afterwards received from the elector of Mentz an invitation to be profeffor of philofophy and the belles lettres at Erfurt, and during his refidence in this place he became acquainted with Anna Amelia, duchefs dowager of Weimar, a patronefs of polite literature, and in 1772 fhe appointed him tutor to the two princes, Charles Auguftus and his brother Conftantine, of whom fhe was guardian. In this fituation he occupied himfelf in preparing a variety of works, both in profe and verfe, which have done honour to German literature. He was at this time aulic counfellor to the duke of Saxe Weimar, with a penfion, and a counfellor of government to the elector of Mentz. Wieland married his favourite daughter Charlotte to a bookfeller at Zurich, who was a fon of the celebrated poet Solomon Gefner. In 1797 he vifited visited his children at Zurich, and resided with his family in a romantic situation on the border of the lake, where he was visited by the most eminent literati of Switzerland. Conceiving a fond attachment to a rural retreat, he sold his house at Weimar, and purchased a small estate in the neighbourhood, where he fixed his abode. Although his fortune was small, his disposition was liberal; and he assisted many distressed young poets and authors for their contributions to the German Mercury, which he commenced in the year 1783. To the ex-monk Reinhold, who had escaped from Vienna, he was a generous patron, and gave to him one of his daughters in marriage. This monk was afterwards professor of philosophy at Kiel. He also supported another monk, who had fled to him from a Cistertian monastery in Swabia, during his residence at Jena, where he studied philosophy. Wieland had married in 1765 a person of good family at Augsburg, of whom he expresses himself in the highest terms of respect and affection, and by whom he had thirteen children; "sound," he says, "in body and mind; with their mother, they form the happiness of my life." In 1807 this venerable poet was elected a member of the floral order at Nuremberg; and in 1808, Buonaparte sent him the cross of the legion of honour. After the battle of Jena, he was protected by a special order of that conqueror. He died in January 1813, in his 80th year. For the delineation of his talents and character by Küttner and others, and an account of his works, which were very numerous, we must refer to his article in the General Biography, observing that his original works have been published in thirty-six large 4to. volumes, and six supplementary volumes. Leipsic, 1794—1802.

WIELAS, in *Geography*, a town on the east coast of the island of Gilolo. N. lat. 1° 9′. E. long. 128° 30′.

WIELCZYNY, a town of Lithuania, in the palatinate of Novogrodek; 40 miles S.E. of Slonim.

WIELDEMAN. See WILDEMAN.

WIELEN, a town of the duchy of Warsaw; 46 miles N.W. of Posen.

WIELICHOW, a town of the duchy of Warsaw; 25 miles S.S.W. of Posen.

WIELICZA, a town of Austrian Poland, celebrated for its salt-mines, which produce a great revenue to the emperor, to whose lot it fell in the year 1773. The inhabitants reside chiefly in the mines, and the church is underground; 8 miles S. of Cracow. These salt-mines, with the territory belonging to them, were assigned to the emperor of Austria by the treaty at Vienna in 1815.

WIELONA, a town of Samogitia; 20 miles S. of Rosienne.

WIELUN, a town of Poland, in the palatinate of Siradia; 16 miles S. of Siradia.

WIEN, a river of Austria, which runs into the Danube at Vienna.

WIENNERHORBEG, a town of Austria; 12 miles W. of Brugg.

WIENNERWALD, or *The Forest of Vienna*, the south part of the arch-duchy of Austria, bordering on Hungary.

WIEPERZ, or WIPRZ, a river of Poland, which runs into the Vistula, near Stericza, in the palatinate of Sandomirz.

WIER, JOHN, in *Biography*, a physician, was born in 1515, at Grave on the Meuse; and being domesticated with the famous Cornelius Agrippa, adopted his opinions with regard to the occult sciences. After having studied at Paris and Orleans, he took the degree of M.D. about the year 1534. In the course of his travels, he visited the court of the duke of Cleves, and was appointed his physician. He died at Tecklenburg, in Westphalia, in 1586. He was a man of considerable learning; and though participating in a great degree the credulity of the age, he incurred the enmity of the monks by ascribing to deception and imposture the sorcery, witchcraft, and magical practices, which they supported, to the operation of natural causes. The turn of his mind is discernible in his book "De Dæmonum Prestigiis et Incantationibus." In his treatise of medical observations he has given an account of the putrid sore throat, under the name of "Angina pestilentialis." Among his other writings are enumerated "De Iræ Morbo, et ejus Curatione Philosophica, Medica, et Philosophica;" "Tractatus de Commentitiis Jejuniis;" "De Tussi Epidemica, Anno 1580;" "De Varenis, Morbo endemio Westphalorum." Haller. Eloy.

WIERINGEN, in *Geography*. See VIERINGEN.

WIERNITZ, a town of Austria; 8 miles N. of Korn-Neuburg.

WIESE, a town of Silesia, in the principality of Grotkau; 2 miles N.E. of Weydenau.

WIESEN, a river of Germany, which rises in the Black Forest, and runs into the Rhine a little below Bâle.

WIESENBACHE, a river of Saxony, which runs into the Weissnitz, 4 miles N. of Dippoldiswalda.

WIESENBRUN, a town of the county of Castell; 14 miles E. of Wurzburg.

WIESENBURG, a citadel of Saxony, in the circle of Erzgebirg; 5 miles S. of Zwickau.—Also, a town of Saxony; 15 miles N.N.W. of Wittenberg.

WIESENFELD, a town of the duchy of Wurzburg; 5 miles S.S.E. of Gemunden.

WIESENSTEIG, a lordship of Bavaria, situated between the territories of Ulm and Wurtemberg, about eight miles long, and nearly as much in breadth. It descended from the dukes of Teck to the counts of Helfenstein, and gave name to a peculiar line. On the failure of the counts of this house, in the year 1627, in the person of count Rudolph, one-third of this lordship devolved to the house of Furstenberg, but the other two-thirds were purchased by the elector of Bavaria, of the two elder daughters of the last count; to this the dukes of Wurtemberg indeed would not give their consent, and in the year 1704 took possession of the lordship, but by virtue of the peace of Baden, concluded in the year 1714, were obliged to restore it to the elector of Bavaria.—Also, a town of Bavaria, and capital of a lordship of the same name; 25 miles S.E. of Stuttgart.

WIESENT, a town of Bavaria, in the bishopric of Bamberg; 3 miles E. of Forcheim.

WIESENTHAL, BOHMISCH, a town of Bohemia, in the circle of Saatz; 25 miles N.W. of Saatz. N. lat. 50° 23′. E. long. 12° 57′.

WIESENTHAL, *Ober*, a town of Saxony, in the circle of Erzgebirg; 11 miles S.E. of Schwartzenberg.

WIESENTHAL, *Unter*, a town of Saxony, in the circle of Erzgebirg. All these towns are very near together, a small brook only separates the Bohemian town from the two German ones; 10 miles S.E. of Schwartzenberg.

WIESENTHEID, a lordship situated between the duchy of Wurzburg, the county of Castell, and the margravate of Anspach. It takes its name from a citadel belonging to the counts of Schonburg.

WIESPINCAN, a river of Louisiana, which runs into the Mississippi, N. lat. 41° 22′. W. long. 91° 36′.

WIESSEN,

WIESSEN, a town of Germany, in the county of Rieneck; 10 miles N.W. of Löhr.

WIESTERBURG, a town of Weſtphalia, in the principality of Halberſtadt; 7 miles N.E. of Oſterwick.

WIETHEN, a lake of North America. N. lat. 62° 30'. W. long. 99° 50'.

WIETLISBACH, a town of Switzerland, in the canton of Berne; 20 miles N. of Berne.

WIETMARSEN, or WITTMARSCHEN, a town of Germany, in the county of Bentheim, with an abbey, which formerly belonged to the Benedictines, and was in the 12th century ſecularized for noble ladies; 4 miles N. of Northorn.

WIFE, UXOR, a married woman; or one joined with, and under the protection of, a huſband. See MARRIAGE.

A wife, in our Engliſh law, is termed *feme covert; fœmina viro co-operta;* her condition during marriage is called her *coverture;* and, in the judgment of the law, is reputed to have no will, as being ſuppoſed entirely under, and ſubject to, that of her huſband: *uxor fulget radiis mariti.*

A man cannot grant any thing to his wife, or enter into covenant with her; for the grant would ſuppoſe her ſeparate exiſtence, and to covenant with her would be only to covenant with himſelf; and, therefore, it is generally true, that all compacts made between huſband and wife, when ſingle, are void by the intermarriage. A woman, however, may be attorney for her huſband; and a huſband may bequeath any thing to his wife by will, for that cannot take effect till the coverture is determined by his death.

From the unity of perſon that ſubſiſts between the huſband and wife, in conſequence of marriage, it follows, that whatever perſonal property belonged to the wife before marriage, is by marriage abſolutely veſted in the huſband. In a real eſtate, he only gains a title to the rents and profits during coverture; for that, depending upon feodal principles, remains entire to the wife, after the death of her huſband, or to her heirs, if ſhe dies before him; unleſs by the birth of a child, he becomes tenant for life by the curteſy. But in chattel intereſts, the ſole and abſolute property veſts in the huſband, to be diſpoſed of at his pleaſure, if he chooſes to take poſſeſſion of them: for, unleſs he reduces them to poſſeſſion, by exerciſing ſome act of ownerſhip upon them, no property veſts in him, but they ſhall remain to the wife, or to her repreſentatives, after the coverture is determined.

There is, however, a conſiderable difference in the acquiſition of this ſpecies of property by the huſband, according to the ſubject-matter; *viz.* whether it be a *chattel real* or *perſonal;* and of chattels perſonal, whether it be in *poſſeſſion*, or in *action* only.

A *chattel real* veſts in the huſband, not abſolutely, but *ſub modo.* As, in caſe of a leaſe for years; the huſband ſhall receive all the rents and profits of it, and may, if he pleaſes, ſell, ſurrender, or diſpoſe of it during the coverture: if he be outlawed or attainted, it ſhall be forfeited to the king; it is liable to execution for his debts; and if he ſurvives his wife, it is to all intents and purpoſes his own. Yet if he has made no diſpoſition thereof in his life-time, and dies before his wife, he cannot diſpoſe of it by will; for, having never been transferred from the wife, after his death ſhe ſhall remain in her ancient poſſeſſion, and it ſhall not go to his executors.

Thus alſo with regard to chattels perſonal (or *choſes in action*), as debts upon bond, contracts, and the like; theſe the huſband may have if he pleaſes; that is, if he reduces them into poſſeſſion by receiving or recovering them at law: in which caſe, they are abſolutely and entirely his own: and ſhall go to his executors or adminiſtrators, or as he ſhall bequeath them by will, and ſhall not reveſt in the wife. But if he dies before he has reduced them into poſſeſſion, ſo that at his death they ſtill continue *choſes in action*, they ſhall ſurvive to the wife.

Thus in both the ſpecies of property the law is the ſame, in caſe the wife ſurvives the huſband; but, in caſe the huſband ſurvives the wife, the law is very different with reſpect to *chattels real* and *choſes in action;* for he ſhall have the *chattel real* by ſurvivorſhip, but not the *choſe in action;* except in the caſe of arrears of rent, due to the wife before her coverture, which in caſe of her death are given to the huſband by the ſtatute 32 Hen. VIII. cap. 37.

As to *chattels perſonal* (or *choſes in poſſeſſion*), which the wife hath in her own right, as ready money, jewels, houſehold goods, and the like, the huſband hath therein an immediate and abſolute property, devolved to him by the marriage, which can never again reveſt in the wife or her repreſentatives.

The wife alſo, by marriage, acquires a property in ſome of her huſband's goods, called her *paraphernalia*, which ſhall remain to her after his death, and ſhall not go to his executors. Theſe, ſignifying the apparel and ornaments of the wife, ſuitable to her rank and degree, the huſband cannot deviſe by his will; though during his life perhaps he hath the power (if unkindly inclined to exert it) to ſell them or give them away. But if ſhe continues in the uſe of them till his death, ſhe ſhall afterwards retain them againſt his executors and adminiſtrators, and all other perſons, except creditors where there is a deficiency of aſſets. And her neceſſary apparel is protected even againſt the claim of creditors.

The wife can make no contract without her huſband's conſent; and, in all law-matters, *ſine viro reſpondere non poteſt.*

The huſband is bound to provide his wife with neceſſaries by law, as much as himſelf; and if ſhe contracts debts for them, he is obliged to pay them; but for any thing beſides neceſſaries, he is not chargeable. Alſo if a wife elopes, and lives with another man, the huſband is not chargeable even for neceſſaries, at leaſt if the perſon who furniſhes them is ſufficiently apprized of her elopement.

If the wife be indebted before marriage, the huſband is bound afterwards to pay the debt. If the wife be injured in her perſon or property, ſhe can bring no action for redreſs without her huſband's concurrence, and in his name as well as her own; neither can ſhe be ſued, without making the huſband a defendant. There is indeed one caſe where the wife ſhall ſue and be ſued as a *feme ſole*, *viz.* where the huſband has abjured the realm, or is baniſhed; for he is then dead in law. See CUSTOM *of London.*

In criminal proſecutions, the wife may be indicted and puniſhed ſeparately; for the union is only a civil union. But in trials of any ſort, they are not allowed to be evidence for or againſt each other. However, where the offence is directly againſt the perſon of the wife, this rule has been uſually diſpenſed with; and, therefore, by ſtat. 3 Hen. VII. cap. 2. in caſe a woman be forcibly taken away and married, ſhe may be witneſs againſt ſuch her huſband, in order to convict him of felony. See FORCIBLE *Abduction.*

In the civil law, the huſband and wife are conſidered as two diſtinct perſons; and may have ſeparate eſtates, contracts, debts, and injuries; and, therefore, in our eccleſiaſtical courts, a woman may ſue and be ſued without her huſband.

But, though our law in general conſiders man and wife as as one perſon, yet there are ſome inſtances in which ſhe is ſeparately conſidered; as inferior to him, and acting by his compulſion. And, therefore, all deeds executed, and acts done by her during her coverture, are void; except it be a fine or the like matter of record, in which caſe ſhe muſt be ſolely and ſecretly examined, to learn if her acts be voluntary. She cannot by will deviſe lands to her huſband, unleſs under ſpecial circumſtances; for at the time of making it ſhe is ſuppoſed to be under his coercion. And in ſome felonies, and other inferior crimes, committed by her through conſtraint of her huſband, the law excuſes her; but this extends not to treaſon and murder. See FEME-*Covert*.

The huſband alſo, by the old law, might give his wife moderate correction; but this power of correction was confined within reaſonable bounds, and the huſband was prohibited from uſing any violence to his wife. The civil law gave the huſband the ſame, or a larger authority over his wife; allowing him, for ſome miſdemeanors, *flagellis et fuſtibus acriter verberare uxorem;* for others, only *modicam caſtigationem adhibere.* But, with us, in the politer reign of Charles II., the power of correction began to be doubted; and a wife may now have ſecurity of the peace againſt her huſband, or, in return, a huſband againſt his wife. The courts of law will ſtill permit a huſband to reſtrain a wife of her liberty, in caſe of any groſs miſbehaviour. Blackſt. Com. book i. book ii.

If a wife bring forth a child during her huſband's abſence, though of many years; yet if he lived all the time *inter quatuor maria*, within the iſland, he muſt father the child; and the child, if firſt born, ſhall inherit. See BASTARD.

If a wife bring forth a child begot by a former huſband, or any other perſon, before marriage, but born after marriage with another man; this latter muſt own the child, and that child ſhall be his heir at law.

The wife, after her huſband's death, having no jointure ſettled before marriage, may challenge the third part of his yearly rent of land, during her life; and, within the city of London, a third part of all her huſband's moveables for ever. See DOWER, INTESTATE, and CUSTOM *of London.*

The wife partakes of the honour and condition of her huſband; but none of the wife's dignities come, by marriage, to her huſband.

Yet, the huſband, who marries a woman ſeiſed of lands in fee-ſimple, or fee-tail, *i. e.* of any eſtate of inheritance, and has by her iſſue born alive, which was capable of her eſtate, ſhall, on the death of his wife, hold the lands for his life, as tenant by the curteſy of England.

The Engliſh laws are generally eſteemed by foreigners as very hard, in reſpect to the women; and yet Chamberlayne is of a very different opinion, aſſerting, that the condition of wives in England is better than in any other country.

The diſabilities to which the wife is ſubject are for the moſt part intended for her protection and benefit. So great a favourite (ſays judge Blackſtone) is the female ſex of the laws of England.

Tertullian has two books, on the ornaments and attire of wives. In the ſecond, he labours to prove that a Chriſtian wife cannot, in conſcience, endeavour to pleaſe by her beauty, which ſhe knows to be naturally liable to raiſe looſe deſires; and that ſhe ought not only to avoid all affected beauty, but even to conceal and cover her natural beauty.

WIFE, *Mid, Obſtetrix.* See DELIVERY.

WIFFLISBURG, in *Geography.* See AVENCHES.

WIGAN, a borough and market-town in the hundred of Weſt-Derby, and county of Lancaſter, England, is ſeated near the riſe of the river Douglas, the banks of which are noted for a celebrated battle fought between king Arthur and the Saxons, when the latter were defeated. In the time of Henry VIII., Wigan is deſcribed by Leland as a "paved town, as big as Warrington, but better builded, and inhabited by ſome merchants, artificers, and farmers." In its preſent ſtate, it has a neat though irregular appearance; and has been lately much improved by the opening of two new ſtreets, and the erection of ſeveral handſome buildings. An extenſive trade is carried on in the manufacture of coarſe home-made linens, checks, calicoes, fuſtians, and other cotton goods. Here are alſo large braſs and pewter works.

Wigan is a borough by preſcription, and has had its privileges confirmed by the ſeveral charters of Henry III., Edward II., Edward III., Richard II., and Charles II. Its corporate body conſiſts of a mayor, recorder, twelve aldermen, and two bailiffs. Two members are returned to parliament; and the right of election is veſted in the free burgeſſes, in number about 200. The repreſentation of this borough has occaſioned ſome very expenſive conteſts; and it is ſaid to have coſt George Byng, eſq. 10,000*l.* in his oppoſition to the intereſt of ſir Fletcher Norton, and Simon Luttrell, eſq. Returns appear ſo early as the 23d and 35th Edward I., after which the privilege was ſuffered to be dormant for 240 years; no other return being made till 1ſt Edward VI.

The pariſh-church is ancient, and conſidered to be a handſome ſtructure: it conſiſts of a nave, a ſpacious chancel, and two ſide-aiſles. Among the monuments in the church is one to the memory of ſir Roger Bradſhaigh, and another to ſir William and lady Mabel Bradſhaigh. The remains of George Hole, rector of this church and biſhop of Cheſter, are depoſited within the communion-rails. He died Auguſt 23, 1668. The rectory is one of the beſt endowed in the kingdom, and the incumbent is always lord of the manor. In the town is a chapel of eaſe, three chapels for diſſenters, and one for Roman Catholics. A town-hall was built in 1721, at the joint expence of the earl of Barrymore and ſir Roger Bradſhaigh, the then repreſentatives of the borough. A free-ſchool was erected, and liberally endowed, about the beginning of the laſt century, by voluntary contribution; and upwards of 30 years ago, the ſame liberality eſtabliſhed a blue-coat ſchool for 30 boys. A commodious workhouſe has been alſo built at the expence of the inhabitants of the town, where the neceſſitous and ſuperannuated poor are comfortably accommodated; induſtry in the more able are furniſhed with the means, and the meritorious are encouraged and rewarded. A diſpenſary has been erected, and is ſupported by the benevolence of the inhabitants of the town and its vicinity.

At the north end of the town is a monumental pillar, erected in 1679 by Alexander Rigby, eſq., then ſheriff of Lancaſhire, to commemorate the valour and loyalty of ſir Thomas Tyldeſley, who was ſlain on this ſpot in 1651, in the action wherein the earl of Derby was defeated by colonel Lilburne.

In a field near Scholes-bridge, contiguous to this town, a ſpring was lately diſcovered, which has obtained the name of *Wigan Spa*, or New Harrowgate, as the water reſembles that of Harrowgate in Yorkſhire.

The population of Wigan, which has been progreſſively increaſing, was, in the year 1801, according to the return to parliament, 10,989; the number of houſes, 2236. In 1811, the former had increaſed to 14,060, and the latter to 2686.

The pariſh of Wigan contains twelve townſhips, in three of which, beſides that in the town, are chapels of the eſtabliſhment,

blishment, ſubordinate to the mother church. Three of theſe townſhips, Haigh, Aſpinall, and Hindley, are worthy of notice for the production of the fineſt cannel or candle coal, which is found in large blocks as black as jet, and will bear a beautiful poliſh. (See COAL, *Cannel.*) The Liverpool and Leeds canal, and the river Douglas, afford navigable communication between this town and ſeveral other towns. On an eminence in this townſhip, about a mile north of Wigan, is Haigh-hall, the ancient ſeat of the Bradſhaighs, a family of high antiquity and diſtinction, but now extinct; from whom it deſcended by marriage to the earl of Balcarras, who now reſides here. This venerable manſion was built at different periods; the chapel is ſuppoſed to be coeval with the reign of Edward II. In the vicinity of Wigan originally ſtood the ancient family manſion of the Marklands.

Four miles weſt of Wigan is the village of Holland, or Up-Holland, whence the illuſtrious but ill-fated family of Holland derived their name.

About three miles north of Wigan is the village of Blackrode, at which place the Rev. John Whitaker fixes the Roman ſtation, named Coccium. Mr. Percival and Mr. Watſon both agree with Mr. Whitaker in placing Cocclum here; but theſe opinions are ſatisfactorily refuted by the hiſtorian of Whalley, who contends that this ancient ſtation was at Ribcheſter.—Beauties of England and Wales, vol. ix. Lancaſhire, by J. Britton, F.S.A.

WIGEON PENELOPE, *Anas Penelope* of Linnæus, in *Ornithology*, is a well-known bird. (See DUCK.) Its bill is lead-coloured, and the end of it black; the head, and upper part of the neck, of a bright light bay; the forehead paler, in ſome almoſt white; the plumage of the back, and ſides under the wings, are elegantly marked with narrow, black and white undulated lines; the breaſt is of a purpliſh hue, ſometimes, though rarely, marked with round black ſpots; the belly white; and the vent-feathers black. In ſome birds the coverts of the wings are almoſt wholly white; in others of a pale brown, edged with white; the greater quill-feathers are duſky; the outmoſt webs of the middle feathers of a fine green, the tips black; the laſt are elegantly ſtriped with black and white; the two middle feathers of the tail are longer than the others, black, and ſharp pointed; the reſt aſh-coloured; the legs duſky.

The head of the female is of a ruſty brown, ſpotted with black; the back is of a deep brown, edged with a paler; the tips of the leſſer quill-feathers white; the belly white.. Pennant.

WIGGER, in *Geography*, a river of Switzerland, which runs into the Aar, 3 miles N.W. of Zoffingen.

WIGHT, ISLE OF. See ISLE *of Wight*.

WIGHT, *Iſle of*, a county of Virginia, on the right ſide of James river, about 40 miles long and 15 broad, watered by the Nanſemond. It contains 9186 inhabitants, including 4041 ſlaves.

WIGLEN, a ſmall iſland in the North ſea, near the coaſt of Norway. N. lat. 65°.

WIGSTADT, a town of Bohemia, in the circle of Konigingratz; 6 miles N.E. of Geyerſberg.

WIGSTADTEL, or WAROW, a town of Sileſia, in the principality of Troppau; 10 miles S. of Troppau. N. lat. 49° 38′. E. long. 17° 47′.

WIGTON, a town of Cumberland, England, ſtands in a fine dry open country; and within the laſt thirty years has been greatly increaſed in population, from the introduction of manufactures. In the year 1811 its inhabitants amounted to 2977, who occupied 643 houſes.

The firſt manufactories eſtabliſhed here were for different kinds of coarſe linens; but ſince the year 1785, this buſineſs has received a conſiderable check by the encouragement given to the various branches of the cotton trade, which flouriſh in great vigour. In 1790 a manufactory for printing calicoes was eſtabliſhed at Spittle, about a quarter of a mile from the town, and ſeems likely to become an important undertaking, as the goods are in high repute, and the ſituation extremely convenient for extending the works.

The preſent church was erected in 1788: its neatneſs is eminently contraſted with the ancient fabric, which was a dark gloomy ſtructure, built, according to the Chronicon Cumbriæ, by Odoard de Logiz, to whom the barony was given by Waldeof, ſon of earl Goſpatrick. The materials it was conſtructed with were procured from the Roman ſtation at Old Carliſle, as appears from the ſtones being marked in a ſimilar manner to thoſe that may yet be obtained there. In removing the foundations of the old tower, two Roman ſepulchral inſcriptions were diſcovered. The ſtreets are tolerably ſpacious, and many of the buildings are handſome and modern. In the year 1723, an hoſpital was founded here, under the will of the Rev. John Thomlinſon, A.M. for ſix indigent widows of Proteſtant beneficed clergymen, epiſcopally ordained; and incorporated by the name of "The Governeſs and Siſters of the College of Matrons, or Hoſpital of Chriſt in Wigton." The endowment has been augmented by ſome ſmall benefactions: the allowance to each widow is about eight pounds annually. A free-ſchool was alſo eſtabliſhed here in 1780; chiefly by the contributions of the inhabitants, aided by the benevolence of Dr. Thomlinſon's brother. In this town, obſerves Mr. Gough, was anciently an hoſpital or free chapel, dedicated to St. Leonard, to which, Mr. Pegge is of opinion, belongs a ſeal found in Pickering-caſtle, Yorkſhire: it is of wood, and has the repreſentation of the Deity, with the crucifix, circumſcribed *Sigillvm Wighton*.

About one mile ſouth from Wigton are the ruins of the conſiderable Roman ſtation, now called Old Carliſle, but generally ſuppoſed to have been the Olenacum of the Notitia, where the Ala Herculea were in garriſon. Veſtiges of ancient buildings are very conſpicuous; the foundations of numerous ruined edifices being ſcattered over many acres, as well within the vallum as on every ſide, without excepting to the weſtward, where the ground deſcends precipitouſly to the brook Wiſa. The ſtation itſelf occupied an elevated ſcite, and commanded an extenſive view north and north-weſt. Its form is an oblong ſquare 170 paces in length and 110 broad, with obtuſe angles, defended by a double ditch and vallum, and having an entrance near the middle of each ſide. The military way, on which it ſtands, is very broad and diſtinct, and leads immediately to Carliſle and the Wall. Within the vallum, a well was diſcovered a few years ago, about three feet in diameter, and regularly lined with ſtones. Various inſcriptions, ſacrificing inſtruments, coins, altars, ſmall images, ſtatues on horſeback, urns, and other veſtiges of antiquity, have been found at this ſtation.

Several antiquities, diſcovered near this place in the courſe of the laſt century, have been deſcribed in different volumes of the Gentleman's Magazine, particularly in thoſe for the years 1748, 1756, and 1757.

Clea-hall, a ſeat of ſir Henry Fletcher, bart., whoſe family obtained it by an intermarriage with the female heir of a branch of the Muſgraves, ſtands on a cultivated ſpot in the midſt of an elevated and dreary moor.—Beauties of England and Wales, vol. iv. Cumberland, by J. Britton and E.W. Brayley.

WIGTOWN, a royal borough, market-town, and the capital of the fhire of the fame name, Scotland, is fituated on the fide of a hill near the confluence of the river Bladenock, at the diftance of 105 miles S.W. by S. from Edinburgh. It is of very high antiquity, and appears to have received its charter of incorporation from king Robert Bruce. The civil government is vefted in a provoft, two baillies, and twelve counfellors. Wigtown unites with the boroughs of Whitehorn, New Galloway, and Stranraer, in fending one member to the Britifh parliament. The church is in good repair. A well-fupplied market is held weekly, and five fairs annually. Being the fhire-town, the fheriffs' courts are holden here. A grammar-fchool is eftablifhed, and well conducted. The parifh of Wigtown is in the form of an oblong-fquare, extending five miles in length and four in breadth, and comprehends about 5500 acres. The climate is cold, but remarkable for producing health and longevity. A great diverfity prevails in the foil and furface: towards the fouth it is interfperfed with hills, which are almoft entirely arable, with a dry, light, and fertile mould; the north-weft corner is more varied and lefs productive; and the north-weft part is principally covered with mofs, and appears to have been formerly an arm of the fea. The greater part is inclofed; and the fpirit of agricultural improvement is much encouraged. Particular attention is paid to the repairs of the roads and bridges. The population of the parifh, at the enumeration of the year 1811, amounted to 1711. In the weftern part of the parifh is a large circle of ftones, called "The Standing Stones of Torhoufe," which is fuppofed to have been a temple of the Druids.—Beauties of Scotland, vol. ii. Wigtownfhire. Gazetteer of Scotland, 1806. Carlifle's Topographical Dictionary of Scotland, 2 vols. 4to. 1813.

WIGTOWN *Bay*, a bay of the Irifh fea, on the S. coaft of Scotland, at the mouth of the river Cree, between the counties of Wigtown and Kircudbright.

WIGTOWNSHIRE, the weftern part of the diftrict of Galloway, forms the fouth-weftern extremity of Scotland. It is bounded on the E. by Kircudbright, on the S.E. by Wigtown bay, on the S. and W. by the Irifh fea, and on the N. by Ayrfhire. It is of an irregular figure, of which the greateft length is about thirty miles, and the breadth nearly twelve. The fuperficial contents are 469 fquare miles, or 238,721 Scottifh acres. The fhire comprehends three royal boroughs, Wigtown, Stranraer, and Whitehorn; alfo the town of Portpatrick, and thirteen other parifhes. By the population return of the year 1811, the number of houfes is ftated to be 5402; that of the inhabitants 26,891; namely, 12,205 males, and 14,686 females. The fhire fends one member to the imperial parliament, and the three boroughs unite to fend another. Wigtownfhire is one of the moft level counties in Scotland; and the hills are in general free from projecting rocks, and very acceffible to the plough. The navigation along the coaft is fo uninterrupted, that it may be regarded as one of the moft eligible fituations in the ifland, in point of natural advantages, for a trading diftrict. The richeft lands lie upon the coaft, where the means of improvement are to be met with in the greateft abundance: the inland and more elevated parts have a confiderable mixture of heath and mofs, but are all in a greater or lefs degree fufceptible of improvement. There are few mountains in Wigtownfhire. The Cairnpat, near Portpatrick, is one of the moft confiderable: it rifes 800 feet above the level of the fea. The fummit bears all the marks of having been a military ftation, being furrounded by three ftone walls, with very ample fpaces between them; and commands a profpect of Loch-ryan, and Luce bay, which by advancing inland form the peninfula, called the Rhynns of Galloway, in which Portpatrick is fituated.

The *rivers* of this county are of no great importance. The Cree forms part of its eaftern boundary. The next ftream to the weftward is the Bladenocb, which rifes from a lake called Loch Macbeary, fituated moftly between the two parifhes of Kirkowen and Penningham. There are feveral fmall iflands in it; upon the largeft of which are the remains of a confiderable building and fmall garden. The river Bladenoch, which has its fource in this lake, runs in a fouth-eaftern direction for about two-thirds of its length; after which it takes a more eafterly courfe, and empties itfelf into the bay of Wigtown: its whole length is about twenty-four miles. Tarff is a ftream which rifes in the precincts of Ayrfhire, and after a courfe of twelve miles, in a fouth-eafterly direction, falls into the Bladenoch in the parifh of Kirkowen. Luce-water is a fmall river, which runs into the great bay of that name. Salmon are caught in it; and it is obferved that the fkin of the falmon, when it firft goes up the river, which is deeply tinged with mofs, is of a filvery colour, but after remaining fome time, it becomes of a brownifh-yellow.

Wigtownfhire has feveral frefh-water *lakes*, but none of particular importance. In the parifh of Sorbie is one of three miles in circumference, well ftored with pike, perch, and eels. It is called Dowalton lake, becaufe the ancient powerful chiefs, the Macdowals, had their refidence near it. In the parifh of Ince are fifteen lakes, of different degrees of extent, abounding with fifh of feveral kinds, and frequented by a variety of water-fowls. Swans emigrate from Ireland, particularly in fevere winters, and continue in thefe lakes till fpring. The fhire of Wigtown is deeply penetrated by navigable bays. Wigtown bay and Luce bay advance in a direction nearly parallel far into the country towards the north. At the fame time, from the northern part of the county, the long and narrow bay called Loch-ryan advances fouthward towards the bay of Luce, and peninfulates an extenfive territory, which appears to have long remained divided from the reft of Scotland. Loch-ryan is a beautiful as well as a fafe and commodious bay for fhipping. It is about ten miles in length from north to fouth: the entrance into it is nearly two miles broad. It is bounded on the eaft by the parifh of Balantrae, in Ayrfhire, and on the weft by Millar Point, a headland in the parifh of Kirkholm. About three or four miles from the mouth of the loch, on the eaft fide, is the little village of Cairn; contiguous to which is a commodious bay with good anchoring ground, and depth of water fufficient for fhips of any burthen; and all veffels entering into or coming out of the frith of Clyde feek this bay in ftormy weather. King William's fleet anchored here in their paffage to Ireland. Befides the Cairn bay, there are feveral other good anchoring bays in the loch. Luce bay, which advances from the fouth towards Loch-ryan, is far more extenfive. In dark and hazy weather, veffels often miftake Luce bay for the Irifh channel, and when keeping a northerly courfe, fometimes run on fhore, before the error is difcovered. The bay of Luce contains a great variety of leffer bays, fome of which are capable of being converted into convenient harbours; and mariners acquainted with them find anchoring places, in which they are in fafety from almoft every wind. The coaft around the bay of Luce is very various: in fome places it confifts of a fine gravel beach; at other points fteep rocks project into the fea, forming a bold inacceffible fhore. The moft fouthern point of the coaft, or rather of Scotland, is called the Mull of Galloway: in the weftern fide of it rifes a very elevated coaft: it is about the extent of a mile, and projects itfelf as the boundary between the Irifh fea and the bay of Luce. In a high wefterly wind a prodigious fwell of fea rolls round the point, and is then awfully grand. Here the fea has formed caverns, which are rendered dreadful by a fetting-in tide and a ftrong wefterly wind. The noife is like loud claps of thunder. Ships pafs and repafs this point from England, Ireland, and the weft of Scotland.

Though the *agriculture* of this county is yet but in an inferior ftate, great exertions are making to bring the foil under the beft management of which it is capable. Still, however, the defects of the foil, added to the imperfect ftate of the hufbandry which has hitherto exifted, greatly deprefs the value of the territory. The earl of Stair's eftate is faid to extend to about 55,000 acres, but produces an annual rental of no more than 11,000*l.* fterling. There are in this county great tracts of flow mofs, of that foft confiftence which renders it almoft inacceffible, and of no utility either for agriculture or pafturage. Little hopes are yet entertained of the practicability of improving this fort of territory. But it is confidently afferted, that an immenfe field of mofs of this defcription below Newton Douglas might by proper management be floated into the fea, leaving fome thoufand acres of rich clay behind. The great trunks of trees that are found in the moffes of this county, afford full proof of its having been formerly covered with wood. The renewal of the forefts, however, proves a very arduous tafk; and in certain expofures on the coaft has repeatedly baffled the hopes of the moft ingenious and attentive planters. Wood, corn, and potatoes, in this expofure, are more or lefs injured, according to their vicinity to the fea; whereas, when protected from it, they are found to grow with their ufual vigour. Shelter, therefore, either natural or artificial, muft be had on this coaft before wood can be planted with any chance of fuccefs. Scottifh firs, which ferve to nurfe up plantations in many other parts of the country, are unfortunately found to thrive worfe here than any other fpecies of wood. Under this difficulty, the earl of Galloway fortunately difcovered the valuable properties of the pinafter, or maritime pine, which he obferved to grow with a degree of luxuriancy fuperior to any other in his plantations. He has fince increafed the propagation of that tree, and now finds that under its protection, almoft any other wood may be planted with fuccefs. Attempts are making to introduce dairy-farms into this county, for the purpofe of fupplanting the univerfal practice of breeding cattle. One farmer, upon this plan, has no lefs than eighty milking cows: he ufes his whole milk in the manufacture of cheefe, which he exports to the Clyde. A remarkable breed of fmall white-faced fheep, peculiar to the coaft of this county, deferves notice. It is called the Mochrum breed. Thefe are faid to be of Spanifh extraction, an idea the more readily adopted, from the quality of their wool, which is of the fine clothing fort, of a texture fuperior to moft in Scotland, and but little inferior to real Spanifh. This breed, which is at prefent of an under fize, is well-fhaped, hardy, and found by proper attention to improve much, both in weight of carcafe and wool.

The mineral productions of the county are but few: the parifh of Kirkmaiden, which forms the fouthern part of the peninfula that bounds the bay of Luce on the weft, contains valuable quarries of flate, of which confiderable quantities are wrought and fent to market. Here are feveral natural caverns, in one of which is a petrifying water, dropping from the roof. In the parifh of Inch, fituated upon Loch-ryan, are feveral mineral fprings: one, with a fulphurous impregnation, has been found ufeful in ftomachic and fcorbutic complaints. There is alfo a chalybeate fpring. Some appearances of coal have been thought to exift here; but that valuable mineral has hitherto been fought in vain. In this quarter, towards Ayrfhire, is a bold rocky fhore, containing feveral natural excavations or caverns, extending eighty or an hundred yards under ground. The parifh of Whitehorn, in the fouth-eaftern part of the county, produces very fine variegated marble, and alfo flate of a ftrong quality. The chief natural defect incidental to this county is the want of coal, a defect common to it with almoft the whole of the fouthern border of Scotland. Was it not for this check to the eftablifhment of manufactures, it might be likely to affume fome fhare of commercial importance. Though of fmall extent, it has an ample fea-coaft, which affords great facility for exporting the produce of its agriculture and dairies. This facility is fo great, that the inhabitants of Wigtownfhire are fometimes in dread of fcarcity, in confequence of the greater part of their produce being carried to Glafgow, Paifley, or Liverpool, where a market is always to be obtained.—Beauties of Scotland, vol. ii. Wigtownfhire, 1805. Gazetteer of Scotland, 1806.

WIGWORM Point, a cape on the coaft of Patagonia, in the ftraits of Magellan; 3 miles N.E. of Cape Providence.

WIHACS, or Wihats. See Bihacs.

WIHENAIS, a town of Sweden, in the province of Savolax; 40 miles N. of Chriftina.

WIHR, or Weyer, a town of France, in the department of the Upper Rhine; 6 miles W. of Colmar.

WIHRBACH, a river of France, which runs into the Rhine, 7 miles above Germerfheim.

WIKES, in *Agriculture*, a term ufed to fignify temporary boundaries or marks, fet up in order to divide the fwaths to be mown; fuch as the boughs of trees, in the common fields and meadows in different diftricts; as well as fuch boughs when fet upon hay-cocks and ftouks of corn for the taking of tithes, and other fuch purpofes.

WIKINISH Creek, in *Geography*, a river of Pennfylvania, which runs into the Sufquehanna, N. lat. 40° 32′. W. long. 77° 1′.

WILAUF, a river of Wurtemberg, which runs into the Rems, near Schorndorf.

WILBASSEN, or Wilbadessen, a town of Weftphalia, in the bifhopric of Paderborn; 8 miles S.E. of Dringenberg.

WILBRAHAM, a townfhip of Maffachufetts, in the county of Hampfhire, with 1776 inhabitants; 10 miles E. of Springfield.

WILBURG, a citadel of Auftria; 8 miles E.S.E. of Ips.

WILBYE, John, in *Biography*, one of our beft madrigalifts of queen Elizabeth's reign. In his firft fet, the following are well-known: "Lady, when I behold the rofes fprouting;" and "Flora gave me faireft flowers:" but, "Hard by a cryftal fountain," which, according to Hearne, (Lib. Nig. Scacc.) ufed annually to be fung by the fellows of New college, Oxon, we are unable to find. Thofe words are adjufted to the mufic of Giov. Croce, in the fecond book of Mufica Tranfalpina, and are fet by Morley in the Triumphs of Oriana; but appear not either in the firft or fecond fet of Madrigals publifhed by Wilbye, and we know of no other.

WILD Alben, in *Geography*, a mountain of the duchy of Stiria; 7 miles N.N.W. of Muertzenfchlag.

Wild *Angelica*, *Basil*, *Briar*, *Campion*, *Carline Thistle*, *Carrot*, *Chervil*, *Cisily*, *Climber*, *Lettuce*, *Liquorice*, *Madder*, *Marjoram*, *Melic*, *Mint*, *Mustard*, *Oat*, *Radish*, *Rape*, *Rocket*, *Tare*, *Thyme*, and *Vine*, in *Agriculture*. See Weed.

Wild-*Fire*, or *Erysipelas*, a disease in sheep, which affects the skin, and which, if not well attended to, is liable to spread very quickly among the flock. It is attended with considerable inflammation in many cases, though but seldom with blisters over the body. It commonly takes place towards the latter end of summer, and does not continue more than eight days at a time, although such sheep as are once affected with it are very liable to have it again. It was formerly a practice with shepherds to bury the sheep that were affected with this disease in the ground at the door of the fold, with their feet upwards, which, they believed, acted as a charm to drive it from the flock. But this folly is now done away with.

In the cure of this affection of the skin, recourse may be had to evacuations from the bowels by the use of calomel, or purging-salts, dissolved in warm water, for three or four days; then sulphur with nitre may be given in pretty full doses, cooling washes being used at the same time. Strengthening remedies should afterwards be employed, such as oak, or other barks of the same nature. During the cure, the sheep should be kept from being too much exposed to cold, and in a dry sound pasture, being well fed when necessary.

Wild-*Fire*, *Ignis Gregalis*, or *Græcus*. See *Wild*-Fire.

Wild-*Fire Arrows*, such as were trimmed with wild-fire, and shot burning, to stick in the sails or rigging of ships in a fight. See Fire-*Arrow*.

Wild-*Fowl*. See *Water*-Fowl, and Decoy.

Wild-*Goose*, *Anas Anser*. See Duck.

Wild-*Goose Chace*. See Chace.

Wild-*Honey*. See Honey.

Wild-*Land*, *Reclaiming of*, in *Agriculture*. See *Reclaiming* Lands.

Wild-*Olive*. See Elæagnus.

Wild *Service-Tree*, in *Agriculture* and *Gardening*, a deciduous tree of considerable growth, which is much cultivated in the field and pleasure-ground. It has been observed, that this tree is sometimes planted in orchard-grounds among fruit-trees, but that it should be put in pleasure-grounds, plantations, or on lawns, for its ornamental effect in the autumnal season.

If trained up with straight clean stems, service-trees will grow to the height of thirty or forty feet; in that case, they should be planted among forest-trees, or in the back parts of large shrubberies. But those who wish to plant them as flowering shrubs must head them down when young, to make them throw out horizontal shoots; they may then be planted among the middling-sized shrubs, which will make a beautiful variety, both when in flower, and when bearing fruit. These trees grow to a considerable size when properly managed, and are very much used by wheelers and others, on account of the wood being all, what they call, heart-wood.

The fruit has been found excellent for feeding game, and other sorts of birds and fowls.

WILDAU, in *Geography*, a town of the duchy of Stiria, on the west side of the Muchr; 12 miles S. of Gratz.

WILDBAD, a town of Wurtemberg, celebrated for its warm-baths; 30 miles N.E. of Strasburg. N. lat. 48° 40′. E. long. 8° 26′.

WILDBERG, a town of Wurtemberg, on the Nagold; 3 miles N. of Nagold. N. lat. 48° 33′. E. long. 8° 48′.—Also, a town of Prussia, in the province of Oberland; 12 miles S. of Ortelsburg.

Wildberg, or *Wildbergen*, a town of the Middle Mark of Brandenburg; 28 miles N. of Brandenburg. N. lat. 52° 55′. E. long. 12° 38′.

WILDE, James, in *Biography*, a Swedish historian, was born in Courland in 1679, and educated at Riga; and having quitted that city in 1695, he sought farther improvement in several German academies, graduating M.A. at Griefswald. At the age of 21, such was his proficiency in various branches of literature, he was appointed co-rector of the cathedral school at Riga, and soon after teacher of politics, history, and eloquence, in the royal gymnasium of that place. Qualified by his talents and acquirements for a higher rank in the department of instruction, he was invited, in 1703, to be professor of history in the academy of Pernau; but declining this office, he was, in the following year, nominated by Charles XII. to fill the chair of Latin eloquence and poetry, which he occupied for five years. During his stay at Aix-la-Chapelle, which he visited in 1709 for the recovery of his health, the Russians made an irruption into Livonia, and he lost his library, with all his documents and papers. From hence, instead of returning to his native country, he proceeded to Stockholm, and offered his services to the senate. Such were the existing troubles at that time, that it was not till the year 1713 that government appointed him to be professor of eloquence and poetry at Griefswald. But he preferred a humble and more private situation as tutor to the two sons of count Cronhielm, with whom he made a tour to England, Holland, France, and Germany. Pursuing a similar tour with a young Holstein count, and becoming acquainted with the duke of Holstein, he was appointed his cabinet-secretary, in connection with the professorship of the law of nature and nations at Kiel. And in the same year king Frederick made him historiographer to the kingdom; on which office he entered at Stockholm in November 1719. His works were numerous and learned; but his constitution was feeble, so that he sunk under his labours, and died in 1755. Although he was more than thirty years old when he went to Sweden, he obtained a thorough acquaintance with the Swedish history: he was also well acquainted with the public law of Germany; and in his earlier years he had raised himself by writing Latin poetry. He was also a good philosopher, and a theologian, and often preached. His memory was singularly retentive; and this served him in various works which he composed after having lost his sight in 1741. Many of his works were lost at the capture of Pernau. During his tour with the sons of count Cronhielm, he published at Frankfort, in 1717, "Diatriba de Jure et Judice Legatorum á Stephano Cassio;" "Sueciæ Historia Pragmatica, quæ vulgo jus publicum dicitur, &c." Holm. 1731, 4to.; "The Foundation, Nature, Origin, and Antiquity of the Swedish Laws, with an Account of the Changes and Alterations which have been made in them," ibid. 1736, 4to.; "Puffendorf's Introduction to the History of Sweden, with Additions, Proofs, and Notes," by J. Wilde; "I. Part," ibid. 1738, 4to.; "II. Part," ibid. 1743, 4to.; "Preparatio hodegetica ad Introductionem Puffendorfii in Svethuci status Historiam, &c." ibid. 1743, 4to. Gen. Biog.

Wilde, in *Geography*, a river of Prussian Lithuania, which runs into the Russe.

WILDE-

WILDEBERG, a town of Pomerelia; 2 miles S. of Marienburg.

WILDEMAN, a town of Weftphalia, in the principality of Grubenhagen, near which are fome mines of filver and lead; 6 miles S.W. of Goflar.

WILDENBERG, or WILDENBORG, a town of the duchy of Berg; 10 miles E. of Homberg.

WILDENBERG, a town and caftle of France, in the department of the Rhine and Mofelle; 10 miles W. of Kirn.

WILDENBRUCH, a town of Hinder Pomerania; 5 miles S. of Balm.

WILDENECK, a town of the duchy of Carniola; 10 miles S.E. of Stein.

WILDENFELS, a town of Saxony, in the circle of Erzgebirg; 5 miles S.E. of Zwickau.—Alfo, a citadel in the territory of Nuremberg; 3 miles W.S.W. of Bezenftein.

WILDENFURT, a town of Saxony, in the circle of Neuftadt; 2 miles N.N.E. of Weyda.

WILDENHOF, a town of Pruffia, in Natangen; 23 miles S. of Brandenburg.

WILDENS, JOHN, in *Biography*, was born at Antwerp in 1584. He became an admired painter of landfcapes, but under whom he acquired the art is unknown. He appears to have been a diligent obferver of nature, and to have ftudied much in the open air; as his ftudies of forefts, fields, &c. are numerous. When he had obtained confiderable reputation, his talents introduced him to the notice of Rubens, who employed him to affift in executing the landfcape parts of back-grounds, which he did with fo great felicity, that there appears no diffimilarity in ftyles in the pictures on which they both took their refpective parts. Two of his beft pictures are in the chapel of St. Jofeph at Antwerp, embellifhed with figures by Lang Jan: the fubject of one is the Flight into Egypt, and of the other a repofo. He died in 1644, aged 60.

WILDENSCHWERT, in *Geography*, a town of Bohemia, in the circle of Chrudim; 9 miles E. of Hohenmaut.

WILDENSTEIN, a town of Germany, in the margravate of Anfpach; 7 miles S.E. of Creilfheim.

WILDENTHAL, a town of Saxony, in the circle of Erzgebirg; 7 miles S.S.W. of Schwartzenberg.

WILDERNESS, in *Gardening*. There is nothing fo great an ornament to a large garden as a wildernefs, when properly contrived, and judicioufly planted.

The wildernefs fhould always be proportioned to the fize of the garden, and fhould never be fituated too near the houfe: becaufe the trees perfpire fo large a quantity of watery vapours, as makes the air very unwholefome: though vegetables ferve, as modern experiments have fufficiently afcertained, to purify and meliorate the air. See AIR.

The wildernefs fhould never be fo placed as to block up a good profpect; but where the view naturally ends with the verge of the garden, or little more, nothing terminates it fo well as a fine plantation of trees. The fize of the trees fhould be confidered, and tall growing ones fhould be planted in larger places; fmaller, in lefs extenfive; evergreens alfo fhould be kept by themfelves, and placed moft in fight, not mingled confufedly among the trees which caft their leaves. The walks fhould be large and not numerous; the large walk is beft made ferpentine, and this fhould not be entered upon in the grand walks of the garden, but by fome private walk.

It is too common a method to difpofe the trees in wildernefles, in form of regular fquares, triangles, &c. but this is faulty; for as nature fhould be ftudied in thefe works of fancy, the moft irregular is the moft pleafing plantation. The walks for the fame reafon are much more pleafing when they run in wild meanders, than when they interfect one another in ftudied and regular angles. The winding walks fhould be made to lead to an open circular piece of grafs, with a ftatue, an obelifk, or a fountain: or, if an opening large enough for a banqueting-houfe be contrived in the middle, it will afford a very pleafing fcene. The trees fhould gradually rife from the fides of the walks and openings, one above another, to the middle of the quarters, where the largeft trees fhould ftand, by which means the heads of all the trees will appear in view, but their ftems will not appear in fight.

Not only the growth of trees is to be confidered in the planting of a wildernefs, but their nakedneffes are to be confidered and hid. The larger growing trees are allowed a proportionable diftance, and their ftems hid by honeyfuckles, rofes, fpiræas, and other low-flowering fhrubs. Thefe may alfo be planted next all the walks and openings; and at the foot of thefe, near the walks, may be fet rows of primrofes, violets, and daffodils, with other the like flowers; behind the firft rank of lower flowering fhrubs fhould be planted thofe of a fomewhat higher ftature, as the *althæa-frutices*, the cytifufes and guelder-rofes; and behind thefe may be rows of the talleft flowering fhrubs, as the lilacs, laburnums, and the like; and behind thefe, the heads only of the lower growing trees will appear, which fhould be backed gradually with thofe of higher growth to the centre of the quarter; from whence the heads of the trees fhould defcend every way to the walks, or openings. The grand walks and openings fhould always be laid with turf, and kept well mowed; but, befide thefe, there ought to be fmaller ferpentine walks through the feveral quarters, where perfons may retire for privacy; thefe fhould be left with the bare earth, only kept clear of weeds, and laid fmooth.

Thefe walks fhould be made as winding as poffible, and a few wood-flowers planted along their fides will have a very good effect. The ever-greens fhould be allotted a peculiar part of the wildernefs, and fuch as fronts the houfe; and in the planting of thefe, the fame regard is to be had to their growth, that the talleft trees be planted hindmoft, and their ftems hid by fhorter ones, and fo on, down to the verge: as in the firft row may be planted lauruftines, boxes, fpurge, laurels, junipers, and favins; behind thefe, laurels, hollies, and arbutufes; next behind thefe, yews, alaternuffes, phillereys, cypreffes, and Virginian cedars; behind thefe, Norway and filver firs, and the true pine; and finally, behind thefe, the Scotch pine and pinafter. Thefe will have a very beautiful appearance, as their tops will only be feen, and make a fheet of green, which may alfo be very beautifully varied, from the artful admixtures of the feveral fhades of green which the various plants have.

In all thefe plantations, the trees, however, fhould not be fet in formal ftiff rows, but in a loofe variety, proportioned to their manner of growth. Miller.

WILDERSDORF, in *Geography*, a town of Auftria, on the Zeya; 8 miles W.S.W. of Zifterftorf.

WILDESHAUSEN, a town of Weftphalia, with a diftrict formerly belonging to the archbifhopric and duchy of Bremen, and afterwards to the duchy of Brunfwick, in which it is infulated. It is fituated on the Hunte, and contains about 312 houfes. The inhabitants are partly Roman Catholics; in the bailiwick are 30 villages; 20 miles S.S.W. of Bremen. N. lat. 52° 52′. E. long. 8° 27′.

WILDING, in *Rural Economy*, a four auftere fort of apple, often ufed with others that correct thefe qualities, for making home cyder. See CYDER.

WILDING, *Royal*, an excellent cyder-apple. It is faid, in the Gloucefter Report on Agriculture, to be a native of Dimock; that it is a free, clean, and handfome grower; makes excellent cyder, is a great favourite among the planters in the upper part of the foreft-diftrict of that county, and is much introduced in the vale, on the eaft fide of the Severn. See CYDER.

WILDS, a term ufed by our farmers to exprefs that part of a plough by which the whole is drawn forwards.

The wilds are of iron, and are of the form of a gallows, whence they are by fome called the gallows of the plough, but improperly; the gallows of the plough being properly that part formed by the crow-ftaves, and the tranfverfe piece into which they are mortifed at the top. The wilds confift of two legs, and a tranfverfe top-piece: one of the legs, and the top-piece, are all of one piece of iron; and the other leg, which is loofe, has a hole in the top, into which the end of the tranfverfe piece is received: both thefe legs pafs through the box of the plough, which is that tranfverfe timber through which the fpindles of the wheels run. Thefe legs are pinned in behind the box with iron pins: the holes through the box at which thefe legs pafs, are not made at right angles, but flanting upwards, fo that the forepart of the wilds is higher than the hinder part; were it not for this, the upper part of the crow-ftaves would lean quite back when the plough is drawn.

The ufe of the notches in the wilds is to give the plough a broader or narrower furrow; if the links are moved to the notches on the right-hand, it brings the wheels toward the left, which gives the greater furrow; and, on the contrary, a fmaller furrow is made when the links are moved to the notches on the left. The legs of the wilds fhould be nineteen inches, and their diftance eight inches and a half; they muft be made ftrong, and the links muft be placed in different notches, that the front of the plough may be kept fteady, and the wheels not be drawn one before the other. Thefe links are of iron alfo, and are each fix inches and a half long, and to thefe are faftened the chains of the harnefs, by which the whole plough is drawn along.

WILDSAUBACH, in *Geography*, a river of Germany, which runs into the Elbe, 6 miles below Drefden.

WILDSEE, a lake of the duchy of Stiria; 8 miles E. of Neumarck.

WILDSHUT, a town and caftle of Bavaria; 5 miles N.N.W. of Lauffen.

WILDSTADT. See WILLSTADT.

WILDUNGEN, a town of Germany, in the county of Waldeck; 7 miles S.S.E. of Waldeck. N. lat. 51° 7′. E. long. 9° 8′.

WILEHENGEN, a town of Switzerland; 9 miles W. of Schaffhaufen.

WILEIA, a town of Samogitia, on the Niemen; 25 miles S.S.E. of Rofienne.

WILF, in *Agriculture*, a term ufed provincially to fignify the white willow. See WILLOW.

WILFERSDORF, in *Geography*, a town of Auftria; 4 miles W. of Brugg.

WILHELMSDORF, a town of Pruffia, in Oberland; 13 miles S. of Holland.

WILHELMSHOF, a town of Germany, in the duchy of Anhalt Bernburg, near Hartzgerode.

WILHELMSPURG, a town of Auftria; 8 miles S. of St. Polten.

WILHELMSTEIN, a town of France, in the department of the Roer; 7 miles S.W. of Juliers.

WILHELMSTHAL, or NEUSTADTEL, a mine-town of Silefia, in the principality of Glatz; 15 miles S.E. of Glatz. N. lat. 50° 3′. E. long. 16° 42′.

WILIA, a river of Lithuania, which runs into the Niemen, near Kowno, in the palatinate of Troki.

WILINGO, a town of Sweden, in the province of Schonen; 7 miles N. of Helfingborg.

WILITZ, a town of Bohemia, in the circle of Kaurzim; 5 miles N.N.W. of Kaurzim.

WILKES, JOHN, in *Biography*, was born in London in 1727, and finifhed his ftudies at the univerfity of Leyden. Soon after his return to England, he married a Mifs Mead, who was a lady of large fortune, and fettled at Aylefbury. This lady, though highly refpectable both in her character and connections, and belonging to a diffenting family as well as himfelf, was older than he, and in other refpects an unfuitable wife, fo that the attachment was originally formed, on his part, from lucrative motives: one daughter was the fruit of this connection. Mr. Wilkes, thus furnifhed with the means of profufion, lived in an expenfive ftyle, and being little anxious about domeftic happinefs, affociated with the gay and licentious, to whofe habits and manners his principles and character were facrificed. Urged by his partial friends who thought him qualified for public life, he offered himfelf, in 1754, as a candidate for the town of Berwick, but his views were difappointed. In this and in feveral other inftances, he counteracted the inclinations and wifhes of his wife, fo that their continued connection was a fource of difquietude, and they determined to feparate. In 1757 he was returned as a member for the borough of Aylefbury, the confequence of which was an increafe of expenditure, that involved him in pecuniary embarraffments, and led him to difhonourable practices, and particularly to an attempt of freeing himfelf from the obligation of paying his wife's annuity, in which he failed of fuccefs. His parliamentary patron was earl Temple, by whofe influence he was chofen reprefentative for Aylefbury; and from whofe intereft he expected to obtain fome place under government, which the perplexity of his circumftances rendered particularly defirable. But he was once and again difappointed; and he afcribed his failure to the interference of lord Bute. In 1762 he connected himfelf, as a political writer, with lord Temple and Mr. Pitt, and defended them, whilft he expofed the miniftry, on occafion of the rupture with Spain, in a pamphlet entitled "Obfervations on the Papers relative to the Rupture with Spain." This publication was followed in 1763 by an ironical dedication to lord Bute, of Ben Jonfon's "Fall of Mortimer," in which he indulged unreftrained levity againft the "favourite," as he was called, and his antipathy to the Scottifh nation; which was further manifefted in a periodical paper called "the North Briton," commenced in 1762, and intended to counteract "the Briton," which Smollet conducted in defence of lord Bute's adminiftration. The North Briton, however, was written with a fpirit fo confonant to the fentiments of the public at that period, that it probably contributed to the refignation of that nobleman in April 1763. The 45th number of this periodical work was publifhed on the 23d of April, and contained fo fevere and farcaftic a comment on the king's fpeech, that his minifters, under the fanction of the crown-lawyers, determined upon a profecution: and the home fecretary of ftate, lord Halifax, iffued a "general warrant;" *i. e.* a warrant, in which no particular names were fpecified, for the apprehenfion of the authors, printers, and publifhers of that paper. As foon as it was difcovered that Wilkes had given orders for the printing, he was taken into custody, and brought before the two secretaries of state. Perfectly self-possessed, and avowing the illegality of his arrest, he refused to answer any interrogatories; and a habeas corpus which had been sued out for him being evaded, he was closely confined in the Tower. However, he was soon after brought by habeas corpus before the court of common pleas, when lord chief justice Pratt declared the opinion of that court against the legality of his commitment, so that he was discharged amidst the acclamations of the audience and of the populace. In the course of these proceedings he was deprived of his commission as colonel, by the king's order; and his patron, lord Temple, lost his post of lord-lieutenant of the county. This nobleman, at his own expence, availed himself of the legal decision against general warrants, and commenced actions against the king's messengers, the secretaries, the under secretary, and the solicitor of the treasury; in all which the prosecutors obtained damages, which were paid by the crown, in consequence of an express order of council. Thus the doctrine of the illegality of such warrants was established, and for this accession to the cause of liberty the public were indebted to John Wilkes, lord Temple, and lord chief justice Pratt, afterwards lord Camden. Wilkes, not satisfied with this triumph, proceeded, against the advice of friends, to set up a press in his own house, and to reprint the North Briton; for which he was again prosecuted to conviction. Having withdrawn to France in 1763, he was expelled from the house of commons, because he did not appear to answer the charges that were produced against him. The next attack that was directed against him was occasioned by his printing an indecent and profane piece, called "Essay on Woman," and said to have been written by Mr. Potter, son of the archbishop of the same name; and as some scandalous reflexions on a bishop were introduced in this piece, complaint of breach of privilege was made in the house of lords; and on a prosecution, he was found guilty of both the crimes of blasphemy and libel. By his continued absence, he incurred the penalty of outlawry. Upon a change of ministry he returned to England, and delivered himself to custody; and confiding in his popularity, he offered himself as a candidate to represent the city of London; but failing in this object, he was immediately elected for the county of Middlesex. Although his sentence of outlawry was reversed as illegal, he was condemned for his two libels to an imprisonment of 22 months, and a fine of 1000*l.* In 1769 he was charged with being the author of a pamphlet relating to the riots, occasioned by his imprisonment, and expelled from the house; and being immediately re-elected, he was declared incapable of a seat in the house during the existing parliament. He now became popular as the martyr of liberty, and large sums were collected towards the payment of his debts. He was again re-elected, and his election was declared void. At the next election, the court-candidate, colonel Luttrel, whose votes were about a fourth of those of Mr. Wilkes, was declared the sitting member. This measure caused dissatisfaction and complaint through the country, and produced petitions for the dissolution of parliament. Wilkes, though excluded from parliament, was chosen an alderman of the city of London; and in the exercise of his office as a magistrate, he resisted with his usual spirit exactions of authority which he considered as illegal; and actually liberated one of the printers of newspapers in which the speeches of members of parliament were detailed, and who had been arrested by royal proclamation. Two others were released by lord mayor Crosby and alderman Oliver, who being members of the house were committed to the Tower. Wilkes was ordered to attend at the bar of the house; but in a letter to the speaker, he objected, that in the order for attendance, no notice was taken of his being a member of the house, and his attendance in his place had not been desired, which forms, he said, were essential: he also demanded his seat, and then he would give a full account and justification of his conduct. The house, sensible of the difficulty to which it had subjected itself, saved its authority by adjourning for the day on which Wilkes was ordered to attend. In 1772 Wilkes was chosen one of the sheriffs for London and Middlesex, and in 1774 lord mayor of London. Having conducted himself with propriety and reputation in his public offices, he was re-elected in 1776 a representative for the county of Middlesex; and was allowed to take his seat without opposition. In parliament, he opposed the measures that occasioned the American war; and on the accession of the Rockingham administration, he carried his motion for rescinding the decision of the house of commons, which gave Luttrel a seat by a minority of votes. In 1779 he succeeded in his application for the office of chamberlain in the city of London, and retained it during the remainder of his life. Tired of political conflicts, the latter years of his life passed off without much notice, so that, to adopt his own expression, he was an "extinguished volcano;" and he expired at the house of his daughter in 1797, in the 73d year of his age. His private history affords no memorial that is either amusing or instructive. The early errors of his conduct cast a shade over his character. His literary talents and attainments, devoted as he was to pleasure, and engaged in business, never attracted much notice; though as a companion he knew how to render himself agreeable. Although his patriotism might possibly originate in disappointed views and expectations, he was consistent and steady in maintaining the cause to which he was attached; and he was, either intentionally or incidentally, and by an intrepidity and self-possession which he possessed in an eminent degree, the instrument of gaining some important advantages to public and private liberty. Alm. Mem. of Wilkes. Ann. Reg. Gen. Biog.

WILKES, in *Geography*, a town of Ohio, in Gallia county, with 187 inhabitants.—Also, a county of the state of Georgia, bordering on South Carolina, containing 7066 inhabitants. Tobacco is the chief produce, of which 3000 hogsheads were exported in 1788.—Also, a county in the N.W. corner of North Carolina, with 7247 inhabitants, including 790 slaves.—Also, a town of North Carolina; 50 miles W. of Salem.

WILKESBARRE, formerly WYOMING, called also *Wilkesburg*, a town of Pennsylvania, and chief town of Luzerne county; situated on a plain, bounded on one side by the Susquehanna, and on the other by a range of mountains, and containing about 150 wooden dwelling-houses, a church, court-house, and gaol, with 1225 inhabitants. A dreadful massacre was committed in this place, during the American war, by the Indians under the command of colonel Butler, which is recorded in most histories of that war, and which will ever remain a blot on the English annals. Several of the houses, to which the unfortunate victims retired to defend themselves on being refused quarter, are still standing, perforated in every part with balls; the remains of others that were set on fire are also still to be seen, nor will the inhabitants on any account suffer them to be repaired. N. lat. 45° 13′. W. long. 75° 50′. Weld's Travels, vol. ii.

WILKINS, DAVID, in *Biography*, a learned antiquary, was born in 1685, and in early life more than once made the tour of Europe, acquiring a knowledge of most modern languages. In 1715 he was appointed by archbishop Wake keeper

keeper of the Lambeth library, of which he made a catalogue, and for his three years' labour in this way he was recompenfed with feveral preferments, fuch as the rectories of Hadley and Monk's Ely, the archdeaconry of Suffolk, and a canonry of Canterbury. Among his principal publications we may reckon "Novum Teftamentum Copticum," Oxon, 1716, 4to.; an edition of "Leges Saxonicæ ecclefiafticæ et civiles," with many valuable additions, 1721, fol.; "Joannis Seldeni Opera omnia," 1726, 3 vols. fol.; "Pentateuchus Copticus," 1731, 4to.; "Concilia Magnæ Britanniæ," 4 vols. fol. 1736; and a learned preface to bifhop Tanner's "Britannico-Hibernica." He married the eldeit daughter of Thomas, lord Fairfax, fettled in Scotland, and died in 1745, in his 60th year. Nichols's Lit. Anecd. Gen. Biog.

WILKINS, JOHN, D.D., an Englifh prelate, was born near Daventry, in Northamptonfhire, in 1624, and finifhed his education at Magdalen-hall, Oxford, where he graduated M.A. He afterwards took orders, and became chaplain, firft to lord Say, and then to Charles, count palatine of the Rhine. At the commencement of the civil war he joined the parliament, took the folemn league and covenant, and became warden of Wadham college. In 1649 he graduated D.D., and in 1656 married the fifter of Oliver Cromwell. In 1659 he was nominated head of Trinity college, Cambridge; but being ejected on the reftoration of king Charles II., he became preacher to the fociety of Gray's-Inn, London, and rector of St. Lawrence, Jewry; about which time he was introduced into the Royal Society as fellow and one of the council, and advanced to the fee of Chefter. He was diftinguifhed by his moderation, and was reproached on this account by his enemies, who reprefented him as wavering in his religious principles. Several bifhops cenfured him with uncandid feverity, among whom were archbifhop Sheldon, bifhop Fell, and archbifhop Dolben, making no allowance for the favourable difpofition which he was led to manifeft towards the diffenters by his education under Mr. John Dod, his grandfather, a truly pious and learned man, who difapproved many things in the church of England long before the grand feparation which took place on account of Laud's impofitions and feverities. After the Reftoration he was a moderate conformift, and difpofed to be indulgent in many things, for the fake of preventing religious diffenfions. On this account he incurred hatred and obloquy. He at length fell a victim to the ftone, occafioned by his fedentary habits, and clofe application to ftudy; and died, with a tranquillity and firmnefs becoming a wife man and a Chriftian, at the houfe of his friend Dr. Tillotfon, in Chancery-lane, London, in November, 1672. Bifhop Wilkins was not only an able divine, but a good mathematician and aftronomer; and well fkilled in mechanics and experimental philofophy. As a writer he was judicious and plain; and he ftudied more to be ufeful than to pleafe. Generous in his difpofition, he neither fought honour nor riches. The revenues which he received from the church he fpent in its fervice; and whilft he was fecure from want, he did not wifh to be richer. His character is thus delineated by Dr. Burnet: "He was a man of as great a mind, as true a judgment, as eminent virtues, and of as good a foul, as any he ever knew; and though he married Cromwell's fifter, yet he made no other ufe of that alliance but to do good offices, and to cover the univerfity of Oxford from the fournefs of Owen and Goodwin. At Cambridge he joined with thofe who ftudied to propagate better thoughts, to take men off from being in parties, or from narrow notions, from fuperftitious conceits, and fiercenefs about opinions. He was alfo a great obferver and promoter of experimental philofophy, which was then a new thing, and much looked after. He was naturally ambitious, but was the wifeft clergyman I ever knew. He was a lover of mankind, and delighted in doing good." He alfo poffeffed, according to this hiftorian, "a courage which could ftand againft a current, and againft all the reproaches with which ill-natured clergymen ftudied to reproach him." His principal works are the following: *viz.* "The Difcovery of a New World; or, a Difcourfe tending to prove that it is probable there may be another habitable World in the Moon," London, 1638, 4to., written when he was only twenty-four years of age; "Difcourfe concerning the Poffibility of a Paffage to the World in the Moon;" "Difcourfe concerning a new Planet, tending to prove that it is probable our Earth is one of the Planets," ibid. 1640, 8vo.; "Mercury; or, the Secret Meffenger: fhewing how a man may with privacy and fpeed communicate his thoughts to a friend at any diftance," ibid. 1641, 8vo.; "Mathematical Magic; or, the Wonders that may be performed by Mechanical Geometry," in two books, ibid. 1648 and 1680, 8vo. Thefe latter five, compofing his mathematical works, were printed at London in one volume, 8vo. 1708. "Effay towards a real Character and a philofophical Language," ibid. 1668, fol.; "Of the Principles and Duties of Natural Religion," two books, ibid. 1675, 8vo. publifhed by Dr. Tillotfon. Alfo, "Sermons preached on feveral Occafions," and fome others. Life prefixed to his Philofophical and Mathematical Works.

WILKINSON, in *Geography*, a county of Georgia, with 2154 inhabitants, including 318 flaves.—Alfo, a county of the Miffiffippi, with 5068 inhabitants, including 2630 flaves.

WILKOMIERS, a town of Lithuania, in the palatinate of Wilna, on the Swienta, near its union with the Wilna; 44 miles N.N.W. of Wilna.

WILKS, a county of North Carolina, with 9054 inhabitants.

WILKUSCHKE, a town of Pruffia; 5 miles N.N.E. of Ragnitz.

WILL, VOLUNTAS, is ufually defined a faculty of the mind, by which it embraces or rejects any thing reprefented to it, as good or evil, by the judgment.

Others will have it to be the mind itfelf, confidered as embracing or refufing; adding, that as the underftanding is nothing elfe but the foul, confidered as *perceiving*; fo the will is nothing elfe but the foul, confidered as *willing*, &c.

Mr. Locke more intelligibly defines the will, a faculty which the foul has of beginning or forbearing, continuing or ending, feveral actions of the mind, and motions of the body, barely by a thought or preference of the mind, ordering, or as it were commanding, the doing, or not doing, fuch and fuch a particular action. This power which the mind has, to order the confideration of any idea, or the forbearing to confider it; or to prefer the motion of any part of the body to its reft, and *vice verfâ*, is what we call the will. See POWER.

The actual exercife of that power, is what we call *volition*, or willing; and the doing or forbearing of any action confequent on fuch order of the mind, is called *voluntary*. So far, according to this writer, as a man has a power to think or not to think, to move or not to move, according to the preference or direction of his own mind, fo far he is free: and hence liberty, he fays, is not an idea belonging to volition or preferring, but to the perfon having the power of doing, or forbearing to do, as the mind fhall choofe or direct. On the other hand, wherever any performance or forbearance is not equally in a man's power; wherever doing or not doing will wil not equally follow upon the preference of his mind; there he is not free, though perhaps the action may be voluntary. Accordingly, where thought is wholly wanting, or the power to act or forbear according to the direction of thought, there neceffity takes place; this, in an agent capable of volition, when the beginning or continuation of any action is contrary to the preference of his mind, is called *compulfion*: when the hindering or ftopping of any action is contrary to his volition, it is called *reftraint*. Agents that have no thought, no volition at all, are in every refpect neceffary agents.

Father Malebranche lays it down, that the will is that to the foul, which motion is to the body; and argues, that as the Author of nature is the univerfal caufe of all the motions in matter, fo he is of all the inclinations in the mind; and that as all motions are direct, unlefs their courfe be diverted and changed by fome foreign caufe; fo all inclinations are right, and could have no other end but the enjoyment of truth and goodnefs, were there not fome foreign caufe to determine the natural impreffion to evil ends.

Accordingly, he defines will to be the impreffion, or natural motion, which carries us towards good indeterminately, and in the general; and the power the mind has, to direct this general impreffion towards any particular object that pleafes it, is what he calls *liberty*.

Ariftotle diftinguifhes two kinds of acts of the will, *viz.* βούλησις, *willing*, *volition*; and προαίρεσις, *election*. The firft, that employed about the ultimate end; the latter, about the means.

The fchoolmen alfo diftinguifh the actions of the will into *elicit* and *commanded*. Elicit acts, *actiones elicitæ*, are thofe immediately produced by the will, and really inherent in it; fuch are *willing* and *nilling*. Commanded acts, *actiones imperatæ*, are effects produced by other powers; *v. gr.* the fenfitive, intellective, or locomotive powers, at the command or inftigation of the will. As to *follow*, *ftay*, *fight*, *fly*, &c.

But others will have the former kind properly to belong to the underftanding; and only the latter to the will.

The word will is taken in three fenfes:

1. For the power or faculty of willing, in which fenfe it is, we have confidered it above.

2. For the act or exercife of this power; as, when we fay, No man wills his own deftruction.

3. For a habit, or a conftant difpofition and inclination to do any thing. In which fenfe juftice is defined a conftant will to give every one what belongs to him: "Juftitia eft cõnftans et perpetua voluntas jus fuum unicuique tribuendi." Inftit. Juftin.

Will, *Antecedent*. See Antecedent.

Will, *Free*. See Liberty, and Freedom.

Will, *Laft Will*, or *Teftament*, in *Law*, a folemn act, or inftrument, by which a perfon declares his mind and intention as to the difpofal of his goods, effects, &c. after his death. See Testament.

This act or inftrument is emphatically ftyled the will of the deceafed, becaufe it directs the difpofal of the whole or part of his property, by written or oral inftructions properly witneffed and authenticated, according to his pleafure. Some have diftinguifhed between a teftament and a will; a will being properly limited to land, and a teftament only to chattels, requiring executors, which a will only for land doth not require: fo that every teftament is a will, but every will is not a teftament. However, the words have been commonly ufed indifcriminately.

Wills, *Hiftory of*. Wills or teftaments, fays judge Blackftone, are of very high antiquity. We find them among the ancient Hebrews: not to mention what Eufebius and others have related of Noah's teftament, made in writing, and witneffed under his feal, by which he difpofed of the whole world, a more authentic inftance of the early ufe of teftaments occurs in the facred writings (Gen. chap. xlviii.), in which Jacob bequeaths to his fon Jofeph a portion of his inheritance double to that of his brethren; which will we find executed many hundred years afterwards, when the pofterity of Jofeph were divided into two diftinct tribes, thofe of Ephraim and Manaffeh, and had two feveral inheritances affigned them; whereas the defcendants of each of the other patriarchs formed only a fingle tribe, and had only one lot of inheritance. Solon was the firft legiflator that introduced wills into Athens; but in many other parts of Greece they were totally difcountenanced. In Rome they were unknown, till the laws of the Twelve Tables were compiled, which firft gave the right of bequeathing; and among the northern nations, particularly among the Germans, teftaments were not received into ufe. Hence it appears, that the right of making wills and difpofing of property after death, is merely a creature of the civil ftate, which has permitted it in fome countries, and denied it in others, and fubjected it to various reftrictions and regulations, where the law allows it.

With us in England, this power of bequeathing is coeval with the firft rudiments of the law; not indeed, that it extended originally to all a man's perfonal eftate. See Rationabili *parte bonorum*.

It is alfo fufficiently clear, that, before the Conqueft, lands were devifable by will. But, upon the introduction of the military tenures, the reftraint of devifing lands naturally took place, as a branch of the feodal doctrine of non-alienation without the confent of the lord. By the common law of England fince the Conqueft, no eftate, greater than for term of years, could be difpofed of by teftament; except only in Kent, and in fome ancient burghs, and a few particular manors, where their Saxon immunities by fpecial indulgence fubfifted. But when ecclefiaftical ingenuity had invented the doctrine of *ufes*, as a thing diftinct from the land, ufes began to be devifed very frequently, and the devifee of the ufe could in chancery compel its execution. However, when the ftatute of ufes, *viz.* 27 Hen. VIII. cap. 10. had annexed the poffeffion to the ufe, thefe ufes, being now the very land itfelf, became no longer devifable: whereupon the ftatute of wills was made, *viz.* 32 Hen. VIII. cap. 1. explained by 34 & 35 Hen. VIII. cap. 5. which enacted, that all perfons being feifed in fee-fimple (except feme-coverts, infants, ideots, and perfons of nonfane memory) might by will and teftament in writing devife to any other perfon, except to bodies corporate, two-thirds of their lands, tenements, and hereditaments, held in chivalry, and the whole of thofe held in focage; which now, through the alteration of tenures by the ftatute of Charles II. 12 Car. II. cap. 25. amounts to the whole of their landed property, except their copyhold tenements. As for copyhold and other cuftomary lands, thefe are devifable or not, according to the cuftom of the refpective manors. And generally, a devife of copyhold will not pafs, without a furrender to the ufe of the will. In the cafe of a child or widow, a court of equity, in favour of thefe, will fupply a defect of furrender (2 Vez. 582. 5 Vez. 557.); fo alfo, when there is a general devife of real eftate to pay debts, and there is no real eftate but copyhold: alfo where a copyhold is in the hands of truftees, the perfon for whom the lands are holden in truft may devife the fame without furrender. (2 Atk. 38. 1 Vez. 489.) And though the court will fupply the defect of a furrender for the benefit of children, yet the rule doth not extend to grand-children, or to a natural child, and consequently not to any more distant kindred. (2 Vez. 582. 1 Wilson, 161. 6 Vez. 544.) And if a man, seised of copyhold lands, surrenders the same to the use of his will, and executes a will, not attested by any witnesses, yet it shall direct the uses of the surrender: for the clause in the statute, which requires the testator's signing in the presence of three witnesses, is confined only to such estates as pass by the statute of wills of 34 & 35 Henry VIII., which doth not extend to copyhold. (2 Atk. 37. 7 East's Rep. 299.) See MORTMAIN.

By 29 Car. II. cap. 3. any estate *pur auter vie* shall be devisable by a will in writing, signed by the party so devising the same, or by some other person in his presence and by his express directions, attested and subscribed in the presence of the devisor by three or more witnesses; and if no such devise thereof be made, the same shall be chargeable in the hands of the heir, if it shall come to him by reason of a special occupancy, as assets by descent, as in case of lands in fee-simple; and in case there be no special occupant thereof, it shall go to the executors or administrators of the party that had the estate thereof by virtue of the grant, and shall be assets in their hands.

One that hath money to be paid him on a mortgage may devise this money when it comes. God. O. L. 391.

And if the feoffee in mortgage, before the day of payment which should be made to him, maketh his executors and die, and his heir entereth into the land as he ought; it seemeth in this case, that the feoffor ought to pay the money at the day appointed to the executors, and not to the heir of the feoffee: but yet the words of the condition may be such, as the payment shall be made to the heir; as if the condition were, that if the feoffor pay to the feoffee or to his heirs such a sum at such a day, there after the death of the feoffee, if he dieth before the day limited, the payment ought to be made to the heir at the day appointed. 1 Inst. 209, 210.

And hereby it appeareth, that the executors do more represent the person of the testator, than the heir doth that of the ancestor; for though the executor be not named, yet the law appoints him to receive the money, but so doth not the law appoint the heir to receive the money unless he be named. 1 Inst. 209, 210.

A person may devise by his will the right of presenting to the next avoidance, or the inheritance of an advowson. And if such devise be made by the incumbent of the church, the inheritance of the advowson being in him, it is good, though he die incumbent; for though the testament hath no effect but by the death of the testator, yet it hath an inception in his life-time: and so it is, though he appoint by his will who shall be presented by the executors, or that one executor shall present the other, or doth devise that his executors shall grant the advowson to such a man. Wats. c. 10.

But where an advowson was devised to the first or other son of B, that should be bred a clergyman and be in holy orders, and if B should have no such son, to C; both devises were holden by the court of common pleas to be void, as depending on too remote a contingency; for the rule of law is, that the contingency on which such an executory devise hinges must take effect within some life in being, or 21 years afterwards; but it was uncertain that the son of B, if he ever should have any, would take, or be able to take orders within 21 years of the death of his father. Proctor *v.* the Bishop of Bath and Wells, and others, 2 H. Bla. 358.

If upon articles for a purchase, the purchaser die, having devised the land before a conveyance executed, the land will pass in equity; for the testator had an equity to recover the land, and the vendor stood trustee for the testator, and as he should appoint, till a conveyance executed. 1 Chanc. Cas. 39. 2 Vern. 679.

For the vendor of the estate is, from the time of his contract, considered as a trustee for the purchaser; and the vendee, as to the money, is considered as a trustee for the vendor. 1 Atkyns, 573.

So if a man covenants to lay out a sum of money in the purchase of lands, generally; and deviseth his real estate before he hath made such a purchase: the money to be laid out will pass to the devisee. Id.

But if a man, having made his will, afterwards contracts for the purchase of lands; the lands contracted for will not pass by the will, but descend to the heir at law. Id.

But if a good title cannot be made of the lands; as the heir in such case cannot have the lands, so he shall not have the money intended to be laid out. Id.

If a man have a lease for ever so many years, determinable upon life or lives, that is, if such or such live so long; this estate may well enough be given and disposed by will, because it is but a chattel. Went. 19.

A lease for years may also be devised to A for life, remainder to B. And if the lease be renewable, and A renew, B shall contribute to the fine so partaking of the benefit of the renewal.

If the testator, by his last will and testament, do give or bequeath to another any debt due unto him, or a thing in action belonging unto him, the legacy is good and effectual in the law, and may be recovered in this manner, that is to say, if the testator do make the legatary executor of that particular debt or thing in action bequeathed, then the legatary as executor thereof may commence suit in his own name, and recover the same to his own use, against him by whom it was due; but if the testator do not make the legatary executor of the debt or thing in action bequeathed, then his remedy lieth in the ecclesiastical court, where he may convent the executor, and compel him either to sue for that debt in a court competent, and upon recovery and payment thereof to pay it over to the legatary, or else to make a letter of attorney to the legatary for the recovery of the debt or thing in action bequeathed in the name of the executor to the use of the legatary. Swin. 187, 188.

Albeit the testator have no such thing of his own as is bequeathed, yet nevertheless the legacy is good in law; therefore, if the testator do bequeath a horse or a yoke of oxen, the legacy is good in law, though the testator have neither horse nor ox of his own. But who shall make choice, in this case, of the thing so bequeathed, is a question not to be neglected: and the solution is this; that if the words of the devise be directed to the legatary, as if the testator shall thus say, I will that A B shall have a horse, the choice doth belong to the legatary; but if the words be directed to the executor, as if the testator shall thus say, I will that my executor give to A B a horse, the election doth belong to the executor. Provided nevertheless, that to whomsoever the election doth belong, whether to the legatary, or to the executor, they must not be unreasonable in their election, but frame themselves according to the meaning of the testator; otherwise the legatary might make choice of the best horse in the country, and the executor of the worst, contrary to the meaning of the deceased. Swin. 188.

If there be two joint-tenants of lands, and one of them deviseth that which to him belongs, and dieth; this is no good devise, and the devisee takes nothing, because the devise

vise doth not take effect until after the death of the devisor, and then the surviving joint-tenant takes the whole by prior title, to wit, from the first feoffment. Gilbert on Wills, 120.

And although the jointure is severed before the testator's death, yet if the will be made before the severance, it will have no effect; unless there is a republication of the will after the partition. Bur. Mansf. 1496.

So also a man cannot give or bequeath by will any of those goods or chattels which he hath jointly with another: for if he should bequeath his portion thereof to a third person, this bequest is void by the laws of this realm; and the survivor, which had those goods or chattels jointly with another, shall have that portion so bequeathed, notwithstanding the said will. Swin. 189.

But otherwise it is with the tenants in common (God. O. L. 131.) and coparceners. For there is no survivor between coparceners, but the part of each is descendible, and consequently may be devised. (Co. Lit. 185. *b.*) And a deed of partition is not a revocation of a devise of his moiety by tenant in common. Luther *v.* Ridley, cited in 3 P. Wms. 169.

By 20 Hen. III. cap. 2. widows may bequeath the crop of their ground, as well of their dowers, as other their lands and tenements; saving to the lords of the fee all such services as be due for their dowers and other tenements. And this is only in affirmance of the common law. (2 Inst. 80.) But by 27 Hen. VIII. cap. 10. a married woman, having a jointure made, shall not have any dowry of the residue of her husband's lands.

By 28 Hen. VIII. cap. 11. if the incumbent before his death hath caused any of his glebe land to be manured and sown, at his proper costs and charges, with any corn or grain; he may make and declare his testament of all the profits of the corn growing upon the said glebe land so manured and sown.

But if the testator is lessee for years, and sow the land a short time before his lease expires, and then dies, before the corn can possibly be ripe within the term, in this case a devise thereof is void, because he himself could not have reaped it after the expiration of the term, if he had lived. Swin. 191.

Not only that thing may be devised or bequeathed by the testator, which is truly extant, or hath an apparent being at the time of the making of the will or death of the testator; but that thing also which is not in *rerum natura*, whilst the testator liveth: therefore, it is lawful for the testator to bequeath the corn which will be sown or grow in such soil after his death, or the lambs which shall come of his flock of sheep the next year, depasturing in such a field. But if there be no such corn growing in that soil, nor any lambs arising out of that flock, then the legacy is destitute of effect, because no such thing is extant at all as was bequeathed. But if the testator devise a certain quantity of grain or number of lambs, as for the purpose, twenty quarters of corn or twenty lambs, and doth will and devise, that the same shall be paid out of the corn which shall grow in such a field, or arise out of his sheep depasturing in such a ground; though not so much or no corn at all there grow, or not any or not so many lambs there arise, yet nevertheless the executor is compellable by law to pay the whole legacies entirely; because the mention of the soil and of the flock was rather by way of demonstration than by way of condition, rather shewing how or by what means the said legacy might be paid, than whether it should be paid at all yea or no. Swin. 186.

Those things which after the death of the testator descend to the heir of the deceased, and not to his executor, cannot be devised by testament, except in such cases wherein it is lawful to devise the lands, tenements, or hereditaments.

If a man be seised of a house, and possessed of divers heir-looms, that by custom have gone with the house from heir to heir, and by his will deviseth away these heir-looms; this devise is void: for the will taketh effect after his death; and by his death, the heir-looms by ancient custom are vested in the heir, and the law prefers the custom before the devise. And so it is, if the lord ought to have a heriot against his tenant, and the tenant deviseth away all his goods; yet the lord shall have his heriot for the reason aforesaid. 1 Inst. 185.

The testator may devise all goods and chattels which he hath in his own right, but not those which he hath in the right of another as executor. Swin. 185.

An administrator cannot make a testament of those goods which he hath as administrator to any person dying intestate; because he hath not any such goods to his own proper use, but ought therewithal to pay the debts of the dead person, and to distribute the rest according to law. Swin. 189.

The husband cannot devise such goods as his wife hath as being executrix to another, nor such things as are in action, as debts due to her before marriage by obligation or contract, unless he and his wife recover the same during marriage, or that he renew the bonds, and take them in his own name; otherwise after his death they remain to her. 1 Inst. 351.

But the husband may, at any time during the coverture, release a bond given to his wife. And where the husband makes a settlement, the bonds to his wife, being part of her fortune, will notwithstanding his death in the life-time of his wife, before the security be changed, be decreed in equity to his executor; he being considered in that case as a purchaser for a valuable consideration. Cases in the time of L. Talb. 168.

A man may by his will dispose of his chattels and personal estate that he shall for the future acquire, any time after the making his will, to the time of his death. And this is necessary from the reason of the thing; because the chattels and personal estate are in a continual fluctuation; and if the law were not so, it would create very great confusion, or else would render it necessary for a man to make a new will every day. Gilb. 122.

But it is not so with lands, for they are fixed and permanent: and, therefore, if a man maketh his will, and deviseth therein all the lands which he shall have at the time of his death; and after that, he purchaseth lands, and dieth without republication or making a new will; in this case, though his intent to the contrary is very apparent, yet it is a void devise: for a man cannot devise any lands but what he hath at the time of making his will. And this was adjudged upon great deliberation, by Holt chief justice and the court, in the case of Bunker and Cook: and the judgment was affirmed afterwards upon a writ of error in the house of lords, Feb. 24, 1707. Gilb. 122.

But, by Holt chief justice: If he republished his will, in such manner, and with such circumstances, as are necessary to complete execution of an original will; then the purchased lands will pass as by an original will. (11 Mod. 127.) And in truth this seemeth to make it a new will, to all intents and purposes; and not a republication of the old one.

But a codicil, which concerneth only personal legacies, will not amount to a republication of the will, so as to pass lands purchased after the making of the will. 2 Vern. 625.

If

If a man deviseth all his lands for payment of his debts, and purchaseth lands afterwards: the lord keeper said he would decree a sale, though there were no precedent articles. 2 Cha. Ca. 144.

If a man hath a lease, and disposeth of it specifically by his will; and after surrenders it and takes a new lease, and after dies; the devisee shall not have this last lease, because this was a plain countermand of his will. Golds. 93.

But in the case of Stirling and Lydiard, Nov. 21, 1744, where a man devised all and singular his leasehold estate, goods, chattels, and personal estate whatsoever, and afterwards renewed a lease; it was held by the lord chancellor Hardwicke clearly, that the leasehold estate passed by the will.

If a man deviseth a term for years, which he hath not at the time of the devise, but purchaseth some time before his death; Holt chief justice doubted whether this would be good. But Mr. Peere Williams says, that notwithstanding the doubt which the court of king's bench seems to have had in that case, it hath been clearly held to pass by such a will. 3 P. Wms. 169.

Wills, *Persons capable of making.* Every person hath full power and liberty to make a will, that is not under some special prohibition by law or custom: which prohibitions are principally upon three accounts; for want of sufficient discretion; for want of sufficient liberty and free will; and on account of criminal conduct.

In the first class are to be reckoned infants, under the age of fourteen if males, and twelve if females; which is the rule of the civil law. By statute 34 & 35 Hen. VIII. cap. 5. wills or testaments made of any manors, lands, tenements, or other hereditaments, by any person within the age of twenty-one years, shall not be taken to be good or effectual in law; for until that time, by the common laws of this realm, they are accounted infants. (Swinb. 74.) But by custom in particular places, they may devise lands before the age of twenty-one. (God. O. L. 21. Wentw. 24.) But no custom of any place can be good, to enable a male infant to make any will before he is fourteen years of age. (Law of Exec. 153.) If the testator is not of sufficient discretion, whatever be his age, that will overthrow his testament. Accordingly, madmen, or otherwise *non compotes*, ideots or natural fools, persons grown childish by age or distemper, such as have their senses besotted with drunkenness; all these are incapable, by reason of mental disability, to make any will as long as such disability lasts. To this class may also be referred such persons as are born deaf, blind, and dumb; who, as they have always wanted the common inlets of understanding, are incapable of having *animum testandi*, and their testaments are therefore void. It has been maintained that persons deaf and dumb, who understand what a testament meaneth, and that are desirous of making one, may by signs and tokens declare their testament: and that a blind person may make a nuncupative testament, by declaring his will before a sufficient number of witnesses; and that he may make his testament in writing, provided the same be read before witnesses, and in their presence acknowledged by the testator for his last will. Swinb. 95, 96.

Persons of the second description are by the civil law of various kinds; as prisoners, captives, and the like. But the law of England does not make such persons absolutely intestable; but only leaves it to the discretion of the court to judge, upon the consideration of their peculiar circumstances of duress, whether they could be supposed to have *liberum animum testandi*. With regard to feme-coverts, our laws differ still more materially from the civil. Among the Romans, a married woman was as capable of bequeathing as a feme-sole. But with us, a married woman is not only utterly incapable of devising lands, being excepted out of the statute of wills, 34 & 35 Hen. VIII. cap. 5. but also she is incapable of making a testament of chattels, without the licence of her husband, who frequently, upon marriage, covenants with her friends to allow her that licence: his assent, therefore, must be given to the particular will in question, without which it will not be a complete testament. Her will, therefore, operates in the nature of an appointment, the execution of which the husband by his bond, agreement, or covenant, is bound to allow. The queen-consort is an exception, for she may dispose of her chattels by will, without the consent of her lord: and any feme-covert may make her will of goods, which were in her possession *in auter droit*, as executrix or administratrix; for these can never be the property of her husband: and if she has any pin-money or separate maintenance, it is said she may dispose of her savings thereout by testament, without the controul of her husband. But if a feme-sole makes her will, and afterwards marries, such subsequent marriage is esteemed a revocation in law, and entirely vacates the will.

Persons of the third class are, first, all traitors and felons, from the time of conviction; for then their goods and chattels, and all such lands, tenements, and hereditaments, as they shall have in their own right, use, or possession, of any estate or inheritance, at the time of such treason committed, or at any time after, are forfeited to the king. The testament before made doth, by reason of the same conviction, become void both in respect of goods, and also in respect of lands, tenements, and hereditaments. But if a person, attainted of treason, obtain the king's pardon, and be thus restored to his former estate, he may make his testament, and his former testament is good. (Swinb. 97.) Neither can a *felo de se* make a will of goods and chattels, for they are forfeited by the act and manner of his death; but he may make a devise of his lands, for they are not subjected to any forfeiture. (3 Inst. 55.) Outlaws also, though only for debt, are incapable of making a will, so long as the outlawry subsists, for during that time their goods and chattels are forfeited; but he that is outlawed in an action personal, may make his testament of lands, for they are not forfeited. (Swinb. 107.) An outlaw in a personal action may in some case make executors; for he may have debts upon contract, which are not forfeited to the king; and those executors may have a writ of error to reverse the outlawry. (Cro. Eliz. 851.) Coke observes, that an excommunication (meaning the greater excommunication) is worse than an outlawry; for if a plaintiff, who is an executor, be outlawed, his outlawry cannot be pleaded to disable him from proceeding in the suit, because it is in the right of another; but if he is excommunicated, it is otherwise, because every man that converses with such a person is excommunicated himself (1 Inst. 134.); that is, after he is denounced excommunicate, and they are admonished not to converse with him. (Ayl. Par. 266.) As for persons guilty of other crimes, short of felony, who are by the civil law precluded from making testaments, (as usurers, libellers, and others of a worse stamp,) by the common law their testaments may be good.

Will, *Nature and Incidents of a.* Wills or testaments are divided into two sorts, *viz. written* and *verbal* or *nuncupative:* of which the former is committed to writing; the latter depends merely upon oral evidence, being declared by the testator *in extremis* before a sufficient number of witnesses, and afterwards reduced to writing. A codicil is a supplement to a will.

 As

As *nuncupative* wills and codicils are liable to great impositions, and may occasion many perjuries, the statute of frauds, 29 Car. II. cap. 3. hath laid them under many restrictions; except when made by mariners at sea, and soldiers in actual service. As to all other persons, it enacts, 1. That no written will shall be revoked or altered by a subsequent nuncupative one, except the same be in the life-time of the testator reduced to writing, and read over to him and approved; and unless the same be proved to have been so done by the oaths of three witnesses at least; who, by 4 & 5 Ann. cap. 16. must be such as are admissible upon trials at common law.

2. That no *nuncupative* will shall be good, where the estate bequeathed exceeds 30*l.*, unless proved by three such witnesses, present at the making of it, and unless they or some of them were specially required to bear witness to it by the testator; and unless it was made in his last sickness, in his own habitation, or where he had previously resided at least ten days, except he be surprised with sickness on a journey, or from home, and dies without returning to his dwelling.

3. That no *nuncupative* will shall be proved by the witnesses after six months from the making, unless it were put in writing within six days; nor shall it be proved till fourteen days after the death of the testator, nor till process hath first issued to call in the widow, or next of kin, to contest if they think proper.

As to *written* wills (*viz.* those that concern not the devise of lands), they need not any witness of their publication. A testament of chattels, written in the testator's own hand, though it has neither his name nor seal to it, nor witnesses present at its publication, is good; provided sufficient proof can be had that it is his hand-writing. (Swinb. 353. Gilb. Rep. 260.) And though written in another man's hand, and never signed by the testator, yet if proved to be according to his instructions, and approved by him, it hath been held a good testament of the personal estate. However, it is the safer and more prudent way, and leaves less in the breast of the ecclesiastical judge, if it be signed or sealed by the testator, and published in the presence of witnesses. It is said in 3 Salk. 396. that by the canon law, and also by the common law, two witnesses are requisite to prove a will of goods; for one witness by the civil law, unto which the other laws are conformed in this matter, is as no witness at all. 1 P. Wms. 13.

The statute of frauds and perjuries, 29 Car. II. cap. 3. directs, that all devises of lands and tenements shall not only be in writing, but signed by the testator, or some other person in his presence, and by his express direction; and be subscribed, in his presence, by three or four credible witnesses. In the construction of this statute, it has been adjudged that the testator's name, written with his own hand at the beginning of his will, as, "I John Mills do make this my last will," &c. is a sufficient signing, without any name at the bottom; though the other is the safer way. (3 Lev. 1.) It hath been said, that if the testator only put his seal to the will, without signing it, this is a sufficient signing within the statute; because signing is no more than a mark to distinguish a man's act, and sealing is a sufficient mark to know it to be his will. (Gilb. 93.) Others, however, have held that sealing without signing was not sufficient. (1 Wilson, 313. 2 Vezey, 459.) Signing being only mentioned in the statute, sealing is not necessary. (God. O. L. 5. 1 Wentw. 29.) It has also been determined, that though the witnesses must all see the testator sign, or at least acknowledge the signing, yet they may do it at different times. But they must all subscribe their names as witnesses in his presence, lest by any possibility they should mistake the instrument. In one case determined by the court of king's bench, the judges would not allow any legatee, nor consequently a creditor, where the legacies and debts were charged on the real estate, to be a competent witness to the devise. This determination occasioned the statute 25 Geo. II. cap. 6. which restored both the competency and credit of such legatees, by declaring void all legacies given to witnesses, and thereby removing all possibility of their interest affecting their testimony. The same statute likewise established the competency of creditors, by directing their testimony to be admitted; but leaving their credit (like that of all other witnesses) to be considered, on a view of all the circumstances, by the court and jury before whom such will shall be contested. And in a much later case, M. 31 Geo. II. the testimony of three witnesses, who were creditors, was held to be sufficiently credible, though the land was charged with the payment of debts. By stat. 29 Car. II. cap. 3. all declarations or creations of trusts or confidences, of any lands, tenements, or hereditaments, shall be manifested and proved by some writing signed by the party who is by law enabled to declare such trust, or by his last will in writing, or else they shall be utterly void, and of none effect. And all grants and assignments of any trust or confidence shall likewise be in writing, signed by the party granting or assigning the same by such last will or devise; or else shall be utterly void, and of none effect.

No testament is of any effect till after the death of the testator; and, therefore, if there be many testaments, the last overthrows all the former; but the republication of a former will revokes one of a later date, and establishes the first again. Although no man can die with two testaments, because the latter doth always infringe the former; yet a man may die with divers codicils, and the latter doth not hinder the former, so long as they be not contrary. (Swinb. 15.) All codicils are part of the will; therefore, a codicil merely for a particular purpose, as to change an executor, and confirming the will in all other respects, does not revive a part of the will revoked by a former codicil. If two testaments be found, and it doth not appear which was the former or latter, both testaments are void; but if two codicils be found, and it cannot be known which was the first or last, and one and the same thing is given to one person in one codicil, and to another person in another codicil, the codicils are not void, but the persons therein named ought to divide the thing betwixt them. Swinb. 15.

If codicils are regularly executed and attested, they may be proved as wills are. So if they are found written by the testator himself, they ought to be taken as part of the will, and to be proved in common form by the oath of the administrator with the will annexed; and in case of opposition, by witnesses to the hand-writing and finding: and it hath been usual to exhibit an affidavit of the hand-writing and finding, before a probate or administration passes even in common form.

But in case of a real estate, a codicil cannot operate, unless it be executed according to the statute. 1 Atk. 426.

By stat. 29 Car. II. cap. 3. no devise in writing of lands, tenements, or hereditaments, or any clause thereof, shall be revocable, otherwise than by some other will or codicil in writing, or other writing declaring the same, or by burning, cancelling, tearing, or obliterating the same by the testator himself, or in his presence, and by his directions and consent; but all devises and bequests of lands and tenements shall remain and continue in force, until the same be burnt, cancelled, torn, or obliterated by the testator, or by his directions

tions in manner aforefaid, or unlefs the fame be altered by fome other will or codicil in writing, or other writing of the devifor, figned in the prefence of three or four witneffes declaring the fame.

And no will in writing concerning any goods or chattels or perfonal eftate fhall be repealed, nor fhall any claufe, devife, or bequeft therein be altered or changed, by any words, or will by word of mouth only, except the fame be in the life of the teftator committed to writing, and after the writing thereof read unto the teftater, and allowed by him, and proved to be fo done by three witneffes at the leaft.

A will which will pafs perfonal eftate is not a fufficient revocation of a former will, by which a real eftate is devifed. Comyns, 451.

Although the ftatute fays, that no will in writing concerning perfonal eftates fhall be repealed by word of mouth only, except the words be put into writing, and read to and allowed by the teftator, and proved to be fo done by three witneffes; yet where a man by will in writing devifed the refidue of his perfonal eftate to his wife, and fhe dying, he afterwards by a nuncupative codicil bequeathed to another all that he had given to his wife, this was refolved to be good: for by the death of the wife, the devife of the refidue was totally void; and the codicil was no alteration of the former will, but a new will for the refidue. 1 Abr. Caf. Eq. 408.

Alfo, the ftatute hath not taken away revocations of wills by act of law; as if the teftator afterwards make a feoffment, or do any other act inconfiftent with the will: but fuch revocation remains as before the ftatute. Carth. 81.

If a man devifes lands to one and his heirs, and afterwards mortgages the fame lands to another for years or in fee; though a mortgage in fee is a total revocation at law, yet in equity it fhall be a revocation *pro tanto* only. 1 Abr. Eq. Caf. 410.

And the reafon is, becaufe a mortgage is not confidered as a conveyance of the eftate, but only as a charge upon it; being merely a fecurity, and in the confideration of equity carries only a chattel intereft, the creditor gains nothing real, it affords no dower, and goes to executors. Sparrow and Hardcaftle, May 6, 1754. 3 Atk. 798.

But if lands be devifed to one in fee, and afterwards mortgaged to the fame devifee; this is a revocation *in toto*, being inconfiftent with the devife: but if the mortgage had been to a ftranger, it had been a revocation *quoad* the mortgage only. Prec. Cha. 514.

If a man feifed in fee devifes it to one in fee or for life, and afterwards makes a leafe to another for years; this, even at law, fhall not be a revocation but during the years. 1 Roll's Abr. 616.

So if a hufband poffeffed for forty years devifes it to his wife, and after leafes the land to another for twenty years, and dies; this leafe is not any revocation of the whole eftate, but only during the twenty years, and the wife fhall have the refidue by the devife. Id.

But where a man feifed of a leafe for lives devifed it, and afterward furrendered the old leafe, and took a new one to him and his heirs for three lives; it was decreed, that this renewal of the leafe was a revocation of the will as to this particular. For by the furrender of the old leafe, the teftator had put all out of him, had divefted himfelf of the whole intereft; fo that there being nothing left for the devife to work upon, the will muft fall, and the new purchafe, being of a freehold defcendible, could not pafs by a will made before fuch purchafe. 3 P. Wms. 166. 170.

But where the teftator devifed all and fingular his leafehold eftate, and afterwards renewed a leafe; it was held by lord Hardwicke clearly, that this leafehold eftate paffed by the will: for that this is not a fpecific legacy, but only an enumeration of the feveral particulars of the perfonal eftate, but yet is a general devife of the whole. 3 Atk. 199.

Though a covenant or articles do not at law revoke a will; yet if entered into for a valuable confideration, amounting in equity to a conveyance, they muft confequently be an equitable revocation of a will, or of any writing in nature thereof. 2 P. Wms. 624.

A woman's marriage is alone a revocation of her will. Id.

A man made a will, and appointed one (who was no relation) to be his executor. He afterwards went abroad, where he became a governor of one of the plantations, and fent over for an Englifh woman of his acquaintance, whom he married, and had children by; and died, without an actual revocation of his will. Yet it was determined, that this total alteration of his circumftances was an implied revocation. 1 P. Wms. 304.

It is an eftablifhed maxim, that wills fhould be conftrued favourably. Accordingly, the intention of the teftator is called by lord Coke the polar-ftar, to guide the judges in the expofition of wills. In divers inftances, relating to the interpretation of wills, collateral evidence hath been admitted in the court of chancery to explain the teftator's intention. But notwithftanding thefe cafes, the courts have been very unwilling to admit of parol evidence in relation to any thing that appears on the face of a will; and it is certain that too much caution cannot well be ufed in this particular, efpecially when it is confidered that the ftatute of frauds and perjuries, which was made to prevent perjury, contrariety of evidence, and uncertainty, binds the courts of equity as well as the common-law courts; as alfo that little regard ought in many cafes to be had to the expreffions of the teftator, either before or after the making his will, becaufe poffibly thefe expreffions might be ufed by him, on purpofe to conceal or difguife what he was doing, or to keep the family quiet, or for other fecret motives and inducements which cannot after his death be found out. 2 Bac. Abr. 310.

Notwithftanding that wills are generally favoured by the law; yet where the teftator endeavours to eftablifh a fettlement againft the reafon and policy of the common law, the judges will reject it. Gilb. 110. 2 Bac. Abr. 79.

Alfo where the teftator by his will maketh no other difpofition of his eftate than the law itfelf would have done, had he been filent; there fuch a will is ufelefs, and fhall be rejected: and, therefore, if a devife be made to a perfon and his heirs, which perfon is heir at law to the devifor; this is a void devife, and the heir fhall take by defcent as his better title; for the defcent ftrengthens his title, by taking away the entry of fuch as may poffibly have right to the eftate; whereas if he claims by devife, he is in as by purchafe. Gilb. 110. 2 Bac. Abr. 79.

Alfo devifes are void and rejected, where the words of the will are fo general and uncertain, that the teftator's meaning cannot be collected from them; and, therefore, where a man by will gave *all* to his mother, the general words did carry no *lands* to his mother; for fince the heir at law hath a plain and uncontroverted title, unlefs the anceftor difinherits him, it would be fevere and unreafonable to fet him afide, unlefs fuch intention of the teftator is evident from the will; for that were to fet up and prefer a dark and at beft but a doubtful title to a clear and certain one. Gilb. 112. 2 Bac. Abr. 81.

The claufe of "perfect mind and memory" is more ufual than neceffary in a will, and yet not hurtful. (Swinb. 7.)

But

But in case of contest, it is necessary to prove the sanity of the testator. 2 Atk. 56.

For the different modes of devise, and the legal meaning of the appropriate terms by which they are expressed, we refer to Burn's Ecclesiastical Law, *ubi infra*.

From the above accounts it follows, that testaments may be avoided three ways: 1. If made by a person labouring under any of the incapacities before mentioned. 2. By making another testament of a later date. And, 3. By cancelling or revoking it.

The Romans were wont to set aside testaments, as being *inofficiosa*, deficient in natural duty, if they disinherited or totally passed by (without assigning a true and sufficient reason) any of the children of the testator. But if the child had any legacy, though ever so small, it was a proof that the testator had not lost his memory nor his reason, which otherwise the law presumed. Hence probably, says Blackstone, has arisen that groundless vulgar error of the necessity of leaving the heir a shilling or some other express legacy, in order to effectually disinherit him; whereas the law of England, though the heir or next of kin be totally omitted, admits no *querela inofficiosa*, to set aside such testament. Burn's Eccl. Law, vol. iv. art. WILL. Blackst. Com. book ii.

WILLS *of Seamen and Marines*. By the statute 26 Geo. III. c. 63. no will made by any petty officer or seaman in the king's service, whereby any wages, pay, prize-money, or allowance of money of any kind due for such service is bequeathed, shall be valid, unless, if made while the party is in the service, it be signed before and attested by the captain, or the officer then commanding, and one of the signing officers of the ship to which the party belongs, and unless it specify in the body thereof the name of the ship, and the number at which the maker of the will stands upon the ship's books, and contains a full description of the residence, profession, or business of the person in whose favour it is made, and the day of the month and the place where it was executed, or by the agent of any of his majesty's hospitals or quarters appointed to receive sick and wounded seamen, in which the party may be at the time; or if made by such officer or seaman discharged from the service, within the bills of mortality, unless it be attested by the officer appointed by the treasurer of the navy to inspect such wills; or if made at any of the ports where seamen's wages are paid, unless it be attested by the treasurer of the navy, chief or second clerk there; or if made at any other place, unless it be attested by the minister and churchwardens of the parish in England or Ireland, or by two elders of the parish in Scotland. In order to obtain a probate thereof, the will must be sent to a proctor by the inspector of wills appointed by the treasurer of the navy.

If any such petty officer or seaman should die intestate, the person claiming administration must apply by petition to the said inspector, who is to grant a certificate directed to a proctor, that letters of administration may pass in favour of the petitioner, if entitled thereto by law.

If any proctor, register, or other officer of any ecclesiastical court shall be aiding and assisting in procuring probate of a will, or letters of administration, for the purpose of enabling any person to receive such wages, pay, prize-money, or allowance of money of any kind, without first obtaining the certificate from the inspector of seamen's wills, or person authorized to officiate for him, every such proctor, register, or other officer, shall forfeit 500*l.*, and for ever after be incapable of acting in any capacity in any ecclesiastical court in Great Britain or Ireland.

And by the 32 Geo. III. c. 34. after the 1st day of August 1792, no letter of attorney or will of a non-commissioned officer of marines or marine shall be valid unless made according to the 26 Geo. III. c. 63.

All are to be deemed petty officers, seamen, marines, &c. except such as are rated upon the books of such ship, admirals or flag officers, and their secretaries, captains, and lieutenants, masters, second masters, and pilots, physicians, surgeons, chaplains, boatswains, gunners, carpenters, and pursers, captains of marines, captain lieutenants of marines, lieutenants, and quarter-masters of marines.

Every lieutenant, on board any of his majesty's ships, shall upon a page of every muster book of such ship sign his name for the purpose, and for the purpose only, that the inspector of seamen's wills, or such person as shall be deputed by him, may have an opportunity of comparing the same with the name of any such lieutenant attesting the will, &c. executed by or in favour of any petty officer, seaman, non-commissioned officer of marines or marine.

And all captains of ships shall, upon their monthly muster books or returns, specify which of the men, mentioned in the said returns, have granted or issued any will or testament during that month or space of time from the preceding returns, by inserting the date thereof opposite to the party's name. The muster books, &c. in case of sailing from any foreign station, at a time when no opportunity shall offer of transmitting them to the navy-board, to be left with the naval officer of the place, if any, or with some respectable merchant, with directions to forward the same to the commissioners of his majesty's navy by the first safe opportunity, and in case of the removal of the commander, to be delivered over to his successor and a receipt given for the same.

Provided that it shall be lawful for the minister of any parish, to whom the inspector of seamen's wills shall transmit his check of any letter of attorney or will, passed and allowed by him, to deliver the said check to the attorney or executor in the said letter of attorney or will named and appointed. And all seamen's letters of attorney, and wills made prior to the 1st of August 1786, and those of marines prior to the 1st of August 1792, shall be examined and inspected by the inspector of seamen's wills for the purpose of preventing frauds, forgeries, or impositions of any kind therein; and if such inspector shall see no cause to suspect the authenticity of the same, he shall affix the stamp of his office, and issue checks for the same, but if he shall see good cause to suspect the truth and authenticity of such letter of attorney or will, he shall report the same to the treasurer, or to the paymaster of the navy, and shall enter his caveat against such letter of attorney or will, which shall prevent any money from being had or received thereon until the same shall be authenticated to the satisfaction of the said treasurer or paymaster.

The wages, pay, prize-money, or allowances of petty officers or seamen, non-commissioned officers of marines, and marines dying intestate, are to be paid only upon letters of administration obtained in the following manner:

The person claiming such administration shall send or give in a note or letter to the inspector of seamen's wills, stating the name of the deceased, the name of the ship or ships to which he belonged, and that he has heard or been informed of his death, and requesting the inspector to give such directions as may enable him to procure letters of administration to the deceased, or to the like effect, upon receipt whereof the inspector of seamen's wills shall deliver or send to the person claiming such administration, a paper in a peculiar form of words, which paper being duly filled up and certified shall be returned to the treasurer, or to the paymaster of his majesty's navy, London, who upon receiving the

the same shall direct the inspector of seamen's wills to examine the same, and make such inquiry relative thereto as may appear to him necessary on that behalf; and being satisfied, he shall forthwith make out a certificate for obtaining letters of administration, and pursue the course minutely described in Burn's Ecclesiastical Law, art. *Wills*.

By 32 Geo. III. c. 34. the following sums are to be paid for the seal, parchment, writing, and suing forth of probates of wills and letters of administration granted in pursuance of this act, for the purpose of receiving wages, or pay, or allowances of money of any kind, which shall remain due to the deceased, *viz.*

	£.	*s.*	*d.*
For probates of wills, if the goods and chattels are under the value of 20*l.* - - - -	0	15	2
For letters of administration - - -	1	4	2
For probates of wills under 40*l.* - - -	1	8	8
For administration - - - - - -	1	17	8
For probates of wills under 60*l.* - - -	1	11	2
For administration - - - - - -	2	8	6
For probates of wills under 100*l.* - -	1	13	8
For administration - - - - - -	2	11	0
For commissions or requisitions to swear executors or administrators:			
Under 20*l.* - - - - - -	0	15	0
And under 100*l.* - - - - -	1	3	0

But if the probates or letters of administration be granted to the widow, children, father, mother, brother, or sister, in pursuance of this act, for the same purpose of receiving wages, or pay, or allowances of money of any kind, which shall remain due to such warrant or petty officer, &c. then the following sums are to be paid, *viz.*

	£.	*s.*	*d.*
For probates of wills under 20*l.* - - -	0	6	0
For administration - - - - - -	0	14	0
For probates of wills under 40*l.* - - -	0	19	6
For administration - - - - - -	1	7	6
For probates of wills under 60*l.* - - -	1	3	0
For administration - - - - - -	1	11	0
For probates of wills under 100*l.* - -	1	7	6
For administration - - - - - -	1	15	6
For commissions or requisitions to swear executors or administrators:			
Under 20*l.* - - - - - -	0	12	0
Under 40*l.* - - - - - -	0	15	6
Under 60*l.* - - - - - -	0	16	6
Under 100*l.* - - - - - -	0	18	6

And no more than 5*s.* are to be taken for the suing forth of the probate of any will or letters of administration granted to the widow, children, father, mother, brother, or sister of any such seaman or marine, &c. and 5*s.* for commissions or requisitions to swear such widow, &c. unless the goods amount to 100*l.*: which last-mentioned charge of 5*s.* must be understood to be demandable where the probate or letters of administration are not for the purpose of receiving wages, or pay, or allowances of money remaining due, but for general purposes, as to obtain administration of the goods and chattels of the deceased.

A bill of the expences of obtaining letters of administration to creditors, is to be laid before and taxed by one of the registers of the prerogative court of Canterbury, or their deputies, who are entitled to a fee of 3*s.* 4*d.* for the same; and the proctor is to transmit such letters of administration with the bill of expences so certified, to the treasurer or paymaster of his majesty's navy. Proctors taking more than the prescribed sums forfeit 50*l.*, and registers and other officers of any ecclesiastical court, procuring letters of administration or probate contrary to this act and the 26 Geo. III., to be incapacitated to act, and forfeit 500*l.*

WILL, *Qualification and Office of the Executor of a.* See EXECUTOR, EXECUTOR *de son Tort*, and JOINT-*Executors.* See also DEBTS, DEBTEE-*Executor*, INVENTORY, and LEGACY.

WILL, *Probate of a.* See PROBATE.

WILL, *Estate at*, in *Law*, is where lands and tenements are let by one man to another, to have and to hold at the will of the lessor; and the tenant by force of this lease obtains possession. Every estate of this kind is at the will of both parties, landlord and tenant: so that either of them may determine his will, and quit his connection with the other at his own pleasure, under certain restrictions. For, if the tenant at will sows his land, and the landlord, before the corn is ripe, or reaped, puts him out, the tenant shall have the emblements, and free ingress and egress to cut and carry away the profits. But where the tenant himself determines the will, the landlord shall have the profits of the land. The law is careful, that no such sudden determination of the will by one party shall tend to the manifest and unforeseen prejudice of the other. This appears in the case of emblements just mentioned; and also, the lessee after the determination of the lessor's will shall have reasonable ingress and egress to fetch away his goods and utensils. And if rent be payable quarterly or half-yearly, and the lessee determines the will, the rent shall be paid to the end of the current quarter or half-year. Upon the same principle, courts of law have of late years inclined as much as possible against construing demises, where no certain term is mentioned, to be tenancies at will: but have rather held them to be tenancies from year to year, so long as both parties please, especially where an annual rent is reserved: in which case they will not suffer either party to determine the tenancy even at the end of the year, without reasonable notice to the other. Blackst. Com. vol. ii.

WILLACH. See VILLACH.

WILLAERT, ADRIAN, in *Biography*, the disciple of John Mouton, and master of Zarlino, has been long placed at the head of the Venetian school of counterpoint by the Italians themselves. He was born at Bruges in Flanders, and during his youth studied the law at Paris; if with the view of making it his profession, there must have been an early conflict between legislation and music, which having a powerful advocate in his own heart gained the cause; for by his own account (see JOSQUIN) he went to Rome in the time of Leo X., where he found that his motet, "Verbum bonum et suave," was performed in the pontifical chapel, as the work of that renowned composer; he therefore must have been a contrapuntist some time, before any of his works could have travelled to Rome.

The account which Zarlino gives of this motet (P. i. p. 175.) having passed for a work of Josquin, excited our curiosity to see it; and finding it among the Motetti della Corona, in the British Museum, we scored it; but discovered that the predilection for a great name had operated too powerfully in favour of this composition while Josquin was imagined to be the author of it; for it is neither written with the clearness, dexterity, nor even correctness, of that wonderful contrapuntist: there is not only confusion in the

the parts and defign, in many places, but fomething very harfh and unpleafing in the harmony, particularly in the clofes without a fharp feventh, both in the key-note and in the fifth. The motet is in fix parts, soprano, two countertenors, tenor, baritono, and bafe. Some of thefe fevenths would doubtlefs have been made fharp in performance by the fingers of thofe times, in obedience to a rule for fharpening afcending fevenths in minor keys, and flattening them in defcending.

The lift of his works, in Walther's Dictionary, though ample, is far from complete. The motet Verbum bonum, juft mentioned, was publifhed at Foffombrone in 1519, forty-three years before Zarlino made him an interlocutor in his dialogue (Ragionamente), at Venice; and it can hardly be imagined that no others of his compofitions appeared till 1542, when, we are told, that his motets for fix voices were publifhed. In the Fior de Motetti, lib. i. Venice, 1539, there is a Pater-nofter, in four parts, by Adriano; and in the fame year the firft book of his motets, for four voices, was republifhed in the fame city by Ant. Gardano, in folio, under the following pompous title: "Famofiffimi Adriani Willaert, Chori Divi Marci illuftriffimæ Reipublicæ Venetiarum Magiftri, Mufica Quatuor Vocum (quæ vulgo Motectæ nuncupatur) noviter omni ftudio, ac diligentia in lucem edita." This edition, which, we find by the title, was not the firft, is preferved in the Britifh Mufeum. Indeed, for near fifty years after his name firft appeared, hardly a collection of motets or madrigals was publifhed to which he did not contribute; but the moft fplendid and curious work of this author, that we have feen, is preferved in the Britifh Mufeum. It was publifhed at Ferrara, 1558, by his fcholar and friend, Francefco Viola, another of the interlocutors in Zarlino's Ragionamente, under the title of Mufica Nova, in three, four, five, fix, and feven parts. In the dedication of this work to Alfonfo d'Efte, duke of Ferrara, the editor, his maeftro di capella, calls Adriano (the name by which he is always mentioned by the Italians) his mafter, and fays, that he is ftrongly attached to him, not only for his wonderful abilities in mufic, but integrity, learning, and the friendfhip with which he has long honoured him. Zarlino, in like manner, omits no opportunity of exalting the character of his mafter. Thefe are honourable teftimonies of regard, which feem the more worthy of being recorded, as, either from the worthleffnefs of the mafter, or ingratitude of the fcholar, they are but feldom beftowed.

In the cantus part there is a wooden cut of the author: "Adrian Willaert Flandrii Effigies." And indeed the compofitions are of that kind for which he was moft renowned, and fuch as the editor thought would conftitute the moft durable monument of his glory. In the tenor part there are many canons of very curious conftruction; fome with two and three clefs, and a different number of flats and fharps for the feveral parts, which are moving in different keys at the fame time; and one particularly curious, in feven parts, "Præter rerum feriem," of which three are in ftrict canon of the fourth and fifth above the guide; the tenor leading off in G, the fextus following in C, and the feptima pars in D, while the reft move in free fugue.

Zarlino (P. iii. p. 268.) affigns to Adriano the invention of pieces for two or more choirs; and Piccitoni (Guida Armonica) fays, that he was the firft who made the bafes in compofitions of eight parts, move in unifons or octaves; particularly when divided into two choirs, and performed at a diftance from each other, as then they had occafion for a powerful guide. The dexterity and refources of this author, in the conftruction of canons, are truly wonderful, as is, indeed, his total want of melody; for it is fcarcely poffible to arrange mufical founds, diatonically, with lefs air or meaning, in the fingle parts. But there are many avenues through which a mufician may travel to the temple of Fame; and he that purfues the track which the learned have marked out, will perhaps not find it the moft circuitous and tedious; at leaft theorifts, who are the moft likely to record the adventures of paffengers on that road, will be the readieft to give him a caft. A learned and elaborate ftyle conceals the want of genius and invention, more than the free and fanciful productions of the prefent times.

Adriano lived to a great age, and filled a very high mufical ftation, maeftro di capella of St. Mark's church at Venice. His works and fcholars were very numerous; and among thofe to whom he communicated the principles of his art, there were feveral who afterwards arrived at great eminence; fuch as Cipriano Rore, Zarlino, and Coftanzo Porta. In the title of a book, publifhed at Venice, 1549, there are "Fantafie," or "Ricercari," compofed dallo excellentiffimo Adrian Vuigliart, and Cipriano Rore, fuo difcepolo. P. Martini, in his Saggio di Contrappunto, P. ii. p. 266. calls Adrian Willaert the mafter of Coftanzo Porta. Burney.

WILLAFANS, in *Geography*, a town of France, in the department of the Doubs; 3 miles S.E. of Ornans.

WILLAKALA, a town of Sweden, in Finland; 48 miles E. of Biorneborg.

WILLAWAKY, an Indian town on the N.W. coaft of lake Michigan. N. lat. 47° 45′. W. long. 87° 10′.

WILLDENOVIA, in *Botany*, received its name from profeffor Thunberg, in honour of Dr. Charles Lewis Willdenow, late profeffor of botany at Berlin, well known as the author of many learned botanical writings, but efpecially by his *Species Plantarum*, of which the immortal work of Linnæus, bearing the fame title, is the bafis. The addition of effential characters, and of many new fpecies, befides thofe accumulated in profufion, with great intelligence and difcrimination, from authors fubfequent to Linnæus, might entitle this to rank as an original work; were not the Linnæan part of it too fervile a tranfcript, not only of miftakes, of remarks contradicting each other, and of evidently falfe fynonyms; but in general of errors of the prefs, and wrong citations of plates and pages, which prove that the refpective books, though in every body's hands, were not confulted. The learned editor happily lived to complete the firft part of the fifth volume, comprifing the order of *Filices*, in which he was well verfed. That he left the reft of the *Cryptogamia* unattempted, is perhaps rather fortunate than otherwife. The *Mufci*, *Lichenes*, and *Fungi*, each form a ftudy by themfelves, and are treated of feparately by different authors. They would have added enormoufly to Willdenow's work, and could, after all, have proved but a compilation. If the fcience goes on as it has done, an univerfal botanift will be nearly as impoffible a character as an univerfal naturalift is at prefent.

Another genus (fee SCHLECHTENDALIA) was dedicated to Willdenow by Cavanilles, which is retained in Lamarck's Illuftrations, t. 685, by the name of *Vildenovia*. The change of orthography at the conclufion we readily adopt, inftead of the uncouth *Willdenowa*, or *Willdenowia*, and it is now likewife followed by Thunberg himfelf, in his *Flora Capenfis*.—Thunb. in Stockh. Tranf. for 1790, 28. Prodr. 14. Fl. Capenf. v. 1. 312. Willd. Sp. Pl. v. 4. 717. Poiret in Lamarck Dict. v. 6. 177.—Clafs and order, *Dioecia Triandria*. (Triandria Monogynia; *Thunb.*)—Nat. Ord. *Tripetaloideæ*, Linn. *Junci*, Juff. *Reftiaceæ*, Brown Prodr. v. 1. 243.

Gen. Ch. Male, *Cal.* Perianth inferior, of numerous, imbricated, membranous, pointed, permanent glumes, longer than

than the fruit. *Cor.* Petals six, equal, erect, oval, membranous, permanent. *Stam.* Filaments three, capillary, shorter than the corolla; anthers ovate-oblong.

Female, *Calyx* and *corolla* as in the male. *Pist.* Germen superior, roundish; style very short, two or three-cleft; stigmas two or three, downy. *Peric.* Drupa dry, roundish, smooth. *Seed.* Nut solitary, of one cell.

Eff. Ch. Male, Calyx of many imbricated glumes. Corolla of six petals, permanent.

Female, Calyx and corolla as in the male. Style one. Stigmas two or three. Drupa with one seed.

Obs. This genus differs from RESTIO (see that article), chiefly in having a single-seeded *drupa* instead of a *capsule*, opening by valves, and containing several *seeds*. We have here merely altered the phraseology respecting the *calyx*, which in *Restio* is termed, rather improperly, a *catkin*.

1. W. *striata*. Striated Willdenovia. Thunb. in Stockh. Transf. for 1790, 27. t. 2. f. 1. Fl. Cap. v. 1. 312. Willd. n. 1. Poiret n. 3.—Stem leafless, round, striated.—Native of the Cape of Good Hope, as are likewise the two following species. The *stem* is two feet high, or more, erect, rushy, hard and rather shrubby, branched, usually simply forked, rarely three-forked, round, jointed, striated, smooth; the branches also round, striated. *Sheaths* at each joint and subdivision solitary, ovate, close, brown, smooth. *Leaves* none. *Flowers* terminal, solitary, erect, the size of a pea. Scales of the *calyx* about ten, rarely fewer, or more, loosely imbricated, equal, oblong, pointed, brown, smooth, the length of the nail, membranous at the edges. *Corolla* white, much shorter than the *drupa*, and pressed close to its sides. *Style* in two short, broad, yellow divisions. *Stigmas* short, obtuse, brown. *Drupa* ovate, black, dotted; sometimes, according to Thunberg, of two cells, which last circumstance, if real, greatly invalidates the generic character.

2. W. *teres*. Smooth Willdenovia. Thunb. in Stockh. Transf. for 1790, 28. t. 2. f. 2. Fl. Cap. v. 1. 314. Willd. n. 2. Poiret n. 1.—Stem and branches leafless, round, smooth and even. The *stem* of this species is shrubby, much branched, jointed, simply or triply forked, erect, a foot or more in height, not striated; its branches somewhat level-topped. *Sheaths* at each subdivision ovate, brown, smooth, as long as the nail. *Flowers* terminal, solitary, erect. Scales of the *calyx* about six, ovate, awned, grey and smooth. *Petals* very short, emarginate, shining, surrounding the base of the *fruit*. *Style* undivided, very short. *Stigmas* feathery, tapering, purplish. *Drupa* hard, ovate, black, smooth, of one cell.—This plant differs from the foregoing in having fewer *calyx-scales*, a smooth and more branched *stem*, long tapering *stigmas*, and a smooth, not dotted, *fruit*. Poiret, who had seen a specimen, attributes to the present species the fleshy cylindrical body, with six notches, surrounding the base of the *corolla* externally, which Willdenow calls a *nectary*, and admits into his generic character. We have seen but few and incomplete specimens of any of the genus, and therefore cannot judge of the part in question, but we presume the term *nectary* must here be misapplied. Thunberg does not mention it in his *Flora*.

3. W. *compressa*. Compressed Willdenovia. Thunb. in Stockh. Transf. for 1790, 28. t. 2. f. 3. Fl. Cap. v. 1. 315. Willd. n. 3. Poiret n. 2.—Stem leafy, smooth and even; branches compressed. *Stem* two feet high, or more, shrubby, erect, smooth in every respect, simply or triply forked; its branches compressed, or semi-cylindrical, wand-like. *Sheaths* of the subdivisions ovate, pointed. *Leaves* on the young branches, and resembling them, thread-shaped, tapering. *Flowers* terminal, solitary, upright, the size of a pea. Scales of the *calyx* ovate, awned, smooth, membranous at the edges. *Petals* ovate, acute, as long as the *fruit*. *Style* undivided. *Stigmas* three, feathery. *Drupa* ovate, compressed, obtuse, grey. *Thunberg*.

WILLEBROD, in *Biography*, the apostle of Friseland, was an Anglo-Saxon, and born in Northumberland about the year 658, and educated in the abbey of Rippon, where he engaged in the religious profession. At the age of 33, he accompanied eleven of his countrymen into Batavia, and employed himself for three or four years in converting the Frisians who were under the French dominion; and having met with great success, he went to Rome, and received from pope Sergius the pallium, ordaining him archbishop of Friseland. Pepin gave him a residence at Wilteburg, now Utrecht, of which he was the first prelate. Embarking from Friseland for the north, he penetrated into Denmark, and in his return was cast by a storm on an island called Fosteland, supposed to be the same with Heligoland. He afterwards baptized Pepin, son of Charles Martel, and spent the rest of his life in propagating Christianity among the Batavians. His colleague and assistant was Winfrid, his countryman, surnamed Boniface, the apostle of Germany. He died in 740, at the age of 82; was buried at his abbey of Esternac, in the diocese of Treves, and honoured with canonization. His life was written by the celebrated Alcuin. Mosheim. Moreri.

WILLEMSTADT, or WILLIAMSTADT, in *Geography*, a strong town of Holland, situated upon that part of the Meuse called Buttervliet, built in 1584, by William I., prince of Orange, from whom it receives its name. This fortress is one of the keys of Holland, and defended with seven bastions and double fosse; it has also a good harbour, but which it is sometimes dangerous for vessels to enter at certain times of the year. It was besieged by the French in the year 1793, but by the brave resistance of the governor and garrison, assisted by the English, with gun-boats, &c. the besiegers were compelled to retire with great loss; 12 miles S.W. of Dort. N. lat. 51° 41′. E. long. 4° 18′.

WILLENBERG, or WILDENBERG, a town of Prussia, in the province of Oberland; 93 miles S. of Königsberg. N. lat. 53° 11′. E. long. 20° 53′.

WILLERING, a town of Austria, on the Danube; 4 miles W. of Lintz.

WILLERSDORF, a town of Bavaria, in the bishopric of Bamberg; 5 miles S.W. of Forcheim.

WILLET'S BAY, a bay on the north-west coast of the island of St. Christopher, about a mile to the south-west of Dieppe Bay.

WILLIAM I., called "the Conqueror," king of England, and duke of Normandy, in *Biography*, was the natural son of Robert, duke of Normandy, by Arlotta, the daughter of a tanner, and born in 1024. When his father went on a pilgrimage to Jerusalem, and his son was only nine years of age, he caused the states of the duchy to swear allegiance to William, as his heir. On his return in 1033, Robert died; and the consequence was a variety of dissensions among the barons of the duchy, in which Henry I. of France took a part; so that when William arrived at majority, he found his dominions in a low and distracted state. But his vigour and exertions soon restored order and submission, and general tranquillity through his duchy. Edward the Confessor, at this time king of England, had no children; and the archbishop of Canterbury, who was a Norman, recommended his adopting William as his successor, and he was commissioned by the king to inform the duke of his intention. However, as he had not publicly divulged his purpose, Harold, the son of earl Godwin, ascended the throne without opposition, on his decease

in

in 1066. Harold, however, had previoufly taken a folemn oath to affift William in accomplifhing the purpofe of Edward refpecting the fucceffion; and his perfidy excited the indignation of William, and induced him to prepare for difpoffeffing Harold of the Englifh throne by force of arms. His intentions were no fooner announced than he was joined by a great number of military adventurers; and upon an appeal to Rome, the pope fanctioned the conteft, and fent him a confecrated banner. Thus encouraged, he affembled a fleet of 3000 veffels, and an army of 60,000 men; and determining on invading England, landed on September 28, 1066, at Pevenfey, in Suffex. Harold, as foon as he received this intelligence, marched from York, and having recruited his forces at London, haftened to encounter the Normans, who were encamped near Haftings. On the 14th of October the two armies engaged, and after a fevere battle, which lafted during a whole day, the Englifh were defeated, with the lofs of Harold and his two brothers. William loft no time in availing himfelf of this victory; but having reduced the town and caftle of Dover, and received the fubmiffion of the Kentifh men, proceeded towards London. In his way he was met by Edgar Atheling, who had been proclaimed legal heir to the monarchy, Stigand, archbifhop of Canterbury, and fome of the principal nobility, who made an offer to him of the crown; and on Chriftmas-day, 1066, after a kind of tumultuous election, he was crowned at Weftminfter-abbey by the archbifhop of York, and took the coronation-oath. Having adopted meafures for conciliating his fubjects, and overawing thofe who were adverfe to him, he re-croffed the fea to Normandy, taking with him as hoftages Edgar, the primate, and feveral of the principal nobility. Soon after his departure, the Englifh were treated contumelioufly and oppreffively by the Normans, whofe conduct excited infurrections, and led to a confpiracy for the maffacre of all who remained in the country. This intelligence occafioned William's return in December 1067; and among other meafures of a more conciliatory nature, he imprudently renewed the tax called "danegelt," which excited infurrections through various parts of the kingdom. As foon as thefe infurrections were fuppreffed, his queen, Matilda, was crowned at Weftminfter: but new troubles arofe from the union of the two principal nobles, Edwin and Morcar, with the kings of Scotland and Denmark, and the prince of North Wales, which threatened an extenfive revolt. The confpiracy for this purpofe was difcovered and crufhed, and meafures were taken for preventing the evils that were likely to refult from it. From this time William's government became daily more and more defpotic; and the nobility of the country, perceiving that their ruin was the object of his contemplation, prepared to leave the kingdom. Infurrections broke out in various parts of the country, and the means which he adopted for fuppreffing them were in the higheft degree rigorous and deftructive. As a meafure of future prevention, he brought from Normandy the feudal conftitution into England, and divided moft of the lands into baronies, which he granted to the moft confiderable of his followers, under the condition of certain fervices and payments; and thefe fubdivided their fhares on fimilar tenures, among others, chiefly foreigners, of inferior rank. The ecclefiaftical property of the kingdom was regulated upon a fimilar fyftem; and under various pretences, the Normans fuperfeded the Englifh in the poffeffion of all church dignities. In order to favour this expulfion of the Englifh dignitaries, a legate from the pope was, for the firft time, admitted into this country, and a reverence for the fee of Rome, fimilar to that which fubfifted on the continent, was inculcated on all Britifh fubjects; whilft the king took care, by referving certain powers to himfelf, to guard the civil fovereignty againft papal ufurpations. In order further to fubjugate the minds of the Englifh, and reduce them to the ftate of a conquered people, the king projected the abolition of their language; and by admitting at court no other language befides the French, he caufed all the youth in the fchools of the kingdom to be inftructed in it, and the laws to be drawn up in that language, which was alfo ufed in all judicial pleadings and writings.

Having fuppreffed an infurrection which broke out in 1071 by the inftigation of the earls Edwin and Morcar, and in the following year negotiated a peace with Malcolm, king of Scotland, he was called to Normandy in 1073, on occafion of a revolt in that country. In 1075 his prefence was neceffary in England to check a confpiracy among the Norman barons, whom he had diftinguifhed by his favour, and who were joined by Waltheof, an Englifh nobleman, on whom he had beftowed his niece Judith. Waltheof, in this confpiracy, fell a facrifice to the treachery of his wife. In the following year, *viz.* 1076, the haughty and ambitious Hildebrand, who was now pope Gregory VII., required William to do homage for his kingdom to the holy fee, alleging a promife to this purpofe, and alfo to pay the accuftomed Englifh tribute. William denied his promife of homage, which he refufed to render, but remitted to Rome the Peter-pence; and whilft he would not allow the Englifh prelates to attend a general council fummoned by Gregory, he permitted the pope's legate to convene a fynod at Winchefter for eftablifhing the celibacy of the clergy. On his return to Normandy in this year, he found the country engaged in a civil war, in confequence of a rebellion excited by his fon Robert. On this occafion the father and fon had a perfonal encounter; but when the fon difcovered that he was thus engaged, he was ftruck with horror, fell at his father's feet, and implored forgivenefs. The father was at firft unrelenting; but they were afterwards reconciled. About the year 1081, William ordered that furvey of the landed property of the kingdom to be made which is recorded in Domefday-book. (See Domesday. For an account of the impolitic as well as cruel manner in which he indulged his paffion for the chace, we refer to the article Forest.) The latter years of his life furnifhed various occafions of affliction and difquietude. The death of his queen Matilda, to whom he was affectionately attached, was an event that took place in 1083, and was the caufe of undiffembled forrow and lamentation. The preparations made by the king of Denmark and the earl of Flanders for an invafion of England occafioned to him no fmall degree of anxiety: and when he was refcued from this danger by the death of the Danifh king, he was called into Normandy in 1086, to repel the incurfions of fome French barons; and fufpecting that the king of France had inftigated them to thefe acts of hoftility, he commenced a war againft him in 1087, in the profecution of which he even laid wafte the country at the approach of harveft by the moft cruel devaftation. But an accidental injury which he received in mounting his horfe ftopped his career, and terminated in his death. Alarmed by the near profpect of diffolution, his mind was haraffed with remorfe in the review of the atrocious conduct with which he was chargeable, and he fought relief by donations to the church, to which perfons of his character have commonly reforted, and by the pardon and releafe of fome of his enemies. By his laft teftament he bequeathed to his eldeft fon Robert the counties of Normandy and Maine, and to his fecond fon William, the crown of England, and to his third fon, Henry, the property of his mother. He expired at the abbey of St. Gervais, near Rouen,

Rouen, on September 9, 1087, in the 63d year of his age, and the 21ſt of his reign over England, leaving five daughters, as well as ſons. "William the Conqueror at his death," ſays one of his biographers, "was the moſt powerful and greateſt ſovereign of his time. He poſſeſſed ſuperior talents, political and martial, and employed them with ſingular vigour and induſtry. But his paſſions were ſtrong, his diſpoſition was ſevere and mercileſs, and his ambition and love of rule cauſed him to diſregard all reſtraints of juſtice and humanity. There never was a more fortunate uſurper of a throne, which he tranſmitted to a long and ſtill ſubſiſting line of deſcendants; and the eſtabliſhment of his dynaſty is the moſt conſpicuous era of Engliſh hiſtory." Rapin. Hume. Henry. Lyttleton. Gen. Biog.

WILLIAM II., ſurnamed *Rufus*, ſecond ſon of the Conqueror, and king of England by his father's nomination, was crowned at Weſtminſter in September 1087, and recognized as king when he was about 27 years of age. His brother Robert ſucceeded to the dukedom of Normandy by the diſpoſition of his father, which proved the occaſion of much diſcontent and conteſt; partly becauſe the great barons poſſeſſed eſtates both in England and Normandy, and under ſeparate governments; and partly becauſe Robert was the eldeſt ſon, and the moſt popular. A conſpiracy was ſoon formed by the maternal brothers of the late king, in which many nobles concurred for depoſing William. But William, poſſeſſing a certain portion of his father's vigour, took meaſures for defeating them. With this view he conciliated the native Engliſh, took poſſeſſion of the caſtles and perſons of the unfortunate barons, baniſhed them to Normandy, and beſtowed their eſtates on his faithful adherents. When he was firmly ſeated on the throne, he forgot his promiſes of relieving the Engliſh from oppreſſion, and even enhanced the ſeverity of the foreſt laws. The death of Lanfranc, whom he reſpected, left him at liberty to ſeize vacant biſhoprics and abbeys, and to beſtow church lands on his captains and favourites. In 1090 he viſited Normandy with hoſtile intentions reſpecting his brother; but a negociation took place, and they were reconciled. Robert accompanied William to England, and commanded an army which was ſent againſt Malcolm, king of Scotland. But a variance ſoon took place between the brothers, occaſioned by the encroaching and treacherous diſpoſition of William, which led him to excite the Norman barons to rebel againſt Robert. Whilſt William was proſecuting hoſtile meaſures againſt his brother, he was recalled to England in 1095, to ſuppreſs a conſpiracy among the barons in the north, whom he ſpeedily defeated and ſeverely puniſhed. The ſpirit of cruſading having at this time pervaded Europe, Robert was ſeized with the mania, and mortgaged his dukedom to William for 10,000 marks, in order to enable him to unite with the cruſaders in 1096. William, having gone over to the continent to take poſſeſſion of Normandy and Maine, was taken extremely ill, and apprehending danger, reſolved to repair the injury which he had done to the church, and to ſupply the vacancy of the archbiſhopric of Canterbury, which had continued from the death of Lanfranc. The eccleſiaſtic nominated on this occaſion was Anſelm, who, notwithſtanding the diſinclination he had manifeſted againſt accepting the appointment, was afterwards a zealous defender of the rights of the church, and of eccleſiaſtical authority in general. The king and the primate ſoon diſagreed; and though a ſynod was aſſembled for the depoſition of the archbiſhop, the king failed in the attempt. But when Anſelm deſired permiſſion to leave the kingdom, he obtained leave; but his temporalities were ſeized, and the pope received him as a confeſſor in the cauſe of religion. William's French acquiſitions were the occaſion of trouble to him; for whilſt he was hunting in the New Foreſt, he received information that the citadel of Maine was beſieged, and he therefore haſtened to Dartmouth, and determined to embark without delay. As the weather was tempeſtuous, the mariners expreſſed ſome apprehenſion of danger; the king, however, was reſolute and perſevering, and aſked them if they had ever heard of a king who was drowned. Having accompliſhed his object, he was applied to by the duke of Guienne, who was under the influence of the paſſion for cruſading, for the loan of a ſum of money, as a mortgage on his rich provinces of Guienne and Poitou. William accepted the propoſal; but whilſt he was preparing to carry over the money, and to take poſſeſſion of the provinces, he was accidentally killed in the New Foreſt. Having alighted from his horſe after a chaſe, a ſtag ſprung up near him; and a French gentleman, Walter Tyrrel, perceiving the animal, ſhot off an arrow, which glancing from a tree, entered the king's breaſt, and penetrated to the heart. Tyrrel immediately fled, and embarking for France, joined the cruſaders. The king's body was found by the country people, and interred without ceremony at Wincheſter. This happened on Auguſt 2, 1100, when the king was in the 40th year of his age, and the 13th of his reign. The character of William Rufus has been unfavourably repreſented, both on account of the depredations which he committed in the church, and of his indifference to religion. "The incidents of his reign," ſays a biographer, "prove him to have poſſeſſed vigour and deciſion, courage and policy; but to have been violent, perfidious, and rapacious, and void of all ſenſe of juſtice and honour. One of his beſt public acts was the ſending Edgar Atheling into Scotland, to reſtore prince Edgar, ſon of Malcolm, to the throne of that kingdom, of which he was the lawful heir. He deſerves to be regarded as a promoter of the uſeful arts by his ſtill-remaining erections of the Tower, London-bridge, and Weſtminſter-hall." Gen. Biog.

WILLIAM III., king of England, prince of Orange, and ſtadtholder of Holland, was the poſthumous ſon of William II., prince of Orange, and of Mary, daughter of Charles I., king of England, and born on November 14, 1650, at a very intereſting period. His guardianſhip was divided between the princeſs-royal his mother, the princeſs-dowager his grandmother, and the elector of Brandenburg. During the negociations that ſucceeded the naval war between the Engliſh and Dutch republics, Cromwell, the protector, ſtipulated, that the prince of Orange, who was a branch of the houſe of Stuart, ſhould be for ever excluded from the ſtadtholderate; but on the event of the Reſtoration, the princeſs-royal petitioned, in 1662, that her ſon might be inveſted with the offices and dignities which belonged to his anceſtors; and ſoon after the act of excluſion againſt him was annulled. Although the ſtates of Holland would not admit, as a condition of peace in the ſucceeding war between England and the United States, the preliminary propoſed by Charles II. of elevating the prince to the ſtadtholderate, they formally adopted him as "a child of the ſtate," and placed him under the care of perſons who ſhould inſpire him with principles ſuited to his ſituation under a free government. After ſome ſubſequent debates concerning the rank which ſhould be aſſigned him, he was raiſed in 1670 to the dignity of firſt noble of Zealand, and then admitted into the council of ſtate. On occaſion of the war, which was declared by Lewis, and his penſioner Charles, againſt the United States in 1672, the public voice obliged the magiſtracy of Holland to revoke the perpetual edict procured by De Witt for aboliſhing the ſtadtholder-

ate,

ate, and to confer that dignity with all its prerogatives upon William. Thus authorized by the States to change the regency in all the moft confiderable towns of Holland and Zealand, party oppofition was extinguifhed, and every propofal for the defence of the country was unanimoufly adopted. The prince, at this early age, fully juftified the confidence that was repofed in him by the firmnefs and elevation of his mind. At an extraordinary affembly of the ftates, he pointed out, in an elaborate fpeech, the pernicious confequences that muft refult from the "peace propofed by the French king, who was in poffeffion of three of the provinces; he fhewed the poffibility of raifing fupplies for a war in defence of their religion and liberty; and by the cool intrepidity of his manner and force of his arguments, he produced fuch an effect upon his before-defponding audience, that they concurred in the refolution of making every facrifice, rather than defert the caufe of their country. Vigorous meafures were entered upon; foreign alliances were formed; fortunate circumftances prevented the further advance of the French, who evacuated the province of Utrecht; Charles II. was obliged by his parliament to make peace, in 1674, with the Dutch, who in the fame year figned feparate treaties with the bifhop of Munfter and the elector of Cologne; and at length the three conquered provinces were re-united to the States General; and the conduct of the prince of Orange fo much ingratiated him with the ftates of Holland, that the offices of ftadtholder and captain-general were declared hereditary in his male line." In all his military actions, he difplayed both courage and wifdom; fo that the prince of Condé teftified in his favour, that at the battle of Seneff, "he had in every point acted like an old captain, except in venturing his life too like a young foldier." The humiliation of the French king feems to have been his favourite object; and with this view he wifhed to fix the Englifh court in the fame intereft. This was one motive which induced him to connect himfelf more clofely with the royal family, by a marriage with Mary, eldeft daughter of the duke of York. Accordingly he came into England in 1678, and then the nuptials took place which were fo fatisfactory to the nation, and which were afterwards followed by the moft important confequences. Without enlarging on the meafures purfued by the prince on the continent, we fhall direct our attention to thofe in which our own country was more immediately interefted. The fucceffion of the prince's father-in-law to the crown of England in 1685, inftead of ftrengthening the bonds of affinity by which they were attached to one another, ferved only to feparate them more widely. The king was a bigotted papift, and the prince was regarded as a great fupporter of the Proteftant caufe on the continent, and therefore they could not cordially concur in their views and operations. King James, whofe object was to render the Catholic religion predominant, began with endeavouring to procure for it a free toleration in Great Britain, by a repeal of the penal laws and the teft-act; and in order the more effectually to accomplifh his purpofe, he ftrongly folicited the prince of Orange to exprefs his concurrence and that of the princefs; but as they knew how unpopular the defign was in England, they refufed to grant it. About this time Lewis XIV., under the impulfe of his own bigotry, and that of thofe with whom he acted, repealed the edict of Nantes, which had fecured the privileges of his Proteftant fubjects; and by his harfh treatment of them, drove numbers of them out of his dominions, and thus excited a dread and hatred of popery through all Proteftant countries of Europe. The effect of this meafure with regard to the prince of Orange was, that it fufpended all party oppofition to him in Holland, and gave him additional importance in Europe, as the determined foe of French ambition. The arbitrary proceedings of king James alarmed all the friends of civil liberty, and of the eftablifhed religion in England; and apprehenfive of danger, they directed their views to the prince of Orange as their deliverer. Accordingly conferences were held with a confidential envoy whom he fent over to afcertain the public opinion; applications were made to the prince by feveral perfons of rank; and at length, when the birth of a prince of Wales difappointed all hopes of a Proteftant fucceffion, the leading men of different parties concurred in actually inviting him to come over, and to undertake the protection of the church and conftitution from threatening ruin. The prince confented, and with confummate prudence and fecrecy prepared for the interefting expedition; and as exifting circumftances afforded a profpect of a breach between the United States and their allies, and the king of France, he was thus enabled to augment the Dutch forces by fea and land without fufpicion. Having previoufly difperfed through the kingdom a declaration, ftating the grievances of the reign, and announcing his intention of bringing over an armed force to defend the nation from tyranny, and to procure the affembling of a free parliament, he put to fea in October 1688, with a fleet of about 500 veffels, and an army of 14,000 men. He was once driven back by a ftorm, but a fecond attempt fucceeded, fo that he gained the Englifh coaft without oppofition, (the king's fleet being windbound,) and on the 5th of November difembarked his troops at Torbay. Of the caufes, progrefs, and termination of the Revolution, we have given an account under the articles JAMES II. *of England*, and REVOLUTION. King William feated on the throne became fovereign of a powerful kingdom; but his tranquil poffeffion of the crown depended on a variety of circumftances which he could neither direct nor controul. The conflict of different parties was not eafily reftrained; nor were his difpofition and manners, which were cold and referved, notwithftanding all his excellent qualities, adapted to unite and conciliate the partifans of the old and new government. Amongft thofe who had taken an active part in the late meafures, or who had acquiefced during their progrefs, fome were diffatisfied with the total exclufion of James and his infant fon; and others could not approve the transfer of the crown by the will of the people. In Scotland, the appointment of William was the act merely of the whigs; and in Ireland, where the population was chiefly Catholic, the intereft of James was predominant. The church zealots in England were not pleafed with the tolerant principles manifefted by king William, and with the wifhes he expreffed for the comprehenfion of the diffenters. Thus circumftanced, the commencement of his reign was embroiled by the open oppofition and fecret intrigues of his enemies, and in the progrefs of it the collifion of parties was the occafion of much perfonal difquietude both to him and to the queen. His attention was for a confiderable time diftracted by the ftate of his native country, when war with France was renewed in 1689, by James's invafion of Ireland in the fpring of that year, when his intereft with the Catholics was powerful, and in which he was aided by the French king, and alfo by an infurrection of the Jacobite party in Scotland. Ireland feemed at this time to demand his principal exertions; for though marfhal Schomberg had been fent over in 1689 to oppofe the progrefs of the late king, little had been done to any important purpofe. Accordingly in the fummer of 1690, he embarked with a reinforcement for this country, and by the battle of the Boyne, in which Schomberg was killed,

he

he routed the Irifh army, and totally difperfed it. James abandoned the conteft, and fled precipitately to France, leaving the reduction of the ifland to William, which was completely effected in the following year. Whilft he was thus engaged in military operations, a party fpirit agitated his domeftic government. The convention parliament, confifting of whigs, who were his decided friends, dreaded monarchical power, and refufed to fettle upon him the crown revenue for life. Hence he was led to diffolve the parliament in difguft; but he foon found that the new parliament, in which the influence of the tories preponderated, though it readily indulged his defires with regard to the revenue, and voted liberal fupplies for the Irifh war, was compofed of perfons that were not real friends to the principles which placed him upon the throne. We fhall leave to the details of hiftory the events that occurred on the continent in the profecution of the war againft France; and proceed to obferve, that in the year 1695 he fuffered a fevere lofs by the death of queen Mary, who had proved herfelf an affectionate wife, and both faithful and zealous in promoting his intereft; nor was his attachment to her lefs ardent and fincere. The deceafe of Mary revived the hopes of the Jacobites, and they were bufy and active in forming confpiracies, not fcrupling to concert the atrocious plan of affaffinating the king. In 1697 peace with France was concluded at Ryfwick, and Lewis was reduced to the neceffity of acknowledging William as the lawful fovereign of Great Britain, and to make no future attempts for difpoffeffing him of his throne. The next conteft that engaged political parties at home related to the reduction of the military eftablifhment. King William, attached to a military life, and not very confident with refpect to his own fecurity on the throne, wifhed to retain a greater force than parliament was difpofed to allow; which was no more than 7000 men, who were to be all natives; fo that he was under a neceffity, though with great reluctance, of parting with his favourite Dutch guards. The next political object that engaged the king's attention was connected with the balance of power in Europe, and that was the fucceffion to the crown of Spain, upon the death of Charles II., who was in a declining ftate of health, and who had no iffue. In 1701 the king of Spain died, and left a teftament in favour of the grandfon of Lewis XIV., which will was accepted by the French king; and of courfe preparations were made by William and the Dutch for renewing the war with France. This meafure was further rendered neceffary by the death of James II. in the fame year, and Lewis's acknowledgment of his fon as king of Great Britain. On the meeting of the parliament at the end of this year, William made a fpeech on the ftate of affairs, on his own propofed conduct, and on the neceffity of mutual confidence between the crown and people. This fpeech was much applauded, and was anfwered by a very loyal addrefs. Thus was his reign, which had been diftinguifhed by its viciffitudes and trials, and by the extenfive and permanent benefits that refulted from it, drawing to its termination. A fall from his horfe gave a fhock to his enfeebled conftitution, and brought on a fever, the iffue of which he tranquilly expected; and he expired on the 8th of March, O.S. 1702, in the 52d year of his age, and 13th of his reign.

The character of king William has been varioufly delineated by political writers of different fentiments and difpofitions. All allow that he poffeffed confiderable political talents, and though in his military operations he was often unfuccefsful, few perfons exceeded him in his ability for repairing loffes, and making a good clofe of a campaign. Although, as we have before faid, his manners were cold and referved, he was not deftitute of fenfibility. The partifans of James, and thofe who difapproved of the Revolution, have cenfured his conduct in depofing his father-in-law; but public liberty and the welfare of a nation muft be ever regarded as paramount to private duties. He never fought power otherwife than for accomplifhing the important and beneficial ends to which his views were directed; and therefore he cannot be juftly charged with a culpable degree of ambition. Whatever may be the opinion of erroneous and interefted individuals of the jacobites and tories of more ancient or modern times, "he will ever be gratefully remembered," as one of his biographers fays, "by the United Netherlands, as the great founder of their freedom and independence; and will be honoured as the deliverer of the Britifh iflands from tyranny, civil and religious, as long as a due fenfe of the benefits of that deliverance fubfifts among their inhabitants."

Though the Jacobites in England would not allow that this prince had any mufic in his foul, Bonnet Bourdelot, in his "Hift. de la Muf. et de les Effets," fays, "that he had been informed by a friend, one of the attendants of the prince of Orange, afterwards king of England, that in the year 1688, the prince being then at the Hague, and, as may be fuppofed, deeply engaged in reflexions on the critical fituation of his affairs at that time, had three choice muficians to play to him whenever he found himfelf too much agitated and thoughtful."

William *of Naffau*, prince of Orange, and founder of the Dutch republic, was born in Germany in 1533, and defcended from Lutheran parents, though, being introduced into the fervice of Mary queen of Hungary, and afterwards of Charles V., he conformed to the Catholic religion. He was trained to military and civil employments of high rank; and as he had ample poffeffions in the Low Countries, he attained to the dignity of governor of the provinces of Holland, Zealand, and Utrecht, under the Spanifh government. His character is very highly drawn, and is faid to have combined magnanimity, prudence, bravery, equanimity in all fortunes, fingular penetration and fagacity, retentive memory, popular eloquence, and the art of conciliating men's affections. Upon the introduction of the inquifition by the bigotry of Philip II., a flame broke out in the Netherlands; and the prince of Orange, with the counts Egmont and Hoorn, did every thing in their power to reftrain the feverities exercifed on a religious account, and to induce the Spanifh court to recal cardinal Granvelle, to whofe influence folely they were owing; and in this effort they fucceeded in 1564. On occafion of the fanguinary meafures propofed in the councils of Philip, and carried into execution by the duke of Alva, the prince of Orange, the moderation of whofe temper caufed him to be fufpected, furrendered his employments, and retired with his family, in 1567, to his brother at Naffau. Alva, having arrefted counts Egmont and Hoorn, and occafioned them to be condemned and executed, cited the prince of Orange to anfwer charges of fedition and treafon that were preferred againft him; and on his non-appearance, his eftates were confifcated, and his eldeft fon, a ftudent at Louvain, was carried off into Spain. William, who about this time feems to have declared himfelf a Proteftant, levied an army with a view of penetrating into Brabant; but Alva's military fkill defeated his purpofe, and he was under a neceffity of difbanding his troops. Still determined on relieving his country, he made another application in 1571 to feveral Proteftant powers for fuccour, but they were all averfe from encountering the power of Spain. At length he obtained from the court of France fome fupplies of money, and was then enabled to fit out a fmall fquadron, which, in in 1572, took poffeffion of the port of Brill. This trivial fuccefs roufed the fpirits of the Netherlanders, and feveral places in Zealand and Holland declared for the Orange party. At length a convocation of nobles and deputies from the principal towns in Holland took place at Dordrecht, and forming themfelves into an independent ftate, chofe William for their chief. Convinced by the maffacre of the Proteftants in France, that it was in vain to expect affiftance from that quarter, he difmiffed his troops, and retired to Holland; and whilft Alva was exercifing his ufual feverities, the people of Holland and Zealand alone remained in arms againft the Spanifh government; and the prefence of William gave order and ftability to the new republic. Although the duke of Alva was recalled from his government in 1573, the caufe of independence was in a very precarious ftate. However, in 1574, the ftates of Holland and Zealand conferred on William the fovereign authority during the war, and formed a treaty of union and alliance with each other. Peace with the court of Spain could not be obtained otherwife than on terms which could not be accepted; and the afpect of affairs in 1576 was very difcouraging. At length, however, the death of Requefens, who had fucceeded Alva as governor, and the depredations to which the towns of Brabant and Flanders were expofed, favoured William in his efforts to accomplifh a general union of the provinces of the Low Countries for mutual defence; and this was effected by the treaty, called the pacification of Ghent. William was now juftly regarded as the true patron of public liberty. At the beginning of the year 1579, the duke of Parma being the Spanifh governor, the union of Utrecht was figned, which was the bafis of the confederation of the Seven United Provinces, all of which, by their deputies, concurred in forming it. When the feparation of the Catholic and Proteftant Netherlands took place, the latter, being diftreffed, fought the affiftance of France, by nominating, in 1580, the duke of Anjou, brother to Charles IX. king of France, for their fovereign, and renouncing their allegiance to Philip; but the adminiftration of Holland and Zealand was ftill entrufted with the prince of Orange. Philip, afcribing this meafure to William, iffued an edict of profcription againft him; in confequence of which his life was in danger, and an attempt was made to affaffinate him. At length he fell a victim to the fanaticifm of a native of Franche-Compte, who was urged forward by a Cordelier and a Jefuit, who, under pretence of bufinefs, obtained accefs to him, and fhot him through the body. He fell, and ejaculating "My God! have mercy upon me and thy poor people," inftantly expired, on July 10, 1584, having nearly completed his 52d year. He was interred with great honour and teftimonies of refpect, at Delft. He was four times married, and had iffue by each wife. His fecond fon, Maurice, fucceeded to his authority in the United Provinces. (See MAURICE.) William, having been educated in a court, acquired the manners and habits of a ftatefman, and was charged with diffimulation and proud ambition. But his objects were always pure and patriotic, and he zealoufly preferved the liberties of his country; and, though he has been traduced by the advocates of defpotifm, he has received the higheft tokens of refpect from a people who gratefully acknowledge him as the principal author of their freedom and independence. Univ. Hift. Gen. Biog.

WILLIAM *of Wykeham*, an Englifh prelate, was born in 1324, at Wykeham in Hampfhire, and by the liberality of a patron, educated at Winchefter fchool, and afterwards recommended to Edyngdon, bifhop of Winchefter, who introduced him into the fervice of king Edward III. about his 23d year. Acquiring extraordinary fkill in architecture, he was appointed in 1356 clerk of the king's works in two manors, and furveyor of the royal works at the caftle and in the park of Windfor. The king was fo highly fatisfied with his conduct in thefe fimilar departments, that he recompenfed him by feveral preferments, civil and ecclefiaftical. In 1359 he was nominated chief warden and furveyor of the royal caftles of Windfor, Leeds, Dover, and Hadlam, and of feveral other caftles, manors, and parks. Whilft he had only the clerical tonfure, he enjoyed many ecclefiaftical dignities; and, in order to his further advancement in the church, he was ordained prieft in 1362. In the following year he was made warden and jufticiary of the royal forefts fouth of Trent, and in 1364 keeper of the privy-feal. He was alfo chief of the privy-council, and governor of the great council; and befides other civil preferments which he enjoyed, he fucceeded Edyngdon, in 1366, as bifhop of Winchefter, which paved the way for his elevation to the poft of high-chancellor in 1367, of which latter dignity, however, he was divefted in 1370. Thus poffeffing ample means of munificence in a ftate of celibacy, and a liberal fpirit, his profeffion as an architect led him to repair and erect numerous buildings in his fee at an expence of no lefs than 20,000 marks. He alfo directed his attention to the improvement and proper difcipline of the religious houfes comprehended within his diocefe. For the better education of his clergy, he laid the foundation of a college in Oxford, which was to be fupplied with ftudents from a feminary at Winchefter. He was interrupted, however, in his liberal defigns of general utility by an impeachment for mifconduct in the adminiftration of public affairs, occafioned by the influence of the duke of Lancafter, who had conceived a prejudice againft him; and, in confequence of this impeachment, his temporalities were feized to the king's ufe, and he was banifhed from court. The clergy, however, interfered, and the people regarded him as a fufferer from the duke's exorbitant power; fo that a tumult enfued, that procured the reftoration of his temporalities, and his recovery of the royal favour, a little while before the king's death. During the turbulent reign of Richard II. Wykeham conducted himfelf with caution, and fucceeded in the eftablifhment of his two colleges. For that at Oxford he obtained a patent in 1379, and it was completed in 1386. It is now known by the name of the New college. His college or fchool at Winchefter was finifhed in 1393. He alfo undertook the repair of the cathedral, which was a Saxon edifice of the eleventh century, and in the courfe of ten years rebuilt it in the Gothic ftyle. (See WINCHESTER.) In 1384 he was induced, againft his inclination, to accept the office of high-chancellor, which he refigned again in 1391, after having reftored the public tranquillity. When the king recovered his authority, he procured a parliament in 1397, which impeached feveral of the commiffioners, who had almoft divefted him of his authority, of high treafon; but Wykeham, who was one of them, efcaped with a forced loan of 1000*l.* He attended the firft parliament of Henry IV. in 1399, which depofed Richard, but was not prefent at the council, which adjudged him to perpetual imprifonment. As his health declined, he was difabled from performing the duties of his office; and therefore nominated coadjutors in his bifhopric, fettled all his temporal and fpiritual concerns, and with tranquillity waited his difmiffion from the world. This happened in September 1404, when he had finifhed his 80th year. His remains were interred in his own chapel or oratory in Winchefter cathedral, where a tomb of white marble was erected to his memory. Lowth's Life of William of Wykeham. Biog. Brit.

WILLIAM, *Sweet*, in *Botany*. See DIANTHUS, and PINK.

WILLIAMS, DANIEL, D.D. in *Biography*, an eminent non-conformift divine, was born at Wrexham, in Denbighfhire, about the year 1643 or 1644. The difadvantages of his early education were counterbalanced by the natural vigour of his mind, and by future application. Devoting himfelf to the miniftry among Proteftant diffenters, he was one of the firft who had refolution to engage in it, after the privations and fufferings which followed the Act of Uniformity in 1662. At the age of 19 years he was admitted a preacher among the Prefbyterians, and for feveral years officiated occafionally in feveral parts of England. Being here in danger of perfecution, he accepted an invitation to become chaplain to the countefs of Meath in Ireland, where diffenters enjoyed a greater degree of liberty; and fome time afterwards he became paftor to a refpectable congregation in Wood-ftreet, Dublin. Here he continued for nearly twenty years, exercifing his miniftry with acceptance and ufefulnefs, and conducting himfelf fo as to maintain harmony with his brethren in the miniftry, and to fecure refpect and efteem from the Irifh Proteftants in general. During his refidence in Dublin, he married a lady of an honourable family, with a confiderable eftate. Towards the clofe of the reign of James II., his oppofition to popery rendered his fituation in Ireland unpleafant to him, and he therefore came over to England in 1687, and fettled in London. Here he joined thofe minifters who oppofed an addrefs to the king on occafion of his difpenfing with the penal laws; and by his firmnefs and intrepidity contributed in no fmall degree to their unanimous rejection of it. Out of his own funds, and by his wealthy connections, he procured relief for thofe Irifh Proteftants who fought refuge in London from the tyranny and perfecution of Tyrconnel. After the Revolution in 1688, which was an event that gave him and his brethren inexpreffible fatisfaction, he was often confulted by king William on Irifh affairs; and his reports concerning the abilities and character of Irifh refugees, who were capable of ferving the government, were duly regarded. On occafion of his vifit to Ireland, in the year 1700, for fettling his own affairs, his conduct in the inftances now fpecified was gratefully acknowledged. Towards the latter end of the year 1688, he was unanimoufly chofen paftor to a numerous congregation of Prefbyterians in Hand-alley, Bifhopfgate-ftreet; and in this connection he fpent the remainder of his days, devoting to charitable purpofes the falary which he received from his congregation. With the famous Richard Baxter he cultivated an intimate acquaintance; and at his death, in 1691, he was chofen to fucceed him at the Merchants' Tuefday lecture in Pinners'-hall. Some of his fellow-lecturers advanced what he conceived to be Antinomian tenets; and thefe dangerous notions he thought it to be his duty to oppofe. Hence arofe a fufpicion of his orthodoxy, and an attempt to exclude him from the lecture. Their defign was fruftrated by a majority of the fubfcribers; but as their oppofition was inveterate, it was thought moft advifable to feparate and to eftablifh another Tuefday lecture at Salters'-hall. Three of the moft refpectable of the old lecturers, *viz.* Dr. Bates, Mr. Howe, and Mr. Alfop, feceded with Mr. Williams.

Upon the publication of the works of Mr. Crifp, who avowed himfelf the champion of Antinomianifm, Mr. Williams undertook to refute them; and in 1692 publifhed his "Gofpel Truth ftated and vindicated, &c." 8vo.; a work which, though now almoft forgotten, was defervedly approved by the principal London minifters of that period; and as it is diftinguifhed by great clearnefs and ftrength of argument, as well as a truly Chriftian temper, it ferved to check the pernicious errors which were then induftrioufly circulated. It was defended by the author in his "Defence of Gofpel Truth, &c." 8vo., and in a "Poftfcript" to a new edition of his work, and alfo in other pieces. Againft the charge of Socinianifm, an appeal was made to Dr. Stillingfleet, then bifhop of Worcefter, and Dr. Jonathan Edwards of Oxford, who were deemed mafters and judges in this controverfy; and they honourably acquitted the author, with many expreffions of refpect for him. Difappointed in their efforts to induce fufpicion of his orthodoxy, his enemies indulged their malignity further by arraigning the purity of his morals. Indignant as he well might be at this attack, he fubmitted his conduct to the inveftigation of the United London Minifters, who concurred in the report of their committee, "that he was entirely clear and innocent of all that was laid to his charge." The attachment of his congregation, it fhould be obferved, was not in the leaft degree diminifhed by the malignant mifreprefentations of his enemies.

In the year 1701, Mr. Williams, after having been for fome time a widower, married a fecond wife of confiderable fortune and diftinguifhed worth, who furvived him.

During the reign of queen Anne he exerted himfelf, though ineffectually, in oppofing the bills againft occafional conformity, and for impofing the facramental teft upon the diffenters in Ireland. In 1707 he ufed all his influence with his friends in Scotland in promoting the union between the two kingdoms; and in the year 1709 he was honoured with the degree of D.D. by the univerfities of Edinburgh and Glafgow. Availing himfelf of his long acquaintance with the earl of Oxford, he took the liberty of remonftrating againft the political meafures which he was purfuing. The doctor's franknefs did not pleafe the ftatefman; and his refentment againft him for declaring unfavourable fentiments of the meafures of his adminiftration, and communicating them to his friends in Ireland, was deep and permanent. Upon the acceffion of king George I., he had the honour of prefenting an addrefs of congratulation to his majefty, at the head of the Proteftant diffenting minifters of the different denominations refiding in London and its vicinity; and it has been ever fince the cuftom for the body of fuch minifters to prefent addreffes on all public occafions, and they have the honour, as a body, of being received on the throne, and by their committees in the clofet, and of receiving a written anfwer. Soon after the acceffion of George I., the health of Dr. Williams began to decline; and at length an afthmatic diforder terminated his life on January 26, 1715–16, in the 73d year of his age. In the fequel of this article we fhall take advantage of literally tranfcribing the well-written account given of Dr. Williams by the Rev. Mr. Morgan, the highly refpectable and much efteemed librarian of the excellent inftitution which he has eftablifhed; under whofe infpection and care this library is gradually rifing into a reputation, which, by the contributions of its friends in books and money, and by the annual appropriation of a fmall fum out of the furplus of its founder's bequefts, will vie with the principal eftablifhments of a fimilar nature in the city of London.

"He had been bleffed by nature," fays our biographer, "with a ftrong and vigorous conftitution, and poffeffed a found penetrating judgment, and great ftrength of memory. The fubjects of his pulpit performances were always practical and ufeful; his fentiments folid, pertinent, and diftinguifhed by an uncommon variety; and his manner of enforcing them powerful and impreffive. He was remarkable for his boldnefs and courage in avowing and defending what he he conceived to be truth of importance, and 'pursued what he thought right with a blunt integrity and unſhaken reſolution.' At the ſame time his candour towards thoſe who differed from him, his kind treatment of perſons who had endeavoured to injure his own reputation, and his conſcientious tender regard for that of others, were prominent features in his character. He was a ſteady non-conformiſt upon principle; yet he maintained a charitable diſpoſition towards the eſtabliſhed church, and at the Revolution was very deſirous of promoting the ſcheme of a *comprehenſion*. Though he poſſeſſed an ample fortune, he exerciſed great frugality in his perſonal expences, for the noble purpoſe of being more uſeful to others who ſtood in need of aſſiſtance, and of more effectually ſerving the great intereſts of truth and virtue. The ſame laudable views governed him in the final diſpoſal of his property. By his laſt will, beſides liberal benefactions to numerous benevolent and charitable inſtitutions in London and Dublin, he provided for the ſupport of an itinerant preacher to the native Iriſh, of two perſons to preach to the Indians in North America, and of ſeveral charity-ſchools in England and Wales. He directed that a certain fixed ſum, from the income of his eſtates, ſhould be appropriated to the aſſiſtance of poor miniſters, the widows of poor miniſters, ſtudents for the miniſtry, and to other benevolent purpoſes. He alſo left eſtates to the univerſity of Glaſgow, which at preſent furniſh handſome exhibitions to ſix ſtudents for the miniſtry among Proteſtant diſſenters in South Britain, who are to be nominated by his truſtees. The laſt grand bequeſt in his will was for the eſtabliſhment of a library in London, for the benefit of the public. Having formed this deſign, he purchaſed Dr. Bates's curious collection of books, which he added to his own, and directed his truſtees to provide a proper building for their reception. Such an edifice was erected by them in Red-Croſs-ſtreet, Cripplegate, where the library was opened in 1729, and admiſſion to it is eaſily obtained by perſons of every deſcription, without any exception, upon application to one of the truſtees. Since it was firſt eſtabliſhed, very conſiderable additions have been made to it by legacies, as well as gifts of money and books; and it now contains upwards of 16,000 volumes, many of which are very valuable and rare, in the various departments of literature and ſcience. The founder's works were collected together, and printed at different periods, in 6 vols. 8vo.; the laſt conſiſting of Latin verſions of ſeveral of his tracts, which he directed to be publiſhed in that language for the uſe of foreigners." Memoir prefixed to his Works.

WILLIAMS, in *Geography*, a townſhip of Pennſylvania, in Northampton county, with 1243 inhabitants; 60 miles N. of Eaſton.

WILLIAM'*s Port*, a town of Maryland, on the Potomack; 5 miles S.W. of Hagars Town.

WILLIAM'*s River*, a river of Vermont, which runs into the Connecticut, N. lat. 43° 10'. W. long. 72° 24'.

WILLIAMSBOROUGH, a poſt-town of North Carolina, on a creek which falls into the Roanoke; 48 miles N.E. of Hillſborough.

WILLIAMSBURG, a county of the ſtate of South Carolina.—Alſo, a county of the ſtate of Virginia.—Alſo, a town of Virginia, ſituated on an iſthmus between York river and James river, a creek from each river coming up within a mile of the town, but not navigable for large veſſels. It was at one time the ſeat of government and reſidence of the governor, now removed to Richmond. It contains about 200 houſes, and 1200 inhabitants. The principal buildings are a college and town-houſe, an epiſcopal church, and an hoſpital for lunatics; 50 miles E.S.E. of Richmond. N. lat. 37° 13'. W. long. 76° 50'.—Alſo, a town of Maſſachuſetts, in Hampſhire, with 1122 inhabitants; 8 miles N.W. of Northampton.—Alſo, a town of New York, on the Geneſee; 288 miles N.N.W. of Philadelphia.—Alſo, a town of the ſtate of Ohio, on the Little Miami, in the county of Clermont, with 1251 inhabitants.—Alſo, a town of Maryland; 4 miles N. of Talbot.

WILLIAMSBURG, or *Joneſtown*, a poſt-town of Pennſylvania; 23 miles E.N.E. of Harriſburg.

WILLIAMSON, a townſhip of Ontario county, in New York, 206 miles from Albany, bounded N. and W. by lake Ontario. In 1810 the whole population conſiſted of 1139 perſons, and it had 55 ſenatorial electors. A red oxyd of iron is found in this town, which is a good pigment for painting.

WILLIAMSON, a county of Weſt Tenneſſee, with 13,153 inhabitants, including 3985 ſlaves.

WILLIAMSPORT, a poſt-town of Pennſylvania, on the weſt branch of the Suſquehanna, in the county of Lycoming, with 344 inhabitants.

WILLIAMSTOWN, a townſhip of the ſtate of Vermont, in Orange county, with 1353 inhabitants; 60 miles N. of Norwich.—Alſo, a poſt-town of North Carolina, on the Roanoke; 55 miles W. of Halifax.—Alſo, a town of Maſſachuſetts, in the N.W. corner of the ſtate, in the county of Berkſhire, with 1843 inhabitants; 132 miles W.N.W. of Boſton.—Alſo, a poſt-townſhip of Oneida county, in New York, erected in 1805, from a part of Mexico, and conſiſting of two townſhips of Scriba's patent, each being ſix miles ſquare. The population in 1810 conſiſted of 562 perſons, and 82 ſenatorial electors. The poſt-office was eſtabliſhed in 1812.

WILLICHIA, in *Botany*, was ſo called by Mutis, after Dr. Chriſtian Lewis Willich, a phyſician at Clauſthal, in Lower Saxony, who publiſhed at Gottingen, in 1747, 1762, and 1766, various obſervations and illuſtrations of Botany, of more or leſs importance, chiefly relating to the determination of ſpecies and their ſynonyms, with curſory remarks on variations or irregularities of ſtructure, exceptions to received characters, &c. The author died in 1776. —Linn. Mant. 553. Schreb. Gen. 32. Willd. Sp. Pl. v. 1. 189. Vahl Enum. v. 2. 39. Mart. Mill. Dict. v. 4. Juſſ. 418. Poiret in Lamarck Dict. v. 8. 798.—Claſs and order, *Triandria Monogynia*. Nat. Ord. uncertain, Juſſ. We ſhould preſume *Scrophulariæ*.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, in four ovate, acute, ſpreading, permanent ſegments. *Cor.* of one petal, wheel-ſhaped, twice the length of the calyx: tube ſcarcely any: limb flat, in four roundiſh, convex ſegments. *Stam.* Filaments three, inſerted into the clefts of the limb, except the lowermoſt, and ſhorter than its ſegments; anthers erect, roundiſh, of two cells. *Piſt.* Germen ſuperior, roundiſh, compreſſed; ſtyle thread-ſhaped, the length of the ſtamens, declining towards the lower cleft of the corolla; ſtigma obtuſe. *Peric.* Capſule roundiſh, compreſſed, ſharp-edged, of two cells and two valves, with an oppoſite partition. *Seeds* ſeveral, roundiſh, minute. *Receptacle* globular, formed of two hemiſpheres.

Eſſ. Ch. Calyx four-cleft. Corolla four-cleft. Stamens in three of its clefts. Capſule ſuperior, of two cells, with many ſeeds.

1. W. *repens*. Creeping Willichia. Linn. Mant. 558. Willd. n. 1. Vahl n. 1.—Gathered in Mexico, by Mutis, whoſe deſcription, communicated to Linnæus, is our only ſource of information concerning this plant. The *root* is fibrous, annual. *Stem* herbaceous, creeping, thread-ſhaped, branched, hairy, about two feet in length. *Leaves* alternate, ſtalked, rather diſtant, orbicular, ſomewhat peltate, crenate,

crenate, hairy, an inch in diameter; reddiſh underneath. *Footſtalks* very long, hairy, thicker than the ſtem. *Flower-ſtalks* axillary, in pairs, ſingle-flowered, thread-ſhaped, hairy, the length of the footſtalks. *Flowers* ſmall, roſe-coloured, with a hairy *calyx*.

There is no ſpecimen in the Linnæan herbarium.

WILLIESBURG, in *Geography*, a poſt-town of Virginia; 243 miles S.S.W. of Waſhington.

WILLIMANTIC, a river of Connecticut, which runs into the Shetucket at Windham.

WILLINCK, a large townſhip of New York, at the S. end of Niagara county, erected in 1808; 315 miles W. of Albany. It compriſes about eighteen townſhips of the Holland company lands. The general character of the ſoil is, that it is good land for farming. In 1810 the population conſiſted of 2028 perſons, and there were 260 ſenatorial electors.

WILLING'S CREEK, a river of Weſt Florida, which runs into the Miſſiſſippi, N. lat. 30° 49′. W. long. 91° 21′.

WILLINGBOROUGH, a town of New Jerſey, in Burlington county, with 619 inhabitants; 14 miles N.E. of Philadelphia.

WILLINGTON, a town of Connecticut, in Tolland county, with 1161 inhabitants; 6 miles E. of Tolland.

WILLIS, BROWNE, in *Biography*, an eminent antiquary, the grandſon of Dr. Willis, a celebrated phyſician, was born at Blandford in 1682, and was removed from Weſtminſter-ſchool in the year 1690 to Oxford, where he was admitted a gentleman-commoner of Chriſt-church; and after leaving the univerſity he proſecuted his ſtudies for three years under Dr. Wotton. When he came into poſſeſſion of the family eſtate, he was returned in 1705 as a repreſentative for the town of Buckingham. In 1715 and 1716 he publiſhed two parts of a work, intitled "Notitia Parliamentaria; or, a Hiſtory of the Counties, Cities, and Boroughs in England and Wales, with Liſts of all the Knights, Citizens, and Burgeſſes," 8vo., to which in 1750 he added a third part, being an appendage to the journals of the houſe of commons, then printed. On the revival of the Society of Antiquaries in 1717, he was choſen a member; and he ſuſtained his reputation as an antiquary by various writings, among which are, "Surveys of the Four Welſh Cathedrals;" "Hiſtory of the United Parliamentary Abbeys and Conventional Cathedral Churches;" "Survey of the Cathedrals of England, with Parochiale Anglicanum," 3 vols. 4to.; "Hiſtory and Antiquities of Buckingham." In 1723 he received, in conſideration of his literary merit, from the univerſity of Oxford, the degree of A.M. by diploma. He manifeſted his attachment to the church by expending conſiderable ſums in repairing thoſe in the country, and thus injured his own fortune. But frugality in his perſonal and domeſtic expences compenſated this injury. He poſſeſſed a fine cabinet of Engliſh coins, which in 1741 he preſented to the univerſity of Oxford; the univerſity, in conſideration of his family, liberally paying for thoſe of gold by weight, and conferring upon him the degree of LL.D. With many peculiarities in his character, he claimed reſpect as a man of moral worth from thoſe who knew him. To him belonged the honour of having firſt placed the Engliſh eccleſiaſtical hiſtory and antiquities upon the firm baſis of records and regiſters, which he aſſiduouſly ſearched. He died in 1760, in the 78th year of his age. Biog. Brit.

WILLIS, THOMAS, an eminent phyſician, was born in 1621–2, at Great Bedwin, in Wiltſhire; and in 1636 admitted into Chriſt-church college, Oxford, where he took the uſual degree with a view to the clerical profeſſion. But he changed his purpoſe, and ſtudied phyſic, taking his bachelor's degree in 1646, and commencing medical practice at Oxford. He diſtinguiſhed himſelf by his ſteady attachment to the church of England, and alſo by his love of ſcience, ſo that he became one of the firſt members of that philoſophical ſociety at Oxford, which laid the foundation of the Royal Society of London. As a chemiſt, which was the character under which he was ambitious of excelling, he publiſhed in 1659 a work, intitled "Diatribæ duæ; prior agit de Fermentatione, altera de Febribus. His acceſſit Diſſertatio epiſtolica de Urinis." The recompence of his attachment to the cauſe of epiſcopacy and loyalty was the Sedleian profeſſorſhip of natural philoſophy at Oxford, conferred upon him after the Reſtoration, by the recommendation of archbiſhop Sheldon, ſoon after which he received the degree of doctor. Upon the eſtabliſhment of the Royal Society, he was one of its firſt members. In the year 1664, when he is ſaid to have diſcovered, and brought into uſe, the mineral water of Aſtrop in Northamptonſhire, he publiſhed his "Cerebri Anatome; cui acceſſit Nervorum Deſcriptio et Uſus." This work, on which his reputation principally depends, was followed in 1667 by his "Pathologia Cerebri et Nervoſi Generis, in qua agitur de Morbis convulſivis, et de Scorbuto." Before this year he was ſettled in London, and being nominated a phyſician in ordinary to the king, was advancing to the firſt rank in practice. His next publication was intitled "Adfectionum quæ dicuntur Hyſtericæ et Hypochondriacæ Pathologia Spaſmodica, vindicata contra reſponſionem epiſtolarem Nath. Highmori. Cui acceſſerunt Exercitationes Medico-Phyſicæ de Sanguinis Accenſione, et Motu muſculari," 1670. On occaſion of the loſs of his wife, a daughter of dean Fell, he amuſed himſelf by writing his work "De Anima Brutorum quæ Hominis Vitalis ac Senſitiva eſt; Exercitationes duæ," 1672, in which he conſiders the ſoul of brutes as the ſame with the vital principle in man, corporeal in its nature and periſhing with the body. After his ſecond marriage, he began to print in 1673 his "Pharmaceutice Rationalis, ſive Diatriba de Medicamentorum Operationibus in Humano Corpore;" but he did not live to publiſh this work, as he was carried off by a pleuriſy in 1675, at the premature age of 54, in the full vigour of his faculties and zenith of his reputation. Dr. Willis had no powers for appearing with advantage and brilliancy in ſociety; but he was intent on ſcience and practice, frugal, pious, and charitable. His works engaged great attention on their firſt publication; but in conſequence of modern improvements, they have ſunk in the public eſtimation, though they are not altogether neglected. They are written in a rich and elegant Latin ſtyle. Haller. Biog. Brit.

WILLIS, in *Geography*, a town of the ſtate of New Jerſey; 33 miles S.E. of Burlington.

WILLIS's *Creek*, a river of Virginia, which runs into James river, N. lat. 37° 40′. W. long. 78° 18′.

WILLIS's *Iſland*, a ſmall iſland in the South Atlantic ocean, near the north-weſt coaſt of the iſland of Georgia, ſo named by captain Cook, from one of his crew who diſcovered it in the year 1775. S. lat. 54°. W. long. 38° 23′.

WILLISAU, a town of Switzerland, and capital of a bailiwick, in the canton of Lucerne; 15 miles W. of Lucerne.

WILLISTON, a poſt-town of the ſtate of Vermont, in the county of Chittenden, with 1195 inhabitants; 25 miles N. of Newhaven.

WILLISTOWN, a townſhip of Pennſylvania; 15 miles S.W. of Philadelphia.

WILLMAR, a town of the county of Henneberg; 7 miles S.E. of Meinungen.

WILLOBOCKE, a river of Yorkſhire, which runs into the Swale.

WILLONGTALYS, a lake of Vermont. N. lat. 44° 45′. W. long. 71° 58′.

WILLOUGHBY, a town of England, in the county of Warwick, ſituated on a navigable canal, on the borders of Northamptonſhire; 14 miles S.E. of Coventry.

Willoughby *Bay*, a bay on the ſouth-eaſt coaſt of the iſland of Antigua. N. lat. 17° 10′. W. long. 61° 25′.

Willoughby *Lake*, a lake of the ſtate of Vermont.

WILLOW, &c., in *Botany*. See Salix.

Our common willows in the ſpring ſeaſon, when they are in flower, produce a quantity of cottony matter, which might be put to ſome uſe.

The Chineſe are induſtrious enough to collect this cotton as it falls from their willows; and the women and children, among the poorer people, card it, and pick out the ſeeds, and render it fit for many uſes in the place of cotton.

The poor people, in ſome part of the Indies, make a ſort of liquor of the flowers of their willows before they are opened, which intoxicates them very ſuddenly; and the dry huſks of the ſame tree remaining after the flowers and ſeeds are fallen, are wholeſome as food, people in time of famine having lived upon them, boiled in water.

The wood of the willow, though in itſelf very light and ſpongy, is yet of a nature to bear the injuries of wet better than almoſt any other kind. It is uſed by the Chineſe on this occaſion, in the making of their wells, and on all other occaſions where wood is to ſtand under water, and ſucceeds perfectly well. Obſerv. ſur les Coutumes de l'Aſie. For the uſes to which willow-bark and wood are applied, ſee Salix, and Gunpowder.

Willow, in *Agriculture*, a well-known tree, of which there are ſeveral different ſpecies or kinds; but thoſe moſtly cultivated for farm purpoſes are, the common white willow, the purple or red willow, the ſallow, and the broad-leaved or Huntingdon willow.

The firſt is a tall-growing tree, of the deciduous kind. It has a fine ſilvery appearance in the leaves; is quick of growth, and the wood is very uſeful where lightneſs and cleanneſs of the grain is beneficial, as for hurdles, gates, hop-poles, &c.

The ſecond is a free-ſhooting willow; but its wood is inferior for many uſes, eſpecially thoſe of the farmer.

The third ſort delights in a rather dry ſoil, being a tree below the middle growth. It has numerous branches, of a ſmooth appearance, and dark green colour. Its wood is very uſeful for hurdles and other ſimilar purpoſes of the farmer.

It has two varieties, the long-leaved, and the ſtriped ſallow, both which are very uſeful.

The fourth ſort, or red-hearted willow, is ſuppoſed by ſome as the beſt ſort for planting, for the uſe of the farmer, as growing quickly; but the great uſe to which they are applied is that of making hurdles, ſtakes, gates, and farming implements, being a wood uncommonly tough and light, owing, as is conceived, to a new method uſed in planting them cloſe to the ground. If it is the deſign of the planter to let them grow into timber, (which would be far ſuperior to deal for the purpoſe of flooring, or other light work, particularly as it will neither ſplinter nor fire; and if ſuffered to remain for twenty or twenty-five years, would make good maſts for ſmall craft, as they ſhoot up perfectly ſtraight, and without any collateral branches,) it is neceſſary, at the firſt or ſecond year's growth, to obſerve which pole is the ſtrongeſt, as the remaining poles muſt be cut away. In about fifteen years' time it is ſuppoſed they will want thinning; of courſe the inferior muſt be taken out and the ſuperior be ſuffered to remain.

In cultivating them on waſte moiſt lands, laying out the ground into lands, like hop-lands, as from three to four yards wide, with a ditch on each ſide; three feet wide at the top, one foot at the bottom, and two and a half deep, is adviſed by a late writer as the beſt mode from much experience. The earth that comes out of the ditch ſhould be thrown on the land. But if there is not fully ſufficient fall for the water to get off, the ditch ſhould be deeper and wider, till there is near a yard of earth above the level of the water. As ſoon as this is done, the ground muſt be double dug, that is, trenched two ſpades' depth, except it be very boggy, which will afford room for the plants to ſhoot, and will ſave the expence of weeding, which otherwiſe muſt be incurred in the firſt ſummer after the plants are ſet; for if they are not kept clear of weeds the firſt year, the hopes of the planter will certainly be deſtroyed.

In reſpect to the times of planting, they muſt be from January to the end of March; but the ſets for that purpoſe ſhould be cut from December to the end of February, when the ſap is down. And the reaſon is, that if poles are cut in the ſpring (the ſap being up), the ſtool will at leaſt be weakened by bleeding, if not killed; and of courſe prevented from ſhooting ſo vigorouſly as if cut at the preceding time.

In regard to the ſets or truncheons, they may be cut from twenty inches to two feet long; particular care ſhould be taken in the cutting, that the bark be not fridged or bruiſed, or in any other reſpect injured; for in that caſe the plant will be weak and puny.

The poles have been ſold at eight years' growth for 214*l.* *per* acre, net-money; the kids or bruſhwood pay for the felling. Had they been ſuffered to have ſtood two years longer, they would, it is ſaid, have produced 300*l.* *per* acre.

The plantation of the baſket and cooper's willow is an object of importance in thoſe waſte and neglected corners which are to be found upon every eſtate and farm.

The refuſe dwarf willows or offal, as it is termed, are uſed in the fiſheries and baſket-work, and will pay, *communibus annis*, for the labour. The cooper's-willow differs from the common or baſket-willow; the former is known by a ſingle bud or eye throughout the rod, which ſimply throws out a leaf; the latter by a double or flattened eye, which produces a branch or ſprig. The former is applicable to every purpoſe; the latter the cooper rejects: of courſe the former ſhould be propagated.

Plantations of the willow kind have been vaſtly increaſed, indeed, in many parts of the country within theſe few years.

Willow-*Galls*, in *Natural Hiſtory*, the name given by authors to certain protuberances found very frequently on the leaves of the ſeveral ſpecies of willow, which are properly galls, each containing the worm of a fly, and owing its exiſtence to that inſect.

The galls are uſually of a roundiſh or oblong figure, and are equally protuberant on each ſide of the leaf: they are of a pale green at firſt; but they afterwards become yellowiſh, and finally reddiſh. The ſurface of theſe is ſeldom perfectly even, but uſually has ſeveral little prominences and cavities in it. When this gall is opened, there is found in it a worm reſembling a caterpillar in figure, having a ſmooth annulated body, a hard brown head, and twenty legs; and by Reaumur called falſe or baſtard caterpillar. This creature, when the gall is young, is blue; it afterwards becomes greeniſh; and finally, when the gall becomes red, it is white. This inſect ſeems to eat in its priſon more voraciouſly than any

any other gall-infect whatever; for while the gall grows in fize, it becomes alfo thinner in every part; fo that the creature, at the proper time, has but little difficulty to get out. Reaum. Hift. Infect. vol. vi. p. 211.

When the time of the laft change of this infect draws nigh, it leaves the tree, and defcending to the earth makes its way into it in a proper place, and then becomes a nymph, out of which at a proper time iffues a four-winged fly.

The flies which are produced in April copulate almoft as foon as freed from their exuviæ of the chryfalis ftate, and the females foon after lodge their eggs in the leaves of the willows. This is all done before the end of April, and the young ones hatched of thefe eggs live but a fhort time before they pafs into the chryfalis ftate, and living flies are hatched from thefe in June. The young ones of this brood pafs their chryfalis ftate in the earth, and appear not during the whole winter, till the fpring fun enlivens them again. There is, befide thefe, another kind of galls of the willow-leaves, which are of the clafs of thofe, each of which contains feveral cells; in each cell of thefe there is found a fmall white maggot, the offspring of the egg of a two-winged fly, which, after paffing the chryfalis ftate in the earth, alfo comes out in the form of its winged parent. The cells in the galls are different in number in the feveral galls, and are from four or five to twenty: they have no communication with one another, but each worm lives in its own cell.

Befide thefe there is alfo fometimes found in thefe galls a worm of a brownifh-white colour, having two hooks in its head, and no legs at all. This has all the appearance of a carnivorous animal, and probably was depofited there in the egg-ftate by its parent, not to feed on the gall, but on its defencelefs inhabitant. This worm finally becomes a fmall blueifh beetle, and is often found alone in the cavity of the gall, often in company with its proper inhabitant, fucking its juices as it feeds on thofe of the plant. There feem to be feveral fpecies of thefe devourers common to thefe galls; fince Vallifnieri obferved, in the boxes where he kept thefe galls to produce the animals from thence, many fpecies of fmall beetles, and feveral diftinct kinds of flies, which were probably the laft ftate of feveral kinds of carnivorous worms, which had preyed upon the proper inhabitant of the galls. Vallifnieri, Dialog. des Infect.

Willow-*Herb*, or *French* Willow, in *Botany*. See Epilobium.

Willow-*Herb* is a name fometimes given to the *lythrum* or purple loofe-ftrife. See Lythrum.

Willow, *Sweet*, *Dutch* Willow, Gale, or *Candle-Berry* Myrtle, in *Botany*. See Candle-*Berry-Tree*, and *Candle-Berry* Myrtle.

Willow-*Weed*, in *Agriculture*, a term provincially applied to fmart-weed, or perficaria, which is a troublefome weed on many places in the corn-fields and other tillage-lands. See Weed.

WILLS, in *Geography*, a town of Ohio, in the county of Guernfey, with 659 inhabitants.

WILLSBOROUGH, a poft-townfhip of Effex county, in New York, with a poft-office, 530 miles from Wafhington, erected in 1788, then in Clinton county, and very extenfive; from which feveral towns have been fince erected. It is bounded N. by Chefterfield, E. by lake Champlain, in the ftate of Vermont, S. by Effex, and W. by Lewis. Along the lake the land is level and tolerably productive. A fmall well-drain affords many fcites for water-works; and iron-ore of the beft quality is found in great abundance. The population confifts of 668 perfons, and the fenatorial electors are 57. Here are, one diftillery, a forge for making bar-iron, an anchor-fhop, a carding-machine, and a clothiery, befides a confiderable number of grain and faw mills.

Willsborough, a townfhip of New York, near Crown Point.

WILLSTADT, a town of Sweden, in the province of Smaland; 50 miles W. of Wexio.—Alfo, a town of Germany, in the county of Hanau Lichtenberg; 7 miles S.E. of Strafburg.

WILLUGHBEIA, in *Botany*, was fo named by Schreber, in memory of our great Englifh naturalift, Francis Willughby, efq. of Middleton-hall, Warwickfhire, the friend of Ray, in our biographical account of whom the reader will find many particulars relating to Mr. Willughby and his family. This gentleman may well claim botanical diftinction, on account of his enquiries into the philofophy of vegetation, in conjunction with his illuftrious affociate, during the fpring of 1669.—Schreb. Gen. 162. Willd. Sp. Pl. v. 1. 1231. Mart. Mill. Dict. v. 4. (Ambelania; Aubl. Guian. 265. Juff. 148. Lamarck Dict. v. 1. 125. Illuftr. t. 169. Pacouria; Aubl. Guian. 268. Juff. 148. Lamarck Dict. v. 4. 691. Illuftr. t. 169.)—Clafs and order, *Pentandria Monogynia*. Nat. Ord. *Contortæ*, Linn. *Apocineæ*, Juff.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, flefhy, in five deep acute fegments, very fmall. *Cor.* of one petal, falver-fhaped: tube cylindrical, enlarged at the bottom: limb horizontal, in five deep, oblique, acute, wavy fegments, more dilated at one fide than the other, lying over each other at the bafe. *Stam.* Filaments five, very fhort, inferted into the tube juft above the bafe; anthers arrow-fhaped. *Pift.* Germen fuperior, roundifh; ftyle quadrangular; ftigma capitate, ovate, thick, ftriated, double-pointed, fubtended by a flat orbicular difk. *Peric.* Berry ovate, coated, of one or two cells. *Seeds* numerous, angular, compreffed, imbedded in pulp.

Eff. Ch. Corolla falver-fhaped, contorted. Stigma capitate. Berry coated, with many angular feeds.

1. W. *acida*. Acid Willughbeia. Willd. n. 1. (Ambelania acida; Aubl. Guian. 266. t. 104.)—Stem erect. Flower-ftalks the length of the footftalks.—Native of extenfive forefts in Guiana and Cayenne, bearing flowers and fruit in September. The *trunk* of this tree is feven or eight feet high, and feven or eight inches in diameter, with a greyifh bark, and foft white wood. The *head* confifts of very numerous, ftraight, knotty *branches*, fubdivided in an oppofite manner. *Leaves* oppofite, on fhort ftalks, elliptical, fomewhat pointed, entire, wavy, fmooth and fhining, with one rib, and many tranfverfe parallel veins; their greateft length feven inches, by three in breadth. *Flowers* axillary, three or four together on one common ftalk, which is hardly fo long as the adjoining footftalk. *Bracteas* fcaly, folitary at the bafe of each general as well as partial ftalk. *Corolla* whitifh, fcarcely fo large as that of *Vinca minor*. *Fruit* lemon-coloured, oval, corrugated or warty, two inches long, feparated by a longitudinal flefhy partition, into two cells, filled with acid vifcid pulp, and containing many brown rough *feeds*. This *fruit*, though milky, is wholefome. After the rind is taken off, the remainder is foaked for a while in water. The flavour is agreeably acid, notwithftanding a great degree of vifcidity, by which the pulp adheres to the lips and teeth. This *fruit*, with or without its rind, is preferved in fugar. In the latter ftate it is cooling, flightly acid; in the former moderately purgative, and efteemed ufeful in dyfenteries. The whole plant when wounded difcharges a milky, very tenacious, juice.

2. W. *fcandens*. Climbing Willughbeia. Willd. n. 2. (Pacouria guianenfis; Aubl. Guian. 269. t. 105.)—Stem twining. Flower-ftalks branched, as long as the leaves.—Native

Native of woods about the mouth of the creek of the Galibis in Guiana, bearing flowers, as well as fruit, in May. The *trunk* is about three inches in diameter, fending off long, knotty, trailing *branches*, which twine round the neighbouring trees to their very fummits, from whence the extremities hang down, clothed with oppofite, oval, fmooth, entire *leaves*, not unlike the foregoing, and about as large, on fhort ftalks; their rib, as well as lateral veins, are prominent and reddifh. The *flower-ftalks* are axillary, folitary, wavy, alternately branched, refembling tendrils, terminating in feveral little tufts, or umbels, of yellow *flowers*, rather fmaller than the firft fpecies. *Fruit* roundifh or obovate, the fize and colour of a quince, of an agreeable fcent when ripe, pulpy, yielding but a fmall quantity of milky juice if cut, though all the other parts of the plant contain a great quantity of the fame kind of glutinous milk as the preceding. Aublet does not mention any ufe to which this fpecies, or its *fruit*, is applied.

WILLUGHBY, Francis, in *Biography*, was born in 1635 of a good family in Lincolnfhire, and educated in Trinity college, Cambridge, under the tuition and in habits of friendly intercourfe with the excellent philofopher and natural hiftorian, John Ray. They were intimate affociates, and made a foreign tour together in the years 1663 and 1664. To birds and fifhes Willughby paid particular attention, and he formed a rich mufeum of animal and foffile productions. In 1668 he married the daughter of fir Henry Bernard, and his family refidence at Middleton, in Warwickfhire, was the place of Ray's frequent refort, where he and his hoft profecuted their philofophical experiments and obfervations, the refult of which they communicated to the Royal Society, of which they were both members. This inftructive and pleafant intercourfe was, however, prematurely interrupted by the death of Willughby in 1672, at the age of 37. His confidence in Mr. Ray was manifefted by appointing him one of his executors, and committing to him the charge of educating his two infant fons, bequeathing to him an annuity for life as a compenfation. Ray afcribes to him, without any trace of adulation, fingular moral excellence and high mental endowments. His pofthumous work, publifhed under the infpection of Mr. Ray, was entitled "Francifci Willughbeii Arm. Ornithologiæ Libri tres; in quibus Aves omnes hactenus cognitæ, in methodum naturis fuis convenientem reductæ, accuraté defcribuntur. Defcriptiones iconibus elegantiffimis et vivarum avium fimillimis æri incifis illuftrantur. Totum Opus recognovit, digeffit, fupplevit Johannes Raius," Lond. fol. This work was alfo tranflated into Englifh by Ray, and publifhed in 1671 with large additions. Mr. Ray alfo collected and arranged Willughby's papers on Ichthyology. He added the two firft books, and with the affiftance of the Royal Society publifhed them in 1686 under the following title: "Fran. Willughbeii Arm. de Hiftoria Pifcium, Libr. quatuor, juffu et fumptu Soc. Regiæ Lond. editi. Totum Opus recognovit, coaptavit, fupplevit librum etiam primum et fecundum integros adjecit J. Raius." Oxon. fol. The papers of Willughby in the Phil. Tranf. relate to vegetation, plants, and infects. The collection of Ray contains fome of his letters. Biog. Brit. Pulteney's Sketches of Botany.

WILLY, in *Geography*, a river of England, which runs into the Avon, near Salifbury.

WILLYKA, a town of Lithuania, in the palatinate of Wilna; 60 miles E. of Wilna.

WILMANSTRAND. See Vilmanstrand.

WILMANTON, a town of New York; 50 miles N. of New York.

WILMINGTON, a fea-port town of the ftate of Delaware, on Brandy-wine Creek; 22 miles S.W. of Philadelphia. N. lat. 39° 45′. W. long. 75° 34′.—Alfo, a fea-port town of North Carolina, with about 250 houfes, on a branch of Cape Fear river. In January 1781, this town was taken by the Britifh troops; 76 miles S.S.W. of Newbern. N. lat. 34° 11′. W. long. 78° 5′.—Alfo, an ifland near the coaft of Georgia, at the mouth of the Savanna. N. lat. 32°. W. long. 81° 6′.—Alfo, a poft-town of Vermont, on Deerfield river, in Windham county, with 1193 inhabitants; 10 miles E.S.E. of Bennington.—Alfo, a town of Maffachufetts, in the county of Middlefex, with 716 inhabitants; 16 miles N. of Bofton.—Alfo, a town of New York; 53 miles N. of New York.

WILMOT, John, in *Biography*, earl of Rochefter, was the fon of Henry, earl of Rochefter, an eminent loyalift in the reign of Charles I., and was born in 1647, at Ditchley, in Oxfordfhire. In 1659 he was entered at Wadham college, Oxford, and afterwards travelled into France and Italy under a tutor, who is faid to have reclaimed him from his early licentioufnefs; but upon his return to the profligate court of Charles II., in which he was a gentleman of the bed-chamber, he relapfed into his former intemperance. In 1665 he went to fea, and, as it is faid, behaved with great intrepidity in the attack of a caftle at Bergen, in Norway, which character for courage he alfo maintained when he afterwards ferved under fir Edward Spragge. In fome of his domeftic adventures, however, he forfeited this kind of reputation. Welcomed in all companies on account of his wit and vivacity, he became habitually intemperate, infomuch that, on a fubfequent review of his conduct, he acknowledged that for five fucceffive years he was never free from the inflaming effects of wine. His various adventures, in his real, or in a difguifed character, have furnifhed many anecdotes, that have been circulated in converfation, or in books of mere amufement, but which are not worth recording in graver publications. His wit furnifhed in the focieties which he frequented a kind of apology for his profanenefs and licentioufnefs; and as for his poetical compofitions, they were for the moft part lampoons or amatory effufions, the titles of which would ftain the page of biography. "In all his works, (fays Dr. Johnfon, meaning probably thofe which *can be read*,) there is fprightlinefs and vigour, and every where may be found tokens of a mind which ftudy might have carried to excellence." The juftice of Walpole's fentence, in his "Catalogue of Noble Authors," will be generally allowed: "Lord Rochefter's poems have much more obfcenity than wit, more wit than poetry, more poetry than politenefs." His courfe of debauchery was of no long duration; for foon after the age of 30 he funk into a ftate of debility and difeafe, which induced him to ftudy phyfic, and this ftudy permitted him to reflect on the courfe of his paft life, the irremediable effects of which he learnt from experience. Towards the clofe of his fhort life, he became acquainted with bifhop Burnet, who convinced him of the truth both of natural and revealed religion, and his mind was then impreffed to fuch a degree, that he is faid to have became a fincere, penitent. His life terminated in July, 1680, foon after he had commenced his 33d year. He left a fon and two daughters. Biog. Brit. Johnfon. Burnet.

Wilmot, in *Geography*, a town of Nova Scotia, near Annapolis.—Alfo, a town of New Hampfhire, in the county of Hillfborough, with 298 inhabitants.

WILNA, a city and capital of the duchy of Lithuania, on the Wilia, founded in the year 1305. This city lies in a mountainous country, on feveral little eminences. It is very

very large, and has two confiderable fuburbs, called Antokolla and Rudaifzka. In the old ruinous royal palace is the arfenal, and the hall where the court of juftice is held; and over-againft it is the magnificent church belonging to the caftle, which was built in the year 1386. The treafury belonging to this church is very rich; and it is alfo remarkable for the elegant marble chapel of St. Cafimir, whofe filver fhrine is faid to weigh thirty quintals. There are upwards of forty churches in this city, and among thefe are, one Lutheran and one Calvinift church, a Jewifh fynagogue, a Tartarian church, and a Greek church; but all the reft are Popifh churches. Not to mention the devaftation which Wilna formerly fuffered from the Ruffians in the years 1610 and 1655, and from fire in 1737, it was deftroyed by a dreadful conflagration in the year 1748, when 13 churches, the Jewifh fynagogue, 25 palaces, 469 ftone edifices, confifting of private houfes, hofpitals, inns, baths, convents, and mills, with 146 tradefmen's fhops, and difpenfaries, befides a great number of granaries and warehoufes, were confumed to afhes. In 1749 another fire happened by lightning, which confumed 6 churches, the council-houfe, 8 palaces, and 277 other ftone buildings. The chapel of St. Cafimir was alfo burned, and the lofs fuftained by the deftruction of this edifice only amounted to a vaft fum. The churches have been fince rebuilt at a very great expence, and fome of them in a more elegant manner than before; but the city has not recovered its former grandeur. Wilna is the fee of a bifhop, founded in 1387. The univerfity was founded in 1570. It gives name to a palatinate. In 1794 it was taken by the Ruffians, and with its territory annexed to that empire; 168 miles E. of Königfberg. N. lat. 54° 36'. E. long. 25° 18'.

WILRE, a town of France, in the department of the Ourthe; 4 miles E. of Fauquemont.

WILS, a town of the county of Tyrol, on the borders of Bavaria; 5 miles N.N.W. of Reutten.

WILSCOW, a river of Brandenburg, which empties itfelf into a large lake, communicating with the Rega, 4 miles S. of Treptow.

WILSDEN, a townfhip of England, in the Weft Riding of Yorkfhire, near Halifax.

WILSDRUF, or Wilsdorf, a town of Saxony, in the margravate of Meiffen; 9 miles W. of Drefden. N. lat. 51°. E. long. 13° 8'.

WILSELMAUR, a town of Auftria; 3 miles W. of Brugg.

WILSNACH, a town of Brandenburg, in the Mark of Prignitz. This town was anciently famous, there being no lefs than three hofts worfhipped at this place, which hofts they fay, in 1383, remained untouched in the church when it was burned down, and upon each of them was feen a drop of blood. To thefe hofts numerous pilgrimages were made from the remoteft countries; by which means this place rofe from a village to a fmall town. At length the hofts were burned in the year 1552, by the Lutheran preacher, Joachim Ellefeldt; 8 miles S. of Perleberg.

WILSON, Richard, in *Biography*, the moft eminent landfcape-painter of the Englifh fchool, was the fon of a clergyman, and was born at Pineges, in Montgomeryfhire, in 1714.

Having received from his father a good claffical education, in the courfe of which he had evinced a decided difpofition for drawing, he was fent to London at the age of 15, and placed as a difciple with an obfcure portrait-painter, named Wright. After a lapfe of fix years, he commenced profeffor, and under the patronage of Dr. Hayter, bifhop of Norwich, he foon afterwards had the honour to paint portraits of his prefent majefty and his brother, the late duke of York; both at that time under the tuition of the bifhop. He continued to practife portrait-painting fome time in London, but with no great fuccefs, and at length went to Italy to cultivate his tafte. Even there he continued to practife it, ftill unacquainted with the genuine bias of his genius, although occafionally exercifing his talents and employing his time in ftudies of landfcape. At Venice Wilfon painted a portrait of the late Mr. Lock, of Norbury-park, one of the moft creditable of his performances in that branch of the art; and it was there that accident opened his eyes to his own peculiar gratifications, and led him into that path, by purfuing which he has obtained a name among the worthieft in art.

As a matter of relaxation and amufement, he had painted a landfcape, which being feen by Zuccarelli, fo warmly excited that eminent artift's admiration, that he advifed Wilfon to purfue that line of art exclufively. From this time it is believed that he abandoned portraiture, and followed the judicious advice of a rival artift; and foon after he left Venice in company with Mr. Lock, and travelling flowly to Rome, made numerous ftudies on the way, which are ftill preferved at Norbury-park. On his arrival at Rome, the advice of Zuccarelli was confirmed by Vernet and Mengs, both then in high repute. So much were they delighted with Wilfon's landfcapes, that they each offered to exchange a picture with him; a propofal far too flattering for refufal. This liberality, as commendable as it is unufual, was followed by Vernet in the handfomeft manner, as he hung the picture by the Englifhman in his exhibition-room, and recommended him to the particular attention of the cognofcenti.

His progrefs in landfcape-painting muft have been very rapid; indeed it muft have had the character of being almoft intuitive, fince he obtained a very great degree of reputation during his ftay in Italy, and painted many pictures there of known celebrity. He travelled with the late earl of Dartmouth to Naples, and made a number of very fine drawings for that nobleman, now preferved by his grandfon; and for him alfo he painted two pictures, one a very fine one, a view of Rome, which has been beautifully engraved by Middiman. He was alfo employed by the late duke of Bridgewater to paint a landfcape with the ftory of Niobe; but his grace had the bad tafte to employ Placido Conftanza to repaint the figures. To preferve his reputation, Wilfon painted another of the fame fubject, and both are now in England. He returned from Italy in 1755, and occupied apartments over the north piazza of Covent-Garden. He had merited, and here he alfo obtained celebrity, and for a while employment. Many of his principal performances appear to have been painted about this time, moft of which are known by the fine prints engraved from them by Woollett and others; in which the grandeur, breadth, and purity of compofition in mafs and in line, contend for admiration with the talents confpicuous in the engravings.

Hitherto the life of Wilfon was honoured as his talents deferved; the remainder of it exhibited a gradual declenfion, not fo much of power as of patronage. 'Tis true he was often too free in his pencil, and too much mannered in his ftyle; repeating himfelf, perhaps, till it became irkfome: 'tis faid, alfo, that he was not of the moft tractable humour, and was low in his purfuits and affociations. Whencefoever it arofe, he was doomed to undergo indifference and neglect, and confequently the inconveniences of lownefs of purfe. Sometimes he was employed to paint views of gentlemen's feats, but probably the occupation fuited the artift as little as the refult gratified the patron. Wilfon's view of nature was far too broad for fuitable adaptation to ſuch a purpoſe, and conſequently there are not many pictures of this claſs to be met with which have proceeded from his pencil. The great characteriſtic of his works is grandeur, reſulting from breadth, purity, and ſimplicity, united in fullneſs of colour and mellowneſs of touch. He was perfectly original in feeling and execution, more grand in general conception than Claude, though infinitely leſs perfect in detail; and far from travelling through his career in art, with ſo even a pace as his great predeceſſor and only rival in the more exalted ſtyle of landſcape-painting before our time. Now a third ſhines in the ſame hemiſphere, and Claude and Wilſon find no ill-ſuited aſſociate in the name of Turner.

At the inſtitution of the Royal Academy, Wilſon was choſen one of the founders; and after the death of Hayman he was made librarian. That ſtation he retained till his death, which happened in May 1782, in the 68th year of his age.

Wilson, Thomas, an Engliſh prelate, was born in 1663, at Burton-in-Wirral, Cheſhire, and finiſhed his education in Dublin college, where he took his degree of arts. In 1689 he was ordained prieſt, and in 1692 became domeſtic chaplain to the earl of Derby, and attended his ſon, lord Strange, who was his pupil, on a tour to the continent. Upon the death of the young gentleman, he returned to England, and in recompence of his faithful ſervices, was nominated to the biſhopric of the Iſle of Man, by the earl of Derby, who then poſſeſſed the ſovereignty of the iſland. The nomination was approved by king William, and he was conſecrated in January 1697-8, having received at Lambeth the degree of LL.D. The revenue of the biſhopric did not amount to more than 300*l.* a year; but by ſome collateral advantages the biſhop was enabled to exerciſe hoſpitality and charity, to repair his ruined palace, and to found a new chapel at Caſtletown. He alſo eſtabliſhed parochial libraries, which he furniſhed with religious books, among which was a ſmall tract, the firſt that was ever printed in the Manks language. He improved the agriculture of the iſland by introducing into it corn, horſes, cattle, and ſheep, from England; and he ſtudied phyſic with a view of adminiſtering to the relief and comfort of the iſlanders. He publiſhed eccleſiaſtical conſtitutions, which were ſo much approved, that lord chancellor King ſaid of them, that "if the ancient diſcipline of the church were loſt, it might be found in all its purity in the Iſle of Man." Biſhop Wilſon, chiefly with a view to the intereſt of religion and morality, was anxious to maintain a due regard to epiſcopal authority, and this anxiety led him in two inſtances to exceed the bounds of prudence and propriety. When ſome copies of the "Independent Whig" had found their way into the iſland, he ordered them to be ſeized, apprehending that they inculcated ſentiments hoſtile to Chriſtianity and the eſtabliſhed church. He alſo involved himſelf in difficulties and incurred reproach by excluding from the communion the wife of the governor, on account of an act of defamation, for which ſhe refuſed to aſk pardon of the injured party. This led to a ſerious altercation with the governor, who fined both the biſhop and his two vicars-general, for ſuſpending his chaplain for diſobedience in admitting the wife to communion, and who arreſted them for refuſing to pay the fine. Accordingly they were kept cloſe priſoners in the caſtle for nine weeks, till the biſhop, by application to the council in England, obtained their releaſe. The pious and mild-tempered biſhop afterwards declined proſecuting the governor for damages. From his piety and attachment to the church, he was honoured in 1707 with the degree of D.D. from the univerſity of Oxford, in full convocation, and in which he was afterwards aggregated at Cambridge.

Such was the biſhop's zeal for doing good, that he would not quit the ſphere aſſigned him for this purpoſe, though he was offered an Engliſh biſhopric; in reference to which circumſtance queen Caroline, directing her attention to Wilſon, among a number of other prelates who happened to be at court at the ſame time with him, ſaid to them, "Here, my lords, comes a biſhop whoſe errand is not to apply for a tranſlation, nor would he part with his ſpouſe becauſe ſhe is poor." His character was in ſuch eſtimation with the French miniſter, that he procured an order that no French privateer ſhould commit ravages on the Iſle of Man. In this retired ſituation his life was prolonged to his 93d year, when he calmly expired in March, 1755, leaving one ſurviving ſon, known in the political world as rector of St. Stephen's, Walbrook, and patron of the celebrated hiſtorian Mrs. Macaulay. After his death a collection of his works was publiſhed in two vols. 4to. 1781. His notes to Crutwell's Bible, which was publiſhed under the biſhop's name in three vols. 4to. 1785, are of little value. The tranſlation of the New Teſtament into the Manks language, which he had undertaken, was completed by his ſucceſſor, Dr. Mark Hilleſley. Biog. Brit. Life prefixed to his Works. Gen. Biog.

Wilson, Dr. John, a native of Feverſham, in Kent, was a gentleman of Charles the Firſt's chapel, and ſervant in ordinary to his majeſty, in the character of chamber-muſician. His inſtrument was the lute, upon which he is ſaid to have excelled all the Engliſhmen of his time; and, according to Ant. Wood, his royal maſter was ſo pleaſed with his talents, and had even ſuch a perſonal regard for him, that he not only liſtened to him with the greateſt attention, but frequently condeſcended to lean or lay his hand on his ſhoulder, while he was playing.

For the excellence of his performance we muſt now wholly depend on tradition, as the compoſitions he has left behind him for the lute are but feeble teſtimonies of a great hand. Nor will his vocal productions, or Fantaſias, either in print or manuſcript, generate very exalted ideas of his genius or abilities as a compoſer. That he was admired by his majeſty, and by the lovers of muſic at Oxford, where he was honoured with the degree of doctor in muſic, 1644, and where he long reſided, proves more the low ſtate of the art at this time, before the ears of the public were rendered diſcriminative, by a variety of great and rival talents, than his own perfections. Little had been heard, and but little was expected. Swift ſays, "we admire a little wit in a woman, as we do a few words ſpoke plain by a parrot:" and it might more ſeriouſly be ſaid, that the beſt muſic, during times of ignorance and inexperience, is perhaps more admired than the moſt exquiſite productions and performance of a more enlightened period. Nothing can prove this more clearly than the unbounded and hyperbolical praiſes beſtowed in France on the operas of Lulli, of which, at preſent, the whole nation is aſhamed.

Dr. Wilſon, indeed, ſeems to have ſet words to muſic more clumſily than any compoſer of equal rank in the profeſſion; but as he was reſpected by his contemporaries, and held an exalted rank in his art, a liſt ſhall here be inſerted of his works; not ſo much for their intrinſic worth, as to enable curious enquirers to judge for themſelves of the progreſs which muſic had made in this kingdom, when ſuch productions were in high favour, not only with the greateſt perſonages but principal profeſſors of the times.

"Pſalterium Carolinum, the devotions of his ſacred majeſty

jeſty in his ſolitude and ſufferings, rendered in verſe, ſet to muſic for three voices and an organ or theorbo." Folio, 1657.

"Cheerful Aires or Ballads, firſt compoſed for one ſingle voice, and ſince ſet for three voices." Oxon. 1660.

"Aires to a voice alone, to a theorbo or baſs viol;" theſe are printed in a collection entitled "Select Aires and Dialogues." Folio, 1653.

"Divine Services and Anthems," the words of which are in Clifford's Collection. Lond. 1663.

He alſo compoſed muſic to ſeveral of the odes of Horace, and to ſome ſelect paſſages in Auſonius, Claudian, Petronius Arbiter, and Statius; theſe were never publiſhed, but are preſerved in a manuſcript volume curiouſly bound in blue Turkey leather, with ſilver claſps, which the doctor preſented to the univerſity, with an injunction that no perſon ſhould be permitted to peruſe it till after his deceaſe. It is ſtill among the archives of the Bodleian library.

The compoſitions of Dr. Wilſon will certainly not bear a ſevere ſcrutiny either as to genius or knowledge. It is, however, not eaſy to account for the ignorance in counterpoint which is diſcoverable in many luteniſts of theſe times; for having harmony under their fingers, as much as the performers on keyed inſtruments, it facilitates their ſtudy, and ſhould render them deeper contrapuntiſts than the generality of flute-players, whoſe flimſy compoſitions are proverbial.

On the ſurrender of the garriſon of the city of Oxford, 1646, Dr. Wilſon left the univerſity, and was received into the family of ſir William Walter, of Sarſden, in Oxfordſhire; but, in 1656, he was conſtituted muſic-profeſſor, and had lodging aſſigned him in Baliol college, where, being aſſiſted by ſome of the royaliſts, he lived very comfortably, exciting in the univerſity, according to A. Wood, ſuch a love of muſic, as in a great meaſure accounts for that flouriſhing ſtate in which it has long ſubſiſted there, and for thoſe numerous private muſic-meetings, of which this writer, in his own life, has given ſuch an amuſing relation. At the Reſtoration, Dr. Wilſon was appointed chamber-muſician to Charles II.; and, on the death of Henry Lawes, 1662, was again received into the chapel-royal, when, quitting the univerſity, he reſided conſtantly in London, till the time of his deceaſe, at near 78 years of age, in 1673. Burney.

Wilson, in *Geography*, a town of South Carolina; 15 miles S.W. of Queenborough.—Alſo, a town of Scotland, in the county of Lanerk, founded in the latter end of the 18th century, by Meſſrs. Wilſon of London, to accommodate the workmen employed in an iron foundery there; 5 miles E. of Lanerk.—Alſo, a county of Weſt Tenneſſee, with 11,952 inhabitants, including 2297 ſlaves.

WILSONIA, in *Botany*, received that appellation from Mr. R. Brown, who commemorates by it the remarkable zeal and perſeverance of Mr. John Wilſon, an inhabitant of Kendal, Weſtmoreland, author of a "Synopſis of Britiſh Plants in Mr. Ray's Method," publiſhed at Newcaſtle-upon-Tyne in 1744. This work, however, is incomplete, the graſſes, trees, ſhrubs, and all the cryptogamic tribe, except Ferns, being omitted. The author, whom Dr. Pulteney ſuppoſes to have died about the year 1750, is ſaid to have left theſe claſſes finiſhed in MS.; but they were never publiſhed. His performance indeed is now altogether obſolete, being chiefly tranſlated from Ray and Tournefort; though with ſome alterations of the ſyſtem of the former, and much additional matter, reſpecting the ſtations of rare plants; all which evinces a conſiderable portion of practical knowledge. Copious medical information is interſperſed, and a botanical dictionary is prefixed. But the botaniſt of whom we are ſpeaking is principally worthy of memory, for that indefatigable love of ſcience, which even the moſt humble ſituation, and the moſt limited circumſtances, could not counteract. Whether he was employed in the manufacture of knitted ſtockings, formerly very extenſive in his native town, or whether he made ſhoes, his biographers are not agreed; but he contrived to attain more knowledge, and cultivation of mind, than perhaps a great majority of the gentry around him. He muſt have had a competent acquaintance with Latin, and he may rank as an Engliſh writer among the moſt reſpectable, upon ſcientific ſubjects, in his time. We cannot commend his prudence, if we compaſſionate his difficulties, when he would have ſold his only cow, the ſupport of his wife and family, to buy a copy of Moriſon's work. But we may be allowed to regret that his mental application did not tend to ſo ample a pecuniary reward, as that of the famous ſir Richard Arkwright, who repeatedly incurred the cenſure of many a prudent friend, for neglect of buſineſs, while he was planning a ſcheme of unbounded profit for himſelf and family. We rejoice to read that the book ſo much deſired, was preſented to Wilſon by a benevolent lady, who lived near him, and who by this act has afforded a laſting teſtimony to the worth of his character. An honeſt man may always hope for indulgence and aſſiſtance, if he ſmooths the path of hard duty with a little mental excurſion, inſtead of mere unprofitable recreation or diſſipation, whatever may be his ſituation in life. Many a cow has been ſold in conſequence of evil propenſities; few have been ſacrificed to procure food for the mind. — Brown Prodr. Nov. Holl. v. 1. 490. Claſs and order, *Pentandria Monogynia*. Nat. Ord. *Convolvuli*, Juſſ. *Convolvulaceæ*, Brown.

Eſſ. Ch. Calyx pitcher-ſhaped, five-ſided, five-toothed. Corolla funnel-ſhaped, of one petal; imbricated in the bud. Germen with two ſeeds. Style cloven. Stigmas capitate. Capſule . . . .

1. W. *humilis*. Humble Wilſonia. Br. n. 1.—Diſcovered by Mr. Brown, in the ſouth part of New Holland. A little, dwarf, ſhrubby, proſtrate, much branched, downy plant. *Leaves* ſmall, ſeſſile, thickiſh, imbricated in two ranks. *Flowers* axillary, ſolitary, ſeſſile, without *bracteas*. Mr. Brown remarks, that the natural affinity of this genus muſt be uncertain while its *fruit* continues unknown. He met with the plant after the *flowers* were faded, before the *ſeed-veſſel* was formed, nor is he certain whether the *germen* conſiſted of one cell, or of two. He ranges *Wilſonia* next after *Creſſa*, of whoſe place in the natural ſyſtem Linnæus had formed no opinion, but which Juſſieu well refers to his *Convolvuli*, notwithſtanding the ſolitary *ſeed*.

WILSONVILLE, in *Geography*, a town of Pennſylvania; 120 miles N. of Philadelphia.

WILSTER, a town of the duchy of Holſtein, on the river of the ſame name; 8 miles N. of Gluckſtadt.

WILSUM, a town of Germany, in the county of Bentheim; 11 miles W.N.W. of Nienhuus.

WILTER, a town of the Tyroleſe, on the Inn; 3 miles above Inſpruck.

WILTON, an ancient market, borough, and county-town of Wiltſhire, England, derives its name from the river on which it was originally built. By old writers, it was called Wile, or Wily-Vilodunum and Ellandunum; and according to Baxter it was a chief ſeat of the Britiſh prince, Carvilius, and thence denominated Caer-Guilou. Henry of Huntingdon ſays, it afterwards became the capital of the Weſt-Saxon dominions; but Leland and Dr. Milner contend,

tend, that Winchefter was the chief town of that monarchy. It is not improbable that both places were at different periods poffeffed and occupied by the Weft-Saxon kings.

Antecedent to the Norman Conqueft, Wilton was certainly a place of diftinguifhed confequence. It contained feveral religious eftablifhments; and was the principal town of the county, as appears from its having given name to the fhire. Leland ftates, that it poffeffed twelve parifh-churches at the period of Henry III.; a ftatement, if fully authenticated, would afford decided proof both of its great extent and population. The Weft-Saxon monarchs moft probably had a palace here, and conferred on this place many marks of their royal favour. During their dynafty, Wilton was a royal borough, and appears to have been the fcene of feveral important hiftorical events. In 823, Egbert gave battle to and defeated the Mercian army near this town, which army was commanded by their king, Beornwulf. Several other engagements between the Saxons and Danes took place at and near Wilton. One of thefe occurred in 871, when the valiant Alfred commanded the Saxon army againft a vaft horde of the Danifh marauders, who having plundered and laid wafte feveral other places, were checked in their fanguinary career near this town, and after a defperate battle were compelled to petition for mercy and peace. Again in 1003, Wilton was vifited by the Danes, when part of the town was confumed. During the civil warfare between king Stephen and the emprefs Maud, this place was the fcene of much flaughter.

Wilton continued for many centuries after the Conqueft celebrated for its monaftic inftitutions, and particularly for its abbey. This was inftituted in 773 by Wulftan, earl of Wiltfhire, who, having defeated Ethelmund, king of the Mercians, repaired "a certain old church of St. Mary, at Wilton, which had been deftroyed by the Danes, and placed in it a college of fecular priefts." After the Conqueft, king William and feveral of his fucceffors added greatly to the opulence of this abbey, which was diffolved in the thirty-fifth year of Henry VIII. The other monaftic inftitutions in this town were, a houfe of black friars, an hofpital dedicated to St. Mary Magdalen, a collegiate church, and an hofpital dedicated to St. John.

Wilton, though much decayed, ftill retains many of its ancient privileges. It is a borough both by prefcription and by charter, and is governed by a corporation of its own, confifting of a mayor, recorder, five aldermen, three capital burgeffes, and eleven common-councilmen, with a town-clerk, and other officers, as fixed by the laft charter granted in the reign of Henry VIII. The town fends two members to parliament, and has regularly done fo fince the twenty-third year of Edward I. In 1710, it was agreed that the elective franchife was vefted "in the mayor and burgeffes, who are to do all corporate acts and receive the facrament." The number of voters is ftated at twenty-four in the Hiftory of Boroughs, where it is alfo obferved, that "the election of any perfon to be a burgefs of Wilton, who has not taken the facrament of the Lord's fupper, according to the rites of the church of England, within one year before fuch election, is a void election." The mayor is the returning officer; and the patron of the borough is the earl of Pembroke, whofe feat is in the vicinity of the town.

The county courts of juftice are fometimes held here; as are likewife the elections for the county members. The precife fpot where the electors meet to choofe their reprefentatives, is marked by a large ftone in the Warren, at a fhort diftance fouth of the town. The market-days here were formerly Wednefday and Friday in every week; but a fmall one on the former day is now only continued. The fairs are held on the 4th of May and the 12th of September.

The principal public buildings in this town are the parifh-church and the town-hall. The other buildings here appropriated to public purpofes are two chapels, one belonging to the Methodifts, and another to the Independents, a free-fchool, and eight alms-houfes. Wilton, including the borough and parifh, contains, according to the parliamentary returns of 1811, 393 houfes, and a population of 1963 perfons. It was formerly celebrated for its carpet manufactories, which gave employment to a large proportion of its inhabitants. The firft carpet made in England was manufactured at Wilton. Fancy woollens and flannels are now the only articles of manufacture. At the eaftern end of the town is,

Wilton-houfe, feated in a fine park. This edifice is a large, extenfive pile, erected at different periods, and difplays different ftyles of architecture. It was formerly an abbey, but the alteration of Mr. James Wyatt has deftroyed every monaftic part of the building. This architect (now no more) was employed by the prefent noble proprietor, to enlarge the manfion and adapt it for the better difplay of its rich ftores of ancient fculpture and paintings. A principal feature in this alteration is the formation of a glazed cloifter, round a central court, which contains nearly the whole collection of ftatues, bufts, baffo-relievos, &c. Another confiderable novelty is a large court-yard on the north, furrounded by offices, a lodge, and a new fide to the houfe. The approach is through a triumphal arch, which is furmounted by a bold equeftrian ftatue of Marcus Aurelius. A veftibule leads to the cloifter, both of which are filled with ancient marbles.

The collection of works of art at Wilton-houfe has long been highly celebrated, and different publications have been given to the world, with catalogues and accounts of the various fubjects. Thefe are, the "Ædes Pembrochianæ," by Mr. Richardfon, 12mo. 1774; an eleventh edition of which was publifhed in 1788. Gambarini of Lucca publifhed a "Defcription of the Earl of Pembroke's Pictures," in 1731. Kennedy alfo produced a "New Defcription of the Pictures, &c." in 1764. Another volume in 4to., with feveral engravings of the fculpture, was publifhed in 1786. Wilton-houfe was formerly exhibited to ftrangers, but the prefent nobleman has fhut it up. Several perfons of the Pembroke family have been particularly diftinguifhed in the annals of the country; particularly in Clarendon's hiftory. Philip Maffinger, an eminent dramatic poet, was probably born at Wilton-houfe, as his father lived in the fervice of the earl of Pembroke. See Giffard's Life and Works of Maffinger.

About a mile eaft of Wilton is Bemerton, the living of which is poffeffed by the Rev. William Coxe, author of feveral valuable works of Hiftory, Travels, and Topography. It is rather fingular that the rectory of Bemerton has been enjoyed by feveral eminent literary characters, among whom we find the names of Walter Curle, bifhop of Winchefter, &c. George Herbert, (commonly called the divine Herbert,) and John Norris.—Beauties of England, Wiltfhire, 8vo. 1814; by John Britton, F.S.A.

Wilton, a town of the diftrict of Maine, in the county of Kennebeck, containing 770 inhabitants; 60 miles N.N.E. of Portland.—Alfo, a town of New Hampfhire, in Hillfborough county, with 1017 inhabitants; 30 miles E. of Chefterfield.—Alfo, a town of Connecticut, in the county of Fairfield, with 1728 inhabitants.—Alfo, a town of South Carolina; 27 miles S.W. of Charleftown.

WILTOWN, a town of South Carolina; 21 miles W.S.W. of Dorchefter.

WILTPERG, a town of Auftria; 8 miles S.W. of Freyftadt.

WILTSHIRE, an inland county, fituated towards the fouth-weftern divifion of England, derives its name from the town of Wilton, which, according to fome ancient hiftorians, was the metropolis of the Anglo-Saxon kingdom of Weffex. On the north and north-weft it is bounded by Gloucefterfhire, on the fouth-weft by Dorfetfhire, on the fouth and eaft by Hampfhire, and on the north-eaft by the county of Berks. Thefe boundaries are in general artificial, and form a figure approaching that of an ellifpe. Concerning the extent and fuperficial area of this county, various are the ftatements of different writers. In the Magna Britannia it is faid to be thirty-nine miles in length from north to fouth, and thirty in breadth from eaft to weft. Gough, in his additions to Camden's Britannia, eftimates its length at forty-nine miles, and its breadth at thirty-feven. Its circumference, according to the fame author, is one hundred and fifty miles, and the number of acres it contains 876,000. Mr. Davis, whofe authority on this fubject is highly refpectable, in his Agricultural Report on the County, ftates it to be in length fifty-four miles, and in breadth thirty-four. The fame writer computes the fuperficial area to be 1372 fquare miles, or 878,000 acres.

The county of Wilts is a diftrict peculiarly interefting to the topographer and antiquary. To the latter, indeed, it offers a wider and more varied field for refearch than perhaps any other county in England. The grand and myfterious monuments of Stonehenge and at Avebury, and the numerous barrows which cover its plains, are relics of an age anterior to hiftorical record, and of which the annals of the world do not furnifh a parallel example. Like the proud pyramids of Egypt, the former were calculated by their conftruction to have remained entire to almoft endlefs futurity, if the agency of the elements had not been affifted by the deftructive influence of man. In the Wanfdyke, Bokerly-ditch, and Grimfditch, and in the fimpler intrenchments with which the county abounds, we behold the remains of Britifh towns, and perceive the mode adopted by the Britons to mark boundaries and form communications. The caftles of Old Sarum, Scratchbury, Battlefbury, and Bratton, difplay the efforts of a more advanced period; and many other of the Wiltfhire intrenched works bear marks of fucceffive occupation by the Romans, the romanized Britons, the Saxons, and the Danes. This part of the kingdom, indeed, feems to have been the principal theatre of the military and civil events which were confequent on the Saxon and Danifh invafions. Here the far-famed Arthur and the ftill more illuftrious Alfred contended at different periods for the liberties of their country, and checked for a time the tide of invading conqueft. At Ludgerfhall, Devizes, Malmfbury, and Marlborough, the veftiges of Norman fortreffes may yet be traced; and in Clarendon-park ftood a fumptuous palace, erected by king John. Malmfbury yet preferves the ruins of a magnificent abbey; and in the cathedral of Salifbury, we behold an edifice furpaffing every fimilar ancient ftructure in uniformity of ftyle and fymmetry of parts. Many of the parochial churches in the county are alfo objects worthy the examination of the antiquary, as fpecimens of architectural fkill and fcience; and in Wilton-houfe, Longford-caftle, Font-hill, Corfham-houfe, Bowood, Tottenham-park, Charlton-park, Stourhead, and Longleat, we are prefented with manfions alike celebrated for magnificence and beauty of fcenery, and for popular attractions to the connoiffeurs and artifts of the country.

At the period of the invafion of our ifland by Julius Cæfar, a people called the Belgæ inhabited a portion of this county. The Hedui are faid to have occupied its north-weftern divifion, near the fource of the Avon and about Cricklade. Another diftrict is mentioned by Carte, in his Hiftory of England, as being fubfequently poffeffed by the Carvilii, fo named from their prince Carvilius; but whether thefe people were fome of the Belgæ, or a diftinct tribe, does not appear. Other authors fuppofe that the Cangi inhabited the northern parts, if not at this era, at leaft foon after it.

When the Romans, after the lapfe of nearly a century, from the final departure of Cæfar, again invaded Britain in the reign of Claudius (A.D. 44.), they found the political condition and relations of its feveral tribes very materially altered. The opinion of Camden, in his Britannia, is, that the Belgæ had fubdued the whole of Wiltfhire, and alfo had poffeffed themfelves of all the territories of the Hedui.

It is very generally admitted, that the Belgæ were the moft powerful people in the fouth-weftern divifion of England at the era of which we are now fpeaking; and no doubt is entertained of their having occupied all the fouthern diftrict of this county, as far as the Wanfdyke, which is therefore defignated by the appellation of 'The great Belgic Boundary.'

Under the Romans, Wiltfhire formed part of Britannia-Prima, and many ftations, encampments, and other military veftigia of that people can be traced in different parts of it.

Subfequent to the departure of the Romans, the earlieft event of political importance which occurs in hiftory relating to Wiltfhire is the maffacre of three hundred Britifh nobles, on the fpot where Stonehenge is fituated, by the orders of Hengift (leader of the firft Saxon expedition to England), who had invited them here to a banquet under the pretence of effecting a reconciliation between the Britons and himfelf. The truth of this dreadful cataftrophe, however, is extremely doubtful, as it does not appear to be mentioned by any of the Saxon writers, and feems to reft folely upon the authority of Nennius, and a few of the Britifh or Welfh bards, who were evidently interefted in the propagation of ftories calculated to excite feelings of enmity and revenge in the breafts of their countrymen, againft a people, once their allies, but afterwards their inveterate and barbarous enemies. Carte fays, that this "ftory was borrowed from Witikind, who relates it of the Thuringians, who were murdered by the Saxons on a like occafion, and upon a fignal given in the fame words made ufe of by the Britifh writers." Turner, in his Hiftory of the Anglo-Saxons, regards it as an incident which can neither be authenticated nor difproved; and Whitaker, in his Hiftory of Manchefter, afferts, that the conquefts of Hengift never extended beyond the limits of Kent; a circumftance which, if fully eftablifhed, would no doubt tend to invalidate our belief of the tranfaction. Hume, in his Hiftory of England, calls it a ftory "invented by the Welfh authors, in order to palliate the weak refiftance made at firft by their countrymen, and to account for the rapid progrefs and licentious devaftations of the Saxons." About the year 520, Cerdic, founder of Weffex, having received confiderable reinforcements from Saxony, and cut off a body of Britons which had been difpatched to intercept them, collected all his difpofable forces, and advanced to Mount Badon, Badbury-caftle, a Britifh poft then

then confidered of great ftrength and importance, on account of its commanding fituation, and its proximity to the concurrence of the Roman roads, which interfect the northeaftern divifion of this county. The diftinguifhed Arthur, who fo long upheld the falling fortunes of his country, relieved the garrifon with a large army formed under his own infpection: Cerdic, apprized of his intention, abandoned the fiege, and waited the approach of the enemy. The conflict was fevere; the genius of Arthur, however, ultimately prevailed over the fuperior fcience of the Saxon general, and the more fteady conduct of his veteran troops. The fubjugation of Wiltfhire was not again attempted till the year 552, when warfare was once more renewed. Kenric, the fon of Cerdic, and his fucceffor in the Weft-Saxon monarchy, again paffed the frontiers of his dominions, and threatened Sorbiodunum or Old Sarum.

The Britifh army took a pofition to fecure its fafety, and fought with their ufual intrepidity, but were defeated by the fuperior difcipline of the Saxons. At "Beranbyrig," Barbury-caftle, in the vicinity of Marlborough, another decifive battle was fought, in which the invaders were again the conquerors; and Wiltfhire in confequence became incorporated in the kingdom of Weffex.

After feveral fkirmifhes, a decifive battle was fought at Wodnefbury, in which the ufurper of Weffex was defeated. The Danes made a defcent on the ifland in the thirty-fecond year of Egbert's reign, and effected great ravages in Wiltfhire. King Alfred afterwards attacked the Danes near Wilton, and routed them; but elated by fuccefs, he incautioufly fuffered them to rally when they gained a victory.

Alfred engaged them in feveral battles with varied fuccefs, and ultimately compelled them to fue for peace, which was granted; yet in the following year, regardlefs of their recent engagements, they fuddenly advanced to Chippenham, then a royal refidence, and eftablifhed themfelves in that town. They had gained fuch confiderable reinforcements, that the king, with a part of his army, retired into Somerfetfhire. Here he remained feveral months, occafionally fallying out upon the enemy, deftroying their magazines, and carrying off their provifions. Having muftered a confiderable army, Alfred quitted his retirement, and advanced to Æthandune, where the Danifh forces lay encamped, attacked them by furprife, and gained a complete victory. No other particular event occurred in Wiltfhire until 976, when a fynod was held at Calne, in which the refpective rights of the regular and fecular clergy underwent a folemn difcuffion: the fecular clergy would not relinquifh their pretenfions; another council was, therefore, convened the fame year at Amefbury, in which it appears the canons were unfuccefsful.

The next hiftorical occurrence in Wiltfhire happened in 1003, when the towns of Wilton and Sarum were plundered and nearly burned to the ground by the Danifh monarch.

In 1006 another army of Danes vifited Weffex, and retiring to the coaft through Wiltfhire, when fome of its natives attacked it in the vicinity of Kennet; the Saxons were, however, defeated, and purchafed peace by fubmitting to the tribute called Danegelt.

England now remained tranquil five years, when in 1011 king Swein and his fon Canute again landed on the fouth coaft, and entering this county, levied heavy contributions on the inhabitants. King Edward at this time being indifpofed at Corfham, his fon Edmund took the field, and put the invaders to flight. An obftinate battle was fought, about this time, at "Scearftan," or Sherfton, on the northweftern verge of the county, by Edmund (who had juft fucceeded his father, Edward) againft the Danes; the decifion of the battle turned in favour of king Edmund by the unexpected flight of Canute. Subfequent to the Norman Conqueft, Wiltfhire retained a confiderable fhare of political intereft.

In the year 1086, the conqueror held a great council at Sarum; "where," fays Blackftone, "all the principal landholders fubmitted their lands to the yoke of military tenure, became the king's vaffals, and did homage and fealty to his perfon." Thus was the feudal fyftem formally introduced into this country.

Clarendon, in this county, is remarkable for the laws paffed there in the reign of Henry II.; "whereby," fays Blackftone, "the king checked the power of the pope and the clergy, and greatly narrowed the total exemption they claimed from the fecular jurifdiction;" though the completion of his wifhes was prevented by the murder of the proud and arrogant prelate, archbifhop Becket. Thefe laws are ftill familiar to the antiquary, by the appellation of the 'Conftitutions of Clarendon.' At Marlborough, in 1267, Henry III. held a parliament, or a general affembly of the 'Eftates of England,' to provide for "the better ftate of the realm, and the more fpeedy adminiftration of juftice;" and here were confequently enacted thofe ftatutes for the fuppreffion of tumults, which have ever fince been denominated, 'The Statutes of Marlbridge.' In the contefts between the houfes of York and Lancafter, the inhabitants of Wiltfhire were confpicuous for their attachment to the fortunes of the Henries. Many of them were prefent at the battle of Tewkfbury, an event which tended to fix the crown on the brows of Edward.

In the deplorable events of the 17th century, this county was equally diftinguifhed. Many actions between the parliamentary and royal forces were decided within its boundaries; particularly at Malmfbury, at Ludgerfhall, and at Round-a-way-hill, in the neighbourhood of Devizes. Wardour and Longford caftles were alternately befieged and taken by both parties within one year.

The remains of antiquity in Wiltfhire, firft entitled to notice in a collective view, are the ftupendous monuments at Avebury and Stonehenge, both of which are regarded as druidical temples. In thefe ftructures we are prefented with the moft wonderful works of a rude but powerful people; works in which the bodily ftrength of affociated numbers, with the fcience and cuftoms of their age, are ftrongly manifefted, and which are calculated not only to excite the aftonifhed gaze and amazement of the multitude, but alfo to roufe curiofity and awaken inquiry in the minds of antiquaries and hiftorians. See Avebury, and Stonehenge.

Next to thefe immenfe temples, becaufe refembling them in relative magnitude, though totally diffimilar in kind, the Wanfdyke may properly claim attention. This vaft earthwork, which is fuppofed to have originally interfected the whole country, is now only diftinctly vifible in detached places, throughout the range of hills to the fouth and weft of Marlborough, where it ftill remains tolerably entire, and in one place is feen in a bold and connected line for the fpace of ten or twelve miles.

Barrows, or Tumuli.—Of correfponding antiquity to the monuments already named, are the artificial hillocks or mounds of earth which abound in this county, and which appear to have an intimate connection with thofe temples, as they are more numerous around Stonehenge and Avebury than in any other places. Thefe memorials were undoubtedly appropriated to fepulchral purpofes. By the refearches of Mr. Cunnington, fir Richard C. Hoare's "Ancient Wiltfhire," the Rev. James Douglas's "Nennia Britannia," and a few other enlightened antiquaries, we are made

made familiar with the contents of thefe facred depofitories. See BARROW, and TUMULI.

The Roman ftations mentioned in the Itinerary of Antoninus, as being fituated within the county, are three in number, *Sorbiodunum*, *Verlucio*, and *Cunetio*. The firft of thefe is placed by all antiquaries at Old Sarum; but the fituation of the other two has been much difputed. Camden fixes Verlucio at Weftbury; Horfley, at Lackham; and Stukeley, whofe opinion is the moft probable, in the neighbourhood of Heddington. Cunetio was formerly fuppofed by fome writers to be at the village of Kennet, and by others at the prefent town of Marlborough; but it is now generally allowed to have been fituated at a fhort diftance eaft from the latter place, near the north-eaftern boundary of Savernake foreft. Befides thefe, the Romans had feveral other fettlements in this county; particularly at Eafton-Grey, at Wanborough, at Pitmead near Heytefbury, and at Littlecot, at each of which places teffellated pavements and other Roman remains have been found. Of the Roman roads which paffed through Wiltfhire, the principal was a continuation of the Julia Strata, which entering the county from Bath, left it near Hungerford on the eaft. The Foffe road branched off from the Julia Strata at Bathford, at the north-weft córner of the county, where in many places it is ftill confpicuous. Several other roads connected Sorbiodunum with neighbouring ftations; and of thefe, three are traced with confiderable certainty: firft, one which led to *Durnovaria*, or Dorchefter; fecondly, that to *Venta-Belgarum*, Winchefter; and thirdly, another to *Vindonum*, or Silchefter.

The numerous encampments and other intrenched earthen works with which Wiltfhire abounds vary not only in fize and fhape, but in method of conftruction and peculiarity of fituation. Some of thefe are doubtlefs the works of the Britons, others of the Belgæ, of the Romans, of the Saxons, the Danes, and the Normans. Many of them, however, have been in all probability fucceffively occupied and altered by the armies of one or more of thefe nations, at different periods fubfequent to their original formation. The immenfe fortifications of Old Sarum, Chidbury-hill, near Warminfter, and Vefpafian's camp, near Amefbury, conftitute the moft diftinguifhed monuments in this clafs of antiquities.

Caftles.—That this county, at an early period, contained a number of thofe baronial fortified ftructures, which are ufually defignated by the term caftles, and which are fuppofed by feveral writers to have been firft introduced by the Normans, is undoubted. Moft of them, however, are now totally demolifhed, fo that it is even difficult to afcertain their actual fcites; and the reft have been fo much altered in later times, as almoft to efface every veftige of the original building. The more celebrated of thefe edifices, and thofe which moft frequently occur in the ancient hiftorians, are the caftles of Marlborough, Devizes, Ludgerfhall, Wardour, Combe, and Malmfbury.

General Afpect.—In a geographical arrangement, Wiltfhire may be faid to be naturally divided into two portions, by an irregular range of hills, which extends tranfverfely through the greater part of the county in a direction inclining from the north-eaft to the fouth-weft. Thefe diftricts are ufually denominated South and North Wiltfhire, and differ very materially from each other, not only in appearance, but in almoft every diftinguifhing quality.

South Wiltfhire, which claims priority of notice on account of its fuperior extent, forms the weftern divifion of a vaft tract of chalk-hills, which extends into Hampfhire, and having for its boundaries the rich lands of Berkfhire, and the extreme verge of the Marlborough hills on the north; the broken ground of Somerfetfhire on the weft; the new foreft of Hampfhire on the fouth; and the heaths of Surrey and Suffex, together with the Weft Downs of the latter county, on the eaft. The furface of the higher downs, to ufe the words of Gilpin, is "fpread out like the ocean, but it is like the ocean after a ftorm; it is continually heaving in large fwells." In fome parts, the hills affume the form of rotund knolls, and are feparated by fmoothly-fided hollows, which vary confiderably both in depth and extent. At other places they range along for a fhort diftance in connected ridges, fhewing on one fide of the range rather a rapid declivity, from the top of which, on the other fide, the hills fink in irregular gradation, till at length they frequently fhelve into a perfect flat. This effect, fays Marfhall in his "Obfervations on" what he terms "the Weftern Diftrict" of chalk hills, is of courfe more particularly diftinguifhable, "where the range of hills is narrow, *fingle*, than where a congeries of fuch ranges are crowded together diforderly." The whole of this diftrict, generally fpeaking, is feparated into two divifions, the one called Marlborough-Downs, and the other Salifbury-Downs or Plain.

The principal valleys in this divifion of the county lie along the banks of the rivers, the moft remarkable of which diverge like irregular radii from the country around Salifbury and Wilton. Thefe difplay rich meadow and corn lands, interfperfed with feats and villages, and finely covered in various parts with plantations of wood.

North Wiltfhire differs entirely from the fouthern divifion of the county in its general appearance. Inftead of a conftant feries of "chalky waves," the afpect of this diftrict, which extends from the verge of the Downs to the hills of Gloucefterfhire, is nearly that of a perfect flat; the few deviations from the ordinary level being fo gradual as fcarcely to be perceptible, on a curfory view. The country here is fo clofe and well wooded, that when viewed from any of the furrounding hills, it appears like one vaft plantation of trees. If examined in detail, however, it is found alfo to contain many extenfive tracts of rich pafture land, fituated on the banks of the Lower Avon and the Thames, and of fmaller ftreams which flow into both of thofe rivers.

Rivers.—Wiltfhire abounds with rivers, which either take their rife within the county, or on its immediate confines. Two of thefe, the Thames and the Lower Avon, are unqueftionably important ftreams. All the others are much inferior both in extent and confequence; but feveral of them deferve to be particularly noticed, *viz.* the Upper or Salifbury Avon, the Nadder, the Willey, the Bourne, and the Kennet. See THAMES.

The Lower Avon rifes in the hilly diftrict of North Wiltfhire, at a fhort diftance from the town of Wootton-Baffet.

The Upper Avon is formed by the confluence of feveral fmaller ftreams, which take their rife among the hills near the centre of the county. The Kennet rifes near Avebury, and running in an eafterly direction, unites with the Thames at Reading. The Willey and the Nadder join their ftreams at Wilton, and unite with the Avon at Salifbury.

The *cheefe* of North Wiltfhire has long been defervedly celebrated; though for fome time after it became the ftaple commodity here, it was fold in the London market as the manufacture of Gloucefterfhire. See CHEESE.

Wafte Lands.—It is a common idea that the Wiltfhire downs confift entirely of "wafte land." This notion, however, is completely erroneous; for if the correct appropriation of land is to be eftimated by its comparative utility in in different conditions, the application of the grounds in the chalk diftrict cannot be very eafily improved, or materially altered for the better.

In North Wiltfhire the number of common fields is very great, but none of them are of any confiderable extent. It is fubject of regret, however, that they fhould exift at all, as many of them are difperfed over the richeft foil in the diftrict; and if brought under regular cultivation would be extremely productive.

The chaces within Wiltfhire are fuppofed to have been numerous formerly, but only three woodland diftricts now retain that peculiar appellation: thefe are Cranbourn-chace, Vernditch-chace, and Albourn-chace. The firft and fecond join each other, and occupy a long narrow tract of country on the fouthern confines of Wiltfhire. There are three canals which interfect parts of this county: firft, the Thames and Severn; fecondly, the Kennet and Avon; and thirdly, the Wiltfhire and Berkfhire. See CANALS.

The *manufactures* of Wiltfhire are various, and of great extent. Salifbury is noted for its flannels and fancy woollens; and befides carries on a confiderable manufactory of cutlery and fteel goods, which are probably fuperior in workmanfhip to any in the kingdom. Wilton was celebrated for a large manufactory of carpets, and Mere for another of fancy woollens; and in its neighbourhood a great quantity of linen is made, chiefly dowlas and bed-ticks. Broad cloths, kerfeymeres, and fancy cloths, are the principal produce of the towns of Bradford, Trowbridge, Warminfter, Weftbury, Melkfham, Chippenham, and all the adjacent towns and villages from Chippenham to Heytefbury. At Albourn is an excellent manufactory of cotton goods, of which fuftians and thickfets form the moft valuable portion. Swindon and its vicinity has been long famed for its manufactory of gloves.

Ecclefiaftical and Civil Divifion and Government.—The whole of this county is fituated in the province of Canterbury; and, with exception of the parifh of Kingfwood, is in the diocefe of Salifbury. It comprehends two archdeaconries, Sarum and Wilts; the former comprifing the deaneries of Salifbury, Amefbury, Chalk, Pottern, Wilton, and Wily; and the latter, with the annexed rectory of Minety, thofe of Avebury, Cricklade, Malmfbury, and Marlborough.

As in the other counties of England, the chief civil magiftrates of Wiltfhire are, the lord-lieutenant, the cuftos rotulorum, and the high fheriff; which laft is elected annually, and whofe official bufinefs is chiefly conducted by a deputy-fheriff. The other local members of government are, juftices of the peace, mayors and bailiffs of boroughs, and a variety of fubordinate officers. The acting magiftrates are feventy-three, and the petty feffions for the county thirteen.

Wiltfhire is comprehended in the weftern circuit, and fends thirty-four members to parliament, *viz.* two knights of the fhire, two citizens for Salifbury, and two burgeffes for each of the following boroughs; Chippenham, Calne, Cricklade, Devizes, Heytefbury, Hindon, Downton, Great Bedwin, Marlborough, Malmfbury, Ludgerfhall, Weftbury, Wilton, Wootton-Baffet, and Old Sarum. At an early period the whole county was divided into twenty-nine portions, called *hundreds;* and thefe are again fubdivided into two hundred and ninety-five fmaller diftricts, called parifhes; with parts of fourteen others. In the county is one city, Salifbury; and twenty-three market-towns, *viz.* Amefbury, Bradford, Calne, Chippenham, Cricklade, Devizes, Downton, Great Bedwin, Heytefbury, Hindon, Ludgerfhall, Malmfbury, Marlborough, Market-Lavington, Melkfham, Mere, Swindon, Trowbridge, Warminfter, Weftbury, Wilton, and Wootton-Baffet.

The government, provincial management, number, and ftate of the poor in this county, as laid before parliament in the year 1804, and publifhed by authority of the houfe of commons, are detailed in the following particulars. It is ftated, "that returns were received from three hundred and thirty-fix parifhes, or places, in the county of Wilts, in the year 1803; in 1785, the returns were from three hundred and thirty-fix; and from three hundred and twenty-five, in 1776." It is then further ftated, "that forty-one parifhes, or places, maintain all or part of their poor in workhoufes; the number of perfons fo maintained, during the year ending Eafter 1803, was one thoufand fix hundred and feven; and the expence incurred therein amounted to 14,547*l.* 2*s.* 0½*d.*, being at the rate of 8*l.* 19*s.* 8*d.* for each perfon maintained in that manner. By the returns of 1776, there were forty workhoufes capable of accommodating two thoufand and feventy-nine perfons. The number of perfons relieved out of workhoufes was forty thoufand five hundred and eleven, befides four thoufand five hundred and thirty-fix, who were not parifhioners. The expence incurred in the relief of the poor, not in workhoufes, amounted to 113,888*l.* 17*s.* 9½*d.* A large proportion of thofe who were not parifhioners appear to have been vagrants; and, therefore, it is probable the relief given to this clafs could not exceed 2*s.* each, amounting to 453*l.* 12*s.* 0*d.* This fum being deducted from the above 113,888*l.* 17*s.* 9½*d.*, leaves 113,435*l.* 5*s.* 9¼*d.*; being at the rate of 2*l.* 16*s.* 0*d.* for each parifhioner relieved out of any workhoufe. The number of perfons relieved *in* and *out* of workhoufes was forty-two thoufand one hundred and twenty-eight, befides thofe who were not parifhioners. Excluding the expence fuppofed to be incurred in the relief of this clafs of poor, all other expences relative to the maintenance of the poor amounted to 131,864*l.* 19*s.* 9¾*d.*, being at the rate of 3*l.* 2*s.* 7*d.* for each parifhioner relieved. The refident population of the county of Wilts, in the year 1801, appears from the population abftract to have been one hundred eighty-five thoufand one hundred and feven; fo that the number of parifhioners relieved from the poor's rate appears to be twenty-three in a hundred of the refident population. The number of perfons belonging to Friendly Societies appears to be fix in a hundred of the refident population. The amount of the whole total money raifed by rates is 16*s.* 0¾*d.* *per* head on the population. The amount of the whole expenditure on account of the poor appears to average at 14*s.* 3½*d.* *per* head on the population. The expenditure in fuits of law, removal of paupers, and expences of overfeers, and other officers, according to the prefent abftract, amounts to 3682*l.* 15*s.* 0*d.* The amount of fuch expenditure, according to the returns of 1785, was then 2501*l.* 13*s.* 9*d.* The expenditure in purchafing materials for employing the poor, according to the prefent abftract, amounts to 849*l.* 8*s.* 7½*d.* The amount of fuch expenditure, according to the returns of 1785, was 434*l.* 11*s.* 9*d.* It does not appear from the returns received, that the poor of any parifh or place in this county are farmed or maintained under contract. The poor of fix parifhes are maintained and employed under the regulations of fpecial acts of parliament. Thirty-fix Friendly Societies have been enrolled at the quarter-feffions of this county, purfuant to the act of 33 & 35 Geo. III."—Beauties of England and Wales, Wiltfhire, by J. Britton, F.S.A. 8vo. 1814. Ancient Wiltfhire, by fir Richard C. Hoare, bart., folio, 1815.

after which the ſpun-yarn is wound round the body of the winch.

WINCHCOMBE, in *Geography*, a market-town in the lower diviſion of the hundred of Kiftſgate, Glouceſterſhire, England, is ſituated on the Cotſwold-hills, 15 miles N.E. by E. from the city of Glouceſter, and 95 miles W.N.W. from London. It was anciently a town of conſiderable importance, was written Wincelcumbe in Domeſday-Book, and was there ſtyled a borough when only Glouceſter and Briſtol, in the ſame county, were dignified with that title. It was the ſcite of a caſtle, and of a mitred abbey ſufficiently capacious for the reception of 300 monks; but every veſtige of theſe buildings has long been levelled with the duſt, and the places where they ſtood are only conjectured. By whom the caſtle was erected is unknown; but the abbey was founded in 798, by Kenulph, king of Mercia, and was conſecrated with great ſolemnity in the preſence of three kings, and a great number of prelates and nobles. Being deſtroyed by the Danes, it was rebuilt in 981 by Oſwald, biſhop of Worceſter, who converted it into a college of ſeculars, and reſtored it to great ſplendour. It was largely endowed; and in the reign of the Conqueror nineteen manors in this county were annexed to it, independently of Winchcombe itſelf. In 1265 its abbot was ſummoned to parliament, and the privilege was continued to all the ſucceeding abbots. The twenty-eighth abbot, Richard Ancelme, ſurrendered his abbey and its poſſeſſions to Henry VIII. in 1539. The edifice was ſoon after totally deſtroyed. Tradition reports it as very magnificent; but no deſcription of it is now extant. Winchcombe, with a ſmall territory adjoining, is ſaid to have been, in the Anglo-Saxon time, a ſheriffdom or county of itſelf; but in the reign of Canute, it was diveſted of its independence, and annexed to Glouceſterſhire. The town now conſiſts chiefly of two ſtreets, interſecting each other; the houſes are low, and principally of ſtone. The difficulty of approaching it, through the badneſs of the roads, has prevented it from being much viſited; but the new turnpike-roads have now opened a ſhort and eaſy communication. The church is a ſpacious ſtructure, with a nave, chancel, two aiſles, and an embattled tower: the body of the church is alſo ornamented with battlements and pinnacles. The old church ſtood at the weſt end of the town; but having fallen to decay, the preſent fabric was begun in the reign of Henry VI. by the abbot, William Winchcombe, who completed the eaſt part: the remainder was finiſhed by the pariſhioners, aſſiſted by the munificence of Ralph Boteler, lord Sudeley. The government of the town, which is a borough by preſcription, is veſted in two bailiffs and ten aſſiſtants; from the latter, the bailiffs are annually choſen. A weekly market is held on Saturdays, and here are three annual fairs, which are well attended; but from the recluſe ſituation of the town very little trade is carried on, a paper-mill and a tan-yard being the chief ſources of employ. The workhouſe is an ancient irregular building, in which the poor are employed in ſpinning and weaving linen. Here are alſo an alms-houſe for twelve poor women, and three charity-ſchools. The population of the town in the year 1811, according to the return to parliament, was 1256, occupying 299 houſes: the pariſh extends twelve miles in circumference, and includes nine hamlets; the enumeration of the whole was 461 houſes, and 1936 inhabitants.

About a quarter of a mile to the ſouth-eaſt of the town are the ruins of Sudeley-caſtle, erected by Ralph, lord Boteler, an eminent ſtateſman in the reign of Henry VI., on the ſcite of a more ancient caſtle which appears to have been the reſidence of Herald, ſon to Radulf, earl of Hereford, in the time of the Norman conqueror. In this family, which aſſumed the name of Sudeley, the manor continued till the 41ſt of Edward III., when it was conveyed by marriage. Sudeley was attached to the crown till the reign of Edward VI. when it was granted to ſir Thomas Seymour, who ſettled here with Catharine Parr, the queen-dowager, whom he had married, and who died here in child-bed, not without ſuſpicion of poiſon. Seymour being afterwards attainted, Sudeley was granted to William Parr, marquis of Northampton, who forfeited it ſoon afterwards. It now belongs to the marquis of Buckingham. Of this once-famed fortreſs, very little remains: parts of towers, the hall, and the chapel, ſerve to ſhew the ſtyle of architecture and character of the buildings.—See Williams's Hiſtory, &c. of Sudeley Caſtle, folio. Alſo Beauties of England and Wales, vol. v. by J. Britton and E.W. Brayley.

WINCHELSEA, a borough and market-town on the coaſt of Suſſex, England, ſituated about 3 miles W. from Rye, 8 E. from Haſtings, and 67 from London. It is a member of the Cinque Ports, and an incorporated town, the officers of which conſiſt, according to its charters, of a mayor and twelve jurats; but theſe are ſeldom compoſed of more than four or five perſons. Winchelſea is a place of antiquity; but by the ravages of the ſea, the ſcites of its houſes, at different periods, have totally changed. The epoch of the rapid though gradual overthrow of the original town is fixed by Leland between 1280 and 1287. During that time the inhabitants petitioned Edward I. for ground to found another town, who accordingly granted them the ſcite of the preſent town, which he ſurrounded with walls, and to it the inhabitants gradually removed. The new town afterwards fell into decay, from a cauſe juſt the reverſe of that which ruined the old; for the ſea deſerted its neighbourhood, and left in its place a dreary marſh. This began to be ſenſibly felt in the end of the reign of queen Elizabeth. The channel leading to the harbour was choaked, the coaſt was deſerted, and the town, abandoned by the trader, ſoon declined. The houſes and churches fell to ruin, ſo that a town, once covering a ſurface two miles in circuit, is now reduced to comparatively a few houſes in a corner of its ancient ſcite, now a mile and a half from the ſea. Of the ancient church, the lofty and ſpacious chancel, now uſed for divine ſervice, and three aiſles, alone remain entire. In it are two monuments, with effigies of knights templars. Some fragments of the walls and of three gates of the town ſtill exiſt. From the ſituation of Winchelſea, and the ſpacious vaults frequently diſcovered, it is probable that the town was the principal mart for French wines, imported into England before the wine-trade with Portugal was eſtabliſhed. Winchelſea ſends two members to parliament, who are elected by about forty freemen. The houſes in this pariſh, in 1811, were 126, containing 131 families, and 652 perſons.—Beauties of England, vol. xiv. 8vo. 1813, Suſſex, by F. Shoberl.

WINCHELSEA *Iſland*, an iſland in the Pacific ocean; 30 miles S.E. of ſir Charles Hardy's iſland.

WINCHENDON, a town of the ſtate of Maſſachuſetts, in the county of Worceſter, with 1173 inhabitants; 56 miles N.W. of Boſton.

WINCHESTER, an ancient and eminent city in Hampſhire, or the county of Southampton, in England, 11 miles N.N.E. from Southampton, and 62½ W.S.W. from London. The buildings are diſpoſed on the eaſtern declivity of a low hill, which gently ſlopes to the valley of the river Itchen, the chalky cliffs of which, and the chalky ſoil of the ſurrounding heights, in the opinion of Camden, occaſioned the ancient name of the city, *Caer-Gwent*, ſignifying the 'white city.' The latter portion of the name, under

under the Romans, became *Venta*, with the addition of *Belgarum*, from its ſituation in the country occupied by the *Belgæ*, by which it was diſtinguiſhed from *Venta Silurum*, now Caerwent, in Monmouthſhire, and *Venta Icenorum*, now Caſtor, near Norwich, in Norfolk. From *Gwent* or *Venta* we have the firſt part of the name, and *cheſter*, the laſt part, is a corruption of *caſtra*, the Roman term for encampments of different kinds; a frequent name, or appendage of a name, of various places in England, and perhaps invariably an indication that ſuch places owe both their origin and their primitive form to the military ſtations of the earlieſt conquerors of Britain.

Hiſtoric Events.—The origin of Wincheſter, remote as it unqueſtionably is, has been carried back to an epoch far beyond belief, even a century and half anterior to the foundation of Rome. Without referring to ſuch remote and uncertain time, we may ſafely infer that this ſpot was occupied by the Belgæ, a Germanic tribe, who paſſing from Gaul, took poſſeſſion of the country bordering the ſouthern coaſt of England. (Cæſar's Bel. Gal. ii. 4.) Previous to their occupancy, it is conjectured that Wincheſter was the Caer-Gwent, or white city, of the aboriginal Britons. After the Romans had ſubdued the Belgæ and the Britons, they took poſſeſſion of this town, and fortified it with ramparts and walls. Theſe were diſpoſed on the ſloping ſide of a hill, and in the uſual form of a parallelogram. Within this incloſure the town was conſtructed and arranged; and from the importance of this ſtation, and its connection with other ſtations by military roads, there can be little doubt that *Venta Belgarum*, the Roman name, was a place of conſiderable importance. Among the antique relics of the Romans, which have been diſcovered at Wincheſter, are ſeveral coins, urns, &c.; alſo ſome fine coins of Caractacus, called the firſt Britiſh emperor. After the Romans left the iſland in 446, Gortheryn, or Vortigern, was elected chief of the weſtern diſtrict, and he fixed his ſeat of government at Wincheſter. This town, as well as the whole iſland, was ſoon deſtined to experience a total change of polity, cuſtoms, and manners, by the introduction and domination of the Saxons in 519. On this occaſion, the name of the city was changed from the Britiſh Caer-Gwent and the Roman Venta to another of equal import, *Wintan-ceaſter*, from which the modern name, Wincheſter, has gradually been formed. In 635 an important event occurred in Wincheſter, the arrival there of Birinus, deputed by pope Honorius to preach the goſpel in thoſe parts of the country ſtill involved in paganiſm. Favoured by king Kinegils, Birinus's apoſtolic labours were eminently ſucceſsful; for the king founded a new cathedral on the ſcite of that deſtroyed under Diocletian, which was conſecrated under his ſon and ſucceſſor, Kenewalch, in 648. Egbert, king of the Weſt-Saxons, ſucceeding in the ſubjection of all the other Saxon princes, was in 827 crowned king of all England in the cathedral of Wincheſter, thus created or conſidered to be the metropolis of the whole kingdom; and there, about 854, Egbert's ſucceſſor, Ethelwolf, granted his famous charter, eſtabliſhing a general ſyſtem of tythes. About this period the commerce of the city is recorded to have greatly increaſed, and the principal inhabitants are ſtated to have conſtituted a guild, under the royal protection; the earlieſt aſſociation of the kind, by a century, recorded in hiſtory. During the greater part of this and the ſucceeding reign, the ſee of Wincheſter was filled by the celebrated St. Swithun, by whoſe advice king Ethelbald raiſed fortifications for the defence of the cathedral againſt the Danes. Landing at Southampton, they advanced to Wincheſter, where they committed horrible exceſſes; but the cathedral eſcaped their fury. About 871, however, that greatly ſuffered by them, and all the clergy belonging to it were maſſacred. On the ultimate ſucceſs of the great Alfred, Wincheſter reſumed a portion of its former ſplendour; it became again the ſeat of government; there the public records of the kingdom were depoſited, in particular the general ſurvey, called, from this circumſtance, *Codex Wintonienſis*, afterwards imitated by William the Conqueror in 1086, in the famous Roll of Wincheſter, or *Domeſday-book*. (See DOMESDAY.) The ſucceſſion of Edgar the Peaceable increaſed the importance of Wincheſter. Among the judicious laws which he eſtabliſhed was one to prevent frauds ariſing from the diverſity of meaſures uſed in the country, by providing a ſtandard legal meaſure for the whole of his dominions. This was the origin of the eſtabliſhed *Wincheſter meaſures;* the ſtandard veſſels for meaſurement made by Edgar's orders being depoſited in that city, where the original buſhel is ſtill preſerved. In the reign of this prince, in 980, the cathedral, having been partly rebuilt, was ſolemnly re-conſecrated. About the ſame time the married canons of the cathedral were, at the ſuggeſtion of St. Dunſtan, removed, to make room for Benedictine monks. In Wincheſter, in 1002, and in the reign of Ethelred, ſurnamed the Unready, commenced the general maſſacre of the Danes, in mercileſs vengeance for the atrocities they had committed on the inhabitants of the country. Thence aroſe the noted *hock-tide ſports*, of which ſome traces may ſtill be obſerved in remote corners of England. But this vengeance remained not long unrequited by Swayne the Dane, who obtained poſſeſſion of Wincheſter eleven years afterwards. St. Elphage II., then biſhop, is ſaid to have firſt introduced organs into the cathedral. Canute, obtaining the ſovereignty of England by the death of Edmund Ironſide in 1016, choſe Wincheſter for his capital, and, with other rich gifts, beſtowed on the cathedral his crown, which was placed over the crucifix on the high altar: for Canute had vowed never more to wear that enſign of royalty, from the day when, by commanding in vain the flowing tide not to approach his feet, he proved to his flatterers the emptineſs of their adulation, in hailing him lord of the ocean. Wincheſter cathedral is deſcribed to have been the ſcene of a legendary tale relating to queen Emma, mother of Edward the Confeſſor, who is ſaid, but very improbably, there to have eſtabliſhed the purity of her character, by walking unhurt over nine burning plough-ſhares. In the reign of the ſame Edward, the broad ſeal of the chancellor of England was firſt made and kept in Wincheſter.

The Norman invaſion produced many changes in the ſtate of the city: there king William I. founded a caſtle, as he did in many other parts of the kingdom, with the view of overawing, under the pretence of protecting, the inhabitants. It continued, however, to be a principal royal reſidence, although London then began to aſſume the pre-eminence. The politic monarch knew the influence of the clergy over the people; he conſequently aſſigned all or moſt of the chief offices in England to his relatives, dependants, and oſtenſible friends. Councils were held in Wincheſter, in which the new clergy, with the primate Lanfranc at their head, drew up canons or laws levelled at the Saxons, and framed to protect or juſtify themſelves. Wincheſter, the reſidence of the court, was of courſe filled with the prieſts, the officers, and the followers of the king. The curfew (*couvre-feu*), or eight-o'-clock-bell, was firſt rung in Wincheſter. The year 1079 is memorable in the hiſtory of Wincheſter, for then was commenced the preſent ſpacious and magnificent cathedral church. In the reign of Henry I. a ſingular tranſaction is recorded to have taken place in Wincheſter. The current coin of the realm having been greatly debaſed by the different mint-maſters, the king in 1125 aſſembled them in this city, when all, except three who dwelt in Wincheſter, were found guilty and ſeverely puniſhed. The baſe money was cried down, and an entirely new coinage ordered to be made by the three maſters who had preſerved their honeſty. About the ſame period Henry cauſed to be made a ſtandard yard, from the length of his own arm, in order to prevent frauds in the meaſurement of cloth. This ſtandard is ſuppoſed to have been depoſited with other meaſures, &c. in Wincheſter. The city ſuffered greatly in the diſſenſions conſequent on the death of Henry, by the ſtruggle between his nephew Stephen and his daughter, the empreſs Matilda, or Maud. Stephen's party held the biſhop's palace, the cathedral, and adjoining quarters, while Maud's poſſeſſed the caſtle and the remainder of the city. By fire from Stephen's party, the whole north portion, then the moſt populous, the royal palace, the abbey of St. Mary, and twenty churches, the magnificent monaſtery of St. Grimbald, the ſuburb of Hyde, &c. were deſtroyed. Many privileges were conferred on Wincheſter by Henry II., in particular, in 1184, that of being governed by a mayor, with a ſubordinate bailiff. His ſucceſſor, Richard Cœur-de-lion, was ſolemnly re-crowned in the cathedral in 1194, on his return from captivity under the duke of Auſtria. In the end of 1207 was born in Wincheſter Henry III.; and ſoon afterwards his father John, for the ſum of 200 marks paid at once, and 100 marks *per annum*, conferred on the city all the great and unprecedented privileges of a corporation. Thus Wincheſter became the firſt of all the corporate cities or towns in the kingdom, nearly two years before London had even obtained the privilege of being governed by a mayor. The dignity of the city was in ſome meaſure reſtored by the reſidence of Henry III. during his minority; but it again ſeverely ſuffered in the conteſts between the king and the barons. A heavy blow on Wincheſter proceeded from the removal of the royal reſidence, in the reign of Edward I.; who nevertheleſs held ſeveral parliaments there. Under Edward III. it was conſtituted one of the fixed markets, or ſtaples for wool; but by the removal of the ſtaple in 1363, the decline of Wincheſter from commerce and wealth was ſenſible and uniform. In this reign the rebuilding of the nave of the cathedral was begun by biſhop Edington; but the honour of completing it, with material alterations, was reſerved for his celebrated ſucceſſor, William of Wykeham. To Wincheſter Henry VI. was a conſiderable benefactor; for in his reign it was ſo reduced in trade and population, that the inhabitants, in a petition to the king, repreſented 997 houſes to be unoccupied, and 17 churches ſhut up. The ſee of Wincheſter was held for a ſhort time by cardinal Wolſey; but in the time of his ſucceſſor, Gardiner, the final diſſolution of the monaſteries, and the conſequent deſtruction of religious houſes, reduced the city to be little more than the ſkeleton of what it had formerly been. It revived for a ſhort time in the reign of Mary, who there ſolemnized her union with Philip of Spain, and reſtored to the ſee many lands which had been alienated by her father and brother. The city itſelf, however, had, as appears by a charter of Elizabeth, fallen "into great ruin, decay, and poverty." The commencement of 1603 was diſtinguiſhed by the proclamation of James I. in Wincheſter, by the ſole authority of the ſheriff of the county, without waiting for the orders of the privy council in London, who had paſſed ſeveral hours in deliberation on the ſubject. In the civil wars of Charles I.'s time, Wincheſter was ſucceſſively held by the oppoſite parties; but after the fatal battle of Naſeby in 1645, it was finally reduced by Cromwell. The works of the caſtle were blown up, the fortifications of the city were deſtroyed, together with the biſhop's caſtle of Wolveſey, and ſeveral churches, and other public buildings. During the latter part of the reign of Charles II. Wincheſter had a proſpect of recovering ſome portion of its former ſplendour; for he choſe it for his uſual reſidence, when not required by preſence in the capital. In imitation of his example, many of the nobility and gentry likewiſe erected manſions in the city; but by Charles's death in 1685, the project was laid aſide; the palace was left unfiniſhed; and ſo completely has its original deſtination ſince been changed, that, after being frequently uſed as a priſon of war, it is now converted into military barracks for the diſtrict.

Fortifications: Palace.—The ancient walls of Wincheſter form an irregular parallelogram, incloſing a portion of the ſlope of the weſtern hill, and of the level valley watered by the Itchen. But the walls are now nearly deſtroyed, and the foſs in many places filled up. The four gates ſeemed to have been conſtructed where thoſe of the Roman intrenchment were opened. Through two of them, on the north and ſouth ſides, paſſed the great Roman road communicating between *Vindonum*, now Silcheſter, and *Clauſentum*, near Southampton. Through the gate in the weſt ſide of the incloſure, correſponding to the Prætorian gate of the intrenchment, ran the road communicating with *Sorbiodunum*, where now ſtand the remains of Old Sarum. This gate ſtill exiſts, but much altered from its ancient ſtate: part of it is ſuppoſed to be coeval with the city walls, but the whole weſtern face diſplays workmanſhip of much later date. The eaſt or Decuman-gate opened acceſs to the lively and wholeſome waters of the Itchen.

The caſtle, now entirely deſtroyed, overlooking the city from the weſt, owes its origin to the ſyſtem of dominion adopted by William of Normandy. Within its boundary, of an elliptic form, 850 feet from north to ſouth, and in its greateſt breadth 250 feet from weſt to eaſt, ſtands the original chapel dedicated to St. Stephen, and apparently erected by the king of that name. It is in length 110 feet, divided into a nave and ſide-aiſles. At the eaſt end is ſuſpended the antique curioſity called king Arthur's round-table; but with more accuracy attributed to king Stephen, and probably introduced by him to prevent diſputes for precedency, during their entertainments, among the chivalrous champions of that age. It is 18 feet in diameter, compoſed of ſtout oaken planks, painted with the figure of the renowned Arthur, and the names of his twenty-four knights, as collected from the romances of the 14th and 15th centuries. The coſtume is, however, of the time of Henry VIII., when the table was painted. This chapel was, in Cromwell's time, converted into a county-hall, a deſtination to which it continues to be applied. In the year 1792, ſeveral thouſands of French eccleſiaſtics ſought refuge on the Britiſh ſhores. In their deſtitute ſituation, they were generouſly ſuccoured by the ſtate and the people; and at one time one thouſand of them were accommodated with lodgings, and all other neceſſaries, in this deſerted abode of royalty.

Wincheſter poſſeſſed alſo another fortreſs at the oppoſite end of the city: this was Wolveſey caſtle, the epiſcopal reſidence erected by the powerful biſhop Henry de Blois, brother of king Stephen.

Cathedral.—The grand object of attraction in Wincheſter is its cathedral, one of the moſt intereſting ſtructures of its kind in England, whether conſidered with reſpect to the antiquity of its foundation, to the importance of the tranſ-

actions

actions of which it has been the fcene, or to the characters of the perfonages whofe mortal remains it contains. This magnificent and venerable ftructure has been called, and not without fome propriety, a fchool of ecclefiaftical architecture; for it difplays to the ftudent an interefting and varied feries of examples of the ancient architecture of England, from an early age down to a recent period. If the ftudent fail to fatisfy himfelf as to Roman remains, or genuine Saxon work; if, after careful examination, he retire either doubtful or perfuaded that no fuch architecture is there to be difcovered; ftill he will have ample evidence and examples of Norman works. The plans and magnificent defigns of thofe proud invaders and innovators are in that fabric amply difplayed. There he will fee that the Normans built not for themfelves only, but for pofterity; that their edifices were folid and fubftantial, fimple in their forms, and large in their parts; that as their fyftem of religion was intended to awe, terrify, and foothe the mind, fo its primary temple in England was calculated moft effentially to promote thofe ends.

The cathedral of Winchefter is of great extent, its extreme external length being 556 feet, that of the crofs or tranfepts 230 feet; the external breadth of the whole body and choir 118 feet, and that of the tranfepts 88 feet. The body of the church is divided by ranges of cluftered columns into a nave and two fide-aifles, as are alfo the tranfepts, with the unufual addition of aifles at the extremities. The great central tower refts upon four piers of great folidity, and rifes 140 feet from the pavement. The prefent fabric may be confidered as the foundation of bifhop Walkelyn, a chaplain and relative of William of Normandy, who began it in 1079, conftructing the crypts, the tranfepts, and tower; alfo the internal parts of the piers and walls of the nave. The work was continued under fucceeding prelates, in particular by bifhop de Lucy, who built part of the eaft end; by Edington, who erected the weft front about 1330; and above all by Wykeham, who, between 1370 and 1400, brought the nave to completion. The exterior of the cathedral prefents but few beauties, or attractive features. Its length of nave, plainnefs of mafonry, fhortnefs and folidity of tower, width of eaft end, and boldnefs of tranfepts, furnifh, however, fo many peculiar and fpecific characteriftics. The interior of the cathedral will amply compenfate for any defects or deficiencies of the outfide. While the fine and fublime architecture of Wykeham, in the nave and aifles, produces the moft impreffive effect, and claims general admiration; the large, plain, and fubftantial works of Walkelyn, in the tower and tranfepts, are fimply grand and impofing. The tranfepts and tower are entitled to attention, as unrivalled fpecimens of Norman architecture. The choir and eaftern end are elevated above the nave and aifles, by an afcent of feveral fteps; the choir itfelf occupying the fpace moftly beneath the Norman tower, and fitted up with ftalls of elaborate workmanfhip. On the north fide ftands the pulpit, curioufly carved in the time of Silkftede, who became prior in 1498. On the fame fide of the choir is placed the organ, in an unufual fituation, under one of the lofty arches of the tower. The choir is feparated from the nave by a fcreen of the Compofite or Roman order of architecture, faid to have been defigned by Inigo Jones. The lofty ftone fcreen erected behind the high altar is an elaborate and fumptuous work, covered with niches, canopies, buttreffes, pinnacles, crockets, pediments, &c.; and when in its original colour and condition, with ftatues and coftly ornaments, muft have been peculiarly fplendid and beautiful. On entering the church by the weft door, the attention is firft arrefted by the vaft and lofty columns of the nave, which have been made to affimilate with the pointed ftyle, by furrounding them with cluftered fhafts and other ornaments. Between the fifth and fixth columns, on the fouth fide, ftands the chantry or mortuary chapel, containing the tomb of bifhop William of Wykeham, erected in his life-time, or prior to the clofe of the year 1404. On an altar-tomb within the chapel is the marble effigy of the founder. On the fame fide of the nave is the chantry of bifhop Edington, who died in 1366; within an open fcreen is an altar-tomb fupporting his effigy. Immediately behind the altar-fcreen in the fouth aifle is placed the fumptuous chantry of bifhop Fox, containing neither tomb, ftatue, nor infcription, to commemorate the founder, or to explain his works in the church. In a recefs beneath is the effigy of an emaciated human figure, the head ornamented with a mitre, but the feet refting on a fkull. Oppofite to this chantry in the north aifle ftands that of bifhop Gardiner, who died in 1555. Towards the eaftern extremity of the church are the chantries of cardinal-bifhop Beaufort on the fouth fide, and of bifhop Waynflete, the munificent founder of St. Mary's college, Winchefter, and Magdalen college, Oxford, on the north fide; each containing the tombs and figures of the refpective prelates. The eaftern extremity of the church is terminated by the fpacious Lady-chapel, with a fmaller inclofed on each fide. In the middle of the prefbytery, between the choir and the altar, lies a coffin-tomb, faid to cover the remains of William Rufus, who was killed while hunting in the New Foreft, and buried in this cathedral in 1100. On the top of the fide-fcreens, between the prefent choir and the aifles, are placed fix wooden chefts, the work of bifhop Fox, containing memorials and relics of Saxon monarchs, princes, and other illuftrious perfonages, former protectors and benefactors of the cathedral. Another object of undoubted antiquity is the curious font, now placed between two columns on the north fide of the nave. It is a large fquare block of black marble, charged on each fide with fculptures, the whole fupported by fmall columns at the corners. The fubject of the fculptures is a matter of difpute; and although as productions of art they are beneath criticifm, yet as reprefentations of coftume, manners, implements, &c. they deferve particular attention.

Epifcopal Caftle, or Palace.—Of this ftructure, better known by the name of Wolvefey caftle, the ruins fhew it to have been an imperfect parallelogram of about 250 feet by 160. What ftill remains belonged to the keep. Much was removed to make way for the new palace erected by bifhop Morley, under the fuperintendance of fir Chriftopher Wren, after its deftruction by Cromwell. The front of Morley's palace was pulled down by the prefent bifhop, who never occupies the prefent houfe.

College.—One of the moft celebrated inftitutions of Winchefter is the college, founded by bifhop Wykeham, and completed in 1393, on the fcite of an ancient grammar-fchool; intending it as preparatory for his eftablifhment of New college, Oxford. The eftablifhment in Winchefter confifts of a warden, 70 fcholars, 10 fecular priefts, who are perpetual fellows, 3 priefts' chaplains, 3 clerks, 16 chorifters, and a firft and a fecond mafter. So judicious and complete were the ftatutes drawn up by Wykeham for the government of his college in Winchefter, as to be adopted, with very little alteration, by Henry VI., for his own fplendid inftitutions at Eton and King's college, Cambridge. On the confirmation, by Edward VI., of the general diffolution of colleges, &c. introduced by his father, Winchefter college, with thofe of Eton and the univerfities, were fpecially excepted. The buildings of the college occupy a confiderable extent of ground, and confift principally

cipally of two courts, with a cloifter. The entrance to the firft court is under a fpacious gateway, having the mutilated bufts of a bifhop and a king, to reprefent the founder and his royal patron, Edward III. The fecond court is alfo entered by a tower gateway. The chapel and hall form the fouth wing of the quadrangle, and are enlightened by lofty windows. The interior of the chapel has a fine and lofty vaulting, ornamented with tracery. In the centre of the cloifter is the library, originally conftructed for a chantry in 1430, but converted to its prefent ufe in 1627. In the fouth-weft corner of the fecond court is the hall or refectory, between which and the paffage to the chapel is the fchool, a plain brick building, erected by fubfcription in 1687; over the door is the ftatue of the founder in bronze, by Cibber.

City.—The prefent city of Winchefter confifts chiefly of one main ftreet, extending from the weft to the eaft, with a number of collateral ftreets and lanes branching off on each fide. Towards the middle of the High-ftreet ftands the city crofs, an elegant fpecimen of the ftyle of the age of Henry VI., confifting of three ftories adorned with open arches, niches, pinnacles, and fmall croffes. The ecclefiaftical buildings in Winchefter, and its fuburbs, were once very numerous, and, according to fome writers, amounted to upwards of ninety. Scarcely twelve now remain. St. Laurence's church, near the crofs, is confidered as the mother-church of the city, and by a folemn entry into it the bifhop takes poffeffion of his fee; but the principal parochial church is now that of St. Maurice. The town-hall, or more properly the hall of the guild of merchants of Winchefter, rebuilt in 1713, occupies the place of one erected about 1112. There the city archives, the original Winchefter bufhel of king Edgar, and other meafures of length and capacity fixed as ftandards by fucceeding princes, and various curious memorials of antiquity, are now preferved. The front of the building is ornamented with a ftatue of queen Anne. A neat market-houfe was erected in 1772. The ancient building on the north fide of the High-ftreet, called St. John's Houfe, was originally founded as an hofpital, apparently fo early as in the 10th century; but falling into the poffeffion or the adminiftration of the knights templars, or of St. John of Jerufalem, it was on the fuppreffion of their order granted by Edward II. to a citizen of Winchefter, who refounded the inftitution for the fick and lame foldiers, pilgrims, and wayfaring men, to have their lodging and diet there gratis for one night or longer, as their inability to travel might require. At the general diffolution of hofpitals and monafteries, the revenues and moveable property were feized by Henry VIII.; but the corporation of the city referved the building itfelf to be ufed for municipal bufinefs. In 1554 it again became a charitable foundation, being endowed by Richard Lamb, efq. for the fupport of fix widows. The principal chamber or hall, which is 62 feet in length, 38 in breadth, and 28 in height, has been handfomely fitted up, chiefly by a donation from the late colonel Brydges of Avington. Among the decorations of this hall, in which public feafts, mufic-meetings, and affemblies are held, is a whole-length picture of Charles II. by Lely, prefented to the city by that king himfelf. In the adjoining council-chamber are fufpended the city tables, as they are called, containing a chronological arrangement of the moft remarkable occurrences relating to Winchefter. The ancient chapel of the hofpital is now ufed as a free-fchool. The celebrated monaftery founded by the great Alfred, called the 'Newen Mynftre,' and afterwards Hyde abbey, occupied nearly the whole fpace between the cathedral and the High-ftreet. Completed under his fon Edward, it was firft filled by canons regular, who, in 963, gave place to Benedictine monks. Alwyn, the eighth abbot, with twelve of his monks, fell in the battle of Haftings, in fupporting the caufe of his nephew, Harold, which drew upon the abbey the vengeance of William of Normandy. But the pofition being unhealthy and inconvenient, a new and magnificent church and monaftery were erected juft without the north wall of the city, on the fpot called Hyde-meadow, to which the monks removed in 1110, carrying with them the remains of feveral illuftrious perfonages who had been buried in the former abbey, among which were thofe of Alfred himfelf and fome of his defcendants. The annual revenues of Hyde abbey, of which the abbot fat in parliament, were at the diffolution valued at 865*l.* 18*s.* The church and monaftery were foon afterwards demolifhed, and even the tombs of Alfred and other eminent perfons were defpoiled. What now remains of this inftitution is the fmall and mutilated parifh-church of St. Bartholomew. Precifely on the fpace occupied by the abbey-church was fome time ago erected a bridewell, or houfe of correction, on the plan of the benevolent Howard. In digging the foundations, ftone coffins, rings, and veffels for the fervice of the church, were difcovered, together with fragments of architectural fculpture. But between fifty and fixty years ago, among the remains of the buildings, was found a ftone with this infcription in Saxon characters, 'Alfred Rex DCCCLXXXI.' Another remarkable religious eftablifhment in Winchefter was the Nunna Mynftre, or abbey of St. Mary, founded by Alfred's queen, Alfwitha, and the place of her retirement after his death. Scarcely any veftige of the conventual buildings now remain, excepting in a modern manfion built out of the ancient materials, and the name of the abbey ftill applied to the inclofure where it ftood.

Winchefter, befides the numerous churches of the eftablifhment, contains meeting-houfes for diffenters of various denominations, among which the principal building is the Roman Catholic chapel, rebuilt by Dr. Milner in 1792, on the foundations of one more ancient. A large and commodious county-gaol, from the defigns of Mr. Moneypenny, has been lately erected on the north fide of the city.

Many privileges have at various times been beftowed on Winchefter by Englifh fovereigns. Its chief magiftrate, as was before noticed, received the title of mayor in 1184, fome years before the title was granted to the chief magiftrate of London. The firft charter was conferred by king John; but that under which the city is now governed was the gift of Elizabeth, "in confideration," as it is ftated, "of the city of Winchefter having been moft famous for the celebration of the nativities, coronations, fepulchres, and for the prefervation of other famous monuments of the queen's progenitors." By this charter, the government is vefted in a mayor, recorder, fix aldermen, a town-clerk, two coroners, two conftables, and a council of twenty-four of the "better, difcreeter, and more honeft fort" of inhabitants. The firft return of reprefentatives to parliament for Winchefter took place in the twenty-third year of Edward I. The right of election is vefted in the corporation.

Winchefter poffeffes very little trade but what arifes from its fituation in the centre of an extenfive and populous county. An ancient wool-combing manufactory, however, is ftill in exiftence, and of late years the filk manufacture has been introduced. All the public bufinefs of Hampfhire is tranfacted in Winchefter, which occafions a frequent and ample influx of ftrangers from all quarters. The cathedral and the college fecure to the city the refidence of a number of fuperior clergy. When in the height of its profperity, and poffeffing the benefit of the wool-ftaple, the wealth of the inhabitants was greatly increafed by the multitudes

tudes

tudes reforting to its fairs, the principal of which was held on the neighbouring hills of St. Giles and St. Mary Magdalen. St. Giles's fair was, at one time, by far the greateft in England. By a grant from William the Conqueror, it was originally to be held for one day only; but by Henry II. its duration was enlarged to fixteen days; and in that time no mercantile bufinefs was permitted to be tranfacted in Southampton, nor in any other place within feven leagues of St. Giles's hill. This fair has long become very infignificant; that of St. Mary Magdalen is ftill, however, much frequented. Since the year 1770, various improvements have been made in the general appearance of the city, by paving, repairing, and cleanfing. As early as 1736 was eftablifhed in Winchefter an hofpital or infirmary for the county, a very ufeful inftitution, conducted on a plan judicious in itfelf, and honourable to thofe entrufted with its adminiftration. According to the parliamentary returns of 1811, the number of houfes compofing the city and fuburbs was 1134, and the inhabitants 6705.

Hofpital of St. Crofs.—About a mile fouth from Winchefter, in the valley watered by the Itchen, ftands the venerable hofpital of the holy crofs; an inftitution ftill retaining more of its original character. "The lofty tower," obferves Dr. Milner, "with the grated door and porter's lodge beneath it, the retired ambulatory, the feparate cells, the common refectory, the venerable church, the flowing black drefs, and the filver crofs worn by the members, the conventual appellation 'brother' with which they addrefs one another, the filence, the order, the neatnefs, in fhort, that reign here, feem to recall the idea of a monaftery to thofe who have feen one, and will give no imperfect idea of fuch an eftablifhment to thofe who have not had that advantage." But this eftablifhment was never a monaftery, being only an hofpital originally founded by bifhop Henry de Blois, between 1132 and 1136, for the refidence and maintenance of thirteen poor men, and the relief of a hundred others of the moft indigent of the city, but of creditable character. Each of thefe was to be provided daily with a loaf of bread, three quarts of fmall beer, and two meffes for his dinner, in a hall appointed for the purpofe. In the hofpital was an endowment for a mafter, a fteward, four chaplains, thirteen clerks, and feven chorifters. Before the time of William of Wykeham, bifhop of Winchefter in 1366, the revenues of St. Crofs had been employed in a way very different from the intentions of the founder; but that munificent prelate fucceeded, after long litigation, in reftoring the inftitution to its original ufes, re-eftablifhing it on a fecure and well-ordered foundation. The plan was afterwards refumed and enlarged by cardinal-bifhop Beaufort, for the additional fupport of two priefts and thirty-five refident poor men: he alfo rebuilt a confiderable portion of the hofpital. The prefent eftablifhment of St. Crofs is but the wreck of its ancient inftitutions, having been feverely fleeced, though not quite deftroyed, like many other charitable eftablifhments, at the Reformation. Inftead of feventy refidents, clergy and laity, entirely fupported in the place, and one hundred outpenfioners, the inftitution at prefent confifts of but ten refiding brethren, and three out-penfioners, with one chaplain and the mafter. Certain doles of bread, it is true, continue to be diftributed to the poor of the neighbourhood; and, as perhaps the only veftige remaining in the kingdom of the fimple hofpitality of ancient days, the porter is daily furnifhed with a certain quantity of good bread and beer, of which every traveller, or other perfon whatever, who knocks at the lodge and calls for relief, is entitled to partake gratuitoufly. The buildings of the hofpital once compofed two courts; but the fouth fide of the interior quadrangle has been of late years pulled down. On the eaft fide of the outer court is the 'hundred-menne's hall,' about forty feet long, now converted into a brewhoufe; on the fouth fide is the handfome tower-gateway, with the ftatue of the founder, Beaufort, in the upper part. In the fecond, or inner court, is the church, built in the cathedral form, with a nave and tranfepts, and a low maffive tower at their interfection. The architecture of the edifice is fingularly curious, as it throws fome light on the progrefs, if not on the origin, of the pointed, or Englifh ftyle. The whole edifice feems to be a collection of architectural effays, with refpect to the form and the difpofition, of both the effential parts and the fubordinate ornaments. It prefents the ponderous pillar of a height equal to its circumference, but fupporting an incipient pointed arch. The lower part of the nave contains maffive Norman pillars; and the portal of the weft front is an elegant fpecimen of the time of king John, or beginning of that of Henry III. The weft wing of the remaining buildings contains the apartments of the Brethren, each of whom has for his own ufe three chambers and a feparate garden. Adjoining to the hall on the north fide are the apartments of the mafter, which are fpacious and convenient; and on the eaft fide is the ambulatory or open portico for exercife.

St. Catherine's Hill, or College Hill, feparated from the meadows of St. Crofs by the branches of the Itchen, is remarkable for the intrenchment carried round its fummit: the former name it acquired from an ancient chapel on it, deprived of its endowments by cardinal Wolfey; the latter, becaufe it is a frequent place of refort for the ftudents of the college.

About three miles north-eaft from Winchefter is Avington, anciently Abyngton, a feat and manor of the prefent marquis of Buckingham, in confequence of his marriage with the fole daughter and heirefs of James, the laft duke of Chandos. The manor, originally a royal demefne, was granted, in 961, by king Edgar to the monaftery of St. Swithun, in Winchefter; but in confequence of the diffolution, it became, in the reign of Elizabeth, the property of the ancient family of Bruges, or Brydges, firft fettled in Shropfhire at the Conqueft. Inter-marrying with the family of lord Chandos, renowned in the wars in France under Edward III., the honours of the two families have ever fince continued united. Avington is fituated in a fecluded valley, well planted and nearly inclofed by high downs. The prefent manfion is moftly of brick, and has been greatly improved by the prefent poffeffor, having been previoufly difmantled by the late duke, for the purpofe of adding two wings. Some of the apartments are fitted up with great elegance, and enriched by a felection of excellent paintings. The park formed by the late duke, about three miles in circumference, contains a piece of water fupplied by the river Itchen.—Hiftory, &c. of Winchefter, by the Rev. John Milner, D.D. F.S.A., 2 vols. 4to. 2d edit. 1809. Beauties of England, vol. vii. Hampfhire, by J. Britton and E. W. Brayley. Hiftory, &c. of Winchefter Cathedral, by J. Britton, 1 vol. 4to. with 30 Prints.

WINCHESTER, a town of New Hampfhire, in the county of Chefhire, with 1478 inhabitants; 13 miles S.E. of Chefterfield.—Alfo, a town of the ftate of Connecticut, in Litchfield county, with 1466 inhabitants; 22 miles N.W. of Hartford.—Alfo, a town of the ftate of Kentucky, with 4 churches, and 2000 inhabitants.

WINCHESTER, or *Fredericktown*, a town of Virginia; 56 miles W.N.W. of Wafhington. N. lat. 39° 15′. W. long. 78° 22′.

WINCING, in the *Manege*, is faid of a horfe when he kicks, fpurs, or throws out his hind feet.

WINCKHEIM, in *Geography*, a town of the duchy of Wurzburg; 4 miles N.N.W. of Lauringen.

WINCRANTUM, in *Natural Hiſtory*, a name given by the people of the Eaſt Indies to a foſſile ſubſtance reſembling, in ſome degree, the plated lead ores of Europe, but containing very little of that metal; it is properly a ſpecies of blende, or mock-lead, of a talcky appearance; it is conſiderably hard, and is uſually found in other ſtones. It is given in medicine in the Indies as a provocative to venery, being firſt calcined and beat to powder.

WIND, Ventus, a ſenſible agitation of the air, by which a large quantity of it flows in a current or ſtream out of one place, or region, into another. See Meteorology.

The winds are divided into *perennial*, *ſtated*, and *variable*. They are alſo divided into *general* and *particular*.

Winds, *Perennial* or *Conſtant*, are ſuch as always blow the ſame way.

Of theſe we have a very notable one between the two tropics, blowing conſtantly from eaſt to weſt; called the *general trade-wind*.

Winds, *Stated* or *Periodical*, are ſuch as conſtantly return at certain times. Such are the ſea and land breezes, blowing from ſea to land in the evening; and from land to ſea in the morning.

Such alſo are the *ſhifting* or *particular* trade-winds, which, for certain months of the year, blow one way, and the reſt of the year the contrary way. See Trade-*Winds*.

Winds, *Variable* or *Erratic*, are ſuch as blow now this, now that way; and are now up, now huſhed, without any rule or regularity, either as to time or place.

Such are all the winds obſerved in the inland parts of England, &c. though ſeveral of theſe claim their certain times of the day. Thus, the *weſt* wind is moſt frequent about noon; the *ſouth* wind in the night; the *north* in the morning, &c.

Wind, *General*, is ſuch a one, as at the ſame time blows the ſame way, over a very large tract of ground, almoſt all the year. Such only is the *general* trade-wind.

But even this has its interruption: for, 1. At land it is ſcarcely ſenſible at all, as being broken by the interpoſition of mountains, valleys, &c. 2. At ſea, near the ſhore, it is diſturbed by vapours, exhalations, and particular winds, blowing from landward; ſo that it is chiefly conſidered as *general*, only at mid-ſea: where, 3. It is liable to be diſturbed, by clouds driving from other quarters.

Winds, *Particular*, include all others, excepting the *general trade-winds;* which ſee.

Thoſe peculiar to one little canton, or part, are called *topical* or *provincial* winds. Such is the north wind, on the weſtern ſide of the Alps, which does not blow above one or two leagues lengthwiſe, and much leſs in breadth: ſuch alſo is the pontias in France, &c.

Winds, *Phyſical Cauſe of*. Some philoſophers, as Des Cartes, Rohault, &c. account for the general wind, from the diurnal rotation of the earth, and from this general wind derive all the particular ones. The atmoſphere, ſay they, inveſting the earth, and moving round it; that part will perform its circuit fooneſt which has the ſmalleſt circle to deſcribe: the air, therefore, near the equator, will require a ſomewhat longer time to perform its courſe in, from weſt to eaſt, than that nearer the poles.

Thus, as the earth turns eaſtward, the particles of the air near the equinoctial, being exceedingly light, are left behind; ſo that, in reſpect of the earth's ſurface, they move eaſtwards, and become a conſtant eaſterly wind.

This opinion ſeems confirmed by this, that theſe winds are found only between the tropics, in thoſe parallels of latitude where the diurnal motion is ſwifteſt. But the conſtant calms in the Atlantic ſea near the equator, the weſterly winds near the coaſt of Guinea, and the periodical weſterly monſoons under the equator in the Indian ſeas, declare the inſufficiency of this hypotheſis.

Beſides, the air, being kept cloſe to the earth by the principle of gravity, would, in time, acquire the ſame degree of velocity that the earth's ſurface moves with, as well in reſpect of the diurnal rotation, as of the annual, about the ſun, which is about thirty times ſwifter. See Trade-*Winds*.

Dr. Halley, therefore, ſubſtitutes another cauſe, capable of producing a like conſtant effect, not liable to the ſame objections, but agreeable to the known properties of the elements of water and air, and the laws of the motion of fluid bodies. Such a one is the action of the ſun's beams upon the air and water, as he paſſes every day over the ocean, conſidered together with the quality of the ſoil, and the ſituation of the adjoining continents.

According to the laws of ſtatics, the air, which is leſs rarefied or expanded by heat, and conſequently is more ponderous, muſt have a motion towards thoſe parts of it which are more rarefied, and leſs ponderous, to bring it to an equilibrium; alſo, the preſence of the ſun continually ſhifting to the weſtward, that part towards which the air tends, by reaſon of the rarefaction made by his greateſt meridian heat, is, with him, carried weſtward; and, conſequently, the tendency of the whole body of the lower air is that way.

Thus a general eaſterly wind is formed, which being impreſſed upon the air of a vaſt ocean, the parts impel one the other, and ſo keep moving till the next return of the ſun, by which ſo much of the motion as was loſt is again reſtored; and thus the eaſterly wind is made perpetual.

From the ſame principle it follows, that this eaſterly wind ſhould, on the north ſide of the equator, be to the northward of the eaſt, and in ſouth latitudes to the ſouthward of it; for, near the line, the air is much more rarefied than at a greater diſtance from it; becauſe the ſun is twice in a year vertical there, and at no time diſtant above $23\frac{1}{2}$ degrees; at which diſtance, the heat, being as the ſine of the angle of incidence, is but little ſhort of that of the perpendicular ray; whereas under the tropics, though the ſun ſtay longer vertical, yet he is a long time 47 degrees off, which is a kind of winter, in which the air ſo cools, as that the ſummer heat cannot warm it to the ſame degree with that under the equator. Wherefore, the air towards the north and ſouth being leſs rarefied than that in the middle, it follows, that from both ſides it ought to tend towards the equator.

This motion, compounded with the former eaſterly wind, accounts for all the phenomena of the general trade-winds, which, if the whole ſurface of the globe was ſea, would undoubtedly blow quite round the world, as they are found to do in the Atlantic and the Ethiopic oceans. But ſeeing that ſo great continents do interpoſe, and break the continuity of the ocean, regard muſt be had to the nature of the ſoil, and the poſition of the high mountains, which are the two principal cauſes of the variations of the wind from the former general rule; for if a country lying near the ſun prove to be flat, ſandy, and low land, ſuch as the deſerts of Lybia are uſually reported to be, the heat occaſioned by the reflexions of the ſun's beams, and the retention of it in the ſand, is incredible to thoſe who have not felt it; by which the air being exceedingly rarefied, it is neceſſary that the cooler and more denſe air ſhould run thitherwards, to reſtore the equilibrium. This is ſuppoſed to be the cauſe, why, near the coaſt of Guinea, the wind always ſets in upon the land, blowing weſterly inſtead of eaſterly, there being ſufficient reaſon to believe that the inland parts of Africa are prodigiouſly hot, ſince the northern borders of it were ſo very intemperate, as to give the ancients cauſe to conclude that all beyond the tropics was uninhabitable by exceſs of heat.

Mr. Clare, in his Motion of Fluids, p. 302. mentions a familiar experiment, that ſerves to illuſtrate this matter, as well as the alternate courſe of land and ſea breezes. Fill a large diſh with cold water, and in the middle of it place a water-plate, filled with warm water: the firſt will repreſent the ocean, the other an iſland, rarefying the air above it. Then holding a wax-candle over the cold water, blow it out, and the ſmoke will be ſeen, in a ſtill place, to move toward the warm plate, and riſing over, it will point the courſe of the air (and alſo of vapour) from ſea to land. And if the ambient water be warmed, and the plate filled with cold water, and the ſmoking wick of a candle held over the plate, the contrary will happen. (See Breeze.) For the phenomena of the wind obſerved by Dr. Halley, and explained by his theory, ſee Wind, in *Navigation.*

From the ſame cauſe it happens, that there are ſo conſtant calms in that ſame part of the ocean, called the *rains;* for this tract being placed in the middle, between the weſterly winds blowing on the coaſt of Guinea, and the eaſterly trade-winds blowing to the weſtward of it; the tendency of the air here is indifferent to either, and ſo ſtands in equilibrio between both; and the weight of the incumbent atmoſphere being diminiſhed by the continual contrary winds blowing from hence, is the reaſon that the air here holds not the copious vapour it receives, but lets it fall in ſo frequent rains.

But, as the cold and denſe air, by reaſon of its greater gravity, preſſes upon the hot and rarefied, it is demonſtrable that this latter muſt aſcend in a continued ſtream as faſt as it rarefies; and that, being aſcended, it muſt diſperſe itſelf, to preſerve the equilibrium; that is, by a contrary current, the upper air muſt move from thoſe parts where the greateſt heat is: ſo, by a kind of circulation, the north-eaſt trade-wind below will be attended with a ſouth-weſterly wind above; and the ſouth-eaſt, with a north-weſt wind above.

That this is more than a bare conjecture, the almoſt inſtantaneous change of the wind to the oppoſite point, which is frequently found in paſſing the limits of the trade-winds, ſeems ſtrongly to aſſure us; but that which above all confirms this hypotheſis, is the phenomenon of the monſoons, by this means moſt eaſily ſolved, and without it hardly explicable. See Monsoons.

Suppoſing, therefore, ſuch a circulation as above, it is to be conſidered, that to the northward of the Indian ocean there is every where land, within the uſual limits of the latitude of 30°; *viz.* Arabia, Perſia, India, &c. which, for the ſame reaſon as the Mediterranean parts of Africa, are ſubject to inſufferable heats when the ſun is to the north, paſſing nearly vertical; but yet are temperate enough when the ſun is removed towards the other tropic, becauſe of a ridge of mountains at ſome diſtance within the land, ſaid to be frequently, in winter, covered with ſnow, over which the air, as it paſſes, muſt needs be much chilled. Hence it happens, that the air coming, according to the general rule, out of the north-eaſt, to the Indian ſea, is ſometimes hotter, ſometimes colder, than that which, by this circulation, is returned out of the ſouth-weſt; and, by conſequence, ſometimes the under-current, or wind, is from the north-eaſt, ſometimes from the ſouth-weſt.

That this has no other cauſe is clear from the times in which theſe winds ſet, *viz.* in April; when the ſun begins to warm theſe countries to the north, the ſouth-weſt monſoons begin, and blow, during the heats, till October, when the ſun being retired, and all things growing cooler northward, and the heat increaſing to the ſouth, the north-eaſt winds enter, and blow all the winter till April again. And it is, undoubtedly, from the ſame principle, that to the ſouthward of the equator, in part of the Indian ocean, the north-weſt winds ſucceed the ſouth-eaſt, when the ſun draws near the tropic of Capricorn. Phil. Tranſact. N° 183. or Abridg. vol. ii. p. 139.

Some philoſophers, diſſatisfied with Dr. Halley's theory above recited, or not thinking it ſufficient for explaining the various phenomena of the wind, have had recourſe to another cauſe, *viz.* the gravitation of the earth and its atmoſphere towards the ſun and moon, to which the tides are confeſſedly owing. See Tides.

From the laws of univerſal attraction it has been inferred, that theſe celeſtial bodies muſt act upon the atmoſphere, or that they muſt occaſion a flux and reflux of the atmoſphere, as well as of the ocean. Hence it has been alleged, that though we cannot diſcover aerial tides, of ebb or flow, by means of the barometer, becauſe columns of air of unequal height, but different denſity, may have the ſame preſſure or weight; yet the protuberance in the atmoſphere, which is continually following the moon, muſt, they ſay, of courſe produce a motion in all parts, and ſo produce a wind more or leſs to every place, which, conſpiring with or counteracted by the winds ariſing from other cauſes, makes them greater or leſs. Several diſſertations to this purpoſe were publiſhed, on occaſion of the ſubject propoſed by the Academy of Sciences at Berlin, for the year 1746.

Although the atmoſpherical air is much more variable than water, and the action of the ſun and moon upon it becomes much leſs apparent to us, becauſe they muſt frequently concur with or be counteracted by the much more powerful effects of heat and cold, of dryneſs and moiſture, of winds, &c. ſo that their action upon the barometer has been long diſputed and even denied, (ſee Moon, *Influence of,*) yet that the moon in particular, as well as the ſun, has ſuch an action has been for a conſiderable time ſurmiſed; and of late years it has been in a degree obſerved and rendered ſenſible by means of very accurate and long-continued barometrical obſervations, and perceived only by taking a mean of the obſervations of many years.

Toaldo, the learned aſtronomer of Padua, after a variety of obſervations made in the courſe of ſeveral years, found reaſon to aſſert, that, *cæteris paribus,* at the time of the moon's apogeum, the mercury in the barometer riſes the 0.105 of an inch higher than at the perigeum; that at the time of the quadratures, the mercury ſtands 0.008 of an inch higher than at the time of the ſyzygies; and that it ſtands 0.022 of an inch higher when the moon in each lunation comes neareſt to our zenith, (meaning the zenith of Padua, where the obſervations were made,) than when it goes fartheſt from it. Journal des Sciences Utiles.

In the ſeventh volume of the Philoſophical Magazine, there is a paper of L. Howard, eſq. which contains ſeveral curious obſervations relative to this ſubject. This gentleman found, both from his own obſervations, and from an examination of the Meteorological Journal of the Royal Society, which is publiſhed annually in the Philoſophical Tranſactions, that the moon had a manifeſt action upon the barometer. "It appears," he ſays, "to me evident, that the atmoſphere is ſubject to a periodical change of gravity, by which the barometer, on a mean of ten years, is depreſſed at leaſt one-tenth of an inch while the moon is paſſing from the quarters to the full and new; and elevated, in the fame proportion, during the return to the quarter." A great fall of the barometer generally takes place before high tides, efpecially at the time of new or full moon.

The caufes, it is faid, which render the diurnal tide of the atmofphere infenfible to us, may be the elafticity of the air, and the interference of the much more powerful effects of heat, cold, vapours, &c.

It has been calculated by D'Alembert, from the general theory of gravitation, that the influence of the fun and moon in their daily motions is fufficient to produce a continual eaft wind about the equator. So that, upon the whole, we may reckon three principal daily tides, *viz.* two arifing from the attractions of the fun and moon, and the third from the heat of the fun alone: all which fometimes combine together, and form a prodigious tide.

In corroboration of the opinion of the influence of the fun, and principally of the moon, in the production of wind, we muft likewife mention the obfervations of Bacon, Gaffendi, Dampier, Halley, &c.; namely, that the periods of the year moft likely to have high winds are the two equinoxes; that ftorms are more frequent at the time of new and full moon, efpecially thofe new and full moons which happen about the equinoxes; that, at periods otherwife calm, a fmall breeze takes place at the time of high water; and that a fmall movement in the atmofphere is generally perceived a fhort time after the noon and the midnight of each day.

M. Mufchenbroeck, however, will not allow that the attraction of the moon is the caufe of the general wind; becaufe the eaft wind does not follow the motion of the moon about the earth; for in that cafe there would be more than twenty-four changes, to which it would be fubject in the courfe of a year, inftead of two. Introd. ad Phil. Nat. vol. ii. p. 1102.

Some action in the production of wind may alfo be derived from volcanoes, fermentations, evaporations, and efpecially from the condenfation of vapours: for we find that, in rainy weather, a confiderable wind frequently precedes the approach of every fingle cloud, and that the wind fubfides as foon as the cloud has paffed over our zenith.

Wherever any of the above-mentioned caufes are conftantly more predominant, as the heat of the fun within the tropics, there a certain direction of the wind is more conftant; and where different caufes interfere at different and irregular periods, as in thofe places which are confiderably diftant from the torrid zone, there the winds are more changeable and uncertain.

In fhort, whatever difturbs the equilibrium of the atmofphere, *viz.* the equal denfity or quantity of air at equal diftances from the furface of the earth; whatever accumulates the air in one place, and diminifhes it in other places, muft occafion a wind both in difturbing and in reftoring that equilibrium, as above ftated.

Mr. Henry Eeles, apprehending that the fun's rarefying of the air cannot fimply be the caufe of all the regular and irregular motions which we find in the atmofphere, afcribes them to another caufe, *viz.* the afcent and defcent of vapour and exhalation, attended by the electrical fire or fluid; and on this principle he has endeavoured to explain at large the general phenomena of the weather and barometer. Phil. Tranf. vol. xlix. art. 25. p. 124.

M. Briffon (Principes de Phyfique) alfo is of opinion that electricity is the principal and more general caufe which produces winds; but Mr. Cavallo is of a different opinion.

After making various obfervations on the nature and theory of winds, Dr. Darwin recapitulates his opinions in the following manner. 1. The north-eaft wind confifts of air flowing from the north, where it feems to be occafionally produced; and has an apparent direction from the eaft, owing to its not having acquired in its journey the increafing velocity of the earth's furface. Thefe winds are analogous to the trade-winds between the tropics, and frequently continue in the vernal months for four or fix weeks together, with a high barometer, and fair and frofty weather. They fometimes confift of fouth-weft air, which had paffed by us or over us, driven back by a new accumulation of air in the north; and they continue but a day or two, and are attended with rain.

2. The fouth-weft wind confifts of air flowing from the fouth, and feems occafionally abforbed at its arrival to the more northern latitudes. It has a real direction from the weft, owing to its not having loft in its journey the greater velocity it had acquired from the earth's furface from whence it came. Thefe winds are analogous to the monfoons between the tropics, and frequently continue for four or fix weeks together, with a low barometer, and rainy weather. They fometimes confift of north-eaft air, which had paffed by us, and which becomes retrograde by a commencing deficiency of air in the north. Thefe winds continue but a day or two, attended with fevere froft, with a finking barometer; their cold being increafed by their expanfion as they return into an incipient vacancy.

3. The north-weft wind confifts firft of fouth-weft winds which have been paffed over, been bent down, and driven back towards the fouth by newly-generated northern air. They continue but a day or two, and are attended with rain or clouds. They confift of north-eaft winds bent down from the higher parts of the atmofphere, and having there acquired a greater velocity from the earth's furface are frofty and fair. They confift of north-eaft winds formed into a vertical eddy, not a fpiral one, with froft or fair.

4. The north winds confift firft of air flowing flowly from the north, fo that they acquire the velocity of the earth's furface as they approach it; they are fair or frofty, but feldom occur. They confift of retrograde fouth winds; thefe continue but a day or two, are preceded by fouth-weft winds, and are generally fucceeded by north-eaft winds, cloudy or rainy weather, the barometer rifing.

5. The fouth winds confift firft of air flowly flowing from the fouth, lofing their previous wefterly velocity by the friction of the earth's furface as they approach it; they are moift, but feldom occur. They confift of retrograde north winds; thefe continue but a day or two, and are preceded by north-eaft winds, and are generally fucceeded by fouth-weft winds, colder, and the barometer finking.

6. The eaft winds confift of air brought haftily from the north, and not impelled farther fouthward, owing to a fudden beginning abforption of air in the northern regions; they are very cold, the barometer high, and are generally fucceeded by fouth-weft winds.

7. The weft winds confift of air brought haftily from the fouth, and checked from proceeding farther to the north, by a beginning production of air in the northern regions; they are warm and moift, and generally fucceeded by north-eaft winds. They confift of air bent downwards from the higher regions of the atmofphere; if this air be from the fouth, and brought haftily, it becomes a wind of great velocity, moving perhaps 60 miles in an hour, and is warm and rainy: if it confifts of northern air bent down it is of lefs velocity, and cooler.

Various other interefting remarks and reflections on winds may be feen in the notes to the Botanic Garden, by the fame writer.

The

The induſtry of ſome late writers having brought the theory of the production and motion of winds to ſomewhat of a mathematical demonſtration; we ſhall here give it the reader in that form.

Winds, *Laws of the Production of.* If the ſpring of the air be weakened in any place, more than in the adjoining places; a wind will blow through the place where the diminution is.

For, 1. Since the air endeavours, by its elaſtic force, to expand itſelf every way; if that force be leſs in one place than another, the effort of the more againſt the leſs elaſtic, will be greater than the effort of the latter againſt the former. The leſs elaſtic air, therefore, will reſiſt with leſs force than it is urged by the more elaſtic: conſequently, the leſs elaſtic will be driven out of its place, and the more elaſtic will ſucceed.

If, now, the exceſs of the ſpring of the more elaſtic above that of the leſs elaſtic air, be ſuch as to occaſion a little alteration in the baroſcope; the motion both of the air expelled, and that which ſucceeds it, will become ſenſible, *i. e.* there will be a wind.

2. Hence, ſince the ſpring of the air increaſes, as the compreſſing weight increaſes, and compreſſed air is denſer than air leſs compreſſed; all winds blow into rarer air, out of a place filled with a denſer.

3. Wherefore, ſince a denſer air is ſpecifically heavier than a rarer; an extraordinary lightneſs of the air in any place muſt be attended with extraordinary winds or ſtorms.

Now, an extraordinary fall of the mercury in the barometer, ſhewing an extraordinary lightneſs of the atmoſphere, it is no wonder if that foretels ſtorms. See Barometer.

4. If the air be ſuddenly condenſed in any place, its ſpring will be ſuddenly diminiſhed: hence, if this diminution be great enough to affect the barometer, there will a wind blow through the condenſed air.

5. But ſince the air cannot be ſuddenly condenſed, unleſs it have before been much rarefied, there will a wind blow through the air, as it cools, after having been violently heated.

6. In like manner, if air be ſuddenly rarefied, its ſpring is ſuddenly increaſed: wherefore, it will flow through the contiguous air, not acted on by the rarefying force. A wind, therefore, will blow out of a place, in which the air is ſuddenly rarefied; and on this principle, in all probability, it is, that,

7. Since the ſun's power in rarefying the air is notorious, it muſt neceſſarily have a great influence on the generation of winds.

8. Moſt caves are found to emit wind, either more or leſs. M. Muſchenbroeck has enumerated a variety of cauſes that produce winds, exiſting in the bowels of the earth, on its ſurface, in the atmoſphere, and above it. See Intr. ad Phil. Nat. vol. ii. p. 1116, &c.

The riſing and changing of the wind are determined experimentally, by means of weather-cocks, placed on the tops of houſes, &c. But theſe only indicate what paſſes about their own height, or near the ſurface of the earth: Wolfius aſſures us, from obſervations of ſeveral years, that the higher winds, which drive the clouds, are different from the lower ones, which move the weather-cocks. And Dr. Derham obſerves ſomething not unlike this. Phyſ. Theol. lib. i. cap. 2.

The author laſt-mentioned relates, upon comparing ſeveral ſeries of obſervations made of the winds in divers countries; *viz.* England, Ireland, Switzerland, Italy, France, New England, &c. that the winds in thoſe ſeveral places ſeldom agree; but when they do, it is commonly when they are ſtrong, and of long continuance in the ſame quarter; and more, he thinks, in the northerly and eaſterly than in other points. Alſo, that a ſtrong wind in one place is oftentimes a weak one in another, or moderate, according as the places are nearer, or more remote. Phil. Tranſ. N° 267 and 321.

Wind, *Laws of the Force and Velocity of.* Wind being only air in motion, and air being a fluid ſubject to the laws of other fluids, its force may be regularly brought to a preciſe computation: thus, "The ratio of the ſpecific gravity of any other fluid to that of air, together with the ſpace that fluid, impelled by the preſſure of the air, moves in any given time, being given; we can determine the ſpace through which the air itſelf, acted on by the ſame force, will move in the ſame time." By this rule:

1. As the ſpecific gravity of air is to that of any other fluid; ſo, reciprocally, is the ſquare of the ſpace, which that fluid, impelled by any force, moves in any given time, to the ſquare of the ſpace which the air, by the ſame impulſe, will move in the ſame time.

Suppoſing, therefore, the ratio of the ſpecific gravity of that other fluid to that of air, to be $= \frac{b}{c}$; the ſpace deſcribed by the fluid to be called s; and that which the air will deſcribe by the ſame impulſe, x. The rule gives us $x = \sqrt{\frac{b s^2}{c}}$.

Hence, if we ſuppoſe water impelled by the given force, to move two feet in a ſecond of time, then will $s = 2$; and ſince the ſpecific gravity of water to the air is as 800 to 1, we ſhall have $b = 800$, and $c = 1$; conſequently, $x = \sqrt{800 \times 4} = \sqrt{3200} = 57$ feet nearly. The velocity of the wind, therefore, to that of water, moved by the ſame power, will be as 57 to 2; *i. e.* if water move two feet in a ſecond, the wind will fly 57 feet.

2. Add, that $s = \sqrt{\frac{c x^2}{b}}$; and therefore the ſpace any fluid, impelled by any impreſſion, moves in any time, is determined, by finding a fourth proportional to the two numbers that expreſs the ratio of the ſpecific gravities of the two fluids, and the ſquare of the ſpace the wind moves in, in the given time. The ſquare root of that fourth proportional is the ſpace required.

Mr. Mariotte, *e. gr.* found, by various experiments, that a pretty ſtrong wind moves 24 feet in a ſecond of time, which is at the rate of 1440 in a minute; *i. e.* at the rate of ſomewhat more than 16 miles in an hour: wherefore, if the ſpace which the water, acted on by the ſame force as the air, will deſcribe in the ſame time, be required; then will $c = 1$, $x = 24$, $b = 800$; and we ſhall find $s = \sqrt{\frac{576}{800}} = \frac{24}{28}$ nearly.

Derham eſtimated the velocity of the wind in very great ſtorms at 66 feet *per* ſecond; and de la Condamine at $90\frac{1}{2}$ feet *per* ſecond.

3. "The velocity of wind being given, to determine the preſſure required to produce that velocity;" we have this rule. The ſpace the wind moves in one ſecond of time, is to the height a fluid is to be raiſed in an empty tube, in order to have a preſſure capable of producing that velocity, in a ratio compounded of the ſpecific gravity of the fluid to that of the air, and of quadruple the

 altitude

altitude a body deſcends in the firſt ſecond of time, to the aforeſaid ſpace of the air.

Suppoſe, *e. gr.* the ſpace through which the air moves in a ſecond, $a = 24$ feet, or 288 inches; call the altitude of the fluid x; and the ratio of mercury to air, $\frac{b}{c} = \frac{800 \times 14}{1} = \frac{11200}{1}$; and the altitude through which a body deſcends in the firſt ſecond of time, 16 feet 1 inch; then, by the theorem, we ſhall have $288 : x :: 11200 \times 762 : 288$, and conſequently $x = \frac{288 \times 288}{11200 \times 762} = .01$, &c. of an inch. Hence we ſee why a ſmall but ſudden change in the barometer is followed with violent winds. See an account of the principle upon which theſe calculations are founded under the article WATER.

When the direction of the wind is not perpendicular, but oblique to the ſurface of the ſolid, then the force of the former upon the latter will not be ſo great as when the impulſe is direct, and that for reaſons which are eaſily derived from the theory of the reſolution and compoſition of forces, and from the theory of direct and oblique impulſes. In ſhort, the general propoſition for compound impulſes is, that the effective impulſe is as the ſurface, as the ſquare of the air's velocity, as the ſquare of the ſine of the angle of incidence, and as the ſine of the obliquity of the ſolid's motion to the direction of the impulſe, jointly; for the alteration of every one of thoſe quantities will alter the effect in the ſame proportion. But theſe general rules, as we have already more than once obſerved, are ſubject to great variations; ſo that their reſults ſeldom coincide with thoſe of actual experiments.

Philoſophers have uſed various methods for determining the velocity of the wind, which is very different at different times. The method uſed by Dr. Derham was that of letting light downy feathers fly in the wind, and accurately obſerving the diſtance to which they were carried in any number of half ſeconds. This method he preferred to that of Dr. Hooke's mola alata, or pneumatica. (See Phil. Tranſ. N° 24. and Birch's Hiſt. Roy. Soc. vol. iv. p. 225.) He tells us, that he thus meaſured the velocity of the wind in the great ſtorm of Auguſt, 1705, and by many experiments found, that it moved at the rate of thirty-three feet *per* half-ſecond, or of forty-five miles *per* hour: whence he concludes, that the moſt vehement wind (as that of November, 1703) does not fly at the rate of above fifty or ſixty miles *per* hour, and that at a medium the velocity of wind is at the rate of twelve or fifteen miles *per* hour. Phil. Tranſ. N° 313. or Abr. vol. iv. p. 411.

Mr. Brice obſerves, that experiments with feathers are ſubject to uncertainty: as they ſeldom or ever deſcribe a ſtraight line, but deſcribe a ſort of ſpirals, moving to the right and left, and riſing to very different altitudes in their progreſs. He, therefore, conſiders the motion of a cloud, or its ſhadow, over the ſurface of the earth, as a much more accurate meaſure of the velocity of the wind. In this way he found, that the wind, in a conſiderable ſtorm, moved at the rate of 62.9 miles *per* hour; and that, when it blew a freſh gale, it moved in the ſame time about twenty-one miles; and that in a ſmall breeze, the wind moved at the rate of 9.9 miles *per* hour. Phil. Tranſ. vol. lvi. p. 226.

But it has been obſerved by Cavallo and others, that this method is very fallacious, partly becauſe it is not known whether the clouds do or do not move exactly with the air in which they float; and partly becauſe the velocity of the air in the region where the clouds float is by no means the ſame with that of the air which is nearer to the ſurface of the earth, and is ſometimes quite contrary to it, as indicated by the motion of the clouds themſelves. Others have eſtimated the velocity of the wind by the changes effected by it upon the motion of ſound, which muſt of courſe be very inaccurate. A very ſimple method of determining the velocity of the wind is that which M. Coulomb (Mem. de l'Acad. Roy. 1781, p. 70.) employed in his experiments on wind-mills, becauſe it requires neither the aid of inſtruments nor the trouble of calculation. Two perſons were placed on a ſmall elevation, at the diſtance of 150 feet from one another, in the direction of the wind; and, while the one obſerved, the other meaſured the time which a ſmall and light feather employed in removing through this ſpace. The diſtance between the two perſons, divided by the number of ſeconds, gave the velocity of the wind *per* ſecond. The beſt method, ſays Cavallo, of meaſuring the velocity of the wind, is by obſerving the velocity of the ſmoke of a low chimney, or by eſtimating the effect it produces upon certain bodies, and thus may be determined its force as well as its velocity. We ſhall here obſerve, that from the concurrence of experiments made with various inſtruments, and different modes of calculation, it has been inferred, that in currents of air, of the denomination which are expreſſed in the 4th column of the annexed table, the air moves at the rate of ſo many feet *per* ſecond as are expreſſed in the 2d column, or of ſo many miles *per* hour as are expreſſed in the 1ſt column.

A TABLE of the different velocities and forces of the winds, conſtructed by Mr. Rouſe with great care, from a conſiderable number of facts and experiments, and communicated to Mr. Smeaton, and firſt publiſhed by him in the 51ſt volume of the Philoſophical Tranſactions.

Velocity of the Wind.		Perpendicular Force on one ſquare Foot, in Avoirdupois Pounds.	Common Appellations of the Forces of Winds.
Miles in one Hour.	= Feet in one Second.		
1	1.47	.005	Hardly perceptible.
2	2.93	.020	Juſt perceptible.
3	4.40	.044	
4	5.87	.079	Gentle pleaſant wind.
5	7.33	.123	
10	14.67	.492	Pleaſant briſk gale.
15	22.00	1.107	
20	29.34	1.968	Very briſk.
25	36.67	3.075	
30	44.01	4.429	High wind.
35	51.34	6.027	
40	58.68	7.873	Very high.
45	66.01	9.963	
50	75.35	12.300	A ſtorm or tempeſt.
60	88.02	17.715	A great ſtorm.
80	117.36	31.490	A hurricane.
100	146.70	49.200	A hurricane that tears up trees, and carries buildings, &c. before it.

The force of the wind is as the ſquare of its velocity; as Mr. Ferguſon has ſhewn by experiments on the whirling-table; and in moderate velocities this will hold very nearly.

Upon this principle the numbers in the third column are calculated. The propofition upon which this column has been formed feems to be, that the impulfe of a current of air, ftriking perpendicularly upon a given furface, with a certain velocity, is equal to the weight of a column of air which has that furface for its bafe, and for its height the fpace through which a body muft fall, in order to acquire that velocity of the air.

It is obferved, with regard to this table, that the evidence for thofe numbers, where the velocity of the wind exceeds fifty miles an hour, does not feem of equal authority with that of thofe of fifty miles, or under. Phil. Tranf. vol. li. p. 165.

Dr. Hales found (Statical Eff. vol. ii. p. 326.) that the air rufhed out of a pair of fmith's bellows, at the rate of 68.73 feet in a fecond of time, when compreffed with a force equal to the weight of one inch perpendicular depth of mercury, lying on the whole upper furface of the bellows. The velocity of the air, as it paffed out of the trunk of his ventilators, was found to be at the rate of three thoufand feet in a minute; which is at the rate of thirty-four miles in an hour. Dr. Hales fays, that the velocity with which impelled air paffes out at any orifice may be determined by hanging a light valve over the nofe of a bellows, by pliant leathern hinges, which will be much agitated and lifted up from a perpendicular to a more than horizontal pofition by the force of the rufhing air. There is another more accurate way, he fays, of eftimating the velocity of air, *viz.* by holding the orifice of an inverted glafs fiphon full of water, oppofite to the ftream of air, by which the water will be depreffed in one leg, and raifed in the other, in proportion to the force with which the water is impelled by the air. Defcript. of Ventilators, 1743, p. 12, &c.

The velocity and force of the wind are determined experimentally by a peculiar machine, called an *anemometer* or *wind-meafurer*. Of thefe there have been many, varioufly conftructed. See Anemometer, Anemoscope, and Wind-*Gage*.

Wind, *Qualities and Effects of.* 1. "A wind blowing from the fea is always moift; in fummer, it is cold; and in winter, warm, unlefs the fea be frozen up." This is demonftrated thus: there is a vapour continually rifing out of all water, (as appears even hence, that a quantity of water, being left a little while in an open veffel, is found fenfibly diminifhed,) but efpecially if it be expofed to the fun's rays; in which cafe, the evaporation is beyond all expectation. By this means, the air incumbent on the fea becomes impregnated with a quantity of vapour. But the winds, blowing from off the fea, fweep thefe vapours along with them; and confequently they are always moift.

Again, water in fummer, &c. conceives lefs heat than terreftrial bodies, expofed to the fame rays of the fun, do; but in winter, fea-water is warmer than the earth covered with froft and fnow, &c. Wherefore, as the air contiguous to any body is found to partake of its heat and cold, the air contiguous to fea-water will be warmer in winter, and colder in fummer, than that contiguous to the earth. Or thus: vapours raifed from water by the fun's warmth in winter, are warmer than the air they rife in, (as appears from the vapours condenfing, and becoming vifible, almoft as foon as they are got out into air.) Frefh quantities of vapour, therefore, continually warming the atmofphere over the fea, will raife its heat beyond that of air over the land. Again, the fun's rays reflected from the earth into the air, in fummer, are much more than thofe from the water into air: the air, therefore, over the earth, warmed by the reflection of more rays than that over water, is warmer. Hence, *fea-winds* make thick, cloudy, hazy weather.

2. "Winds, blowing from the continent, are always dry; in fummer, warm; and cold in winter." For there is much lefs vapour arifing from the earth, than from water; and, therefore, the air over the continent will be impregnated with much fewer vapours. Add, that the vapours, or exhalations, raifed by a great degree of heat out of the earth, are much finer, and lefs fenfible, than thofe from water. The wind, therefore, blowing over the continent, carries but little vapour with it, and is therefore dry.

Farther, the earth in fummer is warmer than water expofed to the fame rays of the fun. Hence, as the air partakes of the heat of contiguous bodies, that over the earth in fummer will be warmer than that over the water: therefore, the winds, &c.

After the like manner it is fhewn, that the land-winds are cold in winter. Hence, we fee why land-winds make clear cold weather.

Our northerly and foutherly winds, however, which are commonly efteemed the caufes of cold and warm weather, Dr. Derham obferves, are really rather the effect of the cold or warmth of the atmofphere. Hence it is, that we frequently fee a warm foutherly wind, on a fudden, changed to the north, by the fall of fnow or hail; and that in a cold frofty morning, we fee the wind north, which afterwards wheels about toward the foutherly quarter, when the fun has well warmed the air; and again, in the cold evening, turns northerly, or eafterly. See Darwin's Obfervations *fupra.*

For the manner in which north-eafterly winds contribute to blights, fee Blight. For the effect of winds on the barometer and thermometer, fee Barometer, &c.

The utility of winds has been univerfally acknowledged. The ancient Perfians, Phœnicians, Greeks, and Romans, facrificed and erected temples to the winds; as we learn from Voffius, Theolog. Gentil. lib. iii. part i. cap. 1. Befides their ufe in moving bellows, mills, and other machines, applied in various ways to the fervice of mankind, and the benefits refulting from them to navigation and trade, they ferve to purify and refrefh the air, to convey the heat or cold of one region to another, to produce a regular circulation of vapours from the ocean to countries remote from it, and to fupply, by wafting them in their progrefs againft hills, &c. fprings and rivers.

Wind has been, by many authors, made the bafis of many different difeafes: among others, Dr. Reyn has given it as his opinion, in a Treatife on the Gout (De Arthritid.), that flatufes, or wind inclofed between the periofteum and the bone, are the true caufe of that difeafe; and accordingly, that all the methods of cure ought to tend to the expelling of that wind.

He is alfo of opinion, that head-aches, palpitations of the heart, tooth-ache, pleurify, convulfions, colics, and many other difeafes, are originally owing to the fame caufe, and only differ in regard to the place affected, and to the various motions and determinations of the wind. The moveablenefs of the pain in gouty perfons from one part to another, he looks on as a proof of this, and thinks that the curing of the gout by burning moxa, or the cotton of the mugwort leaves, upon it, is owing to its giving way to the wind in the part to evaporate itfelf.

That thefe winds are cold, appears from the fhivering fits which generally precede a paroxyfm of the gout; and that the fhiverings in the beginning of fevers, and before all fits of agues, are owing to the fame caufe, is fuppofed by this

this author a natural conclufion from the former obfervations.

Their differences, he fays, principally proceed from the various ferments producing in us a variety of humours; which acting upon one another, do in their effervefcences create winds of various effects, and denominate difeafes from the places which are the fcenes of their action. It is on this account that the acupunctura, or pricking with long needles, among the Chinefe, is of ufe: the Japanefe, and other neighbouring nations, having no other cure for moft difeafes than the pricking with the needle, and the burning of the moxa on the part.

The hufbandman often fuffers extremely by high winds in many different refpects. Plantations of trees, at a fmall diftance from the barns and houfes, are the beft fafeguard againft their fuffering by winds; but they muft not be planted fo near as that their fall, if it fhould happen, would endanger them. Yews grow very flowly, otherwife they are the beft of all trees for this defenfive plantation. Trees fuffer by winds, being either broken or blown down by them; but this may be in a great meafure prevented by cutting off great part of the heads and branches of them, in places where they ftand moft expofed.

Hops are the moft fubject to be injured by winds of any crop; but this may be in a great meafure prevented by a high pale, or very thick thorn-hedge; this will both keep off the fpring wind, which nips the young buds, and be a great fafeguard againft other winds that would tear the plants from their poles. The poles fhould always be very firm in the ground; and the beft fecurity to be added to this, is a row of tall trees all round the ground.

Winds, attended with rain, do great injury to the corn, by laying it flat to the ground. The beft method of preventing this, is to keep up good enclofures; and if the accident happens, the corn fhould be cut immediately, for it never grows at all afterwards. It fhould be left on the ground, in this cafe, fome time after the cutting, to harden the grain in the ear. Mortimer's Hufbandry, p. 302.

Wind, in *Navigation*, is the fame agitation of the air, confidered as ferving for the motion of veffels on the water.

If the wind blows gently, it is called a *breeze;* if it blows harder, it is called a *gale*, or a ftiff gale; and if it blows very hard, it is called a *ftorm*.

The following obfervations on the wind have been made by fkilful feamen, and particularly by Dr. Halley.

1. Between the limits of 60°, *viz.* from 30° of north latitude to 30° of fouth latitude, there is a conftant, or almoft conftant, eaft wind through the year, blowing in the Atlantic and Pacific oceans, called the *trade-wind;* which fee.

2. The trade-winds, near their northern limits, blow between the north and eaft; and near their fouthern limits they blow between the fouth and eaft.

The trade-wind feems to depend principally upon the rarefaction of the air, which is occafioned by the heat of the fun progreffively from the eaft towards the weft. The air which is rarefied, and, of courfe, elevated by the heat of the fun immediately over it, is condenfed, and defcends as foon as the fun is gone over another place to the weft of the former; then the air of the latter place is rarefied, and the condenfed air of the former rufhes towards it, &c. From the northern and fouthern parts of the world, the air likewife runs to the place which is immediately under the fun; but thofe directions, combining with the eafterly wind, which blows nearer to the equator, form the above-mentioned north-eafterly and fouth-eafterly winds on the borders of the trade-wind.

3. Thefe general motions of the wind are difturbed on the continents, and near their coafts.

In places that are farther from the equator, the rarefaction which arifes from the heat of the fun, and from the attraction of the fun and moon, is lefs active; and is befides influenced by a variety of local and accidental circumftances, fuch as extenfive continents, mountains, rains, iflands, &c. which difturb, interrupt, or totally change the direction of the wind. Hence, in thofe latitudes north and fouth, which are beyond the limits of the trade-wind, or near the coafts, the winds are very uncertain; nor has any good theory been as yet formed refpecting them.

4. In fome parts of the Indian ocean there are periodical winds, which are called *Monfoons;* which fee.

For the explication of thefe, it is faid, that as the air, which is cool and denfe, will force the warm rarefied air in a continual ftream upwards, there it muft fpread itfelf to preferve the equilibrium. Therefore the upper courfe or current of air muft be contrary to the under current; for the upper air muft move from thofe parts where the greateft heat is; and fo, by a kind of circulation, the N.E. trade-wind below will be attended with a S.W. above; and a S.E. below, with a N.W. above.

5. In the Atlantic ocean, near the coafts of Africa, at about a hundred leagues from the fhore, between the latitudes of 28° and 10° north, feamen conftantly meet with a frefh gale of wind blowing from the N.E.

6. Thofe bound to the Caribbee iflands, acrofs the Atlantic ocean, find, as they approach the American fide, that the faid N.E. wind becomes eafterly; or feldom blows more than a point from the eaft, either to the northward or fouthward. Thefe trade-winds, on the American fide, are extended to 30°, 31°, or even to 32° of N. latitude; which is about 4° farther than they extend on the African fide: alfo to the fouthward of the equator, the trade-winds extend three or four degrees farther toward the coaft of Brafil, on the American fide, than they do near the Cape of Good Hope, on the African fide.

7. Between the latitudes of 4° N. and 4° S., the wind always blows between the fouth and eaft: on the African fide, the winds are neareft the fouth; and on the American fide, neareft the eaft. In thefe feas, Dr. Halley obferved, that when the wind was eaftward, the weather was gloomy, dark, and rainy, with hard gales of wind; but when the wind veered to the fouthward, the weather generally became ferene, with gentle breezes, approaching to a calm. Thefe winds are fomewhat changed by the feafons of the year; for when the fun is far northward, the Brafil S.E. wind turns to the fouth, and the N.E. wind to the eaft; and when the fun is far fouth, the S.E. wind gets to the eaft, and the N.E. winds on this fide of the equator veer more to the north.

8. Along the coaft of Guinea, from Sierra Leone to the ifland of St. Thomas, under the equator, which is above five hundred leagues, the foutherly and fouth-weft winds blow perpetually; for the S.E. trade-wind, having paffed the equator, and approaching the Guinea coaft within eighty or a hundred leagues, inclines toward the fhore, and becomes fouth, then S.E., and by degrees, as it comes near the land, it veers about to fouth, S.S.W., and in with the land it is S.W. and fometimes W.S.W. This tract is fubject to frequent calms, violent fudden gufts of winds, called tornadoes, blowing from all points of the horizon.

The wefterly wind on the coaft of Guinea is probably owing

owing to the nature and ſituation of the land, which, being greatly heated by the ſun, rarefies the air exceedingly; hence the cooler and heavier air from over the ſea will keep ruſhing in to reſtore the equilibrium.

9. Between the fourth and tenth degrees of north latitude, and between the longitudes of Cape Verd, and the eaſternmoſt of the Cape Verd iſles, there is a tract of ſea ſubject to perpetual calms, attended with frequent thunder and lightning, and rains; whence this part of the ſea is called 'The Rains.' Ships in ſailing theſe ſix degrees are ſaid to have been ſometimes detained whole months.

The cauſe of this ſeems to be, that the weſterly winds ſetting in on this coaſt, and meeting the general eaſterly wind in this tract, balance each other, and cauſe the calms; and the vapour carried thither by the hotteſt wind, meeting the cooleſt, is condenſed, and occaſions the very frequent rains.

The three laſt obſervations account for two circumſtances which mariners experience in ſailing from Europe to India, and in the Guinea trade.

The *firſt* is the difficulty which ſhips, in going to the ſouthward, eſpecially in the months of July and Auguſt, find in paſſing between the coaſt of Guinea and Braſil, although the breadth of this ſea is more than five hundred leagues. This happens, becauſe the S.E. winds at that time of the year commonly extend ſome degrees beyond the ordinary limits of four degrees north latitude; and beſides coming ſo much ſoutherly, as to be ſometimes ſouth, ſometimes a point or two to the weſt; it then only remains to ply to windward: and if, on the one ſide, they ſteer W.S.W. they get a wind more and more eaſterly; but then there is a danger of falling in with the Braſilian coaſt, or ſhoals; and if they ſteer E.S.E. they fall into the neighbourhood of the coaſt of Guinea, from whence they cannot depart without running eaſterly as far as the iſland of St. Thomas; and this is the conſtant practice of all the Guinea ſhips.

Secondly, With regard to all ſhips departing from Guinea for Europe, their direct courſe is northward; but on this courſe they cannot go, becauſe the coaſt bending nearly eaſt and weſt the land is to the northward: therefore, as the winds on this coaſt are generally between the S. and W.S.W., they are obliged to ſteer S.S.E. or S., and with theſe courſes they run off the ſhore; but in ſo doing they always find the winds more and more contrary; ſo that when near the ſhore they can lie ſouth, at a greater diſtance they can make no better than S.E., and afterwards E.S.E.; with which courſes they commonly fetch the iſland of St. Thomas and Cape Lopez, where, finding the winds to the eaſtward of the ſouth, they ſail weſterly with it, till coming to the latitude of four degrees ſouth, they there find the S.E. winds blowing perpetually.

On account of theſe general winds, all thoſe that uſe the Weſt India trade, even thoſe bound to Virginia, reckon it their beſt courſe to get as ſoon as they can to the ſouthward, that ſo they may be certain of a fair and freſh gale to run before it to the weſtward; and for the ſame reaſon, thoſe homeward-bound from America endeavour to gain the latitude of thirty degrees, where they firſt find the winds begin to be variable; though the moſt ordinary winds in the North Atlantic ocean come from between the ſouth and weſt.

10. Between the ſouthern latitudes of ten and thirty degrees in the Indian ocean, the general trade-wind about the S.E. by S. is found to blow all the year long in the ſame manner as in the like latitude in the Ethiopic ocean; and during the ſix months from May to December, theſe winds reach to within two degrees of the equator; but during the other ſix months, from November to June, a N.W. wind blows in the tract lying between the third and tenth degrees of ſouthern latitude, in the meridian of the north end of Madagaſcar; and between the ſecond and twelfth degree of ſouth latitude, near the longitude of Sumatra and Java.

11. In the tract between Sumatra and the African coaſt, and from three degrees of ſouth latitude quite northward to the Aſiatic coaſts, including the Arabian ſea and the gulf of Bengal, the monſoons blow from September to April on the N.E., and from March to October on the S.W. In the former half year the wind is more ſteady and gentle, and the weather clearer than in the latter ſix months; and the wind is more ſtrong and ſteady in the Arabian ſea than in the gulf of Bengal.

12. Between the iſland of Madagaſcar and the coaſt of Africa, and thence northward as far as the equator, there is a tract, in which, from April to October, there is a conſtant freſh S.S.W. wind; which to the northward changes into the W.S.W. wind, blowing at that time in the Arabian ſea.

13. To the eaſtward of Sumatra and Malacca on the north of the equator, and along the coaſts of Cambodia and China, quite through the Philippines as far as Japan, the monſoons blow northerly and ſoutherly; the northern ſetting in about October or November, and the ſouthern about May: theſe winds are not quite ſo certain as thoſe in the Arabian ſeas.

14. Between Sumatra and Java to the weſt, and New Guinea to the eaſt, the ſame northerly and ſoutherly winds are obſerved; but the firſt half-year monſoon inclines to the N.W., and the latter to the S.E. Theſe winds begin a month or ſix weeks after thoſe in the Chineſe ſeas ſet in, and are quite as variable.

15. Theſe contrary winds do not ſhift from one point to its oppoſite all at once: in ſome places, the time of the change is attended with calms; in others, by variable winds: and it often happens on the ſhores of Coromandel and China, towards the end of the monſoons, that there are moſt violent ſtorms, greatly reſembling the hurricanes in the Weſt Indies; in which the wind is ſo very ſtrong, that hardly any thing can reſiſt its force.

All navigation in the Indian ocean muſt neceſſarily be regulated by theſe winds; for if mariners ſhould delay their voyages till the contrary monſoon begins, they muſt either ſail back, or go into harbour, and wait for the return of the trade-wind.

16. The irregularities of the wind in countries which are farther from the equator than thoſe which have been mentioned above, or nearer to the poles of the earth, are ſo great that no particular period has as yet been diſcovered, excepting that in particular places certain winds are more likely to blow than others. Thus at Liverpool the winds are ſaid to be weſterly for near two-thirds of the year; in the ſouthern part of Italy, a ſouth-eaſt wind (called the *ſchirocco*) blows more frequently than any other wind, &c.

17. The temperature of a country with reſpect to heat or cold is increaſed or diminiſhed by winds, according as they come from a hotter or colder part of the world. The north and north-eaſterly winds, in this country and all the weſtern parts of Europe, are reckoned cold and drying winds. They are cold, becauſe they come from the frozen region of the north pole, or over a great tract of cold land. Their drying quality is derived from their coming principally over land, and from a well-known property of the air; namely, that warm air can diſſolve, and keep diſſolved, a

greater quantity of water than colder air: hence the air which comes from colder regions, being heated over warmer countries, becomes a better folvent of moifture, and dries up with greater energy the moift bodies it comes in contact with; and, on the other hand, warm air coming into a colder region depofits a quantity of the water it kept in folution, and occafions mifts, fogs, clouds, rains, &c. "In fhort," fays colonel Roy, "the winds feem to be drier, denfer, and colder, in proportion to the extent of land they pafs over from the poles towards the equator; but they appear to be more moift, warm, and light, in proportion to the extent of ocean they pafs over from the equator towards the poles. Hence the humidity, warmth, and lightnefs, of the Atlantic winds to the inhabitants of Europe. On the eaft coafts of North America the feverity of the N.W. wind is univerfally remarked; and there can fcarcely be a doubt, that the inhabitants of California, and other parts on the weft fide of that great continent, will, like thofe on the weft of Europe, feel the ftrong effects of a N.E. wind."

18. In warm countries, fometimes the winds, which blow over a great tract of highly-heated land, become fo very drying, fcorching, and fuffocating, as to produce dreadful effects. Thefe winds, under the names of *Blooms*, *Samiel*, and *Solanos*, are often felt in the deferts of Arabia, in the neighbourhood of the Perfian gulf, in the interior of Africa, and in fome other places. There are likewife in India, part of China, part of Africa, and elfewhere, other winds, which depofit fo much warm moifture as to soften, and actually to diffolve glue, falts, and almoft every article which is foluble in water.

19. It is impoffible to give any adequate account of irregular winds, efpecially of thofe fudden and violent gufts as come on at very irregular periods, and generally continue for a fhort time. They fometimes fpread over an extenfive tract of country, and at other times are confined within a remarkably narrow fpace. Their caufes are by no means rightly underftood, though they have been vaguely attributed to peculiar rarefactions, to the combined attractions of the fun and moon, to earthquakes, to electricity, &c. They are called in general *hurricanes*, or they are the principal phenomenon of a hurricane, that is, of a violent ftorm.

Almoft every one of thofe violent winds is attended with particular phenomena, fuch as droughts, or heavy rains, or hail, or fnow, or thunder and lightning, or feveral of thofe phenomena at once. They frequently fhift fuddenly from one quarter of the horizon to another, and then come again to the former point. In this cafe they are called *tornadoes*.

In mountainous countries, the wind fometimes rages with extreme violence, and the mountains generally exhibit figns of the approaching ftorm. Thus, at the Cape of Good Hope, there are four remarkable mountains, called Table Land, or Mountain; Sugar Loaf, or the Lion's Head; James Mount, or the Lion's Rump; and Charles Mount, called alfo the Devil's Tower, or Devil's Head, from the violent fqualls of wind which come from it. In the fummer feafon Table Mountain is fometimes fuddenly covered with a white cloud, called the *Table-cloth*; when this cloud feems to roll down the fteep face of the mountain, it is a fure indication of an approaching gale of wind from the S.E., which generally blows with great violence, and fometimes continues a day or more, but in common is of fhort duration. On the firft appearance of this cloud, the fhips in Table bay begin to prepare for it, by ftriking yards and top-mafts, and making every thing as fnug as poffible. If, in the morning, the cloud extends from the Table to Mount Charles, or the Devil's Tower, which are almoft contiguous, it is a general faying among feamen, that the old gentleman is going to breakfaft; if in the middle of the day, that he is going to dinner; and if in the evening, that the cloth is fpread for fupper.

There are various other periodical winds: of thefe, however, that generally known by the name of *Limbat*, which is common in the ifland of Cyprus, fhall only be mentioned here. The period of this wind is five days: on the firft day, it begins to blow at eight in the morning, and increafes till noon; from thence it gradually weakens, and ceafes entirely about three P.M. On the fecond day, it arifes at the fame hour; but it does not attain its greateft ftrength till about one in the afternoon, and ceafes at four. On the third day, it begins as before; but it falls an hour later. On the remaining days, it follows the fame progreffion as on the third; but it is remarked, that a little before it ceafes, it becomes extremely violent. Upon the N.W. fide of the above ifland, this wind is confidered as a fea-breeze; and upon the S.E. as a land-breeze. See WIND, *Qualities of*, *fupra*. See alfo HURRICANES, TORNADOES, and WHIRL-*Wind*. See Phil. Tranf. N° 183, or Abr. vol. ii. p. 133, &c. Robertfon's Elem. of Nav. b. vi. f. 6. Cavallo's Philof. vol. ii.

The winds are divided, with refpect to the points of the horizon from which they blow, into *cardinal* and *collateral*.

WINDS, *Cardinal*, are thofe blowing from the four cardinal points; eaft, weft, north, and fouth.

Thus, a wind that blows from the E. towards the W. is called *eaft wind;* when it blows from the W. towards the E., *weft wind;* when it blows from the N. to the S., it is called *north wind;* and when it blows from the S. towards the N., it is called *fouth wind.*

WINDS, *Collateral*, are the intermediate winds between any two cardinal winds. The number of thefe is infinite, as the points from which they blow are; but only a few of them are confidered in practice; *i. e.* only a few of them have their diftinguifhing names.

Thofe winds which deviate a little from the cardinal points are called *northerly*, *eafterly*, *foutherly*, and *wefterly* winds. But for the fake of greater diftinction, the fpace or arch which lies between any two contiguous cardinal points, is fuppofed, by the mariners, to be divided into eight equal parts, or *points*, and each point into four equal parts, called *quarter-points*. So that the horizon is fuppofed to be divided into thirty-two principal points, which are called *rhumbs*, or *winds*, to each of which a particular name is affigned; and thofe names are derived from the names of the adjacent cardinal points. See COMPASS.

The ancient Greeks, at firft, only ufed the four cardinal ones; at length they took in four more. Vitruvius gives us a table of twenty, befides the cardinals, which were in ufe among the Romans.

The moderns, as their navigation is much more perfect than that of the ancients, have given names to twenty-eight collateral winds, which they range into *primary* and *fecondary;* and the fecondary they fubdivide into thofe of the *firft* and *fecond order*.

The Englifh names of the primary collateral winds and points are compounded of the names of the cardinal ones, north and fouth being ftill prefixed.

The names of the fecondary collateral winds of the firft order are compounded of the names of the cardinals, and the adjacent primary one. Thofe of the fecond order are compounded of the names of the cardinal, or the next adjacent primary; and the next cardinal, with the addition of the word *by*. The Latins have diftinct names for each; all which are expreffed in the following Table.

Names of the Winds and Points of the Compaſs. English.	Latin and Greek.	Diſtances of the Points, &c. from the North.

For the uſe of the winds in navigation, &c. ſee Sailing.

Wind, a diſeaſe in ſheep of a very dangerous and diſtreſſing kind.

It is obſerved in the Shepherd's Guide, that in this complaint, the ſheep, immediately after being clipped or ſhorn, appear to be in violent pain, their ſides are ſomewhat extended, and their breathing very ſhort, the head is hung down drooping, and they have a great averſion to moving or walking. Theſe ſymptoms continue to increaſe until the ſheep dies, which is in a very few hours, unleſs a violent purging comes on, which generally gives immediate relief. On inquiring for the name of this affection, the writer ſays, he found it was called the wind, but where the ſeat of it lay few could tell him; ſome thought it was in the head, others in the lungs; and the remedies they applied were as various as their opinions of the nature of the diſeaſe.

Not being ſatisfied with theſe accounts, he endeavoured, by inſpecting the carcaſes of ſheep that died of the diſeaſe, to diſcover the cauſe and ſeat of the complaint. On opening four ſheep that died of the diſeaſe, he found all the inteſtines rather diſtended with flatus, but not in any great degree. Their blood-veſſels were very turgid, and of a deep red, particularly thoſe of the large inteſtines, excepting the rectum, or what is called the *bum-gut*, which had a healthy appearance, as likewiſe had the ſtomach, milt, caul, liver, heart, lungs, and in ſhort all the viſcera contained in the cavity of the trunk. From theſe appearances he will venture to ſay, that the diſeaſe in queſtion is a violent inflammation of the inteſtines, perhaps in ſome meaſure ariſing from bruiſes in ſhearing, but more ſo from loſing a warm clothing, and being ſuddenly expoſed to cold air and cold feeding.

He therefore recommends to farmers, that on the firſt appearances of the complaint they put the ſheep into a ſtable or other warm place, and immediately bleed it freely. Then to bruiſe a quarter of an ounce of ſome carminative ſeed, ſuch as carraway, aniſe, cummin, or fennel, and to mix theſe with two ounces of Glauber's purging ſalts, in a pint of water, placing it on a fire, and making it boil for a few minutes, then to ſtrain it off. Then to add a quarter of an ounce

ounce of powdered jalap, and while lukewarm to give the ſheep a quarter of a pint of this liquor, well ſhaken together, every half hour till it dungs. It ſhould have no food or cold water until recovered, but a little warm water might be of ſervice in ſome caſes.

This is a diſorder which is in general ſo ſuddenly fatal, that recourſe ſhould be inſtantly had to any remedy that may have been found beneficial; but bleeding is probably that on which the greateſt dependence may be placed, with calomel in ſome inſtances.

WIND, among *Animals*, is another name for the breath, or rather for the power with which the lungs are endowed in the exerciſe of their functions, which in many caſes is a ſort of morbid affection of them, eſpecially in horſes, ſwine, calves, and ſome others. Horſes are often thick-winded and purſive, which is this ſtate, and require much exerciſe and management, and the other two are ſometimes affected in much the ſame way.

WIND, in *Rural Economy*, a term applied to a winch or wince in ſome places.

WIND, *Freſh*. See FRESH.

WIND, *To haul the*. See HAUL.

WIND, *Large*, in the *Sea Language*. See LARGE.

WIND, *Quarter*, at *Sea*. See QUARTER.

WINDS, *Reigning*. See REIGNING.

WINDS, *Tropic*. See TRADE-*Winds*, and WIND *ſupra*.

WIND, *Side*, at *Sea*, that which blows on the ſide of the ſhip.

To WIND *a Ship* or *Boat*, in *Sea Language*, is to change her poſition, by bringing the ſtern to lie in the ſituation of the head, or directly oppoſite to its former ſituation.

WIND, in the *Manege*. A horſe that carries in the wind, is one that toſſes his noſe as high as his ears, and does not carry handſomely.

The difference between carrying in the wind and beating upon the hand is, that a horſe who beats upon the hand ſhakes his head, and reſiſts the bridle; but he who carries in the wind, puts up his head without ſhaking, and only ſometimes beats upon the hand. The oppoſite to carrying in the wind is arming and carrying low.

WIND, *Whirl*. See WHIRL-*Wind*.

WIND, *Colic*. See COLIC.

WIND-*Dropſy*. See TYMPANITES.

WIND-*Egg*, an addle egg, or an egg that has taken wind. See EGG.

WIND-*Fall* denotes fruit blown off the tree by the wind.

WIND-*Flower*, in *Botany*. See ANEMONE.

WIND-*Furnace*. See FURNACE.

WIND-*Gage*, in *Pneumatics*, an inſtrument ſerving to determine the velocity and force of the wind. See ANEMOMETER, ANEMOSCOPE, and *Laws of the Force, &c. of the* WIND *ſupra*.

Dr. Lind, of Edinburgh, has contrived an apparatus of this kind, which is ſimple and eaſy of conſtruction, and which ſeems to be well adapted for meaſuring the force of the wind with a ſufficient degree of accuracy. This inſtrument conſiſts of two glaſs tubes A B, C D, (*Plate* XV. *Pneumatics*, *fig.* 9.) five or ſix inches in length, and about four-tenths of an inch in bore; which are connected together like a ſiphon, by a ſmall bent glaſs tube *a b*, the bore of which is one-tenth of an inch in diameter. On the upper end of the leg A B there is a tube of latten braſs, which is kneed or bent perpendicularly outwards, and has its mouth open towards F; on the other leg C D is a cover, with a round hole G in the upper part of it, two-tenths of an inch in diameter. This cover and the kneed tube are connected together by a ſlip of braſs, *c d*, which ſtrengthens the whole inſtrument, and ſerves to hold the ſcale H I. The kneed tube and cover are fixed on with hard cement, or ſealing-wax. To the ſame tube is ſoldered a piece of braſs, *e*, with a round hole in it, to receive the ſteel ſpindle K L, and at *f* another ſuch piece of braſs is ſoldered to the braſs hoop *g h*, which ſurrounds both legs of the inſtrument. There is a ſmall ſhoulder on the ſpindle at *f*, upon which the inſtrument reſts, and a ſmall nut *i*, to prevent it from being blown off the ſpindle by the wind. The whole inſtrument is eaſily turned round upon the ſpindle by the wind, ſo as always to preſent the mouth of the kneed tube toward it. At the end of the ſpindle there is a ſcrew, by which it may be ſcrewed to the top of a poſt or ſtand: it has alſo a hole at L, to admit a ſmall lever for ſcrewing it into wood with greater facility. A thin plate of braſs *k* is ſoldered on the kneed tube, about half an inch above the round hole G, ſo as to prevent rain from falling into it. There is alſo a crooked tube A B (*fig.* 10.), to be put occaſionally upon the mouth of the kneed tube F, in order to prevent rain from being blown into the mouth of the wind-gage, when it is left expoſed to the rain.

This inſtrument ſerves to aſcertain the force of the wind, by filling the tube half full of water, and puſhing the ſcale a little up or down, till o upon the ſcale, when the inſtrument is held perpendicularly, be on a line with the ſurface of the water, in both legs of the wind-gage. The inſtrument being thus adjuſted, hold it up perpendicularly, and turning the mouth of the kneed tube toward the wind, obſerve how much the water is depreſſed by it in one leg, and how much it is raiſed in the other. The ſum of the two is the height of a column of water, which the wind is capable of ſuſtaining at that time; and every body that is oppoſed to that wind, will be preſſed upon by a force equal to the weight of a column of water, having its baſe equal to the ſurface that is oppoſed, and its height equal to the altitude of the column of water ſuſtained by the wind in the wind-gage. Hence the force of the wind upon any body, where the ſurface oppoſed to it is known, may be eaſily found; and a ready compariſon may be made betwixt the ſtrength of one gale of wind, and that of another, by knowing the heights of the columns of water which the different winds were capable of ſuſtaining. The heights of the column in each leg will be equal, provided that the legs are of equal bores; but unequal if their bores are unequal. For ſuppoſe the legs equal, and the column of water ſuſtained by the wind to be three inches, the water in the leg which the wind blows into will be depreſſed $1\frac{1}{2}$ inch below o, and raiſed as much in the other leg. But if the bore of the leg which the wind blows into be double that of the other, the water in that leg will be depreſſed only one inch, whilſt it is raiſed twice as much, or two inches, in the other, and *vice verſâ*.

The force of the wind may likewiſe be meaſured with this inſtrument, by filling it till the water runs out at G. For if it be then held up to the wind as before, a quantity of water will be thrown out; and if both legs of the inſtrument are of the ſame bore, the height of the column ſuſtained will be equal to double the column of water in either leg, or the ſum of what is wanting in both legs. But if the legs are of unequal bores, neither of theſe will give the true height of the column of water which the wind ſuſtained. For, obtaining in this caſe the true height, Dr. Lind has ſubjoined the requiſite formulæ. The uſe of the ſmall tube of communication *a b* (*fig.* 9.), is to check the undulation of the water, ſo that the height of it may be read off from the ſcale with eaſe and certainty; and alſo to prevent the water

water from being thrown up to a much greater or lefs altitude than the true height of the column which the wind is able at that time to fuftain. The author has calculated a table, by means of which, having the height of the column of water fuftained in the wind-gage, the force of the wind upon a foot fquare may be determined.

Height of the Water in the Gage.	Force of the Wind on One Foot Square in Pounds Avoirdupois.	Common Defignations of fuch Winds.
Inches.		
12	62.500	
11	57.293	
10	52.083	Moft violent hurricane.
9	46.875	
8	41.667	Very great hurricane.
7	36.548	Great hurricane.
6	31.750	Hurricane.
5	26.041	Very great ftorm.
4	20.833	Great ftorm.
3	15.625	Storm.
2	10.416	Very high wind.
1	5.208	High wind.
0.5	2.604	Brifk gale.
0.1	0.521	Frefh breeze.
0.05	0.260	Pleafant wind.
0.025	0.030	A gentle wind.

When the height of the water is not exactly mentioned in the table, then that height may be feparated into fuch parts as are mentioned in the table, and the fum of the forces anfwering to fuch parts will be the force of the wind correfpondent to the height in queftion: thus, if the height of the water be 4.6 inches; then this height is equal to 4 + 0.5 + 0.1, which parts are all in the table; therefore,

Inches.		Pounds.
4	-	20.833
0.5	-	2.604
0.1	-	0.521

The fum is 23.958, which expreffes the force of the wind when the height of the water in the gage is 4.6 inches.

Any alteration that can ufually take place in the temperature of the water, makes no fenfible difference in this inftrument.

In frofty weather this gage cannot be ufed with common water. At that time fome other liquor muft be ufed, which is not fo fubject to freeze; and, upon the whole, a faturated folution of common falt in water is the moft eligible: but in that cafe, (fince the fpecific gravity of a faturated folution of falt is to that of pure water, as 1.244 to 1,) the forces which are ftated in the preceding table muft be multiplied by 1.244. Thus, if in the preceding example the faturated folution of falt had been ufed inftead of water only, the force of the wind on a fquare foot would have been 29.8 pounds.

When falt-water is ufed, the force of the wind, which is ftated in the table, muft be increafed in the proportion of the fpecific gravity of falt-water to that of common water; thus, ufing the preceding example, we muft fay, as 1 : 1.244 : : 23.958 to a fourth proportional, which muft be found by multiplying the fecond term by the third, and then dividing the product by the firft term; but, the firft term being unity, we need only multiply 23.958 by 1.244.

On the 9th of May, 1775, Dr. Lind obferved, that the wind fupported a column of water in his wind-gage $6\frac{7}{10}$ inches in height; and from his table it appeared, that the force of the wind in this hurricane, which did great damage to the gardens in his neighbourhood, was equal to 34.921 pounds avoirdupois, on every fquare foot.

If the velocity and denfity of the wind in any particular cafe were accurately determined, this inftrument, which gives its force or momentum, would enable us to afcertain the velocity in every other cafe, the denfity being known: for the force of the wind is as the fquare of its velocity. Phil. Tranf. vol. lxv. part ii. art. 34. p. 353, &c.

Mr. Martin, from a hint firft fuggefted by Dr. Burton, contrived an anemofcope, or wind-gage, of the following conftruction. A B C D E F G H I (*fig.* 11.) is an open frame of wood, firmly fupported by the fhaft or poftern I. In the two crofs pieces H K, L M, is moved an horizontal axis Q M, by means of the four fails *a b*, *c d*, *e f*, *g h*, in a proper manner, expofed to the wind. Upon this axis is fixed a cone of wood M N O, upon which, as the fails move round, a weight S is raifed by a ftring on its fuperficies, proceeding from the fmall to the largeft end N O. Upon the great end or bafe of the cone is fixed a ratchet-wheel *i k*, in whofe teeth falls the click X, to prevent any retrograde motion from the depending weight.

From the ftructure of this machine, it is eafy to underftand, that it may be accommodated to eftimate the variable force of the wind, becaufe the force of the weight will continually increafe, as the ftring advances on the conical furface, by acting at a greater diftance from the axis. And, therefore, if fuch a weight be put on, on the fmalleft part at M, as will juft keep the machine in equilibrio with the weakeft wind; then as the wind becomes ftronger, the weight will be raifed in proportion, and the diameter of the bafe of the cone N O may be fo large in comparifon of that of the fmaller end or axis at M, that the ftrongeft wind fhall but juft raife the weight to the great end.

Thus, for example, let the diameter of the axis be to that of the bafe of the cone N O as 1 to 28; then if S be a weight of one pound at M on the axis, it will be equivalent to twenty-eight pounds, or $\frac{1}{4}$ of an hundred, when raifed to the greateft end. If, therefore, when the wind is weakeft, it fupports one pound on the axle, it muft be twenty-eight times as ftrong to raife the weight to the bafe of the cone. Thus may a line or fcale of twenty-eight equal parts be drawn on the fide of the cone, and the ftrength of the wind will be indicated by that number therein from which the ftring fhall at any time hang.

Furthermore, the ftring may be of fuch a fize, and the cone of fuch a length, that there fhall be fixteen revolutions of the ftring between each divifion of the fcale on the cone; fo will the ftrength of the wind be expreffed in pounds and ounces. And if greater exactnefs be required, let the periphery of the cone's bafe be divided into fixteen equal parts; then whenever the equilibrium happens, the ftring will leave the conic furface againft one of thofe divifions, and thus fhew the force of the wind to a drachm avoirdupois weight. Martin's Phil. Brit. vol. ii. p. 211, &c.

M. Bouguer contrived a very fimple inftrument, by means of which we may immediately difcover the force which the wind exerts on a given furface. This is a hollow tube A A B B (*fig.* 12.), in which a fpiral ftring C D is fixed, that may be more or lefs compreffed by a rod F S D, paffing

paffing through a hole within the tube at A A; then having obferved to what degree different forces or given weights are capable of compreffing the fpiral, mark divifions on the rod in fuch a manner, that the mark at S may indicate the weight requifite to force the fpring into the fituation C D; afterwards join at right angles to this rod at F, a plane furface E F E of a given area, either greater or lefs, at pleafure; then let this inftrument be oppofed to the wind, fo that it may ftrike the furface in the directions V E, V E, parallel to that of the rod, and the mark at S will fhew the weight to which the force of the wind is equivalent.

The ingenious profeffor Leflie (Enquiry into the Nature and Propagation of Heat) having found, in the courfe of his experiments on heat, that the refrigerant, or cooling power of a current of air, is exactly proportional to its velocity, derives from this principle the conftruction of a new and fimple anemometer. "It is in reality nothing more," fays he, "than a thermometer, only with its bulb larger than ufual. Holding it in the open ftill air, the temperature is marked: it is then warmed by the application of the hand, and the time is noted which it takes to fink back to the middle point. This I fhall term the fundamental meafure of cooling. The fame obfervation is made on expofing the bulb to the impreffion of the wind, and I fhall call the time required for the bifection of the interval of temperatures, the occafional meafure of cooling. After thefe preliminaries, we have the following eafy rule: Divide the fundamental by the occafional meafure of cooling, and the excefs of the quotient above unit, being multiplied by $4\frac{1}{2}$, will exprefs the velocity of the wind in miles *per* hour. The bulb of the thermometer ought to be more than half an inch in diameter, and may, for the fake of portability, be filled with alcohol, tinged, as ufual, with archil. To fimplify the obfervation, a fliding fcale of equal parts may be applied to the tube. When the bulb has acquired the due temperature, the zero of the flide is fet oppofite to the limit of the coloured liquor in the ftem; and after having been heated, it again ftands at 20° in its defcent, the time which it thence takes until it finks to 10° is meafured by a ftop-watch. Extemporaneous calculation may be avoided, by having a table engraved upon the fcale for the feries of occafional intervals of cooling."

WIND-*Gall*, a difeafe in horfes and fome other animals. It is a puffy kind of fwelling or tumour, which yields to the preffure of the finger, but upon removing the preffure recovers itfelf, and pufhes out as before. Thefe fwellings have been thus named from a falfe notion of their containing nothing but air or wind. Thefe tumours are often feated on both fides of the back-finew of a horfe, above the fetlock on the fore-legs, but moft frequently on the hind-legs. They are quite loofe and detached from the parts on which they grow, and exhibit the fame figns whereever they are met with, whether in the hocks or about the knees; for thefe fwellings are not confined to the lower limbs only, but appear in any of thofe parts of a horfe's body where the cellular membrane can be eafily feparated; and they exift, for the moft part, without occafioning any pain. They are ufually caufed by riding on very hard roads, or on dry hilly grounds. Sometimes travelling horfes, when they are worked too young, before the limbs are grown firm and vigorous, will have them. And Gibfon obferves, that they fometimes proceed from conftitutional weaknefs, efpecially in bulky horfes, that are fomewhat under-limbed and flefhy about the fetlock-joint. Thefe, it is faid, have been known to have wind-galls without any ftrain, hard riding, or other ill ufage of any kind.

It has been obferved too, that when thefe tumours appear upon the hind-legs they never caufe lamenefs, though fuch horfes are often ftiff behind after riding. When on the fore-legs they always make a horfe go lame at firft; but afterwards that tendernefs goes off in a great meafure, and they feldom go lame, but ftiff, and inclinable to ftumble. They generally recover, however, with a day's reft. Thofe flatulent fwellings indeed that come in the ligaments of the hocks are always troublefome, disfigure the animal, and, unlefs fpeedily affifted, will caufe incurable lamenefs. At firft they are but fmall, but in time they grow to the fize of a pullet's egg, perhaps, and pufh out on each fide of the hollow of the hock. Swellings of the fame kind alfo appear before the knee, where they often precede a difeafed joint. Very fmall fimilar fwellings under the fore part of the knee, in the interftices of both fides of the joint, are alfo dangerous; but thefe feldom happen, and are ufually caufed by fome violent ftrain, efpecially when a horfe falls down upon a defcent with his whole weight upon his knees. The other flatulent fwellings which horfes are fubject to feldom caufe lamenefs, but are, for the moft part, eafily cured. We mean thofe that arife in the interftices of the large mufcles of the hips and thighs, which are diftended like little bladders filled with air. Thefe come by ftrains and over-exertion; for draught-horfes are the moft fubject to them.

Wind-galls that proceed from mere weaknefs are feldom curable, unlefs the conftitution can be improved; but we often fee horfes that were fubject to wind-galls when young, get the better of them as they advance in age. The methods of cure in thefe cafes is by means of bliftering, firing, and the ufe of aftringent applications.

As thefe are enlargements of the capfules, or *burfæ mucofæ*, fituated between the tendons, that contain an oily lubricating fluid for the prevention of friction and to facilitate motion, arifing from long exertion producing inflammation of them, and an increafed fecretion of the contained fluid, they are capable of being eafily removed in their beginning ftates, by reft and the ufe of blifters to the parts compofed of cantharides and corrofive fublimate with olive oil; afterwards turning the animals out to grafs or the ftraw-yard. Or where this cannot be permitted, the parts may be ftrengthened by the ufe of a flannel roller, made and continued wet by a wafh compofed of equal parts of ftrong vinegar and Goulard water, or the latter alone in fome cafes. If, however, the difeafe may have been neglected, recourfe muft be had to the hot iron; after which the bliftering fhould be practifed as before advifed.

WIND-*Gun*. See AIR-*Gun*.

WIND-*Hatch*, in *Mining*, a term ufed to exprefs the place at which the ore is taken out of the mines.

The word *hatch* is the general term ufed by the miners to exprefs an opening from the furface into the mine, or in the attempting to find a mine.

Thus the word *effay-hatches* fignifies the openings made in fearch of the trains of fhoad-ftones; and the *tin-hatch* in Cornwall is the name of the opening by which they defcend into a tin-mine.

The word *wind-hatch* feems to be a corruption of *winder-hatch*; for at thefe places they have a winder conveying two buckets, the one conftantly up, the other conftantly down; the man below fills the bucket that defcends; and when that which afcends full is emptied at the mouth of the hatch, the perfon who has the care of that part of the work, delivers it empty to go down again. Phil. Tranf. N° 69.

WIND-*Hover*, in *Ornithology*, the name of a fpecies of hawk,

hawk, called alfo by fome the *ftannel*, but more ufually the *keftrel*, and known among authors by the names of the *tinnunculus* and *cenchris*.

WIND-*Inftruments*, in *Mufic*, are inftruments played by wind, chiefly by the breath; in contradiftinction to ftringed-inftruments, and inftruments of the *pulfative* kind.

The wind-inftruments known to the ancients were, the *tibia*, *fiftula*, or *fyringa* of Pan, confifting of feven reeds, joined fidewife; alfo, *organs*, *tubæ*, *cornua*, and the *lituus*. Thofe of the moderns are, the *flute*, *bagpipe*, *hautboy*, *trumpet*, &c. See INSTRUMENT, and MUSIC.

WIND-*Mill*, in *Mechanics*, a machine which is put in motion by the force of the wind. Wind-mills are in general applied to the purpofe of grinding corn, but are occafionally ufed to give motion to machines for raifing water, fawing-mills, or for other purpofes. We fhall in this article confider the wind-mill as a firft mover, or *primum mobile*, which may be applied to many purpofes.

The invention of wind-mills is not of very remote date. According to fome authors they were firft ufed in France in the fixth century; while others maintain that they were brought to Europe in the time of the crufades, and that they had long been employed in the Eaft, where the fcarcity of water precluded the application of that powerful agent to machinery.

The wind-mill, though a common machine, has fome things in it more ingenious than is ufually imagined. Add, that it is commonly allowed to have a degree of perfection, which few of the popular engines have attained to, and which the makers are but little aware of: though the aid of mathematics has furnifhed ample matter for its improvement.

The vertical wind-mill, which is the kind in moft common ufe, confifts of an axis or fhaft A B, (*fig.* 1. *Plate* II. *Wind-Mill*,) placed in the direction of the wind, and ufually inclining a little upwards from the horizontal line. At one end of this, four long arms or yards, S, T, V, W, are fixed perpendicular to the axis, and crofs each other at right angles; into thefe arms fmall crofs-bars are mortifed at right angles; and other long bars are joined to them, which are parallel to the length of the arms; fo that the bars interfect each other in the manner of lattice-work, and form a furface, on which a cloth can be fpread to receive the action of the wind. Thefe are called the fails; they are in form of a trapezium, and are ufually nine yards long and two wide.

The circular motion is produced by the obliquity of the planes of thefe furfaces, from the plane in which all the four arms are fituated; by thefe means, when the wind blows in the direction of the axis, it does not impinge upon the fails at right angles to their furfaces, but ftrikes obliquely; hence the effort of the fail to recede from the wind, caufes it to turn round with the common axis, and the four fails are all made oblique in the fame direction, fo as to unite their efforts for the common object.

That the wind may act with the greateft efficiency upon the fails, the wind-fhaft muft have the fame direction as the wind. But as this direction is perpetually changing, fome apparatus is neceffary for bringing the wind-fhaft and fails into their proper pofition: this is done by turning the axis and fails round in an horizontal direction. There are two methods of effecting this. In the old mills, like *fig.* 1, the whole of the mill or building which contains the machinery is fuftained upon a vertical poft, firmly fixed as a ftand or foot, upon which the whole machine can be turned by a lever, to prefent the fails to any quarter of the horizon from whence the wind blows; and hence thefe are called poft wind-mills, and are neceffarily made of wood. The other kind, *fig.* 2, is called a fmock-mill, in which only the dome-cap or head, which contains the axis of the fails, and covers the great cog-wheel, turns round horizontally; the other parts of the machinery being contained in a fixed building, which rifes up in form of a conical tower of mafonry, and is furmounted by this moveable cap or dome, which is fupported on rollers, fo as to turn round eafily.

As both the common methods of adjufting the wind-fhaft require human affiftance, it would be very defirable that the fame effect fhould be produced folely by the action of the wind. This may be done by fixing a large wooden vane or weathercock at the extremity of a long horizontal arm, which lies in the fame vertical plane with the wind-fhaft.

By thefe means, when the furface of the vane and its diftance from the centre of motion are fufficiently great, a very gentle breeze will exert a fufficient force upon the vane to turn the machinery, and will always bring the fails and wind-fhaft to their proper pofition. This weathercock, it is evident, may be applied either to machines which have a moveable roof, or to thofe which revolve upon a vertical arbor. This method is practifed in fmall machines; but a vane of fufficient power to turn a large mill about would be unwieldy. A much better method is therefore practifed in the beft mills, as we fhall foon defcribe.

In a *poft-mill* the building muft neceffarily be of fmall fize, and it can only contain one pair of mill-ftones. For this purpofe, a large cog-wheel is fixed upon the main-fhaft or axis of the fails; the cogs are placed in the face or flat furface of the wheel, and act upon the teeth of a pinion, which is fixed upon the vertical axis or fpindle of the mill-ftones. The mill-houfe is of a rectangular figure, but narrow in the direction which is prefented to the wind: it is two ftories high, the main-fhaft and mill-ftones being in the upper chamber, whilft the lower is only ufed to contain facks of flour, and alfo to receive the poft on which the mill turns round horizontally to face the wind. This poft is a very ftrong tree, and is held perpendicularly by fixing it upon the middle of long timbers, which form a large crofs on the ground, and are the bafement of the whole mill. The poft is fixed perpendicularly by means of feveral oblique braces, extending from the ground-crofs to the middle part of the poft; but ten or twelve feet of the upper end of the poft muft be round, and clear from the obftruction of the braces. This part of the poft rifes up through the middle of the lower chamber, in the floor of which a circular collar is formed, to furround the lower part of the poft exactly. At the upper end of the poft is a pivot or gudgeon, which enters into a focket fixed in the middle of the upper floor, and to one of the ftrongeft crofs-beams, becaufe this beam muft fuftain the whole weight of the mill. In this manner, the whole mill can turn about upon the vertical poft, but remains always in equilibrio. To make it firm, and prevent it from turning about at every moment, a ftrong framing is united by joints to the back part of the mill-houfe, and defcends in a floping direction till it touches the ground: this is furnifhed with fteps, fo that it ferves as a broad ladder to afcend to the mill; but another ufe is to fteady the mill, becaufe the end of this frame, which is very heavy, refts on the ground, and fhort pofts are fixed in a circle round the mill at regular intervals, to which the end of the ladder is faftened with cords. In order to turn the mill about, a rope is faftened to the end of the floping ladder, and is carried up to the top of the mill in an inclined direction. By means of a ftrong lever, or a tackle of pulleys, this rope can be fhortened, fo as to lift up the ladder clear of the ground; and then, by pufhing it like a long lever, the whole mill is turned round. To obtain more force, a fmall capftan is often provided to draw

a rope

a rope attached to the end of the ladder. This capſtan is moveable, and is faſtened at pleaſure to any one of the poſts which are fixed in the ground.

The internal mechaniſm of a poſt wind-mill is exhibited in *fig.* 3. *Plate* II. *Wind-Mill.* A H O is the upper room; H *o z* the lower one; A B the axis paſſing through the mill; S, T, V, W, the ſails, covered with canvas, ſet obliquely to the wind, and turning round in the order of the letters in *fig.* 1; C the cog-wheel, having about forty-eight cogs, which carry round the lantern E, having eight or nine rounds, together with its ſpindle G N; K is the upper mill-ſtone, and L the lower one; Q R is the bridge ſupporting the axis or ſpindle G N; this bridge is ſupported by the beams *c* and X Y, wedged up at *c* and Q; *z* Y is the lifting-tree, which ſtands upright; *a b* and *e f* are levers, whoſe centres of motion are *a* and *u*; *f g h i* is a cord, with a ſtone, *i*: it goes about the pins *g* and *h*, to wind up and raiſe the ſtone at pleaſure. The ſpindle *t* N is fixed to the upper mill-ſtone K, by a piece of iron called the rynd, and fixed in the lower ſide of the ſtone, which is the only one that turns about, and its whole weight reſts upon a hard ſtone, fixed in the bridge Q R at N. The trundle E, and axis G *t*, may be taken away; for it reſts by its lower part at *t* by a ſquare ſocket, and the top runs in the edge of the beam *w*. By bearing down the end *f* of the lever *f e*, *b* is raiſed, which raiſes *z* Y, and this raiſes Y X, which lifts up the bridge Q R, with the axis N G, and the upper ſtone K; and thus the ſtones are ſet at any diſtance. The lower immoveable ſtone is fixed upon ſtrong beams, and is broader than the upper one: the flour is conveyed through the tunnel *n o* into a cheſt; P is the hopper, into which is put the corn, which runs along the ſpout *r* into the hole *t*, and ſo falls between the ſtones, where it is ground. The axis G *t* is ſquare, which ſhaking the ſpout *r*, as it goes round, makes the corn run out; *r s* is a ſtring going about the pin *s*, and ſerving to move the ſpout nearer to or farther from the axis, ſo as to make the corn run faſter or ſlower, according to the velocity and force of the wind. And when the wind is great, the ſails S, T, V, W, are only in part or one ſide covered; or perhaps only one half of two oppoſite ſails. Toward the end B of the axis another cog-wheel may be fixed, with a trundle and mill-ſtones, like that already deſcribed; ſo that the ſame axis moves two ſtones at once; and when only one pair is to grind, the trundle E, and axis G *t*, are taken out from the other; *x y l* is a girt or gripe of pliable wood, fixed at the end *x*; and the other end *l* is tied to the lever *k m*, moveable about *k*; and the end *m* being put down, draws the gripe *x y l* cloſe to the cog-wheel; and thus the motion of the mill is ſtopped at pleaſure; *p q* is a ladder for aſcending to the higher part of the mill; and the corn is drawn up by means of a rope, rolled about the axis A B, when the mill is at work.

The ſtructure of the mill-ſtones, or grinding parts, is the ſame as the water-mills. See Mill.

It is plain that this conſtruction confines all the machinery to the two chambers, or that part of the mill which is poiſed upon the vertical poſt; hence this kind of wind-mill is unfit for any other purpoſes than that of grinding corn, and for expreſſing oil, becauſe there is ſo little room for the machinery. The Dutch, who are famous for wind-mills, make them ſometimes with a very large poſt, which has a hole down through the centre of it, like a trunk, and through this, a perpendicular axis paſſes to convey the power of the mill down into a building below, and upon the top of which, as a roof, the foundation-beams of the poſt are fixed. (See *fig.* 4.) In this way, the mill is applied to ſaw wood, or to make paper, or any other purpoſe; but the conſtruction is complicated, and leſs effective than the other kind of mill, in which only the head or top turns round, as we ſhall now deſcribe.

The Smock-Mill.—This is the beſt kind of mill, becauſe the building which contains the machinery may be made of any required dimenſions, the ſails and turning cap being all at the top of the houſe. *Fig.* 3. in *Plate* I. *Wind-Mill*, is a vertical ſection of one of theſe mills. K K are the walls of the houſe, and O O ſtrong timbers forming a roof to it; upon theſe eight principal timbers H are erected, to form an octagonal pyramid of carpentry, the ſides of which are filled up by diagonal bracing, and ſmall uprights to nail the boarding to.

The four ſails are fixed on an iron axis B N, by ſcrewing them to an iron croſs formed at one end of it. Two of theſe ſails are marked A A; but the other two are end-ways, and cannot be ſeen. Upon the axis within the mill the cog-wheel C is fixed; and this turns a trundle or lantern D, fixed on the upper end of a ſtrong vertical ſhaft, E E, extending from the top to the bottom of the mill, to turn the machinery: on the lower end of it is a large wheel, *f f*, which turns two pinions, *g g*, upon the ſpindles of the mill-ſtones *h h*. Theſe are on the ſame conſtruction as thoſe deſcribed in our article Mill, to which we refer. At *l* is a wheel upon the main axis, giving motion to a pinion on a horizontal ſhaft or roller, *k*, which has a rope wrapped upon it, to wind up the ſacks of corn. The wheel *l* alſo turns a ſimilar horizontal axis with ſeveral wheels, to receive endleſs ropes for turning the bolting and dreſſing machines.

We will now enter more fully into the mechaniſm of the upper part of the mill, which is called its head or cap, marked G, and contains the axis B N. This is ſupported upon bearings, one being near its ſails, and the other at its extreme end, as is ſhewn in *fig.* 5. *Plate* II. *Wind-Mill*, which is an horizontal ſection of the head, ſhewing the circular kirb, or wooden ring, K, and the framing which is bolted upon it to ſupport the axis.

The conſtruction of the axis is ſhewn in *fig.* 6. of the ſame plate. It conſiſts of an octagonal iron ſhaft with two cylindrical necks at *c* and *d*, where it reſts upon its bearings. At the end it has a kind of box, which has two mortiſes, *e* and *f*, through it in perpendicular directions to receive the ſails. At the back of one of theſe mortiſes, and the front of the other, a projecting arm is left in the caſting to receive ſcrew-bolts, which hold the ſails faſt in the mortiſes. The cog-wheel is fixed on by bolting its arms againſt a flanch C, caſt on the axis. The ſails are braced by a rope-ſtay to each arm, proceeding from the end of a pole, which is fixed at the end of the caſt-iron axis. Each ſail is formed of a ſail-cloth, ſpread upon a kind of lattice-work or framing, compoſed of rails mortiſed into the arms of the ſails. The plane of this frame is inclined to the plane of the ſails' motion at ſuch an angle, that the wind blowing in the direction of the axis acts upon the ſails as inclined planes, and turns them about with a power proportionate to the ſize of the ſails and force of the wind. It is neceſſary, as the wind changes its direction, to turn the ſails about, that the axis may be always in the direction of the wind. (See *fig.* 3. *Plate* I.) This motion is effected by turning the head of the mill round upon the fixed part, on a circle or kirb at the top of the frame compoſing the houſe of the mill. At the bottom of the frame of the wood-cap is a circular or moveable kirb, between which and the fixed kirb a number of rollers are placed; and the moveable kirb of the cap lies upon theſe rollers, which are kept

equidiſtant

equidistant from each other by their centre-pins being fitted into a circular hoop: by these means, though the head of the mill with the wheels and sails weigh several tons, they can be made to turn round to face the wind by a slight power.

The head is contrived to turn itself about whenever the wind changes in the following manner:—A small pair of sails, or fans, M, are fixed up in a frame L, projecting from the back of the head: it has a pinion of ten leaves upon its axis, engaging in a wheel of 60 teeth upon an inclined axis *b*; and this has a pinion *d* of 12 leaves at the other end of it, turning a bevilled wheel of 72 teeth upon a vertical iron axis, at the lower end of which is a pinion *e* of 11 teeth: this works in a circle of 120 cogs, fixed round on the outside of the fixed kirb. By these means, whenever the fan M is turned, it moves the head of the mill slowly round, and with proportionate power.

Now if ever the wind varies in the least from the direction of the main shaft of the sails, it acts obliquely upon the vanes of the fan, and turns them round, at the same time setting the head right again, so that the axis points to the wind. But when the axis is in this situation, the wind blows in the planes of the vanes of the fan, and has no effect upon them. The head of the mill is kept firmly in its place when it turns about by rollers; the axles of which are bolted to the inside of the framing of the head, and the rollers apply to the inside of the fixed kirb: there are four of these rollers. The pivot at the upper end of the vertical shaft is supported in a bearing bolted to a cross-beam in the framing of the head of the mill; and this is fixed precisely in the centre of the head, that it may not vary in its situation as the head turns round. Many other things are so evident in the drawing as to need little farther explanation; such as the different floors of the building, and the circular gallery, I I, all round the mill, for the miller to go round to take the cloth off the sails in high winds, or when the mill is to stop. This is done by untying the cloth at the extremity of the sail, and twisting it up like a rope; then tying the end of it again to the lattice, in which state it presents no surface to the wind. At *k* is a roller turned round by a wheel *l*, fixed on the middle part of the vertical shaft: it is used to draw up the sacks of corn from the bottom of the mill into the upper part, which is used as a store-house for the corn, being divided into as many compartments as the miller requires. The mill-stones are made the same as those used in water-mills. A pair of regulating balls are attached to the upper part of the mill-stone spindle, to regulate the velocity of the mill. The manner of applying this regulator is explained in *fig.* 5. *Plate* II. *Wind-Mill.* The lower end of the iron spindle F is fitted to a square, formed on the top of the mill-stone axis, and the pinion *g g* is fixed on the upper end, to give motion to the stones: immediately beneath the pinion two rods are jointed, hanging downwards, having a heavy iron ball, *l*, fixed fast on the lower end of each: two links are jointed to the arms at *m*, and suspend a collar, which is capable of sliding freely up and down upon the spindle F. It is evident that when the balls fly out from the spindle by their centrifugal force, that the collar will be elevated, and the contrary when the balls approach the spindle. The sliding collar is embraced by a fork formed at the end of a steelyard, lying horizontal, and suspended by the rod *p* as a fulcrum; an iron rod *q* descends from the extreme end of the steelyard, having its lower end formed to a hook, by which it is connected with a lever, *r*, whose fulcrum is *s*; this, by an iron rod *t*, suspends one end of the beam called the bridge, on which the lower pivot of the mill-stone axis rests, the other end bearing on a fulcrum or centre. Now it follows from this arrangement of levers, that by elevating the forked end of the steelyard, or the sliding collar, that the spindle of the stones will be suffered to descend a very minute quantity. This regulates the velocity of the mill, because when the wind increases, and the motion of the mill is accelerated, the balls fly out by the centrifugal force; this lets the upper stone down nearer to the lower, thereby increasing the resistance to the mill, and counteracting the increased force of the wind. On the other hand, if the wind falls, and the mill moves more slowly in consequence, the balls fall together, and let down the sliding collar; this raises the stone up, and increases the distance between them, thereby diminishing the resistance; for this purpose, a weight *o* (*fig.* 5.) is hung upon the steelyard, sufficient to elevate the stone whenever the closing of the balls and consequent descent of the collar will permit it to do so. There are several notches made in the steelyard for different positions of the fulcrum *p* and rod *q*; by means of these the quantity of the regulation can be adjusted to the following rule. If when the wind blows stronger the mill goes slower, contrary to the effect expected, it shews that the regulation is too active; then increase the leverage of the balls by shortening the distance between the fulcrum *p* of the steelyard and the suspension of the rod *q*, by shifting either of them into different notches. On the contrary, if the mill goes much faster when the wind increases, it shews that the regulation does not act sufficiently; then increase the distance between the rod *q* and the fulcrum *p*. If the whole limits of the notches in the steelyard should not be sufficient to effect this, the acting length of the lever *r s* must be increased or diminished by removing its fulcrum *s* to a greater or lesser distance from the suspending-rod *t*; by means of this contrivance the miller is enabled, without much inconvenience, to regulate the velocity of the stones to that degree which is found best for reducing the greatest quantity of grain to flour, without damaging it by heating, as is the case when the stones move too quick.

Theory of the Motion of a Wind-Mill, with the Position of its Sails or Vanes.—The angle which the surfaces of the sails are to make with their common axis, that the wind may have the greatest effect, or the degree of weathering, as the mill-wrights call it, is a matter of nice inquiry, and has much employed the thoughts of the mathematicians.

To conceive why a wind-mill moves at all, the theory of compound motions must be supposed. A body moving perpendicularly against any surface, strikes it with all its force. If it move parallel to the surface, it does not strike it at all: and if it move obliquely, its motion, being compounded of the perpendicular and parallel motion, only acts on the surface, considered as it is perpendicular, and only drives it in the direction of the perpendicular. So that every oblique direction of a motion is the diagonal of a parallelogram, whose perpendicular and parallel directions are the two sides. Add, that if a surface, which, being struck obliquely, has only received the perpendicular direction, be fastened to some other body, so as that it cannot pursue its perpendicular direction, but must change it for some other; in that case, the perpendicular itself becomes the diagonal of a new parallelogram, one of whose sides is the direction which the surface may follow; and the other, that which it cannot.

Thus, a rudder fastened obliquely to the keel of a vessel, being struck by the current of water parallel to the keel, and, of consequence, obliquely with regard to itself; it will appear, by drawing the line of perpendicular impulse, that it tends to tear the rudder from the keel, and to carry it away: and that this direction, perpendicular to the rudder,

der, is oblique to the keel. The rudder, then, would be carried off in an oblique direction; but as, in reality, it is so secured, that it cannot be torn and carried off, we are only to consider, in this compound motion, that of the two directions wherewith it can move without being torn from the keel; and leave the other, which would tear it off, as useless.

Now, the direction in which it can move without parting from the keel, is that which carries it circularly about its extremity, as about a centre. So that the effect of the oblique impulse of the water on the rudder is reduced, first to a perpendicular impression, which is again reduced to the mere turning of the rudder round; or, if the rudder be immoveable, to the turning of the vessel. Now, in an oblique and compound motion, where only one of the directions is of service; the greater ratio the other has to it, the less effect will the motion have, and *vice versâ*. In examining the compound motions of the rudder, we find, that the more oblique it is to the keel, the ratio of the direction that serves to turn it to the other is the greater. But, on the other hand, the more obliquely it is to the keel, and, of consequence, to the course of the water which is supposed parallel to it, the more weakly it strikes. The obliquity of the rudder, therefore, has, at the same time, both an advantage and a disadvantage; but as those are not equal, and as each of them is still varying with every different position of the rudder, they become complicated variously; so that sometimes the one prevails, and sometimes the other.

It has been a point of inquiry to find the position of the rudder, in which the advantage should be the greatest. M. Renau, in his famous theory of the working of ships, has found, that the best situation of the rudder is, when it makes an angle of fifty-five degrees with the keel. See Rudder.

If, now, a wind-mill, exposed directly to the wind, should have its four sails perpendicular to the common axis in which they are fitted, they would receive the wind perpendicularly; and it is visible that impulse would only tend to overturn them. There is a necessity, therefore, to have them oblique to the common axis, that they may receive the wind obliquely.

For the greater ease, let us only consider one vertical sail. The oblique impulse of the wind on this sail is reducible to a perpendicular impulse; and that direction, as the sail cannot absolutely keep to it, is compounded of two; one of which tends to make it turn on its axis, and the other to fall backwards. But it is only the first of these directions that can be obeyed. Of consequence, the whole impulse of the wind on the sail has no other effect but to make it turn from right to left, or from left to right, as its acute angle turns this way or that. And the structure of the machine is so well contrived, that the three other sails are determined, from the same causes, to move the same way.

The obliquity of the sails, with regard to their axis, has precisely the same advantage and disadvantage with the obliquity of the rudder to the keel. And M. Parent, seeking, by the new analysis, the most advantageous situation of the sails on the axis, finds it precisely the same angle of fifty-five degrees.

For the farther illustration of this point, let A B (*Plate* II. *Wind-Mill*, *fig*. 7.) be the axis of the mill, C D a sail, and its angle of obliquity (*viz*. that which it makes with the axis) be E C G; then if G C be the force of the wind in the direct position of the sail, G E (the sine of the angle of incidence G C E) will be the force of the wind in its oblique position; but the force of G E is resolvable into two others, E F and G F; of which the latter, being parallel to the axis, avails nothing in turning the sails about it; but the other, E F, being perpendicular to it, is wholly spent in compelling the sail to turn round. The force of the wind on the sail will be as the square of the sine of incidence, or as GE^2; and if the area of the sail, and the velocity of the wind, be supposed constant, the force of the wind in the direct position will be to that in the oblique one, as G C to GE^2; but when G E is the whole force, that part which turns the sail is represented by E F; and $GE : EF \; (:: GC : CE) :: GE^2 : \frac{CE \times GE^2}{GC}$ = to the force which turns the sail, when the whole force is represented by GE^2. This expression $\frac{CE \times GE^2}{GC}$ begins from nothing, when the angle of incidence begins to be oblique, and increases with the obliquity of the said angle to a certain number of degrees; because that part of the force which is parallel to the axis, becomes less in proportion to that which is perpendicular to it; but after it has passed this limit, it again decreases, and becomes nothing, when the angle of incidence vanishes. There is, therefore, one certain position of the sail, in which the force of the wind upon it is a *maximum*. In order to find this, put radius $GC = a$, $EC = x$; and we have $GE^2 = aa - xx$, and consequently the force $\frac{CE \times GE^2}{GC} = \frac{aax - xxx}{a}$, which must be a *maximum*: therefore its fluxion $aa\dot{x} - 3x^2\dot{x} = 0$: whence $a\,a = 3\,x\,x$, and so $x = \sqrt{\frac{aa}{3}}$ = (in logarithms) $\frac{20.000000 - 0.477121}{2} = 9.761439$, which is the logarithmic sine of the angle $35° \; 16' = CGE$; and therefore the angle $ECG = 54° \; 44'$, when the force of the wind is a *maximum*. Thus, also, if lm (*fig*. 7.) parallel to the axis Q M, be equal to a, and represent the whole force of the wind on the sail; this force is reduced to ln, and this again to no, which acts perpendicularly to the axis, and turns the sail. This force, putting $mn = x$, is expressed by $\frac{aax - x^3}{a}$, and thus, as before, when it is a *maximum*, $x = \sqrt{\frac{aa}{3}} = a\sqrt{\frac{1}{3}}$; and the angle $lmn = 54° \; 44'$. Martin's Phil. Brit. vol. i. p. 220, vol. ii. p. 212.

This angle, however, is only that which gives the wind the greatest force to put the sail in motion, but not the angle which gives the force of the wind a *maximum* upon the sail when in motion: for when the sail has a certain degree of motion, it yields to the wind; and then that angle must be increased, to give the wind its full effect. Mr. Maclaurin, in his Fluxions, vol. ii. p. 734. has shewn how to determine this angle.

It may be observed, that the increase of this angle should be different, according to the different velocities from the axis to the extremity of the vane or sail. At the axis it should be $54° \; 44'$, and thence continually increase, giving the

the vane a twift, and fo caufing each rib of the vane to lie in a different plane.

It is obferved, that the ribs of the vane or fail ought to decreafe in length from the axis to the extremity, giving the vane a curvilineal form; fo that no part of the force of any one rib be fpent upon the reft, but all move on independent of each other. The twift above-mentioned, and the diminution of the ribs, are exemplified in the wings of birds. As the end of the fail neareft the axis cannot move with the fame velocity which the tips or fartheft ends have, although the wind acts equally ftrong upon them, Mr. Ferguson (Lect. on Mechanics, p. 52.) fuggefts, that perhaps a better pofition than that of ftretching them along the arms directly from the centre of motion, might be to have them fet perpendicularly acrofs the farther ends of the arms, and there adjufted lengthwife to the proper angle. For, in that cafe, both ends of the fails would move with nearly the fame velocity; and being farther from the centre of motion, they would have fo much the more power, and then there would be no occafion for having them fo large as they are generally made; which would render them lighter, and, confequently, there would be fo much the lefs friction on the thick neck of the axle, when it turns in the wall.

M. Parent confidered what figure the fails of a wind-mill fhould have, to receive the greateft impulfe from the wind; and he determined it to be a fector of an ellipfis, whofe centre is that of the axis, or arbor, of the mill; and the little femi-axis the height of thirty-two feet: as for the greater, it follows neceffarily from the rule that directs the fail to be inclined to the axis, in an angle of 55 degrees.

On this foundation he affumes four fuch fails, each of which is one-fourth of an ellipfis; which, he fhews, will receive all the wind, and lofe none, as the common ones do. Thefe four furfaces, multiplied by the lever with which the wind acts on one of them, exprefs the whole power the wind has to move the machine, or the whole power the machine has when in motion.

The fame manner of reafoning, applied to a common wind-mill, whofe fails are rectangular, and their length about five times their breadth, fhews, that the elliptic wind-mill has about feven times the power of the common one.

A wind-mill with fix elliptic fails, he fhews, would ftill have more power than one with only four. It would only have the fame furface with the four, fince the four contain the whole fpace of the ellipfis as well as the fix. But the force of the fix would be greater than that of the four, in the ratio of 245 to 231. If it were defired to have only two fails, each being a femi-ellipfis, the furface would be ftill the fame; but the power would be diminifhed by near one-third of that with fix fails, becaufe the greateft of the fectors would much fhorten the lever with which the wind acts.

Beft Form and Proportion of rectangular Wind-Mills.—As elliptical fails would be fomething fo new, that there is little room to expect they will come into common ufe, the fame author has confidered which form, among the rectangular ones, will be the moft advantageous. And by the method *de maximis et minimis*, he finds it very different from the common ones.

The refult of this inquiry is, that the width of the rectangular fail fhould be nearly double its length; whereas the length is ufually made almoft five times the width. Add, that as we call length the dimenfion which is taken from the centre of the axis, the greateft dimenfion of the new rectangular fail will be turned toward the axis, and the fmalleft from it; quite coutrary to the pofition of the common fails.

The power of a wind-mill with four of thefe new rectangular fails, M. Parent fhews, will be to the power of four elliptic fails, nearly as 13 to 23; which leaves a confiderable advantage on the fide of the elliptic ones; yet will the force of the new rectangular fails be confiderably greater than that of the common ones.

M. Parent likewife confiders what number of the new fails will be moft advantageous; and finds, that the fewer the fails, the more furface there will be, but the lefs power. The ratio of the power of a wind-mill with fix fails will be to another with four, nearly as 14 to 13. And the power of another with four will be to that with two, nearly as 13 to 9.

For a variety of curious experiments and obfervations concerning the conftruction and effects of wind-mill fails, by the ingenious Mr. Smeaton, fee Phil. Tranf. vol. ii. p. 138, &c.

Mr. Smeaton's experiments did not realize M. Parent's theory; for he found the fails fixed at the angle of 55 degrees with the axis, to be the leaft advantageous of any which he tried; but if the fails are included from 72 to 75 degrees from the axis, or 15 to 18 degrees to the place of their motion, the greateft effect will be produced that can be when the fails are plane furfaces.

He alfo found, that the elliptical fails, which intercept the whole cylinder of wind, do not produce the greateft effect, for want of proper interftices for the wind to efcape.

The following maxims, deduced by Mr. Smeaton from his experiments, contain the moft accurate information upon the fubject.

Maxim 1.—The velocity of wind-mill fails, whether unloaded or loaded, fo as to produce a maximum effect, is nearly as the velocity of the wind, their fhape and pofition being the fame.

Maxim 2.—The load at the maximum is nearly, but fomewhat lefs than, as the fquare of the velocity of the wind, the fhape and pofition of the fails being the fame.

Maxim 3.—The effects of the fame fails at a maximum are nearly, but fomewhat lefs than, as the cubes of the velocity of the wind.

Maxim 4.—The load of the fame fails at the maximum is nearly as the fquares, and their effects as the cubes of their number of turns in a given time.

Maxim 5.—When fails are loaded, fo as to produce a maximum at a given velocity, and the velocity of the wind increafes, the load continuing the fame: 1ft, The increafe of effect, when the increafe of the velocity of the wind is fmall, will be nearly as the fquares of thofe velocities. 2dly, When the velocity of the wind is double, the effects will be nearly as 10 to $27\frac{1}{2}$. But, 3dly, When the velocities compared are more than double of that where the given load produces a maximum, the effects increafe nearly in the fimple ratio of the velocity of the wind.

Maxim 6.—In fails where the figure and pofitions are fimilar, and the velocity of the wind the fame, the number of turns in a given time will be reciprocally as the radius or length of the fail.

Maxim 7.—The load at a maximum that fails of a fimilar figure and pofition will overcome, at a given diftance from the centre of motion, will be as the cube of the radius.

Maxim 8.—The effects of fails of fimilar figure and pofition are as the fquare of the radius.

Maxim 9.—The velocities of the extremities of the fails, in all their ufual pofitions, when unloaded, or even loaded

loaded to a maximum, are confiderably quicker than the velocity of the wind.

Rules for modelling the Sails of Wind-Mills.—Fig. 4. *Plate* II. *Wind-Mill,* is a front view of one of the four fails of a wind-mill. The letters of reference will ferve to explain the terms made ufe of in the following defcription.

1. The length of the arm or whip A A, reckoned from the centre of the great fhaft B, to the outermoft bar 19, governs all the reft.

2. The breadth of the face of the whip A, next the centre, is one-thirtieth of the length of the whip; its thicknefs at the fame end is three-fourths of the breadth; and the back-fide is made parallel to the face for half the length of the whip, or to the tenth bar; the fmall end of the whip is fquare, and as its end is one-fixtieth of the length of the whip, or half the breadth at the great end.

3. From the centre of the fhaft B, to the neareft bar 1 of the lattice, is one-feventh of the whip; the remaining fpace of fix-fevenths of the whip is equally divided into nineteen fpaces, fo as to make nineteen bars; one-ninth of one of thefe fpaces is equal to the mortifes for the bars, the tenons of which are made fquare where they enter and go through the whip, and confequently the mortifes muft be fquare alfo.

4. To prepare the whip for mortifing, ftrike a gage-fcore at about three-fourths of an inch from the face on each fide, and the gage-fcore, on the leading fide 4, 5, will give the face of all the bars on that fide; but on the other fide, the faces of all the bars will fall deeper than the gage-fcore, according to a certain rule. To find the fpace to be fet off for this purpofe for each bar, conftruct a fcale in the following manner.

5. Extend the compaffes to any diftance at pleafure, fo that fix times that extent may be greater than the breadth of the whip at the feventh bar; fet thofe fix fpaces off upon a ftraight line for a bafe, at the end of which raife a perpendicular; fet off three fpaces upon the perpendicular, and divide the two fpaces that are fartheft from the bafe line into fix equal parts each, fo that this quantity of two fpaces may be equally divided into twelve fpaces marked out by thirteen points; from each of thefe points draw a line to the oppofite end of the bafe, as fo many rays to a centre, and the fcale is finifhed.

6. To apply this fcale to any given cafe, fet off the breadth of the whip at the laft bar, (that is, the bar at the extremity of the fail,) from the centre of the fcale along the bafe towards the perpendicular; and at this point raife a perpendicular to cut the ray neareft to the bafe; alfo fet off the breadth of the whip at the feventh bar in the fame manner, and at this point erect another perpendicular to cut the thirteenth radius. From the interfection of the perpendicular (drawn upon the breadth of the laft bar) with the firft of the thirteen radii, to the interfection of the other perpendicular with the thirteenth radius, draw an oblique line cutting all the reft, and the diftances of each of thefe laft-mentioned points of interfection from the bafe line is the fpace which the face of each bar is diftant from the gage-line on the driving fide.

7. Thefe diftances give a different fet-off for each bar till the feventh, which fame muft be fet off for all the reft to the firft.

8. The mortifes muft be fquare to the leading fide of the whip.

9. When the mortifes are cut, let the face of the whip be floped off fo as to agree with the face of the bars in every part.

10. Two-fifths of the whip are the length of the laft or longeft bar.

11. Five-eighths of the longeft bar muft be on the driving fide of the whip, and three-eighths on the leading fide, each being reckoned from the middle of the whip.

12. The proportion of the mortifes already given determines the fize of the bars at the mortifes, but their thicknefs muft be diminifhed each way, fo as to be only one-half at the ends; but the face muft be kept of equal breadth all the way.

13. The leading fide goes no farther than the fourth bar, and there only projects one-third of the projection of the laft bar.

14. All the bars on the driving fide are made hollowing in the arch of a circle, which begins to fpring one-third of the length of the bars on the driving fide from the whip; and the fweep is fuch, that if a ftraight line is applied to the face of the bar from the whip to the end, the face of the bar fhould leave the ftraight line about the breadth of the bar.

15. There ought to be three uplongs, as 3, 2, 10, *fig.* 4, to the driving, and two to the leading fide, as at 5, 4, to ftrengthen the lattice.

Self-regulating wind-mills are thofe which adapt themfelves to the irregularities of the wind, by diminifhing or increafing the furface on which the wind can act to turn them round. If the wind increafes in force, the furface expofed to its action is diminifhed; on the contrary, if it decreafes in force, the furface will be increafed in the fame proportion, fo as in fome meafure to render their motion uniform.

The following felf-regulating wind-mill is ftated as the invention of Mr. Andrew Mickle in 1772, the inventor of the threfhing-machine. The length of the fail was divided into eleven compartments, by the bars forming a number of oblong openings, which were each filled up by a fquare frame of wood covered with canvas, and mounted on pivots at their ends; one pivot turning in a hole in the whip, and the other in the bar which lies parallel to it, in the manner of a Venetian blind: the pivots were not placed in the middle of the breadth of the frames, but at one-third from that edge, towards the fhaft or axis of the fails. On the end of each pivot which enters the whip a fmall roller is fixed, round which a chain paffes, and its end is attached to a fteel fpring, placed at right angles to the whip, and in the direction of the length of the canvaffed frames. Now, if the wind blows too hard, it acts to turn the frames edgeways, in which cafe the wind paffes through the fails, and exerts lefs force to turn them round; but as foon as the wind becomes moderate, the fteel fpring brings up the frames into a plane, prefenting their whole furface to its action. A rod of iron extends the whole length of the whip, and is connected with the feveral fprings, to afford the means of ftrengthening or diminifhing their action, according to the feafon of the year. This rod was formed into a fcrew at its outer extremity, and a nut put on to enable the miller to adjuft the ftrength of the fprings conveniently, from the circular gallery furrounding the outfide of the mill.

Mr. William Cubit of North Walfham, in the county of Norfolk, took out a patent, in 1807, for a method of equalizing the motion of wind-mill fails. It is fimilar to Mr. Mickle's, in the fails being made like a Venetian blind; but inftead of the fprings, he applied racks and pinions on the ends of the blind pivots, and a fliding rod, which paffed in a fmall hole made through the length of the axis of the fails; the end of this rod within the mill was

 made

made into a rack, working in a wheel upon which a weight was hung. By this means, when the wind blows too hard, the blinds turn upon their pivots, and by the racks draw out the rod which paffes through the axis, and raife the weight; but as foon as the wind abates, the weight brings the blinds to their former pofition.

A patent was granted in 1804 to Mr. John Bywater of Nottingham, for a method of clothing and unclothing the fails of wind-mills while in motion. The invention confifts in a manner of rolling or folding up, and unfolding again, the cloths of common wind-mill fails while in motion. It is effected by placing a long roller in the direction of the length of the whip round which the cloth is rolled; the inner end of the roller is furnifhed with a pinion, which engages in the teeth of a circular ring of cogs fixed to the fhaft-head, clofe behind the back-ftocks, with the liberty of turning round independent of the fhaft. Another roller is placed at the back-fide of the fail, round which feveral cords pafs, and are conveyed over pulleys at the edge of the fail, and then made faft to the cloth at different diftances along its length. The object of this fecond roller is to clothe the fail, in the fame manner as the firft-mentioned roller unclothed it. The inner end of the back roller is furnifhed with a bevelled pinion, which acts in the teeth of a ring of cogs placed concentric with the one before defcribed, which has alfo the liberty of turning round independent of the fhaft. Suppofe the fails to be completely clothed, and turning round by the wind, the two rings of cogs revolve with the axis, and therefore produce no effect on the pinions; but if the wind blows too violent, and it becomes neceffary to partly unclothe the fails, the miller pulls a cord which is connected with a lever in the head of the mill. This lever comes in contact with a projection on the ring of cogs belonging to the rollers, upon which the cloth winds. Now it is evident, that if the ring of cogs is held faft, and the fails continue to revolve, it will caufe the pinions to turn round and roll up the cloth upon the rollers; on the contrary, if the wind falls, the fails will require to be more clothed, which is effected by the fame lever being moved farther, fo as to quit the ring of cogs it held before, and hold the other faft, which will put the rollers at the back of the fails in motion, and by winding the cords upon them, draw the cloth off the fail-roller, which increafes the furface for the wind to act upon. We have not entered into the minute details of this invention, as given in the patent, for it would have exceeded our limits, but only given a fufficient defcription to enable a perfon to underftand the means of effecting the regulation.

Horizontal Wind-Mills.—Thefe are of various kinds; but only one kind that we know of has been put to any valuable ufe.

Horizontal wind-mills were a favourite fpeculation a century ago; and the Theatrum of the celebrated Leopold contain a great variety, but they are all upon one or other of two principles. In one of thefe, a very large wheel, like a water-wheel, is mounted with its axis in a perpendicular direction. It confifts of feveral circular wheels fixed upon the axis; and it has large boards or vanes fixed parallel to its axis, and arranged at equal diftances round the circular wheels. Upon thefe vanes the wind can act to blow the wheel round; but if the wind were to act upon the vanes at both fides of the wheel at once, it would have no tendency to turn the wheel round; hence one fide of the wheel muft be fheltered from the wind, whilft the other is fubmitted to its full action. For this purpofe, the whole wheel is inclofed within a large cylindrical framing of wood, which is furnifhed with doors or fhutters on all fides to open at pleafure, and admit the wind, or to fhut and ftop it. If all the fhutters on one fide are open, whilft all thofe on the oppofite fide are fhut, the wind, acting with undiminifhed force on the vanes at one fide, whilft the oppofite vanes are under fhelter, turns the mill round; but whenever the wind changes, the difpofition of the open vanes muft be altered, to admit the wind to ftrike upon the vanes of the wheel in the direction of a tangent to the circle in which the vanes move. A horizontal wind-mill is thus defcribed in Leopold's Theatrum Machinarum for grinding corn with one pair of ftones. A ftrong upright axis is fo poifed on a pivot at the lower ends, and fuftained in a collar or bearing, as to turn round. Into this feveral long arms are fixed, in the manner of radii, and at the extreme ends of each arm a vane is fixed, to receive the action of the wind. Thefe vanes are made of two or more moveable leaves, which clofe up flat like a book, when they are at that fide of the circle which moves in a direction to advance towards the wind; fo that only the edges of the boards are oppofed to the wind; but when thefe vanes arrive at the oppofite fide of the wheel, fo that the wind blows upon them, the leaves fly open, and expofe their full furfaces to the wind, and receive the impulfe thereof.

A horizontal wind-mill is defcribed by Dr. Hooke in the Philofophical Collections for 1681. It confifted of four vanes mounted upon vertical axes, and arranged round in a circle by the upper and lower pivots of the vanes being received into holes in the rims of two horizontal wheels fixed upon the fame vertical fhaft. The vanes were difpofed in fuch a manner, that on one fide of the wheel each vane prefented its furface to the wind, whilft the one on the oppofite ftood edgeways, fo as to move through the air without much refiftance. This was effected by cog-wheels placed on the lower pivots of the vanes, and fo arranged, that as one vane turned round upon its pivots, the whole number moved together, and the motion was given to them by a cog-wheel fixed faft to the framing over the wheel, but concentric with it. This wheel communicated, by means of an intermediate wheel, with the wheels on the axes of the vanes.

The action of this machine is as follows:—Suppofe the wind blowing at the wheel; it acts againft that vane which is at right angles to its motion, to turn the wheel round upon its axis. The oppofite vane prefenting its edge to the wind oppofes very little refiftance. The motion of the wheel upon its axis turns the vanes round upon their pivots, by means of the fixed cog-wheel before defcribed; fo that by the time that one has paffed out of the direction of the wind, another arrives in the fame perpendicular pofition; and when the wheel has made half a revolution, the vane which ftood edgeways will be perpendicular to the wind, and the one which before ftood perpendicular will be edgeways; thus a continued motion is produced without the wheel being cafed up.

Horizontal wind-mills, which are inclofed in a houfe with blinds on all fides, are very fully defcribed in Jacob Leopold's Theatrum Machinarum, 1724; but we believe they were firft practifed in this country by captain Hooper, who erected one at Margate, and another at Batterfea. The latter is upon a very large fcale, and is ufed for grinding corn; but at prefent it does not work with much advantage, as the repairs are more confiderable in proportion to the power it exerts, than in the mills with fails conftructed in the common manner.

In *Plate Wind-Mill, fig.* 1, is an upright fection, and *fig.* 2. a plan a plan of the horizontal mill erected at Margate by captain Hooper. H H are the fide walls of an octagonal building which contains the machinery. Thefe walls are furmounted by a ftrong timber-framing G G, of the fame form as the building, and connected at top by crofs-framing to fupport the roof, and alfo the upper pivot of the main vertical fhaft A A, which has three fets of arms, B B, C C, and D D, framed upon it at that part which rifes above the height of the walls. The arms are ftrengthened and fupported by diagonal braces, and their extremities are bolted to octagonal wooden frames, round which the vanes or floats E E are fixed, as feen in outline in *fig.* 2, fo as to form a large wheel refembling a water-wheel, which is lefs than the fize of the houfe by about eighteen inches all round. This fpace is occupied by a number of vertical boards or blinds F F, turning on pivots at top and bottom, and placed oblique, fo as to overlap each other, and completely fhut out the wind, and ftop the mill, by forming a clofe cafe furrounding the wheel; but they can be moved all together upon their pivots to allow the wind to blow in the direction of a tangent upon the vanes on one fide of the wheel, at the time the other fide is completely fhaded or defended by the boarding. The pofition of the blinds is clearly fhewn at F F, *fig.* 2. At the lower end of the vertical fhaft A A, a large fpur-wheel *a a* is fixed, which gives motion to a pinion *c*, upon a fmall vertical axis *d*, whofe upper pivot turns in a bearing bolted to a girder of the floor N. Above the pinion *c*, a fpur-wheel *e* is placed, to give motion to two fmall pinions *f*, on the upper ends of the fpindles *g* of the mill-ftones *h*. Another pinion is fituated, at the oppofite fide of the great fpur-wheel *a a*, to give motion to a third pair of mill-ftones, which are ufed when the wind is very ftrong; and then the wheel turns fo quick, as not to need the extra wheel *e* to give the requifite velocity to the ftones. The weight of the main vertical fhaft is borne by a ftrong timber *b*, having a brafs box placed on it to receive the lower pivot of the fhaft. It is fupported at its ends by crofs-beams mortifed into the upright pofts *b b*, as fhewn in the plan, *fig.* 2. A floor, or roof, I I, is thrown acrofs the top of the brick building, to protect the machinery from the weather; and to prevent the rain blowing down the opening through which the fhaft defcends, a broad circular hoop K is fixed to the floor, and is furrounded by another hoop or cafe L, which is fixed to the arms D D of the wheel. This laft is of fuch a fize, as exactly to go over the hoop K, without touching it when the wheel turns round. By this means, the rain is completely excluded from the upper room M, which ferves as a granary, being fitted up with bins *m m*, to contain the different forts of grain which is raifed up by the fack-tackle. A wheel *i* is fixed on the main fhaft, having cogs projecting from both fides. Thofe at the under fide work into a pinion on the end of the roller *k*, which is for the purpofe of drawing up facks. Another pinion is fituated above the wheel *i*, which has a roller projecting out over the flap-doors feen at *p*, in the *fig.* 2, to land the facks upon. The two pinions *m m*, *fig.* 2, are turned by the great wheel *a a*, and are for giving motion to the dreffing and bolting machines, which are placed upon the floor N, but are not fhewn in the drawing, being exactly fimilar to the dreffing-machines ufed in all flour-mills. The cogs upon the great wheel *a* are not fo broad as the rim itfelf, leaving a plain rim about three inches broad. This is encompaffed by a broad iron hoop, which is made faft at one end to the upright poft *b*; the other being jointed to a ftrong lever *n*, to the extreme end of which a purchafe *o* is attached, and the fall is made faft to iron pins on the top of a frame fixed to the ground. This apparatus anfwers the purpofe of the brake or gripe ufed in common wind-mills to ftop their motion. By pulling the fall of the purchafe *o*, it caufes the iron ftrap to embrace the great wheel, and produce a refiftance fufficient to ftop the wheel. The mill can be regulated in its motion, or ftopt entirely, by opening or fhutting the blinds F, which furround the fan-wheel. They are all moved at once by a circular ring of wood fituated juft beneath the lower ends of the blinds upon the floor I I, being connected with each blind by a fhort iron link. The ring is moved round by a rack and fpindle, which defcend into the mill-room below, for the convenience of the miller.

A fort of wind-mill has been long much employed in Portugal, in which, from the difference in the conftruction of the fails, it is fuppofed by fome, as lord Somerville, who has infpected it when working, to poffefs a fuperiority in having the broad part of the fail at the end of the levers or booms; in confequence of which equal refiftance is overcome with lefs length of branches: and that from this fhortnefs a confiderable faving is made in the timber of both the booms and fpindles, as well as in the height, firft coft of the mills, and their future repairs.

The advantages of making ufe of thefe forts of wind-mills in preference to others are, that as there are four booms, as well as four mafts for the fails, they are capable of being more eafily braced out to the wind, and in cafe of a fudden gale or guft of it, are more eafily caft loofe than in thofe of the common conftruction; and that as the fails in thefe mills are placed in the beft poffible direction by the booms, it is prefumed that a wind-mill built on this plan and principle will do more work than any common wind-mill with an equal quantity of canvafs.

Thefe forts of mills have alfo lately been very much improved by conftructing and difpofing thofe furface parts upon which the wind is intended to act, in fuch a particular manner, as that by alternately oppofing a refifting and non-refifting furface, the whole force or impulfe may operate in a direct manner upon the refifting fide of the fail or vane, in proportion to its extent; and that when the non-refifting fide is returning againft thefe powers, the mill being fo contrived that there is very little refiftance, however large the furface. Thefe improvements, when applied to horizontal wind-mills, the power of them, even with the fame quantity of fail, or acting furface, may too be increafed or diminifhed at pleafure, which is a circumftance of very great utility and convenience in many cafes.

WIND-*Pump*, that fort of pump which is fo contrived and formed as to be driven by the wind. Thefe kinds of pumps are very ufeful for draining and lifting water in many cafes, as where the depth of it is too great to admit of cutting drains, or the fuperftrata too loofe for forming them, and when the height to which the water is to be raifed is great. See SPRING-*Draining* and SURFACE-*Draining*.

WIND-*Row*, in *Agriculture*, a term fignifying the green parts or borders of a field, dug up, in order to carry the earth on other land to mend it; fo called becaufe it is laid in rows, and expofed to the wind. It alfo fignifies a row of peats fet up to dry for fuel. Likewife a row of hay expofed to the wind and fun to get dry. And alfo of turfs or fward cut up in paring and burning.

The peats are fet up in thefe rows in an open manner, to the height of two or three feet or more, that the wind may pafs between and dry them. The rows of hay of this kind are either fingle or double, the former for that which is in the more graffy ftate, and the latter for that which has been more made; and the work is performed by different perfons

raking

raking the fpread hay in oppofite directions towards themfelves, and by fuch means forming a row between them of double the extent of that of the fingle wind-row. See HAY-*Making*.

The turf or fods for burning are fet up in thefe rows, in leaning directions againft each other, fo as to let the wind readily pafs among and dry them in a quick manner for burning.

Whins are fometimes, too, formed into wind-rows for being burnt for the afhes. See WHIN-*Afhes*.

WIND-*Sail*, or VENTILATOR, in a *Ship*, is made of canvas, and ufed for circulating frefh air between the decks, and is in the form of a cylinder, or an obtufe-ending cone, and is adapted to the fize of the fhip. Four breadths of canvas are fewed together, and the outer felvages are joined with an inch feam, leaving one cloth four feet fhort of the top. A three-inch tabling goes round the top and bottom. It is kept diftended by circular hoops, made of afh, fewed to the infide, one at top, and one at every interval of fix feet. The upper part, or top, is covered with canvas, and a fmall rope fewed round the edge; into which are fpliced, at the quarters, the ends of two pieces of rope, that are fewed up to the middle, and an eye formed by feizing the bights. The length of a wind-fail is taken nine feet above the deck, to three or four feet below the lower hatchway; the quantity of canvas is obtained by multiplying the number of cloths by the length.

Thefe, of which there are generally three or four in our capital fhips of war, have the advantage of taking little room, of requiring no labour in working, and of a fimple contrivance, fo that they can fail in no hands. But their powers are faid to be fmall in comparifon with thofe of Dr. Hales's ventilators: they cannot be put up in hard gales of wind, and are of no efficacy in dead calms, when a refrefhment of air is moft wanted. See VENTILATOR.

WIND-*Seed*, in *Botany*. See ARCTOTIS.

WIND-*Shock*, a name given by our farmers to a diftemperature to which fruit-trees, and fometimes timber-trees, are fubject.

It is a fort of bruife and fhiver throughout the whole fubftance of the tree; but the bark being often not affected by it, it is not feen on the outfide, while the infide is twifted round and greatly injured.

It is by fome fuppofed to be occafioned by high winds; but others attribute it to lightning. Thofe trees are moft ufually affected by it, whofe boughs grow more out on one fide than on the other.

The beft way of preventing this in valuable trees, is to take care in the plantation that they are fheltered well, and to cut them frequently in a regular manner while young.

The winds not only twift trees in this manner, but they often throw them wholly down: in this cafe, the common method is to cut up the tree for firing, or other ufes; but if it be a tree that is worth preferving, and it be not broken but only torn up by the roots, it may be proper to raife it again by the following method:—Let a hole be dug deep enough to receive its roots, in the place where they before were; let the ftraggling roots be cut off, and fome of the branches, and part of the head of the tree; then let it be raifed, and when the turn-up roots are replaced in the earth in their natural fituation, let them be well covered, and the hole filled up with rammed earth; the tree will, in this cafe, grow as well, and perhaps better, than before. If nature be left to herfelf, and the tree be not very large, the pulling off the roots will raife it. Mortimer's Hufbandry, vol. ii. p. 79.

WIND-*Tackle Blocks*, in a *Ship*. See WINDING-*Tackle*.

WIND-*Taught*, in *Sea Language*, denotes the fame as ftiff in the wind. Too much rigging, high mafts, or any thing catching or holding wind aloft, is faid to hold a fhip wind-taught; by which they mean, that fhe ftoops too much in her failing in a ftiff gale of wind.

Again, when a fhip rides in a main ftrefs of wind and weather, they ftrike down her top-mafts, and bring her yards down, which elfe would hold too much wind, or be too much diftended and wind-taught.

WIND-*Thrufh*, in *Ornithology*, a name given by fome to the red-wing, and fuppofed to be given from their generally firft appearing with us in windy feafons; but it appears more probably to be derived from the German name *wint-troffel*, or vine-thrufh, from its doing great mifchief there in the vineyards, by eating and deftroying the grapes. Ray.

WIND-*Tumours*. See TUMOUR.

WIND-*Ward*, in *Sea Language*, denotes any thing towards that point from whence the wind blows, in refpect of a fhip.

WIND-*Ward*, *Sailing to*. See SAILING.

WIND-*Ward Tide* denotes a tide which runs againft the wind.

WIND, in *Geography*, a river of America, which runs into the Connecticut at Windfor.

WIND *Gap*, a pafs in the Blue Mountains of Pennfylvania.

WINDAGE *of a Gun*, is the difference between the diameter of the bore and the diameter of the ball.

The windage is not the fame in England as it is abroad. With us, if the diameter of the fhot is divided into twenty equal parts, then the diameter of the bore is twenty-one of thefe parts. The French fuppofe the diameter of the fhot divided into twenty-fix parts, and the diameter of the bore to be twenty-feven. Mr. Muller obferves, that the lefs windage there is, the truer the fhot will go, and having lefs room to bounce from one fide to another, the gun will not be fpoiled fo foon. Accordingly, he divides the diameter of the fhot into twenty-four equal parts, and makes the bore twenty-five, which is a medium between the Englifh and French method. Artillery, p. 84.

Dr. Hutton obferves, that if the windage be one-twentieth of the calibre, which is the ufual fize, no lefs than one-third or one-fourth of the powder efcapes, and is loft. As the balls are often fmaller than the regulated fize, it frequently happens, that half the powder is loft by unneceffary windage.

Dr. Hutton alfo recommends the diminifhing of the windage. See GUNNERY.

WINDALA, in *Geography*, a town of Sweden, in Eaft Bothnia; 65 miles E. of Wafa.

WINDALL, a town of the ftate of Vermont; 22 miles S.S.W. of Windfor.

WINDASS, WANDASS, or WANLASS, an ancient term in hunting. Thus, to drive the windafs fignifies the chafing of a deer to a ftand, where one is ready with a bow, gun, or to fhoot. This is one of the cuftomary fervices of fiefs.

"——Omnes illi qui tenuerunt in bondagii tenura, folebant vocari cuftumarii: & quotiefcunque dominus ad venandum venerit, illi cuftumarii folebant fugare windaffum, ad ftabulum, in venatione ferarum beftiarum fecundum quantitatem tenuræ fuæ." MS. de Confuetud. Manerii de Sutton Colfield, an. 3 Ed. II.

WINDAU, in *Geography*, a fea-port town of the duchy of Courland, near the mouth of the Wera, on the Baltic. It was the capital of a palatinate, and has a caftle, once the refidence of the Livonian knights; the ftates of Courland likewife held their affemblies here, which made it populous; but it is now much decayed, and chiefly fupported by fhip-building, and exporting pitch, tar, wax, &c.; 8 miles N.N.E. of Piltyn. N. lat. 57° 10'. E. long. 21° 32'.

WINDAU. See WETA.

WINDECK, a town of France, in the department of the Scheldt; 9 miles S.S.E. of Ghent.—Alfo, a town of the duchy of Berg; 21 miles E. of Bonn.

WINDECKEN, a town of Germany, in the county of Hanau Munzenburg; 4 miles N. of Hanau.

WINDELSBACH, a town of the margravate of Anfpach; 22 miles N.W. of Anfpach.

WINDER, in *Agriculture*, a term ufed provincially to fignify to clean corn with a fan-machine. See FAN-*Machine*.

WINDER-*Meb*, in *Ornithology*, the name of a bird of the larus, or gull-kind, the *larus cinerarius* of Linnæus, moderately large, and defcribed by Aldrovandus under the name of *larus major*.

Its head is remarkably large and thick, and is of a mottled colour of white and grey; its breaft and belly are alfo variegated with the fame colours, but they are fomewhat paler; its beak is thick and ftrong, of a yellow colour, and very fharp, and the opening of its mouth very wide; its wings are variegated with white, grey, and chefnut colour, and both thefe and the tail have much black in them; the feet are webbed and yellow, the claws are fharp, and the hinder toe larger than in moft birds of this kind. Ray's Zoology, p. 267.

WINDERS *of Wool*. See WOOL-*Winders*.

WINDHAM, or WYMONDHAM, in *Geography*, a town of England, in the county of Norfolk, with a weekly market on Friday. The chief trade of the place is making wooden ware. In 1549, William Kett, one of the Norfolk infurgents, was hanged on the fteeple of the church; 9 miles W.S.W. of Norwich. N. lat. 52° 34′. E. long. 1° 7′.

WINDHAM, a large poft-townfhip of Greene county, in New York, comprifing all that part of the county on the S. and W. of the fummit of the Catfbergs or Catfkill mountains; bounded N. by Durham, Cairo and Catfkill, E. by the northern angle of Ulfter county, S. by Ulfter and a part of Delaware counties, and W. by Delaware county. It has a poft-office, and is about 24 miles in length, its medial breadth being about 12 miles.

It is mountainous, with much good pafture-lands that yield excellent dairy. It is watered by the Schoharie creek, which has feveral mill-feats and fmall branches. Along thefe ftreams are fome alluvial lands, which are rich and fertile. The view from the Catfbergs, over which is a road, is very grand and interefting. The W. part of Windham is about 35 miles W. from Catfkill, its principal market. The population confifts of 3965 perfons, and the fenatorial electors are 267.

WINDHAM, a town of the ftate of Connecticut, on the Thames. It is the chief town of a county, to which it gives name. The county contains 28,611 inhabitants, and the town 2416; 63 miles S.W. of Bofton. N. lat. 41° 38′. W. long. 72° 11′.—Alfo, a town of the ftate of Vermont, in the county of Windham, with 782 inhabitants; 20 miles E. of Bennington.—Alfo, a county in the S.E. part of the ftate of Vermont, bordering on the Maffachufetts. It contains 26,760 inhabitants.—Alfo, a poft-town of New Hampfhire, in Rockingham county, with 743 inhabitants; 40 miles S.W. of Portfmouth.

WINDING, twifting from an even furface, or not a direct plane.

WINDING *a Call*, in *Sea Language*, denotes the act of blowing or piping upon a boatfwain's whiftle, fo as to communicate the neceffary orders of hoifting, heaving, belaying, flackening, &c. See CALL.

WINDING-*Engine*, in *Mining*, a machine employed to wind or draw up corves or buckets out of a deep pit or fhaft. There are feveral different machines employed for this purpofe, and each has a different name.

The moft fimple winding-machine is a roller placed horizontally over the pit, to wind up the rope, by which the bucket is fufpended; the roller is turned round by a handle at each end. This fimple machine, which is called a windlafs, wind-up, or roller, is commonly ufed for well-digging, and formerly was the common machine for mines; but for mining on the prefent fyftem more powerful machinery is required. In Derbyfhire it is called a ftowfe, and the conftruction is very minutely directed in the ancient mining-laws of the diftrict, called 'The King's Field.' A fmall model or effigy of a ftowfe, conftructed according to law, and fixed up "in fight of all men," is ftill the fign of legal poffeffion of a lead-mine, and one of thefe muft be conftantly maintained at every thirty-nine yards in length of the vein of ore; for by thofe laws no man may work more than thirty-nine yards, and it is fuppofed that each one of thefe is a feparate working and drawing up of the ore from the mine.

With this fimple machine a man can work continually to draw up a weight of 3750 pounds, at the rate of one foot *per* minute, or any fmaller weight with a proportionably quicker motion. This is a fair average of the ftrength of man, which has been determined by a number of experiments, as fhewn in our article WATER. The radius of a winch or handle fhould not be above fourteen inches, which defcribes a circle of $7\frac{1}{3}$ feet circumference; a man can turn this round twenty times *per* minute with convenience, and the motion of his hands will therefore be $146\frac{2}{3}$ feet *per* minute, at which rate a man can exert a force of $25\frac{1}{2}$ pounds according to our ftandard. To apply a man's force to the greateft advantage, we muft not depart much from thefe proportions; but the load which is drawn up at one time may be varied according to the diameter of the roller or barrel on which the rope winds: for inftance, if this barrel is feven inches diameter, it will draw up the weight only one-fourth as faft as the man moves the handle; and in confequence the weight may be $4 \times 25\frac{1}{2} = 102$ pounds, and this he will be able to wind up at the rate of thirty-feven feet *per* minute. It is beft to employ two men, and make the two handles at right angles to each other; the roller may then be 14 inches diameter, and they can draw up the 102 pounds at the rate of 74 feet *per* minute. The roller fhould have two ropes wrapped upon it in oppofite directions, and a bucket being fufpended from each, one bucket will be drawn up as the other is let down, and no time will be loft.

The next machine is the horfe-gin: it has a large drum or barrel to wind up the rope; the barrel is mounted on a vertical axis, which is provided with one or more long levers, to the extreme ends of which a horfe is harneffed, and by walking round in a circle, the barrel is turned round, and the rope which defcends into the pit or fhaft, is wound up by wrapping round the barrel. The gin is placed at a convenient diftance from the mouth of the pit, and the rope is conducted over a pulley at the top of the pit, to change the direction from horizontal to vertical. The horfe-gin ufually has two ropes wrapping round the barrel in oppofite directions, and one winds up as the other unwinds. The two buckets or corves which are fufpended in the pit at the fame time, go up and down alternately, one full and the other empty, and the weight of the empty corve, which is defcending, tends in fome meafure to balance that which is coming up full.

The barrel muft be turned in a contrary direction every time a bafket is drawn up, and for this purpofe the horfe is turned

turned round every time, ſo as to draw the barrel round in one direction the firſt time, and in a reverſe direction the next time. The horſe turns at the ſame time that the baſkets are unhooked and changed at the top and bottom of the pit, and very little time is loſt. A boy is required to lead and direct the horſe. In ſome large horſe-machines wheel-work is introduced, to communicate the motion of the vertical axis of the horſe-levers to the barrel on which the rope winds; and this work may be ſo contrived as to reverſe the motion of the barrel at pleaſure, although the horſes always walk in the ſame direction.

In very deep pits an inconvenience is experienced from the weight of the great length of rope which muſt be employed; for the whole weight of this rope is added to the weight of the loaded corve when it is at the bottom of the pit; and at the ſame time, the other corve being at the top of the pit, there is no length of rope on that ſide to counterbalance. As the corve is drawn up from the bottom, the other deſcends into the pit; this ſhortens the length of the aſcending rope, and increaſes the deſcending rope, ſo that by the time that the corve is half drawn up, the other is let half down, and the weight of the rope is equally divided, ſo as to be in balance; but after this, the deſcending rope becomes the longeſt, and its weight tends to weigh up the loaded corve, and in very deep pits, the weight of the rope exceeds that of the corve ſo as to draw it up: hence, there is a great inequality in the force required to turn the machine. To remedy this, the barrel is often made of a conical ſhape, being ſmalleſt in the middle, and larger towards the upper and lower ends; the ends of the two ropes are made faſt to it in the middle, or at the ſmalleſt part, and therefore the horſe has greater power when the corve is to be drawn from the bottom, and all the length of rope is added to its weight, becauſe the rope winds on a ſmaller radius; but as the rope coils on the barrel, it winds on a larger part of the cone, and the power or leverage diminiſhes; therefore, the horſe will draw up the corve with a rapidity which increaſes in proportion to the diminution of the load, by the ſhortening of the rope.

A very convenient mode of conſtructing a double conical barrel is to fix two circular wheels upon the axis, one for the top of the barrel, and the other for the bottom of the ſame. Two old cart-wheels are frequently employed for this purpoſe. The barrel on which the rope is wound is formed by a number of ſtraight pieces of wood, which are fixed to the rims of the wheel, and extend from the upper to the lower one. Theſe pieces are not fixed in a direction parallel to the vertical axis of the barrel, but are fixed croſswiſe in an oblique direction, and thus form a barrel, which is ſmall in the middle, and larger at the ends. When a cylindrical drum is fixed upon the main ſhaft to wind up the rope, if the pit is deep, a counterbalance to the weight of the rope muſt be applied to a ſmaller conical drum fixed on the vertical axis above the great drum. The circumference of the conical barrel is grooved with a ſpiral groove, like the fuſee of a watch; upon this fuſee a rope is applied, which deſcends into a ſmall pit made on purpoſe, and has a counter-weight at the end of it: this balances the unequal weight of the great rope, if the rapidity of the cone is properly proportioned. This anſwers very well for ſmall depths; but for a deep pit, the fuſee muſt be placed on a ſeparate barrel. This barrel may be placed horizontally over the pit in which the balance-weight deſcends, and muſt have a wheel upon it to communicate by a rope with a wheel fixed upon the vertical axis of the gin; by this means, the ſame motion is communicated to a ſpiral, as if it was placed immediately on the vertical axis.

A perfect equal motion is not neceſſary for horſe-work, and if it is not ſo much in extremes as to ſtrain the horſe in one part of his journey, whilſt he has nothing to do in another, he will work very well. Gentle aſcents and deſcents in a road are found as advantageous to the action of horſes as a road upon a perfect flat. The following is the conſtruction recommended by Mr. Smeaton for a two-horſe gin for a lead-mine:—The horſe-track 36 feet diameter, and two horſes are employed at once; the diameter of the drum 14 feet; the weight to be drawn at once $5\frac{3}{4}$ cwt. or 644 lbs. excluſive of the bucket, becauſe there are two, and the one ſerves as a balance for the other; depth of the pit 45 fathom, or 270 feet; the girt of the rope $6\frac{1}{2}$ inches. The counterbalance for the unequal weight of the great rope is conſtructed as follows:—Above the drum or rope-wheel, a ſmaller one, or balance-drum of one-fourth the diameter of the great drum, or 3 feet 6 inches, muſt be firmly fixed to the upright axis; alſo a little ſhaft or pit muſt be ſunk at a convenient diſtance from the machine: if this is oppoſite the great pit, it will require leſs bracing to keep the fixed parts of the framing at their proper diſtances. A hole muſt be made in the circumference of the ſmall wheel, or balance-drum, through which the end of a rope is paſſed, and ſecured by a knot. This rope, which is for the counter-weight, is to paſs over a pulley of 3 feet or more diameter, ſuch as is uſed to direct the great ropes down the main ſhaft; but it muſt be ſtrongly and ſubſtantially fixed, becauſe there will be a greater ſtrain upon it. Over this pulley the balance-rope goes down into a little pit ſunk for the purpoſe, and a balance-weight is hung to it, which muſt be double the weight of 45 fathom of the main pit-rope, and it will act as a counter-weight to the great pit-rope. The counter-weight muſt not, however, go down ſo as to touch the bottom of the little pit; and it muſt be ſo regulated as to be at the loweſt point when the two buckets are at their meetings, half way down the main pit. Hence, whichever way the main drum turns round, the counter-weight will be drawn up, and will arrive at the top when either of the buckets arrive there: by this means, whatever be the weight of the rope, though it exceeds the weight of matter in the bucket, yet the horſe will always have ſomething to draw; whereas in the old horſe-gins made at Newcaſtle, they had no other method than turning the horſes at the point of equilibrium; and after that letting them draw the backward way, which obliged them alſo to walk backwards, till the bucket arrived at the top.

As a $6\frac{1}{2}$-inch rope is far more than equivalent to the weight required to be drawn, the ſame ſort of rope will do for the counter-weight alſo; but as there will be a great deal of chafing at the hole where it is fixed to the little drum-wheel, in conſequence of its bending alternately one way and then the other, it will be proper to fortify it there with the white leather made of horſes' ſkins, and the hole itſelf ſhould be rounded off on each ſide, ſo as to make the rope bend eaſily.

In the ſinking of the little ſhaft, if there is any particular advantage or obſtacle, the depth may be greater or leſs than a quarter part of the main ſhaft; but then the ſize of the little drum and counter-weight muſt be proportioned accordingly. If practicable, the pit had better be deeper; and if it was half the depth, then the little drum might be half the diameter of the large one, and the counter-weight would be no more than the weight of the rope in the great pit. On account of the expence of the balance-pit, the double conical drum, which requires no counter-weight, is much preferable to any machine with a counter-weight.

In our article Water we have given the experiments on the ſtrength of horſes; from which it appears that a proper load

load for a horse to work eight hours in a day is 22,000 lbs. avoirdupois, to be raised one foot in a minute, or any smaller weight to be drawn quicker in proportion; hence the weight of 644 lbs. may be drawn by two horses at the rate of 71 feet *per* minute, or the whole depth of 45 fathoms in $3\frac{3}{4}$ minutes. The horses will then walk in their circle rather more than three miles *per* hour; but $2\frac{1}{2}$ miles is the best pace. Horses are frequently loaded much more than this, and indeed one strong horse may work this machine; but as he could only work a short time each day, it is better to employ two.

When mines were sunk to very great depths, the drawing of the ore by horse-gins became too expensive, particularly for coal-mines, and more effective winding-machines were introduced. The water-gin was the first of these. The most simple of these is called a whimsey, and consists of a bucket, which is let down full of water, and by its descending force, draws up a loaded basket or corve from the bottom of the pit. (See WHIMSEY.) This machine requires a very considerable fall of water, and it can rarely be less than one-fourth or sixth of the whole depth from which the coal or ore is to be drawn.

In cases where the fall is smaller, an over-shot water-wheel is employed; and in order to make the wheel turn at pleasure either way round, so as to wind up or let down, the wheel is made double; that is, with two rows of buckets, one row adapted to receive the water from a spout, which will cause it to turn round in one direction, and the other row of buckets is supplied with water from a different spout, and will turn the wheel in the opposite direction. Each spout is provided with valves to stop the stream at pleasure, and when one is open the other must be shut, and thus the wheel may be made to turn either way round. This is a very old invention, and is fully described by Agricola in his De Re Metallica, 1621. It was at one time in very common use in the collieries, and they raised up the supply of water for it by a pump applied to the beam of the great steam-engine, or sometimes by an engine on purpose.

Mr. Smeaton made a machine, in 1774, for drawing coals at Griff, in Warwickshire, by a water-wheel, in which the motion of the wheel is always continued in the same direction; and by a change in the communication of the wheel-work, the barrel is made either to draw up or to let down.

In 1777 Mr. Smeaton made a larger machine for Long Benton colliery, at Newcastle, which is worked by the water raised by a steam-engine on Newcomen's principle. The water-wheel and machinery are represented in *Plate Winding-Engine*, in several different elevations. X is the over-shot water-wheel, which is 30 feet in diameter: it is mounted on a cast-iron axis, which is clearly represented in the drawing. The water is delivered upon the wheel by a spout from a trough or cistern, which is supplied by the pump of the steam-engine. This trough is supported on tall piers of masonry, one of which is shewn in the sketch. Upon the axis of the water-wheel are fixed two cog-wheels, U V, of 88 cogs each, and the cogs are turned towards each other; W is a trundle, which is situated between the two wheels, and is turned round by either of them, according as it is placed; but it is smaller in diameter than the space between the two wheels, so that it cannot engage with both wheels at the same time. The trundle is fixed at the extremity of a long shaft, as shewn in the plan, *fig.* 1; and the opposite end of this shaft is connected with the barrel on which the ropes are wound: this barrel is composed of two cones, joined together at their bases. The ropes from the barrel are conducted over pulleys at the top of the pit, as shewn in the elevation, *fig.* 2, and descend into the same. The baskets, or corves, in which the coals are brought up, are hooked to the ends of the two ropes; so that by the motion of the water-wheel one basket is drawn up whilst another is let down.

To regulate the motion of the machine, two brakes or gripes are applied: one encompasses the great cog-wheel U, which is fixed on the axis of the water-wheel, in the same manner as the brake of a wind-mill; and in like manner, the fixed circle or brake is provided with a lever, as shewn in *fig.* 4, by means of which the brake can be drawn tight round the wheel, and will then cause such a friction as to stop the water-wheel and all the machine.

The other brake-wheel D C (*fig.* 1.) is fixed near the end of the long axis, and has clogs or pieces of wood applied at the top. This piece of wood is supported by a lever A B, as shewn in *fig.* 2, A being the centre; and to the other end, B, a box E is suspended, and contains as much weight as will press the clog upon the wheel, with the force necessary to retain the corve from descending when it is full loaded. To enable the man at the mouth of the pit to lower down the corve, a cord is fastened to the lever A B, and is conducted over the pulleys, *g k* and *l*, to the mouth of the pit, where it hangs down in a knot, which the man can always reach, and by pulling it, he raises up the lever, and releases the wheel from the clog. To prevent accidents, if the clog and lever A should fail to stop the machine, another clog and lever F G are applied beneath the wheel; this lever is drawn upwards by a cord and a block of pulleys O, which are attached to the lower part of the weight for the upper lever. This cord is conducted to the pit's mouth, and hangs down, so that the man can always reach it, and by pulling this, he compresses both the upper and lower clogs upon the wheel at the same time, which will be certain to stop it even if it be in a rapid motion; but he only resorts to this lower clog on occasion, as the curb-rein is used for a horse; the weight of the upper lever, like a horse's bridle, being a sufficient check for common use.

To make the machine wind either up or down, the trundle W must be changed from one of the wheels, U or V, to the opposite one, and this will cause the barrel to turn in an opposite direction. The pivot of the trundle W is supported by the long upright beam shewn in *fig.* 3, which is moveable on a centre at the lower end, so that by inclining it to the right or left, the trundle may be engaged with either of the wheels U or V. The requisite motion is given to the upright beam by two tackles of pulleys applied to the upper end of the beam, as shewn in *fig.* 3.

The ropes of both these tackles are fastened together, and hang down in a loop in reach of a boy, who can pull it either way, and make the trundle engage with either wheel, so as to wind up or let down the corves at pleasure. This boy is always stationed in a small room immediately over the wheels U V, so as to have the brake-lever, as well as the upright lever, always at his command; likewise the shuttle of the water-wheel, which is fixed, as is shewn in *fig.* 3. A lever is made to communicate with it, and from the opposite end of the lever a rod descends into the room, so that the boy, by pulling it, can open or shut the shuttle at pleasure. This he must do whenever the corve comes up, or rather before; and notice of the proper time is given by a large knot in the main rope. The water being then shut off, the wheel will continue to turn by its momentum until the corve comes fully up, but by that time will have diminished its velocity, so that the application of the brake will stop it without any strain: the man at the mouth of the

the pit alſo applies the brake on the wheel C D. Immediately the motion ceaſes, the boy pulls the tackle, which diſengages the trundle W from the wheel, but without engaging it with the oppoſite one, and in conſequence the barrel is detached from the water-wheel. A man now ſeizes the corve with a long hook, like a ſhepherd's crook, and draws it aſide; then another man releaſes the clog or brake on the wheel C D, and the wheel and the corve immediately deſcend upon the ground at the ſide of the pit. The pulley over the pit is raiſed up to a conſiderable height, becauſe the machine cannot be ſtopped exactly at the preciſe ſpot; but if the corve ſhould be drawn up a few feet higher than neceſſary, no harm can enſue as ſoon as the full corve is landed and exchanged for an empty one; and the ſame is done at the bottom of the pit. The boy throws the trundle in gear with the oppoſite wheel, then draws the ſhuttle to let the water flow upon the wheel, and the wheel reſumes its motion.

For the facility of ſtopping the machine at the proper moment, Mr. Smeaton applied a piece of machinery, which he called a count-wheel. This received its motion from a pinion of 15 teeth, fixed upon the extremity of the pivot of the lantern W; the pinion gave motion to a ſmall cog-wheel of 60 teeth, ſituated between the two great cog-wheels U V, being fixed at one end of an horizontal ſpindle; and at the oppoſite end of it was a pinion of eight teeth, which gave motion to the count-wheel. This wheel had 80 teeth, and was fixed in a vertical poſition. It had affixed to its plane two projecting pieces of iron, which operated upon a lever that was connected with the lever which lets down or draws up the ſhuttle to regulate the flow of water upon the wheel. Theſe projections were ſo fixed to the wheel as to be capable of regulation in ſuch manner, that when the machine had worked long enough to have brought up the corve to the top of the pit, the projection of the count-wheel would ſeize the lever, and let fall the ſhuttle ſo as to ſtop the water-wheel at the proper moment, without any attention on the part of the boy. This could be eaſily regulated by the poſition of the projection on the count-wheel, and when once adjuſted always operated correctly; for as the count-wheel turned only once for forty turns of the barrel, the machine would therefore draw up a corve from the bottom of the pit before the count-wheel made a complete turn.

As the two corves in the pit aſcend and deſcend mutually, they muſt paſs each other at half the breadth of the pit; and it ſometimes happens that they ſtrike together, and overſet the coals. The beſt remedy for this is to divide the pit in two, or make two ſeparate pits, and the barrel may be ſituated between the two. As it is frequently impracticable to do ſo, a ſmaller projection was applied in Mr. Smeaton's machine upon the count-wheel, which acted in the middle of the courſe upon the lever, and raiſed it up ſo as to diminiſh the opening of the water-ſhuttle, and make the machine move ſlowly at the moment when the corves met and paſſed each other: this prevented accidents.

The principal dimenſions of this machine were as follow:—The cylinder of the ſteam-engine 26 inches diameter, and 5 feet 8 inches the length of ſtroke. It made 14 ſtrokes *per* minute. It was on the principle of Newcomen, *i. e.* atmoſpheric, with injection into the cylinder. The pump was $18\frac{1}{2}$ inch bore, and 5 feet 8 inches ſtroke: it raiſed the water 33 feet high. This water, being conveyed in a trough to the machine, was delivered upon the water-wheel, which was 30 feet diameter, with 72 buckets; its caſt-iron axis was 7 inches diameter; the great cog-wheels 12 feet diameter, with 88 cogs; the trundle 20 cogs, ſo that the barrel turned 4.4 times for once of the water-wheel. The barrel was 5 feet 3 inches diameter in the middle, and 2 feet $11\frac{1}{2}$ inches diameter at the ends; the whole length being $10\frac{1}{2}$ feet. Upon the circumference of the barrel a ſpiral line is traced, and a groove ſunk, which receives half of the rope, to prevent the rope from ſlipping on the barrel.

The depth of the pit was 165 yards; and it was found, on a long courſe of experiments, that the total conſumption of coals was one corve of coals to draw up $82\frac{1}{2}$ corves from that depth. The machine would draw 18 ſcore of corves, each containing 20 pecks and weighing $5\frac{1}{2}$ cwt., every 12 hours.

The more modern winding-engines by ſteam are upon a much more ſimple conſtruction. The power of the ſteam-engine is applied at once to the barrel which winds up the rope, with only one pair of cog-wheels; *viz.* a large wheel fixed on the axis of the barrel, and a ſmaller one on the axis of the fly-wheel of the ſteam-engine. Theſe engines are frequently made on Newcomen's principle, as the conſumption of coals is a ſmall object, but Mr. Watt's engines are more manageable. As the ſteam-engine with a crank will turn either way, according as it is ſet in motion, it is very well adapted for winding-machines; the boys who manage them are very dexterous in ſtopping and turning them the contrary way. See STEAM-*Engine*.

There are many ingenious contrivances for facilitating the landing of the corves when they come up to the pit's mouth. The beſt is a platform, which runs upon wheels, and can be puſhed over the pit's mouth, when the corve is drawn up, by means of a light carriage with one horſe, which is backed on the platform beneath the corve, and puſhes the platform over the pit by the ſame motion. The corve is lowered down upon the carriage, and then the horſe draws the corve away; the ſame motion withdraws the platform from the pit's mouth, ready to let down an empty corve and draw up another full one.

In many modern pits, conductors are fixed in the pit. Theſe are perpendicular rods, and the baſkets have projecting parts which embrace the conductors, and guide the corve regularly up or down the pit.

In many collieries flat ropes are uſed. Theſe are compoſed of four ſmall ropes placed flat, ſide by ſide, and ſewed together by a packthread, which pierces all the four ropes. When theſe flat ropes are uſed, a barrel or drum of ſmall ſize is uſed, and the coils of the rope wind one upon the other, ſo as to form a ſpiral, and increaſes the diameter of the effective barrel as the rope winds up, ſo as to balance the weight of the rope. This was invented by Mr. John Curr, of Sheffield, who has ſeveral patents for machinery for manufacturing ſuch flat ropes, as they are extenſively uſed in Yorkſhire.

In others, iron chains are uſed inſtead of ropes, and are found to anſwer extremely well.

WINDING *of Cotton*. See COTTON *Manufacture*.

WINDING *of Silk*. See *Manufacture of* SILK.

WINDING-*Screw Cheeſe-Preſs*, in *Rural Economy*, a contrivance of this ſort, in which the weight is ſaid, in the Glouceſterſhire Report on Agriculture, to be capable of being gradually let down on the vats. It is thus deſcribed:—A ſtrong platform, or ſill, is raiſed on four legs, about a foot from the floor; near the edge is made a channel all round, to carry off the whey as it is expreſſed, by a lip, into the pan or receiver. Two ſtrong ſide-poſts are mortiſed into the ſill, reaching about ſix feet high; acroſs which, about four feet high, is firmly faſtened a ſtrong bar, with an aperture in the centre large enough to let in the ſcrew with eaſe. This ſcrew is fixed, at the lower part, into a heavy cubical ſtone of of two feet dimenſions, or nearly: the upper part of the ſcrew, having paſſed the perforation in the croſs-bar, enters a nut or female ſcrew, large in the middle, but worked off at the two ends fine enough to be graſped by the hand: by turning this nut, the weight is raiſed or let down on the cheeſe-vats underneath.

Where ſtones of the required weight and dimenſions are not to be had, a wooden frame of the ſame ſize is uſed, which is filled with ſand, pebbles, or rubble-ſtones.

The ſcrew part of this preſs has, in many dairies, been lately ſuperſeded by the adoption of an apparatus leſs ſimple in its conſtruction, though more eaſily worked. In which, on the right ſide of the preſs, a third upright is raiſed from the floor, and connected by two croſs-bars, about a foot long, with the upright poſt parallel with it. About four feet high, a cylinder of wood, from five to ſix inches diameter, is inſerted, paſſing quite through the additional upright, but kept to its place by a ſhoulder. To the end are fixed four ſpokes, or levers, or an iron handle, to which manual power is applied. A ſtrong rope is faſtened to and coiled round the cylinder, which paſſing over a pulley let lengthways into the upper bar, proceeds horizontally to another pulley, fixed directly over the centre of the weight, and by an iron hook attached to it. Very moderate ſtrength will raiſe the weight, which in this conſtruction ſlides with grooves fitted to the ſide-poſts. The mechanical powers are varied in ſome preſſes by the uſe of a wheel of a foot or eighteen inches diameter, inſtead of the pulley; but the effect is ſimilar. In either way of working the weight, there is a ſuperiority over the old preſs, and little difference in the expence.

WINDING *Stairs*. See STAIR.

WINDING *of Wool*, in *Rural Economy*, the practice of putting it up into fleeces. There is ſome nicety required in this operation; all the looſe ragged parts are to be turned inwards, ſo as to form a neat ſolid ſort of fleece, and all the dirty parts removed. The work is done on a large table or bench for the purpoſe. In ſome caſes of expert winders, four hundred fleeces can be wound in the courſe of the day.

WINDISCH FEISTRITZ, in *Geography*, a town of the duchy of Stiria, on the river Pluſcka; 40 miles S. of Gratz. N. lat. 46° 30′. E. long. 15° 28′.

WINDISCH *Gratz*, a town of the duchy of Stiria; 18 miles N.N.W. of Cilley. N. lat. 16° 35′. E. long. 15°.

WINDISCH *Landſberg*, a town of the duchy of Stiria; 12 miles E. of Cilley.

WINDISCH *Mark*, a part of Carniola, bordering on Hungary and Croatia.

WINDISCH *Matray*, a town of the archbiſhopric of Salzburg; 54 miles S.S.W. of Salzburg. N. lat. 46° 55′. E. long. 12° 36′.

WINDISH, a village of Switzerland, near Konigsfelden, at the conflux of the Aar and the Reuſs, in the canton of Berne, in which are found the ruins of the ancient city of Vindoniſſa, a fortreſs mentioned by Tacitus, which the Romans made a place of arms to ſtop the irruption of the Germans, and is ſaid to have been the ſee of a biſhop. It was deſtroyed in the 7th century; 3 miles W. of Baden.

WINDISHGARTEN, a town of Auſtria; 16 miles S.W. of Bavarian Waidhoven.

WINDLASS, or WINDLACE, a machine uſed for raiſing heavy weights, as guns, ſtones, anchors, &c.

It is very ſimple, conſiſting only of an axis, or roller, ſupported horizontally at the two ends by two pieces of wood and a pulley. The two pieces of wood meet at top; being placed diagonally, ſo as to prop each other. The axis, or roller, goes through the two pieces, and turns in them. The pulley is faſtened at top, where the pieces join.

Laſtly, there are two ſtaves, or handſpikes, which go through the roller, by which it is turned; and the rope, which comes over the pulley, is wound off and on the ſame.

WINDLASS, an horizontal machine, compoſed of timber, &c. and moſt uſed in merchant-ſhips for heaving up their anchors in lieu of a capſtan. The body of the windlaſs is octagonal, and is tapered from the middle to the ends by given dimenſions. It is ſawn from oak-timber of the beſt quality, and the length between the cheeks is in one piece. But when fitted with an iron axle or ſpindle in the middle, it muſt be in two pieces. The ends without the cheeks are fitted with iron ſpindles, and have a hoop driven over their ends. The ſpindles muſt be very accurately let into the ends and middle of the body, that the axis of each may exactly agree in a right line. A bolt is driven through the body of the windlaſs and each end of the ſpindles. On each end of the body is let on and ſecurely bolted an iron pall-hoop, with teeth or notches at every two or three inches. The palls, which are iron, are fixed againſt the aft-ſides of the pall-bits, and fall into the teeth or notches of the pall-hoop, ſo as to prevent it turning backwards when charged by the effort of the cable, &c. Holes or mortiſes are cut through, along the middle of the windlaſs on each ſquare, to admit the handſpikes, and each ſquare of the body is covered with elm or fir facings between the cheeks, on the working ſide in particular. It is ſuſpended by its axles or ſpindles in braſs rhodings, or gudgeons, which are let in and bolted into a frame of oak-timber called the cheeks, which are let down through the deck, and bolted to the pall-bits.

There are other methods of fitting windlaſſes, but this is recommended as the beſt.

WINDLASS-*Cheeks*, pieces of oak or elm faſtened to the ſides of ſmall veſſels, and by which the ends of their windlaſſes are ſuſpended.

WINDLE, in *Geography*, a townſhip of England, in Lancaſhire; 10 miles N.E. of Liverpool.

WINDLESTRAW, in *Agriculture*, a term applied to the naked ſtems of the creſted dog's-tail, and other natural graſſes.

It is obſerved in the third volume of the Tranſactions of the Highland Society of Scotland, that the common *poa* there ſometimes goes by the name of windleſtraw-graſs. See GRASS, and POA.

WINDMANNIA, in *Botany*. See WEINMANNIA.

WINDO, in *Geography*, a ſea-port town of Sweden, in the province of Smaland; 85 miles N. of Calmar.

WINDORS, a town of the biſhopric of Paſſau; 10 miles W. of Paſſau.

WINDOT CREEK, a river of America, which runs into the Ohio, N. lat. 37° 59′. W. long. 86° 48′.

WINDOW, *q. d.* WIND-DOOR, an aperture, or open place, in the ſide of a houſe, to let in the air and light.

Before glaſs windows came into uſe, (for the antiquity and firſt introduction of which, ſee GLASS,) the window caſements were commonly made of a tranſparent ſtone, called *ſpecularis lapis*, and thence called *ſpecularia*; and before the *ſpecularia*, veils were the only defence they had againſt the weather. Pitiſc. Lex. Antiq. in voc. *Specularia*.

We have various kinds and forms of windows; as glaſs-windows, wire-windows, horn-windows, &c. Arched windows, circular windows, elliptical windows, ſquare and flat windows, round windows, oval windows, Gothic windows, regular windows, ruſtic windows; to which add ſky-lights.

The chief rules with regard to windows are, 1. That they be as few in number, and as moderate in dimenſions, as may conſiſt with other reſpects; inaſmuch as all openings are weakenings.

2. That they be placed at a convenient diſtance from the angles, or corners of the building; becauſe thoſe parts ought not to be opened and enfeebled, whoſe office is to ſupport and faſten all the reſt of the building.

3. That care be taken the windows be all equal one with another, in their rank and order; ſo that thoſe on the right-hand may anſwer to thoſe on the left, and thoſe above be right over thoſe below; for this ſituation of windows will not only be handſome and uniform, but alſo, the void being upon the void, and the full upon the full, it will be a ſtrengthening to the whole fabric.

As to their dimenſions, care is to be uſed to give them neither more nor leſs light than is needful; therefore regard is to be had to the bigneſs of the rooms which are to receive the light. It is evident, that a great room needs more light, and, conſequently, a greater window, than a little room; and *e contra.*

The apertures of windows, in middle-ſized houſes, may be four and a half or five feet between the jambs; and in the greater buildings, ſix and a half or ſeven feet; and their height may be double their length at the leaſt. But in high rooms, or larger buildings, their height may be a third, a fourth, or half their breadth, more than double the length.

Such are the proportions for windows of the firſt ſtory; and, according to theſe, muſt thoſe in the upper ſtory be for breadth; but, as to height, they muſt diminiſh; the ſecond ſtory may be one-third part lower than the firſt; and the third ſtory, one-fourth part lower than the ſecond.

WINDOWS, *Architrave.* See ARCHITRAVE.

WINDOWS, *Dormer*, or *Lutherns.* See LUTHERNS, &c.

WINDOWS, *Scenography of.* See SCENOGRAPHY.

WINDOWS, *Tranſom.* See TRANSOM.

WINDOW *and Houſe Tax*, is one of the aſſeſſed taxes transferred to the commiſſioners for the affairs of taxes. The duties charged annually with reſpect to the windows or lights in every dwelling-houſe, (for which, ſee TAX,) are ſubject to the following regulations.

All ſkylights, and all windows or lights, however conſtructed, in ſtaircaſes, garrets, cellars, paſſages, and all other parts of dwelling-houſes, to what uſe or purpoſe ſoever applied, and whether ſuch windows or lights ſhall be in the exterior or interior parts of ſuch dwelling-houſes, to be charged to the ſaid duties.

Every window or light in any kitchen, cellar, ſcullery, buttery, pantry, larder, waſhhouſe, laundry, bakehouſe, brewhouſe, and lodging-room, belonging to or occupied with any dwelling-houſe, whether the ſame ſhall be within or contiguous to or disjoined from the body of ſuch dwelling-houſe, ſhall be charged to the ſaid duties.

The ſaid duties to be charged yearly upon the occupier or occupiers of the houſes, cottages, or tenements, in reſpect whereof the ſaid duties ſhall be charged, and to be in force for one whole year, from the 5th day of April in the year in which the ſame ſhall be charged, to be levied on them, or on their reſpective executors or adminiſtrators, except as hereinafter provided.

Where any change in the occupation of any houſe, cottage, or tenement, ſhall take place after the aſſeſſment ſhall be made, then the ſaid duties ſhall be levied upon and paid by the occupier, landlord, or owner, for the time being, or on both or all of them, according to their times or poſſeſſion thereof, without any new aſſeſſment, notwithſtanding ſuch change in the occupation for the year that ſuch houſe ſhall have been aſſeſſed: provided, that where a tenant ſhall quit the ſame, on the determination of the leaſe or demiſe after an aſſeſſment made, and ſhall have given notice thereof to the aſſeſſor, the duty ſhall be diſcharged by the commiſſioners for this act for the remainder of that year, in caſe it ſhall appear to them at the end of ſuch year, that ſuch houſe, &c. ſhall have continued wholly unoccupied during the remainder of ſuch year.

Where any dwelling-houſe is or ſhall be let in different apartments, tenements, lodgings, or landings, and ſhall be inhabited by two or more perſons or families, the ſame ſhall nevertheleſs be charged as if inhabited by one perſon or family only; and the landlord or owner ſhall be deemed and taken to be the occupier, and ſhall be charged with the ſaid duties: provided, that where the landlord ſhall not reſide within the limits of the collector, or the ſame ſhall remain unpaid by him for twenty days after the ſame is due, the duties ſo charged may be levied on the occupier or occupiers reſpectively, and ſuch payment ſhall be deducted and allowed out of the next payment on account of rent.

Every houſe, of which the keeping is left to the charge of any perſon or ſervant, ſhall be ſubject to the like duties as if it were inhabited by the owner or by a tenant; and, if ſuch perſon or ſervant ſhall not pay rates to the church and poor, the ſaid duties ſhall be paid by the reſpective owners or tenants of the ſaid houſe.

Every diſtinct chamber or apartment in any of the inns of court, or of chancery, or in any college or hall in either of the univerſities of Oxford or Cambridge, or any public hoſpital, being ſeverally occupied, ſhall be ſubject to the ſame duties as if an entire houſe, which ſhall be paid by the reſpective occupiers; provided, that every ſuch chamber or apartment, which ſhall not contain more than ſeven windows or lights, ſhall be charged at the rate of 3*s.* 6*d.* for every ſuch window or light.

All dwelling-rooms in any hall or office whatever, belonging to any perſon, or to any body politic or corporate, or to any company, lawfully charged with the payment of any other taxes or pariſh-rates, ſhall be ſubject to thoſe hereby payable, and be reſpectively charged as dwelling-houſes; and the perſon, &c. to whom the ſame ſhall belong ſhall be charged as the occupier or occupiers thereof.

When a partition or diviſion between two or more windows or lights, fixed in one frame, is of the breadth or ſpace of twelve inches, the window or light on each ſide of ſuch partition or diviſion ſhall be charged as a diſtinct window or light.

Every window extending ſo far as to give light into more rooms, landings, or ſtories than one, ſhall be reckoned and charged as ſo many ſeparate windows as there are rooms, landings, or ſtories enlightened thereby.

Every window or light, including the frame, partitions, and diviſions thereof, which by due admeaſurement of the whole ſpace on the aperture of the wall of the houſe or building, on the outſide of ſuch window or light, ſhall exceed in height twelve feet, or in breadth four feet nine inches, not being leſs than three feet ſix inches in height, ſhall be reckoned and charged as two windows or lights, except ſuch windows or lights as ſhall have been made of greater dimenſions at any time prior to April 5, 1785; except alſo the windows or lights in ſuch parts of dwelling-houſes as are uſed for ſhops, workſhops, and warehouſes, and except the windows or lights in the public room of any houſe licenſed to ſell wine, ale, or other liquors by retail, which ſhall be uſed for the entertainment of gueſts; and the windows or lights in farm-houſes eſpecially exempted from the duties

duties in the fchedule marked (B.), or in any dwelling-houfe not chargeable to the duties mentioned in the faid fchedule.

Where any dwelling-houfe fhall be divided into different tenements, being diftinct properties, every fuch tenement fhall be fubject to the fame duties as if the fame were an entire houfe, which duties fhall be paid by the refpective occupiers; provided, that every fuch tenement, which fhall not contain more than feven windows or lights, fhall be charged at the rate of 3*s.* 6*d.* for every fuch window or light; and every fuch tenement in Scotland, which fhall not contain more than feven windows or lights, fhall be charged at the rate of 3*s.* for every fuch window or light.

The cafes in which windows are exempted are the following.

1. Any houfe belonging to his majefty, or any of the royal family, and every public office, for which the duties heretofore payable have been paid by his majefty or out of the public revenue.

2. Any hofpital, charity-fchool, or houfe provided for the reception and relief of poor perfons, except fuch apartments therein as are or may be occupied by the officers or fervants thereof, which fhall feverally be affeffed, and be fubject to the faid duties as entire dwelling-houfes.

3. The windows in any room of a dwelling-houfe, licenfed according to law as a chapel for the purpofes of divine worfhip, and ufed for no other purpofe whatfoever.

Provided that every fuch hofpital, charity-fchool, houfe for the reception and relief of poor perfons, or room licenfed as a chapel as aforefaid, fhall be brought into charge by the affeffor or affeffors, or in their default, by the furveyor or infpector, and fhall be ftated on the certificate of affeffments as fuch; and on due proof of the fact before the commiffioners by the affeffors, it fhall be lawful for the commiffioners for executing the faid act to difcharge fuch hofpital, &c. from the faid duties, or fuch part thereof as is hereby intended to be exempted, in like manner as they are authorized to difcharge the affeffment on poor perfons by this act, but not otherwife.

4. The windows or lights, in any dairy or cheefe-room belonging to and occupied with any dwelling-houfe, chargeable with the faid duties, although the fame fhall be part thereof, which fhall be ufed by the occupiers for the purpofe of keeping butter or cheefe, being their own produce, for fale or private ufe; provided, that the windows or lights in fuch dairies or cheefe-rooms fhall be made with fplines or wooden laths, or iron bars, or wires, and wholly without glafs, and that the occupiers of the dwelling-houfes to which fuch dairies and cheefe-rooms belong fhall caufe to be painted on the outer door thereof, or on the outfide of the windows thereof, or one of them, in large Roman letters, the words, "dairy, or cheefe-room," as the cafe may require, and fhall keep fuch words fo painted diftinctly legible, during all fuch time as fuch exemption fhall be claimed; and provided, that fuch dairies or cheefe-rooms fhall not be ever ufed to dwell or to fleep in by any perfon, but fhall be wholly kept for the feveral purpofes hereinbefore mentioned; and provided alfo, that an affeffment of all fuch windows or lights fhall be duly made, and the fact be truly returned in the manner directed by this act, in other cafes of exemption from the faid duties, fo that the number of windows fo to be exempted may be afcertained, and the exemption be allowed by the commiffioners for executing this act.

The provifions that refpect the exemptions of windows from affeffment by 43 Geo. III. c. 161. are as follow.

Windows are to be ftopped up with ftone or brick, or the fame kind of materials as the outfide of the houfe; allowance being made for thofe in the roof made of the fame materials with the outfide of the roof, or ftopped up before the commencement of this act; or windows are not to be made, reftored, or ftopped up without fix days' previous notice given to the furveyors, under a penalty of 10*l.*: and furveyors are to charge windows newly made or reftored, and omitted in the affeffment; and the penalty on ftopping up windows to elude payment is a charge on the occupier of the tenement, at the rate of double the fum by which the affeffment fhall be augmented, by reafon of fuch certificate, fubject to appeal, provided it be proved to the fatisfaction of the commiffioners for executing this act, that the fame windows or lights were refpectively ftopped up according to the directions of this act, previous to the commencement of the year on which the faid affeffment fhall or ought to have been made.

The duty on dwelling-houfes (for which, fee TAX) comprehends every coach-houfe, ftable, brewhoufe, wafhhoufe, laundry, woodhoufe, bakehoufe, dairy, and all other offices, and all yards, courts, and curtilages, and gardens, and pleafure-grounds, belonging to and occupied with any dwelling-houfe, within the limits of one acre.

All fhops and warehoufes which are attached to the dwelling-houfe, or have any communication therewith, fhall, in charging the faid duties, be valued together with the dwelling-houfe and the houfehold and other offices aforefaid thereunto belonging, (except fuch warehoufes and buildings upon or near adjoining to wharfs which are occupied by perfons who carry on the bufinefs of wharfingers, and who have dwelling-houfes upon the faid wharfs for the refidence of themfelves or fervants employed upon the faid wharfs.)

And alfo except fuch warehoufes as are diftinct and feparate buildings, and not parts or parcels of fuch dwelling-houfes, or the fhops attached thereto, but employed folely for the purpofe of lodging goods, wares, and merchandize, or for carrying on fome manufacture (notwithftanding the fame may adjoin to or have communication with the dwelling-houfe or fhop.)

Every chamber or apartment in any of the inns of court, or of chancery, or in any college or hall in any of the univerfities of Great Britain, being feverally occupied, fhall be charged thereto as an entire houfe, and on the refpective occupiers thereof.

Every hall or office whatever belonging to any perfon or to any body politic or corporate, or to any company lawfully charged with the payment of any other taxes or parifh-rates, fhall be fubject to the duties as inhabited houfes; and the perfon, &c. to whom the fame fhall belong fhall be charged as occupier.

Where any houfe fhall be let in different ftories, tenements, lodgings, or landings, and fhall be inhabited by two or more perfons or families, the fame fhall neverthelefs be charged to the faid duties as if inhabited by one perfon or family only, and the landlord or owner fhall be deemed the occupier, and fhall be charged to the faid duties: provided, that where the landlord fhall not refide within the limits of the collector, or the fame fhall remain unpaid by fuch landlord for the fpace of twenty days after the fame is due, the duties fo charged may be levied on the occupier or occupiers refpectively; and fuch payment fhall be deducted and allowed out of the next payment on account of rent.

No dwelling-houfe, or other fuch premifes as aforefaid, fhall be eftimated or rated at any lefs annual value than the rent or value at which the fame premifes ftand charged in the laft rate made on or before the time of making the affeffment

affeffment for the relief of the poor in the fame parifh or place, under certain fpecified reftrictions with regard to the poor rate.

Where any dwelling-houfe fhall be divided into different tenements being diftinct properties, every fuch tenement fhall be fubject to the fame duties as an entire houfe, which duty fhall be paid by the occupiers refpectively.

The cafes of exemption are the following.

1. Any houfe belonging to his majefty, or any of the royal family, and every public office for which the duties heretofore payable have been paid by his majefty, or out of the public revenue.

2. Every dwelling-houfe, being a farm-houfe occupied by a tenant, and *bonâ fide* ufed for the purpofes of hufbandry only.

3. Every dwelling-houfe, being a farm-houfe occupied by the owner thereof, and *bonâ fide* ufed for the purpofes of hufbandry only, which, together with the houfehold and other offices aforefaid, fhall be valued under this act at 10*l. per annum*, or any lefs fum.

4. Any hofpital, charity-fchool, or houfe provided for the reception or relief of poor perfons.

5. Every houfe whereof the keeping is committed to the care of any perfon or fervant, who doth not pay rates to the church and poor, and who refides therein for the purpofe only of taking care thereof: provided, that an affeffment fhall be duly made in every fuch cafe, and the fact be truly returned in the manner directed by this act in other cafes of exemption from the faid duties, and the exemption be allowed by the commiffioners for executing this act.

Any perfon inhabiting a dwelling-houfe, containing not more than fix windows in the whole, fhall be exempted from the duties in fchedule (A.), in cafe fuch perfon fhall be on the books of fuch parifh or place as receiving parochial relief; and fhall not be affeffed, or liable to be affeffed to any of the duties contained in fchedules (B.), (C.), (D.), or (E.); which feveral exemptions fhall be proved or claimed in the manner hereinafter mentioned.

And, in order to relieve fuch perfons who may be charged to the feveral duties fet forth in the fchedules (A.) and (B.), or either of them, it is enacted, that where any fuch houfe, cottage, or tenement, as is defcribed in the preceding claufe, fhall be brought into charge, and the occupier thereof fhall be entitled to the faid exemption by reafon of poverty, in every fuch cafe, the affeffors fhall, on the certificate of affeffment, fet oppofite the fum charged on the occupier thereof, the fact of his or her being poor, and fhall return the fame, together with the affeffment and a certificate, as hereinafter mentioned, to the commiffioners for executing this act in the diftrict where fuch affeffment fhall be made; who, before allowing any fuch affeffment, or making any order thereupon, fhall examine the affeffors, who fhall refpectively attend them for that purpofe, at fuch time as they fhall appoint, touching the return fo made; and if the faid commiffioners fhall, from fuch examination, and from the certificate hereinafter mentioned, be fatisfied that any fuch occupier is entitled to fuch exemption, they may, after fuch proof, ftrike out the charge, leaving his name, and the number of windows and rent of fuch houfe in the affeffment, and every fuch occupier fhall be exempted accordingly; which exemption fhall, in the like cafes, extend to, and fhall be allowed on all affeffments on fuch poor perfons, of the duties payable at the time of paffing this act, which fhall have been, or fhall be made, at any time after the commencement of the prefent year.

But before any fuch exemption or abatement fhall be allowed, the affeffors fhall produce to the commiffioners a certificate under the hands of five or more fubftantial houfeholders of fuch parifh or place, in veftry affembled, of whom the refident minifter fhall be one; but in cafe there fhall be no fuch minifter refident therein, then at leaft two or more churchwardens and overfeers of the poor of fuch parifh or place fhall concur with fuch houfeholders in fuch certificate, certifying thereby, that they have carefully examined the affeffment of the faid duties, and the allegations therein made by the affeffors, touching fuch perfons who fhall be therein ftated to be poor, and that in their judgment and belief the perfons therein certified to be poor are entitled to be exempted by reafon of their poverty, and are wholly unable to pay the duties affeffed upon them; provided, that if in any parifh or place there fhall not be five fubftantial houfeholders, then fuch certificate may be made by the fubftantial houfeholders there refiding; or if there fhall be no churchwardens or overfeers, then the fame may be granted by the refident minifter, or by any two churchwardens or overfeers of any adjoining parifh or place, who can certify the truth of fuch allegations, concurring therein with the fubftantial houfeholders refiding in the parifh or place where fuch affeffment fhall be made.

And where the occupier of any houfe, cottage, or tenement, containing more than the number of windows or lights before fpecified, fhall be brought into charge, and the occupier thereof fhall, at the commencement of the year for which fuch affeffment is made, be poor and indigent, or fhall become fo during that year, in every fuch cafe, fuch occupier may give notice thereof in writing, ftating the caufes to the affeffor, or to the furveyor of the diftrict in which fuch houfe is fituate, annexing thereto a certificate, under the hands of fuch perfons as aforefaid, certifying that, in their judgment and belief, fuch perfon is juftly entitled to relief on account of poverty for the caufes mentioned in fuch notice; and every affeffor fhall deliver the notices by him received to fuch furveyor: and if fuch furveyor fhall be fatisfied of the truth thereof, after due examination of the facts and circumftances, and that fuch perfon is unable to pay the duties charged on him or her, and has no probable means of bettering his or her condition within that year, he is hereby required to certify the fame to the commiffioners; and if fuch furveyor fhall not be fatisfied, then, on notice thereof to fuch occupier, he may appeal from fuch charge to the commiffioners, giving ten days' previous notice thereof to the faid furveyor.

And in every cafe where the furveyor fhall certify to the faid commiffioners that he is fatisfied of the truth of the claim made by any fuch occupier, and that he is, and will be unable to pay the duties charged on him or her within that year; or if, upon appeal, it fhall appear to the fatisfaction of the major part of the faid commiffioners prefent, on the oath of fuch appellant, or by other lawful evidence on oath produced by fuch appellant, that he or fhe is entitled to maintain fuch appeal, and wholly unable to pay the duties charged on him or her, the faid commiffioners may give fuch relief, either by ftriking off the whole of the duty fo charged, or diminifhing the fame, as to them fhall feem meet and neceffary; and which appeals, for the caufes in this claufe mentioned, may be heard and determined, either on the days mentioned in this act for hearing appeals in other cafes, or at the end of the year, or any days to be appointed by the refpective commiffioners for executing this act; which exemption fhall, in the like cafes, extend to, and fhall be allowed on all affeffments on fuch poor perfons of the duties payable at the time of paffing this act, which fhall have been or fhall be made at any time after the commencement of the prefent year.

Unoccupied

Unoccupied houfes are to be inferted in the affeffment, and the affeffors, or the furveyors and infpectors, are to certify when they become occupied; and the perfon occupying fhall give notice to the affeffor, furveyor, or infpector, within twenty days after occupation, under a penalty of 5*l.*, and be liable to be charged for the reft of the preceding quarter; and houfes becoming unoccupied after affeffment are to be charged for the whole year, unlefs notice is given. Notices are alfo to be given by occupiers of houfes or managers of hofpitals, charity-fchools, poor-houfes, or licenfed chapels, entitled to exemptions; and the exemptions are to be allowed by the commiffioners after examination. Burn's Juftice, vol. v. See TAX and COMMUTATION.

WINDOW, in *Anatomy*, &c. See FENESTRA.

WINDRUSH, in *Geography*, a river of England, in the county of Oxford, which runs into the Thames, 5 miles S.S.W. of Witney.

WINDSBACH, a town and citadel of Germany, in the principality of Anfpach; 10 miles S.E. of Anfpach. N. lat. 49° 13′. E. long. 10° 46′.

WINDSHEIM, a town of Bavaria. The inhabitants are chiefly Lutherans. This town was imperial till 1802, when it was given to the elector of Bavaria; 28 miles S.W. of Wurzburg. N. lat. 49° 34′. E. long. 10° 26′.

WINDSOR, commonly called NEW WINDSOR, to diftinguifh it from a parifh named Old Windfor, a market and borough town of Berkfhire, England, is eminent in the hiftoric annals of the kingdom, on account of containing one of the palaces of the fovereigns, and from the many diftinguifhed events which are identified with the place. Some of our moft eminent military and chivalrous fovereigns have made the caftle, or palace of Windfor, their chief refidence, and confequently the fcene of various celebrated feftivities, tournaments, and national affemblies. In the annals of the caftle, this is fully verified. When the Domefday-book was compiled, the caftle, which had been then lately built by William the Conqueror, was within the manor, and it is probable within the parifh of Clewer, of which Windfor was formerly a chapelry: it afterwards became the feat of an extenfive honor.

We are told by the Saxon Chronicle, that William the Conqueror kept his Whitfuntide at Windfor in 1071; and that a fynod was held there in 1072, wherein the province of York was made fubject to Canterbury. It is probable, that William Rufus kept his Whitfuntide at Windfor in 1095, his Chriftmas in 1096, and his Eafter in 1097: but in all probability all thefe feftivals were held at the palace at Old Windfor. Windfor-caftle feems to have been intended by William the Conqueror more for a military poft, for which by its fituation it was well adapted, than for the refidence of himfelf and his fucceffors.

Several monarchs kept their Chriftmas and other feftivals at Windfor; on fome of which occafions there were tournaments and other chivalrous fêtes performed. After the contentions between Stephen and Maud, Windfor-caftle, as the fecond fortrefs of the kingdom, was committed to the cuftody of Richard de Lacy.

It appears that a new barbican, or out-work, was built to the caftle by king Henry III. In 1263, during the wars between that monarch and his barons, prince Edward garrifoned Windfor-caftle with foreigners, who nearly deftroyed the town, and did much injury to the furrounding country. The fame year it was given up to the barons, and the king made an order that Eleanor, wife of prince Edward, with her daughter and all her houfehold, fhould, without delay, retire from the caftle.

A great tournament was held in Windfor-park on the 9th of July, in the fixth of king Edward I. That monarch and his fucceffor, king Edward II., refided frequently at Windfor, where feveral of their children were born.

John, king of France, and his fon Philip, were prifoners in Windfor-caftle. David, king of Scotland, is alfo faid to have been prifoner there at the fame time.

All hiftorians agree, that Windfor-caftle owes its magnificent fabric to the affection which king Edward III. bore to the place of his nativity. Walfingham relates, that in 1334, he built a chamber, which he called the round table, 200 feet in diameter: this, by other accounts, appears to have been only a temporary ftructure. Holingfhed fays, that in 1359, "the king fet workmen in hand, to take down much old buildings belonging to the caftle of Windfor, and caufed divers other fair and fumptuous works to be fet up in and about the fame caftle, fo that almoft all the mafons and carpenters, that were of any account within the land, were fent for, and employed on the fame works." But it appears that various commiffions for appointing furveyors and impreffing workmen had been iffued fome years before; and that in 1356, William of Wykeham, then one of the king's chaplains, was made clerk of the works with ample powers, and a fee of one fhilling a day whilft at Windfor, and two fhillings when he went elfewhere upon bufinefs: his clerk had a falary of three fhillings a week. In 1359, the architect's powers were further enlarged, and he was appointed keeper of the manors of Old and New Windfor. The next year 360 workmen were impreffed to be employed on the buildings at the king's wages, fome of whom having clandeftinely left Windfor, and engaged in other employments for greater wages, writs were iffued to prevent perfons employing them, on pain of forfeiting all their goods and chattels, and to commit fuch of the workmen as fhould be apprehended to Newgate. The plague having carried off a great number of the king's workmen in 1362, new writs were iffued to the fheriffs of feveral counties to imprefs 302 mafons and diggers of ftone to be employed in the king's works. The counties of York, Salop, and Devon, were to furnifh fixty men each. Glaziers were impreffed in the year 1363; very few commiffions were iffued after the year 1369, and none after 1373, fo that it may be prefumed that this noble work was then completed; comprifing the king's palace, the great hall of St. George, the lodgings on the eaft and fouth fides of the upper ward, the round tower, the chapel of St. George, the canon's houfes in the lower ward, and the whole circumference of the walls, with the towers and gates.

The appeal of high treafon, brought by the duke of Lancafter againft Thomas Mowbray, duke of Norfolk, in 1398, was heard by king Richard II., on a fcaffold erected within the caftle at Windfor, when, it being found impoffible to reconcile the opponents, a day of combat was appointed to take place at Coventry. The caftle continued to be the occafional refidence of our monarchs, who from time to time made various alterations in the buildings, particularly king Henry VII. Windfor-caftle was garrifoned by the parliament, foon after the breaking out of the civil war between Charles and his fubjects; and colonel Venn, who was afterwards one of the king's judges, was appointed the governor. Prince Rupert made an unfuccefsful attack upon it in the autumn of 1642. The caftle continued under the jurifdiction of parliament during the war, and in the year 1648 became the prifon of its unfortunate monarch. Judge Jenkyns was alfo a prifoner here for feveral years; whence he was removed to Wallingford, in 1656.

Upon the Reftoration, king Charles II. finding the buildings

ings of the caſtle much dilapidated by plunder and neglect, cauſed it to be thoroughly repaired and richly furniſhed. During the greater part of his reign, he made Windſor his ſummer reſidence. King James II. in 1687 received the pope's nuncio at Windſor-caſtle. Queen Anne, when princeſs of Denmark, lived in a ſmall houſe adjoining the little park, and was very partial to Windſor.

During the reign of his preſent majeſty, Windſor-caſtle has undergone conſiderable improvements, under the direction of the late James Wyatt, eſq. ſurveyor-general of his majeſty's works.

The caſtle conſiſts of two courts, between which is the keep, or round tower. The upper court contains on the north ſide the ſtate apartments, chapel, and the hall of St. George. The eaſt and ſouth ſides have been lately fitted up for the reſidence of their majeſties and the royal family. Our limits will not allow us to enter into a detail of the magnificent rooms which conſtitute the ſtate apartments, or of dwelling on the valuable collection of pictures therein contained.

St. George's hall, on the north ſide of the upper ward, was built by king Edward III., as a refectory for the knights companions of the garter: it is a noble room 108 feet in length. The ceiling and walls are painted by Verrio; the ſubjects are the triumphs of the warlike founder, and his brave ſon, Edward the Black Prince.

In the area of the upper court is a bronze ſtatue of king Charles II. on horſeback, executed by Stada at the expence of the munificent Tobias Ruſtat.

On the north ſide of the caſtle is the terrace made by queen Elizabeth, which was extended by king Charles II. along the eaſt and ſouth ſides: its whole length is 1870 feet, and it may be regarded as the nobleſt walk of the kind in Europe, as well as the moſt intereſting in ſituation.

The chapel of St. George is ſituated on the north ſide of the lower court of the caſtle. King Henry I. built a chapel at Windſor, dedicated to St. Edward the Confeſſor, and placed in it eighty canons, who were maintained out of the king's exchequer. This chapel appears to have been rebuilt, or conſiderably enlarged and decorated, by king Henry III.: that monarch, in the year 1243, iſſued a commiſſion to Walter de Gray, archbiſhop of York, to expedite the works at the king's chapel at Windſor, directing that the workmen ſhould proceed as well in winter as in ſummer, till the whole was completed; that a lofty wooden roof, like the roof of the new work at Lichfield, ſhould be made to appear like ſtone-work, with good ceiling and painting: that the chapel ſhould be covered with lead, and four gilded images be put up in it, where the king had before directed images of the ſame kind to be placed; and that a ſtone turret ſhould be made in front of the chapel of ſufficient ſize to hold three or four bells. Some remains of Henry III.'s buildings, as may be preſumed by the ſtyle of the arches and architectural decorations, may be ſeen on the ſouth ſide of the dean's cloiſters, and at the eaſt end of the chapel behind the altar.

King Edward III., who had been baptized at Windſor, rebuilt St. Edward's chapel there, and dedicated the new ſtructure to the Virgin Mary and St. George. In the year 1349, he augmented the number of canons to twenty-three, beſides a warden; and appointed 24 poor knights, for all of whom he built habitations, and granted land for their ſupport. In 1351, the biſhop of Wincheſter made conſiderable alterations in the college; and Henry IV. changed the title of warden to that of dean.

The preſent ſplendid and truly intereſting chapel of St. George may be regarded as the moſt perfect and moſt beautiful pile of eccleſiaſtical architecture in the kingdom. It was commenced by king Edward IV. and committed to the ſuperintendance of Richard Beauchamp, biſhop of Saliſbury. The work was not completed till the reign of king Henry VIII.: the beautiful roof of the choir was put up in the year 1508. Sir Reginald Bray, prime miniſter to king Henry VII., and one of the knights companions of the order of the garter, who died in 1502, ſucceeded biſhop Beauchamp in the ſuperintendance of this great work, and was a liberal contributor to the building of the choir and other parts of the fabric: his cognizance is frequently repeated on the roof of the choir, as are the royal arms and thoſe of ſeveral noble families with the order of the garter. The rood loft and lanthorn were erected in 1516; the preſent organ-gallery and ſcreen at the end of the choir are of Coade's artificial ſtone. The ſtalls of the knights companions, which are very richly carved in wood, exhibit the names and arms of the ſeveral illuſtrious and noble perſons by whom they have been reſpectively filled. The altar-piece, which repreſents the Laſt Supper, is by Mr. Weſt, from whoſe deſigns the eaſt window, repreſenting the Reſurrection of our Saviour, was executed in painted glaſs by Jarvis and Foreſt, and put up in 1788: the expence of the latter was about 4000*l.* Another window by the ſame artiſts diſplay the angels appearing to our Saviour. Moſt of theſe improvements, as well as ſeveral others in the chapel and caſtle, have been executed under the patronage, and partly at the expence, of his preſent majeſty. Beneath the choir repoſe the remains of Henry VIII., his queen, lady Seymour, and king Charles I. Henry VI. was alſo interred in this chapel; alſo his rival and ſucceſſor, Edward VI.

At the eaſt end of the ſouth aiſle is the Lincoln chapel, which contains the monument of Edward, earl of Lincoln, lord high admiral of England for thirty years, who died in 1584. Sir Henry Clinton, bart., a deſcendant of the earl of Lincoln, was buried in this chapel in 1795. In the ſame aiſle is an elegant chantry chapel, built by John Oxenbridge, canon of Windſor. Farther weſt is a chapel built by Dr. Oliver King, biſhop of Bath and Wells, who died in 1492.

In the middle of the ſouth aiſle is a ſpacious chapel, founded by ſir Reginald Bray, who died in 1502, and is here interred: his arms and creſt appear in ſeveral parts of the chapel, particularly in the beautiful ſcreen which ſeparates it from the aiſle.

At the weſt end of the ſouth aiſle is the Beaufort chapel, in which is an altar-tomb with the effigies of the founder, Charles Somerſet, earl of Worceſter, who died in 1526, and his lady; and a ſplendid monument, ſupported by Corinthian pillars, to the memory of Henry, the firſt duke of Beaufort, who died in 1699.

Near the ſouth door of the choir is interred Charles, duke of Suffolk, a favourite miniſter and brother-in-law of king Henry VIII., who died in 1545.

On the weſt ſide of the choir-door in the north aiſle is a chapel built by Elizabeth, wife of William, lord Haſtings, who is buried here.

At the eaſt end of the chapel is a diſtinct though attached building, called the tomb-houſe, which was commenced by Henry VII. and intended for his burial place. It was granted by Henry VIII. to cardinal Wolſey, who began a ſumptuous monument for himſelf within its walls. This was deſtroyed in the civil wars. James II. fitted up the building as a Roman Catholic chapel; and publicly attended the celebration of maſs. After that monarch's deceaſe the chapel was deſerted; but in 1800 his preſentt majeſty gave orders

orders for it to be repaired, beautified, and appropriated for the interment of his family. The princess Mary and the princess Charlotte of Wales have been committed to its vault. On the north and east sides of the chapel are houses and lodgings for the dean and canons. The south and west sides of the lower ward are occupied by houses appropriated to the poor knights.

Between the two wards or courts of the castle is the keep, or round tower, for the residence of the governor of the castle. It consists of a lofty, artificial, conical mount, surrounded by a moat, and surmounted by a strong fortified tower, which is approached by a flight of 100 steps. The circumference of the whole castle is 4180 feet; its length from east to west 1480 feet; and the area, exclusive of terrace walks, is about twelve acres.

On the south side of the castle is a modern mansion, called the Queen's-lodge, where the royal family resided for several years; but it is now unoccupied. About half a mile S.E. of the castle is Frogmore, a modern seat belonging to the queen. It is principally noted for its beautiful garden.

To the south and west of the town is *Windsor Forest*, which formerly was computed to measure 120 miles in circuit. At present it is about 56 miles. A part of this, called the great park, consists of 3800 acres. The little park, on the north and east sides of the castle, contains about 500 acres.

Windsor is a large irregular town, disposed on the sides of a hill, and at its base, on the southern banks of the Thames. In 1276 it was declared a free borough by king Edward I., who granted to the burgesses a mercatorial guild, and various privileges and exemptions. He constituted it the county-town. King Edward IV. incorporated the burgesses by the name of mayor, bailiffs, and burgesses. By the last charter of king Charles II., the corporate body is made to consist of twenty-eight or thirty members. A weekly market is held by royal grant, as well as three annual fairs. Near the centre of the town is a guildhall or town-house, which was built in 1666.

This borough sent two members to parliament in the reign of Edward I.; but omitted making any returns from 1340 to 1446. The right of election has frequently been contested, but was finally settled to be vested in all the inhabitant householders not receiving alms. Windsor has continued to increase in population for the last 300 years. In 1555, there appears to have been 1000 persons; in 1801, they amounted to 3461; and in 1811 to 6155, who occupied 1051 houses. The parish-church is a spacious building, and part of it ancient, though it was formerly only a chapel subordinate to the church of Clewer. In it are several old monuments. On the west side of the town are extensive barracks, and an hospital for sick soldiers.

Windsor, *Old*, a village about two miles S.E. of New Windsor, was a place of some consequence at the time of the Domesday-survey, as by that record it is stated to contain 95 houses, which paid gabel tax to the crown. Some of the Saxon kings had a palace here, and Edward the Confessor sometimes kept his court at this place. After William the Conqueror had erected a castle at New Windsor, the old palace and the surrounding houses were gradually deserted. A great part of Windsor-park is within the parish of Old Windsor, and includes three lodges: 1. The great lodge built in the reign of Charles I. and occupied by the illustrious William, duke of Cumberland; 2. The little lodge or dairy, occupied by the deputy ranger; and 3. The manor lodge near Virginia water. Beaumont lodge, the seat of lord viscount Ashbrooke, was originally built by lord Weymouth, who died in 1705. There are other family mansions and villas in this parish; one of which was lately fitted up and occasionally occupied by the princess Elizabeth, now princess Homberg.—The Magna Britannia, by S. Lysons and the Rev. D. Lysons, Berkshire, 4to. 1806. The Beauties of England, &c. vol. i. by J. Britton, F.S.A. and E. W. Brayley, 8vo. 1801. The History of Windsor and its Neighbourhood, by J. Hakewill, Architect, 4to. 1813. This elegant volume contains accounts and views of several places in the vicinity of Windsor. The History of the Royal Residences, 4to. 1817, by J. Pyne, a very handsome and interesting work, contains several views of the state apartments in Windsor-castle. The Architectural Antiquities of Great Britain, 4 vols. 4to. by J. Britton, contains several views, and a full history and description of St. George's chapel.

Windsor, a large township in the south-east corner of Broome county, New York, erected in 1807 from the east part of Chenango; situated 15 miles E. of Chenango; bounded north by Chenango county, east by Delaware county, south by the state of Pennsylvania, and west by Chenango. Its extent is nearly 15 miles square, and it has two post-offices. It is traversed by the Susquehanna river. In 1810 it had eleven saw-mills, seven grain-mills, a fulling-mill, and carding-machine, eight school-houses, one house of worship, a population of 1960 souls, 138 electors, and nearly 300 families.

Windsor, a town of Nova Scotia; 25 miles N.W. of Halifax.—Also, a town of the state of Vermont, capital of a county of the same name, which contains 34,877 inhabitants; the town contains 2757 inhabitants; 92 miles N.W. of Boston. N. lat. 43° 33′. W. long. 72° 22′.—Also, a town of the state of Connecticut, on the west side of the Connecticut river, in the county of Hartford, with 2868 inhabitants; 3 miles N. of Hartford.—Also, a town of Massachusetts, in the county of Berkshire, with 1108 inhabitants; 136 miles W. of Boston.—Also, a township of Pennsylvania, in Berks county, with 1358 inhabitants; 70 miles W. of Philadelphia.—Also, a township of Pennsylvania, in York county, with 1739 inhabitants.—Also, a town of New Hampshire, in the county of Hillsborough, with 238 inhabitants.—Also, a town of North Carolina; 23 miles S.W. of Edenton.—Also, a township of Lower Canada, on the St. Francis.

Windsor, *East*, a town of New Jersey, in Middlesex county, with 1747 inhabitants.—Also, a town of the United States of America, in Connecticut, on the east side of the Connecticut, opposite Windsor, with 3081 inhabitants.

Windsor, *West*, a town of New Jersey, in Middlesex county, with 1714 inhabitants.

Windsor, *New*, a post-township of Orange county, New York, on the west bank of the Hudson; 100 miles S. of Albany; bounded north by Montgomery and Newburgh, east by the Hudson, south by Cornwall and Blooming-grove, west by Montgomery and Wallkill. Its medial extent east and west is eight miles, and north near four, giving an area of about 30 square miles. Its population in 1810 consisted of 2331 persons, and its senatorial electors were 147. It has two post-offices, *viz.* the village of New Windsor, pleasantly situated on the west bank of the Hudson, and having considerable trade; and Little Britain, said to be discontinued in 1813. This township has several mill-streams, and the land is occupied chiefly by farmers, who enjoy much of the independence resulting from prosperous industry. The whole is well watered by springs and brooks.

Windsor *Forest*. See Windsor.

Windsor *River*, a river of the state of Connecticut, which runs into the Connecticut, 4 miles N. of Hartford.

Windsor *Bean*, in *Agriculture* and *Gardening*. See Bean, and Vicia.

WINDTBERG, in *Geography*, a town of the duchy of Holftein; 4 miles S.S.E. of Meldorp.

WINDTHAAG, or Windthag, a town of Auftria; 3 miles E. of Bavarian Waidhoven.

WINDWARD Passage, a name given to a courfe from the fouth-eaft angle of the ifland of Jamaica, in the Weft Indies, and extending from 160 leagues to the north fide of Crooked ifland, in the Bahamas. Ships have often failed through this channel, from the north part of it to the ifland of Cuba, or the gulf of Mexico, notwithftanding the common opinion, on account of the current which is againft it, that they keep the Bahama fhore on board, and that they meet with the wind in fummer for the moft part of the channel eafterly, which, with a counter current on fhore, pufhes them eafily through it.

Windward *Iflands*, in oppofition to Leeward. Thefe iflands in the Weft Indies extend from Martinico to Tobago. See West Indies.

Windward *Point*, a cape on the north-eaft coaft of the ifland of St. Chriftopher. N. lat. 17° 23′. W. long. 62° 22′.

WINDY Tumours. See Tumour.

WINE, the fermented juice of the grape. The name is alfo applied to the fermented juice of other fubacid fruits.

It is impoffible to fix the era when mankind firft difcovered fermented liquors. Some hiftorians have afcribed the difcovery to Noah, others to Saturn, others to Bacchus, &c. In fhort, almoft every country in which the vine is indigenous has boafted of fome individual or native deity, to whom the honour has been attributed; and if we reflect upon the fimplicity of the proceffes effentially neceffary to be had recourfe to in making wine, it will appear exceedingly probable that the difcovery was not made by one perfon or country exclufively, but by different individuals and nations at very different periods. A poet has elegantly reprefented wine as a recompence given by the deity for the miferies brought upon mankind by the general deluge:

> " ——— Deus nobis felicia vini
> Dona dedit, triftes hominum quo munere fovit,
> Reliquias; mundi folatus vite ruinam."
> Prædium Rufticum.

Different kinds of wine were known at a very early period; and as civilization and luxury advanced, the number was greatly extended. Hence the cultivation of the vine became an object of importance, and many new varieties were produced, which, favoured by foil and fituation, rendered particular places more famous than others. Thus the ancient Romans not only poffeffed a great variety of native wines, but, in the days of their greateft fplendour, thofe alfo of diftant and ftill more favoured climes, as the *Vinum Chium*, *Lefbium*, *Leucadium*, *Rhodium*, &c. &c. See Pliny, xiv. 6.

Little is known refpecting the modes of manufacturing fome of the moft celebrated of the ancient wines. The general proceffes, however, did not perhaps differ much from thofe at prefent in ufe. The fruit was collected, bruifed by the feet, and fubjected to preffure, as now practifed. The juice that firft flowed fpontaneoufly was called πρωτοτον by the Greeks, and by the Romans *vinum primarium*; fuch as was obtained by preffure was denominated δευτεριον, or *vinum fecundarium*, and confidered as inferior.

Both Greeks and Romans appear to have frequently concentrated their wines, either by fpontaneous evaporation, or by boiling. For the former purpofe, the wine was fometimes introduced into bladders or large jars, and expofed in the chimney to the heat of the fire, or in the upper parts of the houfe to the heat of the fun. Sometimes the fruit was converted into raifins by drying, and the wine prepared from fuch fruit was denominated *paffum*. At other times the *muft* was reduced by boiling to one-half. This formed the *vinum defructum*: occafionally even to one-third, when it was termed *Sapa*. (See Pliny, xiv. 9.) By one or perhaps more of thefe methods, the wines were reduced to the ftate of fyrup, or in fome inftances even to drynefs, and were capable of being preferved for a very long time. Thus Ariftotle ftates, that the Arcadian wines required to be diluted with water before they were drank, as indeed was the cafe with moft of the ancient wines; and Pliny fpeaks of wines as thick as honey, which it was neceffary to diffolve in warm water, and filter through linen, before they were ufed. This was the cafe with the wine of Cæcuba, according to Martial:

> "Turbida folicito tranfmittere Cæcuba facco."

Pliny mentions Staphylus as the firft who mixed wine with water; but Athenæus gives the credit of it to Amphitryon, king of Athens. On this occafion a fable was invented, that Bacchus, having been ftruck by a thunderbolt, and being all inflamed, was prefently caft into the nymphs' bath, to be extinguifhed.

Thefe remarks, however, are applied by the above authors chiefly to very old wines. Thus the wine compared by Pliny to honey had been made two hundred years before, in the time of conful Opimius: indeed wines of a hundred years old, and upwards, feem not to have been uncommon among the luxurious citizens of ancient Rome. (See Hor. od. iii. 14. 18. Juvenal, v. 34.) And fimilar allufions will be found in various other authors. Seven years was the fhorteft period, according to Ariftotle and Galen, for keeping a wine before it was fit for drinking.

Among the Romans, the age of wines was, as it were, the criterion of their goodnefs. Horace, in his odes, which one may call *Bacchic fongs*, boafts of his drinking Falernian wine, born, as it were, with him, or which reckoned its age from the fame confuls.

The age of wine has been reckoned by leaves: thus they fay, wine of two, four, or fix leaves, to fignify a wine that was two, four, or fix years old; taking each new leaf put forth by the vine, fince the wine was made, for a year. The moderns keep no wine to fuch an age as that mentioned by Pliny. Where they are kept the longeft, as in Italy and Germany, there are fcarce any to be found of above fifteen leaves. In France, the wines that keep beft, as thofe of Dijon, Nantz, and Orleans, are reckoned fuperannuated at five or fix years old.

Wine kept in a cool vault, and well fecured from the external air, will preferve its texture entire in all the conftituent parts, and fufficiently ftrong for many years, as appears not only from old wines, but other foreign fermented liquors, particularly thofe of China, prepared from a decoction of rice, which being well clofed down in the veffel, and buried deep under ground, will continue, for a long feries of years, rich, generous, and good, as the hiftories of that country univerfally agree in affuring us.

Sir Edward Barry, in his Obfervations, hiftorical, critical, and medical, on the Wines of the Ancients, fuggefts, that our beft modern wines, efpecially thofe of a delicate texture and flavour, may be more effectually preferved in earthen veffels of a larger fize than our bottles, well glazed externally and internally: that dry fand is preferable for covering the bottles in the binns to faw-duft; and that a fmall ſmall anti-cellar, built before all large cellars, would be a conſiderable defence and improvement.

The ancients were fond of giving their wines an artificial flavour, and for this purpoſe they introduced pitch, turpentine, and different herbs into the *muſt;* a practice ſtill followed by the modern Greeks. Plin. *ubi ſupra.*

Such are the principal facts known reſpecting the celebrated ancient wines, which, as Chaptal juſtly remarks, appear in general to have rather deſerved the name of *extracts* or *ſyrups* than wines. They muſt have been ſweet and little fermented, and conſequently have contained a very ſmall proportion of alcohol. Indeed it is difficult to ſuppoſe how they could contain any ſpirit whatever, or poſſeſs in conſequence any intoxicating properties.

The above remarks, however, can be only applicable to thoſe wines which the refinements of luxury or caprice had rendered valuable, from their uncommon occurrence, or the difficulty with which they were procured. It is certain that the ancients were well acquainted with the fermentative proceſs, and ordinarily took advantage of it in the formation of their wines: hence it is extremely probable that the wines uſed in the primitive ſtates of ſociety, and perhaps at all times by the common people, conſiſted ſimply of the fermented juice of the grape, and therefore differed in no reſpects whatever from the wines in common uſe at the preſent time.

General Principles of Wine-making.—We ſhall conſider this intereſting ſubject under two principal points of view: 1ſt, The manufacture of wine from grapes; and 2d, From other fruits.

1. The manufacturing of wine from grapes is liable to be influenced by a great variety of circumſtances, ſuch as *climate, ſoil, aſpect, ſeaſon,* &c.; of ſome of the moſt important of which we ſhall take a curſory view.

The vine is a native of the middle regions of the temperate zone, that is to ſay, between the latitudes of 25° and 50°, and here only does it flouriſh and mature its fruit in abſolute perfection. Indeed a belt compriſed between the latitudes of 40° and 50°, may be ſaid to include all the moſt celebrated vineyards of the northern hemiſphere; thoſe, namely, of Spain, Portugal, France, Italy, Auſtria, Styria, Carinthia, Hungary, Tranſylvania, and part of Greece. The vine grows beyond the latitude of 50°, but its juices are auſtere, and without the requiſite degree of ſaccharine matter to form good wine. The fine aromatic odour and flavour of its fruit alſo are not developed much beyond this latitude. In the ſouthern hemiſphere, which is colder than the northern, the vine flouriſhes ſomewhat nearer the equator.

The vine grows in every ſoil, but that which is light and gravelly is beſt adapted for its cultivation. It flouriſhes extremely well alſo in volcanic countries. Thus ſome of the beſt wines in Italy are made in the neighbourhood of Veſuvius. The famous Tokay wine is alſo made in a volcanic diſtrict, as are ſeveral of the beſt French wines; many parts of the ſouth of France bearing evident marks of extinct volcanoes. The vine alſo flouriſhes well in primitive countries, and eſpecially among the debris of granite rocks: thus the celebrated Hermitage wine is made from a ſoil of this deſcription.

The ſame climate, ſoil, and mode of culture, however, often produce wines of very different qualities. Poſition and aſpect alone, all other circumſtances being the ſame, make a prodigious difference. The ſame vineyard, for example, according as its different parts have a northern or ſouthern aſpect, will produce wines of oppoſite characters, as will alſo the ſame hill, at its top, middle, and bottom. The aſpect moſt favourable for a vineyard is upon a riſing ground or hill facing the ſouth-eaſt, and the ſituation ſhould not be too confined:

> " —————— apertos
> Bacchus amat colles."

If the ſoil be not favourable for the vine no art can make it ſo. Manure of different ſorts will indeed render the fruit more abundant, but the wine will ſuffer in quality. The beſt manure is ſtated to be the dung of pigeons or poultry. Burnt ſea-wrack alſo is a favourite manure with ſome. Fat and putrid manures are abſolutely to be rejected, as they deſtroy the wine altogether, by vitiating its flavour.

The qualities of wines are very much affected by the ſeaſons. In cloudy and wet ſeaſons the wine is always inferior. Rain is moſt to be dreaded at the ſeaſon of the vintage. Moderate rains juſt after the ſeaſon of bloom are of great advantage, and cauſe the fruit to ſwell very rapidly. Rough winds are very prejudicial to vineyards. Miſts are ſtill more ſo, eſpecially during the ſeaſon of bloom, as they are apt to deſtroy the flower, and conſequently the fruit: the reaſon of this is perhaps not very evident, but it ſeems to depend in part upon the rapid evaporation of the moiſture left by the fogs, when the ſun breaks through them, and the great and ſudden change of temperature which takes place in conſequence. Too great a degree of heat is injurious to the vine; the perfection of their fruit, as well obſerved by Chaptal, depends upon a due equilibrium between the quantity of water affording aliment to the plant, and the degree of heat neceſſary to elaborate this water into its juices.

Towards the northern limits of the vine country, the plants are always ſupported on poles, and in cold and wet ſeaſons they ſometimes ſtrip off the leaves, or twiſt the ſtalks of the cluſters, in order to ſuppreſs vegetation and facilitate the ripening of the grapes. The latter practice was not unknown to the ancients: "Ut dulcia præterea fierent, aſſervabant uvas diutius in vite, *pediculo intorto.*" Pliny. But in warmer climates, on the contrary, the earth requires to be ſhielded from the heat, and here the vine is generally left to ſpread over the ground, and thus by its foliage to protect the ſoil, as well as its fruit, from the direct rays of the ſun. With reſpect to the beſt methods of pruning and training vines, ſee the articles VINE, and VITIS.

Of the Vintage.—It is of the utmoſt importance in the manufacture of wines, to attend to the preciſe moment when the grapes have arrived at their full maturity; and then, and not before, ought the vintage in general to commence. This may be known, according to Chaptal, by the following ſigns.

1. The green end of the cluſter becomes brown.
2. The cluſter becomes pendant.
3. The ſeed loſes its hardneſs, and the ſkin becomes thin and tranſparent.
4. The cluſter and ſeeds are eaſily detached.
5. The juice is ſweet, bland, thick, and clammy.
6. The kernels of the ſeeds are free from glutinous matter.

The fall of the leaves denotes rather the approach of winter than the maturity of the fruit, eſpecially in the more northern climates. This therefore is a fallacious ſign. Nevertheleſs, when the froſt has been ſo ſevere as to deſtroy the leaves, it will ſeldom be proper to delay the vintage much longer, as the fruit can hardly be expected after this to become ripe; and by delay it may ſtand a chance of being ſpoiled entirely.

On the contrary, in the manufacture of particular wines, the grapes are permitted to remain till they wither, or they are

are gathered and dried in the ſun. Thus the celebrated Tokay wine is made of dried fruit, as are alſo many of the luſcious wines of Italy. Some of the French wines likewiſe are made with fruit that has been ſuffered to ripen and wither upon the vines.

It is deſirable in general that the weather ſhould be ſettled, and the ſoil and fruit dry during the vintage. It is therefore recommended to abſtain from gathering till the ſun has diſperſed the dew. As a general rule, this is proper; but in Champagne they commence gathering the fruit before the ſun is riſen, and ceaſe their labours about nine o'clock, unleſs there be a fog, when they continue to gather all day; by theſe means they improve the whiteneſs and briſkneſs of their wine, which are the qualities that chiefly render them celebrated. They alſo increaſe their quantity. Thus it is found in Champagne, that they gain a tun in every twenty-four where they collect the fruit moiſt with dew, and a great deal more if there happens to be a fog.

When the fruit is ripe, a proper number of experienced hands ſhould be procured, ſo as to be able, in a ſingle day, to fill the fermenting tub or vat, in order to enſure an uniform degree of fermentation. Women are commonly employed for the purpoſe, but the preſence of an intelligent male overſeer is abſolutely neceſſary. In ſome parts of France the fruit is ſeparated with ſciſſors; in others with the nail; and in Champagne they uſe a knife. The ſciſſors is undoubtedly preferable, as it does not ſhake the ſtock. The ripe fruit only ſhould be collected, if the object be to make good wine, and what is unripe or decayed ſhould be carefully rejected; indeed they have always two or three ſeparate vintages in thoſe countries, where they are careful of the quality of their wines; and the wine made firſt is always conſidered the beſt. In thoſe parts, on the contrary, where the wine is chiefly diſtilled, as in Languedoc and Provence, they uſually collect all the fruit indiſcriminately at one time. In ſome diſtricts, where the fineſt wines are made, as in Bourdeaux, &c. the fruit is carefully picked, and only the prime of the cluſters taken. On the contrary, they carefully avoid having the fruit too ripe in Champagne, and other diſtricts where ſparkling wines are chiefly manufactured, and prefer the preſence of a certain proportion of unripe fruit. It need ſcarcely be remarked, that the greateſt care ſhould be taken to prevent the fruit from being bruiſed or otherwiſe damaged.

The next important ſtep is the management of the fruit after it has been collected. In different countries different preliminary ſteps are purſued before the fruit is ſubmitted to preſſure. Thus in Spain, eſpecially in the neighbourhood of St. Lucar, they leave the fruit expoſed for two days to the rays of the ſun. In Lorraine, part of Italy, in Calabria, and the iſland of Cyprus, as before obſerved, they dry the fruit completely, and this is the caſe in the manufacture of all the rich white wines.

A queſtion that has been much agitated is, whether it be advantageous to ſtrip the grapes from the ſtalks and remove the latter, or ſuffer them to remain. Both theſe methods have their advocates; but Chaptal remarks very properly that neither ought to be followed excluſively. It is true, the ſame celebrated chemiſt obſerves, that the ſtems have a rough and auſtere taſte; but this appears to be of advantage to ſome wines, eſpecially thoſe made in the more northern diſtricts, where the ſlight aſtringency imparted by the ſtems corrects their inſipidity, and appears to have the property of making them keep better, perhaps by rendering the fermentation more complete. In the neighbourhood of Bourdeaux, indeed, they remove the ſtalks from the red grapes in the manufacturing of their beſt wines, but they modify that part of the proceſs in ſome degree according to the ripeneſs of the fruit: when the fruit is unripe, or has been injured by the froſt, they remove nearly the whole of the ſtalks, but if the fruit be over-ripe they leave a very large proportion of them. A certain portion, however, is always permitted to remain with the view of facilitating the fermentative proceſs, and rendering it more perfect. From the white grapes, the ſtalks are never removed. In ſhort, in the colder diſtricts, where the wines are of an inferior quality, or where the object is to render the wines as ſtrong as poſſible, with the view of diſtilling them, the ſtems in general do not require to be removed; but in warmer countries, where the finer-flavoured and richer wines are manufactured, every thing liable to affect theſe deſirable qualities is to be carefully removed, and the ſtems among the reſt. The ſtems are ſeparated in various ways: ſometimes by agitating the grapes in the veſſels in which they are depoſited with three-pronged forks, ſometimes by coarſe ſieves made of oziers, &c.

The next important ſtep is bruiſing the fruit, which is generally performed by treading them with the feet in perforated tubs or baſkets placed over the *vat* or tub deſtined to receive the muſt. This mode of bruiſing grapes, though as ancient perhaps as wine-making itſelf, is very imperfect, as a great deal of the fruit remains unbroken. In England we ſhould adopt the uſe of machinery.

Of Fermentation, the Circumſtances affecting it, Phenomena, Products, &c.—The juice, or *muſt*, as it is termed, is no ſooner in the *vat* than it uſually begins to ferment. The *vat* is a capacious veſſel made of wood or ſometimes of maſonry, and its ſize correſponds, or ought to correſpond, with the quantity of wine to be made. Before it is uſed, it requires to be thoroughly waſhed, and its ſides in France are uſually covered with lime, which has the effect of ſaturating a portion of the malic and other acids which exiſt in abundance in the *muſt*.

The fermentative proceſs has been already deſcribed (ſee FERMENTATION); we ſhall therefore be very brief upon the ſubject here, and confine our attention principally to a conciſe recapitulation of the particulars, in order to preſent our readers with a general and connected view of the art of wine-making.

The vinous fermentation is influenced by ſeveral circumſtances, ſuch as temperature, preſence of the air, the volume of the muſt, &c. The muſt of the grape requires a temperature of at leaſt 55°, to enable it to commence the fermentative proceſs. Some have denied that the preſence of the air is neceſſary to fermentation. The recent experiments of Gay Luſſac, however, ſeem to prove the reverſe. This celebrated chemiſt found that the muſt would not begin to ferment in cloſe veſſels, but that the introduction of a little oxygen inſtantly ſet it going; the oxygen being firſt rapidly abſorbed. Perhaps we may explain the oppoſite concluſions of different experimentaliſts upon this ſubject, by ſuppoſing that the preſence of oxygen, though neceſſary to enable the muſt to commence fermentation, is not neceſſary to ſupport it afterwards. The fermentative proceſs is much influenced by the bulk or quantity of the muſt. It is a well-eſtabliſhed fact, that the greater the quantity the more violent is the fermentation. An experienced manufacturer of wine, therefore, will take care to proportion the quantity of muſt to the qualities of his fruit, or rather perhaps to thoſe of the wine which it is his object to procure: the ſweeter and more luſcious the muſt, the greater the quantity in general, which it will be proper to ſubmit to the fermentative proceſs in one maſs.

Other important circumſtances which influence the fermentative proceſs are the requiſite quantities and due relative proportions

proportions to one another of the neceſſary principles. The ſaccharine and fermentative principles, tartar and water, are the principles (as explained under the article FERMENTATION) eſſential to the production of wine. The ſweeteſt grapes do not always make the beſt wine, nor actually contain the greateſt proportion of ſugar, at leaſt of real ſugar, ſuch as is proper for the formation of alcohol. An experienced taſte, it is ſaid, can readily diſtinguiſh between a really *ſaccharine* grape and a *ſweet* grape; and conſequently pronounce *à priori* whether it be adapted for making good wine or not. Pure ſaccharine matter, however, will not ferment alone, but requires a certain proportion of other principles to put it in motion. When the muſt contains too large a proportion of water, the fermentative proceſs is feeble, and the wine is conſequently bad. The ancients obviated this, as we before mentioned, by boiling the muſt; a practice ſtill ſometimes followed in the northern diſtricts, eſpecially in wet ſeaſons. The ſame object is gained alſo by drying the fruit; and ſometimes by the introduction of lime into the vat. The juice of the grape always contains a certain proportion of tartar. This quantity is greater in general as the quantity of ſugar is leſs. If the juice contains too large a proportion of ſugar in relation to the tartar, it is cuſtomary to add a portion of the latter principle. On the contrary, if the ſaccharine principle be deficient and the tartar in exceſs, ſugar is to be added.

The fermentative proceſs is accompanied by the production of heat, by the diſengagement of carbonic acid gas, and the formation of alcohol. Theſe phenomena have been already diſcuſſed under the article above alluded to. Another important circumſtance, however, which takes place during this proceſs, is the *colouring* of the muſt. The juice of the black grape, as well as of the white, is nearly colourleſs; and if the fermentation be not permitted to take place in contact with the huſks or *marc*, a colourleſs wine is obtained in all caſes. The colour of red wines is derived from the *marc*; by permitting the wine to ferment in contact with it, the colouring principle of the *marc* or huſks being ſoluble in alcohol. Hence, when alcohol begins to be developed by the fermentative proceſs, it acts upon the colouring principle and diſſolves it, and the muſt becomes coloured. The following are the principal facts connected with this part of the ſubject. The wine is more coloured the longer the fermentative proceſs is continued, and *vice verſâ*. The wine is more coloured in proportion as the fruit is more ripe and leſs watery. Wine obtained by preſſure is more coloured than other wine, and laſtly wines manufactured in the ſouth are in general deeper coloured than thoſe produced in more northern diſtricts.

Great attention and practical knowledge are required in managing the fermentation properly, as on this important proceſs depend entirely the future qualities of the wines. The ſame fruit in different ſeaſons, and from various cauſes, requires to be managed differently; and almoſt every kind of wine requires a different, and, in ſome caſes, even an oppoſite, mode of treatment. Thus the fine *bouquet* of Burgundy is completely diſſipated by a too violent or laſting fermentation; while, on the contrary, the fermentation of the ſtrong wines of Languedoc, celebrated chiefly for the quantity of alcohol which they contain, ought to be long and complete. In Champagne, as we formerly mentioned, they collect the fruit deſtined to form their white wines while moiſt with dew or miſt: on the contrary, in the manufacture of their red wines, they prefer fruit as dry as poſſible. In the former caſe, the fermentative proceſs is ſo languid, as often to require a gentle heat; in the latter, ſo violent, as to require to be moderated. Weak wines ought in general to be fermented in caſks; ſtrong wines in the vat. No general rules, however, can be given that will apply in all inſtances; but the proceſſes muſt be varied according to circumſtances, and the judgment of the manufacturer.

The fermentative proceſs, for obvious reaſons, is moſt difficult to manage in the northern diſtricts, where the fruit is more imperfect. To encourage the proceſs, they ſometimes introduce a little warm muſt to the bottom of the vat by means of a long funnel. They alſo agitate it frequently, and to preſerve a due degree of temperature, cover the vat with blankets, or heat the room artificially.

The theory or rationale of the fermentative proceſs has been explained, as far as it is known, under the article FERMENTATION, before alluded to; we ſhall therefore paſs it over entirely here, and confine our attention to practical points only.

A moſt material point in the manufacture of wines is to know the preciſe moment when the fermentative proceſs has been carried far enough, and the means neceſſary to prevent its getting farther than this point. In the wine countries almoſt every manufacturer boaſts of his knowledge in theſe particulars, and often adopts different methods. Chaptal lays down the following rules to be attended to.

1. The wine ought to ferment ſo much the leſs time as it contains leſs ſaccharine matter. Thus the light wines of Burgundy require to ferment no longer than from ſix to twelve hours.

2. The muſt ought to ferment a leſs time in the vat when it is intended to retain the carbonic acid gas, and make ſparkling wines. In this caſe, the muſt is ſeldom left longer in the vat than twenty-four hours before it is put into caſks; and frequently it is introduced into the caſks as ſoon as it is ſeparated from the fruit; by theſe means the fermentation is checked, and the carbonic acid gas prevented from eſcaping.

3. The fermentation ought to be of ſhorter duration, in proportion as it is the object to obtain wines more free from colour. This ſhould be, therefore, particularly attended to in the manufacture of thoſe wines where the abſence of colour is an eſſential requiſite.

4. The fermentative proceſs is more active in warm weather, and when the maſs is large, &c. than under the oppoſite circumſtances; and therefore, *cæteris paribus*, is ſooner completed.

5. When the object is to preſerve to the wine the original perfumed flavour of the grape, the fermentation requires to be checked ſooner than under ordinary circumſtances.

6. On the contrary, the fermentation requires to be continued longer in proportion as the muſt is more thick, and the ſaccharine matter more abundant.

7. It will alſo require to be longer when the object is to manufacture wines for diſtillation.

8. It will be longer in cold weather, and eſpecially if the fruit has been gathered on a very cold day.

9. Laſtly, it will be longer in proportion as it is the object to make a deeper coloured wine.

Theſe principles ſteadily kept in view will perhaps be ſufficient, with a little practice, to enable any perſon of ordinary knowledge and powers of obſervation to decide upon the important points in queſtion.

Great care is requiſite in the preparation of the caſks for receiving the wine. When they are new, they will ſpoil its flavour if not prevented. For this purpoſe, boiling-water, holding ſalt in ſolution, is introduced into them, which is frequently agitated, and permitted to remain in them a long time. After this they are to be waſhed out with a portion of boiling muſt in a ſtate of fermentation, or ſometimes with a little wine, &c. If the caſks are old but ſweet, the top is merely

merely taken out, and the tartar removed; they are then washed well with warm water. If the casks have acquired a bad odour, Chaptal recommends to commit them to the flames; for though it may be possible to cover in some degree their bad odours, yet they are very likely to re-appear and spoil the wine.

The vessels being ready, the wine is introduced into them, for which purpose it is drawn off from the vat by a cock placed a few inches above the bottom into an open vessel, from whence it is conveyed to the casks. That portion of the wine resting immediately over the must is termed *surmont* in Burgundy. This is carefully defecated, as it constitutes the most delicate and palest of the wine. The liquor is drawn off till the head comes in contact with the *marc*. The head is then carefully removed, and the *marc* is subjected to repeated pressure. The wine thus farther obtained is usually mixed with the rest. That produced by the first pressure is strongest; that obtained by the last is usually more harsh and coloured. Sometimes, however, when it is the object to make vinegar, the *marc* is pressed but once. At other times, they keep the wine obtained by all the different pressures in separate casks. In Champagne they usually mix together the wines obtained by the different pressures, though they are known by different names. The wines obtained without any pressure, or a very slight one, they call *vins gris*; those obtained by the first and second pressure, *œil de perdrix*; those by the third, *vin de taille*, which are most coloured, though sufficiently agreeable.

The *marc* is employed in various ways in the different districts. Some submit it to distillation; others, especially in the vicinity of Montpellier, prepare verdigris from it; others vinegar. In some districts, they feed cattle with it; in others, they burn it for the sake of the potash it yields, &c.

Of the Management of the Wine in the Casks.—The wine receives its last degree of elaboration in the casks; this consists in a sort of fermentative process, to which the name of *insensible fermentation* has been applied. Almost immediately after the wine is introduced into the casks, a scum begins to be formed upon its top, and escapes by the bung-hole, which at first requires to be covered slightly only with a leaf or tile. In proportion as the fermentation subsides, the mass of wine diminishes in bulk; and they watch this cautiously, in order to supply its place from time to time with new wine, so as to keep the cask always full: this process is denominated in France *ouiller*, which may be rendered *filling up*. In some districts they *fill up* every day during the first month, every other day during the second, and every eight days afterwards, till the time of racking. This is the method they adopt with the wines of Hermitage. In Champagne they permit the *vins gris* to ferment in casks for ten or twelve days, and when the ebullition has ceased, they close the bung-hole, leaving, however, a small spigot-hole by its side, which is permitted to remain open for eight or ten days longer; after which they close this with a plug, in such a manner as to be able to open it at pleasure. When the bungs are introduced, they *fill up* every eighth day by the spigot, for twenty-five days. After this every fifteenth day, for one or two months; and finally, every two months during the whole time the wine remains in the cellar. When the season has been wet and unfavourable, and the wines want body, or when it has been dry and hot, and they are too rich, twenty-five days after they have been made, they roll the casks five or six times, in order to mix the grounds, and re-excite the fermentative process, and this they repeat every eighth day for a month.

The fermentation of the Champagne wines, which are designed to be brisk and sparkling, is very long and tedious. It is generally understood that they will be sparkling, provided they are bottled any time between the vintage and the following May, and that the nearer the vintage the brisker they will be. It is, however, generally taken for granted, that they will be sufficiently sparkling if bottled about the middle of March. Wines begin to sparkle in about six weeks after they have been bottled; those, however, produced on mountains become sparkling sooner than others. Wines bottled in June and July will be very little sparkling, and quite *still* if bottled so late as October and November.

In Burgundy, after the fermentation has relaxed in the cask, they put in a bung pierced with a small hole, in which they introduce a plug that can be easily removed at pleasure, in order to suffer the gas that may be extricated to escape. In the district of Bourdeaux, they begin to *fill up* eight or ten days after the wine has been introduced into the cask. A month after this they introduce the bung, and *fill up* every eight days. At first they bung the casks loosely, and then fasten them down by degrees, without running any risk. The white wines are racked and sulphured in December, and these require much more care than the red wines, from their containing more sediment, and their being more liable to become ropy. The red wines are not racked till towards February or March, and as these are much more apt to become sour than the white wines, they require to be kept in cooler cellars during the summer. There are some who, after the second racking, turn the casks so as to place the bung on one side; and thus the casks being hermetically sealed from there being no loss, there is no need of *filling up*. They then rack off annually, at any time of the year they find it convenient.

Methods nearly similar are adopted in other wine countries; hence it will be needless to repeat them. We shall, however, give a short account of the methods followed in the manufacture of *Port*, *Madeira*, and *Sherry*, the most popular wines of this country.

In *Oporto*, the complete fermentation of the must takes place in the vat. The wine is then introduced into large tuns, capable of holding twenty-five pipes each; and at this stage the brandy is added according to the judgment of the manufacturer.

In *Madeira*, the second or insensible fermentation is carried on in casks, and the wine is racked from them at the end of three or four months, at which time a portion of the brandy is added. The remainder is reserved to be mixed at the time of exportation.

In the manufacture of *Sherry*, the grapes are first slightly dried, and sprinkled with quick-lime. They are then wetted with brandy on being introduced into the press, and a portion of brandy is added to the must before the fermentation commences. The subsequent processes consist in repeated rackings at intervals of a month or two, till March, brandy being added at each racking.

The object of racking the wines is to separate the dregs consisting of tartar, &c. deposited from the wine, and which, if left, are liable to render it sour, by re-exciting from time to time the fermentation. The tendency to fermentation is counteracted by a process termed *sulphuring*, and the spontaneous separation of the dregs is rendered more complete by Clarification, which see. See also Fining and Forcing.

The *sulphuring* of wines consists in impregnating them with the vapours of burning sulphur, or sulphurous acid, and is generally effected by burning sulphur-matches in the casks. (See Matching.) These matches are made in different ways, aromatics being sometimes mixed with the sulphur; but the sulphur is the only useful and necessary ingredient.

Sometimes

Sometimes a wine highly impregnated with fulphurous acid is prepared, a little of which mixed with the reft anfwers the purpofe of burning matches in the cafk. Other fubftances, according to Dr. Macculloch, anfwer the fame purpofe as *fulphuring;* namely, the *black oxyd of manganefe*, and particularly the *fulphite of potafh.* A drachm of which falt is fufficient for a pipe of wine, and is very effectual in counteracting the fermentative procefs. The theory of thefe proceffes is very obfcure.

We have before obferved that the mere racking of wines is not fufficient to render them pure, and various methods are adopted at the racking periods to render this operation more effectual, and thefe altogether conftitute the procefs termed *clarification.*

Lord Bacon mentions a practice among the ancients of putting wine into veffels well ftopped, and letting it down into the fea. That this practice is very ancient is manifeft from the difcourfe of Plutarch (Quæft. Nat. 27.) about the efficacy of cold upon muft.

Different periods, as before-mentioned, are chofen in different diftricts for racking wines. Thus the wines of Hermitage are racked in March and September, thofe of Champagne about the middle of October, the middle of February, and the latter end of March. If poffible, a ferene and fettled ftate of the atmofphere, and a dry and cold day, fhould be chofen for the purpofe, as the wine is always turbid in damp clofe weather, and during the prevalence of foutherly winds.

In racking wines, it is in general defirable to expofe them as little as poffible to the atmofpheric air. In fome diftricts, a fyphon is employed for the purpofe. In Champagne they ufe a fort of pump. Dr. Macculloch recommends that the wine fhould be transferred from one cafk to another by means of a leather hofe, and this method is undoubtedly preferable. For clarifying wines, a great variety of fubftances are employed. Ifinglafs and albumen either from eggs or blood are the moft common; but gum, ftarch, rice, milk, the fhavings of beech-wood, gypfum, fand, &c. are ufed in different wine countries. An ounce of ifinglafs, or about eighteen or twenty whites of eggs, are fufficient for one hundred gallons of wine.

Two very important circumftances in the practice of wine-making require yet to be mentioned; thefe are the *medication* of wines, and the means of *remedying thofe difeafes* to which they are liable.

The *medication* of wines confifts in altering the colour, the flavour, or the ftrength of any given wine, or in fo mixing two or more together, as to produce a compound differing from, or fuperior to, either. It is difficult to give any general rules for this purpofe, and the proper management of the proceffes depends chiefly upon the experience and tafte of the maker.

It generally happens that when two wines are mixed, the fermentative procefs is partially renewed, or the mixture is technically faid to *fret*, whence the practice itfelf has derived the name of *fretting in.* Mixed wines appear to unite into one durable and homogeneous liquor, only in confequence of this fermentation. It is therefore defirable, if poffible, to mix wines only at thofe periods when they both fhew a tendency to *fretting*, which, according to Chaptal, in the wine countries, appears to be at three principal feafons of the year, *viz.* when the vines begin to fhoot, when they are in flower, and when the fruit begins to acquire colour. The wines being then proportioned according to the fancy or experience of the maker, a ftrong fermentation is excited, which is ftill farther affifted by agitation. The wine thus becomes homogeneous, and fhews no more tendency to farther change than if it had been originally produced by one operation; and the repetition of the proceffes of fining and racking renders it perfect.

In wine countries, particular wines, diftinguifhed either by their ftrength, harfhnefs, colour, or flavour, are often manufactured for mixing with others, and are applied according to circumftances. For making fuch wines, different fruit and peculiar management are often reforted to. The ufual faults of wines requiring correction are, *fweetnefs*, *drynefs* bordering on *acidity*, and excefs or defect of *brifknefs.* Connected alfo with this part of the fubject are the means of imparting to wine *colour*, *flavour*, and *ftrength*, and other remarkable properties. *Sweetnefs* arifes from the prefence of too much faccharine matter, and may be generally remedied by prolonging the fermentation. On the contrary, when the fermentation has been carried fo far as to decompofe the whole of the fugar, the wine is faid to be *dry;* and if the original quantity of fugar has been rather defective, it will have a ftrong tendency to become four. The remedy in this cafe is, to add fugar, or fometimes brandy. The modes of enfuring a due degree of *brifknefs* in thofe wines intended to poffefs this quality have been already pointed out.

Many of the proceffes followed in imparting *colour*, *flavour*, *ftrength*, &c. to wines, are unknown to the public, and confined to the cellars of the manufacturer or the merchant. The general principles, however, are fufficiently obvious. The *roughnefs* and *colour* of red wines are derived, as we formerly ftated, from the hufks of the fruit; and when it is wifhed to impart thefe qualities in a higher degree, the manufacturers fometimes mix a certain portion of wild and high-coloured grapes with the other fruit. At other times, various aftringent and coloured drugs are employed, as catechu, kino, logwood, &c.: popular ingredients are the juices of floes or elderberries. The chips of oak and beech-wood are alfo employed. With refpect to yellow tints, thefe can be all accurately imitated by means of burnt fugar. As to *flavours*, in general thofe which are foreign and unufual are commonly unpleafant. Cuftom, however, has reconciled us to many. The ancients, as formerly mentioned, feem to have been much more accuftomed to artificial flavours than the moderns, and the moft in requeft was the turpentine or refinous flavour, which was imparted by means of chips of fir-wood, a practice ftill followed in modern Greece. In Madeira wines, as well as thofe of Xeres and San Lucar, it is the practice at prefent to ufe fweet and bitter almonds; hence the *nutty* flavour of thefe wines. In Egypt, the flower of the vine itfelf has been employed from time immemorial, and is ftill ufed in different wine countries; its odour is very like that of mignonette, which may be doubtlefs fubftituted for it. Rafpberries, orris-root, elder-flowers, worm-wood, and a variety of other fubftances, are employed for a fimilar purpofe. In ufing thefe different articles, the eftablifhed practice is to fufpend the flavouring ingredients in the cafk a few days during the ftage of infenfible fermentation; by which means their flavour is retained without a chance of being diffipated. Where the *ftrength* of wine is deficient, brandy is added, according to circumftances; and to render the mixture of this more complete, it fhould be added while the procefs of infenfible fermentation is going on. If there be a neceffity to add it after the wine is completed, it fhould then be managed by the *fretting-in* procefs.

The laft of the circumftances connected with wine-making is the means of *obviating thofe difeafes* to which wines are liable.

One of the moft common difeafes of weak wines is *acidity.*

Strong

merely taken out, and the tartar removed; they are then washed well with warm water. If the casks have acquired a bad odour, Chaptal recommends to commit them to the flames; for though it may be possible to cover in some degree their bad odours, yet they are very likely to re-appear and spoil the wine.

The vessels being ready, the wine is introduced into them, for which purpose it is drawn off from the vat by a cock placed a few inches above the bottom into an open vessel, from whence it is conveyed to the casks. That portion of the wine resting immediately over the must is termed *surmont* in Burgundy. This is carefully defecated, as it constitutes the most delicate and palest of the wine. The liquor is drawn off till the head comes in contact with the *marc*. The head is then carefully removed, and the *marc* is subjected to repeated pressure. The wine thus farther obtained is usually mixed with the rest. That produced by the first pressure is strongest; that obtained by the last is usually more harsh and coloured. Sometimes, however, when it is the object to make vinegar, the *marc* is pressed but once. At other times, they keep the wine obtained by all the different pressures in separate casks. In Champagne they usually mix together the wines obtained by the different pressures, though they are known by different names. The wines obtained without any pressure, or a very slight one, they call *vins gris*; those obtained by the first and second pressure, *œil de perdrix*; those by the third, *vin de taille*, which are most coloured, though sufficiently agreeable.

The *marc* is employed in various ways in the different districts. Some submit it to distillation; others, especially in the vicinity of Montpellier, prepare verdigris from it; others vinegar. In some districts, they feed cattle with it; in others, they burn it for the sake of the potash it yields, &c.

Of the Management of the Wine in the Casks.—The wine receives its last degree of elaboration in the casks; this consists in a sort of fermentative process, to which the name of *insensible fermentation* has been applied. Almost immediately after the wine is introduced into the casks, a scum begins to be formed upon its top, and escapes by the bung-hole, which at first requires to be covered slightly only with a leaf or tile. In proportion as the fermentation subsides, the mass of wine diminishes in bulk; and they watch this cautiously, in order to supply its place from time to time with new wine, so as to keep the cask always full: this process is denominated in France *ouiller*, which may be rendered *filling up*. In some districts they *fill up* every day during the first month, every other day during the second, and every eight days afterwards, till the time of racking. This is the method they adopt with the wines of Hermitage. In Champagne they permit the *vins gris* to ferment in casks for ten or twelve days, and when the ebullition has ceased, they close the bung-hole, leaving, however, a small spigot-hole by its side, which is permitted to remain open for eight or ten days longer; after which they close this with a plug, in such a manner as to be able to open it at pleasure. When the bungs are introduced, they *fill up* every eighth day by the spigot, for twenty-five days. After this every fifteenth day, for one or two months; and finally, every two months during the whole time the wine remains in the cellar. When the season has been wet and unfavourable, and the wines want body, or when it has been dry and hot, and they are too rich, twenty-five days after they have been made, they roll the casks five or six times, in order to mix the grounds, and re-excite the fermentative process, and this they repeat every eighth day for a month.

The fermentation of the Champagne wines, which are designed to be brisk and sparkling, is very long and tedious. It is generally understood that they will be sparkling, provided they are bottled any time between the vintage and the following May, and that the nearer the vintage the brisker they will be. It is, however, generally taken for granted, that they will be sufficiently sparkling if bottled about the middle of March. Wines begin to sparkle in about six weeks after they have been bottled; those, however, produced on mountains become sparkling sooner than others. Wines bottled in June and July will be very little sparkling, and quite *still* if bottled so late as October and November.

In Burgundy, after the fermentation has relaxed in the cask, they put in a bung pierced with a small hole, in which they introduce a plug that can be easily removed at pleasure, in order to suffer the gas that may be extricated to escape. In the district of Bourdeaux, they begin to *fill up* eight or ten days after the wine has been introduced into the cask. A month after this they introduce the bung, and *fill up* every eight days. At first they bung the casks loosely, and then fasten them down by degrees, without running any risk. The white wines are racked and sulphured in December, and these require much more care than the red wines, from their containing more sediment, and their being more liable to become ropy. The red wines are not racked till towards February or March, and as these are much more apt to become sour than the white wines, they require to be kept in cooler cellars during the summer. There are some who, after the second racking, turn the casks so as to place the bung on one side; and thus the casks being hermetically sealed from there being no loss, there is no need of *filling up*. They then rack off annually, at any time of the year they find it convenient.

Methods nearly similar are adopted in other wine countries; hence it will be needless to repeat them. We shall, however, give a short account of the methods followed in the manufacture of *Port*, *Madeira*, and *Sherry*, the most popular wines of this country.

In *Oporto*, the complete fermentation of the must takes place in the vat. The wine is then introduced into large tuns, capable of holding twenty-five pipes each; and at this stage the brandy is added according to the judgment of the manufacturer.

In *Madeira*, the second or insensible fermentation is carried on in casks, and the wine is racked from them at the end of three or four months, at which time a portion of the brandy is added. The remainder is reserved to be mixed at the time of exportation.

In the manufacture of *Sherry*, the grapes are first slightly dried, and sprinkled with quick-lime. They are then wetted with brandy on being introduced into the press, and a portion of brandy is added to the must before the fermentation commences. The subsequent processes consist in repeated rackings at intervals of a month or two, till March, brandy being added at each racking.

The object of racking the wines is to separate the dregs consisting of tartar, &c. deposited from the wine, and which, if left, are liable to render it sour, by re-exciting from time to time the fermentation. The tendency to fermentation is counteracted by a process termed *sulphuring*, and the spontaneous separation of the dregs is rendered more complete by CLARIFICATION, which see. See also FINING and FORCING.

The *sulphuring* of wines consists in impregnating them with the vapours of burning sulphur, or sulphurous acid, and is generally effected by burning sulphur-matches in the casks. (See MATCHING.) These matches are made in different ways, aromatics being sometimes mixed with the sulphur; but the sulphur is the only useful and necessary ingredient.

Sometimes

Sometimes a wine highly impregnated with ſulphurous acid is prepared, a little of which mixed with the reſt anſwers the purpoſe of burning matches in the caſk. Other ſubſtances, according to Dr. Macculloch, anſwer the ſame purpoſe as *ſulphuring;* namely, the *black oxyd of mangneſe*, and particularly the *ſulphite of potaſh*. A drachm of which ſalt is ſufficient for a pipe of wine, and is very effectual in counteracting the fermentative proceſs. The theory of theſe proceſſes is very obſcure.

We have before obſerved that the mere racking of wines is not ſufficient to render them pure, and various methods are adopted at the racking periods to render this operation more effectual, and theſe altogether conſtitute the proceſs termed *clarification*.

Lord Bacon mentions a practice among the ancients of putting wine into veſſels well ſtopped, and letting it down into the ſea. That this practice is very ancient is manifeſt from the diſcourſe of Plutarch (Quæſt. Nat. 27.) about the efficacy of cold upon muſt.

Different periods, as before-mentioned, are choſen in different diſtricts for racking wines. Thus the wines of Hermitage are racked in March and September, thoſe of Champagne about the middle of October, the middle of February, and the latter end of March. If poſſible, a ſerene and ſettled ſtate of the atmoſphere, and a dry and cold day, ſhould be choſen for the purpoſe, as the wine is always turbid in damp cloſe weather, and during the prevalence of ſoutherly winds.

In racking wines, it is in general deſirable to expoſe them as little as poſſible to the atmoſpheric air. In ſome diſtricts, a ſyphon is employed for the purpoſe. In Champagne they uſe a ſort of pump. Dr. Macculloch recommends that the wine ſhould be transferred from one caſk to another by means of a leather hoſe, and this method is undoubtedly preferable. For clarifying wines, a great variety of ſubſtances are employed. Iſinglaſs and albumen either from eggs or blood are the moſt common; but gum, ſtarch, rice, milk, the ſhavings of beech-wood, gypſum, ſand, &c. are uſed in different wine countries. An ounce of iſinglaſs, or about eighteen or twenty whites of eggs, are ſufficient for one hundred gallons of wine.

Two very important circumſtances in the practice of wine-making require yet to be mentioned; theſe are the *medication* of wines, and the means of *remedying thoſe diſeaſes* to which they are liable.

The *medication* of wines conſiſts in altering the colour, the flavour, or the ſtrength of any given wine, or in ſo mixing two or more together, as to produce a compound differing from, or ſuperior to, either. It is difficult to give any general rules for this purpoſe, and the proper management of the proceſſes depends chiefly upon the experience and taſte of the maker.

It generally happens that when two wines are mixed, the fermentative proceſs is partially renewed, or the mixture is technically ſaid to *fret*, whence the practice itſelf has derived the name of *fretting in*. Mixed wines appear to unite into one durable and homogeneous liquor, only in conſequence of this fermentation. It is therefore deſirable, if poſſible, to mix wines only at thoſe periods when they both ſhew a tendency to *fretting*, which, according to Chaptal, in the wine countries, appears to be at three principal ſeaſons of the year, *viz.* when the vines begin to ſhoot, when they are in flower, and when the fruit begins to acquire colour. The wines being then proportioned according to the fancy or experience of the maker, a ſtrong fermentation is excited, which is ſtill farther aſſiſted by agitation. The wine thus becomes homogeneous, and ſhews no more tendency to further change than if it had been originally produced by one operation; and the repetition of the proceſſes of fining and racking renders it perfect.

In wine countries, particular wines, diſtinguiſhed either by their ſtrength, harſhneſs, colour, or flavour, are often manufactured for mixing with others, and are applied according to circumſtances. For making ſuch wines, different fruit and peculiar management are often reſorted to. The uſual faults of wines requiring correction are, *ſweetneſs*, *dryneſs* bordering on *acidity*, and exceſs or defect of *briſkneſs*. Connected alſo with this part of the ſubject are the means of imparting to wine *colour*, *flavour*, and *ſtrength*, and other remarkable properties. *Sweetneſs* ariſes from the preſence of too much ſaccharine matter, and may be generally remedied by prolonging the fermentation. On the contrary, when the fermentation has been carried ſo far as to decompoſe the whole of the ſugar, the wine is ſaid to be *dry;* and if the original quantity of ſugar has been rather defective, it will have a ſtrong tendency to become ſour. The remedy in this caſe is, to add ſugar, or ſometimes brandy. The modes of enſuring a due degree of *briſkneſs* in thoſe wines intended to poſſeſs this quality have been already pointed out.

Many of the proceſſes followed in imparting *colour*, *flavour*, *ſtrength*, &c. to wines, are unknown to the public, and confined to the cellars of the manufacturer or the merchant. The general principles, however, are ſufficiently obvious. The *roughneſs* and *colour* of red wines are derived, as we formerly ſtated, from the huſks of the fruit; and when it is wiſhed to impart theſe qualities in a higher degree, the manufacturers ſometimes mix a certain portion of wild and high-coloured grapes with the other fruit. At other times, various aſtringent and coloured drugs are employed, as catechu, kino, logwood, &c.: popular ingredients are the juices of ſloes or elderberries. The chips of oak and beech-wood are alſo employed. With reſpect to yellow tints, theſe can be all accurately imitated by means of burnt ſugar. As to *flavours*, in general thoſe which are foreign and unuſual are commonly unpleaſant. Cuſtom, however, has reconciled us to many. The ancients, as formerly mentioned, ſeem to have been much more accuſtomed to artificial flavours than the moderns, and the moſt in requeſt was the turpentine or reſinous flavour, which was imparted by means of chips of fir-wood, a practice ſtill followed in modern Greece. In Madeira wines, as well as thoſe of Xeres and San Lucar, it is the practice at preſent to uſe ſweet and bitter almonds; hence the *nutty* flavour of theſe wines. In Egypt, the flower of the vine itſelf has been employed from time immemorial, and is ſtill uſed in different wine countries; its odour is very like that of mignonette, which may be doubtleſs ſubſtituted for it. Raſpberries, orris-root, elder-flowers, worm-wood, and a variety of other ſubſtances, are employed for a ſimilar purpoſe. In uſing theſe different articles, the eſtabliſhed practice is to ſuſpend the flavouring ingredients in the caſk a few days during the ſtage of inſenſible fermentation; by which means their flavour is retained without a chance of being diſſipated. Where the *ſtrength* of wine is deficient, brandy is added, according to circumſtances; and to render the mixture of this more complete, it ſhould be added while the proceſs of inſenſible fermentation is going on. If there be a neceſſity to add it after the wine is completed, it ſhould then be managed by the *fretting-in* proceſs.

The laſt of the circumſtances connected with wine-making is the means of *obviating thoſe diſeaſes* to which wines are liable.

One of the moſt common diſeaſes of weak wines is *acidity*. Strong

Strong wines, for obvious reafons, feldom become four. When acidity is prefent only in a very flight degree, it may be palliated confiderably by fugar, or by the addition of muft concentrated by boiling. It is obvious, however, that the acid can only be got rid of by neutralizing or deftroying it. For this purpofe, the alkalies and alkaline earths have been employed, but they impart a difagreeable flavour to the wine. Of thefe fubftances, lime is the fafeft and beft. It was formerly the practice to employ lead, in fome form or other, for counteracting acidity in wines; but we truft that this murderous practice has been long fince laid afide. *Ropinefs* is another difeafe to which wines are liable. This occurs more particularly in thofe which contain a good deal of extractive matter. It may be much relieved, and fometimes cured, by expofing the bottles to the fun and air, by agitating and fubfequently uncorking them, by adding a fmall quantity of vegetable acid, and by fining. The laft difeafe we fhall notice is perhaps the moft formidable of any, namely, a *muftinefs*, or other *ill-flavour* communicated by the cafk or cork. This appears to be, in general, abfolutely incurable, though it may be fometimes diminifhed by agitating the wine in contact with the air, or by the introduction of common air or carbonic acid by pumping. Such is a fummary account of wine-making from grapes, as practifed in the countries where that delicious fruit comes to perfection, and more efpecially in France. (See Birch's Hift. of the Royal Society, vol. i. p. 156.) We come now to confider,

2. *The Manufacturing of Wines from other Fruits, or artificial Wines.*—In the above fketch we have endeavoured to prefent our readers with a general view of the principles of wine-making, at the fame time that we defcribed the practice. Thefe principles are equally applicable to the manufacture of wine from all forts of fruit; we fhall therefore take the prefent opportunity of briefly recapitulating them here, as they cannot be too ftrongly impreffed upon the memory, and as they at the fame time conftitute the moft appropriate introduction to the prefent fection that occurs to us.

The juice of the grape confifts of a large proportion of water, holding in folution certain proportions of *faccharine matter*, of the *fweet* or *fermenting principle*, which appears to be a modification of the faccharine principle, of *various acids*, efpecially the tartaric and malic, and of various ill-defined *extractive matters*. Thefe principles, left to themfelves for a fhort time in a medium temperature, foon begin to re-act upon one another, and fome of them at length undergo remarkable changes. This procefs is termed *fermentation*, and conftitutes the grand principle of wine-making. When this procefs has begun to fubfide, it will be found that the greater portion of the faccharine principle has difappeared, and that its place is fupplied by a correfponding portion of ardent fpirit or alcohol. This is the moft ftriking feature of the change that has taken place, but all the other principles of the juice or *muft* appear to have undergone likewife fome change either in quality or quantity. In fhort, the fweet and crude *juice* of the grape is found to be converted into *wine*.

In this ftate, the *wine* is introduced into cafks, where it undergoes further changes, and is matured by a modification of the fermentative procefs, which has been called the *infenfible fermentation*. This is a moft important ftep in the procefs of wine-making, as by different modes of management in this ftage almoft the whole of that infinite variety which exifts among wines is produced. Here alfo it is that all foreign fubftances defigned to impart flavour, &c. to wines are in general introduced with the greateft propriety. When the *infenfible fermentation* has been carried to the point defired, it is checked by the proceffes of *racking*, *fulphuring*, *clarification*, &c.; and thus the wine is rendered capable of being preferved at any point or ftate we choofe.

Let us now apply thefe principles to the manufacture of wines from other fruits.

We ftart upon the grounds that artificial wines are intended to be imitations of wines prepared from grapes. In the firft place, therefore, we have to prepare a juice or muft fimilar to the juice or muft of the grape in its general compofition. Now, no fruit whatever yields a juice precifely fimilar to that of the grape. In our northern climate more efpecially, the faccharine principle, which is the fundamental principle in wine-making, exifts in very minute proportion in moft fruits. It muft be, therefore, fupplied artificially. The tartaric acid, or rather *tartar*, which appears to be another effential principle in wine-making, is likewife wanting in moft of our fruits. This, therefore, muft be fupplied. On the contrary, other principles, and particularly the malic acid, appear to exift in too large a proportion in moft of our fruits, which, in their natural ftate, are thus better adapted for making *cyders* than wines. To get rid of the malic acid, and to prevent its deteriorating effects, as well as the deteriorating effects of other foreign principles, is difficult, or perhaps impoffible; and this will doubtlefs always render artificial wines in general inferior to thofe of the grape, though very near approaches may be made by judicious management.

The practical mode of obviating thefe difficulties is to dilute the juice of the fruit to fuch a degree, that a given quantity of it when diluted fhall contain no more of the malic acid, for example, than a given quantity of the juice of the grape; and, as before obferved, to fupply artificially the two grand principles, fugar and tartar, which are wanting. Having thus prepared an artificial muft, as nearly refembling in its compofition that of the grape as poffible, the application of the other principles will be obvious, as we have nothing to do but to manage, in general, all the fubfequent proceffes precifely as if we were operating upon the muft of the grape. We fhall now, therefore, defcend from generals to particulars, and, after having made a few remarks upon our native fruits, endeavour to point out the modes in which the more important foreign wines may be beft imitated by them.

Fancy or caprice has led to the formation of wine from an infinite variety of fubftances, and almoft every good houfewife boafts of fome favourite *receipt* for making wines from what nature never intended for the purpofe. Such compounds hardly deferve the name of *wine*; we fhall, therefore, principally confine our attention to *fruits*. The following are the domeftic fruits moft ufually employed for the purpofe:

Goofeberry, and three varieties of currant.
Strawberry, rafpberry, blackberry, mulberry.
Sloe, damfon, elderberry.
Quince, cherry.
Britifh *grapes*.

To them may be added the foreign fruits

Raifins.
Orange, lemon.

The goofeberry and currant are of all others the fruits moft commonly employed for the fabrication of artificial wines; and, perhaps, upon the whole, they are beft adapted for the purpofe. When ufed in their green ftate, both goofeberry and currant may be made to form light brifk

brifk wines, falling little fhort of Champagne. Ripe goofeberries are capable of making fweet or *dry* wines; but thefe are commonly ill-flavoured, particularly if the hufk has not been carefully excluded. Ripe currants, if properly managed, make much better wines than goofeberries. Thefe fruits are much improved, according to Dr. Macculloch, by boiling previoufly to fermentation. This, he ftates, is particularly the cafe with the black currant, which, when thus managed, is capable of making a wine clofely refembling fome of the beft of the fweet Cape wines.

The ftrawberry and rafpberry are capable of making both *dry* and fweet wines of agreeable quality. As commonly managed, however, their peculiar flavour is diffipated in the procefs; hence, as Dr. Macculloch obferves, little is gained by their ufe to compenfate for their comparatively high price. A fimple infufion of thefe fruits, in any flavourlefs currant wine during the period of infenfible fermentation, will, with greater cheapnefs and certainty, enfure the production of their peculiar flavour. The blackberry and mulberry are capable of making coloured wines, if managed with that view: they are deficient, however, in the aftringent principle; neverthelefs, they may be occafionally employed with advantage when a particular object is to be gained.

The floe and damfon are fo affociated in qualities, that nearly the fame refults are obtained from both. Their juice is acid and aftringent; and hence they are qualified only for making *dry* wines. By a due admixture of currants or elderberries with floes or damfons, wines not much unlike the inferior kinds of port are often produced. The elderberry is capable of making an excellent red wine. Its cheapnefs alfo recommends it. It does not, indeed, poffefs any great degree of flavour, but it poffeffes no bad one, which is a negative property often of great importance in artificial wine-making.

The quince, from its analogy to the apple and pear, is better qualified for making a fpecies of cyder than wine. The cherry produces a wine of no very peculiar character. If ufed, care fhould be taken not to bruife too many of the ftones, otherwife a difagreeable bitter tafte will be imparted to the wine.

Grapes of Britifh growth are capable of making excellent fparkling and other wines, by the addition of fugar. Dr. Macculloch informs us, that he has fucceeded in making wines from immature grapes and fugar fo clofely refembling Champagne, Grave, Rhenifh, and Mofelle, that the beft judges could not diftinguifh them from foreign wines. The grapes may be ufed in any ftate, however immature; when even but half grown and perfectly hard they fucceed completely.

The cottagers in Suffex, fays Dr. Macculloch, are in the habit of making wine, almoft annually, from the produce of vines trained on the walls of their houfes. Many individuals through various parts of the fouthern counties, and even as far north as Derbyfhire, practife the fame with fuccefs. But the experiment is well known to have been made for many years on a large fcale, and with complete refults, at Pain's-hill, by the Hon. Charles Hamilton, in a fituation with refpect to foil and expofure of which parallel inftances are to be found throughout the country, and produced from land of no value whatever for the ordinary purpofes of agriculture. That our anceftors made wine from the produce of their vineyards there can be no doubt, and Dr. M. juftly remarks, that we can ftill make by far better wine from our grapes, even as produced at prefent, than from any other fruit whatever. Thefe, therefore, are cogent reafons for the cultivation of the vine, efpecially as, the fame gentleman obferves, we might, with care, inure and domefticate to our climate many of the richer and more delicate varieties of fouthern latitudes. See VINE, and VARIETIES; under the laft of which articles fome interefting experiments on this fubject are related.

Raifins are extenfively ufed in this country for making domeftic wines, and alfo for the fraudulent imitation and adulteration of foreign wines, although not a native fruit; therefore they deferve to be mentioned here. When properly managed, they are capable of making a pure and flavourlefs vinous fluid, well adapted for receiving any flavour which may be required, and thus of imitating many wines of foreign growth. See the clofe of this article.

The orange and lemon are likewife ufed for making domeftic wines. Upon the whole, however, they are not very well adapted for the purpofe, as they contain too much acid, and too little of the extractive and of the fweet or fermentative principle.

From what has been faid of the manufacture of wine from grapes, our readers will obferve, that different methods are purfued, according to the kind of wine which it is intended to make. Now thefe remarks are equally applicable to artificial wines, in the manufacture of which it is abfolutely neceffary that the maker fhould determine beforehand upon the kind of wine which it is his object to produce, and to modify his proceffes accordingly. We may, with Dr. Macculloch, confider wines as of four general defcriptions: *fweet* wines; *fparkling* or *effervefcing* wines; *dry* and *light* wines, analogous to hock, grave, and Rhenifh, in which the faccharine principle is entirely decompofed during fermentation; and laftly, *dry* and *ftrong* wines, as Madeira and fherry.

Thofe of the firft and moft fimple clafs are the *fweet* wines, or thofe in which the fermentative procefs has been incomplete. It is to this clafs that by far the greater number of our artificial wines bear the greateft refemblance; a refemblance, fays Dr. M., fo general as to fhew that few makers of this article poffefs fufficient knowledge of the art to enable themfelves to fteer clear of what may be firmly called the radical defect of domeftic wines. *Sweet* wines may be made from almoft any ripe fruits. Thofe moft generally employed, however, are the goofeberry and currant. We fhall fuppofe that we wifh to make the quantity of ten gallons of fweet wine from one or other of thefe fruits. For this purpofe, the following are the proportions and other circumftances to be attended to. Forty pounds of fruit are to be introduced in a clean and fufficiently capacious tub, in which it is to be bruifed in fucceffive portions, by a preffure fufficient to crufh the berries without breaking the feeds, or if goofeberries be employed, without materially compreffing the fkins. Four gallons of water are then to be poured into the veffel, and the contents are to be carefully ftirred and fqueezed in the hand until the whole of the juice and pulp are feparated from the folid matters. The materials are then to be permitted to remain at reft for a period of from fix to twenty-four hours, when they are to be ftrained through a coarfe bag by as much force as can be conveniently applied to them. One gallon of frefh water may afterwards be paffed through the *marc*, for the purpofe of removing any foluble matter which may have remained confined. From thirty to forty pounds of fugar, according to the defired ftrength and fweetnefs of the wine, and about fix ounces of cream of tartar, or, what is better, crude tartar, are now to be diffolved in the juice thus procured, and the total bulk of the fluid made up with water, to the amount of ten gallons and a half.

The liquor thus obtained is the artificial *muft*, which is equivalent

equivalent to the juice of the grape. It is now to be introduced into a tub of fufficient capacity, which is to be well covered, and placed in a temperature varying from 55° to 60°. Here it is to remain two or three days, more or lefs, according to the fymptoms of fermentation which it may fhew, and from this tub it is to be drawn off into the cafk, where the fermentative procefs is intended to be brought to the point defired. As the fermentative procefs proceeds the bulk of the liquor diminifhes, and its place muft be fupplied from time to time by the fuperfluous portion of muft made for the purpofe, fo as to keep the liquor always near the bung-hole. When the fermentation has fubfided a little, the bung may be driven in, taking care, however, to leave a fmall hole open by its fide, which may be ftopped with a peg, and opened occafionally to give vent to any air that may be generated.

When the wine has arrived at the defired point of fweetnefs, &c. it muft be racked and clarified in the manner defcribed in the former part of this article; and thefe proceffes muft be repeated, and the cafks fulphured, if neceffary, in order to prevent the fermentative procefs from proceeding farther. In general, however, one racking in the following December or January will be fufficient, after which it may be kept in the cafk for any length of time, or it may be bottled without the ufual precautions. A fine ferene and cold day fhould be chofen for thefe operations. Sometimes the fermentative procefs will ftop before the wine has arrived at the defired point, in which cafe it may be commonly eafily re-excited by raifing the temperature, and fhaking the cafk; or, if thefe fail, by having recourfe to the means formerly defcribed for that purpofe.

By attending to thefe general directions, fweet wines may be made from other fruits, care being taken to increafe or diminifh the quantity of fugar according to the natural fweetnefs of the fruit employed.

The fecond general defcription of wines comprehends the *brifk* or *fparkling* wines; which may be, at the fame time, either *fweet* or comparatively *dry*. Our readers will recollect the methods adopted in Champagne, and other countries where they manufacture fparkling wines from the grape, and which are defcribed in the former part of this article. Now thefe principles are to be held in view in the manufacture of artificial wines intended to poffefs fimilar properties. The fruits moft generally employed for forming wines of this defcription, are the immature goofeberry and currant; fometimes alfo immature grapes, and even vine leaves are made ufe of for a fimilar purpofe, but grapes are doubtlefs preferable when they can be procured. Wines of this defcription are more difficult to be made than the laft, at leaft they require much more care. If goofeberries are employed, they muft be gathered when they have nearly attained their full growth, but before they have fhewn the leaft tendency to ripen. The variety of goofeberry is perhaps indifferent, but it will be advifable to avoid the ufe of thofe, which in their ripe ftate have the higheft flavour. Dr. Macculloch recommends the *green bath* as among the beft. Thofe which are unfound, as well as the remains of the bloffom and footftalk, fhould be carefully removed. Forty pounds of this fruit, thirty pounds of fine white fugar, and about fix ounces of tartar, are fufficient for making ten gallons of wine. All the preliminary proceffes are to be conducted precifely in the fame manner as thofe above-defcribed for making fweet wines. The *muft*, however, ought to remain in the fermenting tub for about twenty-four hours, or two days only, when it is to be transferred to the cafk, and the proceffes of *filling up*, &c. managed as before, except that the wooden peg or fpile muft be permanently tightened as foon as the danger of burfting the cafk has fubfided. The wine thus made may commonly remain during the winter in a cool cellar, as it is no longer neceffary to excite the fermenting procefs. To enfure its finenefs, however, it is a good practice to draw it towards the end of December into a frefh cafk, fo as to feparate the lees; and if at this time it fhould prove too fweet, inftead of decanting, it will be better to ftir up the lees fo as to renew the fermenting procefs, taking care alfo to increafe the temperature at the fame time. At whatever time the wine has been decanted, it is to be fined with ifinglafs in the ufual manner. Sometimes it will be neceffary to decant it a fecond and even a third time into a frefh cafk. All thefe operations fhould take place, as formerly mentioned, in dry cool weather, and the wine muft, at any rate, be finally bottled in March. If immature currants be employed, which are perhaps upon the whole preferable to goofeberries, the fame proportion of fruit, fugar, and tartar, and the fame modes of management, may be had recourfe to; care being taken to feparate carefully the ftalks of the currants. If grapes be ufed for the purpofe, they may be fafely taken of different degrees of ripenefs, nor is it neceffary to attend to the felection of any particular variety. The fame proportions of fruit and fugar will be proper as when goofeberries and currants are employed, but the tartar muft be omitted. The hufks alfo may be permitted to ferment with the liquor in the vat. The fubfequent management is to be precifely the fame as that defcribed above. An excellent wine of the prefent defcription may be made from the leaves and tendrils of the vine. About forty pounds of thefe, and twenty-five or thirty pounds of fugar, will be fufficient for ten gallons of wine. To prepare it, feven or eight gallons of boiling water are to be poured upon the leaves in a tub, and permitted to remain for twenty-four hours. The liquor being poured off, the leaves muft be ftrongly preffed, and fubfequently wafhed with another gallon of water. The fugar and the remainder of the water are then to be added, and the fermentative and all the fubfequent proceffes conducted precifely the fame as before. The prefent clafs of wines, if the procefs has been fuccefsful, (which is not always the cafe,) is brifk, and precifely fimilar in their qualities (flavour excepted) to the wines of Champagne, with the ftrength of the beft Sicily.

The third variety of wines is that of which hock, grave, and Rhenifh may be taken as examples. In thefe the faccharine principle is entirely overcome by a complete fermentation, while their future change is prevented by a careful application of the proceffes laid down for the prefervation of wines of this clafs. Makers of domeftic wines have rarely, fays Dr. Macculloch, fucceeded in imitating thefe wines. The reafons obvioufly are, the great difproportion of the fugar to the fubfequent fermentation in the firft inftance; and that want of the after-management, the neglect of which foon configns thefe wines to the vinegar cafk, if chance fhould even at firft have produced fuccefs. In making thefe wines, the relative proportion of fruit and fugar in common ufe muft be materially altered, and the fermentative procefs be conducted in a very careful manner. The fubfequent proceffes alfo of racking, fulphuring, and fining, muft be practifed with great affiduity, in order to preferve thefe wines after we have fucceeded in making them. Dr. Macculloch ftates, from his experience, that thefe wines may be fuccefsfully imitated, and that they conftitute fome of the very beft of thofe which can be made from domeftic fruit. The proportion of fruit (generally of immature fruit) to the fugar, in the manufacturing of fweet wines, muft be the greateft. The bung muft remain open, but the fluid within muft not be allowed to efcape, while, if the fermentation proceeds

ceeds languidly, it muſt be accelerated by heat and agitation. If, when it is finiſhed, the wine continues too ſweet, it may be bunged down till the ſpring without racking or fining, when the fermentation muſt again be renewed. The renewal of the fermentation may alſo be effected by adding ſome freſh juice of the ſame fruit. At whatever time, and under whatever of theſe proceſſes, it has become *dry*, it is to be carefully fined and racked into a ſulphured caſk, and bottled, after being once more carefully fined.

The fourth and laſt claſs of wines conſiſts of thoſe which are both dry in their quality, and ſtrong in their nature; ſuch are, Madeira, ſherry, &c.; the theory of theſe, from what has been ſaid, will be ſufficiently apparent. With due attention to the fermentative proceſs, ſuch wines may be made of the requiſite degree of ſtrength without brandy. By means of this, however, if managed as formerly directed, the operator has it always in his power to produce wines of any required degree of ſtrength.

We need not here repeat the methods of imparting different flavours to domeſtic wines, or of correcting their faults, ſince they differ in no reſpect from thoſe recommended to be adopted in the manufacture of wines from grapes, to which therefore we refer.

The following general remarks upon the fabrication of domeſtic wines, will not perhaps prove unintereſting to our readers.

The great radical defect in the manufacture of domeſtic wines, is uſing too ſmall a proportion of fruit compared with the ſugar employed. It is this circumſtance chiefly which renders the fermentative proceſs incomplete, and thus imparts that ſweet and mawkiſh taſte to our domeſtic wines, which renders them intolerable to many people, and even to all, perhaps, without the addition of brandy. The proportions of fruit and ſugar given above may be conſidered as mean ſtandards, which may be varied either way, according to circumſtances and the nature of the wine intended to be produced. A very ſuperior claſs of fruit wines may be manufactured by uſing the juices of our different fruits, either alone or very ſlightly diluted with water.

We mentioned that ſome fruits, and eſpecially the black currant, were much improved by boiling. For this purpoſe, it will be ſufficient that the fruit be ſimply brought to the boiling point before uſing it, the water in the veſſel being ſo managed as to avoid any riſk in burning. The black currant thus treated, and ſubſequently managed upon the principles we have endeavoured to lay down, is capable of making a wine very nearly reſembling ſome of the beſt ſweet Cape wines.

The fermentative proceſs being rendered tardy and incomplete, by the improper adjuſtment of the ſugar to the fruit, is frequently endeavoured to be excited by *yeaſt:* nothing can be more injudicious than this. *Yeaſt* invariably ſpoils wines, by imparting to them a flavour that nothing will ever overcome. The only ferment to be employed in wine-making, is that furniſhed by nature; and when this is defective, as is ſometimes the caſe in our domeſtic fruits, the ferment of the grape muſt be ſupplied artificially. This may be done by introducing a certain proportion of *crude tartar*, the doſe of which may vary from one to ſix *per cent.* without materially affecting the wine, as a great proportion of what eſcapes decompoſition will be ſubſequently depoſited. All fruits, except the grape, will require more or leſs of *tartar*.

The laſt circumſtance we ſhall notice is the introduction of *brandy*, or other ſpirit, into domeſtic wines. As commonly manufactured, they often require, as we have juſt ſtated, this addition to render them tolerable. We truſt, however, that from the attention that has been lately paid to the ſubject of artificial wines, the modes of manufacturing them will be better underſtood, and that this will no longer be the caſe. Fine wines are invariably ſpoiled by the addition of ardent ſpirit, which ſeems to have the effect of ſlowly decompoſing them, and thus of deſtroying that delicate, lively, and briſk flavour, ſo eminently poſſeſſed by all natural wines. Hence it is ſeldom or never uſed in wine countries; or rather it is confined to the manufacture of thoſe wines deſtined for this country, where only this barbarous practice is tolerated. We again repeat, that if the fruit and ſugar be duly adjuſted to one another, and the fermentative proceſs be properly managed, an infinitely better wine will be produced without the uſe of brandy, than can ever be produced with it.

General Chemical Properties and Compoſition of Wines.—The juice of the grape, as we formerly mentioned, conſiſts of a large proportion of water, of certain proportions of the ſaccharine and fermentative principles, of various acids, eſpecially the tartaric, and ſome ill-defined extractive principles. Theſe were ſtated during the fermentative proceſs to undergo different remarkable changes, one of the moſt important of which is the converſion of the ſaccharine principle into alcohol. The nature of the other changes are not ſo well underſtood, nor does the little we know at preſent of the compoſition of wines throw any very ſatiſfactory light upon the ſubject. One principle indeed, *viz.* the fermentative principle, does not exiſt in perfect wines, and therefore muſt be decompoſed or ſeparated during the proceſs of fermentation. The principles formed in wines may perhaps be arranged under the four following heads: 1. *Acids;* 2. *Extractive and colouring matters;* 3. *Eſſential oils;* and 4. *Alcohol.* Water is not mentioned, becauſe it forms the baſis of all potable fluids, and conſequently of wines.

1. *Acids.*—All acids have the property of reddening turnſole or litmus papers, and therefore contain more or leſs of a free acid. The acids found in wines are, the tartaric, the malic, the citric, the carbonic, and occaſionally the acetic.

The tartaric acid, in combination with potaſh, or *tartar*, as it is uſually termed, exiſts in great abundance in the juice of grapes, as formerly ſtated, and appears to be one of its moſt important ingredients. A large proportion of this tartar is doubtleſs decompoſed during the fermentative proceſſes, and a conſiderable quantity of what remains is ſubſequently depoſited in the caſks or veſſels in which the wine is kept, conſtituting what is termed the *cruſt.* It appears probable, however, that the whole is not ſeparated, and conſequently, as Dr. Thomſon juſtly remarks, that wines are never entirely deſtitute of tartar. Satiſfactory experiments, however, upon an extenſive ſcale, are at preſent wanting upon this part of the ſubject. The malic acid, according to the experiments of Chaptal, exiſts in the greater number of wines, if not in all, and that in much greater proportion than any other acid. If this be really the caſe, it is probably, in part at leaſt, a product of fermentation, for the juice of grapes appears to contain very little of this acid. Traces of the citric acid were found by Chaptal to exiſt in ſome wines. This acid alſo exiſts in the juice of the grape, but in ſmall quantity. All wines that have the property of efferveſcing, or ſparkling, when poured from the bottle into a glaſs, contain carbonic acid. Champagne, for example, owes its characteriſtic properties to this acid. Sparkling wines are uſually weak, and contain leſs alcohol than uſual, for reaſons that have been already explained. The acetic acid is not an eſſential ingredient of wine, nor in fact ought it ever to exiſt in it. If the

the fermentation, however, be permitted to go too far, this acid will be formed, and hence it occafionally occurs in inferior wines.

2. *Extractive and colouring Matters.*—Thefe ill-defined fubftances exift more or lefs in all wines. Their properties, however, are not well afcertained, nor are they probably uniformly the fame in every inftance. They have a tendency to feparate fpontaneoufly, and along with the tartar form what is termed the *cruft;* hence, as wines become older, from their containing lefs of thefe matters, they ufually become paler. Thefe extractive matters may be alfo feparated artificially by means of animal charcoal, the fubacetate of lead, and even partially in fome inftances by lime-water, or the heat of the fun. The colouring matter, as we formerly noticed, is not derived from the juice of the grape, but from its hufk.

3. *Effential Oils.*—Wines, though effentially the fame in their general compofition, are diftinguifhed from one another principally by their flavour and odour, no lefs than by the proportion of alcohol they may contain. Now their fenfible properties evidently depend upon fome volatile and fugacious principle, which has been confidered to be analogous to an effential oil. This principle is fometimes derived immediately from the fruit, as, for example, in the wines made from the Frontignac and Mufcat grape. At other times, it is the product of fermentation. Thus the finer flavours of claret, hermitage, and Burgundy, bear no refemblance to thofe of the grapes, from whence they are formed. Very often, as before ftated, the principles of odour and flavour are communicated to wines artificially, by the introduction of foreign ingredients, as orris-root, grape, and elder-flowers, mignonette, &c. The menftruum of this volatile principle is doubtlefs, in moft inftances, the alcohol contained in wines; but its quantity is fo minute as to be incapable of feparation.

4. *Alcohol.*—The characteriftic ingredient of wines is alcohol. Indeed, wines may be confidered as more or lefs dilute folutions of alcohol, impregnated with different flavouring fubftances, and a little acid. There have been great differences of opinion in what ftate alcohol exifts in wines. Some chemifts maintain, that alcohol does not exift ready formed in wines, but that its elements only exift in a peculiar ftate, and that their union is determined, and confequently alcohol formed, by the act of diftillation. This opinion was advanced by Fabroni, and feems to have been adopted by fome fubfequent writers. Mr. Brande, however, has fhewn by very decifive experiments, that all wines contain alcohol ready formed, and that this fluid is merely feparated during the diftillation of thefe liquors; and his experiments have been fince fully confirmed by Gay Luffac.

The following Table, reprefenting the Quantity of Alcohol and other Principles in different Wines, is taken from Dr. Thomfon's Chemiftry, though it was compiled originally by Neumann. The refults are not abfolutely to be relied upon, as the ftate of chemical Knowledge, at the time Neumann wrote, was very imperfect.

The

The following Table has been given by Mr. Brande, repreſenting the quantity by meaſure of alcohol, ſp. gr. .825, contained in different wines, and other fermented liquors. The wines were all genuine.

	Proportion of Spirit *per Cent.* by Meaſure.
1. Liſſa	26.47
Ditto	24.35
Average	25.41
2. Raiſin wine	26.40
Ditto	25.77
Ditto	23.20
Average	25.12
3. Marſala	26.30
Ditto	25.05
Average	25.09
4. Port	25.83
Ditto	24.29
Ditto	23.71
Ditto	23.39
Ditto	22.30
Ditto	21.40
Ditto	19.00
Average	22.96
5. Madeira	24.42
Ditto	23.93
Ditto (Sercial)	21.40
Ditto	19.24
Average	22.27
6. Currant wine	20.55
7. Sherry	19.81
Ditto	19.83
Ditto	18.79
Ditto	18.25
Average	19.17
8. Teneriffe	19.79
9. Colares	19.75
10. Lacryma Chriſti	19.70
11. Conſtantia white	19.75
12. Ditto red	18.92
13. Liſbon	18.94
14. Malaga kept ſince 1666	18.94
15. Bucellas	18.49
16. Madeira red	22.30
Ditto	18.40
Average	20.35
17. Cape Muſchat	18.25
18. Cape Madeira	22.94
Ditto	20.50
Ditto	18.11
Average	20.51

Average	13.37
40. Frontignac	12.79
41. Cote Rotie	12.32
42. Gooſeberry wine	11.84
43. Orange wine (average of ſix ſamples made by a London manufacturer)	11.26
44. Tokay	9.88
45. Elder wine	8.79

Other fermented Liquors.

1. Cyder, higheſt average	9.87
Ditto, loweſt average	5.21
2. Perry, average of four ſamples	7.26
3. Mead	7.32
4. Ale (Burton)	8.88
Ditto (Edinburgh)	6.20
Ditto (Dorcheſter)	5.56
Average	6.87
5. Brown ſtout	6.80
6. London porter (average)	4.20
Ditto ſmall beer (ditto)	1.28
7. Brandy	53.39
8. Rum	53.68
9. Gin	51.60
10. Scotch whiſkey	54.32
11. Iriſh ditto	53.90
12. Hollands (genuine)	56.00

On the Uſes of Wine in a Dietetic and Medicinal Point of View.—Mankind in every ſtage of civilization and ſociety betray a propenſity for fermented liquors. This indeed is ſo ſtrongly marked, that ſome have been induced to conſider it as the reſult of an inſtinctive faculty, and conſequently have been led to ſuppoſe that fermented liquors are the proper and natural drink of the human race. Others, on the contrary, have contended that fermented liquors are of no real uſe to mankind, and are often even productive of much poſitive

positive evil, and hence have arrived at a conclusion diametrically opposite to the former. It is difficult to decide between these opinions. We confess, however, that we do not think it necessary, on the one hand, to have recourse to the supposition of an instinctive faculty to account for wine-drinking; nor, on the other, do we believe that the moderate use of natural wines is productive of any bad effects. The propensity for strong drinks seems explicable upon the general principle that all animals feel a pleasure in *living faster*, or, as it were, crowding a greater portion of existence into a shorter space than natural; an effect in some degree produced by the exciting effects of such liquors. As to the bad effects too frequently produced by fermented liquors, they may, in almost every instance, be fairly traced to the badness of their quality, or to an excess in quantity.

While, however, we do not object to the moderate use of what providence has so liberally bestowed upon us, no one can object more strongly than ourselves to its abuse. The melancholy effects of habitual intoxication are too well known to require particular description here. Severely do the victims of this degrading propensity suffer in mind, body, and fortune; nor are their sufferings confined to themselves, but entailed upon their ill-fated posterity. For proofs of these positions, we refer our readers to the articles Gout, Calculus, Apoplexy, Epilepsy, Insanity, &c. &c. in this work, where they will find these and other diseases justly ranked among the most painful and distressing to which humanity is liable, frequently ascribed to habitual intemperance as their cause.

But putting out of the question these effects of drunkenness, what a horrible picture of moral depravity does it present for a man to sit down deliberately, day after day, with the professed object of annihilating his intellectual faculties, and thus degrading himself below the vilest of the brute creation! And even supposing he has arrived at the *enviable point* of being able to swallow two or three bottles without losing his senses, and that this quantity has become necessary to his comfort, nay even perhaps to his very existence, to what a wretched state of dependence has he reduced his bloated carcase; what a tax is such a being upon society, who, to prolong a loathsome existence, is obliged to consume daily in an unnecessary superfluity more than is sufficient to support a whole family for a week! See Drunkenness.

With respect to the operation of different wines upon the animal economy, they vary exceedingly according to their properties. New wines in general are unwholesome, and often prove purgative. Sweet wines are upon the whole perhaps the most wholesome, and, where the taste has not been previously vitiated, doubtless the most agreeable. Weak and acid wines are very apt to disagree with the stomach, especially when that organ has been accustomed to stronger wines. Hence an occasional debauch with such wines is notorious for inducing a fit of the gout, especially in this country, where the usual wines are immoderately strong. The same is true also, though perhaps in a somewhat less degree, with the effervescing wines. Red wines, in general, are of a more astringent and tonic nature than white wines, and commonly contain more spirit. There are, however, many exceptions to this rule.

It will be seen by consulting the above table, that port, Madeira, and sherry, the three wines in most common use in this country, contain from one-fourth to one-fifth of their bulk of alcohol. A person, therefore, who takes his bottle of wine every day, will thus take nearly half a pint of alcohol, or almost a pint of pure brandy! This at first sight will appear almost incredible, especially as the same person would not perhaps be able to take a similar quantity of ardent spirit, either diluted with water, or in any other way. Some have concluded from this circumstance that the above experiments are not to be relied upon; but from the manner in which they were conducted there is no reason to doubt their general accuracy; the fact therefore remains to be explained. The most probable explanation is, that the alcohol in the wine is in some state of combination, which prevents its immediate action upon the stomach, and thus renders it liable to be digested or altered in its properties before it can exert its specific effects. The peculiar nature, however, of this state of combination is at present unknown. What renders this opinion the more probable is, that some bad wines, and especially domestic wines, which are often little better than mere mixtures of brandy and water, exert much more effect upon the animal economy than fine old wines, though they may not contain nearly so much spirit.

With respect to the *medicinal* uses of fermented liquors, when cordials are required, wines are by far the most efficient of the whole tribe, and of these *port wine* is perhaps the best. For full information on this head, we refer our readers to the articles Fever, Gangrene, and *Analogous Diseases of* Debility. See Chaptal's excellent Essay on the Manufacture of Wines, Annales de Chimie, vol. xxxvi. and xxxvii. Dr. Macculloch's Essay on Wine-making. Mr. Brande's Essays in Phil. Transf. for 1811 and 1813, &c.

For the distillation of wines, see Distillation.

Wine being a liquor mostly of foreign produce, the different names, forms, kinds, distinctions, &c. of it are borrowed from the countries where it is produced, particularly France.

Wine, in France, is distinguished, from the several degrees and steps of its preparation, into

Merre-goutte, mother-drop; which is the virgin wine, or that which runs of itself out of a tap of the vat, in which the grapes are laid, before the vintager enters to tread, or stamp, the grapes.

Must, *surmust*, or *stum*, is the wine, or liquor, in the vat, after the grapes have been trodden, or stamped.

Pressed Wine, *Vin de Pressurage*, is that squeezed with a press out of the grapes, when half-bruised by the treading. The husks left of the grapes are called *rape*, *murk*, or *marc*; by throwing water upon which, and pressing them afresh, they make a liquor for servants' use, answerable to our cyder-kin, and called *boisson*; which is also of some use in medicine, for the cure of disorders occasioned by viscid humours.

Sweet Wine, *Vin doux*, is that which has not yet worked, or fermented. This is turbid, and has an agreeable and very saccharine taste. It is very laxative, when drunk too freely, or by persons disposed to diarrhœas, it is apt to occasion these disorders. Its consistence is somewhat less fluid than that of water, and it becomes almost of a pitchy thickness when dried.

Bouru, that which has been prevented working, by casting in cold water.

Cuve, or *worked wine*, that which has been let work in the vat, to give it a colour.

Cuit, or *boiled wine*, that which has had a boiling before it worked; and which, by these means, still retains its native sweetness.

Passé, or *strained wine*, a sort of raisin-wine, made by steeping dry grapes in water, and letting it ferment of itself.

Wines are also distinguished with regard to their colour, into *white wine*, *red wine*, *claret wine*, *pale wine*, *rose* or

black

black wine. And, with regard to their country, or the foil which produces them, into *French wines*, *Spanifh wines*, *Rhenifh wines*, *Hungarian wines*, *Greek wines*, *Canary wines*, &c. And, more particularly, into *Port wine*, *Madeira wine*, *Burgundy wine*, *Champagne wine*, *Falernian wine*, *Tokay wine*, *Schiras* or *Sheraaz wine*, &c.

Wines, again, are diftinguifhed, with regard to their quality, into *fweet wines*, *rough* or *dry wines*, and *rich* or *lufcious wines*, *vins de liqueur;* of which laft fome are exceedingly fweet, others fweet and poignant; and all chiefly ufed by way of a dram after meals, &c.

Such are French, *Frontignac*, *Madeira*, the *Canary*, the *Hungary*, *Tokay*, the Italian *Montefiafcone*, the Perfian *Schiras*, the *Malmfey wines* of Candia, Chio, Lefbos, Tenedos, and other iflands of the Archipelago, which anciently belonged to the Greeks, but now to the Turks. Thefe are fometimes called *Greek wines*, and fometimes *Turkey wines*.

The chief wines drank in Europe are as follow. 1. The Madeira ifland, and Palma, one of the Canaries, afford two kinds: the firft called *Madeira fec*, the latter, which is the richeft and beft of the two, *Canary* or *Palm fec*. The name *fec* (corruptly written *fack*) fignifies dry; thofe wines being made from half-dried grapes. There is another fort of *fec* wine, prepared about Xeres, in Spain, and hence called, according to our orthography, *Sherris*, or *Sherry*. 2. The wines of Candia and Greece are of common ufe in Italy. *Malmfey* was formerly the produce of thofe parts only, but is now brought chiefly from Spain: it is a fweet wine, of a golden or brownifh-yellow colour, and to this is applied an Italian proverb, fignifying, *Manna to the mouth, and balfam to the brain.* Almoft all the wines ufed in the Venetian territories come from Greece and the Morea. 3. Italy produces the *vino Greco*, which is a gold-coloured unctuous wine, of a pungent fweetnefs, the growth of mount Vefuvius, but much fophifticated by the Neapolitans. In the neighbourhood of mount Vefuvius is made the *Mangiaguerra* wine, and a thick, blackifh one, called *Verracia;* and at the foot of the hill the delicious *vino vergine*. The kingdom of Naples affords the *Campania* or *Paufilippo*, *Mufcatel*, *Salernitan*, and other excellent wines, and alfo the *Chiarello*, much drank at Rome. But the principal is the red, fat, fweet, and grateful poignant one, called *Lachryma Chrifti*. 4. The Ecclefiaftical State produces the bright, pleafant *Albano*, and the fweet *Montefiafcone*, a yellowifh not very ftrong wine, refembling good Florence, &c. 5. In Tufcany are the excellent white and red *Florence;* the celebrated hot, ftrong, red wine, *de Monte Pulciano*, &c. 6. In Lombardy, the *Modenefe* and *Montferrat* are tolerable; between Nizza and Savona is produced an incomparable *Mufcadine*. 7. Piedmont and part of Savoy have excellent light wines. 8. The Sicilian, Sardinian, and Corfican wines are alfo good. 9. Moft of the Spanifh wines are compofed of fermented or half-fermented wine mixed with infpiffated muft, and varioufly manufactured, or of an infufion of dry grapes in weak muft. Of thefe wines, there are a few in Germany, as the *Alicant*, which is a thick, ftrong, very fweet, and almoft naufeous wine, *Sherry*, *Spanifh*, *Malmfey*, &c. 10. In Portugal there is plenty of red *Port*, which is much drank in England. The beft *Vino tinto*, a blackifh-red wine ufed by the coopers for colouring other wines, is faid to be the produce of Portugal. This kingdom alfo deals largely in *Madeira*. 11. In France there is a great variety of wines; of which the ftrong, fweet, full-bodied, fpirituous ones, are called *Vins de liqueur*. Languedoc and Provence afford the fweeteft wines, and the fame provinces, with Champagne and Burgundy, the ftrongeft; the wines of the northern parts, as Picardy and Bourdeaux, are the worft, and thofe about the middle of the kingdom, as Paris and Orleans, of a middling kind. The moft celebrated of the French wines are, *Champagne*, *Burgundy*, *Vin de beaune*, or partridge-eye, *Frontiniac*, *Hermitage*, &c. 12. In Switzerland, the beft wines are, the *Neufchatel*, *Valteline*, *Lacote*, and *Reiff:* the *Valteline* ftraw-wine, fo called from the grapes being laid for fome time upon ftraw before they are preffed, is particularly celebrated. 13. The dry-grape wines of the Upper Hungary are in general excellent, and much fuperior to thofe of the Lower. (See Tokay.) 14. Among the German wines, thofe of *Tyrol* are very delicate, but do not keep. 15. Of Auftrian wines, thofe of *Klofter-Newburg* and *Brofenberg* are deemed the beft: and there are alfo good wines in other parts of the Imperial dominions. 16. In the Palatinate, the beft wine is that of *Worms*, efpecially the fort called Women's Milk. 17. Among the more efteemed German wines may be reckoned alfo *Rhenifh*, *Mayne*, *Mofelle*, *Neckar*, and *Elfafs:* a certain writer calls the *Rhenifh* made in Hockheim (Hock) the prince of the wines of Germany.

Wine is alfo varioufly denominated, according to its ftate, circumftances, qualities, &c. *e. g.*

Natural Wine, is fuch as comes from the grape, without farther mixture, or fophiftication.

Brewed Wine, or *Adulterated*, is that in which fome drug is added, to give it ftrength, finenefs, flavour, brifknefs, fweetnefs, or fome other quality which is wanted.

Pricked Wine, or *Eager*, is that turned fourifh.

An eafy method of recovering pricked wines may be learned from the following experiment:—Take a bottle of red port that is pricked, add to it half an ounce of tartarized fpirit of wine; fhake the liquor well together, and fet it by for a few days, and it will be found very remarkably altered for the better.

This experiment depends upon the ufeful doctrine of acids and alkalies. All perfect wines have naturally fome acidity, and when this acidity prevails too much, the wine is faid to be pricked, which is truly a ftate of the wine tending to vinegar: but the introduction of a fine alkaline falt, fuch as that of tartar, imbibed by fpirit of wine, has a direct power of taking off the acidity, and the fpirit of wine alfo contributes to this, as a great prefervative in general of wines. If this operation be dexteroufly performed, pricked wines may be abfolutely recovered by it, and remain faleable for fome time: and the fame method may be ufed to malt-liquors juft turned four. Shaw's Lectures, p. 214.

Flat Wine, is that fallen weak and vapid, for want of being drank in time.

Sulphured Wine, is that put in cafks in which fulphur has been burnt; in order to fit it for keeping, or for carriage by fea.

Colour, is a thick wine, of a very deep colour, ferving to dye the wines that are too pale, &c. as the black wine in ufe among vintners. See Wine *fupra*.

The method of converting white wines into red, fo much practifed by the modern wine-coopers, is this: put four ounces of turnfole rags into an earthen veffel, and pour upon them a pint of boiling water; cover the veffel clofe, and leave it to cool; ftrain off the liquor, which will be of a fine deep red, inclining to purple. A fmall proportion of this colours a large quantity of wine. This tincture might be either made in brandy, or mixed with it, or elfe made into a fyrup, with fugar for keeping. A common way with the wine-coopers is to infufe the rags cold in wine for a night or more, and then wring them out with their hands; but

but the inconveniency of this method is, that it gives the wine a difagreeable tafte, or what is commonly called the tafte of the rag, whence the wines, thus coloured, ufually pafs among judges, for preffed wines, which have all this tafte from the canvas rags in which the lees are preffed.

The way of extracting this tincture, as here directed, is not attended with this inconvenience; but it loads the wine with water; and if made into a fyrup, or mixed in brandy, it would load the wine with things not wanted, fince the colour alone is required. Hence the colouring of wines has always its inconveniences. In thofe countries which do not afford the tinging grape, which affords a blood-red juice, wherewith the wines of France are often ftained, in defect of this, the juice of elderberries is ufed, and fometimes logwood is ufed at Oporto.

The colour, afforded by the method here propofed, gives wines the tinge of the Bourdeaux red, not the Port; whence the foreign coopers are often diftreffed for want of a proper colouring for red wines in bad years. This might perhaps be fupplied by an extract made by boiling ftick-lack in water. The fkins of tinged grapes might alfo be ufed, and the matter of the turnfole procured in a folid form, not imbibed in rags. Shaw's Lectures, p. 211.

Chip Wine, is that poured on chips of beech-wood, to fine or foften it.

Rape Wine, is that put in a cafk half-full of frefh grapes picked for the purpofe, to recover the ftrength, brifknefs, &c. which it had loft by keeping, &c.

Burnt Wine, is that boiled up with fugar, and fometimes with a little fpice.

There is alfo a fort of Malmfey wine made by boiling of mufcadine.

Wines, *Condenfing of*, a phrafe ufed by Stahl, and fome other writers, to exprefs what is more ufually called the concentrating of them, that is, the freeing of them from the fuperfluous humidity which they contain, and by thefe means rendering them more rich and noble, freeing them from their taftelefs part, reducing them to a fmaller bulk, and thus making them fitter for tranfportation, and finally rendering them more durable in their perfect ftate, and much lefs fubject to the various accidents that make them decay. See Concentration.

Various methods have been attempted for the effecting of this, as by means of heat and evaporation, or by percolation, &c. and great objections found in the way of all of them, except the lateft, brought into ufe by Stahl, and fince recommended greatly to the world by Dr. Shaw in his Chemical Effays.

If any kind of wine, but particularly fuch as has never been adulterated, be, in a fufficient quantity, as that of a gallon or more, expofed to a fufficient degree of cold in frofty weather, or be put in any place where ice continues all the year, as in our ice-houfes, and there fuffered to freeze, the fuperfluous water that was originally contained in the wine will be frozen into ice, and will leave the proper and truly-effential part of the wine unfrozen, unlefs the degree of cold fhould be very intenfe, or the wine but weak and poor. This is the principle on which Stahl founds his whole fyftem of condenfing wine by cold.

When the froft is moderate, the experiment has no difficulty, becaufe not above a third or fourth part of the fuperfluous water will be frozen in a whole night; but if the cold be very intenfe, the beft way is, at the end of a few hours, when a tolerable quantity of ice is formed, to pour out the remaining fluid liquor and fet it in another veffel to freeze again by itfelf.

If the veffel, that thus by degrees receives the feveral parcels of the condenfed wine, be fuffered to ftand in the cold freezing place where the operation is performed, the quantity lying thin in the pouring out, or otherwife, will be very apt to freeze anew; and if it be fet in a warm place, fome of this aqueous part thaws again, and fo weakens the reft. The condenfed wine, therefore, fhould be emptied in fome place of moderate degree as to cold or heat, where neither the ice may diffolve, nor the vinous fubftance mixed among it be congealed. But the beft expedient of all is to perform the operation with a large quantity of wine, or that of feveral gallons, where the utmoft exactnefs, or the danger of a trifling wafte, needs not be regarded.

If the wine now once concentrated fhould, by a long continuance in the freezing cold, be again congealed to the utmoft (unlefs the cold were very fevere indeed), and then again be drained from its ice, there, foon after this, falls to the bottom of the veffel a pure white powder or tartar, and even the icy part afterwards depofits alfo a little of the fame fubftance after thawing; and after ftanding two or three days, there is always more and more of this tartar precipitated, and that conftantly the more in proportion as the wine was more auftere, or lefs adulterated with fugar, brandy, or the like; for thefe things contain no tartar.

The ice of the fecond operation on a quantity of wine differs in nothing from that of the firft, provided only that the wine was poured clear off from it, before the ice is fet to melt, by which means it diffolves into a clear phlegm. This fhews the excellency of the operation; as it lofes not its efficacy upon repetition, but brings away mere water as well at laft as at firft, without robbing the wine of any of its genuine or truly valuable parts. The remaining unfrozen liquor is a real concentrated wine, as appears by its colour, confiftence, tafte, and fmell, and is actually become a nobler and richer wine than could have been procured without fuch a contrivance.

This operation, though it be perfect in regard to wine, yet does not fucceed fo well in regard to the malt-liquors. The experiment has been fairly tried by Stahl on a gallon of ftrong malt-drink, and the fuccefs was as follows:—The ice feparated in the firft operation, when thawed by heat, refolved into a liquor of the colour and tafte of fmall-beer; and the fecond concentration afforded an ice of much the fame kind, which might have paffed for ordinary fmall-beer, but for a flafhy watery tafte that manifeftly predominated in it. The liquor unfrozen was but a pint and a half by meafure, but it was extremely rich and thick, and feemed very ftrong and fpirituous, and perfectly aromatic, or highly flavoured. The confiftence was fomething like that of a thin fyrup, and it had a pleafing foftnefs that fheathed the acrimony of the fpirit, and covered the bitter tafte of the hop.

The mucilaginous nature, which is predominant in all malt-liquors, occafions a great inaccuracy in this experiment, as not fuffering the water to run clear, or be feparated from the richer tincture of the malt, nor letting the condenfed liquor be obtained clean from the ice; but as the lofs occafioned by this is not great, and the liquor is much cheaper than wine, if this fhould ever come into ufe in the large way, the thawed liquor of the ice might be ufed again in a new brewing, and fo the lofs of that part of the ftrength which was carried away by the freezing be recovered.

Wines in general may by this method be reduced to any degree of vinofity or perfection. Thus, for example, if a wine of a moderate ftrength hath a third part of its water taken away, in form of ice, by congelation, the remaining part will thereby be doubled in ftrength and goodnefs: for if we allow, in the better forts of wine, that one-third part, which

which is near the truth, is truly good or vinous, and two-third parts are nothing but water, one-third part of the good wine being blended among the two-third parts of water, of no ftrength or value; it follows, that if one of thefe third parts of water be taken away, and all the wine left, that which was before but one-third wine, is now one-half wine, no way reduced in its ftrength, and therefore the whole muft be ftronger in that proportion.

But if this operation of congelation be carried to the utmoft, and be practifed on a large quantity of wine, and with a very intenfe cold, and the ice taken away feveral times, and the wine, thus freed from a part of its water, again and again expofed, it will be found that good wines will be reduced to one-fixth part of their original quantity: and the vintner will eafily find out the ufe of this remaining fixth part, which is a true quinteffence of wine, and will be of the utmoft benefit, by mixing it in fmall quantities with poor and low-flavoured wines, to meliorate and improve them; and even to convert the low-flavoured and leaft valuable ones into thofe very wines from which this condenfed part was procured.

This method is not practicable to advantage in the wine countries alone. Dr. Shaw affures us, that he has himfelf experimented it here, and with the ufe of proper freezing mixtures has reduced wines in England to a much fmaller quantity, in proportion to the whole, than in the ftrongeft of Stahl's experiments. It is evident, that by how much the quantity is fmaller, by fo much it is richer and ftronger, provided that the operation has been properly performed. The doctor affures us, the noble effence or rob, thus prepared, is capable of working almoft miracles, by turning water into wine, and the like; but that, in order to its fucceeding well, there requires great care in the operator, when the congelation is repeated the laft times. Shaw's Chem. Eff. Stahl's Schediafm. de Concentrat. Vin.

Wine, *Clarification of.* See Clarification, and Wine *fupra.*

Wine, *Colouring of.* See Wine *Colour*, and Wine *fupra.*

Wine, *Fining of.* See Fining, and Wine *fupra.*

This operation is practifed in Germany in the following manner: they have in fome vaults three or four ftoves, which they heat very hot: others make fires almoft before every vat; by which means the muft is made to ferment with great vehemence. When the ebullition, fermentation, and working ceafe, they let the wine ftand, and then rack it. This fining is only ufed in cold years, when the wine happens to be green.

Wine, *Forcing of.* See Forcing.

Wine, *Domeftic.* See Wine *fupra.*

In the Mufeum Rufticum we have the following directions for making raifin wine: put thirty gallons of foft water into a veffel at leaft one-third bigger than fufficient to contain that quantity; and add to it one hundred weight of Malaga raifins, grofsly picked from their ftalks. Mix the whole well together, and cover it partly with a linen cloth. When it has ftood a little while in a warm place, it will begin to ferment, and muft be well ftirred about twice in twenty-four hours, for twelve or fourteen days. When the fweetnefs is nearly gone off, and the fermentation much abated, which will be perceived by the fubfiding and reft of the raifins, ftrain off the fluid, preffing it, firft by the hand, and afterwards by a prefs, out of the raifins. Let this liquor be put into a found wine-cafk, well dried and warmed, adding eight pounds of Lifbon fugar, and a little yeaft, and referving part of the liquor to be added from time to time, as the decline of the fermentation will give room. In this ftate, the liquor muft remain for a month, with the bung-hole open; and having filled the veffel with the referved liquor, let it be clofely ftopped, and kept for a year or longer, and then bottled off. At the end of a year and a half it may be drank, but will improve for four or five years.

Some faving may be made in the expence, by diminifhing the quantity of raifins, and increafing that of the fugar, in the proportion of four pounds of raifins for one of fugar; or by diminifhing the proportion of both raifins and fugar, and adding clean malt-fpirits, when the bung of the cafk is clofed up. Any other large raifins may be ufed, as well as the Malaga; but the thinner the fkins and the fweeter the pulp, the ftronger will be the wine.

If this wine be perfectly fermented, and kept a long time, fo that no fweetnefs remain, it will refemble Madeira.

An artificial Frontignac may be made of this wine, in which the proportion of fugar or of malt-fpirits to the raifins is large, and the whole body weaker: the mufcadel flavour being communicated by an infufion of the flowers of meadow-fweet. In the making of this artificial Frontignac, the ferment fhould be ftopped, by clofing the cafk and adding the fpirit, while a confiderable degree of fweetnefs remains, and the wine may be drank after it has been a little while in the bottles.

Cyprus wine may be imitated by the fame means, ufing three or four pounds more of fugar than the quantity above prefcribed, and ftopping the fermentation while a confiderable degree of fweetnefs remains.

Artificial Mountain may be made by preferving a fmall degree of fweetnefs, giving the nut-like flavour, and keeping the beft kind of the above wine to a due age. The flavour may be obtained by the infufion of the Florentine orris-root, powdered, with a very fmall proportion of orange and lemon peel; and the wine may be rendered more dry or fweet, by continuing the fermentation for a greater or lefs time, and adding a correfponding proportion of clean malt-fpirits, when the fermentation is ftopped fooner. The adding of fome of the ftony feeds of the raifins well bruifed will give the nut-like flavour; and the putting in a part of the ftalks will add a fharpnefs, found generally in this kind of wine.

The racy tafte of Canary, commonly called fack, may be counterfeited by the addition of a proper quantity of the juice of white currant-berries to the wine, made with a large proportion of fugar to the raifins, and left very fweet in the fermentation. But it is faid that a fpirit, diftilled from the leaves of clary and clean malt-fpirits, put to the wine, will give it a very ftrong refemblance of fack. It is faid alfo, that the juice of the bramble-berries, added to the mixture of the wine, before the fermentation, will give both the colour and flavour of claret: but in this cafe the quantity of raifins fhould be confiderably diminifhed, and that of the fugar increafed, as the fermentation muft be continued till the fweetnefs be wholly deftroyed.

Wines of this kind fhould be kept at leaft a year before they are drank. See Sweets.

Wine, *Extemporaneous.* A hundred weight of good treacle will produce, according to the art of the diftiller, from four to feven gallons of pure alcohol; that is, from eight to fourteen gallons of the common-proof melaffes fpirit. The ftill-bottoms have many ufes. The diftillers fcald and recover their mufty cafks with them, and they may be ufed for all thofe purpofes of cleanfing where argol is required. Mr. Boyle's acid fpirit of wine, or a fpirit very like it, may alfo be procured from them, and a matter analogous

analogous to that Becher calls the *media fubftantia vini*. This liquor gives a durable extemporaneous wine.

Wine, *Stooming of*. See Stooming.

Wines, *Low*, in *Diftillation*, a term applied to the liquor which firft comes over, when the *wafh* is fubjected to diftillation, and which is concentrated by a fecond operation. See Distillation.

Wines, *Medicinal* or *Medicated*, in *Pharmacy*, a term applied to thofe preparations, confifting of wine holding different active ingredients in folution. They were formerly very numerous, but at prefent their number is very limited. See Vinum, under which article thofe at prefent in ufe are defcribed.

Wine, *Lees of*, are the impurities of it, or the thick fediment remaining at the bottom of the cafks, when the wine is drawn out.

The diftillation of wine-lees into fpirit is conducted very much in the fame manner with that of the malt-wafh, when diftilled with the mealy part in it: the principal difference is on this account, that the oil of the malt being very naufeous and difagreeable, the utmoft care is to be ufed to keep it back in all the proceffes of primary diftillation, and of rectification; whereas, on the other hand, the oil of the wine-lees being a very agreeable and pleafant one, as much care as poffible is to be taken to bring it over with the fpirit. Glauber has written a peculiar treatife on this fubject, in which, without touching upon the moft advantageous production of all, he has proved the work to be fo very profitable, that the whole ufually paffes for one of his wild flights, rather than a folid bufinefs.

The method of diftilling a liquid ley for its fpirit is a thing univerfally known; but the advantageous thing, on this bafis, is the diftilling of a dry ley preffed and preferved, and the managing of the bufinefs in fuch a manner as at firft or laft to procure and feparate all its valuable parts. The folid ley, here mentioned, is that ufually fold to the hatters in England, and is the fame thing that in France and other wine countries the vinegar-makers difpofe of in cakes, after they have preffed out all the wine, and which was afterwards burnt, and makes what Lemery and others call *cineres clavellati;* and the Englifh *gravelled afhes*, a fixed alkaline falt-like potafh.

This ley, when ufed for diftilling, fhould be that of the French wines, and either fuch as is newly preffed, or has been well fecured by packing in a clofe manner in tight cafks, with fome proper contrivance of dry fand, or the like, to keep its external furface from the contact of the air, which is very apt to corrupt or putrefy it.

If this ley is intended to be kept many months, it will be very proper to fecure it by fprinkling the layers as they are packed up with a little brandy. The expence of this is nothing, for the brandy is recovered again in the operation. Shaw.

Wine, *Oil of*, a very precious liquid, kept as a fecret in the hands of fome dealers in fpirits, and ufed to give the brandy flavour to fpirits of lefs price. It is certain that all the fpirits we ufe take their flavour from the effential oil of the fubftance they are made from; that of malt is very naufeous and offenfive, and renders the fpirit horribly difagreeable, if not carefully kept back in the diftillation of it; that of the grape, on the other hand, is extremely agreeable, and is what gives the delicious flavour to French brandy: this, therefore, is to be carefully brought over among the fpirits in diftillation.

This is that oil of wine fo much celebrated among our diftillers, and is for their ufe made feparate, and is of fuch effect, that half an ounce of it will determine a pure and clear malt fpirit to be French brandy, fo as to ftand the teft of the niceft palate, and all the trials that can be invented, provided the oil and the fpirit have both been carefully made.

The manner of making the oil is this: they take fome cakes of dry wine-lees, fuch as are ufed by our hatters, and diffolving them in fix or eight times their weight of water, they diftil the liquor with a flow fire, and feparate the oil by the feparating pot, referving for this nice ufe only that which comes over firft, the oil that follows being coarfer, and more refinous. To render this bufinefs perfectly fuccefsful, there muft be feveral things obferved: 1. The ley muft be of the right kind, that is, of the fame nature with the French brandy propofed to be imitated. 2. The malt-fpirit muft be extremely pure. 3. The dofe of the oil muft be very well proportioned. And, 4. The whole muft be artificially united into one fimple and homogene liquor. Thefe cautions all regard only the tafte, and befides thefe, in order to come up to a nice counterfeit, feveral other particulars muft be attended to; fuch as the colour, proof, tenacity, foftnefs, and the like; fo that, in fhort, the operation has too much nicety in it to be hit off by every ordinary dealer. When this fine oil of wine is procured, it may be mixed into a quinteffence, with pure diftilled alcohol, or the totally inflammable fpirit of wine, to prevent its growing diftafteful, rancid, or refinous; and thus it may be long preferved in full poffeffion of its flavour and virtues.

The ftill-bottoms, or remaining matter after the diftillation of this oil, will yield many productions to advantage, particularly tartar, and falt of tartar, as alfo an empyreumatic oil, and a volatile falt, like that of animals. Some kind of lees afford all thefe in much greater quantity than others; the lees of Canary and Mountain wines yield very little of them; and, indeed, fcarce any tartar or fixed falt at all; but the white French lees of thofe thin wines that afford the ordinary brandies, yield them all very copioufly, infomuch that fometimes a fingle hogfhead of dry and clofe-preffed lees will afford, by this procefs, three gallons of brandy, forty pounds of clean tartar, a large proportion of empyreumatic oil, and volatile falt, befide full four pounds of good falt of tartar. It is not to be expected, however, that every parcel of this ley fhould yield fully in this proportion. Shaw's Effay on Diftillery.

Wine, *Piece of*. See Piece.

Wine-*Prefs*, a machine contrived to fqueeze the juice out of grapes, and confifting of feveral pieces of timber, varioufly difpofed, which compofe three bodies of timber-work, clofely united to the axis, which ferves as a fwing, by which it may be moved by the vice. Of thefe there are different fizes as well as different conftructions.

Wine, *Prifage of*. See Prisage.

Wine, *Racking of*. See Rack, and Wine *fupra*.

Wine, *Spirit of*. See Spirit.

Wine-*Spirit*, a term ufed by our diftillers, and which may feem to mean the fame thing with the phrafe *fpirit of wine;* but they are taken in very different fenfes in the trade.

Spirit of wine is the name given to the common malt-fpirit, when reduced to an alcohol, or totally inflammable ftate; but the phrafe *wine-fpirt* is ufed to exprefs a very clean and fine fpirit, of the ordinary proof-ftrength, and made in England from wines of foreign growth.

The way of producing it is by fimple diftillation; and it is never rectified any higher than common bubble-proof. The feveral wines of different natures, yield very different proportions of fpirit; but in general the ftrongeft yield one-fourth, the weakeft in fpirits one-eighth part of proof-fpirit;

ſpirit ; that is, they contain from a ſixteenth to an eighth part of their quantity of pure alcohol.

Wines that are a little ſour ſerve not at all the worſe for the purpoſes of the diſtiller; they rather give a greater vinoſity to the produce. This vinoſity is a thing of great uſe in the wine-ſpirit, whoſe principal uſe is to mix with another that is tartarized, or with a malt-ſpirit, rendered alkaline by the common method of rectification. All the wine-ſpirits made in England, even thoſe from the French wines, appear very greatly different from the common French brandy; and this has given our diſtillers a notion that there is ſome ſecret art practiſed in France, for giving the agreeable flavour to that ſpirit; but this is without foundation.

When we diſtil Sicilian or Spaniſh wines, we do not produce Sicilian or Spaniſh brandies; and the true reaſon of this is, that the wines which they diſtil on the ſpot into brandy, are very different from thoſe which they export as wines.

Thoſe they diſtil are ſo poor and thin, that they will not keep many months, nor can poſſibly bear exportation. If we had in England thoſe poor wines they diſtil into brandy near Bourdeaux, Cognac, or up the Loire, there is no doubt that the ſpirit we made from them would be univerſally allowed to be French brandy. We have proof of this from ſome of the Scotch diſtilleries, where they, with no peculiar art, or ſecret method, procure from ſome of the poor pricked and damaged wines received here, brandy ſo nearly reſembling that of France, that a good judge will ſcarcely be able to make the diſtinction. Wine-ſpirits and brandies, therefore, are the ſame thing, only with this difference, that the former is the product of a rich wine, and the latter of a poor one; or, at the utmoſt, they differ only as our two home products, the cyder-ſpirit and the crab-ſpirit, do.

The wine-ſpirit, diſtilled in England, is not eaſy to be had pure and unmixed at our diſtillers, nor under a price almoſt equal to that of French brandy; ſo that if it ever be required out of the trade, it is as well to uſe the French brandy, which will, in all caſes, ſerve the ſame purpoſes, unleſs where a high flavour or a copious eſſential oil are required. All other ſpirits are carefully diveſted of their oil in the rectifications; but the wine-ſpirit is coveted only for its oil, and all that can be obtained is preſerved in this, its principal uſe being to give a flavour to a worſe ſpirit, and to cover the taſte of a diſagreeable oil in it.

When a caſk of wine chances to turn ſour in private hands, it is worth while to diſtil it for the ſpirit. The lees, alſo, if in any conſiderable quantity, will yield ſuch a proportion of the ſame ſort of ſpirit, as to render it worth while; and as the high flavour is not required in this intent, it will be beſt to draw off the ſpirit very gently, either by the cold or hot ſtill, and afterwards it may be rectified without any addition, and reduced to the ſtandard-ſtrength of proof. It thus makes a very clean and pleaſant ſpirit, though very different from the brandy from the ſame country whence the wine came. Shaw's Eſſay on Diſtillery. See SPIRIT.

WINE, *Philoſophic Spirit of*, in the writings of ſome chemiſts and phyſicians, a phraſe that often occurs as the name of a liquid prepared from wine, and endued with very remarkable properties.

It is generally ſuppoſed that this was the ſame ſort of liquor, which we at this time call by the name of ſpirit of wine; but this is a very erroneous opinion, and has led many into errors, about the operations in which it was concerned. It was truly no diſtilled liquor, but the ſpirituous parts of wine condenſed and concentrated by the freezing of the more aqueous part.

WINE *Vinegar, Method of making of.* See VINEGAR.

WINE, *Laws relating to.*

Wine may be imported only in Britiſh-built ſhips, or veſſels of the built of that country of which the wine is the produce, legally navigated; or in ſhips the built of the country in Europe under the dominion of the ſovereign or ſtate in Europe, of which the wine is the produce, or of the uſual place of ſhipping. Penalty, forfeiture of the wine and the ſhip. 12 Car. II. c. 18. and 27 Geo. III. c. 19.

No other than Rheniſh wine may be imported from the Netherlands or Germany, on forfeiture of ſhip and goods. 13 & 14 Car. II. c. 11. But wine, the produce of Hungary, may come from Hambro'; alſo wine, the produce of Hungary, the Auſtrian dominions, or any part of Germany, may come from the Auſtrian Netherlands, or any place ſubject to the emperor of Germany or houſe of Auſtria. 1 Ann. ſtat. 1. c. 12. and 22 Geo. III. c. 78. Wine may not be imported in veſſels under ſixty tons burthen: wine and veſſel forfeited. 24 Geo. III. c. 47. 26 Geo. III. c. 59. and 45 Geo. III. c. 121. Spaniſh and Portugal wines may not be imported in any caſk containing leſs than a hogſhead, except for private uſe. 18 Geo. III. c. 27. and 25 Geo. III. c. 69. French wine the ſame; and, except French wine in bottles, from France, Guernſey, Jerſey, or Alderney. 18 Geo. III. c. 27. and 27 Geo. III. c. 13. By the 5 Ann. c. 27. a hogſhead is to contain 63 gallons, or 231 cubical inches of wine. Wine (*i. e.* not Spaniſh nor Portugal) may not be imported in flaſks, bottles, or caſks, containing leſs than 25 gallons, except of the produce of the dominions of the grand duke of Tuſcany, in open flaſks, or any part of the Levant, and alſo wine for private uſe. 1 Geo. II. ſtat. 2. c. 17. and 25 Geo. III. c. 69. Wine may be imported in caſes containing ſix dozen reputed quart bottles at the leaſt. 39 & 40 Geo. III. c. 83. 42 Geo. III. c. 44. and 45 Geo. III. c. 121. Five reputed quart bottles deemed a gallon in charging duty. Wine not to be imported unleſs accompanied by a manifeſt, atteſted by the conſul at the place of ſhipment. 26 Geo. III. c. 40. Wine muſt be entered at the cuſtom-houſe and exciſe-office within 20 days after the ſhip has reported, or it may be ſold for the duties, and muſt be removed from the quays in 10 days. 26 Geo. III. c. 59. and 35 Geo. III. c. 118. Wine landed without payment of duty is forfeited (20 Geo. III. c. 59.); but wine may be warehouſed under ſchedule B, without payment at the time of entry of the duties due on importation, on the importer giving bond to export the ſame, or pay the duties within 12 months. But duty muſt be paid when taken out, on any exceſs or deficiency, from the quantity taken at the time of landing; and no wine to be warehouſed in caſks leſs than 45 gallons. 43 Geo. III. c. 132. Wine that has been warehouſed may be exported, and wine that has paid duty may be ſhipped for drawback; but muſt be packed in the preſence of the proper exciſe-officers, and the caſks to be ſealed with their official ſeals, and if they are afterwards damaged or broken, the party offending to forfeit 50*l.* for each caſk or package. Due notice to be given in writing of the times of packing and ſhipping. 26 Geo. III. c. 59. ſ. 46, 47. The exporter to give bond before ſhipping that the ſame ſhall be exported to the place entered for, and ſhall not be relanded or unſhipped. To be landed in Great Britain, on forfeiture. 26 Geo. III. c. 59. ſ. 48.

 35 Geo.

35 Geo. III. c. 118. Wine may be exported to Douglas, in the Isle of Man, in British vessels of 50 tons, by licence of the commissioners of the customs. 52 Geo. III. c. 140.

All the duties paid upon wine shipped for the actual consumption of officers of the navy on board ship, to be drawn back according to the following proportions. 33 Geo. III. c. 48.

	Tons.
Admiral	6
Vice-admiral	5
Rear-admiral	4
Captain of a first and second rate	3
Captain of a third, fourth, and fifth rate	2
Captain of every inferior ship	1
Lieut. and other officer in commission	$0\frac{1}{2}$

Officers of marines to be allowed half a ton *per annum.* 53 Geo. III. c. 44. But to be shipped only at the ports of London, Rochester, Dover, Dartmouth, Portsmouth, &c. Officers may remove their stock from one ship to another, and dispose of it to other officers. 38 Geo. III. c. 33.

Dealers in foreign wine to enter their premises at the excise-office, on penalty of 100*l.* for every place not entered, and forfeiture of the wine found therein. 26 Geo. III. c. 59. s. 12. Dealers to have the words 'Dealers in foreign Wines' painted over their doors, on penalty of 50*l.* sect. 15. Retailers to have the word 'Wine' exhibited in some conspicuous part of their premises, on penalty of ten shillings. 30 Geo. II. c. 19. and 32 Geo. II. c. 19. Dealers to take out a licence, to be renewed ten days before the expiration of every year, on penalty of 100*l.*; but not to apply to auctioneers selling wine by auction. 26 Geo. III. c. 59. Retailers of foreign wines, and dealers in sweets or British wines, to take out licences also; and selling them after its expiration, and before renewed, subjects them to 50*l.* penalty. 30 Geo. III. c. 18. Retailers not to sell wine in their houses, unless they have a beer licence granted by the magistrates, on penalty of 20*l.* (See ALE-*Houses.*) Officers may enter at any time to take an account of the stock, but if they go in the night they must be attended with a constable. The party refusing them admittance, or obstructing them, forfeits 100*l.* 26 Geo. III. c. 59. s. 17. No wine to be brought into a dealer's possession without a permit, and dealers to mark on a conspicuous part the content of each cask. 26 Geo. III. c. 59. s. 32. Any excess in dealer's stock from the account last taken, after deducting the quantity sold and entered in their books, deemed not to have paid duty, and is forfeited, and double the value. 26 Geo. III. c. 5. s. 59. 27 Geo. III. c. 31. Different kinds of wine and liquors, (cyder, spirits, &c.) to be kept separate. 26 Geo. III. c. 59. 42 Geo. III. c. 93. And no dealer in foreign wine to have any sweets or British wines in his possession. Penalty 10*s.* *per* gallon. 26 Geo. III. Account of wine daily sold to be kept, and no quantity above three gallons to be removed without permit, on forfeiture of the same, and the carriage and horses. 26 Geo. III. c. 59. 42 Geo. III. c. 95. Wine, in possession of persons *not* dealers, may have permits granted for its removal, on proving to the satisfaction of the commissioners of excise, or the collector or supervisor of the district, that the duties have been paid. 26 Geo. III. c. 59. s. 33. Permits not used to be returned to the officer, on penalty of treble the value of the wine. 26 Geo. III. c. 59. s. 37, 38; and persons forging or counterfeiting them to forfeit 500*l.* Ibid. sect. 39.

For the laws relating to low wines and domestic wines, see DISTILLER, and SWEETS.

WINE *of Squills.* See SQUILLS.

WINE-*Measure.* See MEASURE, and *Laws relating to* WINE *supra.*

WINE-*Fly*, in *Natural History*, the name of a small black fly, found in empty wine-casks, and about wine-lees, and called by the Latins, *Bibio.*

It is produced of a small red worm, very common in the sediment of wine.

The drippings of wine or beer vessels, the pressings of the wine or cyder press, the pots in which honey has been kept, and in which a little remains sticking to the sides, and turning sour, all afford vast numbers of a small species of worm or maggot. This is of a white colour, and has two hooks placed near the head; in short, it resembles in all the parts the maggot of the common flesh-fly. Multitudes of these small creatures live and move very briskly about in these substances for several weeks together; but at the end of that time, when they have arrived at their full growth, they enter into the nymph-state under a covering or case made of their own skin, which dries, and becomes of a brown colour. After eight or ten days in this state, the case is opened by the falling off of a small piece at the end, and the fly makes its way out. The fly is extremely small when its wings are not extended.

It does not exceed the size of the head of a middling pin; it is however very beautiful; the breast and body are yellow, the reticulated eyes are red, and the wings have all the rainbow-colours. The best way of procuring these little flies, which make a very beautiful microscope object, is to keep the matter, in which the worms are placed, in a glass, covered down with a paper; as soon as the cover is taken off, at the time of their being in the fly-state, they rise up at once in the form of a cloud; enough of them for observation will however remain about the sides of the vessel. When examined, they are found to have all the regular parts of the larger flies; their antennæ are oval and flatted, and their legs, and every other part, are as elegantly perfect, as they are seen to be in the most elegant large fly.

It is not known whether they are oviparous or viviparous; but this is to be observed, that they give us great light into the origin of animalcules in different fluids.

Since we see in these the evident course of nature in their origin, what prevents but that there may be numbers of flies yet smaller then these, whose eggs may be deposited in the fluids in which we find our microscope animalcules. Reaum. Hist. Inf. vol. ix. p. 82.

WINEBAGO, in *Geography*, a lake of North America. N. lat. 43° 50′. W. long. 87° 46′.

WINEBAGO *River*, a river of America, which runs from Winebago lake to Green bay into lake Michigan. The Winebago Indians inhabit near this river and lake, in about N. lat. 43° to 44°. W. long. 84° to 89°.

WINEBAGOES CASTLE, an Indian settlement in North America, near Winebago lake.

WINEE or BLACK RIVER, a river of South Carolina. See BLACK *River.*

WINERSTA, a town of Sweden, in East Gothland; 18 miles N.W. of Linkioping.

WING, in *Botany* and *Vegetable Physiology*, is generally used for any appendage to a seed, which serves to assist in its flight through the air. In this sense, the feathery crown of the Dandelion, and other syngenesious plants; the membranous expansion at the top of the scabious seed, so curiously and variously constructed in different species; the long feathery awn of the *Stipa;* and the delicate silky plumage

plumage of many feeds among the order of *Contortæ*, are juftly denominated wings. In a more limited and technical fenfe, the *Ala*, or wing, properly fo called, is a thin membranous expanfion, enabling the feeds to flutter to a fmall diftance from their native capfule, rather than to fly very far. Such is found in EMBOTHRIUM, GREVILLEA, BANKSIA, CONCHIUM, (fee thofe articles,) as well as in our Englifh genera RHINANTHUS and SPERGULA; in the latter we believe this part to vary, in degree at leaft. Gærtner meant to confine the term *ala* to a membranous expanfion of the upper part of a feed, or feed-veffel, but he has not adhered to this intention. Winged capfules, which do not burft, are feen in the Afh and the Maple. One which does burft occurs in the curious exotic genus BEGONIA. The feeds of fome umbelliferous plants, as THAPSIA, have feveral wings; thefe are always lateral and longitudinal in that natural order; but it is far more general for them to be folitary. When the wing encompaffes the feed, as in the beautiful inftance of *Bignonia echinata*, figured in Gærtner, t. 52, that author properly adopts the term *ala*, and yet the expanfion to which it applies is really a *margo membranaceus*, (membranous expanfion,) furrounding the feed entirely, except at the very bafe.

The appellation of wing is given alfo to any membranous or leafy dilatation of a footftalk, or of the angles of a ftem, branch, or flower-ftalk, as well as of a calyx. The wings of a papilionaceous *corolla* are the two lateral petals, both alike, which embrace the bafe of the keel, and are fheltered by the ftandard. Thefe fpread remarkably in fine weather. They differ greatly in fize and fhape in different genera. See PAPILIONACEÆ.

WING, in *Geography*, a village of England, in Buckinghamfhire, with 993 inhabitants; 7 miles N.E. of Aylefbury.—Alfo, a town of Sweden, in Weft Gothland; 40 miles E. of Gotheburg.

WING, in *Ornithology*. See FEATHER, and FLYING.

The wings are adapted for flight in all birds, except the dodo, oftriches, great awk, and the penguins, whofe wings are too fhort for the ufe of flying: but in the dodo and oftrich, when extended, they ferve to accelerate their motion in running; and in penguins perform the office of fins, in fwimming or diving. The wings have near their end an appendage covered with four or five feathers, called the *baftard* wings: the leffer coverts are the *tectrices:* the greater coverts are thofe which lie beneath the former, and cover the quill-feathers and the fecondaries. The quill-feathers, or *primores*, fpring from the firft bones of the wings, are ten in number, and broader on their inner than exterior fides: the fecondaries are thofe that arife from the fecond part, or cubitus, are about eighteen in number, and equally broad on both fides. The primary and fecondary wing-feathers are called *remiges*. The tertials are a tuft of feathers placed beyond the fecondaries, near the junction of the wings with the body. This, in water-fowl, is generally longer than the fecondaries, and cuneiform. The fcapulars are a tuft of long feathers arifing near the junction of the wings with the body, and lie along the fides of the back, but may be eafily diftinguifhed, and raifed with one's finger. The inner coverts are thofe that clothe the under fide of the wing.

The wings of fome birds are inftruments of offence: the anhima of Marcgrave has two ftrong fpines in the front of each wing; a fpecies of plover has a fingle one on each; as have alfo the whole tribe of jacana, and the gambo, or fpur-winged goofe of Willughby. Pennant's Genera of Birds, pref. p. 4.

WINGS, among the *Fly-clafs*, afford feveral fubordinate diftinctions of the genera of thofe animals, under the ancient general claffes.

Several fpecies of flies, while they are in a ftate of reft, or only walking, fhew feveral regularly diftinct manners of carrying their wings. The much greater numbers, however, carry them in a parallel or plain pofition: fome being perpendicular to the length of the body without covering it, others covering the body without covering one another: the wings of others crofs one another on the body of the animal, fome of which round themfelves there, the upper wing being more elevated on the middle of the body than on the fides. Some flies have their wings placed on their backs, and applied againft one another, in a perpendicular pofition: the wings of others are applied obliquely againft their fides, and meet above the body of their inner edges, forming a kind of hollow roof under which the body is placed; others form at their junction on the back a flat depreffed roof, and others have them meeting under their bellies.

The ftructure of the wings of different flies might alfo furnifh matter of farther diftinctions. The greater part of them are of a fine ftructure, and reprefent the fineft gauze, and are equally tranfparent, or nearly fo, in all parts. Some flies, however, have wings of a lefs degree of tranfparence, and fome even opaque ones. Others of the four-winged flies have obfcure fpots alfo diftributed near their very tranfparent texture; fuch are the wings of the fcorpion-fly; and fome of the two-winged flies have wings partly opaque, partly pellucid, the opaque fpots being feparated by tranfparent lines. Reaumur's Hift. Inf. vol. iv. p. 136, &c.

WINGS *of Butterflies*. The beautiful wings of this genus of infects are diftinguifhed from thofe of the fly-kind, by their not being thin and tranfparent, like them, but thicker and opaque. This opacity in them is owing only to the duft which comes off from them, and fticks to the fingers in handling them, and it is alfo to this duft that they owe all their beautiful variety of colours. The earlier naturalifts, for this reafon, diftinguifhed thefe infects by the appellation of fuch as had farinaceous wings. The ufe of the microfcope has taught us, that this duft is not the refult of fome other fubftance broken into fragments; but every particle of it is a regularly figured body, made for the place and order it has in the covering of the wing.

The feveral fpecies of butterflies, and even the different parts of the fame wing, afford thefe bodies of different fhapes and figures. Moft of the authors who have written of microfcopic objects, have given the figures of the principal varieties of thefe; but no one has given fo many as Bonani in his Micrographia, in which work the figures of the various kinds take up four quarto plates.

It has been the general cuftom of authors to call thefe feathers; but they are by M. Reaumur, with much greater juftice, called fcales. Their ftructure has no refemblance to that of feathers, for they are little flat and thin bodies, of more or lefs length, and always having a fhort pedicle which enters into the fubftance of the wing.

When the wing of a butterfly is viewed by a microfcope, the arrangement of thefe feveral bodies in it is feen to be extremely beautiful and regular. The fcales lie as regularly and evenly one over another, as the tiles on a houfe or the fcales on the fifh-kind, every feries of them covering a fmall part of that feries which runs below it. The upper and under part of the wing are equally furnifhed with thefe, and there is no fpecies of this creature, in every wing of which there are not feveral figures of thefe fcales in feveral parts.

The

The ſtructure of the wing itſelf which ſupports theſe ſeveral ſcales, hairs, &c. is very worthy our attention. In order to examine this, it is neceſſary to rub off all the duſt or ſcales. We then find that the wing itſelf is framed of ſeveral large and ſtrong ribs, which all take their origin at that part where the wing is fixed to the body, and thence extend themſelves along the ſeveral ſides of the wing. The largeſt and thickeſt of theſe ſurrounds the outer edge of the wing, the largeſt next to this extends itſelf round the interior edge, and the others direct their courſe along the middle of the wing, and then divaricate, and become ramified in the manner of the ribs in the leaves of plants. The ſubſtance which connects and fills up the ſpaces between theſe ribs, is of ſo peculiar a nature, that it is not eaſy to find any name to deſign it by, at leaſt there is no ſubſtance that enters the compoſition of the bodies of the larger animals, that is at all analogous to it: it is a white ſubſtance, tranſparent and friable, and ſeems indeed to differ in nothing from that of the large and thick ribs, but in that it is extended into thin plates; but this is ſaying but little toward the determining what it really is, ſince we are as much at a loſs to know by what name to call the ſubſtance they are compoſed of. Malpighi, indeed, calls them bones; but though they do ſerve in the place of bones, rendering the wing firm and ſtrong, without making it heavy, and are, when cut tranſverſely, found to be hollow; yet, when ſtrictly examined, they do not appear to have any thing of the ſtructure of bones, but appear rather of the ſubſtance of ſcales, or of that ſort of imperfect ſcales, of which the covering of thoſe inſects which we call cruſtaceous is compoſed.

The wings of butterflies, thus large, and thus light, are very well able to ſuſtain them a long time in the air, and thus they might be expected to fly better than moſt other inſects; but many people have obſerved the irregular manner in which theſe inſects uſually fly, which is not ſtraight forward, but up and down, and to one ſide and the other: this has been ſuppoſed owing to ſome imperfection of the wings; but, in reality, it is their great perfection that enables the creatures to do this, and this manner of flying is abſolutely neceſſary to the preſervation of their life, as birds of many kinds are continually after them while they are on the wing; and it is a pleaſant ſight to obſerve in what manner this ſort of dodging motion in the butterfly diſappoints the bird that flies ſtraight at it, and often preſerves it ſafely for a long way together.

The beautiful variety of colours, ſeen in the wings of theſe inſects, is owing to the ſcales and feathers. Reaumur's Hiſt. Inſ. vol. i. part i. p. 255, &c.

Wings *of Gnats*. Theſe are of a very curious ſtructure, and well worthy the uſe of the microſcope, to ſee them diſtinctly.

It is well known that on touching the wings of butterflies, a coloured powder is left on the fingers, which, though to the naked eye it appear a mere ſhapeleſs duſt, yet when examined by the microſcope, it is found to be very regularly-figured beautiful bodies, encompaſſed with a furbelow of long feathers, and with veins or ribs that ſeem to ſtrengthen them, in form of feathers or ſcales, or ſometimes beſet with prickles: theſe are of various figures, and all of them very elegant. The generality of flies have nothing of this kind; but the cloſe examination of the wings of the gnat will ſhew, that they are not wholly deſtitute of them; they are much more ſparingly beſtowed indeed upon the gnat than on the butterfly, but then they are arranged with great regularity. Between the ribs of the wings there is extended a very thin tranſparent membrane, full of little black ſharp-pointed hairs, ranged throughout with the utmoſt regularity. The wings in different ſorts of gnats are very different: ſome have a border of long feathers, others of ſhort ones, and others have none at all. Reaumur's Hiſt. Inſ. vol. iv. p. 577. Baker's Microſc. 8vo. 1743, p. 204.

Wings, *Warbling of the*. See Warbling.

Wings, in *Heraldry*, are borne ſometimes ſingle, ſometimes in pairs, in which caſe they are called *conjoined;* when the points are downward, they are ſaid to be *inverted;* when up, *elevated.*

Wings, in *Gardening*, &c. denote ſuch branches of trees, or other plants, as grow up aſide of each other.

Quintiny ſays, the term is particularly applied to artichokes, whoſe wings, or *alæ*, are the leſſer heads, or fruits, that grow up with the principal one on the ſame ſtalk.

Wings, *Alæ*, in the *Military Art*, are the two flanks, or extremes of an army, ranged in form of battle; being the right and left ſides thereof, and including the main body.

The cavalry are always poſted in the wings, *i. e.* on the flanks, on the right and left ſides of each line; to cover the foot in the middle.

Pan, one of Bacchus's captains, is ſaid to have been the firſt inventor of this method of ranging an army; whence, ſay they, it is, that the ancients painted him with horns on his head; what we call wings, being by them called *cornua*, *horns*. This at leaſt is certain, that the method of arranging in wings is very ancient. The Romans, we know, uſed the term *alæ*, or wings, for two bodies of men in their army; one on the right, the other on the left, conſiſting each of four hundred horſe, and four thouſand two hundred foot uſually, and wholly made up of confederate troops. Theſe were deſigned to cover the Roman army, as the wings of a bird cover its body.

The troops in theſe wings they called *alares*, and *alares copiæ;* and we, at this day, diſtinguiſh our armies into the *main body*, the *right* and *left* wings.

Wings are alſo uſed for two files, that terminate each battalion, or ſquadron, on the right and left. The pikes uſed to be ranged in the middle, and the muſqueteers in the wings.

Wings, in *Fortification*, denote the longer ſides of hornworks, crown-works, tenailles, and the like outworks, including the ramparts and parapets, with which they are bounded on the right and left, from the gorge to their front.

Theſe wings, or ſides, are capable of being flanked, either with the body of the place, if they ſtand not too far diſtant, or with certain redoubts; or with a traverſe made in the ditch.

Wings, in a *Ship*, the places next the ſide upon the orlop, uſually parted off in ſhips of war, that the carpenter and his crew may have free acceſs round the ſhip in time of action, to plug up ſhot-holes, &c.

Wings are alſo the ſkirts or extremities of a fleet, when it is ranged into a line a-breaſt, or when bearing away upon two ſides of an angle.

It is uſual alſo to extend the wings of a fleet in the daytime, in order to diſcover any enemy which may fall into their track. To prevent ſeparation, however, they are commonly ſummoned to draw nearer to the centre of the ſquadron before night, by a ſignal from the commander-in-chief, which is afterwards repeated by ſhips in the intervals. Falconer.

Wing-*Tranſom*, the uppermoſt tranſom in the ſtern-frame of a ſhip, &c., upon which the heels of the counter-timbers are reſted. It is by ſome called the main-tranſom.

Wings,

WINGS, *Goofe.* See GOOSE.

WING, *St. Michael's*, is the name of a military order in Portugal, inftituted, according to the Jefuit Mendo, in 1165; or, according to di Michieli, in his Teforo Militar. de Cavalleria, in 1171. Its inftitutor was Alphonfus Henry I. king of Portugal; and the occafion was a victory gained by him over the king of Savil, and his Saracens; for which he thought himfelf beholden to St. Michael, whom he had chofen for his patron in the war againft the infidels.

The banner they bore was a wing refembling that of the archangel, of a purple colour, encompaffed with rays of gold. Their rule was that of St. Benedict; the vow they made was to defend the Chriftian religion, and the borders of the kingdom, and to protect orphans. Their motto, *Quis ut Deus!*

WING-*Walls*, of a bridge or lock, are fplaying-walls for diminifhing the width of the canal to fuch bridge or lock, and for keeping up the banks.

WINGE, in *Geography*, a river of France, which runs into the Demer, 2 miles W. of Arfchot.

WINGED, in *Botany*, a term applied to fuch ftems of plants as are furnifhed, all their length, with a fort of membranous appendage.

Several kinds of thiftles have winged ftalks and branches.

WINGED *Leaves* are fuch as confift of divers little leaves, ranged in the fame direction, on each fide of a rib or ftalk, fo as to appear no more than one and the fame leaf. Such are the leaves of agrimony, acacia, afh, &c. See WING.

WINGED *Seeds* are fuch as have down or hairs on them, by which the wind taking hold blows them to a diftance.

WINGED *Stalk.* See STALK.

WINGED, in *Heraldry*, is applied to a bird when its wings are of a different colour, or metal, from the body.

Winged is alfo applied to any thing reprefented with wings, though contrary to its nature; as *winged* or *flying hart*, &c.

WINGER, in *Geography*, a town of Norway, in the province of Aggerhuus; 2 miles S. of Kongfwinger.

WINGHAM, a village and parifh in the hundred of its own name, and lathe of St. Auguftine, in the county of Kent, England, is fituated 34 miles E. from Maidftone, and 62 E. by S. from London. A college of a provoft and fix fecular canons was projected here by Kilwardby, archbifhop of Canterbury, but fettled and endowed by his fucceffor, Peckham, in 1286. It was valued at 84*l. per annum* at the general fuppreffion. By Edward VI. the college, with the patronage of the church and all tythes, were granted to fir Henry Palmer. The building, now called the college, and which formed the manfion of the Palmers, appears to have been the provoft's lodge. The church contains memorials of the Palmers and the Oxendens, who have a feat at Deane, in the parifh. A double row of ftalls ftill exifts in the chancel. Wingham gives a title to earl Cowper, who, however, has no eftate in the parifh. It gave birth to Henry de Wingham, chancellor of England, bifhop of Winchefter, and afterwards of London. In 1811 the inhabitants of the parifh were 859, who occupied 162 houfes.—Beauties of England, Kent, by E. W. Brayley.

WINGHAM'*s Ifland*, a fmall ifland in the North Pacific ocean, near the W. coaft of North America; 3 miles N.W. of Kaye's ifland. N. lat. 60° 4′. E. long. 215° 46′.

WINGROD, a town of Auftrian Poland, in Galicia; 16 miles N.W. of Sniatyn.

WINHALL, a townfhip of Vermont, in the county of Bennington, with 429 inhabitants; 30 miles N.E. of Bennington.

WININGEN, a town of France, in the department of the Rhine and Mofelle, on the N. fide of the Mofelle; 5 miles W. of Coblentz.

WINKEL, a town of France, in the department of Mont Tonnerre; 14 miles W. of Mentz.

WINKELMAN, *Abbé* JOHN, in *Biography*, a German antiquary, was born at Stendal, in the Mark of Brandenburg, in 1718. Although born in very humble life, he fortunately enjoyed favourable opportunities of cultivating his talents in that department in which he afterwards attained to eminence. He had arrived at the age of 37 years before he was known to the public as an author. His firft work was "Reflections on the Imitation of the Greeks in Painting and Sculpture;" and it was received in a manner that very much contributed to eftablifh his reputation. At the court of Auguftus, king of Poland, he was profelyted to the Catholic faith, more, as fome have faid, by arguments addreffed to his worldly intereft, than to his fpiritual welfare. It is certain, however, that he much wifhed to vifit Italy for the fake of examining thofe mafterpieces of art that were to be found in that country. With this view he left Drefden, and in paffing through Florence in 1756, he made a defcriptive catalogue of the antiquities in the collection of the celebrated baron de Stofch, which feemed to introduce him with advantage to Rome, whither he proceeded towards the clofe of this year. His acquaintance with the famous painter Mengs, Bianconi, and feveral other ingenious artifts, forwarded his accefs to two of the moft celebrated literary men at Rome, cardinal Paffionei and the prelate Giaconelli; from whofe library and learning he derived much ufeful information, fo that he was foon acknowledged as a man of fine tafte, and a diftinguifhed connoiffeur in works of art. Affuming the ecclefiaftical habit, he fucceeded the abbé Venuti as keeper of the pope's cabinet of antiquities; and he was alfo appointed copyift in the library of the Vatican. Under the patronage of the pope, who increafed his income out of his privy-purfe, he completed his Hiftory of Art among the Ancients, and then left Rome in 1768 to vifit his friends in Germany, and to revife his work to be tranflated into French by M. Touffaint of Berlin. On his return to Rome by way of Triefte, he was affaffinated, in June 1768, by a wretch who had joined him on the road, and who had fo far gained his confidence, that he had fhewn him fome gold medals and valuable prefents which he had received at Vienna. "Abbé Winkelman," fays one of his biographers, "was of the middle fize, with a very low forehead, a fharp nofe, and black hollow eyes, which gave him rather a gloomy appearance. An ardent and impetuous difpofition often hurried him into extremes. Naturally enthufiaftic, he frequently indulged an extravagant imagination; but as he poffeffed a ftrong and folid judgment, he knew how to give things their juft value. In confequence of this turn of mind, as well as a neglected education, he was a ftranger to cautious referve. If he was bold in his decifions as an author, he was ftill more fo in his converfation, and often made his friends tremble for his temerity." The tranflation of his Hiftory of the Arts was completed only in part by Touffaint. Another French tranflation was publifhed by Huber, profeffor at Leipfic. It is faid that the laft French tranflation is far preferable to the firft, as it was made from an enlarged edition of the original, printed at Vienna in 1776, after a MS. left by the author. Among the other works of Winkelman were, "Letters on the Difcoveries made at Herculaneum," tranflated into Englifh by Mr. Gough; "Unpublifhed Monuments of Antiquity, fuch as Statues, ancient Paintings, engraved Stones, Bas-Reliefs, in Marble and

and Terra Cotta," of which there is a French tranflation from the Italian, Paris, 1808, 3 vols. 4to. with plates; "On Allegory, or Treatifes on that Subject," 2 vols. 8vo.; and "Remarks on the Architecture of the Ancients," 8vo. Winkelman's "Letters to his Friends" were publifhed in German, in 2 vols. 8vo., with an account of his life prefixed by Heyne. Nouv. Dict. Hift. Gen. Biog.

WINKOOP'S BAY, or *Wine Cooper's Bay*, in *Geography*, a large bay on the fouth coaft of Java. S. lat. 7° 5'. E. long. 106° 38'.

WINKOOP'*s Ifland*, a fmall ifland near the fouth coaft of Java. S. lat. 7° 28'. E. long. 106° 36'.

WINKOOP'*s Point*, a cape on the fouth coaft of Java. S. lat. 7° 25'. E. long. 106° 36'.

WINLATON, a townfhip of Durham; 6 miles W. of Newcaftle.

WINNEBAGO. See WINEBAGO.

WINNENBURG, a citadel of France, in the department of the Sarre, which heretofore gave name to a lordfhip within the archbifhopric of Treves; 1 mile N.W. of Cocheim.

WINNENDEN, a town of Wurtemberg. In the year 1693, this town was laid in afhes by the French; 12 miles E.N.E. of Stuttgart. N. lat. 48° 53'. E. long. 9° 30'.

WINNICZA, a town of Poland, in the palatinate of Braclaw; 32 miles N.N.W. of Braclaw.

WINNING OF HAY, in *Agriculture*, a term fometimes applied to the operation of making hay in certain ftates of the weather. See HAY-*Making*.

WINNINGE, in *Geography*, a river of Lancafhire, which runs into the Lune, 6 miles N.E. of Lancafter.

WINNINGEN, a town of Weftphalia, in the principality of Halberftadt; 4 miles N. of Afcherfleben.

WINNIPEG, or WINIPIC, a lake of Upper Louifiana, being the great refervoir of feveral large rivers, and fuppofed to be the largeft of the inland feas, near the heads of the Miffiffippi, which difcharges itfelf by the river Nelfon into Hudfon's bay. It is connected with other lakes to the N.W., and has, from the rivers entering into it, an inconfiderable portage to the waters of lake Superior. This lake is faid to be 240 miles in length, and from 50 to 100 in breadth, though in fome places it is hardly five. N. lat. 52° 10'. W. long. 97° 30'.

WINNIPEG or *Winipic River*, a large body of water, interfperfed with numerous iflands, caufing various channels, and interruptions of portages and rapids. The lake Du Bois difcharges itfelf at both ends of an ifland, on which is the carrying-place out of the lake, and which is named Portage du Rat, in N. lat. 49° 37', and W. long. 94° 25', about 50 paces long, and forms this river. In fome parts, the river has the appearance of lakes, with fteady currents: its winding courfe to the Dalles is eftimated at 8 miles; to the Great Décharge $25\frac{1}{2}$ miles, which is a long carrying-place for the goods; from thence to the Little Décharge $1\frac{1}{2}$ mile; to the Tunejaûne Portage $2\frac{1}{2}$ miles; then to its galet or rocky portage, 70 yards; $2\frac{3}{4}$ miles to the Tune Blanche, near which is a fall of from four to five feet; $3\frac{1}{2}$ miles to Portage de l'Ifle, where is a trading port, and about 11 miles on the N. fhore a trading eftablifhment, which is the road, in boats, to Albany river, and from thence to Hudfon's bay. There is alfo a communication with lake Superior, through what is called the Nipigoes country, that enters the lake Winipic above 35 leagues E. of the Grande Portage. Mackenzie's Voyages, &c. Introd. p. 60.

WINNIPEG, *Little*, a lake of North America, 80 miles long and 15 wide. N. lat. 52° 10'. W. long. 100° 15'.

WINNIPISIOGEE, or WINNIPISSIOKEE, a lake of New Hampfhire; 80 miles N. of Bofton. N. lat. 43° 35'. W. long. 71° 18'.

WINNOW, in *Agriculture*, fignifies to fan, or feparate corn from the chaff by wind.

WINNOWING, and WINNOWING-*Machine*. See FAN-*Machine*, and THRESHING-*Machine*.

WINNSBOROUGH, in *Geography*, a town of South Carolina; 30 miles N. of Columbia. N. lat. 34° 28'. W. long. 81° 15'.

WINNY HAY, in *Agriculture*, a term applied to hay in fome conditions of it. See HAY.

WINSCHOTE, or WINSCHOTTEN, in *Geography*, a town of Holland, in the department of Groningen, near which the Spaniards were defeated by Louis, brother to the prince of Orange, on the 24th of May 1568. The Spaniards loft 2500 men, all their baggage, and fix pieces of cannon. This was the firft battle fought on account of the Revolution, and gave the prince a happy prefage of fuccefs; 19 miles E. of Groningen.

WINSDER, a river of Norfolk, which runs into the Yare, 12 miles W.N.W. of Norwich.

WINSEN AM DER ALLER, a town of Weftphalia, in the principality of Luneburg, on the Aller; 6 miles below Zell.

WINSEN *am der Luhe*, a town of Weftphalia, in the principality of Luneburg, on an ifland in the lake; 12 miles S.E. of Hamburg.

WINSLOW, JAMES BENIGNUS, in *Biography*, an eminent anatomift, was born in 1669 at Odenfee, in the ifle of Funen, and having ftudied a year under Borrichius, was fent with a penfion from the king of Denmark to feek improvement in the principal univerfities of Europe. In 1698 he became a pupil of the celebrated anatomift Duverney at Paris, and during his refidence in this capital, he abjured Proteftantifm, and was confirmed by Boffuet, affuming in addition to his own baptifmal name that of his converter, Benignus. Haller denominates Winflow "fimple and fuperftitious," and of courfe his converfion to the Catholic faith afforded no great occafion for triumph. This event, however, detached him from his family and native country, and was the means of fixing his abode in France, where the patronage of Boffuet was highly favourable to his advancement, and ferved to obtain for him the degree of doctor in 1705. In 1707 Duverney recommended him to be an elève of anatomy in the Academy of Sciences. He afterwards read lectures of anatomy and furgery for Duverney at the royal garden; and in 1743 was promoted to the profefforfhip in this inftitution. In the meanwhile, he communicated feveral papers on anatomical and phyfiological fubjects to the Academy of Sciences, by which body, as well as by the Royal Society of Berlin, he was admitted into the number of affociates. His great work, mentioned by Haller as fuperfeding all former compofitions of anatomy, and entitled "Expofition Anatomique de la Structure du Corps Humain," firft appeared at Paris in 1732, 4to. It was frequently reprinted, and tranflated into various languages; and is ftill regarded as of ftandard authority. Winflow planned, but never finifhed, a larger work, of which this was merely an abridgment, and he was alfo the author of difputations and treatifes on particular topics. He died in 1760 at the advanced age of 91. Haller. Eloy. Gen. Biog.

WINSLOW, in *Geography*, a market-town in the county of Buckingham, England, $6\frac{3}{4}$ miles from Buckingham, and 51 N.W. from London. The market, now inconfiderable, was granted in 1235 to the abbot of St. Alban's, lord of the manor,

manor, by king Offa. The manor is now the property of William Selby, efq., who has a feat in the town. The parifh-church, a fpacious ftructure confifting of a nave, two aifles, a chancel, and a tower, contains no monuments of note. According to the population return of 1811, the houfes in the parifh were 223, and the inhabitants 1222. Here is a fmall market on Thurfdays, and five annual fairs.—Magna Britannia, by the Rev. D. Lyfons and S. Lyfons, efq. 4to. 1806.

WINSLOW, a town of the province of Maine, on the Kennebeck, in the county of the fame name, containing 658 inhabitants; 88 miles N.N.E. of Portland.

WINSTER, a fmall market-town in the hundred of High Peak, and county of Derby, England, is fituated 5 miles W. by N. from Matlock, and 152 miles N.N.W. from London. The manor belonged to Henry de Ferrars when the Domefday-furvey was taken. At a later period it was held by the Mountjoys, who were fucceeded by the Meynells. The latter fold it to the freeholders in the reign of queen Elizabeth. The town affords nothing worthy of particular notice. It has a chapel of eafe to the parifh of Youlgrave, of which Winfter forms a part; and alfo a chapel for the Wefleyan Methodifts. A market is held on Saturdays, which appears to be by prefcription; for there is no grant of it on record: till lately here was an annual fair, but it is now difcontinued. The population return of the year 1811 ftates Winfter to contain 217 houfes, and 852 inhabitants; the latter are chiefly employed in the mining bufinefs, and in the inferior branches of the cotton trade. On the commons, in the vicinity of the town, are feveral cairns, or ftone barrows, and alfo two or three barrows of earth: in one of the latter, which was opened in the year 1768, two glafs veffels were difcovered, about nine inches in height, containing a pint of water, of a light green colour, and very limpid. With thefe a filver collar or bracelet was found, together with fome fmall well-wrought ornaments, feveral beads of glafs and earth, and remains of brafs clafps and hinges, with pieces of wood, that feemed to have belonged to a box in which the ornaments had been depofited. Thefe antiquities induced Mr. King to fuppofe the barrow to have been raifed over fome Briton of diftinction, though long after the Romans were in poffeffion of the ifland.—Beauties of England and Wales, vol. iii. Derbyfhire; by J. Britton and E. W. Brayley, 1803. Lyfons' Magna Britannia, vol. v. Derbyfhire, 1817.

WINSTER, a river of the county of Lancafter, which runs into the Ken, at its mouth.

WINTBERG, a town of Pruffia, on the Curifch Haff; 14 miles N. of Preckol.

WINTENAU, a town of the duchy of Stiria; 2 miles S. of Marburg.

WINTER, ——, in *Biography*, a German opera compofer, of great abilities, who fucceeded Bianchi at our Lyric theatre in 1803; during which year he produced, in 1803-4, the mufic of the ballet of Achille and Deidamia, and for Mrs. Billington's benefit.

WINTER, one of the four feafons or quarters of the year.

Winter properly commences on the day when the fun's diftance from the zenith of the place is the greateft, and ends on the day when its diftance is at a mean between the greateft and leaft.

Notwithftanding the coldnefs of this feafon, it is proved, in aftronomy, that the fun is really nearer to the earth in winter than in fummer. The reafon of the decay of heat, &c. fee under HEAT.

Under the equator, the winter, as well as the other feafons, return twice every year; but all other places have only one winter in the year; which, in the northern hemifphere, begins when the fun is in the tropic of Capricorn; and in the fouthern hemifphere, when in the tropic of Cancer: fo that all places in the fame hemifphere have their winter at the fame time.

WINTER *Management of Flowers*, in *Gardening*, among florifts, moftly confifts in placing them in proper fituations and expofures, in properly protecting them, in duly earthing them on the approach of the fpring feafon, and fome other matters of lefs confequence. Different kinds of flower-plants require different forts of management in thefe refpects; but in thofe of the primrofe kind, efpecially in the auricula, (fee AURICULA and PRIMULA,) the plants, after being placed out in proper frames, in a full fouthern expofure, from about the middle of October throughout the winter, and having a rather warm protection given them the whole of that time, when the weather is fevere, fhould in all the autumnal and winter months, until the beginning of April, or later, be expofed during the day to the full open air, by wholly removing the glaffes, except in the time of very heavy rains, and fevere frofts or ftorms, though the common practice is that of keeping them on, and only letting in air by raifing the lights behind. In the mid-winter feafon they fhould be kept very dry, as fevere froft has in that cafe lefs effect on the roots; confequently, when rain obliges the lights to be kept on, they fhould be raifed behind. Heavy rain, or much wet, is very prejudicial and fometimes deftructive to thefe plants, which are otherwife hardy. Much expofure to the free air in dry weather has likewife great effect on the richnefs and brilliancy of their ground colours and good fpring bloom, as well as on their health, vigour, and hardinefs. In the afternoon, as about four o'clock, however, the plants fhould be covered by the lights at this feafon in a clofe manner, and have two or three thickneffes of mats thrown over them, to remain until about nine o'clock on the morning following, when, fhould there not be rain, hail, or fnow, they may be expofed to the full open air as above; but in the contrary circumftances, the mats fhould only be removed fo as to give light, air being plentifully let in behind. In the two beginning months of the year much muft depend on the ftate of the weather; when mild and open, the plants may be managed nearly as above; but in fevere froft and fnow much more caution muft be ufed in regard to expofure, fo as not to have the mould of the pots much frozen, as the bloom is now beginning to form, and would be injured thereby; but in long frofts air fhould be let in as much as poffible in the above manner, and light be given, with the influence of the fun, when there is any, in the middle of the day; the plants being always clofely fhut and covered up by three o'clock in the afternoon. Though the plants fhould be very dry, they fhould have but little water, either in rain, or from the watering-pot, in the two preceding months, and only a fmall quantity, or fome fmall light foutherly fhowers in thefe, fo as to render the ground in a moderately moift condition. Towards the middle or end of February, the plants fhould be dreffed, cleaned, and new-earthed with frefh mould for the fpring, when there is mild open weather, removing thofe from the fmall pots into larger, and expofing them fully to the gentle rains and fhowers, but conftantly defending them well from frofts, hail, and ftorms, as they now begin to fhoot new fibres more quickly, and to grow faft. This manner of managing them fhould be continued until nearly the middle of March, after which they fhould be covered more warmly in the nights, for fear of frofts, and that they may be bloomed very fine.

From the middle period of the above month, and through the following, they muſt alſo be defended from froſt, in order to promote the coming bloom. Great care and attention are eſpecially neceſſary for blooming the plants well from the above time in March to near the end of the ſucceeding month, as in this time they will moſtly attain their greateſt perfection and beauty. It is only neceſſary, as it is thought, for blooming ſuch flower-plants in the greateſt perfection, to have them continually under glaſs, night and day, for about twenty-four of the laſt days, as they will then have their middle pips well expanded. In very ſtrong ſun they muſt be ſlightly ſhaded by a thin mat, but in other caſes they may be thrown open and expoſed to the full free air.

After the beginning of April, as the fifth or ſixth, the glaſſes of the frames are to be kept completely over the plants night and day, until they are in full bloom, only letting in proper ſupplies of air from behind the frames, and giving the ſhade of old thin mats when neceſſary. This mode is to be purſued to about the middle of this month; but the plants are not to be over-haſtened in their bloom by too much ſun, as that may fade their fine colours; but in ſuch caſes they muſt be removed from the full ſouthern expoſure to a full eaſtern one, though by no means yet to a northern aſpect, as that would endanger their bloom; if the ſeaſon be ſuitable, the protection of a privet-hedge, wall, or paling-fence, is the moſt proper, being covered by hand-glaſſes; when about the end of the month, they may be removed to a northern expoſure on ſtages, or in other proper places.

In this finiſhing blooming eaſtern expoſure, all the mats and other coverings ſhould be taken off from the glaſſes that are placed over the flowers, about ſeven o'clock in the morning, and in ſunny weather the plants be ſhaded from about nine to twelve or one, the thin mats being then removed. The covering-glaſſes are to be prepared by well waſhing, and other means.

The flowers in blooming are moſtly much benefited by having a ſouth-weſt expoſure as much as poſſible, and by carefully attending to the north and north-eaſt winds, as well as by receiving all mild moderate rains from about the beginning of February until towards the end of March. In the latter part of this time, before the truſſes are too forward, and the bloſſoms open, three or four hours rather heavy mild rain greatly promotes the ſwelling of the pips, and much increaſes the ſize of the foliage, eſpecially if care be taken immediately after it is over to ſhut the flowers cloſe down, and cover them up in a warm manner, as below. Watering them from a pot with a fine roſe in a warm ſunny day all over the leaves in the afternoon, in the manner of rain, and directly covering them up warmly while the ſun is upon them, has likewiſe been found beneficial. They are now, too, to be well guarded from late froſts, as they are ſo ſoon deſtroyed by them.

In the late winter, or early ſpring, night-covering, as from the middle of the above month, the following mode has been found highly beneficial, in not only repelling the cold froſty night-air, but in aſſiſting the bloom, and preventing its being checked in any way thereby.

The heat at this period being uſually from about forty-five to fifty degrees in the day-time, the flowers may be expoſed to the open air in it, and in covering them in for the night, be kept nearly to that ſtate; which is only to be effected by an artificial covering of ſome ſort or other, for other ſorts of heat do not anſwer the purpoſe; as thoſe of the warm blanket, horſe-cloth, ſheep-ſkin, and other ſimilar kinds, laid next to the glaſſes, over which mats may be placed ſo as fully to protect the flowers, and keep the other coverings from being injured by rain or other wetneſs. Where wood-frames and not brick ones are uſed, it is alſo often neceſſary to have hay, fern, ſtraw, or ſome other ſuch material, applied on the outſides of them, to guard againſt the penetration of the cold froſty air, as is otherwiſe liable to be the caſe in ſevere ſeaſons. But ſuch full coverings ſhould not be had recourſe to in the winter ſeaſon ſooner than about the middle of March, as they might not only injure the fine ſtrong blooming plants, but counteract the good effect they are intended to have in aſſiſting nature to gradually bloom the flowers in fine condition as the ſeaſon approaches. The keeping the flowers ſo warm on the nights at this period of the ſeaſon is ſuppoſed to prevent any check to the vegetation of the plants; and another great effect which it has is, that as ſoon as the pips open, they proceed vigorouſly, expand freely, and come out level, fine, and nearly flat; while, if they once get a complete *chill* by cold night air, their bloſſoms will not expand flat, but on the contrary, ruffle or furbelow.

In the leaves of the auricula and ſome other kinds of plants, there is as much variety produced by theſe means in the ſhades of their green as in the colours of their flowers. The green of the leaves, or *graſs*, as it is termed, in this ſort of flower-plants, ſhould conſtantly be that which affords the beſt contraſt, and has the moſt power in ſetting off the flower to which it belongs. Different varieties in the ſhape of the leaves alſo proceed from the nature of the culture and management, as well as from the raiſing them from ſeed. They have from theſe cauſes leaves with ſmooth even edges, with thick and fleſhy edges, and with thin edges. Theſe varieties in the leaves of ſuch plants are often of importance to the floriſt in different ways. In the graſs or green leaves of theſe plants, there is likewiſe ſome variety in the mealy duſt or farina which is upon them: in ſome the whole plant is nearly covered with it; but thoſe with blueiſh or pea-green leaves are commonly the moſt powdered with this ſort of duſt, which contributes not only to the beauty of the plants, but ſerves in ſome degree to preſerve them from the effects of the ſcorching heat of the ſun during the ſummer ſeaſon.

The different other fine flower-plants are to have ſomething of the ſame ſort of winter-management purſued for them, only making proper allowances and diſtinctions, in ſo far as their differences in the nature of their growths or other habits are concerned.

The diverſities of the auricula, as well as moſt other flower-plants, owe their preſent perfection, in a great meaſure, to the care, ingenuity, cultivation, and management of the floriſt-gardener, and ſome of thoſe private individuals who cultivate flowers for the amuſement and delight which they afford. By theſe means, this and many other ſorts have been wonderfully improved, which were at firſt ſingle and ſimple, and their variety, ſize, and beauty, have been increaſed in an aſtoniſhing manner. The ſportiveneſs of nature has likewiſe done much, as is evident in ſo many flower-plants; as in the daiſy, ranunculus, the anemone, the ſtock, the wall-flower, the pink, the carnation, the Siberian larkſpur, and a vaſt many more.

There is, indeed, ſomething extraordinary in the great and uncommon diverſity of the colours, and the differences of the ſhades and hues of this as well as ſome other flowers; and it is not leſs ſingular or true that out of more than an hundred flowers of this ſort, which are raiſed from ſeed in this way, there will not, perhaps, be two which are exactly alike; and that yet, in all theſe deviations, the changes take place in the moſt naturally pleaſing, agreeable, and unthought-of manner poſſible.

By attention to proper winter and other management, ftill more diverfity and variety may moft probably be produced in this and different other flowers.

WINTER, among *Printers*, that part of the printing-prefs, ferving to fuftain the carriage, &c. See PRINTING-*Prefs*.

WINTER'*s-Bark*, *Cortex* WINTERI, or WINTERANUS, WINTERA *Aromatica*; which fee. See CORTEX.

This is one of the largeft foreft-trees upon Terra del Fuego, often rifing to the height of fifty feet. Dr. Solander has given an accurate botanical defcription of it, illuftrated by a figure, in Med. Obf. and Inq. vol. v. p. 46, &c. Its leaves are ever-green, fmooth, oval, and entire; the flowers confift of feven petals, with from fifteen to thirty ftamina, and from three to fix germina, terminating in as many ftigmata; each germen becomes a feed-veffel, containing feveral feeds: the bark of the trunk of the tree is externally grey, and very little wrinkled. The pieces of this bark brought over by the Dolphin are about three or four inches fquare, of different degrees of thicknefs, from one-fourth to three-fourths of an inch. It is of a dark brown cinnamon colour, an aromatic fmell if rubbed, and of a hot, pungent, fpicy tafte, which is lafting on the palate, though imparted flowly. A watery infufion of it ftruck a black colour with a folution of green vitriol. An infufion of two ounces, coarfely powdered, yielded on evaporation two drachms and twenty-four grains of extract: the fame quantity, with rectified fpirit, afforded two drachms of extract.

This bark, though much celebrated as an antifcorbutic by the firft difcoverers, is unknown in the practice of phyfic; the *canella alba*, (fee CANELLA,) which is totally different from it, having been confounded with it in the fhops; and no quantity having been brought to Europe, except as a curiofity, till the return of the fhips fent out on an expedition to the South feas. It has been thought to be a ufeful antifcorbutic; but it feems to poffefs in this refpect no advantage over the other pungent aromatics, and it is now generally fuperfeded by the canella alba.

From fome experiments on this bark by Dr. Morris, it appears to be an aftringent of a particular kind, and therefore likely to be of ufe in feveral manufactures; and that water is the proper diffolvent of it.

It is hoped that this tree, no lefs ufeful than elegant, may be cultivated in our country, where it would probably grow luxuriantly, as in a much warmer region than its own, and furnifh, not only a valuable ever-green, bearing our fevereft winters, but alfo a valuable medicine. Med. Obferv. *ubi fupra*.

WINTER-*Barley*, in *Agriculture*, a term applied to an excellent fort, which is put into the ground in the autumn, and which ftands the winter. It is found by fome farmers to be very productive in its nature, and when made into malt to form a much ftronger fort than that which is produced from common barley.

In fome diftricts, it is a good deal fown and cultivated as an early fheep-feed, in which intention it often anfwers very well. See BARLEY.

WINTER-*Berry*. See PRINOS.

WINTER-*Bloom*. See AZALEA.

WINTER-*Cherry*. See PHYSALIS *Alkekengi*.

WINTER-*Creffes*. See ERYSIMUM *Barbarea*.

WINTER-*Crops*, in *Agriculture*, a term ufed to fignify all fuch as are put into the foil to grow or rife at that time of the year, which are capable of withftanding that fevere feafon, or which can be converted to the purpofe of fodder for animals at that inclement and neceffitous period.

WINTER-*Fallow*. See FALLOW.

WINTER-*Garden*, a term often applied to that kind of ornamental garden which is chiefly for ufe and amufement at that feafon of the year. It has been advifed by Mr. Loudon, that a winter-garden fhould contain all fuch trees, fhrubs, plants, and other vegetable productions, as are in a ftate of perfection, or retaining their beauty and verdure, at and during this feafon, in the moft complete manner; as moft of the ever-green tribe or clafs of trees and fhrubs, many flowering plants, as the aconite, fnow-drop, Chriftmas-rofe, and feveral others of fimilar kinds; that thefe fhould be *grouped* and *arranged* in the *natural* manner in fuch garden-grounds; and that a dry gravel or other fimilar kind of walk fhould be conducted throughout, or carried round-about the whole, in the view of being walked upon at this feafon without inconvenience; that thefe forts of gardens fhould be fituated near the manfion or refidence, in order that they may be comfortably and conveniently approached in the different winter months; and that the confervatory too, as well as fome other fuch houfes, fhould be placed in them.

WINTER-*Green*, in *Botany*. See PYROLA.

The greater round-leaved winter-green, or *pyrola rotundifolia major*, is generally brought over from Switzerland with other vulnerary plants, in which clafs it is ranged, and by fome greatly commended. Miller.

WINTER-*Green*, *Ivy-flowering*. See KALMIA.

WINTER-*Green*, with *Chickweed Flowers*. See TRIENTALIS.

WINTER-*Heyning*, in our *Statutes*, a feafon between the eleventh day of November, and the three-and-twentieth of April, which is excepted from the liberty of commoning in the foreft of Dean, &c. Stat. 20 Car. II. cap. 3. Blount.

WINTER-*Pears*, in *Gardening*, fuch as will keep, and are ready for ufe in that feafon. It has been fuggefted in a paper in the fecond volume of the "Memoirs of the Caledonian Horticultural Society," that in the cultivation of pears of this fort, thofe of the *fhy*-bearing forts fhould be carefully avoided; that they fhould be fuited as much as poffible to the nature of the climate or region where they are to be grown; that they fhould have their fituation in a proper expofure, and in a proper foil; that they fhould be well pruned, trained, and managed, in all other refpects; that thofe kinds which can be moft depended on be had recourfe to; that new varieties may probably be raifed from feed with advantage in this view; and that endeavours fhould be made to bring into ufe any good late forts of this fruit.

The number of winter-pears in the northern parts of this ifland are fuppofed to be fcanty indeed. That if the few that have been favourably fpoken of by fome cannot be had, there are not, it is believed, above five more to be depended on in thefe fituations; which are thefe, the fwan-egg, achan, brier-bufh, the John Monteth, and to which may be added the muirfowl-egg, which keeps there much longer than the fwan-egg, and muft be allowed to be a winter-pear, though commonly fet down as an autumn fruit. The fwan-egg has there, it is faid, never kept good longer than the end of November, while the muirfowl has fometimes remained in good prefervation until towards the end of April. In the then laft feafon they were taken from the tree, it is faid, fooner than ufual; confequently were earlier ripe or fit to eat, and of courfe have decayed more fpeedily, than ordinary. They were, however, perfectly good until towards the end of January in the following year, after which they fpoiled in a very fudden manner. The muirfowl-egg

 may

may alſo, however, with great ſafety, be allowed to remain on the tree ten or twelve days longer than the ſwan-egg; the leaves of the latter, too, fall, it is ſaid, much ſooner than thoſe of the former.

On walls, in different proper aſpects, the following ſorts of winter-pears have, it is ſaid, been recommended to be planted: the creſſanne, the colmar, the boncretien d'hyver, the chaumontelle, and ſome others, which are certainly excellent pears, but that ſome of them are *ſhy*-bearers, and others do not ripen well in theſe parts, except in the moſt favourable ſituations. Some have found the four following ſorts particularly uſeful on walls, eſpecially in high ſituations in thoſe northern parts of the country where the other finer ſorts do not ripen in a proper manner: the green yair, muirfowl-egg, ſwan-egg, and winter achan. But it is noticed, that the ſecond and the laſt of theſe ſorts of pears, when planted as ſtandards, produce not only better crops, but fruit of a higher flavour. Many other ſorts are mentioned by different writers as very good winter-pears for the purpoſe of cultivation in theſe and other places; as may be ſeen in the above uſeful paper.

WINTER-*Proud*, in *Agriculture*, a term applied provincially to ſuch winter-wheat, or other crop, as puts on a more green and luxuriant growth and appearance than it is able to maintain and ſupport in the following ſummer ſeaſon; or in which the tillering ſhoots, branches, or ramifications of the ſeed-grain, become too numerous to be nouriſhed and brought to maturity in conſequence of the previous over-exertion of the ſoil or land. In theſe caſes, the crops decline during the ſpring and ſummer months, and at the harveſt time yield imperfectly, falling much below the quantity afforded by ſuch crops as had a more backward appearance in the winter ſeaſon.

It is of courſe always of advantage to have theſe ſorts of crops in rather a backward ſtate in the winter period of the year.

WINTER-*Quarters*. See QUARTERS.

WINTER-*Rig*, among *Huſbandmen*, ſignifies to fallow or till the land in winter.

WINTER-*Solſtice*. See SOLSTICE.

WINTERA, in *Botany*, is ſo called in memory of the companion of ſir Francis Drake, captain William Winter, who brought the bark, of the firſt ſpecies, from the ſtraits of Magellan in 1579, and introduced it to the knowledge of European phyſicians, as a valuable tonic, more eſpecially uſeful in the ſcurvy. Linnæus, meaning to commemorate this diſcovery, eſtabliſhed a genus by the name of *Winterana*, G. Pl. 238, the bark of which he conceived to be what captain Winter introduced. But the Linnæan plant is the *Canella alba*, to the fructification of which alone the deſcription applies. Browne had already founded this genus, by the name of CANELLA, (ſee that article,) and Swartz, as well as Murray, have confirmed it. Meanwhile Forſter, having found and inveſtigated the fructification of the Winter's-bark tree, deſcribed it by the name of *Drimys*, alluding to its hot and pungent flavour. This is retained by the younger Linnæus in his *Supplementum*, with a remark properly diſtinguiſhing it from the *Canella alba*, though his father, like prof. Bergius, *Mat. Med.* v. 1. 381, had confounded them. Finally Murray, in *Linn. Syſt. Veg. ed.* 14, aware of theſe various errors and miſconceptions, very properly eſtabliſhes Browne's genus, by its right denomination, *Canella*, and reſtores Winter's name to the plant to which it properly belongs, and with which Linnæus intended to aſſociate it. Murray, however, prefers *Wintera* to *Winterana*, which is the more judicious, as his genus is not really the *Winterana* of Linnæus. The name he has choſen is now, except by an accidental miſtake of De Candolle in chronology, univerſally adopted. Perhaps *Winteria* would have been better; but we refrain from embroiling the ſubject with any further alteration, of what has received the ſanction of ſuch men as Murray and Schreber.—Murr. in Linn. Syſt. Veg. ed. 14. 507. Forſt. Prodr. 86. Schreb. Gen. 368. Willd. Sp. Pl. v. 2. 1239. Mart. Mill. Dict. v. 4. (Drimys; Forſt. Nov. Gen. t. 42. G. Forſt. Nov. Act. Upſ. v. 3. 181. Linn. Suppl. 43. Lamarck Illuſtr. t. 494. De Cand. Syſt. v. 1. 442. Drymis; Juſſ. 280. Lamarck Dict. v. 2. 330.)—Claſs and order, *Polyandria Tetragynia*. Nat. Ord. *Magnoliæ*, Juſſ.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, ſplitting into two or three ſegments. *Cor.* Petals ſix, or more, ovate, ſpreading. *Stam.* Filaments numerous, ſhorter than the corolla, dilated upwards; anthers terminal, of two lateral ovate cells, ſeparate at the baſe, converging at their points. *Piſt.* Germens four to eight, crowded, obovate; ſtyles none; ſtigmas depreſſed, flat. *Peric.* Berries four to eight, ovate, ſomewhat triangular. *Seeds* ſeveral, diſpoſed in two rows.

Eſſ. Ch. Calyx ſplitting unequally. Petals numerous. Stamens club-ſhaped, with terminal two-lobed anthers. Styles none. Berries ſuperior, aggregate. Seeds ſeveral, in a double row.

Obſ. Willdenow copies what we ſuſpect may be a caſual error of the younger Linnæus, *germina clavata*, for *ſtamina clavata*. De Candolle, who deſcribes two new ſpecies, firſt gave a correct account of the arrangement of the ſeeds, an important circumſtance in this natural order. His obſervations, confirming thoſe of Linnæus, ſhew the *petals* to be indeterminate in number. Poſſibly the line is not drawn diſtinctly between them and the *ſtamens*, of which *Nymphæa* affords another inſtance, ſo that an inner ſeries of ſmaller petals may occaſionally occur.

1. W. *aromatica*. Officinal Winter's-bark. Murray n. 1. Willd. n. 1. Mart. n. 1. Forſt. Pl. Magell. 24. t. 7. Comm. Goett. v. 9. 34. t. 7. Soland. in Med. Obſ. and Enq. v. 5. 41. t. 1. Woodv. Med. Bot. t. 257. (Drimys Winteri; Forſt. Act. Upſ. v. 3. 181. Linn. Suppl. 269. Winteranus cortex; Cluſ. Exot. 75. Dale Pharmac. 324. Laurifolia magellanica, cortice acri; Bauh. Pin. 461. "Periclymenum rectum, foliis laurinis, cortice aromatico acri; Sloane in Phil. Tranſ. v. 17. 923. t. 1. f. 1, 2.")—Leaves elliptical, obtuſe, coriaceous. Flower-ſtalks aggregate, terminal. Piſtils about four.—Native of the country on both ſides of the ſtraits of Magellan, in valleys expoſed to the ſun, where it was firſt obſerved by captain Winter, and has ſince been found by ſeveral following navigators, but no one has brought living plants or ſeeds to Europe. This is a *tree* of conſiderable ſize, often 50 feet high, with twiſted knotty branches, and a thick rugged bark, of an aromatic ſmell, and pungent permanent flavour. This bark is not much uſed in practice at preſent, there being many drugs of equal, or ſuperior, powers; as the *Canella alba*, which has taken its place, and cauſed the botanical miſtake above-mentioned. (See WINTER'*s Bark*.) The *leaves* are alternate, crowded about the ends of the branches, ever-green, two or three inches long, and one and a half wide, thick and rigid, entire, ſomewhat revolute, with a ſtout midrib, and ſcarcely viſible veins, very ſmooth on both ſides; ſomewhat glaucous, but not invariably or permanently ſo, beneath. *Footſtalks* broad and thick, ſmooth, half or three-quarters of an inch long. *Stipulas* none. *Flower-ſtalks* at the ends of the branches, two or three together, ſimple or three-cleft, ſmooth, not half the length of the leaves, accompanied at their baſe by ſeveral ovate, pale, deciduous *bracteas*. *Flowers* ſmaller

fmaller than a hawthorn bloffom, white. *Calyx* reddifh, unequally three-lobed. *Berries* from three to fix, each with four triangular *feeds*. By the above fynonyms to this fpecies it appears, that even G. Forfter, who with his father eftablifhed the genus and unexceptionable name of *Drimys*, gave way to thofe eminent botanifts who wifhed to retain the memory of the original difcoverer. Indeed the name of Winter may claim even a right of priority, though a miftake attended its commemoration and publication by Linnæus, in his Gen. Pl. We truft our amiable friend M. De Candolle will forgive our not joining with him, in overturning what has been finally fettled, with the approbation of all the world. If chronology is to be our abfolute guide, without attention to fenfe, or expediency, the nomenclature of botany muft relapfe into its priftine barbarifm, and in this cafe Bauhin's name *Laurifolia* fhould have been adopted. Even on this ground, weak as it is, we can however defend the name we have retained; for Clufius's *Winteranus cortex*, erroneoufly printed *Cortex Winteranus* by De Candolle, may be confidered as the firft commemoration of captain Winter, being the firft publication of any thing relating to the genus in queftion.

2. W. *granadenfis*. New Granada Winter's-bark. Murr. n. 2. Willd. n. 2. Mart. n. 2. "Humb. et Bonpl. Pl. Æquinox. v. 1. 205. t. 58. Lozano in Sem. Nov. Gran. for 1809, 180." (Drimys granadenfis; Linn. Suppl. 269. De Cand. n. 3.)—Leaves elliptic-lanceolate, obtufe. Flower-ftalks axillary, folitary. Piftils eight.—Sent by Mutis from New Granada. It grows on the moft lofty mountains of that country, Quito, &c. The *tree* is 18 or 20 feet high, with round branches, more ftraight, and lefs rugged, than the foregoing. *Leaves* four or five inches long, and near one inch and a half broad, obtufe, not acute, fcarcely revolute, perfectly fmooth; very glaucous beneath, like thofe of *Magnolia glauca*, the longer-leaved variety of which they greatly refemble. *Footftalks* fmooth, an inch long. *Flower-ftalks* fometimes nearly the length of the leaves, always half as long, fimple, divided, or three-cleft. *Flowers* twice the fize of *W. aromatica*, with about 12 *petals*, and a deeply three-cleft *calyx*. *Berries* fix or eight, obovate, fometimes confluent, each with from four to fix *feeds*. The *bark* is aromatic, like the former. The younger Linnæus imagined this to be a variety of that fpecies, caufed by a warmer climate. They are indeed more nearly related than appears at firft fight, and yet we can fcarcely think they belong to one fpecies, though well aware that the *leaves*, in this natural order, are liable to vary confiderably in fhape; witnefs the *Magnolia* juft mentioned, if more than one fpecies be not confounded under that name.

3. W. *chilenfis*. Chili Winter's-bark. (Drimys chilenfis; De Cand. n. 4.)—Leaves oblong-obovate; glaucous beneath. Flower-ftalks either aggregate or compound, axillary. Piftils five or fix.—Gathered by Dombey, in marfhy fituations in Chili. A tall *fhrub*, with a very aromatic bark, and round branches. *Leaves* nearly obovate, coriaceous, very fmooth, tapering at the bafe, on fhort ftalks, refembling the foliage of *Magnolia glauca*. *Flower-ftalks* axillary; fometimes very fhort, bearing an umbel of four or five elongated fimple ftalks; fometimes four or five fimple ones all together, each an inch long at moft, fingle-flowered. *Calyx* in two or three ovate blunt divifions, not foon deciduous, and perhaps lafting till the fruit is ripe. *Petals* fix to nine, oblong, bluntifh, twice the length of the calyx. *Stamens* very fhort. *Germens* five or fix, ovate, crowded, on a fmall globofe receptacle. *Berries* oval, rather compreffed, obtufe. *De Candolle.*

4. W. *mexicana*. Mexican Winter's-bark. (Drimys mexicana; De Cand. n. 5. "Moç. et Seffé Pl. Mex. ined. t....") — Leaves oblong-lanceolate, pointed at each end. Flower-ftalks elongated, umbellate, four-flowered. Petals twenty to twenty-four, acute. Germens four.—Native of Mexico. A *fhrub*, with round branches, terminating in a fharp bud, as in the *Magnoliæ*. *Leaves* ftalked, tapering at each end. *Common flower-ftalks* an inch, or an inch and a half long, divided at the top into an umbel of four long, fingle-flowered, *partial ftalks*. *Calyx* divided, permanent, concave. *Petals* white, fpreading, oblong, in a double row. *Stamens* very fhort. *Berries* four, or, from occafional abortion, only two or three, obovate, tapering at the bafe, of a blueifh-violet colour. *De Candolle from a coloured drawing.*

5. W. *axillaris*. Small-flowered Winter's-bark. Forft. Prodr. 42. Willd. n. 3. Mart. n. 3. (Drimys axillaris; Linn. Suppl. 270. Forft. Act. Upf. v. 3. 182. De Cand. n. 1. Lamarck f. 2, copied from Forft. Nov. Gen. t. 42. f. *a*—*l*.)—Leaves obovate, pointed, reticulated with veins. Flower-ftalks fimple, aggregate, thread-fhaped. Calyx orbicular, lobed, reflexed.—Native of woods in New Zealand. A *tree*, with round branches, rough to the touch, but not warty. *Leaves* on ftalks rather above half an inch long, broadly obovate, tapering to a bluntifh point, fmooth, more thin and membranous than in any of the other fpecies, copioufly reticulated with innumerable veins, not obfervable in any of thofe; their length three or four inches, breadth two; their under fide glaucous when young only. *Flower-ftalks* two or three together, feldom folitary, from the bofoms of moft of the leaves, fimple, very flender, each bearing a fmall green *flower*. *Calyx* difcoid, foon reflexed, about a line broad, fplitting into two principal, and two fmaller, lobes, not differing in any particular refpect from the divifions of the calyx of the other fpecies, though Forfter's figure has mifled De Candolle to fuppofe otherwife. *Petals* fix, oblong, flat, equal, four times the length of the calyx. *Stamens* about fixteen. *Germens* four, turbinate, all perfectly and evidently diftinct, in the numerous flowers of the Linnæan fpecimen; fo that Forfter might well wonder how the younger Linnæus, who had this very fpecimen before him, could make a "folitary piftil" a part of the fpecific character. *Stigmas* dilated, peltate, terminal. *Berries* four, globofe, black, with a tawny pulp, lodging four ovate, acute, fomewhat triangular, gibbous *feeds*. The flavour of the whole plant, efpecially of the bark, is extremely acrid and pungent. *G. Forfter.*

WINTERANA. See CANELLA, and WINTERA *fupra*.

WINTERBERG, in *Geography*, a town of the duchy of Weftphalia; 37 miles S. of Paderborn. N. lat. 51° 11'. E. long. 8° 39'.

WINTERBERG, or *Winberg*, a town of Bohemia, in the circle of Prachatitz; 10 miles W. of Prachatitz. N. lat. 49° 2'. E. long. 13° 39'.

WINTERBURG, a town of France, in the department of the Rhine and Mofelle; 10 miles W.N.W. of Creutznach.

WINTERHAM, a place in Virginia, where black-lead is found; 30 miles N. of Richmond.

WINTERHAUSEN, a town of the duchy of Wurzburg, on the Maine; 4 miles S. of Wurzburg.

WINTERINGHAM, a town of England, in the county of Lincoln; 166 miles N. of London.

WINTERTHUR, a town of Switzerland, in the canton of Zurich. This was formerly an imperial town. In the year 1467, it was mortgaged to the canton of Zurich, and by fubfequent treaties entirely ceded, fince which Winterthur has acknowledged Zurich for its sovereign. It is governed, however, by a magistracy and police of its own. The government is aristocratical; the supreme power, in all things not interfering with the claims of Zurich, residing in the Great and Little council, in all criminal proceedings these two tribunals unite, and pass sentence of death without appeal. In civil causes, an appeal lies from the Little to the Great council. In all cases respecting the burghers, appeals may be carried from the town-court to the council of magistracy, and no farther; but if either of the parties be a foreigner, an appeal lies from the council to the senate of Zurich. A bailiff from this latter place likewise resides here, but without any authority over the town, excepting that of assisting at the ceremony of an annual homage paid to Zurich by the burghers on St. Alban's day. In case of a war, Winterthur furnishes Zurich with 200 men, either burghers or dependents, but to serve under its own colours. Except in the articles of silk manufacture, and the establishment of a printing-press so profitable to Zurich, the commerce of Winterthur is under no restraint. The principal manufactures are, muslin, printed cottons, and cloth: it has some vitriol works; and the earthen-ware made here, particularly the white, together with its painted stoves, are in great repute for their beauty and durableness. The town is small, and the inhabitants, who are about 2000, are very industrious. The schools are well endowed and regulated. Ober Winterthur, or Upper Winterthur, is a small village near the town, on the high road leading to Frauenfeld, on the scite of the ancient Vitodurum, which was a Roman station. Here are found the foundations of ancient walls and numerous Roman coins and medals. The castle of Kyburgh, seated on an eminence overlooking Winterthur, is a picturesque object; 14 miles N.E. of Zurich.

WINTERTON, a town of England, in Lincolnshire; 9 miles N.N.W. of Glanford Brigs.—Also, a town of England, in the county of Norfolk, near the coast. The market is discontinued; 7 miles N. of Yarmouth.

WINTERTON *Ness*, a cape on the E. coast of the county of Norfolk, on which is a light-house; 10 miles N. of Yarmouth. N. lat. 52° 44′. E. long. 1° 41′.

WINTFELDEN, a town of France, in the department of the Upper Rhine; 10 miles S.W. of Colmar.

WINTHAG, a town of Austria; 6 miles N.E. of Freystadt.

WINTHROP, a post-town of the province of Maine, in the county of Kennebeck, with 1444 inhabitants; 57 miles N. of Portland.

WINTHROP's *Bay*, a bay on the N. coast of Antigua.

WINTON, a county of United America, in the state of South Carolina.—Also, a post-town of North Carolina; 30 miles E. of Halifax.

WINTONIÆ ROTULUS. See ROTULUS.

WINTZENBERG, in *Geography*, a town of Silesia, in the principality of Neisse; 5 miles S.E. of Grotkau.

WINTZENHEIM, a town of France, in the department of the Upper Rhine; 3 miles W. of Colmar.

WINTZIG, a town of Silesia, in the principality of Wohlau; 9 miles E.N.E. of Steinau. N. lat. 51° 27′. E. long. 16° 36′.

WINWEILER, a town of France, in the department of Mont Tonnerre; 24 miles N.E. of Deux Ponts.

WINWOOD, *Sir* RALPH, in *Biography*, a statesman in the reign of James I., was born at Aynho in Northamptonshire, about the year 1564, educated at St. John's college, Oxford, and having passed through several stages of preferment, was chosen proctor of the university in 1592. After having sustained several diplomatic characters and missions, he was made secretary of state in 1614, which office he occupied till his death in 1617. "He was married, and left one son. Sir Ralph was an accomplished gentleman, well acquainted with business, and particularly conversant with commercial and military affairs." A work, intitled "Memorials of Affairs of State in the Reign of Queen Elizabeth and King James I., collected chiefly from the Original Papers of the Right Honourable Sir Ralph Winwood, Knt. &c. &c." was published in 1725 by Edmund Sawyer, esq. in 3 vols. fol., and contained a valuable record of the political transactions of those times. Biog. Brit.

WINYAH, in *Geography*, a county of South Carolina.

WINZAH HARBOUR, a bay on the coast of South Carolina, a little to the N. of the mouth of the Santee. N. lat. 33° 12′.

WINZER, a town of Bavaria, on the Danube; 9 miles S.S.E. of Deckendorf.

WIOCHIST, among the *Indian Natives of Virginia*, is their priest, who is also generally their physician; and is the person in the greatest honour amongst them, next to their king, or great war-captain. Phil. Trans. N° 454. sect. 1.

WIOGRODEK, in *Geography*, a town of Poland, in Volhynia; 14 miles E.S.E. of Kreminiek.

WIP, a town of Prussia, on the Curisch Haff; 23 miles S.W. of Tilsit.

WIPACH, a town of the duchy of Carniola; 5 miles S. of Hydria.

WIPE, a town of Prussia, in the province of Smaland; 28 miles N.E. of Königsberg.—Also, a river of Prussia, which runs into the Curisch Haff, 10 miles E.N.E. of Labiau.

WIPFELN, a town of the duchy of Wurzburg; 5 miles N.N.W. of Volckach.

WIPPELSPACH, a town of the duchy of Stiria; 17 miles S.W. of Voitsberg.

WIPPER, a river of Germany, which rises in the county of Mark, about 6 miles S.S.W. of Lunschede, passes by Wipperfurt, Elberfeld, Solingen, &c. and runs into the Rhine, between Cologn and Zons.—Also, a river of Thuringia, which rises 2 miles N. of Dingelstadt, and runs into the Unstrutt, 4 miles N.E. of Kindelbrucken.—Also, a river of Pomerania, which runs into the Baltic below Rugerwalde.—Also, a river of Saxony, which runs into the Saal, near Bernberg.

WIPPERAU, a river of Westphalia, which runs into the Ilmenau, near Ultzen.

WIPPERFURT, a town of the duchy of Berg; 27 miles S.E. of Dusseldorf. N. lat. 51° 5′. E. long. 7° 27′.

WIPPINGEN, a town of Switzerland, in the canton of Friburg; 12 miles S.S.W. of Friburg.

WIPPRA, a town of Westphalia, in the county of Mansfeld, on the Wipper; 10 miles W.N.W. of Eisleben. N. lat. 51° 30′. E. long. 11° 30′.

WIRBEN, a town of Westphalia, late in the Old Mark of Brandenburg, on the left side of the Elbe; 12 miles N. of Stendal.

WIRBENTHAL. See WURBENTHAL.

WIRDOIS, a town of Sweden, in North Finland; 65 miles N.N.E. of Biorneborg.

WIRE, in the *Mechanic Arts*, is a very useful preparation of different metals, in form of a regular and even thread, which can be obtained in very great lengths, and of any required size or shape.

Wire is made of any ductile metal, as platina, gold, silver, copper, brass, zinc, iron, or steel. The process of making wire confifts in drawing the piece of metal through a hole in a plate of fteel, by which means the metal is rendered of an equal fize, and either round or of any other figure correfponding with the figure of the hole in the draw-plate; the metal is thus reduced in fize, and at the fame time is lengthened in proportion. From the great regularity of wire, and from its toughnefs and ductility, it is extremely ufeful to all artifts who work in metal.

The operation is called wire-drawing, and the plate of fteel a draw-plate. The machine by which the wire is drawn is called a draw-bench.

The common draw-bench is of a fimple ftructure. A ftrong plank of wood is fixed on legs, like a ftool or bench, *fig.* 1. *Plate Wire.* At one end is a roller or axis, A, fixed in an horizontal pofition, fo that it can be turned round by means of four levers, B B, fixed like radii on the end of the axis of the roller. If the refiftance is great, the workman applies both his hands and his feet to the levers, to turn them round in the fame manner as for a rolling-prefs. It is ufual to have a ftrong ftrap, or chain, C, to wrap and wind up round the roller; and at the end of it a pair of pincers, D, are linked: thefe take hold of the end of the piece of metal, and draw it through the hole in the draw-plate E, which is lodged againft two ftrong iron pins, *a a*, fixed in the bench, and ftanding up perpendicularly, fo that the plate bears againft them.

The pincers are fhewn in *fig.* 2. They are adapted to bite the end of the wire; and the infide of the jaws, *d d*, are cut with teeth like a file, that they may hold the metal very tight. The oppofite ends of the handles are bent in form of hooks at *e e*; and a triangular link of iron *f*, which is faftened to the end of the ftrap or chain C, embraces both hooks *e e*, and from its triangular figure, it tends to approach the two hooks at the ends of the tongs together: by thefe means, the ftrain of drawing the wire clofes the pincers, and makes them bite more forcibly in proportion as the wire makes a greater refiftance, fo that they rarely let the wire flip.

The draw-plate, *figs.* 3 and 4, is a thick plate of fteel, with holes made through it of various fizes, and in a regular gradation from the largeft to the fmalleft. The holes are made large on that fide where the wire enters, and they diminifh with a regular taper to the other fide; the goodnefs of the draw-plate is an object of the firft importance. The different holes muft diminifh by very fmall gradations, or there will be danger of breaking the wire by forcing it too much at once.

In fome draw-benches a rack and pinion are employed, inftead of a ftrap or chain; and a train of wheel-work may be ufed like that of a crane to obtain a fufficient power. (See *fig.* 5.) If the workman turns the machine by a winch or handle, it is preferable to four levers, becaufe the motion is more regular; this is of importance for fome purpofes. Suppofe a piece of elaftic metal is forcibly drawn through a hole in a plate with a tolerably quick motion, it will be compreffed at the moment of paffing through the hole; but after it quits the hole, the metal will expand a little. When it is drawn very flowly, this effect will not take place; for if the compreffion is continued long enough it becomes permanent: hence, if a piece of large wire be drawn with an irregular motion, firft quicker, and then flower, it will be fenfibly larger at all the parts which pafs quickly through the hole, and fmaller where it is drawn flowly: if the motion is fufpended for a few feconds, that part of the wire which remains in the hole will have a ring or indentation round it. This is moft obvious in drawing hollow tubes, or copper-wire, which is plated over with gold or filver.

In the machine which is ufed for drawing ftrong pieces of metal, and for the very largeft, the roller is ufually placed in a vertical pofition, like a capftan, with four levers, at which feveral men pufh, whilft they walk round in a circle to turn the capftan, and wind up the chain which draws the wire through the draw-plate.

A powerful machine of this kind is defcribed in our article PIPES, for drawing lead-pipe through a fteel plate.

We have feen a very powerful wire-drawing machine ufed for forming large hollow tubes of brafs or copper, on which the power to draw the tube was obtained by a fcrew, like that of a prefs. This fcrew was turned by a train of wheel-work, with a fly-wheel to regulate the motion.

Another plan, which is perhaps the beft mode for a very powerful drawing-machine, is to apply the force of the hydroftatic machine originally invented by Pafcal, and revived by the late Mr. Bramah. (See MACHINE, and PRESS.) By this means, very large wires for pifton-rods of fteam-engines, and other fimilar pieces, may be rendered ftraight and true with little expence.

All thefe machines are confined to draw pieces of metal, which are only a few feet in length, that is, the length of the bench. But when the metal by repeated drawing becomes lengthened into a regular wire, if it is required to reduce it to a ftill fmaller fize, it muft be drawn through fucceeding plates, by wrapping the wire itfelf upon the roller or barrel, inftead of employing a long chain. This method is not applicable at firft, becaufe a thick bar of iron could not be made to bend eafily round a roller; but when the wire becomes fmall and flexible, it can be practifed very advantageoufly, and admits of drawing a very great length of wire by a fmall and commodious machine.

The common wire-mills ufed in France do not, however, employ a roller or windlafs, but the pincers are attached to a lever, which draws them backwards and forwards alternately by the power of the water-wheel.

The pincers are fo conftructed, that the jaws open when they move towards the draw-plate, and releafe themfelves from the wire; but when the pincers are drawn back from the draw-plate, the link caufes the pincers to clofe and bite the wire with fuch force, that they will draw it through the plate.

A machine of this kind is fhewn in *fig.* 7. of the plate. The bafe of the machine is a very ftrong log of timber R; one end of it is cut open to receive a wooden lever A B, which moves round an iron pin or bolt *n*, as a centre of motion; this lever is fhaped like the letter L. To the upright arm A of this lever, an iron link C is jointed, and the other end of this link is formed like a ring, to receive the handles of the pincers D. The pincers are fupported upon a plate of iron *d*, which is placed in an inclined pofition, and there is a groove in the plate, into which the end of the pin or joint of the pincers is received, and they are by that means guided in their motion backwards and forwards: *a a* are the pins which fupport the draw-plate E; there are four of them, and the plate is faftened between them by wedges.

The end B of the lever is operated upon by cogs fixed on the axis of the water-wheel, which, as it turns round, depreffes the end B of the lever; and the end A pulls the pincers back, and draws the wire through the draw-plate; but when the cogs quit the end of the lever, it is returned by means of a rope faftened to the end of B, and going up to a ftrong wooden pole fixed on the roof of the building; and it acts as a fpring. When the pincers return, they open to releafe the wire, and flide down the inclined plate *d* by their own weight, till they are near the draw-plate; the wire being all the time included between the jaws, though they do not bite. The next cog which feizes the end of the lever draws back the pincers, which immediately clofe upon the wire, and draw it through the plate.

A wire-mill ufually contains three fuch machines of different fizes: the largeft only draws two inches of the wire at each ftroke, and makes about forty-eight ftrokes in a minute; the fecond machine, four inches; and the third, five inches. This works quicker than the other two, and makes fixty-four ftrokes *per* minute. This is a fimple machine, but very defective, for much time is loft in the returning of the pincers; they fometimes fail to take good hold of the wire, and they always make deep marks upon the wire at every place where they bite, which are not more than two inches diftance in the great wire, and five inches in the fmaller.

Fine wire is always made from large wire, by reducing it and lengthening it out by repeated drawings. The large wire is ufually manufactured at the wire-mills in the country, and fome part of it is reduced to fmall wire at the fame eftablifhments, but more commonly the large wire is bought by thofe who have occafion for it, and they reduce it by drawing until it becomes as fmall as it is wanted.

The hand-machine for this purpofe, reprefented in *fig*. 8, is extremely fimple. A is the roller on which the wire is wound up; it turns round upon a vertical pin, fixed in the bench R, and to the upper end a handle B is fixed, for the workman to turn it round; E is the draw-plate, and *a a* the pins againft which it refts. The wire which is to be drawn is put upon a fmall circular reel F, which turns round upon a vertical pin; this pin is fometimes fixed in the table, or otherwife in a fmall cafk containing ftarch-water, or beer which has become acid. The ufe of this is to loofen the oxyd from the furface of the wire, for it is neceffary to anneal or foften the wire very frequently, by putting it in the fire, and this produces a black coat of oxyd on the furface, which will be removed when the wire is again drawn through the plate, and the wire will come out bright and clean. The removal of this oxyd will be facilitated by fome flightly corrofive menftruum.

Fig. 9. is a very fimple and complete wire-drawing machine, to draw three wires at once. A R are two rollers or barrels with cog-wheels, T V, on the ends of their axis, which wheels are engaged together. S is a pinion, which is turned round by means of a handle B, and gives motion to the wheels T V. Both thefe wheels are fitted upon round parts of the axis of their refpective rollers, fo as to flip or turn freely round upon the fame; but a fquare is formed on the axis outfide of the wheel, and a clutch or catch, *t* or *v*, is fitted on this fquare part, fo as to turn always round with the axis. The catch is at liberty to flide upon the axis in the direction of its length, by means of a lever W, which operates upon both catches at once. When either of them is pufhed back in contact with the wheel, it intercepts two ftuds which project from the face of the wheel, and then compels the axis and roller to turn round with the wheel; but when the catch is drawn away from the wheel, then the wheel will flap round upon its axis, without communicating any motion. By means of the lever W, only one wheel can be engaged at once, and the other muft be free. The draw-plate E is firmly fixed between the two rollers, and it has a great many holes; the rollers are long enough to receive three wires at the fame time. Each roller has a groove in it parallel to the axis, into which a bar of metal is fitted, and will exactly fill it up. When the wires are introduced through the holes in the plate, the ends are laid acrofs this groove; the bar is then put in and faftened by a fimple contrivance, and it faftens the ends of the wires beneath it, fo that they become attached to the roller; then by turning the handle B round, the two wheels are put in motion in contrary directions; and that wheel which is connected with its axle by its catch, will turn its barrel round, and wind up the wires fo as to draw them through the plate E. The other roller being at the fame time detached, its wheel is at liberty to turn round in a contrary direction to the wheel, as faft as the wires are drawn off from it. When the whole length of the wires has been drawn through the plate, they are detached from the roller, the ends introduced through fmaller holes in the plate, and faftened again to the roller; then the lever W is fhifted, to difengage that wheel which operated before, and engage the other. This being done, the rollers will be turned in an oppofite direction, and will wind back the wires, although the handle B is turned the fame way round.

After the wire has been then drawn three or four times, the metal becomes fo hard and fibrous, that it would not draw any more without breaking; it therefore requires to be heated in the fire to reftore its ductility; for this purpofe it muft be taken off the barrels. A roller M is provided to wind the wire upon and draw it off from the barrel; this roller is turned round by a handle *m*, fixed on the extremity of its axis; and the wire which is wound upon it in a coil is flipped off fideways. This machine is well adapted to be worked by a mill, becaufe the handle may always be turned the fame way.

Fig. 10. reprefents the machine ufed at the wire-mills for reducing the wire which is to be ufed for mufical inftruments, or for making cards for wool and cotton. The rollers A are fituated in a vertical pofition, being fitted on the tops of iron fpindles, which are fuftained in a vertical pofition by bearings in the frame of the table or bench. Thefe fpindles are kept in continual motion by wheel-work fituated beneath the bench, but the fpindles are round, fo that the rollers A are not turned with the fpindles, unlefs any one of the rollers is lifted up upon the fpindle. A crofs-bar, which is fixed on the top of the fpindle, then engages with two projecting knobs fixed in the roller, within a hollow recefs made at the top of it, and turns the roller round. The draw-plate E is fupported by two pins, as before defcribed; and the wire which is to be drawn is wound on a reel, which is put into a cafk of ftale-beer grounds, or ftarch-water. The end of the wire, which is put through the draw-plate, is made faft to the roller, which does not turn round as long as it is dropped down upon the fpindle; but when all is ready to begin drawing, the roller muft be lifted up, and the clutch at the top of the fpindle will engage with the two knobs within the hollow at the top of the roller. This puts it in motion, and draws the wire through the draw-plate. The ftrain of drawing is fufficient to keep the roller up upon the fpindle; but as foon as the whole of the wire is drawn through the plate, the refiftance ceafes, and the roller drops down on its fpindle, and becomes difengaged until the workman puts it again in action.

Manufacture of Iron Wire.—Iron is a very ductile metal, but requires a careful treatment in the procefs of wire-drawing, becaufe it becomes very hard and brittle when the fibres are greatly compreffed by repeated drawing. Its ductility muft then be reftored by heating the wire to rednefs; this is called annealing: it renders the wire foft, and it will then draw finer and longer; but it will foon require annealing again, and fo on.

The iron which is felected for wire-drawing muft be of good quality, to bear the requifite extenfion without breaking. It muft be of an uniform fubftance, without any grains of of hard or soft parts. The softest iron is not always found the best, as it will diminish by the strain of drawing it through the holes alone: and to obviate this, the workman must draw such iron through a greater number of holes to obtain the required extension.

The iron is wrought at the tilt-mills from square bars into round rods of a proper size to commence drawing. The operation of tilting is nearly the same as *tilting of steel.* (See that article.) The tilt-hammer for a wire-work generally makes twenty strokes *per* minute, and weighs about fifty pounds. There is also a larger hammer worked by the same mill, which strikes about 130 times *per* minute, and weighs 100 pounds. This hammer is only used for the first preparation of the iron, or for welding a faggot of small bars together, in order to give the iron a better quality by a preparation similar to the German steel. To draw out the iron bars into rods of a proper size to begin drawing, the workman heats six or eight inches of the end of a large bar, which comes from the great forge where the iron is made, and when properly heated he works it regularly under the small tilt, until it is drawn out to a small and regular round rod of five or six feet in length. A good workman can thus draw out two hundred weight of iron in a day, or an ordinary workman one and a half hundred weight. The loss of metal in the operation is near 26 *per cent.* by weight.

The small rod, before it is cold, is taken by another workman, who straightens the rod with a hammer upon an anvil, then cuts it off, and places the end of the great bar again in the forge. This same workman also superintends the heating of the iron, and must be very careful not to overheat it, but to heat the whole regularly.

It is a good practice to pass the iron-rod through a pair of grooved rollers, the grooves of the two rollers being opposite, so as to form a round between them. By these means, the iron may be reduced small, and rendered very true, previously to beginning the drawing. For common wire, the whole reduction may be done by the rolling-mill without a tilt; but the hammer will give a more tenacious quality to the iron than can be obtained by rolling.

A small round bar, thus prepared, must be drawn through a hole in a draw-plate, by a strong machine with a chain, or else by the lever-machine, *fig.* 7. The end of the iron is first reduced, so that it will enter the hole in the draw-plate, and pass through sufficiently for the pincers to take hold. This is done at the forge by a hammer and anvil. By passing through the plate the wire becomes lengthened, in proportion as it is diminished in size. It must then be annealed to soften it, the end pointed anew, and again put through a smaller hole.

The workman who attends the process must study the nature of the iron, and regulate the manner of drawing accordingly. This he does by altering the figure of the hole through which the wire is drawn. The hole must be conical; the smallest part, being that which acts principally on the metal, must be at that side of the plate where the wire comes through. If the taper of the hole is not properly proportioned, the iron will be strained in drawing; for though the machine will force it through, grains of harder metal than the rest of the wire will form themselves, which will occasion the wire to break when it comes to be much reduced. This is particularly the case in soft iron. To avoid this, the hole must be chosen very little smaller than the iron, and must be made with a regular taper. It must be well supplied with grease, to diminish as much as possible the friction; and the motion of the draught must be regulated according as the metal will bear it.

Much depends upon the quality of the draw-plate; although the metal of the plate is sufficiently hard to draw the wire, it will not resist the blow of a hard steel hammer and punch. The punch is driven into the hole from behind, until it enlarges it to the required size and figure. In the operation of drawing, the hole becomes gradually enlarged, and that in a greater degree at the smallest end of the hole, so that it becomes nearer to a cylinder. To rectify this, the punch must be applied, or the wire would not pass easily; that is, if the same degree of reduction in the size of the wire was attempted, it would break or strain the wire, if the hole was cylindrical, although it would pass through a regular taper hole. The hole sometimes wears irregularly, and loses its circular figure. In this case, the plate is hammered around the small end of the hole, and the hole is thereby reduced. The punch is then driven in, to enlarge it again to the required size: sometimes the punch is introduced at the small end, and then at the large end, as it may be required to form the hole. In all cases, the punch must be driven very gently; and after every stroke of the hammer it must be loosened in the hole, and turned round before another blow is struck, and without this precaution it would fix fast in the hole.

The French draw-plates are the most esteemed; and, in time of war, a good French draw-plate has been sold for its weight in silver. M. Du Hamel, in Les Arts et Metiers, vol. xv. gives the following account of the process of making the draw-plates for the large iron-wire.

A band of iron is forged of two inches broad and one inch thick. This is prepared at the great forge. About a foot in length is cut off, and heated to redness in a fire of charcoal. It is then beaten on one side with a hammer, so as to work all the surface into furrows or grooves, in order that it may retain the substance called the potin, which is to be welded upon one side of the iron, to form the hard matter on which the holes are to be pierced. This potin is nothing but fragments of old cast-iron pots; but those pots which have been worn out by the continued action of fire are not good: the fragments of a new pot which has not been on the fire are better.

The workman breaks these pieces of pots on his anvil, and mixes the pieces with charcoal of white wood. He puts this in the forge, and heats it till it is melted into a sort of paste; and to purify it he repeats the fusion ten or twelve times, and each time he takes it with the tongs to dip it in water. M. Du Hamel says, this is to render the matter more easy to break into pieces.

By these repeated fusions with charcoal, the cast iron is changed, and its qualities approach those of steel, but far from becoming brittle; it will yield to the blows of the hammer and to the punch, which is used to enlarge the holes. The bar of iron which is to make the draw-plate is covered with a layer of pieces of the potin, or cast iron, thus prepared. It is applied on the side which is furrowed, and should occupy about half an inch in thickness. The whole is then wrapped up in a coarse cloth, which has been dipped in clay and water mixed up as thick as cream, and is put into the forge. The potin is more fusible than the forged iron, so that it will melt. The plate is withdrawn from the fire occasionally, and hammered very gently upon the potin, to weld and in some measure amalgamate it with the iron, which cannot be done at once; but it must be repeatedly heated, and worked until the potin fixes to the iron. The workman then throws dry powdered clay upon it, in order, they say, to soften the potin.

The union being complete, the plate is again heated, and forged by two workmen, who draw out the plate of one

 foot

foot to a length of two feet, and give it the form it is to have. It is well known that caft iron cannot be worked at the forge without breaking under the hammer; but in the prefent inftance, it is alloyed with the iron-bar, and is drawn out with it. It has alfo acquired new properties by the repeated fufions with charcoal.

The holes are next pierced whilft the plate is hot. This is done with a well-pointed punch of German fteel, applied on that fide of the plate which is the iron-bar. It requires four heats in the fire to pierce the holes, and every turn a finer punch is employed, fo as to make a taper hole. The makers of draw-plates do not pierce the holes quite through, but leave it to the wire-drawers to do it themfelves when the plate is cold, with fharp punches, and then they open the hole to the fize they defire; and although this potin is of a very hard fubftance, the fize of the hole may be reduced by gentle blows with a hard hammer, on the flat furface of the plate, round the hole.

A great many holes are made in the fame plate; and it is important that they fhould diminifh in fize by very imperceptible gradations; fo that the workman can always choofe a hole fuitable for the wire he is to draw, without being obliged to reduce it too much at once.

To afcertain the fize of the wire, gauges are ufed. They are commonly made of a piece of wire bent in zigzag, as fhewn in *fig.* 11; and the fpace between every bend is of a different width; but a better fort is made of a fteel-plate, with notches on the edge. (See *fig.* 12. for the ftandards.) Thefe fhould be hardened, that they may not be fubject to wear.

Fig. 13. is another kind of gauge, which is very accurate. It confifts of two ftraight rules of fteel, put together at an angle. The diameter of the wire is indicated by the depth to which it will enter into the angle; the edges of the rulers are divided into equal parts for that purpofe, and numbered, to correfpond with the different fizes of wire.

The wire manufactory of Meffrs. Mouchel, fituated at l'Aigle, in the department de l'Orne, is one of the moft confiderable in France. It furnifhes annually, in cards for wool-combing only, an hundred thoufand quintals of iron-wire, each 100lbs. A part of this is confumed in France, and the reft is exported to Portugal, Spain, Italy, and even to the fhores of the Levant.

They employ the iron manufactured in the departments of l'Orne and La Haute Saone, as being of the beft quality. The firft produces the beft wire for making fcrews, nails, and pins, as much on account of its hardnefs as its fine polifh, which refembles fteel-wire. In this refpect, it is fuperior to the iron of Haute Saone, but from its ductility the latter can now be made extremely fine, and it appears to be moft free from heterogeneous particles.

The fmelted iron, prepared and hammered, being in a ftate nearly fit for their purpofe, is tranfported, at a fmall expence, to l'Aigle, by the rivers and canals. They have a forge to reduce the fteel and iron of Normandy, which arrives in large pieces, into fmall and regular bars.

When the iron is formed into an irregular bar of about a centimetre, near four-tenths of an inch in diameter, they begin to draw it into wire. Although it be already much extended by hammering, it is in the firft place paffed four times through the drawing-plate; then its molecules become difpofed lengthways, and exhibit fibres at their utmoft extenfion. The fibres muft be removed by means of heat, which difperfes and divides them; and after that the wire may again be reduced three numbers. The fibres which are re-produced by this operation are again removed by heat. The whole procefs is five times repeated; confequently the wire is paffed through fifteen numbers; after which, a fingle expofure to the fire is fufficient to fit it for paffing fix others, whereby it is reduced to the thicknefs of a knitting-needle.

The fteel-wire, being much harder, requires to be paffed through forty-four numbers, and to be annealed every other time.

The machine which draws the fteel-wire muft go flower than that which draws the iron; for the firft being very hard, and offering more refiftance to the drawing-plate, fhould be pulled out with more care, fince the quicknefs ought to be proportioned to the refiftance, and reciprocally; and if they depart from this principle, the refults will vary. Thus, for example, the iron of the department de l'Orne, which is more compact than that produced at Haute Saone, if drawn by the fame machines, augments in hardnefs, and is weakened when it is brought to too great a degree of finenefs. But this iron, which is very hard, and capable of receiving a very high polifh, is to be preferred for certain ufes.

In order to anneal the wire, they formerly employed a large and elevated furnace, with bars of caft iron to fupport the wire in the middle of the flames. It contains feven thoufand pounds weight, fo contrived as to contain equal portions of each number. They are fo arranged that the thickeft wires receive the ftrongeft heat; therefore, the whole is equally heated in the fame fpace of time. The operation lafts three hours with a fire well kept up, and it might be imagined that this apparatus was completely adapted to the purpofe; but there are imperfections in this method, becaufe it leaves the wire expofed to the contact of the atmofpheric air, the oxygen of which feizes it with extreme avidity; whence a confiderable quantity of oxyd is occafioned, and alfo an operation to free it from the fcales, which confifts of beating the bundles of wire with a wooden hammer wetted with water.

Notwithftanding this precaution, there often remains a portion of oxyd adhering to the furface of the metal, which ftreaks the draw-plate, or fixes on the wire, and gives it a tarnifhed appearance, and caufes it to break when it is brought to a great degree of finenefs. This furnace is only ufed for the fteel-wire, or the iron from l'Orne, which is lefs liable to change, and befides being harder is not fo eafily attacked by the oxygen.

In order to diminifh the wafte that the fire occafions, they have contrived another procefs, which confifts in dipping the bundles of wire into a bafin of wet clay before they put them into the furnace; and they are left in the furnace to dry before the fire is lighted, without which precaution the clay would peel off from the iron.

For making wire for cards, M. Mouchel invented another furnace. It is round, and about one metre fix decimetres in diameter, and one metre eight decimetres in height, without including its parabolic arch and the chimney above it. The interior is divided by horizontal grates into three ftories; the loweft receives the cinders, the fecond is the fire-place, and into the third or upper place they flide a roleau of wire, weighing one hundred and fifty kilogrammes, which is inclofed in a fpace comprifed between two caft-iron cylinders, being luted to prevent the admiffion of air between them. The flames circulate about the outfide of the firft, and within the interior of the fecond, which defends the wire from atmofpheric air. The diameter of the largeft cylinder is about one metre four decimetres, that of the fecond one metre. Thus the fpace comprifed between them is two decimetres, on an elevation of five decimetres. There muft be feveral pairs of cylinders provided; becaufe whilft one

pair

pair is in the furnace another muſt be prepared to receive a freſh roleau of wire. They are changed every hour by means of a long iron lever, with which a ſingle man can eaſily puſh them in and draw them out again, as the cylinder ſlides on caſt-iron rails.

They are very careful not to open the cylinders immediately on their being drawn out of the fire; for the roleaus of wire contained in them, being ſtill red, would oxydate quite as much as if they had been heated in the midſt of the flames without the leaſt precaution.

The opening contrived for the paſſage is on the ſide, and has a door of caſt iron, with a groove which winds round the furnace. The fire-place has one ſomething ſimilar to it. That of the aſh-hole is vertical, in order that it may be raiſed to increaſe the fire at will.

When the iron-wire is reduced to the thickneſs of a knitting-needle, it is made up in bundles of 125 kilogrammes (275 pounds) each, into a large iron veſſel, in order to anneal it ſufficiently to be reduced for the laſt time. This veſſel is placed upſide-down in the middle of a round furnace, which is ſo conſtructed as to ſuſtain burning coals all round it, and of which it conſumes 35 kilogrammes (77 pounds) before the operation is completed. The cover muſt be carefully luted, as the ſlighteſt admiſſion of air is ſufficient to burn the external ſurfaces of the wire to an oxyd, which cannot afterwards be reduced.

When one of theſe veſſels is ſufficiently heated, it is filled with water, containing three kilogrammes (ſix pounds and a half) of tartar, and ſuſpended over the flames of the furnace to make it boil. This ſolution, without attacking the metal, frees it from the greaſe and the little oxyd that adheres to it. This is the laſt operation in which the wire is expoſed to the fire; and it is then in the proper ſtate for being reduced to the utmoſt degree of fineneſs it is capable of ſuſtaining, and will preſerve enough of the effect of the annealing to require it no more. But when the natural hardneſs of the iron varies, this laſt expoſure to the fire ſhould take place in proportion to its thickneſs. As ſteel loſes its capacity of extenſion much ſooner than iron, it is annealed until it is no thicker than a ſewing-needle. The ſpace which is left in the veſſel is filled up with charcoal-duſt, which prevents it from loſing the quality of ſteel, and preſerves the heat long enough to give it the proper degree of pliancy.

As Meſſrs. Mouchel always uſe iron and ſteel of the ſame manufactory, they have been able to reduce their operations to a general ſyſtem; and to attain this end, have determined a graduated ſcale, by which the wire will not be more ſtretched in the drawing-plate in one number or ſize than another. The following is the method they contrived, in order to form this ſcale for the iron-wire. They take a certain quantity of various thickneſſes, which has been drawn as fine as the iron would bear. The ſmalleſt ſize is 100,000 metres (109,333 yards) in length to the kilogramme, 2.2 pounds avoirdupois. They note the weight that each might be capable of ſupporting without breaking. This being expreſſed by figures, it is eaſy, by a few interpolations, to expreſs them in a progreſſive form. This kind of ſcale has been partly formed by comparing the weight of the different ſizes with equal lengths, from which gauges or calibres may be made for the uſe of the workmen. Theſe gauges are certain guides, which they cannot miſtake except through great careleſſneſs. If they had not theſe guides they would often paſs the wire through holes in the drawing-plate that are too large for it, whence it does not acquire the ſtrength it ſhould have in proportion to its thickneſs, and loſes its hardneſs. They might alſo paſs it through holes that were too ſmall, which would weaken it, and render it very brittle. In the latter caſe, it frequently happens that the ſteel of the drawing-plate, being unable to ſuſtain the force to which it is expoſed, will give way, as if the plate were too ſoft; and the wire will be brittle at the beginning, and ſoft and too thick at the other extremity.

The greateſt part of the fine wire of Meſſrs. Mouchel's manufactory is drawn by workmen who are diſperſed about the country; but they have alſo a machine which moves twenty-four bobbins in a horizontal direction, which only requires the workman to look after it. It is upon the bobbins that the wire is reduced to the different degrees of thinneſs deſired; therefore, this is the laſt operation in the art of making iron and ſteel wire; although it has all requiſite qualities given to it in the work-ſhop of the wire-drawer.

Wire is ſtill incapable of being made into needles and carding-hooks, until it has undergone another operation for dreſſing or ſtraightening the wire, by which it is made to loſe the bend or curve that it acquires on the bobbins.

This work conſiſts in drawing the wire between nails fixed in a piece of wood, and which act to bend the wire, firſt in one direction, and then in the oppoſite, in a waving line, of which the waves are at firſt larger, but decreaſe gradually, and the laſt bend of which tends to force the wire into a ſtraight line. The dreſſer is obliged conſtantly to adjuſt the nails, by inclining or raiſing them with ſtrokes of the hammer. Alſo for each number of wires the pins muſt be at different and calculated diſtances. This requires a workman of intelligence, diligence, and addreſs.

An ingenious inſtrument is now appropriated to this operation, and removes all difficulty. Six little puppets of very hard ſteel are ſubſtituted for the nails of the ordinary inſtrument, and are fixed on parallel bars of metal, ſo jointed together that the movement of them all will be parallel, and the puppets are widened or brought nearer together by ſcrews. The wire is drawn between theſe puppets in a zigzag or waving line, and the repeated flexures break the ſinuoſities of the wire. There is a conductor of the wire to the puppets, and another conductor which ſerves to prevent the wire from being ſhaken. There are ſlight grooves at the extremity of the puppets, to give a paſſage to the wire. A ſcale ſuſtained by a ſcrew indicates the diſtance at which the puppets ſhould be placed from each other, to ſtraighten each ſize of wire. This forms an invariable rule, and the dreſſer (who may be a child) ſaves a third of the time which is employed in regulating the nails of the inſtrument formerly uſed. There is nothing more to be done but to draw out the wire by means of a wheel, on which he reels it, and then forms it into bundles to be delivered to the conſumers.

The ſteel-wire of France is proper for many purpoſes. It is brought from Meſſrs. Mouchel, for making knitting-needles in the Engliſh faſhion, ſhoemakers' needles, and other ſimilar articles. It may alſo be uſed for needles of all ſizes, and even for cards for wool-combing; but as this ſteel is much more expenſive than the iron-wire, it is very ſeldom uſed for the latter purpoſe.

The method of preparing the draw-plates is deſcribed by Meſſrs. Mouchel, and is different from that before deſcribed.

For making wire for cards, two ſorts of drawing-plates are uſed, large and ſmall ones. The firſt, for the ſort of wire that we have been deſcribing, is drawn with the pincers, as *fig.* 7, and with the bobbin or roller, which is a cylinder adapted to the axis turned by the water-mill, and is uſed in preference, to avoid the marks made on the wire by the pincers. The ſmall drawing-plates are uſed for ſuch wire as may be drawn by hand. The ſteel which they employ for theſe drawing-plates ſhould never vary in quality, except that the ſmaller plates are made of the fineſt ſteel. Several pieces of iron are diſpoſed in the furnace in the form of a box without a lid, their weight being according to the uſe for which they are intended to be employed.

The workman fills each of theſe boxes with caſt ſteel, and having covered it over with a luting of clay, it is expoſed to a fierce fire until the ſteel be melted. His art conſiſts in ſeizing the proper moment to withdraw the plate from the fire: he raiſes the luting, and blows on it through a tube, in order to drive off all heterogeneous parts, and then amalgamates it with the iron by light blows. After it is cool, he replaces it at the fire, where the fuſion again takes place, but to a leſs degree than before; he afterwards works the ſteel with light blows of the hammer, to purify and ſolder it with the iron. This operation is repeated from ſeven to ten times, according to its quality, which renders it more or leſs difficult to manage. During this proceſs, a cruſt forms on the ſteel, which is detached from it the fifth time of its expoſure to the fire, becauſe this cruſt is compoſed of an oxydated ſteel of an inferior quality. It ſometimes happens that two and even three of theſe cruſts are formed of about two millimetres, or one-ſixteenth of an inch in thickneſs, which muſt alſo be removed.

After all theſe different fuſions, the plate is beaten by a hammer wetted with water, and the proper length, breadth, and thickneſs, are given to it. When thus prepared, the plates are heated again, in order to be pierced with holes by punches of a conical form; the operation is repeated five or ſix times, and the punches uſed each time are progreſſively ſmaller. It is of importance that the plate never be heated beyond a cherry-red, becauſe if it receives a higher degree of heat, the ſteel undergoes an unfavourable change. The plates, when finiſhed, preſent a very hard material, which nevertheleſs will yield to the ſtrokes of the punches and the hammer, which they require when the holes become too much enlarged by the frequent paſſing of the wire through them.

When the plates have been repaired ſeveral times, they acquire a degree of hardneſs, which renders it neceſſary to anneal them, eſpecially when they paſs from one ſize to another; ſometimes they do not acquire the proper quality until they have been annealed ſeveral times. Notwithſtanding all the precautions which are taken in preparing the plates, the ſteel ſtill varies a little in hardneſs, and according to this variation they ſhould be employed for drawing either ſteel or iron wire; and if the workman who proves them finds that they are too ſoft for either the ſteel or iron, they are put aſide, to be uſed by the braſs-wire drawers.

A plate that is beſt adapted for drawing ſteel-wire is often unfit for the iron; for the long pieces of this latter metal will become ſmaller at the extremity than at the beginning, becauſe the wire as it is drawn through the plate is inſenſibly heated, and the adhering parts are ſwelled, conſequently preſſed and reduced in ſize towards the latter end. The plates that are fit for braſs are often too ſoft for iron, and the effect reſulting is the reverſe of that produced by a plate that is too hard.

The ſmalleſt plates which Meſſrs. Mouchel uſe are at the leaſt two centimetres, or eight-tenths of an inch in thickneſs, ſo that the holes can be made ſufficiently deep; for when they are of a leſs thickneſs, they will ſeize the wire too ſuddenly and injure it. This inconvenience is much felt in manufactories where they continue to uſe the plates for too long a time, as they become exceedingly thin after frequent repairs. One of Meſſrs. Mouchel's large plates reduces 1400 kilogrammes (3080 pounds avoirdupois) from the largeſt ſize of wire to No. 6, which is of the thickneſs of a knitting-needle; 400 kilogrammes (880 pounds) of this number are afterwards reduced in one ſingle ſmall plate to No. 24, which is carding wire; and to finiſh them, they are paſſed through twelve times ſucceſſively.

For the tenacity of iron wire, ſee Iron.

The firſt wire-mill in England was ſet up by a Dutchman at Sheen, near Richmond, in 1663.

Wires are frequently drawn ſo fine, as to be wrought along with other threads of ſilk, wool, or hemp: and thus they become a conſiderable article in the manufactures. See Ductility.

Wire, *Gold*. See Gold-*Wire*.

Muſchenbroeck records, that an artiſt of Augſburg drew a wire of gold ſo ſlender, that 500 feet of it weighed only one grain; and Dr. Wollaſton, ſecretary of the Royal Society, has ſhewn, that a wire of gold may be drawn much finer than this, and that wires of platina may be drawn much more ſlender, with the utmoſt facility. Thoſe who draw ſilver-wire in large quantities for lace and embroidery, ſometimes begin with a rod that is about three inches in diameter, and ultimately obtain wires that are ſo ſmall as $\frac{1}{100}$ of an inch in thickneſs. If in any ſtage of this proceſs a rod of ſilver-wire be taken, and a hole be drilled through it longitudinally, having its diameter one-tenth part of that of the rod, and if a wire of pure gold be inſerted, ſo as to fill the hole, it is evident that by continuing to draw the rod, the gold within it will be reduced in diameter exactly in the ſame proportion as the ſilver; ſo that if both be thus drawn out together till the diameter of the ſilver is $\frac{1}{500}$ of an inch, then that of the gold will be only $\frac{1}{5000}$; and of ſuch wire, 550 feet would be requiſite to weigh one grain. In order to remove the coating of ſilver that ſurrounds it, the wire muſt be ſteeped for a few minutes in warm nitrous acid, which diſſolves the ſilver without any injury to the gold. Dr. W., in his endeavours to make ſlender gold-wires by the method above-deſcribed, found it difficult to drill the central hole in a metal ſo fine as ſilver, and therefore tried whether platina might not be ſubſtituted for the gold, as in that caſe its infuſibility would allow its being coated with ſilver, without the neceſſity of drilling. Having formed a cylindrical mould one-third of an inch in diameter, he fixed in the centre of it a platina wire previouſly drawn to the $\frac{1}{100}$ of an inch, and then filled the mould with ſilver. When this rod was drawn to $\frac{1}{30}$, his platina was reduced to $\frac{1}{1000}$, and by ſucceſſive reduction he obtained wires of $\frac{1}{4000}$ and $\frac{1}{5000}$, and excellent for applying to the eye-pieces of aſtronomical inſtruments, and perhaps as fine as can be uſeful for ſuch purpoſes. The extremity of a platina wire having been fuſed into a globule near $\frac{1}{4}$ of an inch in diameter, was next hammered out into a ſquare rod, and then drawn again into a wire $\frac{1}{253}$ of an inch in diameter. The fuſion was effected by the following ſimple and eaſy method ſuggeſted by Dr. Marcet:

Marcet:—A piece of wire, about fix inches long, having been bent to an angle in the middle, one half of its length was held in the flame of a fpirit-lamp impelled by a current of oxygen, and its extremity was thus fufed in about half a minute. An inch of the wire above-mentioned duly coated with filver was drawn, till its length was extended to 182 inches; confequently the proportional diminution of the diameter of the platina will be expreffed by the fquare root of 182, fo that its meafure had become $\frac{1}{253 \times 13.5} = \frac{1}{3425}$. The fpecific gravity of the coated wire was affumed to be 10.5, and fince the weight of 100 inches was 114 grains, its diameter was inferred to be $\frac{1}{42.8}$ of an inch, and juft eighty times of the platina thus contained in it. With portions of the platina wire thus obtained, and fucceffively reduced in diameter, its tenacity was afcertained; and the refults of feveral trials fhewed in general, that the procefs of wire-drawing, which is known to improve the ftrength of metals within moderate limits, continued alfo to add fomething to the tenacity of platina, even as far as $\frac{1}{18.000}$ of an inch, which fupported $1\frac{1}{3}$ grain before it broke; but the wire in which the experiments were made began then to be impaired by repetition of the operation; fo that although he afterwards obtained portions of it as fmall as $\frac{1}{30.000}$ of an inch in diameter, it was in many places interrupted, and he could not rely on any trials of its tenacity. For other particulars with regard to thefe fine wires, we refer to the Phil. Tranf. vol. ciii. pt. 1.

Wire, *Silver*, is the fame with gold wire, except that the latter is gilt, or covered with gold, and the other is not. There are alfo counterfeit gold and filver wires: the firft made of a cylinder of copper, filvered over, then covered with gold; and the fecond of a like cylinder of copper filvered over, and drawn through the iron, after the fame manner as gold and filver wire.

By 43 Geo. III. c. 68. feveral duties are impofed on wire imported, as fet forth in tables annexed to the act; and by c. 69. fched. A. duties are laid upon wire made in Great Britain; and by 49 Geo. III. c. 98. new duties are impofed. Every wire-drawer who fhall draw any gilt or filver wire, commonly called 'big wire,' fhall take out a licence, for which he fhall pay 2*l.*, to be renewed annually on pain of 20*l.* 24 Geo. III. c. 41. One licence fuffices for a partnerfhip. Notice is to be given of working on pain of 20*l.*, and the place of working is to be approved by the commiffioners under the fame penalty. Wire, and bars for making it, and utenfils, found in any private workhoufe, of which no notice hath been given, fhall be forfeited. Officers fhall be permitted to enter and furvey, and the penalty of obftructing him is 20*l.* 10 Ann. c. 26. Preventing him from taking a juft account incurs a forfeiture of 100*l.* 26 Geo. III. c. 77. Juft fcales and weights fhall be kept on pain of 10*l.* Perfons ufing falfe fcales and weights forfeit 100*l.* 10 Geo. III. c. 44. And the fame fhall be forfeited and feized. 28 Geo. III. c. 37. Ingots or bars of filver, defigned for gilt wire, fhall be weighed in the prefence of the excife officer, before they be covered with gold, and again weighed and marked after the gold is laid on, under penalty of 20*l.* 15 Geo. II. c. 20.

By 10 Ann. c. 26. an allowance of one-fifth is made for wafte in reducing the big wire to fmall wire. Removing wire before it is furveyed incurs a penalty of 40*l.*; and unfurveyed wire is to be kept feparate, on pain of 10*l.*; and the punifhment of concealing wire, &c. is a forfeiture of 20*l.* The wire made fhall be entered every month, on oath, on pain of 100*l.* The duty muft be cleared off in fix weeks after entry, on pain of double duty.

By 15 Geo. II. c. 20. and 22 Geo. II. c. 36. no foreign embroidery, or gold or filver brocade, thread, lace, fringe, or work made thereof, or of copper, brafs, or other inferior metal, or gold or filver wire, or plate, fhall be imported. And by 10 Ann. c. 26. if any perfon fhall export any gold or filver thread, or lace or fringe made of plate wire fpun upon filk, he fhall have a drawback after the rate of 5*s.* a pound avoirdupois, of fuch filver thread, lace, or fringe, and of 6*s.* 8*d.* a pound of fuch gold thread, lace, or fringe.

For regulations concerning the true making of gilt and filver wire, fee the ftatute 15 Geo. II. c. 20. and for prohibiting the felling or working up of foreign gold or filver lace or thread, fee 22 Geo. II. c. 36.

Wire, *Brafs*, is drawn after the fame manner as the former. Of this there are divers fizes, fuited to the divers kinds of works. The fineft is ufed for the ftrings of mufical inftruments, as fpinets, harpfichords, manichords, &c.

The pin-makers likewife ufe vaft quantities of wire of feveral fizes, to make their pins of. See Pin.

Wire, *Iron.* See Wire *fupra.*

Wire-*Gauze Safety-Lamp*, and *Safety-Lamp*, in the *Arts*, are lamps conftructed to prevent the explofion of inflammable air in mines, by intercepting the communication of the flame on the infide of the lamp with the furrounding atmofphere. The difcovery of fafety-lamps for this purpofe belongs exclufively to our own country, and will form a new era in mining operations. We fhall, therefore, ftate the hiftory of their invention with as much accuracy as poffible, amidft the contending claims of the different inventors for priority. The explofions of inflammable air in coal-mines arife from the ignition of carburetted hydrogen evolved from the ftrata, and mixed with the atmofpheric air that circulates through the mine. Thefe explofions very frequently occafion the moft fatal effects, deftroying the lives of all the perfons employed as well as of the horfes, and producing great mifchief to the fubterranean works. Some mines are much more liable to accidents from this caufe than others. In fome the carburetted hydrogen accumulates flowly from the want of due circulation; in other mines, it is generated very rapidly, iffuing from fiffures called blowers, which occur either in the roof, the floor, or the fides of the mine.

In the coal-fields of the Tyne and the Wear, it has been eftimated that fix hundred men and boys were deftroyed in two years by explofions in the mines; but thefe accidents, unlefs they took place on a large fcale, were as much as poffible kept from public notice, partly from the fear of alarming the workmen, and partly from the apprehenfion of blame to the viewers and managers of the works. Of thefe melancholy cataftrophes, few regifters are kept in any part of Great Britain; but in the year 1810 an explofion took place in a mine in the parifh of Felling near Newcaftle, which, from the magnitude of the evil it occafioned, excited a general fenfation of horror throughout the country. In this mine, the property of wealthy and liberal owners, no expence had been fpared in the introduction of machinery and the moft approved methods of ventilation. (See Ventilation *of Mines.*) Notwithftanding this, on the 25th of May

May 1812, the inflammable air exploded in two difcharges from one of the pits, which was fhortly followed by a third from another pit.

The depth of thefe explofions under the furface obtunded the found of the reports; but for half a mile round the vibrations of the earth announced the occurrence of the accident before the noife efcaped, and an alarm was created four or five miles round by low and hollow rumblings in the air. Immenfe volumes of denfe vapour and coal-duft, with pieces of wood and coal, were driven high into the atmofphere; and the mangled bodies of feveral men and boys were abfolutely thrown out of the fhaft. The country in the immediate vicinity was enveloped in darknefs, and every kind of machinery near the mouths of the pits was blown to pieces, or fet fire to. Out of a hundred and twenty men and boys employed in the mine only thirty-two were faved, three of whom afterwards died. The coal being fet fire to, and the fubterranean works blown down or deftroyed, the owners were compelled to clofe the mouths of the pits in order to extinguifh the fire; and it was not till the feventh or eighth of the following month that it could be re-opened to extract the bodies, which were, many of them, too much mangled, and in too putrefcent a ftate, to be identified by the relatives. A feries of fimilar difafters, in each of which from twenty to thirty-five human beings were deftroyed, occurred foon afterwards in the fame diftricts, and even in the Felling mine another explofion took place in December 1813, by which twenty-three men and boys and twelve horfes were killed. The only method that bad been adopted to prevent explofions, befides the ufual modes of ventilation for clearing the mine, was the fubftitution of fteel-mills for candles.

The fteel-mill is an inftrument for producing light by the collifion of flint and fteel: it confifts of a brafs wheel about five inches in diameter, with fifty-two teeth, which works a pinion with eleven teeth. On the axis of the pinion is fitted a thin jagged fteel wheel, from five to fix inches in diameter; againft the circumference of this wheel the fharp edge of a flint is fixed, and the toothed wheel has a handle, which is turned by a boy; the whole machine being fixed in an iron frame fufpended by a leather belt. The fteel wheel revolves with great velocity, and elicits a ftream of fcintillations, which give a confiderable light. Where the mines were fufpected to contain inflammable air, thefe machines were ufed; but befides affording only an unfteady light, and being difficult to manage, many inftances had occurred of the air igniting from the fcintillations of fteel-mills. For the purpofe of exploring the unworked and more dangerous parts of the mine, the fteel-mill was both an inconvenient and incomplete inftrument; but until the year 1809 no method of lighting had been attempted which might fuperfede its ufe.

About that time Dr. Reid Clanny, a fcientific and ingenious phyfician at Sunderland, commenced a feries of experiments, with a view to infulate the gas which might explode in a lamp, and cut off its communication with the furrounding air in the mine. With this intent, he conftructed a lamp in which the combuftion of the oil or tallow is fupported by the ordinary air of the coal-mine fupplied by a pair of bellows, and paffing through a ftratum or refervoir of water below the light; at the fame time, a portion of the air already in the lamp is driven through another refervoir in the upper part above the light, and thus the air fupplied may explode within the body of the lamp without communicating the flame to the external air, however highly it may be charged with carburetted hydrogen gas. The moment the air enters the lamp it comes in contact with the flame, and confequently only a fmall portion of it can be exploded, inftead of the whole contents of the lamp; by this means feveral obvious advantages are fecured. The air paffing in a brifk current clofe by the flame carries the fnuff with it, fo that the light is always clear and fteady. The other parts of the lamp were air-tight, and the whole made very ftrong, with a glafs nearly half an inch thick to prevent it from being broken by any common accident. It is capable of being managed by a boy at a much lefs expence than the fteel-mill. This lamp, which, for ftrength and for fecurity from explofions and accidents, exceeds any other that has fince been invented, excited little attention among the coal-workers where it was firft made known. Had not the prejudices againft improvements prevented its general introduction, more than one thoufand lives might have been preferved, which were deftroyed in the mining diftricts of the Tyne and Wear in a few years after its difcovery. In its firft form, the lamp, though fecure, was not made fufficiently light to be portable without being placed on a barrow; but Dr. Clanny afterwards improved it in this refpect, by fubftituting a fmall pair of bellows to be worked under the right arm; the lamp, being fufpended by a leather belt from the left fide of the boy who carried it, might in this way be moved into the narroweft or moft dangerous parts of the mine. A defcription of Dr. Clanny's fafety-lamp, with a plate, was firft given in the Philofophical Tranfactions of the Royal Society for 1813, part ii. p. 200. In this lamp, however ftrong may be the currents of air in the mine, the flame cannot be affected by them, and the moft dangerous *blower* may be approached in perfect fafety. When an explofion takes place in the lamp it extends no farther, and the flame is inftantly extinguifhed; and wherever there is fufficient atmofpheric air to fupport life, this lamp will afford a fafe and abundant light. The conftruction of the lamp was rendered more fimple by paffing the air through the oil, by which the neceffity of the lower refervoir of water was avoided.

In *Plate* I. *fig.* 2. *Geology*, is given an outline of the lamp on its original principle, which, though lefs portable, is, we confider, the fafeft that has yet been employed. A is the body of the lamp, conftructed of copper or block-tin; B, the upper part of the lamp, ending in a conical bent tube, by which the air is difcharged after fupporting combuftion through the water-ciftern C and D, the part D being filled with water to keep the lamp cool, if neceffary; E, the window of the lamp, made of very thick glafs; F, the candle, fupported on a tin ftand; G, a ciftern containing water, through which the air is forced by the bellows; H, a tube from the bellows, which conveys air to the lamp. A flexible leather tube may be fixed to the valve of the bellows, to fend atmofpheric air from a diftance, if neceffary. If the lamp be in order, it is fcarcely poffible to conceive any infulation of the flame more perfect than it prefents; and to Dr. Clanny muft be allowed the undoubted claim of priority in having firft directed the attention of miners to a method of avoiding danger before unknown, and of fhewing practically how it might be effected. In the improvement which Dr. Clanny made in this lamp afterwards, to render it more portable, (fee *fig.* 3. in the fame plate,) *a* is the tube fixed to the lamp, and which conveys the air; *b*, the oil-ciftern; *c*, the air aperture, under the burner of the oil; *d*, the flexible tube connected with the bellows; *e*, *f*, the glafs. In both thefe lamps, the air being fupplied by bellows, required the conftant attention of a boy; this, however, was the cafe with the fteel-mills, which were in general ufe before. A lamp that would fupply itfelf with atmofpheric air was ftill a defideratum; when Dr. Clanny difcovered, in November 1815, as he was making experiments with the original fafety-lamp in an atmofphere of fire-damp

in

in the Horrington mine, near Sunderland; that if the infulation of the lamp were made with hot water, the fire-damp burned filently at the wick, and did not explode within the lamp, as formerly. This he afcertained to be owing to the fteam; and he farther difcovered, that one part in volume of fteam to two of the moft explofive mixtures deftroyed their inflammability. A fimilar effect of fteam had been before noticed by Von Grotthus, in the 82d volume of the Annales de Chimie, but had not been applied to any ufeful purpofe. In December of the fame year, Dr. Clanny conftructed a fteam fafety-lamp, which he exhibited to the Society, for preventing accidents in coal-mines, and received their unanimous thanks; and in 1817 he received a gold medal from the Society of Arts for the difcovery.

In the fteam fafety-lamp there is a refervoir of water at the top of the lamp, which is a clofed tin box, or ciftern. The water is kept boiling by the flame of the lamp, and the fteam mixing with the carburetted hydrogen prevents all rifk from explofion. The air is fupplied through a tube to the upper part of the ciftern above the water, and defcends, mixed with the fteam, down two other tubes, into the body of the lamp. By this means, the fire-damp burns filently and fteadily at the wick of the lamp alone for any length of time. Should the carburetted hydrogen exceed the proportion of atmofpheric air for fupporting combuftion, the light is extinguifhed, but this can rarely happen. It has alfo the valuable property of keeping cool throughout every part, and under all circumftances; this is effected by the evolution and motion of the fteam. This lamp, fays Dr. Clanny, is now well known to burn moft brilliantly in an atmofphere of fire-damp, even after the original fafety-lamp has had the fire-damp exploded within it. The fteam-lamp has now been extenfively ufed in feveral of the northern collieries. Its great recommendation over other inventions is the fuperior light which it affords. Thefe lamps are made of the ftrongeft tinned iron, with a flat glafs in front, three-eighths of an inch in thicknefs. They are exceedingly ftrong and durable, and coft about twelve fhillings, but might be manufactured on a large fcale for half the price.

Fig. 4. reprefents the fhort tube by which the air enters into the tube *b*, and this tube fupports the water-ciftern *c* at the top, being fitted into the tube *a* at the bottom, fo as to be taken out and replaced when the water is to be poured in or removed from the ciftern *c*. The air which afcends the tube *b* mixes with the fteam of the water-ciftern, and paffes down the two tubes *d*, *d*, to fupport the combuftion of the flame, and afterwards afcends by the fide of the ciftern through the chimney of the lamp. Thefe tubes are clofed at the bottom, and perforated on the fides, to retard the progrefs of the air, and mix it with the fteam before it reaches the flame *e*. The bottom is air-tight; *f* the glafs, and *g* the oil-lamp. Thefe lamps are twelve inches in length, exclufively of the chimney. They fhould be cleared of water, and well dried, after they have been in ufe, that they may be more durable. When the lamp is firft lighted it is neceffary to eftablifh a current, which is beft done by turning the lamp, fo that the tube *a* may be expofed to the current of air; this will be effected in five minutes, and the lamp will afterwards continue to burn regularly and fteadily.

Dr. Clanny farther applied the fame principle to the conftruction of a larger lamp, in which were three wicks to burn the inflammable air as it was made to iffue through the oil; this is intended to confume the hydro-carburetted gas as it rufhes from a blower.

In the hiftory of ufeful inventions, perhaps no inftance of fupinenefs can be adduced, among thofe interefted in any difcovery, which equals the inattention fhewn for feveral years by the coal-workers in the north to the valuable labours of Dr. Clanny. We had an opportunity of examining his lamp in 1813, and were fatisfied with the complete fecurity which it affords. At that time, however, fo far from receiving the patronage he highly merited, he was regarded by many with a ftrange jealoufy, as an officious intruder into the myfteries of mining; myfteries which he had no right to inveftigate. To Dr. Clanny, however, the firft difcovery of a fafety-lamp is undoubtedly due; and we have no hefitation in afferting our belief that his original fafety-lamp is the moft fecure of any that have fince been invented, where dangerous parts of the mine are to be explored, on account of its more complete infulation, and its greater ftrength. His lamp had alfo the merit of firft fuggefting the poffibility of infulating the flame in the different lamps which have fince been conftructed.

The attention of the public was at length directed to the dangerous fituation of the men working in the mines by a few gentlemen, who formed a fociety, in 1813, at Sunderland, entitled A Society to prevent Accidents in Coal-Mines. Dr. Gray, rector of Bifhop-Wearmouth, an active member of this fociety, invited fir H. Davy, in 1815, who was then on a vifit in the north of England, to examine the collieries with a view to affift the efforts of the fociety to prevent the accidents to which they were fubject. From the information communicated to him by perfons employed in the mines, he was induced to commence a feries of experiments on carburetted hydrogen gas, which led to feveral unexpected refults, not lefs interefting to fcience than ufeful in their application to the arts. Before proceeding to defcribe thefe, we muft notice the labours of Mr. Stephenfon, an engineer in the Killingworth main colliery, who previoufly to this time had, as he afferts in a pamphlet on the fubject, entitled "A Defcription of the Safety-Lamp invented by George Stephenfon," made the difcovery that inflammable air will not explode through fmall apertures. In the fame pamphlet he ftates, that a lamp conftructed by him on this principle was tried in the above colliery on the 21ft of October 1815, the lamp being carried in fafety into a part of the mine where a ftrong blower of inflammable air was iffuing. The experiment, he adds, was immediately repeated in the prefence of two perfons employed in the works.

Thefe lamps, judging from Mr. Stephenfon's own defcription, yielded but a feeble light. They were afterwards improved; but thefe improvements bear fo clofe a refemblance to parts of fir H. Davy's lamp, hereafter to be defcribed, that we conceive Mr. Stephenfon muft labour under no fmall difficulty in eftablifhing his claim for their original invention. The queftion, at prefent agitated with much warmth, can only be decided by a reference to well-eftablifhed dates and authentic evidence; an inveftigation not fuited to the nature of the prefent work.

We have little doubt that the infulation obtained in Dr. Clanny's lamp by water firft fuggefted to Mr. Stephenfon the poffibility that fmall apertures might intercept the extenfion of the flame as effectually as water. On this fuggeftion his firft lamp appears conftructed, the tube which admitted the air being covered with a flide, to diminifh the aperture at pleafure; but the quantity of air which could be fafely admitted through one aperture being inadequate to the fupport of the flame, it was obvious that the only way to enfure both light and fafety was to increafe the number of apertures, diminifhing the fize of each. In this manner, it appears that Mr. Stephenfon proceeded mechanically, without a correct knowledge of the properties of the gas, or the principles on which the effects were produced. We think, however,

that

that as an approximation to a valuable difcovery, Mr. Stephenfon's lamp entitled him to the patronage and fupport which he has received. It ought alfo to be recollected that Dr. Clanny and Mr. Stephenfon both laboured under the difadvantage of living at a diftance from the refidence of ingenious practical mechanics to execute their inventions in the moft fimple, cheap, and portable manner; an advantage only to be obtained in the neighbourhood of the metropolis, or of large mechanical manufactories.

Sir H. Davy, after afcertaining that the fire-damp, or inflammable air in coal-mines, is the light carburetted hydrogen gas, as ftated by other chemifts, proceeded to examine accurately its combuftibility and explofive nature. When one part of fire-damp was mixed with one of common air, the mixture burned on the approach of a taper, but did not explode. Two of air and three of fire-damp produced fimilar refults. When four of air and one of fire-damp were expofed to a lighted candle, the mixture being in the quantity of fix or feven cubic inches in a narrow-necked bottle, the flame defcended to the bottom, but there was no noife. One part of gas inflamed with fix parts of air in a fimilar bottle, producing a flight whiftling found. One part of gas with three of air rather a louder found. One part with ten, eleven, twelve, thirteen, and fourteen parts, ftill inflamed, but the violence of the combuftion diminifhed. In one part of gas and fifteen parts of air, the candle burned without explofion, with a greatly-enlarged flame. The fame effect was obferved, but in a gradually diminifhing ratio, as far as thirty parts of the gas to one of common air. The mixture which feemed to poffefs the greateft explofive power was feven or eight parts of air to one of gas; but the report produced by fifty cubic inches of this mixture was lefs than that produced by one-tenth of a mixture confifting of two parts of common air and one of pure hydrogen.

It was alfo very important to afcertain the degree of heat required to explode the different mixtures of fire-damp. A common electrical fpark, he found, would not explode five parts of air and one of fire-damp, though it exploded fix parts of air and one of the latter gas. Very ftrong fparks from the difcharge of the Leyden jar feemed to have the fame power of exploding different mixtures of the gas, as the flame of a taper. Well-burned charcoal, ignited to the ftrongeft heat, did not explode any mixtures of the gas; and when a fire of the fame charcoal, which burned without flame, was blown to whitenefs by an explofive mixture without producing inflammation. An iron rod at a red or even at a white heat did not inflame explofive mixtures of the gas; but when in brilliant combuftion it produced that effect.

The flame of gafeous oxyd of carbon, as well as of olefiant gas, exploded the mixtures of the fire-damp.

In refpect of combuftibility, fays fir H. Davy, the fire-damp differs materially from the other common inflammable gafes. Olefiant gas, when rendered explofive by a mixture of common air, is fired both by charcoal and iron, heated to a dull rednefs. Gafeous oxyd of carbon, which explodes with two parts of air, is likewife inflammable by hot iron or charcoal. And hydrogen, which explodes when mixed with three-fevenths of air, takes fire at the loweft vifible heat of iron or charcoal; and the cafe is the fame with fulphuretted hydrogen.

The importance of thefe experiments is too obvious to require illuftration. Having afcertained the above facts, fir H. Davy proceeded to examine the degree of expanfion of mixtures of fire-damp and air during their explofion, and likewife their power of communicating flame through apertures to other explofive mixtures. It is to this latter part of fir H. Davy's experiments and its application to fafety-lamps, that the controverfy refpecting the priority of the difcovery refers.

When fix parts of air and one of fire-damp were exploded over water by a ftrong electrical fpark, the explofion was not very ftrong; and at the moment of the greateft expanfion, the volume of the gas did not appear to be increafed more than one-half. In exploding a mixture of one part gas from the diftillation of coal, and eight parts of air in a tube one-quarter of an inch in diameter, and one foot long, more than a fecond was required before the flame reached from one end of the tube to the other, and he could not make any mixture explode in a glafs tube one-feventh of an inch in diameter; and this gas was more inflammable than fire-damp, as it confifted of carburetted hydrogen mixed with fome olefiant gas.

In exploding mixtures of fire-damp and air in a jar, connected with the atmofphere by an aperture of half an inch, and connected with a bladder by a ftop-cock having an aperture of about one-fixth of an inch, the flame paffed into the atmofphere, but did not communicate through the ftop-cock fo as to inflame the mixture in the bladder; and in comparing the power of tubes of metal and thofe of glafs, it appeared that the flame paffed more readily through tubes of glafs of the fame diameter, and that explofions were ftopped by metallic tubes of one-fifth of an inch, when they were one inch and a half long; and this phenomenon probably depends upon the heat loft during the explofion, in contact with fo great a cooling furface, which brings the temperature of the firft portions exploded below that required for firing the other portions.

Metal is a better conductor of heat than glafs; and it has been already fhewn, that the fire-damp requires a very ftrong heat for its inflammation.

A mixture of the gas with air, he alfo found, would not explode in metallic canals or troughs when their diameter was lefs than one-feventh of an inch, and their depth confiderable in proportion to their diameter, nor could explofions be made to pafs through fuch canals.

Azote and carbonic acid, even in fmall proportions, diminifhed the velocity of inflammation in explofive mixtures of fire-damp. Azote, when mixed in the proportion of one to fix of an explofive mixture containing twelve of air and one of fire-damp, deprived it of its power of explofion; when one part of azote was mixed with feven of an explofive mixture only, a feeble blue flame paffed through it.

One part of carbonic acid to feven of an explofive mixture deprived it of the power of exploding; fo that its effects are more remarkable than thofe of azote, probably in confequence of its greater capacity for heat, and probably likewife of its higher conducting power connected with its greater denfity.

The confideration of thefe various facts, fir H. Davy informs us, led him to adopt a form of lamp in which the flame, being fupplied with only a limited quantity of air, fhould produce fuch a quantity of azote and carbonic acid as to prevent the explofion of the fire-damp; and which, by the nature of its apertures for giving admittance and exit to the air, fhould be rendered incapable of communicating any explofion to the external air.

If in a clofe lantern fupplied with a fmall aperture below and another above, a lighted lamp having a very fmall wick be placed, the natural flame gradually diminifhes, till it arrives at a point at which the fupply of air is fufficient for the combuftion of a certain fmall quantity of oil; if a lighted taper be introduced into the lantern through a fmall door

door in the ſide, which is inſtantly cloſed, both lights will burn for a few ſeconds, and be extinguiſhed together.

A ſimilar phenomenon occurs: if in a cloſe lantern ſupplied with a quantity of air merely ſufficient to ſupport a certain flame, a mixture of fire-damp and air is gradually admitted, the firſt effect of the fire-damp is to produce a large flame round that of the lamp, and this flame conſuming the oxygen which ought to be ſupplied to the lamp, and the ſtandard of the power of the air to ſupport flame being lowered by the admixture of fire-damp and by its rarefaction, both the flame of the fire-damp and that of the lamp is extinguiſhed together; and as the air contained a certain quantity of azote and carbonic acid before the admiſſion of the fire-damp, their effect by mixing it is ſuch as to prevent an exploſion in any part of the lantern.

In an experiment which ſir H. Davy made, to aſcertain that the flame was extinguiſhed in the lantern, though the mixture was ſtill exploſive which ſupplied the flame, the lantern was placed on a ſtand under a large glaſs receiver ſtanding in water, which was of ſufficient capacity to enable the candle to burn for ſome minutes. A quantity of fire-damp was thrown in from a bladder, ſo as to render the atmoſphere exploſive. As the fire-damp mixed with the air, the flame of the taper gradually enlarged till it half filled the lantern; it then gradually diminiſhed, and was ſuddenly extinguiſhed without the ſlighteſt exploſion. The air in the receiver was found after the experiment to be highly exploſive.

Sir H. Davy then introduced into a glaſs jar, containing an exploſive mixture of one part fire-damp and ten parts of air, a lighted lantern, to which air was ſupplied by two glaſs tubes one-tenth of an inch in diameter, and half an inch long. The taper burned at firſt with a feeble light, the flame ſoon became enlarged, and was then extinguiſhed. Theſe experiments were ſeveral times repeated with a conſtancy of reſult. It is evident, he ſays, from hence, that it is only neceſſary to uſe air-tight lanterns ſupplied with air from tubes or canals of ſmall diameter, or from apertures covered with wire-gauze, placed below the flame, through which exploſions cannot be communicated, and having a chimney at the upper part on a ſimilar ſyſtem for carrying off the foul air.

This principle ſir H. Davy adapted to a variety of glaſs lanterns, in which the air was admitted through ſmall apertures or wire-gauze, with a top protected by the ſame. Theſe lanterns, however they might have anſwered for experiments in the laboratory, were not, however, well fitted for practical uſe; for beſides the frangibility of common glaſs, which expoſed the miner to exploſions from the enlargement of the flame, the glaſs was liable to become heated and to break, however ſtrong it might be made. This inconvenience was, however, removed by the ſubſtitution of a cylinder of fine wire-gauze, forming a cloſe lamp or lantern, into which the air is admitted, and from which it paſſes through very ſmall apertures. In the firſt experiments, the wire was of braſs the $\frac{1}{200}$th part of an inch in thickneſs, and the apertures were not more than the $\frac{1}{120}$th part of an inch; this was found to ſtop exploſions as well as the long tubes or canals, and to admit a free current of air. The wire-gauze lamp, in its preſent improved form, is the moſt ſimple and portable that has yet been introduced. *Plate* V. *fig.* 5. *Geology*, repreſents the lamp as at preſent uſed; *a* repreſents the ſingle cylinder of wire-gauze; the foldings *a a a* muſt be very well doubled and faſtened by wire. If the cylinder be of twilled gauze, the wire ſhould be at leaſt of the one-fortieth of an inch of iron or copper, and thirty in the warp, and ſixteen or eighteen in the weft. If of plain wire-gauze, the wire ſhould not be leſs than one-ſixtieth of an inch in thickneſs, and from twenty-eight to thirty both warp and weft; *b* repreſents the ſecond top, which fits upon *a*; *c* repreſents a cylinder of braſs, in which the wire-gauze is faſtened by a ſcrew, to prevent its being ſeparated from the lamp by any blow; *c* is fitted into a female-ſcrew, which receives the main-ſcrew *b* of the lamp *f*, furniſhed with its ſafe-trimmer *b*, and ſafe-feeder for oil *i*.

Lamps on the ſame principle were conſtructed, in which the cylinder is made of copper of one-fortieth of an inch in thickneſs, perforated with longitudinal apertures of not more than one-ſixteenth of an inch in length, and the one-thirtieth in breadth. (See *Plate* I. *fig.* 6. *Geology*.) In proportion as the copper is thicker, the apertures may be increaſed in ſize. This form of the lamp may be proper where ſuch an inſtrument is only to be occaſionally uſed, but for the general purpoſe of the collier, ſir H. Davy ſtates that wire-gauze is much ſuperior from its flexibility, and the eaſe with which new cylinders are introduced.

To this lamp a valuable addition has been lately made by the application of a lens before the flame, to condenſe the rays of light, and direct them to any particular ſpot. It has the farther advantage of protecting that part of the wire-gauze from coal-duſt, by which it is liable to be choaked and obſcured in a few hours.

In ſubſequent experiments, ſir H. Davy diſcovered that much thicker wires and larger apertures might be uſed than were at firſt applied. This gave to the lamp greater ſtrength, and tranſmitted more light.

Gauze made of braſs wire $\frac{1}{30}$th of an inch in thickneſs, and containing only 100 apertures in the ſquare inch, did not communicate exploſion in a mixture of one part coal-gas and twelve of common air, ſo long as the wire was cool; but as ſoon as the top became hot an exploſion took place. A quick lateral motion alſo enabled it to communicate exploſion. With 196 apertures to the ſquare inch, the exploſion was not communicated till the wire became ſtrongly hot.

Iron wire-gauze, containing 240 apertures to the ſquare inch, was ſafe in exploſive mixtures of coal-gas, till it became ſtrongly red-hot at the top.

Iron wire-gauze, of 576 apertures to the ſquare inch, or the $\frac{1}{24}$th part of an inch each in diameter, appears, ſays ſir H. Davy, to be ſafe under all circumſtances, in exploſive mixtures of coal-gas. With very fine wire-gauze, mixtures of oxygen and hydrogen gaſes may be burned without exploſion until the braſs wire begins to melt.

The explanation which ſir H. Davy gives of the effect of wire-gauze, and ſmall tubes in arreſting the progreſs of flame, is as follows:—Theſe reſults are beſt explained by conſidering the nature of the flame of combuſtible bodies, which in all caſes muſt be conſidered as the combuſtion of an *exploſive mixture* of inflammable gas, or vapour and air; for it cannot be regarded as a mere combuſtion at the ſurface of contact of the inflammable matter: and the fact is proved by holding a taper, or a piece of burning phoſphorus, within a large flame made by the combuſtion of alcohol; the flame of the candle, or of the phoſphorus, will appear in the centre of the other flame, proving that there is oxygen even in its interior part.

The heat communicated by flame muſt depend upon its maſs: this is ſhewn by the fact, that the top of a ſlender cylinder of wire-gauze hardly ever becomes dull-red in the experiment on an exploſive mixture; whilſt in a larger cylinder made of the ſame material, the central part of the top ſoon becomes bright-red. A large quantity of cold air thrown upon a ſmall flame, lowers its heat beyond the exploſive

exploſive point; and in extinguiſhing a flame by blowing upon it, the effect is probably produced principally by this cauſe, aſſiſted by a dilution of the exploſive mixture.

If a piece of wire-gauze ſieve is held over a flame of a lamp, or of coal-gas, it prevents the flame from paſſing it, and the phenomenon is preciſely ſimilar to that exhibited by the wire-gauze cylinders: the air paſſing through is found very hot, for it will convert paper into charcoal; and it is an exploſive mixture, for it will inflame if a lighted taper is preſented to it; but it is cooled below the exploſive point, by paſſing through wires even red-hot, and by being mixed with a conſiderable quantity of air comparatively cold. The real temperature of viſible flame is, perhaps, as high as any we are acquainted with. Mr. Tennant was in the habit of ſhewing an experiment which demonſtrates the intenſity of its heat. He uſed to fuſe a ſmall filament of platinum in the flame of a common candle; and it is proved by many facts, that a ſtream of air may be made to render a metallic body quite hot, yet not be itſelf luminous.

A conſiderable maſs of heated metal is required to inflame even coal-gas, or the contact of the ſame mixture with an extenſive heated ſurface. An iron-wire of $\frac{1}{30}$th of an inch, and eight inches long, red-hot, when held perpendicularly in a ſtream of coal-gas, did not inflame it, nor did a ſhort wire of one-ſixth of an inch produce the effect held horizontally; but wire of the ſame ſize, when ſix inches of it were red-hot, and when it was held perpendicularly in a bottle containing an exploſive mixture, ſo that heat was ſucceſſively communicated to portions of the gas, produced its exploſion.

A certain degree of mechanical force, which rapidly throws portions of cold exploſive mixture upon flame, prevents exploſions at the point of contact. Thus, on preſſing an exploſive mixture of coal-gas from a ſyringe, or a gum elaſtic bottle, it burns only at ſome diſtance from the aperture from which it is diſengaged.

Taking all theſe circumſtances into account, there appears no difficulty in explaining the combuſtion of exploſive mixtures within, and not without the cylinders: for a current is eſtabliſhed from below upwards, and the hotteſt part of the cylinder is where the reſults of combuſtion, the water, carbonic acid, or azote, which are not inflammable, paſs out. The gas which enters is not ſufficiently heated on the outſide of the wire to be exploded; and as the gaſes are no where confined, there can be no mechanical force preſſing currents of flame towards the ſame point.

Two papers by ſir H. Davy, connected with this ſubject, were afterwards publiſhed in the Philoſophical Tranſactions for 1817, entitled "Some Reſearches on Flame." In theſe papers, a number of new and extremely intereſting experiments on the properties of flame are detailed. The practical application of the reſults to ſafety-lamps we ſhall briefly ſtate, as they explain more clearly the principle on which their ſafety depends, and the circumſtances eſſentially requiſite to their proper conſtruction. Sir H. Davy commences the paper by informing us, that the intenſity of the light of flames depends principally upon the production and ignition of ſolid matter in combuſtion; and that the heat and light in this proceſs are in a great meaſure independent phenomena: and he afterwards defines flame to be gaſeous matter, heated ſo highly as to be luminous, and that to a degree of temperature beyond the white heat of ſolid bodies, as is ſhewn by the experiment; that air not luminous will communicate this degree of heat; for if we hold a fine platina wire one-twentieth of an inch from the exterior of the middle flame of a ſpirit-lamp, and conceal the flame by an opaque body, the wire will become of a white heat in a ſpace where there is no viſible light.

When an attempt is made to paſs flame through a very fine meſh of wire-gauze at the common temperature, the gauze cools each portion of the elaſtic matter that paſſes through it, ſo as to reduce its temperature below that degree at which it is luminous; and the diminution of temperature muſt be proportional to the ſmallneſs of the meſh and the maſs of the metal. The power of a metallic or other tiſſue, to prevent exploſion, will depend upon the heat required to produce the combuſtion, as compared with that acquired by the tiſſue; and the flame of the moſt inflammable ſubſtances, and of thoſe that produce moſt heat in combuſtion, will paſs through a metallic tiſſue that will intercept the flame of leſs inflammable ſubſtances, or thoſe that produce little heat in combuſtion. Or the tiſſue being the ſame, and impermeable to all flames at common temperatures; yet when heated it will become permeable to each different kind of flame at different temperatures: thoſe which produce moſt heat will moſt readily paſs through it. A tiſſue of one hundred apertures to the ſquare inch, made of wire of one-ſixtieth part of an inch, will, at common temperatures, intercept the flame of a ſpirit-lamp, but not that of hydrogen; and when ſtrongly heated will no longer arreſt the flame of the ſpirit-lamp.

The ratio of combuſtibility of the different gaſes is to a certain extent proportionate to the maſſes of heated matter required to inflame them. Thus, an iron-wire of one-fortieth of an inch heated cherry-red will not inflame olefiant gas, but will inflame hydrogen gas: and a wire of one-eighth of an inch heated to the ſame degree will inflame olefiant gas; but a wire of one-five-hundredth part of an inch muſt be heated to whiteneſs to inflame hydrogen.

Theſe circumſtances will explain why a meſh of much finer wire is required to prevent the exploſion from hydrogen and oxygen from paſſing; and why ſo coarſe a texture of wire is ſufficient to prevent the exploſion of the fire-damp, the leaſt combuſtible of the known inflammable gaſes.

The following experiments afford a ſatisfactory and ſimple explanation of the cauſe of the ſtoppage of flame by the wire-gauze lamp. Let the ſmalleſt poſſible flame be made by a ſingle thread of cotton immerſed in oil, and burning immediately on the ſurface of the oil; it will be found to be about one-thirtieth of an inch in diameter. Let a fine iron-wire one-hundred-and-eightieth part of an inch be made into a circle of one-tenth of an inch in diameter, and brought over the flame. Though at ſuch a diſtance it will inſtantly extinguiſh the flame if it be cold; but if it be held above the flame, ſo as to be ſlightly heated, the flame may be paſſed through it without being extinguiſhed. The effect depends entirely on the power of the metal to abſtract the heat of the flame. This is ſhewn by bringing a glaſs capillary ring of the ſame diameter and ſize over the flame: this being a much worſe conductor of heat will not extinguiſh it even when cold. If its ſize, however, be made greater, and its circumference ſmaller, it will act like the metallic wire, and require to be heated to prevent its extinguiſhing the flame.

Suppoſe a flame to be divided by the wire-gauze into ſmaller flames, each flame muſt be extinguiſhed in paſſing its aperture, till that aperture has attained a temperature ſufficient to produce the permanent combuſtion of the exploſive mixture. Where rapid currents of exploſive mixtures are made to act upon wire-gauze, it is of courſe much more rapidly heated, and therefore the ſame meſh which arreſts the flames of exploſive mixtures at reſt will ſuffer them to paſs when in rapid motion; but by increaſing the cooling ſurface,

ſurface, by diminiſhing the ſize or increaſing the depth of the aperture, all flames, however rapid their motion, may be arreſted. Preciſely the ſame law applies to exploſions acting in cloſe veſſels: very minute apertures, when they are only a few in number, will permit exploſions to paſs which are arreſted by much larger apertures, when they fill a whole ſurface. A ſmall aperture was drilled at the bottom of a wire-gauze lamp, in the cylindrical ring which confines the wire-gauze; this, though leſs than one-eighteenth part of an inch in diameter, paſſed the flame, and fired the external atmoſphere, in conſequence of the whole force of the exploſion of the thin ſtratum of the mixture included within the cylinder driving the flame through the aperture; though, had the whole ring been compoſed of ſuch apertures, it would have been perfectly ſafe. Nothing, ſays ſir Humphrey Davy, can demonſtrate more decidedly than theſe ſimple facts and obſervations, that the interruption of flame by ſolid tiſſues permeable to light and air, depends on no recondite or myſterious cauſe, but to their cooling powers ſimply conſidered as ſuch.

When light, included in a cage of wire-gauze, is introduced into an exploſive atmoſphere of fire-damp at reſt, the maximum of heat is ſoon obtained, the radiating power of the wire and the cooling effects of the atmoſphere, more efficient from the mixture of inflammable air, preventing it from ever arriving at a temperature equal to that of dull redneſs. In rapid currents of exploſive mixtures of fire-damp, which heat common gauze to a high temperature, twilled gauze, in which the radiating ſurface is conſiderably greater and the circulation of air leſs, preſerves an equal temperature. Indeed the heat communicated to the wire by combuſtion of the fire-damp in wire-gauze lamps is completely in the power of the manufacturer, for by diminiſhing the apertures, and increaſing the maſs of metal, or the radiating ſurface, it may be diminiſhed to any extent. One important circumſtance, however, is not here adverted to by ſir Humphrey Davy; by increaſing the thickneſs of the wire and diminiſhing the aperture, the quantity of light tranſmitted is greatly reduced, and its power of illumination rendered nearly inefficient. Hence the power of the manufacturer to conſtruct a lamp perfectly ſafe and ſufficiently luminous muſt be limited by certain conditions. However, ſir Humphrey Davy informs us, he has lately had lamps made of thick twilled gauze formed of wires the one-fortieth of an inch, ſixteen to the warp and thirty to the weft, which being rivetted to a ſcrew cannot be diſplaced, from its flexibility it cannot be broken, and from its ſtrength cannot be cruſhed, except by a very ſtrong blow.

From ſome very ingenious experiments on the combuſtion of inflammable ſubſtances at low temperatures, ſir Humphrey Davy diſcovered that a coil of platina wire, one-ſeventieth of an inch thick, remains at a white heat when the quantity of coal-gas is increaſed ſo as to extinguiſh the flame of the lamp; hence he has ſuggeſted the advantage of introducing a coil of ſuch wire into the ſafety-lamp, but we do not learn that it has yet been found of practical uſe. An account of theſe experiments is given in the Phil. Tranſ. for 1817.

The principal objections to the uſe of wire-gauze ſafety-lamps in mines, and alſo to other ſafety-lamps, may be briefly ſtated; namely, the accidents to which the lamps may be unavoidably ſubject, and the accidents which may ariſe from negligence in the uſe of them; the injury to the health of the men, from remaining in exploſive mixtures of fire-damp longer than they would have done before the introduction of theſe lamps into mines; and laſtly, the temptation they preſent to neglect the more expenſive methods of ventilating mines, and truſting too much to the ſecurity of the lamp. The accidents which may happen to the *lamp* from one or more of the meſhes being broken, when made of ſuch ſlender wire, and expoſed to the corroſive effects of mineral waters in the mine, or the rapid oxydation from moiſture alone, muſt be very frequent, independently of accidents from the falling of pieces of coal on the lamp. The breaking of a ſingle wire being ſufficient to enlarge the aperture and occaſion an exploſion, it is obvious that extreme caution is required in the uſe of the lamps, and a careful inſpection of them ſhould be made every day before they are delivered to the men. This we underſtand is done in extenſive collieries, a perſon being appointed for the ſole purpoſe of inſpecting and trimming the lamps. The accidents which may ariſe from the negligence of a ſingle man, in extenſive mines where more than fifty or one hundred perſons are employed, are leſs eaſy to guard againſt; the lives of a great number are conſtantly depending on the carefulneſs of each perſon; and, however perfect the inſtrument may be, no one can feel perfectly ſafe when the air in the mine is in an exploſive ſtate. Some of the lamps were at firſt ſo conſtructed that they could not be opened except by the key of the inſpector; but we believe this precaution is not generally introduced, the great object being to get the lamps made as cheap as poſſible. We conceive it, however, eſſential to the ſecurity of the miners, that the lamp ſhould be cloſed by a lock, to prevent the men from uncovering the flame. The lamp itſelf, by the enlargement of the flame, gives due notice when the air of the mine is in an exploſive ſtate, and at ſuch times the proper remedy is to be ſought in ventilation; for we conceive it to be neither wiſe nor humane to ſuffer the men to remain working in an exploſive atmoſphere, unleſs under particular circumſtances. Should the invention of ſafety-lamps induce coal proprietors to allow their workmen to remain for a longer time inhaling the fire-damp, or lead them to neglect the only permanent ſecurity, that of efficacious ventilation, we ſhould conſider the diſcovery as injurious to the intereſts of humanity. It would, however, be extremely unfair to decry the merit of any invention from the poſſible miſuſe of it. Were coal-mines firſt opening in a diſtrict where they had never before been worked, we believe that in moſt caſes it would be practicable to ſecure a conſtant and ſafe ventilation through all the works: but in diſtricts like thoſe on the Tyne and the Wear, there are numerous old excavations remaining filled with impure air, of which the preſent miners have little knowledge, having been worked out in remote periods. Any communications accidentally opened with theſe old workings may ſuddenly fill a mine with a mixture of fire-damp, in which caſe the ſafety-lamp offers the only means of ſecurity with which we are acquainted. For viewing the old workings or *waſtes* of the mine, which cannot be approached with a common lamp or candle, the ſafety-lamp is a moſt invaluable inſtrument; and in all caſes where the ſteel-mill was formerly uſed it affords a far more ſecure and convenient light. Though we have thought it neceſſary to ſtate the objections which may be urged againſt the ſafety-lamp, we conceive that they apply principally to the miſuſe of it: and the following ſtatement made by ſir Humphrey Davy offers the moſt ſatisfactory proof of its utility. "It has now been (Jan. 1817) for ten months in the hands of hundreds of common miners in the moſt dangerous mines in Great Britain, during which time not a ſingle accident has occurred where it has been employed, whilſt in other mines much leſs dangerous, where it has not been adopted, ſome lives have been loſt, and many perſons burned."

The farther experience of another year, on a more ex-

tended

tended ſcale, has fully confirmed the concluſions to be drawn from the above ſtatement, and we may juſtly conſider the ſafety-lamp as one of the moſt valuable preſents which philoſophy has made to the uſeful arts.

Wire-*Grates*, in *Gardening*, are contrivances formed of fine wire-work, and uſed for keeping various kinds of large inſects out of vineries, hot-houſes, and ſuch places, as being very miſchievous to the fruit in them.

Wire-*Heels*, *&c.* a defect and conſequent diſeaſe in the feet of the horſe or other animal. Some, as Gibſon, think that narrow heels are for the moſt part a natural defect, but that they are often rendered incurable by bad ſhoeing. Some, in ſhoeing, hollow the quarters ſo deep and ſo thin, it is ſaid, that one may almoſt pinch them in with one's fingers, and think by that means to widen them out by a ſtrong broad-webbed ſhoe; but this turns them narrow above and *wires their heels*, and dries up or rots the frog. The beſt way in all ſuch caſes is, it is ſuppoſed, not to hollow the foot in ſhoeing, and to pare nothing out but what is rotten or foul. If the foot be hard or dry, or inclined to be ragged, it may be bathed often with chamber-ley; or two pounds of linſeed bruiſed may be boiled in two quarts of chamber-ley to the conſiſtence of a poultice, then adding to it ſix ounces of ſoft-ſoap, and the foot be ſoftened with it every day, rubbing a little of it upon the ſole; or, a compoſition formed of two ounces of bees'-wax, ſix ounces of hog's-lard, one ounce of tar, and linſeed oil as much as will make it into the conſiſtence of a ſmooth ointment, may be mixed together, and be uſed daily in the ſame manner as the foregoing poultice.

The diſeaſes and affections of the feet of theſe animals have of late been more accurately underſtood, and better means of relief and cure recommended.

In the caſe of narrow or contracted heels, attended with inflammation, and moſtly confined to the fore-feet, there is great pain; the animal is conſtantly moving its legs, and generally inclined to lie down. When firſt taken out, it is almoſt incapable of performing any of the paces; the weight being ſo much thrown on the hinder legs. In trotting, the legs are ſcarcely lifted above the ſurface of the ground; the ſteps are very ſhort, and a walk or canter is gone into inſtead of any other pace. In the gallop, the weight of the body is thrown on the fore-part of the foot; and in trotting, on the heels; which produce very conſiderable pain, on account of the action of the foot being confined to the quarter in a backward direction.

The diſeaſe is moſtly cauſed by improper ſhoeing, very great and hard exerciſe, ſtanding in confined ſituations on litter, and many other ſuch cauſes.

In effecting a cure in all the more freſh caſes of this ſort, where the variation from the natural round form of the hoof is not conſiderable, it may be accompliſhed without the animal being entirely made to reſt, by removing the ſhoes, and if poſſible reducing the heels on a line with the inferior part of the frog. The ſole parts may be thinned, and that portion which is between the bars of the foot and the cruſt be hollowed out. The hoofs ſhould likewiſe be thinned with a proper tool, eſpecially at the quarters. The ſhoes ſhould not be put on again for two or three weeks in ſuch caſes, and the parts from near the coronet to the fetlock be anointed with a bliſtering liniment, compoſed of half an ounce of finely-powdered cantharides and four ounces of Barbadoes tar, well mixed together.

And when neceſſary, three or four pints of blood may be taken from the plate vein, and a rowel be put in the cheſt.

Maſhes, containing nitre in the quantity of an ounce, are to be occaſionally had recourſe to. At the ſame time, the feet of the animal ſhould be put in a trough of warm water for two or three hours every day, ſo filled as juſt to cover the hoof-parts of them; gentle walking or trotting exerciſe being uſed on ſuch ground as is ſoft.

Afterwards the ſhoes which are made uſe of ſhould be thinner at the heels than thoſe which were taken off, the heels reſting well and firmly on the bars and cruſt. The patent frog may be uſed when the animal is at reſt, as by continuing its uſe in a proper manner, the foot will gradually regain its natural form and action. See Frog.

In ſuch caſes, too, the coronet may now be bathed every day with an embrocation compoſed of an ounce and a half each of marſh-mallow ointment and Barbadoes tar, with half an ounce of ſpirit of turpentine, well incorporated together; which will promote and haſten the growth of the hoof-part of the foot.

In caſe the animal has been lame ſome length of time, and the contraction of the heels is very conſiderable, it ſhould be put in moiſt paſture-grounds, to run for ſome time, carefully lowering the heels every four or five weeks, or oftener if neceſſary. As ſoon as the hoof has been elongated from the coronet to the ſole, the cure will be completely effected; which will in moſt caſes be accompliſhed in the courſe of about five months; at the end of which time the animal will have regained an entirely new circular foot of the natural ſhape. The animal ſhould then be ſhod with thin-heeled ſhoes, which admit the frog-part of the foot to reſt upon the ground.

In caſes in which the animals cannot be turned out in this manner, they ſhould be provided with a large ſhed building, well clayed on the bottom part, and preſerved ſoft and moiſt by the occaſional application of water ſlightly over it.

But though this ſort of management may moſtly recover and reſtore the natural ſhape of the foot, the proper action of it is not reſtored with ſuch facility. In a great number of caſes, the feet become ſo much altered in their ſtructure and power on account of the long-continued inflammation, that the means of expanſion are wholly deſtroyed; as is often the caſe in the cartilages that are ſituated at the higher and hinder part of the foot, which not unfrequently become bony, and, of courſe, it becomes impoſſible to regain the action of the foot. As in theſe caſes, the more the foot is expoſed, the greater will be the injury and miſchief afforded; the only means of relief that can be made uſe of, is the covering of the foot with ſuch a ſhoe as is calculated to prevent concuſſion, which may be accompliſhed by the application of a bar-ſhoe that will reſt on every part of the cruſt, and not upon the frog-part of the foot. This is ſuppoſed to be the beſt form of ſhoe that can be uſed for the purpoſe.

In theſe caſes, when the animals are at reſt, the feet ſhould be ſtopped with an ointment, compoſed of one ounce and a half each of common turpentine and tar, and two ounces and a half of mallow ointment, well mixed together.

In the caſes of cracks or ſeparations of the fibres of the hoofs in a perpendicular manner, which when they extend to the coronet are often very troubleſome; the animals moſt liable to them, are thoſe which have either ſtrong brittle hoofs or narrow heels. Blood animals of the horſe kind are more ſubject to them than others.

In the management and cure of them, the parts around the cracks ſhould be made thin by the raſp, when the firing iron ſhould be drawn over above and below them, to the extent of the fiſſures, in order to prevent their extenſion. It ſhould

ſhould likewiſe be carried over the cracks, by which means a ſlight quantity of tenacious moiſture will exude, and glue up the ſeparated parts; which may be covered over with an ointment compoſed of four ounces of marſh-mallow ointment, and two ounces of common turpentine, ſpread upon tow, and kept on the parts by bandages.

The animals ſhould have bar-ſhoes, which may reſt firmly on the frogs, and be made hollow in the parts oppoſite to the ſeats of the complaints, in order that no preſſure may be given to thoſe parts of the feet; reſt being given for ſome days, and then only moderate exerciſe allowed, until the cracks have deſcended towards the lower parts of the feet. The coronets and hoofs may be bathed twice a day, as in the above caſes of contracted heels, in order that the growth of horn may be promoted. By the uſe of theſe means, the animals moſtly ſoon get better.

Wires *of Aſteriæ*, in *Natural Hiſtory*, a name given by authors to a ſort of extraneous foſſil belonging to the *aſteriæ*, and being a ſort of branches from the body of that column.

Wire *of Lapland*. The ſavage inhabitants of Lapland have a ſort of ſhining ſlender ſubſtance in uſe among them on ſeveral occaſions, which is much of the thickneſs and appearance of our ſilver wire; and is therefore called, by thoſe who do not examine its ſtructure or ſubſtance, *Lapland wire*.

The people of this miſerable country find many uſes in every thing nature has afforded them, and, among the reſt, that ſpecies of ſtag called the rein-deer, which is the moſt frequent animal among them, is not only ſerviceable in furniſhing them with meat, clothes, houſes, and the means of carriage and travelling; but its bones make many of their moſt neceſſary utenſils; and the ſinews, which are all carefully ſeparated in the eating, are, by the women, after ſoaking in water, and beating, ſpun into a ſort of thread, which is of admirable fineneſs and ſtrength, when wrought to the ſmalleſt filaments; but when larger, is very ſtrong, and fit for the purpoſes of ſtrength and force. Their wire, as it is called, is made of the fineſt of theſe threads, covered with tin. The women do this buſineſs, and the way they take is to melt a piece of tin, and placing at the edge of it a horn with a hole through it, they draw theſe ſinewy threads, covered with the tin, through the hole, which prevents their coming out too thickly covered. This drawing is performed with their teeth, and there is a ſmall piece of bone placed at the top of the hole, where the wire is made flat, ſo that we always find it rounded on all ſides but one, where it is flat.

This wire they uſe in embroidering their clothes as we do with gold and ſilver; and they often ſell it to ſtrangers, under the notion of its having certain magical virtues. Scheffer, Hiſt. Lapland.

Wire-*Worm*, in *Agriculture*, a moſt miſchievous worm in different ſorts of grain-crops. It has been deſcribed by Bierkander, in the Swediſh Tranſactions, as having in the grub-ſtate a yellow colour, with the head brown, and the extremities of the jaws black; the body conſtituted of twelve joints, ſhining, and hard-ſkinned; when it changes its ſkin it is for ſome time white; a few hairs are ſcattered here and there, but moſtly upon the head and laſt joint; under the three firſt joints are ſix horny and pointed feet, and at the beginning of the laſt joint, which is round, there are two black ſpots, one on each ſide, which are, probably, apertures through which it breathes.

It is conſidered by ſome, notwithſtanding the almoſt general opinion of farmers to the contrary, that the diſeaſe of wheat-crops, which is attributed to this inſect or worm, depends upon ſome other cauſe, as a fault in ploughing, by which the land is left in too light, open, and porous a ſtate or condition, and which prevents the young plants from being fully and properly nouriſhed, and conſequently from forming their roots in a proper manner in the ground. And this notion is in ſome meaſure ſupported by the circumſtance of the benefit which is afforded by rolling, treading, and otherwiſe compreſſing the land.

It has been proved and ſhewn by many different trials, that this worm is one which is extremely tenacious of life, and conſequently not eaſily deſtroyed or got quit of by any means which have yet been made uſe of for the purpoſe.

Wire, in *Geography*, one of the ſmaller Orkney iſlands, ſeparated from Rouſa by a ſtrait called Wire Sound, about three-quarters of a mile in breadth. N. lat. 58° 58′. W. long. 2° 51′.

Wire. See Wyre.

WIREDY, a town of Sweden, in the province of Smaland; 16 miles N.E. of Jonkioping.

WIRESTA, a town of Sweden, in the province of Smaland; 26 miles S.W. of Wexio.

WIRI, two ſmall iſlands in the gulf of Finland. N. lat. 59° 50′. E. long. 27°.

WIRING, among *Animals*, the operation of putting a ſharp-pointed wire up the noſtrils of a ſheep, ſo as to paſs up into the brain, and produce a diſcharge in caſes of the ſturdy, turn, gid, or vertigo. It ſeems, however, a dangerous remedy, though it is ſaid to have been ſucceſsful in curing the diſeaſe in many caſes.

Wiring *Fruit-Trees*, in *Gardening*, the operation and practice of paſſing a fine wire round their branches, in order to bring on the fruiting ſtate.

WIRKOWENES, in *Geography*, a town of Poland, in the palatinate of Kiev; 44 miles W.N.W. of Bialacerkiew.

WIRKSWORTH, an ancient market-town in the wapentake of the ſame name, in the county of Derby, England, is ſituated near the ſouthern extremity of the mining diſtrict, in a valley nearly ſurrounded by hills, at the diſtance of 14 miles N.N.W. from the county-town, and 140 miles N.W. by N. from London. In the year 835, the manor belonged to the abbey of Repton; after the deſtruction of that monaſtery by the Danes, it became veſted in the crown, to which it appertained at the time of taking the Domeſday-ſurvey. King John granted it to William de Ferrars, earl of Derby. Having been forfeited by the attainder of earl Robert in 1265, it was granted, together with the wapentake, by Edward I. to his brother, Edmund, earl of Lancaſter; and has ever ſince formed part of the earldom or duchy of Lancaſter. It is now held under the duchy by Richard Arkwright, eſq. A market on Wedneſdays, and a fair of three days, were granted for this town to Thomas, earl of Lancaſter, in 1305. The market is now held on Tueſday, chiefly for butcher's-meat, butter, eggs, and pedlar's-ware: the corn-market is ſmall. Four annual fairs are now held. The town-hall, a handſome brick ſtructure, was built in 1773, by the direction of Thomas, lord Hyde, the chancellor of the duchy. In this hall are held courts-baron for the manor, courts-leet for the wapentake, and barmote-courts for regulating the mines and mineral concerns. The church, a ſpacious edifice, apparently of the fourteenth century, conſiſts of a nave and ſide-aiſles, a north and ſouth tranſept, a chancel, and a ſquare tower, ſupported by four large pillars. In the church-yard is a grammar-ſchool, founded in 1576, by Anthony

Anthony Gell, efq. who endowed it with lands which now produce 170*l.* *per annum.* He alfo founded an alms-houfe for fix poor men, to which he gave a rent-charge of 20*l.*; this has been augmented by fubfequent benefactions. In the town was formerly a meeting-houfe for Prefbyterians, but it is now occupied by a congregation of Independents. Here are alfo chapels for Baptifts and Wefleyan Methodifts. In the population return of the year 1811, the inhabitants of this town are enumerated at 3474, occupying 777 houfes. The parifh of Wirkfworth is extenfive, and includes, befides the town, fourteen townfhips or villages, fome of which are very populous.—Beauties of England and Wales, vol. iii. Derbyfhire. By J. Britton and E. W. Brayley, 1803. Lyfons' Magna Britannia, vol. v. Derbyfhire, 1817.

WIRNAU, a town of the county of Henneberg; 5 miles S.E. of Smalkalden.

WIRRAL, or WIREHALL, a ftrip of land in the county of Chefter, extending from the city of Chefter to the fea, between the rivers Dee and Merfey.

WIRREY, or ST. ANDREW, one of the Shaint iflands. N. lat. 57° 53'. W. long. 6° 19'.

WIRSRUM, a town of Sweden, in the province of Smaland; 46 miles N.N.W. of Calmar.

WIRSTBERGHOTZEN, a town of Weftphalia, in the bifhopric of Hildefheim; 8 miles S. of Hildefheim.

WIRSUNG, JOHN GEORGE, in *Biography*, was a native of Bavaria, ftudied medicine at Padua, and was a difciple of Vefling. In 1642 he publifhed the difcovery of the pancreatic duct, with which his name is connected; and in the following year he was affaffinated by a Dalmatian, under the influence of a paffion excited by having been filenced by him in a public difputation. Haller. Eloy.

WISANGI, in *Geography*, a town of Sweden, in Weft Bothnia, on the Tornea; 95 miles N.N.W. of Tornea.

WISBADEN, a town of Germany, in the principality of Naffau Saarbruck Ufingen. This town was known to the Romans, and the *Heidenifche Maur*, or *Heathen Wall*, which runs through the prefent town of Wifbaden, appears to be a work of that nation; and a part of the boundaries of this town are derived from the lined trenches thrown up by Drufus, oppofite to Mentz, for the covering of the Rhine. In the days of the kings of the Franks, in this town was a royal court. At Wifbaden are fome medicinal fprings, formerly in great repute; 5 miles N.W. of Mentz. N. lat. 50° 3'. E. long. 8° 9'.

WISBECH, a large market-town in the county of Cambridge, England, gives name to a hundred and a deanery, and is fituated in the extreme northern part of the county, about 30 miles N. from Ely, 42 from Cambridge, and 90 from London, in the fame direction. Wifbech is a great mart for corn, about 100,000 quarters being annually exported from thence by the river Oufe, and the canals communicating with Cambridge, Lynn, and other towns. Other articles of export are rape-feed and long wool, of which great quantities are fent to the Yorkfhire clothiers. Timber, from Northamptonfhire, is alfo embarked for the fervice of the navy. The principal imports are, coals, deals, and wine. The river is navigable up to Wifbech, at fpring-tides, flowing fix or eight feet, for veffels of 60 tons, which are conftantly employed in the corn trade, to London, Hull, and other ports. Prior to the Norman Conqueft, Wifbech belonged to the convent of Ely. In 1071 William of Normandy erected a caftle of ftone at the town; but this being difmantled, a new caftle of brick was built on the fcite, between 1478 and 1483, by Morton, bifhop of Ely, and which became the epifcopal refidence. Being purchafed by fecretary Thurloe during the interregnum, it was rebuilt after defigns by Inigo Jones. Reverting at the Reftoration to the fee of Ely, it was fold fome years ago, and on the ground of the detached buildings fome good houfes have been erected. The church is a fpacious, handfome fabric, although of a fingular conftruction, having two naves and two aifles. The naves are lofty, and feparated by light flender pillars, with pointed arches; the aifles, which are the moft ancient, are divided from their refpective naves by low maffy pillars and femicircular arches. The tower of the church is beautiful, and notwithftanding the antiquity attributed to it, is proved by records to have been erected pofterior to 1520. Wifbech, with the adjacent country, has frequently fuffered by inundations, particularly in 1236, when great numbers of fmall craft, cattle, and men, were deftroyed. In 1437, by a breach in the bank of Wifbech fen, upwards of 4000 acres of land were overflowed. But the greateft devaftations of this kind occurred in Nov. 1613, by the fpring-tide concurring with a violent N.E. wind; and in March 1614, by the melting of the fnow in the country. In 1611 the inhabitants obtained a renewal of their charter, which conftituted them a body corporate, by the ftyle of the burgeffes of Wifbech; but the right of the election of the ten capital burgeffes was limited to the poffeffors of freeholds of the value of 40*s.* *per annum.* The executive officer, the town-bailiff, although a perfon wholly unknown to the charter, has the entire management of the eftates and affairs of the corporation. The annual income under the management of thefe capital burgeffes, allotted to public and charitable purpofes, amounts to about 800*l.* A principal object of this charge is the maintaining of beacons and buoys, and the clearing of the channel of the river Oufe or Wis, from which the town takes its name; precautions highly neceffary, on account of the fhifting fands between the town and the fea. Among the improvements made in Wifbech of late years, muft be mentioned the ftone bridge of one elliptic arch, and the new cuftom-houfe. The ftreets are paved, lighted, and watched, at the expence of the corporation. The trade of Wifbech has much increafed of late years, through the improved ftate of the drainage and navigation of the fens. The neighbouring lands are in high cultivation, and are chiefly appropriated to grazing. The fheep and oxen grow to a great fize; and confiderable numbers are fent off twice every week to London. The inhabitants are almoft wholly employed in commerce, the town poffeffing no kind of manufacture, although the furrounding country produces vaft quantities of wool, hemp, and flax. The canal, opened not many years ago, extending from Wifbech river to the river Nene at Outwell, and thence to the Oufe, affords a communication with Norfolk, Suffolk, and the weftern counties, and which proves very beneficial to the town. In 1781 a literary fociety was eftablifhed in Wifbech, and the education of youth is provided for by a free-fchool, and by two charity-fchools, fupported by fubfcription. The diffenters from the eftablifhed church are not numerous, but have their refpective places of worfhip. The parifh, containing 6308 acres, is in the greateft part a very rich arable and pafture land. In 1676 the inhabitants of Wifbech were computed to be 1705; in 1801 they amounted to 5004; and in 1811 to 6300: the inhabited houfes were 1237.—Beauties of England; Cambridgefhire. By J. Britton and E. W. Brayley, 8vo. 1802. Magna Britannia, by the Rev. D. Lyfons and S. Lyfons, 4to. 1808.

WISBERG, a town of Germany, in the principality of Culmbach; 8 miles E. of Culmbach.

WISBY, a town of Sweden, on the weſt coaſt of the iſland of Gothland. This is a very ancient ſtaple, and in former times one of the Hanſe towns. When Wineta, a place of great trade in the iſland of Uſedom, near the coaſt of Pomerania, was deſtroyed by an inundation, ſeveral of its wealthieſt inhabitants removed to Wiſby. It was likewiſe frequented by Swedes, Goths, Danes, Normans, French, Engliſh, Saxons, Livonians, Spaniards, Ruſſians, Greeks, and other nations. The maritime laws of Wiſby were famous in all parts, and adopted along the coaſt of the Baltic. (See INSURANCE.) The wall of Wiſby, and the towers with which it is flanked, were built in the year 1289. This town continued in a flouriſhing condition till the year 1361, when the Danes almoſt totally deſtroyed it. The harbour is ſafe and commodious, but not very large. N. lat. 57° 38′. E. long. 18° 18′.

WISCASSET, a ſea-port town of America, in the province of Maine, in the county of Lincoln, on the Sheep cut, with 2083 inhabitants; 30 miles N.E. of Brunſwick.

WISCHAU, or WISKAU, a town of Moravia, in the circle of Brunn; 15 miles E. of Brunn. N. lat. 49° 17′. E. long. 16° 54′.

WISCHBACH, or FISCHBACH, a town of the duchy of Stiria; 5 miles S. of Muertzenſchlag.

WISCHGROD, a town of the duchy of Warſaw, on the Viſtula; 27 miles S.E. of Poloczk.

WISCHITEN, a town of Lithuania, in the palatinate of Troki; 70 miles W. of Troki.

WISCHKOWA, a town of Bohemia, in the circle of Saatz; 5 miles N.N.E. of Saatz.

WISCHNOWA, a town of Bohemia, in the circle of Beraun: 3 miles E. of Przibram.

WISDIM, a town of Bohemia, in the circle of Boleſlaw; 14 miles W.N.W. of Jung Buntzel.

WISDOM, SAPIENCE, uſually denotes a higher and more refined knowledge of things, immediately preſented to the mind, as it were by intuition, without the aſſiſtance of ratiocination.

In this ſenſe, wiſdom may be ſaid to be a faculty of the mind, or at leaſt a modification and habit of it.

Sometimes the word is more immediately uſed in a moral ſenſe, for what we call *prudence* or *diſcretion;* which conſiſts in the ſoundneſs of the judgment, and a conduct anſwerable to it.

The ſchool-divines ſometimes reſtrain wiſdom to the knowledge of the more ſublime and remote objects, as that of God, &c. In which ſenſe, theology is properly ſaid to be wiſdom.

The Latin word for wiſdom is *ſapientia*, which literally expreſſes the ſenſe of taſting; to which wiſdom is ſuppoſed to have ſome conformity. The ſight, and other ſenſes, only repreſent to us the ſurface of things: taſte goes deeper, and penetrates into the ſubſtances; ſo that what, *e. gr.* to the feeling ſeemed cold, to the taſte will be found hot: ſo wiſdom, ariſing from a deep attention to our ideas, goes farther, and frequently judges otherwiſe than the common apprehenſions of men would reach to.

WISE, MICHAEL, in *Biography*, an admirable compoſer for the church, foſtered in the Chapel Royal after the Reſtoration, under captain Henry Cook, at the ſame time as Humphrey and Blow, three muſicians, who not only far ſurpaſſed their maſter in genius and abilities, but all our church compoſers of the 17th century, except Purcell. However, they prepared the way for his bold and original genius to expand; as ſeveral new melodies, modulations, and happy licences, which we uſed to think entirely of his invention, upon an attentive examination of their works, appear to have been firſt ſuggeſted by theſe three fellow-ſtudents. Yet, what they had ſlightly and timidly touched, Purcell treated with the force and courage of a Michael Angelo, whoſe abilities rendered the difficult eaſy, and gave to what, in leſs powerful hands, would have been diſtortion, facility, and grace.

Dr. Boyce has printed ſix verſe and full anthems, by Wiſe, which are admirable; and in Dr. Tudway's collection, Brit. Muſ., there are ſeven more, and a whole ſervice in D minor.

He was author of the celebrated two-part ſong, "Old Chiron thus preached to his pupil Achilles," which is ſtill too well known to need an encomium here.

Michael Wiſe was killed in a ſtreet-fray at Saliſbury, by the watchman, in 1687.

The firſt movement of his verſe-anthem for two voices, "The ways of Zion do mourn," is more beautiful and expreſſive than any grave and pathetic compoſition for the church of other countries, of the ſame kind and period of time, that we have hitherto diſcovered.

The uſe which the author has made of chromatic intervals at the word *mourn*, is not only happy and maſterly, but *new*, even now, at more than a hundred and twenty years diſtance from the time when the anthem was produced! The whole compoſition ſeems to us admirable; and beſides the intelligence and merit of the deſign, the melody is truly plaintive, and capable of the moſt touching and elegant expreſſion of the greateſt ſingers of modern times; the harmony too and modulation are ſuch as correſpond with the ſenſe of the words, and enforce their expreſſion.

There is an elegance of phraſe in a paſſage of the ſecond movement of the preceding anthem, at the word *down*, which has been lately revived, and in great favour, with a very minute difference, among the firſt ſingers of Italy. The difference conſiſts only in pointing the firſt note if a crotchet or quaver, and making the ſecond and third notes ſemiquavers or demiſemiquavers.

Wiſe was a native of Saliſbury, in which cathedral he was appointed organiſt and maſter of the choriſters, in 1668; and in 1675, a gentleman of the chapel royal. In 1686, he was preferred to the place of almoner and maſter of the boys at St. Paul's. He is ſaid to have been in great favour with Charles II., and being appointed to attend him in a progreſs, claimed, as king's organiſt for the time, the privilege of playing to his majeſty on the organ, at whatever church he went.

WISE *Men of Greece, Seven*, in the *Hiſtory of Philoſophy*, an appellation given to ſeveral eminent men, on whom was beſtowed the praiſe of civil and moral wiſdom. The hiſtory of theſe perſons, originally without doubt plain and ſimple, has been rendered obſcure and uncertain by traditionary reports. The incident to which this appellation was at firſt owing was as follows:

In the third year of the 49th Olympiad, it happened that certain youths of Ionia, purchaſing from a fiſherman of Miletus a large draught of fiſh, which he had brought to ſhore, found in the net a golden tripod of great value. Upon this a diſpute aroſe between the fiſherman and the purchaſers: the former maintaining that he had only ſold them the capture of fiſh; the latter aſſerting that they had bought the chance of the draught, whatever it might be. The queſtion was referred to the citizens of Miletus, who were of opinion, that in an affair ſo extraordinary, the Delphic oracle

oracle ſhould be conſulted. The anſwer of the oracle was 'To the Wiſeſt.' In obedience to this anſwer, the Mileſians unanimouſly adjudged the tripod to Thales. Thales modeſtly declined the honour intended him by his fellow-citizens, and ſent the tripod to Bias, a wiſe man of Priene; from him it was paſſed on through ſeveral hands, till it came to Solon, the Athenian legiſlator, who judging that the character of 'the wiſeſt' could not properly belong to any human being, ſent the prize of wiſdom to Delphos to be dedicated to Apollo. The ſtory, as above related, has in it ſomething fabulous; and the circumſtances that attend it are differently related by different writers. It is more probable, ſays Brucker, that in ſome public aſſembly a tripod was propoſed as an honorary prize to the man who ſhould recite, in verſe, the moſt excellent maxims of political and moral wiſdom, and that the ſages who engaged in this generous conteſt afterwards agreed to dedicate the prize to Apollo. In confirmation of this conjecture it is alleged, from a paſſage in Plato's Protagoras, that the wiſe men of this period met together to frame conciſe precepts and maxims for the conduct of life, and agreed to ſend ſuch ſentences as were thought moſt valuable to Delphos, to be inſcribed in the temple. Hence Apollo is ſaid by the ancients to have been the author of the precept 'Know thyſelf.'—'E cœlo deſcendit, Γνῶθι σεαυτόν.' The names commonly included under the appellation of the Seven Wiſe Men of Greece are, Thales, Solon, Chilo, Pittacus, Bias, Cleobulus, and Periander. Brucker's Philoſ. by Enfield, vol. i.

WISECK, in *Geography*, a river of Heſſe, which runs into the Lahn, near Gieſſen.

WISELL, a town of the duchy of Stiria; 4 miles N.E. of Rein.

WISEMAN, Richard, in *Biography*, was firſt known as a ſurgeon in the civil wars of Charles I., and accompanied prince Charles, when a fugitive, in France, Holland, and Flanders. He ſerved for three years in the Spaniſh navy, and returned with the prince to Scotland, and was made priſoner in the battle of Worceſter. After his liberation, in 1652, he ſettled in London. When Charles II. was reſtored, he became eminent in his profeſſion, and was made one of the ſerjeant-ſurgeons to the king. In May 1676 he appears, from the preface to his works, to have been a ſufferer by ill health for twenty years; but the time of his death is not known. The reſult of his experience appears in "Several Chirurgical Treatiſes," fol. 1676, 1686, and in 2 vols. 8vo. 1719. The ſubjects of theſe treatiſes are, tumours, ulcers, diſeaſes of the anus, king's-evil, wounds, gunſhot-wounds, fractures and luxations, and lues venerea. The courſe of his practice comprehended more than 600 caſes, of which he gives apparently an honeſt account, recording his failures as well as his cures, and the detail merits attention. In his relation of the miraculous effects of the royal touch in ſcrofula, it is not eaſy to reconcile his honeſty with his ſagacity, though from his own narration, duly conſidered, the fallacy is eaſily detected. His writings have long been regarded as ſtandard authority in the examinations at Surgeon's-Hall. Gen. Biog.

Wiseman, *Mr.*, a worthy Engliſh muſician, who went early in life to Italy, in order to receive leſſons on the violin from Tartini, in Padua, who recommended him, in 1736, to one of his favourite ſcholars, Paſqualino Bini, at Rome, where, after ſome time, finding himſelf likely to thrive as a profeſſor, by the patronage of the Engliſh nobility and gentry with which that city always abounds in their travels, ſettled there for the reſt of his life; and though not a performer of the firſt claſs, being a good muſician, and a man of probity and good conduct, he was not only reſpected by his countrymen, but by the natives of that city, which, though no longer the capital of the world, is ſtill the capital of Italy and the fine arts.

Mr. Wiſeman had reſided ſo long in Italy, that he had almoſt forgotten his native tongue. In 1770 he lived in the Palazzo Rafaele, without the gates of Rome, where, during the firſt winter months, he had a weekly concert till the operas began. It was here that the great Raphael lived and died, where there were ſtill ſome of his paintings in freſco, and where the late duke of York, the prince of Brunſwick, and ſeveral other great perſonages, gave concerts to the firſt people of Rome.

WISEN, in *Geography*, a river of Baden, which runs into the Rhine, near Bâle.

WISENT, a river of Bavaria, which runs into the Rednitz, near Forcheim, in the biſhopric of Bamberg.

WISEPPE, a town of France, in the department of the Meuſe; 3 miles S. of Stenay.

WISFTARDA, a town of Sweden, in the province of Smaland; 22 miles N. of Carlſcrona.

WISHART's Island, an iſland in the Pacific ocean. This is one of the Solomon iſlands, and by the Spaniards called Artreguada. S. lat. 2° 20′. E. long. 150° 55′.

WISIR, a ſmall iſland in the Eaſt Indian ſea, near the weſt coaſt of Aroo. S. lat. 15° 21′. E. long. 134° 51′.

WISK, or Wirsk, a river of England, in the county of York, which runs into the Swale.

WISKA, a river of Sweden, which runs into the ſea, 3 miles S. of Waro, in Weſt Gothland.

WISKI, a town of Bohemia, in the circle of Beraun; 4 miles N. of Przibram.

WISLAUFF, a river of Wurtemberg, which runs into the Rems, N.E. of Schorndorff.

WISLITZA, a town of Poland, in the palatinate of Sandomirz; 48 miles W.S.W. of Sandomirz.

WISLOCH, a town of the duchy of Baden, in the palatinate of the Rhine; 14 miles E. of Spire. N. lat. 49° 18′. E. long. 8° 45′.

WISMAR, a town of the duchy of Mecklenburg, ſituated in a bay of the Baltic, with a good harbour; large, well fortified, and defended by a citadel. This is one of the beſt and largeſt places in the country; as, beſides ſix churches, it has alſo a particular conſiſtory of its own, with a grammar-ſchool, under the direction of eight maſters, and is the ſeat of a Swediſh court of juſtice, erected in the year 1653, both for the diſtrict and Swediſh Anterior Pomerania. The court conſiſts of a preſident, a vice-preſident, and four aſſeſſors. It was formerly a Hanſe town, and poſſeſſed of the privilege of coining: the firſt origin is not known with any degree of certainty. In the year 1238, it was enlarged; and in the year 1266, obtained the Lubeck rights. In the year 1261, it was annexed to the duchy of Schwerin; in the year 1627, the Imperialiſts got poſſeſſion of it; but in the year 1632 were driven out by the Swedes, to whom it was ceded, at the peace of Weſtphalia, in 1648; 33 miles E. of Lubeck. N. lat. 53° 55′. E. long. 11° 26′.

WISMATH, a town of Auſtria; 14 miles S. of Ebenfurth.

WISNA, a town of the duchy of Warſaw; 70 miles N.E. of Warſaw.

WISNUM, a town of Sweden, in the province of Warmeland; 25 miles E.N.E. of Carlſtadt.

WISOKIA, a town of Lithuania; 20 miles N.N.W. of Brzeſc.

WISP, in *Rural Economy*, a term ſignifying a ſmall bunch of of ſtraw which is uſed in rubbing horſes down. Wiſp is alſo a term ſometimes applied to a rowel or ſeton put in animals.

WISPEL, in *Commerce*, a corn meaſure in Germany. A laſt of wheat contains 3 wiſpels; and a laſt of oats only 2 wiſpels. See SCHEFFEL.

WISSANT, in *Geography*, a town of France, in the department of the ſtraits of Calais; 12 miles N. of Boulogne.

WISSING, WILLIAM, in *Biography*, was born at Amſterdam in 1656. He received inſtructions in the art of painting from Dondyns, an hiſtorical painter at the Hague, but on leaving that maſter went to Paris, and in the year 1680, came to England, and aſſiſted Lely in his numerous works. After Lely's death, he became rather a favourite, and promiſed to become a formidable rival to Kneller. He drew all the royal family, and was particularly favoured by the duke of Monmouth, whoſe portrait he painted ſeveral times. The duke of Somerſet alſo patronized him, and employed him to paint himſelf and his ducheſs, and the pictures are now at Petworth.

Wiſſing was appointed principal painter to James II., and was ſent by him into Holland, to paint portraits of William and Mary. He did not long ſurvive his return to England, and died at Burleigh, the ſeat of the earl of Exeter, in 1687, at the age of 31. His heads were painted with ſoftneſs and delicacy, in a ſtyle quite diſtinct from that of his maſter, Lely, or his rival, Kneller; too ſoft, indeed, for character; and his larger pictures lack compoſition and harmony, both in line and colour.

WISSOKY-MEYTO, in *Geography*. See HOHENMAUT.

WISSOWATIUS, ANDREW, in *Biography*, a Socinian divine, was born of a noble family in Lithuania, in 1608, educated in the New Unitarian college at Racow under Crellius, and for ſome time purſued his ſtudies at Leyden, ſtrictly adhering to the principles of his tutor. Finding, on his return to Poland, that his brethren ſuffered perſecution from the diet of Warſaw, he exerted himſelf courageouſly in their defence, and encountered many perſonal difficulties and ſufferings in the exerciſe of his miniſtry in various parts of Poland. He was not ſilenced by the decree iſſued againſt Unitarians in 1658, but leading an unſettled life, he was induſtrious in ſeizing every opportunity that occurred for making proſelytes. In 1660, he was the only perſon of his party who was preſent at the "Colloquium Charitativum," where he firmly maintained his opinions againſt the jeſuit Chichovius and others. He is ſaid to have reſiſted large bribes, as well as to have encountered ſevere trials, in maintaining his ſentiments. Removing to Hungary, he ſpent two years in learning the language ſo as to be able to inſtruct and fortify his brethren in that kingdom. Laſt of all he retreated to Holland, where he was employed in ſuperintending an edition of the "Bibliotheca Fratrum Polonorum," in 9 vols. fol., and where he died in 1678. His integrity and conſtancy are highly applauded by the hiſtorians of his ſect; his writings were numerous, and one of them, publiſhed after his death, was entitled "Religio rationalis, ſeu de Rationis judicio in controverſiis, etiam theologicis ac religioſis adhibendo, tractatus." Gen. Biog.

WISSOWITZ, in *Geography*, a town of Moravia, in the circle of Hradiſch; 20 miles E.N.E. of Hradiſch.

WIST, WISTA, a quantity or meaſure of land among our Saxon anceſtors; of different dimenſions, in different places. In the Monaſticon, it is ſaid to be half a hide, or ſixty acres: in an old chronicle of the monaſtery of Battle, it is ſaid to be forty-eight acres.

WIST, in *Geography*, a town of Sweden, in the province of Eaſt Gothland; 6 miles S.S.E. of Linkioping.

WISTE, a town of the duchy of Bremen; 10 miles S.W. of Bremen.

WISTE, a river of the duchy of Bremen, which runs into the Wumme, 1 mile E. of Otterſberg.

WISTERNITZ, a town of Moravia, in the circle of Olmutz; 4 miles E. of Olmutz.

WISTERNITZ, *Unter*, a town of Moravia, in the circle of Brunn; 22 miles S. of Brunn.

WISTON, or WIZTON, a town in the hundred of Dan-Gladdan, county of Pembroke, South Wales, at the diſtance of 5 miles N.E. by E. from Haverford Weſt. It is a contributory borough with Pembroke and Tenby in ſending one member to parliament, and is governed by a mayor. The pariſh contains about 6000 acres: and in the return of the year 1811, the population was enumerated as 607 perſons, occupying 103 houſes. An annual fair is held on the 8th of November. In ancient times here was a caſtle of great extent; but it is now in ruins.—Carliſle's Topographical Dictionary of Wales, 4to. 1811.

WISTRIZ, or WESSERIZ, a river of Bohemia, which runs into the Egra, 3 miles E. of Schlakenwerth.

WISTYCZA, a town of Lithuania; 5 miles N. of Brzeſc.

WISZOGZOD, a town of the duchy of Warſaw; 52 miles N.W. of Warſaw.

WIT, DE, in *Biography*. There were ſeveral painters of this name very reſpectable in their profeſſion. Peter Candido de Wit, born at Bruges in 1548, went to Italy, and became a friend and co-labourer with G. Vaſari. He was afterwards employed by the grand duke of Tuſcany at Florence, and painted in oil and freſco. The emperor Maximilian invited him to Munich, and there he terminated his career. Gaſper de Wit, his brother, painted ſmall landſcapes very highly finiſhed, in which he introduced Italian architectural ruins. Of later date was Emanuel de Wit, born at Alkmaer in 1607, and a painter of ſtill life. He afterwards became a painter of architecture and perſpective views of churches, &c. which were touched with great clearneſs, animation, and ſpirit. He died in 1692. Another of the name, Jacob de Wit, is the flower of the flock. He was born at Amſterdam in 1695, and having exhibited a deſire for the purſuit of art, was placed with Van Spiers, an hiſtorical painter, for three years. He afterwards went to Antwerp to contemplate the admirable productions of Rubens and Vandyke, which adorned that city; and there he became the pupil of Jacob van Halen, continuing with him two years.

To him we are indebted for the preſervation of the compoſition made by Rubens for four cielings, divided into thirty-ſix compartments, in the church of the Jeſuits, which was deſtroyed by lightning in 1718. They have been ſince engraved from de Wit's ſketches by John Prout.

He was principally employed in adorning cielings and the walls of apartments; and generally choſe allegorical and emblematical ſubjects, which he compoſed with conſiderable ingenuity, and coloured in a clear and pleaſing manner. He was employed by the magiſtrates of Amſterdam, in 1736, to adorn their great council-chamber; and his work has had the honour of being applauded by ſir J. Reynolds. His ſketches for his larger works are touched with great freedom and neatneſs, and with good colour. He was living in 1744.

WIT, a faculty of the mind, conſiſting, according to Mr. Locke, in the aſſembling and putting together of thoſe ideas with quickneſs and variety, wherein can be found any reſemblance or congruity; by which to make up pleaſant pictures, and agreeable viſions, in the fancy.

This faculty, the ſame great author obſerves, is juſt the contrary of *judgment*, which conſiſts in the ſeparating carefully from one another, of ſuch ideas wherein can be found the ing optic nerve, fupplied in great abundance by the vicinity of the brain, muft make a fund of volatile matter to be difpenfed, and, as it were, determined by the eye.

Here, then, we have both the dart, and the hand to fling it. The one furnifhed with all the force and vehemence, and the other with all the fharpnefs and activity, one would require. No wonder if their effects be great!

Do but conceive the eye as a fling, capable of the fwifteft and intenfeft motions and vibrations: and again, as communicating with a fource of fuch matter, as the nervous juice elaborated in the brain; a matter fo fubtile and penetrating, that it is fuppofed to fly inftantaneoufly through the folid capillaments of the nerves; and fo active and forcible, that it diftends and convulfes the mufcles, and diftorts the limbs, and alters the whole habitude of the body, giving motion and action to a mafs of inert, inactive matter. A projectile of fuch a nature, flung by fuch an engine as the eye, muft have an effect wherever it ftrikes: and the effect will be limited and modified by the circumftances of the diftance, the impetus of the eye, the quality, fubtilty, acrimony, &c. of the juices, and the delicacy, coarfenefs, &c. of the object it falls on.

This theory, it is fuppofed by many, may account for fome of the phenomena of witchcraft, particularly of that branch called fafcination. It is certain the eye has always been efteemed the chief feat, or rather organ, of witchcraft; though, by moft, without knowing why, or wherefore: the effect was apparently owing to the eye; but how, was not dreamed of. Thus, the phrafe, to have an *evil eye*, imports as much as to be a witch. And hence Virgil,

"Nefcio quis teneros oculus mihi fafcinat agnos."

Again, old bilious perfons are thofe moft frequently fuppofed to have the faculty; the nervous juice in them being depraved and irritated by a vicious habitude of body, and fo rendered more penetrating and malignant. And young perfons, chiefly children and girls, are moft affected by it; becaufe their pores are patent, their juices incoherent, and their fibres delicate and fufceptible. Accordingly the witchcraft mentioned by Virgil only reaches to the tender lambs.

Laftly, the faculty is only exercifed when the perfon is difpleafed, provoked, irritated, &c. it requiring fome extraordinary ftrefs and emotion of mind to dart a proper quantity of the effluvia, with a fufficient impetus, to produce the effect at a diftance. That the eye has fome very confiderable powers is paft difpute.

The ancient naturalifts affure us, that the bafilifk and opoblepa kill other animals merely by ftaring at them. If this fail of credit, a late author affures us to have feen a moufe running round a large fnake, which ftood looking earneftly at it, with its mouth open; ftill the moufe made lefs and lefs circles about it; crying all the while, as if compelled to it; and, at laft, with much feeming reluctance, ran into the gaping mouth, and was immediately fwallowed.

Who has not obferved a fetting-dog; and the effects of its eye on the partridge? The poor bird, when once its eyes meet thofe of the dog, ftands as if confounded, regardlefs of itfelf, and eafily lets the net be drawn over it. We remember to have read of fquirrels alfo ftupified and overcome by a dog's ftaring hard at them, and thus made to drop out of the trees into his mouth.

That man is not fecure from the like affections is matter of eafy obfervation. Few people but have, again and again, felt the effects of an angry, a fierce, a commanding, a difdainful, a lafcivious, an intreating eye, &c. Thefe effects of the eye, at leaft, make a kind of witchcraft. But our readers will excufe our enlarging.

Witchcraft prevailed to fuch a degree both in England and Scotland in the 16th century, that it attracted the attention of government under the reign of Henry VIII., in whofe 33d year was enacted a ftatute which adjudged all witchcraft and forcery to be felony without benefit of clergy; and at the commencement of the reign of Elizabeth, the evil feems to have been very much on the increafe; for bifhop Jewel, in a fermon preached before the queen in 1558, tells her; "It may pleafe your grace to underftand that witches and forcerers within thefe four laft years are marvelloufly increafed within your grace's realm. Your grace's fubjects pine away even unto the death, their colour fadeth, their flefh rotteth, their fpeech is benumbed, their fenfes are bereft; I pray God they never practife further than upon the fubject." Of the prevalence of this delufion in 1584, we have the teftimony of Reginald Scot, in his treatife intitled "The Difcoverie of Witchcraft," written in behalf of the poor, the aged, and the fimple, as the author informs us; and it reflects fingular difcredit on the age in which it was produced, that a detection fo complete, both with regard to argument and fact, fhould have failed in effecting its purpofe. The mifchief, inftead of being reftrained, was rapidly accelerated by the publication of the "Dæmonologie" of king James, at Edinburgh, in the year 1597; and the contagion was promoted by the fucceffion of James to the throne of Elizabeth. In the year 1603, the royal treatife was printed at London, with an alarming preface concerning the increafe of witches or enchanters, "thefe deteftable flaves of the devil;" and it was accompanied by a new ftatute againft witches, which defcribes the crime in a variety of particulars, and enacts, that offenders, duly and lawfully convicted and attainted, fhall fuffer death. Reginald Scot, in the treatife abovementioned, has pourtrayed at large the character of thofe who were branded with the appellation of witches, ftating the deeds that were imputed to them, and the nature of their fuppofed compact with the devil. The abode of a witch is admirably defcribed by Spenfer, the defcription being formed from an exifting fubject:

"There in a gloomy hollow glen fhe found
A little cottage built of ftickes and reedes
In homely wife, and wald with fods around;
In which a witch did dwell, in loathly weedes
And wilful want, all carelefs of her needes:
So choofing folitarie to abide
Far from all neighbours, that her devilifh deeds
And hellifh arts from people fhe might hide,
And hurt far off unknowne whom ever fhe envide."
Faerie Queene.

Scot has, with fingular induftry, collected from every writer on the fubject the minutiæ of witchcraft, and he has annexed comments for the purpofe of refuting and expofing them; whereas James, the royal pedant, wrote in defence of this folly, and, unfortunately for truth and humanity, the doctrine of the monarch was preferred to that of the fage.

The old laws made in England and Scotland againft conjuration and witchcraft are repealed by a late ftatute, and no perfon is to be profecuted for any fuch crime. 9 Geo. II. c. 5. See Conjuration.

WITCHES-Butter, a name given by the common people of England to a fort of tremella growing on the bark of old trees, in form of a corrugated membrane.

WITELSHOFEN, in *Geography*, a town of Germany,

many, in the margravate of Anſpach; 7 miles S.E. of Creilſheim.

WITGENAU, or WITCHENAU, a town of Luſatia, on the Elſter; 13 miles N.N.W. of Budiſſen. N. lat. 51° 20′. E. long. 14° 16′.

WITGENAU, or *Wittengau*, or *Trſebon*, a town of Bohemia, in the circle of Bechin, on the river Lauſnicz; 22 miles S.S.E. of Bechin. N. lat. 49° 4′. E. long. 14° 40′.

WITGENSTEIN, a county of Germany, ſituated between the principalities of Heſſe Darmſtadt, Naſſau Dillenburg, and the duchy of Weſtphalia; about 18 miles long, and 12 broad. Some parts are mountainous and woody, and contain mines of ſilver, copper, and iron; the paſtures are good, but the arable land inconſiderable. The principal rivers are the Lahn and the Eder. It is united to the county of Sayn, and that princely houſe is divided into two branches, Sayn Witgenſtein of Witgenſtein, and Sayn Witgenſtein of Berleburg, each of which had a diſtinct vote in the Imperial college, and in the diet of the Upper Rhine. The county takes its name from a ſeat, the reſidence of the counts, which is ſituated on a mountain; 1 mile N. of Laaſphe.

WITGEWALT, a town of Pruſſia, in Oberland; 8 miles N.E. of Oſterrode.

WITH-VINE, or WINE, in *Agriculture*, a term provincially ſignifying couch, or couch-graſs. See BIND-*Weed*.

WITHAM, in *Geography*, a market-town and pariſh in the hundred of the ſame name, in the county of Eſſex, England, ſituated on a branch of the river Blackwater, 8¾ miles N.E. from Chelmsford, and 37¾ in the ſame direction from London. By the parliamentary returns of 1811, the number of houſes in the pariſh was 466, and the inhabitants amounted to 2352. Witham has a weekly market on Tueſday, and fairs on Friday and Saturday of Whit-week, on the 14th of September, and 8th of November. The petty ſeſſions for the Witham diviſion of the county are alſo held in the town. Witham is ſuppoſed to have been conſtituted a town by Edward the Elder, though perhaps it was only reſtored by him, at leaſt the part on Cheping Hill round the church, which ſtands about half a mile N.W. from the other part of the town. On this eminence are conſiderable remains of a circular camp, incloſed by a double ditch and rampart. From this work, and the quantity of Roman bricks worked up in the body and tower of the church, Witham has been thought to occupy the poſition of the Canonium of Antoninus. The manor was anciently poſſeſſed by earl Harold, and afterwards by Euſtace, earl of Boulogne, who married the ſiſter of Edward the Confeſſor. Near the eaſt end of the town is a manſion, now poſſeſſed by Thomas Kynaſton, eſq., but formerly belonging to the late earl of Abercorn. Faulkbourne-hall, between one and two miles N.W. from Witham church, is the ſeat of colonel Bullock, formerly member of parliament for the county of Eſſex. Here is a cedar-tree, about nineteen feet in circumference near the ground. A coin of Domitian and veſtiges of walls indicate the Romans to have had a villa at this place.—Beauties of England and Wales, Eſſex. By J. Britton and E.W. Brayley, 8vo. 1808.

WITHAM, a river of England, in the county of Lincoln, which riſes in the ſouth part of Lincolnſhire, on the borders of Leiceſterſhire, paſſes by Grantham to Lincoln, where it becomes navigable; from thence it paſſes by Tatterſall, Boſton, &c. and runs into the German ſea, 5 miles below Boſton, in what are called the *Waſhes*.

WITHE, in *Agriculture*, a ſmall twiſted ſtick of any kind uſed as a band.

WITHER-BAND, in *Rural Economy*, the band or piece of iron which is laid underneath a ſaddle, about four fingers above the withers of the horſe, to keep tight the two pieces of wood that form the bow of the ſaddle.

WITHER-*Wrung*, in the *Manege*. A horſe is ſaid to be wither-wrung, when he has got a hurt in the withers; which ſort of hurts it is very hard to cure. See WITHERS.

WITHERING, WILLIAM, M.D. F.R.S., in *Biography*, was born in 1741, and finiſhed his medical education in the univerſity of Edinburgh, where he took his degree of doctor in 1766. From Stafford, where he firſt ſettled and married, he removed to Birmingham, and ſpeedily attained by his ſkill and aſſiduity to very extenſive and profitable practice; without ſeeking much ſociety or neglecting his ſcientific purſuits in order to ſecure it. The chief objects of his attention, independently of his profeſſional engagements, were botany and chemiſtry. The reſult of his ſcientific inquiries and labours appears in the following liſt of his valuable publications; *viz.* "A Botanical Arrangement of Britiſh Plants," in 2 vols. 8vo. 1776, which paſſed through two more editions, in 1787, 3 vols., and in 1796, 4 vols., with numerous improvements and additions, ſome of which were ſuggeſted by his friends, and particularly by Dr. Stokes. In chemiſtry and mineralogy, a tranſlation of Bergman's "Sciagraphia Regni Mineralis," 1783, and the following papers in the Philoſophical Tranſactions; "Experiments on different Kinds of Marle found in Staffordſhire," 1773; an "Analyſis of the Toad-ſtone of Derbyſhire," 1782; "Experiments on the Terra Ponderoſa," 1784; and "Analyſis of a Hot Mineral Spring in Portugal," 1798. In the improvement of his own profeſſion, "Account of the Scarlet Fever and Sore Throat, particularly as it appeared at Birmingham in the year 1778;" and "An Account of the Fox-glove and ſome of its Medical Uſes; with Practical Remarks on the Dropſy and other Diſeaſes," 1785. Subject to pulmonic attacks, which weakened his lungs, he thought it neceſſary, in 1793 and 1794, to paſs the winter in a warmer climate, and he fixed on Liſbon. Afterwards he became incapable of his former profeſſional exertions, and died at the Larches, near Birmingham, in November 1799, at the age of 58. In his intellectual character he joined unremitting application with ſagacity and diſcernment. In his medical practice he limited preſcription to that quantity and kind of medicine which was abſolutely neceſſary for his patients; and if any in the inferior branches of the profeſſion diſliked this mode of practice, their diſapprobation of it was a teſtimony in its favour. In his diſpoſition he was mild and humane; and his natural reſerve did not preclude him from the pleaſure of rational ſociety. His valuable library and handſome property were inherited by an only ſon. Gen. Biog.

WITHERING, in *Medicine*. See ARIDURA.

WITHERING *of a Cow*, is when, after calving, ſhe does not caſt her cleanſing, which, if not timely remedied, will kill her.

WITHERINGIA, in *Botany*, was ſo named by the great French botaniſt, M. L'HERITIER, (ſee that article,) in compliment to the late Dr. William Withering, F.R.S. F.L.S., the well-known author of a moſt uſeful and popular Engliſh work, entitled an "Arrangement of Britiſh Plants," which has gone through ſeveral editions, in ſome of the earlier of which Dr. Stokes was his coadjutor. (See STOKESIA.) —L'Herit. Sert. Angl. 33. Schreb. Gen. 791. Willd. Sp.

Profeffor Martyn fuppofed the honour had been defigned for Nicholas Witfen, a writer on fhells, who gave one of the earlieft accounts of New Holland. (See Phil. Tranf. v. 17 and 20.) Thunberg's miffion to Japan appears to have been furthered by the influence of the above-named gentleman. We can only rely on him for the propriety of the appellation in queftion.—Thunb. Nov. Gen. 33. Murray in Linn. Syft. Veg. ed. 14. 83. Schreb. Gen. 37. Willd. Sp. Pl. v. 1. 247. Vahl Enum. v. 2. 47. Mart. Mill. Dict. v. 4. Ker in Sims and Kon. Ann. of Bot. v. 1. 236. Ait. Hort. Kew. v. 1. 109. Juff. 59. Lamarck Illuftr. t. 30.—Clafs and order, *Triandria Monogynia*. Nat. Ord. *Enfatæ*, Linn. Ker. *Irides*, Juff.

Gen. Ch. *Cal.* none, unlefs the upper pair of the *bracteas* be fo confidered. *Cor.* of one petal, tubular, erect: tube cylindrical, flender at the bafe, gradually dilated at the top: limb fpreading, regular, in fix deep, equal, obovate fegments. *Stam.* Filaments three, very fhort, inferted into the mouth of the tube, at the bafe of three alternate fegments of the limb; anthers oblong, erect. *Pift.* Germen fuperior, roundifh, fmall: ftyle thread-fhaped, erect, longer than the tube of the corolla, flightly curved at the extremity; ftigma in three fhort, equal, rather fpreading fegments. *Peric.* Capfule membranous, of three cells and three valves. *Seeds* feveral, angular.

Eff. Ch. Calyx none. Corolla with a cylindrical tube; limb in fix deep, equal, obtufe fegments. Stigma flightly three-cleft. Capfule of three cells, with feveral angular feeds.

1. W. *maura*. Downy-flowered Witfenia. Thunb. Nov. Gen. 34. t. 2. f. 1. Fl. Cap. v. 1. 255. Willd. n. 1. Vahl n. 1. Ait. n. 1. Redout. Liliac. t. 245. (Antholyza maura; Linn. Mant. 175.) — Flowers terminal, in pairs. Outer fegments of the corolla exterally downy.— Native of the fhady fides of hills, at the Cape of Good Hope, flowering in April and May. Sent to Kew by Mr. Maffon, in 1790, but it does not appear to have bloffomed in that collection, nor elfewhere in Europe, M. Redoute's fine figure being made from a dried fpecimen, aided by defcription. The *root* is perennial and woody. *Stem* fhrubby, erect, more or lefs branched, two feet high, compreffed; naked in the lower part, and appearing as if jointed, from the fcars left by former foliage; leafy above. *Leaves* numerous, alternate, feffile, two-ranked, equitant, four or five inches long, compreffed, ftriated, acute, entire. *Flowers* in pairs at the extremities of the fhort terminal branches, crowded, more or lefs numeroufly, into a corymbofe tuft. *Corolla* two inches long: its tube yellow at the bafe, dark blue for a confiderable extent in the upper part; limb yellow, fcarcely fpreading, full half an inch long, clothed externally with denfe fhaggy pubefcence of a very peculiar kind, confined to the tips of the inner fegments.

2. W. *corymbofa*. Corymbofe Witfenia. Ker in Curt. Mag. t. 895. Ait. n. 2. Sm. Exot. Bot. v. 2. 17. t. 68. —Corymb many-flowered. Corolla externally fmooth.— Native of the Cape of Good Hope. Raifed from feed by G. Hibbert, efq. in 1803. A green-houfe plant, flowering in fpring and autumn. The *ftem* is fhrubby, from four to fix inches high. *Leaves* like the laft, but only half the fize, fomewhat glaucous. *Flowers* very numerous, bright blue, in a forked corymbofe, compound panicle, fupported by a long ftalk, at firft terminal, but foon becoming lateral. *Bracteas* two pair at the bafe of each flower, concave, obtufe. *Corolla* about an inch long, including its horizontal limb.

3. W. *ramofa*. Branching Witfenia. Thunb. Fl. Cap. v. 1. 256. Vahl n. 2. (W. fruticofa; Ker in Ann. of Bot. v. 1. 237. Ixia fruticofa; Thunb. Diff. n. 1. t. 1. f. 3. Lamarck Illuftrat. t. 31. f. 4. Linn. Suppl. 93.) —Stem much branched. Corolla externally fmooth; its tube capillary, twice the length of the limb.—Native of hills at the Cape of Good Hope, flowering in October, November, and December. The *ftem* is a fpan high at moft, remarkably woody, repeatedly branched in a corymbofe manner; naked below; the branches compreffed, two-edged, knotty or fcarred as if jointed, leafy at their extremities. *Leaves* equitant, two-ranked, linear, narrow, one and a half or two inches long, rather glaucous; reddifh at the bafe. *Flowers* terminal, very few together, if not quite folitary, blue, remarkable for the length and flendernefs of their tube, which fometimes meafures nearly two inches; the limb is rather lefs fpreading, and more bell-fhaped, than that of *corymbofa*. *Bracteas* membranous, elongated, brownifh.

4. W. *pumila*. Dwarf Witfenia. Vahl n. 3. (Ixia pumila; Forft. Comm. Gott. v. 9. 20. t. 2. I. magellanica; Lamarck Illuftr. v. 1. 109. Moræa magellanica; Willd. Sp. Pl. v. 1. 241, excluding Cavanilles' fynonym. Tapeinia, Juff. 59.)—Stems fimple, fingle-flowered.—Gathered by Forfter, Commerfon, and others, at the ftraits of Magellan. The *root* is perennial, long, branched, bearing denfe tufts of numerous, fimple, leafy *ftems*, an inch or inch and a half high. *Leaves* crowded, two-ranked, awl-fhaped, compreffed, ftrongly ribbed, about an inch long. *Flowers* whitifh, fmall, folitary, nearly feffile, among the uppermoft leaves, which form a kind of fheath, but each appears to have alfo a bivalve *fheath*, or pair of *bracteas*, which are permanent. *Capfule* brown, with rather rigid, emarginate valves.

Mr. Ker obferves, that this is the only genus of its natural order whofe habit is in any degree fhrubby. He mentions, in the Annals of Botany, another fpecies, by the name of *partita*, feen by himfelf in Mr. Hibbert's herbarium; but without any indication of its characters, fo that we have no means of knowing how it differs from the foregoing.

WITSIO, in *Geography*, a town of Sweden, in the province of Schonen; 28 miles N.N.W. of Chriftianftadt.

WITT, John de, in *Biography*, the fon of a burgomafter of Dordrecht, was born in 1625, and educated in various ufeful fciences, fo as to excel in a knowledge of jurifprudence, politics, and mathematics, in the latter of which he was fo great a proficient, that he wrote a treatife on the elements of curve-lines, which was publifhed under the infpection of Francis Schooten. For further improvement he fpent fome years in travel, and upon his return was elected to his father's poft of penfionary of Dordrecht. Attached by his defcent to the principles of republicanifm, and jealous of the houfe of Orange, he oppofed the elevation of this houfe, and diffuaded the province of Zealand from conferring the office of captain-general upon the young prince, William III. His conduct in this bufinefs was much approved, and he was henceforth regarded as at the head of the political adminiftration of the United Provinces. This was a period peculiarly critical and interefting. The war with the new Englifh republic diftreffed the ftates; it was injurious to their trade and finances; and prefented to the Orange party a favourable opportunity for advancing prince William to the power and dignities poffeffed by his anceftors. Peace at length became abfolutely neceffary; and one of the articles concluded upon in 1654, and dictated by Cromwell, was the perpetual exclufion of the prince of Orange from the high offices formerly held by his family. This article was agreed to by the ftates of Holland alone, and when De Witt drew up a declaration for divulging it, it, ſome of the provinces cenſured it, and charged the anti-Orange party with having ſuggeſted it to Cromwell. The province of Holland, however, carried the point, and the general tranquillity was little diſturbed. De Witt now directed his attention to the ſtate of the finances, and ſucceeded in reducing the intereſt of the public debt, and perſuading the people to acquieſce in this meaſure. The reſtoration of Charles II. was generally agreeable to the United States, and more eſpecially to the Orange party: but the reſtored ſovereign ſoon declared his diſſatisfaction with De Witt, becauſe he had been hoſtile to the elevation of the houſe of Orange. From this time, the Dutch ſtateſman favoured the politics of France more than thoſe of England. At length a war took place between the Dutch and Engliſh in 1665; during the progreſs of which De Witt was often unpopular, though he was the main ſpring which kept in action the reſources of the ſtate, and remedied every calamity. Peace with England in 1667 developed the ambitious projects of Lewis XIV. in taking poſſeſſion of the Spaniſh Netherlands; and the alarm which this meaſure produced in the United Provinces gave occaſion to the friends of the houſe of Orange to propoſe the elevation of the young prince to the dignities which his family had poſſeſſed. De Witt, with a view of counteracting this purpoſe, obtained a reſolution on the part of the ſtates of Holland for ſeparating the offices of captain-general and ſtadtholder (ſee William III.), which reſolution gave great offence to the other provinces, and rendered De Witt, with whom it was ſuppoſed to have originated, extremely unpopular. Senſible, however, of the dangers ariſing from French ambition, he concurred in the triple alliance between England, Sweden, and the United Provinces, concluded, in 1668, by himſelf and ſir William Temple. The ſtates of Holland were ſo ſatisfied with his conduct, that they nominated him for five years more to the office of their penſionary, which he had already occupied for fifteen years. Confiding in the triple alliance, and the ſubſequent peace of Aix-la-Chapelle, he again indulged his jealouſy of the Orange party and a ſtanding army, and conſidered the danger from France as a ſecondary object. But the ambition of Lewis had no bounds; the unprincipled Charles II. could not be relied upon; the triple alliance was ſet aſide; and the Engliſh cabinet joined the French in direct war with the United Provinces; ſo that in the year 1672 a French army made an irruption into the territories of the ſtates, and threatened to overwhelm the whole country. The anti-Orangiſts were then compelled to confer the chief command on William. The conduct of the French had been ſo atrocious, that every perſon who had manifeſted the ſlighteſt attachment to their politics was charged with treaſon. De Witt became the object of public indignation, and to him were aſcribed all the calamities which were felt or feared. Four aſſaſſins attempted his life, as he was returning home from an aſſembly of the ſtates of Holland, attended by a ſingle ſervant; but though he received many wounds, none of them were mortal. One of the aſſaſſins was taken and executed; but ſuch is the influence of party, the friends of the houſe of Orange regarded the wretch as a martyr. Cornelius de Witt, on his return from the fleet, where he had ſerved as deputy of the ſtates, narrowly eſcaped from a ſimilar attempt. The prince was now elevated to the ſtadtholderate; and the penſionary, as ſoon as he was recovered from his wounds, viſited him with congratulation on the event, but was coolly received. Finding that, as he was become an object of the public hatred, he could be no longer of any ſervice, he requeſted permiſſion from the ſtates of Holland to reſign his office, which was granted him upon the moſt honourable terms. His brother was at this time impriſoned among common felons at the Hague, under a charge, preferred by a perſon of infamous character, of having formed a plot againſt the life of the prince of Orange. On his trial he was put to the torture, in the moſt cruel form of applying it; but though he endured the moſt aggravated ſufferings, proteſting his innocence, and citing his judges before the tribunal of God for their treatment of him, they pronounced ſentence, which deprived him of all his dignities, and baniſhed him for life from the province. Although no criminal charge was brought againſt John de Witt, the enemies of the family reſolved that neither of the brothers ſhould eſcape with life. Decoyed by a fictitious meſſage to viſit his brother Cornelius in the priſon, a furious mob aſſembled to prevent his return. The ſtates of Holland ordered a guard to diſperſe the people, and requeſted ſome companies of horſe and foot to be ſent from the camp of the prince of Orange. But the commanding officers were inveterate in their enmity againſt the De Witts; and the inflamed populace, not reſtrained from executing their bloody purpoſe, forced open the doors of the priſon, dragged out the two brothers, and inhumanly maſſacred them. This cataſtrophe took place in Auguſt 1672, John de Witt being in the 47th year of his age. Although the ſtates of Holland pronounced the deed to be deteſtable, and requeſted the ſtadtholder to take proper meaſures for avenging the death of theſe two brothers, it was pretended that it would be dangerous to inquire into a deed in which the principal burghers of the Hague were concerned, and therefore none of the murderers were brought to juſtice. It ſhould, however, be recollected, that the prince never ſpoke of this maſſacre without the greateſt horror.

The character of De Witt has been deſcribed in honourable terms by ſir William Temple, who knew him well, both in private life and in his public ſtation. He ſpeaks of him as a perſon of indefatigable application, of invincible reſolution, of a ſound and clear judgment, and of irreproachable integrity, inſomuch, that if he was blinded in any reſpect, it was in conſequence of his paſſion for promoting what he thought the welfare of his country. He bears teſtimony to the penſionary's knowledge of the intereſts of foreign courts, though he did not make ſufficient allowance for the treachery of princes, or rather their miniſters, and was thus miſled with regard to the ambitious views of France. If he had any wrong bias in his political conduct, it was that of an hereditary jealouſy and diſlike of the houſe of Orange, which led him in ſome caſes to act rather as a party leader than an unprejudiced patriot. No man could be leſs influenced than De Witt by views of avarice or oſtentation. His manners and appearance were adapted to the ancient ſimplicity and frugality of his country, even in the height of his power. When his papers and private letters were ſubmitted to a rigorous ſcrutiny after his death, nothing was diſcovered that could impeach his integrity. When one of the commiſſioners was aſked what they had found in De Witt's papers; "What (ſaid he) could we have found—nothing but probity!" As a man of buſineſs, he was ſcrupulouſly attentive to order and method; and when he was once aſked, How he was able to tranſact ſuch a multiplicity of affairs? he replied, "By doing only one thing at a time." Mod. Un. Hiſt. Gen. Biog.

WITTBACH, in *Geography*, a river of Germany, which riſes near Hackenburg Sayn, and after a circuitous courſe runs into the Rhine, about a mile below Neuwied.

WITTELM, a ſmall iſland in Steinhuder lake, with a fort; 3 miles N. of Hagenburg.

WITTELOHE, a town of Germany, in the county of Verden; 10 miles S.E. of Verden.

WITTEM, a citadel of France, in the department of the Roer. It heretofore gave name to a lordſhip, wholly ſurrounded by the duchy of Limburg; 6 miles S.E. of Aix-la-Chapelle.

WITTEN, in *Commerce*, a money of account at Pernau and Stettin, &c. At Pernau a current rix-dollar is reckoned at 60 wittens, or 75 copecks; and an Albert's rix-dollar is eſtimated at 80 wittens, or 100 copecks; a Pernau mark is worth 3 wittens; a Lettiſh mark = 2 wittens; and 4 wittens = 5 copecks. At Stettin the rix-dollar was formerly divided into 36 ſhillings current, 72 ſhillings Sundiſh, or 144 wittens; which monies of account are now nearly diſcontinued.

WITTEN, in *Geography*, a town of Germany, in the county of Mark; 7 miles S.E. of Bockum.

WITTEN *See*, a lake of the duchy of Bremen; 10 miles S.E. of Bremen.

WITTENA-GEMOTE, among our *Saxon Anceſtors*, a term literally ſignifying a council, or aſſembly of ſages, or wiſe men; applied to the great council of the land, in later days called *parliament;* which ſee. See alſo GEMOTE.

In the Saxon times, this was the chief court of the kingdom, where all matters, both civil and criminal, and thoſe relating to the revenue, were determined. In civil and criminal matters, it was a court, in the firſt inſtance only, for facts ariſing in the county where it ſat; but it heard and determined cauſes from all other counties by way of appeal. To this court were ſummoned the earls of each county, and the lords of each leet, as alſo the repreſentatives of towns, who were choſen by their burgeſſes. This was the legiſlative and ſupreme judicial aſſembly of the Anglo-Saxon nation. As higheſt judicial court of the kingdom, it reſembled our preſent houſe of lords; and in thoſe periods, when the peers of the realm repreſented territorial property rather than hereditary dignities, the compariſon between the Saxon wittena-gemote, and the upper houſe of our modern parliament, might have been more correctly made in their legiſlative capacity. The German ſtates are recorded by Tacitus to have had national councils, and the continental Saxons are alſo ſtated to have poſſeſſed them. When the Cyning was only the temporary commander of the nation for the purpoſes of war, whoſe function ceaſed when peace returned, the wittena-gemote muſt have been the ſupreme authority of the nation; but when the Cyning became an eſtabliſhed and permanent dignity, whoſe privileges and power were perpetually increaſing till he attained the majeſtic prerogatives and widely-diffuſed property which Athelſtan and Edgar enjoyed, the wittena-gemote then aſſumed a ſecondary rank in the ſtate. This council was called by different names, and it was compoſed of perſons who were denominated witan from their preſumed wiſdom, and with reference to their rank and property eadigan, (the wealthy,) optimates, principes, primates, proceres, cucionatores angliæ, &c. The gemotes of the witan, without doubt, varied, as our parliaments vary, in the number and quality of the perſons who from time to time attended. Moſt of thoſe whoſe names are ſubſcribed to councils or charters, and who appear to have been the witan who conſtituted the gemote, have ſome titles after their names; but there are ſome gemotes which have names without any addition. It is not eaſy to aſcertain all the qualifications which entitled perſons to a ſeat in the wittena-gemote. There is, however, one curious paſſage, cited from the Book of Ely, in Gale's Script. vol. i. p. 513, which has been alleged by ſome writers as aſcertaining that a certain amount of property was an indiſpenſable requiſite, and that acquired property would anſwer this purpoſe as well as hereditary property. The poſſeſſion ſtated to be neceſſary to conſtitute one of the proceres was forty hides of land. The incident to which this paſſage refers occurred in the reign of Edward the Confeſſor. It related to the brother of an abbot, who, though nobly born, could not be reckoned among the nobility of the kingdom, becauſe he had not an eſtate of forty hides of land; and, therefore, he was refuſed by a lady, whom he ſought in marriage, till his eſtate was increaſed to that magnitude by grants of land from his brother. This paſſage merely proves, that a certain portion, and that a very large one, of landed property *in dominio* was a neceſſary qualification, under the Anglo-Saxon government, to admit any perſon to the "rank and degree of nobility." But no argument, ſays lord Littelton, can be juſtly drawn from hence, that, in order to be qualified for a place in the Saxon great council, or wittena-gemote, it was requiſite to be lord of forty hides of land. Such a notion does not agree with any accounts that are given us of that aſſembly in the writings or records of thoſe times. By a paſſage in the preface to Ina's laws, as tranſlated by Wilkins, it appears, that the Saxon legiſlature was compoſed of the king, *cum omnibus ſuis ſenatoribus*, which ſenators Littelton ſuppoſes to have been the "nobility of the kingdom," ſuch as afterwards formed the ordinary council of lords under our kings of Norman race; et *cum ſenioribus ſapientibus populi ſui*, by whom he underſtands the deputies or repreſentatives of the people, either by election or magiſtracy; et *cum multa etiam ſocietate miniſtrorum Dei*, which words evidently denote the inferior clergy, mentioned by Eadmer as preſent in the parliaments of thoſe times. It appears alſo, by a paragraph in Spelman's Councils Sub. Ann. 855, that the Saxon conſtitution required not only the "preſence," (ſee BOROUGH,) but the "approbation of the people," to the enacting of a law; though, by way of marking the diſtinction between theſe and the higher orders of the ſtate, the nobility alone ſet their hands to the act. "Whoever," ſays ſir John Forteſcue Aland, who was very learned in the Saxon language and legal antiquities, in his preface to the book of chancellor Forteſcue on the difference between an abſolute and limited monarchy, "carefully and ſkilfully reads the Saxon laws, and the prefaces or preambles to them, will find, that the commons of England always in the Saxon times made part of that auguſt aſſembly." In a paſſage occurring in lib. iii. ſ. 56. of William of Malmſbury, we have an expreſs declaration, that by the Saxon conſtitution eſtabliſhed in England, the "people," as well as the nobles, had a right to be called to the "General Aſſembly" upon affairs of great moment, and to join in the "edicts" made there; ſo that, without "their conſent," the ſucceſſion to the crown could not be ſettled. The term *Senatus* uſed by this hiſtorian denotes the ordinary aſſembly of the nobles, which he diſtinguiſhes from the "people;" but he ſuppoſes that the latter ought to be joined to the former, in order to compoſe the entire legiſlature and great council of the nation, upon extraordinary occaſions. This was agreeable to the cuſtom aſcribed by Tacitus to the Germans, from whom they ſprung; "De minoribus rebus principes conſultant, de majoribus omnes; ita tamen, ut ea quoque, quorum apud plebum arbitrium eſt, apud principes pertractantur." See BOROUGH.

It has been, among conſtitutional antiquarians, an intereſting queſtion, whether they who poſſeſſed this quantity of land had thereby the right of being in the wittena-gemote; or whether the members of this great council were elected from the territorial proprietors, and ſat as their repreſentatives? One perſon is mentioned by Mr. Turner (ubi infra), whoſe

whose designation seems to have the force of expressing an elected member.. Among the persons signing to the act of the gemote at Closeshoe in 824 is, "Ego Beonna *electus* consent. et subscrib."

The members of the gemote were convened by the king's writ, of which many instances occur; and the times of their meeting seem to have been usually the great festivals of the church, as Christmas, Easter, and Whitsuntide; but of these Easter, being most frequently mentioned, seems to have been the favourite period. Their meetings, however, were not absolutely restricted to these seasons. The place of their assembly was not fixed. Perhaps this might depend on the king's residence at the time, and might have suited his convenience. Our monarchs seem to have maintained their influence in the wittena-gemote by their munificence. The king presided at this council, and sometimes, perhaps always, addressed them. In 993 we have an account of a royal speech. One of their duties was to elect the sovereign, and to assist at his coronation. Another was to co-operate with the king in making laws. The wittena-gemote appears also to have made treaties jointly with the king. Many instances occur to this purpose. The treaty, printed in Wilkins's Leges Anglæ-Saxonicæ, p. 104, is said to have been made by the king and his witan. They are also mentioned as assisting the king in directing the military preparations of the kingdom. Impeachments of great men were made before the wittena-gemote. At these councils grants of land were made and confirmed; and the wittena-gemote frequently appears in the Saxon remains, as the high court of judicature of the kingdom, and it exercised power over the public guilds of the nation. The lands of the Anglo-Saxons, the burghs, and the people, appear in all the documents of our ancestors, as subjected to certain definite payments to the king as to their lords; and by a custom, whose origin is lost in its antiquity, among the Anglo-Saxons, all their lands, unless specially exempted, were liable to three great burdens, the building and reparation of bridges and fortifications, and to military expeditions. But what we now call taxation seems to have begun in the time of Ethelred, and to have arisen from the evils of a foreign invasion. Thus the payment of 10,000*l.* to the Danes to buy off their hostility, mentioned by Henry of Huntingdon, and those which followed, are stated to have been ordered by the king and the wittena-gemote. Under sovereigns of feeble capacity, the wittena-gemote seems to have been the scene of those factions, which always attend both aristocracies and democracies, when no commanding talents exist to predominate in the discussions, and to shape the council. Turner's Hist. of the Anglo-Saxons, vol. ii. book 10. Littelton's Hist. Henry II. vol. iii.

WITTENBERG, in *Geography*, a town of Saxony, and capital of a circle or district, situated on the side of the Elbe, over which is a ferry: it is the head town of the electoral circle, the seat of an aulic judicature, of the assize, as also a consistory, together with that of the general superintendancy of the electoral circle, a spiritual inspection, the circle amt, and a famous university, founded in the year 1502, at which, in 1517, the Reformation took its rise by means of Martin Luther. This town is not large, but fortified. The old citadel was formerly the electoral residence; near it stands an arsenal. In the large round tower are kept the archives of the electoral and princely houses. The university library is kept in what was formerly an Augustine cloister. The first founder of the town of Wittenberg was Bernard, duke of Saxony. In the year 1547, it was taken by the emperor Charles V.; in the year 1756, it was possessed by the Prussians, who also broke down a bastion of the fortifications; 60 miles N. of Dresden. N. lat. 51° 53′. E. long. 12° 46′.

Wittenberg, a town of Prussia, in Natangen; 8 miles N. of Heilsberg.—Also, a town of the duchy of Lauenburg, on the Elbe; 8 miles W. of Lauenburg.

WITTENBERGEN, a town of Brandenburg, in the Mark of Pregnitz; 6 miles S.S.W. of Perleberg. N. lat. 53° 2′. E. long. 11° 50′.—Also, a town of the duchy of Holstein; 8 miles S.W. of Lutkenborg.

WITTENBURG, a town of the duchy of Mecklenburg; 17 miles W. of Schwerin.

WITTENHALL, a township of England, in Staffordshire; 2 miles N.E. of Wolverhampton.

WITTENHAUSEN, a town of the duchy of Holstein; 5 miles W. of Oldeburg.

WITTENSTEIN, a town of Prussia, in the province of Natangen; 10 miles S.S.E. of Königsberg.

WITTGENAU. See Witgenau.

WITTHOEC, a town of Africa, in the country of Cape Lopez Gonsalvo; 30 miles N. of Olibato.

WITTICHSTHAL, a town of Saxony, in the circle of Erzgebirg; 7 miles S. of Schwartzenberg.

WITTINGEN, a town of Westphalia, in the principality of Luneburg Zelle; 27 miles E. of Zelle.

WITTLESEE Mere, a lake of England, in the county of Huntingdon; 4 miles S. of Peterborough.

WITTLICH, a town of France, in the department of the Rhine and Moselle; 16 miles N.E. of Treves. N. lat. 50° 4′. E. long. 6° 52′.

WITTMUND, a town of East Frieseland, on the Harle; 7 miles S.E. of Essens.

WITTOBA, in *Hindoo Mythology*, is a name of the god Vishnu in one of his numerous *descents*, or *avataras*, as they are called. Some account of these avataras is given under our article Vishnu. This, now under consideration, was one of inferior importance; and not, it is said, of very ancient occurrence, and therefore not described in the Puranas, unless it be in the one supposed to be more modern than the rest, which is entitled Maha Bhagavat. (See Purana, and Sri Bhagavata.) A splendid temple is dedicated to the worship of Wittoba, or Vishnu, at Panderpoor, a town of great respectability on the river Beemah, about 100 miles to the south-eastward of Poona. The manifestation is said to have taken place there. He is there represented sculptured in stone, of the size of a man, standing with his feet parallel to each other; his hands upon his hips, the fingers pointing forward, his thumbs backward. Two of the wives of Vishnu in his avatara of Krishna accompanied him in this; these were Rukmeni and Satyavama, and they have smaller temples at Panderpoor, besides their lord's. (See Krishna, Rukmeni, and Satyavama.) Images of Wittoba are common in the Mahratta country, generally of clumsy manufacture. Several representations of Wittoba and his wives are given in the Hindoo Pantheon, from casts and pictures. That work contains also a history of the avatara, and many particulars respecting it.

WITTORF, in *Geography*, a town of Germany, in the county of Verden; 10 miles S.S.E. of Rotenburg.

WITTOW, a town on a peninsula at the northern extremity of the island of Usedom, near Artona, an ancient fortress destroyed by the Swedes. N. lat. 54° 44′. E. long. 13° 27′.

WITTSTOCK, a town of Brandenburg, in the Mark of Pregnitz; 47 miles N.N.W. of Berlin. N. lat. 53° 10′. E. long. 12° 39′.—Also, a town of Brandenburg, in the New Mark; 12 miles N. of Custrin. N. lat. 52° 49′. E. long. 14° 50′.

WITTEM, a citadel of France, in the department of the Roer. It heretofore gave name to a lordſhip, wholly ſurrounded by the duchy of Limburg; 6 miles S.E. of Aix-la-Chapelle.

WITTEN, in *Commerce*, a money of account at Pernau and Stettin, &c. At Pernau a current rix-dollar is reckoned at 60 wittens, or 75 copecks; and an Albert's rix-dollar is eſtimated at 80 wittens, or 100 copecks; a Pernau mark is worth 3 wittens; a Lettiſh mark = 2 wittens; and 4 wittens = 5 copecks. At Stettin the rix-dollar was formerly divided into 36 ſhillings current, 72 ſhillings Sundiſh, or 144 wittens; which monies of account are now nearly diſcontinued.

WITTEN, in *Geography*, a town of Germany, in the county of Mark; 7 miles S.E. of Bockum.

WITTEN *See*, a lake of the duchy of Bremen; 10 miles S.E. of Bremen.

WITTENA-GEMOTE, among our *Saxon Anceſtors*, a term literally ſignifying a council, or aſſembly of ſages, or wiſe men; applied to the great council of the land, in later days called *parliament;* which ſee. See alſo GEMOTE.

In the Saxon times, this was the chief court of the kingdom, where all matters, both civil and criminal, and thoſe relating to the revenue, were determined. In civil and criminal matters, it was a court, in the firſt inſtance only, for facts ariſing in the county where it ſat; but it heard and determined cauſes from all other counties by way of appeal. To this court were ſummoned the earls of each county, and the lords of each leet, as alſo the repreſentatives of towns, who were choſen by their burgeſſes. This was the legiſlative and ſupreme judicial aſſembly of the Anglo-Saxon nation. As higheſt judicial court of the kingdom, it reſembled our preſent houſe of lords; and in thoſe periods, when the peers of the realm repreſented territorial property rather than hereditary dignities, the compariſon between the Saxon wittena-gemote, and the upper houſe of our modern parliament, might have been more correctly made in their legiſlative capacity. The German ſtates are recorded by Tacitus to have had national councils, and the continental Saxons are alſo ſtated to have poſſeſſed them. When the Cyning was only the temporary commander of the nation for the purpoſes of war, whoſe function ceaſed when peace returned, the wittena-gemote muſt have been the ſupreme authority of the nation; but when the Cyning became an eſtabliſhed and permanent dignity, whoſe privileges and power were perpetually increaſing till he attained the majeſtic prerogatives and widely-diffuſed property which Athelſtan and Edgar enjoyed, the wittena-gemote then aſſumed a ſecondary rank in the ſtate. This council was called by different names, and it was compoſed of perſons who were denominated witan from their preſumed wiſdom, and with reference to their rank and property eadigan, (the wealthy,) optimates, principes, primates, proceres, cucionatores angliæ, &c. The gemotes of the witan, without doubt, varied, as our parliaments vary, in the number and quality of the perſons who from time to time attended. Moſt of thoſe whoſe names are ſubſcribed to councils or charters, and who appear to have been the witan who conſtituted the gemote, have ſome titles after their names; but there are ſome gemotes which have names without any addition. It is not eaſy to aſcertain all the qualifications which entitled perſons to a ſeat in the wittena-gemote. There is, however, one curious paſſage, cited from the Book of Ely, in Gale's Script. vol. i. p. 513, which has been alleged by ſome writers as aſcertaining that a certain amount of property was an indiſpenſable requiſite, and that acquired property would anſwer this purpoſe as well as hereditary property. The poſſeſſion ſtated to be neceſſary to conſtitute one of the proceres was forty hides of land. The incident to which this paſſage refers occurred in the reign of Edward the Confeſſor. It related to the brother of an abbot, who, though nobly born, could not be reckoned among the nobility of the kingdom, becauſe he had not an eſtate of forty hides of land; and, therefore, he was refuſed by a lady, whom he ſought in marriage, till his eſtate was increaſed to that magnitude by grants of land from his brother. This paſſage merely proves, that a certain portion, and that a very large one, of landed property *in dominio* was a neceſſary qualification, under the Anglo-Saxon government, to admit any perſon to the "rank and degree of nobility." But no argument, ſays lord Littelton, can be juſtly drawn from hence, that, in order to be qualified for a place in the Saxon great council, or wittena-gemote, it was requiſite to be lord of forty hides of land. Such a notion does not agree with any accounts that are given us of that aſſembly in the writings or records of thoſe times. By a paſſage in the preface to Ina's laws, as tranſlated by Wilkins, it appears, that the Saxon legiſlature was compoſed of the king, *cum omnibus ſuis ſenatoribus*, which ſenators Littelton ſuppoſes to have been the "nobility of the kingdom," ſuch as afterwards formed the ordinary council of lords under our kings of Norman race; et *cum ſenioribus ſapientibus populi ſui*, by whom he underſtands the deputies or repreſentatives of the people, either by election or magiſtracy; et *cum multa etiam ſocietate miniſtrorum Dei*, which words evidently denote the inferior clergy, mentioned by Eadmer as preſent in the parliaments of thoſe times. It appears alſo, by a paragraph in Spelman's Councils Sub. Ann. 855, that the Saxon conſtitution required not only the "preſence," (ſee BOROUGH,) but the "approbation of the people," to the enacting of a law; though, by way of marking the diſtinction between theſe and the higher orders of the ſtate, the nobility alone ſet their hands to the act. "Whoever," ſays ſir John Forteſcue Aland, who was very learned in the Saxon language and legal antiquities, in his preface to the book of chancellor Forteſcue on the difference between an abſolute and limited monarchy, "carefully and ſkilfully reads the Saxon laws, and the prefaces or preambles to them, will find, that the commons of England always in the Saxon times made part of that auguſt aſſembly." In a paſſage occurring in lib. iii. f. 56. of William of Malmſbury, we have an expreſs declaration, that by the Saxon conſtitution eſtabliſhed in England, the "people," as well as the nobles, had a right to be called to the "General Aſſembly" upon affairs of great moment, and to join in the "edicts" made there; ſo that, without "their conſent," the ſucceſſion to the crown could not be ſettled. The term *Senatus* uſed by this hiſtorian denotes the ordinary aſſembly of the nobles, which he diſtinguiſhes from the "people;" but he ſuppoſes that the latter ought to be joined to the former, in order to compoſe the entire legiſlature and great council of the nation, upon extraordinary occaſions. This was agreeable to the cuſtom aſcribed by Tacitus to the Germans, from whom they ſprung; "De minoribus rebus principes conſultant, de majoribus omnes; ita tamen, ut ea quoque, quorum apud plebum arbitrium eſt, apud principes pertractantur." See BOROUGH.

It has been, among conſtitutional antiquarians, an intereſting queſtion, whether they who poſſeſſed this quantity of land had thereby the right of being in the wittena-gemote; or whether the members of this great council were elected from the territorial proprietors, and ſat as their repreſentatives? One perſon is mentioned by Mr. Turner (ubi infra), whoſe

whose designation seems to have the force of expressing an elected member. Among the persons signing to the act of the gemote at Closeshoe in 824 is, "Ego Beonna *electus* consent. et subscrib."

The members of the gemote were convened by the king's writ, of which many instances occur; and the times of their meeting seem to have been usually the great festivals of the church, as Christmas, Easter, and Whitsuntide; but of these Easter, being most frequently mentioned, seems to have been the favourite period. Their meetings, however, were not absolutely restricted to these seasons. The place of their assembly was not fixed. Perhaps this might depend on the king's residence at the time, and might have suited his convenience. Our monarchs seem to have maintained their influence in the wittena-gemote by their munificence. The king presided at this council, and sometimes, perhaps always, addressed them. In 993 we have an account of a royal speech. One of their duties was to elect the sovereign, and to assist at his coronation. Another was to co-operate with the king in making laws. The wittena-gemote appears also to have made treaties jointly with the king. Many instances occur to this purpose. The treaty, printed in Wilkins's Leges Anglæ-Saxonicæ, p. 104, is said to have been made by the king and his witan. They are also mentioned as assisting the king in directing the military preparations of the kingdom. Impeachments of great men were made before the wittena-gemote. At these councils grants of land were made and confirmed; and the wittena-gemote frequently appears in the Saxon remains, as the high court of judicature of the kingdom, and it exercised power over the public guilds of the nation. The lands of the Anglo-Saxons, the burghs, and the people, appear in all the documents of our ancestors, as subjected to certain definite payments to the king as to their lords; and by a custom, whose origin is lost in its antiquity, among the Anglo-Saxons, all their lands, unless specially exempted, were liable to three great burdens, the building and reparation of bridges and fortifications, and to military expeditions. But what we now call taxation seems to have begun in the time of Ethelred, and to have arisen from the evils of a foreign invasion. Thus the payment of 10,000*l.* to the Danes to buy off their hostility, mentioned by Henry of Huntingdon, and those which followed, are stated to have been ordered by the king and the wittena-gemote. Under sovereigns of feeble capacity, the wittena-gemote seems to have been the scene of those factions, which always attend both aristocracies and democracies, when no commanding talents exist to predominate in the discussions, and to shape the council.
