6. *A. verna.* Vernal Egg-Agaric. Lamarck Dict. v. 1. 113. Perf. n. 6. (*Agaricus bulbosus vernus*; Bulliard t. 108. *Fungus totus candidus, pileolo ampliore, glutine limacino infecto, pediculo tenuiori cylindrico, annulo strictionis cinctio*; Mich. Gen. 171? at the suggestion of Lamarck.)—Pure white in every part. *Head* at length concave, somewhat funnel-shaped. Ring pendulous. Stalk elongated, solid, cylindrical.—Common in woods in France during the spring. Bulliard says many persons have died from eating this fungus by mistake for the white-gilled variety of the Common Mushroom. It may be kept in the mouth for eight or ten minutes, before its acrimony, resembling pepper, becomes perceptible. If the *wrapper* at the base be attended to, the plant can never be confounded with any eatable *Agaric*.

7. *A. porphyria.* Purple Egg-Agaric. Albert. and Schwein. Confp. 142. n. 401. t. 11. f. 1.—*Head* convex, naked, smooth, of a livid purplish-brown. Ring nearly of the same colour. Gills and stalk white.—Not rare in moist, turfy, mossy spots, in fir woods more especially, over which it is scattered in September and October. Habit of *A. viridis*, n. 9, but only half the size. *Stalk* three or four inches high, too dark-coloured in the figure. *Head* almost as much in breadth, never found with warts; very rarely and slightly striated at the margin.

8. *A. bulbosa.* White Bulbous Egg-Agaric. Perf. n. 7. P p Albert.

Albert. and Schw. Confp. 143. (*Agaricus bulbosus*; Schæff. Fung. v. 4. 61. t. 241. With. v. 4. 217. *A. ovoides albus*; Bulliard t. 364. *Leucomyces speciosior*; Battar. Arim. 28. t. 6. f. A.)—White in every part. Head convex. Stalk elongated, tapering; bulbous at the base. —Frequent from spring to the end of autumn, in rich soil, in woods, gardens, about hot-beds, &c. Its size is considerable. Bulliard speaks of his plant as having a very agreeable flavour, and therefore we presume it to be one of the eatable *fungi*. In the fourth of France it is known by the name of *Agaric orange blanche*, to distinguish it from the *A. orange vrai*; see n. 11. The bulbous base of the nearly solid stalk is a characteristic mark. The ring is broad, loosely pendulous, permanent. Head almost hemispherical, rarely with a slightly indented boss. Schæffer's plate is too much coloured. The gills, if not absolutely white, are semi-pellucid, or watery, in their appearance.

9. *A. citrina*. Lemon-coloured Egg-Agaric. Perf. n. 8, not 7. Disp. Meth. 66. Albert. and Schwein. Confp. 143. (*Agaricus citrinus*; Schæff. Fung. v. 4. 11. t. 20.)—Head smooth, convex, lemon-coloured. Stalk and gills white.—This is described as not unfrequent on the continent, in beech or oak woods, where the ground is sandy. Whether it be found in England, we are doubtful. Mr. Sowerby has exhibited in his t. 286, a pale yellow variety of *Agaricus muscarius*, see n. 13, for Schæffer's *citrinus*; but this is not quite conclusive to us. Perfoon cites *Agaricus Mappa*, Willd. Berol. 381. Batsh. Elench. 57, as a variety of the present *Amanita*, distinguished by a darker colour of the head, and yellow gills: he speaks also of brownish warts on the head. Willdenow says the gills of his plant are whitish. Albertini and Schweiniz, accurate practical observers, say, "we find the warts upon the head not very rare. The ring, and frequently the stalk, is distinguished by a palish lemon-colour. The whole fungus is sometimes half a foot high, in which case the head is four inches broad, or more." Perfoon notices apparently a still different variety, on rotten trunks of trees, distinguished by its elegant sulphur-colour, flattish head, and aerid flavour.

10. *A. viridis*. Green Egg-Agaric. Perf. n. 9, not 8. Disp. Meth. 67. Albert. and Schwein. Confp. 143. (*Agaricus bulbosus*; Bulliard t. 2, and t. 577. Fungus phalloides annulatus, fœtidè virescens et patulus; Vaill. Parif. 74. t. 15. f. 5.)—Head convex, dull green, mostly naked. Stalk and gills white.—Found in sandy moist shady woods, from August to October, in France and Germany. The wrapper is inflated, whitish. Head four or five inches broad, convex, not bossed, of a more or less bright green, variegated occasionally with brown, and turning olive-brown in decay, when, according to Bulliard, it exhales an intolerable cadaverous smell, being a very dangerous species, though when young destitute of any bad scent or flavour. The head sometimes retains fragments of the wrapper, in the form of warts or broad patches, but this seems far from being universal or frequent.

11. *A. caesarea*. Imperial Egg-Agaric. Perf. n. 10, not 9. (*A. aurantiaca*; Perf. n. 11, not 10. *Agaricus caesarius*; Scop. Carn. v. 2. 419. Schæff. Fung. v. 4. 64. t. 247. *A. aurantiacus*; Bulliard t. 120. Fungus planus orbicularis aureus; Bauh. Pin. 371. Mich. Gen. 186. t. 77. f. 1. F. ovinus; Sterbeek Fung. 64. t. 4. f. D, E, F. Fungorum efulentorum genus 17; Cluf. Hist. v. 2. 272.)—Head convex, naked, deep orange-coloured; striated at the margin. Gills yellow, convex. Wrapper dilated upwards.—Native of Italy, France, Carniola, Bohemia, &c., but never observed in England. The wrapper is white, with a dilated entire border. Stalk hollow, nearly cylindrical, yellowish-white, or pale yellow, from four to six inches high.

Head from four to six inches wide, almost hemispherical when young, of a rich deep orange, smooth and naked, scarcely ever warty, striated near the edge, turning brownish or purplish in fading, as in Schæffer's figure, where it is drawn somewhat bossed, which we have never seen. The gills are usually of a delicate lemon-colour, as well as the ring. Perfoon rightly suspected his *A. caesarea* and *aurantiaca* not to be distinct species; they do not appear to us to be even varieties, Schæffer's plant being only in a more forward state than Bulliard's. We retain the oldest specific name, which is that of Scopoli. It serves to commemorate an historical fact, that the emperor Claudius was murdered by poison given with this fungus, to which the Romans applied the name of *Boletus*, and which Nero called "the food of the gods," because Claudius had eaten it, who was subsequently, like his sacred compeers, become a god! The Agaric before us is esteemed the most delicious and delicate of all *fungi*. The writer of this has examined and eaten it in Italy, where it is far from rare in summer, though so much in request, as to find a place chiefly at the tables of the great. Clusius tells of his supping some soup, at a distinguished man's table in Hungary, made of this fungus, to have been coloured with saffron. Dr. Withering has confounded Schæffer's plate with *Agaricus xerampelinus* of the same author, v. 4. 49. t. 214. Sowerb. Fung. t. 31. With. v. 4. 214. Hence he was led into the further mistake of supposing, as his *A. xerampelinus*, though eatable, is strong and disagreeable, that *Agaricus deliciosus* was what Claudius feasted upon. The latter is indeed a very favourite food, but destined to the vulgar in France and Italy, being by far more abundant than our *Amanita caesarea*. The oversight committed by Dr. Withering, respecting this famous fungus, and his own, as well as Schæffer's, *Agaricus xerampelinus*, is the more remarkable, as the latter has neither a wrapper nor a ring. Such errors are rare in this excellent writer. Mr. Sowerby has avoided the same mistake, though he has not explained it. We decline citing *Elvela Cicconis*, Battar. Fung. Arim. 27. t. 4. C, because no ring is there expressed; but we do not doubt the identity of the plant.

SECT. 3. Stalk with an obliterated wrapper at the base, and a ring at the upper part. Warts on the head small, and generally equal. To this section Perfoon gives the name of *Mycopæda*, because some of the species are used for killing flies. All of them perhaps are dangerous.

12. *A. muscaria*. Fly Egg-Agaric. Perf. n. 12, not 11. Albert. and Schwein. Confp. 143. (*Agaricus muscarius*; Linn. Sp. Pl. 164c. Hudf. 612. With. v. 4. 184. Schæff. Fung. v. 4. 13. t. 27, 28. Sowerb. Fung. t. 286. *A. psfendo-aurantiacus*; Bulliard t. 122. Fungus bulbosus, e volvâ erumpens, pileolo supernâ parte auro, ad ora striato, infernâ, et annulato pediculo, albis, radice bulbosa; Mich. Gen. 188. t. 78. f. 2. Fungi lethales; Ger. Em. 1581, fig. on the left, at the bottom.)—Head scarlet, shining, convex, at length flattish, variously fludded with white warts. Gills, ring, and stalk pure white. Wrapper with scarcely any remaining border.—Common in woods in autumn, especially under fir-trees. A large species, conspicuous for the splendid orange-red hue of its fatuin-like head, contrasted with the stalk and gills, and with the prominent angular white or cream-coloured warts, scattered, more or less abundantly, over its surface. These warts are formed from the wrapper, torn off close to the base of the stalk, which Bulliard well observed, as a specific mark between this and our last. It is highly important to discriminate them, *A. muscaria* being venomous in a great degree. When dried, it renders milk poisonous to flies and bugs, killing them very expeditiously; for

for which purpose it is preserved in some countries all the year round. Bulliard records, that he ate two ounces of this fungus raw, without any harm whatever, though he found it fatal when given to cats or dogs. Perfoon mentions a variety by the name of *A. formosa*, whose warts were loofe and yellowish, the *stalk* likewise being yellowish, very long, and loofely fealy. Also another, called *A. puella*, which is smaller, mostly naked, or only bordered with the warty substance; this is Schæffer's t. 28. Dr. Withering reduces the two following, perhaps, to the same species; but so many authors have kept them separate, especially Albertini and Schweiniz, that we shall follow Perfoon in the same measure.

13. *A. umbrina*. Brown Warty Egg-Agaric. Perf. n. 13, not 12. Albert. and Schw. Confp. 143. (Agaricus verrucosus; Hudf. 613. Curt. Lond. fasc. 5, t. 72. *A. maculatus*; Schæff. Fung. v. 4. 39. t. 90. Fungus muscas interficiens fuscus, maculis albis; Buxb. Hallen. 121.)—Head of a footy or tawny brown, flattish, variously ludded with white warts. Gills, ring, and stalk white.—More common than the preceding, but often accompanying it, in dry sandy woods, fields and pastures, especially under beech-trees, through the autumn. Withering, Curtis, and Light-foot consider this as a mere variety of *A. muscaria*, differing in the brown colour of its *head*, often tinged with yellow, or faintly with red. The size of the whole plant is usually somewhat smaller. We have made no particular observations on this subject. Colour in this tribe often affords good specific characters, and we should, moreover, be careful, in all the departments of natural history, not to be led away by any one very peculiar mark, like the warts in the present instance, to consider every thing, that has such a mark, as one species. Even Linnæus often fell into this error. We know not how the question is to be decided respecting these fungi, their artificial propagation by seed being attended with so much difficulty. It is sufficient that we here register their names and distinctions, under the correction of any person who may find good reasons for uniting them. The poisonous quality of *A. umbrina*, with respect to flies, is acknowledged in the above synonym of Ruxbaum. Curtis however found the base of the stalk to be the favourite food of a nondescript species of *Tipula*, smaller than the *plumosa*, whose larvae soon devour that and every other part of the plant.

14. *A. rubescens*. Blush-coloured Egg-Agaric. Perf. n. 14, not 13. Albert. and Schweiniz. Confp. 144. (Agaricus pustulatus; Schæff. Fung. v. 4. 39. t. 91.)—Head convex, opaque, reddish. Warts crowded, white like the gills. Flesh turning red when broken.—Native of beech woods in Germany, in autumn. We know nothing of its occurrence in Britain, for Dr. Withering's fifth variety of the *muscaria* may probably be different from what is before us. Albertini and Schweiniz assert that the *head* and *stalk* invariably turn red, sooner or later, after being broken, and that this is a sure specific test. The *head* seems more convex than that of *A. umbrina*. Its hue, according to the authors just quoted, is occasionally reddish, livid, smoky, or inclining to a liver-colour. *Stalk* two inches high. *Taste* scarcely any. We conceive this to be distinct from both the foregoing, whatever may be the case between them with regard to each other; and its usual appearance is very elegant, owing to the delicate tawny flesh-colour of the *head*, studded with copious white, or pale flesh-coloured, warts. Perfoon has a variety under the name of *circinnata*, for which he cites with doubt *Agaricus myodes*, Schæff. Fung. v. 4. 69. t. 261. The character given by Perfoon is, "Head hemispherical, somewhat umbilicated, reddish. Warts oblong, whitish, circularly disposed. Gills flattish, whitish. *Stalk* bulbous,

fealy, the colour of the head." He adds that the *stalk* is two inches long, solid, always perforated by worms (or insects) at the base. *Gills* obovate, sometimes decurrent in a tooth-like form. Substance reddish under the cuticle. Taste not unpleasent. It occurs, but rarely, in woods during autumn. Schæffer's figure exhibits a most elegant blush-coloured fungus, internally red, when cut, which we can have no hesitation in considering one species with Perfoon's *circinnata* and *rubescens*.

15. *A. virescens*. Greenish Egg-Agaric. Perf. n. 15, not 14.—"Head fleshy, flat, palish-green. Warts thick, whitish, with many angles. *Stalk* stoutish, white, with shaggy scales."—In woods, but extremely rare. *Stalk* three or four inches long, clothed with soft shaggy scales. *Wrapper* nearly obliterated. Substance of the *head* spongy, from four to six lines in thickness, not unpleasent to the taste.

16. *A. ampla*. Broad Egg-Agaric. Perf. n. 16, not 15.—"Head fleshy, very broad, mouse-coloured; smooth at the margin. Warts thickish, paler. *Stalk* white, solid, very stout. Gills narrow, rather thick."—Found in fir woods in Germany, but rarely. Perhaps the largest of its genus. *Stalk* four or five inches long, transversely fealy at the summit. *Gills* thick, about three lines only in breadth. *Head* minutely, in some degree, fibrous, and after the warts fall off, cellular. Taste like the Common Mushroom, *Agaricus campestris*. Perfoon.

17. *A. aspera*. Rough-headed Egg-Agaric. Perf. n. 17, not 16. Obs. Mycol. v. 2. 38. ("Agaricus asper; Abbild. der Schwämme, fasc. 3, with a plate." *A. verrucosus*; Bulliard t. 316. *A. myodes*; Bolt. Fung. v. 4. t. 139, excluding both synonyms.)—Head hemispherical, fleshy, compact, dusky red, rough with crowded pointed warts. Gills white, crowded. *Stalk* rather bulbous.—Not rare in woods, about July, August, or September, growing dispersed. It has been observed in Germany, France, and England. Perfoon says the scent is powerful; Bulliard, on the contrary, describes this species as inodorous, with a salt taste, partaking but little of a mushroom flavour, and he presumes it to be poisonous. This author justly adverts to the affinity of his plant to our *Amanita muscaria*, observing that it is white or reddish under the skin, never, like the *muscaria*, yellow. Perfoon in his excellent *Obs. Mycol.* gives the following account. "*Head* at first ovate, inclining to cylindrical; when expanded six inches broad, half an inch thick, compact in substance, strong in scent, often streaked with white at the margin, from cracks in the cuticle. *Warts* small, erect, pointed. *Gills*, as usual with this genus, thin, unconnected. *Stalk* from four to six inches high, solid, marked towards the base, with little fealy warts, like rudiments of the *wrapper*. *Ring* sometimes almost obliterated, and hanging in fragments to the edge of the head."

The *wrapper* in all the species of this third section is, indeed, so closely united to the base of the *stalk*, as to constitute a kind of bulb, but there is a marginal dilatation, less visible in *A. aspera* than any other, which evinces the true nature of the part in question. This species, though generally so very convex, even hemispherical, appears by Bulliard's plate, to assume a concave cup-shaped form in advancing towards decay.

AMARANTHI, the 30th natural order in Jussieu's system, being the first of his seventh class. See *НУСТА-ГОНУС* for the characters of this class. The following are the characters of the *Amaranthi*.

Calyx divided, more or less deeply, often surrounded by scales at the base. *Stamens* definite, sometimes distinct, sometimes monadelphous; in some genera there are scales alternate with the filaments; in others the combined fila-

ments form a tube or sheath. *Germen* simple; *style* or *stigma* simple, or double, or triple. *Capsule* of one cell, with an unconnected receptacle, and either bursting at the summit, or splitting all round, containing one or many seeds. The *coraculum* is curved round a farinaceous mass. *Flowers* capitate or spiked. *Leaves* generally undivided and pointed; in some alternate; in others opposite; in a few instances accompanied by *stipulas*. *Stem* for the most part herbaceous. *Stamens* and *pistils* sometimes in separate flowers.

SECT. 1. *Leaves alternate, without stipulas.*

Under this section Jusſieu enumerates *Amaranthus* and *Celosia* of Linnæus; with *Arenis* of Forſkall, a genus formed of alternate-leaved species of *Illecebrum*; and *Digera* of the same author, to which *Achyranthes muricata* of Linnæus is supposed to belong.

SECT. 2. *Leaves opposite, without stipulas.*

Consists of *Iresine*, *Achyranthes*, *Gomphrena*, and *Illecebrum*.

SECT. 3. *Leaves opposite, with stipulas.*

Under this section are ranged *Paronychia* of Tournefort, separated from the Linnæan *Illecebrum*; and *Herniaria* of all authors.

This order, as Jusſieu candidly observes, is very nearly related to that of the *Caryophylleæ*, which, on account of its having petals, he is obliged to place in a far distant part of his system. He remarks, on this subject, that the absence or presence of a *corolla* does not always afford an essential, or eminently natural, distinction; which is very true, but there is no character of natural orders without some exception, and hence Linnæus was led to deny the possibility of defining really natural orders by words, or any essential characters.

Jusſieu, in the *Annales du Muséum*, v. 2. 131, has published some additions to the present order, which, according to a recent alteration, and perhaps an improvement, in the nomenclature of natural orders, he there terms *Amaranthaceæ*. A translation of his paper may be seen in Sims and König's *Ann. of Bot.* v. 2. 274. The author here makes but two sections of the order in question, one having naked, the other stipulated, leaves. To the first he adds a new genus by the barbarous name of *Pupalia*, founded on the Linnæan *Achyranthes lappacea*, called in Rheede's *Hortus Malabaricus*, v. 7. t. 43. *Pupal-Valli*. Of this we are surprised to find Jusſieu had never seen the fruit, and we cannot but observe that its generic characters are rather weak, being chiefly taken from the inflorescence and bractæas.

To the section with stipulated leaves, this eminent botanist adds three new genera. 1. *Anychia* of Michaux, to which belongs *Queria canadensis* of Linnæus. 2. *LITHOPHILA* of Swartz. 3. *POLYCHROA* of Loureiro. The two last are already described in their proper places. See also *QUERIA*.

Jusſieu proceeds to remark, that *Cyathula* of Loureiro, a plant of this order, is really an *Achyranthes* with a many-clift stigma; but that *POLIA* of the same author, (see that article and *HAGÆA*), supposed to belong to the *Amaranthi*, is really one of the *Caryophylleæ*.

VOL. II.

AMBOISE, AMBASIA, or *Ambacia*, in *Geography*, a town of France, in the department of the Indre and Loire, and chief place of a canton in the district of Tours, situate at the conflux of the Loire and Amasse. The place contains 5100, and the canton 14,415 inhabitants; the territory comprehends 322½ kilometres, and 16 communes.

AMDOA, in *Geography*. See THIBET.

AMEDNAGUR, l. 1, Soubah, now called Dowlatabad. Add—This city has generally been placed 50 miles to the S.E. of its true position.

AMELIA, l. 5, for including *r.* exclusive of; l. 6. *r.* 10,594 and 7186. Add—Nottaway contains 9278 inhabitants, of whom 6368 are slaves.

AMENTACEÆ, in *Botany*, of which term mention has already been made in its place, as designating a Linnæan natural order, is also the appellation of the 99th order in Jusſieu's system, the fourth of his fifteenth class; corresponding for the most part, though not entirely, with that of Linnæus, and so called from *Amentum*, a Catkin, in allusion to the nature of its fructification. See EUPHORBIÆ for the characters of this fifteenth class of Jusſieu, and remarks thereon. He thus defines his *Amentaceæ*.

Flowers monoecious or dioecious, (rarely with stamens and pistils in the same,) all destitute of petals. The male, or barren, flowers disposed in a catkin, consisting either of scales, into which the stamens are inserted, or each of those scales has a *calyx* attached to it, which bears the *stamens*. The latter are either definite, or indefinite, with distinct filaments. (We would here observe that two or three species of *Salix* are remarkable for their combined, or monadelphous, filaments.)—The female, or fertile, flowers are either amentaceous, or fasciculated, or solitary; sometimes furnished with a single-leaved *calyx*, sometimes with only a scale. The *germen* is superior, either simple, or in some rare instances more than one, of a certain determinate number. *Style* one or more. *Stigmas* generally several. *Seeds* either naked, or enclosed in superior *capsules*, which are either of a coriaceous or bony texture, as many in number as the germens, and for the most part of a single cell. *Coraculum* destitute of *albumen*, with a straight radicle. *Stem* arboreous, or shrubby, rarely of humble growth. *Leaves* alternate, accompanied by *stipulas*, mostly simple.

SECT. 1. *Flowers with stamens and pistils.*

Here Jusſieu ranges *Fothergilla*, *Ulmus*, and *Celtis*; of which the two latter are placed by Linnæus among his *Scabridæ*. *Hamelis*, which the last-named author has, in manuscript, referred to his *Amentaceæ*, and which is surely next akin to *Fothergilla*, is reckoned by Jusſieu among his *Berberidæ*; or at least among several genera supposed related to that rather miscellaneous order.

SECT. 2. *Flowers dioecious.*

This contains *Salix*, *Populus*, and *Myrica*.

SECT. 3. *Flowers monoecious.*

A larger assemblage of genera, if not of species, consisting of *Betula*, *Carpinus*, *Fagus*, *Quercus*, *Corylus*, *Liquidambar*, (under which last the genus now called *COMPSONIA*, see that article, is hinted at,) and *Platanus*. There is no appendix of doubtful genera, as in most other orders of Jusſieu, but a suspicion is expressed respecting *Liquidambar* and *Platanus*.

The *Amentaceæ* of Linnæus are, *Salix*, *Populus*, *Platanus*, *Sloanea*, with a just indication of doubt, *Fagus*, *Juglans*, *Quercus*, *Corylus*, *Carpinus*, *Betula*, *Myrica*, *Pistacia*, and *Cynomorium*. *Brabejum* is, in the Linnæan manuscript, inserted immediately before *Fagus*; *Hamelis* before *Betula*, after which *Brabejum* is again written; an evident indication of great uncertainty in the mind of the writer, who knew this genus but imperfectly, and who had conceived no idea at all of the order *Protaceæ*, to which it clearly belongs, and which makes so striking a figure in the works of Jusſieu; and especially of our countryman Mr. Brown. See *Prodr. Nov. Holl.* v. 1. 363, and *Tr. of Linn. Soc.* v. 10.

AMERCOTE, in *Geography*, a fortified place, which formerly belonged to the country of Scind, but is now in the possession of the rajah of Joudpore. Situated S.E. of Hydrabad, and about 25 miles from the eastern branch of the Indus.

AMERICA, NORTH. See UNITED STATES.

AMES, a township of Ohio, in the county of Athens, having 608 inhabitants.

AMESEURY, a town of the Massachusetts, in Essex county, having 1890 inhabitants.

AMHERST, l. 3, r. 10,548; l. 4, r. 5207.

AMHERST, l. 6 from the bottom, r. 1554. Add—Alfo, a town of Massachusetts, in the county of Hampshire, having 1469 inhabitants.

AMIA, in *Ichthyology*, a genus of the abdominal fishes, the characters of which are, that the head is bony, naked, rough, with conspicuous fures; teeth, both in the jaws and palate, close-set and sharp; the two cirri near the nostrils; the gill-membrane twelve-rayed; and body scaly. There is one species, *viz.*

CALVA; the Carolinian Amia, with a black spot at the base of the tail. This is a small fresh-water fish, inhabiting some parts of Carolina. Described by Linnæus, from a specimen sent from Carolina by Dr. Garden.

AMITY, in *Geography*, a township of Pennsylvania, in the county of Berks, containing 1990 inhabitants.

AMMODYTES, in *Ichthyology*. Add—The ammodytes tobianus is the lance with the lower jaw longer than the upper. It conceals itself about a foot in the sand, with its body rolled into a spiral form; it is dug or drawn up, and used by the fishermen as a bait; it is also considered as a delicate article of food. The general length is from eight to ten inches. The lance lives on worms, water-insects, and small fishes, and even occasionally on those of its own species. It is itself preyed upon by the larger fishes, and particularly by the mackerel. It spawns in the month of May, depositing its eggs in the mud near the edges of the coast. The swimming bladder is wanting, so that the animal is fitted only for a littoral residence; and its scales are so small that they have been wholly overlooked, and their existence disputed by some ichthyologists. Shaw.

AMMONIA, in *Chemistry*. The following additions to our knowledge, respecting the volatile alkali, have been made since that subject was treated in the Cyclopædia. Water, as has been already stated, by absorbing ammoniacal gas increases in bulk, and becomes specifically lighter. The following table by Mr. Dalton exhibits the quantity of ammonia contained in ammoniacal solutions of different specific gravities.

Specific Gravity of Liquid.	Grs. of Ammonia in 100 Water-grain Measures of Liquid.	Grs. of Ammonia in 100 grs. of Liquid.	Boiling Point of the Liquid.	Volumes of Gas condensed in a given Volume of Liquid.

.99	2	2.0	196	28

When potassium or sodium is heated in ammoniacal gas, the metal becomes changed to an olive-green colour, and loses its metallic lustre; at the same time a portion of the gas is absorbed, and a quantity of hydrogen emitted, exactly equal to the quantity that would be evolved if the potassium or sodium were put into water. If the olive-green matter be heated, it gives out three-fifths of the ammonia absorbed, two-fifths in the state of ammoniacal gas, and one-fifth in the state of hydrogen gas and azote. Sir Humphrey Davy, having heated the olive-coloured matter strongly in a platinum tube, obtained nearly the whole of the ammonia absorbed, though about three-fifths of it were in the state of azotic and hydrogen gas. If the olive-coloured matter be placed in contact with a very little water, it is converted into potash, or soda and ammoniacal gas, and the gas is just equal to what the metal had absorbed. If it be placed in contact with a metal and heated, an alloy of the metal with potassium or sodium is obtained.

For these curious facts we are indebted to Gay Lussac and Thenard, and Davy. Dr. Thomson thinks they shew that potassium and sodium have the property of decomposing ammonia, and combining with its azote, while the hydrogen of the ammonia is set at liberty; and the *azoturet* formed, he thinks, combines with a portion of the remaining undecomposed ammonia. He acknowledges, however, that there are some objections to this opinion; and the facts accord better with the opinion, that an unknown compound of azote and hydrogen unite with the alkaline metal, while the compound thus formed combines with a portion of undecomposed ammonia.

A curious experiment made by Berzelius and Pontin induced Berzelius to draw the conclusion that ammonia is composed of an unknown metallic basis, which he has called *ammonium*, united to oxygen. This experiment has been since confirmed by sir H. Davy, Gay Lussac, and others, and is as follows:

When mercury is brought in contact with ammonia at the negative end of a galvanic battery, it gradually increases in volume, and is converted into a soft solid, having all the appearances of an amalgam. The experiment succeeds better if sal ammoniac slightly moistened be substituted for liquid ammonia. This amalgam, at the temperature of 70° or 80°, is a soft solid, of the consistence of butter; at 32° it is a firm crystallized mass, having a specific gravity below 3. When exposed to the air, it soon becomes covered with a crust of carbonate of ammonia. When thrown into water, hydrogen is evolved equal to half its bulk, the mercury is revived, and the water becomes a weak solution of ammonia. When confined in a given portion of air, the air increases in bulk, and pure mercury appears. Ammoniacal gas, amounting to $1\frac{1}{2}$ or $1\frac{2}{3}$ the volume of the amalgam, is evolved; and a quantity of oxygen equal to $\frac{1}{3}$ th or $\frac{1}{4}$ th of the ammonia disappears. When thrown into muriatic acid gas, it becomes coated with muriate of ammonia, and a little hydrogen is disengaged. In sulphuric acid it becomes coated with sulphate of ammonia and sulphur. All attempts to preserve this amalgam failed, from the impossibility of obtaining it free from water. When put into a glass tube, or when confined under naphtha or oils, the mercury separated, ammonia was formed, and a quantity of hydrogen evolved.

Gay Lussac and Thenard considered this amalgam as a simple compound of mercury and ammonia; but no analogous compound is known to chemists, as mercury when it unites to other substances, except metals, always loses its metallic lustre. These reasons induced Berzelius to form the above opinion. Most chemists at present agree with Gay Lussac and Thenard; but if their opinion be well founded, we must alter the notions entertained respecting amalgams.

The opinion at present entertained respecting the composition of ammonia is, that it is composed of three volumes of hydrogen and one volume of azote condensed into two volumes. Hence its specific gravity compared with that of common air is .590; 100 cubic inches at a mean temperature and pressure weigh 18 grains, and the weight of its atom is 21.25; that of oxygen being considered as 10.

AMMONIA, Salts of. These have been omitted in the usual place, namely, under AMMONIA; but most of them will be found in a subsequent part of the work, under SALTS. Those described elsewhere will be referred to here, and those remaining to be described will be now noticed.

Sulphate of Ammonia. See SULPHATE of Ammonia.

Chromate of Ammonia. This salt may be formed by saturating chromic acid by ammonia. It usually exists in the form of dendritic crystals of a fine yellow colour. When slightly heated, it is decomposed, even when in solution, brown flocks of chromic oxyd precipitating.

Arsenate of Ammonia. See ARSENATE of Ammonia.

Molybdate of Ammonia. This salt dissolves readily in water. The solution does not crystallize. When heated, the ammonia is partly driven off, partly decomposed, and the acid is reduced to the state of an oxyd.

Tungstate of Ammonia. This salt may be formed by dissolving tungstic acid in carbonate of ammonia. It is soluble in water, and crystallizes. Its taste is metallic, and it is entirely decomposed by heat.

Benzate of Ammonia. This salt crystallizes with difficulty. It deliquesces, and is very soluble in water. It has been recommended by Berzelius as an excellent re-agent for precipitating iron from its solution. It throws down this metal of an orange colour, and occasions no insoluble precipitates with any of the other bases, except tellurium and mercury, and perhaps copper, all of which are thrown down white.

Succinate of Ammonia. See SUCCINIC Acid. This salt has also been much recommended for precipitating iron when in the state of peroxyd.

Camphorate of Ammonia. This salt may be prepared by dissolving carbonate of ammonia in hot water, and adding camphoric acid slowly till the alkali is saturated. It crystallizes with difficulty; is sparingly soluble in cold water, but much more soluble in hot. It is completely soluble in alcohol. Most of the calcareous salts form triple compounds with this salt.

Citrate of Ammonia. See CITRATE of Ammonia. The remaining salts of ammonia are so totally devoid of interest, or so little known, that we do not think it necessary to enumerate them.

AMMYRSINE, in Botany, a new genus of Mr. Pursh's, more happily circumstanced in its characters, perhaps, than in its name. The latter is formed from *αμυρς*, *sand*, and *μυρτιν*, a *dwarf myrtle*; but *Myrsine*, being an established generic name, cannot, with propriety, make a part of another. Linnæan law, (see *Phil. Bot. fecit.* 225,) and good sense, are both against it; and if some similar innovations have, from peculiar causes, crept in, they are not to be imitated, though for the present they may be tolerated. The genus in question is founded on *Ledum buxifolium*, (see LEDUM, n. 3.) and stands in the Class and Order *Pentandria Monogynia*, in Mr. Pursh's *Flora* 280 and 301, agreeing, of course, in Natural Order with *Ledum*. The following are its characters.

Calyx in five deep segments. Petals five. Stamens prominent. Capsule of five cells, bursting at the summit.

Ledum is characterized.

Calyx minute, five-toothed. Corolla flat, in five deep segments. Capsule of five cells, bursting at the base.

AMNIOS, Liguor of the, Chemical Properties of. The peculiar acid principle termed by Vauquelin and Buniva *amniotic acid*, does not appear to exist during all the periods of gestation in the liquor amnii of the cow. Dr. Prout examined this fluid taken from an animal which had been slaughtered in an early period of her gestation, but was not able to detect any of the acid in question. See *Annals of Philology*, vol. v. p. 416.

AMOMUM, in Botany, *αμομον* of the Greeks, most probably derived from its Arabic denomination *hamamâ*, as De Theis writes it, is the ancient name of a sort of aromatic grain, or fruit, included, according to all appearance, among the species of the present AMOMUM of botanists. (See our former article, where this genus comprehends a much more extensive range of species than are now understood to belong to it.) Linnæus, and his immediate followers, included under *Amomum* almost every plant of the *Scitamineæ* that they knew not how otherwise to dispose of; and Gertner, though he altered the name for the worse, to ZINGIBER, (see that article,) threw no new light upon the characters or history of the genus, but rather, like every body else, added to their confusion. Mr. Roscoe first defined this genus, like the rest of the SCITAMINEÆ, as the reader will find under that head, by a clear distinctive character; and while he greatly reduced the number of species, rendered the whole perfectly clear and intelligible. We shall, as we have done with ALPINA, give a full view of this genus, as at present understood, and while we make considerable retractions, shall have something new to add in their place.—Roscoe Tr. of Linn. Soc. v. 8. 351. t. 20. f. 11. *Dryandr.* in *Ait. Hort. Kew.* v. 1. 8. Linn. Gen. 2. Schreb. 3. *Willd. Sp. Pl.* v. 1. 6. Mart. Mill. Dict. v. 1. *Carex Hort. Bengal.* 1. Roxb. *Monard.* 23. *Juff.* 63. *Lamarck Illust.* t. 2. f. 1. (Zingiber; Gartin. t. 12. f. 1, 2, 3. 6.)—Class and order, *Monandria Monogynia*. Nat. Ord. *Scitamineæ*, Linn. *Canna*, Juff.

Gen. Ch. Cal. Perianth superior, of one leaf, tubular, sheathing, membranous, coloured, splitting at one side about half way down. Cor. of one petal; tube shorter than the calyx, cylindrical, erect; outer limb in three nearly equal, oblong-lanceolate, concave, erect segments much longer than the calyx; inner of one large, undulated lip, with a short concave claw. Stam. Filament one, rather longer than the claw, stout, oblong, depressed, somewhat incurved, with a lanceolate, acute, ascending lobe, about half its own length on each side, at the base, and a pair of similar, erect or transverse, lobes, forming a crest at the summit, with either an intermediate prominence, or a notch; anther of two distinct, elliptic-oblong, lobes, attached by the back, below the summit. Pist. Germen inferior, small, roundish, somewhat furrowed; style thread-shaped, lying close to the filament, between the lobes of the anther; stigma funnel-shaped, fringed, erect, projecting a little beyond the filament. Peric. Capsule either ovate-oblong, or nearly globular, of three cells, and three coriaceous, somewhat striated, valves; the partitions membranous. Seeds numerous, oblong, roundish, or slightly angular, each enveloped in a soft pulpy tunic, which becomes membranous, or evanescent, when dry.

Eff. Ch. Anther of two distinct lobes. Filament with a lobed crest, above the anther. Outer limb of the corolla in three oblong lobes; inner a single lip. Capsule of three cells and three valves. Seeds tunicate.

One of the most natural genera that can exist, in any natural order, and the best defined in habit, as well as character.

AMOMUM.

character. The *root* is perennial, tuberous, jointed, and somewhat creeping, with strong and deep fibres. *Stems* at least biennial, erect, simple, invested with the sheaths of the two-ranked, simple, elliptic-oblong, striated, vertical *leaves*. *Spikes* invariably radical, simple, rather lax, stalked, their stalks scaly. *Bractæas* large, concave, coriaceous, more or less closely imbricated, single-flowered. *Flowers* large and handsome, white or reddish, remarkable for the broad, rounded, undulated, generally crenate *lip*, often yellowish at the base. *Capsules* large, with very numerous, in general powerfully aromatic, or very pungent, *seeds*. Every part of the plant is commonly aromatic. We have improved our knowledge of the *fruit*, and the nature of the *tunic* of the *seeds*, from Dr. Roxburgh's observations in India. Gertner speaks of the *capsule* as not bursting, because he had chiefly examined specimens gathered before they were ripe, like all the Cardamoms of the druggists' shops, some of which belong to the genus before us. The same able author has also mistaken the top for the bottom, in his figure called *A. sylesifere*.

We know not how it has happened that only one species of *Amomum* appears in *Hort. Kew.* *A. Afzeli*; with another, *A. grandiflorum*, (published long before) in the *Addenda* to that work. *A. Granum-Paradisii*, raised from seeds brought from Sierra Leone by Dr. Afzelius, has long been cultivated in England, though we have never heard of its flowering; and there are several more in the same predicament. They are stove plants, requiring a considerable degree of heat. No collection perhaps is so rich in this genus, or in the whole natural order, as that of the Botanic Garden at Liverpool, where the plants have every advantage of skill of cultivation, and where nothing that may occur, relative to their growth or history, can escape the eye of that illustrious writer and botanist, who first reduced them to order.

All the known species appear to be natives either of equinoctial Africa, Madagascar, or the East Indies; nor have we any from America, or the West Indies.

1. *A. Cardamomum*. Cluiter Cardamom, or True Amomum. Linn. Sp. Pl. 2. Willd. n. 7. Loureir. Cochinch. 3. Retz. Obf. fasc. 3. 59. Rofc. n. 1. Roxb. n. 1. (A. n. 2; Linn. Mat. Med. 1. A. verum; Ger. Em. 1548. f. 6. Amomum; Dale Pharmac. 277. Barrel. Ic. t. 571. f. 1. Amomo legitimo degli antichi; Pona Baldo, 50. Cardamomum minus; Rumph. Amboin. v. 5. 152. t. 65. f. 1. Bont. Hist. Nat. 126, with a figure (the oblong capsule excepted, which belongs to Cardamomum medium of the shops). Zingiber minus; Gært. t. 12. f. 6.)—Leaves lanceolate. Spikes lax, many-flowered. Bractæas lanceolate, acute. Lip three-lobed. Crest of three, nearly equal, erect lobes. Capsule globular.—Native of the Malay islands, where the inhabitants use the seeds as a substitute for the Malabar, or Lesser, Cardamom. Dr. Charles Campbell sent plants from Sumatra to the Calcutta garden, where they blossom in May, just before the rains begin. Roxburgh. Rumphius speaks of this species as cultivated plentifully, but not wild, in Amboyna and the neighbouring islands. It is certainly the true original *Amomum* of the shops, still to be met with at Venice and in other parts of the south of Europe, though generally supplanted by the more valuable Lesser Cardamom, *Amomum repens* of Sonnerat, which Linneus confounded herewith, and of which we propose to treat by the name of *ELETTARIA* hereafter. Nothing is more rare, with collectors of the *Materia Medica*, than the capsules of this *A. verum* in their native clusters or spikes. We were fortunate enough, after ransacking the druggists' shops at Marseilles and Venice, to

meet with two or three such specimens, accompanied by *bractæas*, very important as determining the identity of this plant with the Linnæan specimens of *A. Cardamomum*. By macerating the *flowers* of these last, we have also ascertained their structure, which agrees with Dr. Roxburgh's account, the summit, or crest, of the *filament* being three-lobed. The lateral lobes are short and erect, not much elevated above the central one; neither are they transverse, awl-shaped, and elongated, as in *A. Afzeli*, *grandiflorum*, and some others. The two lobes of the *anther* stand near the edges of the *filament*, remote from each other, but meet round the *style*. Dr. Roxburgh speaks of the *flower-spikes* as even with the earth. But however this may be, they are elevated above the *root*, each on a simple wavy *stalk*, two inches long, clothed with sheathing, elliptical, ribbed, abrupt, barren scales. The *spike* is an inch or an inch and a half long, sometimes two inches when in seed, with many pale, smooth, imbricated, elliptic-lanceolate *bractæas*, near an inch in length, one to each *flower*. The *germen*, *calyx*, and *common receptacle*, are hairy, or rather bristly. *Capsules* sessile, the size of a black currant, globular, somewhat depressed, obscurely three-lobed, striated, crowned with a blunt protuberant scar. *Seeds* roundish, angular, dotted, brown, aromatic and pungent, resembling in flavour the *Elettaria*, but less powerful, and rather less agreeable. The *leaves* of this species are rather narrower than in others of the genus, except perhaps the following; but our leading distinctions throughout must be taken from the *bractæas*, *flowers*, and *fruit*.

2. *A. angustifolium*. Greatest Cardamom, or Madagascar Amomum. Sonnerat Ind. Or. v. 2. 242. t. 137. Willd. n. 6. Rofc. n. 2. Roxb. n. 2. (A. madagascariense; Lamarek Dict. v. 1. 133. Cardamomum majus; Matth. Valgr. 25; but not Dale Pharmac. 276.) Camer. Epit. 11. f. 1. Barrel. Ic. obf. 1394. t. 971, the largest fruit. Grana Paradisi; Ger. Em. 1542, the figure, as being copied from Matthioli, but not the description. (See also Bauh. Hist. v. 2. 204, and Lob. Ic. v. 2. 204, where the same error is committed, as well as in Chabr. Strip. 128.)—Leaves lanceolate. Spikes capitate. Bractæas ovate. Lip obovate, undivided. Lateral lobes of the crest tapering, horizontal. Capsule ovate, pointed, striated. Seeds globular, abrupt at the base.—Native of marshy ground in Madagascar, where it was first ascertained and figured by Sonnerat. It is cultivated at the Mauritius, and from thence was carried by captain Tennent to the Calcutta garden, where it blossomed during the cool season. Dr. Roxburgh says, "the *flowers* possess a considerable share of spicy fragrance, and are showy, the upper *bractæas*, and exterior border of the *corolla*, being red, and the large lip yellow." This writer terms the *leaves* broad-lanceolate; which does not answer to Sonnerat's figure, name, or description, but perhaps this circumstance is variable. The *flower-stalks* rise above the ground, and are seven or eight inches high, clothed with tubular scales. *Flowers* in a short crowded *spike*, with a concave *bractæa* to each, near an inch and a half long. The *capsule* and *seeds* we have already described, (see MELLEGETTA,) where some other species are mentioned, which we shall here attempt to arrange systematically, but need not repeat the minute remarks there given.

3. *A. macrospermum*. Large-seeded Guinea Amomum. (Zingiber Melegueta; Gært. t. 12.)—Spikes capitate. Bractæas ovate, as long as the fruit. Capsule ovate, pointed, somewhat striated. Seeds obovate, with a prominent, bordered, crenate scar.—Native of Sierra Leone, in the burying-ground of the settlement, from whence seeds were brought us by professor Afzelius; but having unluckily

unluckily not observed the plant or its *flowers*, nor gathered more than one *capsule*, he was unable to give us any further information than what these *seeds* afford. Their flavour is very slightly aromatic. Their lead-coloured hue is well noticed by Gartner, though his figure represents them scarcely half large enough. The *bractæes* appear twice the size of the last, to which unquestionably this species is next akin. This is *Amomum*, n. 1. of professor Afzelius's MSS. The natives call it *Mabooboo*.

4. *A. Clusii*. Long-seeded *Amomum*. (Fructus 14; Clus. Exot. 37, 38, with a figure. Grævis Paradyfi, five Mellegettae ænis fructus; Bauh. Pin. 413.)—Spikes capitate. *Bractæes* ovate, much shorter than the fruit. *Capsule* ovate, pointed, striated. *Seeds* cylindrical, highly polished, with a bordered, crenate scar.—The native country of this species is unknown, Clusius's specimen having been collected by an apothecary, who died in the course of his voyage, and left no memorandum respecting this point. (See MELLEGETTA for a description of a specimen, which we accidentally met with in a druggist's shop, in a chest of Great Cardamoms, *A. angustifolium*, if we mistake not, and which therefore probably came from Madagascar.) The cylindrical, dark-brown, highly polished *seeds*, appearing as if varnished, clearly distinguish it from both the two last. The short *bractæes* in Clusius's figure, unless the upper ones had been stripped off, afford a no less striking distinction. The *seeds* had only a slight pungency from the first. Those of our Great, as well as Clusier, Cardamoms, are as high flavoured as ever, though at least twenty-five years old.

5. *A. Grana-Paradyfi*. Grains of Paradise *Amomum*, or Mellegetta Pepper.—Spikes capitate. *Bractæes* ovate, rather shorter than the fruit; lower ones crowded. *Capsule* oblong, bluntly triangular, minutely hispid. *Seeds* ovate. *Stipula* entire, fringed. (See MELLEGETTA for the history and synonyms of this species.) The brown *seeds*, distinguished by a peculiar and very hot flavour, are very different from the following, and the *bractæes* have a short, thick, dorsal spine.

6. *A. grandiflorum*. Large-flowered Cardamom. Sm. Exot. Bot. v. 2. 103, t. 111. Ait. Epit. 363.—Spikes capitate. *Bractæes* elliptical, shorter than the fruit; lower ones distant. *Capsule* oblong, bluntly triangular, minutely hispid. *Seeds* ovate. Intermediate lobe of the filament entire. *Stipula* cloven, smooth.—Native of Sierra Leone. *Seeds*, brought by professor Afzelius, have produced flowering plants in England. The root is perennial, woody, creeping. *Leafy stems* about three feet high, erect, round, smooth, very slender. *Leaves* several, elliptic-lanceolate, long-pointed, recurved, often tinged with red, very smooth: the long, narrow, polished *sheaths* each crowned with a somewhat cloven, rounded *stipula*, whose edges are quite smooth, not fringed with bristly hairs, as in *A. Grana-Paradyfi*. *Flower-stalks* erect, two inches high, striated, downy. *Lower bractæes* elliptical, concave, spreading, and so far distant that the stalk is usually visible between them; upper much larger, though of a smaller proportion than those of our second or third species, and not above half so long as the *flower* or *fruit*, membranous, finely ribbed, scarcely spinous, somewhat coloured, permanent. *Flowers* in a short, dense, capitate cluster, large and handsome, whether fragrant or not we have no information, but when dried, and moistened again, they are highly aromatic. *Galyx* rose-coloured, above an inch long, with a blunt spreading point. *Outer limb* of the *corolla* of the same hue, twice as long; *lip* of a broad rounded kidney-shape, waved, plaited, crenate, slightly notched, but not divided, nor

deeply lobed, near two inches broad, white, with a yellow spot at the base. *Stamen* white, not half so long as the *lip*, furnished at the bottom with two awl-shaped divaricated lobes, and at the top with two nearly horizontal ones, of the same size and figure, having between them a central, short, rounded, quite entire lobe. The *capsule* is very like that of *Grana-Paradyfi*, in size, shape, and pubescence. The *seeds* are also similar in size and shape to that species, but differ in being grey or lead-coloured, much less polished, and in having a totally different flavour resembling camphor, which they equal in warmth and pungency. As a stimulant, or cordial, these *seeds* appear equal to any Cardamom whatever. When the *flowers* of *Grana-Paradyfi* become known, which is now one of our greatest botanical desiderata, there probably will be more distinctive characters discovered between that species and the present.

7. *A. Afzelii*. Sweet-scented *Amomum*. Rofc. n. 8. Ait. n. 1. (*A. excapum*; Sims in Ann. of Bot. v. 1. 548. t. 13.)—Spikes capitate, of few flowers. *Bractæes* shorter than the fruit. *Capsule* oblong, triangular. *Stipula* smooth? Intermediate lobe of the filament cloven.—For this also we are indebted to Dr. Afzelius, who brought the seeds from Sierra Leone. From them Mr. Loddiges at Hackney raised plants, which flowered in his stove in June 1804, and were described by Dr. Sims. The original name, *excapum*, not being exactly correct, has been changed for one to which no lover of science or of personal worth can object. The *leaves* are as broad as the last, nor does the herbage of these plants in general afford many distinctive marks. We presume, from the figure, that the *stipulas* are smooth. The *flower-stalk*, though not wanting, is much shorter than any of the former, and there seem to be no more than two external *bractæes*, besides some membranous ones close to the flowers, apparently less firm and durable than usual. The outer limb of the *corolla* is pale flesh-coloured. *Lip* rather more oblong, and plaited lower down, than in the last, crenate at the edges, white, with a yellow central spot. *Stamen* essentially different from *A. grandiflorum*, in having its middle lobe in two deep acute segments. What we have for the *capsule* of this species is ovate, pointed, triangular, nearly or quite smooth, rather larger than either of the two last. *Seeds* obovate, dark brown, highly polished, with a prominent-bordered scar, as in *A. macrospermum* and *Clusii*, totally unlike the two foregoing. These *seeds* have scarcely any flavour, and are not at all aromatic. The *flowers* are fragrant only when dried, as in *grandiflorum*.

8. *A. srobilaceum*. Cone-bearing *Amomum*.—Spikes capitate. *Outer bractæes* numerous, elliptical, gradually larger upwards; floral ones scarcely longer, membranous, striated, rough at the extremity. *Stipula* abrupt, nearly smooth.—Native of Sierra Leone, from whence we were favoured with a specimen by Dr. Afzelius. This has very slender *leafy stems*. The *leaves* are elliptic-ovate, pointed, very smooth. *Stipula* rounded, scarcely cloven, very slightly, if at all, fringed. *Flower-stalks* several inches high, smooth, covered with numerous, imbricated, elliptical, very broad, concave, sheathing *bractæes*, gradually larger upwards, with broad dorsal points; the lowermost not quite an inch long, the upper two inches; all finely striated, very smooth to the touch, of a bright chestnut colour when dry. Within the two uppermost are the proper *bractæes*, accompanying the head of *flowers*, much narrower, hardly at all longer, flatter, more membranous, hairy in the upper part, abrupt with a small point. Of the *flowers* we know nothing, nor are we certain of the *fruit*. The only unappropriated *capsules* of any *Amomum*, communicated from Sierra Leone

by Francis Borone, (see the article *RUTACEÆ*), are those of *A. n. 2.* of Afzelius, called by the natives *Massa-aba*, which are very likely to belong to the present plant, though we have no proof of it. These agree with the outer *bracteas* in colour and smoothness, and are ovate-oblong, only half the size of the last, with which their *seeds* very precisely accord, both in appearance and in want of flavour. Indeed they are so alike, and such a coincidence between the *seeds* of different species of *Amomum* is so unusual, that we could almost presume the *capsule* above described for *A. Afzelii*, might be a very large one of this *n. 2.* We do not however form any such conclusion, the seeds of *A. Clusii*, undoubtedly a distinct species from both these, having *seeds* precisely like them, only rather larger.

10. *A. villosum*. Rough-fruited Amomum. Loureir. Cochinch. 4. Willd. n. 8. Rofc. n. 5. (*Globba crispata rubra*; Rumph. Amboin. v. 6. 137. t. 61. f. 2.)—Spike ovate, stalked. Bracteas linear-lanceolate, elongated. Capsule globular, obscurely triangular, rough with feathered bristles.—Native of Java, Amboyna, and the Molucca islands, as well as of Cochinchina, in hilly situations. The seeds are exported in great quantities to China, for medical use, being, according to Loureiro, stomachic, warm and strengthening. The root is woody and creeping; its fibres aromatic. Leafy stems six feet (Rumphius says fourteen to sixteen feet) high, weak, erect, perennial. Leaves smooth. Flower-stalk four inches long, slender, reclining. Spike nearly ovate, with linear, imbricated bracteas. Flowers pale. Capsule nearly globular, half an inch in diameter, rather pulpy and sweet, reddish, clothed with numerous thick protuberances. Seeds angular, brown. The whole plant has an aromatic, but not powerful, odour. This description of Loureiro's is not unfitting to the above synonym of Rumphius, to which he refers, except that the latter describes the roughness of the fruit as consisting of short feathered spines, or bristles.

11. *A. uliginosum*. Marsh Amomum. Retz. Obf. fasc. 3. 56. Rofc. n. 6.—Cluster stalked. Bracteas ovate-oblong. Capsule globular, obscurely triangular, shaggy. Intermediate lobe of the filament in two rounded segments.—Found by Kœnig at Raput-Nok, in Tranquebar, in shady wet situations, flowering about the middle of May. Leafy stems, a yard or more in height. Leaves smooth on both sides, with hairy stipulas. Flower-stalks somewhat curved, clothed with ovate-oblong, smooth, red scales. Flowers white, variegated with red and yellow. Stamen crowned with four lobes, the two lateral ones narrowest and smallest, the two middle ones broad and rounded. Capsule clothed, before it is dried, with blood-coloured cirrhi, or threads. *Kœnig*.

12. *A. echinatum*. Hedge-hog Amomum. Willd. n. 9. Rofc. n. 7. (*Globba crispata viridis*; Rumph. Amboin. v. 6. 137. t. 61. f. 1.)—Spike capitate, nearly sessile. Bracteas membranous. Capsule globose, all over spinous.—Native of Amboyna, the Molucca islands, &c. Rumphius. Leafy stems, according to Rumphius, ten or twelve feet high. Leaves twenty inches long, of the breadth of four or five fingers. Fruit larger than that of *A. villosum*, always of a deep green, and armed with spines like a Thorn-apple, growing in dense sessile clusters or tufts at the root. We know nothing of this species but from Rumphius, for after much perplexity and consideration, we are decidedly of opinion that *Amomum n. 2.* of Kœnig, Retz. Obf. fasc. 3. 50, cannot belong to it. See *A. maximum* hereafter.

13. *A. aculeatum*. Prickly Oval Amomum. Roxb. n. 3.—Spikes obovate, on short stalks. Bracteas lanceolate. Crest of the filament abruptly three-lobed. Capsules oval,

prickly. Leaves nearly sessile, lanceolate; heart-shaped at the base.—Native of the Malay Archipelago, from whence it was brought to the Calcutta garden, and flowers freely there in April and May, ripening feed in October. The capsule is perfectly destitute of grooves, and its coat of a soft fleshy texture. *Roxburgh*.

14. *A. maximum*. Great Winged Amomum. Roxb. n. 4. (*A. n. 2*; Kœnig in Retz. Obf. fasc. 3. 50?)—Spikes oval, on short stalks. Bracteas lanceolate. Crest of one semi-lunar lobe. Capsules globose, with nine wings. Leaves stalked, lanceolate, villous beneath.—Native of the Malay Archipelago. Long cultivated in the Calcutta garden, where it blossoms in April and May, ripening feed in September and October. The flowers are nearly white, with a small tinge of yellow on the middle of the lip. The seeds have a warm pungent aromatic taste, not unlike the real Malabar Cardamom, (see *ELETARIA*), but by no means so grateful. *Roxburgh*. The author appears to have confused himself between *Globba crispata rubra* of Rumphius, and t. 60, of that writer, but we readily agree with him, though not exactly for the reasons he gives, that neither of these synonyms belong to his *A. maximum*.

15. *A. Rumphii*. Angular-winged Amomum. (*Globba longa*; Rumph. Amboin. v. 6. 134. t. 60.)—Spikes ovate, on stalks thrice their own length. Bracteas ovate. Capsule globose, with many angular-notched wings. Leaves stalked, smooth.—Native of valleys, and at the foot of mountains, in a cold, wet, clay, or stony soil, throughout the Malay Archipelago, and all the eastern parts of India. The barren stems are a yard high before they expand into leaves, after which they attain the height of twelve or fifteen feet. Leaves thin and smooth, two feet or two feet and a half in length, two palms broad. Flower-stalks a foot high, scaly, each bearing a dense, ovate, many-flowered spike, three or four inches long. Bracteas ovate, acute, reddish, spotted. Calyx with a very long three-cleft tube. Corolla reddish externally, with a white lip, soon fading. Capsule nearly globular, with many unequal, yellowish, irregularly and sharply toothed wings. Seeds black, enveloped in a silvery pulp, of a gratefully acid flavour, very fragrant, but not acrid or aromatic to the taste. *Rumphius*.

We cannot reduce this plant to any of the species of Rofcoe, Roxburgh, or Kœnig. We feel indeed great scruples in referring the *Amomum n. 2.* of the latter to *A. maximum*, and shall therefore venture to propose it here as distinct, with that diffidence which must always attend the definition of a species taken up from description.

16. *A. Kenigii*. Single-fruited Amomum. (*A. n. 2*; Kœnig in Retz. Obf. v. 3. 50.)—Spikes sessile. Bracteas ovate, membranous. Capsule solitary, globose, deeply furrowed, with intermediate wings, and somewhat tuberculated. Crest of three lobes; the middle one rounded, finely toothed. Leaves downy beneath.—Native of dense woods in the East Indies. Leafy stems two feet high. Spikes or tufts of flowers sessile at the root, each perfecting but one capsule, the size of a large cherry, containing rarely more than nine seeds.

Although we have made out a far more ample list of species, of genuine *Amomum*, than has ever been attempted before, we are aware that several may yet exist, of which imperfect traces are to be found in various authors, so that it is more likely our number should be augmented than diminished by future enquiry. This genus ought perhaps to be divided into two families, the first with spiked or raemose flowers, globular fruit, and angular seeds; the second with capitate flowers, ovate pointed fruit, and ovate or oblong, even seeds. To the first belong *A. Cardamomum* and many

of our latter species; to the latter the Cardamom tribe, comprising the second and all after it to the eighth inclusive.

AMPHIBOLE, or HORNBLLENDE. See MINERALOGY, *Addenda*.

AMPHIGENE. See LEUCITE.

AMPHIPOGON, in *Botany*, $\alpha\mu\phi\iota\gamma\omega\gamma$, as having a beard, or awns, upon both valves of the corolla.—Brown Prodr. Nov. Holl. v. 1. 175.—Clafs and order, *Triandria Digynia*. Nat. Ord. *Gramina*.

Efl. Ch. Calyx of two nearly equal valves, fingle-flowered. Corolla of two valves; outer valve with three fegments; inner with two; all the fegments fetaceous, awned, uniform.

A genus of graffes, growing in patches, with creeping roots, fufcated ftems, and fetaceous leaves. The flowers compofe an equal fpike, which fometimes affumes the form of a roundifh head.

SECT. 1. *Spike capitate, the outermoft flowers abortive, colored, conflituting a kind of involucrium. Calyx hairy.*

1. *A. laguroides*. Hare's-tail Amphipogon.—Head globose. Calyx-glumes hippid, with hairs dilated at the bafe; outer valve twice the length of its point.—Gathered by Mr. Brown, on the fourth coaft of New Holland.

2. *A. turbinatus*. Turbinate Amphipogon.—Head obovate. Calyx-glumes clothed with fhaggy hairs, fimple at the bafe; outer valve fcarcely longer than its point.—From the fame country.

SECT. 2. *Spike oblong. Calyx fmooth.*

3. *A. ftrictus*. Stiff Amphipogon.—Calyx-glumes fringed, undivided, fhorter than the fmooth corolla. Awns and leaves ftraight.—Found by Mr. Brown, near Port Jackson, New South Wales.

4. *A. debilis*. Weak Amphipogon.—Calyx-glumes three-cleft, fhorter than the fmooth corolla. Awns ftraight. Leaves rather flaccid.—Gathered by the fame on the fourth coaft of New Holland.

5. *A. avenaceus*. Oat Amphipogon.—Calyx-glumes pointed, undivided, longer than the filky corolla. Awns fpreading.—Native of the fame country as the laft.

We have feen no fpecimens, and therefore are indebted to Mr. Brown for all the above information. We would obferve that this genus affords an exemplification of what fpecific characters ought to be, under the hand of a mafter, with nothing ambiguous or fuperfluous, but fuch a contrast of diftinctions between all the fpecies, as can leave no doubt in the mind of a ftudent.

AMPHORA. Add—As a wine meafure at Venice, contains 4 bigonica, and a bigonica contains 4 quantari, 116 fecchie, or 256lbs. peso grofo; but a bigonica of brandy is only 14 fecchie, or 56lbs.

AMSTERDAM, in *Geography*, an ifland in the Indian fea, lying in S. lat. $38^{\circ} 42'$. E. long. $76^{\circ} 54'$. This ifland is of volcanic origin, and fill in a ftate of inflammation. The great crater on the eaftern fide, now full of water, is by far the largeft here, or, perhaps, elfewhere, and is of an aftonifhing fize, confiderably exceeding in diameter thofe of Etna or Vefuvius. Its length from N. to S. is upwards of four miles; its breadth from E. to W. about $2\frac{1}{2}$ miles; and its circumference 11 miles, comprehending a furface of about eight fquare miles, or 5120 acres, almoft the whole of which is covered with a fertile foil. The ifland is inaccessible, except on the eaft fide, where the great crater forms a harbour, the entrance into which is deepening annually, and might, by the aid of art, be made fit for the paffage of large fhips. The tides run in and out at the rate of three miles an hour, and rife perpendicularly eight or

nine feet on the full and change of the moon. Their direction is S.E. by S., and N.E. by N. A northerly wind makes the higheft tide. The water is eight or ten fathoms deep almoft clofe to the edge of the crater. The fea fupplies this ifland with excellent fifh, particularly a kind of cod, and cray-fifh in abundance. Nevertheless, fharks and dog-fifh, of uncommon fize, were very numerous in the fame place. The penguin, diftinguifhed in the Linnæan fyftem by the name of "Chryfocoma," having large yellow feathers, forming two femi-circles over the eyes, like eyebrows, is found here in great abundance. Of the larger birds, here are alfo feveral fpecies of the albatros, and alfo the large black petrel, or "procellaria equinoctialis" of Linnæus; the blue petrel, or "procellaria Forfteri;" and the stormy petrel. The fmalleft of the feathered tribe, inhabiting or vifiting this ifland, was the filver kind, or "fterna hirundo," about the fize of a large fwallow or fwift, with a forked tail. The ifland St. Paul's, lying to the northward of Amfterdam, prefented no very high land, or any rifing in a conic form. In fir George Staunton's Embaffy to China, we have a view and plan of the ifland of Amfterdam, and of the great crater on its eaftern fide.

AMUL, an ancient city of the Perfian empire, in the province of Mazanderan, fituated in an agreeable plain at the foot of a mountain, on the banks of a river, and celebrated for a handfome bridge of twelve arches, an old fortrefs, and a palace of Shah Abbas the Great.

AMURATH (or MORAD) III., in *Biography*, fucceeded his father fultan Selim II. in 1575, commencing his reign with caufing his five brothers to be ftrangled in his preference. His reign was eventful in military tranfactions; but as he took no part in them, he is not much noticed by the Turkish hiftorians. Amurath contributed to the election of Stephen Batori, as king of Poland; and this circumftance favoured his own defigns againft Perfia. The invafion of this empire by the Turks began in 1578, and after much flaughter, terminated in Amurath's poffeffion of Tauris, and three contiguous provinces of Perfia. The Krim Tartars, who revolted from the Turkish dominion, were reduced. In 1590, Amurath being at peace with the other powers declared war againft the emperor of Germany, which was the caufe of much devaftation and bloodfhed; and the Turks triumphed in the capture of the important town of Raab, in Upper Hungary. During this war, Amurath died, in January 1596, at the age of 52. Chriftian authors reprefent him as of a mild difpofition, a lover of juftice, zealous in his religion, and a friend to temperance and order. Mod. Univ. Hift.

AMURATH (or MORAD) IV., furnamed *Ghazi*, or the Valiant, was fon of Achmet I., and fucceeded his depofed uncle Muftapha in 1622, in his 13th year. He loſt Bagdad at the beginning of his reign; and after many unfeceful attempts to retake it, he marched, in 1637, at the head of a numerous army, and after thirty days continual affault, and an immense lofs of lives, formed the place. On this occafion he fhewed the brutal ferocity of his temper, not only by driving on his men with a fcytetar to the attack, but by flaughtering 30,000 Perfians who had furrendered at difcretion after the capture of the town. It is faid, that the only perfon who efcaped was a famous harp-player, who requested the executioners to permit him to fpeak to the fultan before his death. When introduced into his prefence, and ordered to give a fpecimen of his powers, he touched his inftrument fo fweetly, accompanying the ftrains with pathetic lamentations on the tragedy of Bagdad, and artful praifes of Amurath, that the tyrant was foftened

softened to tears, and not only saved him but the rest of the survivors. Habits of debauchery broke down the sultan's constitution in the prime of life, and he sacrificed his life in a revel at the feast of Bairam, in February 1640, at the age of 31. — Mod. Univ. Hist.

AMUSKEAG FALLS, l. 10, for acrofs *r.* a little below.

AMWELL. Add—Also, a township of Hunterdon, in New Jersey, containing 5727 inhabitants.—Also, a township of Pennsylvania, in Washington county, having 1673 inhabitants.

ANADENIA, in *Botany*, so named by Mr. Brown, from α , *without*, and $\alpha\delta\eta$, a *gland*, because the nectariferous glands, usual in some neighbouring genera, are wanting.—Brown Tr. of Linn. Soc. v. 10. 166. Prodr. Nov. Holl. v. 1. 374.—Class and order, *Tetrandria Monogynia*. Nat. Ord. *Protæaceæ*, Juss. Brown.

Gen. Ch. *Cal.* none. *Cor.* Petals four, equal, regular, cohering by their lower part into a tube, linear, at length revolute; their funnits dilated, concave, bearing the stamens. *Stam.* Filaments four, very short, inserted into the hollow near the tip of each petal; anthers roundish, sunk in the said hollow. *Pistl.* Germen with rudiments of two seeds, superior, stalked, half-ovate, erect, without any gland at the base; style cylindrical, incurved; stigma vertical, conical. *Peric.* Follicle stalked, of one cell, crowned with the style. *Seed* solitary, compressed, without a wing.

Eff. Ch. Petals four, regular. Stamens sunk in the cavities of the limb. Nectariferous glands none. Stigma conical. Follicle of one cell. Seed solitary, without a wing.

A shrubby genus, akin to GREVILLEA. (See that article.) Leaves either pinnatifid or lobed, their outline wedge-shaped. Spikes terminal or lateral; flowers in pairs, each pair accompanied by a single bractea, the uppermost sometimes earlier than the rest.

1. *A. pulchella*. Elegant Anadenia.—Leaves pinnatifid, slightly hairy; lobes wedge-shaped, three-cleft or pinnatifid at the extremity. Spikes flowering from the top downwards. Follicles glutinous.—Native of stony hills in Lewin's land, on the fourth coast of New Holland, where this, as well as the two following species, were gathered by Mr. Brown.

2. *A. trifida*. Three-cleft Anadenia.—Leaves wedge-shaped, triple-ribbed, without veins, three-cleft; silvery beneath: lobes entire, or the lateral ones with two or three teeth.—Found in woods, on a sandy soil, in Lewin's land. Leaves only the length of the finger-nail. "Perhaps a distinct genus, the corolla being irregular, stigma a little different from the rest, and the follicle woody, splitting into two parts." Br. in Tr. of Linn. Soc.

3. *A. ilicifolia*. Holly-leaved Anadenia.—Leaves wedge-shaped, veiny; silvery beneath; tapering at the base; pinnatifid half way down.—Found on the sandy sea-coast of Flinder's land, on the fourth coast of New Holland, with unexpanded flowers, and no fruit. Leaves an inch long. Brown.

ANAGNORISIS. See CATASTROPHE.

ANALCIME. See ZEOLITE.

ANALYSIS, in *Chemistry*. The analysis of minerals, including earths, stones, and the ores of metals, and the analysis of organized bodies, or vegetable and animal substances, have been omitted; we shall, therefore, introduce a summary account of these subjects here, and at the same time endeavour to supply what has been omitted under other analogous heads.

Analysis of Minerals.—The particular methods of ana-

lyzing different minerals and ores are given under their respective heads: our object here is to give a summary view of chemical analysis in general, a subject often referred to in the Cyclopædia, but which has been unaccountably omitted.

"The progress," says Dr. Thomson, "which the art of analysing minerals has made within these last thirty years is truly astonishing. To separate five or six substances intimately combined together, to exhibit each of them separately, to ascertain the precise quantity of each, and even to detect the presence of the weight of substances which do not approach the five-hundredth part of the compound, would, at no very remote period, have been considered as a hopeless, if not an impossible task; yet this can now be done with considerable accuracy."

Margraff of Berlin was the first who undertook the analysis of minerals. He was followed by Bergman and Scheele, who very much improved this department of chemistry. The indefatigable and ingenious Klaproth succeeded, to whom the present improved state of the analysis of minerals is more indebted than to any other individual. To Vauquelin and Berzelius likewise we are much indebted, as well as to many other eminent living chemists. In short, this interesting branch of chemistry is still daily making rapid progress, and will doubtless ere long become much more perfect than it is even at present.

Minerals of a saline nature, and soluble in water, may be analysed by the methods pointed out in the article WATER, *Mineral Analysis of*.

Hard stony minerals are first to be reduced to a state of powder. When they are extremely hard, they may be heated to redness, and then thrown into cold water, which will cause them to crack and fly to pieces; and this process may be repeated, if necessary. The mineral is then to be reduced to a coarse powder, in a steel or agate mortar (see LABORATORY); and when thus reduced, a given weight of it, 100 grains for example, is to be reduced in a similar mortar (one of agate is preferable) to an impalpable powder. The powder, after this operation, will be generally found heavier than before, owing to the abrasion of the mortar; and this addition in weight is to be carefully noticed, and allowed for. If the mortar employed was agate, the addition in weight may be considered as flux.

Crucibles of platinum and silver, evaporating dishes of glass or porcelain, and other apparatus and requisites, will be necessary for the subsequent processes, all which are described under the article LABORATORY above referred to. In the class of minerals commonly denominated *stones* and *earths*, the ingredients usually met with are, silica, alumina, zirconia, glucina, lime, and magnesia; and the oxys of iron, manganese, nickel, chrome, and copper. Seldom more than four or five of these, however, enter the composition of a mineral at the same time; though, to avoid repetition, we shall suppose them all to exist at once.

When a mineral of the above description is to be analysed, 100 grains of it in fine powder are to be mixed with three times their weight of pure potash and a little water, and then introduced into a silver crucible, and exposed to a red heat for upwards of half an hour. Care must be taken to stir the mixture well till all the water be driven off, lest, by the ebullition, any of the compound should be forced out of the crucible.

From the appearances presented during this step of the operation, some conjectures may be usually formed respecting the nature of the stone, so as to afford some assistance in the future steps of the analysis. If the matter melts completely, it may be concluded that the mineral is chiefly

ANALYSIS.

siliceous. If it remains thick and opaque, the other earths are most abundant. If it assumes the form of a pulverulent bulky white powder, the stone is mostly argillaceous. If the colour be dull green or brownish, oxyd of iron is present. A bright grass-green indicates the presence of manganese, and yellowish-green chrome. When a stone is aluminous and very hard, potash acts very feebly upon it; and in this case, borax was used with great advantage by Mr. Chenevix.

The crucible being now removed from the fire, and cleaned externally, is to be placed in a porcelain capsule, and filled with water; and this is to be repeated till the whole of the matter is separated. A portion of the compound of potash, with the flux and alumina of the mineral, is taken up by the water, which would indeed dissolve the whole if added in sufficient quantity.

The detached matter is then to be dissolved in muriatic acid: at the commencement of the solution, an abundant precipitation takes place of a flocculent matter, which had been held in solution by the alkali, with which the acid combines. Then an effervescence takes place from the decomposition of the alkaline carbonate formed after and during the fusion, and at the same time the precipitate is redissolved. The portion of matter also not dissolved by the water, and which had remained at the bottom in the form of a powder, is dissolved; this not being attended with any effervescence, if it be alumina or flux; but if it contains lime, an effervescence takes place. If the muriatic solution be colourless, we may conclude that it contains very little or no metallic oxyd. If its colour be purplish-red, it is a further proof that manganese is present; orange-red indicates iron; and golden-yellow, chrome.

This solution is now to be evaporated to dryness upon a sand-bath, in a flat porcelain vessel loosely covered with paper. Towards the end of the operation, the fluid becomes gelatinous, and requires to be constantly stirred with a silver or porcelain rod, to facilitate the disengagement of the water and acid, and to render the exsiccation uniform throughout the whole. If this precaution be not observed, there is a risk of a portion of the alumina, from which the acid has been expelled, remaining with the flux; and with the alumina of a portion of flux being retained in solution; by the acid on account of its not being sufficiently dissipated.

When the matter is almost reduced to the form of a dry powder, a large quantity of distilled water is to be poured upon it; the whole is then to be gently heated, and thrown upon a filtre. The powder remaining on the filtre is to be washed with water, until the last portions added give no precipitate with solution of silver. This powder is *flux*. It is to be carefully dried between folds of blotting paper, exposed afterwards to a red heat, and weighed while warm. It ought to be a fine white powder, insoluble in acids. If it be coloured, the presence of a metallic oxyd is indicated, which is a proof that the heat towards the end of the evaporation had been raised too high. To remove this oxyd, the powder is to be boiled with an acid, and afterwards washed and dried, and the liquor must be added to the filtered fluid above-mentioned.

The solution is then to be evaporated till its quantity does not exceed an English pint. A solution of carbonate of potash is to be poured in, till no farther precipitation takes place; and in order to render the separation more complete, the whole should be boiled for a few minutes. When all the precipitate has collected at the bottom, the supernatant liquor is to be decanted off; and water being substituted in its place, the precipitate and water are to be thrown upon a filtre. When the water has passed

through, the filtre with the precipitate upon it is to be placed upon some folds of bibulous paper; and when the precipitate has acquired a little consistence, it is to be carefully collected with an ivory knife, and mixed with a solution of pure potash, and boiled in a porcelain crucible. If any alumina or glucina be present, they will be dissolved in the potash, while the other substances remain untouched in the form of a powder.

The solution of alumina in the potash is to be super-saturated with an acid, that is, so much acid is to be added as is sufficient to redissolve any precipitate that may be formed. Carbonate of ammonia is then to be added in excess, so as to be sensible to the smell. This will precipitate completely the alumina, if any be present, while the glucina will remain in solution. The alumina is to be collected on a filtre, washed with distilled water, and then dried at a red heat, and weighed. To determine if it be really alumina, dissolve it in sulphuric acid, and add a sufficient quantity of sulphate or acetate of potash; if it be alumina, the whole of it will be converted into crystals of alum. If glucina be present in the remaining liquor, it will fall down on boiling it for some time, so as to dissipate the excess of ammonia. After being washed and dried as before, it is to be accurately weighed.

The matter remaining undissolved by the solution of potash above-mentioned may consist of lime, magnesia, yttria, and the metallic oxyds. If yttria be suspected, add carbonate of ammonia, which will dissolve the yttria, and leave the other bodies. Then let the whole be dissolved in dilute sulphuric acid, and the solution be afterwards evaporated to dryness, so as to dissipate any excess of acid. A little water is to be added to the solid residuum, which will take up the metallic sulphates and the sulphate of magnesia, but leave the sulphate of lime, which is to be dried at a red heat, and weighed; and from its weight the quantity of lime present may be readily estimated. The substances retained in solution by the sulphuric acid may be magnesia and the oxyds of iron, manganese, chrome, and nickel. To separate these, the solution is to be diluted with a large quantity of water, a slight excess of acid added to it; and then a solution of carbonate of potash saturated with carbonic acid is to be poured in. The oxyds of iron, chrome, and nickel, will be precipitated, while the magnesia and manganese will remain in solution with the carbonic acid. To separate these, hydro-sulphuret of potash well saturated with sulphuretted hydrogen is to be added to the solution, which will precipitate the manganese in the state of hydro-sulphuret, while the magnesia will still remain in solution. The magnesia may then be separated by a solution of pure potash, and its weight estimated after it is washed and dried at a red heat. To obtain the weight of the *oxyd of manganese*, its precipitate must be calcined with the admission of air to expel the sulphuretted hydrogen.

There still remain to be separated the oxyds of chrome, iron, and nickel. To do this, the precipitate is boiled in successive portions of nitric acid, to bring the oxyd of chrome to the state of acid. It is then heated for a few seconds with potash, and after being heated the liquid is poured off. The undissolved matters are to be washed with water, which washings are to be added to the other liquid. The chromic acid remains in solution combined with the potash; muriatic acid is added to it, so as to be in excess; it is then evaporated until it assumes a green colour. If pure potash be then added, the *oxyd* will be precipitated, and it may thus be collected, and its quantity ascertained.

The undissolved matter of the preceding experiment may consist of the oxyds of iron and nickel. To separate them, they

they are dissolved in muriatic acid, and ammonia is added in excess. The *oxyd of iron* will be thus precipitated, and its weight may be ascertained. The excess of ammonia will retain the *oxyd of nickel* in solution, which may be lastly obtained separately by driving off the ammonia by heat.

When the different constituent principles of a fossil have been thus obtained separately, their united weight ought of course to be equal to the original weight of the fossil itself. If they correspond, or differ only by .03 or .04 of a part, we may conclude that the analysis has been properly performed. But if the loss of weight be considerable, the analysis must be repeated; and if the result be still the same, it may be concluded that the stone has contained some principle either volatile or soluble in water, which must, therefore, be sought for. A proportion of the stone being broken to pieces, is first to be exposed to a strong heat in a retort of porcelain, to which a receiver is adapted. If it contains water, or any other volatile substance, this will be collected in the receiver, and its nature and quantity may be ascertained. But if it sustain no loss by this operation, or a loss not equivalent to the loss indicated by the analysis, it is probable that it contains some substance soluble in water.

To ascertain the quantity of *potash* present in a mineral, Vanquelin (from whom the above account of the analysis of stony bodies has been chiefly extracted) recommends that the stone reduced to an impalpable powder should be cautiously heated with sulphuric acid, and the mass digested with water. The solution properly concentrated is set aside for some days. If crystals of alum make their appearance, the stone contains *potash*. If no crystals appear, the solution is to be evaporated to dryness, and the residue exposed to a moderate red heat. It is then to be digested in water, and the solution mixed with carbonate of ammonia, and filtered. It must be then again evaporated to dryness, the residue exposed to a heat of 700°, and redissolved. The solution by proper concentration will yield crystals, either of sulphate of soda or of potash, which may be readily distinguished. The presence or absence of potash may be also ascertained by means of the muriate of platina.

The following method has been recommended by Rofe for detecting and distinguishing the fixed alkalis in minerals, and is easier than the above. He fused one part of the mineral with four parts of nitrate of barytes in a porcelain crucible. A spongy mass of a light blue colour, and completely soluble in muriatic acid, was obtained. The yellow-coloured solution formed was mixed with a sufficient quantity of sulphuric acid, not only to precipitate the barytes, but to expel the muriatic acid; and the liquid was evaporated to dryness. The mass was digested in water, and thrown upon a filter. The sulphate of barytes and silica remained behind. The solution was now saturated with carbonate of ammonia, which separated all the earthy and metallic bodies, leaving in the solution only the sulphates of fixed alkali and ammonia, the latter of which was then expelled by heat. The fixed alkaline sulphate thus obtained was redissolved in water, and decomposed by means of the acetate of barytes. The sulphate of barytes formed was then separated by the filter, and the liquid evaporated to dryness. The other salt was acetate of a fixed alkali, which was exposed to a red heat in a crucible, the charry residue dissolved in water, filtered, and crystallized; and thus a fixed alkaline carbonate was obtained, easily distinguished by its properties.

Sir H. Davy adopted still a different method. He fused one part of the mineral with two parts of boric acid, dissolved the fused mass in diluted nitric acid, and concentrated the solution to separate the silica. The liquid was

then mixed with carbonate of ammonia in excess, and boiled and filtered; by which means all the earthy and metallic ingredients were separated. The liquid was then mixed with a sufficient quantity of nitric acid, and evaporated till the whole of the boric acid separated. Nothing now remained but the nitric acid, combined with the alkaline constituents of the mineral, and with ammonia. The nitrate of ammonia was dissipated by heat, and the nature of the alkaline nitrate left was easily distinguished by its properties.

When the mineral contains *fluoric acid*, Klaproth ascertained its presence by heating the mineral with sulphuric acid in a glass retort. The corrosion of the retort, and the siliceous deposit in the water of the receiver, sufficiently demonstrate the presence of that principle. To determine its quantity, the mineral was fused with potash, and the silica separated as usual. The remaining liquid was precipitated by means of the carbonate of potash; and the liquid being neutralized was mixed with lime-water. The precipitate of fluuate of lime thus obtained was heated to redness, and from its weight the quantity of fluoric acid present in the mineral was estimated.

Those fossils in which earths are combined with acids, forming compounds not soluble in water, require different modes of analysis. The earthy *carbonates* are analysed by calcination by heat, with or without charcoal, or by solution in dilute nitric or muriatic acid; estimating the quantity of carbonic acid disengaged, by collecting it, and discovering the base by the nature of the salt obtained by evaporation; or by precipitation by re-agents, and estimating by the same modes their quantities. Earthy *sulphates* may be decomposed by boiling with carbonate of potash for a considerable time: the sulphuric acid unites with the potash, and its quantity may be estimated by precipitating with barytes: the carbonic acid is attracted by the earthy base, and the carbonate thus obtained may be decomposed in the same manner as a native carbonate, or the quantity of earth which it contains may be estimated by its weight. *Phosphate of lime*, which is the only earthy phosphate that has been discovered, may be dissolved in diluted nitric acid by the assistance of heat; the lime may be then precipitated by sulphuric or oxalic acid; the phosphoric acid remaining in solution may be obtained concrete by evaporation; or its quantity may be estimated by combining it with lead, a solution of acetate of lead being added for the purpose.

Analysis of Ores.—Metallic minerals, in general, admit more easily of analysis in the humid way than the earthy fossils, from their being less hard. In the dry way also, their composition may be sometimes ascertained by expelling the mineralizing substance by heat, and reducing the metal to its metallic state.

Proper specimens of the ore, free from all foreign matters, should be chosen; and if the object be to ascertain the quantity of metal it may contain, different specimens taken from different parts of the metallic vein should be examined, as it often happens that different parts of the same vein vary much in richness. The ore being powdered, the general process, in the *dry way*, consists in calcining it at a low red heat in an earthen vessel loosely covered, to expel the sulphur or other volatile matter. Or this operation may be performed in an earthen retort and receiver, when the object is to ascertain the nature and quantity of the substance expelled. The residual matter in either case being weighed, to ascertain the loss of weight it has suffered, is mixed with three times its weight of black flux, and exposed in a crucible, to a heat sufficiently intense for its reduction and fusion. Sometimes borax, pounded glass, or lime, are used

ANALYSIS.

as fluxes. The metallic matter, when the operation is well conducted, is collected in a button at the bottom of the crucible, and its nature and composition may be ascertained in the humid way in the usual manner by means of the proper re-agents, &c.

In submitting an ore to analysis in the humid way, the general process is to digest it previously reduced to powder in different acids. Sulphur, if present, is precipitated, or is sometimes partially converted into sulphuric acid. If the quantity of sulphur be large, it is best previously separated as much as possible by roasting the ore as above. The residual matter is then submitted to the action of the different acids, these being often applied successively; so that different metals, if present, are separated by their proper solvents. The solutions afford by evaporation the metallic salts they contain, or each metal is detected in the solution by its proper test: it is also precipitated by the alkalis and other re-agents, and the precipitate is reduced to the metallic state, as before, by the aid of fluxes and heat; or sometimes it may be thrown down at once in the metallic state, by another metal having a stronger attraction for oxygen.

These are almost all the general rules that the analyses of ores will admit of, as the processes required for different ores differ extremely from one another, and are often very complicated. We refer our readers, therefore, for the analysis of particular earthy fossils and ores, to the different articles in the Cyclopædia, where they are described.

Analysis of organized Bodies, including vegetable and animal Substances.—The older chemists attempted the analysis of organic compounds by distillation, and thus obtained a variety of resulting substances equally or perhaps more complicated in their nature than the original substance to be analysed. When the theory of chemistry was changed by Lavoisier, that illustrious chemist began to consider the composition of organic substances in a proper point of view, and he endeavoured to discover the elements of these bodies, and to determine their proportions. He discovered the nature of their elements, though he was not so successful in determining their properties. Lavoisier's principle of analysis was to oxidize organic bodies till he converted them into binary oxides, the composition of which was known, and to perform the experiment in such a manner, that the quantity of these binary compounds with oxygen could be correctly determined. His mode of operating was to burn organic substances in oxygen gas; but this method, though just in principle, did not enable him to determine by the balance with much accuracy, either the quantity of water or of carbonic acid formed by the combustion; so that his results could be only considered as approximations.

Some chemists, after Lavoisier, endeavoured to determine the exact quantity of the products of dry distillation, and to calculate from them the composition of the body. Such was the attempt of Fourcroy and Vauquelin on the composition of urea, and of Dr. Higgins on the acetic acid. But the composition, and probably also the quantity of the products of distillation, being only imperfectly known, it is obvious that such experiments, however exact, can only afford data for calculations hereafter, when the products of the distillation come to be better examined and more accurately known. Theodore de Saussure has analysed alcohol and ether in Lavoisier's manner, and the results he obtained probably approach nearer the truth than any preceding analysis of a ternary compound. Thenard has also analysed different species of ether in the same manner.

The first grand step, however, towards proportion in the analysis of organic substances, was made by Gay Lussac and Thenard. These celebrated chemists, in an

interesting memoir on the subject, after pointing out the difficulties and sources of inaccuracy of the methods then generally employed, gave a description of a new method of proceeding, by which they considered they were able to combine the hydrogen and carbon with the utmost quantity of oxygen with which they can unite; and thus, by proper data, to estimate the proportion of their constituent parts, and of oxygen existing in the compound analysed. The substance selected to furnish oxygen was the oxymuriate of potash, and the matter to be analysed was mixed with this salt, and deflagrated in an apparatus contrived for the purpose, consisting of a thick glass tube, A, (*Plate XXI. fig. 3. Chemistry.*) set vertically in a fire, with a lateral tube, B, to conduct the gases produced to a mercurial apparatus; and a cock, C, above, the stopper of which was not perforated, but contained a depression, D, into which a portion of the material to be analysed was introduced; and by turning the cock downwards, this portion fell into the tube, and was there deflagrated. E is a vessel containing ice, to keep the upper part of the tube cool. The proportion of the oxymuriate requisite to burn completely the substance analysed was ascertained by previous trials in an open crucible; so much of the salt being required, that the residue after deflagration should be quite white, or at least not carbonaceous; and in the actual experiment a considerable excess of the oxymuriate was employed. The materials were then completely dried, by submitting them for a considerable time to a temperature of 212°, and afterwards accurately weighed and mixed in a mortar, with a little water, so as to form an adhesive mass, which was divided by being thrust into a brass mould, and the pieces shaped by the fingers into little balls, that they might drop clean from the stopper of the cock down into the deflagrating tube. These balls were dried again at the same temperature before they were thus burnt.

The oxymuriate of potash was itself analysed before it was used; and in order to insure uniformity in its composition, a considerable quantity of it was fused and pulverised, and kept for use. If the substance to be analysed was a vegetable acid, it was combined with lime or barytes before it was mixed with the salt; and this calcareous or barytic salt was separately analysed, and the carbonic acid remaining united with the earth after deflagration was properly estimated. The earthy or other incombuible matter belonging to the substance to be examined was also separately estimated, by calcining this substance by itself in a platinum vessel, and lixiviating the residue.

The authors, in their memoir, have given at length all the precautions required in the management of the apparatus, both in preparing for the deflagration, and in the estimation of the gases obtained; and after the operation the results of the analysis were made out in the following manner: "The proportion of combustible matter in the substance examined was previously found by calcination of another portion of the same; the actual quantity of oxygen employed in the deflagration was known by that of the oxymuriate used; the carbonic acid was absorbed by potash, and its carbon estimated; the excess of oxygen was found by subsequent detonation with hydrogen; the hydrogen of the substance was presumed to form water with all the oxygen unaccounted for; and the azote existed in the residual azotic gas."

Soon after the method of Gay Lussac and Thenard was published, Berzelius turned his attention to the same subject; and after bestowing, in his admirable essay, some just encomiums on the merits of his predecessors, proceeds to point out some defects in the apparatus and methods they employed, and proposes new ones of his own. The essential

tial principle of Berzelius's method is the same as that of Gay Lussac and Thenard, *viz.* the complete combustion of the substance to be analysed with the oxy muriate of potash; but the apparatus he employed was very different, and certainly much better adapted for the purpose. It consisted of a glass tube, between one-half and five-eighths of an inch in diameter, and of a length sufficient to contain the mixture of the salt and substance to be analysed. This tube was hermetically sealed at one end, and at the other of the shape represented at A 1, (*Plate XXI, fig. 4. Chemistry*), in order to facilitate the introduction of the mixture. When the mixture was introduced, this end was drawn into the shape A. 2, in order to adapt its introduction into the small thin receiver B. C is a tube about twenty inches long, and a quarter of an inch in diameter, filled with dry muriate of lime in a state of coarse powder; from one extremity of this, a bent tube D was connected with a small mercurial gageometer E; in this was introduced a small globular glass vessel, F, containing caustic potash, with the view of absorbing the carbonic acid. All the joinings in this apparatus were made by small caoutchouc tubes, prepared by cutting thin pieces of that substance into the requisite shape, and pressing the newly cut edges together, which unite readily. The tube exposed to the fire was surrounded by a thin piece of tin plate, secured by wire to prevent its bursting. The apparatus was so managed, that by shifting the piece G the whole length of the tube could be heated in succession by the fire H, and thus the slow and uniform combustion of the whole substance be ensured. The other parts of the apparatus will be readily understood from inspection of the figures. At the end of the operation, the greater part of the water formed was found collected in the small receiver B; the remainder of course was found in the tube C, absorbed by the muriate of lime; and by subtracting the known weights previously ascertained of these portions of the apparatus, from their weights after the experiment was concluded, the quantity of water was accurately determined. The greater portion of the carbonic acid was attached to the potash in the vessel F, and its quantity ascertained by weight. The minute portion adhering to the soda derived from the oxy-muriate of soda was ascertained as nearly as possible by elimination. The substances analysed were all carefully dried at 212° in a vacuum with sulphuric acid, and were generally combined with oxyd of lead. The quantity burnt was from five to eight grains of the substance with thirty or forty grains of the oxy-muriate of potash. For further particulars we refer our readers to Thomson's *Annals of Philosophy*, vols. iv. and v.

Berzelius was induced to adopt the use of the oxy-muriate of potash from the recommendation of Gay Lussac and Thenard. Before that time he had employed the brown oxyd of lead.

In the analysis of animal substances, and all compounds into which azote enters, the use of the oxy-muriate of potash is very troublesome, and liable to great objections from the uncertain state of oxydation of the azote. It became, therefore, an object of the first importance to possess a substance that would oxydize hydrogen and carbon, but not azote; such a substance has been happily lately pointed out by Gay Lussac. This is the black oxyd of copper, which at a low heat, scarcely amounting to redness, parts readily with its oxygen to hydrogen and carbon, but not to azote. Berard, Dr. Prout, and others, have taken advantage of this in their recent analyses of several animal substances, as will be mentioned under their proper heads. The apparatus employed by Dr. Prout closely resembles that of Berzelius described above, but is more simple.

Dr. Prout in general prefers making separate experiments for ascertaining the gaseous and aqueous products, for the former of which he uses a simple tube only; for the latter, a tube with a small ball, analogous to the receiver of Berzelius, connected with a tube filled with dry muriate of lime. See for further particulars *Medico-Chirurgical Transactions*, vol. viii.

ANALYSIS of Soils. See SOILS.

ANALYSIS of Mineral Waters. See WATER.

ANAMENIA, in Botany, a name corrupted by Ventenat, *Jard. de la Malmaison*, t. 22, from the Arabian appellation of some flowers of the family of *Adonis* and *Anemone*, *Anabamen*, to which the present genus is related. See KNOWLTONIA.

ANARHICHAS, l. 6. The species of this genus enumerated by Gmelin are, *Lupus, Minor, Pantherinus*, and *Strigofus*.

LUPUS; shark, or wolf-fish. (See *LUPUS Marinus*.) This fish commonly frequents the deep parts of the sea, but in spring-time approaches the coasts, in order to deposit its spawn among the marine plants, &c. It is taken both in nets and by the line; and though the flesh is tolerable, its disgusting appearance prevents its being much used as food, except by the fishermen. The Greenlanders, however, eat it, both fresh and dried, and make convenient catchers of the skin, in which they keep various kinds of utensils.

MINOR. Cinerous, black, with sharper cartilaginous teeth: found near Greenland.

STRIGOSUS, with transverse dusky bands, raremose and somewhat less regular than usual; supposed by Dr. Shaw to be merely a variety: found in the British ocean.

PANTHERINUS; Panther wolf-fish, marked over the whole body with round brown spots. This is allied to the first species, but differs much in colour, being of a deep yellow, variegated with numerous, round, deep-brown or blackish spots of different sizes, the largest being on the back, upper part of the sides, and dorsal fin: its length is about three feet or more. A native of the Northern seas.

ANARTHRIA, in Botany, from *anarthros, destitute of joints*, because the stems are, in the unbranched species of this genus, destitute of knots, or articulations.—*Brown Prodr.* Nov. Holl. v. 1. 248.—Class and order, *Dioecia Triandria*. Nat. Ord. *Tripetaloides*, Linn. *Junci*, Juss. *Reslicese*, Brown.

Edif. Ch. Male. Petals six, nearly equal. Filaments distinct. Anthers didymous, cloven at each end.

Female, Petals six, nearly equal. Styles three. Capsule three-lobed, three-celled. Seeds solitary.

The root is perennial. Stems compressed, simple, sometimes branched in a proliferos manner; when simple they are without joints, and without sheaths, having at the base vertical, equitant, two-ranked leaves. Spikes terminal, compound, each branch subtended by a sheathing deciduous bractea; sometimes they are simple, or the flowers are solitary. The capsules in some species form a kind of catkin, scarcely bursting. The structure of the flowers and fruit comes nearest to *Elegia*, but the want of sheaths upon the stem, and the equitant vertical leaves, make a wide difference. This genus agrees with *LYGINIA*, (see that article,) in having twin anthers, but differs altogether in habit.

1. *A. scabra*. Rough-edged *Anarthria*.—Stems perfectly simple, flat, rough-edged as well as the leaves. Petals of the male linear; of the female the three innermost are smallest.—Found by Mr. Brown on the south coast of New Holland.

2. *A. levis*. Smooth-edged *Anarthria*.—Stems perfectly simple, flattish, smooth-edged as well as the leaves. Petals

of the male elliptic-lanceolate; of the female all nearly equal.—From the same country.

3. *A. gracilis*. Slender Anarthria.—Stems perfectly simple, thread-shaped, compressed, resembling the leaves, and likewise smooth-edged. Spike racemose, divided. Petals lanceolate, keeled, nearly equal.—Native of the same country.

4. *A. pauciflora*. Slender-clustered Anarthria.—Stems simple, thread-shaped, compressed, nearly resembling the solitary leaf, and likewise smooth. Cluster loose, of few flowers. Flower-stalks in pairs, unequal, shorter than the sheathing bractea.—The male plant only was gathered by Mr. Brown, on the southern coast of New Holland.

5. *A. prolifera*. Proliferous Anarthria.—Stems branched in a proliferous manner, two-edged, leafy. Flowers either solitary or somewhat spiked.—Found in the same part of New Holland as all the preceding. *Brown*.

ANATHO. For ANAH *r.* ANNA.

ANATOMY, *Pictureque*, col. 4, l. 15, for head *r.* face.

ANCHOR, in *Architecture*, &c. l. 3, for Tufcan *r.* Doric.

ANDALUSITE. See MINERALOGY, *Addenda*.

ANDANTE, l. 2, *dele* *o* *graziioso*; l. 5, *r.* or rather *graziioso*.

ANDERSONIA, in *Botany*, received that denomination from the pen of Mr. Brown, in honour of three different botanists of the name of Anderson. First, Mr. William Anderson, surgeon in the navy, the companion of captain Cook in two separate voyages, during the latter of which he died. Although most devoted to the study of man, and of the animal kingdom, in those new and remote regions which it was his lot to visit, he did not overlook the vegetable world. Several of his manuscript descriptions exist in the Banksian library, where characters of some new genera, since published under other names, are to be found. The genus in question also serves to commemorate Mr. Alexander Anderson, curator of the botanic garden at St. Vincent's, so important, in a national point of view, as a nursery for tropical plants, and for their interchange between our several colonies. Thirdly, this genus is well merited by a most assiduous and observing cultivator and botanist, Mr. William Anderson, F.L.S., now superintendent of the Apothecaries' celebrated garden at Chelsea. Let the writer of this be allowed to subscribe to Mr. Brown's list of these botanical worthies, the name of his lamented friend Mr. George Anderson, F.L.S., whose early death, owing to a melancholy accident, January 10th, 1817, is a real loss to science. No one had paid more attention to the cultivation and distinction of the different kinds of British *Salices*, or the beautiful exotic tribe of *Paeonia*; on which last subject a paper in the Linnaean Society's *Trans.* v. 12. 283, published under the care of his able friend Mr. Sabine, will always evince Mr. George Anderson's just claim to botanical commemoration.—*Brown Prodr. Nov. Holl.* v. 1. 553. *Dryand.* in *Ait. Hort. Kew.* v. 1. 321.—Clafs and order, *Pentandria Monogynia*. *Nat. Ord. Ericae*, Juss. *Epaerideæ*, *Brown*.

Gen. Ch. Perianth inferior, of one leaf, chaffy, coloured, in five deep, equal, lanceolate segments, erect after flowering, permanent, accompanied at the base by two, or more, imbricated scales. *Cor.* of one petal, wheel-shaped, in five very deep, linear-lanceolate, equal segments, nearly as long as the calyx, each of them bearded at the base. Nectary of five scales, below the germen, sometimes combined. *Stam.* Filaments five, inserted into the receptacle, linear, hairy, shorter than the corolla; anthers vertical, oblong, distinct. *Pist.* Germen superior, roundish; style simple, cylindrical, about as long as the stamens; stigma obtuse, crenate. *Peric.*

Capule oblong, with five furrows, five valves, and five cells, the partitions longitudinal, from the centre of each valve. *Seeds* several, small, erect, inserted into the angles of the short central column.

Eff. Ch. Calyx in five deep segments, permanent, coloured, with two or more imbricated scales at the base. Corolla wheel-shaped, the length of the calyx; segments bearded at the base. Stamens inserted into the receptacle. Anthers unconnected. Nectary of five scales at the base of the germen. Capule of five valves and five cells, the partitions from the middle of each valve.

This genus consists of small shrubs, with squarrose, half-sheathing leaves, no annular scars remaining on the denudated branches. Flowers terminal, either spiked or solitary, erect. Receptacles from the bottom of the capule, short. *Seeds* but few brought to maturity. *Brown*.

In habit, as well as in the general structure of the fructification, nothing can be more absolutely like our *SPRENGELIA* (see that article); inasmuch that no person could, at first sight, form any idea of a difference between the two genera. (See also PONCELETIA.) The presence of scales at the base of the calyx, so unlike it as to be more properly termed, with Mr. Brown, *bractææ*, but in that case not entitled to enter into the generic character; the five nectiferous scales, wanting in *Sprengelia*; and the bearded base of the segments of the corolla; these are the distinctive marks of *Andersonia*. Similar differences serve to subdivide the original genera of EPACRIS and STYPHELIA (see those articles); but, as it seems to us, the genera thence derived are better defined, and accompanied with some distinctions in habit. In the present instance, with the greatest deference to the acute and learned author of *Andersonia*, we should be inclined to reduce to one genus, under one essential character, plants so strikingly alike, and so different from all others. *Genus dabit characterem*. One thing is certain, that we are in no danger of being suspected of wishing, by this means, to get rid of the name *Andersonia*, though *Sprengelia*, having been long previously established, must be preferred to it. Its character indeed must be reformed, because we were originally acquainted with but one species, the only one, it seems, whose anthers are connected. Such is the case with some species of *Gentiana*, but not with all. The following are Mr. Brown's six species of *Andersonia*, ranged in two sections.

SECT. 1. *Flowers with two scales, spiked.*

1. *A. sprengeloides*. Spreading-leaved *Andersonia*. Br. n. 1. *Ait. n. 1.*—Leaves spreading; with a flat point. Flowers spiked.—Found by Mr. Menzies, at King George's sound, on the south-west coast of New Holland. Sent to Kew, by Mr. Good, in 1803. It is said to flower most part of the year, being treated as a green-house plant. We received specimens from Messrs. Lee and Kennedy's green-house in 1814, but this little shrub is far from being generally cultivated, nor has it yet been figured. The stem is a foot or more in height, determinately branched, round, rigid, smooth, all the branches covered with numerous, rigid, glaucous, sessile, smooth, ovate, spinous-pointed, entire leaves; roughish at the edges; clasping the stem at their base; each about a quarter of an inch long, permanent. Flowers pale rose-coloured, scentless, in dense, short, leafy, terminal, upright spikes, not separately stalked, or racemose, as in *Sprengelia incarnata*, but otherwise very nearly resembling, in size and colour, the elegant blossoms of that plant.

2. *A. parvifolia*. Small-leaved *Andersonia*. Br. n. 2.—“Leaves close-pressed; with a triangular point.”—Discovered by Mr. Brown, on the southern coast of New Holland. We have not seen this species. The spinous point of each

each leaf is somewhat triangular in the former, though with an obtuse keel.

SECT. 2. *Flowers with many scales, solitary at the ends of small branches.*

3. *A. cerulea*. Blue Andersonia. Br. n. 3.—“Leaves moderately spreading; by the young ones, as well as the calyx, externally downy.”—Found by Mr. Brown, in the same part of New Holland as the last.

4. *A. squarrosa*. Squarrose Andersonia. Br. n. 4.—“Leaves prominent, divaricated and recurved, smooth; naked at the edges. Calyx and style smooth. Stem erect.”—Native of the same country, where it was gathered by Mr. Brown. We have not seen this, nor either of the two preceding.

5. *A. depressa*. Procumbent Andersonia. Br. n. 5.—Leaves prominent, divaricated, twisted and recurved, downy; fringed at the edges. Calyx smooth. Style hairy in the middle. Stem depressed.—Gathered at King George's sound, on the south-west coast of New Holland, by Mr. Archibald Menzies, to whom we are obliged for specimens. Mr. Brown also met with this species in the same country. The root is long and tapering. Stem hardly a span long, much branched, for the most part in an alternate manner, thickly covered with imbricated, spreading, rigid, minutely pungent, lanceolate, variously twisted and projecting leaves; smooth and somewhat glaucous on both sides; dilated at the lower part, where especially the edges are fringed. Flowers larger than in the first species, sessile at the ends of the little lateral leafy branches, solitary, apparently flesh-coloured. Corolla densely clothed internally with long white hairs. Style just perceptibly hairy about the middle.

6. *A. micrantha*. Small-flowered Andersonia. Br. n. 6.—“Leaves close-pressed. Style downy below the middle.”—Found in the same part of New Holland as the rest, by Mr. Brown. We have seen no specimen.

ANDERTON, in *Geography*, a township of Ohio, in the county of Hamilton, having 1358 inhabitants.—Also, a township of East Tennessee, having 3959 inhabitants, of whom 260 are slaves.

ANDOVER, 2d article, l. 3, r. 3164; 3d article, l. 2, r. 1259; 4th article, l. 3, r. 957.

ANDOVER, *Egß*, a township of Maine, in the county of Oxford, having 264 inhabitants.

ANDRÆA, in *Botany*, a very curious and distinct genus of Mosses, is thus named by Ehrhart, in honour of his friend JOHN GERHARD REINHARD ANDRÆE. (See that article.) This genus was intended to have been inserted by its author into the *Supplementum* of Linnæus, with the printing of which he was entrusted. (See LINNÆUS, or VON LINNÆ, CHARLES.) Such was the case with many others, belonging to the same natural order, and now well-established, though the younger Linnæus then forbade their admission into his book. Ehrhart called it *Andræa*, but the above orthography is justified by many similar examples among learned botanists.—Ehrh. Hannov. Mag. for 1778, 1601. Bieträge v. 1. 15 and 180. Hedw. Sp. Mufc. 47. Turn. Mufc. Hib. 13. Sm. Fl. Brit. 1178. Comp. ed. 3. 153. Hooker Tr. of Linn. Soc. v. 10. 381. Mufc. Brit. 1. t. 1.—Class and order, *Cryptogamia Mufci*. Nat. Ord. *Mufci*.

Gen. Ch. Male, terminal, bud-like. *Anth.* three to seven, nearly cylindrical, somewhat stalked, interperfed with numerous, jointed, succulent threads, swelling upwards, taller than themselves.

Female, terminal, sessile. *Sheath* of several imbricated concave scales, shorter than the *fruit-stalk*, which is cylindrical, scarcely longer than the capsule, tumid at its base. *Peric.*

Vol. XXXIX.

Capsule on a turbinate fleshy base, ovate or cylindrical, somewhat quadrangular, of four equal oblong valves, separating longitudinally, cohering at their points, under the permanent lid: column cylindrical, about as long as the valves: lid minute, conical, permanent, confining the points of the valves. Veil membranous, pellucid, bell-shaped, torn irregularly from its base, and finally turned to one side, crowned with the slightly prominent style. *Seeds* minute, spherical, brown.

Erf. Ch. Capsule of four valves, cohering at the summit, crowned by the permanent lid. Veil irregularly torn.

Ehrhart first removed this genus from *Jungermannia*, with which it had been confounded, and properly referred it to the order of *Mufci*. But he mistook, as he well might, the valves of the capsule for its *fringe or teeth*; an error first corrected by Mr. W. Hooker, who, in the *Trans.* of the Linn. Soc., has first given a just and clear view of the subject. In his *Muscologia Britannica* the same author remarks, that the supposed *fruit-stalk*, as he himself had heretofore called it, is merely an elongated *receptacle*, bearing some abortive *pisilli*. This is certainly true, but we conceive it nevertheless to be analogous to the more extended *fruit-stalk* of the generality of Mosses, truly wanting in *Sphagnum*. All the known species of *Andræa* are British, and amount to four.

1. *A. alpina*. Chocolate Alpine *Andræa*. Hedw. Sp. Mufc. 49. Fl. Brit. n. 2. Engl. Bot. t. 1278. Turn. Mufc. Hib. 13. Hook. Tr. of Linn. Soc. v. 10. 388. t. 31. f. 1. Mufc. Brit. n. 1. t. 8. (*A. petrophila*; Ehrh. Beitr. v. 1. 192. Crypt. 67. Roth Germ. v. 3. 359. Jungermannia alpina; Linn. Sp. Pl. 1601. Fl. Dan. t. 1002. f. 1. Lichenatrum alpinum atro-rubens teres, calycibus squamosis; Dill. Mufc. 506. t. 73. (not 83.) f. 39.)—Stems branched. Leaves obovate, obtuse with a small point, concave, ribbed, imbricated every way.—Found in the crevices of alpine rocks, in Ireland, Wales, and Scotland, but, according to Mr. Hooker, not common. Ehrhart gathered it likewise in Sweden and Germany. The numerous stems form little dense tufts, usually of a very dark chocolate brown, but varying somewhat in hue, as well as in density. The minute leaves are concave, straight, neither keeled nor falcate, nor turned to one side. Capsule elliptic-oblong, on a paler base, raised on its white fleshy *fruit-stalk* a little above the numerous scales of the *sheath*.

2. *A. rupestris*. Dusky Rock *Andræa*. Hedw. Sp. Mufc. 47. t. 7. f. 2. Engl. Bot. t. 1277. Hook. Tr. of Linn. Soc. v. 10. 391. t. 31. f. 2. Mufc. Brit. n. 2. t. 8. (*Jungermannia rupestris*; Linn. Sp. Pl. 1603, excluding the synonym of Dillenius.)—Stems branched. Leaves ovate, taper-pointed, ribbed; upper ones falcate.—On rocky mountains throughout Great Britain. Hooker. Smaller and greener than the former, with which it agrees in the want of a mid-rib; but differs from it in the tapering, more or less curved, leaves. All botanists confounded this species with the following, till Dr. Roth distinguished them chiefly by the presence of the mid-rib in that species.

3. *A. Rotii*. Black Mountain *Andræa*. Mohr Crypt. Germ. 385. t. 11. f. 7—9. Hooker Tr. of Linn. Soc. v. 10. 393. t. 31. f. 3. Mufc. Brit. n. 3. t. 8. Engl. Bot. t. 2162. (*A. rupestris*; Fl. Brit. n. 1. Turn. Mufc. Hib. 14. Lichenatrum alpinum nigricans, foliis capillaceis reflexis; Dill. Mufc. 507. t. 73. (not 83.) f. 40.)—Stems slightly branched. Leaves lanceolate, keeled, curved to one side, single-ribbed. Scales of the sheath without a rib.—This, according to Mr. Hooker, is common on alpine rocks. We have often gathered it in dry exposed situations, in Westmoreland, as well as Scotland, where it composes little dense tufts, of a very dark or blackish hue. The same

is also found in Germany, and doubtless in other mountainous parts of Europe. Like both the foregoing, it bears *cap-sules* in the spring and summer. The presence of a strong rib in the *leaves* clearly distinguishes it from those species, though the paler, blunt, and more oblong, scales of the *sheath* have no rib. The *stems*, generally almost simple, are occasionally much branched, as in *Engl. Bot.*

4. *A. nivalis*. Tall Slender Andraea. Hook. Tr. of Linn. Soc. v. 10. 395. t. 31. f. 4. Musc. Brit. n. 4. t. 8. Engl. Bot. t. 2334. (not 2507).—Stems branched. Leaves loosely imbricated, lanceolate, single-ribbed, curved towards one side. Scales of the sheath similar.—Gathered by Mr. Hooker and Mr. Borrer, on rocks upon the highest summit of the Scottish mountain Ben Nevis, at the eastern end. It is, like all the rest, perennial, bearing *capsules* in summer.

This is by far the tallest *Andraea* known, being three inches high, or more, forming rather lax olive-brown tufts, tinged with a chocolate-colour, of which last hue are the *capsules*, whose substance is strongly reticulated. The scales of the *sheath* being of the same lanceolate figure, furnished with a mid-rib, as the *leaves*, clearly defines the species. Mr. Hooker has observed this moss on the granite rocks of the most elevated of the Swiss alps, retaining all the characters of the Scottish specimens.

ANDREW, *Knights of*, &c. 1. 12, *r.* Favin; col. 2, 1. 28, *r.* commissioner; 1. 29, *r.* little for litter.

ANDROMACHA, 1. 1, *r.* Zygæna.

ANDRONICUS II., PALÆOLOGUS, in *Biography*, son of Michael Palæologus, succeeded to the Greek empire in 1283. He is characterized as learned and virtuous, but feeble in his conduct, and abjectly superstitious. His old age was embittered by blindness and neglect; and having assumed the name of Father Autony, he closed his unquiet life four years after his abdication, A.D. 1332, aged 74.

ANDRONICUS III., *Palæologus*, the younger, was the son of Michael, eldest son and colleague of the elder Andronicus. With his grandfather he was a favourite, on account of his wit and beauty; and he was thus led into habits of intemperance and debauchery, which involved him in difficulties and disgrace. Having compelled his grandfather to abdicate in 1328, he reigned alone, and contended against the Bulgarians and Turks, with the latter of whom he signed an ignominious treaty, relinquishing to them all the places which they had taken in Asia. At length, exhausted by his vices, he died in his 45th year, A.D. 1341. Gibbon.

ANDROPHYLAX, in *Botany*. See WENDLANDIA.

ANEILEMA, from *α*, without, and *ειλεμα*, an involucre, this genus being separated by Mr. Brown, Prodr. Nov. Holl. v. 1. 270, from COMMELINA, (see that article,) on account of the want of the large folded involucre, or rather bractea, which in *Commelina* contains a considerable number of flowers; whereas in *Anilema* the inflorescence is scattered, somewhat panicked. The difference between the two resides therefore in this part of the plant, and not strictly in the fructification.

The known species of *Commelina* referred by Mr. Brown to *Anilema* are, *vaginata*, *audiflora*, and *spirata* of Linnæus, *medica* of Loureiro, Vahl Enum. v. 2. 175. n. 28; and *gigantea* of Vahl, n. 34, found by Mr. Brown, in the tropical part of New Holland. To these the author adds nine new species, found by himself, either in New South Wales, or the warmer parts of New Holland, one of them only being described from the collection made in the latter country by fr Joseph Banks. Some have smooth *filaments*, others bearded ones. It is suspected that *Pollia* of Thunberg may not be generically distinct from these; but the *fruit* in our specimen is evidently a *berry*, according to Thunberg's de-

scription, and remarkable, even after having been dried more than thirty years, for its bright blue colour. (See POLLIA.) The habit and inflorescence are indeed, as Mr. Brown observes, similar to his *Anilema*. Whether *Cartonema* of this author be distinct, we do not presume to judge, having seen no specimen. In the regularity of its *flowers*, and the equality of their *filaments*, it differs from *Commelina* and *Anilema*, and agrees with *Tradejantia*, but differs from the latter in several particulars pointed out by Mr. Brown, besides its spiked inflorescence.

ANEMIA, a genus of ferns, separated from OS-MUNDA, (see that article,) by Dr. Swartz, and thus named from *ανεμων*, naked, or not covered; because its capsules are destitute of all covering or involucre whatever.—Swartz Syn. Fil. 155. Willd. Sp. Pl. v. 5. 89. Ait. Hort. Kew. v. 5. 498.—Class and order, *Cryptogamia Filices*. Nat. Ord. *Filices*, sect. 2, *spuriæ gyrate*.

Ess. Ch. Capsules somewhat turbinate, concentrically striated at the top, bursting laterally, sessile on one side of a compound linear receptacle. Involucreum none.

The habit of this genus is different from *Osmunda*, and extremely remarkable, on account of its compound spikes, always perfectly distinct from the leafy part of the frond, and generally situated in pairs, on long stalks, on the common stalk at the base of that leafy part. Such at least is the case with the whole of the first section; in the second, the fruit-bearing stalks are radical and solitary. It is closely related to BOTRYCHIUM, to be described hereafter; but that has globular capsules of two distinct valves, neither striated nor annulated. Their receptacles, indeed, exactly agree; and the striæ are so obscure in *Anemia*, that we are much inclined to unite it with *Botrychium*.

SECT. 1. *Panicles of spikes in pairs, stalked, at the base of the leaf.*

1. *A. phyllitidis*. Broad-leaved Anemia. Swartz n. 1. Willd. n. 1. (*Osmunda phyllitidis*; Linn. Sp. Pl. 1520. *O. lanceolata* et *subtiliter serrata*; Plum. Fil. 133. t. 156. O. racemifera, *phyllitidis* folio vix crenato; Petiv. Fil. n. 163. t. 8. f. 15).—Frond pinnate; leaflets ovato-lanceolate, pointed, finely serrated, smooth as well as the common stalk.—Native of South America and the West Indies. Brought from Brazil, by the late sir George Leonard Staunton, in 1793. A very handsome fern, eighteen inches or two feet high, its tufted root producing several upright fronds. Each of these consists of a smooth, rather slender, straight common stalk, bearing at the top an upright simply pinnate leaf, of from four to eight pair of smooth, veiny, bluntly serrated, somewhat stalked, leaflets, besides an odd one; their length from two to four inches. Close to the base of this pinnate leaf, on the upper side, or front, are stationed a pair of equal, long-stalked, triply pinnate spikes, of minute, pale, very numerous, capsules, ranged in double rows along one side of the linear compound stalk, or receptacle, the common stalk of the whole being somewhat hairy. These compound spikes always rise a little above the point of the terminal leaflet.

2. *A. hirta*. Rough-leaved Anemia. Swartz n. 2. Willd. n. 2. (*Osmunda hirta*; Linn. Sp. Pl. 1520. *O. hirsuta*, *lonchitidis* folio; Plum. Fil. 134. t. 157. *O. spicis geminis*; Petiv. Fil. n. 164. t. 14. f. 5. *Lonchitis hirsuta florida*; Plum. Amer. 18. t. 26).—Frond pinnate; leaflets oblong-lanceolate, hairy, finely serrated, and somewhat cut; very unequal at the base. Stalks all hairy.—Native of the West Indies. Smaller in every part than the last, being scarcely above a foot high; and distinguished also by the great dilatation of the upper side of each leaflet, at its base. The upper ones run into a sort of pinnatifid elongated point.

ANEMIA.

point. Both sides of the *leaflets* are hairy in our specimen, as Plumier describes them; though Willdenow and Swartz call them smooth. The dense, twin, hairy, twice-compound *spikes* usually rise a little above the *leaf*.

3. *A. blechnoides*. Many-leaved Anemia. — Frond pinnate, longer than the *spikes*; *leaflets* numerous, parallel, oblong, obtuse, serrated, smooth; rectangular on their upper side at the base. — Brought from Brasil, by the late Sir George Leonard Staunton, from whom we received specimens in 1793. We cannot find any figure or description of this species, though a very remarkable one. The *common stalk*, in its naked part, is smooth. The *leaflets* are about forty pair, parallel and crowded; the lowermost an inch and a quarter long, and opposite; upper ones gradually smaller and alternate; all together forming a linear-oblong *frond*, eighteen inches in length, with a slightly hairy *common rib*, which, by a hairy bud at the summit, seems as if it would take root there. *Spikes* lax, twice compound, measuring with their slightly hairy stalks, about two-thirds of the length of the leafy part. Their subdivisions are extremely narrow.

4. *A. oblongifolia*. Oblong-leaved Anemia. Swartz n. 3. Willd. n. 3. (*Osmunda oblongifolia*; Cavan. Ic. v. 6. 69. t. 592. f. 2.) — Frond pinnate; *leaflets* obovate, obtuse, dilated at the upper angle of their base, fringed. Stalks smooth. — Gathered by Louis Née at Panama. Several stalked *fronds*, hardly six inches high, spring from the hairy crown of the tufted *root*; some of them barren. The *leaflets* of each are about ten pair, rather alternate than opposite, half an inch long, rounded at their extremity, as well as at the dilated angle. Both *spikes* rise much higher than the leafy part, on slender stalks, and appear to be rather dense. We know this and the following from the work of Cavanilles only.

5. *A. humilis*. Dwarf Anemia. Swartz n. 4. Willd. n. 4. (*Osmunda humilis*; Cavan. Ic. v. 6. 69. t. 592. f. 3.) — Frond pinnate; *leaflets* obovate-wedge-shaped, abrupt; crenate at the extremity; hairy beneath. *Common stalk* hairy. — Native of Tabago, an island on the Mexican coast, near Panama. Of more humble stature than the last, and further distinguished by the wedge-like shape of its *leaflets*, which are fewer, rather larger, crenate, and not fringed. The *spikes* are much smaller than in the foregoing, raised high upon slender smooth stalks.

6. *A. filiformis*. Slender Hoary Anemia. Swartz n. 5. Willd. n. 5. (*Osmunda filiformis*; Lamarck Dict. v. 4. 652.) — Frond pinnate, downy and hoary; *leaflets* oblong-wedge-shaped, obtuse; jagged at the extremity. *Common stalk* hairy. — Gathered in South America by Mr. John Frazer, who is reported to have communicated a specimen to Lamarck. We have never seen this plant. It is described as eight or nine inches high, besprinkled in every part with white or hoary hairs. *Leaflets* striated very copiously and conspicuously beneath. *Spikes* slender, compound, on capillary stalks, rising high above the leaf. *Savigny* in Lamarck.

7. *A. tenella*. Delicate Anemia. Swartz n. 6. Willd. n. 6. (*Osmunda tenella*; Cavan. Ic. v. 6. 69. t. 592. f. 1.) — Frond pinnate; *leaflets* lanceolate, deeply pinnatifid, with linear-awl-shaped fringed segments. *Common stalk* smooth. — Found by Louis Née, on the trunks of trees in Quito, especially on mount St. Antonio. A slender delicate fern, about six inches high, whose *leaflets* have many fine, acute, partly opposite, segments. The *spikes* are somewhat taller than the leaf.

8. *A. hirsuta*. Hairy Anemia. Swartz n. 7. Willd.

n. 7. Ait. n. 1. (*Osmunda hirsuta*; Linn. Sp. Pl. 1520. O. molliter hirsuta, et profundè laciniata; Plum. Fil. 139. t. 162. O. spicis geminis villosa; Petiv. Fil. n. 165, t. 8. f. 16. Lunaria elatior, matricariæ folio, spicâ duplici; Sloane Jam. v. 1. t. 25. f. 6.) — Frond pinnate, hairy; *leaflets* deeply pinnatifid; segments tapering downwards; obtuse and jagged at the extremity. — Native of the West Indies, growing on rocks. About a foot high, hairy all over, except the *spikes* and their stalks. Several of the *fronds* are barren, which we presume is the case with most of the neighbouring species. Each *leaflet* is about an inch and a half long, with many narrow-wedge-shaped, deep, striated segments, hairy on both sides, and sharply notched. Each *spike*, near three inches long, is doubly pinnate, with flat close segments, broader than in most of the genus, and the *capsules* are represented by Plumier as marginal, and blackish, with much more intermediate space than usual on each segment. Willdenow adverts to this circumstance, and the hairiness of the *common stalk*, as indicating a specific difference between Plumier's plant and what he had examined. Specimens from the West Indies, and from Dr. Swartz, certainly agree with Sloane's plant, and like that, have a smooth *common stalk*; but having seen none answering to Plumier's, we decline attempting a specific definition, from his figure. He is, however, the original authority for *Anemia*, or *Osmunda*, *hirsuta*, and Petiver copies him; but Sloane's synonym must be referred to the new species, if such be established.

9. *A. deltoidea*. Triangular Anemia. Swartz n. 8. Willd. n. 8. (*Osmunda deltoidea*; Cavan. Ic. v. 6. 70. t. 593. f. 1.) — Frond triangular, pinnate; *leaflets* deeply pinnatifid, with rounded, crenate, crowded segments; glaucous above; hairy beneath. *Common stalk* hairy at the upper part. — Found on rocks in the plain of Buenos Ayres, by Louis Née. A span high, with broader and rounder segments of the *leaflets* than any of the foregoing. The divisions of the *common receptacle* of the *spike* also are broader, and more rounded, than usual, approaching to those in Plumier's plate of the last.

10. *A. villosa*. Shaggy Anemia. Willd. n. 9. — "Frond doubly pinnatifid, oblong, shaggy on both sides; segments roundish-ovate, obtuse, entire; the lower ones obscurely three-lobed. *Common stalk* shaggy." — Gathered by Humboldt and Bonpland in South America. *Common stalk* six inches high, or more, roundish, clothed with short rusty wool. *Frond* three or four inches long, covered with rusty hairs; the upper segments roundish-ovate, very blunt, and entire; lower with two or three slight lobes; *common rib* densely shaggy. *Spikes* triply compound, dense, taller than the leaf, with hairy ribs and stalks. Apparently akin to the following, but the outline of the *frond* is oblong, not triangular, and the *rib* straight, not zigzag. Willdenow.

11. *A. flexuosa*. Zigzag Anemia. Swartz n. 9. Willd. n. 10. (*Osmunda flexuosa*; Lamarck Dict. v. 4. 652.) — "Frond doubly pinnatifid, triangular, downy; segments oblong, obtuse, nearly entire; *common rib* zigzag. *Common stalk* downy." — Supposed to be a native of Peru, but for this there is no direct authority. We have seen no specimen. *Savigny* in Lamarck describes this species as related, in many respects, to *A. hirsuta*, n. 8, but the principal *leaflets* are simply pinnatifid. The stalks are about a foot high, semi-cylindrical, channelled, besprinkled with rather rigid, tawny hairs. *Fronds* from five to seven inches long, with narrow, deeply pinnatifid, *leaflets*; their segments oval, or somewhat oblong, nearly opposite, very blunt, decurrent, ribbed, entire, or slightly notched; paler beneath.

The fummit of each *frond* is obtuse, and simply pinnatifid. *Spikes* triply and minutely compound, with linear short segments; their *stalks* hispid.

12. *A. tomentosa*. Downy Anemia. Swartz n. 10. Willd. n. 11. (*Osmunda tomentosa*; Lamarck Dict. v. 4. 652.)—*Fron*d doubly pinnate, oblong, clothed with tawny down; leaflets crescent-shaped, entire; the lower ones bluntly pinnatifid. Common *stalk* downy.—Found by Commerçon at Buenos Ayres. A pretty species, seven or eight inches high, exhaling the smell of myrrh, and covered all over with fine, long, cottony, tawny down. The common *stalk* is rather stout, twice the length of the leafy part, which is about two inches broad. *Spikes* compound, on slender decurrent *stalks*. *Savigny*.

13. *A. fulva*. Tawny Branching Anemia. Swartz n. 11. Willd. n. 12. (*Osmunda fulva*; Cavan. Ic. v. 6. 70. t. 593. f. 2.)—*Fron*d doubly pinnate, triangular, somewhat downy; leaflets elliptic-oblong, bluntly pinnatifid, or serrated. Spikelets partly whorled. All the *stalks* hairy.—Gathered by Louis Néé, on the hill called *Pan de Azucar*, or the Sugar-loaf, thirty-two miles from Monte Video. Above a foot high, with very hairy *stalks*, and a broad *frond*, doubly pinnate throughout, except at the very top. *Leaflets* three-quarters of an inch long, and one-third as broad, uniform, somewhat decurrent. The *spikes* seem to be simply compound, their *branches* horizontal, linear, deeply notched, many of them in whorls of three or four together; their common *stalks* and *ribs* hairy, sending off one or three lateral branches, which we have seen in no other species.

14. *A. adiantifolia*. Maiden-hair-leaved Anemia. Swartz n. 13. Willd. n. 13. Ait. n. 2. (*Osmunda adiantifolia*; Linn. Sp. Pl. 1520. *O. filiculæ folio major*; Plum. Fil. 135. t. 158. *O. adiantum nigri facie*; Petiv. Fil. n. 167. t. 9. f. 1. *Adiantum faxofolium floridum*; Plum. Amer. 29. t. 43.)

β. Willd. (*A. asplenifolia*; Swartz n. 10. *Osmunda asplenifolia*; *Savigny* in Lamarck Dict. v. 4. 652.)

*Fron*d doubly or triply pinnate, triangular; leaflets obovate, sharply toothed at the end, partly notched, hairy, as well as their common rib. Common *stalk* nearly smooth. Spikelets digitate.—Native of the West Indies, particularly of Hispaniola, in dry rocky or stony places. Its large handsome, shining, striated *frond* bears considerable resemblance to our common *Asplenium Adiantum-nigrum*, to which, and not to the real genus *Adiantum*, the specific name alludes. The naked *stalk* is often a foot high; the length of the leafy part almost as much. The copious *leaflets* measure about half an inch, and are strongly striated; convex above; paler, and rather moist hairy, beneath; all their *stalks* hairy. *Spikes* somewhat panicled; their ultimate divisions radiating, or finger-like, linear, flat. *Cap*sules of a light shining brown.

Sir Joseph Banks has favoured us with several specimens of a variety of this fern, gathered at Campechy by Houffoun, which differs chiefly in being not above a span high, with a less compound *frond*, and having sometimes, from the same root, much narrower, almost linear, *leaflets*. The common *stalks* are also rather more hairy, and the *spikes* more compact. It is nevertheless an evident variety, and probably the β of Willdenow, to the characters of which it answers.

SECT. 2. *Panicles of spikes on radical stalks*.

15. *A. bipinnata*. Great Radical Anemia. Swartz n. 14. Willd. n. 14. (*Osmunda bipinnata*; Linn. Sp. Pl. 1521. *O. latis crenis incisa*; Plum. Fil. 133. t. 155.)—*Fron*d oblong, doubly pinnate; leaflets elliptical, acute, entire. *Spikes* on radical *stalks*, doubly pinnate; their ultimate seg-

ments densely crowded.—Gathered by Plumier in a dry stony tract of land in Hispaniola. We find no good authority for its having ever been found elsewhere, nor by any other botanist. Linnæus adopted this species entirely from Plumier, between whose figure and description there is a strange contrariety. The plate, drawn and engraved by himself, evidently exhibits the barren *fronds* as doubly pinnate, each of the numerous primary divisions being composed of a rather smaller number, (about thirty,) of oval or ovate, somewhat decurrent *leaflets*, except a few of the uppermost, which run into a terminal serrated point. His description says, "the tufted root bears seven or eight ribs, about a foot and a half long, garnished nearly throughout their whole length, with longish, narrow, pointed, yellowish-green leaves, but slightly furrowed, and all cut into rather broad, and somewhat pointed notches." As the author is known to have lost many of his specimens, we can only suppose this description was made from too slight a view of his own drawing, without a re-examination of the plant, which he seems to have gathered but once. A few taller and more slender *stalks*, springing also from the root, and doubly pinnate in the first instance, bear innumerable *cap*sules crowded into dense masses, which we presume to be composed of narrow compound segments, like the other species. At least the analogy of *A. filiculifolia* hereafter described justifies this supposition.

16. *A. aurita*. Auricled Radical Anemia. Swartz n. 15. Willd. n. 15. (*Osmunda aurita*; Swartz Ind. Occ. 1578.)—"Frond pinnate; upper leaflets simple, ovate, obtuse, finely toothed, unequally wedge-shaped at the base; lower ternate. *Spikes* compound, on radical *stalks*; spikelets digitate."—Found by Dr. Swartz, on the sides of lime-stone rocks, in the interior part of Jamaica. *Roots* creeping, slender. Common *stalks* several, crowded, about a span high, slender, most hairy and scaly at the base; downy and roughish upwards. Each bears an erect *frond*, six inches in length; doubly pinnate in its lower part, the *leaflets* small, roundish, the terminal ones larger and rhomboidal; the upper part is simply pinnate; *leaflets* oblong, oblique at the back, dilated on the upper edge, at the base, into an obtuse angle: all the *leaflets* are coriaceous, smooth and shining, slightly convex, streaked with radiating veins; finely crenate at the margin; more opaque beneath. *Clusters*, (or rather *spikes*), compound, on radical *stalks*, close to, and resembling, those of the barren *fronds*; their branches compound, nearly opposite, spreading; their ultimate segments digitate, lanceolate, acute, bearing on the upper side roundish-ovate bivalve *cap*sules, with concentric streaks on their apex, and interperfed with minute scales or hairs. *Swartz*. By this description, the genus is put out of all doubt.

17. *A. verticillata*. Whorled Radical Anemia. Swartz n. 16. Willd. n. 16. (*Osmunda verticillata*; Linn. Sp. Pl. 1520. Plum. Fil. 137. t. 160. Petiv. Fil. n. 171. t. 12. f. 4.)—*Fron*d three-branched, triply pinnate; leaflets elliptic-oblong, acute, serrated; terminal ones lanceolate, pointed. *Spikes* in whorled branches, on radical *stalks*.—Gathered once only, in the forests of Hispaniola, by Plumier, nor does it appear that any other botanist has even seen this species, his work having been Linnæus's sole authority. The genus, therefore, can only be presumed from analogy, but we think this analogy as fair as in any similar instance. The tufted root sends up many barren *fronds*, which are supported by long rough *stalks*, and three-cleft in the first instance, then doubly pinnate; their common outline pentagonal, a foot in diameter; their *leaflets* usually

near an inch long. The height of each *frond*, with its *stalk*, is about two feet. A few rather more slender *stalks*, from the root, bear each a long interrupted, whorled *spike*, with six or eight drooping, obtuse, dense, blackish *branches*, in every whorl, above an inch long, on capillary *stalks*, but how they are subdivided we have no information. Plumier compares them to little black caterpillars.

18. *A. filiculifolia*. Hemlock-leaved Radical Anemia. Swartz n. 17. Willd. n. 17. (*Osmunda filiculifolia*; Linn. Sp. Pl. 1521. *O. filicula folio altera*; Plum. Fil. 138. t. 161. *O. cicutæ folio*; Petiv. Fil. n. 170. t. 9. f. 3.)—*Fron*d three-branched, pinnate, pinnatifid; segments wedge-shaped, decurrent; notched at the extremity. Spikes panicled, on radical *stalks*.—Found but rarely by Plumier, in the forests of Hispaniola. A specimen, without any indication from whence it came, is preserved in the Linnean herbarium, and referred to *Osmunda* (*Anemia*) *bipinnata*, (see n. 15.) Linnaeus appears to have had it when he wrote the first edition of Sp. Pl., but all he says of either of these species is entirely taken from Plumier, who is the primary authority for both. *A. filiculifolia* varies from five inches to above a foot in height. The barren *fronds* have slender, roughish, rather long, *stalks*, and are nearly pentagonal in their outline; having three principal branches, which are first pinnate, then more or less deeply pinnatifid and cut, always in a wedge-like manner; they are hairy on both sides. The common *mid-rib* is winged. From the same tufted *root* grow one or more rather taller *stalks*, each bearing a triply-compound, slightly hairy, panicled, or compound *spike*, whose linear ultimate segments are laden, on one side, with rather large, and not very numerous, *capsules*, each having a very distinct, brown, shining, radiated top, below which is a lateral fissure. The engraving of Plumier gives no idea of the size or nature of these *capsules*, nor of their arrangement, so that we may suppose him equally incorrect with regard to our fifteenth or seventeenth species.

Dr. Swartz, Syn. Fil. 158, points out, as a probable species of this genus, *Filicium americanum minus, foliis ramosis bifidis*, Ammann in Comment. Petrop. v. 10. 295. t. 19. This was found by Dr. Houttoun at Vera Cruz, and however unlike the figure may seem to Plumier's t. 161, our specimen mentioned, and partly described, under the last species, serves to prove them, at least in our opinion, one and the same plant; for it explains the inaccuracies of both figures, and is intermediate between the two in the structure of the barren *frond*. We cannot doubt its being one of Houttoun's specimens. The panicled *inflorescence* agrees with Ammann's figure, but the detail of that figure is no less incorrect than Plumier's, so that nothing precise can be gathered from either.

ANEMOMETER, col. 2, for IX. infer VIII. No. 3. ANEMONE, in *Botany*, has received to much improvement and illustration from the pen of professor De Candolle, that our former article is by no means sufficient to give a complete, or an accurate, idea of this genus. Linnaeus indeed had but an imperfect acquaintance with its species, nor do all authors agree with him as to its generic limits. M. De Candolle however excludes HEPATICA only. (See that article hereafter.) His view of the subject cannot but prove instructive and interesting.—De Cand. Syst. v. 1. 188. Linn. Gen. 279. Schreb. 375. Willd. Sp. Pl. v. 2. 1272. Mart. Mill. Dict. v. 1. Sm. Fl. Brit. 580. Prodr. Fl. Græc. Sibth. v. 1. 374. Ait. Hort. Kew. v. 3. 336. Pursh 386. Juss. 232. Tourn. t. 147. Lamarck Illustr. t. 496. Gærtn. t. 74.—Clafs and order, *Polyandria Polygynia*. Nat. Ord. *Multifloræ*, Linn. *Ranunculacæ*, Juss. De Cand.

Gen. Ch. *Cal.* none, except a three-leaved, variously

cut, involucrem. *Cor.* Petals from five to fifteen, ovate or oblong. *Stam.* Filaments numerous, capillary, not half the length of the corolla; anthers two-lobed, erect. *Pist.* Germens numerous, collected into a head, single-feeded; styles tapering; stigmas blunt. *Peric.* none. *Recept.* globose or oblong, covered with small excavations. *Seeds* numerous, crowded, roundish, pointed with the permanent style, which in some is lengthened out into a feathery tail.

Ess. Ch. Involucrem three-leaved, cut. Petals from five to fifteen. Seeds numerous, capitate.

This genus consists of perennial herbs. *Roots* (or perhaps subterraneous *stems*?) either tuberous, or horizontally creeping, or simply fibrous. *Leaves* radical, stalked, simple (or compound), lobed or cut. *Flower-stalk* radical, bearing at the summit an *involucrem* of three, rarely but two, leaves, variously cut, but conformable in general to the proper foliage. From this *involucrem* proceeds usually one or many simple, naked, single-flowered *stalks*; some apparently caulescent species have one such leafless *stalk*, and, besides, a sort of branch, bearing another *flower-stalk*, accompanied by a two-leaved *involucrem*. The *flowers* are inodorous, very variable, and readily become double.

The recent plants are acrid, and raise blisters in the skin, if applied externally: internally they are poisonous in some degree, though several have been prescribed in chronic ophthalmia, and venereal caries of the bones.

The forty-five species, with which we are at present acquainted, inhabit pastures, hills, woods or thickets, of temperate climates, principally in the northern hemisphere; the *Pulsatilla* are found on rough exposed hilly fields; *Prenanthis* on the loftiest mountains; *Pulsatilla* at the Cape of Good Hope; *Anemonanthea* in meadows, pastures, or woods; *Anemonepermis* in North and South America and in Asia; *Omalocharis* in mountainous situations. There are two species from the Cape of Good Hope, four from South America, eleven from North America, seventeen are natives of Europe, three of the Levant, five of Siberia, two of Nepal, and one of Japan. Four appear to be common to North America and Europe.

Anemone is a very natural genus, and De Candolle declares his opinion against subdividing it; first, because the section *Prenanthus* has the habit and flower of the *Anemonantheæ*, with the feathery-tailed fruit of *Pulsatilla*; secondly, because the fruit being furnished with such an appendage, or destitute of it, is not to be considered essential in the present case, the same circumstance proving of no avail in the genus *Clematis*, so nearly related to the present.

The following divisions, founded on the whole habit as well as the fruit, prove extremely natural.

SECT. 1. *Pulsatilla*. Seeds terminating in long, bearded tails. Involucres feffile, deeply palmate, with linear lobes. Species 1—7.

2. *Prenanthus*. Seeds terminating in long bearded tails. Involucres leaves stalked, in three segments. Species 8.

3. *Pulsatilloides*. Seeds very hairy. Petals fifteen to twenty. Involucres leaves two or three, feffile, cut at the summit. Species 9 and 10.

4. *Anemonanthea*. Seeds without tails, ovate. Partial flower-stalks solitary or in pairs, always leafless and single-flowered. Involucres leaves stalked. Species 11—32.

5. *Anemonepermis*. Seeds without tails, rather compressed. Partial flower-stalks several; one of them leafless and single-flowered; two or three others bearing a two-leaved partial involucrem. Species 33—40.

6. *Omalocharis*. Seeds compressed flat, orbicular, or slightly oval, smooth, without tails. Partial flower-stalks numerous, umbellate, leafless, single-flowered. Species 41—43.

† Species

ANEMONE.

† Species not sufficiently known; 44 and 45.

We have corrected some accidental numerical errors, and we take the liberty of using the Linnæan terminology, as to *calyx* or *corolla*, here as in *Aconitum*, &c. *Carpella*, a word used by our learned friend for partial fruits, several of which belong to one flower, as in *Uvaria*, *Unona*, &c., seems to us well expressed, in English at least, by the plural, *fruits*; the singular, *fruit*, being always used when the pericarp is simple, or solitary. *Cariopsis* is used by Richard and De Candolle for the naked seed of Grasses, as well as of *Ranunculaceæ*, of which we do not see the utility. A multiplication of terms, without absolute necessity, is burdensome to science, and we rather wish the learned would labour to compress, instead of extending, the terminology of natural history.

SECT. 1. *Pulsatilla*. Bauh. Pin. 177. Tourn. t. 148.

Seeds terminating in long bearded tails. Involucral leaves sessile, dilated at the base, divided upwards, in a palmate manner, into linear segments. Petals five or six. Glands, (abortive stamens,) in several species, on short stalks, between the perfect stamens and petals. The radical leaves are mostly divided in a pinnate manner, their segments many-cleft, with linear or wedge-shaped lobes. *Flowers* in general purple or crimson.

1. *A. vernalis*. Parsley-leaved Spring Anemone. Linn. Sp. Pl. 759. Fl. Lapp. ed. 2. 189. De Cand. n. 1. Willd. n. 4. Ait. n. 3. Fl. Dan. t. 29. (A. n. 1147; Hall. Hist. v. 2. 61. t. 21. *Pulsatilla altera alpina*; Dalech. Hist. 851. *P. apii folio vernalis*, fl. majore, et fl. minore; Bauh. Pin. 177. Prodr. 94. "Helw. Pulf. 63. t. 9.")—Leaves pinnate; leaflets elliptic-wedge-shaped, notched or three-cleft, nearly smooth. Flower erect. Involucrum very hairy. Petals six, straight, elliptic-oblong.—Native of rocky pastures on the loftiest mountains of Switzerland, the Pyrenees, Germany, Sweden, and Norway, flowering among the melting snow in spring. The broad leaflets, with the beautifully silky *involucrum* and *petals*, distinguish this species. The *flower-stalk* is three or four inches high, hairy, much elongated above the *involucrum* after flowering, as in all the *Pulsatilla* tribe. *Flower* white, variegated with purple, extremely elegant; we have some doubt whether the report of its being ever yellow be well founded, and whether the term "golden" in Dalechamp, copied by J. Bauhin, may not apply to the brilliant yellow pubescence of the living as well as dried *flowers*, noticed by Haller.

2. *A. Halleri*. Silvery Swif's Anemone. Allion. Pedem. v. 2. 170. t. 80. f. 2. De Cand. n. 2. Willd. n. 5. Villars Dauph. v. 3. 725. (A. n. 1148; Hall. Hist. v. 2. 62.)—Leaves pinnate, deeply cut, with linear-lanceolate, pointed segments; very hairy beneath. Flower erect. Petals six, straight, elliptic-lanceolate.—Native of the alps, flowering in summer. Haller gathered it in the valley of St. Nicholas, in the Upper Vallais; Villars in Dauphiny; Molineri on the Piedmontese mountains; De Candolle in the eastern Pyrenees. The leaflets and their segments are much longer and narrower than in the foregoing; pubescence of the *flower* and *involucrum* silvery, not yellow. *Petals* dull purple, converging, not spreading.

3. *A. cernua*. Drooping Japanese Anemone. Thunb. Jap. 238. De Cand. n. 3. Willd. n. 3.—"Leaves pinnate; shaggy and somewhat downy beneath; leaflets pinnatifid, with notched oblong segments. Flower rather drooping. Petals six, elliptic-oblong, spreading."—Native of Japan, about Jedo and Nagasaki, (Thunberg,) flowering in spring. All the *stalks* are very hairy, as are the *leaves* beneath, especially when young. The segments of the latter

are intermediate between *vernalis* and *Pulsatilla*. *Stalk* fix inches high. *Flower* dark purple, hairy externally, smaller than in *A. Pulsatilla*. De Candolle.

4. *A. patens*. Naked-flowering Anemone. Linn. Sp. Pl. 759. De Cand. n. 4. Willd. n. 2. Ait. n. 2. (*Pulsatilla polyanthos violacea*, anemones folio; Breyne. Cent. t. 61. "Helw. Pulf. 52. t. 2, 3.")—Leaves later than the flower; leaflets ternate, wedge-shaped, deeply and acutely pinnatifid and cut. Flower erect, spreading.—Native of Siberia, Poland, Silesia, &c.; recently found by Mr. Schleicher in Switzerland. The *flowers* are as large as any of this section, and more spreading, either pale yellow, white, or purplish, on a very short partial stalk; the *involucrum* in very narrow, linear, hairy segments. The *leaves* expand after the flower is past, and are ternate, not pinnate, with radiating, very acute, variously notched, segments. The *partial stalk* is greatly elongated, from six to nine inches, as the *fruit* ripens. De Cand.

5. *A. Pulsatilla*. Pasque-flower Anemone. Linn. Sp. Pl. 759. De Cand. n. 5. Willd. n. 6. Fl. Brit. n. 1. Engl. Bot. t. 51. Fl. Dan. t. 153. Bull. Fr. t. 49. Ehrh. Pl. Off. n. 135. (*Pulsatilla*; Matth. Valgr. v. 1. 568. Dalech. Hist. 849. *P. vulgaris*; Lob. Ic. 281. Ger. Em. 385.)—Leaves doubly pinnate, cut, with linear segments. Flower somewhat drooping. Petals six, rather spreading, straight.—Found in wild open fields, and on dry hills, especially where the soil is chalky, throughout most parts of Europe, flowering in April or May. The finely divided, doubly or triply pinnate, *leaves*, whose segments are sometimes nearly awl-shaped, distinguish this from all the preceding. Its *flower*, usually of a dull purplish blue, is said to be occasionally red, greenish, or white, none of which variations have we noticed in England. The *petals* are an inch and a half long, finely downy at the back. Head of *seeds* large and hairy, raised on a tall stalk.

6. *A. pratensis*. Dark Meadow Anemone. Linn. Sp. Pl. 760. De Cand. n. 6. Willd. n. 7. Ait. n. 5. Fl. Dan. t. 611. Woodv. Med. Bot. t. 148. (Herba venti; Trag. Hist. 413. *Pulsatilla*; Camer. Epit. 392. *P. flore clauo*; Lob. Ic. 283. *P. flore minore*; Ger. Em. 386. *P. altera*; Dalech. Hist. 850.)—Leaves doubly or triply pinnate, with lanceolate, elongated segments. Flower pendulous. Petals six, erect; reflexed at the summit.—Native of meadows, as well as of dry open fields, in Sweden, Denmark, Russia, Germany, France, and, according to the abbé Sestini, near Constantinople with the preceding. This species is distinguished from *A. Pulsatilla*, by the larger coarser segments of its *leaves*, and smaller, darker-coloured *flower*, whose *petals* are recurved at the top. Dr. Storck recommended an extract or infusion of the herb, in chronic diseases of the eyes, and even confirmed lues. Hence it has attracted the notice of physicians, who have been commendably anxious to procure the true plant, which is not found wild in Britain. Probably its virtues, whatever they may be, exist likewise in the *A. Pulsatilla*. Both are easily cultivated.

7. *A. albana*. Pale Caucasian Anemone. "Steven Mem. Soc. Nat. Mosc. v. 3." De Cand. n. 6.* addend. 545.—Leaves doubly pinnate, with numerous oblong-linear segments. Flower drooping. Partial stalk scarcely longer than the involucrum. Petals six, erect, slightly reflexed at the summit.—Gathered by Mr. Steven, on the lofty mountains of the eastern part of Caucasus. Allied to *A. pratensis*, but differing first in the lobes of the *leaves*, and their subdivisions being shorter as well as more obtuse, rather oblong than truly linear; secondly, in the *partial stalk*, even throughout the whole duration of the flower, rising scarcely above the

ANEMONE.

the *involucrium*, instead of being four times longer: thirdly, in the *flower* being whitish, or sulphur-coloured, not purple: fourthly, in the total want of *glands*, or abortive *stamens*, at least in the specimen seen by professor De Candolle; which are very abundant in the preceding species.

8. *A. Nuttalliana*. Louisiana Anemone. De Cand. n. 7. —Leaves ternate, palmate, many-cleft; segments linear, elongated. Involucrium in numerous linear divisions. Flower crocated. Petals six, straight, converging. —Gathered in Louisiana, by Mr. Nuttall. The habit resembles *A. Pulsatilla*, but the *leaves* are ternate, not pinnate. *Footstalks* three inches long, covered with close hairs. *Flower-stalk* from six to twelve inches high; sometimes smooth. *Involucrium* very hairy at the base. *Partial stalk* various in length. *Flower* purplish. *Petals* acute, externally hairy, eight or ten lines long. *Fruit* like *Pulsatilla*. *De Cand.

SECT. 2. *Paeonanthus*. Ehrh. Phytoph. 95.

Seeds terminating in long bearded tails. Involucral leaves ternate, stalked, pinnate, with deeply serrated, notched lobes. Petals five or six. No glands, or abortive stamens. Radical leaves ternate; their divisions pinnate, doubly compound, cut and serrated. Flowers white or yellowish.

9. *A. alpina*. Alpine Anemone. Linn. Sp. Pl. 760. De Cand. n. 8. Willd. n. 8, β . Ait. n. 6. Ehrh. Phytoph. 95. Crantz Austr. fasc. 2. 105. t. 3. f. 2. Villars Dauph. v. 3. 726. (A. n. 1149; Hall. Hist. v. 2. 62. A. alpina alba major; Bauh. Pin. 176. Prodr. 94. Pulsatilla prima alpina; Dalech. Hist. 850.)

β . Flower white, as in α , but much smaller. (A. alpina; Jacq. Austr. t. 85. Willd. n. 8, α . A. sylvestris altera; Clus. Hist. v. 1. 245. Pulsatilla alba; Lob. Ic. 282. Dalech. Hist. 849. P. flore albo; Ger. Em. 386.)

γ . Fl. large, yellow. (A. apii folia; Jacq. Mic. v. 2. 47. t. 4. Willd. n. 9. A. fulpurea; Linn. Mant. 78. A. myrrhidifolia β ; Villars Dauph. v. 3. 727. from the author. A. n. 1149, β ; Hall. Hist. v. 2. 63. Pulsatilla lutea; Camer. Epit. 393. P. tertia; Dalech. Hist. 851, bad.)

Leaves ternate, pinnate, with pinnatifid, decurrent, serrated lobes. Involucral ones similar. Petals six, spreading. —Native of pastures and rocky declivities in most alpine parts of the middle of Europe, Switzerland, the Pyrenees, the south of France, Austria, Carinthia, &c.; flowering in summer. The conformity of structure between the *involucrium* and the radical *foliage*, clearly ascertains this species. We readily concur with Haller and De Candolle, that the difference of colour between the yellow, lemon-coloured, or white *flowers*, or of size between the large-white and the small, indicate mere varieties. But we scarcely see any reason to mark the more or less hairy *leaves* as permanent varieties; the former being caused by more dry and exposed situations of the same plant. The *petals* are always more or less pale, purplish, and hairy, at the back. The flowering plant is from two to twelve inches high. When in seed its dimensions are every way doubled. A singular monstrosity of variety β , sent us by the late Mr. Davall, has one of its *petals* slipped down, if we may so express it, into the *involucrium*, and greatly enlarged. This, as M. De Candolle justly observes, proves an analogy between the *petals*, (his *calyx*;) and the *involucrium*; but it will not prove them to have more affinity than the *petals* and actual *leaves* of a Tulip, which we have several times seen running into each other, or half and half of the perfect nature of each.

SECT. 3. *Pulsatilloides*. De Candolle.

Seeds very hairy. Petals from seven to twenty, oblong. Involucrium of two or three leaves, somewhat sheathing at

their base; cut and toothed upwards. Leaves twice ternate, cut.

10. *A. capensis*. Broad-leaved Cape Anemone. Lamarck Dict. v. 1. 164. De Cand. n. 9. (Atragene capensis; Linn. Sp. Pl. 764. Willd. Sp. Pl. v. 2. 1286. Ait. Hort. Kew. v. 3. 342. Andr. Repof. t. 9. Curt. Mag. t. 716. Pulsatilla foliis trifidis, dentatis, flore incarnata, pleno; Burm. Afric. 148. t. 52.) —Leaves twice-ternate, rigid, smooth; segments wedge-shaped, sharply toothed. —Native of stony acclivities of mountains, at the Cape of Good Hope, flowering from October to March. It is said to have been first cultivated in England, by Messrs. Lee and Kennedy, in 1795. This plant is somewhat caulescent, but the *leaves* are crowded about the lower part, almost close to the woody root. Their texture is extremely firm; their segments varying greatly in size, breadth, and shape; the young ones villous. *Flowers* one or two from each *involucrium*, which resembles the leaves, but is smaller, with a dilated inflated stalk. The *partial flower-stalks* are long and downy. *Petals* thirteen to eighteen, linear-oblong, above an inch in length, pink, or pale bluish-coloured, spreading, very handsome. *Germens* extremely hairy, ovate, each with a recurved style.

11. *A. tenuifolia*. Fine-leaved Cape Anemone. De Cand. n. 10. (Atragene tenuifolia; Linn. Suppl. 270. Willd. Sp. Pl. v. 2. 1286. Thunb. Prodr. 94. A. tenuis; Thunb. Jap. 239, note.) —Leaves thrice-ternate, rigid, smooth; leaflets pinnatifid, with linear-threadshaped, acute, entire lobes. —Found by Thunberg at the Cape of Good Hope. The *leaves* are more compound, and more finely divided than those of the preceding species; the plant is described as more caulescent, and the *flowers* but half as large, with only from seven to nine *petals*. We have seen no authentic specimens, but are not without a suspicion that Linnæus confounded this with the last.

SECT. 4. *Anemonanthea*. De Cand.

Seeds nearly ovate, hooked with the permanent style, either very hairy or shaggy, or in some instances nearly smooth. *Partial flower-stalks* solitary in each *involucrium*, or very rarely two together, always single-flowered and naked. *Petals* from five to fifteen.

* *Involucral leaves sessile. Root-stock tuberous, somewhat ovate.*

12. *A. coronaria*. Poppy Garden Anemone. Linn. Sp. Pl. 760. De Cand. n. 11. Willd. n. 10. Ait. n. 7. Curt. Mag. t. 841. Sm. Fl. Græc. Sibth. t. 514, unpubl. Lamarck l. 1. (Anemone; Camer. Epit. 386. A. hortensis tenuifolia, simpliciflora, n. 2—20; Clus. Hist. v. 1. 255—260; also pleno flore; ibid. 263. A. tuberosa radice, et cocinea multiplex; Lob. Ic. 277. Ger. Em. 374; see also several in his subsequent pages.) —Leaves three ternate, pinnatifid; segments linear-wedge-shaped, smooth-edged, sharply cut. Involucrium sessile, many-cleft. Petals six, oval, concave, converging. —Native of dry, as well as rather moist, pastures, in the south of France, Italy, and the Levant, flowering in the early spring. Very common on dry hillocks in Greece, according to Dr. Sibthorp, who concurred with former botanists in thinking it the *ανημωνια* of Dioscorides; and the learned Sprengel takes the *ανημωνια* of Hippocrates to be the same plant. This species, however, bears the same name in modern Greek, *παναρησα*, as the Field Poppy, *Papaver Rhaas*; nor is the history of these two flowers, however different, free from ambiguity. *A. coronaria* has been the delight of florists ever since the time of Gerard, and its numerous double varieties, displaying every beauty and splendour of colour, are among the most rare and admired decorations of a parterre. We confess

ANEMONE.

confess a predilection for the single kinds, equally beautiful and various in colour, which may be raised abundantly from seed in any airy and sunny spot, and require but little trouble in transplantation every fourth or fifth year. They flower most in the winter or spring. The leaves vary in breadth. The natural colour of the flower, which is cup-shaped, and full two inches broad, is a light purplish-blue, as represented in Dr. Sibthorp's drawing, and as we have gathered it in the groves and grassplots of the Roman villas. The seeds are covered with long, soft, tenacious down, concerning the effect of which an amusing story is told by Tournefort and Miller. A lawyer in the south of France stole these seeds from a covetous amateur, by ordering his page to drop, as if by accident, the silk train of his robe, when they passed over the bed of seeding Anemones, and thus obtained a plentiful supply.

13. *A. pufilla*. Dwarf Anemone. De Cand. n. 12.—Leaves three ternate, pinnatifid, many-cleft, with linear pointed segments. Involucrum sessile; cut at the summit. Petals fix, oblong, distant.—Gathered in Cyprus by Labillardiere. Nearly akin to the last, and perhaps a variety. Root tuberous, the size of a fiblerd. Leaves smooth, stalked, with narrow linear segments. Flower-stalk a finger's length, slender, downy, erect. Involucrum of three leaves, acutely cut and toothed at the apex. Partial stalk either the length of the involucrum, or twice or thrice as long. Flower erect, pale purple. Petals fix, rarely but four or five, oblong, bluntish, distant and spreading, about four times the length of the stamens. Seeds woolly, collected into an oval-oblong head. De Cand.

14. *A. pavonina*. Peacock Garden Anemone. Lamarck Dict. v. 1. 166. De Cand. n. 13. "Fl. Franc. v. 5. 634." Brot. Lufit. v. 2. 363, not 263. (A. hortensis latifolia, pleno flore, et flore cocineo; Cluf. Hist. v. 1. 261, 262, with three figures. A. maxima chalcidonica polyanthos; Ger. Em. 375. Lob. Ic. 278. A. stellata, geranii aut aconiti folio, duplicato flore purpureo; Cupan. Panph. v. 1. t. 121. ed. 2. t. 2.)—Leaves ternate or deeply three-lobed; leaflets or segments wedge-shaped, cut and toothed. Involucrum sessile, its leaves oblong, entire or slightly cut. Petals ten or twelve, lanceolate, very acute.—Found in vineyards in Navarre, also in the south of France, and probably in the Levant. De Candolle. Differs from *A. coronaria* in its less divided leaves, and especially those of the involucrum, which are five or six, elliptic-lanceolate, rough-edged, most of them quite entire, one or two only partially notched. The narrow and acute petals are also peculiar. We feel convinced with Lamarck and De Candolle that this must be a distinct species, though confounded by Linnæus and others with the more frequent *A. coronaria*. We have not sought out its varieties among the double Anemones; but there is a scarlet one not uncommon. The French know some of these varieties by the names of *Oeil de paon*, *Candioté*, &c. If this be not distinct, it should seem to belong to the following rather than to any other.

15. *A. hortensis*. Starry Garden Anemone. Linn. Sp. Pl. 761. Willd. n. 11. Ait. n. 8. Curt. Mag. t. 123. Sm. Fl. Græc. Sibth. t. 515, unpubl. (A. hortensis latifolia simpliciflora, n. 3—18; Cluf. Hist. v. 1. 249—254. A. prima; Dod. Pempt. 434. A. secunda; Camer. Epit. 387. A. tuberosa, bulbo-castani radice; Lob. Ic. 279. Ger. Em. 375. f. 5. A. n. 1152; Hall. Hist. v. 2. 64. A. stellata; Lamarck Dict. v. 1. 166. Brot. Lufit. v. 2. 363. Savi Etrusc. v. 2. 122. De Cand. n. 14. "Fl. Franc. v. 5. 634.")—Leaves ternate; leaflets wedge-shaped, rough-

edge, three-cleft, cut. Involucrum sessile; its leaves lanceolate, undivided or partly cut. Petals ten or twelve, elliptic-lanceolate, obtuse.—Found on banks, ruins, or bushy waste ground, in the south of Europe; very commonly in Italy and Greece, flowering in the early spring; less abundantly in the south of France, and Switzerland. Clufius observed this species near Mentz. It has been known in gardens as long as the *coronaria*, but being inferior in beauty and variety, has given place to that popular species. We cannot follow Lamarck in its specific appellation, because there is no end of changing names for the better; unless all leading botanists would concur in a general reform; and even in that case, positively erroneous names only should be altered. This pretty species has an oblong tuberous root, producing many leaves and stems. The latter are ternate, on long stalks; their leaflets coriaceous, strongly veined, either cut half way down into three broad lobes, or divided nearly to the base, into three subdivided narrow ones; their segments all acute; their edges remarkably rough, though both surfaces are usually, if not always, smooth and naked. Involucral leaves three, an inch long, silky, rough-edged; one of them in general slightly notched at the end. Partial stalk long, silky, especially near the top. Flower scarcely above an inch wide, of a delicate rose-colour, or full carnation; the petals silky at the back, veiny, often emarginate. The rough-edged leaves and involucrum are characteristic of this species, but the involucrum of *pavonina*, (we have not examined its leaves,) has the same character, which *coronaria* has not. We are strongly persuaded of *pavonina* being a variety of *hortensis*, and that the acuteness or bluntness of the petals is variable.

16. *A. palmata*. Cyclamen-leaved Anemone. Linn. Sp. Pl. 758. De Cand. n. 15. Willd. n. 12. Ait. n. 9. Andr. Repof. t. 172. Vahl Symb. v. 3. 73. Desfont. Atlant. v. 1. 432. (A. hortensis latifolia, simpliciflora flava; Cluf. Hist. v. 1. 248. Morif. sect. 4. t. 25. f. 3. A. latifolia Clufii; Lob. Ic. 279. Ger. Em. 376. A. latifolia flava; Barrel. Ic. t. 792.)—Leaves simple, heart-shaped, rounded, with three or five blunt, sharply-toothed lobes. Involucrum sessile; its leaves in three linear, acute, hairy lobes. Petals ten or twelve, oblong, obtuse.—Native of rather moist waste ground, in Portugal, Spain, the south of France, and the north of Barbary, flowering early in spring. Rarely cultivated with us, except in curious gardens, though the brilliant golden flowers are very handsome. The leaves, notwithstanding Mr. Andrews's doubts, are truly palmate, differing from the last in being simple, and, though more or less hairy, not rough at the edges as in that species. They are coriaceous, strongly veined; often purple beneath. The involucral ones are three, almost uniform, hairy or silky, an inch long, narrow, each divided about half way into three nearly equal, sometimes notched, linear lobes; the edges apparently fringed, but not rough. Stalk above the involucrum rather long, silky. Flowers an inch and a half or two inches broad. Petals linear-obovate; the six outer ones remarkably hairy externally, and so disposed in Linnæus's only specimen, that he took them for the same kind of close calyx as occurs in *Hepatica*, only with a double number of segments. Thus he was led to place *A. palmata* in his first section, *Hepatica*, and this will solve Vahl's difficulty, recorded in his *Synbole* above cited. But it will not account for this author's extraordinary quotation of Linnæus's words, which are "*calyx fexpartitus, integerrimus, villosus, coloratus, nec a flore remotus*. Vahl cites this passage, "*calyx hexaphyllus, coloratus, a flore remotus*." The supposed double variety of the present species,

ANEMONE.

much shorter than the involucre, and the small blue flower has only four or five roundish, very obtuse petals, more like *A. nemorosa*, except in colour.

*** *Involucral leaves stalked. Root-stock cylindrical, slender, elongated.*

24. *A. baldensis.* Strawberry-fruited Anemone. Linn. Mant. 78. De Cand. n. 23. Willd. n. 14. Allion. Pedem. v. 2. 172. t. 44. f. 3, and t. 67. f. 2. (*A. fragifera*; Jacq. Misc. v. 2. 55. Ic. Rar. t. 103. *A. alpina*; Scop. Carn. v. 1. 384. t. 26. *A. n.* 1151; Hall. Hist. v. 2. 63.)—Leaves twice-ternate, many-cleft; segments linear-wedge-shaped, acute. Involucral ones similar, stalked, lefs compound. Petals eight to ten, elliptic-oblong. Fruit ovate, woolly.—Native of the alpine precipices of mount Baldus, as well as of Switzerland, Dauphiny, Savoy, Austria, the Tyrol, &c., first cultivated in England by Mr. Loddige, in 1792. It flowers early in summer. The root is long and woody. Leaves firm and rather glaucous, smooth, like rue, but narrower; their footstalks hairy, an inch and a half long. Flower-stalk hairy, erect, three or four inches high, with a large three-leaved involucre below the middle. Flower white, rather larger than *A. apennina*, with fewer and broader petals. Fruit the size and shape of a small strawberry, with the reddish beaks of its seeds sticking out of the copious dense mass of tawny silky wool. Receptacle perfectly cylindrical.

25. *A. nemorosa.* Common Wood Anemone. Linn. Sp. Pl. 762. De Cand. n. 24. Willd. n. 23. Fl. Brit. n. 2. Engl. Bot. t. 355. Prodr. Fl. Græc. Sibth. n. 1249. Curt. Lond. fasc. 2. t. 38. Fl. Dan. t. 549. Bull. Fr. t. 3. (*A. nemorum* alba; Ger. Em. 383. Herba sylvestris, ignoti nominis; Brunf. Herb. v. 2. 80. Ranunculi quarta species lactea; Fuchf. Hist. 161. Ranunculus sylvarium; Cluf. Hist. v. 1. 247, 248. *R. candidus*; Trag. Hist. 95.)

26. Michaux Boreal.-Amer. v. 1. 319. Pursh 386. (*A. quinquefolia*; Linn. Sp. Pl. 762. Willd. n. 22. Ranunculus nemorum, fragariæ foliis, virginianus; Pluk. Phyt. t. 106. f. 3.)

Leaves ternate; leaflets in three, or five, deep, three-lobed, notched, lanceolate, acute segments. Involucral ones similar, stalked, lefs compound. Petals six, elliptical.—Common in groves and thickets throughout Europe, where *A. apennina* scarcely occurs, flowering in spring. About the size of that species, with some resemblance of foliage; but there is lefs difference between the leaflets of the radical leaves and those of the involucre. The root also is long and slender, not ovate. The flowers are white, often tinged with purple externally, formed of six broad petals, totally unlike *apennina*. The double variety is very elegant. That with five deep lobes in each leaflet, occurs occasionally in England as well as North America, and is evidently a most trifling variety, though Linnæus, led perhaps by Plukenet's bad figure, made it a species.

26. *A. ifopyroides.* Wedge-leaved Anemone. "Juss. Ann. du Mus. v. 3. 249. t. 20. f. 3." De Cand. n. 25.—"Leaves twice ternate; leaflets somewhat wedge-shaped, deeply three-toothed. Involucral leaves stalked, ternate; lateral segments divided. Petals five, oblong."—Described by De Candolle, from Jussieu's herbarium, but the native country of the plant is unknown. It is said to be extremely similar to *A. nemorosa*. The root is horizontal. Radical leaves on long stalks, whose partial stalks bear each three nearly wedge-shaped, cut, or toothed, leaflets. The lateral leaflets of each involucre leaf being divided, give the appearance of five leaflets in each. Flowers one or two to an involucre. Petals oblong, narrow, elongated. De Cand.

27. *A. lancifolia.* Lanceolate-leaved Anemone. Pursh n. 2. De Cand. n. 26.—Leaves all stalked, ternate; leaflets lanceolate, bluntly-toothed. Petals five, ovate, acute.—On high mountains in a boggy soil, in Pennsylvania and Virginia, flowering from May to July. Resembles *A. nemorosa*, but the flowers are larger, of a clear white. Pursh. De Candolle says the leaves scarcely differ from *A. trifolia*, by which they are led to suspect that Plukenet's t. 106. f. 3, cited by Linnæus and others for *quinquefolia*, with which it does not well accord, may belong to the species before us.

28. *A. trifolia.* Three-leaved Anemone. Linn. Sp. Pl. 762. De Cand. n. 27. Willd. n. 21. Ait. n. 16. Dod. Pempt. 436. Ger. Em. 377. Morif. sect. 4. t. 25. f. 1. (*A. trifolia*, flore albo; Bauh. Hist. v. 3. 412. Alabastrites, five Dentaria alba; Lob. Ic. 281.)—Leaves and involucre stalked, ternate; leaflets of all ovate, acute, ferrated. Petals five or six, elliptical, obtuse.—Native of rather mountainous groves and thickets, in France, Piedmont, Tuscany, Carniola, Carinthia, and Siberia, flowering in spring. Gerarde appears to have cultivated this species, but we have never seen or heard of it in modern times. The root is oblong, horizontal, somewhat toothed. Leaves two or three inches high, each of three leaflets about an inch long, with hairy ribs and edges. Stalk about a span high, or more, angular, smooth, bearing an involucre of three uniform stalked leaves, like the radical ones, but rather larger; the lateral leaflets very unequal at their base; the central one tapering into the footstalk. Partial flower-stalk about the length of the stalks of the involucre, solitary, simple, slender, hairy. Flower scarcely an inch broad. Petals from five to seven, white; purplish underneath.

29. *A. minima.* Leaf Anemone. De Cand. n. 28.—"Leaves..... Involucral ones stalked, deeply three-lobed; lobes ovate, pointed, ferrated externally and at the extremity. Petals five, oval-oblong, obtuse."—Native of the Allegany mountains in Virginia; *Palisot de Beauvois*. Remarkably tender and delicate, resembling *A. trifolia*, but only one-third its size. Root long, slender, horizontal, sending out a few fibres. Radical leaves wanting in the specimens. Stalk slender, round, smooth, a finger's length. Leaflets of the involucre closely downy; the lateral ones strongly ferrated at their outer margin, and from the middle to the end at both margins. Partial stalk the length of the involucre, erect, downy, simple. Flower small, white. Petals smooth, four lines long, and two broad. Stamens half as long. GERMENS few, downy. De Cand.

30. *A. ranunculoides.* Yellow Wood Anemone. Linn. Sp. Pl. 762. De Cand. n. 29. Willd. n. 26. Fl. Brit. n. 4. Engl. Bot. t. 1484. Fl. Dan. t. 140. Savi Etrusc. v. 2. 123. (*A. n.* 1153; Hall. Hist. v. 2. 64. *A. nemorum* lutea; Ger. Em. 383. Ranunculi quarta species lutea; Fuchf. Hist. 162. *R. tertia* species; Cord. Annot. 120, with Tragus's figure of *A. nemorosa*, of which the larger part resembles that species, the smaller this. Ranunculus nemorosus luteus; Bauh. Pin. 178. Lob. Ic. 674. Morif. sect. 4. t. 28. f. 11.)—Leaves ternate or quinate; leaflets three-lobed, deeply notched; wedge-shaped at the base. Involucral ones similar, ternate or quinate, somewhat stalked. Flowers mostly in pairs. Petals five or six, elliptical.—Frequent in groves, thickets, and hilly pastures, throughout the north and middle of Europe, as well as Siberia and part of Caucasus, but rare in England. Mr. Hudson found it in Kent and Hertfordshire; and the late Mr. Geo. Anderfon brought us specimens from near Abbot's Langley, flowering early in April. The root is slender, horizontal. Herbage not unlike *A. nemorosa*, but the

ANEMONE.

the leaflets are more elongated and cut, and the stalks of the involucre much shorter. The petals are broader, and of a full yellow. *Flowers* often two together, one of which, according to De Candolle, is sometimes deficient in pistils. The partial stalk appears to droop as the fruit ripens. "The germens are nearly orbicular, compressed, downy, the style of each forming a strong incurved beak. There is said to be a violet-coloured variety found on the Pyrenees."

31. *A. reflexa*. Reflexed Anemone. Stephen. in Willd. n. 25. De Cand. n. 30.—"Leaves ternate; leaflets somewhat three-cleft, toothed at the extremity. Involucral ones similar, stalked. Petals five or six, linear, obtuse, reflexed."—Native of Siberia. *Stalk* slightly downy at the top, slender, a palm in height. *Involucral leaves* smooth, on downy stalks; their leaflets acute, tapering at each end. *Partial stalk* solitary, shorter than the involucre while in flower, erect, slightly hairy. *Flower* yellow, one-third the size of the last. *Stamens* very numerous, shorter than the petals. De Candolle, Willd.

**** *Involucral leaves stalked. Root of twisted fibres.*

32. *A. sylvestris*. Snow-drop Anemone. Linn. Sp. Pl. 761. De Cand. n. 31. Willd. n. 15. Ait. n. 12. Curt. Mag. t. 54. Bull. Fr. t. 59. (*A. sylvestris prima*; Clus. Hist. 244. *A. tertia*; Matth. Valgr. v. 1. 565. Lob. Ic. 280. Camer. Epit. 388. Dalech. Hist. 843. *A. Matthioli*; Ger. Em. 377. *A. n. 1150*; Hall. Hist. v. 2. 63.)—Leaves ternate or quinate; leaflets lobed; deeply notched at the end. *Involucral ones* similar, stalked. *Flower* solitary. Petals six, elliptical. Fruit very woolly. Root fibrous.—Found in woods and hedges in various parts of France, Switzerland, the north of Italy, Germany, Siberia, &c. but not in England, though a very desirable hardy perennial in our gardens, flowering in spring, and sometimes in autumn. The root consists of long, black, rather stout fibres, and creeps rather extensively. Leaves large, dark-green, veiny, nearly smooth, coarsely notched; their leaflets or lobes wedge-shaped at the base. *Flower-stalk* fifteen or eighteen inches high, erect, downy at the top, bearing about the middle three, rarely four, large, stalked involucre leaves, whose leaflets, five or more, are scarcely distinct at the base. *Flower* pure white, rarely purplish, or greenish, externally downy; its petals near an inch long, slightly coriaceous. Fruit ovate, the seeds cohering for some time by their dense cottony wool, which at length, by spreading itself, wafts them away. We have one Swiss specimen with two partial stalks, one of which bears a partial involucre, as in the next section.

33. *A. alba*. Cotton Anemone. "Juss. Ann. du Mus. v. 3. 248. t. 20. f. 1." De Cand. n. 32.—"Leaves ternate or quinate; leaflets deeply toothed at the end. Involucral ones similar, stalked. Flower solitary. Petals five, obovate. Fruit very woolly. Root fibrous."—Native of Dauria and the Crimea. Very like the last, but rather smaller. Petals five, not six, shorter, rounder, and very obtuse. The seeds are so woolly, that Demidow asserts they supply the place of cotton. De Candolle. We concur in opinion with our author, that this plant is probably a variety, we should say a very slight one, of the foregoing species. If distinct, the name of *gossypina* would have been far preferable to *alba*. We would also suggest, that this last division of the fourth section of the genus, rather belongs to the fifth, which is shewn by its habit, and by the casual variation in the inflorescence of *A. sylvestris* above noticed, of which we have seen more examples.

Seet. 5. *Anemonepermos* of De Candolle; not of former authors.

Seeds rather compressed, villous, hooked with the per-

manent style. Petals five, very rarely ten. Umbel spicuously composed, there being several stalks in one involucre; one of them naked and single-flowered; two or three others bearing each a two-leaved partial involucre, from whence springs a single-flowered stalk.

34. *A. virginiana*. Virginian Anemone. Linn. Sp. Pl. 761. De Cand. n. 33. Willd. n. 16. Ait. n. 13. Pursh n. 10. (*A. virginiana*, tertie Matthioli similis, parvo flore; Herm. Parad. 18, with a plate.)—Leaves ternate, downy; leaflets three-cleft, pointed, notched, sharply serrated. General and partial involucre similar, stalked. Petals five, elliptical.—In woods, on the sides of dry sandy hills, from Canada to Carolina, flowering in May and June. *Flowers* small, greenish-yellow. *Pursh*. The leaflets and their segments are much more pointed, and more sharply and copiously serrated, than in *A. sylvestris*. Whole herb downy, soft to the touch. Seeds very woolly, in an oval head, on a cylindrical receptacle.

35. *A. multifida*. Magellanic Anemone. "Poiret in Lamarck Suppl. v. 1. 364." De Cand. n. 34.—Radical leaves ternate; leaflets in many deep linear segments. General and partial involucre similar, many-cleft, somewhat stalked. Petals five to ten, elliptical, obtuse.—Gathered by Commerfon from the straits of Magellan. The root is woody. Radical leaves on long, loosely hairy, stalks. *Common flower-stalk* stout, erect, taller than the leaves, about six inches high. *General involucre* of three leaves, about two inches long, including their broad hairy stalks, being rather larger than the radical leaves, but all similarly divided into linear, or narrow-wedge-shaped, partly three-cleft, loosely hairy, lobes. *Partial flower-stalks* three; the middle one earliest, four or five inches long, hairy, leafless; the others much shorter, spreading, each bearing two smaller, but otherwise similar, involucre leaves; all single-flowered. *Flowers* about the size of *A. apennina*, pale yellow, or buff-coloured, according to Commerfon; externally hairy. Seeds hairy, collected into a globular head.

M. De Candolle saw, in the Banksian herbarium, a plant from Hudson's bay, which he considered as a variety, differing from the Magellanic specimens in having only one flower; or, at most, two, one of which bore a partial involucre below the middle. He suggests that it may possibly constitute a distinct species.

36. *A. pennsylvanica*. Pennsylvanian Anemone. Linn. Mant. 247. De Cand. n. 35. Willd. n. 19. Ait. n. 14. Pursh n. 8. (*A. irregularis*; Lamarck Dict. v. 1. 167. De Cand. *A. aconitifolia*; Michaux Boreal-Amer. v. 1. 320.)—Leaves deeply three-cleft; segments three-lobed, notched, acute. Involucral ones similar, sessile. Petals five, elliptical. Seeds villous.—In meadows, and on the borders of woods, from Canada to Pennsylvania, flowering in June and July. *Flowers* large, white, with yellow anthers. *Pursh*. Sir Joseph Banks has specimens from Fort Albany and Hudson's bay. De Cand. We have one from the late Peter Collinson's garden at Mill-hill, probably of an earlier date than 1766; see Hort. Kew. This is a tall, apparently caulescent, species, whose flower-stalk is angular, a foot and a half or two feet high, twice forked, and variouly compound. The radical leaves we have not seen; De Candolle describes them with long footstalks, as tall as the flowering stalk, and deeply divided into three or five principal lobes, which are oblong-lanceolate; wedge-shaped at the base; pointed, cut and toothed, at the extremity. Such, nearly, are the general, as well as partial, involucre leaves, but sessile, the former three, the latter two, at each division of the stalk; all strongly ribbed, two or three inches long, slightly downy with small, close, scattered hairs.

ANEMONE.

Partial stalks long, straight and slender, single-flowered, rarely somewhat leafy. *Petals* three-quarters of an inch long, obtuse. *Seeds* compressed, pointed, sparingly downy. A variety, or perhaps a distinct species, found by Laxmann in Siberia, is mentioned by De Candolle, which approaches *A. narcissiflora* in the first appearance of its *inflorescences*, but is really more akin to *pennsylvanica*, differing, as it seems, chiefly in the situation of each small *partial involucrem*, near the bottom of their respective stalks. We have not seen any specimen.

37. *A. dichotoma*. Forked Anemone. Linn. Sp. Pl. 762. De Cand. n. 36. Willd. n. 20. Ait. n. 15. Pursh n. 9, excluding the syn. of Lamarck. Linn. Fl. Dec. 2. 29. t. 15. (A. n. 37; Gmel. Sib. v. 4. 197, excluding the synonymy. *Ranunculus Brasiliensis*; Linn. Am. Acad. v. 1. 155. n. 102.)—Leaves deeply three-cleft; segments oblong, cut and toothed at the end. *Involucral ones* similar, sessile, all two-leaved. *Petals* five, elliptical. *Seeds* smooth.—Frequent throughout Siberia. *Gmelin*. In wet woods, and natural meadows, of Canada, and the western parts of New York, flowering in May and June. *Pursh*. *Root* slender. *Herb* smaller than the preceding, and smoother, with only two leaves to the *general involucrem*, and the *leaves* or segments have larger, but much fewer, teeth or serratures. The *flower* moreover is smaller, tinged with red on the outside; and the *seeds* are smooth.

38. *A. mexicana*. Mexican Anemone. "Humb. Bonpl. et Kunth, MSS." De Cand. n. 37.—"Leaves three-cleft; segments oval, somewhat wedge-shaped, deeply toothed. *Involucral ones* in pairs, sessile, cut. *Germens* downy."—Native of Mexico, near Santa Rosa. *Herb* rather hairy all over. Segments of the leaves scarcely pointed; the lateral ones often divided. *General involucrem* of only two leaves, its central *flower-stalk* naked; the lateral *stalks*, from one to three, bearing a small two-leaved *partial involucrem* near the bottom. *Flowers* white, much like *pennsylvanica*. *Germens* downy, oblong, taper-pointed. De Cand.

39. *A. helloborifolia*. Hellebore-leaved Anemone. De Cand. n. 38.—"Leaves pedate; leaflets smooth, rather coriaceous, three-cleft; wedge-shaped at the base, and somewhat stalked; lobes serrated, acute. *Involucral ones* all three-leaved, nearly sessile. *Germens* smooth."—Gathered by Dombey, near Huafu-Huafu, in South America. A handsome very distinct species. *Root* round, rather thick, with numerous fibres. *Radical leaves* numerous, on hairy stalks three or four inches long. *Flower-stalk* round, hollow, twelve or eighteen inches high; its first branches three or four, long and smooth; secondary ones rather hairy, mostly three-flowered. *Involucral leaflets* rather snaggy at their base, three-cleft; their lobes three-cleft, serrated, acute. *Flowers* white. *Petals* five, oval. *Stamens* short. *Seeds* fifteen to twenty, oval, smooth, each with a hooked style, crowded upon a hairy *receptacle*. Sometimes a third *partial involucrem* is found under the flower. De Cand.

40. *A. vitifolia*. Vine-leaved Anemone. Buch. MSS. De Cand. n. 39.—Leaves palmate, acutely seven-lobed, serrated; downy and hoary beneath. *Involucral ones* similar, three or five-lobed, stalked, heart-shaped, two or three together. *Petals* five, obovate. *Germens* smooth.—Gathered by Dr. Francis Buchanan, near Sembu (not Lamba), and Narainhetty, in Nepal, flowering in August and September. The *radical leaves*, in his own specimens, are from six to ten inches wide, smooth above, strongly and copiously veined, cut more than half way down, into three principal, pointed lobes, with two or three more shallow, rounded, and imperfect ones at each side. *Footstalks* a foot long, angular, hairy. *Involucral leaves* much smaller, and

less lobed; their *stalks* of various proportions; three at the first subdivision of the tall downy *flower-stalk*; two at the upper ones. *Flowers* the size of *A. sylvestris*, white; externally silky, reddish, and strongly ribbed. *Seeds* numerous, covering a globular *receptacle*, interspersed with long, white, woolly down. This species is remarkable for the great size, and white downy backs, of its *leaves*, some of which rival those of *Rubus odoratus* in dimensions.

41. *A. rivularis*. Water Anemone. Buch. MSS. De Cand. n. 40.—Leaves ternate, hairy on both sides; leaflets wedge-shaped, three-cleft, notched, and sharply toothed; *involucral ones* sessile, deeply three-lobed, pinnatifid, cut. *Petals* five, ovate.—Native of the moist banks of rivulets in Upper Nepal; gathered by Dr. Buchanan, near Chitlong, April 12, 1802. *Root* rather woody, as thick as the thumb. *Radical leaves* numerous, three inches broad, on hairy stalks from four to eight inches long. *General involucral ones* three, larger, more elongated and pinnatifid; *partial two*, with still narrower lobes. *Flowers* half the size of the last, white; purplish and hairy beneath.

Seet. 6. *Omalocarpus*. De Candolle.
Seeds compressed flat, oval-orbicular, very smooth, perfectly destitute of point or tail. *Flower-stalks* numerous, single-flowered, naked, forming an umbel in the *involucrem*; rarely solitary.

42. *A. narcissiflora*. Narcissus-flowered Anemone. Linn. Sp. Pl. 763. De Cand. n. 41. Willd. n. 27. Ait. n. 20. Pursh n. 7. Jacq. Austr. t. 159. Curt. Mag. t. 1120. (not 1170.) Crantz Austr. fasc. 2. 102. t. 3. f. 1. (A. n. 1155; Hall. Hist. v. 2. 65, excluding the references to Matthioli and Lobel. *Ranunculus alpinus*, narcissi flore, et R. montanus albus hirsutus; Bauh. Hist. v. 3. app. 844, 845. R. montanus 2 and 3; Cluf. Hist. v. 1. 235. R. hirsutus alpinus, fl. albo, et R. montanus hirsutus purpureus; Ger. Em. 956. *Aconitum candidum*; Dalech. Hist. 1743.)

β. Willd. et De Cand. (*A. fasciculata*; Linn. Sp. Pl. 763. *Ranunculus orientalis*, *aconiti lycoctoni folio*, *flore magno albo*, vel *purpurascente*; Tourn. Cor. 20. Voy. v. 2. 106, with a plate.)

γ, monantha. De Cand. (*A. dubia*; Bellard. App. ad Fl. Pedem. 26. t. 5, (not 232. t. 7.)

Radical leaves slightly hairy, in three or five, very deep, wedge-shaped segments, with many, unequal, linear-lanceolate lobes. *Flowers* umbellate.—Found in mountainous pastures, especially on a calcareous soil, almost throughout the northern hemisphere; in the Pyrenees and all the alpine countries, in Siberia, Caucasus, Cappadocia, as well as in Canada, and on the north-west coast of America; but not in Britain, Greece, nor the Archipelago, as far as we have any information. It flowers early in summer, and is of an elegant appearance, though seldom seen in gardens. The *umbel* of pure white *flowers*, with obovate *petals*, occasionally tinged, especially underneath, with purple, readily distinguishes this species. The *involucrem* is sessile, divided like the *leaves*, and like them hairy on both sides, but not particularly so at the edges. The *germens* and broad *seeds* are quite smooth. Tournesort's plant, our β, is a very slight variety, with a more dense *umbel*. We know Dr. Bellard's *A. dubia* merely from his figure, for he himself never saw more than one specimen; but we concur with professor De Candolle, who appears to have occasionally seen a two-flowered specimen, in making it a variety. Concerning the two Siberian plants, to which De Candolle alludes, as possible varieties of *narcissiflora*, we have not materials to form any opinion; nor were those with which he was furnished quite satisfactory.

43. *A. umbellata*. Fringed Umbellate Anemone. Willd. n. 28. De Cand. n. 42. (*A. fasiculata*; Vahl Symb. v. 3. 74, excluding the synonym. *Ranunculus orientalis*, napelli folio lanuginoso, flore albo; Tourn. Cor. 20.)—"Radical leaves in three or five, very deep, three-cleft, entire, densely fringed segments. Flowers umbellate.—Gathered by Tournefort, on the mountains of Cappadocia. De Candolle, who examined his original specimens, describes the radical leaves as consisting of numerous deep segments, which are three-cleft, acute, with entire lobes, whose margins are densely fringed, with very long, white, close-pressed hairs, such as occur on the *footsalks*, scarcely two inches in length. *Flower-stalk* a palm in height, with similar, but more scattered, hairs. *Involucral leaves* deeply three-cleft; their lobes entire, chiefly hairy at the edges. *Partial stalks* two or three, simple, longer than the *involucrum*. *Petals* five, white, oval, obtuse, externally hairy. We have Siberian specimens, probably such as M. Patrin communicated to De Candolle. These answer to his description of the hairy-edged leaves, but seem to us not specifically distinct from *narissiflora*, with which they agree in size, and in certain pale glands, between the segments of the leaves, peculiarly visible in these Siberian specimens, though not noticed by authors in any. We suspect that these specimens may prove the identity of *A. umbellata* and *narissiflora*.

44. *A. sibirica*. Siberian Tawny Anemone. Linn. Sp. Pl. 763. De Cand. n. 43. Willd. n. 13. (*A. n. 41*; Gmel. Sib. v. 4. 199.)—Leaves deeply three-lobed; lobes wedge-shaped, in many deep, linear-oblong, bluntish, fringed segments. Involucral ones similar, on short stalks, partly notched. Flower solitary. Petals six, orbicular. Germens smooth.—Native of Siberia, from the river Yenisey to the country beyond the lake Baikal. Gmelin. That author says not a word more concerning the plant in question. One of his specimens is in the Linnean herbarium, and appears evidently allied, in the general nature of its foliage, as well as the smooth germens, to the two last-described. The *footsalks* and the *flower-stalk*, which is only four inches high, bear many, long, scattered, spreading, tawny hairs. The flower is an inch and a quarter broad, with orbicular spreading petals, longer than the *involucrum*, and, as far as can be judged from a plant so long dried, they appear to have been yellow, or orange-coloured, resembling a *Trollius*.

† Species not sufficiently known.

45. *A. Walteri*. Walterian Anemone. Pursh n. 5. De Cand. n. 44. (*Thalictrum carolinianum*; Walt. Carol. 157.)—"Radical leaves palmate, on long stalks. Flower-stalk radical, erect, long, single-flowered. Petals five. Root tuberous and fibrous." Walter.—Native of Carolina. Mr. Pursh never found this plant, nor could he meet with a specimen in Mr. Walter's herbarium; but he considered it as more probably belonging to *Anemone* than to *Thalictrum*. Professor De Candolle suspects it may prove akin to *A. parviflora*, n. 18.

46. *A. pedata*. Pedate Anemone. "Rafinesque Schmaltz in Desf. Journ. Bot. for 1808. v. 1. 230." De Cand. n. 45.—"Leaves deeply five-cleft, pedate; lobes lacinated. Stalk single-flowered, short. Petals six."—Native of New Jersey. Raf. Schm.

†† The following synonyms could not be reduced by De Candolle to any known species.

Anemone n. 1, 2, 4, 5, 6, and 9 of Matthioli; see the Valgriffian edition, v. 1. 563—567, where are figures of the first five, copied in Bauhin's edition of 1598, p. 460, 461; Dalech: Hist. 442—444; and criticised in Bauh. Hist. v. 3. 409. These are very obscure, and perhaps, as De Candolle observes, fictitious; some of the cuts representing

species of *Adonis*, we should say *Papaver*, rather than any *Anemone*.

A. quinta; Camer. Epit. 390, copied in Bauh. Hist. v. 3. 408, 409, by the name of *A. ranunculi facie lutea*. This seems a confusion of *Eranthis (Helleborus) byemalis*, and *Ranunculus montanus*.

Ranunculus nemorosus, *Anemones flore minor*; Bauh. Prodr. 95.—Found at Montpellier; but not known to Magnol.

A. folio aconiti, radice rapunculi, flore ex purpura albi-cante; Bauh. Hist. v. 3. 407, no figure.—Found on funny hills near Warlaw.

A. folio coriandri, radice olivæ, flore purpurco, Tabern; Bauh. Hist. ibid. Probably, as De Candolle suggests, *A. coronaria*.

A. folio multiplicato hirsuto, flore quadrifido, rubro, albo, cæruleo; Bauh. Hist. ibid.—Native of Italy, Sclavonia, and the Morea.

A. Anguillæræ lutea quadrifolia, foliis multifidis; Bauh. Hist. v. 3. 408.—Native of Apulia.

A. lutea Rauwolfii; Bauh. Hist. ibid.—Found about Aleppo.

Pulsatilla flore obsoleto, caule nudo; Breyh. Cent. 1. 135. Raii Hist. v. 1. 636. Pluk. Almag. 308 (not 30).—Found in the Cassubian mountains, flowering in May. Ray suspects this to be a monifer.

P. orientalis tenuifimbriata divisa et villosa, flore rubro; Tourn. Cor. 20.

A. stemmenis; Scop. Ann. Hist. Nat. 2. 54.—Native of mount Feudo, in the Tyrol. This seems, by the author's description, to belong to *A. alpina*, as M. De Candolle suspects. We do not understand the reference of the latter to "Fl. Austr. 2. p. 41." There is nothing to the purpose in that vol. and page of Jacq. Fl. Austr. nor in Scopoli's own Flora Carniolicæ.

A. dodecaphylla; "Krock. Silef. 2. 1. p. 235. t. 20." (*A. decapetalæ* var. β ; Gmel. Syst. Linn. v. 2. 871.)—Found in Silesia.

To these may be added *A. anomala*, Rafinesque in Flora Ludoviciana 82.—"Leaves ternate, sessile, cut. Petals five, unequal. Stem about a foot high.

A. thalictroides. Linn. Sp. Pl. 763. Willd. n. 29. Ait. n. 21. Pursh n. 6. Curt. Mag. 866; is *Thalictrum anemoneoides*; De Cand. Syst. v. 1. 186. Michaux Boreali-Amer. v. 1. 322. See THALICTRUM hereafter.

For *A. Hepatica*, Linn. Sp. Pl. 758; see HEPATICA hereafter.

ANEURISM. Subsequently to the period when the article ANEURISM was inserted in the early part of this Cyclopædia, many new and valuable observations have been made upon the subject; and the success of operations for the cure of the disease has been proved in a manner which has surpassed the expectations of the most sanguine. The first grand improvement in this branch of operative surgery was unquestionably that of not opening the tumour itself, but cutting down to the vessel at a certain distance from the disease, and there applying the ligature so as to impede the flow of blood into the aneurifimal sac. The removal of the swelling was then left to the gentle and gradual action of the lymphatics; a process infinitely safer than the violent and painful proceeding of laying open the large tumour with a knife, extracting the coagulated blood, and leaving an ample cavity to suppurate. But these were not the only objections to the old method of operating; for the sac was opened, and the artery tied in a situation where its coats were actually in a diseased state. Hence the ligatures mostly failed in their effect; the vessel did not undergo favourably
the

the adhesive inflammation by which it was to be closed; and the patient frequently either lost his life by hemorrhage, or was rescued by the performance of amputation under the worst and most disadvantageous circumstances. The genius of a Hunter was soon struck with the defects of the former plan of operating, and instead of meddling with the tumour itself, and tying the artery in a place where it was in a morbid condition, this distinguished surgeon conceived that it would be far better practice to tie the vessel where it was more likely to be found, *viz.*, at a point some way from the disease towards the heart. Thus in the popliteal aneurism, he avoided the painful operation of laying open the swelling in the ham, and more skilfully and scientifically took up the femoral artery itself in the middle of the thigh. From this important innovation, all the successes which has characterized this department of modern surgery has unquestionably been derived. By extending the same principles to other cases of aneurism, and putting due confidence in the competency of the collateral and anastomosing vessels to carry on the circulation, some of our present surgeons have devised and practised operations for the cure of such aneurisms, as a few years ago would have been abandoned as hopeless and inevitably fatal. Not only have the carotid, the external iliac, and the subclavian arteries been repeatedly tied with the most successful result, the internal iliac itself, whose situation seems to render it almost inaccessible to the instruments of the most skilful operator, has now had a ligature put round it in two memorable examples, one of which we have already noticed in the article SURGERY. The other operation was performed by Mr. Atkinson, of York; the case being a gluteal aneurism, the same kind of disease for which Mr. Stevens operated at Santa Cruz. The patient, whose name was Thomas Cost, aged twenty-nine, presented himself at the York county hospital, April 29, 1817. He was a tall, strong, active bargeman, not corpulent, but very muscular. He was enduring great pain from a large, rancid, pulsating tumour, situated under the glutæus of the right side, an obvious aneurism. It had existed about nine months, and was the consequence of a blow from a stone. In a consultation with Dr. Lawson and Dr. Wake, the necessity of the operation was determined upon, and it was performed on the 12th of May, without any material difficulty or interruption, except what depended on the aneurism-needle not being pliable enough, and what was the consequence of the division of, and bleeding from, the small muscular arteries. Having got command of the internal iliac artery within the pelvis, which, says Mr. Atkinson, required the complete length of the fingers to accomplish, the vessel was tied. Sufficient proof of its being the identical artery was repeatedly obtained, by the pressure upon it stopping the pulsation in the tumour. Dr. Wake, Mr. Ward, and all the pupils, were quite assured of the circumstance. The artery being then tied, the pulsation of the swelling entirely ceased. The patient went on tolerably well for some time after the operation; the pulse never exceeded 130, and, after a time, sunk to 85 or 90. He became exhausted, however, partly by the discharge, and partly by hemorrhage, and died on the 31st of May, about nineteen days after the operation. It is to be regretted, that some essential particulars are omitted in the narration of the case, especially those respecting the exact parts divided in the operation, and the place of the external incision; yet, on the whole, whoever reads the account can, we think, entertain no doubt about the important fact, *viz.* that the internal iliac was actually tied. See the Med. and Phys. Journ. vol. xxxviii. p. 267.

Although this operation did not succeed like that exe-

cuted by Mr. Stevens, the record of it is highly interesting, as tending to dispel the doubts which have been entertained about the practicable nature of the proceeding. Even the aorta itself has now been tied in the human subject. Of course, the circumstances which justified such a bold proceeding were desperate in the extreme, nor could much hope of the patient's life be indulged; yet, as it was the only thing from which a possibility of preservation could be derived, we think, notwithstanding its failure, much credit is due to the enterprising surgeon who, performed it. We shall introduce a few particulars of the case in another place. See AORTA.

In the article ANEURISM, in the early part of this Cyclopædia, will be found some observations tending to make the reader imagine, that this disease arises from such a kind of weakness as may be supposed to arise from the division of the outer coat or coats of an artery. We therefore take this opportunity of correcting the statement, since it has been fully proved by the experiments of Hunter, Home, Scarpa, &c. that aneurism never originates from this cause; and that even stripping off the external coat of the vessel will not give rise to such an effect.

With respect to tying the subclavian artery for the cure of axillary aneurisms, we ought to have remarked, that the operation, as performed by making an incision above the clavicle, has never had a successful result in this country; but, from a communication lately made to the Medical and Chirurgial Society of London, such an operation appears to have been recently executed with complete success by Dr. Post, of New York. We believe this to be the only instance in which this mode of operating has cured the disease, and saved the patient's life. The artery, however, has been several times taken up in this way in London; once by the late Mr. Ramsden, and again by Mr. Thomas Blizard; but their patients did not recover. The particulars of Dr. Post's case are inserted in the Medico-Chirurgial Transf. vol. ix. p. 185; &c.

ANGAR ISLAND, in *Geography*, an island of the Persian gulf, somewhat larger than Ormuz, and equally barren. It is now uninhabited, but presents traces of former population in the ruins of a considerable town, and many reservoirs for water. It has two wells and a stream of good water, is covered with pits of salt and metallic ores, and also a soft rocky substance resembling lava: its hills, which are overpread with shells of oysters and other fish, abound in wild goats, rabbits, and partridges. It forms an excellent harbour, which has been recommended for a settlement.

ANGELO AMERIGI, &c. l. 7, r. Domenichino; l. 17, after life, add—The master-piece of all his works, *viz.* the Entombing of Christ, is now in the Louvre at Paris.

ANGIOPTERIS, in *Botany*, from *αγγος*, a vessel, and *πτερις*, a fern, a faulty name, as being composed of one already established.—Hoffm. Comm. Gott. v. 12. 29. Willd. Sp. Pl. v. 5. 69. Swartz in Schrad. Journ. for 1801. 273. t. 2. f. 4. Syn. Fil. 166. (Clematea; Cavan. Leccion. 553.)—Class and order, *Cryptogamia Filices*; sect. *exannulate*. Nat. Ord. *Filices dorssifera*.

Ell. Ch. Capsules aggregate, in elliptical, crowded, masses, obovate, of two equal valves, and one cell, without a ring. Involucrum none.

This is one of those curious genera of ferns, which like DANÆA, GLEICHENIA, and MARATTIA, (see those articles,) bear their capsules on the back of the leaf, or frond, without either a ring or involucrum. In the present instance, indeed, these capsules are not of many cells, like those of *Danæa* and *Marattia*, but as perfectly simple as in *OSMUNDA* already described, or *BOTRYCHIUM* hereafter to be

be mentioned. They are, however, not dispersed, or irregularly placed, but compose oval *masses*, of twelve or more *capsules*, which masses are ranged side by side, in a dense uninterrupted line, near the margins of each *leaflet* of the *frond*, a vein from the mid-rib running along the base, or insertion, of each mass, between its two rows of capsules. That these *masses* are determinate assemblages of capsules of an appropriate figure, is evinced by their having at each end a solitary transverse capsule, completing their oval outline, which is not perfectly expressed in Dr. Swartz's figure. The genus is, doubtless, very distinct; and as its present name is not only faulty, but unmeaning, it would be well if *Clementea*, in honour of an able cryptogamic Spanish botanist, Don Simon de Roxas Clemente, had been retained. We should certainly now, without scruple, have restored it, were there not several other names of ferns, composed of *pteris*, which must stand or fall with *Angiopteris*.

1. *A. eveña*. Tall Angiopteris. Hoffm. Comm. Gott. v. 12. 29. t. 5, excluding the synonyms, except Forster's. Swartz Syn. Fil. 166. 395. Willd. n. 1. (*Polypodium* euevum; Forst. Prodr. 81. *Clementea palmiformis*; Cavan. Leccion. 554.)—Native of the Society Isles, and of Maria's islands. We have an Otaheite specimen from Mr. Menzies. The main stem is said to be arboreous, five feet high, and a span in diameter. *Fronde* six feet long, doubly pinnate; *leaflets* from two to four inches long, opposite, sessile, linear-lanceolate, taper-pointed, smooth, as well as their common stalk; their margins finely crenate, the point serrated. *Capsules* brown, smooth, very numerous, scarcely larger than grains of sea-feed.

ANGLE, RECTILINEAR, l. 2, for I. r. II.

ANGLE at the Periphery, for I. r. II.

ANGOY. See GOY and LOANGO.

ANGRA, l. 1, r. Terceira.

ANGUILLA. For MYTUS r. MYRUS.

ANGUILLARIA, in *Botany*, a genus dedicated by Mr. Brown, to the memory of LUIGI ANGUILLARA, (see that article,) apothecary, in the university of Padua, to the Venetian republic, who left an Italian work on the *Materia Medica*, which has been published at various times, and translated into Latin. Haller speaks of its author as deeply learned in this subject, and perhaps the best Italian botanist of the earlier part of the sixteenth century, having travelled much in Europe and the Levant, and studied critically the writings of those who had gone before him. Gærtner has called a genus *Anguillaria*, from the singular appearance of its embryo, resembling an eel, *Anguilla*; but this is the ARDISIA of all authors at present. (See that article.)—Brown Prodr. Nov. Holl. v. 1. 373.—Class and order, *Hexandria Triginia*. Nat. Ord. *Tripetalioideæ*, Linn. *Junci*, Juss. *Melanthaceæ*, Brown.

Gen. Ch. *Cal.* none, unless the corolla be so called. *Cor.* Petals six, lanceolate, inferior, spreading, equal, deciduous, each furnished with a claw. *Stam.* Filaments six, inserted into the base of each petal, awl-shaped, shorter than the corolla; anthers oblong, petate, reversed. *Pist.* Germen superior, oblong, furrowed; styles three, spreading, shorter than the stamens; stigmas acute. *Peric.* Capsule ovate-oblong, naked, of three cells and three valves, the partitions from the middle of each valve. *Seeds* numerous, nearly globular.

Eff. Ch. Calyx none. Petals six, equal, stalked, deciduous. Stamens inserted into the claws. Stigmas acute. Capsule of three cells, with many seeds.

Obs. *Anguillaria* is nearly akin to ORNITHOCLOSSUM. (See that article.) It consists of herbs, exactly resembling

the Cape species of *Melanthium*, especially in their *leaves* and *roots*. The *flowers* are sometimes dioecious, or polygamous. The claw of each *petal* is, in some instances, marked with a double gland. *A. indica*, in habit, colour of the *flowers*, the perfectly deciduous *corolla*, and perhaps the situation of the *embryo*, differs from the rest; can it be a distinct genus? *Brown*.

1. *A. dioica*. Dioecious Anguillaria. Br. n. 1.—“Flowers spiked, dioecious. Claws of the petals somewhat striped at the upper part.”—Observed by Mr. Brown, at Port Jackson, New South Wales, as well as in Van Diemen's island.

2. *A. biglandulosa*. Glandular Anguillaria. Br. n. 2.—Flowers united. Spikes few-flowered. Claws of the petals with two glands at the upper part. — Sent from Port Jackson, by Dr. John White, where also it was gathered by Mr. Brown. The stem is solitary, from four to six inches high, simple, round, bearing two distant, linear, smooth, recurved leaves; sheathings inflated, and broad at their base. *Spike* solitary, terminal, zigzag, of from three to five pale, perhaps yellowish, flowers, half an inch broad, each *claw* bearing a semi-lunar, glandular, prominent, dark-coloured glandular spot.

3. *A. uniflora*. Single-flowered Anguillaria. Br. n. 3.—“Stem single-flowered. Leaves lax, with hooded sheaths.”—Native of Van Diemen's island.

4. *A. indica*. Indian Anguillaria. Br. n. 4. (*Melanthium indicum*; Linn. Mant. 2. 226. Willd. Sp. Pl. v. 2. 268.)—Stem with few flowers. Partial stalks longer than the petals; the side-ones having a collateral leafy bractea. Leaves straight, with tight sheaths.—Native of Tranquebar and Pondicherry, as well as of the tropical part of New Holland. *Root* bulbous. *Stem* from six to ten inches high, simple, erect, smooth and slender. *Leaves* two or three, linear, taller than the stem. *Flowers* terminal, usually two or three, one much earlier than the others, on angular stalks, with lanceolate bracteæ various in size and number. *Petals* narrow, of a dark dull purple, as well as the *styles*, which are dilated and revolute. *Capsule* elliptical, crowned with the permanent *styles*.

ANGUIS, l. 9, *dele* which see respectively, and add—See SERPENTES.

ANGULOA, in *Botany*, named in honour of Francis de Angulo, a Spanish naturalist, of whom or his works we have no information.—“Ruiz et Pavon Prodr. Fl. Peruv. et Chil. 118. t. 26.” Swartz Orchid. in Schrad. Neues Journal, v. 1. 89.—Class and order, *Gynandria Monogynia*. Nat. Ord. *Orchideæ*.

Gen. Ch. *Cal.* Perianth superior, reversed, of three ovate-lanceolate, concave, converging leaves. *Cor.* Petals two, resembling the calyx, but rather narrower. Nectary a lip shorter than the calyx, stalked, pitcher-shaped, somewhat bell-shaped, split longitudinally at the inner side, two-lobed; lobes rounded, reflexed at the margin; having in the notch in front a small, lanceolate, reflexed segment; in the posterior part another, tongue-shaped, concave, erect appendage. *Stam.* Anther a vertical, large, hemispherical, incumbent lid, pointed in front, of two cells, deciduous; masses of pollen two, globular. *Pist.* Germen inferior, cylindrical; style erect, gibbous, three-toothed at the top, the middle tooth with three points; stigma transverse, in front. *Peric.* Capsule with six angles, three of them larger than the rest, of one cell, and three valves. *Seeds* numerous.

Eff. Ch. Calyx reversed, converging. Petals rather narrower than the calyx-leaves. Lip stalked, pitcher-shaped, two-lobed, shorter than the calyx. Anther a deciduous lid.

1. *A. uniflora*. "Syst. Veg. Peruv. et Chil. 228."—Native of Peru, about Muna, Tarma, and Chincaco.

ANHYDRITE. See MINERALOGY, *Addenda*.

ANJENGO, l. ult. N. lat. 8° 39'. E. long. 76° 40'.

ANIGOZANTHUS, in *Botany*, perhaps from *anigozo*, to expand, or be apparent, and *anthos*, a flower, as the author commends its beauty.—Labillard. Voyage, Engl. ed. v. 1. 441. Gawler, nov. Ker, in Curt. Mag. v. 29. 1151. Brown Prodr. Nov. Holl. v. 1. 301. Ait. Hort. Kew. v. 2. 222.—Class and order, *Hexandria Monogynia*. Nat. Ord. *Hemodoraceae*, Brown.

Gen. Ch. *Cal.* none, unless we take the corolla for such. *Cor.* of one petal, superior, tubular, externally clothed with compound hairs; tube curved, rather swelling upwards; limb in six deep, irregular, lanceolate, acute, unequal segments, much shorter than the tube, directed upwards; the two lowermost largest and most spreading. *Stam.* Filaments six, awl-shaped, inserted into the mouth of the tube, shorter than the limb, opposite to its segments, and having a similar direction; anthers linear-oblong, erect, bursting lengthwise in front. *Pist.* Germen inferior, oval; style thread-shaped, ascending, on a level with the stamens, deciduous; stigma undivided, tumid. *Peric.* Capsule nearly spherical, of three cells and three valves, crowned with the permanent corolla, bursting at the summit. *Seeds* numerous, angular, inserted into the inner angle of each cell.

Eff. Ch. Corolla superior, tubular, incurved; limb irregular, in six deep divisions. Stamens inserted into the throat, ascending. Seeds angular.

A genus of perennial herbs. *Root* of numerous thick fasciculated fibres. *Stem* unbranched, except at the top. *Leaves* sword-shaped, turned, half-sheathing at the base. *Flowers* somewhat corymbose, in short spikes (rather clusters) with a lanceolate bractea at the base of some of the partial stalks. *Brown*.

1. *A. rufa*. Reddish Anigozanthus. Labill. Voy. as above 441. t. 22. Nov. Holl. v. 2. 119. Brown n. 1.—"Stem permanently downy. Anthers pointless."—Native of Lewin's land, in dry sandy deserts, where it flowers in December. The stem is two feet or more in height, round, most downy in the upper part; somewhat leafy below. *Leaves* linear, acute, narrow, entire, finely striated. *Panicle* corymbose, downy. *Flowers* externally covered, like the whole of the panicle, with reddish, branched and tufted hairs. Their partial stalks are short. Labillardiere's figure represents the anthers with a point, but not an incurved one. Nothing is recorded concerning the colour of the inside of the flower. The stamens appear to be dilated at the base.

2. *A. flavida*. Rusty-green Anigozanthus. Br. n. 2. Ait. n. 1. Redout. Liliac. t. 176. Curt. Mag. t. 1151. (*A. grandiflora*; Salis. Parad. t. 97.)—"Stem and leaves very smooth. Down of the panicle deciduous. Anthers with a little reflexed point."—Observed by Mr. Brown on the south-west coast of New Holland. We rely on that gentleman for the above specific characters; otherwise we should, like Mr. Ker, have scarcely considered these two plants as distinct. The present is said to have been sent to Kew by Mr. Good, in 1803. It was raised from seed, in Mr. Vere's garden, by Mr. Anderson, now of Chelsea, who found it required merely to be protected from frost, and flowered during most part of the summer. The leaves are sword-shaped, much broader than the foregoing. *Flowers*, according to Mr. Brown, smaller than in that species. They seem to be two inches long, externally green, covered with red, tufted, branched hairs, as well as their footstalks; inside of the limb smooth, dull purple. *Anthers* red on one side,

yellow on the other, not represented with so much of a point in the Botanical Magazine, as those of the first species in Labillardiere's figure. We have seen no specimens of either. M. Redouté has detected the same specific marks as Mr. Brown, and is the author of the above name. He had specimens of both from his friend Labillardiere, and on minute examination determined them to be most probably distinct. The flowers of *A. flavida* are smaller in his figure than in the Botanical Magazine.

ANIMAL FLOWER, l. ult. See CALENDEULA.

ANISACANTHA, in *Botany*, Brown Prodr. Nov. Holl. v. 1. 410. See SCLEROLEPNA.

ANISOMELES, from *anisos*, unequal, and probably *melas*, the cheeks, or parts surrounding the mouth, alluding to the great difference in shape and size between the upper and under lips of the corolla.—Brown Prodr. Nov. Holl. v. 1. 503. Ait. Hort. Kew. v. 3. 364.—Class and order, *Didynamia Gynodioecia*. Nat. Ord. *Verticillata*, Linn. *Latiniz.* Juss. Brown.

Eff. Ch. Calyx tubular, five-cleft, with ten furrows. Upper lip of the corolla smallest, undivided; lower three-cleft, middle segment two-lobed. Stamens prominent, ascending. Anthers of the shorter ones with two adjoining cells; often the longer ones halved, or dissimilar. Seeds smooth.

Downy herbaceous plants, growing within the tropics. *Leaves* crenate. *Flowers* whorled, with minute bracteas. *Calyx* glandular. *Corolla* purple. The genus is akin to *Ajuga* and *Teucrium*, but sufficiently distinct from both one and the other. The upper lip of *Ajuga* is extremely short, and has a small central notch. Its anthers are observed by Mr. Brown to be uniform, kidney-shaped, of only one cell; and the seeds reticulated.

1. *A. moschata*. Musky Anisomeles.—Leaves elliptical, downy and hoary like the stem. Flowers few in each whorl. Calyx greyish, with conspicuous glands.—Gathered by Mr. Brown, as well as the two following species, in the tropical part of New Holland.

2. *A. inodora*. Scentless Anisomeles.—Leaves elliptical, nearly smooth; dotted beneath. Whorls remote. Calyx green, with conspicuous glands.

3. *A. falsifolia*. Sage-leaved Anisomeles.—Hoary and downy. Leaves lanceolate; soft and smooth above; rugged beneath. Whorls many-flowered. Glands of the calyx imbedded in soft down.

4. *A. ovata*. Broad-leaved Anisomeles. Brown in Ait. n. 1. (*Nepeta indica*; Linn. Sp. Pl. 799, excluding the synonyms. Willd. Sp. Pl. v. 3. 57. *Ballota disticha*; Linn. Mant. 83. Ait. ed. 1. v. 2. 304. Willd. Sp. Pl. v. 3. 108. *Marrubium odoratissimum*, bottonice folio; Burm. Zeyl. 153. t. 71. f. 1.)—Leaves ovate, or somewhat heart-shaped, strongly crenate or serrated. Whorls many-flowered. Bracteas linear. Calyx hairy; with scarcely visible glands.—Native of the East Indies, from whence it is said to have been imported by the first earl of Bute, in 1783. The plant has hardly perhaps been preserved in the stoves, being an annual, of no great beauty, however interesting to the curious botanist. The whole herb has a velvet-like softness, owing to its fine, short, soft, depressed hairs; its habit and size very like our *Ballota nigra*. The leaves sometimes very much resemble those of the common *Urtica dioica*, in size, shape, and serratures, but are often rather crenate than serrated. Whorls for the most part crowded into thick, partly leafy, spikes. Calyx very curiously reticulated with copious transverse veins; its teeth large, broad, pungent. The short upper lip of the corolla did not escape Linnæus, who founds thereon his specific character of this plant, as a *Nepeta*. His
herbarium

herbarium proves Mr. Brown's suspicion to be correct, of *Ballota diflicha* being the same plant. The seeds well answer to the generic character of *Anisoteles*, being beautifully polished, elliptical, of a shining black.

These plants, at least the three new Holland species, seem most allied to *Teucrium Iva* and *salicifolium* of Linnæus, now removed to *Ajuga*. The musky odour of the first species is found in *Ajuga Iva*, whence a singular variety of that plant, with regular flowers, being taken by Forskall for a new genus, received the name of *MOSCHARIA*. (See that article.) The elliptical form of the leaves in *Anisoteles moschato*, rare in this natural order, agrees nearly with the Linnæan *Teucrium Laxmanni*, which is likewise an *Ajuga*. See *TEUCRIUM*.

ANISOPOGON, from *ανιστος*, *unequal*, and *πωγων*, *a beard*, alluding to the inequality and diffusibility of the awns.—Brown Prodr. Nov. Holl. v. 1. 176.—Clafs and order, *Triandria Digynia*. Nat. Ord. *Gramina*.

Eff. Ch. Calyx of two lax, membranous, ribbed, equal valves, single-flowered. Corolla stalked, of two valves; outer cylindrically involute, three-awned at the top, the middle awn twisted, the lateral ones bristle-shaped; inner longer, unawned.

I. A. avenaceus. Oat-like Anisopogon.—Native of the neighbourhood of Port Jackson, New South Wales. A grass three feet high, resembling an *AVENA*. (See that article.) Stems unbranched. Leaves involute, with a fringed stipula. Panicle loose. Calyx-glumes large. The outer valve of the corolla is silky, connected with its awn by an obsolete joint. A small bristle, at the base of the inner valve, indicates this genus to be more strictly allied to *DANTHONIA*, (see that supplementary article), than to *ARISTIDA*, which latter the reader will find in its proper place.

ANKER. Add—An anker of brandy contains 10 gallons. It is also a liquid measure not only at Amsterdam, but at Copenhagen, Hamburg, and other places. (See *VAT.*) At Copenhagen, a fuder of wine contains 2 pipes = 4 oxhofts = 6 ahms; the ahm or tierce being = 4 ankers = 40 ftubgens = 77½ kannes = 155 pots = 620 pocles. A stucksfals is = 7½ ahms = 30 ankers; 32 pots hold the weight of a Danish cubic foot of water, each being 6½ Danish inches high, 3½ ditto wide, and containing 64 cubic inches; 55 Danish pots, or 27½ Danish kannes = 14 English gallons, and an ahm = 39½ gallons nearly. The ahm at Hamburg is the sixth part of the fuder, and is = 4 ankers = 5 eimers = 20 viertels = 40 ftubgens = 160 quartiers = 320 oeffels. See *MEASURE*.

ANN, QUEEN, in *Geography*, a county of Maryland, containing 16,648 inhabitants, of whom 6381 are slaves.

ANNA, a money of account in India. See *RUPÉE*.

ANNAPOLIS ROYAL, l. 13, for item *r.* item.

ANN-ARUNDEL, l. 4, *r.* 26,668; l. 5, *r.* 12,693.

ANNONA, in *Botany*, (see our former article,) is a name of barbarous origin, made into Latin by Linnæus, in allusion, as he tells us in *Hort. Cliff.* 222, to the value of the fruit, as yielding a grateful harvest or crop, *annona*, to the people where it grows. *Annona* is generally supposed to have been the original word, and is accordingly retained by the French school. But by Bauhin's *Pinax*, *Annona* appears to have full as authentic claims, on the score of priority, as *Annona*. The latter is moreover a Portuguese corruption of the original *Anon*, which Clusius taking from Oviedo, makes *Anon*, *Anonis*. *Annona, a*, is very incorrect. We trust our learned friends in France will not insist on such an inaccuracy, any more than on their great countryman Plumier's name, *Guanabanus*, which they have commendably rejected, though of older authority than Linnæus or Jussieu.—Linn.

VOL. XXXIX.

Gen. 279. Schreb. 374. Willd. Sp. Pl. v. 2. 1264. Mart. Mill. Dict. v. 1. Ait. Hort. Kew. v. 3. 333. Juss. 283. De Cand. Syst. v. 1. 466. "Dunal Monogr. 58." Lamarck Dict. v. 2. 123. Illustr. t. 494. Gærtn. t. 138. (*Guanabanus*; Plum. Gen. 42. t. 10.)—Clafs and order, *Polyandria Polygynia*. Nat. Ord. *Coadunata*, Linn. *Annona*, Juss. *Annonaceæ*, De Cand.

Eff. Ch. Calyx in three, more or less deep, concave, somewhat heart-shaped, sharpish lobes. Petals five, thickish, the three innermost smaller or wanting. Anthers numerous, nearly sessile, covering the receptacle; angular and dilated at the summit. Germens numerous, coalescing into a single sessile berry, whose coat is either tubercular, scaly, or reticulated, the internal substance pulpy, surrounded with numerous, single-federed cells. De Candolle.

N.B. In our former article, line 12, read (or a compound berry, as in *Rubus*).

The species are trees or shrubs, whose bark is often reticulated, glandular, and aromatic. Leaves undivided, sometimes besprinkled with pellicid dots. Flower-stalks either axillary, or opposite to the leaves, often solitary, bearing one or more flowers, sometimes accompanied by small bractæas.

Obf. Very rarely the calyx has four lobes. The inner petals are occasionally imperfect.

Twenty-seven species are defined by De Candolle, but of these five are marked as imperfectly known. They are disposed in five sections, by the shape and consistence of their petals.

SECT. I. *Petals concave, thick, rather coriaceous, either heart-shaped or ovate.* Eleven species, subdivided as follows.

* Outer petals acute; inner ones obtuse, and rather smaller. Sp. 1—4.

** Outer petals obtuse. Sp. 5.

*** Petals all acute; inner ones rather the smallest. Sp. 6—11.

A concise view of the species will be sufficient, following the numbers of De Candolle.

1. *A. muricata.* (See *ANNONA n. 1.*) Linn. Sp. Pl. 756. Jacq. Obf. fasc. 1. 10. t. 5. (Zuwick; Merian Surin. t. 14.)—Leaves ovato-lanceolate, smooth, somewhat shining. Stalks solitary, single-flowered. Outer petals heart-shaped, pointed; inner obtuse. Fruit armed with fleshy pointed tubercles.—Native of South America and the West Indies. The flowers are large, yellow. Fruit as big as a large pear, green or yellow, much esteemed.

2. *A. purpurea.* "Dunal Monogr. 64. t. 2."—Leaves nearly sessile, lanceolate; rather rusty beneath. Flowers axillary, almost sessile. Outer petals heart-shaped, acute; inner roundish.—Found in Mexico. Fruit unknown. Outer petals yellowish-brown; inner purple.

3. *A. Humboldtii.* "Ibid. 64. t. 3."—Leaves oblong, pointed, smooth, slightly dotted. Stalks axillary, solitary, short, single-flowered. Outer petals ovate, somewhat heart-shaped, acute; inner bluntish.—Found by Humboldt and Bonpland, in the South American province of Cumana. A shrub. Flowers yellowish, dotted with purple and red.

4. *A. laurifolia.* "Ibid. 65. (Annona, &c.; Catech. Carol. v. 2. t. 67.)"—Leaves ovato-lanceolate, smooth. Stalks solitary, single-flowered, drooping. Outer petals heart-shaped, acute; inner rounded. Fruit smooth, obovate.—Native of South America, and some parts of the West Indies. Outer petals large, green; inner white. Fruit green, shaped like an inverted pear.

5. *A. abyssiflora.* "Tussac Antill. t. 28. Dunal Monogr. 65."—Leaves oblong-lanceolate, wavy, pointed, copiously ribbed; the young ones downy. Stalks axillary, single-flowered.

T t

flowered.

flowered. Outer petals obtuse.—Cultivated in Hispaniola. *Fruit* roundish, tuberculated.

6. *A. palustris*. (See ANNONA n. 6.) Linn. Sp. Pl. 757. (*A. aquatica*, &c.; Sloane Jam. v. 2. 169. t. 228. f. 1.)—Leaves ovate-oblong, coriaceous, very smooth. Flowers solitary, stalked. All the petals acute. *Fruit* reticulated.—Native of the banks of rivers in South America and Jamaica.

7. *A. longifolia*. Aubl. Guian. 615. t. 248. Willd. n. 6.—Leaves oblong, taper-pointed, smooth. Flowers axillary, stalked. All the petals acute. *Fruit* ovate, nearly globular, dotted and reticulated.—Native of the borders of creeks in Guiana. *A shrub*, fifteen feet high. *Flowers* large, purplish. *Fruit* pulpy, gelatinous, and eatable.

8. *A. punctata*. Aubl. Guian. 614. t. 247. Willd. n. 7.—Leaves ovate-oblong, acute, smooth. Flowers axillary, solitary, nearly sessile. All the petals acute. *Fruit* nearly globular, slightly dotted.—Found by Aublet in the forests of Cayenne and Guiana. *A shrub* twenty feet high. *Flowers* small, yellowish. *Fruit* reddish, eatable.

9. *A. peruviana*. Dunal Monogr. 67.—Leaves elliptic-oblong, acute, rather coriaceous, slightly decurrent. Stalks axillary, bracteated. Petals all acute. *Fruit* globose, reticulated.—Found by Humboldt and Bonpland, in bogs about Guayaquil in Peru. *Flowers* yellow; three outer petals marked with a red spot, near the base on the inside. *Fruit* four inches in diameter, not eatable.

10. *A. Ambolay*. Aubl. Guian. 616. t. 249. Willd. n. 13.—Leaves elliptic-oblong, acute; clothed with rusty down beneath. Flowers axillary, solitary, nearly sessile. Petals acute.—Native of woods in Cayenne. *A shrub*, eight feet high. *Flowers* greenish, minute. *Fruit* not observed by Aublet, who alone seems to have seen this species, flowering in November.

11. *A. paludosa*. Aubl. Guian. 611. t. 245. Willd. n. 4.—Leaves oblong, acute; rather downy above; downy, silky, reddish, and ribbed beneath. Flowers on short stalks. Petals all acute. *Fruit* ovate, tuberculated.—Found by Aublet, in boggy meadows in Guiana, flowering in November, ripening its thickly tuberculated yellow fruit in April. The stem is shrubby, four or five feet high. Petals green, externally silky.

SECT. 2. Outer petals ovate, concave, acute, coriaceous; inner wanting. *Fruit* not well known, so that the plants of this section are referred to the present genus by their habit only. Two species.

12. *A. echinata*. “Dunal Monogr. 68. t. 4.”—Leaves ovate-lanceolate, rather acute; very smooth above; downy beneath. Branches rugged. Stalks solitary, single-flowered. Petals three. *Fruit* ovate, prickly.—Gathered by M. Patris, in Cayenne.

13. *A. ferrica*. “Ibid. 69. t. 5.”—Leaves ovate-oblong, pointed; smooth above; silky with rusty down, like the young branches, beneath. Flowers solitary, axillary, stalked; externally rusty. Petals three.—Found likewise in Cayenne, by M. Patris.

SECT. 3. Outer petals linear-oblong, narrow; triangular at the point; concave at the base only; often converging, so as to conceal the organs of impregnation; the inner ones extremely minute. Six species.

14. *A. squamifera*. (See ANNONA n. 3.) Linn. Sp. Pl. 757. Jacq. Obs. fasc. 1. 13. t. 6. f. 1. (Atamaram; Rheed Hort. Malab. v. 3. 21. t. 29.)—Leaves lanceolate, smooth, with pellucid dots. Outer petals somewhat converging. *Fruit* ovate, scaly.—Native perhaps of South America. De Candolle. Cultivated in both Indies, within the tropics. *A tree*, twenty feet high, with a spongy bark.

Flowers green externally, white within, fetid. *Fruit* eatable, of a pleasant taste, and fragrant scent, as big as a large apple; externally green, with tuberculated, scale-like protuberances.

15. *A. Foykahlii*. De Cand. n. 15. (*A. glabra*; Forfk. Ægypt.-Arab. 102. Ic. t. 15. *A. asiatica*; Vahl Symb. v. 3. 73. “var. β ”; Dunal Monogr. 71. *A. squamifera*; Delle Ægypt. 17.)—Leaves elliptic-oblong, smooth, dotted; glaucous beneath. Outer petals oblong, somewhat converging.—Gathered by Forckahl and by Coquebert in Ægypt. Scarcely, in De Candolle’s opinion, distinct from *A. squamifera*, but the leaves are thinner and less pointed, more distinctly dotted.

16. *A. cinerea*. “Dunal Monogr. 71. t. 8.”—Leaves elliptic-oblong, almost lanceolate, dotted; downy beneath. Outer petals somewhat converging. *Fruit* ovate, nearly globular, scaly.—Gathered by Ledru in the island of St. Thomas, but perhaps not really wild. The young branches, leaves, stalks, and flowers, are clothed with greyish pubescence. *Flowers* stalked, two or three together. *Fruit* not unlike *A. squamifera*.

17. *A. Cherimolia*. Mill. Dict. ed. 8. n. 5. Lamarck Dict. v. 2. 124. (*A. tripetala*; Ait. n. 2. See ANNONA n. 2. Guanabarus Perseæ folio, flore intds albo, &c.; Feuill. Peruv. v. 3. 24. t. 17. Trewh Euret, 16. t. 49.)—Leaves ovate-lanceolate, without dots; very finely downy and silky beneath. Outer petals slightly converging; externally downy. *Fruit* nearly globular, somewhat scaly.—Native of Peru, or rather perhaps of some warmer country; for Feuillée speaks of this tree as cultivated there with great care, for the sake of its fruit, which is very wholesome, and much esteemed, though, he adds, one of our pears or plums is certainly worth all the Cherimolias of Peru. The tree is twenty to twenty-four feet high, with pendulous branches. *Flowers* pale green, with a crimson circle in the middle. *Fruit* heart-shaped, scaly and rough, the size of a small apple, being drawn too small in Ehret’s figure. De Candolle says there are three inner petals, though very minute.

18. *A. reticulata*. (See ANNONA n. 4.) Linn. Sp. Pl. 757. Willd. n. 5; excluding the syn. of Rumphius and Plumier. Jacq. Obs. fasc. 1. 14. t. 6. f. 2. (Anona-maram; Rheed Hort. Malab. v. 3. 23. t. 30, 31. Guanabarus fructu purpureo; Plun. Ic. 134. t. 143. f. 1; not 43. f. 2.)—Leaves oblong-lanceolate, acute, smooth, slightly dotted. Outer petals oblong, rather converging. *Fruit* ovate, nearly globular, tessellated like net-work.—Native of the West Indies, according to Browne and Sloane. Rheed speaks of it as only cultivated, not wild, in Malabar. A larger tree than *A. squamifera*, and with a more disagreeable scent. Petals brown underneath; yellowish-white above, dotted with purple at the base. *Fruit* the size of a large orange, but more ovate, of a shining yellowish or reddish brown, eatable. Professor De Candolle suspects that several species may be here confounded; and Dunal distinguishes the plant of Jacquin, from that of Rheed, by the reticulations of the fruit being somewhat pentagonal in the former, more rounded in the latter. Plumier’s seems still more different from both, in having the interstices very convex, each armed with a spine. Dombey appears to have gathered and preferred under this name, in Peru, a species distinguished by broader leaves, not marked with pellucid dots, but with more regular and prominent pinnate ribs. All these points can be cleared up by the acquisition of authentic specimens only, or by observations made on the spot. The history of the whole genus is as yet but a sketch, nor have European botanists materials to fill up the outline.

19. *A. mucosa*. (See ANNONA n. 19.) Jacq. Obs. fasc.

fasc. 1. 16. Atl. Guian. 618. (Manoa; Rumph. Amboin. v. 1. 136. t. 45.)—Leaves oblong-lanceolate, smooth. Outer petals spreading at the extremity. Fruit tessellated, with gibbous interlicies.—Native of South America and some parts of the West Indies. Cultivated in the Molucca islands. This is said to differ from the last, in having the interlicies of the fruit tumid, (what then becomes of Plumier's t. 143. f. 1?) its pulp more slimy, and not agreeably flavoured. The leaves also are somewhat narrower.

SECT. 4. Outer petals elliptic-oblong, obtuse; inner smaller, lanceolate, bluntish. Calyx large, coriaceous, three-cleft, somewhat bell-shaped. Fruit conical, smooth? Three species.

20. *A. glabra*. (See ANNONA n. 8.) Linn. Sp. Pl. 758. Willd. n. 10. ("A. maxima, foliis latis, fructu maximo, luteo, conoide, cortice glabro; Catech. Car. v. 2. t. 64.")—Leaves ovato-lanceolate, smooth. Stalks two-flowered, opposite to the leaves. Fruit conical, obtuse, even.—Native of Carolina, according to Catesby. Cultivated perhaps in the West Indies. A tree sixteen feet high, with smooth leaves, much resembling those of a lemon-tree. Calyx reddish externally, of three broad, very short, often abrupt lobes. Petals six, nearly obovate, twice the length of the calyx.

21. *A. grandiflora*. Lamarck Dict. v. 2. 126. Willd. n. 17. "Dunal Monogr. 75. t. 6 and 6 a."—Leaves ovato-lanceolate, smooth, coriaceous; shining above. Stalks axillary, solitary. Fruit ovate, smooth, somewhat dotted.—Native of the Mauritius, and Madagascar. Leaves rather glaucous beneath. Calyx, and backs of the petals, finely downy. The inner petals are an inch long, being nearly equal to the outer. Fruit of a middling size, slightly rugged.

22. *A. aplexicaulis*. Lamarck Dict. v. 2. 127. Willd. n. 18. "Dunal Monogr. 76. t. 7."—Leaves oblong-heart-shaped, clasping the stem, acute, smooth. Stalks axillary, solitary, single-flowered.—Found by Commerçon in the isles of Mauritius and Madagascar. The leaves are sessile; glaucous or purplish beneath, at least when dry. Three inner petals rather the smallest.

SECT. 5. *Annona* not sufficiently known. Five species.

23. *A. asiatica*. (See ANNONA n. 9.)—Linn. Sp. Pl. 758. Willd. n. 12.—Leaves oblong, pointed, without dots; downy when young.—Native of Ceylon. Linnæus. A specimen under this name is found in his herbarium, but there is no evidence of its being what he intended in his Fl. Zeyl. nor even in the first edition of Sp. Pl. There are neither flowers nor fruit, nor can we satisfy ourselves of this specimen being the same species as the botanists of Tranquebar send us for *A. asiatica*, which latter agrees best with *Squamosa*, n. 14.

24. *A. senegalensis*. "Perf. Ench. v. 2. 95. Dunal Monogr. 75."—Leaves broadly ovate, somewhat heart-shaped, coriaceous, smooth; glaucous beneath. Footstalks finely downy. Flower-stalks two or three together, lateral, between the leaves.—Native of Senegal and Guinea. Flowers small. Three outer petals ovate, obtuse, thick, thrice the length of the calyx.

25. *A. ? uniflora*. "Dunal Monogr. 76."—Leaves oblong, pointed, smooth; glaucous beneath. Flower-stalks downy, hoary, opposite to the leaves.—Native of Para, in Brazil. Young branches downy and hoary. Leaves nearly sessile. Flowers opposite to the uppermost leaf on each branch, with one or two orbicular leafy bractæ. Calyx in three large, deep, ovate, coriaceous segments, externally hoary. The unexpanded petals appear similar thereto. A beautiful species, but the genus is doubtful. De Cand.

26. *A. ? exsucca*. "Dunal Monogr. 77."—Leaves ovate-

oblong, coriaceous, smooth, like the branches, on both sides; polished above. Flower-stalks simple or divided, nearly opposite to the leaves.—Gathered in the woods of Guiana, by Mr. Alexander Anderson, whose specimens were examined by professor De Candolle in Mr. Lambert's herbarium. A handsome tree, with a small, entirely dry, fruit. Branches smooth from the first. Leaves two and a half to four inches long. Petals three-lobed! This surely may well be deemed a doubtful *Annona*.

27. *A. africana*. (See ANNONA n. 10.) Linn. Sp. Pl. 758. Willd. n. 14; excluding the synonyms. (*A. foliis lanceolatis pubescentibus*; Linn. Hort. Cliff. 222.)—"Leaves lanceolate, downy."—This is recorded in the Hortus Clifortianus to have sprung up from African seeds. The "*habitat in America*" is therefore a gross and palpable slip of the pen, in the second edition of Sp. Pl., (it is *Aethiopia* in the first) which the editors of Linnæus's writings should have corrected; for such a contradiction of the specific name, might have induced some inquiry. Nothing appears for this species in the Linnæan herbarium. In Hort. Cliff. the branches are said to be rough with minute dots. Leaves ovate, but rather elongated; downy, and in a manner hoary, on both sides, by no means polished.

For other plants which have been referred to *Annona*, see ORCHIDOCARPUM, ASIMINA, and MONODORA.

ANOMALY, col. 4, l. 15; for 122,441 r. 1,222,441. ANOMATHECA, in Botany, from *anoma*, out of rule, and *brax*, a case; because the capsule is distinguished by its papillary roughness, from all the rest of the plants of the same natural order, that have hitherto been examined.—Ker in Sims and Kon. Ann. of Bot. v. 1. 227. Dryandr. in Ait. Hort. Kew. v. 1. 90.—Class and order, *Triandria Monogynia*. Nat. Ord. *Enfatae*, Linn. *Irides*, Juss.

Gen. Ch. Cal. Sheath inferior, of two very small, elliptical, concave, leafy, nearly equal valves. Cor. of one petal, superior, falver-shaped; tube many times longer than the sheath, straight, nearly cylindrical, a little dilated at the mouth; limb not quite regular, in six, nearly equal, obovate, deep segments. Stam. Filaments three, inserted into the tube, thread-shaped, erect, much shorter than the limb; anthers vertical, oblong, converging. Pist. Germen roundish; style thread-shaped, about the length of the filaments; stigmas three, deeply divided, with linear, spreading segments. Peric. Capsule roundish-ovate, of three cells and three valves, its surface covered with small, papillary tubercles. Seeds numerous, round.

Eff. Ch. Sheath of two valves. Corolla falver-shaped. Stigmas three, deeply divided. Capsule minutely tuberculated.

1. *A. juncea*. Cut-leaved Anomatheca. Ker n. 1. Ait. n. 1. (Lapeyroufia juncea; Curt. Mag. t. 606. Gladiolus junceus; Linn. Suppl. 94. Thunb. Glad. n. 18. Cap. v. 1. 201, excluding the synonym of Jacquin! Redout. Liliac. t. 141. G. polytachius; Andr. Repof. t. 66.)—Found by Thunberg, in Lange Kloof, at the Cape of Good Hope, flowering from October to December. It flowers in May in our green-houses, where it is not uncommon, being easily propagated by offsets and by seed. The bulb is ovate. Leaves radical, equitant, sword-shaped, acute, dark-green, many-ribbed, with a deep flogging notch at their inner edge, from the base about half way up. Stalk a foot high, being twice as tall as the leaves, round, rather slender, branched, smooth, bearing many solitary, unilateral, slightly zigzag, spikes, of elegant, rose-coloured, scentless flowers; the irregularity of whose corolla is evinced by the three lower segments being each marked with a deep red spot, and the middle one being moreover

white at the base. *Capsule* rough, with crowded, glandular, or papillary, protuberances. Mr. Ker conceives *Isia excisa*, Linn. Suppl. 92, or at least one of its varieties, to be the same plant; but the specimens in the Linnean herbarium are surely different. They may indeed prove another species of *Anomatheca*, but this can only be ascertained by their *capsule*, which is wanting in all of them. *A. juncea* is certainly *Gladiolus amabilis* of Mr. Salisbury's Prodr. 41, (not 4.) as appears by a specimen from himself. He was the first author who noticed the peculiar roughness of the *capsule*, which he compares to the *fruit* of a *Caulis*. Few of the same natural order can be much more distinct than Jacquin's *G. floribundus*, Ic. Rar. t. 254, cited by Thunberg, with a faulty reference, in his *Fl. Capensis*.

ANONACEÆ, the fourth natural order of the *Dicotyledoneæ*, or *Exogena*, of De Candolle; separated by him from the *Coadunata* of Linnaeus, and answering to the *Anonæ* of Jusseu, being thus named after *Anona*, one of the chief genera. De Candolle thus defines the order.

Calyx of three lobes, very rarely of four. *Petals* six, in two rows, alternate with each other; the inner row sometimes wanting. *Stamens* indeterminate, unconnected. *Germens* indeterminate; very rarely solitary. *Fruit* compound, either separate or combined. *Seed* with internal processes, separating the portions of the albumen.

FRUCTIFICATION. *Calyx* inferior, short, permanent, more or less deeply three-cleft, very rarely with four lobes. *Petals* six, inferior, in a double row, alternate with each other, mostly coriaceous, and somewhat resembling an inner calyx, imbricated in the bud, though each row is valvular in that state; the inner one sometimes larger, sometimes smaller, rarely wanting. *Stamens* numerous, close-pressed, generally covering the hemispherical disk (or receptacle of the flower); filaments very short; anthers never sessile, with glandular, quadrangular, occasionally nectariferous points; their cells bursting longitudinally, externally, and downwards. *Germens* mostly numerous, crowded closely together, in some instances aggregate or combined, in others, though very rarely, and possibly from abortion, solitary. *Styles* one to each germen, short. *Fruits* as many as the germens, sessile or stalked, sometimes combined, either pulpy or capsular, with one or many seeds, which are ovate, or ovate-oblong, in one or two rows, inserted into the inner corner of each fruit. Their *skin* is brittle, membranous or crustaceous, having internal, sometimes plaited, processes, either flat or awl-shaped, insinuating themselves into the chinks or perforations of the albumen. The latter is fleshy, hard, shaped like the seed, very often bordered with a depressed furrow, accompanied by transverse plaits, or contiguous perforations. *Embryo* minute, situated in the umbilical region of the albumen. *Cotyledons* short. *Radicls* nearly cylindrical.

HABIT. Trees or shrubs, with round, often slightly two-ranked, branches, whose bark is mostly either reticulated, or warty; the young ones generally downy. *Leaves* alternate, connected with the stem by a joint, either sessile or with short footstalks, simple, almost always entire, or scarcely toothed, with pinnate veins; folded, and often downy, when young. *Stipules* none. *Flower-stalks* mostly axillary, sometimes lateral, or opposite to the leaves, solitary, generally furnished with small bracts; they are shorter than the leaves, bearing one or many flowers, and not uncommonly twisted into a hook, some of the flowers being abortive.

QUALITIES. The roots, bark, leaves, and fruits, especially such as are capsular, are acrid, pungent, aromatic, and stimulating, often used for seasoning. Those fruits

which are of a fleshy nature are eatable, and esteemed in tropical climates.

HISTORY. The *Anonaceæ*, being all strangers to Europe, were unknown to the ancient botanists. Caspar Bauhin has scarcely indicated two species, Linnaeus thirteen, Willdenow thirty-six, Perfoon forty-four; but Dunal in a most excellent treatise, almost literally followed by De Candolle, defines one hundred and five. Of these, five are natives of the temperate zone in America; forty-seven of the tropical regions of the same quarter of the globe; eight of equinoxial Africa; three of the Mauritius isles; twenty-six of India or its islands; six of China and Japan; two of New Holland; and there are six whose native country is uncertain.

AFFINITIES. This order agrees with the *Magnoliaceæ* of the same learned author, in having the parts of the flower disposed in a ternary order, anthers united to the filaments, numerous stamens and pistils; but differs very essentially (according to him) in having no stipulas, and differently shaped anthers as well as seeds. Some few climbing species make an advance towards the *Menispermæ*; but the indefinite stamens, and the structure of the fruit, afford a distinction. The *Anonaceæ* differ from all other polypteralous orders, with a superior germen, in the ternary structure of their flowers, as well as in the very peculiar insertion of the internal processes of the seed into its albumen. Such a structure was indeed found by Mr. Brown, in his *Eupomatia* (hereafter to be described in its proper place); a genus otherwise very different from the order before us.

The genera enumerated by De Candolle are, *Kadsura* of Jusseu; *Anona* of Linnaeus; *Monodora* of Dunal; *Affmina* of Adanson; *Poreelia* of Ruiz and Pavon; *Uvaria*, *Xylopia*, and *Unona* of Linnaeus; and *Gutteria* of Ruiz and Pavon.

ANOPILOTHERIUM, in *Natural History*, an animal of an extinct genus, whose remains are found in a fossil state in the vicinity of Paris. It is so called by Cuvier, to denote that it was without weapons, having no canine teeth. In the natural system, this animal should be placed between the horse on one side, and the hippopotamus, the pig, and the camel on the other. The remains of five species of the anopliotherium have been discovered. The largest was the size of a small horse; the smallest not larger than a small rabbit. See STRATA in the *Vicinity of Paris*.

ANOPIPTERUS, in *Botany*, owes that appellation to Labillardiere, who meant to express the situation of the wing, at the upper part of the seed, the word being formed from *ανω*, upwards, and *πτερον*, a wing.—Labill. Nov. Holl. v. 1. 85. Brown Prodr. Nov. Holl. v. 1. 457.—Class and order, *Hexandria Monogynia*. Nat. Ord. *Genitiana*, Juss. or perhaps *Erica*, according to Mr. Brown.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, in six deep, acute, equal, spreading segments, permanent. *Cor.* of one petal, bell-shaped; tube very short; limb in six deep, equal, concave, obtuse, imbricated segments, much longer than the calyx. *Stam.* Filaments six, awl-shaped, smooth, equal, inserted into the tube of the corolla, opposite to each segment, and about half as long; anthers incumbent, heart-shaped, obtuse, two-lobed. *Pist.* Germen superior, ovate; style short, cylindrical, erect; stigma in two acute lobes. *Peric.* Capsule elliptic-oblong, of one cell and two valves. *Seeds* numerous, inserted into the margin of each valve, pendulous, imbricated, each crowned with an obovate, obtuse, membranous wing, thrice its own length.

Eff. Ch. *Calyx* in six segments, inferior, permanent. *Corolla* in six segments, with a very short tube. *Stigma* cloven.

cloven. Capsule of one cell and two valves. Seeds imbricated, pendulous, winged.

1. *A. glandulosa*. Glandular Anopterus. Labill. Nov. Holl. v. 1. 86. t. 112.—Native of Cape Van Diemen. An elegant slender tree, about thirty feet high, very smooth in every part. Leaves scattered, occasionally opposite, obovate-oblong, serrated, single-ribbed, coriaceous, about four inches long, rather bitter to the taste; tapering at the base; a black prominent gland on the inner edge of each serrature. Clusters terminal, simple, half the length of the leaves, either solitary, or as many as four together. Corolla about the size and shape of *Pyrola rotundifolia*; of its colour nothing is recorded, Labillardiere's descriptions having been drawn up from his dried specimens after his return to Europe. Mr. Brown remarks, that the embryo is minute, nearly globose, enclosed in a fleshy albumen; the radicle superior.

ANREDERA, a name of which we find no explanation. Juss. Gen. 84. 448.—Class and order, *Pentandria Monogynia*. Nat. Ord. *Holeraceae*, Linn. *Atriplicae*, Juss.

Ess. Ch. Calyx in two deep segments; keeled at the back. Corolla none. Style divided. Stigmas two. Seed clothed with the compressed, membranous, two-winged calyx, emarginate at the top and bottom.

1. *A. scandens*. Climbing Anredera. (*Fegopyrum scandens*, seu *Volubilis nigra major*, flore et fructu membranaceis, subrotundis, compressis; Sloane Jam. v. 1. 138. t. 90. f. 1.)—Native of Jamaica, growing among trees near the ruins of a monastery by the town. Sloane. The stems are twining, round, red, succulent, climbing to the height of seven or eight feet. Leaves alternate, heart-shaped, or somewhat deltoid, succulent, smooth, entire, two inches and a quarter long, on footstalks half an inch in length. Clusters numerous, alternate, many-flowered, axillary and terminal. Flowers orbicular, compressed, green, bordered with a thin white membrane formed of the keel of each calyx-leaf. As the seed ripens, they turn brown. Sloane compares them to parsnip-seed. Swartz seems not to have noticed this plant. Its habit is nearly that of *Basella*.

ANTELOPE, col. 3. l. 7 from bottom, r. BUBALIS or CERVINE Antelope.

ANTHERYLUM, in Botany, so named, either by Vahl or Von Rohr, apparently from *ανθηρα*, an anther, and *ωξ*, wood, or materials of any kind, in allusion to its numerous and conspicuous anthers.—Vahl in Mem. of the Nat. Hist. Soc. of Copenhagen, v. 2. 211. Willd. Sp. Pl. v. 2. 980.—Class and order, *Icosandria Monogynia*. Nat. Ord. *Hesperideae*, Linn. *Myrti*, Juss.

Gen. Ch. Cal. Perianth of one leaf, inferior, in four deep, lanceolate, spreading, permanent segments. Cor. Petals four, inserted into the calyx between its segments, large, obovate, plaited and undulated, with short linear claws. Stam. Filaments numerous, from about thirteen to sixteen, capillary, inserted into the calyx, longer than the corolla, permanent; anthers incumbent, convoluted, furrowed. Pist. Germen superior, globose; style thread-shaped, very long; stigma capitate. Peric. Capsule globose, obscurely triangular, of one cell, and three, occasionally four, valves, bursting at the top and deciduous. Recept. globose, somewhat triangular, spongy, dotted with little hollows to receive the Seeds, which are numerous and minute.

Ess. Ch. Calyx inferior, in four deep permanent segments. Petals four, inserted into the calyx. Capsule of one cell and three valves. Seeds numerous.

1. *A. Roburii*. Flowery Antherylum. Vahl as above, 212. t. 8. Symb. v. 3. 66. Willd. n. 1.—Native of

the West Indian island of St. Thomas. Von Rohr, and Wessl. *A. tree*, with round, grey, feathered, scarred branches; leafy, and somewhat quadrangular, in their upper part. Leaves nearly opposite, stalked, ovate, acute, entire, two inches long, thin, very smooth, with one rib, and many transverse veins. There is a pair of stipuleaceous prickles, at the base of each footstalk, which disappear from the older branches. Flower-stalks axillary from the insertion of the last year's leaves, from five to eight, fewer on one side of the branch than the other, hardly an inch long, simple, single-flowered, naked, thread-shaped. Capsule downy, the size of a currant. Nothing is recorded of the colour of the flowers, nor of the qualities or use of any part. The habit of the tree is compared by Vahl to the *Legnetis* of Swartz, to which genus he supposes this to be allied. He suspects also some affinity to Aublet's CRENEA. See that article.

ANTHOBOLUS, we presume from *ανθος*, a flower, and *βολος*, a mass, or lump, the flowers forming little dense tufts.—Brown Prodr. Nov. Holl. v. 1. 357.—Class and order, *Diocia Triandria*. Nat. Ord. *Calyciflorae*, Linn. *Elaeagni*, Juss. *Santalaceae*, Brown.

Ess. Ch. Male, Calyx of three leaves. Corolla none. Stamina inserted into the base of the calyx-leaves.

Female, Calyx of three deciduous leaves. Corolla none. Stigma sessile, three-lobed. Drupa with one seed. Embryo inverted, in the axis of the fleshy albumen.

Akin to EXOCARPUS and OSYRIS. (See those articles.) The genus consists of smooth rushy shrubs, copiously branched, in habit resembling *Olyris*, the principal as well as the ultimate branches jointed at their insertion. Leaves scattered, sessile, articulated with the branch, narrow, nearly thread-shaped, destitute of stipules. Flower-stalks axillary; the male ones bearing each an umbel of three or four flowers; the female from one to three, jointed in the middle when simple, at the division when branched, and furnished at the joint with two deciduous bractæae. Flowers small, yellowish.

1. *A. filifolius*. Slender-leaved Anthobolus.—Leaves thread-shaped, lax, as well as the young branches.—Gathered by Mr. Brown, in the tropical part of New Holland.

2. *A. triquetus*. Awl-leaved Anthobolus.—Leaves awl-shaped, semi-cylindrical, moderately spreading. Branches angular, straight.—Found by Sir Joseph Banks and Dr. Solander, in the same country. Brown.

ANTHOCERCIS, so named by Labillardiere, from *ανθος*, a flower, and *κερως*, a ray, the narrow divisions of the corolla spreading in a radiant manner, like the spokes of a wheel.—Labill. Nov. Holl. v. 2. 19. Brown Prodr. Nov. Holl. v. 1. 448. Ait. Hort. Kew. v. 4. 53.—Class and order, *Didynamia Angiospermia*. Nat. Ord. *Luridae*, Linn. *Salicaceae*, Juss. Brown.

Gen. Ch. Cal. Perianth inferior, of one leaf, cut half way down into five equal, erect, acute segments, permanent. Cor. of one petal, wheel-shaped; tube bell-shaped, contracted at the base, twice as long as the calyx; limb about as long as the tube, in five, sometimes seven or eight, very deep, equal, linear-lanceolate, spreading segments. Stam. Filaments four, with the rudiment of a fifth, inserted into the base of the tube, and not above half so long, awl-shaped, simple, smooth; anthers roundish, incumbent. Pist. Germen superior, oblong; style cylindrical, the length of the tube; stigma capitate, notched. Peric. Capsule obovate-oblong, of two cells and two valves, with inflexed edges, meeting the parallel partition. Seeds numerous, small, roundish, reticulated.

Ess. Ch. Calyx five-cleft. Corolla wheel-shaped, regular, with a bell-shaped tube. Stigma capitate. Capsule of

two cells and two valves, with inflexed edges, and a parallel partition.

A shrubby smooth genus, whose habit announces an affinity to the *Solanæ*, but whose regular, deep-cut, radiating corolla, is altogether strange in the Linnæan class *Didynamia*. The leaves are alternate, tapering at the base, or somewhat flaked, articulated with the branch, thick, sometimes dotted with glands. Flowers axillary, nearly solitary, their stalks minutely bracteate, and mostly separating easily at the joint. Corolla white or yellow, handsome; its tube internally striated; limb in from five to eight segments.

1. *A. littorea*. Yellow Anthocercis. Labill. Nov. Holl. v. 2. 19. t. 158. Br. n. 1. Ait. n. 1.—Leaves obovate, without dots, smooth at the edges, as well as on both sides. Young branches smooth. Segments of the corolla longer than the tube. Capsule oblong, twice the length of the calyx.—Discovered by Labillardiere in Lewin's land; and observed in the same neighbourhood by Mr. Brown, and Mr. Good. The latter sent seeds to Kew in 1803. This is a greenhouse plant, flowering during most part of the summer. Mr. Aiton favoured us with a specimen in May 1811, when it first began to produce flowers. These are an inch in diameter, inodorous, pale lemon-coloured; the radiant segments of the limb narrow, taper-pointed; the tube striated internally with deep violet. Leaves about an inch long, abrupt or emarginate; nearly entire in our specimens. Labillardiere says they are sometimes toothed, or serrated.

2. *A. viscosa*. Glutinous Anthocercis. Br. n. 2.—Leaves obovate, marked with glandular dots; roughish at the edges; when young finely downy, as well as the young branches. Capsule ovate, about the length of the calyx.⁵³—Native of the southern coast of New Holland. Brown. We have seen no specimen of this species, but from the above account, furnished by Mr. Brown, we presume its flowers to be white, and their limb not longer than the tube.

ANTHODON, a name which seems to allude to the toothed calyx and petals, is applied in the Flora Peruviana, v. 1. 45. t. 74. f. b, to a plant referred by professor Vahl to his TONSELLA; see that article, sp. 4th.

ANTHOLOMA. Labill. Voy. Engl. ed. v. 2. 245. t. 41. Nov. Holl. v. 2. 121, is certainly the same genus as BASSIA. (See that article.) Whether Labillardiere's plant may be the *obovata* of Forster, or a new species, we have no certain means of knowing.

ANTHOTIUM, from *anthos*, a flower, and *thos*, a little ear, expressive of the auricles accompanying the upper segments of the corolla.—Brown Prodr. Nov. Holl. v. 1. 582.—Class and order, *Bractæandria Monogynia*. Nat. Ord. *Campanaceæ*, Linn. *Campanulacæ*, Juss. *Goodenovicæ*, Brown.

Gen. Ch. Cal. Perianth superior, in five deep equal segments, permanent. Cor. of one petal, longer than the calyx, irregular; tube slit at the back from top to bottom, and easily separable into five parts, with inflexed edges; limb two-lipped; upper lip in two, lower in three, deep segments, those of the upper lip having an ear-like appendage at their inner margin. Stam. Filaments five, shorter than the tube; anthers closely united into a tubular form. Pist. Germen inferior, oblong; style capillary, the length of the filament; stigma large, obtuse, enveloped in a bivalve beardless cover, contrary to the lips of the corolla. Peric. Capsule of two cells. Seeds several.

Ess. Ch. Corolla of one petal, slit longitudinally at the back; limb two-lipped, its upper segments auricled at their inner margin. Anthers combined. Stigma with a bivalve beardless integument. Capsule inferior, of two cells.

1. *A. humile*. Dwarf Anthotium. Br. n. 1.—Native of the south coast of New Holland. A little smooth, stemless herb. Leaves radical, almost cylindrical, scarcely dilated at the base. Stalks several, spreading, undivided. Flowers collected in tufts, subtended by leafy bractææ. Corolla approaching to a violet colour. Pollen of simple grains. There are two varieties, one almost twice the size of the other, the parts of the flower somewhat differing also in their relative proportion. Brown.

ANTHRACITE. See MINERALOGY, *Addenda*.

ANTIARIS, in Botany, altered by Lefchenault from the name of the famous Poison-tree of Java, *Upas Antiar*, which that botanist calls *Antiaris toxicaria*, and which Mr. Brown considers as of the same genus with what we are about to describe from his excellent General Remarks, Geographical and Systematical, on the Botany of Terra Australis, p. 70; published at the end of the account of captain Flinders's Voyage, 1814.—Class and order, *Monocæcia Tetrandria*. Nat. Ord. *Scabrideæ*, Linn. *Urticæ*, or *Urticæ*, Juss. Brown.

Gen. Ch. Male, Cal. Involucrum many-flowered; its margin in numerous, imbricated, lanceolate, acute, fringed, converging segments, at length expanded and reflexed; disk flat, covered with crowded sessile florets; perianth of four nearly spatulate, concave, equal, spreading leaves, converging at the extremity. Cor. none. Stam. Filaments scarcely any; anthers erect, converging, ovate, obtuse, two-celled, with white pollen. No rudiments of a pistil.

Female, Cal. Involucrum single-flowered, ovate, small, smooth, many-cleft at the summit, with lanceolate, fringed, converging, deciduous segments, some of them scattered over the body of the involucrum; perianth none. Cor. none. Stam. none. Pist. Germen in the body of the involucrum, oblong, single-seeded; style divided almost to the bottom, its segments thread-shaped, parallel, smooth, divaricated at the upper part; stigma simple, acute. Peric. Drupa formed of the enlarged involucrum, oval, smooth, the size of a small plum, dark purple, internally fleshy and yellowish, containing a white milk. Seed. Nut pendulous, ovate, with a smooth, brown, tenacious crust; kernel without a skin; albumen none; embryo white, of two large, ovate, fleshy, almond-like cotyledons, flat on the inside, rather convex externally; radicle superior, very short.

Ess. Ch. Male, Involucrum many-flowered, many-cleft. Perianth of four leaves.

Female, Involucrum single-flowered, urceolate, many-cleft at the margin. Perianth none. Style deeply divided. Drupa from the enlarged involucrum. Seed without albumen. Radicle superior.

1. *A. macrophylla*. Brown as above, t. 5.—Found by Mr. Brown, in barren stony places, on the shores of the Company's islands, adjacent to Arnhem's land, on the north coast of New Holland, in about 12° south latitude, bearing flowers and ripe fruit in February 1803. A shrub, or very small tree, about six feet high, much branched, smooth, milky. Branches round. Leaves alternate, flaked, elliptic-oblong with a sharp point, entire, coriaceous, six inches long and three wide; unequal and slightly heart-shaped at the base; dark-green and shining above; more verdant beneath; with one rib, and many transverse parallel veins. Footstalks roundish, grey, half an inch long. Stipules intrafoliaceous, lanceolate, pointed, folded, leafy. Flower-stalks axillary, solitary, racemose, scarcely longer than the footstalks, each bearing six or eight alternate flowers, of which one or two of the lowest are female, and earlier than the rest, which are all male.

We presume the *A. toxicaria* of Lefchenault, Annales du Mus. y. 16. 478. t. 22, is another species of the same genus; but

but we are not informed of the specific characters of either. Of that celebrated Poison-tree the first satisfactory account, according to Mr. Brown, is there given, which differs from his description above, merely in some particulars relative to the male flowers. He adds that *Antiaris* should stand in the *Urticeæ*, between *Brosimum* of Swartz; and *Olmedia* of the Flora Peruviana, agreeing with the latter in the structure of its male flowers, and more nearly resembling the former in its female flowers and fruit.

ANTIMONY, in *Chemistry*. Several important additions have been lately made to our knowledge respecting this metal and its compounds, which we shall briefly notice here.

In describing this metal, we stated that Haiiy had been unable to ascertain its primitive crystalline form. This indefatigable observer has at length, however, determined that the primitive form of its crystal is an octahedron, and that its integrant particles have the figure of tetrahedrons. The specific gravity of antimony, according to Hatchett, is 6.712. It melts at a low red heat, or about 810° of Fahrenheit; and after this, if the heat be raised, the metal evaporates.

The oxys of antimony have been lately investigated with great care by Thenard, Proust, Bucholz, and Berzelius. According to Thenard, this metal forms no less than six oxys; according to Proust and Bucholz, it forms only two; while according to Berzelius, it forms four. These discordancies arise from the great difficulty of the investigation. The protoxyd of Berzelius is obtained by exposing antimony to the air, or to the action of a galvanic battery. It is a grey powder. When acted upon by muriatic acid, it is separated into the protoxyd of Proust and metallic antimony. Hence Dr. Thomson remarks it is only a mixture of the two. The two oxys of Proust are easily obtained, and possess specific characters. Berzelius has shewn that the second of them possesses the properties of an acid. The protoxyd of Berzelius is also readily obtained, though it is difficult to free it from water. This likewise possesses the properties of an acid. Hence, says Dr. Thomson, we know three oxys of antimony. The grey protoxyd, the white antimonious acid, and the straw-yellow antimonic acid.

The following is the composition of the protoxyd of antimony according to

	Proust.	Berzelius.	Thomson.
Antimony	100	100	100
Oxygen	22.7	18.6	17.775

Antimonious acid is composed, according to the same chemists, of

	Proust.	Berzelius.	Thomson.
Antimony	100	100	100
Oxygen	29.87	24.8	23.7

And antimonic acid of

	Proust.	Berzelius.	Thomson.
Antimony	—	100	100
Oxygen	—	37.2	35.556

The above results of Berzelius and Thomson are rather obtained by calculation than actual experiment, being founded on the supposed composition of sulphuret of antimony, which, according to Berzelius, is composed of 100 antimony and 37 sulphur, and according to Thomson, of 100 antimony and only 35.572 sulphur.

While such discordancies exist respecting the composition of the oxys of antimony, it is impossible to fix with certainty the weight of its atom. Dr. Thomson, however, it may be proper to state, considers it as 56.25.

The two oxys of antimony, denominated above the antimonious and antimonic acids, are capable, according to Berzelius, of combining with different bases and forming two

sets of salts, the first of which may be termed *antimonites*, the second *antimoniates*.

The following is the method of preparing the *antimonium tartarizatum*, or tartrate of antimony and potash, according to the last edition of the London Pharmacopœia.

Take sulphuret of antimony pounded, two ounces; nitrate of potash, one ounce; supertartarate of potash, two ounces; sulphuric acid by weight, two ounces; distilled water, a pint and a half. Mix the acid with half a pint of water in a proper glass vessel, and place it in a sand-bath. When moderately heated add by degrees the sulphuret and nitre previously well mixed together; and then apply heat till the whole of the water is driven off. Wash the remainder with distilled water until it comes off tasteless, and while the mass is yet moist mix it with the supertartarate of potash. To this mixture add a pint of distilled water. Boil the mixture, and when filtered put it aside to crystallize.

ANTONIUS LIBERALIS, in *Biography*, a Greek writer of an uncertain age, known as the author of *Μεταμορφωσεων Συναγωγης*, or a Collection of Metamorphoses, published at Basil, in 8vo., by Xylander, in 1568; at Leyden, in 12mo., by Berkelius, in 1674; by Munkeras, at Amsterdams, in 1676; and by Gale, at Paris, 1675, 8vo. This writer is not the same with a Latin rhetorician, mentioned by Jerom. Fab. Bib. Græc.

ANYCHIA, in *Botany, so called by Michaux, on account of its affinity to **PARONYCHIA**. (See that article.) This plant therefore has as little concern with the *finger nail*, *ωνυχία*, as the other has with a whitlow.—Michaux Boreal.-Amer. v. 1. 112. Pursh 176. St. Hilaire Paron. 98. (Queria; Gærtn. t. 128.)—Class and order, *Pentandria Monogynia*. Nat. Ord. *Holeraceæ*, Linn. *Amaranthi*, Juss. *Paronychie*, Juss. Ann. du Mus. St. Hilaire.*

Gen. Ch. Cal. Perianth inferior, of one leaf, oblong, in five deep, oblong segments, slightly hooded at the extremity, with a posterior point. Cor. none. Stam. Filaments five, sometimes fewer, shorter than the calyx, opposite to each segment and inserted into its base, bristle-shaped, erect, distinct, without any intermediate processes; anthers nearly heart-shaped. *Peric.* Germen superior, roundish; style one, very short; stigmas two, oblong, recurved. *Peric.* Capsule roundish, membranous, of one cell and one valve, covered by the calyx, with an orbicular depression at the summit, pointed, separating at length irregularly at the lower part. *Seed* one, nearly kidney-shaped, smooth, attached by a lateral thread to the base of the pericarp.

Ess. Ch. Calyx inferior, in five deep, converging segments, hooded at the summit. Stigmas two. Capsule membranous, of one valve. Seed solitary.

This is a genus of diminutive herbs, with opposite leaves, attended by stipules. Flowers minute, in leafy tufts, each of them sessile, with bractæes like the stipules. *Michaux*.

1. *A. dichotoma*. Forked Anychia. Michaux n. 1. Pursh n. 1. (*QUERIA canadensis*; see that article, n. 2.)—Stem forked, much branched, spreading. Leaves elliptic-lanceolate, smooth, erect. Bractæes about as long as the smooth calyx.—On dry lime-stone hills, from New York to Kentucky, flowering from June to August. Perennial. Flowers exceedingly small; very variable in the number of *stamens*, generally from two to five. *Pursh*; who quotes Ortega's Dec. t. 15. f. 2, a work not in our possession. The root has all the appearance of being annual, as professor Schrader found it in the garden of Gottingen.

2. *A. bernardioides*. Rupture-wort Anychia. Michaux n. 2. Pursh n. 2.—Stem diffuse, densely branched, downy all over. Leaves elliptic-oblong, fringed, bristle-pointed. Segments of the calyx awl-shaped, with bristle spreading points.³¹

points."—Found by Michaux, on the dry sands of North Carolina. Perennial. Pursh did not meet with this species.

3. *A. argyrocoma*. Silvery-headed *Anychia*. Michaux n. 3. Pursh n. 3.—Procumbent, tufted. Stems minutely downy. Leaves linear, acute, rather hairy. Flowers in terminal tufted heads, with membranous bractæes. Segments of the calyx hairy, with long bearded points.—On rocks in Upper Carolina, and Virginia. Perennial, flowering in June and July. *Pursh*. Michaux compares the habit of this plant to that of *Illecebrum Paronychia*, doubtless on account of its large silvery bractæes.

AORTA, in *Surgery*. As professor Scarpa observes, the whole body may be regarded as an anastomosis of vessels,—a vascular circle,—and the remark is so true, that even an obliteration of the aorta itself may happen, immediately below its arch, without the general circulation of the blood in the body being stopped. Meckel met with two cases in which the aorta was thickened and considerably constricted just below its arch; yet in both subjects there was every reason to believe, that the abdominal viscera and lower extremities had been duly supplied with blood. This fluid, which could only pass from the heart with great difficulty, and in small quantities, had, by regurgitating, lacerated the semi-lunar valves. (Mém. de l'Acad. Royale de Berlin, 1756, obs. 17 and 18.) A like example is recorded by Stoerk. *Ann. Med.* vol. xi. p. 171.

We have a very interesting case of obstructed aorta related by Monsieur Paris, formerly dissector for the Amphitheatre of the Hôtel-Dieu. He injected the body of a very lean old woman, about fifty years of age, whose arterial system was found to be singularly deranged, and the circle of the blood altogether changed by a complete contraction of the aorta a little beyond the arch. The attention of M. Paris was particularly excited to the condition of this subject by the unaccountable enlargement of the small arteries upon the forepart of the chest. The injection which was employed entered the mouth of the aorta so readily, that, so far was he from suspecting any obliteration of this vessel, he could have thrown in more injection than is usually required for filling an adult body. The subject was so meagre, that, without dissecting, M. Paris felt the thoracic arteries running down the sides of the chest tortuous and remarkably enlarged. On dissection, he found the aorta immediately beyond its arch contracted to the size of a writing quill; the coats of the artery were of their usual thickness, and its cavity of course extremely small; the arch of the aorta above this contraction was but very slightly dilated; the part below had lost nothing of its natural size.

The carotids were in the natural state; the arteria innominata and the left subclavian were enlarged to twice their natural diameter; all their smaller branches were increased in the same proportion, and had assumed a curled and zigzag course. The internal mammary and phrenic arteries were greatly enlarged, and very tortuous. The transverse arteries of the neck were of twice their natural size; their posterior branches were tortuous, extending to a great distance over the back, with long inosculations, which were met from below by the branches of the upper intercostal arteries, which were also remarkably enlarged. The thoracic and scapular arteries which run along the side of the chest were twice their natural size.

Below the constricted part of the aorta the lower intercostals were much enlarged, even to three or four times their natural size. Each of them was dilated; but those were most affected which were given off nearest the contracted part; and the posterior branch of each, which penetrates to the muscles of the back, was more dilated than that which

runs between the ribs. Indeed those posterior branches were so remarkably dilated with contortions so closely succeeding each other, that they resembled a necklace of beads; and their inosculations with the branches of the *transversalis cervicis* were very remarkable. The lower phrenic artery was enlarged, forming considerable inosculations with the superior phrenic. The epigastric artery was dilated to the size of the enlarged mammary, and was joined with it by very numerous and conspicuous inosculations. *Deault's Parisian Chir. Journ.* tom. ii. p. 107, &c.

In the body of a male subject, two steatomatous tumours were found by Stenzel, situated in the substance of the membranes of the aorta immediately below its arch. Notwithstanding these swellings rendered the vessel nearly impervious, the man had the appearance of strength, and of having been well nourished. "Hæc corpora ferè cor magnitudine æquabant ut omnem propemodum exanti è finitri cordis thalamo languini spatium præcluderent." *Diff. de Steatomatibus Aortæ*.

Dr. Graham, of Glasgow, has very recently published a still more remarkable case, in which the circulation was carried on for a considerable time through the anastomoses, notwithstanding a complete obstruction of a part of the aorta. The patient was a lad fourteen years old, who, in consequence of exposure to cold, was affected at first with a dry cough, followed by copious expectoration, pain, and difficulty of respiration. The disease was supposed to be pneumonia in an advanced stage. Dyspnoea, palpitations, and pain of the left side, were also the most remarkable symptoms at a later period. The pulse became weak, but was always regular to the very last. The boy at length died, after remaining in the Glasgow Infirmary about five months. On dissection, together with other morbid changes, the walls of the left ventricle of the heart were found about an inch in thickness; but no other derangement in the structure of the heart, or its valves, was observed. The aorta was unusually expanded near its origin, so as to form a kind of pouch; but, after having given off the branches to the head and superior extremities, its diameter was preternaturally contracted. It continued of this diminished size till after its union with the *canalis arteriosus*, when it became completely impervious. The coats were not thickened, nor in any way diseased, except that about half an inch below the stricture there was a smooth elevation on the inner surface, less raised, but having nearly the diameter of a split-pea. In other respects, the appearance was exactly such as would result from tying a ligature round the artery.

The artery then received three trunks, about as large as crow-quills, and near them three smaller ones, when it resumed its natural size along the vertebrae. The three trunks were evidently the uppermost of the inferior intercostals, the coats of which were remarkably thin, like those of veins. A probe passed from the pulmonary artery along the *canalis arteriosus* to the obstructed portion of the aorta; but from the thickened appearance of that canal, and the solid countenance of the boy during life, probably there had been little communication allowed by means of it between the aorta and pulmonary artery. Dr. Graham, it appears, did not inject the subject, so as to demonstrate all the exact channels by which the circulation had been carried on; but he tells us, that the arteria innominata, the left subclavian, the superior intercostals, and the mammary arteries, were much enlarged. The epigastric was reported to be of its natural size. "These facts, and the aorta acquiring at least very nearly its natural size immediately below the stricture, shew that the blood did not pass to the inferior extremities in any material quantity, as might perhaps have been expected by the inosculations of

AORTA.

the mammary and epigastric arteries; but chiefly by the communications of the superior intercostals and the mammary arteries with the three large branches entering the aorta below the fricature; and of the mammary and thoracic arteries with the diaphragmatic and other intercostals. See *Medico-Chir. Transf.* vol. v.

If the aorta were obliterated, or obstructed in the abdomen, the blood would find adequate channels for its transmission in the mammary and epigastric, the superior and inferior mesenteric, and the lumbar arteries. Mr. A. Cooper informs us, that he has never met with any instance of the latter description in the human subject. (*Surgical Essays*, part i. p. 113.) But he has several times applied ligatures to the aorta in dogs, and found that the blood was readily carried by anastomosing vessels to the posterior extremities of the animal. (See *Medico-Chir. Transf.* vol. ii. p. 249, &c.) The incision was in each experiment made on the left side of the spine; the aorta was drawn to the surface of the skin by an aneurism needle, and being quite separated from other parts was tied. The animals were then kept for a few weeks, and then killed. They were afterwards injected and dissected, when it appeared that the lumbar arteries were considerably enlarged, so as to be the chief agents of the new circulation.

In those diseases causing obstruction of the thoracic aorta a little beyond its arch, to which we have requested the reader's attention, no doubt the change was the result of a very gradual process, and consequently, the altered course of the blood through the collateral channels would also be established, not all at once, but by degrees. The anastomosing arteries would only enlarge, in proportion as the obstruction in the great artery increased. But in the experiment of tying the aorta in animals things were very different; for the stoppage of the passage of the blood through the tied portion of that vessel was not only effected instantaneously, but also completely, so that the whole office of transmitting the blood to parts beyond the obstruction suddenly devolved altogether to the anastomoses, which had had no time for any gradual and preparatory dilatation. Yet notwithstanding this seeming disadvantage, we find that the blood did pass into the posterior extremities.

The aorta of the human subject, however, has now been tied in the human subject by Mr. A. Cooper, and the following are a few of the particulars of the case. The patient, who was thirty-eight years of age, had on the left side an inguinal aneurism, which had actually burst, and discharged a quantity of blood sufficient to reduce the man to a state of considerable weakness. Another hemorrhage would have carried him off. It was apprehended, that the tumour extended too high up to admit of a ligature being applied to the external iliac artery itself; yet in the hope of being able to dispense with such measures as would be necessary to tie the aorta near its bifurcation, Mr. A. Cooper resolved to try whether it were possible to tie the aneurismal artery itself. He made, therefore, a small incision into the aneurism, about two inches above Poupart's ligament; but he found only a chaos of broken coagula, and that the artery entered the sac above and quitted it below without there being any intervening portion of vessel. The operation was consequently abandoned. "When I was about to withdraw my finger," says Mr. A. Cooper, "I directed two of the students to compress with their hands the aorta upon the spine, and they succeeded in stopping the pulsation in the artery of the right groin. As I withdrew my finger, I put a doffel of lint by its side, and closed the opening which I had made into the sac." *Surgical Essays*, part i. p. 118.

The only other chance of preservation was what might

result from tying the aorta itself; and it was determined to adopt the proceeding, bold and unprecedented as it was in respect to the human subject. A doubtful remedy is always better than none. This ancient maxim in surgery seems to gather strength in proportion to its duration, and is a short but an effectual answer to every attempt which has been made by the ignorant and malicious to throw blame on the distinguished surgeon, whose ardent desire to save the life of an individual was the main-spring of his conduct. Mr. A. Cooper, after enjoining the prudence of emptying the bowels previously to any other similar operation, states, that he made an incision three inches long into the linea alba, giving it a slight curve to the left side to avoid the umbilicus. One inch and a half of the cut was above and the remainder below the navel. He then made a small aperture into the peritoneum, and introduced his finger into the abdomen. This opening was enlarged with a probe-pointed bistoury to nearly the same extent as that of the external wound. During the progress of the operation, only one small convolution of intestine projected beyond the wound. The operator next passed his finger between the intestines down to the spine, where he felt the aorta beating with excessive force. By means of his finger-nail, he scratched through the peritoneum on the left side of the aorta; and next gently and gradually passing the finger between that vessel and the spine, again penetrated the peritoneum on the right side of the aorta. Guided by the same finger, he now conveyed a blunt aneurismal needle, armed with a single ligature, behind the vessel. After the ligature had been placed, much care was requisite to exclude the intestine from it in drawing it into a noose. The operation being finished, the wound was closed with a quill-suture and adhesive plaster.

During the operation the fæces passed off involuntarily, and the pulse, both immediately and for an hour after the operation, was 144 in a minute. An opiate was given, and the involuntary discharge of fæces soon ceased. When the right thigh was touched, the patient thought it was the foot, so that the sensibility of that extremity was very imperfect.

The operation had been performed about nine in the evening. At one o'clock the following morning, the lower extremities, which had become cold soon after the operation, were beginning to get warm again, but their sensibility continued yet indistinct. At eight o'clock, the right leg was warmer than the left, and the sensibility was returning. At noon, the temperature of the right limb was 94; that of the left, or aneurismal limb, 87½. At six o'clock in the evening, the temperature of the right was 96, that of the left 87½. At nine the same evening, the pulse was 104 and feeble, with vomiting, restlessness, and an involuntary discharge of fæces. At eleven, the pulse was 100 and feeble, and the vomiting still continued. At eight the next morning, the aneurismal limb appeared livid and felt cold, more particularly around the aneurism; but the right leg remained warm. At eleven the pulse was 120, and the patient seemed to be sinking. In fact, he died eighteen minutes after one in the afternoon, having survived the operation forty hours. On dissection, no appearance of peritoneal inflammation was found, except at the edges of the wound. The omentum and intestines were free from any unnatural colour. The ligature which had not included any portion of bowels was placed round the aorta about three-quarters of an inch above its bifurcation, and about an inch below the part where the duodenum lies across it. In the aorta a coagulum more than an inch in extent was found to have sealed the vessel above the ligature. Below the bifurcation, other similar coagula were found in the right and left iliac arteries. By the fall to which the patient had ascribed the

tumour, the neck of the thigh-bone had been broken within the capsule, and it was still in a difunitated state. Mr. A. Cooper imputes the man's death not to inflammation, but to the want of circulation in the aneurifimal limb, occasioned in a great measure by the immense size of the tumour, and the disturbed state of the coagula which it contained. He conceives, therefore, that, in any future case of this kind, the ligature should be applied before the swelling has become very large. *Surgical Essays*, part i.

One thing seems proved by this memorable case, *viz.* that the circulation in the lower extremities may continue notwithstanding a sudden ligature on the aorta. Here it did so in the right leg, and probably would have done so in the left, had it not been for the obstruction arising on that side from the magnitude of the tumour.

AOTUS, in *Botany*, so named by the writer of this article, from *αὐτός*, without, and *ὄτος*, an ear; because it is essentially distinguished from PULTENEA, (see that article,) by the want of the two ear-like appendages to its calyx, not to mention other marks hereafter indicated.—Sm. in Sims and König's *Ann. of Bot.* v. 1. 504. Brown in *Ait. Hort. Kew.* v. 3. 14.—Clafs and order, *Decandria Monogynia*. Nat. Ord. *Papilionaceae*, Linn. *Leguminosae*, Juff.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, bell-shaped, two-lipped, without appendages; upper lip of two divaricated, acute segments; lower of three rather longer, more direct ones. *Cor.* papilionaceous, of five petals; standard inversely-heartshaped, ascending, with a linear claw of its own length; wings obovate-oblong, shorter than the standard, each with an abrupt angle at the upper edge where it joins the claw; keel as long as the wings, obtuse, of two obovate-oblong, ascending petals, each with a similar tooth. *Stam.* Filaments ten, separate, awl-shaped, ascending, nearly equal, smooth, deciduous; anthers oval, of two cells. *Pist.* Germen roundish, with the rudiments of two seeds; style thread-shaped, parallel to the stamens, but rather longer, twisted after impregnation, stigma simple, bluntnish. *Peric.* Legume nearly orbicular, acute, of one cell and two concave firm valves. *Seeds* two, elliptical, inserted into the middle of the upper margin of each valve, without any crest or appendage.

Eff. Ch. Calyx simple, five-cleft, two-lipped. Corolla papilionaceous; wings shorter than the standard. Stamens deciduous. Style thread-shaped. Stigma obtuse. Legume of one cell, and two valves. Seeds two, without a crest.

Aotus is very nearly allied to *Pultenea*, and had previously been confounded therewith, but besides the want of appendages to the calyx, and of a *strophilium*, or crest, to the seeds, which last difference was first noted by Mr. Brown, the style is not awl-shaped, but almost capillary, variously twisted as soon as the flower falls, rather swelling upwards, and the stigma is obtuse. The habit of the plant is also very distinct, having nothing like the chafy aspect of a *Pultenea*; there are neither *bractæas* nor *stipulas*; the leaves are partly opposite, and almost whorled. Mr. Brown, by giving a specific character to this shrub in *Hort. Kew.* leads us to presume that he has found other species of the same genus; for he is not one of those botanists who make a distinction without a difference. We are however acquainted with the following only.

1. *A. villosa*. Hairy *Aotus*. Sm. n. 1. Tr. of Linn. Soc. v. 9. 249. *Ait.* n. 1. *Curt. Mag.* t. 949. (*A. ferruginea*; *Labill. Nov. Holl.* v. 1. 104. t. 132. *Pultenea villosa*; *Andr. Repof.* t. 309, but not of Willd. *Sp. Pl.* v. 2. 507. *P. ericoides*; *Venten. Malm. t.* 35.)—Calyx silky, with close hairs. Legume stalked. Seeds rough with minute dots. Leaves rough on the upper side. *Brown.*

—Native of New Holland, and Van Diemen's island. Sent by Sir J. Banks, in 1790, to Kew garden, where it flowers in the green-house, from April to June. The stem is three feet high, with numerous, round, silky, leafy branches. Leaves scattered, or imperfectly whorled, on short hairy stalks, spreading, linear, revolute, entire, a half or three-quarters of an inch long; channelled, and rough with minute points, above; silky beneath. Flowers bright-yellow, axillary, on short, silky, rusty stalks, two or three together, numerous crowded about the tops of the branches, so as to form leafy clusters. Legume very hairy, two lines long. The standard of each flower is marked with radiating crimson lines, as in the *Dillwynia*.

APARGIA, Schreb. Gen. 527. Willd. *Sp. Pl.* v. 3. 1547. See THURINCIA, at the end of which is given the history of this genus.

APERTO, Ital., in *Musci*, open, opposed to *clusus*, closed.

APHELANDRA, in *Botany*, a genus first proposed by Mr. Brown, in a note to his *Prodromus*, to be separated from JUSTICIA. (See that article.) The name he has given it is composed of *ἀφελος*, simple, and *ἀνδρῆς*, a male, expressing the simple structure, or single cell, of the anthers, one of the most distinguishing characters of this genus.—*Brown Prodr. Nov. Holl.* v. 1. 475, obf. *Ait. Hort. Kew.* v. 4. 55.—Clafs and order, *Didynamia Angiosperma*. Nat. Ord. *Personate*, Linn. *Acanthi*, Juff. *Acanthaceae*, Brown.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, in five deep, oblong, unequal, erect segments. *Cor.* of one petal, ringent; tube much longer than the calyx, incurved, angular, gradually swelling upwards; limb in two unequal acute lips; the upper erect, cloven; lower revolute, undivided. *Stam.* Filaments four, awl-shaped, simple, erect, inserted into the tube of the corolla, and rather shorter than its upper lip, parallel, slightly curved, two of them a little the longest; anthers incumbent, attached by the back, oblong, acute at each end, hairy behind, of one cell. *Pist.* Germen superior, ovate; style thread-shaped, the length of the stamens; stigma simple. *Peric.* Capsule oblong, tapering at the base, of two cells and two elastic compressed valves, the partition contrary to, and fixed in the middle of, each. Seeds two in each cell, roundish, each subtended by a spinous process.

Eff. Ch. Calyx in five deep unequal segments. Corolla ringent; lower lip undivided. Anthers single-celled. Capsule of two elastic valves and two cells; with contrary partitions. Seeds subtended by spines.

1. *A. cristata*. Dense-spiked *Aphelandra*. Brown in *Ait. n.* 1. (*Justicia cristata*; *Jacq. Hort. Schoenbr.* v. 3. 38. t. 320. *J. tetragona*; *Vahl Symb.* v. 3. 5. *Enum.* v. 1. 118. Willd. *Sp. Pl.* v. 1. 85. *Ruellia cristata*; *Andr. Repof.* t. 506.)—Leaves elliptic-oblong, pointed, smooth on both sides, with hairy veins beneath. Bractæas ovate, entire. Corolla smooth.—Native of Cayenne and the Caraccas, flowering in the rose throughout August and September. It appears to have been first brought to England by the late earl of Searforth, and flowered at Mr. Lambert's in Wiltshire. The stem is shrubby, three feet high, or more, with opposite, round, smooth branches. Leaves opposite, stalked, broadly elliptical, acute at each end, somewhat wavy, dark green, plant, five or six inches long, and three broad; smooth above, with a reddish mid-rib, and many fine veins; the rib and veins only, according to Jacquin, downy beneath. Flowers scarlet, large, splendid, and extremely numerous, forming dense quadrangular spikes, about a span long, branched at the base, with close, ovate, green, or brownish, fringed, single-flowered bractæas. The

corolla is full two inches in length. This plant is so very nearly allied in habit, foliage, colour of the flowers, and their general appearance, to the magnificent *Jussiaea coccinea*, Sm. Ic. Pict. t. 8, that one would think they must belong to one and the same genus. But on examination, the three-lobed lower lip, two-lobed anthers, and leafy bractæas of the latter, indicate a technical, as well as natural, distinction.

2. *A. pulcherrima*. Downy-leaved Aphelandra. (*Jussiaea pulcherrima*; Jacq. Amer. 6. t. 2. f. 4. Coll. v. 3. (not v. 5.) 252. Ic. Rar. t. 204. Linn. Suppl. 84. Herb. Linn. Willd. Sp. Pl. v. 1. 86. Vahl Symp. v. 2. 14. Enum. v. 1. 119. J. arborea; Mill. Dict. ed. 8. n. 7. J. putata; Loefl. It. 244.)—Leaves elliptic-oblong, pointed; smooth above; finely downy beneath. Bractæas ovate, entire. Corolla smooth.—Native of South America, flowering in February. *Loefling*. Houtton appears to have sent seeds to Miller, who cultivated this species before the year 1733. Mutis communicated a specimen to Linnaeus, which we see no reason to distinguish from Jacquin's plant, notwithstanding what is recorded in the *Supplementum*, of the *stamens* being two only; for we find four in the flower we have examined, bearing the proper simple *anthers* of an *Aphelandra*. How far the complete hoary downiness of the backs of the leaves, and the smaller spikes, with less copious flowers, may prove the present species distinct from the foregoing, we greatly doubt. Mr. Brown in Hort. Kew. unites them, without marking this as even a variety of *crisfata*.

3. *A. scabra*. Rough-leaved Aphelandra. (*Jussiaea scabra*; Vahl Enum. v. 1. 120.)—"Leaves elliptic-oblong, acute; rough on the upper side. Bractæas oblong, acute, hairy."—Native of South America. Leaves three inches long, acute at each end; rough above with prominent points; veins somewhat downy beneath. Vahl speaks of this as very nearly related to the last; but as Mr. Brown, who had doubtless examined specimens, enumerates it in his *Prodromus* as distinct, and does not subsequently unite more than the two first together, we presume it must be different, and that the *corolla* is not smooth, nor the bractæas entire, both which characters he makes discriminative of the *crisfata*, and they certainly exist likewise in the *pulcherrima*.

APHELIA, apparently so called from ἀφελῆ; simple, in allusion to the great simplicity of parts and structure in the flower.—Brown Prodr. Nov. Holl. v. 1. 251.—Class and order, *Monandria Monogynia*. Nat. Ord. *Resifitæ*, Brown.

Gen. Ch. *Cal.* Sheath of several imbricated, two-ranked, single-flowered, pointed, hispid scales; the lower ones sometimes barren, and longer than the rest. *Cor.* of one membranous valve, at the inner side of each flower. *Stam.* Filament one, capillary; anther simple. *Pistil.* Germen superior, single-seeded; style one, thread-shaped; stigma solitary, undivided. *Peric.* Capsule membranous, of one valve, and one cell, bursting longitudinally at one side. *Seed* solitary.

Eff. Ch. Scales two-ranked, single-flowered. Corolla of one valve, interior. Anther simple. Stigma one. Capsule bursting longitudinally, at one side. *Seed* solitary.

Obsf. This genus is closely allied to *DEVAUNIA* of Mr. Brown, which will be described in its proper place hereafter, and from which *Aphelia* differs in having a simple pistil, two-ranked spike, and only one valve to the corolla, situated at the inner side of the flower. The only known species is

1. *A. cyperoides*. Cyperus-spiked *Aphelia*.—Discovered by Mr. Brown, in the southern part of New Holland. A small, tufted, grassy herb, resembling some of the lesser kinds of *Scirpus* and *Cyperus*. *Root* fibrous. *Leaves* radical,

thread-shaped, sheathing at the base. *Stalks* leafless, thread-shaped, undivided. *Spice* terminal, solitary.

APHRITE. See *SCHAUM Earth*.

APPARTITION. Subjoin at the close of the article,

In the year 1805, Dr. Alderfon of Hull read to the literary society of that place, and published in 1811, "An Essay on Apparitions," designed to prove, that the immediate cause of these spectral visitations lies not in the perturbed spirits of the departed, but in the diseased organization of the living. In 1813 Dr. Ferrier of Manchester published, on a more extended scale, "An Essay towards a Theory of Apparitions," similar in result to the anterior production of Dr. Alderfon. Both admit the reality and universality of spectral impressions, and both attribute them to partial affections of the brain, independent of any sensible and external agency. These and other such writers, who consider the appearances of ghosts, &c. as the immediate effect of certain partial but morbid affections of the brain, confine themselves to physical phenomena, professedly discarding the consideration of any higher efficiency in the series of causation, than what appears to be the result of diseased organization; so that their discovery, though completely overturning the common superstition as to the return of the departed spirit, or the invisible interference of angelic agency, is yet, says Dr. Drake, in the learned volume of his "Shakspere and his Times," very reconcilable with the pneumatology of bishop Horley, who conceives that the Deity often acts immediately through his agents on the human sensory, as a part of the material universe, thereby producing disease and morbid impressions. (See Horley's Nine Sermons on the Nature of the Evidence by which the Fact of our Lord's Resurrection is established.) Our Lord, according to the bishop, after his resurrection, was no longer in a state to be naturally visible to any man. His body indeed was risen, but it was become that body which St. Paul describes in the 15th chapter of his 1st Epistle to the Corinthians; which, having no sympathy with the gross bodies of this earthly sphere, nor any place among them, must be indiscernible to human organs, till they shall have undergone the similar refinement. Accordingly it is alleged, that we are told by St. John, that the body of our Saviour, after his resurrection, could only be seen through the operation of a miracle. "Him God raised up the third day," and "gave him to be visible." "Et dedit eum manifestum fieri." Vulgate.

APPRECIATION, l. 2. from bottom, r. abbé Feytaud for Feyer.

APRILE GUISEPPA, in *Biography*. See TENDUCCI.

AQUILEGIA, in *Botany*, (see our former article). The history of this elegant genus is greatly enriched by professor De Candolle, who reckons up thirteen species. The following references require to be added.—Willd. Sp. Pl. v. 2. 1245. Mart. Mill. Dict. v. 1. Ait. Hort. Kew. v. 3. 325. Sm. Fl. Brit. 578. Prodr. Fl. Græc. Sibth. v. 1. 372. Pursh 372. De Cand. Syst. v. 1. 333. Tourn. t. 242. Lamarck Dict. v. 1. 149. Illustr. t. 488.

Eff. Ch. Calyx none. Petals five, deciduous. Nectaries five, gaping and two-lipped at the summit; outer lip large and flat; inner minute; each extended downwards into a hollow spur, callous at the point, projecting between the petals. Stamens numerous, disposed in five or ten parcels, the inner ones abortive, their filaments dilated, membranous, and oblong, destitute of anthers. Germens five. Capsules as many, erect, many-seeded, beaked with the styles. *De Candolle*.

We here, of course, alter the phraseology of our author, with respect to the parts of the flower, as in *ACONITUM*.

AQUILEGIA.

These are perennial herbs, with fibrous *roots*. *Radical*, or lower *stem-leaves*, on long three-cleft *footstalks*, divided in a twice-ternate manner; their *leaflets* three-cleft, toothed, mostly obtuse: *upper leaves* cut, or deeply divided, into linear lobes. *Flowers* terminal, blue, white, rose-coloured, or purple, very rarely of a dirty yellow. To which we may add that the *flowers* are pendulous, *fruit* erect.

The *herbage* is slightly bitter, tonic or somewhat astringent, scarcely acrid. *Seeds* acrid, recommended in eruptive disorders.

The various species inhabit mountainous thickets and pastures of the northern hemisphere; one is found in America, four in different parts of Europe, seven in Siberia.

Obf. The scales, originating in the dilatation of the innermost *filaments*, and the abortion of their *anthers*, often surround the *germens* like *bractæas*, after the *flower* is past. They are delineated in several of Barrelier's plates. Mr. Brown has remarked something analogous in the petal-like scales of his ΕΡΩΜΑΤΙΑ; see that article hereafter. The flowers in *Aquilegia* become double in four different ways. 1. Those termed *corniculati* have accessory *nectaries*, originating from changed *filaments*, all spurred and pointing downwards. 2. *Inversif* have their *spurs* turned upwards, in consequence of a twist in the claws of those parts. 3. *Stellati* have accessory *nectaries* proceeding from enlarged *filaments* deprived of *anthers*; such being all flat, and without *spurs*. 4. *Degeneres* have all their *filaments*, *pisillils*, and *nectaries* obliterated, nothing remaining but multiplied *petals* (*sepala* of De Candolle) of a greenish hue.

We shall follow our author, in a compendious review of the species, with some necessary alterations. They are not separated into sections.

1. *A. vulgaris*. (See AQUILEGIA, n. 2.) Common Columbine. Linn. Sp. Pl. 752. Willd. n. 2. Fl. Brit. n. 1. Engl. Bot. t. 297. Fl. Dan. t. 695. (*Aquilegia*: Trag. Hist. 137. Fuchf. Hist. 102. *A. cœrulea*; Ger. Em. 1093, with figures likewise of the several varieties above-mentioned. *Aquilina*; Matth. Valgr. v. 1. 577. Camer. Epit. 404. varieties, 405. *Hopyrum Diolecoridis*; Column. Phytob. t. 1. 1.)—*Nectaries* incurved. *Capsules* hairy. *Stem* leafy, many-flowered. *Leaves* nearly smooth. *Styles* not overtopping the *filaments*.—Native of rather moist meadows, woods and thickets, throughout Europe, from Sweden to Greece, flowering in July. Thunberg also found this plant in Japan. Baron Marschall von Bieberstein mentions it as occurring, though rarely, in the Iberian tract of Caucasus. Nothing is more common, or more hardy, in gardens; its fanciful varieties being tolerably constant from seed, as far as they produce any. The *root* is rather tuberous. *Herb* smooth, two or three feet high. *Leaves* glaucous beneath. *Flowers* somewhat paniced, pale violet in a natural state, occasionally pink or white, larger and handsomer than in any of their garden deformities. The *alpina* of Hudson, different from the real one, is a rather smaller, more slender, mountain variety, with tapering, less incurved, *nectaries*. We have gathered it at Matlock, Derbyshire.

2. *A. viscosa*. (See AQUILEGIA, n. 1.) Linn. Mant. 77. Willd. n. 1. Ait. n. 1. Gouan Illustr. 33. t. 19. "De Cand. Fr. ed. 3. v. 4. 912. v. 5. 640. (*A. hirsuta*, flore viscosa; Magn. Monsp. 26. Hort. 21. *A. montana*, flore parvo, thalictri folio; Bauh. Pin. 144. Prodr. 75. Lachenal Act. Helvet. v. 8. 146. t. 5. Bauh. Hist. v. 3. 484. Morif. sect. 12. t. 1. f. 5, bad.)—*Nectaries* incurved. *Capsules* hairy. *Stem* with very few flowers, almost naked, downy and viscid as well as the leaves and flowers. *Styles* not overtopping the *filaments*.—Native of Switzerland, the

fourth of France, and all along the rocky hills of the Mediterranean. De Candolle concurs with Villars in opinion, that this plant is only a variety of the foregoing. We have never compared them in a living state, but the singular viscid moisture which covers the whole herb, especially the *flowers*, and is visible even in dried specimens, seems to indicate an essential difference. The *flowers* too are larger, while the plant is smaller, sometimes single-flowered, and the *leaflets*, with their segments, are more wedge-shaped. Linnæus however declares, Syst. Veg. ed. 13. 420, that feeds of the *viscosa*, from Gouan himself, produced the *vulgaris*.

3. *A. speciosa*. Handsome-flowered Columbine. De Cand. n. 3, excluding the synonyms. (*A. vulgaris*, daurica; Willd. n. 2, 3?)—*Nectaries* incurved; spur the length of the border. *Capsules* hairy. *Stem* leafy, many-flowered. *Flower-stalks*, *footstalks*, and backs of the leaves, downy. *Styles* taller than the *filaments*.—"Native..... Seen in a cultivated state by De Candolle, flowering in May and June. He doubts whether his plant were distinct from *A. vulgaris*, as it differed only in the spur and limb of each *nectary* being of equal length, the former generally yellow at the extremity, and the *styles* rising above the *filaments* during the flowering. Fischer and Perloo, it seems, have mentioned a variety, in which the *spurs* are of the same colour as the limb. Whatever their plant may be, we are satisfied that the synonyms of Aiton and Ehrhart belong to the following.

4. *A. sibirica*. Siberian Party-coloured Columbine. Lamarck n. 4. De Cand. n. 4. (*A. vulgaris*, speciosa; Ait. n. 2, 3. Willd. n. 2, 3. *A. bicolor*; Ehrh. Beitr. v. 7. 146. *A. hybrida*; Sims in Curt. Mag. t. 1221? De Cand. n. 11?)—*Nectaries* incurved. *Germens* and *capsules* perfectly smooth. *Styles* taller than the *filaments*.—Native of Siberia. Linnæus cultivated this plant, and found it did not alter. We received it in 1796, from the garden of Messrs. Lee and Kennedy, at Hammermith, who had the seeds from that country. Specimens of the same, in the Linnean herbarium, are marked as having been gathered near Irkutsk. M. De Candolle justly describes "the radical *leaves* on long stalks, smooth, except perhaps some downiness on the *footstalks*; their segments obtuse, broadly notched. *Stem* hardly a foot high, mostly single-flowered, and entirely naked; sometimes bearing two or three *flowers*, with one or two leafy *bractæas*. *Sepala* (*petals*) blue, oval, obtuse. *Nectaries* white, half as long, very blunt. *Capsules* quite smooth, by which character this species is readily distinguished from all the foregoing, and perhaps from all the rest." De Cand. Our wild specimens have three or four *flowers* on each item, and the garden ones are still more luxuriant. The *flowers* in both are purplish-blue, the lips of the *nectaries* cream-coloured, as expressed in Ehrhart's name, and Dr. Sims's figure. We should have no hesitation about his synonym, were it not for the slight downiness which he attributes to the herbage. The proportion of his *styles* is right, but he does not say any thing of the *germens*. We cannot but suspect the gardeners mixed feeds of the Siberian species with the Canada one, or possibly that pollen of the latter might have had some effect on the flowers of the former, of which the rather less curved *nectaries* of the offspring seem an indication; the pale hue of their limb is exactly that of our *sibirica*. The downy *leaves* do not accord with either. If we are right, De Candolle's *hybrida*, n. 11, must be expunged. Respecting Gmelin's *A. n.* 16, Fl. Sib. v. 4. 185, we suppose by its last synonym, alluding to the party-coloured *nectaries*,

nectaries, it must have been what we have just described, taken by him for the Linnæan *alpina*, though not without some doubt.

5. *A. alpina*. (See AQUILEGIA, n. 3.) Alpine Columbine. Linn. Sp. Pl. 752. Willd. n. 3. Ait. n. 3. Ehrh. Beitr. v. 7. 146. Sm. Tour. ed. 2. v. 3. 137. Allion. Pedem. v. 2. 64. t. 66. (A. n. 1196; Hall. Hist. v. 2. 89. A. montana, magno flore; Bauh. Pin. 144. Prodr. 75. Bauh. Hist. v. 3. 484.)—Lips of the nectaries half as long as the elliptic-lanceolate pointed petals; spurs curved at the extremity. Stem two or three-flowered, leafy. Leaflets with many deep, linear-wedge-shaped, segments. Capsules downy, corrugated.—Native of bushy alpine situations in Switzerland, Savoy, Mount Cenis, &c. flowering in July or August; but not, we believe, of Siberia, the variety β of De Candolle appearing to belong to the last species. The real *A. alpina* is the most magnificent of its genus, distinguished by fine blue flowers, spreading two and a half or three inches, and well represented in Allioni's plate. The herbage is smooth. Stem often above two feet high, bearing several flowers. The *germens* are densely downy. Capsules near an inch long, finely hairy, transversely wrinkled, with copious, prominent, parallel, confluent veins. Seeds black and shining, numerous. Miller might have cultivated this noble plant at Chelsea, but it had long been lost, and was restored by seeds from Mount Cenis, in 1787, being now probably again extinct in England.

6. *A. pyrenaica*. Pyrenean Columbine. "De Cand. Fr. ed. 3. v. 5. 640." (A. alpina; Lamarck n. 3.)—"Spurs of the nectaries quite straight, scarcely shorter than the limb. Stem nearly naked, mostly single-flowered. Leaflets with numerous, deep, linear lobes."—Found in elevated rocky pastures, among the Pyrenæes and Apennines. Akin to the last, but in all its parts but half as large. Leaves on longer stalks, their outline nearly circular. Flowers one or two, middle-sized, blue. Petals (sepals, De C.) oval, tapering at each end. Spurs slender, perfectly straight to the very point. Stem and footstalks either quite smooth, or slightly hairy. Some synonyms of *A. viscolosa* are repeated under this species by De Candolle, at least those of the Bauhins and their followers. We have seen no specimen, and can form no opinion. There seems some confusion in our able friend De Candolle's specific characters of this and the last. The spur in *A. alpina* is half the length of its real petals, as Linnæus says; De Candolle says half the length of the limb of his petals, our nectaries, which is not the case, those parts being of equal length, as is nearly the case with *A. pyrenaica*. But in this latter perhaps the petals, his sepals, are no longer. This point is material.

5. *A. canadensis*. (See AQUILEGIA, n. 4.) Canadian Columbine. Linn. Sp. Pl. 752. Willd. n. 4. Ait. n. 4. Curt. Mag. t. 246. Pursh n. 1. Bigelow Bost. 133. (A. pumila præcox canadensis; Cornut. Canad. 59. t. 60. Mill. Ic. t. 47. A. canadensis, flore externè rubricundo, medio luteo; Morif. fect. 12. t. 2. f. 4.)—Spurs straight. Styles and stamens prominent. Petals acute, rather longer than the limb of the nectaries. Leaflets deeply three-lobed, bluntish, notched.—In the crevices of rocks, from Canada to Carolina, flowering in April and May. Pursh. A hardy perennial in our gardens, distinguished by the beauty of its scarlet flowers, variegated with yellow, remarkable for their long, straight, erect spurs. The *germens* are downy, with very long and slender styles.

8. *A. viridiflora*. (See AQUILEGIA, n. 5.) Green-flowered Columbine. "Pallas Ag. Petrop. for 1779. 260. t. 11." Willd. n. 5. Ait. n. 5. Jacq. Ic. Rar. t. 102.—Spurs straight, longer than the limb of each nectary. Sta-

mens the length of the nectaries. Styles much longer. Petals elliptic-oblong, shorter than the nectaries.—Found in Siberia by Pallas, who sent seeds to Kew in 1780. The green flowers, and long spurs, mark this species. *Germens* downy, encompassed by membranous abortive flaments, after the perfect ones are gone.

9. *A. daourico*. Daourian Columbine. De Cand. n. 9.—Spurs straight, shorter than the limb of each nectary, flaments scarcely prominent. Styles much longer. Petals acute, shorter than the nectaries.—On the Daourian mountains, flowering in June. This resembles the preceding and the following species, differing from the former in having dark purple flowers, the spur of whose nectaries is shorter than their limb, and their flaments a little prominent; from the latter in having very prominent styles, and petals shorter than the limb of the nectaries. De Cand.

10. *A. atro-purpurea*. Dark Violet Columbine. Willd. Enum. 577. De Cand. n. 10. (A. viridiflora β ; Willd. n. 5.)—Spurs straight, the length of the limb. Styles and stamens scarcely equal to the petals, which are the length of the limb of the nectaries.—Native of Siberia, according to Willdenow, from whom this species is entirely adopted. The flowers are described as dark purple, or bluish-violet; the limb of each nectary greenish-blue; spur bluish-violet. Professor De Candolle suspects this may be the same plant as Dr. Sims's *hybrida*. (see *Sibirica*, n. 4.) which is not at all improbable, and if so, we lose another out of his thirteen species. The only difficulty is to conceive, that Willdenow could, at any time, reckon this *hybrida* a variety of *viridiflora*, to which his *atro-purpurea* was reduced in his Sp. Pl.

11. *A. parviflora*. Small-flowered Columbine. De Cand. n. 12. (A. fylvarum humilis; Gmel. Sib. v. 4. 186. n. 17. t. 74.)—Spurs straight, short, nearly as long as the obtuse limb of each nectary. Stamens and pistils recurved, the length of the petals. Stem smooth, as well as the leaves.—Very frequent in woods about the river Lena. Gmelin. Herb entirely smooth, except the bristly *germens*. Stem a foot, or rather more, in height, bearing from two to seven flowers. Leaflets ovate-wedge-shaped, with three broad obtuse teeth at the end. Bractæas in linear segments. Flowers blue or violet, much smaller than those of *A. canadensis*; their spurs, (according to De Candolle, who had examined dried specimens,) straight, very short; Gmelin terms them "spiral." Petals ovate, acute, tapering at the base, longer than the blunt limb of the nectaries. Stamens, as well as styles, curved downwards; barren flaments oblong-linear, much crisped at the edges.

12. *A. anemonoides*. Anemone Columbine. "Willd. Geff. Naturf. Berl. Mag. for 1811. 401. t. 9. f. 6." De Cand. n. 13.—Spurs straight, very short, as long as the limb, which is one-third the length of the petals. Stalks radical, single-flowered, nearly naked.—Native of the Altaian region of Siberia. Root perennial. Herb three inches high, smooth, resembling *Anemone triternata*. Leaves radical, divided in a thrice-ternate manner, with oblong segments, either entire, or two or three-lobed. Stalks scarcely longer than the leaves, accompanied by two linear-lanceolate bractæas. Petals ovate, obtuse. Nectaries five, hooded; their spurs gibbous at the base. Willd.

ARACÆI, l. 10, r. Baanah.

ARACCA, l. 5, r. Erach.

ARALIE, in Botany, so named from its principal genus, a natural order of plants, the 59th in Jussieu's series, the 1st of his 12th class. We have given the character of that class under the article UMBELLATÆ. The *Aralia* are thus defined.

Calyx either entire or toothed at the margin. Petals and flaments

flamens definite. *Styles* and *stigmas* several. *Fruit* pulpy, or rarely capsular, of as many cells as there are styles, with a solitary seed in each. *Stem* either arboreous, or shrubby, or herbaceous. *Leaves* alternate, often compound, their footstalk sheathing in its lower part. *Flowers* umbellate, either with an involucre, or, more rarely, naked.

The genera are, *Gaflonia* of Commerlon; *Polyfciat* of Forster nearly related thereto; *Aralia* of all authors; *Cuffonia* of Linnæus in his Supplementum; and *Panax*.

The *Aralia* are naturally allied to the *Umbellata*, but differ in having their seeds in a pericarp, instead of being naked. They are akin to *Cornus* and *Hedera*, but distinguished by having more than one style. *Juff*.

ARANEA, col. 2, l. 10, *dele* which see respectively, and infer, See SPIDER.

ARAZUI, in *Geography*, a river of Georgia, next in importance to the Cyrus, or Kur, which, rising near the gates of Caucasus, flows to the south, and after dividing into two equal parts, the southern range of mount Caucasus, falls into the Kur, at the town of Tigette, 25 miles above Teflis.

ARASCHA, a rapid river of Mingrelia, which has its source near the village of Kemme, and unites, on the borders of the Iberian lordship of Sa Schilio, with the Hippus, which rises in the highest mountains of the Soani, not far from the source of the Phafis, flows through Letsghumi, divides Mingrelia from Iberia, and enters the Phafis, near the Tredia.

ARATUM, r. ARATRUM.

ARAUCARIA, in *Botany*, a barbarous name, given by Juffieu to the Chili Pine, which Lamarck, Schreber, and Lambert, have called DOMBEYA. (See that article.) Willdenow has unfortunately retained the above name, because he had already ignorantly followed Cavanilles in calling a genus *Dombeya*, which is not generically distinct from *Pentapetes*. Hence *Araucaria* has found its way into Mr. Aiton's *Hortus Kewensis*, where Willdenow is taken as the leading authority, and DOMBEY'S ill fortune still pursues him. (See our biographical account of that eminent man, which we trust will be our sufficient justification in always maintaining the genus which he introduced, and which properly belongs to him: nor have we any doubt that our learned countrymen will concur in supporting his well-earned fame, when they properly consider the subject.) We have further to observe, that the *Dombeya* of Lamarck, or that of Cavanilles, has, neither of them, any preference as to date, both having, we believe, been first announced in Juffieu's Gen. Pl. in 1789, a year before the date of publication of each of those authors' works. We are also ready to allow that our illustrious friend Juffieu, in the choice he made, was far from concurring in the base persecution of Dombey, originally raised by the Spaniards. He was however evidently aware that the *Dombeya* he adopted could hardly be maintained, or at least that it was not distinct from *Pentapetes bœniacea*, now received as PENTAPETES. (See that article.) *Araucaria* is not, as has been reported, the denomination of the Chili Pine, in any part of the world, but a perversion of that of its native country, the Araucanian mountains, and to such generic names there are many objections.

ARAUJIA, so named by professor Brotero, in honour of a Portuguese nobleman, Don Antonio de Araujo, an eminent patron of botanical science.—Brot. Tr. of Linn. Soc. v. 12. 62.—Class and order, *Pentandria Digynia*. Nat. Ord. *Corticeæ*, Linn. *Apocineæ*, Juff. *Ajelepiadææ*, Brown.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, in five deep, ovate, permanent segments. *Cor.* of one petal, bell-shaped; tube rather longer than the calyx, inflated at the

base, with five protuberances; limb in five deep, ovate, acute segments, shorter than the tube, slightly spreading, their points somewhat recurved and twisted. Nectaries five cells in the base of the tube, opposite to the segments of the limb. *Stam.* Filaments five, inserted into the base of the tube, between the nectaries, short, thick, flattened; anthers arrow-shaped, each furnished by a small auricle, converging towards the pistil; pollen of two obovate masses, projected upon five angles of the stigma. *Pist.* Germens two, superior, ovate-oblong; styles two, very short; stigma common to both, large, thick, roundish-ovate, smooth, with two acute points at the top, and five glandular lateral tubercles to receive the pollen. *Peric.* Follicles two, divaricated, large, oblong-oval, coriaceous, smooth, abrupt, with a small point, one of them often abortive; partition longitudinal, unconnected when ripe, except at top and bottom, the disk covered on both sides with numerous elevated, parallel, sharply toothed ridges. *Seeds* very numerous, inserted into the teeth of the receptacle, imbricated downwards, ovate, clothed with papillary pubescence, and each crowned with a tuft of long silky hairs.

Eff. Ch. Corolla bell-shaped; tube with five nectiferous cells at the base. Anthers crowned with a membrane. Stigma with two horns. Follicles smooth. Seeds comofe.

1. *A. sericeifera*. Silky Araujia.—Native of Peru. Cultivated in the green-house at Lisbon, where it flowers in autumn, and ripens seed in spring. The whole plant abounds with acrid milk, but every part is inodorous. The root is creeping. *Stem* shrubby, weak, twining, three or four feet high, round, smooth, branched, leafy; the young branches rather downy. *Leaves* opposite, stalked, lanceolate, acute, entire, nearly smooth, an inch and a half to three inches long; heart-shaped at the base, and marked with two glands on the upper side, a little above the insertion of each foot-stalk. *Flowers* three or four, or more, together, in short, lateral, drooping, smooth, somewhat corymbose clusters, about half the length of the leaves, and inserted between the bases of the footstalks. *Corolla* yellowish-white, marked with purple lines; downy about the mouth. *Follicles* three or four inches long.

ARBELA, l. 13, after Arbelitis, add—This place, once the capital of the province of Adiabene, has wholly declined from its former importance, and dwindled into a wretched mud town, with a population not exceeding 3000 souls. Part of this town is built on a hill of a conical form, on which probably stood the old castle, and the remainder of the town encircles the base of the hill. The country surrounding Erbill, its present name, lying in lat. 36° 11', and between that place and Mosul, is fruitful but hilly, and very deficient in wood, there being hardly a tree or even shrub to be seen.

ARBITRATION of Exchange. See EXCHANGE.

ARCH, l. 4, fig. 43; l. 23, fig. 43.

ARC of a Circle, l. 11, fig. 45.

ARCHER, in *Geography*, a township of Ohio, in the county of Jefferson, containing 60 inhabitants.

ARCIPELAGO, col. 2, l. 2, r. 2100.

ARCTOMYS, in *Zoology*. See MARMOT.

ARCTOTHECA, in *Botany*, a name revived from Vaillant, and originally synonymous with ARCTOTIS, (see that article,) from which the genus we are about to describe has recently been separated, chiefly by the want of a seed-crown; in for in habit there is no distinction.—"Wendland Hort. Herrenhuf. 8." Willd. Sp. Pl. v. 3, 2365. Brown in Alt. Hort. Kew. v. 5. 141.—Class and order, *Syngnesia Polyanthia-frustranca*. Nat. Ord. *Compositæ*, Linn. *Corymbifera*, Juff.

Gen. Ch. *Common Calyx* roundish, imbricated; its scales elliptic-oblong, woolly; the innermost with a dilated, membranous termination. *Cor.* compound, radiated; florets of the disk numerous, funnel-shaped, five-cleft, equal, all perfect; those of the radius about twelve, ligulate, elliptic-lanceolate, longer than the diameter of the disk, with four ribs, and about three unequal teeth, neuter. *Stam.* in the florets of the disk only, filaments five, capillary, short; anthers united into a tube, nearly as long as the corolla. *Pist.* Germen in all the florets, oblong; style in those of the disk only, thread-shaped; stigma prominent, cylindrical, erect. *Peric.* none, except the permanent, dry, curled calyx. *Seeds* in the disk only, obovate, without wing or down. *Recept.* flattish, cellular.

Eff. Ch. Receptacle cellular. Seed-down none. Calyx imbricated, partly membranous.

1. *A. repens.* Creeping *Arctotheca*. Willd. n. 1. Ait. n. 1. (*Arctotis* retropis; Jacq. Hort. Schoenbr. v. 3. 31. t. 306. *A. fcapigera*; Thunb. Prodr. 165.)—This, the only known species, is a native of the Cape of Good Hope. Seeds were sent by the celebrated Scopoli to the writer of this article, and the plants raised from thence flowered in the open ground in Chelsea garden, in the summer of 1790, but it was found necessary to shelter them in winter. The roots are perennial, creeping extensively. *Stems* herbaceous, prostrate, branched, clothed like the backs of the lyrate pinnatifid leaves, with fine white cottony down. *Flower-stalks* radical, several together, simple, erect, naked, about six inches high, being rather longer than the leaves. *Flowers* solitary, an inch and a half broad, lemon-coloured, with purple ribs beneath.

ARCYRIA, a curious genus of the Fungus tribe, thus named, originally by Sir John Hill, from *αρκυρ*, a net, and *εἶδος*, a honeycomb, the fine net-work of its ripe head having that appearance.—Perf. *Difp.* Meth. Fung. 10. Syn. Fung. 182.—Class and order, *Cryptogamia Fungi*. Nat. Ord. *Fungi*.

Eff. Ch. Upper half of the head deciduous. Filaments composing a dense denticulated net-work, resting on the cup-like receptacle.

1. *A. ? leucocephala.* White-headed *Arctia*. Perf. n. 1. Hoffm. Germ. v. 2. t. 6. f. 1. *Trichia cinerea*; Trentepohl in Roth Catal. v. 1. 227.)—Aggregate. Head funnel-shaped below, reddish-brown. Net-work globose, mealy, snow-white.—Found on dead leaves or sticks in autumn. Also on mosses, or fragments of leaves, in rainy weather, very copiously, in June and July, according to Albertini and Schweiniz, *Fung. Nijkienf.* 100, who, like Perfoon himself hesitate whether to refer this elegant little species to this genus or to *PHYSARUM*. See that article.

2. *A. flavo.* Yellow *Arctia*. Perf. n. 2. Obf. Mycol. 1. 58. *Difp.* Meth. 10. Albert. and Schw. Nilk. n. 279. (*Trichia nutans*; Bulliard *Fung.* v. 1. 122. t. 502. f. 3. Sowerb. *Fung.* t. 260. *Stemonitis amœna*; Trentepohl in Roth Cat. v. 1. 222.)—Aggregate, yellow. Net-work cylindrical, elongated, drooping.—Found on rotten wood in summer, consisting of little tufts, of a pale or ochraceous yellow, each plant on a short stalk; the receptacle hemispherical; the cylindrical, rather tapering, net-work from half an inch to an inch long, reclining, abundant in powdery seeds.

3. *A. cinerea.* Ash-coloured *Arctia*. Perf. n. 1. Albert. and Schw. Nilk. n. 280. (*A. albidâ*; Perf. *Difp.* Meth. 10. t. 1. f. 2. *Trichia cinerea*; Bull. *Fung.* v. 1. 320. t. 477. f. 3. *Stemonitis glauca*; Trentepohl in Roth Cat. v. 1. 221.)—Aggregate, greyish-white. Net-work

cylindric-ovate, erect. Receptacle crenate.—Found in summer, in woods, on dead branches, stalks, &c. Smaller and shorter, as well as more obtuse, but with a longer stalk, in proportion, than the last, from which also it is distinguished by its dirty-white colour. We are puzzled, as well as the learned authors of the *Fungi Nijkienf.*, by Perfoon's assertion of the resemblance of this species to the fifth, hereafter described.

4. *A. incarnata.* Flesh-coloured *Arctia*. Perf. n. 4. Obf. Mycol. 1. 58. (not 38.) t. 5. f. 4. 5. Albert. and Schw. Nilk. n. 281. (*Stemonitis globosa*, et *S. carnea*; Trentepohl in Roth Cat. v. 1. 222.)—Somewhat scattered, dull flesh-coloured. Net-work pyramidal, obtuse, curved, soon deciduous. Empty receptacle valver-shaped.—Said to be very common in Germany, on oak or fir wood in decay, at all seasons. The empty receptacles resemble little reddish *Perizæ*, and are marked with radiating streaks. The net-work appears to abound in farinaceous seeds of the same hue.

5. *A. punicea.* Scarlet *Arctia*. Perf. n. 5. *Difp.* Meth. 10. Albert. and Schw. n. 282. (*Clathrus denudatus*; Linn. Sp. Pl. 1649. Jacq. *Misc. Austr.* v. 1. 136. t. 6. *Trichia cinnabarina*; Bull. *Fung.* v. 1. 121. t. 502. f. 1. *T. denudata*; Sowerb. *Fung.* t. 49. T. n. 2164; Hall. *Hist.* v. 3. 115. t. 48. f. 6, as Jacquin has it, rather than t. 4, as cited by Haller himself. *Stemonitis crocata*; Trentepohl in Roth Cat. v. 1. 220.)—Crowded, ovate, orange-coloured.—Frequent throughout Europe on rotten wood, in summer and autumn. When young it is white and soft, but advancing in size, it assumes a conspicuous orange-colour, with the dry rather firm texture of its genus. This fine colour chiefly resides in the copious seminal powder, for the net-work itself is brownish. The edge of the remaining base of the receptacle is often irregularly torn, and various in breadth. Bolton's v. 3. t. 93. f. 2, if really taken from this species, is not a happy representation.

ARDELAN, in *Geography*, a province of the Persian empire, forming the eastern division of Kurdistan, is in length 200 miles, from the little river Sharook to the Turkish district of Zohaub, and nearly 160 in breadth. It is separated from the plain of Hamadan by a small range of hills, and its western boundary is 100 miles beyond Senna, the capital, situated in N. lat. 35° 12', and E. long. 40°. The territories of Ardelan extend as far as Kella Shah Khaneh, and are peopled by a tribe denominated Gheffkeeh, who are recorded by the Kurds as the most expert and daring robbers of their nation; nor will torture induce them to betray their accomplices, being habituated to pain and severe chastisement from their earliest infancy. They are, however, slaves to the most abject superstition.

ARGOLASIA, in *Botany*, Juss. Gen. 60, a good name, constructed by Jussieu, from *αργος*, white, and *λασος*, hairy, or *shaggy*, alluding to the white woolly clothing of the herb. But this name is superfluous by one of similar meaning, LANARIA, (see that article,) given to the same plant by Dr. Solander, and published in Ait. Hort. Kew. v. 1. 462, in 1780. This latter has been adopted by Schreber, and is now established.

ARGUNNA, in *Geography*, a town of Armenia, in the pachalic of Diarbekir, distant 48½ miles from Diarbekir; situated on the side of a lofty mountain, from which torrents of water are discharged in courses through the streets so as to render them impassable. The town is populous, but wretchedly built, and is remarkable for the quantity of wine and brandy made in its vicinity.

ARJONA, in *Botany*, so named by the late abbé Cavanilles,

alles, in honour of Mr. Francis Arjona, a celebrated lecturer on botany at Cadiz.—Cavan. Ic. v. 4. 57.—Clafs and order, *Pentandria Monogynia*. Nat. Ord. *Lyfsmachiis*, Juff. affine?

Gen. Ch. Cal. Perianth inferior, of two fmall, concave, permanent leaves, each with three terminal teeth. Cor. of one petal, funnel-shaped; tube thrice the length of the calyx, fightly dilated upward; limb in five deep, ovate, acute, equal fegments. Stam. Filaments five, capillary, very fhort, inferted into the throat of the tube; anthers oblong, within the tube. Pift. Germen fuperior, ovate, crowned with five minute permanent fcales; fyle fimple, three-d-shaped, the length of the tube; ftigmas two, flat. Peric. Berry globose, crowned with the fcales, of two cells. Seeds

Eff. Ch. Corolla funnel-shaped, equal. Berry fuperior, of two cells, crowned with five fcales.

1. *A. tuberoſa*. Tuberosus Arjona. Cavan. as above, t. 383.—Native of South America, in dry barren ground, near Port Defire, flowering in December. We have a fpecimen from the lamented author, gathered by Louis Née. The long fibres of the root are furniſhed, here and there, with oval knobs, well futed to its arid fituation. Stem folitary, a ſpan high, with numerous branches from the bottom; nearly fimple above; leafy throughout. Leaves very numerous, imbricated, ſheathing, awl-shaped, fpinous-pointed, channelled, entire, rather ſpreading, clothed with foft woolly hairs. Flowers in a folitary, terminal, denſe, corymboſe head. Corolla about an inch long; externally yellowiſh and very downy; internally ſmooth, yellowiſh-white. Style reddiſh, with ſometimes three ftigmas. Berry fmall, ſmooth. Seeds not obſerved.

There is ſomething in the characters and hue of this plant, that approaches the natural order of *Veprecula*, or *Thymelææ*, eſpecially in the form and aſpect of its corolla. Poſſibly the fruit may not really be of two cells. The two cotyledons of a fingle drupa might, in an early ſtate, miſlead the author, who ſays he did not ſee the ſeeds. The bark, however, does not appear to have thoſe filky fibres, which are the ſtrong indication of the *Daphne* family.

ARISTEA, (ſee our former article), a name left unexplained by profeſſor Martyn, is rightly derived by De Theis from *ariſta*, an awn, but does not apply as he ſays to the point of the leaf. Solander, the author of this name, appears rather to have alluded to the copious bearded fringe of the ſheaths, ſo remarkable in the original fpecies.—Ker in Ann. of Bot. v. 1. 236. Dryand. in Ait. Hort. Kew. ed. 2. v. 1. 108. Vahl Enum. v. 2. 123.

Eff. Ch. Corolla fuperior, in fix deep regular ſegments, ſpirally twiſted together after flowering, permanent. Capſule of three cells, with many ſeeds.

Four ſpecies having been added to this genus by Mr. Ker, it is neceſſary to review the whole.

1. *A. cyanea*. Graſs-leaved Ariſtea. Ait. n. 1. Andr. Repof. t. 10.—Flowers in terminal heads. Sheaths and bractæes in many fine capillary marginal ſegments.—Native of the Cape of Good Hope, as well as all the following. See ARISTEA, n. 1.

2. *A. capitata*. Talleſt Ariſtea. Ait. n. 2. Ker in Curt. Mag. t. 605. (A. major; Andr. Repof. t. 160. A. cærulea; Vahl n. 3. *Gladiolus capitatus*; Linn. Sp. Pl. 53. *Moræa cærulea*; Thunb. Mor. n. 15. t. 2. f. 2. Prodr. 11. Fl. Cap. v. 1. 277. Willd. Sp. Pl. v. 1. 243.)—Tufts of flowers alternate, racemoſe. Sheaths ovate, entire.—Native of mountains in the road to Hautniquas and Lange Kloof, as well as of hills about Cape Town, flowering

in October and November, or in the latter ſituation, two months earlier. This ſpecies is two feet high, with broadiſh ſword-shaped leaves, and large handſome flowers, of a fine blue, compoſing a long falcateduſt duſter.

3. *A. ſpiralis*. White Ariſtea. Ait. n. 3. Ker in Ann. of Bot. n. 3. (*Moræa ſpiralis*; Linn. Suppl. 99. Willd. Sp. Pl. v. 1. 240. Curt. Mag. t. 520. Thunb. Mor. n. 2. Prodr. 10. Fl. Cap. v. 1. 263.)—Flowers ſpiked, in alternate pairs. Segments of the corolla of equal breadth. Sheaths linear-lanceolate, entire.—Native of the Cape, flowering in Auguſt. Stalk about a foot high. Leaves linear-ſwordſhaped. Flowers large, two inches broad, white with a purple ſtar in the centre; the three outermoſt ſegments brown at the back.

4. *A. melaleuca*. Mourning Ariſtea. Ait. n. 4. Ker in Curt. Mag. t. 1277. (*Moræa melaleuca*; Thunb. Mor. n. 1. t. 1. f. 3. Prodr. 10. Fl. Cap. v. 1. 261. Willd. Sp. Pl. v. 1. 240. Vahl Enum. v. 2. 153. M. lugens; Linn. Suppl. 99.)—Flowers alternate, folitary or in pairs. Three ſegments of the corolla not half the ſize of the reſt. Leaves linear.—Found in ſeveral ſandy buſhy places, at the Cape of Good Hope, flowering in September and October. The root is fibrous. Leaves numerous, two-ranked, four to fix inches long, and not a quarter of an inch broad. Flowers few, ſomewhat racemoſe, larger than the laſt, and very handſome, having three concave, almoſt orbicular, ſegments, of a ſky-blue, an inch and a half long, with three alternate, obovate, black ones, about half as long, and much narrower.

5. *A. puſilla*. Dwarf Ariſtea. Ker in Ann. of Bot. n. 5. (*Moræa puſilla*; Thunb. Mor. n. 4. Prodr. 11. Fl. Cap. v. 1. 265. Willd. Sp. Pl. v. 1. 241. Vahl Enum. v. 2. 154.)—Flower nearly folitary. Three ſegments of the corolla narrower than the reſt. Stalk two-edged. Leaves ſomewhat ſalcate. Thunberg ſeems to have forgotten the particular ſtations of this ſpecies at the Cape. Its root is fibrous. Stalk three inches high. Leaves two-ranked, linear-lanceolate. Sheaths entire. Corolla blue.

ARISTOLOCHIÆ, ſo named from the leading genus, is the twenty-third natural order in Juffieu's ſyſtem, being the only one in his fifth claſs. That claſs is defined as follows. Cotyledons two. Petals none. Stamens inferted into the piſtil. The Calyx is ſuperior, of one leaf. Stamens definite. Germen inferior; ſyle either wanting, or ſingle, or definitely multiplied; ſtigma ſimple or divided. Fruit of one or many cells.

The order is thus characterized. Calyx ſuperior, of one leaf, entire or divided. Stamens definite. Germen inferior; ſyle one, or nearly wanting; ſtigma divided. Fruit of many cells, with numerous ſeeds.

The only genera are, *Ariſtobchia*, *Afarum*, and *Cytinus*. Linnæus arranged them with his SARMENTACEÆ, but was ſubſequenty inclined to refer them to his RHOEADÆÆ. (See thoſe articles.) We have already obſerved that they do not belong to the latter, nor have they any relationship to the *Sarmentaceæ*, except ſomething in the habit and foliage of *Ariſtobchia*.

ARKANSAS, in *Geography*, a river of Louiſiana, which, next to the Miſſouri, is the moſt conſiderable tributary of the Miſſiſſippi. Its length is nearly 2500 miles, and at proper ſeaſons it is navigable nearly through the whole diſtance. In many places, however, its channel is broad and ſhallow, at leaſt above the rapids, ſo as to render navigation almoſt impracticable. Until 800 or 900 miles from its mouth it receives no conſiderable ſtreams, on account of the vicinity

of the waters of the Missouri, of the Kansas, &c. on the one side, and those of Red river on the other. The chief rivers which fall into it are, the Verdigris, the Nebracka, Canadian river, Grand river, &c. Several are remarkable for being strongly impregnated with salt; the Arkansas itself, at certain seasons, is said to be brackish. The lands on this river for 600 or 800 miles upwards are described as very fine, and capable of affording settlements, though principally untimbered. The Arkansas is a place situated 60 miles up the river, and contains 450 inhabitants. It has a few stores, and seems to be improving. There is a considerable trade with the Osages up the Arkansas, and with the Indians, who live in the White river country. This is also a French establishment, and has the same proportion of Americans as the other towns. The territory of the Missouri contains about 874 Arkansas, whose settlements are principally in the neighbourhood of the Arkansas post, or extend up the river; and they are the least considerable of the territory. Brackenridge's Views of Louisiana.

ARMENIA, col. 3, l. 49, add—And the southern, which are possessed by numerous independent chiefs. At the close of the article Armenia add—The Turkish pachalics of Armenia are, Erzeroom, Akikfa, Khars, Bayazid, Moolh, and Diarbekr. These pachalics are subdivided into districts, governed by Vairodes.

ARMENIA, a province of Georgia, which has the Kur to the N.E., the Mossan or Sissian hills to the S., and those of the Karagatch to the W. This province has been long celebrated for its mines of gold, silver, lead, iron, and copper, as well as for its quarries of marble and Jasper; the principal of which are those of Quoefch and Tamblutt. It is the best peopled and most flourishing of the provinces of Georgia, and contains many towns. Kinnair's Persia.

ARNOPOGON, in Botany. See TRAGOPOGON at the end.

ARROIDEÆ, a very natural order of plants, the seventh in Jussieu's method; being the first of his second class, of which we have detailed the characters under ΤΡΥΧÆ.

The *Arroideæ* are thus described. *Spadix* simple, many-flowered, either naked, or involved in a *Spatha*, or Sheath. *Calyx* none, or simple. *Stamens* either definite or indefinite, inserted into the *spadix*. *Germens* originating from the same *spadix*, either naked, or encompassed with a calyx, in some instances mixed with the stamens, in others separated from them; styles one to each germen, or none at all; stigmas as many. *Fruits* as many, of one cell, with one or many seeds. *Corculum* in the centre of a fleshy albumen. *Leaves* sheathing, alternate, for the most part all radical. *Spadix* often solitary, seated either on the top of the stem, or more frequently on a radical stalk. The plants are rarely caulescent; some of them remarkably irregular in the disposition of their organs of fecundation.

SECT. 1. *Spadix* enfolded in a *spatha*.

Amброfina, *Zojlera*, *Arum*, *Calla*, *Dracontium*, and *Pothos*, all Linnæan genera, with *Houttuynia* of Thunberg.

SECT. 2. *Spadix* naked, destitute of a *spatha*.

Orontium and *Acorus*.

It must be observed, on the authority of Jussieu himself, that the plants of this order are only presumed to be monocotyledonous, their germination not having been properly examined. The conjecture however is supported by Gærtner's figures, the habit of the plants, and the ternary disposition of the parts of fructification in some of the genera.

This order is nearly analogous to the *Piperitæ* of Linnæus, except that *Piper* and *Saururus* are included in the latter; a measure to which Jussieu himself seems inclined.

AROSIS. Add—See TAB.

VOL. XXXIX.

ARROBA, in Commerce, a weight in Portugal and Spain. At Oporto 1 arroba, or arrove, = 32 aratees, and 4 arrobas, or 128 lbs. = 1 quintal. The quintal at the India-house is 112 aratees. (See QUINTAL.) In Spain the arroba is also a liquid measure. A moyo of wine contains 16 arrobas, an arroba = 8 azumbres = 2 quartillos. The arroba of wine, or great arroba, is the same all over Spain, regulated by the standard measure of Toledo, which contains 34 lbs. of river water (Castilian weight), and measures 1237½ Spanish or 981 English cubic inches; so that 4 such arrobas are = 17 English wine gallons. The arroba of oil, or lesser arroba, regulated by the same standard measure, which weighs 25 lbs. of oil, or 26 lbs. 9oz. of river water (Castilian weight), and measures 966½ Spanish or 771 English cubic inches. Hence 3 such arrobas answer to 10 English gallons. The arroba is divided into 4 quartillos, or 100 quarterones or panillas. A Spanish botta contains 30 arrobas of wine, or 38½ of oil; a pipe is 27 arrobas of wine, or 34½ of oil; so that the botta is = 127½ English gallons, and the pipe 114½. Kelly's Cambist.

ARSKEEN, or AREKIN, a long measure in Russia. See VERSHOK.

VOL. III.

ARTERIES, *Diseases of*. Arteries being composed of blood-vessels, nerves, and absorbents, are liable to the same morbid alterations, and endowed with the same powers of reparation, as soft parts in general; their coats inflame, and pass through the different stages of adhesion, suppuration, or gangrene, in the same manner as the skin, a gland, or a muscle.

The internal coat of an artery, Mr. Hodgson observes, bears a striking analogy to serous membranes in its tendency to the adhesive inflammation; and this property is in the blood-vessels, as in all organs, the first agent of reparation in injuries from accident or disease. The inflammation which is excited by the wound or division of an artery produces an effusion of lymph, which seals the extremity of the vessel, and affecting also the external coat becomes the basis of adhesion and final obliteration. A punctured artery is united by the same adhesive process which repairs wounds in general; and if irritation be excited in the coats of an artery by pressure, adhesive inflammation is the consequence, lymph is effused into the cavity, and into the cellular substance, connecting the coats of the vessel; its sides coalesce; and it is rendered impervious. The same adhesive process frequently prevents hemorrhage, where abscesses, or extensive ulcerations, exist in the neighbourhood of large vessels, the inflammation which precedes the suppuration having produced an effusion of lymph between the coats, and into the cavity of the arteries, whereby it is obliterated. But the most perfect demonstration of the effects of acute inflammation upon the internal coat of an artery, Mr. Hodgson thinks, is to be met with in the cases where the disease appears to have extended to the vessel from the contiguous parts. Thus, in a fatal instance of violent pneumonia, besides the usual appearances on dissection, the inflammation was found to have extended to the aorta, the internal coat of which was of a deep red colour, and a considerable effusion of lymph had taken place into its cavity. The effused lymph was very intimately connected with the internal coat of the vessel, and a plug of it had extended into the left subclavian artery, and nearly obliterated the cavity of that vessel. (Treatise on the Diseases of Arteries and Veins, p. 5.) Mr. Hodgson has observed a similar state of the great blood-vessels in a less degree from carditis, pneumonia, and bronchitis,

ARTERIES.

bronchitis. The granulations, or fungous growths, which are not infrequently met with at the origin of the aorta upon the semi-lunar valves, or in the cavities of the heart, are said sometimes to originate in the lymph thus effused upon the internal membrane. Mr. Hodgson also assures us, that the inflammation excited in an artery of the extremities by the application of a ligature has been known to extend along the internal coat of the vessel to the heart itself, as we know is often the case with respect to the veins.

According to the same well-informed writer, chronic inflammation may generally be remarked in thickened and calcareous arteries, particularly in aneurismal subjects. The internal coat of the vessel is soft, thickened, of a deep red colour, which is not uniform, but irregularly disposed in the vicinity of ulcerations, thickenings, or calcareous depositions. P. 9.

Ulceration of an artery may commence in the vessel itself, or extend to it from the surrounding part. In the first circumstance, it is always found first on the internal coat, and is generally preceded by some other morbid change of the vessel. Thus, it is not infrequently met with around the circumference of calcareous depositions, or upon the surface of atheromatous thickenings; and aneurism is, without doubt, occasionally a consequence of such ulceration, the coats of the vessels being completely destroyed by it, and the blood escaping into the surrounding cellular substance, which becomes gradually expanded into a sac. Hemorrhage is often caused by ulceration extending from surrounding parts to the coats of arteries, as in cancerous and phagedenic ulcers; and Mr. Hodgson even thinks that many passive hemorrhages are produced by ulceration beginning on the inner surface of these vessels.

Sphacelation of arteries in consequence of inflammation of their internal coat has not hitherto been observed. Arteries, however, are often included in extensive sloughing of parts, in which case the blood generally coagulates in the vessels to a considerable extent above the line of sphacelation; an occurrence which seems destined to prevent hemorrhage on the separation of the slough. The coagulum is afterwards absorbed, and the vessel obliterated.

From considering the inflammation of arteries and its effects, our author proceeds to speak of various morbid appearances to which the coats of arteries are liable, in consequence of their peculiar structure and functions.

1. The internal coat of arteries is sometimes thickened and converted into a substance resembling cartilage, or the thickened peritoneum of an old hernial sac. This disease is confined to the internal coat, which having lost its elasticity sometimes cracks, and forms scales that hang into the cavity of the vessel. Calcareous depositions often accompany this alteration of structure, and the surrounding parts of the membrane generally exhibit signs of chronic inflammation. The semi-lunar valves of the aorta are not infrequently changed into a dense fibrous structure, resembling ligament, or tendon; sometimes they are converted into cartilage, and are manifestly incompetent to their office as valves. In several instances, Mr. Hodgson has found them ruptured, forming cartilaginous eminences on the sides of the vessel.

2. The internal surface of arteries exhibits frequently a thickened and pulpy structure, sometimes with the appearance of small flattened tubercles, and, in other examples, with an irregular and somewhat fleshy appearance over the whole surface. This disease is confined to the internal coat, and is often found in aneurismal subjects.

3. A deposition of atheromatous or purulent matter in the cellular membrane, which connects the internal and middle coats of the vessel. The diseased part is of an opaque yellow colour, sometimes extensive, and considerably elevated above the surrounding surface, and on other occasions circumscribed, and having a pustular or tuberculated appearance. If punctured, matter may be pressed from underneath the internal coat, varying in consistency from that of cheese to that of common pus. Mr. Hodgson has seen the emulgent and femoral arteries in the same subject quite obstructed by the accumulation of this curdy matter.

4. Certain fungous or wart-like excrescences have been observed upon the semi-lunar valves of the aorta and pulmonary artery, and also upon the mitral and bicuspid valves. They are of rare occurrence. Corvisart's opinion respecting the syphilitic nature of their cause is not intitled to any degree of credit; and Mr. Hodgson relates a case, where the absence of that disease throughout the whole of life made it impossible that they could have had such an origin. The femoral artery and commencement of the profunda were in this instance completely obstructed by a fungous growth, similar to what was found upon the semi-lunar valves of the aorta.

5. The next disease to be noticed is a deposition of calcareous matter in the coats of arteries. In old age this happens so frequently, that Bichat was induced to regard it as a natural phenomenon rather than a disease. The incrustation seems to commence in the substance of the internal coat, a delicate pellicle covering the calcareous matter, and separating it from the blood passing through the cavity of the vessel. Sometimes this pellicle is deficient, or hangs into the cavity of the vessel, and the blood is in contact with the incrustation itself. Sometimes all the coats of the vessel are involved in the disease, and are converted into a long cylinder, in which no remnants of the original structure can be traced. (Hodgson, p. 21.) The formation of these depositions bears no resemblance to that of bone; they are seldom, if ever, preceded by the existence of cartilage; and no regular arrangement is discernible in them, corresponding to the fibrous structure of bone. According to Mr. Brande's analysis of them, they contain 65.5 phosphate of lime, and 31.5 animal matter, without any carbonate of lime.

Calcareous matter is frequently deposited in the substance of the semi-lunar valves of the aorta, and produces more serious consequences, than when it takes place in any other part of the arterial system. The valves becoming rigid and fixed diminish the size of the opening into the aorta. Whilst the pulse at the wrist is feeble, the heart is acting violently to compensate for the diminution in the quantity of blood which should pass through the aorta; and this comparative difference between the pulse at the wrist and that at the heart will, Mr. Hodgson conceives, in advanced cases, be sufficient to enable us to ascertain the existence of this incurable disease. A similar disproportion between the pulse at the heart and at the wrist exists also when the opening between the left auricle and ventricle is contracted; but a double pulsation of the heart has been observed in this case, and is said to distinguish it from contraction of the orifice of the aorta by ossification of its valves.

Mr. Hodgson has given some interesting cases of ossification of the coronary arteries. In one, the heart was unusually small; its parietes soft and flaccid, and upon the ventricles not the eighth of an inch thick; whilst the coronary arteries and many of their ramifications were converted

into

into calcareous tubes, and some of them nearly rendered impervious. This morbid appearance does not exist in every case which is attended with the train of symptoms, to which we apply the term *angina pectoris*. Violent pain in the situation of the heart, extending down the anus, and terminating in a sensation of numbness, palpitation, and irregularity in its action, with frequent syncope and difficult respiration, accompany almost all the organic diseases of that organ. (Hodgson, p. 36.) The deposition of calcareous matter is seldom found in the upper extremities; and although so frequent in the aorta, it has rarely or never been met with in the pulmonary artery, or its valves. See Hodgson on the Diseases of Arteries and Veins, 8vo. London, 1815.

Aneurism, which constitutes the most important disease of arteries, has been treated of in a separate article, to which we have already annexed some additional particulars under the head of SURGERY. A few other observations, relative to the same subject, will be found at the words ANEURISM and AORTA in this *Addenda*.

ARTHONIA, in *Botany*, a genus of the Lichen tribe, thus named by its learned author professor Acharius, in *Schrad. Neues Journal*, v. 1. fasc. 3. 1. t. 4. "Lichenogr. Univ. 25. t. 1. f. 3, 4." Syn. 4. Sm. Engl. Bot. v. 29. 2079.—Class and order, *Cryptogamia Algæ*. Nat. Ord. *Lichenes*.

Ess. Ch. Receptacles in an uninterrupted crust, shapeless, without a border, smooth, in which the seeds are imbedded.

In habit, the generality of the species which constitute this genus are akin to SPILOMA and OPEGRAPHA. (See those articles.) But Acharius originally included herein the *Lichen croceus*, and *L. faccatus* of Linnaeus, which are now separated on account of their totally different habit, and leafy fronds, by the name of *Solorina*, Lichenogr. Univ. 27. t. 1. f. 5, 6; to that *Arthonia* is rendered much more natural. In the *Synopsis* of this writer, his latest publication, twelve species are defined.

Among them are,

A. Swartziana, n. 5. Engl. Bot. t. 2079.—Crust thin, membranous, scaly, cream-coloured. Receptacles sessile, black, depressed, roundish, wavy, rather uneven, confluent.—Found on the smooth bark of trees.

A. afroidea, n. 7. (*Opegrapha afroidea*; Ach. Meth. 25. Engl. Bot. t. 1847).—Crust limited, membranous, smooth, greenish-white, somewhat shining. Receptacles depressed, flat, angular, irregularly starry, black.—Frequent on young trees. We cannot consider this otherwise than as an *Opegrapha*.

A. obscura, n. 8. Engl. Bot. t. 1752.—Crust membranous, olive-brown. Receptacles minute, flattish, thin, elliptical or kidney-shaped, sunk, slightly uneven, black.—On the barks of trees, not common, nor very easily to be observed. The crust rises into irregular swellings, and the copious receptacles are sunk very deep into its substance. The genus of this plant is indeed obscure, nor can we offer any better determination respecting it than that of Acharius.

A. lyncea, n. 11. (*Lichen lynceus*; Engl. Bot. t. 809.)—Crust white, thin, even, somewhat tartareous. Receptacles numerous but distinct, flat, rather sunk, oblong, blunt, often curved, black, with a glaucous tinge.—Found by Mr. Sowerby, nearly covering the rugged barks of old oaks. The receptacles resemble a leopard's or lynx's skin, and are not crowded nor confluent, though curved and approaching each other in every direction, the margin of each black. We should rather refer this species to *Opegrapha*.

A. pruinosæ, n. 12. (*Lichen impolitus*; Ehrh. Crypt. Achar. Prodr. 56. Engl. Bot. t. 981.)—Crust whitish, thin, somewhat tartareous, unequal, smooth. Receptacles flat, sunk, roundish or angular, confluent, dull orange-brown, with a glaucous tinge.—On the trunks of trees, especially oaks. We cannot but think the original specific name peculiarly happy, and for that reason, if no other, it ought not to have been changed, especially as *pruinosa* is equally suitable to the last species. The present looks of an uniform dirty white, till touched by some hardish body, when the brown receptacles, tinged with yellow, become strikingly apparent, and are contrasted with the unaltered crust. The figure in *Engl. Bot.* printed in red, is altogether erroneous.

ARTHROPODIUM, named in allusion to the joint in each flower-stalk, by Mr. Brown, from *ἄρθρον*, a joint, and *πους*, a foot, or support.—Brown Prodr. Nov. Holl. v. 1. 276. Ait. Hort. Kew. v. 2. 271.—Class and order, *Hexandria Monogynia*. Nat. Ord. *Coronaria*, Linn. *Asphodeli*, Juss. *Asphodeles*, Brown.

Gen. Ch. *Cal.* none. *Cor.* of one petal, inferior, in six deep, regular, spreading, deciduous segments; the three innermost waved or fringed at the margin. *Stam.* Filaments six, tapering, densely bearded; anthers roundish, attached by the notch at their base. *Pist.* Germen superior, roundish, with three furrows; style solitary, erect, cylindrical; stigma capitate, hairy. *Peric.* Capsule nearly globular, with three furrows; three cells, and three valves; the partitions from the centre of each valve. *Seeds* few in each cell, somewhat angular, with a naked scar.

Ess. Ch. Corolla in six deep equal segments; three innermost waved or fringed at the margin. Filaments bearded. Capsule nearly globular.

This genus is allowed by its author to come very near *Anthericum*, to which some of the species have been referred by other writers. Indeed we can discover no difference, (three of the filaments in *Anthericum*, if not all of them, being bearded,) except the wavy or fringed inner segments of the corolla. *Anthericum* being a very extensive genus, whose limits are not well defined, it is highly desirable to lessen the number of species, by establishing new genera from among them, by any certain, however apparently slight, criterion; and it must always be recollected that, in the natural order to which these plants belong, very natural genera are discriminated by apparently rather trivial marks.

Arthropodium is observed by Mr. Brown to consist of smooth herbaceous plants, with fasciculated roots, composed either of bulbs, occasionally stalked, or of thick fleshy fibres. Leaves linear, flaccid. Clusters lax. Flower-stalks either aggregate or solitary, each with a joint in the middle. Flowers pendulous, either purplish or white. Corolla closing after flowering, and long before the fruit ripens, falling off, leaving its permanent cup-like withered base behind. The anthers are purple, or whitish. THYSANOTUS of our learned friend, already described in our thirty-fifth volume, comes nearer to *Arthropodium* and *Anthericum* than to the *Asparagus* tribe, to which it has been referred; the beautifully fringed inner segments of the corolla especially resembling the present genus. But *Thysanotus* has smooth filaments, unequal anthers, and a declining style, with a smaller stigma. The seeds moreover differ very essentially.

1. *A. paniculatum*. Panicled *Arthropodium*. Br. n. 1. Ait. n. 1. (*Anthericum paniculatum*; Andr. Repos. t. 395. A. milleflorum; Redout. Liliac. t. 58.)—Cluster divided; flower-stalks aggregate. Inner segments of the corolla

X x 2 finely

finely crenate. Capsule pendulous. Bulbs stalked.—Native of the neighbourhood of Port Jackson, New South Wales, from whence we received specimens, near thirty years ago, through the hands of Dr. White. Seeds were communicated by Mr. Geo. Caley to Sir J. Banks, for Kew garden, in 1800, and this elegant species is now to be seen in many green-houses, flowering in various summer months. The root is perennial. Stem erect, round, three or four feet high; slightly leafy in the lower part; much branched and panicled above. Leaves linear, pointed, channelled; sheathing at the base, a foot or more in length, chiefly radical. Branches of the panicle usually in pairs, spreading, racemose. Flowers drooping, three or four together, on undivided partial stalks. Corolla reflexed, half an inch in diameter, white variegated with lilac; three outer segments small, acute; three inner ovate, elegantly crisped at the margin. Beard of the *filaments* dense, yellow. Anthers and stigma purple.

2. *A. striatum*. Upright Arthropodium. Br. n. 2.—“Cluster almost simple, many-flowered; flower-stalks foliary. Capsules erect.”—Gathered by Mr. Brown, in Van Diemen’s island, but after the flowers were past.

3. *A. minus*. Lesser Arthropodium. Br. n. 3.—“Cluster simple, with few flowers; flower-stalks foliary. Bulbs sessile.”—Found by Mr. Brown, near Port Jackson.

4. *A. fimbriatum*. Fringed Arthropodium. Br. n. 4.—“Cluster simple; lower flower-stalks in pairs. Filaments naked in their lower part; tumid and spongy at the top. Anthers linear. Inner segments of the corolla fringed.”—Native of the neighbourhood of Port Jackson, where it was noticed by Mr. Brown, who observes that the structure of the *filaments* is so different from the rest, as to make him hesitate whether this species ought not to form a genus by itself. We are not sure whether we are possessed of any specimens.

ARTHROSTYLIS, from *arthron*, a joint, and *stylis*, the style, because of the articulation by which that part is joined to the germen.—Brown Prodr. Nov. Holl. v. 1. 229.—Class and order, *Triandria Monogynia*. Nat. Ord. *Calamaria*, Lin. *Cyperaceae*, Brown.

Eff. Ch. Spikelet single-flowered. Glumes chaffy, imbricated; the lower ones empty. No bristles around the germen. Style awl-shaped, triangular, articulated with the germen, deciduous. Stigmas three. Nut triangular.

1. *A. aphylla*. Leafless Arthrostylis. Br. n. 1.—Found by Sir Joseph Banks, in that part of New Holland which lies within the tropic. The stems are slender, unbranched, without joints or knots; sheathed at the base; naked in the upper part. Head terminal, simple, turbinate, longer than its three or four-leaved, awl-shaped involucre. This genus differs from *ABILDGARDIA* in its habit, and single-flowered spikelet; from *RHYNOSPORA* in having a deciduous style, and no bristles surrounding the base of the germen; see those articles. Brown.

ARTUSI, l. 4, insert, he.

ARVE, for Rhine r. Rhone.

ARUNDINARIA, in Botany, inadmissible as a generic name, being formed by an alteration of *Arundo*, already received, is applied by Michaux, Fl. Boreal-Amer. v. 1. 73, to a genus now called *Miegia*, in Perf. Ench. v. 1. 102, according to Pursh, 59. This cannot, we presume, answer to Schreber’s *MIEGIA*, (see that article,) as the florets in Michaux’s plant are numerous; so that here is some confusion which we must leave the writers in question to settle.

AS, in Commerce, a small Dutch weight, used also at Hamburg, and in Sweden. At Amsterdam, 640 aſes are = an ounce, and 8 ounces = a mark troy. (SEE MARK.)

In Sweden the smallest denomination of weight is the *as*, which is the same as the *as* of Amsterdam. The mark for weighing gold and silver, called “silver-marck,” is 4384 aſes, or 3252 grains English troy weight. Hence 40 such marks are = 271 ounces troy. In apothecaries’ weight, the pound is 7416 aſes, or 5400 grains troy; and hence 16 such pounds = 15 pounds English troy, or apothecaries’ weight.

As, l. 16. 23. 27, for Thullus r. Tullus.

ASAM, l. 2, after Bengal, insert—bordering on the country of the Grand Lama, or Bootan—after Hindoftan, or separated from Decca, the N.E. quarter of Bengal, by a range of hills, intersected by the Garrows;—after Meckley, or Ava and Arracan.

L. 16, after journey, add—It is understood to be about 700 miles in length, and its mean breadth above 70, though in some places, where the mountains recede, it greatly exceeds that proportion. Dr. Wade thinks 60,000 square miles a very moderate calculation of its superficial extent, so that it considerably exceeds England and Wales. The whole country is a valley of great fertility, not only divided by the great stream of Burhampooter, but every where intersected by numerous rivers.

ASAPH, Str. l. 12, for Shipley r. Bagot.

ASCHRAFF. Add—This place is seated on the shore of a bay, which is the only good harbour on the southern side of the Caspian sea.

ASCOBOLUS, in Botany, from *ασκος*, a skin, or case, and *βολος*, a cast, or throw, because the seeds are thrown out with elasticity, several together, in oblong cases.—Perf. Syn. Fung. 676. Obf. Mycol. fasc. 1. 33.—Class and order, *Cryptogamia Fungi*. Nat. Ord. *Fungi*.

Eff. Ch. Receptacle hemispherical, fleshy. Seed-cases prominent, oblong, discharged elastically. Seeds about eight, lodged in moisture.

1. *A. furfuraceus*. Powdery Ascobolus. Perf. Obf. Mycol. fasc. 1. 33. t. 4. f. 3, a, and 4, 5, 6. (Peziza stercoraria; Bull. Fung. v. 1. 256. t. 376. Sowerb. Fung. t. 18.)—Crowded, rather concave, olive-brown, externally scurfy.—Common on cow-dung late in autumn. Variable in colour. Bulliard has what he conceives a variety, t. 438. f. 4, in which the disk is pale purple, the outside white.

2. *A. carneus*. Flesh-coloured Ascobolus.—Smooth, flesh-coloured.—Found rarely on dung, in woods. All over of a very pale red.

3. *A. glaber*. Smooth Brown Ascobolus. Perf. Obf. Mycol. fasc. 1. 34. t. 4. f. 3, b, and f. 7, a, b, c.—Minute, crowded, smooth, rather convex, of a shining brown.—Common on cow-dung, in autumn. Variable in shape according to its age.

4. *A. immerfus*. Sunk Ascobolus. Ibid. 35. t. 4. f. 7, d, e.—Scattered, immerfed, irregular, somewhat conical, rather scurfy externally.—In the same situations, almost entirely sunk in the dung, so that the seed-cases only are prominent, containing black seeds, floating in an evident fluid. *Perfoon*.

ASCOPHORA, from *ασκος*, a skin, or bladder, and *σπορα*, to bear. The name originated with Tode, Fung. Mecklenb. fasc. 1. 13, who extended his genus to several species. Perfoon restricts it to a solitary species. Perf. Syn. Fung. 685.—Class and order, *Cryptogamia Fungi*. Nat. Ord. *Fungi*.

Eff. Ch. Thread-shaped, terminating in an empty, slightly inflated, head.

1. *A. perennis*. Perennial Bladder-mould. (*A. ovalis*; Tode Fung. Mecklenb. fasc. 1. 15. *Ascidium oratum*;
Tode

Tode in Schrift. der Berl. Gesellsch. Naturf. Fr. v. 3. 247. t. 1. f. 4—6.)—Found in autumn, either at the extremities of the branches, or on the trunks, of trees, such as Willows, &c. It may be preserved a long time without decaying, or even shrinking. Tode describes the *head* as at first like a drop of water, but soon assuming an oval figure, shining like silver, and subsequently besprinkled with snow-white powder, probably the *seeds*. This betrays some affinity to *STILBUM*; see that article.

ASCIDIA, l. ult., *dele* which see respectively, and insert, See VERNES.

ASCONUS, l. 1, r. Pedianus; l. 3, 4, *dele* Quintilian and ASH, in *Geography*, a county of North Carolina, containing 6304 inhabitants, 147 being slaves.

ASHARIANS. See ASCHIARIANS.

ASHBURNHAM, l. 4, r. 1036.

ASHBY, l. 3, r. 1103.

ASHFIELD, l. 4, r. 1809.

ASHFORD, a township of America, &c. add—The number of inhabitants by the census in 1810 is 2532.

ASHFORD, *New*, &c. for 460 r. 411.

ASHTABELU, a township of the county of Georgia, in the district of Ohio, having 221 inhabitants.

ASHTON, a township of Pennsylvania, in the county of Delaware, having 765 inhabitants.

ASIA, col. 24, l. 31, after height, insert—but by late discoveries and measurements, their altitude has been found to be much more considerable than geographers formerly apprehended and stated. See MOUNTAINS.

ASILUS, l. 16, *dele* which see respectively.

ASMINA, in *Botany*, a barbarous name, employed by Adanson, and, according to him, of Canadian origin. De Candolle, by his adoption, *Syll.* v. 1. 478, might possibly render it classical, there being no objection on the score of euphony, nor any meaning contrary to reason or sense, as in many other cases of a similar kind. As far as we know, the word is destitute of all meaning whatever; in which respect Michaux's synonym, *Orchidocarpum*, would be preferable, were the idea it conveys unexceptionable, and the word not compounded of another generic name. All things considered, we prefer PORCELIA (see that article hereafter) as entirely free from objection; for we cannot follow our distinguished friend, De Candolle, in separating this last-named genus from his *Afmina*. Our preceding articles ORCHIDOCARPUM and PORCELIA are now superseded, in consequence of more accurate information, chiefly furnished by De Candolle.

ASPARAGI, the 12th natural order in Jussieu's system, the second of his third class; for the full characters of which class, see PALMÆ.

Jussieu thus defines the *Asparagi*, which are nearly equivalent, as we have already observed, to the Linnæan SARMEN-TACEÆ. See that article.

Calyx in six divisions, regular, usually deeply divided and inferior, rarely superior. *Stamens* six, inserted into the lower part, rarely into the middle, of the calyx. *Germen* simple, mostly superior; styles either three, with as many stigmas, or the style is simple, with a simple or three-cleft stigma. *Fruit* pulpy, rarely capsular, superior, rarely inferior, of three cells, with one, two, or not many more seeds in each. *Coraculum* at the scar of the horny albumen.

The *stem* is frequently herbaceous, in some cases shrubby. *Leaves* mostly alternate, seldom opposite or whorled, for the most part not sheathing, but merely clasping the stem. *Flowers* each with a separate sheath; in some instances, perhaps from abortion, dioecious. A third part of the fructi-

fication is sometimes, in a few instances, suppressed, or a fourth is added.

SECT. 1. *Flowers perfect. Germen superior.*

Dracana of Linnæus; *Dianella* of Lamarck; *Ripogonum* of Forster; *Flagellaria* and *Asparagus* of Linnæus; *Calixene* and *Phlegia* of Comberlon; *Medeola*, *Trillium*, *Paris*, and *Convallaria* of Linnæus and others, constitute this section.

SECT. 2. *Flowers dioecious. Germen superior.*

Ruscus, *Smilax*, and *Discorea*.

SECT. 3. *Flowers dioecious. Germen inferior.*

Tamus of Linnæus, (which Jussieu, following Tournefort, calls *Tamnus*), and *Rajania*.

Mr. Brown, *Prodr. Nov. Holl.* v. 1, has greatly curtailed this order, referring some of its genera to the *Asphodeli* or *Asphodelez*, and establishing out of it a new order, termed *Smilacæ*, composed of *Trillium*, *Paris*, *Medeola*, (except its Cape species,) *Convallaria*, and *Streptopus*, with his own *Dryophila*, *Ripogonum* of Forster, and *Smilax*. The same author has also founded on the genera of *Discorea* and *Rajania* another order called *Discoreæ*; but surely *Tamus*, by his own account, connects this with the *Smilacæ*.

ASPE, for Berne r. Bear; and for Switzerland r. France.

ASPER, in *Commerce*. Subjoin—See PIASTRE.

ASPERGILLUS, in *Botany*, a name first applied by Micheli, *Nov. Gen.* 212. t. 91, to a tribe of minute *Fungi*, and expressive of their resemblance to the form of a sprinkling-brush, used for holy water in Catholic countries. This tribe is now become a section of Perfoon's MONILIA. See that article.

ASPERIFOLIÆ, the forty-first of the natural orders of Linnæus, is one of the most natural of these assemblages. It was first pointed out by Cæsalpinus, but obtained the above name from Ray, in allusion to the roughness of the foliage. To this character one or two species of *Cynoglossum* and of *Pulmanaria* alone afford exceptions; which indeed are but partial, for even in these some bristly roughness is almost always to be discovered, either on the surface or margin. This order is analogous to Jussieu's *Borraginæ*, and is so well defined that Linnæus has, contrary to his usual practice, given its characters at some length, as follows.

Root fibrous. *Cotyledons* two. *Stem* with alternate round branches. *Leaves* alternate, simple, for the most part nearly entire, rough with scattered bristly hairs, or callous warts; convolute before they expand. *Stipulas* wanting, as well as all other appendages in general. *Flowers* unilateral; their common stalks, generally in pairs, revolute in a spiral manner, and gradually unrolled as the flowers are ready to open. *Calyx* in five more or less deep divisions. *Corolla* monopetalous, inferior, five-cleft, regular except in *Echium*; its mouth either closed with vaulted valves, or crowned with teeth, or naked and perversive. *Stamens* five, equal, except in *Echium*. *Fruit* superior. *Germens* four, except in some species of *Cynoglossum*, *Tournefortia*, and *Nolana*, to which *Cerinthæ* should be added; but *Nolana* was properly removed by Linnæus afterwards to his *Luride*; these are inserted into the receptacle by their base; hence the lower part of each *seed* becomes tapering, as if finished artificially. *Pistil* one; style not an elongation of the germens, but sunk between them in the centre, often divided into two equal parts. *Seeds* four, rarely combined into two.

The genera stand thus:

SECT. 1. *Symphytum*, *Onosma*, *Cerinthæ*, *Borago*, *Echium*, *Lycophis*,

Lycopis, *Asperugo*, *Pulmonaria*, *Lithospermum*, *Cynoglossum*, *Anchusa*, *Myosotis*, and *Heliotropium*.

SECT. 2. *Tournefortia*, *Varronia*, *Ebretia*, *Cordia*, and *Patagonula*.

SECT. 3. *Nolana*; here placed by itself, is now removed.

In the Linnæan manuscript, *Messerschmidia* is introduced between *Echium* and *Lycopis*; *Coldenia* after *Heliotropium*; *Hypophyllum* and *Ellisia* after *Tournefortia*; and *Ebretia* is removed to the end of all.

In the generic distinctions of this order, the valves or teeth of the *corolla*, and the more or less deep divisions of the *calyx*, take the lead. Linnæus has been thought by some to have multiplied the genera beyond necessity; yet it is hard to say how they could naturally be abridged. The plants love a dry hilly situation, and become smoother as they approach nearer to water.

The numerical anomaly in the fructification of the *Asperifolia*, of the four-cleft fruit, with a five-cleft flower, is one of their striking characters, in which they indeed agree with the Linnæan *Verticillata*, Jussieu's *Labiata*; but the irregular *corolla*, unequally-divided style, opposite *leaves*, and square *stems*, of the latter, and especially their four *stamens*, two longer and two shorter, clearly distinguish them. Their qualities also greatly differ, being aromatic, not mucilaginous and scentless. Their *flowers* are generally red or purple; those of the *Asperifolia* of a beautiful blue, though mostly of as beautiful a red before expansion.

ASPHODELI, the sixteenth natural order in Jussieu's method, the sixth of his third class, thus denominated after *Asphodelus*, one of its well-known genera. Mr. Brown, who has greatly enriched this order with new genera, as well as with removals from the ASPARAGI (see that article), gives it the appellation of *Asphodeles*, Prodr. Nov. Holl. v. 1. 274. The characters of Jussieu's third class are detailed under PALMÆ. He thus defines the *Asphodeli*.

Calyx inferior, coloured, often in fix deep equal segments; rarely tubular, with six less deep divisions. *Stamens* six, inserted into the bottom or the middle of the *calyx*. *Germen* superior, simple; style single; stigma either simple or three-cleft. *Capsule* of three cells and three valves, with many seeds.

The root in a great portion of these plants is bulbous, sending up a leafless *stalk*, and producing capillary fibres from its base downwards; in the rest it is fibrous, bearing a *stem*, for the most part herbaceous. *Leaves* sheathing, alternate, all generally radical. *Spike* often simple, terminating the stalk; sometimes branched, with scaly sheaths under each branch. *Flowers* each accompanied by a sheath, or *spatha*, spiked, (in *Allium* umbellate,) terminal, or rarely axillary.

SECT. 1. *Flowers* spiked. *Root* fibrous. *Calyx* tubular. *Aletris* and *Aloe* compose this section.

SECT. 2. *Flowers* spiked. *Root* fibrous. *Calyx* in six deep segments, bearing the *stamens* at its base.

Anthericum of Linnæus, comprehended under *Asphodelus* by Tournefort; *Phalangium* of Tournefort, partly comprehended by Linnæus under *Anthericum* (and very improperly named, as *Phalangium* is an established genus of insects); with *Asphodelus*, of Tournefort and Linnæus, constitute this section.

SECT. 3. *Flowers* spiked. *Root* bulbous. *Calyx* tubular at the base.

Basilæa of Jussieu, now universally called *Encomis*; *Hycinthus* of Tournefort and Linnæus, and including *Muscari* of the former; *Phormium* of Forster, and *Maflonia* of Thunberg. *Lachenalia* of Jacquin ought also, as Jussieu suspects,

to be placed here, being very distinct from *Phormium*, though once confounded with it.

SECT. 4. *Flowers* spiked. *Root* bulbous. *Calyx* in six deep segments, bearing the *stamens* at their base. *Cyanella*, *Albuca*, *Scilla*, and *Ornithogalum*.

SECT. 5. *Flowers* umbellate. *Root* bulbous. *Calyx* in six deep equal segments.

Allium is here the only genus.

Mr. Brown declares, that he has in vain sought to establish a clear definition of this order, though a truly natural assemblage, whether considered as an order by itself, or as a section of the *Liliaceæ*. (See LILIA.) He has not been able to detect any character common to all the plants, which is not found in several of their near allies, except the black, crustaceous, brittle skin of the *seed*, easily separable from its very thin proper membranous integument. Hence Mr. Brown has been led to place at the end of this family *Hypoxis* and *Curculigo*, as having a similar skin, though their *germen* is inferior: and for the same reason he removes *Blansfordia* from hence, not only on account of the hairy integument of its *seed*, but also because there is a difference in the bursting of its *capsule*, to say nothing of other particulars. The same author notices a joint at the middle or summit of the flower-stalks, frequent in this family, and scarcely observable in the neighbouring orders, except in *Sansiveria*, and some of the *Commelina* tribe. He is decided against separating the pulpy-fruited genera from the rest, either in this order, or the true *Liliaceæ*. It is needless to point out, that what Jussieu and Brown term *calyx* in all these plants, is with Linnæus and his school a *corolla*, and bears the latter appellation in Hort. Kew. The New Holland *Asphodeles* are thus arranged by Mr. Brown. *Anthericum*; *Arthropodium*, Br.; *Chlorophyllum*, Ker in Curt. Mag.; *Casia*, *Tricoryne*, and *Stypandra*, of Brown; *Dianella*, Lamarck; *Cordylina*, Commerfon; *Asparagus*; *Eustrephus*, Br.; *Luzuriaga*, Ruiz et Pavon Fl. Peruv.; *Thysanotus*, Br.; *Sowerbaea*, Sm.; *Laxmannia*, Br.; *Borya*, Labill. Nov. Holl.; *Johnsonia*, Br.; and *Xanthorrhæa*, Sm. To which are subjoined genera intermediate between the *Asphodeles* and *Amaryllidæ*; *Hypoxis*; *Curculigo*, Gærtn.; and *Campynema*, Labill. With *Astelia*, intermediate between *Asphodeles* and *Juncæ*.

ASPIDIUM, a genus of FILICES (see that article), separated from the Linnæan *Polypodium*, on account of its being furnished with an involucre, to each round dot, or mass, of *capsules*, *ovoides* meaning a small shield, which is very descriptive of the shape of this involucre. The propriety of subdividing the original *Polypodium* was doubtfully hinted by the writer of this article, in his Essay on the Genera of Doriferous Ferns, and Dr. Swartz adopted this measure. Mr. Brown has carried it still further, by founding his genus NEPHRODIUM; see that article and POLYPODIUM. We need not here repeat our observations, already made in those places. We shall give a general view of *Aspidium*, according to our ideas of this genus.—Swartz in Schrad. Journ. for 1800. v. 2. 29. Syn. Fil. 42. Sm. Fl. Brit. 1118. Willd. Sp. Pl. v. 5. 211. Ait. Hort. Kew. v. 5. 507. Brown Prodr. Nov. Holl. v. 1. 147. Pursh 660. (Nephrodium; Michaux Boreal.-Amer. v. 2. 266. Brown Prodr. Nov. Holl. v. 1. 148.)—Class and order, *Cryptogamia Filices*. Nat. Ord. *Filices*.

Gen. Ch. *Capsules* annulated, numerously assembled in roundish masses, scattered over the back of the frond. *Involucre* roundish or kidney-shaped, with a lateral sinus, by which it is attached to the frond, at length becoming umbilicated, and more or less orbicular.

ASPIDIUM.

Eff. Ch. Fructification in roundish, feathered, not marginal, dots. Involucrum umbilicated, separating almost all round.

SECT. 1. *Fronde simple*. Two species in Swartz; three in Willdenow.

A. nodosum. Knotty Shield-fern. Willd. n. 1. (*A. articulatum*; "Schkuhr Crypt. 28. t. 27, copied from Plumier." *Lingua cervina lucida*, pediculis articulatis; Plum. Fil. 118. t. 136. Petiv. Fil. t. 10. f. 3.)—Fronde simple, oblong, wavy, bordered; acute at each end. Dots in interrupted lines. Stalks jointed, smooth. Root creeping, chaffy and hairy.—Found by Plumier on trees in the forests of Martinico, no other botanist having, as far as we know, ever met with this species. Willdenow separates it from the following, which he had examined, chiefly on account of the *fori* being disposed in chain-like rows, and the *fronde* having a thickened margin. Petiver's figure is copied from Plumier, as usual with the Ferns of that author.

A. articulatum. Jointed Shield-fern. Swartz n. 1. Willd. n. 2. (*Polypodium articulatum*; Lamarek Dict. v. 5. 514.)—Fronde simple, oblong-lanceolate, finely crenate and wavy, pointed. Dots scattered, solitary. Stalks jointed, scaly. Root creeping, chaffy and hairy.—Native of the Mauritius, on trunks of trees. We have one of Commerçon's specimens. The *fronds* are a foot long, not thickened at the edges, but very unequally and minutely wavy, as if crenate; the *stalk* of each not one inch in length, instead of two, or more, as in the foregoing. *Sori* in a simple, slightly undulating row, on each side the mid-rib, not half way between it and the margin, rather small. *Involucrum* perfectly peltate, but more or less notched at one side, dark brown; pale and undulated at the circumference. *Capfulæ* light brown, minute.

SECT. 2. *Fronde ternate*. One species in Swartz; four in Willdenow.

A. trifoliatum. Three-leaved Variable Shield-fern. Sw. n. 3. Willd. n. 5. Ait. n. 1. "Schkuhr Crypt. t. 23." (*Polypodium trifoliatum*; Linn. Sp. Pl. 1547. Jacq. Coll. v. 3. 185. Ic. Rar. t. 638. Petiv. Fil. n. 18. t. 7. f. 3. *Hemionitis maxima trifolia*; Plum. Amer. 22. t. 32. Fil. 127. t. 148. *Hemionitidis affinis filix major, trifida, auriculata, pinnis latissimis sinuatis*; Sloane Jam. v. 1. 85. t. 42.)

β. *Polypodium Pica*; Linn. fil. Suppl. 446.

Fronde smooth-edged; either simple, heart-shaped at the base, and three-lobed; or ternate, partly pinnatifid at the middle lobe or leaflet largest: lateral ones auricled at the base.—Native of groves and shady places in the West Indies. A rather large, very variable species, of a fine grass-green, thin and pliant; either simple, in three deep taper-pointed lobes, laterally lobed or auricled, in which state it is, as Swartz rightly judged, *Polypodium Pica* of the younger Linnæus; or perfectly and simply ternate, like Plumier's figure, copied by Petiver, and Pluk. Phyt. t. 291. f. 3; or the leaflets are three-lobed, sinuated, occasionally pinnatifid, as in the plates of Jacquin and Sloane. The *fori* are numerous and scattered. *Involucrum* perfectly peltate, separating equally all round, without any sinus, or notch. The margins of all the segments or leaflets are sometimes only undulated, but more frequently toothed, in a blunt irregular manner.

A. cicutarium. Hemlock Shield-fern. Swartz n. 46. Willd. n. 7. Pursh n. 1. (*Polypodium cicutarium*; Linn. Sp. Pl. 1549, excluding both the synonyms of Plukenet, and inserting the following. *Filix jamaicensis*,

five *Polypodium Cicutarie latifoliz foetidissimæ foliis quodammodo conveniens*, &c.; Pluk. Almag. 153. t. 289. f. 4.)—Fronde ternate: leaflets pinnatifid, pointed, with rounded, obtuse, entire segments: the lowermost segments greatly elongated and subdivided.—Native of mountains in Jamaica and Virginia. The Linnæan specimens came from Dr. Patrick Browne, and answer well to Plukenet's t. 289. f. 4, whatever his t. 296. f. 2, cited by authors, may be. The *fronds* are a span high, thin, delicate and smooth, with fine interbranching angular veins. We have seen no fructification. Neither Willdenow nor Pursh appear to have examined any specimens.

SECT. 3. *Fronde pinnate*. Forty-four species in Swartz; seventy-four in Willdenow.

A. falcatum. Sickle-leaved Japanese Shield-fern. Swartz n. 7. Willd. n. 13. (*Polypodium falcatum*; Thunb. Jap. 336. t. 36, not 35. Linn. Suppl. 446. *Filix cheufanica, latiori lonchitidis ferrato folio, averâ parte ferrugineis punctulis refertissimo*; Pluk. Amalth. 93. t. 405. f. 1.)—Fronde pinnate: leaflets ovate, coriaceous, bluntly ferrated, pointed, curved upwards; oblique and unequal at the base; strongly veined beneath; the odd one somewhat three-lobed. Stalk scaly.—Gathered in Japan by Thunberg, from whom we have a specimen. Twelve or fifteen inches high, rigid; rather glaucous beneath. *Involucrum* perfectly peltate and orbicular, with a central boss. The upper side of each *leaf* is quite smooth and even; the under very curiously reticulated, with stout, prominent, chain-like veins, meeting, but not strictly interbranching with, each other.

A. punctulatum. Dotted-bordered Shield-fern. Swartz n. 21. Willd. n. 17. (*Lingua cervina dentata, punctulis nigris notata*; Plum. Fil. 98. t. 112.)—Fronde pinnate: leaflets uniform, linear-lanceolate, pointed, ferrated; with a marginal row of minute impressions on the upper side; downy beneath.—Gathered by Plumier in Martinico. We have it from Jamaica. Willdenow moreover mentions Guinea, as the native country of this species. Each *fronde* is five or six feet high. *Common stalk* round at the base, furrowed in front, light brown, not smooth, but clothed with fine, soft, narrow, rusty scales. *Leaflets* very numerous, alternate, four or five inches long and nearly one broad, slightly stalked, bright green, rather thin and pliant, unequally, and sometimes doubly, ferrated; finely downy at the back; broadly wedge-shaped, and occasionally slightly auricled at the base; their upper side smooth, each vein terminating near the margin in a blueish, withered, minute spot, the feat, as it appears, of the *flowers*; for a similar mark is found over every mass of *capfulæ*; but these being situated in a simple row, at some distance from the margin, the spots which mark their insertion are much further from the edge than the abortive spots. Plumier represents a row of such spots on the *under side*, at every ferrature. He is so supremely accurate, that we have sometimes doubted our plant being the same as his, of which there is otherwise no appearance. Every thing which may lead to the discovery of the *flowers* of ferns is so interesting, that we are here tempted to be more particular than usual. The masses of *capfulæ* are large, prominent, of a bright tawny-brown, each with an almost perfectly circular and umbilicated *involucrum*. It seems to us a curious question, how the spots above-mentioned which are attended by fertile *capfulæ*, in large convex *fori*, come to be areited at a considerable distance from the edge of the leaf, while, without any difference in their size or appearance, the abortive ones are advanced almost to the base, or even the disk of each ferrature.

A. Lon-

ASPIDIUM.

A. Lonchitis. Rough Alpine Shield-fern. Swartz n. 5. Willd. n. 25. Fl. Brit. n. 1. Engl. Bot. t. 797. (Polypodium Lonchitis; Linn. Sp. Pl. 1548. Fl. Dan. t. 497. Lonchitis aspera major; Ger. Em. 1140. Matth. Valgr. v. 2. 273. Camer. Epit. 664.)—Fronde pinnate, chaffy; leaflets fickle-shaped, declining, acute, with fringe-like ferratures; auricled at the upper angle of their base; wedge-like at the lower.—Native of the crevices of dry rocks in alpine or subalpine situations, throughout Europe. It has been found in Scotland and Wales, but scarcely we believe in England, though starved plants of *A. aculeatum* are occasionally taken for this species. The fronds are a span high, more or less, growing in tufts, erect, lanceolate, rather narrow, or linear. Leaflets numerous, crowded, dark greyish-green, about an inch long, the upper ones, about one-third of the whole, copiously fructifying; the rest barren; several of the lowermost gradually shortened, but not contracted in breadth. Sori in a simple row on each side of the rib, rather nearer to it than to the margin, pale; the involucre of each petlate and umbilicated, without any notch, completely orbicular.

A. acrostichoides. Crowded Shield-fern. Swartz n. 11. Willd. n. 26. Pursh n. 2. ("A. auriculatum; Schkuhr Crypt. 31. t. 30, excluding the synonyms." Willd. Nephrodium acrostichoides; Michaux Boreal.-Amer. v. 2. 267. Polypodium fronde pinnatâ lanceolatâ, foliis lunulatis, &c.; Gron. Virg. ed. 2. 167, excluding all the synonyms, except Clayton's.)—Fronde pinnate, chaffy; leaflets fickle-shaped, acute, with fringe-like ferratures; auricled at the upper angle of their base: uppermost diminished, covered with confluent masses of capsules.—Native of rocks, in shady low places, from New England to Carolina, bearing capsules in the summer. Pursh. This fern has long been cultivated in the more curious gardens of England, having been introduced, if we recollect aright, by Robert Barclay, Esq. at Clapham. A taller plant than the last, and of a lighter green. The auricle of the lowermost leaflets sometimes becomes quite distinct and separate. The sori are found upon half, or one-third, of the upper leaflets, in a single or double row, at each side of the mid-rib, and are particularly crowded on the auricles. They become tumid as the capsules ripen, and run into one mass, studded, as it were, with the pale-brown involucre, which are circular and petlate, though cloven at one side, the edges of the sinus folding over each other. Linnæus confounded this with *Asplenium ebeneum*, as well as with his own *Polypodium auriculatum*, an East Indian species, hereafter described.

A. auriculatum. Auricled Shield-fern. Swartz n. 10. Willd. n. 30. Ait. n. 3? (Polypodium auriculatum; Linn. Sp. Pl. ed. 1. 1088, ed. 2. 1548. Filix zeylanica, lonchitidis facie; Burm. Zeyl. 98. t. 44. f. 2.)—Fronde pinnate: leaflets lanceolate, falcate, serrated, striated; auricled at the upper angle of their base. Masses of capsules distinct, in simple rows.—Native of the rocky summits of mountains in Ceylon. König. Brought to Kew garden, in 1793, by admiral Bligh. Aiton. This species has no affinity or resemblance to the last, with which Linnæus, and after him Swartz, confounded its synonyms and character. Even Willdenow, who corrected these errors, is mistaken in saying the stalk is smooth. The frond is from six to twelve inches high. Stalk scaly in front; roughish with minute points behind. Leaflets numerous, narrow, an inch and a quarter or an inch and a half long, tapering but not pointed, coriaceous, smooth, with fine, blunt, notched, not fringed, ferratures; even above, striated with transverse veins beneath; dilated at the base; the auricle broad, short, and

bluntish. Sori small, distinct, in an even row on each side the mid-ribs of the leaflet and its auricle. We have not seen the involucre. The ripe capsules are inserted by fine capillary stalks into a convex knob. Linnæus says in Fl. Zeyl. n. 383, where he originally defined his *Polypodium auriculatum*, that the plant is entirely smooth. The shagreened and slight roughness of the stalk may therefore be variable. He there cites Plukenet, t. 30. f. 4; which is in no respect discordant with König's specimens. Mr. Menzies gathered on the west coast of North America a fern very like this, except that the ferratures are bristly, and the leaflets less striated. Its stalk is very scaly all the way up.

A. exaltatum. Lofty Shield-fern. Swartz n. 14. Willd. n. 34; excluding the synonym of Linnæus. Ait. n. 4. "Schkuhr Crypt. 33. t. 32, b." (Lonchitis glabra minor; Plum. Amer. 19. t. 28. Fl. 48. t. 63. L. altissima, pinnis utrinque, feu ex utroque latere, auriculatis; Sloane Jam. v. 1. 77. t. 31.)—Fronde pinnate: leaflets lanceolate, serrated; with a row of minute white impressions on the upper side, towards the margin; unequally haltate at the base. Masses of capsules in a simple row, towards the margin. Stalk even, slightly scaly.—Native of Jamaica, and other parts of the West Indies. Brought to the stoves at Kew, by admiral Bligh, in 1793. The fronds are usually three or four feet high, erect, straight, narrow, with a polished, pale-brown stalk and mid-rib, occasionally somewhat shaggy. Leaflets numerous, parallel, close, nearly straight, two inches long at most, very smooth; rather rounded at the point, their shallow, blunt, unfringed ferratures most abundant in their upper half; the base dilated into two short broad auricles, destitute of fructification, of which the lower one is shortest, and most rounded. Sori numerous, distinct, rather large. Involucre not perfectly orbicular, nor strictly petlate, having a deep sinus at the side towards the base of the leaflet, so as to resemble a horse-shoe. This fern is very distinct from our *Davallia falcata*, though Dr. Swartz suspected the contrary. Linnæus confounded its synonyms with the following. The row of minute withered specks, as far as we can see, only accompany the sori, there being, in our specimens, no barren ones as in *A. punctatum*.

A. blechnoides. Long-leaved Shield-fern. (Polypodium exaltatum; Linn. Syst. Nat. ed. 10. v. 2. 1326. Sp. Pl. ed. 2. 1549; excluding the synonyms, and substituting the following. Filix minor, in pinnas tantum divisa, crebras non crenatas, inferiore latere auriculatas, et rotundis pulverulentis areolas averſâ parte notatas; Sloane Jam. v. 1. 86. t. 44. f. 1.)—Fronde pinnate: leaflets linear-lanceolate, elongated, entire, with a rounded incurved auricle at the base on the lower side, and a slight dilatation on the upper. Masses of capsules in a double row.—Native of Jamaica, on the sides of hills. Linnæus received his specimen in Browne's herbarium, with an erroneous reference to Sloane's t. 31, which belongs to our last-described. Hence there has always been a confusion respecting these two ferns, which even Dr. Swartz could not reconcile; see his Syn. Filicum, 65, where he cites Sloane's t. 44, but ought to have added fig. 1; as fig. 2 is *Blechnum occidentale*. The specific name of *Polypodium exaltatum*, being taken from Plumier's and Sloane's accounts of the foregoing, and that being universally received as *Aspidium exaltatum*, we have not changed its denomination. That name is not at all applicable to the species before us, which is more expressly called *blechnoides*. Its height is only eighteen or twenty inches. Leaflets from four to six inches long, taper-pointed; the lower auricle of each overlapping the main stalk, and hooked

ASPIDIUM.

hooked or curved in a curious manner, not well expressed in Sloane's plate. *Sori* in double rows close to the mid-rib at each side. *Involucrum* perfectly peltate, orbicular, and entire.

Seet. 4. erroneously marked 3 by Willdenow, as is often the case in other parts of his work. *Fron*d pinnate; *leaflets* pinnatifid. *Involucrum* rounded, or kidney-shaped. Thirty-seven species in Willdenow. Swartz does not separate this section from the following.

A. Hippocrepis. Horse-hoe Shield-fern. Swartz n. 45. Willd. n. 46. (Polypodium Hippocrepis; Jacq. Col. v. 3. 186. Ic. Rar. t. 641. Hemionitis laciniis incisâ; Plum. Fil. 129. t. 150. Petiv. Fil. t. 7. f. 7.)—*Fron*d pinnate: leaflets oblong, sinuated; the upper ones confluent and decurrent; lowermost stalked, pinnatifid; segments obtuse, somewhat crenate; veins downy. *Involucrum* crescent-shaped.—Native of South America, and of Hispaniola, from whence our specimen was brought by M. Thiery de Menonville. Jacquin had living plants of this rare fern from Venezuela, and cultivated it at Vienna. The *fronds* are eighteen inches or two feet high, tufted, of a fine green, more or less downy, especially about the ribs and veins: their *leaflets* sinuated in the manner of some species of oak; the segments also sinuated, wavy, or crisped. *Sori* chiefly ranged on each side of the mid-ribs of the segments, but not being uniformly perfected, they appear irregularly scattered. *Involucrum* like a horse-hoe, to which the specific name applies.

A. unitum. United Shield-fern. Swartz n. 47. Willd. n. 57. Ait. n. 5. Schkuhr Crypt. 34. t. 33. b. (Polypodium unitum; Linn. Sp. Pl. 1548; omitting the synonym of Sloane and Plukenet. Filix pyramidalis madraspatana elegans, pinnulis ferratis; Pet. Mus. 10. n. 55. t. 1. F. zeylanica denticulata, non ramosa; Burm. Zeyl. 98. t. 44. f. 1.)—*Fron*d pinnate: leaflets linear, pinnatifid; their very numerous segments ovate, acute, combined, hairy beneath. Stalk downy in the leafy part. *Involucrum* nearly circular, with a deep notch.—Native of Tranquebar and Ceylon. *Fron*d two feet, or more, in height: smooth and nearly naked in its lower half, except a few distant small leaflets: finely downy and rusty in the upper half, and crowded with sessile, narrow, acute, linear leaflets from three to five inches long. These are composed of innumerable little convex segments, a quarter of an inch in length; smooth and veiny above; ribbed and downy beneath; appearing as if deeply separated, but their edges are firmly united for one-half or three-quarters of their length. Near the margins of these segments are simple rows of smooth horse-hoe like *involucrums*, covering numerous *capsules* with glittering brown rings.

A. obtusatum. Blunted Shield-fern. Swartz n. 30. defc. 248. Willd. n. 58. (Pteris interrupta; Willd. Phytogr. 13. t. 10. f. 1.)—*Fron*d pinnate: leaflets linear, pointed, slightly pinnatifid; segments obtuse, downy beneath. Stalk smooth. Fructification near the margin.—Native of the East Indies. Very like the last, but the leaflets are more pointed, rather crenate than pinnatifid, and the rows of *sori* so near the margin that Willdenow actually took the plant for a *Pteris*!

A. Oreopteris. Heath Shield-fern. Swartz n. 39. Willd. n. 70. Fl. Brit. n. 3. Engl. Bot. t. 1019. "Schkuhr Crypt. 37. t. 35, 36." (Polypodium Oreopteris; Ehrh. Crypt. n. 22. Dickf. Tr. of Linn. Soc. v. 1. 181. Fl. Dan. t. 1121. P. Thelypteris; Hudf. 457. Bolt. Fil. 40. t. 22. f. 1, 2. Hedw. Theor. 44. t. 6.)—*Fron*d pinnate: leaflets lanceolate, pinnatifid, entire, besprinkled

with refinous glands beneath. Fructification near the margin, confluent.—Mountainous heathy ground, and dry woods, in various parts of Europe, from Denmark to Italy, produce this fern, bearing capsules in July. Our British botanists long overlooked it, as a variety of the common *Filix mas*, whilst others mistook it for *Thelypteris*. The refinous dots at the back of the *frond* exhale a fragrant smell, more or less perceptible at different times; which induces a suspicion that this species may have been taken by Mr. Hudson for *Polypodium fragrans* of Linnæus, never found in our island. In size the present species vies with *A. Filix mas*, hereafter to be described, but the whole *frond* is rather narrower. The segments of the leaflets usually quite entire, are occasionally somewhat crenate about their rounded obtuse points. *Sori* crowded, in a simple row near the margin, at length confluent, forming a beaded line. *Involucrum* small and thin, umbilicated, with a deep lateral sinus, and soon vanishing. *Root* large, scaly, tufted, not creeping.

A. Thelypteris. Marsh Shield-fern. Swartz n. 36. Willd. n. 74. Fl. Brit. n. 2. Engl. Bot. t. 1018. Pursh n. 4. "Schkuhr Crypt. 51. t. 52." (Polypodium Thelypteris; Linn. Mant. 505. Fl. Dan. t. 760. Acrostichum Thelypteris; Linn. Sp. Pl. 1528. Bolt. Fil. 78. t. 43, 44. Thelypteris non ramosa; Schmidel Ic. t. 11. Filix tenuissimâ et profundè denticulata Montebelgardica; Bauh. Hist. v. 3. 731, good. F. palustris repens, pinnulis non dentatis; Morif. sect. 14. t. 4. f. 17, 1.)—*Fron*d pinnate: leaflets lanceolate, pinnatifid, somewhat crenate; distinct, but crossing each other, at the base. Fructification scattered, confluent. *Root* thread-shaped, creeping.—Native of rotten bogs, and turf marshes on a sandy soil, in various parts of the north of Europe, as well as in North America. Mr. Pursh says the fructification is very rare in the latter country: with us it is but sparingly produced, the plant increasing most by the roots, which are long, slender, and creeping. The *fronds* are not half the size of the last, and much more delicate; their height about a foot, their colour bright grass-green. Leaflets generally smooth; sometimes a little hairy; the lower lobe of each extended, so as to fold over the opposite one. Fructification, if present, abundant, confluent, blackish.

A. cristatum. Lesser Crested Shield-fern. Swartz n. 49. Willd. n. 79. Sm. Compend. Fl. Brit. 157. Engl. Bot. t. 2125, not 1949. Pursh n. 5. "Schkuhr Crypt. 39. t. 37." (Polypodium cristatum; Linn. Sp. Pl. 1551. Afzel. in Stockh. Transf. for 1787. 248. t. 9. P. Callipteris; Ehrh. Crypt. n. 53.)—*Fron*d pinnate, nearly bipinnate: segments ovate, obtuse, crenate or pinnatifid, with sharp little terminal teeth. Stalk scaly at the base. *Involucrum* nearly orbicular, with a deep notch.—Native of Sweden, Germany, and England, as well as North America, in low boggy woods and thickets. Found by the Rev. R. B. Francis, on the heath between Holt and Hempstead, Norfolk. The *root* is tufted, as in *A. Oreopteris*. not creeping like that of *Thelypteris*, and the whole habit and texture of the fern more resembles the first of these two species. *Fronds* pale green, from one to two feet high; the fertile ones remarkably erect; their barren leaflets shorter and rather more distant, than those which bear fructification, the latter composing the upper half of the *frond*; all are very deeply pinnatifid, sometimes to the very rib, their segments, or partial leaflets, close, broad, obtuse, with sharp, scarcely spinous, teeth. *Ribs* somewhat zigzag. *Capsules* blackish when fresh, with a white circular *involucrum* to each assemblage, having a deep sinus at the lower side; but the

ASPIDIUM.

dried *sori* are tawny. *Common stalk* of the *frond* chiefly scaly at the bottom. Mr. Pursh considers Willdenow's *lanceolifrons*, n. 97, as a variety of this.

A. fragrans. Fragrant Shield-fern. Swartz n. 42. Willd. n. 80. (*Polypodium fragrans*; Linn. Sp. Pl. 1550. *Dryopteris rubum idæum spirans*; Amman. Ruth. 174. n. 251.)—*Frond* pinnate: leaflets lanceolate, crowded, deeply pinnatifid; segments elliptic-oblong, bluntly and deeply toothed; stalks and mid-ribs scaly. *Fructification* crowded. *Involucrum* nearly orbicular, with a deep notch.—Native of hilly situations in Siberia, near the rivers Angara and Selenga. The inhabitants are said to boil this fern with their beer, in order to give that liquor the taste and smell of Raspberries, which is so powerful in the plant, that even in a dried state its odour fills the room where it is kept. The *root* is tufted, very scaly. *Fronde* several, a span high, lanceolate, tapering at each end, the lower leaflets being gradually much shortened. *Stalk* short, bearing large, rounded, lax scales; those on the leafy part, as well as on the mid-rib of each leaflet, being lanceolate and acute. The upper side of the leaflets is perfectly smooth; and their lobes and indentations peculiarly elegant, without any terminal bristles. *Sori* so crowded about the lower half of each leaflet, that their expanded *involucrum*s sometimes touch, or fold over each other, being moreover intermixed with rusty membranous scales.

SECT. 5, marked 4 by Willdenow. *Frond* doubly or triply pinnate. *Involucrum* rounded or kidney-shaped. Forty species in Willdenow. The *involucrum* in this, as well as the preceding section, though, for the most part, laterally inserted, is often nearly or completely orbicular, and it is even strictly peltate in *A. aculeatum* and *lobatum*. Some of professor Willdenow's species, adopted from Plumier's plates only, appear to us scarcely certain in genus,—such are *A. nenoriforme*, Willd. n. 83, *vellem*, n. 84, and *squamatum*, n. 87.

A. aculeatum. Common Prickly Shield-fern. Swartz n. 53. Willd. n. 92. Fl. Brit. n. 5. Engl. Bot. t. 1562. Pursh n. 7. "Schkuhr Crypt. 41. t. 30." (*Polypodium aculeatum*; Linn. Sp. Pl. 1552. Mill. Illust. t. 101. Bolt. Fil. 48. t. 26.)—*Frond* doubly pinnate: leaflets ovate, somewhat falcate, stalked, with prickly serratures; hairy beneath. *Common stalks* and ribs scaly. *Involucrum* peltate, entire.—Found in shady woods and hollows, throughout Europe, as well as in Africa, and North America, bearing seed in summer and autumn. The *root* is large and tufted, producing numerous dark-green *fronds*, usually two or three feet high, spreading in a circular manner, varying much in size; paler beneath; their general and partial *stalks* remarkably scaly. *Partial leaflets* about a quarter of an inch long, rigid or coriaceous, each tapering down into a small short footstalk; their points and serratures each tipped with a little spinous bristle; their upper edge at the base dilated, more or less, in a broadish aricle. *Sori* plentiful on the upper part of the frond, but in single rows, and distinct, brown. *Involucrum*s pale brown, orbicular, peltate, at length deeply umbilicated, quite entire all round, as in *A. Lonchitis*, to which this species and the following are closely allied, though all three are very distinct.

The late Mr. Rob. Teesdale, (see TEESDALIA,) found in many parts of England, a variety of this, which he suspected might prove a distinct species. It is softer, and more delicate in texture, than the common kind, with smaller, more copious, *partial leaflets*, which are more remarkably stalked, and their aricles are larger, broader, and different in aspect. This lay in Mr. Rose's herbarium for *A. lobatum*,

which it certainly is not, the *partial leaflets* being even less decurrent than in our common *aculeatum*. It may probably be the variety β of *Fl. Brit.* figured in Plukenet, t. 180. f. 1, which figure represents well enough the general appearance of the *fronds*, and shape of the *leaflets*; but their partial stalks are much more considerable and evident than they appear in that plate. *A. aculeatum*, if transplanted into a dry open situation, soon diminishes greatly in size, so as to resemble *A. Lonchitis*, for which we once received it; but these species are nevertheless essentially different, as any careful investigator will find.

A. lobatum. Close-leaved Prickly Shield-fern. Swartz n. 54. Willd. n. 95. Fl. Brit. n. 6. Engl. Bot. t. 1563. (*Polypodium lobatum*; Hudf. 459. *Filix aculeata major*, pinnis auriculatis crebrioribus, foliis integris angustioribus; Raii Syn. 121. *F. aculeata*, *Lonchitidis æmula nostras*; Pluk. Phyt. t. 180. f. 3.)—*Frond* doubly pinnate: leaflets elliptical, somewhat falcate, decurrent, with prickly serratures; hairy beneath: the foremost of the lowest pair very large. *Common stalks* and ribs scaly. *Involucrum* peltate, entire.—Found in shady places, under hedges, in England; not unfrequent in the county of Essex, where Ray first noticed this species, and from whence Mr. Edward Forster has sent us specimens. The Rev. Mr. Francis has met with it at Edgefield, near Holt, Norfolk. There is no record of this fern being found out of Britain. The *fronds* are always of a narrower, more linear, form than the last, and generally altogether smaller, as well as more rigid, of a paler more shining green. *Leaflets* rather elliptical than ovate, and Mr. Dawson Turner has well observed that they are decurrent, not stalked, which is perhaps one of the most certain means of distinguishing this species from *A. aculeatum*. The most striking character, indicated by the specific name, consists in the great size, and angular-lobed figure, of the lowest *partial leaflet*, on the upper side of each general leaflet or *pinna*, close to the main stalk, often extending beyond the *pinna* above it. The upper half of the *fronds*, principally, is covered with *fructification*. The *involucrum* is perfectly peltate, entire; finally umbilicated.

A. marginale. Marginal-flowering Shield-fern. Swartz n. 41. Willd. n. 93. Ait. n. 11. Pursh n. 8. "Schkuhr Crypt. 195. t. 45. b." (*Polypodium marginale*; Linn. Sp. Pl. 1522. *Nephradium marginale*; Michaux Boreal-Amer. v. 2. 267.)—*Frond* doubly pinnate; leaflets oblong, obtuse, decurrent, crenate; almost pinnatifid at the base. Masses of capsules marginal. *Involucrum* orbicular, with a lateral sinus.—In rocky shady places, from Canada to Carolina, bearing capsules in July. This species has often been supposed a native of Britain, *A. Oreopteris*, whose fructification is likewise marginal, having been taken for it; but the American plant is very distinct, more resembling *Filix mas* than any other. The *marginale* however is a smaller plant, the upper half of whose *frond* only bears fructification, and the leaflets are bluntly crenate, instead of being sharply serrated. They are moreover not uniform, as in *Filix mas*, but the lower ones of each *pinna* are larger and more or less pinnatifid. *Involucrum* tumid, corrugated, forming a complete circle, though not peltate.

A. Filix mas. Male Shield-fern. Swartz n. 59. Willd. n. 94. Fl. Brit. n. 4. Engl. Bot. t. 1458. Pursh n. 9. "Schkuhr Crypt. 45. t. 44. also *A. erofum*, t. 45, and *A. depauperum*, t. 51," according to Willdenow. (*Polypodium Filix mas*; Linn. Sp. Pl. 1551. Bolt. Fil. 44. t. 24. Woodv. Med. Bot. t. 49. *Filix mas vulgaris*; Ger. Em. 1128. Fuchf. Hist. 595. Matth. Valgr. v. 2. 626. Camer. Epit. 991.)—*Frond* doubly pinnate: leaflets oblong, obtuse,

sessile,

ASPIDIUM.

fessile, sharply ferrated without prickles, uniform. Masses of capsules crowded towards the rib and base of each leaflet. Involucrum orbicular, with a lateral sinus.—Very common throughout Europe, as well as in the northern parts of Asia, Africa, and America, in shady situations, under dry banks, bearing seed about July and August. The root is tufted and scaly, often very large. Fronds numerous, bright green, about a yard high, and a span wide, their stalks and principal rib scaly; the rib of each leaflet is sometimes a little hairy, and slightly bordered, though the partial leaflets are scarcely decurrent, except the uppermost. The fructification is abundant over great part of the frond, of a rich tawny-brown, crowded, not confluent. Involucrum tumid, umbilicated, with a lateral notch, which is rather more open than in *A. marginale*, but not quite so deep. The root is a celebrated cure for intestinal worms, in Switzerland and other parts of the continent; and its nauseous taste may, as we understand, be detected in one or more of the popular quack medicines, which in this country obtain credit by puffing advertisements, whose truth it is easier to believe than to examine. Happy if they are never composed of more dangerous materials than the root of the Male Fern!

A. spinulosum. Lesser Crested Shield-fern. Fl. Brit. n. 8. Engl. Bot. t. 1460. Swartz n. 58. Willd. n. 99. Pursh n. 11? "Schkuhr Crypt. 48. t. 48." (Polypodium spinulosum; Retz. Prodr. 250. Fl. Dan. t. 707. P. n. 841; Mull. Friedr. 193. t. 2. f. 2. Filix pumila faxatilis altera; Pluk. Phyt. t. 179. f. 5.)—Frond doubly pinnate: leaflets decurrent, elliptical, confluent, with deep-cut prickly ferratures. Mid-rib smooth. Nerves zigzag. Involucrum orbicular, with a lateral sinus.—Native of boggy shady places, in various parts of Europe; as well as in North America, if Mr. Pursh be right; but he speaks of his plant as "a large species;" ours is certainly rather small, not above a foot high. The root is creeping. Frond broad, with a long stalk, which is scaly in the lower part only. Partial leaflets elliptic-oblong, of an elegant bright pellucid green, with wavy ribs; decurrent, so as to form a border to the partial stalk. Dots of capsules small, and rather distant. Involucrum small, soon pushed to one side. We see nothing in it of a glandular nature, as mentioned by Willdenow.

A. dilatatum. Great Crested Shield-fern. Fl. Brit. n. 9. Engl. Bot. t. 1461. Willd. n. 100. Pursh n. 12. (Polypodium dilatatum; Hoffm. Germ. v. 2. 7. P. aristatum; Villars Dauph. v. 3. 844. Bellardi in Act. Taurin. v. 5. 255. P. cristatum; Ehrh. Crypt. 81. Hudf. 457. Bolt. Fil. 42. t. 23. P. n. 845; Mull. Fl. Friedr. 193. t. 2. f. 4. Filix mas ramosa, pinnulis dentatis; Raii Syn. 124. Pluk. Phyt. t. 181. f. 2. F. mas, pinnulis cristatis; Morif. sect. 14. t. 3. f. 11.)—Frond doubly pinnate: leaflets deeply pinnatifid, sharply cut, with prickly teeth and ferratures. Stalk and branches scaly. Involucrum kidney-shaped, soon orbicular, with a lateral sinus.—Native of shady watery places, sometimes on dry banks, in a sandy or gravelly soil, or in stony moist woods, throughout Europe. Mr. Pursh met with this species in the shady rocky woods of Pennsylvania and Virginia. The root is tuberous or tufted, scarcely creeping. Fronds generally two feet, or more, in height, though sometimes much smaller. Their broad, much compounded, form and structure, and their bright-green colour, give them a very handsome aspect. They are often triply pinnate, or at least their ultimate subdivisions are so deeply separated as to cause that appearance; these are pretty uniform, with deep, sharp, prickly-toothed ferratures and points. Stalks, ribs, and veins, a little downy, or glandular; none of them zigzag, or at most very slightly so. Fructification

copious all over the frond, rather crowded, not confluent, of a bright brown. Involucrum at first kidney-shaped, tumid, but soon becoming orbicular, the sinus nearly closing, retaining only an umbilicated depression, and at length the membrane remains folded together vertically, in the centre of the mass of capsules.

SECT. 6, marked 5 by Willdenow. Frond either doubly pinnatifid, or doubly or triply pinnate. Involucrum lateral. Twenty-six species in Willdenow; nineteen in Swartz. These are perhaps most entitled to constitute a distinct genus, but in several instances they too nearly approach the last section to admit of a clear generic definition.

A. fontanum. Smooth Rock Shield-fern. Swartz n. 74. Willd. n. 122. Engl. Bot. t. 2024. (Polypodium fontanum; Linn. Sp. Pl. 1550. Fl. Brit. 1114. Hudf. 456. Villars Dauph. v. 3. 849. P. n. 1706; Hall. Hist. v. 3. 15. Adiantum filicinum durius crispum minimum; Barrel. Ic. t. 432. f. 1. Filicula faxatilis, omnium minima, elegantissima; Tourn. Init. 542. Pluk. Phyt. t. 89. f. 3.)—Frond linear-lanceolate, smooth, simply or doubly pinnate: leaflets alternate, rounded, their segments very sharply toothed. Stalks winged. Involucrum oblong.—Native of rocks in England, France, Switzerland, and other parts of Europe, but very rare in this country. Mr. Hudson, and the late Mr. Aiton, to our certain knowledge, have gathered it on Amerham church, Buckinghamshire, where it is no longer, as we are told, to be met with. Linnaeus confounded this fern with what is now named *WOODSIA hyperborea* (see that article); nor has it been well understood by botanists in general, being of rare occurrence, obscure in its generic character, and very variable in luxuriance. This may be seen by comparing Plukenet's figure above cited, fig. 3, with his fig. 2, quoted by Willdenow, after Fl. Brit. which last is we believe the same plant, but not under its usual and most natural appearance. When once seen in perfection, this truly elegant little fern can be confounded with no other. The root is tufted. Fronds from two to six inches high, rigid, smooth, rather glaucous, of a narrow lanceolate figure, composed of numerous, alternate, pinnate or pinnatifid leaflets, whose partial leaflets, or lobes, are wedge-shaped, somewhat stalked, with deep, very sharp, in some degree spinous, teeth, and all the stalks are winged. Masses of capsules at the mid-rib of each lobe, round, or nearly so, with a delicate white involucrum originating from the rib, by a straight lateral insertion, and separating inwards, that is, towards some other more principal rib, not towards the margin. Perhaps this plant is truly an *Asplenium*. Professor Willdenow has an *A. Halleri*, n. 125, which he considers abundantly distinct from *fontanum*, but to which he refers some of our above-mentioned synonyms. We have Haller's plant from Switzerland, and are perfectly certain of its being the same as our *fontanum*, though we have not the means of verifying all Willdenow's synonyms.

This writer, whose labours respecting *Filices* will ever do his memory great honour, notwithstanding errors unavoidably incident to so difficult an enterprise, has, after the example of Swartz, associated with this tribe some species which we refer to *CYATHEA*. (See that article, written by the late Rev. Mr. Wood.) These are, *C. dentata*, *fragilis*, and *regia* of Fl. Brit. and Engl. Bot.; there being also several exotic species in the same predicament. Some of them come very near *A. fontanum*, just described, in the character of their involucrum, but they ill accord with the rest of this genus. A few species, now to be mentioned, perhaps connect them therewith. We shall select such as are most likely to elucidate the subject.

A. bulbiferum. Bulbiferous Shield-fern. Swartz n. 82. Willd. n. 126. Ait. n. 20. Pursh n. 13. "Schkuhr Crypt. 55. t. 57." (Nephridium bulbiferum; Michaux Boreal-Amer. v. 2. 268. Filix bacifera; Cornut. Canad. 5. t. 4. Barrel. Ic. t. 1120. Morif. sect. 14. t. 3. f. 10.)—Fronnd doubly pinnate, oblong-lanceolate: leaflets ovate, obtuse, pinnatifid or deeply ferrated; upper ones confluent. Ribs bulbiferous.—Found in shady woods, among rocks, from Canada to Pennsylvania. *Perfl.* The frond is about eighteen inches high, narrow, bright-green, smooth, delicately cut; *partial leaflets* half an inch long at most, decurrent. Masses of *capsules* mostly scattered, small, round. The *involucrum* seems concave, almost hemispherical, turning to one side; but our specimens are not sufficient to ascertain its exact figure. Several of the secondary ribs bear fleshy bulbs, that fall off and become young plants, of which there are instances in WOODWARDIA, (see that article,) and some other ferns.

A. Filix foemina. Female Shield-fern. Swartz n. 83. Willd. n. 128. Fl. Brit. n. 7. Engl. Bot. t. 1459. "Schkuhr Crypt. 56. t. 58, 59." (Polypodium Filix foemina; Linn. Sp. Pl. 1551. Bolt. Fil. 46. t. 25. Filix mas non ramosa, pinnulis angulis raris, profundè dentatis; Raii Syn. 121. Pluk. Phyt. t. 180. f. 4. Morif. sect. 14. t. 3. f. 8.)—Fronnd doubly pinnate: leaflets pinnatifid, ferrated, pointless, oblong-lanceolate. Stalk smooth. Dots oblong. Involucrum somewhat kidney-shaped.—A common fern throughout Europe, in marshy shady places, varying greatly in dimensions, but of a broadish-oblong figure, from one to two feet high, of a fine dark green, and very smooth. Stalk slender, pale, smooth, somewhat angular. Leaflets innumerable, tolerably uniform, delicately cut, bluntish, without any terminal bristles. Masses of capsules covering the frond, one upon each segment of the leaflets, inserted laterally into its minute mid-rib, oblong, the capsules dark brown. Involucrum separating towards some larger adjoining rib, oblong, white, jagged or fringed, sometimes quite straight at the insertion, sometimes kidney-shaped, but always finally assuming the latter form, as the capsules advance and cause it to turn back.

A. irriguum. Brook Shield-fern. Engl. Bot. t. 2199. Compend. Fl. Brit. 156.—Fronnd lanceolate, pinnate: leaflets deeply pinnatifid, cut and sharply toothed. Stalk quadrangular. Involucrum lateral, short, jagged.—Found by T. F. Forster, esq. about the boggy margins of clear springs, near Tunbridge Wells, in June. Akin to the last, and in some degree to *A. Thelypteris*, but much smaller and more delicate than either. Stalk and main rib exactly square, somewhat scaly, pellucid. Leaflets deeply pinnatifid, not pinnate; their lobes most like those of *A. Filix foemina*. Masses of capsules small, round. Involucrum white, inserted as in the last, but shorter, extremely delicate, jagged and fringed, very slightly kidney-shaped, and rather hemispherical, somewhat resembling *Cyathea fragilis*.

A. alpinum. Fine-cut Alpine Shield-fern. Swartz n. 89. Willd. n. 139. "Schkuhr Crypt. 60. t. 62, a, b." (Polypodium alpinum; Jacq. Coll. v. 2. 171. Ic. Rar. t. 642. P. n. 1709; Hall. Hist. v. 3. 15. Filicula alpina crispata; Bauh. Pin. 358. Segu. Veron. suppl. 55. t. 1. f. 3. Morif. sect. 14. t. 4. f. 27. Felce crepso lassifolia; Pon. Bald. 224, with a figure.)—Fronnd triply pinnate: leaflets linear-wedge-shaped, pinnatifid, confluent; their segments linear, obtuse, emarginate.—Found on the alpine rocks of Carinthia, Switzerland, France, and the north of Italy. A very slender delicate fern, from six to ten inches high, smooth, bright green, sometimes assuming a tawny hue. The frond is linear-

lanceolate; the ultimate segments peculiarly narrow and linear, alternate, sharply cloven at the end, but otherwise entire; tapering down into the linear bordered stalk, quite smooth and naked, single-ribbed. Every segment bears one small round mass composed of a very few capsules, rather large in proportion, each having a shining ring. The involucrum is very thin, white, and membranous, represented by Wulfen and Jacquin as perfectly peltate, without any notch, and attached by a fine central thread. This would make the plant a most indubitable *Alpidium*. But in our specimens, from Jacquin himself, the involucrum, turned aside by the ripe capsules, remains in the form of a thin concave or vaulted scale, or scales, attached laterally beneath them, as in some of our British *Cyathea*, without any peltate appearance. Unfortunately we have no fructification in a sufficiently early state to verify Wulfen's description or Jacquin's figure. We rely on Seguir and Haller for Pona's, and consequently Morison's, synonym, though the figure suggests some idea of *Cheilanthes suaveolens* of Swartz and Willdenow, which Pona's account of the blackish or dark-coloured hue of the root, and upper part of the frond, rather confirms. Seguir's plate, though destitute of fructification, is sufficiently accurate, and cannot be disputed.

A. montanum. Chevill Shield-fern. Swartz n. 91. Willd. n. 147. "Schkuhr Crypt. 61. t. 63." (Polypodium montanum; Lamarck Franc. v. 1. 23. Allion. Pedem. v. 2. 287. Hæncke in Jacq. Coll. v. 2. 46. P. myrrhidifolium; Villars Dauph. v. 3. 851. t. 53, excluding Plukenet's synonym. P. n. 1710; Hall. Hist. v. 2. 16.)—Fronnd ternate, pentagonal, triply pinnate: segments elliptic-oblong, obtuse, slightly toothed at the end, decurrent.—Native of the mountains of Austria, the Tyrol, Switzerland, Italy, and France. The name given by Villars is infinitely preferable to the unmeaning one which this elegant species has been suffered to retain. It differs from all we have hitherto described of this section, in the pentagonal outline of the frond. The colour is a light green. Ultimate leaflets, or segments, not linear, but rather elliptical, very small and delicate. Sori solitary on each segment or lobe, small, globose, of rather numerous brown capsules, entirely covered, while young, with a white, pellucid, hemispherical involucrum, which turns gradually back, remaining attached, at one side, under the capsules, like half the cup of a true *Cyathea*.

A. odoratum. Scented Shield-fern. Willd. n. 146.—"Fronnd ternate, doubly pinnate: leaflets oblong, obtuse, hairy, deeply ferrated; ferratures blunt, with two teeth. Root chaffy."—Gathered by M. Bory de St. Vincent, on rocks in the island of Mauritius. Root as thick as the thumb, springing from the fissures of rocks, densely clothed with brown, oblong-lanceolate, very long-pointed, entire, brown, chaffy scales, half an inch in length. Stalk three or four inches long, smooth. Ribs hairy. Branches of the frond four or five inches long. Leaflets linear, oblong, obtuse, clothed on both sides with short hairs; their lower ferratures mostly with four teeth. Willdenow. The composition of the frond seems to agree with the last, as being ternate, a character we have not observed in any others. This structure gives the whole a pentagonal shape, very different from the oblong or lanceolate figure of the greater part of this genus.

ASSIUT, in Geography. See STOUT.

ASTELIA, in Botany, a name originally given by Sir Joseph Banks and Dr. Solander, formed from *ast*, without, and *telos*, a little pillar, because of the want of a style, which distinguishes this genus from several of its natural allies.

—Brown

—Brown Prodr. Nov. Holl. v. 1. 291.—Clafs and order, *Hexandria Trigynia*. Nat. Ord. between the *Asphodeli* and *Junci* of Juff. *Brown*.

Gen. Ch. *Cal.* none, unlefs the corolla be fo called. *Cor.* of one petal, in fix deep, equal, ovate, half-membranous, permanent fegments. *Stam.* Filaments fix, awl-shaped, about the length of each fegment, and inferted into its bafe; anthers roundifh, of two lobes. *Pifl.* Germen fuperior, ovate, pointed; ftyles none; ftigmas three, obtufe. *Peric.* Berry ovate, more or lefs perfectly three-celled. *Seeds* numerous, elliptic-oblong, fomewhat triangular, polished. *Receptacles* three, attached longitudinally to the coat of the berry. Some flowers have imperfect *ftamens*, and others, on a feparate plant, an imperfect *piftil*.

Efl. Ch. Calyx none. Corolla in fix deep, equal, half-membranous fegments, bearing the ftamens. Styles none. Stigmas obtufe. Berry fuperior, with many feeds.

The habit of the plants of this genus refembles *TILLANDSIA*, (fee that article,) and they in like manner fometimes grow on the living or dead trunks of trees. The roots are fibrous. Radical leaves imbricated in three rows, either linear-lanceolate, or fword-shaped, keeled, furnifhed, on one or both fides, with clofe, compressed, fhaggy hairs; their bafe with filky wool. *Stem* very fhort or none, with few leaves. *Flowers* fmall, filky externally, racemofe, or panicled, rarely almoft folitary; their partial *ftalks* without a joint, and having each a folitary *bractea* at its bafe.

Mr. Brown thinks *Aftelia* not nearly allied to any other genus, though fomewhat approaching *Tillandfia*. The New Zealand plants, upon which fir Joseph Banks and Dr. Solander founded this genus, differ from the folitary fpecies which grows in Van Diemen's ifland, in having a *berry* of three cells: two fpecies moreover have a pitcher-shaped fix-cleft *calyx*, (*corolla*, as we term it,) which in another is pulpy. Should the genus therefore be divided? *MELANTHIUM pumilum* (fee that article n. 9.) appears to be an *Aftelia*. *Brown*.

The learned author defines one fpecies only.

A. alpina. Alpine *Aftelia*. Br. n. 1.—“Leaves ftraight, filky on both fides. Clufter divided in the lower part; its branches bearing few flowers. Berries oval, fingle-celled. Flowers with fix deep fegments.”—Gathered by Mr. Brown, on mountains in the ifland of Van Diemen.

To this we are enabled to add the following.

A. Menziefiana. Many-flowered *Aftelia*.—Leaves ftraight; filky beneath. Stalk fhaggy. Clusters panicled, many-flowered. Berry ovate, three-celled. Flowers in fix deep fegments.—Gathered in the Sandwich iflands, by Mr. Menzies, to whom we are obliged for a fpecimen. The leaves are all nearly, or quite, radical, eighteen inches long, a half or three-quarters of an inch broad, taper-pointed, entire, ftrongly ribbed; fmooth and green above; pale, and filky with fhining clofe hairs, beneath. *Stalk* folitary, nearly as tall as the leaves, round, denfely clothed with pale, fhaggy, fhining wool; fimple below; panicled at the top, with many hairy *clusters*, each two or three inches long. Segments of the *corolla* hairy at the back. *Berries* the fize of a currant, pointed, each containing feveral large, black, fhining feeds.

To thefe are to be added the New Zealand fpecies, not yet publifhed, which, by Mr. Brown's remarks, appear to be at leaft three in number; and probably alfo the above-mentioned *Melanthium*.

ASTEPHANUS, from α , *without*, and $\sigma\tau\epsilon\phi\alpha\nu\sigma$, *a crown*, becaufe of the want of the crown to the ftamens, ufual in this order.—Brown in Wern. Tranf. v. 1. 54.—Clafs and

order, *Pentandria Digynia*. Nat. Ord. *Contorta*, Linn. *Apocineae*, Juff. *Afclepiadeae*, Brown.

Efl. Ch. Corolla nearly bell-fhaped; mouth and tube without fcales. Crown of the ftamens none. Anthers tipped with a membrane. Maffes of pollen pendulous. Follicles

Perennial, generally twining, plants, of fouthern Africa, with oppofite leaves. *Umbels* lateral, between the footftalks. *Flowers* fmall.

This genus is founded on *Apocynum triflorum* and *lineare*, Linn. Suppl. 169, with two new fpecies in the Bankian collection. *A. cordatum* and *lanceolatum*, Thunb. Prodr. 47, probably belong to it. The character is alfo modified fo as to admit a very remarkable plant, found by Mr. Maffon in the fame country, whose *ftem* is fhubby, with fpinefcnt branches; leaves extremely minute, oppofite, diftant, and heart-fhaped. *Corolla* rather urceolate than bell-fhaped; the orifice of the tube furnifhed with deflexed hairs. Maffes of pollen fixed by their tapering funnits. *Stigma* blunt. *Follicles* nearly cylindrical, fmooth. The whole genus differs from *MICROLOMA* chiefly in the want of fcales within the tube. Mr. Brown thinks they might be united, but this would lead to the junction alfo of *METASTELMA*, which being of Weft Indian origin, he was unwilling to join it with Cape plants. We fhould have thought the laft objection might have been overruled by fo near an agreement of character. See the two articles in queftion.

ASTERABAD, in *Geography*, a fmall province of the Perfian empire, fometimes included in Mazanderan, which it refembles in appearance, climate, and productions. It is the ancient Hyrcania; bounded on the W. by the Cafpian fea; on the S. feparated by a lofty ridge of mountains from the diftricts of Damgan and Biftan; extending to the E. as far as longitude 58°, and divided from Daheftan by the river Afhor. The capital of the fame name is fituated near the mouth of the river Eftar, on a bay of the Cafpian fea. E. of the capital, in which much treasure is faid to be deposited, and 25 furlongs from Biftan, is the town of Jorjan, the ancient Hurkaun, from which the name Hyrcania may probably be derived. See *ASTRABAD*.

ASTROLOMA, in *Botany*, fo called from $\alpha\sigma\tau\rho\nu$, *a ftar*, and $\lambda\omicron\mu\omicron\sigma$, *a fringe*, alluding to the five tufts of hair, which form a ftar, near the bottom of the tube of the flower, internally.—Brown Prodr. Nov. Holl. v. 1. 538. (*Vintennatia*; Cavan. Ic. v. 4. 28.)—Clafs and order, *Pentandria Monogynia*. Nat. Ord. *Ericae*, Juff. *Epacrideae*, Brown.

Gen. Ch. *Cal.* Perianth inferior, permanent, double; inner of five elliptic-lanceolate, acute, equal, erect leaves; outer of four or more, much fhorter, concave, imbricated fcales. *Cor.* of one petal, tubular; tube twice the length of the calyx, inflated, furnifhed on the infide, near the bafe, with five tufts of foft hairs; limb in five deep, fpreading, lanceolate, acute, hairy fegments, fhorter than the tube. Nectary a cup-fhaped undivided gland, furrounding the bafe of the germen. *Stam.* Filaments five, linear, inferted into the tube, and enclosed within it; anthers oblong, in the mouth of the tube. *Pifl.* Germen fuperior, roundifh, of five cells; ftyle capillary, the length of the tube; ftigma “globofe, denfely downy.” *Cavan.* *Peric.* Drupa globular, flightly juicy. *Seed.* Nut of five cells, hard and folid, not burfting, with a pendulous oblong kernel in each cell.

Efl. Ch. Outer calyx of feveral imbricated leaves. *Corolla* tubular; tube fwelling, twice as long as the calyx, with five internal tufts of hair at the bafe; tube fhorter, fpreading, bearded. Filaments linear, within the tube. *Drupa* almoft dry, of five cells.

This

This genus is very closely related to *STENANTHERA*, as well as to *MELICHRUS*. (See those articles.) We might perhaps safely unite them all to *STYPIELIA*. The opinion of Mr. Brown, however, who has examined them in a fresh state, deserves all possible attention, and we have therefore followed his views of the subject. *Astroloma* consists of shrubs, of humble stature, for the most part decumbent. Leaves scattered, often ciliated. Flowers axillary, erect. Six species are mentioned by this author, under the following characters.

1. *A. humifusum*. Diffuse *Astroloma*. (*Vintenatia humifusa*; Cavan. Ic. v. 4. 28. t. 348.)—Stem prostrate, much branched. Leaves linear-lanceolate, fringed with minute bristles; slightly convex on the upper side.—Found in various parts of New Holland, on the south-west coast, as well as at Port Jackson, and in Van Diemen's island. We have not heard of this plant, nor any other of its genus, in the gardens of Europe. The stems are a foot, more or less, in length, round, spreading flat on the ground, and sending up numerous, crowded, erect, short, leafy branches. Flowers on the main stems and branches, axillary, solitary, sessile, an inch long, of a fine crimson, with a glaucous, somewhat rose-coloured, calyx. Drupa nearly the size of a pea, reddish, smooth, almost concealed in the permanent calyx. The abbé Cavanilles dedicated this plant, as a distinct genus, to the honour of M. Ventenat, though he made a mistake in its orthography. But there is another *VENTENATIA*, of which the reader may find an account in its proper place. The remaining five species have all been found in the southern part of New Holland, by Mr. Brown, and apparently by no other botanist. We give their names and definitions from his work.

2. *A. prostratum*. Prostrate *Astroloma*.—Stem prostrate, much branched. Leaves linear-lanceolate, fringed; flat above; rather convex beneath.—Seen with unexpanded flowers only, by Mr. Brown.

3. *A. denticulatum*. Toothed *Astroloma*.—Stem pro-cumbent, or somewhat erect. Leaves lanceolate, flat, fringed, with hairs dilated at their base.

4. *A. pallidum*. Pale *Astroloma*.—Stem diffuse, with ascending branches. Leaves lanceolate, sessile, fringed, imbricated; slightly concave on their upper side.

5. *A. compactum*. Compact *Astroloma*.—Stem diffuse, with very short ascending young branches. Leaves obovato-lanceolate, fringed; rather concave on their upper side; tapering at the base into short footstalks.

6. *A. tetrum*. Upright *Astroloma*.—Stem erect, somewhat branched. Leaves lanceolate-oblong, flat, imbricated; rough-edged; their teeth minute, very short, obtuse.

ATHENS, in *Geography*, l. 4. r. 478. Add—Also, a township of Maine, in the county of Somerset, with 374 inhabitants.—Also, a township of Pennsylvania, in Lycoming county, having 759 inhabitants.—Also, a county of Ohio, containing 2790 inhabitants.—Also, a township of the said county, with 840 inhabitants.

ATHEROPOGON, in *Botany*, from *αθηρ*, an awn, and *πωγων*, a beard, alluding to the appearance of the flowers.—Muhlenb. in Willd. Sp. Pl. v. 4. 937. Gram. 287. Pursh 75.—Class and order, *Triandria Digynia*. (*Polygamia Monoecia*, Willd.) Nat. Ord. *Graminea*.

Gen. Ch. Cal. Glume of two valves, two-flowered; floret neuter. Cor. Glume of two valves; in the perfect floret the outer valve has three awns, and the latter is cloven; in the neutral one the outer valve is membranous, cloven, awned below the point, the inner has two awns. Stam. in one floret

only, filaments three; anthers scarlet. Pist. in the female flower only, germen oblong; styles two; stigmas feathery. Seed solitary, oblong.

Efl. Ch. Calyx of two valves, two-flowered; one floret neuter. Corolla of two valves, the outermost with three awns: in the neutral floret both valves are awned.

1. *A. apudoides*. Reflexed *Atheropogon*. Willd. n. 1. Pursh n. 1.—Gathered by the late Rev. Dr. Muhlenberg, on gravelly hills, in Pennsylvania, flowering in September. Root perennial. Stem twelve or eighteen inches high, round, smooth, jointed in the lower part. Leaves lanceolate, very long; hairy at the base; their sheaths downy, crowned with a stipula. Cluster simple, erect, of about twenty alternate, distant, pendulous flowers, each on a short partial stalk. Anthers of a vermilion hue. Willdenow attributes but one valve to the calyx, Muhlenberg two. Their descriptions are meagre. There is no reason for referring this genus to *Polygamia*, even according to the most ample ideas of that class, for the presence of a neutral floret does not constitute its character, nor is perhaps any genus of grasses in the *Triandria Digynia* quite exempt from such.

ATHEROSPERMA, so named by the celebrated voyager M. Labillardiere, from *αθηρ*, an awn, and *σπέρμα*, seed.—Labill. Nov. Holl. v. 2. 74.—Class and order, *Monoecia Monadelphica*. Nat. Ord. *Atherospermeae*, Brown Bot. of Terra Australis, 21.

Gen. Ch. Male, Cal. Perianth of one leaf, bell-shaped, with eight obtuse marginal segments; the four alternate ones external and largest; the inner ones coloured. Cor. none. Stam. Filaments numerous, erect, inserted into the base of the calyx, and much shorter than its limb, somewhat combined at the bottom, and accompanied by scales; anthers elliptical, attached by the back, erect, of two cells, each opening by a longitudinal valve from the base upwards.

Female, Cal. as in the male, with the addition of numerous, internal, acute, marginal scales. Cor. none. Pist. Germens numerous, ovate, hairy; styles solitary, thread-shaped, hairy; stigmas simple. Peric. none, except the permanent, enlarged, hardened calyx. Seeds as many as the germens, small, oval, each crowned with its permanent feathery style.

1. *A. moschata*. Nutmeg *Atherosperma*. Labill. as above, t. 224.—Native of Cape Van Diemen, from whence we have specimens from the author; with others from A. B. Lambert, esq., gathered by general Grose. A tree, twenty-five feet or more in height; the young branches square, finely downy. Leaves opposite, on short thick stalks, without stipulas, elliptic-oblong, acute, either quite entire, or with a few sharp scattered teeth; smooth and besprinkled with minute pellucid dots above; finely downy and hoary beneath, with a reddish mid-rib and slightly visible veins. Flowers axillary, solitary, stalked, drooping, rather small. Bractees two, (*Involutum* of Labillardiere,) close to each flower, ovate, acute, concave, downy, deciduous. Calyx finely hairy; that of the fruit much enlarged, half an inch broad, hemispherical, clothed with dense silky hairs, and filled like a bafon with feathery-tailed seeds, whose down resembles that of a syngeneious plant, and is not represented in the above figure. The dried leaf, like every other part, as far as we can examine, has a very strong flavour of nutmegs, to which, and not to any musky scent, the specific name alludes. We have chiefly followed our author in the above description, except a most important character, of the valvular anthers, borrowed from Mr. Brown, whose remarks in the following article will be found greatly to illustrate the present, and to render some future alterations necessary.

ATHERO.

ATHEROSPERMÆ, a new natural order, thus denominated from its leading genus. See the last article. Brown Bot. of Terra Austr. 21.

Flowers either separated or united. *Calyx* of one leaf; its margin divided into a generally double row of segments, the innermost, sometimes all of them, half petal-like (or internally coloured). There are also in the female, as well as in the united, flowers, small, internal scales, at the base of these segments. *Corolla* none. *Stamens* in the male flowers numerous, inserted into the bottom of the calyx, with accessory scales; in the united flowers they are fewer, and inserted into the throat; *anthers* attached by the back, of two cells, each cell opening by a longitudinal valve, separating from the base upwards. *Germens* one or more, generally an indefinite number, with a single, erect germ; *styles* solitary, occasionally lateral, or from the base; *stigmas* simple. *Seeds*, (termed seed-like pericarps by Mr. Brown,) avned with the feathery styles, and enclosed in the enlarged tube of the calyx; *embryo* erect, short, in the bottom part of a soft fleshy albumen. The several species are trees, with simple, opposite leaves, destitute of stipulas. *Stalks* axillary, single-flowered.

Jussieu it seems, Ann. du Mus. v. 14. 116, has established an order termed *Monimieæ*, in which *Atherosperma* is included, along with *Pavonia* of Ruiz and Pavon, its near ally, and the *Ambora*, (see MITHRIDATA,) *Monimia*, and *Ruiza*, which three last Mr. Brown considers as constituting the genuine order of *Monimieæ*, and therefore he has proposed the above, of which a most eminent distinction is their having the valvular *anthers* of the LAURI. (See that article.) This separation is confirmed by two New Holland plants evidently of the same family, but which have united flowers, a structure not probable in *Monimieæ*. The place of *Atherosperma*, in a natural series, is difficult to fix. Though so widely different, in most parts of their structure, from *Lauri*, (now called *Laurinæ*), they agree in *anthers*, and very remarkably with some of them in sensible qualities. *Pavonia* above-mentioned cannot, by Mr. Brown's account, be separated from *Atherosperma*, differing merely in the oblong form, and regular burbling, of its female calyx! Its qualities are the same.

ATKINSON, l. 3. r. in the year 1810, 556 inhabitants.

ATMOSPHERIC AIR, *Chemical Composition of*. See AIR.

ATOMIC THEORY, in *Chemistry*. This important theory, which has added new lustre to chemistry by raising it to the rank of a mathematical science, was entirely unknown when the earlier volumes of the Cyclopædia were published. The history of its origin and progress has been amply detailed in subsequent parts of the work, particularly under the articles PROPORTIONS, DEFINITE, SIMPLE BODIES, and THEORY, ATOMIC; so that we have little left to add here, except a brief summary of some recent modifications suggested by Dr. Prout, and subsequently adopted by Dr. Thomson. See an anonymous Essay on the relation between the Specific Gravities of Bodies in their gaseous State, and the Weights of their Atoms, vols. vi. and vii. of Thomson's Annals of Philosophy.

The object of Dr. Prout in the above essay is to shew, 1st, that the theory of volumes suggested by Gay Lussac, and adopted by Berzelius and some others, is absolutely identical with Dalton's Theory of Atoms; and 2dly, that the specific gravities of bodies in their gaseous

state are all multiples of the same unit, which unit is considered as hydrogen.

Dr. Prout's essay is terminated very abruptly, and is evidently imperfect. The above views are not explicitly stated in the paper alluded to, though it is obvious they are what the author had in view; and as they have been recently adopted by Dr. Thomson, in the new edition of his System of Chemistry, which may be viewed in the light of a national work, we consider it our duty to lay a brief account of them before our readers.

The first of the above points attempted to be established by Dr. Prout has been already discussed at some length in the articles PROPORTIONS, DEFINITE, and THEORY, ATOMIC. Indeed, we believe it is very generally admitted by all those chemists who have taken the pains to examine and think upon the subject. It is chiefly founded upon facts and reasonings, which few at present affect to doubt, and of which the following is a summary. 1. Bodies unite together in certain definite proportions by weight, that is, certain weights of some bodies always combine with certain weights of other bodies. This constitutes the basis of the atomic theory, or the theory of definite proportions, as some have chosen to term it. 2. Substances in a gaseous state have been demonstrated to combine with reference to their bulk or volume, that is to say, one volume of one gas always combines with one or more similar volumes of another, and not with any odd fractional parts. Moreover, the volume or bulk of the resulting compound, if it happens to be a gas, always bears a similar relation to the original volumes of its component gases. For these important laws we are indebted to Gay Lussac, and they constitute the basis of what has been denominated the theory of volumes. 3. It is universally admitted, that the same weights of the same resulting compounds are formed when bodies unite in a gaseous state according to their volume, as when they unite in any other manner according to their weight; thus, for example, one volume (100 cubic inches) of muriatic acid gas will unite with one volume (100 cubic inches) of ammoniacal gas, and form the same weight of the same compound, (muriate of ammonia,) as if 39.183 grains (the absolute weight of 100 cubic inches) of muriatic acid, united with 18.003 grs. (the absolute weight of 100 cubic inches) of ammonia; the two numbers 39.183 and 18.003 being to one another as 1.278 : .5900, or as 37 : 17, the specific gravities and the weights of the atoms of these two substances respectively. Such is a brief statement of the facts; and it is argued that if the above data are correct, it follows irresistibly from them that the weights of the atoms of bodies, are to one another as the specific gravities of the same bodies in a state of gas; and consequently that the theory of volumes and the theory of atoms is one and the same thing, different sets of numbers only being employed. Some apparent deviations from this law, which however cannot be by any means considered as exceptions, will be noticed hereafter.

With regard to the second point contended for by Dr. Prout; namely, that the specific gravities of all bodies in their gaseous state, or, in other words, the weight of their atoms are multiples of the same unit or hydrogen; it is partly founded upon experiment and reason, and partly (at present at least) upon hypothesis. The following is a summary of the grounds upon which the opinion has been formed.

1. The specific gravity of ammoniacal gas, according to Sir Humphry Davy, is .590164, common air being 1.000; according to Biot and Arrago, it is a fraction greater hence

ATOMIC THEORY.

hence Dr. Prout has fixed upon .5902 as the specific gravity of this gas. The sp. gr. of azote he affumes as .9722, common air being 1.000, for reasons stated below. Now, as ammonia is known to be composed of one volume azote, and three volumes hydrogen, condensed into two volumes, the specific gravity of hydrogen, according to these data, must be .0694.

2. Atmospheric air is admitted to be univerfally composed of about 21 per cent. of oxygen, and 79 per cent. of azote, which so nearly corresponds with one volume of oxygen, and four volumes of azote, or 20 oxygen and 80 azote, that Dr. Prout has concluded that the above is its true composition, and consequently that it is a real chemical compound. (See AIR, *Atmospheric*.) Now the weight of the atom of oxygen being supposed to be 10, and that of the atom of azote 17.5, (Dr. Wollaston makes it 17.54,) the specific gravity of oxygen gas, according to these data, will be 1.1111, and of azote .9722. But these numbers are multiples of .0694 for $1.1111 \div .0694 = 16$, and $.9722 \div .0694 = 14$.

Such are two of the leading circumstances stated in the above essay, which appear to have induced our author to examine further into the subject. For this purpose, he seems to have selected a certain number of substances, and to have instituted a series of experiments on them, with the view of ascertaining the truth of the opinions which he had been led to adopt. These experiments are said to have been numerous; but their results are stated in a very summary way, and in a manner certainly not very likely to carry conviction. The whole is afterwards arranged in tables, and there contrasted with the acknowledged results of other experimentalists, with the view of shewing how nearly they coincide with each other. These tables will be found at the end of the present article, in an extended form, and comprehending all the new determinations of Dr. Thomson. The near approach to whole numbers of the weights of the atoms of all these substances, which have been most carefully examined, and are best known, is certainly very singular, and must strike every one who has paid attention to the subject. At the same time, no argument can be advanced against the opinion that certain relations exist among the combining weights or atoms of bodies; on the contrary, this opinion seems much more probable than that they have no connection and are entirely independent of one another.

With respect to the question, whether the above opinion

will ever be verified by actual experiment? it is difficult to determine. The differences in general assumed by Dr. Prout are so small, that in the present state of chemical analysis they may be fairly said to be within the limits of possible error; until, therefore, some more refined methods of experimental research be discovered, we can scarcely hope the matter will be decided in this manner.

We mentioned above, that there are a few substances whose specific gravity does not correspond with the weight of their atom; thus the specific gravity of oxygen, for example, is sixteen times that of hydrogen, while its combining weight is only half or eight times that of hydrogen. This at present cannot be explained; but it is remarkable, that the specific gravities are always some multiple of the weight of the atom. (See further on this subject under THEORY, *Atomic*.) In the following tables will be found other examples of the curious circumstance under consideration.

We shall make no further observations at present, but adopt Dr. Prout's plan of throwing together in tables the great mass of evidence on the subject, and leaving the question to be decided by the impartial judgment of our readers.

In the first and second columns of the following tables are given the specific gravities and weights of the atoms of the different substances, supposing them to be in a gaseous state, hydrogen being 1; "and if," says Dr. Prout, "we suppose the volume to be 47.2135 cubic inches, the numbers will at the same time represent the number of grains this quantity of each gas will actually weigh." We may remark here, that if these views should ever be established, they afford an excellent rational standard for weights, as compared with measures. Thus the cube of the pendulum, for example, vibrating seconds, might be the unit in volume of hydrogen, whose actual weight might be the unit in weight. Such a relation between weights and measures would be as general and immutable as the laws of nature themselves, and be worthy of the enlightened age in which we live. In the third column are the corrected numbers, the atom of oxygen being supposed, according to Dr. Wollaston, Dr. Thomson, &c., 10 or 1; and in the fourth, the same as obtained by experiment are stated to shew how nearly they coincide. The other columns will be sufficiently understood from inspection. The last column in the first table contains the numbers recently assigned by Mr. Brande to the elementary substances.

ATOMIC THEORY.

TABLE I.—Elementary Substances.

ATRAGENE, in *Botany*, (see our former article,) a name adopted from Theophrastus, whose $\alpha\delta\rho\alpha\gamma\epsilon\iota\sigma\iota\varsigma$, according to De Candolle, is probably our *Clematis Vitalba*. This genus is much reduced by the learned writer just named, who refers *A. japonica* and *alpina* to *Clematis*, *A. capensis* and *tenuifolia* to ANEMONE. (See that article.) The only remaining species is *A. seylanica*, which De Candolle retains as a genus by itself, under the new name of *Naravelia*, taken from *Naravael* of Herm. Zeyl. 26, one of its synonymy. But this being a Linnean *Atragene*, and the only one which remains, that name must, by every principle and right, remain with it, especially as it is distinguished from *Clematis* by the original generic character of *Atragene*. A figure of this plant is given in Roxb. Coromand. v. 2. 47. t. 188.

ATRIPLICES, the twenty-ninth natural order in Jussieu's system, the sixth of his sixth class, whose characters are given under LAURI. Mr. Brown, Prodr. Nov. Holl. v. 1. 405, adopts, from De Candolle, the appellation of *Chenopodee* for this order, for which we have discovered no reason, *Atriplex* being as well-known a genus, and as expressive a type of the order, as *Chenopodium*. The characters are as follows.

Calyx of one leaf, often deeply divided. *Stamens* definite, inserted into the bottom of the calyx. *Germen* solitary, superior; style either single, or wanting, or for the most part manifold, of a determinate number; stigmas one, rarely two, to each style. *Seeds* solitary, (numerous in *Phytolacca*, two in *Galenia*;) either naked, or covered by the calyx, which thus becomes, in a manner, superior; or inclosed in a pulpy, or a capsular, pericarp. *Coraculum* surrounding a farinaceous mass. *Stem* in numerous instances herbaceous, in some shrubby. *Leaves* mostly alternate, sometimes opposite. *Stamens* occasionally in separate flowers from the pistils.

SECT. 1. Fruit pulpy.

Phytolacca, *Rivina*, *Salvadora*, and *Bofsea*; the last suspected to be more akin to the *Rhamnii*.

SECT. 2. Fruit capsular.

Petiveria; *Polycnemum*; *Camphorosma*; and *Galenia*: not without some doubts respecting the two last.

SECT. 3. Seed covered by the calyx. *Stamens* free.

Bajfala; *Anredera*, Jusf. which is *Egoppyrum* scandens, &c., Sloane Jam. v. 1. 138. t. 90. f. 1; *Anabasis*; *Caroxylum*, Thunb.; *Salsola*; *Spinacia*; *Anida*; *Beta*; *Chenopodium*; and *Atriplex*.

SECT. 4. Seed covered by the calyx. *Stamens* fewer than five.

Crucita; *Axyris*; *Blitum*; *Ceratocarpus*; and *Salicornia*.

SECT. 5. Seed not covered by the calyx.

Corispermum only.

This order is analogous to the *Holeracee* of Linnæus, though many extraneous things are referred to the latter.

Mr. Brown asserts that the *Atriplices*, or *Chenopodee* are not distinguishable by any character from the *AMARANTHII*, (see that article,) though different in habit, and differing from the *Illecebree*, (by which is meant Jussieu's third section of *Amaranthii*;) in the want of stipules. The insertion of the stamens into the calyx, according to this accurate observer, is not absolutely constant, nor are the *Amaranthii* all free from that insertion. Yet on this mark the distinction is founded, not merely between these two neighbouring orders, but between the sixth and seventh classes of Jussieu, which thus run into each other. We do not mean, by pointing out these intricacies of Nature, which render it so difficult for us to submit her to human regulations, to throw needless difficulties in the way of those, who attempt this arduous task by other means than we ourselves pursue. We merely remind them of our common fallibility, and recom-

mend patient investigation, with mutual assistance, in the place of dogmatical assumption and invidious criticism.

ATTELABUS, col. 2, l. 1, for are *r.* is; l. 23, *dele* which see respectively, and add—One of the principal species is *A. Coryli*, a smallish insect found in hazel-trees, black, with red wing-veins, usually measuring about a quarter of an inch in length. A much smaller species is the *A. Betula*, altogether black, and remarkable for gnawing the leaves of that tree in the early part of spring; so that they appear notched on the edges. The *A. Apiarius* is an elegant species, deriving its name from the injury which its larva does in bee-hives by destroying the young. See *APIARIUS*.

ATTER of *Rosier*. See *Essence* of *ROSES*.

ATTLEBOROUGH. Add—It contains 2716 inhabitants.

ATTRACTION of *Mountains*, col. 2, l. 50, *r.* 436,44; l. 51, for 43" *r.* 42",94.

AVA, l. 1, *r.* *Aungwa*.

AUBENAS, l. 3, for Coirou *r.* Privas.

AVERILL, in *Geography*, a township of America, in Vermont and county of Essex, having nine inhabitants.

AUGUST, a gold coin of Saxony, of which are double, single, and half august d'ors, reckoned at 10, 5, and 2½ rix dollars: 35 single augusts weigh a Cologne mark of gold 21 carats 8 grains fine.

AUGUSTA, in *Geography*, a town of the district of Maine, in the county of Kennebeck, containing 1805 inhabitants.

AUGUSTA, a county of Virginia, l. 4, *r.* 14,308, and 2880 slaves.

AULAX, in *Botany*, from $\alpha\upsilon\lambda\alpha\zeta$, a *furrow*, alluding to the chink in each petal containing one of the stamens.—Berg. Cap. 33. Brown Tr. of Linn. Soc. v. 10. 49. Ait. Hort. Kew. v. 5. 373.—Class and order, *Diocia Tetrandria*. Nat. Ord. *Proteacee*, Jusf. Brown.

Ess. Ch. Male. Flowers distinct. Calyx none. Petals four, bearing the stamens. Pistil imperfect.

Female. Flowers aggregate. Calyx none. Petals four, bearing imperfect stamens. Stigma oblique. Nut exposed, tumid, bearded.

1. *A. pinifolia*. Pine-leaved Aulax. Berg. n. 1. Br. n. 1. Ait. n. 1.

Male. *Protea pinifolia*; Linn. Mant. 187. Willd. Sp. Pl. v. 1. 515. Andr. Repof. t. 76.

Female. *P. bracteata*; Thunb. Diff. n. 24. t. 1. Linn. Suppl. 118. Willd. Sp. Pl. v. 1. 517.

Leaves thread-shaped, channelled.—Native of hills near the Cape of Good Hope. A shrub one or two feet high, with round, red, leafy branches. *Leaves* numerous, scattered, simple, undivided, smooth, slender, spreading every way, two or three inches long. *Flowers* yellow; the male in several long clusters, forming a terminal leafy umbel; female in a dense solitary head.

2. *A. umbellata*. Umbellate Aulax. Br. n. 2. Ait. n. 2.

Male. *Protea aulacea*; Thunb. Diff. n. 33. t. 2. Willd. Sp. Pl. v. 1. 520.

Female. *P. umbellata*; Thunb. Diff. n. 34. Linn. Suppl. 118. Willd. Sp. Pl. v. 1. 520. Andr. Repof. t. 248.

Leaves linear-implicate, flat.—Native of hills at the Cape of Good Hope. A shrub two or three feet high, with bright-green, bluntnish, smooth leaves. *Flowers* yellowish, terminal; the male in shortish blunt clusters; female in a solitary whitish head, encompassed with long, narrow, yellow, radiating bractæe.

Both these are green-house plants in England, flowering in the latter part of summer. The second is said to be the most hardy.

AVOLA, l. 4, for minor *r. major*.

AVON, in *Geography*, a township of America, in the district of Maine and county of Somerset, having 304 inhabitants.

AURA, in *Ornithology*, l. 5, *r. Ulloa*.

AURANTIA, in *Botany*, a well-marked natural order, comprehending the Orange tribe and its allies, as the name expresses. Jussieu is the author of this order, the seventieth in his arrangement, or the tenth of his thirteenth class; nor are there any traces of it among the *fragmenta* of Linnæus. For the characters of this important thirteenth class, we refer the reader to GERANIA, and proceed to define the order in question.

Calyx of one leaf, often deeply divided. *Petals* definite, broad at the base, inserted around a disk on which the germen is placed. *Stamens* placed upon the same disk, definite, or more rarely indefinite, their filaments either distinct, or combined in one or more parcels. *Germen* one; style one; stigma simple, or rarely divided. *Fruit* mostly pulpy, sometimes capsular, of one or many cells, with one or two seeds in each. *Coraculum* straight, ascending, destitute of albumen. *Stem* arborescent or shrubby. *Leaves* alternate, simple, or, in some few instances, compound.

SECT. 1. *Fruit with only one seed.* The leaves of this section are not marked with resinous dots, and hence the plants are termed spurious *Aurantia*. Except *Ximenia*, their affinity to this order is by no means apparent, in any degree, to us.

Ximenia; *Heisteria*; and *Fissilia* a genus of Commerçon's, whose identity with *Olex* we have already indicated in its proper place. See FISSILIA.

SECT. 2. *Fruit many-seeded, pulpy.* These are genuine *Aurantia*, having the leaves full of pellucid resinous dots.

Chalcas, which is not only, as Jussieu suspected, the same genus, but the very same species with *Murraya*; *Bergera*; *Murraya*; *Cookia* of Somerrat; *Citrus*; and *Limonia*.

SECT. 3. *Fruit many-seeded, capsular.* Leaves not dotted. Genera akin to *Aurantia* and to *Melie*.

Ternstroemia, of Mutis, with *Tonabea* of Jussieu, which is the very same genus, are here prefixed to *Thea* and *Camellia*; but surely they have little relationship to the true *Aurantia*, either in their habit or fructification. They form an order by themselves, and there is so much connection between their stems and the corolla, as might remove this order to Jussieu's ninth class, where it would very naturally follow his *Guaiacane*, if not absolutely reducible to that very family, at least to its second section.

That Linnæus had formed no conception of any order analogous to the genuine *Aurantia*, is evident, from his having referred *Citrus* to a section of the *Bicornes*, and having left *Limonia* undetermined, though so naturally and evidently akin to *Citrus*. He had even introduced *Garcinia*, with a mark of doubt indeed, into the same section of *Bicornes*; but expunged it in manuscript, giving its opposite leaves as a reason. By that character, and indeed every other, *Garcinia* answers to Jussieu's *Guttiferæ*, a natural order which, however striking and important, likewise escaped the sagacity of Linnæus.

AURELIUS, in *Geography*, l. 1, for military *r. post*; l. 2, for Onondago *r. Cayuga*; l. 5, for 1796 *r. 1810*, and for 123 *r. 323*. Add—The number of inhabitants, who are principally employed in agriculture, is 4642, and this capital of Cayuga county ranks the third in population and wealth of the county, and has three post-offices.

AURORA, a township of Ohio, in the county of Portage, containing 189 inhabitants.

AUSTIN, a township of Ohio, in the country of Trumbull, containing 440 inhabitants.

AUTOGRAPHUM. See WRITING-MACHINE.

AUTOMALITE. See RUBY and MINERALOGY, *Addenda*.

AXIA, in *Botany*, from $\alpha\omega\varsigma$, *valuable*, alluding to its medical virtues and high estimation.—Loureir. Cochinch. 35. Vahl Enum. v. 2. 38.—Class and order, *Triandria Monogynia*. Nat. Ord. *Nyctagineæ*, Juss.?

Gen. Ch. *Cal.* Perianth superior, of three short, acute, unequal, deciduous leaves. *Cor.* of one petal, bell-shaped, very small, its border in ten flat, short, rounded, equal segments. *Stam.* Filaments three, capillary, the length of the corolla; anthers of two globular lobes. *Pist.* Germen inferior, ovate, furrowed; style thread-shaped, the length of the stamens; stigma thickish. *Peric.* none. *Seed* solitary, ovate, furrowed, hairy.

Eff. Ch. *Calyx* three-cleft, superior, deciduous. Corolla of one petal, with ten segments. *Seed* solitary.

1. *A. cochinchinensis*. *Nhon sàm phu yen* of the Cochinchinese.—Native of Cochinchina, nor did Loureiro ever meet with this plant elsewhere. It is almost as much esteemed as *Gin-seng*, as a warm strengthening medicine, promoting expectoration and the various secretions, useful in intermittent fevers, indigestions, &c. The stem is shrubby, procumbent, with many knotty branches, extending about two feet. *Root* tapering. *Leaves* opposite, unequal, small, ovate-lanceolate, slightly crenate, downy. *Flowers* small, variegated with red and white, in nearly terminal clusters.

AYA-PANA, a South American plant of the genus EUPATORIUM, (see that article,) of which an account is given in the Bulletin des Sciences, n. 67. 147, as peculiarly efficacious against the poison of serpents, on which account it is much cultivated in the island of Mauritius, and in Cayenne. The bruised leaves are said to cure the sting of a scorpion, and that of a poisonous fish, named *last*. An infusion of the herb has proved useful in dropsy, as well as in syphilitic disorders. This plant has been cultivated in the stoves at Paris, but we have heard nothing of it in England.

AYMOUTH. See EYMOUTH, *del.*

AZOLLA, in *Botany*, an unexplained name.—Lamarck Dict. v. 1. 343. Illustr. t. 863. Willd. Sp. Pl. v. 5. 541. Pursh 672. Juss. 17, under *Salvinia*. Brown Prodr. Nov. Holl. v. 1. 166. Bot. of Terra Austr. 79.—Class and order, *Cryptogamia Filices*. Nat. Ord. *Filices*, Linn. Juss. Rhizospermeæ; Roth. De Cand. *Marfiletea*, Brown.

Gen. Ch. Male, in pairs, enclosed in a single-leaved, membranous, clove *involucreum*, (occasionally solitary under the female,) ovate, of two cells, their outer covering bursting transversely; upper cell containing nine or six angular bodies, inserted around a tubular axis, which finally opens at the summit; lower cell spherical, closed by a double membrane, and filled with a fluid, which may perhaps change to a powder.

Female, axillary, on the same plant, solitary (sometimes accompanied underneath by a solitary male). *Involucreum* double, both closed, membranous; the outer like that of the male flowers; inner ovate, without valves, containing numerous capsules, without valves, attached by capillary stalks to a common receptacle, originating from the base of the involucreum. *Seeds* from six to nine, angular, with exterior radicles.

Eff. Ch. Male, ovate, of two cells, separating transversely; the upper containing several angular, stalked bodies.

Female on the same plant, capsules numerous, stalked, globose,

globose, of one cell and one valve, in an ovate, close involucre. Seeds several, angular.

1. *A. filiculoides*. South-American Azolla. Lamarck n. 1. t. 863. (*A. magellanica*; Willd. n. 1. *Mufcus aquaticus elegantissimus*; Feuille. Voy. v. 3. 43. t. 35. Dill. Mufc. 335. t. 43. f. 72.)—Fronn pinnate. Leaflets all papillary. Roots smooth.—Found by Feuillée in Peru; by Mr. Menzies in Chili; in watery places; and at the straits of Magellan by Commerçon. This is a little floating mossy plant, resembling a *Jungermannia*, an inch or two long, alternately pinnate, with small, imbricated, ovate, fleshy leaves, clothed externally with papillary hairs, and membranous at the edges. The roots are long, slender, smooth and naked, dark brown. No fructification has been discovered in this species.

2. *A. pinnata*. Triangular Pinnate Azolla. Br. n. 1. Bot. of Terra Austr. 79. t. 10.—Fronn pinnate, triangular. Upper leaflets papillary. Roots longitudinally feathery.—Gathered by Mr. Brown, in lakes and ponds, at Port Jackson, New South Wales. A little floating plant like the foregoing. Roots axillary, solitary, perpendicular, unbranched, pellucid, hooded at the point when young, at first light quite simple, but under a magnifier they appear feathery about the middle part. Fronn half an inch long. Branches two-ranked, alternate, crowded. Leaves alternate, imbricated every way; those on the upper side of each branch ovate, somewhat angular, cellular, thick, often reddish, rough on the upper surface with papillary tubercles; those on the under side thinner, smooth, and less angular. Flowers on the under side of the fronn, sessile, solitary at the base of each branch.

Mr. Brown seems to think the true pollen of this curious genus originates in the watery or turbid fluid, which he once found changed to powder, and which may be discharged through the tube above, whose angular appendages, once suspected to be anthers, (see his *Prodr.*) may by pressure facilitate its ejection, whether in a watery or powdery state.

3. *A. rubra*. Red Orbicular Azolla. Br. n. 2.—Fronn orbicular; lobes palmate; their subdivisions undivided or cloven. Upper leaves smooth. Roots feathery beyond the middle.—Gathered by Mr. Brown, at Port Jackson, as well as in Van Diemen's island. The fructification has essentially the same structure of that of *A. pinnata*, except the angular bodies of the upper cell being only six, not nine. *Brown*.

4. *A. caroliniana*. Carolina Azolla. Willd. n. 2. Pursh n. 1.—“Leaves imbricated, ovate-oblong, obtuse, spreading; red underneath.”—Found by Richard, in Carolina; by Pursh floating on the waters of lake Ontario. We know nothing more of this species; and as those who have described it were unacquainted with the fructification, as well as with Mr. Brown's specific definitions, the above character requires revision.

AZORELLA, Lamarck Dict. v. 1. 344. Illustr. t. 189. Juss. 226. 453. See CHAMITIS, as well as BOLAX hereafter.

AZOTE, in *Chemistry*. The specific gravity of azote, according to the most recent determinations, is .9722, and 100 cubic inches of it will weigh, at a mean temperature and pressure, 29.652 grains. Biot and Arrago make its

specific gravity .9691, and Lavoisier .978. See ATOMIC Theory.

A new compound of chlorine and azote was discovered a few years ago, which, from its remarkable properties, deserves to be described here.

This compound seems to have been first noticed by M. Dulong in 1812; but this chemist, on account of two severe accidents which happened to him in the course of his experiments, did not complete the investigation of its properties, nor publish any thing on the subject. Sir H. Davy was informed of the discovery of the substance soon after, but not of the method of preparing it. Chancing, however, to hear from Mr. Children, that Mr. Burton of Cambridge had procured an oily substance by passing a current of chlorine through a solution of nitrate of ammonia, he was enabled to prepare the compound in question, and investigate its properties.

Chloride of azote may be prepared by placing a jar of chlorine gas over a solution of nitrate or muriate of ammonia, heated to about 110°. The gas is slowly absorbed, and an oily-like matter collects at the bottom of the vessel, which is the substance in question. Care must be taken not to collect at one time more than a globe or two, as it explodes with prodigious violence from the slightest cause. Its colour closely resembles that of olive-oil. It is transparent: its smell is strong and peculiar, though it is not so disagreeable nor injurious to the lungs as chlorine. It is very volatile, and soon disappears when left in the open air. At 160° it may be distilled over without danger, but is partially decomposed. The temperature of 200° only occasions it to evaporate faster, but when heated to 212° it explodes with amazing force. In a vacuum it is converted into vapour, but again assumes the liquid form when the pressure of the air is restored. This vapour, if heated sufficiently, explodes with as much violence as the liquid itself. The sp. gr. of the chloride of azote is 1.653. It does not become solid on exposure to cold. When left in water it speedily disappears, and azotic gas escapes. In strong muriatic acid, chlorine escapes, and muriate of ammonia remains in solution. When brought in contact with phosphorus, oils, and many other substances, it explodes with very great violence. Metals, resins, sugar, and most of the gases, do not cause it to explode. The experiments of Sir H. Davy on the composition of this curious substance render it probable, in Dr. Thomson's opinion, that it is composed of one volume or atom of azote, and four volumes or atoms of chlorine.

Azote has likewise the property of forming an analogous compound with iodine. (See IODINE, and SIMPLE BODIES.) The celebrated chemist Berzelius still, we believe, maintains the opinion, that azote is a compound of oxygen and an unknown substance, which he denominates *nitricum*; and a laborious set of experiments was some time ago published by Mr. Miers, to shew that this unknown substance is nothing but hydrogen. Chemists in general, however, do not at present acquiesce in either of these opinions, but consider azote as an elementary substance.

For the combinations of azote with oxygen, see ATOMIC Theory, NITRIC Acid, &c. and PROPORTIONS, *Definite*.

AZUMBRE, a liquid measure in Spain. See ARROBA, *Addenda*.

B.

B A B

BABIANA, in *Botany*, an unexplained name. Can it allude to the Syrian Venus, *Babia*? Or does it acknowledge the baser etymology of *Papio*, a Baboon, because those animals perhaps eat the roots? (See the 8th species.)—Ker in Sims and Kon. Ann. of Bot. v. 1. 233. Dryandra in Ait. Hort. Kew. v. 1. 104.—Clafs and order, *Triandra Monogynia*. Nat. Ord. *Enfate*, Linn. *Irides*, Juff.

Gen. Ch. *Cal.* Spatha inferior, large, of two valves; the inner valve deeply cloven, with an intermediate pellucid membrane. *Cor.* of one petal, fuperior; tube funnel-shaped, longer than the spatha; limb shorter than the tube, in fix deep, ufually regular and nearly equal fegments, fometimes very irregular. *Stam.* Filaments three, thread-shaped, inferted into the mouth of the tube, erect, much fhorter than the limb; anthers oblong, incumbent. *Piff.* Germen roundifh; fyle thread-shaped, rather longer than the tube; ftigmas three, fpreading, obtufe, undivided. *Peric.* Capfule roundifh-ovate, coriaceous, unequally tumid, of three cells and three valves. *Seeds* numerous, globofe, pulpy; tapering at the bafe, at length corrugated, and deformed by mutual preffure.

Efl. Ch. Spatha of two valves; the innermoft deeply divided. Corolla tubular; limb in fix deep fegments. Stigmas three, fpreading. Seeds pulpy.

1. *B. Thunbergii*. Many-piked Babiana. Ker n. 2. Ait. n. 1. (*Antholyza plicata*; Thunb. Prodr. 7. Fl. Cap. v. 1. 169. Linn. Suppl. 96. Willd. Sp. Pl. v. 1. 223.)—Leaves many-ribbed, finely downy as well as the ftalks and fheaths. Corolla ringent.—Native of fandy plains near the fea, below *Verlooren Valley*, at the Cape of Good Hope, flowering in October. *Thunberg*. Mr. Maffon fent this fpecies, in 1774, to Kew, where it flowers in April. *Bulb* deep in the ground. *Leaves* radical, equitant, acute, with fome principal, yellow, and many intermediate green ribs; minutely downy on both fides, with foft prominent hairs. *Stalk* radical, taller than the leaves, a foot high, zigzag, denfely clothed with fine foft hairs, and divided into about half a dozen alternate, fpiked, many-flowered branches. *Flowers* crimfon, two inches long, crowded, erect.

2. *B. ringens*. Gaping Babiana. Ker n. 1. Ait. n. 2. (*Antholyza ringens*; Linn. Sp. Pl. 54. Willd. Sp. Pl. v. 1. 223. Thunb. Prodr. 7. Fl. Cap. v. 1. 167. Gladiolus æthiopicus fimilis; Comm. Hort. v. 1. 81. t. 41. Rudd. Elyf. v. 2. 237.)—Leaves many-ribbed, fmooth. *Stalk* downy. Corolla ringent.—Found in low fandy fields, often by the way fide, in many places about the Cape of Good Hope, flowering from July to September. Not at prefent in the gardens, as far as we could ever learn;

B A B

or at leaft we never heard of its flowering. Not fo tall as the preceding, nor fo much branched, but the *flowers* are larger and more handfome, remarkably widely ringent, with one *flamen* far removed from the other two.

3. *B. nervofa*. Four-ribbed Babiana. (*Antholyza nervofa*; Thunb. Prodr. 7. Fl. Cap. v. 1. 164.)—Leaves fmooth, with four ftrong, prominent ribs. *Stalk* fmooth. *Spike* oblong, two-ranked. *Corolla* ringent.—Native of the Cape of Good Hope. *Leaves* three or four, acute, fmooth, with four yellowifh, elevated ribs, erect, about a foot high. *Stalk* as tall as the leaves. *Flowers* flefh-coloured, drooping, crowded into an ovate, rather abrupt, fpike; their lower lip rather the fhorteft, reflexed. There can furely be no doubt refpecting the genus of this plant.

4. *B. tubiflora*. Long-tubed Babiana. Ker n. 3. Ait. n. 3. Ker in Curt. Mag. t. 847. (*Gladiolus tubiflorus*; Linn. Suppl. 96. Willd. Sp. Pl. v. 1. 219. Thunb. Diff. n. 23. t. 2. f. 2. Fl. Cap. v. 1. 210. Jacq. Ic. Rar. t. 266. *G. inclinatus*; Redoubt. Liliac. t. 44.)

β. Ker in Curt. Mag. t. 680. (*G. tubatus*; Jacq. Ic. Rar. t. 264. Willd. Sp. Pl. v. 1. 219. Redoubt. Liliac. t. 261. *G. longiflorus*; Andr. Repof. t. 5.)

γ. Ker ibid. (*G. tubati varietas*; Jacq. Ic. Rar. t. 265.) *Leaves* ribbed, plaited, downy, taller than the downy *ftalk*. *Tube* of the corolla fender-clubfhaped, thrice as long as the irregular nearly equal limb, whofe upper fegment is divaricated.—Native of Svartland, at the Cape of Good Hope, flowering from August to October. The *leaves* vary greatly in length, but are more or lefs elliptic-oblong, and taller than the oblique *ftalk*, whofe height is from one to ten inches. *Spike* folitary, fimple. *Sheaths* lanceolate, downy. *Corolla* white, with a crimfon fpot on each of the three lower fegments; its tube fometimes reddifh, varying in thicknefs, but always about three inches long.

5. *B. fpathacea*. Stiff-leaved Babiana. Ker n. 4. Ait. n. 4. Ker in Curt. Mag. t. 638. (*Gladiolus fpathaceus*; Thunb. Diff. n. 25. Fl. Cap. v. 1. 208. Linn. Suppl. 96. Willd. Sp. Pl. v. 1. 221.)—Leaves plaited, rigid, pungent, fomewhat downy. *Tube* of the corolla thread-shaped, twice as long as the regular limb. *Sheaths* tumid, pointed, fmooth.—Found in dry fituations above the Cape of Good Hope, in Bockland, and Hantum, flowering in October and afterwards. *Thunberg*. *Leaves* linear-lanceolate; thofe of old plants often naked; their bafe tapering into long *foofstalks*, dilated downward. *Stalk* varying in height, from four inches to near three feet. *Spike* many-flowered. *Spathas* much inflated, with beaked points. *Tube* very fender.

slender. *Limb* pale blueish purple, with elliptic-oblong, nearly equal segments, an inch long; three alternate ones bluntish, with a point; three lowermost marked with white and violet.

6. *B. fambucina*. Elder-scented Babiana. Ker n. 12. Ait. n. 5. Ker in Curt. Mag. t. 1019. (*Gladiolus fambucinus*; Jacq. Hort. Schoenbr. v. 1. 7. t. 15. Vahl Enum. v. 2. 117.)—Leaves scarcely downy. Stalk smooth. Tube hardly longer than the downy, pointed spathe; throat cylindrical; segments of the limb nearly equal and uniform, keeled.—Imported from the Cape, by George Hibbert, esq. in 1799. About a span high, with large, violet-coloured, very sweet-scented flowers, each of whose segments, above an inch long, has a darker violet keel, or mid-rib.

7. *B. sulphurea*. Pale Babiana. Ker n. 5. Ait. n. 6. Ker in Curt. Mag. t. 1053. (*Gladiolus sulphureus*; Jacq. Ic. Rar. t. 239. Vahl Enum. v. 2. 99. *G. plicatus*; Andr. Repof. t. 268.)—Leaves downy, shorter than the ascending downy stalk. Tube shorter than the spathe, and but one-third as long as the nearly uniform limb.—Native of the Cape, from whence it was procured by Messrs. Lee and Kennedy, in 1795. The leaves are elliptic-oblong, strongly plaited, downy all over. Flowers large, with a short tube; limb cream-coloured, with some tints of blue.

8. *B. plicata*. Sweet-scented Babiana. Ker n. 13. Ait. n. 7. Ker in Curt. Mag. t. 576. (*Gladiolus plicatus*; Thunb. Diff. n. 24. Fl. Cap. v. 1. 211, with many wrong synonyms. *G. fragrans*; Jacq. Hort. Schoenbr. v. 1. 7. t. 14.)—Leaves elliptic-lanceolate, loosely plaited, very soft and downy. Segments of the limb nearly equal, the length of the tube; upper one hooded.—One of the most common species at the Cape, near the town, and in various other places, flowering from May to October. Thunberg says the Europeans call this plant *Babianer*. Has this, whatever it means, given occasion to Mr. Ker's generic name? Nearly akin to the last, but of a softer texture. Flowers fragrant, pale lilac, or blueish-white, marked with violet at the base of their three lower segments. Stamens ascending.

9. *B. stricta*. Upright Babiana. Ker n. 6. Ait. n. 8. Ker in Curt. Mag. t. 621. 637. (*Gladiolus strictus*; Ait. ed. 1. v. 1. 63. *G. plicatus*; Linn. Sp. Pl. 53. *Ixia*; Mill. Ic. 103. t. 155. f. 1.)—Leaves elliptic-lanceolate, plaited, downy. Corolla funnel-shaped, nearly regular; segments about as long as the tube, all flat.—Native of the Cape; long known in our green-houses, though not very frequent. The flowers are smaller than most of the foregoing, with obovate, pointed, equal segments, either all blue, or pale grey, or alternately white and purplish, each hardly an inch long. Spathe small, linear-lanceolate, downy.

10. *B. villosa*. Dark-red Babiana. Ker n. 8. Ait. n. 9. Ker in Curt. Mag. t. 583. (*Ixia villosa*; Ait. ed. 1. v. 1. 58. *I. punicea*; Jacq. Ic. Rar. t. 287. Willd. Sp. Pl. v. 1. 198. *Gladioli plicati* var. *purpurea*; Thunb. Diff. n. 24. Fl. Cap. v. 1. 213.)—Leaves downy. Tube thread-shaped, the length of the regular, bell-shaped limb, whose three alternate segments are obtuse with a point.—Native of the Cape. The leaves are rather broad, elliptic-lanceolate, strongly plaited. Stalk oblique and wavy, rather taller than the leaves. Flowers the size of the last, of a deep blood-red, without scent; their tube suddenly united to the limb, without any dilatation at the throat. Anthers dark violet, remarkably large and thick.

11. *B. rubro-cyanea*. Red and blue Babiana. Ker n. 7. Ait. n. 10. (*Ixia rubro-cyanea*; Jacq. Ic. Rar. t. 285. Willd. Sp. Pl. v. 1. 198. Curt. Mag. t. 410. *I. villosa*; Schneev. Ic. t. 16. *Gladiolus rubro-cyaneus*; Vahl Enum. v. 2. 98.)—Leaves elliptic-lanceolate, flaked, downy. Tube thread-shaped, the length of the regular, wide-spreading limb, whose segments are uniform, rhomboid-obovate.—Native of the Cape. Sent to Kew by Mr. Maffon in 1794. Very nearly akin to the last, particularly in the shape of the tube; but the limb is more spreading, with uniform blue segments, red at their base, making a very showy appearance. It is not easy to discover by what rule Vahl reduced this plant to *Gladiolus*, except by the herbage.

12. *B. obtusifolia*. Blunt-leaved Babiana. Ker n. 9. (*Ixia villosa*; Jacq. Ic. Rar. t. 284. Willd. Sp. Pl. v. 1. 198.)—Leaves elliptic, bluntish, downy. Tube thread-shaped, nearly the length of the funnel-shaped regular limb, whose segments are elliptical; throat somewhat dilated.—Native of the Cape. We know this species merely from Jacquin's figure, where it is represented of humble growth, all over downy, with an oblique stalk, and a few large flowers of an uniform blueish-white; their sheaths elliptic-lanceolate, somewhat tumid. Stigmas slender. Anthers small, blue.

13. *B. diffracta*. Hyacinth-scented Babiana. Ker n. 10. Curt. Mag. t. 626. (*Gladiolus plicatus*; Jacq. Ic. Rar. t. 237.)—Leaves elliptic-oblong, strongly plaited, finely fringed. Throat of the corolla funnel-shaped; segments of the limb linear-lanceolate, nearly equal, partly crisped at the margin.—Native of the Cape. It flowered at Mr. Colville's nursery in June 1802. The leaves are broad. Flowers blueish-white, with dark-blue marks and anthers, their scent like an oriental hyacinth, but finer. Mr. Dryander seems to have overlooked this species; unless, as we suppose, he included it under *plicata*, n. 8.

14. *B. mucronata*. Brittle-pointed Babiana. Ker n. 11. (*Gladiolus mucronatus*; Jacq. Ic. Rar. t. 253. Coll. v. 4. 162. Willd. Sp. Pl. v. 1. 221. Vahl Enum. v. 2. 115. *G. ringens*; Thunb. Prodr. 186. Fl. Cap. v. 1. 214; excluding Jacquin's *sulphureus*.)—Leaves elliptic-oblong, flaked, plaited, downy. Stalk branched. Throat of the corolla funnel-shaped, elongated; segments of the limb linear-obovate, three alternate ones awned; three lower reflexed.—Native of the Cape of Good Hope. The leaves, in Jacquin's figure, have stalks nearly of their own length. The sheaths, like the whole herbage, are downy; and as long as the tube of the corolla. Throat rather short, funnel-shaped as well as the limb, whose segments are very deep; linear and elongated at the base, pale yellow in that part, lilac towards the extremity; the central one of the upper lip largest; the two next awned, like the central one of the lower lip.

BACILLUM, (a little stick or staff,) was once used by Acharius for the stalks elevating the tubercles of the Cup Lichens. (See LICHEN; sect. 7.) This term occurs in his Prodromus, but is supplanted in his more recent publications by *Podetium*. Both terms appear to us superfluous, *Pedicellus* having precisely the same meaning.

BADKU, in Geography. See BAKU.

BÆOMYCES, in Botany, from *βασις*, small, and *μυκη*, a fungus, is well appropriated to this genus of *Lichens*, their fructification looking exactly like some minute kinds of *Agaricus* or *Helvella*.—Perfoon in Ur. Annal. fac. 7. 19. Achar. Lichenogr. 108. t. 12. f. 1, 2. Syn. 279.—Class and order, *Cryptogamia Alge*. Nat. Ord. *Lichenes*.

Eff. Ch. Tubercles solitary, on solid simple stalks, from an uninterrupted granulated crust.

In the *Methodus* of Acharius, this genus is so characterized as to include all the *Lichenes pyxidati*, as well as the *Gledonia*, of other authors. At present it is restricted to the first section of the original *Baomyces*, consisting of four species only. The characters and synonyms of these are correctly given by our learned friend, except that of *Lichen ericetorum* of Linnaeus, which we remove from this genus, on the authority of original specimens.

1. *B. rufus*. Rose-coloured Mushroom-Lichen. Perf. as above. Ach. n. 1. (Lichen *Baomyces*; Linn. Suppl. 450. Ehrh. Phyt. n. 89. Sibth. Ox. 321. Engl. Bot. t. 374. Hoffm. Enum. 37. t. 8. f. 3. L. ericetorum; Web. Gott. 195. Lightf. 809. a. Fl. Dan. t. 1003. f. 2. Coralloides fungiforme carneum, basi leprosa; Dill. Musc. 76. t. 14. f. 1.)—Cruft glaucous-grey. Stalks very short, cylindrical. Tubercles tumid, lobed, rose-coloured.—Found on mountainous heaths, in broad uninterrupted patches on the ground, of a greenish or glaucous grey when fresh and moist, conforming to all the inequalities of the soil; the surface finely granulated. *Tubercles* from one to two or three lines in diameter, of a bright and most elegant rose colour, convex, more or less lobed, or irregularly tumid, each supported by a thick, round, solid stalk, about as high as the diameter of the head, white tinged with a bluish red. This is by far the most elegant, as well as the most rare, of our British species. Dr. Acharius here cites Engl. Bot. t. 372, which is his *Leidea Iemadophila*, Syn. 45, the true *Lichen ericetorum* of Linn. Sp. Pl. 1608. Fl. Succ. 408. and Herb. Linn. Fl. Dan. t. 472. f. 4. Lichen Iemadophila; Linn. Suppl. 450. Ehrh. Phyt. n. 40. L. aruginosus; Jacq. Aulstr. t. 275.

2. *B. fungoides*. Pale Mushroom-Lichen. Ach. n. 2. ("B. helvelloides; Bory Voy. 3.") Lichen fungoides; Swartz Ind. Occ. 1836.)—Cruft white. Stalks thrice as tall as the diameter of the pale flesh-coloured tubercles.—Gathered by Dr. Swartz on the gravelly soil of high mountains, in the southern part of Jamaica. Bory de St. Vincent found the same in the isle of Bourbon. We have specimens from Dr. Acharius. The *cruft* is thin, hard, of a dirty white. *Stalks* white, thrice as tall as the foregoing; tumid at the base. *Heads* of a lighter flesh-colour, with a white powdery efflorescence.

3. *B. rufus*. Brownish Mushroom-Lichen. "Wahlenb. Lapp. 449." Ach. n. 3. (Lichen rufus; Hudf. 527. L. fungiformis; Web. Goett. 196. Sibth. Ox. 322. Hoffm. Enum. 38. t. 8. f. 2. L. byssoides; Linn. Mant. 133. Lightf. 809. Engl. Bot. t. 373. L. pelitifer; Wulf. in Jacq. Coll. v. 3. 104. t. 3. f. 1. Coralloides fungiforme faxatile, pallide fuscum; Dill. Musc. 78. t. 14. f. 4.)

β. *B. lignorum*. Achar. (B. rupestris γ; Ach. Meth. 322.)

Cruft greenish-white. Stalks short, somewhat compressed. Tubercles nearly globular, reddish-brown; sometimes aggregate.—Common on heathy ground, or on rocks, rarely on rotten wood; in which last situation the *tubercles* assume a darker brown. They are much smaller than in *B. rufus*, rounder and less lobed, though often clustered together; and their colour is a dirty brick-red.

The variety β of Engl. Bot. figured in Raii Syn. t. 1. f. 3, not f. 4; and in Dill. Musc. t. 14. f. 5, is now esteemed a fungus. See OXYGENA.

4. *B. placophyllus*. Broad-leaved Mushroom-Lichen. "Wahlenb. Lapp. 449." Ach. n. 4. Meth. 323. t. 7. f. 4.—Cruft orbicular, rugged, somewhat lobed and imbricated, glaucous-white. Stalks elevated, compressed. Tubercles convex, simple, reddish-brown.—Found by Wahlenberg, on the sterile sandy soil of Lower Lapland. We are

obliged to Dr. Acharius for a specimen of this very curious species, whose cruft approaches that of the true Cup Lichens, its circumference at least being lobed and almost leafy, though of a thick substance. The tubercles are altogether those of a *Baomyces*.

BAGDAD, col. 4, l. 1, after terraces. Bagdad is still a place of great trade, and the resort of merchants from almost every quarter of the East. It supplies all Asia Minor, Syria, and part of Europe, with Indian commodities, which are imported at Bassora, brought in boats up the Tigris, and then transported by caravans to Tocat, Constantinople, Aleppo, Damascus, and the western parts of Persia. The chief imports from India are, gold brocade, cloths, sugar, pepper, tin, sandal-wood, iron, china-ware, spice, cutlery, arms, and broad-cloth; in return for which they send bullion, copper, gall-nuts, tamarisk, leather, and otto of roses. From Aleppo are imported European silk-stuffs, broad-cloths, steel, cochineal, gold thread, and several other European articles, which are brought in Greek vessels to Scanderoon. The imports from Persia are, shawls, carpets, silk, cotton, white cloth, leather, and saffron; and those from Constantinople are, bullion, furs, gold and silver thread, jewels, brocade, velvets, and otto of roses. The principal manufacture at this place is that of red and yellow leather, which is much esteemed; but silk and cotton stuffs are likewise made. The climate, notwithstanding its excessive heat, is allowed to be very healthy. But the natives are subject to a cutaneous disorder, for which no cure has yet been discovered: it appears in the form of a pimple, then degenerates into an ulcer, and at the end of eight or ten months dries up of itself, leaving a prominent mark. The inhabitants of Aleppo, and other towns in Syria, are subject to this disease. The military government of Bagdad is, &c.

BAGDAD, *Pachalic* of, extends in a N.W. direction from the mouth of the Shat-ul-Arab to the rocks of Merdin, and in an E. and W. line from the confines of Persia to the banks of the Khabor, which separates it from the pachalic of Orfa. It comprehends the whole of the ancient Babylonia, and the greatest part of Assyria Proper; that is, the space which is embraced by the Tigris and the Euphrates, and that which is beyond the Tigris, commonly called the lower Kurdistan. See BABYLONIA and ASSYRIA.

BAHAR. Add—The bahar of Acheen, in Sumatra, consists of 100 catees, and is equal to 490 lbs. avoirdupois. The bahar of Betlefacee, in Arabia, consisting of 40 farcels, is = 815½ lbs. avoirdupois. The bahar of Bencoolen = 560 lbs. avoirdupois. The bahar of Junkfeylon = 8 capins = 485 lbs. 5 oz. 5½ dr. The bahar of Malacca, of 3 peculs = 405 lbs. avoirdupois. The bahar of Mocha, of 15 franks = 445 lbs. avoirdupois.

BAHREIN, N. lat. 26° 43'.

BAJOCO. Add—Rome exchanges with Amsterdam 42 bajocchi, more or less, for 1 florin banco; with Leghorn, 95 bajocchi, more or less, for 1 pezza of 8 reali. Rome keeps accounts in scudi. See SCUDO.

BAIRDSTOWN, l. 3, r. 821, 202 being slaves.

BAIT, WHITE. Add—See CUPPEE Alofa.

BAKERSFIELD. Add—It contains 812 inhabitants.

BAKU. Inert, or BADUK. N. lat. 42° 22'. Add—Baku is defended by a double wall and deep ditch, constructed during the reign of Peter the Great. This was once a celebrated city of the ancient worshippers of fire, and before the conquest of the Saracens was annually visited by thousands of pilgrims.

BALDIVIA, l. 7, r. W. long. 74°.

BALDWIN, in *Geography*, a town of America, in the district of Maine, and county of Cumberland, containing 546 inhabitants.

inhabitants.—Alfo, a county of Georgia, which, together with its town Milledgeville, contains 6356 inhabitants; the flaves in the county being 2324, and in the town 226.—Alfo, a county in the territory of Miffiffippi, having 1427 inhabitants, including 717 flaves.

BALFOURIA, in *Botany*, received its name from the pen of Mr. Brown, in honour of his illuftrious countryman fir Andrew Balfour, knight, founder of the Botanic Garden, as well as of the Public Mufeum, at Edinburgh. His friend, fir Robert Sibbald, has embalmed his memory in the *Memoria Balfouriana*; nor could any one be more competent to this fubject. Thefe diftinguifhed men firft laid the foundation of the ftudy of natural hiftory in Scotland.—Brown Tr. of the Wern. Soc. v. 1. 70. Prodr. Nov. Holl. v. 1. 467.—Clafs and order, *Pentandria Monogynia*. Nat. Ord. *Cortorta*, Linn. *Apocinea*, Juff. Br.

Eff. Ch. Corolla funnel-shaped; throat crowned with a fmall crenate tube; fegments of the limb ftraight, equilateral. Stamens inferted into the throat; anthers arrow-shaped, pointed, cohering with the ftigma about the middle. Germen of two cells; ftyle folitary, thread-shaped, dilated at the top; ftigma angular. Scales ten at the bafe of the calyx, on the outfide of the corolla; none under the germen. *Folicles*.....

1. *B. faligna*. Willow-leaved Balfouria. Br. n. 1.—Discovered by Mr. Brown, in the tropical part of New Holland. A tree, about twelve feet high, fmooth. *Leaves* oppofite, linear-lanceolate, falcate, with little teeth between the infertion of their *footftalks*. *Cymes* lateral as well as terminal, three-cleft.

BALK. Infert—or **BULKH**. Col. 1, l. 3, after *Bactriana*, infert—It was formerly included in *Khoraffan*, and is bounded on the N.E. by the *Oxus*, E. by *Koondooz*, W. by *Khoraffan*, and S.W. by the mountains of *Huzara*, and the independent ftate of *Mymuna*. Col. 2, l. 17, after *Persians*, add—The *Tanjets*, or the race of people who inhabit this country, befides the *Afglians* and *Uibecks*, are corrupt and diffolute, and addicted to the moft unnatural vices. The *Uibecks* are fimple, honeft, and humane. Col. 2, l. 60, after *Hindoftan*, add—It is faid to be as large as *Delhi*; but moft of the houfes are uninhabited; and the population is faid to be reduced to between 6 and 7000 men, fubject to the king of *Cabul*. The vicinity of the town is well cultivated, and corn and provifions are abundant.

BALLABUAN, r. **BALLAMBUAN**, and remove to next column.

BALLISTIC PENDULUM, a pendulum ufed in afcertaining the velocity, &c. of balls, the ftrength of gunpowder, &c. &c. See **GUNNERY**, **GUNPOWDER**, and **PENDULUM**.

BALLOGISTAN, l. 10, r. *Mekran*. At the clofe, add—*Ballogistan*, or, as it is otherwife called, *Balouchistan*, the country of the *Balouches*, is confidered by fome as a province diftinct from *Mekran* or *Meeran*; and as fuch properly commences at *Koobinee* (the hilly road) 25 miles N.E. of *Bayla*, or in N. lat. 26° 35', from which place it extends to *Noohky*, 79 miles N.W. of *Kelat*, or in N. lat. 30°. It is faid to be a confufed mafs of tremendous mountains, through which the road generally leads in water-courfes. Flocks of fheep and herds of cattle are numerous in every part of this country, and it alfo produces great quantities of wheat. The territories of *Mahomed Khan*, chief of *Balouchistan*, comprehend all the countries lying between 20° 30' and 30° N. lat., and from 65° to 69° E. long. It is divided into the two mountainous provinces of *Ihalawan* and *Sarawan*, the low country of *Cutch Gandava* to the E., and the provinces of *Zufree* and *Amund Dajul*; to which

VOL. XXXIX.

may be added the fmall diftricts of *Shat* and *Mufkung*, lying N. of *Kelat*. See *SARAWAN* and *MECRAN*.

BALLOTADE, l. 5, r. thefe airs, &c.; l. 8, r. horfeman.

BALLS, CHAIN. For *chain-balls* r. *chain-bullets*.

BALLS, STANG, *dele*.

BALOUCHISTAN. See **BALLOGISTAN**.

BALSAMITA, in *Botany*, an old name, ufed by *Dodonæus* and others, alluding to the balsamic odour of the flowers and herbage, and their reputed fimulating healing qualities. It is revived by *Proffeur Desfontaines*, who, after the example of *Vaillant*, has recently feparated the feveral fpecies of this genus from *Cotula*, *Chryfanthemum*, and *Tanacetum*, into which they had been forced, though deftitute of radiant, or female, florets, as well as of a crown to their feeds.—*Desfont. Act. Soc. Hift. Nat. Parif. v. 1. 1. Willd. Sp. Pl. v. 3. 1800. Ait. Hort. Kew. v. 5. 519.*—Clafs and order, *Syngenia Polygamia-æqualis*. Nat. Ord. *Compositæ difcoideæ*, Linn. *Corymbifera*, Juff.

Gen. Ch. *Common Calyx* flatifh, imbricated; fcales numerous, linear, convex, acute, the inner ones with a membranous margin. *Cor.* compound, uniform, tubular, longer than the calyx. Florets all perfect, numerous, funnel-shaped, equal; their limb in five regular, acute, fpreading fegments. *Stam.* in each floret, *Vilaments* five, capillary; anthers united into a five-toothed tube, hardly longer than the tube of the corolla. *Pifl.* Germen roundifh; ftyle thread-shaped, longer than the corolla; ftigmas two, revolute. *Peric.* none, except the permanent calyx. *Seeds* folitary to each floret, fmall, oblong, ftriated, fometimes bordered with a narrow longitudinal membrane at one fide, but abrupt at the fmmitt, without any crown or wing. *Recept.* flightly convex, naked.

Eff. Ch. *Receptacle* naked. *Seed-down* none. *Calyx* imbricated.

1. *B. grandiflora*. Large-flowered *Coftmary*. *Defl. Act. Soc. Hift. Nat. Par. v. 1. 1. t. 1. Willd. n. 1.* (*Cotula grandis*; *Linn. Sp. Pl. 1257.*)—Stem herbaceous, hairy, fimple and fingle-flowered. *Leaves* ferrated; radical ones obovate; thofe of the ftem lanceolate; dilated and deeply toothed at their bafe.—Found by *Desfontaines* in corn-fields at *Algiers*, flowering in *May*. *Linnaeus* had it from thence. A handfome biennial plant, confpicuous for its large, yellow, cushion-like flower, about two inches broad, compofed of innumerable crowded florets. The ftem is two or three feet high, unbranched, leafy, and hairy. *Leaves* numerous, fmooth; the radical ones flaked, two or three inches long.

2. *B. virgata*. Wand-branched *Coftmary*. *Defl. as above, 2. Willd. n. 2. Ait. n. 1.* (*Cotula grandis*; *Jacq. Obs. fasc. 4. 4. t. 81.* *Chryfanthemum difcoideum*; *Allion. Pedem. v. 1. 100. t. 11. f. 1.*)—Stem herbaceous, fmooth; branched at the bafe; branches fingle-flowered. *Leaves* linear-lanceolate, ferrated, nearly feffile; upper ones linear, entire.—Native of *Italy*. This is the plant mentioned under his *Cotula grandis* by *Linnaeus*; as having been fent by *Allion*. It is however, as he fufpected, very diftinct from that plant; being much fmallier in every part; the ftem fmooth and branched; leaves none of them fpatulate, nor dilated and deeply cut at the bafe. *Flowers* fimilar, but fearcely half fo large, efppecially thofe of the lateral branches.

3. *B. ageratifolia*. Sharp-toothed *Coftmary*. *Defl. as above, 2. Willd. n. 3. Ait. n. 2.* (*Chryfanthemum ftofulofum*; *Linn. Sp. Pl. 1255.* *Bellis fpinofa*; *Alpin. Exot. 327. t. 326.* *B. major fpinofa*, petals carens; *Morif. fect. 6. t. 9. f. 16.*)—Stem fhrubby, branched at the bafe. *Leaves* obovate, fharply ferrated, crowded. *Flowers* corymbofe.—Native of *Crete*; an old green-houfe plant in

3 A

England,

England, but not popular at present. The *branches* are rather loosely spreading, smooth, covered with smooth *leaves*, an inch and a half long, whose numerous teeth are sharp, and even spinous. Several deep-yellow convex *flowers* compose a corymbose cluster at the extremity of the stem or branch.

4. *B. vulgaris*. Common Colchary. Willd. n. 4. (B. major; Desf. as above, 3. Dod. Pempt. 295. B. mas; Ger. Em. 648. *Mentha græca*; Matth. Valgr. v. 2. 75. Camer. Epit. 480. *Tanacetum Balfamita*; Linn. Sp. Pl. 1184.)—Stem herbaceous. Leaves ovate, serrated; the lower ones stalked; upper auricled. Flowers corymbose.—Native of Tuscany, France, and Switzerland. A hardy old kitchen-garden herb, flowering in August and September. Root perennial. Stems round, leafy, somewhat branched, two feet high. Leaves hoary. Flowers numerous, small, yellowish, accompanied with small leaves. The whole plant has a strong warm odour. Gerard speaks of it as sometimes infused in ale, for medicinal purposes, but we know not of its being in use at present, though often kept in rustic gardens.

BALTIMORE, l. 12, after contains, add—by the census of 1810, 29,255; and for 5877 r. 6697.

BALTIMORE, col. 1, l. 9 from the bottom, add—By the census of 1810, the number of inhabitants in the city of Baltimore was 35,583, including 3713 slaves; in the eastern precincts 4050, comprehending 262 slaves; and in the western precincts 6922, including 697 slaves.

BALTIMORE, a town of Vermont, in the county of Windfor, having 207 inhabitants.

BAMBERG, col. 1, l. 19, add—Before it was secularized in 1813, it contained a surface of 65 German miles, with a population of 192,000 souls, and a revenue of 556,000 dollars. Col. 1, l. 24, after populous, add—containing about 2030 houses, and 16,500 inhabitants.

BAMFF, col. 2, l. 31, insert—The burgh and parish contained, in 1811, 3603 persons; 1540 males, and 2063 females.

BAMFFSHIRE, col. 2, l. 4, r. in 1811, was 36,668 persons; 16,465 males, and 20,203 females: 3815 families being employed in agriculture, and 2195 in trade, manufactures, and handicraft.

BAMPTON, l. 19, r. 1061 houses, and 5864 inhabitants; 2882 males, and 2982 females.

BANBURY, l. ult. r. and the borough and parish, by the returns of 1811, contained 582 houses, and 2841 persons; 1331 males, and 1510 females.

BAND, a weight used on the Gold Coast for weighing gold dust, and equal to two ounces troy.

BAND-Fish. See CEPOLA.

BANDER-ABASSI, r. GAMBRON.

BANGOR, col. 2, l. 37, r. the city and parish, in 1811, contained 456 houses, and 2383 inhabitants, viz. 1094 males, and 1289 females.

BANGOR, in America, add—It contains 850 inhabitants.

BANK, MILLION. Add to dissolution—in 1796.

BANKSIA, in *Botany*, one of the most magnificent and peculiar genera among the native plants of New Holland, was with great propriety dedicated to the honour of the illustrious discoverer of this genus, by the younger Linnaeus. (See our former article BANKSIA, which requires correction, as embracing several species not now included herein, but already described in the present work under the articles CONCHIUM and XYLOMELUM.) On the other hand, a much greater number of genuine *Banksias*, first made known by Mr. Brown, since the publication of that original article, require to be added. We are at a loss to account for the report concerning the species with solitary flowers, at the

end of that article. It may have had some foundation which has escaped the memory of the writer of this. The only SALISBURIA ever published belongs to a totally different family, and may be found in its proper place. Thirty-one species of *Banksia* are defined by Mr. Brown, of which four only were known to Linnaeus, from specimens and engravings communicated by sir Joseph Banks.—Linn. Suppl. 15. Schreb. Gen. 79. Murr. in Linn. Syst. Veg. ed. 14. 161. Willd. Sp. Pl. v. 1. 535. Mart. Mill. Dict. v. 1. Ait. Hort. Kew. v. 1. 213. Brown Tr. of Linn. Soc. v. 10. 202. Prodr. Nov. Holl. v. 1. 391. Juff. 79. Lamarck Illustr. t. 54. f. 1, 2. Gært. t. 48.—Class and order, *Tetrandria Monogynia*. Nat. Ord. *Aggregate*, Linn. *Proteaceae*, Juss. Brown.

Gen. Ch. *Cal.* Catkin cylindrical, dense, many-flowered; flowers in pairs, with three permanent scales to each pair, two of which are interior, and smallest. *Cor.* of one petal, in four deep linear segments, at length separating entirely, somewhat dilated and concave at the summits, their points long cohering, till forced asunder by the growing style. Nectary four scales at the base of the germen. *Stam.* Filaments four, very short, inserted into the base of the cavity of each petal; anthers oblong. *Pist.* Germen superior, of two single-seeded cells, very small; style cylindrical or angular, rigid, gradually curved, firmly held, for a long time, by the combined tips of the corolla; stigma undivided. *Peric.* Follicle woody, firmly fixed in the receptacle, obovate, of two shallow cells; the partition unconnected, rigid, elastic, cloven by a deep transverse fissure at the top. *Seeds* solitary, compressed, quite flat at the inner side, wedge-shaped, and extended into a rounded, membranous, terminal wing.

Eff. Ch. Corolla of one petal, four-cleft, bearing the stamens in the hollows of its segments. Nectary four scales at the base of the germen. Follicle woody, of two single-seeded cells, with a cloven moveable partition. Catkin with three scales to each pair of flowers.

Obs. The greater part of the very numerous flowers are necessarily abortive, or they would not be room for the follicles to ripen.

The various species, all natives of New Holland, are either shrubs, or trees of no lofty stature. The *branches* are umbellate; or in Linnæan language the *stem* is “determinately branched,” as in *Erica* and other *Bicornes*. *Leaves* scattered, rarely whorled, simple, undivided, either entire, serrated, toothed, or cut in a pinnatifid manner; in a young plant they are often variously cut, or toothed, though undivided and entire on the same when full grown. (*Brown.*) *Catkins* solitary, terminal, rarely lateral, cylindrical, in some cases very short. *Bractææ* several at the base of each catkin, short and narrow. *Catkin* when in fruit hard and heavy, its enlarged common receptacle firmly united with the bases of the *follicles*, the surface bristly with remains of the *flowers*, and especially with the unimpregnated *styles* of the greater part, intermixed with the large, hard, usually downy or hairy, *follicles*. *Seeds* black, with a brown, shining, oblique wing, the convex side of each filling a depression in the corresponding side of the thin woody partition.

SECT. 1. *Style longer than the corolla, projecting laterally, in a curved position, between its segments, the stigma being held fast, for some time longer, between their points.* *Catkin, when in flower, cylindrical; when in fruit, laden with numerous transverse follicles.* These Mr. Brown considers as true *Banksia*. Indeed this section embraces the whole genus, except one species. We follow Mr. Brown’s names and numbers.

1. *B. pulchella*. Small-flowered *Banksia*. Ait. n. 1.—Leaves accresce, entire, pointless. Tube of the corolla woolly;

BANKSIA.

woolly; limb smooth. Stigma capitate, depressed.—Native of dry heaths, near the sea-shore in Lewin's land, on the southern coast of New Holland, where it was found by Mr. Brown, and sent to Kew in 1805, but had not yet flowered there in 1810. The leaves are not longer than the finger-nail.

2. *B. sphaerocarpa*. Round-fruited Banksia. Ait. n. 2.—Leaves acrofol, entire, pointed. Corolla hairy all over, externally. Stigma awl-shaped. Scales globose. Follicles tumid, rather compressed at the summit.—Found on low heaths in Lewin's land. Sent to Kew by Mr. Peter Good, in 1803. The leaves are an inch long.

3. *B. nutans*. Nodding-flowered Banksia. Ait. n. 3.—Leaves acrofol, entire, pointed. Catkins drooping. Corolla silky. Follicles dilated at the summit, depressed.—On dry heaths near the shore of Lewin's land, where, like the two former, it was gathered by Mr. Brown.

4. *B. eriofolia*. Heath-leaved Banksia. Linn. Suppl. 127. Willd. n. 7. Ait. n. 4. Banks Ic. Ined. apud Bibl. Linn. t. 4. Andr. Repof. t. 156. Curt. Mag. t. 738. Cavan. Ic. v. 6. 27. t. 538. (Banksia; White's Voy. 225. t. 22. f. 1).—Leaves acrofol, emarginate, with two teeth; entire at the edges. Catkins elongated. Corolla silky. Stigma capitate.—Native of the eastern coast of New Holland, on rocky heaths near Port Jackson, from whence it was sent by Dr. White, among the first botanical communications from that country, and is now in several green-houses, flowering at various times of the year. This species was however first discovered by Sir Joseph Banks and Dr. Solander, in their celebrated voyage. The stem is three or four feet high. Leaves very numerous, the length of the nail, evergreen, smooth, revolute. Flowers bright yellow. Catkins five or six inches long. Follicles abrupt, rough with rusty, deciduous hairs.

5. *B. spinifolia*. Prickly-leaved Banksia. Sm. Bot. of New Holl. 13. t. 4. Willd. n. 6. Ait. n. 5. Andr. Repof. t. 457. Cavan. Ic. v. 6. 26. t. 537.—Leaves linear, revolute, with spinous teeth towards the end, and three terminal ones, the intermediate tooth longest. Corolla smooth internally at the base. Stigma awl-shaped.—Native of dry heaths about Port Jackson. Larger than the last. Leaves from one to three inches long; white beneath. Corolla yellow. Expofed part of the styles purple.

6. *B. collina*. Hill Banksia. Br. n. 6.—Leaves linear, with spinous teeth; veiny beneath; their terminal tooth shortest. Scales of the catkin obtuse, downy at the extremity. Corolla smooth internally at the base. Stem shrubby.—Gathered by Mr. Brown on dry open hills about Hunter's river, New South Wales.

7. *B. occidentalis*. West-coast Banksia. Ait. n. 6.—Leaves linear, with spinous teeth beyond the middle; veinlets beneath. Scales of the catkin smooth at the extremity. Corolla withering; bearded internally at the base. Follicles tumid, downy; rather compressed and naked at the summit. Stem shrubby. Young branches smooth.—Found by Mr. Brown, in heathy ground, at Lewin's land.

8. *B. littoralis*. Sea-side Banksia. Ait. n. 7.—Leaves linear, elongated, with spinous teeth; veinlets beneath; tapering at the base. Corolla deciduous. Follicles compressed, downy at the summit, as well as the scales of the catkin. Stem arborescent. Young branches downy.—Found by Mr. Brown on the sandy shores of creeks in Lewin's land. The flowers were past.

9. *B. marginata*. Various-leaved Banksia. Cavan. Ic. v. 6. 29. t. 544. Ait. n. 8.

10. *B. microtachya*; Cavan. Ic. v. 6. 28. t. 541, excluding the reference to *B. dentata* of Linneus!

11. Brown.

Leaves linear, abrupt, pointed, either entire or toothed, with scarce-visible veins beneath. Ultimate branches hairy. Scales of the catkin all smooth at the end; the larger ones acute. Stem shrubby.—Native of heaths, in the neighbourhood of Port Jackson, New South Wales. The stem is usually six feet high. Leaves generally entire, shorter than the catkin, scarcely exceeding two inches in length; their under side white and downy. Flowers orange-coloured. In variety β the leaves are bordered with spinous teeth, and less revolute, sometimes exceeding the length of the unusually small catkins. γ is a dwarf diffuse shrub, with flatish, wedge-shaped, spinous-toothed leaves, longer than the catkins. Brown.

10. *B. depressa*. Prostrate Banksia. Br. n. 10.—Leaves long-wedge-shaped, abrupt, pointed, spinous-toothed; slightly ribbed and veined beneath; rather longer than the catkins, all whose scales are downy and obtuse. Stem prostrate. Ultimate branches hairy.—Found by Mr. Brown, in stony ground at the roots of the mountains in Van Diemen's island, towards the south.

11. *B. patula*. Spreading Banksia. Br. n. 11.—Leaves linear, somewhat wedge-shaped, abrupt, pointed, very sparingly toothed; reticulated with veins beneath. Scales of the catkin downy at the summit and obtuse. Keel of the limb of the corolla smooth. Stem diffuse. Ultimate branches downy.—Discovered by Mr. Brown, in Flinders' land, on the fourth coast of New Holland, growing amongst other shrubs, in barren elevated spots.

12. *B. australis*. South-coast Banksia. Br. n. 12.—Leaves linear, abrupt, pointed, entire, revolute; reticulated with veins beneath. Ultimate branches downy. Scales of the catkin obtuse, nearly equal; downy at the summit. Keel of the limb of the corolla very slightly silky. Stem arborescent.—Observed by Mr. Brown, every where in the open fields of Van Diemen's island, as well as by the sea-side; and also on the fourth coast of New Holland, near Port Phillip.

13. *B. infularis*. Infular Banksia. Br. n. 13.—Leaves linear-oblong, or somewhat wedge-shaped, slightly rounded, pointed, either scattered or whorled; reticulated with veins beneath. Scales of the catkin obtuse, externally downy. Follicles compressed; smooth at the summit.—Native of the islands of the Bass' strait, as well as of that of Van Diemen, near the shore. Brown.

14. *B. integrifolia*. Entire-leaved Banksia. Linn. Suppl. 127. Willd. n. 3. Ait. n. 9. Banks Ic. Ined. t. 3. Cavan. Ic. v. 6. 30. t. 546. (*B. oleifolia*; Cavan. Ic. v. 6. 30. t. 545. *B. glauca*; Cavan. Ic. v. 6. 31. *B. spicata*; Gertn. t. 48.)—Leaves whorled, oblong-lanceolate, entire, pointed; reticulated with conspicuous veins beneath. Follicles downy. Stem arborescent.—Native of the east coast of New Holland, near the sea-shore at Port Jackson. This is generally a small, or middle-sized, tree. Leaves narrow-obovate, for the most part acute; tapering at the base; white beneath. The twin scales of the catkin obtuse; solitary one acute, and only half as large.

Mr. Brown says this is a very variable species, too nearly akin to the last, as well as to that immediately following. He observed on the fourth coast, near Port Phillip, a variety which forms a large tree, with lanceolate-oblong, mostly rather obtuse, leaves, acute at their base; the solitary scales of the catkin rather acute, but more than half the size of the twin ones.

15. *B. compar*. Doubtful Banksia. Br. n. 15.—Leaves scattered, oblong-tongue-shaped, obtuse, pointless; veinlets and snow-white beneath. Branches, and scales of the catkin, downy. Corolla silky. Stem arborescent.—Found by

BANKSIA.

Mr. Brown, but not in fruit, by the sea-side at Keppel Bay, on the east coast of New Holland. He suspects it to be a variety of the last.

16. *B. verticillata*. Whorled Banksia. Ait. n. 10.—Leaves whorled, oblong-tongue-shaped, obtuse, pointless; veinless and snow-white beneath. Scales of the catkin downy, obtuse. Bractees at the base hairy. Stem arborescent.—Gathered by Mr. Brown, in Lewin's land, near the sea-side. Mr. Menzies also met with this species on the south-west coast of New Holland.

17. *B. coccinea*. Scarlet-flowered Banksia. Ait. n. 11.—Leaves alternate, wedge-shaped-obovate or oblong, toothed, abrupt, ribbed, reticulated with veins; transverse at the base. Scales of the catkin awl-shaped. Corolla woolly. Stigma pyramidal.—Found by Mr. Brown in Lewin's land, in fields near the coast. It was sent to Kew, by Mr. Good, in 1803.

18. *B. paludosa*. Marsh Banksia. Ait. n. 12.—Leaves imperfectly whorled, wedge-shaped-oblong, somewhat abrupt; tapering at the base; slightly revolute; coarsely serrated beyond the middle; ribbed and reticulated with veins beneath. Footstalks and young branches smooth. Corolla silky. Stem shrubby.—Gathered by Mr. Brown, in marshy ground, near Port Jackson. It is said to flower in the green-house at Kew, from January to March.

19. *B. oblongifolia*. Oblong-leaved Banksia. Cavan. Ic. v. 6. 28. t. 542. Ait. n. 13. (*B. falcifolia*; Cavan. Ic. v. 6. 31?)—Leaves scattered, narrow-oblong, abrupt, strongly serrated; rather acute at the base; ribbed, and reticulated with veins, beneath. Footstalks and young branches downy. Larger scales of the catkin pointed. Corolla silky. Stem shrubby.—Seen by Mr. Brown on heaths near Port Jackson. The leaves, according to his observations, are sometimes entire, or nearly so, (as we judge in this case from the word *integra*.) and therefore may answer to the *falcifolia* of Cavanilles, of which it is difficult to judge precisely, for want of a figure.

20. *B. latifolia*. Broad-leaved Banksia. Br. n. 20. Ait. n. 14. (*B. robur*; Cavan. Ic. v. 6. 29. t. 543.)—Leaves obovate-oblong, with spinous serratures; acute at the base; ribbed, reticulated, downy and grey beneath. Tube of the corolla silky; limb smooth. Stem shrubby.—Observed by Mr. Brown, in boggy situations near Port Jackson; plentiful about the town of Sydney, where it rarely ripens seed. That accurate botanist informs us the stem is usually three or four feet high, scarcely ever six feet. Louis Née, from whom Cavanilles had his information, appears to have accidentally confounded his specimens of this species, with his memorandums relating to *B. ferrata*, and hence it is described of the size of an Oak, to which the name *robur* alluding, was necessarily obliged to be changed.

21. *B. marcescens*. Short-leaved Banksia. Br. n. 21. Ait. n. 15. (*B. præmorfa*; Andr. Repof. t. 258.)—Leaves wedge-shaped, flat, scattered, abrupt, strongly serrated more than half way down; rather acute at the base. Branches downy. Corolla permanent, smooth as well as the foliicles.—Native of the southern coast of New Holland; at Lewin's land, near the shore. Mr. Andrews says this species was first raised from seed at Kew, in 1788. Mr. Brown and Mr. Aiton, on the contrary, mark it as introduced in 1794, by its first discoverer Mr. Menzies. The stem is six or seven feet high in the green-house. Leaves so abrupt, that we could almost have allowed the name *præmorfa* to remain. Flowers purple, in large handsome catkins; inside of the corolla white.

22. *B. attenuata*. Smooth-flowered Banksia. Ait. n. 16.—Leaves elongated and nearly linear, abrupt; tapering at

the base; serrated more than half way down; ribbed and reticulated, with downy interstices, beneath. Scales of the catkin hairy at the summit. Corolla smooth. Follicles downy.—This also was discovered by Mr. Menzies, on the southern coast of New Holland; and seen by Mr. Brown in Lewin's land, near the sea-coast. It was raised at Kew, in 1794, but appears not yet to have flowered; nor have we heard of the plant elsewhere.

23. *B. elatior*. Tall Banksia. Br. n. 23.—Leaves elongated and nearly linear, serrated, rather abrupt; reticulated, and almost smooth when full grown, beneath. Scales of the catkin beardless, but, like the corolla, downy. Style quite smooth. Stigma oval-club-shaped. Stem arborescent.—Discovered by Mr. Brown, on the east coast of New Holland, by the sea-side, at Sandy Cape.

24. *B. ferrata*. Great Serrated Banksia. Linn. Suppl. 126. Willd. n. 1. Ait. n. 17. Banks Ic. Ined. t. 2. White's Voy. 222. t. 18, 19, 20. Andr. Repof. t. 82. Cavan. Ic. v. 6. 27. t. 540. (*B. conchifera*; Gærtner. t. 48.)—Leaves linear-oblong, abrupt, rather bluntly serrated; reticulated and nearly smooth beneath; tapering at the base. Lower part of the style downy and powdery. Stigma cylindrical, furrowed; obliquely swelling at the base. Stem arborescent.—Native of the east coast of New Holland, at Port Jackson, in fields near the sea, from whence specimens were brought by sir Joseph Banks; but the plant was first raised in England, by Messrs. Lee and Kennedy, in 1788. This is described as the most stately of its genus, rising to the height of thirty feet, with a hard reddish wood. The leaves are near a span long, almost perfectly smooth on both sides, not so deeply serrated as in the figures of Andrews or Cavanilles, or in White's t. 20, but rather bordered with a series of rectangular bluntish notches. Catkins large, thick and heavy, of innumerable downy flowers, whose corolla is purplish, and style crimson. Cone ten inches long, very heavy. Follicles downy, an inch in diameter. Gærtner's figure is from a poor diminutive cone.

25. *B. æmula*. Large-fruited Banksia. Br. n. 25.—Leaves linear-oblong, abrupt, deeply and sharply serrated; reticulated and nearly smooth beneath. Corolla silky. Stigma capitate, polished, pyramidal, not furrowed, twice as thick as the style. Stem shrubby.—Native of heaths, and sandy fields, near Port Jackson, from whence we long ago received specimens, with full-grown fruit, by the kindness of Dr. White. We have been used to call this species *B. macrocarpa*, a name well expressing its singularly large follicles, which are twice the dimensions of the preceding, though the whole cone is usually much shorter. It is impossible to mistake Mr. Brown's faithful specific definition, especially the character of the short pyramidal stigma. The leaves are much smaller than those of *B. ferrata*, though their serratures are much deeper and sharper. Hence Mr. Brown was led to apply t. 20 of White's Voyage to the present species, with which the leaves in that figure pretty nearly agree; but the cone certainly, to our knowledge, belongs to the *ferrata*, which it well expresses, except being too small. The serratures in Mr. Andrews's plate of *ferrata* most nearly approach our present plant. The shape and proportion of the catkin moreover best agrees herewith.

26. *B. dentata*. Broad-toothed Banksia. Linn. Suppl. 127. Willd. n. 5. Banks Ic. Ined. t. 5.—Leaves wedge-shaped-oblong, abrupt, sinuated and wavy, with broad spinous teeth; contracted at the base; snow-white, ribbed, and finely veiny, beneath. Corolla silky. Capsules downy.—Discovered by sir Joseph Banks and Dr. Solander, near Endeavour river, in the tropical part of New Holland. Mr. Brown also met with this noble species, which as yet is a stranger

stranger to our gardens, at Arnhem's land, on the northern coast. Of the height or size of the plant we are not informed. The *branches* are rusty and somewhat downy. *Leaves* alternate, from a span to a foot long, on short stalks; their margins remarkably undulated, and bordered with broad, shallow, spinous-pointed teeth. *Catkins* six inches long, more slender than usual; their scales downy, the larger one to each pair of *flowers* spinous-pointed.

27. *B. quercifolia*. Oak-leaved Bankfia. Ait. n. 18.—Leaves oblong-wedge-shaped, rather abrupt, smooth, deeply serrated, pointed. Segments of the corolla awned. Follicles nearly smooth.—Found by Mr. Brown, in fields near the shore, in Lewin's land. The awns of the *corolla* are indicated by him as a very remarkable character.

28. *B. speciosa*. Long-leaved Bankfia. Ait. n. 19.—Leaves linear, pinnatifid; lobes triangular-halfovate, pointed; snow-white and slightly ribbed beneath. Limb of the corolla woolly. Style rather hairy. Follicles downy.—Native of the rocky sea-shore of Lewin's land, where it was found by Mr. Brown, and sent to Kew, with the last, in 1805.

29. *B. grandis*. Great Winged Bankfia. Willd. n. 2. Br. n. 29. Ait. n. 20.—Leaves deeply pinnatifid; lobes triangular-ovate, acute, flat; many-ribbed, and nearly smooth, beneath. Corolla and follicles smooth.—Gathered by Mr. Menzies, at King George's sound, on the west coast of New Holland. Mr. Brown met with the same on rocky hills in Lewin's land. Seeds were sent to Kew in 1794, where this magnificent shrub thrives well, in the green-house, but has not yet flowered. Willdenow's specific name alludes, we presume, to the *foliage*, and not to the *flowers*, with which he was not acquainted. The *leaves* are twelve or fourteen inches long, pinnatifid to the very rib; abrupt at the extremity; lobes numerous, more or less alternate, crowded, transverse, coriaceous, entire, rather spinous-pointed; roughish to the touch on the upper side; paler underneath, furnished with five principal ribs, and many intermediate vein reticulations; they diminish gradually towards the top, and especially towards the base, of the leaf. We have seen no *flowers* nor *fruit*.

30. *B. repens*. Creeping Bankfia. Labill. Voy. v. 1. 412. t. 23. Br. n. 30. Ait. n. 21.—Leaves pinnatifid; lobes sinuated or toothed. Stem prostrate.—Found by Labillardiere, on calcareous rocks on the south-west coast of New Holland, where also Mr. Brown met with this species. It flowers there in December. The creeping *stem* is clothed with rusty down. *Leaves* a span long, stalked, erect, deeply pinnatifid, but not quite to the rib, which is winged nearly all its length; they are downy when young, but finally very smooth. *Catkins* ovate, nearly sessile, erect, dense, many-flowered, about three inches long. *Corolla* and *germen* hairy.

Sect. 2. *Points of the corolla* more speedily separating; the narrow part of their segments cohering longitudinally, and as long as the *style*. *Catkin* short and level-topped, perfecting scarcely more than one vertical follicle.

31. *B. ilicifolia*. Holly-leaved Bankfia. Br. n. 31.—Leaves wedge-shaped, deeply serrated; nearly smooth beneath. *Catkins* very short.—Gathered by Mr. Brown, in fields and hilly ground near the sea-coast, in Lewin's land. This species is so singular, that its learned discoverer appears to have been inclined to make it a distinct genus, by the name of *Islyllis*. He remarks that it forms a connecting link between *Bankfia* and *DRYANDRA*; see the latter hereafter.

BANNIUM, in *Ancient Geography*, a Roman station, called Gaer, or Caer Bannau, situated about three miles above the town of Brecknock, in South Wales, near the confluence of the rivers Yakin and Uk. The camp is a

parallelogram, 624 feet by 456, having its longest parallels in a direction nearly S. and N. The foundation of the wall that encompassed this area remains still entire, and may be traced through the underwood that has overgrown and concealed it. In this station there is a causeway, supposed to have been a branch of the great Roman causeway leading from Caerleon, in Monmouthshire, through the vale of Uk, and the eastern part of Brecknockshire to Ariconium, which is the 12th Iter in Antonine's Itinerary.

BANQUETTE. Add—See **BREAST-WORK**.

BANTAM, col. 1. l. 50, after settled there, infer—That of the English was established in 1601, and maintained until 1683. That of the Dutch was erected in the year 1595, and this was their first settlement in the Spice islands, which had been first visited by the Portuguese in 1510. The English made no attempt to recover a free port in Java until the year 1811, when Holland became a province of France, and the Dutch colonies were induced to accept the protection of Great Britain.—Col. 3, at the close of Bantam, add—Raffles's History of Java, 2 vols. 4to. 1817.

BAPTISIA, in *Botany*, so called by the late M. Ventenat, from βαπτίζω, to colour by immersion, to dye, because a tincture of the leaves, of some of the species, is said to be scarcely inferior, in that respect, to Indigo.—Venten. Decas Gener. Novor. 9. Brown in Ait. Hort. Kew. v. 3. 5. (Podalyria; Michaux Boreal.-Amer. v. 1. 263. Pursh 307. Lamarck Illustr. t. 327. f. 1.)—Class and order, *Decadria Monogynia*. Nat. Ord. *Papilionaceae*, Linn. *Leguminosae*, Juss.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, bell-shaped, permanent, cut half way down into four or five segments, forming two lips; its base externally convex. *Cor.* papilionaceous, of five petals. Standard inversely-heart-shaped, reflexed at the sides, with a thick claw. Wings two, nearly as long as the standard, half-obovate, converging at their upper edges. Keel as long as the wings, of two oblong converging petals. *Stam.* Filaments ten, awl-shaped, ascending, equal, inserted into the base of the calyx, deciduous; anthers roundish, two-lobed. *Pist.* Germen superior, stalked, ovate or elliptical; style longer than the stamens, ascending; stigma capitate, hemispherical. *Peric.* Legume on a stalk longer than the calyx, elliptic-oblong, turgid, membranous, of one cell. *Seeds* numerous, elliptical, stalked.

Ess. Ch. Calyx two-lipped, divided half way down into four or five segments. Corolla papilionaceous; petals all nearly of equal length; standard reflexed at the sides. Stamens distinct, deciduous. Legume inflated, stalked, with many seeds.

To this genus we have already adverted, under the article *PODALYRIA*, as comprising the North American species of that genus, as it stands in Lamarck and Willdenow. They are doubtless sufficiently marked by the above characters, to form a genus by themselves. They are herbaceous, perennial, many of them glaucous, and have mostly the quality of dyeing blue. *Leaves* ternate, except the first, with a pair of rather large *stipules*. *Flowers* mostly racemose, with small partial *bractees*; their colour blue, white, or yellow.

1. *B. perfoliata*. Perfoliate Wild Indigo. Ait. n. 1. (*Rafnia perfoliata*; Willd. Sp. Pl. v. 3. 949. *Podalyria perfoliata*; Pursh n. 1. *Crotalaria perfoliata*; Linn. Sp. Pl. 1003. Sm. Inf. of Georgia, v. 2. 133. t. 67. *C. perfoliata* folio; Dill. Elth. 122. t. 102.)—Leaves simple, perfoliate, roundish, entire. *Flowers* axillary, solitary.—Native of Carolina and Georgia, in dry barren fields, flowering

flowering in July. The whole plant is very smooth, scarcely glaucous, two or three feet high, distinguished by its petiole, almost orbicular *leaves*, about two inches broad, accompanied by lemon-colored *flowers*, on short simple stalks. *Legume* nearly globular.

2. *B. uniflora*. Downy Single-flowered Wild Indigo. (*Podalyria uniflora*; Michaux Boreal-Amer. v. 1. 263. Pursh n. 2. *Sophora lanceolata*; Walt. Carol. 135.)—Leaves ternate, sessile, downy; leaflets lanceolate, obtuse. Stipulas bristle-shaped, minute. Flowers axillary, solitary.—Observed by Michaux in Carolina and Georgia. The whole herbage is downy, as well as the *calyx*. *Flowers* stalked, yellow.

3. *B. villosa*. Downy Clustered Wild Indigo. (*Podalyria villosa*; Michaux ibid. 261. Pursh n. 3. *Sophora villosa*; Walt. Carol. 134.)—Leaves ternate, nearly sessile, downy beneath; leaflets elliptic-oblong, obtuse. Stipulas linear. Cluster terminal, dense. *Calyx* four-cleft.—In low sandy grounds of Virginia and North Carolina, flowering in June and July. Resembles a Lupine very much. *Flowers* yellow. *Pursh*. Michaux says the *flowers* are pale, nearly sessile; Walter calls them “*cinerei*.”

4. *B. australis*. Blue-flowered Wild Indigo. Ait. n. 2. (*Podalyria australis*; Willd. Sp. Pl. v. 2. 503. Venten. Hort. Celf. t. 56. P. *cærulea*; Mich. ibid. 264. Pursh n. 4. *Sophora australis*; Linn. Syst. Veg. ed. 13. 325. Mant. 378. Curt. Mag. t. 509. S. *cærulea*; “Trew Pl. Rar. 6. t. 14.”)—Leaves ternate, stalked, smooth; leaflets lanceolate, somewhat wedge-shaped. Stipulas lanceolate, longer than the footstalk.—On the banks of rivers in Virginia and Carolina, particularly in the western districts, flowering in June and July. *Pursh*. A hardy perennial in our gardens, about two feet high, smooth in every part, of a fine glaucous-green, with erect *clusters* of large handsome blue *flowers*; the standard and wings striped with a darker blue; the keel white.

5. *B. alba*. White-flowered Wild Indigo. Ait. n. 4. (*Podalyria alba*; Willd. Sp. Pl. v. 2. 503. Mich. ibid. 264. Pursh n. 5. Curt. Mag. t. 1177. *Sophora alba*; Linn. Syst. Veg. ed. 13. 325. *Crotalaria alba*; Linn. Sp. Pl. 1006. *Anonis caroliniana perennis*; non spinosa, &c. Mart. Cent. t. 44.)—Leaves ternate, stalked, smooth; leaflets elliptic-oblong. Stipulas awl-shaped, shorter than the footstalk, deciduous. Germs smooth.—In the western parts of Virginia and Carolina, on the banks of rivers, flowering in June and July. *Pursh*. Hardy in our gardens, but not of frequent occurrence. Catesby first introduced it in 1724. The habit of this species, its smoothness, and rather glaucous hue, agree with the last, to which it is certainly most nearly allied; but the *leaflets* are elliptical, the *flowers* white, more oblong, in consequence of the greater length of the wings and keel, the *stipulas* smaller and deciduous. The *corolla* is here and there spotted with brown, and is reported to be sometimes blue. Some of the *flowers*, in both these species, are often whorled, and give the *cluster* an interrupted form, like that of a Lupine, the aspect of which genus is otherwise visible in these plants.

6. *B. mollis*. Soft Wild Indigo. (*Podalyria mollis*; Mich. ibid. 264. Pursh n. 6.)—“Herbage and *calyx* minutely downy. Leaves ternate; leaflets lanceolate, slightly rhomboid. Stipulas lanceolate, leafy. Cluster spiked, terminal. Teeth of the *calyx* acute.”—Found by Michaux in the county of Mecklenburg, Upper Carolina. Perennial. *Flowers* deep yellow. *Michaux*.

7. *B. tinctoria*. Common Wild Indigo. Ait. n. 3. (*Podalyria tinctoria*; Willd. Sp. Pl. v. 2. 503. Mich. ibid. 265. Pursh n. 7. Lamarck f. 1. Curt. Mag.

t. 1099. *Sophora tinctoria*; Linn. Sp. Pl. 534. *Cytisus procumbens americanus*, flore luteo, ramiflissimus, qui Anil suppediat apud Barbadienum colonos; Pluk. Phyt. t. 86. f. 2.)—Leaves ternate, somewhat stalked, smooth; leaflets roundish-obovate. Stipulas setaceous, obsolete. Flowers racemose.—In woods on dry hills, from Canada to Carolina, flowering in July and August. Called Wild Indigo. *Pursh*. A low, partly procumbent, smooth plant, whose numerous branches are each terminated by a simple cluster of yellow *flowers*, about half the size of *B. australis*. The *pods* are ovate, on stalks much longer than the permanent *calyx*. This species is said to have been cultivated for Indigo, in the North American settlements, and even in Barbadoes, before the true *Indigofera* was introduced. It is tolerably hardy with us, in a dry soil and sheltered situation, but has nothing to recommend it for general cultivation.

BAR, in *Heraldry*, r. Plate III.

BAR, *Trial* at. See JURY.

BARACKS, col. 2. add—See CASERNS.

BARAQUICIMITO, *dele* lat. and long., and add—See BARQUISIMETO.

BARBARA, in *Botany*, a name used by Dodonæus, because this plant had been called the Herb of St. Barbara by some preceding botanists. It has always been referred to ERYSIMUM, (see that article), till Mr. Brown raised it to the rank of a separate genus, under the above appellation, in Ait. Hort. Kew. v. 3. 109. —Class and order, *Tetradynamia Siliquosa*. Nat. Ord. *Siliquosæ*, Linn. *Cruciferae*, Juss. Eff. Ch. Pod quadrangular, compressed. Cotyledons incumbent. Seeds in a single row. *Calyx* erect. Glands between the shorter stamens and the germs.

Two species only are described.

1. *B. vulgaris*. (*Erysimum Barbara*; Linn. Sp. Pl. 922. Sm. Fl. Brit. 706. Fl. Dan. t. 985.) See ERYSIMUM, n. 2.

2. *B. præcox*. See the same article, n. 3.

Mr. Brown thus defines ERYSIMUM.

Eff. Ch. Pod quadrangular. Seeds without a border. Cotyledons incumbent. Stigma capitate; sometimes emarginate, with spreading lobes. *Calyx* closed.

We have explained the terms *accumbent* and *incumbent*, as thus technically used, under the article TETRADYNAMIA, where a more particular account is given of our ingenious friend's arduous undertaking, of reforming the genera of the natural order in question.

BARBAREËN. See CALTURA.

BARBET, in *Fortification*. See BATTERY.

BARBOURSVILLE, in *Geography*, a town of Kentucky, in Knox county, containing 55 inhabitants, eight of whom are slaves.

BARBULA, in *Botany*, so called by Hedwig, in allusion to the beard-like fringe of the capsule. See TORTULA.

BARSTOWN. Add—See BEARSTOWN.

BARETTI, col. 2, l. 27, for Burke r. Bowle.

BARILLA. Add—See CARBONATE of Soda.

BARium, in *Chemistry*, the metallic base of Barytes. (See BARYTES, *infra*.) Dr. Clarke has lately proposed the name of *Plutenium* for this metal.

BARON, col. 1, *l. 21* from bottom, for *Minerva r. Miniver.*

BARQUISIMETO, in *Geography*, a city of America, in the government of Caracas, 40 leagues W.S.W. of Caracas, 150 leagues N.N.E. of Santa Fé, and 15 leagues from Tocuyo. N. lat. 9° 45'. The excessive heat is rendered supportable by the cooling breeze arising from its elevated situation. The adjacent plains are covered with excellent pasturage favourable for rearing every marketable animal. The sugar-cane and the best wheat are also cultivated. The vales produce excellent cacao; and the sides of the hills are devoted to the culture of coffee. This city accommodates 11,300 persons; its houses are well built, and the streets are so laid out as to afford a free circulation of air. It has a parish-church and two officiating priests, a monastery of Franciscans, and a hospital badly attended.

BARRE', a township of America, *l. 2, r. 1971; l. 11,* add—having 1053 inhabitants.—Also, a town of Vermont, in Orange county, having 1660 inhabitants.

BARREL. By 43 Geo. III. c. 69. every 36 gallons of beer or ale brewed by the common brewers in Great Britain, taken according to the standard of the ale quart, four thereof to the gallon, in the exchequer, shall be reckoned by the gauger or other officer of excise for a barrel of beer or ale.

BARREL, a weight by which corn is sold in Ireland. The barrel of wheat, peas, beans, and rye, is 20 stone: of barley, bere, and rape-seed, 16 stone; of oats 14, and in some places 12 stone; of malt, 12 stone: the stone being 14 lbs. avoirdupois weight. A barrel of good wheat answers to about four Winchester bushels.

BARREN FLOWERS, in *Botany and Vegetable Physiology*, *Flores masculi* in Linnæan terminology, are such as are not provided with organs for the formation of fruit or seed, but only with *filaments* for its impregnation. See FERTILIZATION of Plants.

BARRIER, in *Fortification*. Add—See CHEVAL de Frise, HERISON, KLINKETS, and TERNSTILE.

BARRELE, plur. BARRILI, a liquid measure in Italy.

BARRIN, in *Geography*, a county of the district of Kentucky, containing 11,042 inhabitants, of whom 1656 are slaves. The town, Glasgow, has 244 inhabitants, of whom 68 are slaves.

BARRINGTON, a township in Strafford county, &c. *l. 3,* for 2470 r. 3564. *Id. l. 5,* for 683 r. 604. *Id. l. 2,* for 1373 r. 1784.

BARRIQUE, a measure for wine and brandy in some

parts of France, as at Bourdeaux, Rochelle, &c. At Bourdeaux, a tonneau of wine contains 4 barriques or hoglheads = 50 ftekan in Amsterdams, 259 stubgen in Hamburgh, or 243 English bushels; and weighs with the wood about 2000 lbs. of Bourdeaux. The barrique contains 110 pots, or 32 veltels.

BARRY-BENDY, &c. *Plate III. Heraldry, &c.*

BART, in Laneaster county, add—It contains 1099 inhabitants.

BARTHELEMY, a river of Louisiana, which rises near the Arkansas, and after a course generally from N. to S. of 100 miles, falls into Ouachitta, 3 miles below the Derbane, on the contrary side.

BARTHOLINA, in *Botany*, a genus of the *Orchis* family established by Mr. Brown, and dedicated by him to the memory of the great Danish anatomist and physiologist, THOMAS BARTHOLIN, whose life is already given in its proper place, and whose various writings relating to plants, in the old Copenhagen Transactions, entitle us to adorn the history of our science with his truly illustrious name.—Brown in *Ait. Hort. Kew. v. 5. 194.*—Clas and order, *Gynandria Monogynia.* Nat. Ord. *Orchidee.*

Gen. Ch. *Cal.* Perianth superior, of one leaf, tubular at the base, deeply divided above into three, elliptic-oblong, equal, ribbed, spreading segments, externally hairy. *Cor.* Petals two, linear-lanceolate, erect, smooth, taper-pointed, nearly twice the length of the calyx. Nectary a large spreading lip, united to the base of the petals, thrice the length of the calyx, in three deep principal lobes, the middle one broadest, all divided, more than half way down, into many linear, fringe-like segments, and terminating behind in a tumid, curved, bluntly-pointed spur, rather longer than the tube of the calyx. *Stam.* Anther pointed, of two oblong, rather distant, parallel cells, opening in front, attached to the two margins of the style; masses of pollen each supported on a long, membranous-bordered stalk, to which their cells are laterally attached, "their glands distinct, half covered by the exterior lobe." *Pist.* Germen inferior, elliptic-oblong, curved, very hairy; style flattened, much shorter than the calyx; stigma a cavity between the lobes of the anther. *Peric.* Capsule.....

Efl. Ch. Calyx tubular at the base. Petals united to the base of the lip, whose spur is shorter than the germen. Stalks of the pollen elongated; their cells laterally fixed; "glands distinct, half covered by the exterior lobe."

1. *B. peñinata.* Fringed Bartholina. *Ait. n. 1.* (*Orchis Burmanniana;* Linn. Sp. Pl. 1334. *Am. Acad. v. 6. 108.* "Swartz in Web. and Mohr Archiv. v. 1. 55. t. 3." *O. peñinata;* Thunb. Prodr. 4. Fl. Cap. v. 1. 45. Willd. Sp. Pl. v. 4. 11. *Arethusa ciliaris;* Linn. Suppl. 405.)—Gathered by Thunberg and Sparrmann, on the sides of hills at the Cape of Good Hope, in Roode Sand, as well as near Cape Town, flowering from October to December. The root consists of two ovate hairy knobs, the size of a horse-bean. *Leaf* solitary, radical, orbicular, clasping the flower-stalk, an inch broad, horizontal, fleshy; smooth, and of a fine green, on the upper side; paler and veiny beneath; the margin reflexed, and very densely fringed. *Flower-stalk* solitary, simple, single-flowered, five or six inches high, erect, hairy, with a solitary, funnel-shaped, hairy bractea, half an inch long, near the top. *Flower* large, of a very singular aspect. *Calyx* green, converging, strongly ribbed, and externally hairy, near an inch long, its tube included. *Petals* whitish, with a blue mid-rib, and a stripe of the same colour in their lower part. *Lip* two inches in length and breadth, spreading, finely cut; its segments white above, blue underneath, the throat dotted and minutely streaked with

with

with blue. *Spur* greenish-white. Masses of *pollen*, (which Linnæus in the *Supplement* has described as a pair of styles,) inserted into the base of the style, yellowish, prominent, very conspicuous even in dried specimens.

BARTLET, a town of America, in Coos, &c. r. 436.

BARTON, in Orleans county, &c. add—it contains 447 inhabitants.

BARTON-upon-Humber, l. ult. for 412 r. 101—for 1709 r. 1129. The parish of Barton, St. Mary, has 209 houses and 976 persons; and the parish of St. Peter has 260 houses, and 1228 persons.

BARTONIA, in *Botany*, received that name from Dr. Sims, in 1812, in just commemoration of the scientific merits and zeal of Dr. Benjamin Smith Barton, at that time professor of botany and natural history, in the university of Pennsylvania, who after many exertions, and several publications, in the service of natural science, died of hydrothorax, at Philadelphia, on the 19th of December 1815, in the fiftieth year of his age. His nephew, Dr. William Barton, in an animated and interesting "Biographical Sketch" of his character and pursuits, has preserved some account of the plants which compose this genus, written by the late professor, three or four days before his death, and accompanied by many particulars, relative to Mr. Pursh and Mr. Nuttall, through whose means it has come to the knowledge of European botanists; all which evince a love of science, that the most painful bodily sufferings could not repress.—Sims in *Curt. Mag.* 1487. Pursh 327. Ait. *Epit.* 364.—Clafs and order, *Isolandria Monogynia*. Nat. Ord. *Loasæe*, Juss. *Ann. du Mus. d'Hist. Nat.* v. 5. 18. *Sims*.

Eff. Ch. Calyx superior, in five deep segments. Corolla of many petals, with claws. Stamens uniform. Capsule cylindrical, of one cell, with a lid of three or five valves, and as many parietal receptacles. Seeds numerous, flat, in double rows.

1. *B. ornata*. Large-flowered *Bartonia*. Pursh n. 1. Ait. n. 1. (B. decapetala; Sims as above, t. 1487.)—Germen leafy. Seeds without a wing.—Found by governor Lewis, in 1804, on chalky soil on the borders of the Missouri, flowering in July and August. *Pursh*. Professor Barton records that Mr. Nuttall first made this fine plant known to him in 1811, having found it growing all the way from the river Platte to the Andes, on broken hills and in the clefts of rocks. Mr. Pursh by mistake, as the professor thought, speaks of the soil as volcanic. Living plants were brought to England by Mr. Nuttall, who is unquestionably entitled to the honour of this discovery, as he could not know what might be concealed in the herbarium of any deceased traveller. The figure in the Magazine, though taken from a dried specimen, is unexceptionable, as far as it goes. The herb is biennial, downy, glaucous, about three feet high. Leaves alternate, sessile, oblong, pinnatifid. Flowers terminal, enveloped in leaves, three inches broad, with about ten elliptical, acute, white petals, and numerous stamens, half as long, whose anthers are elliptical, yellowish. These flowers expand suddenly in an evening, diffusing a most agreeable odour, and rival those of some of the fine species of *Caesius* in elegance.

2. *B. nuda*. Small-flowered *Bartonia*. Pursh n. 2. Ait. n. 2.—Germen naked. Seeds winged.—Found by Mr. Nuttall, on gravelly hills near the Grand Detour of the Mississippi, flowering in August. Root perennial. Petals more numerous. *Barton*. Mr. Pursh observes that this has smaller flowers than the foregoing, and less glaucous leaves. The petals vary in number, from ten to fifteen.

We have seen no specimens, and have scarcely sufficient materials for drawing up a full generic character.

BARTRAMIA, is intended to commemorate the venerable John Bartram, the friend of Collinson, Dillenius, Fothergill, and Linnaeus, to whom gardeners and botanists are indebted for some of the most valuable plants of North America. The original *Bartramia* of Linnæus, having been referred by its author himself to *TRIMUMFETTA*, (see that article,) Hedwig has transferred the name to a fine, and very distinct, genus of Mosses, now universally received.—Hedw. *Crypt.* v. 2. 111. Sp. Musc. 164. Schreb. *Gen.* 761. Sm. Fl. Brit. 1339. *Engl. Bot.* v. 14. 997. *Compend.* 182. Turn. in *Sims* and *Kon. Ann.* of Bot. v. 1. 522. *Musc. Hib.* 106. Hooker and Taylor *Musc. Brit.* 85. t. 3.—Clafs and order, *Cryptogamia Musci*. Nat. Ord. *Musci*.

Eff. Ch. Capsule spherical, furrowed. Outer fringe of sixteen teeth, dilated at the base; inner membranous, plaited, deeply lacinated. Veil smooth. Lid preffed.

Eight species are described in *Engl. Bot.* and *Compend. Fl. Brit.*, and there are several of exotic growth.

Seçt. 1. *Fruit-stalks shorter than the stem*.

1. *B. Halleriana*. Lateral *Bartramia*. Hedw. *Crypt.* v. 2. 111. t. 40. *Engl. Bot.* t. 997. Hook. and Tayl. n. 5. t. 23. (Bryum laterale; Hudf. 483. Ehrh. *Crypt.* 33. B. n. 1802; Hall. *Hist.* v. 3. 43. t. 46. f. 8.)—Fruit-stalks lateral, curved, shorter than the linear-awlshaped, single-ribbed, rough-edged leaves.—Native of moist rocky mountainous woods, in Switzerland, Germany, Scotland, Wales, and the north of England. The stems are, as Mr. Hooker observes, perennial, and repeatedly prolific, so that, although the flowers are, like every *Bartramia*, originally terminal, the fruit soon becomes lateral, and remaining two or three years, is found numerously ranged along the main stem, among the dense, slender leaves. When ripe it becomes strongly furrowed, though originally smooth or even.

2. *B. arcuata*. Curve-stalked *Bartramia*. *Engl. Bot.* t. 1237. *Fl. Brit.* n. 5. Hook. and Tayl. n. 6. t. 23. (Mnium arcuatum; Dickf. *Crypt. fasc.* 3. 2. t. 7. f. 3. *M. chrysochromum*; Hedw. *Sp. Musc.* 74. Hypnum palustre erectum, comâ lutea, basi nigricante; Dill. *Musc.* 302. t. 39. f. 36.)—Fruit-stalks recurved. Leaves lanceolate, single-ribbed, furrowed, finely serrated. Branches scattered, spreading.—Native of mountains in Great Britain and Ireland. According to Mr. Hooker, it is found, in the greatest abundance, on wet rocks, at Lowdore and Kefwick, Cumberland, and is also very common in the mountainous districts of Ireland, though unknown on the continent of Europe. With all deference to our worthy friend however, the ripe capsule is as decidedly furrowed as in any other species. The more branched and tufted habit of this moss, and the broader, shorter, rigid, yellowish, more spreading leaves, at once distinguish it from the foregoing. The fruit-stalks soon become lateral, and are wavy rather than recurved, longer than in the preceding. Mouth of the capsule small, with a red outer fringe, whose teeth are lined, as it were, with the sixteen opposite teeth of the inner one.

Seçt. 2. *Fruit-stalks rising above the stem*.

3. *B. pomiformis*. Apple *Bartramia*. Hedw. *Sp. Musc.* 164. *Fl. Brit.* n. 2. *Engl. Bot.* t. 998. Hook. and Tayl. n. 1. t. 23. Hook. in *Curt. Lond. ed.* 2. t. . . . (Bryum pomiforme; Linn. *Sp. Pl.* 1580. B. capillaceum, capsulis sphaericis; Dill. *Musc.* 339. t. 44. f. 1.)—Fruit-stalks erect, taller than the stem. Leaves awl-shaped, single-ribbed; somewhat twisted when dry.—Common on heaths and dry banks, in various parts of Europe, bearing capsules in the spring. An elegant moss, consisting of densely leafy stems from

BARTRAMIA.

from one to three inches in height, clothed and matted together below with copious brown fibres. *Leaves* bright green, slender, gradually tapering from their base; strongly ferrated towards the point; somewhat twisted and curved by drying. *Fruit-stalks* near the tops of the stems, about an inch long, bright orange-red, slightly wavy. *Capsule* globose, green and smooth while young; more elliptical when ripe, oblique, brown, with sixteen furrows. *Lid* rather convex, bossed. *Fringe* short, red. *Veil* conical, curved, split half way up on one side.

4. *B. crispa*. Frizzled Bartramia. Swartz Musc. Succ. 73. Turn. in Ann. of Bot. v. 1. 527. Winch Guide v. 2. 16. "Bridel. Musc. v. 2. 3. t. 1. f. 4. Schwægr. Suppl. t. 59." Sm. Compend. n. 3. Engl. Bot. t. 1526. (*B. pomiformis* β; Turn. in Ann. of Bot. v. 1. 527. Hook. and Tayl. n. 1. β.)—*Fruit-stalks* erect. *Leaves* bristle-shaped; dilated at the base; incurved and curled when dry. *Lid* slightly conical.—Native of mountainous situations in Britain, and other parts of Europe. Larger in its *stems* and *foliage* than the preceding, the *leaves* of a lighter brighter green, longer, and more slender, except at the very base, and when dry so strongly curled, twisted, and involute, as to give the plant a very different aspect. The intelligent authors of the *Muscologia Britannica* nevertheless judge this to be but a variety of the *pomiformis*, and they unite it with Mr. Turner's supposed variety of that species, which he distinguished from *crispa*, and which he has thought to be figured for *crispa*, in Engl. Bot. t. 1526. We acknowledge that figure to be not a very happy one, except the *lid*, which seems to us always rather more conical than in *pomiformis*.

5. *B. ithyphylla*. Straight-leaved Bartramia. Bridel. Musc. v. 4. 132. t. 1. f. 6. Sm. Compend. n. 4. Engl. Bot. t. 1710. Winch Guide v. 2. 17. Hook. and Tayl. n. 2. t. 23.—*Fruit-stalks* elongated, erect. *Leaves* capillary, nearly entire, single-ribbed half way up; dilated at the base; straight when dry.—Found on dry banks, in the mountainous parts of Germany, Sweden, England, and Wales. The long, very slender, light-green *leaves* are only ferrated at the very point, and are remarkable for remaining always straight when dry, which Mr. Hooker has well attributed to the whole substance of the mid-rib being dilated and lost in the upper half of the leaf, to which it consequently gives firmness. The *capsules* are much curved; their *stalks* longer than in the foregoing. The dilated base of each leaf is singularly membranous and shining.

6. *B. gracilis*. Tall Slender Bartramia. Flörke in Schrad. Journ. v. 2. 171. Fl. Brit. n. 3. Engl. Bot. t. 1826. Hook. and Tayl. n. 3. (*B. Oederi*; Schwægr. Suppl. t. 59, as also, according to Mr. Hooker, *B. grandiflora*, t. 58. Bryum Oederi; Retz. Prodr. 261. Fl. Dan. t. 478.)—*Fruit-stalks* from lateral branches, taller than the stems. *Leaves* lanceolate, ferrated towards the point; recurved and twisted when dry.—Native of the loftiest Scottish mountains, as well as of the north of Europe. The *stems* are two or three inches high. *Leaves* broader than in any of the three preceding species, somewhat revolute at the margin, especially when dry, in which state they become recurved, and not curled inwards. Their colour is a darkish grass-green. *Capsules* small, from short lateral shoots.

7. *B. sguarrofa*. Spreading-leaved Bartramia. Turn. in Ann. of Bot. v. 1. 528. t. 11. f. 2.—*Fruit-stalks* lateral, taller than the stems. *Leaves* awl-shaped, entire; single-ribbed at the base; spreading and straight when dry.—Received from Java by Mr. Dickson. Gathered by Commerçon, at the straits of Magellan. The tufted leafy

stems, shaggy with rusty fibres, and scarcely branched, are two or three inches high. *Leaves* slender, yellowish-green, longer than any of the preceding, except perhaps *B. Halleriana*, and always quite straight, probably from the same cause as in *ithyphylla*, the rib being soon lost in the substance of the leaf. *Fruit-stalks* straight, erect. *Capsule* curved, strongly furrowed. *Lid* convex, blunt.

8. *B. Menziesii*. Tall Forked Bartramia. Turn. ibid. 525. t. 11. f. 1.—*Fruit-stalks* slightly elevated above the tall forked stems. *Leaves* lanceolate, single-ribbed, taper-pointed, entire; close-pressed when dry. *Capsule* nearly globular, with shallow furrows.—Gathered on the north-west coast of America, by Mr. Menzies. The tall slender *stems*, covered with close-pressed, tawny, shining *leaves*, half the length of the last, clearly distinguish this species. The *capsules* are scarcely curved, even when fully ripe, and their surface is wrinkled as well as finely furrowed.

9. *B. sphaerocarpa*. Globose Bartramia. Hedw. Crypt. v. 3. 93. t. 38 A. Turn. as above, 525. (Mnium sphaericarpon; Swartz Prodr. 139, from the author.)—*Fruit-stalks* taller than the slender clustered branches. *Leaves* lanceolate-awl-shaped, close-pressed, finely ferrated.—Native of Jamaica. Swartz. The slender *stems* are determinately branched, as in the following, to which this species is very nearly allied, though smaller, with longer branches. In the *leaves*, though usually narrower, we scarcely find a permanent difference. Hedwig's figure erroneously omits the furrows of the *capsule*.

10. *B. marbachii*. Narrow-leaved Bog Bartramia. Web. and Mohr Ind. 5. Sm. Compend. n. 7. Engl. Bot. t. 2074. (*B. fontana* β; Hook. and Tayl. n. 4. Turn. Musc. Hib. 107. t. 10. f. 1. Mnium marbachium; Hedw. Crypt. v. 2. 108. t. 39.)—*Fruit-stalks* elongated, much taller than the clustered branches. *Leaves* lanceolate, finely ferrated at the point, close-pressed.—Native of wet situations in Germany, the Highlands of Scotland, and the mountains of Nepal, for Mr. Hooker assures us his *B. fontana*, Tr. of Linn. Soc. v. 9. 317, is this plant. He is also of opinion that *B. marbachii* is merely a lanceolate-leaved variety of the following.

11. *B. fontana*. Broad-leaved Fountain Bartramia. Fl. Brit. n. 4. Turn. Musc. Hib. 107. Hook. and Tayl. n. 4. t. 23. (Mnium fontanum; Linn. Sp. Pl. 1574. Hedw. Sp. Musc. 195. Eryum fontanum; Engl. Bot. t. 390. *B. palustre*, *foepis teretibus stellatis*, *capsulis magnis fibro-tundis*; Dill. Musc. 340. t. 44. f. 2.)—*Fruit-stalks* elongated, much taller than the clustered branches. *Leaves* ovate, finely ferrated at the point, close-pressed.—Native of spongy bogs throughout Europe, and perhaps in other parts of the world. It is one of our handiomest and largest mosses, bearing capsules in spring and summer. The barren *flowers* form terminal leafy stars, on a separate plant from the *capsules*, whose stalks are two or three inches long, rising high above the tuft of leafy branches, which have overtopped the originally terminal situation of their *flowers*. *Capsule* brown, with a minute sharp beak to the lid. *Leaves* usually direct, broadly ovate, entire at the edges, the point only being ferrated. They appear at first light very different from the lanceolate narrow shape of the last, and still more from the curved taper-points of Mr. Hooker's *B. falcata*, Tr. of Linn. Soc. v. 9. 317. t. 27. f. 4, which he is disposed to reduce to the *fontana*, having found the latter in Switzerland with leaves as decidedly curved. We cannot dispute his accuracy of observation and judgment in this point; nor are we much disposed to question his further opinion, that Hedwig's *sphaerocarpa*, our n. 9, as well as

jacarida Mublenbergii, (of which we have specimens from its finder,) and *radialis* of Schwægrichen's Supplement, may possibly be likewise varieties of *B. fontana*.

BARYTES, in *Chemistry*, one of the earthy substances termed *alkaline*. We stated that this earth was considered by Bergman, Lavoisier, and other eminent chemists, as a refractory metallic oxyd; and this supposition has been since confirmed by the experiments of Berzelius and Pontin, who, led by sir H. Davy's decomposition of potash and soda by galvanism, subjected this earth to the same agent. Their experiments were attended with complete success, and have been since verified by sir H. Davy and other chemists. To this metallic basis, Davy gave the name of *barium*. More lately, Dr. Clarke of Cambridge thought he had decomposed this earth by exposing it to an intense heat, produced by the combustion of a stream of oxygen and hydrogen gas, mixed together in the requisite proportions to form water. To the metal thus obtained, he proposed to give the name of *plutonium*. Many chemists, however, think, that Dr. Clarke from some cause or other permitted himself to be deceived in these experiments, and that instead of a metal he only obtained a slag with a pseudo-metallic surface.

Barium obtained by galvanic agency is a solid metal of the colour of silver. It melts at a temperature below redness, and is not volatilized by a heat capable of melting plate-glass; but at that temperature it acts violently on the glass, probably by decomposing the alkali of the glass, and converting it into a protoxyd. When exposed to the air, it rapidly tarnishes, absorbs oxygen, and is converted into barytes. It sinks readily in water, and seems to be at least four or five times heavier than that fluid. It decomposes water very rapidly. Hydrogen is emitted, and the barium is converted into barytes. Barium seems to be both ductile and malleable.

Barium, according to the experiments of Gay Lussac and Thenard, combines with two proportions of oxygen. The protoxyd is the earth called *barytes*. No direct experiments have been made to ascertain the proportion of oxygen it contains; but this may be determined by other means. Thus, sulphate of barytes is composed of

Sulphuric acid	-	-	-	100
Barytes	-	-	-	194

and carbonate of barytes of

Carbonic acid	-	-	-	100
Barytes	-	-	-	374.54

Hence it may be easily ascertained by calculation, that the equivalent number for barytes is 97.5, oxygen being 10; and if we consider this earth as a protoxyd, the number for barium will of course be 97.5 - 10 = 87.5. Hence one hundred parts of barytes consist of

Barium	-	-	-	89.74
Oxygen	-	-	-	10.26
				<hr/>
				100.00

Gay Lussac and Thenard found, that when dry barium, from nitrate of barytes, or from the carbonate of barytes decomposed by charcoal, was heated in oxygen gas, it absorbed that gas with great rapidity. The peroxyd formed was grey. It gave out its excess of oxygen, when

put into water. When heated in hydrogen gas, the hydrogen was absorbed, and water was formed, which remained united to the barytes.

The salts of barytes are described under **SALTS**. The equivalent numbers of these, however, require a little correction; for which purpose, we refer our readers to the article *Atomic Theory*, where the latest determinations will be found.

The muriate of *barytes* (see **SALTS**) has been employed as a medicine in scrofulous and cancerous cases. Although it has been accounted highly poisonous, Dr. Johnstone, in his "Essay on Poisons," says, that he has seen a female take 30 drops of a saturated solution of muriate of barytes repeatedly in the course of a day, without even nausea: and he concludes, that it would require at least two or three drachms to do mischief. Barytes is capable of making a very tenacious cement, but it has been yet much used in the arts, except by limners, as a most excellent water-colour. Mr. Hume, says Mr. Parkes (Chem. Catch.), many years ago discovered the method of making a colour from this earth. It is the only *white* for water-painting that never changes. It has another peculiar advantage, that it may be mixed with any other colour without injury. It is sold under the name of "Hume's permanent White." See **WHITE**.

BARYTES, *Carbonate of*. See **CARBONATE of Barytes**.

BASALT, in *Mineralogy and Geology*, a compact dark-coloured rock, classed by geologists with trap-rocks. (See **TRAP**.) It has received the name of *whin-stone* in the north of England (see **WHIN-STONE**); and in Staffordshire, *Rowley-rag* (see **ROWLEY-RAG**). In the arrangement of rocks by the Wernerian geologists, basalt is considered as a compact green-stone, which latter rock is composed of feldspar and hornblende; but green-stone being more crystalline, the constituent parts are distinctly separated. Green-stone and basalt often pass into each other. (See **GREEN-STONE**, *Addenda*.) Basalt has generally been classed with simple minerals; and a short account of its characters and constituent parts are given under the article **BASALT** (which see). More correct analyses of this rock have since been made, in which soda is found to be a constituent part. We greatly doubt the propriety of classing basalt with simple minerals; for it has been ascertained, that most basaltic rocks are composed of two or more minerals intimately mixed, but requiring the aid of a lens to distinguish them. Of these, the mineral called *augit* is the one which prevails, or forms the dark colour: it is intermixed with feldspar and olivine. It is thus ascertained that basalt resembles in its constituent parts, as it does in other characters, dark compact lava. (See **VOLCANIC PRODUCTS**.) Before the observations of the French mineralogist Cordier, both basalt and compact dark lava were supposed to be formed of hornblende and feldspar.

Before the blow-pipe, basalt melts easily, without addition, into an opaque black-coloured glass. It melts at a comparative low degree of temperature from 38° to 45° of Wedgwood. If it be cooled rapidly, the mass is vitrified; if cooled slowly, it is stony, and presents a tendency to a columnar arrangement. Some interesting experiments of this kind are described under the article **ROWLEY-RAG** (which see).

The constituent parts of basalt, as given by Klaproth and Dr. Kennedy, are as follow:

Basalt

BASALT.

	Basalt of the Haffenberg.	Basalt of Staffa.	
Silex	44.50	-	48.0
Alumine	16.75	-	16.0
Lime	9.50	-	9.0
Magnesia	2.25	-	-
Soda	2.60	-	4.0
Oxyd of iron	20.0	-	16.0
Oxyd of manganese	0.12	-	-
Muriatic acid	-	-	1.0
Water and volatile matter	2	-	4
Klaproth	97.72	Kennedy	98

Basalt exists abundantly in the northern parts of England and in Scotland. It occurs at the Clee Hills in Shropshire, and at Rowley in Staffordshire; but is not met with in the southern counties of England. Some rocks of the trap or basaltic formation occur in Gloucestershire and Somersetshire. Basalt forms the well-known columnar ranges at the Giant's Causeway in the county of Antrim, and at Staffa. See *GIANT'S CAUSEWAY* and *STAFFA*.

The origin of basaltic rocks has excited much attention among geologists. Their similarity to volcanic rocks in composition and structure, the remarkable positions in which they occur, and the changes they frequently produce on the rocks in their vicinity, have led most intelligent and unprejudiced observers to the conclusion, that a great number, if not all, basaltic rocks have been formed by igneous fusion. The mineral veins filled with basalt, that intersect other rocks, frequently produce all the changes which a fluid mass of heated lava would have effected. (See *VEINS, Mineral*, and *TRAP*.) In the latter article, the arguments which have been offered against the igneous origin of basalt are also stated. For further remarks on the subject, see *Systems of GEOLOGY*. But the most striking phenomena, and which seem to decide the question, are presented in the districts called Velay and Viverais, in the south of France. These districts have all the appearance of having been once the seats of active volcanoes, the remains of which are distinctly visible: from some of these ancient volcanoes, the lava may be traced to the crater, and this lava is a compact columnar basalt. See *Plate II. Mineralogy, Basalt*.

The mountain of Aifa, called La Coupe, or the Col d'Aifa, of which a view is given, is situated near the village Entrague, in the Viverais. This village, according to St. Fond, is placed on a kind of platform of volcanic matter above the torrent of the Volant, which has here excavated a bed of great depth and width, bordered on the right and left by grand ranges of basaltic columns. In the midst of a prodigious rampart of these columns, at different levels, may be seen a current of lava descending from a neighbouring mountain, and joining the columns that border the river. Here we see, in the most unequivocal and convincing manner, that the lava under the form of hard and compact basalt, has flowed at several times from the mountain, and has formed the great causeway at different heights, to which the lava is still united and adhering. We may follow the current of basalt up the declivity of the mountain, which has a conical form and a great elevation, and is entirely volcanic from the base to the summit. According to St. Fond, it is the most remarkable and best characterized crater in all the Viverais.

All the base of the conical mountain La Coupe is covered by porous and cellular lava in detached irregular masses, heaped on each other, so as to leave no doubt that they have been ejected in a liquid state by one or more formidable

eruptions, and have taken their forms as they fell at the foot of the cone.

On reaching the summit or edge of the crater we may see the whole mountain, which forms a regular cone resembling that of Vesuvius. The edges of the crater are steep, and formed in the shape of a tunnel; the greatest diameter being from 140 to 150 toises, and the depth about 600 feet. The lavas are coloured, and converted into a kind of puzzolani, and mixed with great masses of black and sharp scoria, which makes the descent difficult. At the bottom of this inverted cone is a magnificent plantation of chestnut-trees, which have flourished astonishingly in this ancient mouth of a volcano, having no other soil than the dry and friable puzzolani. It may be noticed, that the crater of Vesuvius was lined with lofty trees at the period of its eruption in 1631, having been in a state of repose for nearly four hundred years.

At the bottom of the crater in La Coupe, we may observe a breach or opening on the side facing the houses of the Colet d'Aifa; there is a general inclination to this opening, which has served to give a passage to the lava. When we are arrived at the opening, we may observe a stream of lava coming from the interior, and taking its course down the mountain, it descends in a waving direction amidst the porous lavas. This current is a true black basalt, compact and similar to that of the columns; in certain parts, its surface appears blistered, and in other places is become porous. Following the current of lava, after it has crossed the path, which is at the foot of the mountain, we may trace its course to the bed of a torrent not far from the high road. There may be seen, says St. Fond, a spectacle most gratifying to the geologist; for the lava, whilst still on the descent, and before it had reached the level ground, has affected a prismatic form; and the lava at the bottom has formed a beautiful colonnade.

We cannot doubt, says St. Fond, after viewing this mountain, that the lava which flows from volcanic craters is not absolutely the same as basalt. The name of La Coupe is evidently derived from the crater, the Latin name for a cup.

There is another conical mountain in the Viverais with a distinct crater, called La Coupe de Jaujeac. The general resemblance of the latter is so similar to that of La Colet d'Aifa, that it may well be conceived from the view given of the latter. (See *Plate II. Mineralogy*.) It is rather less lofty, but the crater is nearly twice as large. The river Vignon flows at the foot of Jaujeac. On its banks are immense ranges of basaltic columns, the most elevated of any in the Viverais. They inclose the borders of the river on each side for more than a league.

Some of the prisms rise in one shaft to the height of fifty feet; in other parts, the articulated columns form a kind of regular causeway. In some places the columns are bent, and above we see immense ramparts of basalt, of more than 140 feet in height, in several ranges, spreading out like a fan, and diverging in every direction. On the left, the current of basalt covers several little hills of granite, and is moulded upon them. In some parts, the compact lava forms one solid mass; in other places, it is arranged in great beds. Nothing can be more grand and varied, says St. Fond, than the course of the river Vignon to Ardeche, where the great current of lava joins the streams that have flowed from the volcanoes of Theuys and Neyrac. Faujas St. Fond sur les Volcans eteints du Viverais et du Velay.

Plate II. Mineralogy, Basalt, which is taken for this work, will convey at once a satisfactory proof of the igneous origin of the basaltic columns in the Viverais; but one engraver

has omitted to represent the division of the upper part of the bed into columns. The ends of the columns may be distinctly seen before the basalt reaches the river.

BASALTIC HORNBLEND. See MINERALOGY, *Ad-denda*.

BASMAN, in *Geography*, an island of the Persian gulf, situated $11\frac{1}{2}$ leagues N.N.W. from Shorga, in N. lat. $25^{\circ} 54'$. It is an uninhabited island, about five miles long, and remarkable for a high round hill in its centre.

BASSORA, Col. 1. 1, from the bottom, after 1663, add—subject to various revolutions. L. 11, after *Porte*, insert—The musketeer, or governor, has ever since the year 1787, when it was recovered from the Monte-ridge Arabs, by Solymán Pacha, been sent from Bagdad, and is generally an officer of high rank. Full liberty is allowed, &c. Col. 2, l. 12, after 50,000, add—or 60,000, consisting of persons of almost every nation in the East. L. 29, N. lat. $31^{\circ} 30'$. E. long. $48^{\circ} 39'$.

BAT-Horfes, in *Artillery*, are baggage-horfes belonging to the officers when on actual duty; and *bat-men* were originally servants hired in time of war to take care of the horfes belonging to the train of artillery, baggage, &c., and who, during their service, generally wear the king's livery. Those who are excused regimental duty, for the specific purpose of attending to the horfes belonging to their officers, are called *bat-men*. Horfes and men of the preceding description are sometimes called *bow-horfes* and *bow-men*.

BATARREA, in *Botany, so named by Pursh, in honour of his learned predecessor in the study of the *Fungus* tribe, Antonio Battarra, professor of philology in the Lyceum at Rimini, author of *Historia Fungorum Agri Arminensis*, published at the neighbouring city of Faenza, in 1759, in 4to., with 40 plates. A preceding edition is indicated in the title-page, which Haller dates 1755. The author was a disciple of Janus Plancus, or Giovanni Bianchi, the conchologist, and died in 1789, according to Dryander in *Bibl. Bankf.* He was, however, an original observer, and delineated the figures himself.—*Perf.* Syn. Fung. 129.—*Clas* and order, *Cryptogamia Fungi*. Nat. Ord. *Fungi*.*

Eff. Ch. Stalk bursting from a wrapper, and elevating the bell-shaped, downy, powdery head, capped with a portion thereof.

1. *B. phalloides*. Tall Brown Batarrea. *Perf.* n. 1. t. 3. f. 1. (*Lycopodon phalloides*; *Dickl.* *Crypt. fasc.* 1. 24. *Woodward* in *Phil. Trans.* v. 74. 423. t. 16. *Sm.* *Spicil.* 11. t. 12. *Sowb.* *Fung.* t. 390.)—Found on sandy banks about Norwich, by Mr. William Humphrey, and about Bungay in Suffolk, by T. J. Woodward, *esq.* We have reason to think it may be met with in other parts of England, as Mr. Hudson, author of the *Fl. Angl.*, told the writer of the present article, he had seen this singular production on heaths in Kent, but passed it by as a blasted or abortive *Agaricus procerus*. We have not heard of this very curious fungus in any other part of the world. The *volva*, or wrapper, is about the shape and size of a hen's egg, originally of three slightly coriaceous layers, hollow internally, where a spongy stalk is formed, which rises very suddenly (in a few hours) to its full height of about twelve inches. This stalk is hollow, soon becoming dry, and externally filamentous, and carries up, on its summit, full half the innermost layer of the *volva*, which is white and smooth within, covered externally with copious brown powdery seeds, intermixed with fibres, as in a *Lycopodon*. A smaller portion of the two outer layers, irregularly torn away, forms a double cap to this powdery surface.

BATAVIA, in *Geography*, a post-township of New

York, the capital of Genesee county, 256 miles from Albany, on the great road to Buffalo; about 50 miles from N. to S., and from 24 to 28 miles wide; bounded N. by lake Ontario, E. by Murray and Caledonia, S. by Warlaw, Attica, and Sheldon, and W. by Niagara county. The whole population of this town, in 1810, was 3645, with 104 senatorial electors, and 46,4216 dollars of taxable property.

BATH. Add—The city of Bath, by the return of 1811, contained 3933 inhabited houses, and 31,496 persons; viz. 12,373 males, and 19,123 females.

BATH, a county of Virginia, &c. add—The total number of inhabitants, in 1810, was 4837, including 882 slaves.

BATH, a township, &c. l. 2, for 949 r. 2491.

BATH, in Grafton county, &c. l. 2, for 493 r. 1316.

BATH, a post-township, the capital of Steuben county, 245 miles W. of Albany. The whole population, in 1810, was 1036, with 97 electors.

BATH, a township of the district of Ohio, in the county of Greene, having 913 inhabitants.

BATSCHIA, in *Botany, was so named by professor Gmelin, the compiler of the 13th edition of the whole *Systema Naturæ* of Linnæus, in honour of professor Batfch of Jena, known particularly by his *Elenchus Fungorum*, published at Halle in 1783 and 1784, in 4to., with coloured plates, and his *Analytes Florum*, a work of a similar description, which appeared in 1790. Gmelin however adopted this genus, like many others, entirely from the *Flora Caroliniana* of Mr. Thomas Walter, who had modestly left such genera without names, because, though he supposed them to be new, he had not the advantage of books, or other helps, to confirm his opinion. In the present instance we apprehend his *Anonymos*, n. 78. *Fl. Carol.* 91, cannot be supported, but we shall give its character and synonymy.—*Gmel.* *Linn. Syst.* Nat. v. 2. 315. *Michaux* *Boreali-Amer.* v. 1. 129. *Pursh* 132.—*Clas* and order, *Pentandria Monogynia*. Nat. Ord. *Asterifoliae*, *Linn.* *Borragineæ*, *Juss.**

Gen. Ch. *Cal.* Perianth in five deep, linear, acute, erect segments. *Cor.* of one petal, falver-shaped; tube straight, longer than the calyx, surrounded at the base, internally, with a ring of hairs; throat pervious; limb orbicular, in five deep rounded segments. *Stam.* Filaments five, very short, inserted into the tube; anthers erect, ovate, concealed within the tube. *Pist.* Germen superior, roundish, with four prominences; style capillary, the length of the stamens; stigma minute, slightly cloven. *Peric.* none. *Seeds* four, ovate, hard, polished.

Eff. Ch. Corolla falver-shaped; throat naked; tube with a hairy internal ring at the base; segments of the limb rounded. Calyx in five deep segments.

Obf. It appears to us that this genus cannot be kept separate from *LITHOSPERMUM*. (See that article.) The only mark of distinction is the hairy ring in the bottom of the tube, which surely is not sufficient. The form of the corolla is as much funnel-shaped as in that genus, and the seeds are acknowledged to be precisely the same. *Michaux* asks, (perhaps on account of the yellow flowers,) “whether *L. orientale* of Linnæus be not a *Batfchia*?” We find no traces there of the hairy ring, nor was any such character detected by Mr. Bauer, when he made the drawing for Dr. Sibthorp's *Fl. Græca*, t. 160. This circumstance does away the presumption of a generic difference here indicated by colour. The following are the only reputed species of *Batfchia*.

1. *B. Gmelini*. Hairy Puccoon. *Michaux* n. 1. *Pursh* n. 1. (*Anonymos carolinensis*; *Walt.* *Carol.* 91.)—Hairy. Floral

Floral leaves ovate. Calyx elongated, somewhat lanceolate. —In dry sunny woods of Lower Carolina. Perennial, flowering from May to July. Seen in Mr. Lyon's herbarium. *Pursh.* Flowers bright yellow, on short footstalks. *Walter.*

2. *B. canescens.* True Puccoon. Mich. n. 2. t. 14. Pursh n. 2. (*Anchusa hirta*; Muhlenb. Cat. 19. A. virginiana; Linn. Sp. Pl. 191. A. floribus sparsis, caule glabro; Gron. Virg. ed. 2. 24. Lithospermum virginianum, flore luteo duplici; Morif. sect. 11. t. 28. f. 4.)—Downy and hoary. Leaves all oblong. Calyx very short. Segments of the corolla entire.—On dry sunny hills on a sandy soil, in Virginia, Tennessee, &c. perennial, flowering in June and July. Flowers of a deep golden-yellow. The root is covered with a red substance, which is the true Puccoon of the Indians, and paints a beautiful red. *Pursh.* With this colour, it seems, the native Americans painted their bodies. The whole herb is clothed with soft hairs, nor is the stem, as Linnaeus says, smooth. He had no specimen of this plant, when he wrote either edition of *Sp. Pl.*, but afterwards confounded herewith a totally different Siberian plant, which lies under this name in his herbarium, but without the requisite marks of authenticity. Morifon's figure represents a double-flowered variety, which is very unufal in this natural order.

3. *B. longiflora.* Long-flowered Puccoon. Pursh n. 3. —"Downy and silky. Leaves linear. Calyx long and linear. Segments of the corolla notched; tube elongated." —Found by Mr. Nuttall, on the banks of the Mississippi. Perennial, flowering in July. Flowers yellow. *Pursh.*

We should presume that all these species belong rather to *Lithospermum* than to *Anchusa*, but we have only seen the second, communicated in a dried state, from Pennsylvania, by the late Rev. Dr. Muhlenberg.

BATTAM, the *Batta* of Strabo, in *Geography*, a town of Armenia, in the pachalic of Erzeroom, on the Euxine. This is a commercial place; and between it and Akiska are the towns of Iſchoetſcheloc, Gartzicmie, Schwaghaewal, and Kaettaejac.

VOL. IV.

BATTING. See COTTON, and MANUFACTURE of Cotton.

BATTLE, l. ult. r. and in 1811 had 361 houses, and 2531 persons; 1232 being males, and 1299 females.

BATTLE, Order of. Col. 6, l. 19, to l. 41, dele.

BATZ. Add—The florin at Augsburg is divided into 15 batzes, (or batzen), or 20 kayfergrochen. A thaler, or six-dollar, is worth $1\frac{1}{2}$ florin, $22\frac{1}{2}$ batzes, or 90 creutzers. At Basil, the thaler, or six-dollar, is worth 3 livres, 27 good batzes, or 30 Swiss batzes; the florin, 15 good batzes, or $16\frac{2}{3}$ Swiss batzes; the livre, 9 good batzes, or 10 Swiss ditto. A good batze is 4 creutzers; a Swiss batze, 2 fous, or $3\frac{1}{3}$ creutzers. At Bern, accounts are kept in livres of 20 fous, the fou of 12 deniers; also in livres, or francs, of 10 batzes, or 40 creutzers; and in crowns of 25 batzes, or 100 creutzers. A six-dollar, or ecu blanc, is worth 30 batzes; a crown, 25 batzes; a florin, 15 good batzes; a livre, or franc, 10 batzes; a pfund, $7\frac{1}{2}$ batzes, or 15 fous; a batze, 2 fous, or 4 creutzers.

BAUERA, in *Botany*, received its name, not from Sir Joseph Banks, as Mr. Andrews, by mistake, has recorded, but from the author of the present article; in due commemoration of those excellent botanical artists, and practical observers, Mr. Francis Bauer, so long employed as a draughtsman at Kew, and his brother Mr. Ferdinand Bauer,

who after being engaged in the same occupation by Dr. Sibthorp in Greece, accompanied Mr. Brown to New Holland, and is now returned to Germany, having left behind him in England unrivalled monuments of his abilities.—Andr. Repof. t. 198. Ait. Hort. Kew. v. 3. 317. Salisb. in Ann. of Bot. v. 1. 514. t. 10.—Clafs and order, *Polyandria Dignia*. Nat. Ord. *Saxifrage Juff.* Salisb. *Cunoniaceae*, Brown, Bot. of Terra Austr. 16.

Gen. Ch. Cal. Perianth inferior, of one leaf, in eight deep, lanceolate, reflexed, permanent segments. Cor. Petals eight, obovate, equal, concave, alternate with the calyx, and nearly twice as long. Stam. Filaments numerous, thread-shaped, inserted into the receptacle, half as long as the petals; anthers erect, obovate, of two cells, bursting at the summit. Pist. Germen superior, somewhat pyramidal, obtuse; styles two, thread-shaped, longer than the stamens, recurved; stigmas simple, obtuse. Peric. Capsule roundish, tumid, somewhat compressed, with two short, divaricated, pointed lobes, of two cells and two valves, bursting at the top, between the points; partition contrary to the valves. Seeds numerous, oval, corrugated, inserted into the central column.

Ess. Ch. Calyx inferior, in eight permanent segments. Petals eight. Capsule inflated, of two cells, with many seeds.

1. *B. rubiefolia.* Madder-leaved Bauera. Salisb. as above. Ait. n. 1. (*B. rubioides*; Andr. Repof. t. 198. Curt. Mag. t. 715. Venten. Malmalf. t. 96.)—Native of New South Wales. First discovered in that country by Sir Joseph Banks. We received specimens and seeds from Dr. White, among the first communications from the settlement there, and this beautiful shrub was raised by the late marchioness of Rockingham, at Hillingdon, in 1793. It requires the shelter of a green-house, or conservatory, and flowers during most part of the summer and autumn. The stem is five or six feet high, much branched, woody, but slender and weak; the branches opposite, round, leafy, somewhat hairy. Leaves opposite, or sometimes three together, ternate, nearly sessile, evergreen, widely spreading; leaflets three-quarters of an inch long, lanceolate, distantly serrated, their ribs a little hairy beneath; their upper surface convex, of a deep shining green; under paler. Flowers axillary, on simple hairy stalks, longer than the leaves, a little drooping, scarcely an inch broad, of a beautiful rich rose-colour, with yellow anthers, inodorous. The parts of the flower vary occasionally in number, from seven to nine or ten. The branches, like the leaves, are sometimes three together, and when young, have, like them, a reddish tinge, which the permanent calyx, and old leaves, likewise assume. We do not very clearly perceive the resemblance to Madder in the leaves, and should have been glad if the specific name originally proposed, *formosa*, had been retained for a plant which so well deserves that appellation.

Another species is mentioned, by the name of *B. humifl.*, in Ait. Epit. 364, as introduced at Kew, from New Holland in 1805, and flowering in June and July. But not a word is said respecting the specific differences between the two.

BAYAZID, in *Geography*, one of the Turkish pachalics of Armenia: the city of this name lies at the distance of two days' journey from Erwan, nine from Erzeroom, and four from Khoi, and occupies the declivity of a mountain, the summit of which is strongly fortified. The city is surrounded with walls and ramparts: it has two churches and three mosques; and the monastery of Karu Killesea is famous for the beauty of its architecture, its antiquity, and its grandeur. The inhabitants are reported to amount to

about

about 30,000, and are esteemed the most learned and warlike people in Armenia. The climate is mild, and the city, with the extensive territory attached to it, is under the government of a pacha of two tails, archbishop of Merdin. M^r. Kinneir's Persia.

BAYLA, the capital of Lus, a district of the Persian empire, in the province of Mekran, and country of the ancient Oritæ, is built on the N.E. bank of the river Pooralee, and contains 1500 houses, and 6000 inhabitants, of whom 400 are Hindoos. The present chief can bring into the field 4000 irregular troops, and enjoys a revenue of 50,000 rupees *per annum*.

BAYOU, a term originally Spanish, signifies the diminutive of bay; but in Louisiana, where it frequently occurs, it is synonymous with the word *creek*, and consequently becomes the diminutive of river.

BEAN-GOOSE. See **ANAS** and **DUCK**.

BEATTIE, JAMES, &c. l. 2, born Nov. 5; l. 12, latter, by the liberality of a mother, (his father having died when he was seven years of age,) by, &c.; l. 18, *dele* at Alloa; and l. 19, *dele* assitant to the; l. 24, for 1760 *r.* 1761; l. 41, *infert*—which was written about the year 1764, though not published till some time after. Col. 2, l. 35, *dele* following; l. 62, for not long afterwards *r.* in 1770; l. 65, for 1777 *r.* 1776, (in consequence of which he obtained the pension above-mentioned.) Col. 3, l. 23, *infert*—In 1790 he published a summary of his lectures under the title of "Elements of Moral Science;" the first volume of which contains a very accurate enumeration and arrangement of the perceptive faculties and active powers of man. He has also given a cursory view of what is called natural theology. The second volume, published in 1793, comprehends much miscellaneous information on ethics, economics, politics, and logic, including rhetoric. Towards the latter part of his life, his time, &c.

BEAUCAIRE, l. 7, *dele* The part of the Rhine is well constructed.

BEAVER, in *Geography*, a county of Pennsylvania, containing 12,168 inhabitants, in which are several townships of the same name; such as *North Beaver* with 932, *Big Beaver* with 702, *Little Beaver* with 1379, *Beaver Borough* with 426, and *South Beaver* with 1351 inhabitants.—Also, a township of Pennsylvania, in Northumberland county, having 502 inhabitants.—Also, a township of Crawford county, with 236 inhabitants.—Also, a township of Columbiana county, in the district of Ohio, having 433 inhabitants.—Also, a township of the same district, in Greene county, having 793 inhabitants.

BEAVER CREEK, a township of Pennsylvania, in Beaver county, with 774 inhabitants.

BEAVER KILL, a township of the district of Maine, in the county of Kennebeck, containing 354 inhabitants.

BEAUFORT, in South Carolina, l. 4, *r.* 25, 887, including 20,914 slaves.

BEAUFORT, (col. 2, after l. 14,) a county of North Carolina, containing 7204 inhabitants, of whom 2,568, are slaves.

BEAUFORTIA, in *Botany*, a truly noble genus, consecrated, by Mr. Brown, to the memory of Mary duchess of Beaufort, who died January 7th, 1714, in the 85th year of her age. Her grace cultivated a number of rare plants in the stoves and green-houses at Badminton, Gloucestershire, during the life-time of her husband, Henry, first duke of Beaufort, whose death happened in 1699. The plants introduced by her always therefore bear this date in Mr. Aiton's *Hortus Kewensis*. Numerous specimens from the Badminton garden were communicated to sir Hans Sloane, and if we

are not mistaken, a splendid herbarium in the British Museum, bound in several large folio volumes, bears the title of "The Duchesse of Beaufort's Plants."—Brown in Ait. Hort. Kew. v. 4. 418.—Clafs and order, *Polyadelphia Icosandria*. Nat. Ord. *Heperideæ*, Linn. *Myrti*, Juss.

Gen. Ch. *Cal. Perianth* half superior, of one leaf, turbinate; limb in five deep, awl-shaped, deciduous segments. *Cor.* Petals five, elliptical, sessile, inserted into the rim of the calyx, between its segments, and of equal length. *Stam.* Filaments very numerous, in five sets, inserted into the calyx, opposite to the petals, the claw of each set linear, hairy at the base internally, much longer than the petals, divided at the top into seven, eight, or more, capillary spreading segments about a quarter the length of the claw; anthers terminal, inserted by the base, of two divaricated, conical, deciduous, single-celled lobes. *Pist.* Germen in the bottom of the calyx, small, roundish, hairy at the summit; style thread-shaped, shorter than the stamens, variously bent upwards and downwards; stigma acute. *Peric.* Capsule coated with the base of the calyx, and firmly united to the branch, roundish, of three cells. *Seeds* solitary.

Eff. Ch. *Calyx* in five segments. *Petals* five. *Stamens* numerous, very long, in five sets, opposite to the petals; anthers of two deciduous lobes. *Capsule* clothed with the base of the calyx, three-celled, permanent. *Seeds* solitary.

Obf. Many of the flowers are said to want the *style*. We are not clear, from the account of the author of this genus, whether more than one *seed* is perfected in each *fruit*. The *capsules* remain in masses furrounding the branches, long after the *seeds* are gone, perhaps for several years, being firmly united to the bark or wood; a character common to many of this natural order in New Holland, as MELALEUCA, (see that article,) and others. The very peculiar anthers seem to afford the most essential character of *Beaufortia*, and distinguish it from its near ally CALOTHAMNUS. See that article hereafter.

1. *B. decussata*. Splendid *Beaufortia*. Br. in Ait. n. 1. Sims in Curt. Mag. t. 1733.—Leaves opposite, ovate, many-ribbed, crossing each other in pairs. Claws of the stamens very long, their filaments radiating.—Gathered by Mr. Brown, on the south-west coast of New Holland, and sent to Kew by Mr. Good, in 1803. A green-house shrub, flowering in the spring, and increased by cuttings. The branches are angular. *Leaves* sessile, crowded, half or three-quarters of an inch long, recurved, smooth, rigid, entire, full of pellucid dots; paler beneath. *Flowers* in dense tufts, furrounding the branches here and there, most conspicuous for their copious spreading tufts of *stamens*, an inch and a quarter or more in length, all over of a rich scarlet, the *petals*, as well as calyx, being green.

2. *B. sparsa*. Alternate-leaved *Beaufortia*. Br. in Ait. n. 2.—Leaves scattered, elliptical, many-ribbed.—Gathered in the same country, by Mr. Brown, from whence it was likewise sent to Kew, by Mr. Good, in 1803, but does not appear to have flowered in 1812, when the fourth volume of Hort. Kew. was printed.

We presume Mr. Brown's *Prodromus*, when completed, will make us acquainted with more species of this genus.

BEAUMARIS, col. 2, l. 9, for 1275 *r.* 1295. Col. 3, l. 1, for 37 *r.* 57; l. 37, *r.* Lavan. Add—The borough of Beaumaris contained in 1811, 295 houses, and 1810 persons; 809 being males, and 1001 females.

BECKET, in *Geography*, l. 2, for 751 *r.* 1028.

BEDDOES, THOMAS, M.D. in *Biography*, a distinguished physician and philosopher, was the son of an opulent tanner at Shiffnall in Shropshire, and born in 1760. Indicating at an early age peculiar talents, and disposed to cultivate them by diligent

diligent application, he was destined for a learned profession. With this view, after the requisite previous education, he was entered, in the year 1776, at Pembroke college, Oxford, and in the progress of his studies acquired the reputation of a classical scholar; connecting with his other pursuits the study of the French, Italian, and German languages, as well as of pneumatics, chemistry, mineralogy, and botany. After having taken his first degree of arts, he repaired to London, where he prosecuted the study of anatomy and physiology, and published translations of Spallanzani's Disquisitions, of Bergman's Essay on Elective Attractions, and of Scheele's Chemical Essays. At Edinburgh, where at this time he had commenced his studies, he obtained high reputation among his fellow-students. In 1786 he graduated M.D. at Oxford, and in the following year visited the continent. Upon his return, he was appointed to occupy the chemical chair at Oxford. At this period he formed an acquaintance with Dr. Darwin, which gradually ripened into the intimacy and confidence of friendship. In 1790 he presented to the public an analytical account of the writings of Mayow, well known for his early discoveries in the department of pneumatic chemistry. (See his article in the Cyclopædia.) And he also communicated several papers to the Royal Society. As a chemical professor at Oxford, he was a popular lecturer; and he was much respected in the university on account of the rank he occupied in general literature and science; but interesting himself in the party politics of that period, and avowing his opposition to systems which then prevailed with regard both to church and state, he found it expedient to resign his professorship in 1792. He was adverse, however, to that detestable spirit which blended itself in France with their struggles for liberty. Among other publications which issued from the press about this time, our limits will only allow the mention of his "Observations on the Nature of Demonstrative Evidence, with Reflections on Language," intended to facilitate the study of geometry to youthful minds, by shewing, in opposition to the doctrine of the author of *Hermes*, that geometry is founded in experiment, and that its elements may be rendered palpable to the senses. The most popular of his publications was a small work, which appeared under the title of the "History of Isaac Jenkins," a fictitious narrative, exhibiting the character of a labourer immersed in the evils of habitual drunkenness, but reformed to sobriety and industry; of which his biographer (*ubi infra*) says, that if the author had left no other monument of his ingenuity and benevolence, he would not have lived in vain. Without adverting to his other writings, we shall proceed to mention his pneumatic establishment in the vicinity of the Bristol hot-wells, undertaken and for some time liberally supported for the purpose of curing diseases by the judicious application of different kinds of factitious air. For the convenience of superintending this institution he resided at Clifton, and in 1794 formed a matrimonial connection with a lady of the justly celebrated Edgeworth family. From this time his medical publications became numerous, and as a physician his advice was in high estimation; and he was consulted by persons in distant parts, who are said to have derived great benefit from his prescriptions. Although his pneumatic institution failed with respect to the degree of success which he might augur, and proved of temporary duration, it served to bring into notice the present sir Humphry Davy, one of the most eminent philosophers of our time, whose talents, restricted in their exercise to a remote town in Cornwall, caused him to be engaged as its manager. In the year 1806, Dr. Beddoes was attacked with some affection of the liver, which, after subsiding for a time,

returned with a disease in the chest in 1808, and rapidly increasing terminated in his death on the 24th of December, before he had completed his 40th year. Although his manner, says his biographer, was cold and repulsive, he possessed kind and tender feelings; and in the relations of domestic and private life his conduct was unexceptionable. Stock's *Memoirs of the Life of Thomas Beddoes, M.D.*

BEDFORD, col. 3, l. 4, r. In 1811, the borough contained 940 houses, and 4605 persons; 2057 being males, and 2548 females.

BEDFORD, a township of America, &c. l. 2, for 898 r. 1296.

BEDFORD, in Middlesex county, &c. l. 2, for 523 r. 592.

BEDFORD, *New*, l. 2, for 3313 r. 5651.

BEDFORD, in New York, l. 2, for 2470 r. 2374, with 241 electors, in 1810. Add—Near the centre of this town is the village of Bedford, where the courts for the county are held one half of the time, and the other half at White Plains. Here are, a court-house and prison, a Presbyterian church, an academy, and a small number of houses.

BEDFORD, a county of Pennsylvania, l. 4, for 13,124, including 46 slaves, r. 15,746; subjoin after 1795—it contains 547 inhabitants.

BEDFORD, a township in the same county, includes 1352 inhabitants.

BEDFORD, a county of Virginia, &c. l. 5 and 6, for 10,531 r. 16,148, and for 2754 r. 6147.

BEDFORD, a county of West Tennessee, having 8242 inhabitants, including 1180 slaves.

BEDFORDSHIRE, col. 2, l. 8 and 9, r. The county, in 1811, contained 13,286 houses, and 70,213 persons; 33,171 being males, and 37,042 females: 9431 families employed in agriculture, and 4155 in trade and manufactures.

BEDLIS, or BETLIS, a large town, situated at the opening of the ironage of the passes in the road from Diarbekir to Van and Tabriz. The river of Bedlis (the Centrites of Xenophon) is conducted by Hajy Kalifa through the plain to the southward of Sahert, Sard or Sared (the ancient Tigranocerta). Betlis is one of the most ancient cities of that part of the kingdom called Kurdistan: the castle is on the top of a high mountain, which bounds the plain to the west: the inhabitants of the town and neighbouring villages amount to about 26,000 Kurds, Turks, Armenians, and Syrians. The Armenians, who enjoy a considerable portion of liberty, have four churches and four monasteries. The lands around Betlis are highly cultivated, and produce grain of several kinds, cotton, hemp, rice, olives, honey, truffles, and mushrooms. The neighbourhood abounds with game, and the mountains are infested by lions, wolves, and bears. In the vicinity are quarries of red and white marble. See BETLIS.

BEDMINSTER, a township of Bucks county, in Pennsylvania, having 1199 inhabitants.

BEDRI, a town of the Persian empire, in the pachalic of Bagdad, 13 leagues from Mendeli, and four from the foot of the mountains; is the frontier town, in this quarter, of the Turkish empire. It is surrounded with a number of fine gardens; but its districts are damp and marshy, interspersed with pools of water, the receptacles of the torrents, which, in the spring, are continually rushing from the mountains.

BEER, col. 2, l. 4, from the bottom, add—For the excise duty on beer, see ALE.

BEERING'S STRAITS, l. 7, after Cook, insert—He afterwards ascertained, that Cape Prince of Wales was the western extremity of the whole continent of America; and another cape was observed to the northward of this, lying

in lat. $67^{\circ} 45'$, and long. $194^{\circ} 51'$. To this cape, captain Cook gave the name of Point Mulgrave.

BEE'S-Bread. See *PAIN des Abeilles*.

BEGA, a land measure in Bengal, equal to about the third part of an acre.

BEGARMEE, col. 2, l. 9, for matured *r.* weakened.

BEHABAN, in *Geography*, the capital of the mountainous district of Khogiloea, in the province of Fars, in the Persian empire, which district extends from the valley of Ram Hormuz to the vicinity of Kazeroon. The town is pleasantly situated in the middle of an extensive valley, three miles E. of the ruins of the ancient city of Aragian, which may be seen on the banks of the river Jerahi. It is the residence of a beglerbeg, who has a palace in the N.E. corner of the town. The walls are about three miles in circumference, and the population is said to amount to nearly 10,000 souls. The plain of Behaban is of considerable extent, and highly cultivated. The rivers Tab and Jerahi flow through it. Behaban is 153 miles from Shiraz, separated from it by a mountainous country, almost wholly uninhabited, and infested by banditti.

BEHRING. See *BEERING*.

BELCHER, l. 2, for 1485 *r.* 2270.

BELENUS. See *BEL-TRIN*, and *BEIUS*.

BELFAST, in America, l. 5 *r.* 1274. Add—Also, a township of Bedford county, in Pennsylvania, having 758 inhabitants.

BELGRADE, in America, l. 2, for Lincoln *r.* Kennebeck; add—It contains 996 inhabitants.

BELINUS. See *BEIUS*.

BELLS, *Electrical*, l. 4, *r.* Plate V. *fig.* 38.

BELLEFORTE, a township of Centre county, in Pennsylvania, having 303 inhabitants.

BELLENDENA, in *Botany*, is so called by Mr. Brown, in honour of John Bellenden Ker, esq., late Gawler, an ardent and scientific botanist, whose labours respecting the natural order of *Enfata*, and the Liliaceous tribe, published chiefly in Curtis's Magazine, and often cited by us, richly entitle him to botanical commemoration.—Brown Tr. of Linn. Soc. v. 10. 166. Prodr. Nov. Holl. v. 1. 374.—Class and order, *Tetrandria Monogynia*. Nat. Ord. *Proteaceae*, Juss.

Eff. Ch. Petals four, regular, spreading. Nectariferous glands none. Stamens inserted into the receptacle. Germen two-seeded. Stigma simple. Capsule without wings, not bursting. Seeds one or two.

1. *B. montana*. Mountain Bellendena.—The only species; found by Mr. Brown on the summits of mountains in the island of Van Diemen, but as yet unknown in our gardens. This is a perfectly smooth *shrub*. The leaves are scattered, flat; three-cleft at the extremity. Spikes terminal, racemose. Flowers scattered, rarely in pairs. Corolla white, soon falling. Germen connected by a joint with its stalk. Seed-vessel coloured, furrowed along one edge. Brown. The insertion of the stamens into the receptacle, and not into the petals, is an unique instance in this natural order.

BELLINGHAM, in America, l. 2, for 735 *r.* 766.

BELMONT, in *Geography*, a county of the district of Ohio, containing 11,097 inhabitants.

BELPRE, a township of Ohio, in the county of Washington, having 494 inhabitants.

BELVEDIER, a town of Vermont, in Franklin county, having 217 inhabitants.

BERARDI, l. 8, for Orcani, &c. *r.* Arcani Musicali Dialogo, &c.

BERBERIDES, in *Botany*, the 78th natural order of Jussieu's system; the 18th of his 13th class: for whose characters, see *GERANIA*. This order is defined as follows.

Calyx of a determinate number of leaves, or deep segments. *Petals* definite also, agreeing in number with the divisions of the calyx, and often opposite to them; sometimes simple; sometimes charged at the base with an inner petal. *Stamens* definite, as many as the petals, and opposite to them; *anthers* fixed, bursting by a valve from the base upwards. *Germen* simple; style solitary or wanting; *stigma* often simple. *Berry* or *capsule* of one cell, often with several seeds, inserted into its base. *Coreculum* descending flat, furrowed by a fleshy albumen. *Stem* either shrubby or herbaceous. *Leaves* generally alternate, with *stipulas*, or more frequently without, simple or compound.

The genera are, *Berberis*, *Leontice*, *Epimedium*; with *Rinorea* and *Conoria*, two shrubs in Aublet's work, little known. To these are subjoined the following, as related to the order in question, viz. *Riana* of Aublet; *Corynocarpus* of Forster, and Linn. Suppl.; *Poraguiha* of Aublet, which is *Barreria* of Schreber's Gen. 598; *Hamelis* of Linnaeus; *Othera* of Thunberg; and *Rapanea* of Aublet. These genera, says Jussieu, are in some of their characters akin, in others foreign, to the *Berberides*.

BERGEN, a county of America, &c. l. 9, for 12,601 *r.* 16,603; and for 2301 *r.* 2180.

BERGEN. Subjoin—Their number is 2690, of whom 390 are slaves.

BERGMANITE. See *MINERALOGY*, *Addenda*.

BERKELEY, col. 5, l. 52, to him, insert—the lesson in the burial-service, taken from 1 Cor. xv.; and he was commenting upon it, &c. Col. 6, l. 43, generally, insert—but not truly.

BERKHEYA, in *Botany*, (*Berebeya* is an error), a genus of compound flowers, justly dedicated to the honour of Dr. John le Francq van Berkhey, whose inaugural dissertation, published at Leyden, in 1760, is an elaborate and ample illustration of this difficult tribe, accompanied by numerous

merous excellent figures.—Ehrh. Beitr. v. 3. 137. Schreb. Gen. 577. Willd. Sp. Pl. v. 3. 2269. Ait. Hort. Kew. v. 5. 138. (Agriphyllum; Juff. Gen. 190. Rohria; Thunb. Prodr. n. 52.)—Clafs and order, *Syngenia Palygamia-fruticea*. Nat. Ord. *Compositæ*, Linn. *Corymbifera*, Juff.

Gen. Ch. corrected by Mr. Brown. *Common Calyx* of one leaf, clothed with many lanceolate, imbricated leaves, with spinous teeth, and spreading points; the lower ones shortest. *Cor.* compound, radiant. Florets of the disk numerous, perfect, tubular, funnel-shaped, deeply five-cleft, glandular below; of the radius fewer, ligulate, lanceolate, four-toothed; glandular below, imperfect. *Stam.* in the florets of the disk, filaments five, capillary, very short; anthers forming a tube with five teeth; in those of the radius the anthers are short and incomplete. *Pist.* in the florets of the disk, Germen turbinate, short, hairy; style thread-shaped, longer than the flaments; stigmas two, revolute: in those of the radius, Germen small, with hardly any style, and no stigmas. *Peric.* none, except the permanent calyx. *Seeds* of the disk solitary, turbinate, hairy, crowned with from ten to fifteen chaffy, lanceolate, finely serrated, or fringed, scales: of the radius none. *Recept.* flat, cellular, the cells membranous, jagged and toothed.

Eff. Ch. Receptacle cellular. Seeds hairy. Crown chaffy, serrated or fringed. Calyx of one leaf, clothed with imbricated leafy scales.

The species of this genus, twenty-two in Willdenow, are confined to the Cape of Good Hope and its neighbourhood. Four of them occur under this name in Hort. Kew. as green-house plants, flowering in summer; three others compose Mr. Brown's genus *CULLUMIA*, to be described hereafter. They are generally perennial, often shrubby. They embrace Thunberg's whole genus of *ROHRIA*, (see another genus of that name in its proper place,) and several of them have been referred by Linnæus to *Gorteria*, *Atractylis*, or even *Xeranthemum*. None has yet appeared in any of our English periodical works. We select a few examples.

B. incana. Hozy Shrubby Berkheya. Willd. n. 1. Ait. n. 3. (B. fruticosa; Ehrh. Beitr. v. 3. 138. ("Rohria incana; Thunb. in Act. Soc. Nat. Scrut. Hafn. v. 3. 106. t. 11." *Gorteria ateroides*; Linn. Suppl. 381. Jacq. Ic. Rar. t. 591. G. fruticosa; Linn. Sp. Pl. 1284. *Atractylis fruticosa*; *ibid.* ed. 1. 829. *Carthamus africanus frutescens*, folio ilicis spinoso, flore aureo; Walth. Hort. 13. t. 7.)—Leaves alternate, ovate, spinous-toothed; hoary beneath, like the stem. Calyx-scales with spinous teeth; hoary underneath.—Native of the interior regions of the Cape of Good Hope, in dry situations. The stem is various in height, with slender branches. Leaves recurved, three-ribbed, an inch and a half long, coarsely toothed; tapering at the base. Flowers terminal, solitary, near three inches in diameter, deep yellow.

B. obovata. Smooth Shrubby Berkheya. Willd. n. 2. Ait. n. 2. (*Gorteria spinosa*; Linn. Suppl. 381. "*Bacteria aculeata*; Hoult. Nat. Hist. v. 6. 158. t. 34. f. 2." *Ait.*)—Leaves alternate, wedge-shaped-lanceolate, spinous-toothed, smooth on both sides. Calyx-scales with spinous teeth.—Sent from the Cape to Kew Garden, by Mr. Maffon, in 1794. Akin to the last, but with narrower leaves, and the whole plant is smooth.

B. grandiflora. Large-flowered Berkheya. Willd. n. 7. Curt. Mag. t. 1844. (*Rohria grandiflora*; Thunb. Prodr. 140. "R. ilicifolia; Vahl Act. Soc. Nat. Scrut. Hafn. v. 2. 40. t. 7." *Atractylis oppositifolia*; Linn. Mant. 477. *Gorteria fruticosa*; Berg. Cap. 302, but not Linn. Sp. Pl. 1284.)—Leaves opposite, lanceolate, three-ribbed, spinous.

Vol. XXXIX.

nous-toothed; downy beneath. Calyx-scales with spinous teeth.—Native of hills about Riet-valley and Buffeljags river, at the Cape. The stem is shrubby, with downy branches. Leaves above an inch long. Flowers terminal, solitary, large, of a full golden yellow, with a downy calyx.

B. cynaroides. Artichoke Berkheya. Willd. n. 10. Ait. n. 1. (*Rohria cynaroides*; Thunb. Prodr. 140. *Gorteria herbacea*; Linn. Suppl. 381.)—Stem-leaves alternate, clasping, fringed with prickles: radical ones elongated, entire, unarmed; downy beneath. Calyx-scales ovate, freight, spinous, nearly entire.—Sent to Kew, from the Cape, in 1789, by Mr. Maffon. The stems are herbaceous, a foot or more in height, angular, nearly smooth. Leaves rigid, or somewhat coriaceous; the radical ones three or four inches long, tapering at the base. Calyx ovate, smooth, strongly armed; two or three of the lower scales only being fringed, like the adjoining bractææ.

B. cernua. Drooping Berkheya. Br. in Ait. n. 4. (*Gorteria cernua*; Linn. Suppl. 382. Willd. Sp. Pl. v. 3. 2268.)—Leaves alternate, lanceolate, clasping, spinous-toothed, fringed, smooth on both sides. Flowers drooping. Seed-crown brittle, fringed.—Sent from the Cape, in 1774, by Mr. Maffon. Biennial, flowering from May to July. Leaves slightly cottony when young only. Calyx spinous.

BERKLEY, in Virginia, l. 5, r. 11,479, of whom 1529 are slaves.

BERKLEY, in Massachusetts, r. 1014.

BERKLEY, col. 3, l. 16, for township r. parish; for 90 r. 124; and for 658 r. 616, 296 being males, and 320 females. L. 18, infer after act, in 1811; for 3450 r. 3808; for 9,148 r. 10,144; for 10,074 r. 11,248. Add—1711 families employed in agriculture, and 2215 in trade and manufactures; and for 19,222 in l. 21, r. 21,362.

BERKS, l. 9, r. 43,146, of whom four are slaves.

BERKSHIRE, in Massachusetts, l. 6, r. 35,907.

BERKSHIRE. After Vermont, add—containing 918 inhabitants.

BERKSHIRE, col. 2, l. 20, r. This county contains 22,104 houses, and 118,297 persons; 57,380 being males, and 60,917 females: 13,409 families employed in agriculture, and 7584 in trade and manufactures.

BERKSHIRE, a township of Delaware county, in the district of Ohio, containing 284 inhabitants.

BERLIN, in Vermont, for 134 r. 1067.—In Connecticut, add—the number of inhabitants, in 1810, was 2798.—In Worcester county, for 512 r. 591.—In Somerset county, infer—the number of inhabitants, in 1810, was 330.

BERNACCHI, l. 13, r. when he was past his meridian.

BERNARD, St., a parish of the territory of Orleans, in the county of Orleans, containing 1020 inhabitants, of whom 382 are slaves.

BERNARDSTOWN, l. 2, r. 1879; l. 4, r. 811.

BERNE, a township of the district of Ohio, in the county of Fairfield, having 976 inhabitants.

BERNHARDIA, in *Botany*, so named by professor Willdenow, in honour of Dr. John James Bernharti, of Erfurt, a learned writer on Ferns, and in other respects an excellent cryptogamic botanist.—Willd. in Act. Acad. Erford. for 1802. 11. Sp. Pl. v. 5. 56. Pursh 655. (See *PSILOBUM*, under which name we have treated of this genus in due order.) We know not whether any other genus be already dedicated to Dr. Bernharti, but it is to be presumed that this act of justice will not long be delayed.

BERTIE, l. 5, r. 11,218; l. 6, r. 6059.

BERVIE, l. ult. r. The burgh and parish contain 193 houses,

houses, and 927 persons; 415 being males, and 512 females.

BERWICK, NORTH. Add—The burgh and parish contain 208 houses, and 1727 persons; 759 being males, and 968 females.

BERWICK, col. 3, l. 26, insert—in cruives. Add—The town and county of Berwick-upon-Tweed, by the parliamentary return of 1811, contained 934 houses, and 7746 persons; 3325 being males, and 4421 females.

BERWICK, a town of Adams county, in Pennsylvania, having 1799 inhabitants.

BERWICK, in Maine, l. 2, r. 4455 for 3894.

BESANCON, l. 2 and 3, r. capital of Franche Comte, now of the department, &c.

BESANT, l. ult. r. under Henry.

BESITTOON, a long range of barren mountains, in the province of Irak, in the Persian empire, bounding the plain of Kermanshaw to the N. and terminating abruptly on the E. by a high and perpendicular rock, in one place cut to a smooth surface, and projecting over the road, like a canopy. It receives its name from *sitton*, signifying, in Persian, a pillar, and *be*, a negative proposition. Near its projection, on a high and inaccessible part of the rock, is a group of figures, in the form of a procession, of the same age and character with those of Persepolis. The ruins at this place resemble the magnificent ones of that famous city.

BESLICK, a small Turkish silver coin, equal to 5 paras, the para being 3 persers.

BESSARABIA, col. 2, l. 9, for fourth-east *r.* fourth-west.

BESTIAN, or BOSTANA, a cape of Laristan, in Persia, which forms one of the most secure roadsteads in the gulf of Persia, at the town of Mogoo. The extremity is about N. lat. 26° 30', bearing from Polior N.N.E. 3, and W. from the S. end of Kifima. Lingaas and Boitana are small towns that lie between Linga and Cape Boitana.

BETHEL, in Geography, l. 3, Lowermost Bethel is a township of Northampton county, having 1392 inhabitants; and *Uppermost Bethel*, in the same county, has 1188 inhabitants.—After Dauphin county, add—having 2091 inhabitants; *l. 4, r. 1041*: at the close, add—a township of Maine, in the county of Oxford, having 975 inhabitants.—Also, a township in Bedford county, containing 1095 inhabitants.—Also, a township of Ohio, in the county of Miami, having 506 inhabitants.—Also, a township of Champaign county, in Ohio, having 484 inhabitants.

BETHLEHEM, col. 4, l. 10, add—Also, a town of New Hampshire, in Grafton county, having 422 inhabitants; *l. 13, r. 1738; l. 15, add*—having 1118 inhabitants; *l. 26, add*—but by the census of 1810, they are stated to be 1436.

BETHLEHEM, E. and W., two townships of Pennsylvania, in Washington county; the former has 1806, and the latter 1849 inhabitants.

BETLIS. Subjoin—See **BEDLIS.**

BEVEL ANGLE, l. 3, Plate III. Col. 3, l. 35, r. A p₂

BEVERLEY, l. ult. In 1811 the borough and liberties of Beverley contained 1457 houses, and 6731 persons; 3024 being males, and 3707 females.

BEVERLY, l. 5, r. 4608.

BEVERSTONE, l. 7, r. Edward.

BEWCASTLE. Add—The township includes 35 houses, and 198 persons; 103 being males, and 95 females.

BEWDLEY, l. ult. r. The borough contained, in 1811,

632 houses, and 3454 persons; 1583 being males, and 1871 females.

BEZOZZI, col. 2, l. 8, r. The eldest, &c.; l. 18, composition; l. 26, do.; l. 27, for the *r.* their; after delicacy, insert—there was; l. 40, insert—a labour exquisite in performance.

BIBIENA, FERDINANDO-GALLI, l. 12, r. Alexander; l. 14, r. generosi.

BIBLES, LATIN. See *Italic VERSION.*

BICE. Add—See **CAST.**

BIDDEFORD, in America, l. 5, r. 1563.

BIDDEFORD, col. 3, l. 2, r. 634 houses, and 3244 persons; 1415 being males, and 1829 females.

BIGELOVIA, in Botany, a genus which we here dedicate to our highly intelligent and scientific correspondent, Jacob Bigelow, M.D. of Boston in New England, Rumford professor of Materia Medica and Botany in Harvard university, author of the *Florida Bostoniensis*, published in 1814; and of the American Medical Botany, with coloured plates, now publishing periodically; works which, we are confident, will be but the forerunners of more ample and valuable communications from the same quarter. We have selected for the commemoration of our friend an American genus, to which the name of **BORYA**, (see that article hereafter,) has been erroneously applied, and which therefore requires a new appellation. We have chosen one as indispensible as the genus itself, whose synonyms are the following.—(*Borya*; Willd. Sp. Pl. v. 4. 711. Pursh 22. Ait. Hort. Kew. v. 5. 365. Adelia; Michaux Boreal.-Amer. v. 223. Browne Jam. 361, but not of Linnæus.)—Clafs and order, *Diocia Diandria*. Nat. Ord. *Scpiarie*, Linn. *Jasmineæ*, Jul.

Gen. Ch. Male, *Cal.* Perianth minute, in four deep, erect, lanceolate segments. *Cor.* none. *Stam.* Filaments two or three, thread-shaped, longer than the calyx, inserted into the receptacle; anthers roundish, two-celled.

Female, on a separate plant. *Cal.* Perianth in four deep, oblong, slightly spreading, deciduous segments; two opposite ones very minute, and sometimes wanting. *Cor.* none. *Pist.* Germen superior, roundish-ovate, of two cells; style short, cylindrical, thickish; stigma capitate, depressed, obscurely cleften. *Peric.* Berry oval-oblong, of one cell, its internal surface cartilaginous and rugged. *Seed* almost always solitary, oblong, tapering at each end, furrowed and ribbed longitudinally, with a membranous skin; its embryo straight, in a horny albumen.

Eff. Ch. Male, Calyx deeply four-cleft. Corolla none. Stamens two or three.

Female, Calyx deeply four-cleft; two opposite segments smallest. Corolla none. Stigma capitate. Berry with one seed.

Obf. The description of Michaux, and his hint of the affinity of this genus to *Chionanthus*, have helped us to form, we trust, a correct idea of its characters. Willdenow had seen specimens of Browne's *Adelia*, and he probably had the sanction of the able M. Richard for uniting it with that of Michaux, the latter having already so decided this question; nor do we see any reason for a different opinion.

The species are all shrubby, with opposite, undivided, mostly entire, smooth leaves, and minute, tufted, bracteated flowers. The fruit is probably not eatable.

1. *B. castifnoides.* Elliptical Bigelovia. (*Borya castifnoides*; Willd. n. 1. *Adelia* n. 1; Browne Jam. 361. t. 36. f. 3.)—Leaves stalked, obovate, obtuse, coriaceous, revolute; reticulated with veins beneath.—Native of the West Indies. Common on low gravelly hills, eastward of Kingston, in Jamaica. Sometimes eight or ten feet high, with

with slender leafy branches. Flowers in little axillary tufts, or clusters. Leaves about an inch and a half long, smooth, entire. Br.

2. *B. porulosa*. Pierced Bigelovia. (*Borya porulosa*; Willd. n. 2. Pursh n. 1. Ait. n. 1. *Adelia porulosa*; Mich. Bor.-Amer. v. 2. 224.)—Leaves sessile, oblong-lanceolate, obtuse, coriaceous, revolute; dotted beneath.—On the coasts of Georgia and Florida. The leaves are rusty, and as if pierced with little dots, beneath. *Micbaux*.

3. *B. ligustrina*. Privet-leaved Bigelovia. (*Borya ligustrina*; Willd. n. 3. Pursh n. 2. Ait. n. 2. *Adelia ligustrina*; Mich. Bor.-Amer. v. 2. 224.)—Leaves oblong-lanceolate, somewhat membranous, entire, on short stalks. Berry roundish-ovate.—Native of thickets and woods about rivers, in the countries of the Illinois, Tennessee, &c. flowering in July and August. This has the habit and foliage of our Privet. *Micbaux*.

4. *B. acuminata*. Pointed Bigelovia. (*Borya acuminata*; Willd. n. 4. Pursh n. 3. Ait. n. 3. *Adelia acuminata*; Mich. Bor.-Amer. v. 2. 225. t. 48.)—Leaves ovato-lanceolate, membranous, stalked, slightly ferrated, acute at each end. Unripe berry oblong, taper-pointed.—On the banks of rivers in Carolina and Georgia. The taper lateral branches appear to form something like thorns. The leaves are an inch and a half long. Male flowers several together, in small sessile tufts, encompassed with several ovate bractæas; female ones stalked, very small. Berries pendulous, elliptic-oblong, near an inch in length.

The three latter species are recorded by Mr. Aiton, to have been brought into England by Mr. John Lyon, the *porulosa* in 1806, the two others in 1812. They are hardy shrubs, but do not appear to have yet flowered.

BIGNONIÆ, the 45th order in Jussieu's system; the 12th of his 8th class, whose characters are given at GENTIANÆ. The following is that author's definition of the order before us.

Calyx divided. *Corolla* mostly irregular, with four or five lobes. *Stamens* usually five, one of which is, for the most part, abortive, or imperfect. *Style* one; *stigma* either simple or two-lobed. *Fruit* of two cells; sometimes capsular, with many seeds, and with two perfectly separate valves; the seed-bearing partition opposite or parallel to the valves, and separable therefrom: sometimes coriaceous or woody, bursting at the top only, with but few seeds, the seed-bearing partition a continuation of the valves, not separable, and often sending out a slight wing, dividing each cell into two. *Cocculum* unattended by albumen. *Stem* herbaceous, shrubby, or arborescent. *Leaves* opposite, rarely alternate.

SECT. 1. *Fruit capsular, bivalve*. *Stem herbaceous*,

Chelone and *Sesamum*, with Jussieu's *Incarvillea*, Lamarck Illustr. t. 527, compose this section.

SECT. 2. *Fruit capsular, bivalve*. *Stem arborescent or shrubby*.

Millingtonia of Linnæus; *Jacaranda*, *Catalpa*, and *Tecoma* of Juss. with *Bignonia* of Linnæus.

SECT. 3. *Fruit coriaceous, almost woody, opening at the top*. *Stem herbaceous*.

Tourretia of Dombey and Juss.; *Martynia*, *Craniodaria*, and *Pedalium* of Linnæus.

Mr. Brown, Prodr. Nov. Holl. v. 1. 479, retains the second section only, under the name of *Bignoniaceæ*, to which he adds the genus *SPATHODEA*. See that article.

BIGONCIA, in Commerce, a liquid measure in Venice. See AMPHORA.

BILE, *Chemical properties of*. Bile has been lately denied by Berzelius to contain a resinous or adipocirous matter, as had been maintained by former chemists. The substance pecu-

liar to bile, or, as it is denominated by him, the *biliary principle*, has an excessively bitter taste, followed by some sweetness. Its smell is peculiar, and the colour in most animals varies from green to greenish-yellow. It is soluble in water, and its solubility is not in the least promoted by the alkali of the bile, since when the alkali is neutralized by any acid, the peculiar matter does not separate. It likewise dissolves in alcohol in all proportions. Like the albuminous materials of the blood, of which this peculiar matter is composed, it will unite with acids producing two compounds of two degrees of saturation, and hence of solubility. The dilute acetic acid which gives soluble compounds with the albumen of the blood, does the same with the peculiar matter of the bile; and hence this matter is not precipitated on adding this acid to bile, though it falls down on the addition of the sulphuric, nitric, or muriatic acids. It is this sparingly soluble compound of biliary matter with a mineral acid which has been mistaken by many chemists for a resin, since it possesses the external characters of a resin, melts when heated, dissolves in alcohol, and is again partly precipitated by water. The alkalies, alkaline earths, and alkaline acetates, decompose and dissolve it; the former by depriving it of its combined acid, the latter by furnishing it with acetic acid, which renders it soluble in water.

The peculiar matter of bile will also combine with many of the metallic oxyds. The degree of the solubility possessed by the compound of acid and biliary principle, varies according to the length of time that the bile has been kept, and also according to the species of the animal.

The biliary matter may be obtained in a state of purity by mixing fresh bile with sulphuric acid diluted with three or four times its weight of water. A yellow precipitate first appears, which is to be allowed to subside, and then removed: more acid is then to be added as long as any precipitate is formed; heat the mixture gently for some hours, and afterwards decant the fluid part, and thoroughly wash the green mass left. This green resinous-like mass reddens litmus, and is partially and sparingly soluble in water. It may be deprived of its acid either by the carbonate of barytes, or by the carbonate of potash or lime, and thus obtained pure. It is now soluble in water, and forms a green solution, having all the properties of bile. It is insoluble in ether, which converts it into an adipocirous mass. When burnt it yields no ammonia, and consequently contains no azote.

The following are the results of Berzelius's analysis of bile:

Water	- - - - -	907.4
Biliary principle described above	- - - - -	80.0
Mucus of the gall-bladder, &c. dissolved in the bile	- - - - -	} 3.0
Alkalies and salts, common to all secreted fluids	- - - - -	
		1000.0

The bile of other animals has been but imperfectly examined. It resembles in its general characters the human bile above-mentioned.

BILLARDIERA, in Botany, so named by the writer of this, in honour of his friend James Julian la Billardiere, (or, as it is now written, Labillardiere,) M.D. author of *Icones Plantarum Syria Rariorum*, the fruits of his journey to the Levant, in 1786; and since much better known by his valuable *Novæ Hollandiæ Plantarum Specimen*, in two volumes folio, with many plates. An account of his voyage to New Holland, in search of the unfortunate Lapéyroule,

contains also much botanical matter, and has been published in English, at London, in 1802, with plates. M. Labillardiere has always distinguished himself as a classical botanist, of the Linnæan school, preferring the interests of science to those of system, and following no leader but what he conceives to be truth.—Smith Bot. of New Holl. 1. Labill. Nov. Holl. v. 1. 64. Willd. Sp. Pl. v. 1. 1150. Ait. Hort. Kew. v. 2. 39.—Class and order, *Pentandria Monogynia*. Nat. Ord. uncertain. Akin to *Pittisporum*, and therefore to the *Rhamnii* of Jussieu, as they stand at present. *Salisb.*

Gen. Ch. *Cal.* Perianth inferior, of five lanceolate, coloured, equal, deciduous leaves. *Cor.* Petals five, inserted into the receptacle, alternate with the calyx, and twice as long, linear-lanceolate, erect; their claws more or less converging in the form of a tube; border spreading, acute, recurved. Nectary none. *Stam.* Filaments five, inserted into the receptacle, alternate with the petals, the length of the claws, awl-shaped; anthers ovate-oblong, attached by the back, of two cells, bursting lengthwise, internally. *Pist.* Germen superior, elliptic-oblong; style awl-shaped, the length of the filaments; stigma obtuse. *Peric.* Berry roundish-oblong, of two cells. *Seeds* numerous, roundish, inserted into the central column.

Eff. Ch. Calyx of five leaves, deciduous. Petals five, alternate with the calyx, converging into a tube. Stigma obtuse. Berry superior, of two cells, with many seeds.

The species are all slender, twining, branched *shrubs*, with scattered, simple, undivided, nearly entire, more or less downy, leaves, on short footstalks. *Flowers* and *fruit* pendulous, on terminal stalks.

1. *B. scandens*. Climbing Billardiera, or Apple-berry. Sm. Bot. of New Holl. 1. t. 1. Willd. n. 1. Ait. n. 1. Curt. Mag. t. 801.—Leaves elliptic-lanceolate. Berry cylindrical, obtuse, downy.—Native of Port Jackson, New South Wales, from whence we received specimens and coloured drawings, by the kindness of Dr. White. Sir Joseph Banks sent seeds, or plants, to Kew, in 1790, and we have since seen flowers and ripe fruit in many conservatories. A low *shrub*, with variously twisted and climbing branches. Leaves an inch and a half or two inches long, elliptic-oblong, of a dull but not dark green; paler and most downy beneath; their edges somewhat wavy and reflexed, scarcely notched. *Flowers* on hairy stalks, pale lemon-coloured, an inch long, with a hairy yellowish calyx. Germen very hairy. Berry above an inch in length, cylindrical, equally obtuse at each end, yellow, downy all over, full of brown seeds, its pulp soft, sweet, but rather insipid in this country, though said, in a wild state, to resemble a roasted apple. The figure in the Botany of New Holland was taken from a drawing made in that country. We readily concur with our friend Dr. Sims, in Curt. Mag. p. 1507, that it is impossible to find a name which will contrast the only known species of a genus, with all that may hereafter be found, and it happens that all the *Billardiere* are climbers. The appellation above, therefore, serves to shew the present to have been the originally described species. There are several such instances in the history of Linnæan genera, nor would it be allowable to alter the original specific name on this account.

2. *B. mutabilis*. Changeable-flowered Billardiera. *Salisb.* Parad. t. 48. Ait. n. 2. Curt. Mag. t. 1313.—Leaves linear-lanceolate. Berry cylindrical, obtuse, smooth.—Native of New South Wales. Easily cultivated in a greenhouse, and increased by cuttings or seeds. The leaves are narrower and smoother than in the foregoing species. The *flowers*, at first of a pale greenish-yellow, turn purple before

they fall. The *germen* and *fruit* are said to be always smooth, the form of the latter agreeing with *B. scandens*. *Flower-stalks* smooth.

3. *B. fusiformis*. Spindle-shaped Billardiera. Labill. Nov. Holl. v. 1. 65. t. 90.—Leaves oblong-lanceolate. Flowers aggregate. Petals spreading. Berry spindle-shaped, pointed, silky, dry.—Gathered by M. Labillardiere at the Cape of Van Diemen, in December. The stem is generally climbing. Leaves somewhat hairy, larger than in the last. *Flowers* from two to six at the end of each branch, forming more or less of a cluster, blue, the petals more ovate, and spreading from the base, than in other species. Anthers converging. Berry small and tapering, of a membranous texture, silky, destitute of pulp.

4. *B. longispora*. Blue-berried Billardiera. Labill. Nov. Holl. v. 1. 64. t. 89. Curt. Mag. t. 1507. Ait. Epit. 364.—Leaves lanceolate. Petals converging. Berry nearly globular, lobed, smooth.—Native of the same country as the last. Raised here by Messrs. Loddiges. The flowers are solitary, pale yellow, longer and more tubular than in any of the rest. Fruit remarkably different, being short and roundish, of a fine blue. Dr. Sims has well observed, that this part affords, in the present genus, the best specific distinctions.

BILLERICA, l. 2, r. 1289.

BILLS, EXCHEQUER. See EXCHEQUER-BILLS.

BILL of Health, an account of the health of a crew, given by the captain or master of a vessel.

BILLS, India, bills drawn in India on the East India company in London, and payable at the India-house.

BILLS, Viâualing. See NAVY and Viâualing BILLS.

BILLYMEAD, a town of Vermont, in the county of Caledonia, containing 433 inhabitants.

BILSTON, l. ult. for 1305 r. 1818; and for 6914 r. 9646.

BILSTON, l. ult. for 121 r. 110; and for 744 r. 762.

BIR. Add—According to M. d'Anville this place represents the ancient Birtha. The caravans travelling from Aleppo to Orfa pass the Euphrates on a bridge of boats at this place, situated 144 miles from Aleppo, and 67 from Orfa, in N. lat. 36° 58'. A tax is paid at this town, which is in a dilapidated state; and all travellers and merchants cross the Euphrates, which is here deep and rapid, and about 130 yards broad.

BIRDS, Anatomy of. The references to the plates to be expunged. Col. 7, l. 33, after another, insert—a good instance of which is found in, &c. ending heron; l. 35, r. The bulbus in the ostrich is a long narrow band lying on the front of the stomach. The structure, &c.; l. 53, *dele* like other, &c. to secretion. Col. 9, l. 42, for superficial view r. slight examination. Col. 11, l. 20, after intestine *dele* to ventricle, l. 34; and insert—If the cavity of the stomach in the heron be distended with any transparent fluid and held up to the light, the zone of gastric glands will be plainly seen through its coats. If Spallanzani had employed this expedient, he could not have denied a distinct glandular structure to the heron. The inferior part of the stomach is chiefly composed of muscular fibres, spreading in a radiated manner from a lateral aponeurosis, which supplies the place of the great tendons of the digastric muscle. The second cavity or stomach in the heron is a small round bag, furnished only with circular muscular fibres; l. 35, for straight r. contracted. Col. 13, l. 14, *dele* so; l. 15, after respect *dele* to the end of the paragraph. Col. 14, l. 15, *dele* after adjoining to the end of the paragraph. Col. 47, l. 17, *r.* quadrupeds. The trunk, &c. Col. 51, l. 13 from the bottom, *dele* from urine to the end of the paragraph.

BIRD, in *Geography*, a township of Adams county, in the district of Ohio, containing 1442 inhabitants.

BIRMINGHAM. Add—In 1811, the town of Birmingham contained 16,653 houses, and 85,753 persons; 40,518 being males, and 45,235 females; 589 families employed in agriculture, and 17,294 in trade and manufactures.

BIRMINGHAM, a township of Delaware county, in Pennsylvania, having 586 inhabitants.—Also, a township in Chester county, of the same state, having 200 inhabitants.

BISHOP'S CASTLE, *l. ult. r.* The borough, in 1811, contained 288 houses, and 1367 persons; 651 being males, and 716 females.

BISHOP'S Stortford, col. 2, l. 36, *r.* The parish contains 479 houses, and 2630 persons; 1255 being males, and 1375 females.

BISLEY, *l. ult. r.* 922 *r.* 1022; and for 4227 *r.* 4757.

BISMUTH, in *Chemistry*. There seems to be but one oxyd of this metal. What was formerly termed the *magiftery of bismuth*, and considered as a peroxyd, has been demonstrated by Bucholz to be a compound of the oxyd of bismuth and nitric acid.

Dr. Thomson has determined 88.75 to be the combining weight or weight of the atom of bismuth. According to this determination, the oxyd of bismuth will consist of

Bismuth	100	} or per cent. of	{ 89.87
Oxygen	11.2672		

From the above number, and from the known weights of the different acids, the composition of all the salts of bismuth can be accurately ascertained. See PROPORTIONS, *Definite*, and ATOMIC Theory, *Addenda*.

BISON, in *Zoology*. See BOS and URUS.

BISSEXTILE, col. 2, l. 22, *r.* 1752.

BISTAM, insert—or BISTAN. Add—See SUMNUM and SHARUT.

BISTINEAU, in *Geography, a lake of Louisiana, formed by the agency of Red river, which has raised a bank of earth and sand across the lower extremity of a valley that serves to confine the waters between the hills at all seasons, and to produce this lake. The land along its banks rises into hills from 100 to 200 feet of elevation, clothed with pine, oak, and various other trees, that afford agreeable prospects. The eastern range, more broken than the western, abounds more with petrifications; and along the margin of the water, are found the white-thorn, hawthorn, and other dwarf trees, which form an elegant natural border. Many small prairies, eight or ten acres in extent, spread themselves over the projecting banks, and diversify this wild, uncultivated, but romantic scene. This lake furnishes evidence of the continual change effected in these alluvial regions, by the slow but unceasing action of water. The average depth of the water is from fifteen to twenty feet; and in the deepest part of the lake presents to view cyprus-trees of various sizes that are dead, and the remains of which, resisting the action of air and water, attest the ancient situation of the country. Darby's Louisiana.*

BIT, in *Commerce*. Add—1 bit being worth 5 $\frac{1}{2}$ sterling, as 10 bits and 5d. currency make a dollar.

BITTER PRINCIPLE, *Natural and Artificial*, in *Chemistry*. This name has been given by chemists, and especially by Dr. Thomson, to different principles, extracted from various vegetables, particularly from *quassia*, *cocculus indicus*, *squills*, and some others. Though the characteristic property of these substances be their bitter taste, yet this appears to be almost the only particular in which they all agree. The bitter principle of *quassia*, according to Dr. Thomson, is of a brownish-yellow colour, somewhat transparent, of an intensely bitter taste, soluble in water and alcohol, has no effect on vegetable blues, and is little affected by re-agents; the nitrate of silver, and acetate of lead, being the only ones that precipitate it from its solution. It may be obtained by digesting *quassia* for some time in water, and evaporating the solution formed to dryness. The bitter principles extracted from *colocynth*, *brionia alba*, and from *wheat-flour*, seem to possess properties analogous to the above. The bitter principle from *cocculus indicus*, which has been named PICTOXYN, is described under that article.

The bitter principle of *squills* is white and transparent. It is soluble in water and alcohol, and rapidly attracts moisture from the atmosphere. Its taste is intensely bitter; though it usually retains a little saccharine matter with great obliquity. It was obtained by Vogel by evaporating the juice to dryness, and heating it with alcohol; the tannin taken up by the alcohol was separated by the acetate of lead, and thus the bitter principle, obtained in the state above described, combined with a little sugar, from which it was found impossible to entirely free it. The bitter principle of coffee principally differs from the preceding by the property it possesses of striking a green colour with iron, and of precipitating that metal from concentrated solutions.

According to the experiments of Bouillon la Grange, a substance not much unlike the above exists in the flowers of the *arnica montana*, *absinthium vulgare*, *juniperus sabinus*, *ruta graveolens*, *antibemis nobilis*, and *achillea millefolium*.

The *artificial bitter principle* seems to have been first formed by Hauffman from indigo, though he mistook its nature. Wether afterwards obtained it from silk, ascertained its properties, and gave it the name of *yellow bitter principle*. It was afterwards obtained by Bartholdi from the white willow. Mr. Hatchett formed it, during his experiments upon artificial tannin, by heating indigo with nitric acid; and about the same time Fourcroy and Vauquelin procured it by the same means, and examined its properties. M. Chevreul supposes it to be a compound of nitric acid and a vegetable substance, probably of an oily nature. Its colour is deep yellow, and its taste intensely bitter. It is soluble in water and alcohol. It crystallizes in elongated plates, and possesses many of the properties of an acid, combining with alkaline substances, and forming crystallizable salts possessing peculiar properties.

The *artificial tannin* itself is by some chemists considered as little better than a variety of the bitter principle. See TANNIN, *Artificial*.

BITTERN. See WATER.

BITUMINOUS Marle Slate. See MINERALOGY, *Addenda*.

BIVOUACKE, **BIHOUAC**, or *Bigvac*, Fr. formed from the German *way-wacht*, a double watch or guard, denotes a night-guard, or a detachment of the whole army, which, during a siege, or in the presence of an enemy, marches out every night in squadrons or battalions, to line the circumvallations, or to take post in front of the camp, for

for the purpose of securing their quarters, preventing surprises, and obstructing supplies. When an army does not encamp, but lies under arms all night, it is said to "bivouacke."

BLACKBURN, l. 28, for 24 r. 23. Col. 2, l. 4, r. Blackburn township contained, in 1811, 2945 houses, and 15,083 persons; 6953 being males, and 8130 females: 45 families employed in agriculture, and 2861 in trade and manufactures.

BLACK-LAKE RIVER, in *Geography*, a river of Louisiana, that rises in the same ridge of hills with the Saline, and uniting with it, joins the Rigolet de bon Dieu, 8 miles N.E. of Natchitoches. Here the state of Louisiana begins to rise into elevations of some considerable note. The features of a mountainous country now present themselves, ledges of a loose sand-stone rock abound, nodules of iron-ore are every where met with, and petrifications of the most diversified forms are strewn over every slope. These petrifications generally appear to have undergone their change from ligneous to the siliceous state in which they are found, and to have been imbedded in an argillaceous clay, which, by induration, incloses them in its mass. Darby's Louisiana.

BLACKLICK, a township of Indiana, in the state of Pennsylvania, having 965 inhabitants.

BLACKROD, a township of Bolton parish, in the hundred of Salford, and county of Lancaster, containing 373 houses, and 2111 persons; viz. 1044 males, and 1065 females. See WIGAN.

BLADEN, l. 2, r. 5671; l. 3, 1985.

BLAFFERT, in *Commerce*, a small coin at Cologne; 20 blafferts in account being = the six-dollar specie, and 19½ blafferts being the six-dollar current; 16 blafferts = a rader florin; 2½ blafferts = a shilling; and a blaffert = 4 albus. There are silver blafferts, and half ditto.

BLAINVILLE, col. 2, l. 19, r. Serre.

BLAIR, ROBERT, in *Biography*, a Scotch divine and poet, was the eldest son of the Rev. David Blair, one of the ministers of Edinburgh, and chaplain to the king; and the grandson of the Rev. Robert Blair, minister of the gospel at Bangor in Ireland, and afterwards at St. Andrew's in Scotland, celebrated for his piety, and for his inflexible adherence to Presbyterianism, in opposition to those who endeavoured to establish episcopacy in Scotland. The subject of the present article was born in 1699, and after preparatory studies was ordained minister of Athelstaneford, in East Lothian, where he resided until his death, Feb. 4, 1747. The late right hon. Robert Blair, president of the court of session in Scotland, who died in 1811, was one of his sons, and Dr. Hugh Blair, (see his article,) was his cousin. His only literary production, we apprehend, was a poem, intitled "The Grave," which was long disregarded, and which, though more lately recommended to attention by Hervey, who first printed it, and Mr. Pinkerton, in his "Letters of Literature," has no claim on any high degree of commendation. It is destitute of plan, unembellished by any of the ingenious graces of poetry, and degraded by satirical strokes on physicians and undertakers, warm expressions, and ill-chosen epithets. Upon being previously submitted to Dr. Watts and Dr. Doddridge, the author had no encouragement to publish it: however, it was printed at London in 1743, and is perused by persons of a serious disposition. Biog. Dict. by Chalmers.

BLAIZE, ST., *Cape*, in *Geography*. See MOSSEL'S BAY.

BLANDFORD, col. 2, l. 30, r. contained, in 1811, 431 houses, with 2425 inhabitants; 1017 being males, and 1408 females.

BLANDFORD, in America, l. 6, r. 1613.

BLANDFORDIA, in *Botany*, received its name from the writer of the present article, in honour of his grace George duke of Marlborough, at that time marquis of Blandford, an honorary member of the Linnæan Society, and one of the most ardent botanists and cultivators that this country ever possessed in any rank of life. A genus belonging to what Linnæus terms the Patrician order, was judged peculiarly eligible for this purpose; nor can any one be more distinct, few more beautiful.—Sm. Exot. Bot. v. 1. 5. Brown Prodr. Nov. Holl. v. 1. 295. Ait. Epit. 364.—Clais and order, *Hexandria Monogynia*. Nat. Ord. *Coronaria*, Linn. *Narcissi*, Juss. *Hemerocallidæ*, Brown.

Gen. Ch. *Cal.* none. *Cor.* of one petal, inferior, tubular, straight, with six marginal lobes, regular, withering, *Stam.* Filaments six, thread-shaped, inserted into the middle of the tube, decurrent, shorter than the limb; anthers ovate, two-lobed, incumbent, attached by a hood at their base. *Pist.* Germen superior, stalked, oblong, with three angles, and three intermediate furrows; style vertical, awl-shaped; stigma simple. *Peric.* Capsule stalked, prismatic, of three cells, bursting at their inner angles. *Seeds* numerous, oval, inserted along the margins of each cell, imbricated, clothed with dense bristly hairs.

Eff. Ch. Corolla inferior, funnel-shaped, straight, with six marginal segments. Filaments inserted into the tube. Capsule stalked, prismatic, of three cells. Seeds numerous, imbricated, bristly.

1. *B. nobilis*. Scarlet Blandfordia. Exot. Bot. t. 4. Br. n. 1. Ait. Epit. 364. Curt. Mag. t. 2003.—"Bractæas but half the length of the partial stalks while in flower. Leaves narrow-linear." *Br.*—Native of the neighbourhood of Port Jackson. The root is woody and perennial. Leaves all radical, four or five inches long, scarcely half an inch broad, entire, smooth, coriaceous, tapering at the base into sheathing footstalks. Flower-stalks radical, two or three feet high, erect, round, each bearing a very handsome corymbose cluster, of drooping, scarlet flowers; yellow, and marked with green, at the border; each near an inch and a half long, on a red partial stalk of the same length, at whose base are two unequal, opposite, tapering bractæas. Capsule pointed, twice the length of the permanent withered corolla.

2. *B. grandiflora*. Large-flowered Blandfordia. Br. n. 2. (Aletis punicea; Labill. Nov. Holl. v. 1. 85. t. 111).—Bractæas nearly as long as the partial stalks while in flower; the inner but one-third as large as the outer.—Observed at Port Jackson by Mr. Brown, who is not quite certain of Labillardiere's plant, found at Cape Van Diemen. We have seen neither, but we should scarcely have thought the latter could be distinguished even from *B. nobilis*.

BLANDFORDIA cordata, Andr. Repof. t. 343. See GALAX.

BLATTA, col. 2, l. 29, after gigantea, add—called in the West Indies drummer, from the noise it makes, like a smart knocking with the knuckle upon the waincot; l. 36, dele which see respectively.

BLAYNEY, BENJAMIN, D.D. in *Biography*, an eminent Hebrew scholar and critic, was educated at Oxford, and graduated M.A. in 1753, at Worcester college, and becoming afterwards fellow of Hertford college, took the degree of B.D. in 1768, and of D.D. in 1787, in which year he was appointed regius professor of Hebrew. As a Scripture commentator and translator, he acquired very considerable reputation. The publications by which he was distinguished were, "A Dissertation on Daniel's Prophecy of Seventy Weeks," &c. 1775, 4to.; "A New Translation

of Jeremiah's Lamentations, with Notes, &c." 1784, 8vo.; "The Sign given to Ahaz, a Discourse on Isaiah, vii. 14—16," &c. 1786, 4to.; "Christ the greater Glory of the Temple," 1788, 4to.; "A New Translation of Zechariah, with Notes," &c. 1787, 4to. Dr. Blayney was canon of Christchurch, and rector of Potthor, where he died Sept. 29, 1801, having previously directed by will that his critical papers should be deposited in the library at Lambeth.

BLEACHING, col. 10, l. 19, r. For an account of the progress of discoveries in the new method of bleaching by the oxygenated muriatic acid, see *OXYMURIATIC Acid Gas*.

BLECHINGLEY, col. 2, l. ult. r. By the returns in 1811, the borough and parish contained 184 houses, and 1116 persons; 575 being males, and 541 females.

BLECHUM, in *Botany*, *Βλεχμος*, an old name for *Pulegium*, or Penny-royal, applied gratuitously by Dr. Patrick Browne to a Jamaica plant, and retained by Jussieu. It looks, rather than sounds, too much like *Blechnum*.—Browne Jam. 201. Juss. in Ann. du Mus. v. 9. 269. Brown in Ait. Hort. Kew. v. 4. 55.—Class and order, *Didymania Angiosperma*. Nat. Ord. *Personata*, Linn. *Acanthi*, Juss. *Acanthaceae*, Brown.

Eff. Ch. Calyx in five deep equal segments. Corolla funnel-shaped. Capsule imperfectly two-celled, with two valves, and a contrary partition, at length separating in portions. Seeds several, with awl-shaped proprs. *Br*.

These characters exclude Jussieu's *B. angustifolium*, which, with *Ruellia imbricata* of Forskall, and several East Indian as well as tropical African species, compose Mr. Brown's new genus of *Atteblema*, as yet, we believe, merely indicated in his Prodr. Nov. Holl. v. 1. 478. The following are the only species of *Blechnum* there mentioned.

1. *B. Brownei*. Dense-piked Blechnum. Juss. as above, Ait. n. 1. (*Ruellia Blechnum*; Linn. Sp. Pl. 884. Willd. Sp. Pl. v. 3. 362. Prunella elatior, flore albo; Sloane Jam. v. 1. 173. t. 109. f. 1.)—Leaves ovate-elliptical, slightly toothed. Spikes quadrangular. Bractees ovate, downy.—Native of the West Indies. Perennial. Herbaceous, decumbent, branched, two or three feet high, with opposite leaves, and white flowers of no great beauty.

2. *B. erectum*. Upright Blechnum. (*Ruellia blechioides*; Swartz Ind. Occ. 1068. Willd. Sp. Pl. v. 3. 362.)—Leaves oblong, somewhat toothed, smooth. Spikes ovate. Bractees nearly smooth.—Found in shady woods, in the western part of Jamaica. Stem erect, rather shrubby, flowers blue. Willdenow misquotes the remarks of Swartz, which indeed are not very clearly expressed.

3. *B. angustifolium*. Narrow-leaved Blechnum. (*Ruellia angustifolia*; Swartz Ind. Occ. 1070. Willd. Sp. Pl. v. 3. 363.)—Leaves linear-lanceolate. Spikes oblong. Bractees ovate, hairy.—Native of the Caribbee islands. Herbaceous, a foot high, with tumid joints. Leaves smooth on both sides. Flowers small, blue.

BLETTIA, so named by the authors of the Flora Peruviana, after Louis Blet, a Spanish apothecary, whose botanical merits ought to be very great, to entitle him to so fine, if really distinct, a genus.—"Ruiz et Pavon Prodr. 119." Brown in Ait. Hort. Kew. v. 5. 205. (Phaus; Loureir. Cochinch. 529.)—Class and order, *Gynandria Monandria*. Nat. Ord. *Orchideae*.

Eff. Ch. Calyx and petals distinct. Lip sessile, hooded. Style unconnected. Anther a terminal deciduous lid. Masses of pollen eight or four, two-lobed.

1. *B. Tankervillei*. Lady Tankerville's Bletia. Ait. n. 1. Andr. Repof. t. 426. Curt. Mag. t. 1924. (*Li-*

modorum Tankervillei; Redout. Liliac. t. 43. Schueev. Ic. t. 5. See LIMODORUM for more synonyms, and a description.)—Lip undivided, with a short spur. Leaves radical, elliptic-lanceolate.

2. *B. verucunda*. Tall Bletia. Ait. n. 2. (*Cymbidium verucundum*; Willd. Sp. Pl. v. 4. 105. Limodorum altum; Jacq. Ic. Rar. t. 602. Curt. Mag. t. 930.)—Petals converging. Lip without a spur; the ribs of its disk branched; middle lobe broader than long; lateral ones contracted upwards. Stalk more or less branched.—Native of the West Indies, long known in our floves. Stalk three feet high, with spreading branches. Flowers crimson, an inch broad. Petals forming a hood over the style. Furrows of the lip yellow.

3. *B. florida*. Purple Bletia. Ait. n. 2. (*Cymbidium floridum*; Salisb. Prodr. 9. Limodorum purpureum; Redout. Liliac. t. 83.)—Petals spreading. Lip without a spur; the ribs of its disk simple; middle lobe somewhat wedge-shaped; lateral ones dilated at the summit. Stalk somewhat branched.—Native of the warmest parts of the West Indies. Twelve or eighteen inches high. Flowers larger than the last, with more oblong, and more uniform, petals and calyx-leaves. Disk of the lip yellow.

4. *B. hyacinthina*. Hyacinthine Bletia. Ait. n. 4. (*Cymbidium hyacinthinum*; Sm. Exot. Bot. v. 1. 117. t. 60. Curt. Mag. t. 1492.)—Petals lanceolate, spreading. Lip without a spur. Masses of pollen four, two-lobed. Stem leafy. Flowers racemose.—Native of China, according to Mr. Ker. Of rather more humble growth than the last, from which it differs in having terminal, not radical, flower-stalks. The flowers too are a little larger, purplish rather than crimson. Petals and calyx exactly similar. Lip with four shallow curled lobes in front.

5. *B. capitata*. Capitate Bletia. Ait. n. 5.—"Lip without a spur; callous internally near the base. Stem leafy. Flowers capitate."—Native of the West Indies, from whence it was procured by Sir Joseph Banks, in 1795. It flowers in the flove in June and July. We have seen no specimen nor figure.

Besides these garden species, and the original Peruvian ones, whatever they may be, there are doubtless several remaining latent in every good herbarium. We have some Nepal *Orchideae* from Dr. Buchanan, which may probably be referable to this genus.

BLETTERIE, l. 21, after Guyon, add—He also edited Maslef's Hebrew Grammar, vindicating his method in his "Vindiciæ Methodi Maslefiæ;" annexed to his edition of the Grammar in 1731.

BLIGHTIA, in *Botany*, so named in honour of admiral William Bligh, whose services rendered to botanical science, in the transportation of rare plants from remote countries, have procured him this compliment, in common with the great captain Cook.—König in Ann. of Bot. v. 2. 569. Ait. Hort. Kew. v. 2. 350.—Class and order, *Oständria Monogynia*. Nat. Ord. *Tribilatae*, Linn. *Sapindi*, Juss.

Eff. Ch. Calyx in five deep segments. Petals five, with an internal appendage. Style none. Capsule superior, of three cells and three valves. Seeds solitary, each subtended by a large fleshy tunic.

1. *B. sapida*. Akee-tree. Ait. n. 1. König as above, 571. t. 16, 17. (Akee; Broughton Hort. East. 1792. 10. "Akefia africana; Tuffac Antill. 66. t. 3.")—Native of Africa, between the tropics, from whence it was transported to the West Indies in 1778. The fleshy tunic, or support, of the seed is said to be a delicate article of cookery, resembling the white flesh of a chicken or frog, like which it serves to make fricassées for West Indian epicures. The

tree is large, of handsome growth, with abruptly pinnate, ample, smooth, entire leaves, and copious, small, white flowers, in compound, axillary panicles. Some flowers have imperfect stamens, others an abortive germen. *Nectary* a glandular notched ring, surrounding the base of the germen or its rudiment. *Capsule* elliptic-oblong, three-lobed, fleshy, variegated with red and yellow, about the size of a goose egg. *Seeds* globular, as big as cherries, dark brown, polished, each half sunk in a white, turbinate, lobed and corrugated tunic, of the substance of firm suet, larger than the seed, and attached laterally to the central partition of each valve.

BLIGHT, l. 25, add—See APHIS.

BLISTERS, *Fluid of*, in Chemistry. See FLUIDS, *Animal*.

BLOCKLEY. Add—It contains 1618 inhabitants.

BLOOD, *Chemical Properties of*. The chemical properties of the blood have been lately investigated with considerable success by Drs. Marcet and Bostock, Brande, Berzelius, and others; with a summary view of whose experiments we shall here present our readers.

Of the serum.—The specific gravity of the serum of blood has been stated to lie between 1028 and 1029.5. The opinion of De Haen that it contains gelatine was first shewn to be erroneous by Dr. Bostock in this country, and about the same time by Berzelius in Sweden. The principle formerly termed gelatine has been variously represented and named by different chemists. Thus Dr. Bostock endeavoured to prove that it was a species of mucus, Mr. Brande that it was merely an alkaline solution of albumen; Dr. Marcet terms it *mucro-extractive* matter, Dr. Pearson an *animal oxyd*, the French chemists *ozonozone*, &c.; but it is to Berzelius that we owe the knowledge of its real nature. We infer, nearly in his own words, the following account of his analysis of the serum of the blood, as an excellent model for the analysis of all albuminous fluids.

One thousand parts of serum were evaporated to dryness till it could be easily reduced to powder. In this state the residuum weighed 95 parts, and consisted of a yellowish semi-transparent mass, resembling amber. "Of this mass," says he, "I digested 10 grammes in cold water. The albuminous portion became softened and gelatinous. I separated by the filter the liquid from the insoluble part, and washed the latter repeatedly in boiling water. The undissolved albumen dried on the filter weighed 6.47 grammes, and did not give up its earthy phosphate by subsequent digestion in muriatic acid.

"The solution which passed the filter was evaporated to dryness, during which thick membranes formed at the surface of the solution, and the solution gelatinized before it was perfectly dry. I digested this residue in alcohol whilst it was still gelatinous; the spirit assumed a yellow colour, and on evaporation left an alkaline deliquescent mass, weighing .92 grammes. This consisted of soda holding albumen in solution, of muriate of soda and muriate of potash, of lactate of soda, and of an animal matter which always accompanies the lactate. This animal matter has a brownish-yellow colour, is easily soluble both in water and alcohol, and is precipitated by tannin and submuriate of lead. It is constantly formed, as has been stated, in conjunction with the lactic acid only; and its presence may be taken as a sure indication of the presence of that acid.

"The portion not dissolved by alcohol, when digested with water, left a fresh residue of albumen, weighing 1.95 grammes. The watery solution could not be made to gelatinize, and did not contain the smallest quantity of gelatine. Besides

the alkali, it contained an animal matter, easily precipitated by tannin and by oxymuriate of mercury, and which appeared to me to be extracted from the albumen by the boiling of the water, and to be analogous to the substance obtained by boiling fibrin in water." See FIBRIN.

Berzelius found only a slight trace of the phosphoric acid, and none of the sulphuric in the serum of ox blood; 1000 parts of which, according to him, consist of

Water	-	-	-	-	-	905
Albumen	-	-	-	-	-	79.99
Substances soluble in alcohol,	}	viz. lactate of soda, and ex-	}	6.175	}	8.74

Sulphate of potash	-	-	-	-	-	.35
Earthy phosphates	-	-	-	-	-	.60
						1000

Berzelius remarks on Dr. Marcet's analysis, "A more perfect agreement cannot be expected in the analysis of substances so liable to incidental differences, particularly in the quantity of water, which in the blood depends so much on the proportion of liquid taken into the stomach. It is clear that Dr. Marcet's *extractive matter* is impure lactate of soda; and I must also observe, that the sulphate of potash and earthy phosphates found by him in the ashes of serum are probably, for the reasons above-mentioned, formed by the products of combustion." See ALBUMEN.

Of the colouring matter or red particles of the blood.—An opinion long prevailed among chemists, that blood owed its red colour to iron. Bada appears to have been the first who pointed out the existence of this metal in blood; but its presence was more satisfactorily demonstrated by Menghini, whose experiments were repeated and verified by subsequent

requent chemists. Parmentier and Deyeux supposed, that the red colour depended upon the union of iron with the oxygen contained in the blood; Fourcroy and Vauquelin, who succeeded, denied this, and asserted that it depended upon the subphosphate of that metal. Dr. Wells, however, so long ago as the year 1797, called this opinion in question, and asserted that the most delicate tests of iron did not indicate the presence of that metal in the blood; that other red substances do not all contain iron; and that, on the other hand, other substances that do contain iron are not red. Hence he supposed, that the red part of the blood was an organized animal substance. This opinion has been lately revived by an eminent modern chemist, Mr. Brande; who asserts, contrary to almost every other chemist, that the colouring matter of the blood yields no more iron when burnt than any other constituent of the blood, and that consequently it cannot owe its colour to that principle. Berzelius, however, though he denies the opinion of Fourcroy and Vauquelin, that the red colour depends upon a salt of iron, agrees with most preceding chemists, that its ashes contain much more of this metal than those of either its other constituents, that is to say, that they contain 50 per cent. of oxyd of iron, while the ashes of albumen and fibrin do not yield a trace of that metal. Hence he concludes, that iron, somehow or other, and in a manner unknown to us at present, probably conduces to the colour of the blood. The opinion of Berzelius, and most modern chemists, respecting this principle is, that it closely resembles albumen and fibrin in its properties. According to Berzelius, the mineral acids act upon it nearly in the same manner as upon albumen. It is soluble also in dilute acetic acid, and precipitated by the prussiate of potash, like that principle; and hence Berzelius is inclined to consider it as a modification of albumen. Vauquelin has lately given a method by which he thinks the colouring principle may be separated from the other principles of the blood, which is a very difficult task; we do not think, however, that he has been successful.

Mr. Brande tried to form a lake, by precipitating its acid solution by means of different earthy and metallic salts. Neither alumina nor oxyd of tin answered the purpose well. Corrosive sublimate or nitrate of mercury succeeded best. These gradually precipitated the colouring matter, and formed with it powders of a good red colour, not altered by exposure to the air. Mr. B. likewise made some attempts to employ it as a principle in dyeing, but they were not attended with much success.

Some interesting observations have lately been made on the size of the colouring particles of the blood by Dr. Young. According to this gentleman, they bear no proportion to the size of the animal. Thus,

The particles of bullock's blood from	{	0.000000	inch
beef measured - - - - -			
Ditto of a mouse - - - - -	{	0.000000	to 0.000000
Do. of human blood - - - - -			
Do. of blood recently diluted from	{	0.000000	to 0.000000
swine - - - - -			
Do. of the skate, about - - - - -	{	0.000000	

Of the Fibrin.—The experiments of Berzelius shew that this substance closely resembles albumen in its chemical properties. We do not think it necessary therefore to add any thing on the subject here, but refer our readers to the article ALBUMEN. The physical properties of fibrin have been already described under BLOOD in the Cyclopædia. Acc-

ording to the experiments of Gay Lussac and Thenard, fibrin is composed of

Hydrogen - - - - -	7.021
Carbon - - - - -	53.360
Oxygen - - - - -	19.685
Azote - - - - -	19.934
	100

The buffy coat of blood is fibrin.

Of the Serosity.—This term has been generally applied to the salts and animal matters existing in the serum of the blood, with the albuminous principle. See the description of serum in the present article.

With respect to the blood as a whole, little has been added to our knowledge. M. Vogel has attempted to shew, that when placed in the vacuum of an air-pump, it gives out a considerable quantity of carbonic acid: and Dr. Gordon has asserted, that during its spontaneous coagulation heat is emitted; but this has been denied by other observers, and especially by Dr. J. Davy.

The blood of other animals, and the blood of persons labouring under different diseases, have been but little examined; indeed this extensive and important field of chemical investigation is almost entirely unexplored.

BLOOM, in *Geography*, a township of Pennsylvania, in Northumberland county, having 1285 inhabitants.—Also, a township of the county of Fairfield, in the district of Ohio, having 839 inhabitants.

BLOOMFIELD. Add—Also, a township of Pennsylvania, in Crawford county, having 114 inhabitants.

BLOUNT, l. 1, insert—East Tennessee. Add—containing 8839 inhabitants, of whom 805 are slaves.—Also, a county of the same state, having 3259 inhabitants, including 206 slaves.

BLOW-PIPE. We think it proper to notice here the important modification of this useful instrument, lately contrived by Mr. Brooke, and which, by the intensity of the heat it excites, has produced such interesting results in the hands of different experimentalists, and more especially of Dr. Clarke of Cambridge.

Mr. Brooke's blow-pipe consists merely of a strong copper or iron air-tight box, to which are adapted a condensing syringe and jet-pipe, furnished with a stop-cock. When used, the box is to be filled with condensed air by means of the syringe; the stop-cock is then to be turned, and the condensed air permitted to escape through the jet. From the smallness of the aperture of the jet, a constant and uniform blast is thus kept up for a considerable time, (and by the occasional use of the syringe, may be continued for any length of time whatever,) simply by means of the elasticity of the air itself.

A great advantage attending the use of this blow-pipe is, that the box can be readily filled with any gas, or mixture of gases, we choose. Accordingly advantage was soon taken of this property, and a mixture of oxygen and hydrogen gases, when inflamed as they issued from the jet, was found to yield a more intense heat than any other. From the liability, however, of this mixture to explode, great caution was required in using it, and this led to the necessity of some contrivance for obviating this dangerous circumstance. Various means were soon suggested, most of which were founded on the principle recently discovered by sir H. Davy, that the inflammation of gases will not pass through minute apertures (see WIRE-GAUZE): and, at length, we believe

the instrument has been rendered quite safe; and, in this state, may be obtained of any of the philological instrument makers.

The public attention was particularly excited towards this instrument by the experiments of Dr. Clarke, who supposed that by its means, and the employment of the gaseous compound above-mentioned, he had succeeded in reducing some of the most refractory metallic oxides and ores. The accuracy of many of Dr. C.'s results has indeed been since called in question; but they nevertheless demonstrate the extraordinary powers and valuable properties of this modification of the blow-pipe.

BLUEHILL, l. 4, r. 658.

BLUE-WATER RIVER, a river of America, which rises among the southern branches of Dock river, and empties into the Tennessee.

BLUFF, a term used in N.W. America to denote a particular tract of land. The alluvion of the rivers W. of the Alleghenies is considerably lower than the surrounding country, and is of a breadth corresponding to the magnitude of the rivers; that of the Missouri is from 2 to 6 or 8 miles in breadth, and is for the most part from 150 to 300 feet below the general level of the country. The ascent from this valley into the country is precipitous, and is called "the bluff;" and may consist of rock or clay. Between these bluffs, the river runs in a very crooked channel, and is perpetually changing its bed, and the permanent beds are called the bluffs.

BOA, col. 3, l. 27, for CONSTRUCTOR r. SERPENTS.

BOARD of Agriculture. See SOCIETY.

BOARDMAN, in Geography, a township of Ohio, in the county of Trumbull, containing 343 inhabitants.

BOCCA, a term used both in the Levant and on the N. coast of South America, on the Spanish Main, for a mouth or channel into any port or harbour; or the entrance into a foud which has a passage out by a contrary way.

BOCKFIELD, a town of the district of Maine, in the county of Oxford, containing 1251 inhabitants.

BODMIN, l. ult. r. In 1811, the parish and borough contained 315 houses, and 2383 persons; 158 in the parish and 1008 in the borough being males, and in the former 175 and in the latter 1042 females.

BOEBERA, in Botany, so named by Willd. now, in compliment to a Russian boianist, of the equestrian order.—Willd. Sp. Pl. v. 3. 2126. Pursh 559.—Class and order, *Synopsis Polygamia-superflua*. Nat. Ord. *Compositæ*, Linn. *Corymbifera*, Juss.

Eff. Ch. Receptacle naked. Seed-down of simple hairs. Calyx double; the inner of eight leaves; outer of many.

1. *B. corymbifera*. Dwarf Boebera. Willd. n. 1. Pursh n. 1. (*Tagetes papposa*; Michaux Boreal-Amer. v. 2. 132. Vent. Hort. Cels. t. 35. *Dysflodia glandulosa*; Cavan. Leccion. 202.)—Native of the overflowed banks of the Missouri and Mississippi, annual, flowering in August and September. Pursh. A branched herb, twelve or eighteen inches high, with the habit of an *Antennaria*, besprinkled with glandular pellucid dots, full of a fetid bitter fluid. Flowers of a golden yellow, with eight small rays. Leaves pinnate, toothed, narrow. Cavanilles says this plant grows in every part of America, but especially in the kingdom of Santa Fé, where it is commonly called *Ruda*, on account of its offensive smell. Venterat speaks of it as a vermifuge, and as affording a tolerably durable yellow dye.

BOERO, *del.*

BOEUF, *Rivière aux*, or *Ox River*, in Geography, is the last and largest branch of Ouachitta. It rises in the

angle formed between the Missouri and Arkansaw, and pursues a course to the S.W. for some distance, then turning southward for 70 or 80 miles, enters the state of Louisiana, and afterwards, at a short distance, crosses the N.E. line of Balfrop's grant, pursues a S.W. course, and then resumes its direction to the southward, and after running about 60 miles enters Ouachitta, above the west point of the island of Sicily. The Boeuf, from its source in the Arkansaw lake to the boundary of the state of Louisiana, is about 120 miles, and from thence to its mouth nearly the same distance, producing a length of 240 miles, independently of its windings. It is navigable as far as Prairie Mcr Rouge. A strong brake of cane skirts the Boeuf nearly along its whole course, through the state of Louisiana. Much land near its banks might be cultivated, but is mostly subject to casual inundation.

BOGAERT, l. 3, r. the Netherlands.

BOILING, col. 4, l. 10, after process, add—Under the ordinary pressure of the atmosphere, with due allowance for its variable density, water does not boil till it is heated to 212° Fahrenheit. However Sir George Shuckburgh found, that when the barometer was at 26 inches, water boiled at less than 205°; but when it was at 31 inches it required before it would boil a heat of nearly 214°. Under the common pressure of the atmosphere, ether boils at 98°; alcohol at 176°; water at 212°; nitric acid at 248°; sulphuric acid at 546°; phosphorus at 554°; and mercury and linseed-oil at 600°. From the experiments of Dr. Black upon several liquids in vacuo, it appears that, in general, they all boiled with about 140 degrees of heat less than when sustaining the weight of the atmosphere. Vitriolic ether, if the pressure of the atmosphere be removed, will boil when 52 degrees below the cold sufficient for freezing water.

BOISSEAU, a measure for corn, according to the old system in France, which varies much in different parts of the country.

BOLAX, in Botany, a name of Commerçon's adopted by Jussieu, *Bolax* means a *clod*, or *lump of earth*, which this dwarf umbelliferous genus does not ill resemble.—Juss. Gen. 226. Sprengel Prodr. Umbellif. 33. Spc. Umb. 9. (See CHAMITIS.)—The species, though not numerous, are far from being, as yet, accurately determined, either with respect to their permanent differences, or their synonyms.

BOLINGBROKE, l. ult. for 72 r. 74; and for 283 r. 361.

BOLINGBROKE, Lord. See ST. JOHN.

BOLIN-GREEN, in Geography, a town of Kentucky, in Warren county, containing 154 inhabitants, of whom 51 are slaves.

BOLL, a corn measure in Scotland, containing 4 firlots, each firlot being = 4 pecks; and 16 bolls = 1 chaldron.

BOLOGNINO, a copper coin at Bologna and its neighbourhood.

BOLSOVER, l. ult. for 435 r. 244; and for 1091 r. 1043.

BOLTON, in America, l. 3, r. 249; l. 6, add—containing 700 inhabitants; l. 8, for 861 r. 1037.

BOLTON-*de-Moors*, l. 30, add—In 1811, the township of Great Bolton contained 3120 houses, and 17,070 persons; 7988 being males, and 9082 females. Little Bolton township had 1286 houses, and 7079 inhabitants; 3366 being males, and 3713 females.

BONAVENTURA, l. 2, r. Popayan.

BONDS, INDIA, bonds issued by the East India company of 50l. and 100l. each, bearing interest of 5 per cent.

per annum, which interest is paid at the India-house in London.

BOND, *Post-Obit*, a bond payable after the death of the person whose name is therein specified.

BONES, *Analysis of*, in *Chemistry*. The analysis of bones was omitted under **BONE**, but will be found under **TEETH**, contrasted with the analysis of the teeth.

VOL. V.

BOONE, in *Geography*, a county of Kentucky, containing 3668 inhabitants, of whom 656 are slaves.

BOONSBOROUGH, l. 2, r. Madison; and at the close add—It contains 68 inhabitants, 15 being slaves.

BOOROOJIRD, a flourishing city of Persia, in the province of Irak, the capital of a wealthy district, subject to the prince, Mahomed Tukkee Mirza, and containing a population of 12,000 souls. The district attached to its government is peopled by the tribe of Lack, who do not wander far from the spot to which they are partial, but settle in villages, and employ themselves in the improvement of their estates.

BOOTH BAY, l. 5, r. 1582.

BORACITE. See *MINERALOGY*, *Addenda*.

BORAX, in *Chemistry*. See **BORON**, *infra*.

BORBI, or **BURBI**, in *Commerce*, a copper coin in Egypt, 8 borbi being = 6 forli = 3 aspers = a medino, and 40 medini = a piastra current.

BORELLI, col. 2, l. 6, r. 1670.

BORON, or **BORACIUM**, in *Chemistry*, the peculiar elementary basis of *boracic acid*. Sir H. Davy, in 1807, first decomposed boracic acid, and obtained this principle by the agency of galvanism. Soon afterwards another method of obtaining it was pointed out by Gay Lussac and Theuard, by means of potassium, which was soon verified by Davy and others. One part of pure boracic acid, previously melted and reduced to powder, is to be mixed with two parts of potassium, and the mixture put into a copper or iron tube and gradually heated till it is slightly red, and kept in that state for some minutes. At the temperature of 300° the decomposition begins, and the mixture becomes intensely red hot, as may be perceived by making the experiment in a glass tube. When the tube is cold, the matter in it is to be washed out with water, the potash formed is to be neutralized with muriatic acid, and the whole thrown upon a filter. It may be washed and dried at a moderate heat.

Boron thus obtained is a powder of an olive-brown colour, without either taste or smell. In close vessels, it may be exposed to the most violent heat without being altered, or undergoing any other change than an increase of density. Its specific gravity, before being heated, is less than 1.84, but afterwards greater. It is insoluble in water, alcohol, ether, and oils, whether cold or hot. It does not decompose water even when heated in that fluid. It is a non-conductor of electricity. It undergoes no change when exposed to common air or oxygen at low temperatures; but when heated to about 600° it takes fire, and burns with great splendour; and at the same time absorbs oxygen, and is partly converted into boracic acid. The combustion, however, is soon stopped, from the coating of the boracic acid formed, which prevents the contact of the oxygen. Hence this requires to be frequently removed, by washing, before the whole of the boron can be burnt. The nitric acid also readily converts boron into boracic acid. Boron, heated with most of the neutral salts, deprives their acids of the oxygen which they contain; thus, when heated in close vessels with sulphate or sulphite of soda, borate of soda and

sulphur are formed. When heated with nitre or oxymuriate of potash, much deflagration ensues, and borate of potash is produced: so also the carbonate of soda is converted into borate of soda and charcoal.

There is considerable difficulty in fixing the proportion of oxygen with which boron combines to form boracic acid, as the results of Gay Lussac, Davy, and others, differ very much. Dr. Thomson, guided partly by these experiments, but chiefly by the analysis of borate of ammonia by Berzelius, fixes the weight of the atom of boron at 6.6, and supposes it combines with two atoms of oxygen to form boracic acid. Upon this supposition, 100 parts of boron will combine with 300 of oxygen.

Boron, when heated in chlorine, takes fire, and burns with a brilliant white flame. A white substance coats the vessel in which the experiment is made, and the boron is also covered with a white substance, which by washing is converted into boracic acid. It is probable that this white substance is a chloride of boron, but it has not been much examined.

Boron combines with *fluorine*, (see **FLUORINE**), and forms with it a powerful acid, which has been named *fluoboracic acid*. (See **FLUOBORACIC ACID**.) It also appears, according to the experiments of Gmelin, to combine with hydrogen. Descotils has likewise shewn that it combines with iron, and Davy with potassium; but, as far as it is known, it combines with no other metal. With respect to the nature of this singular substance it may be proper to mention, that some consider the boron described above to be an oxyd of a metallic basis, to which the name of *boracium* has been given.

BORONIA, in *Botany*. (See **RUTACEÆ**.) Mr. Brown, who could not but be aware of the ill-defined limits of this order, as originally constituted by Jusseu, has, in his General Remarks on the Botany of Terra Australis, 13, proposed to remove the 1st section, under the appellation of *Zygophylleæ*, naming the remainder *Diofmeæ*, the genus *Ruta* not being a good type of the order, so limited. This learned Australian botanist informs us that near 70 species have been observed, the greater part of them referable to our *Boronia*, *Correa*, *Eriostemon*, and *Zieria*, (as also we presume to *Croceæ*), and to *Phebalium* of Ventenat. "Of these genera *Boronia* is both the most extensive and the most widely diffused, existing within the tropic, and extending to the south end of Van Diemen's island. Like the others, however, its maximum is in the principal parallel, at both extremities of which it is equally abundant."

BOROUGH, col. 3, l. 10 from the bottom, after London, r. by a writ bearing date the 12th of December, 1264, in the 49th year of the reign of Henry III.

BOROUGH-BRIDGE, l. 23, r. The borough and township of Borough-bridge contain 131 houses, and 747 inhabitants; 373 being males, and 374 females.

BORRAGINEÆ, in *Botany*, the 42d order in Jusseu's system, the 9th of his 8th class; for whose characters, see **GENTIANÆ**.

This order, equivalent to the Linnean **ASPERIFOLIÆ**. (see that article,) is thus characterized.

Calyx in five deep segments, permanent. *Corolla* mostly regular. *Stamens* generally five. *Germen* either simple or four-lobed; style one; stigma either cloven, or furrowed, or simple. *Seeds* generally four; sometimes enclosed in a capsular or pulpy seed-vessel; sometimes naked, obliquely attached to the bottom of the style, and for the most part surrounded by the permanent calyx. *Corculum* without albumen. *Stem* in the greater number herbaceous; in a

few shrubby or arboreous. *Leaves* alternate, often harsh or rough.

Seet. 1. *Fruit* pulpy. Stem shrubby or arboreous.

Patagonula, Cordia, Eubretia, Menais, Varronia, and Tournefortia.

Seet. 2. *Fruit* of one or two capsules.

Hydrophyllum, Phacelia of Jusseu, *Ellisia, Dichondra, Mefferichmidia, and Cerinthe.* DICHONDRA (see that article) is erroneously placed here.

Seet. 3. *Fruit* of four naked seeds. *Throat* of the corolla naked. Plants mostly herbaceous and rough.

Coldenia, Heliotropium, Echium, Lithospermum, Pulmonaria, and Onofina.

Seet. 4. *Fruit* of four naked seeds. *Throat* of the corolla furnished with free scales, hollow like spurs, slightly projecting out of the corolla, at the base of its segments, gaping above. Herbs generally with rough leaves.

Symphitium, Lycopsis, Myosotis, Anchusa, Borago, Asperugo, and Cynoglossum.

Seet. 5. *Genera* allied to the Borragineæ.

Nolana, Siphananthus, and Falkia.

BORRERA, is dedicated by professor Acharius, to the honour of Mr. William Borrer, F.L.S., one of the most eminent British cryptogamists, whose studies have been particularly directed to the Lichen tribe, and who is also critically versed, as well as singularly accurate, in every department of British botany.—Achar. Lichenogr. 93. t. 9. f. 3—9. Syn. 220. Sm. Prodr. Fl. Græc. Sibth. v. 2. 313.—Clafs and order, *Cryptogamia Algæ*. Nat. Ord. *Lichenes*.

Eff. Ch. Shields stalked, coloured, with an elevated, inflexed border, of the substance of the leafy, cartilaginous, elevated, linear frond.

This genus is very natural in habit, comprising the well-known *Lichen ciliaris* of Linnaeus and its allies. Acharius defines seventeen species, among which several are very elegant, such as *B. Trulla* from Peru, figured in Ach. Meth. t. 4. f. 6; *leucomela*, (see Engl. Bot. t. 2548), and *chrysophthalmia*, t. 1088.

We have ventured in Prodr. Fl. Græc. to remove hither the *Evernia prunastri*, Ach. Syn. 245, *Lichen prunastri* of Linnaeus; and feel much inclined to associate the whole of that genus with *Borrera*, there being only two species besides, which are *Lichen divaricatus* and *vulpinus* of Linnaeus. We really cannot perceive any distinctive character to keep *Evernia* separate.

BORROWSTONNESS. Add—The parish contains 352 houses, and 2704 inhabitants; 1102 being males, and 1602 females.

BORYA, in *Botany*, a New Holland genus, thus named by M. Labillardiere, in honour of the distinguished botanical traveller, M. Bory de St. Vincent. This genus was first made public by its author in 1804. A year or two afterwards, professor Willdenow published a different *Borya*, in his Sp. Pl. v. 4. 711. The former is adopted, in his *Prodromus*, by Mr. Brown, who, nevertheless, has admitted the latter into Ait. Hort. Kew. v. 5. 365. This can only have arisen from the professed plan of the Hort. Kew. being in general to copy Willdenow, and we trust Mr. Brown no more intended to give his sanction to this error, than to the adoption of *ARAUCARIA*, to the prejudice of the rightful *DOMBEYA*. (See those articles.) However that may be, we feel it incumbent on us to admit the original *Borya*, against which no valid objection can be raised, having already endeavoured to find a suitable name (see BIGELOVIA) for the other.—Labill. Nov. Holl. v. 1. 81. Brown Prodr. Nov. Holl. v. 1. 286.—Clafs

and order, *Hexandria Monogynia*. Nat. Ord. *Asphodelææ*, Brown.

Eff. Ch. Spatha of two unequal, sheathing, permanent valves. Corolla of one petal, funnel-shaped, withering; limb in six deep equal segments. Stamens inserted into its contracted throat. Style thread-shaped. Stigma obtuse. Capsule superior, of three cells, and three valves, with central partitions. Seeds feveral.

Mr. Brown conceives the present genus to be not very nearly related to any, except perhaps *XANTHORHÆA*, (see that article,) and his own *Jobsonia*. In habit it approaches some of the *Junceæ*, but differs in the black crustaceous integument of the seed, and in the soft, fleshy, somewhat oily, albumen.

It consists of perennial herbs, of a harsh dry texture. *Roots* composed of long, tough, somewhat shining fibres. *Stems* either simple, or divided and creeping, clothed with very crowded, acerose, pointed leaves; dilated and half-sheathing at their base. *Flower-stalks* solitary, terminal, simple. *Head* nearly globular, encompassed with a few short leafy bractæes. Scales of the calyx smooth, membranous, the outer one sheathing the inner, which is narrower, and embraces the tube of the corolla.

1. *B. nitida*. Shining *Borya*. Labill. Nov. Holl. v. 1. 81. t. 107. Br. n. 1.—Stem much branched, taking root below, with simple polished fibres. Flower-stalks shorter than the ascending branches. Head ovate.—Gathered by both the distinguished botanists above cited, on the fourth coasts of New Holland, and the adjacent islands, in sandy ground. The plant is about a span high, and, except the want of downy radicles, seems calculated to confine the blowing sands of its dreary country, like our *Carex arenaria, Elymus arenarius, &c.*

2. *B. sphaerocephala*. Round-headed *Borya*. Br. n. 2.—“Stems simple, nearly erect, shorter than the flower-stalks. Head globose.”—Gathered by Mr. Brown, in the same neighbourhood.

BOS, in *Zoology*, l. 13, after *ferus*, insert — See *Urus*.

BOSCAWEN, l. 4. r. 1829.

BOSSLEA, in *Botany*, a fine papilionaceous genus, consecrated by Ventenat, to the memory of his countryman M. Boissieu-Lamartinière, who accompanied La Péroule in his voyage round the world, the account of which, published at Paris, attests the merit of this unfortunate botanist.—Venten. Jard. de Cels 7. Willd. Sp. Pl. v. 3. 972. Sm. Tr. of Linn. Soc. v. 9. 302. Brown in Ait. Hort. Kew. v. 4. 266.—Clafs and order, *Diadelphia Decandria*. Nat. Ord. *Papilionaceæ*, Linn. *Leguminosæ*, Juss.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, coriaceous, bell-shaped, two-tipped; upper lip largest, in two rounded, obtuse segments; lower in three deep, lanceolate, equal segments. *Cor.* papilionaceous. Standard heart-shaped, ascending, twice as long as the upper lip of the calyx, with a linear, convex claw. Wings half the length of the standard, obovate, each with a tooth at one side. Keel the length of the wings, of two hatchet-shaped, concave, converging petals, each with a lateral tooth, and a prominence on the disk, near the base. *Stam.* Filaments ten, united about half way into one set, separate only along the upper edge; anthers uniform, simple, roundish. *Pist.* Germen stalked, linear, compressed; style recurved; stigma simple. *Peric.* Legume stalked, oblong, compressed, nearly flat; its valves rigid, thickened at each margin; sometimes internally spongy, and of many cells. *Seeds* feveral, oval, compressed, stalked, each with a tumid appendage.

Eff. Ch. Calyx two-lipped; upper lip largest, cloven, obtuse. Stamens all connected. Legume stalked, compressed, thickened at each edge, with many seeds.

1. *B. scolopendria*. Yellow Flat Bofficea, or Plank-plant. Sm. as above n. 2. Sims in Curt. Mag. t. 1235. (B. Scolopendrium; Br. in Ait. n. 1. Platylodium scolopendrium; Andr. Repof. t. 191. P. scolopendrium; Ven. Malmaff. t. 55.)—Branches compressed, winged, toothed, leaflets; flowering at the teeth. Stem erect. Keel naked. Upper bractæas permanent, imbricated, equal to the footstalk. Calyx very smooth.—Native of New South Wales, from whence it was introduced, in 1792, by Lee and Kennedy. A green-house shrub, flowering early in summer. The winged branches, in a manner proliferous, and bearing handsome, red and yellow, stalked, solitary flowers, from their numerous alternate teeth, give this shrub a very singular aspect. The seedling plants only bear simple, alternate, stalked, ovate, entire leaves. The legume of this species, (and perhaps the following,) is said by Dr. Sims to want that internal sponginess, which, in those first described by botanists, seemed to yield a good generic character. The texture of the legumes, its thick edges, and the want of a dorsal membranous wing, are still abundantly sufficient to keep the genus distinct from PLATYLOBIUM. (See that article.) With respect to the specific name, we must beg leave, like Ventenat and Sims, to consider it as an adjective, comparing this singular plant's branches to the insect called a *Scolopendra*, or Centipede. It has no connection with the vegetable genus *Scolopendrium*, and still less has it ever been so called.

2. *B. rufi*. Red Flat Bofficea. Br. in Ait. n. 2.—“Branches compressed, winged, toothed, leaflets; flowering at the teeth. Keel fringed. Upper bractæas deciduous, remote from the lower. Calyx very smooth.”—Gathered by Mr. Brown on the south-west coast of New Holland. Sent to Kew, by Mr. Good, in 1803. A green-house shrub, flowering from June to September.

3. *B. heterophylla*. Various leaved Bofficea. Venten. Jard. de Cels t. 7. Willd. n. 1. Sm. n. 1. Br. in Ait. n. 3. (B. lanceolata; Curt. Mag. t. 1144. Platylodium lanceolatum; Andr. Repof. t. 205. P. ovatum; ibid. t. 266, (not 276,) according to Mr. Brown.)—Branches leafy, compressed. Leaves elliptical, obovate, or linear, flat. Legume of many cells, with spongy partitions.—Native of New South Wales. Imported by Lee and Kennedy in 1792. A branched bushy shrub, flowering most part of the summer. The branches, though nearly flat, are not dilated like the foregoing, nor are they either toothed, or denuded. The leaves are variable in figure, but on full-grown plants usually linear, alternate, on short stalks. Flowers axillary, solitary, stalked, large, yellow with a crimson keel, very ornamental.

4. *B. linophylla*. Narrow-leaved Bofficea. Br. in Ait. n. 4.—“Branches leafy, compressed. Leaves linear; recurved at the margin. Legume of one cell.”—Observed by Mr. Brown, on the south-west coast of New Holland. Sent by Mr. Good to Kew, in 1803, where it is said to flower from July to Sept.-mber.

5. *B. prostrata*. Procurrent Bofficea. Br. in Ait. n. 5. (B. ovata; Sm. n. 3, excluding the synonymy.)—Branches round, leafy. Stem procurrent. Leaves oval, smooth. Stipulas shorter than the footstalks. Legume of a single cell.—Sent from Port Jackson, by Dr. White, in 1793. Mr. Good is mentioned as having sent it to Kew in 1803. The stems are a span long. Leaves nearly uniform, a quarter of an inch long, their edges thickened, wavy, and somewhat crenate. We had mistaken this for the *Platylodium*

ovatum of Andrews, t. 266, but Mr. Brown has convinced us of our error.

6. *B. cinerea*. Downy Sharp-leaved Bofficea. Br. in Ait. n. 6.—“Branches round, leafy. Stem erect, much branched. Leaves ovato-lanceolate; rough above; downy beneath; recurved at the margin.”—Found by Mr. Brown in Van Diemen's island, and sent in 1805 to Kew, where it flowers from May to July.

7. *B. microphylla*. Little-heart-leaved Bofficea. Sm. n. 5. Br. in Ait. n. 7. (Platylodium microphyllum; Sims in Curt. Mag. t. 863.)—Branches round, leafy, spinous-pointed. Leaves inversely-heart-shaped, or wedge-shaped.—Native of New South Wales, from whence Dr. White sent us specimens in 1793. Mr. Calcy sent seeds to Sir Joseph Banks in 1803. This species is said to have flowered at the present duke of Marlborough's, at White Knights, in 1805. The flowers, though smaller than in some other species, are so numerous, and so prettily variegated with yellow, purple, and red, as to render this a very ornamental plant. The leaves are shorter than the flowers, veiny, smooth and entire, very abundant. The tips of the branches finally become spinous.

Mr. Brown is probably furnished with more species of this handsome genus, which have not yet made their appearance in the gardens.

BOSSENEY. Add—The parish of Tintagel, in which this borough is situated, contained, in 1811, 141 houses, and 730 persons; 339 being males, and 391 females.

BOSTANA. See BENTIAN.

BOSTON. At the close, *r.* the parish of Boston, in 1811, contained 1772 houses, and 8180 persons; 3805 being males, and 4375 females.

BOSTON, in Massachusetts, l. 17, after augmented, infert—By the census of 1810, Boston, Chelsea, and the islands within and without the jurisdiction of Boston, included a population of 34,381 souls. The former islands are, Noodle's, Hog, Apple, Deer, Long, Spectacle, Governor's including Fort Warren, and Fort Independence; the latter are, Greene, Thompson's, Rainford's, George's, Great Brewster, Outer Brewster, Lighthouse, and Calf island. Boston itself is stated as containing 33,250 inhabitants.

Boston, a town of the district of Ohio, in the county of Champaign, having 616 inhabitants.

Boston, *New*, l. 12, for 1202 *r.* 1610.

BOSWELLIA, in *Botany*, “in memory of the late Dr. John Boswell, of Edinburgh.”—Roxb. Coromand. v. 3, 4.—Class and order, *Decandria Monogynia*. Nat. Ord. *Meliæ*, Juss. *affine*.

Eff. Ch. Calyx inferior, five-toothed. Petals five. Nectary a crenate ring surrounding the base of the germen. Capsule triangular, of three cells and three valves. Seeds solitary, winged.

1. *B. glabra*. Smooth Boswellia. Roxb. as above, t. 207. (Canarium odoriferum; Rumph. Amboin. v. 2. 156. t. 50. Gungulapootichitoo of the Pelingas.)—Leaflets smooth, with shallow ferrures.—Native of the highest mountains on the coast of Coromandel, flowering in the cool season, and casting its leaves in October. This is one of the largest trees of that country; its wood hard, heavy, and durable. The wounded bark yields a sort of pitch. Leaves crowded at the ends of the branches, a span long, pinnate with an odd one; leaflets all uniform, opposite, ovate-oblong, an inch and a quarter in length. Flowers white, in aggregate, terminal, interrupted, spreading clusters, shorter than the leaves, and coming before them. Nectary red, Anthers oblong, yellow. Capsule oval, about half an inch long.

2. *B. hirsuta*. Hairy Boswellia. (Canarium odoriferum)

terum hirfutum; Rumph. Amboin. v. 2. 157. t. 51, according to Dr. Roxburgh; but the leaflets are represented entire.)—Leaflets downy, deeply serrated.—On the Ballagut mountains. The *flamens* of this are inserted on the exterior margin of the *nectary*. Roxburgh.

BOTEFOURT. Add—By the census of 1810, it contained 13,301 inhabitants, of which 2275 are slaves.

BOTRYCHIUM, in *Botany*, a name derived from *Botrys*, a bunch of grapes, which the fructification of this genus imitates in miniature.—Swartz Syn. Fil. 171. Willd. Sp. Pl. v. 5. 61. Brown Prodr. Nov. Holl. v. 1. 164. Ait. Hort. Kew. v. 5. 496. Sm. Compend. 155. Pursh 655. (Botrypus; Mich. Bor.-Amer. v. 2. 274. Ofmunda; Lamarck Illustr. t. 865. f. 1.)—Class and order, *Cryptogamia Filices*. Nat. Ord. *Filices*, Linn. Juss.

Eff. Ch. Capsules nearly globose, naked, smooth, without a ring, united to the stalk of a compound spike, distinct, each of one cell, and two valves connected behind, bursting transversely in front.

We have already alluded to this genus under *OSMUNDA*, from which it was first separated by professor Swartz. Ten species are described in Willdenow, to which we have two to add.

1. *B. Lunaria*. Common Moonwort. Sw. n. 1. Willd. n. 1. Fl. Brit. n. 1. (Ofmunda Lunaria; Linn. Sp. Pl. 1519. Sm. Fl. Brit. 1107. Engl. Bot. t. 318. Bolt. Fil. 4. t. 4. Fl. Dan. t. 18. f. 1. Lunaria minor; Ger. Em. 405. Matth. Valgr. 254. Camer. Epit. 643.)

B. Lunaria minor ramosa; Camer. Epit. 644.

Fronde simply pinnate; leaflets crescent-shaped.—Native of dry hillsides, or open heaths, throughout the cooler parts of Europe, bearing capsules in June. *Root* perennial, with many stout simple fibres. *Fronde* solitary, from a torn membranous sheath, erect, three to six inches high, smooth, pale green, consisting of a simply pinnate leaf, two inches long, with six or seven pair of obliquely imbricated, fan-shaped, entire or notched, leaflets. From the base of the leaf springs a stout stalk, about the same length, bearing a twice or thrice compound, unilateral, smooth spike of capsules, each about half the size of a mustard-seed; all firmly united, in two sessile rows, with the linear flat rib, or common receptacle.

2. *B. rutaceum*. Rue-leaved Moonwort. Sw. n. 2. Willd. n. 2. (O. Lunaria; Fl. Dan. t. 18. f. 3.) Fl. Brit. 7. Lunaria racemosa minor, matricariae folio; Breyn. Cent. 184. t. 94. Morif. sect. 14. t. 5. f. 3.)—Fronde doubly pinnatifid; segments obtuse, notched at the extremity. Fruitstalk from the base of the leaf.—Native of dry open situations, in several parts of Europe. We are not sure of having seen a British specimen; nor is it impossible that a jagged variety of *B. Lunaria*, such as is represented in Breyn. Cent. t. 93, and in Morison as above, f. 2, may have been confounded herewith. *B. rutaceum* is certainly near akin to the *Lunaria*, differing only in the compound division of its leaf, and sometimes of its spike.

3. *B. matricarianum*. Feverfew-leaved Moonwort. (B. matricarioides; Willd. n. 3. Lunaria racemosa, multifido folio; Bauh. Pin. 355. Breyn. Cent. t. 95. Fl. Dan. t. 18. f. 2, media. Morif. sect. 14. t. 5. f. 26.)—Fronde doubly pinnate, pinnatifid; segments oblong, obtuse, toothed. Fruitstalk from the base of the footstalk.—Native of shady situations in Prussia, Denmark, and Bavaria. Willdenow. Extremely abundant about Peterburgh, according to the Linnæan herbarium, where are three specimens from thence. The more compound leaf, not always solitary, and especially the insertion of the fruitstalk near the root, not at the top of the leafstalk, surely mark this as a distinct species;

which is confirmed by the plant not being of occasional occurrence, amongst the *Lunaria*, as might be expected of any variety, but plentiful in the countries where it grows at all. We have not heard of this species in Britain. The specific name in Willdenow is a barbarous compound of Greek and Latin, such as we wish botanists, not altogether illiterate, would avoid.

4. *B. funarianum*. Fumitory-leaved Moonwort. (B. funarioides; Willd. n. 4. Ait. n. 1. Pursh n. 1. B. lunarioides; Sw. n. 5. "Schkuhr Crypt. 158. t. 157." Botrypus lunarioides; Mich. Boreal.-Amer. v. 2. 274. Ofmunda biternata; Lamarck Dict. v. 4. 650.)—Fronde ternate; doubly pinnate; leaflets crescent-shaped, crenate. Fruitstalk radical.—In pastures and open woods, from New York to Carolina, bearing capsules in June. Pursh. Like the last, especially in the insertion of its fruitstalk, at or near the root, but the leaflets exactly resemble those of *B. Lunaria*, which, with professor Willdenow's leave, are by no means uniformly entire.

5. *B. obliquum*. Oblique-leaved Moonwort. Willd. r. 5. Muhlenb. Cat. 98.—Fronde nearly twice ternate; leaflets oblong-lanceolate, finely serrated, unequally heart-shaped at the base. Fruitstalk towards the base of the footstalk.—In open woods of Pennsylvania and Virginia, in June and July. Resembles the preceding very much, and is probably only a variety. Pursh. This author describes the spikes as doubly pinnate; those of the last only pinnate.

6. *B. australe*. Southern Moonwort. Brown n. 1.—Fronde ternate; doubly pinnate; leaflets confluent, cut. Fruitstalk from the base of the footstalk.—Sent by Dr. White, from Port Jackson, New South Wales; where, as well as in Van Diemen's island, it was gathered by Mr. Brown. Leaflets bluntly toothed. Fruitstalk pale, a span high, being thrice as tall as the leaf, into whose darker-coloured footstalk it is inserted, a little above the root. The spike is twice or thrice compound, spreading; the stalks pale. Capsules dark brown.

7. *B. ternatum*. Ternate Japan Moonwort. Sw. n. 6. Willd. n. 6. (Ofmunda ternata; Thunb. Jap. 329. t. 32.)—Fronde in pairs, triply pinnate; leaflets notched and serrated. Fruitstalk from the middle of the common footstalk. Spike pinnate.—Gathered by Thunberg once only, near Nagasaki in Japan, in November. A foot high, with two large, opposite, spreading, ternate, then twice pinnate, leaves, half the height of the fruitstalk.

8. *B. diffusum*. Cut-leaved Moonwort. Willd. n. 7. Muhlenb. Cat. 98. Ait. n. 3. Pursh n. 3. Sprengel Crypt. engl. ed. 187. "Schkuhr Crypt. 159. t. 158." (Lunaria botryites ramosa, geranii moschati foliis, floridana; Pluk. Amalth. 134. t. 427. f. 5.)—Fronde ternate, thrice pinnate; leaflets decurrent, linear-wedged shaped, sharply toothed at the end. Fruitstalk at the base of the leaf.—In pastures of open dry woods, from New York to Florida, in June. Pursh. We have Pennsylvania specimens from the late Dr. Muhlenberg, very much like Plukenet's figure, but we can discover no essential difference between this plant and the following.

9. *B. virginianum*. Virginian Moonwort. Sw. n. 3. Willd. n. 8. Ait. n. 4. Pursh n. 4. "Schkuhr Crypt. 157. t. 156." (Ofmunda virginiana; Linn. Sp. Pl. 1519, excluding Plumier's synonym. Lunaria americana, foliis cicutarie modo elegantè divisis; Morif. sect. 14. t. 4. f. 5. L. multifido folio crasso, &c.; Pluk. Mant. 120. t. 427. f. 8.)—Fronde somewhat ternate, twice pinnate; leaflets decurrent, obovate-wedged shaped, sharply toothed. Fruitstalk at the base of the leaf.—In shady woods, on a rich vegetable soil, from Canada to Carolina, in June and July.

July. *Pursh*. That author observes, "this is the largest of the species here described. It is known by the name of Rattle-snake Fern, probably from growing near the places where those venomous animals are generally found." Our specimens, one of which was gathered by Clayton, the other by Kalm, are scarcely so large as the last-described, from which they differ chiefly in having rather less compound leaves. The *inflorescence* is somewhat hairy, as in that. Willdenow, negligently as it seems, changed the termination of the specific name to *virginicum*, which could only cause trouble, and we have therefore restored the original.

10. *B. gracile*. Slender Moonwort. *Pursh* n. 5. Frond ternate, doubly pinnatifid, smooth; segments cut, acute. Spikes slender, pinnate, erect.—In shady fertile woods of Virginia, in June. This species approaches nearly, at first sight, to the preceding, but is much smaller and more slender, besides the other distinctions. *Pursh*. We have from Dr. Muhlenberg what answers to the above account, but should scarcely have thought it distinct. The *inflorescence* indeed is smooth, and simply pinnate, but this corresponds with the smaller size of every part.

11. *B. cicutarium*. Hemlock Moonwort. Sw. n. 4. Willd. n. 9. (*Osmunda cicutaria*; Lam. Dict. v. 4. 650. O. aphodii radice; Plum. Fil. 136. t. 159. Petiv. Fil. n. 168. t. 9. f. 2.)—Frond triply pinnate; leaflets pinnatifid; terminal ones pointed. Fruitstalk from near the base of the footstalk.—Gathered by Plumier in the forests of Hispaniola. The root consists of oblong tapering fleshy knobs. Frond much larger than either of the three last, and essentially different in the nearly radical insertion of the fruitstalk. The spike is twice pinnate. Plumier records, that the Indians give the name of Serpent-herb to this, and to the *Anemia adiantifolia*, thinking them useful applications for the bite of a serpent. This may account for the appellation of Rattle-snake Fern given to n. 9.

12. *B. zeylanicum*. Great Ceylon Moonwort. Sw. n. 7. Willd. n. 10. (*Osmunda zeylanica*; Linn. Sp. Pl. 1519. O. n. 373; Linn. Zeyl. 178. Ophioglossum laciniatum; Rumph. Amboin. v. 6. 152. t. 68. f. 3.)—Frond ternate; leaflets ternate or somewhat pinnate, lanceolate, pointed, finely crenate. Spike cylindrical, dense; spikelets capitate.—Native of Ceylon and Amboyna, on the sides of hills, in the borders of woods and thickets. The root is long and creeping, very deep in the ground, with numerous long fibres. Fronds a foot and a half or two feet high, naked, except at the very top of the stalk, from whence proceed three slightly-stalked branches, each of two, three, or more, equal, uniform smooth leaflets, five or six inches long, and one broad, partly decurrent, light green, with many fine transverse veins. From the same point springs a fruitstalk, with a dense cylindrical compound spike, rising rather above the leaflets, the capsules about three together, capitate, at the end of each short partial branch.

BOTRYOLITE. See MINERALOGY, *Addenda*.

BOTRYTIS, in *Botany*, is called from *Botev*, a bunch of grapes, in allusion to the clusters of little globular seeds, or seed-vessels.—Mich. Nov. Gen. 212. t. 91. *Perf. Disp. Meth.* 40. *Syn. Fung.* 660.—Class and order, *Cryptogamia Fungi*. Nat. Ord. *Fungi*.

Eff. Ch. Erect, capillary, forked. Seeds in terminal aggregate globules.

1. *B. cinerea*. Ash-coloured Cluster-mould. *Perf.* n. 1. *Disp. Meth.* 40. t. 3. f. 9, 10.—Ash-coloured, branching, in broad dense patches.—On rotten gourds, pumpkins, and cabbage-stalks, resembling a common *Mucor*, till examined with a magnifier. The globules are dispersed in irregular oblong masses, and discharge powdery seeds.

2. *B. ramosa*. Cross-headed Cluster-mould. *Perf.* n. 2. (*B. ramosa cinerea, feminibus rotundis*; Mich. n. 3. f. 2.) *B. alba*. (*B. non ramosa alba, feminibus rotundis*; Mich. n. 2. f. 3.)—Ash-coloured, branching, with four-rayed spikes.—Very common in all kinds of corrupting substances. *Micheli*. The minute stems are more or less branched and forked, each branch terminating in a cross, composed of four dense ovate masses of globules, on short horizontal stalks.

3. *B. simplex*. Simple Cluster-mould. *Perf.* n. 3. (*B. comata grisea, caule simplici crassiore, feminibus rotundis*; Mich. n. 1. f. 1.)—Grey, simple. Spikes radiating.—On half-rotten wood, or wheat-straw, in winter, not unfrequent about Florence. *Micheli*. Each plant consists of a simple, rather firm, stem, a line or two in height, crowned with from three to six ovate masses of globules, on horizontal radiating stalks.

4. *B. spicata*. Oblong-spiked Cluster-mould. *Perf.* n. 4. (*B. spicata grisea, feminibus rotundis*; Mich. n. 4. f. 4.)—Grey, much branched. Spikes ovate-oblong, stalked, scattered, erect.—Found in September on the shady walks of the botanic garden at Florence. *Micheli*. The stems are repeatedly and irregularly branched, each branch terminating in a little oblong spike of globules.

5. *B. diffusa*. Great White Cluster-mould. Albert. and Schwein. *Fung. Nistk.* 362.—White, with extensive diffuse branches, and terminal clusters, of about four globules each.—Found once only on half-rotten stalks of potatoes in November, composing dense, white, cottony, fugacious masses, two inches or more in diameter. The globules discharge abundance of powdery seeds like smoke.

BOTTOMRY, col. 4, l. 23, for course r. courts.

BOVISTA, in *Botany*, a name of barbarous origin, being formed by Dillenius from the German *Bossp.* It is adopted by Perfoon for a genus separated from *Lycoperdon*. (See that article.)—*Perf. Disp. Meth.* 6. *Syn. Fung.* 136.—Class and order, *Cryptogamia Fungi*. Nat. Ord. *Fungi*.

Eff. Ch. Cafe smooth, sessile, bursting irregularly at the top; its white external coat (or wrapper) at length separating in fragments. (Powder or seed brownish-purple.) *Perfoon*.

The author defines four species.

1. *B. nigrescens*, which is *Lycoperdon globosum*, Bolt. *Fung.* t. 118. With. v. 4. 382, and *L. arribizon* of Batfeh, t. 29.

2. *B. plumbea*, figured in Sowerby's *Fungi*, t. 331, as *L. Bovista*, and judged by that author to be but a variety of the former.

3. *B. pusilla*, "Batfeh, t. 41. f. 228;" akin to the first, but only three lines in diameter.

4. *B. furfuracea*, figured by Micheli, *Nov. Gen.* t. 97. f. 6, who says it is common on heaths, and sold with other fungi of this tribe, in the market, at Florence. Perfoon is doubtful of the genus of this last, and we should suspect it to belong possibly to *Tuber*.

Bovista differs from *Lycoperdon* in not being elongated at the base into a sort of stalk; but surely they might, without violence to nature, be united, especially as the species of the present genus are so few and so disputable.

BOURBON, in Kentucky, l. 2, r. 11,869; l. 3, r. 2307.

BOURN, col. 2, l. 21, r. In 1811, the parish of Bourn contained 308 houses, and 1591 persons; 779 being males, and 812 females.

BOURSIPPA, in *Geography*, a town of Bablyonia, according to Strabo; to which Alexander retired when warned by the Chaldeans not to enter Bablyon. This is supposed to be the present village of Bourfa, two leagues

to the S.E. of Hilleh, the scite, as it is conjectured, of ancient Babylon. On the road from hence to Melked Ali, or Nejjif, is the tomb of the prophet Ezekiel, where they pretend to shew the fiery furnace of Shadrach, Mefhech, and Abednego. It is a large clumsy building, without beauty or ornament; and, like the tomb of Ezra, on the banks of the Tigris, a short way above Korna, is much frequented by Jewilh pilgrims.

BOUARDIA, in *Botany*, so named by Mr. Salisbury, in memory of Charles Bouvard, M.D. formerly superintendant of the garden at Paris.—Salisb. Parad. 88. Ait. Hort. Kew. v. 1. 245.—Clafs and order, *Triandria Monogynia*. Nat. Ord. *Rubiaceae*, Juss.

Eff. Ch. Calyx in four deep segments, with intermediate teeth. Corolla tubular. Anthers within the tube. Capsule of two separable cells, with numerous bordered seeds.

1. *B. triphylla*. Three-leaved Bouvardia. Ait. n. 1. Salisb. Parad. t. 88. (Houftonia coccinea; Andr. Repof. t. 106. *Ixora americana*; Jacq. Hort. Schoenbr. v. 3. 4. t. 257. *I. ternifolia*; Cavan. Ic. v. 4. 3. t. 305.)—Native of Mexico. Introduced by fir Joseph Banks in 1794, and now become common in the English gardens, where, if planted againft the front of a green-house, it will stand our ordinary winters, flowering from Midsummer till the end of autumn. The stem is from one to two feet high, shrubby, branched, downy when young. Leaves usually three in a whorl, ovato-lanceolate, varying in breadth, entire, rough-edged, nearly sessile. Flowers an inch long, bright scarlet, in dense, terminal, forked panicles, very abundant, and extremely showy, though destitute of scent.

BOW, l. ult., r. The parish contains 149 houses, and 727 persons; 329 being males, and 398 females.

Bow, in America, l. 4, r. 729.

BOWDOIN, l. ult., for 983 r. 1649.

BOWDOINHAM, l. ult., for 455 r. 1412.

BOWLESIA, in *Botany*, so named by the authors of the Flora Peruviana, in honour of Mr. William Bowles, a native of Ireland, who published at Madrid, in 1775, an Introduction to the Natural History of Spain, making a 4to. volume of 529 pages, in the Spanish language. This work has been translated into French and Italian. The author died in Spain in 1780.—Sprengel Prodr. 24. Spec. Umbell. 13.—Clafs and order, *Pentandria Digynia*. Nat. Ord. *Umbelliferae*.

Eff. Ch. Fruit ovate, quadrangular, brittle; and concave at the back. Umbel simple.

The author enumerates three certain species in his *Prodrum*.

1. *B. palmata*, of Ruiz and Pavon, of which he gives no character or description.

2. *B. lobata*, of the same, "Fl. Peruv. v. 3. t. 251, B." Spreng. Sp. Umb. 13.—Somewhat hairy. Leaves lobed, ribbed; abrupt at the base; lobes entire, pointed. Foot-stalks elongated. Flower-stalks axillary, mostly solitary. Tendrils none.—Native of the loftiest mountains of Peru. Herb slender, green, with some scattered itary pubescence. Leaves opposite, an inch broad, half an inch long, five-ribbed, on slender zigzag footstalks about a finger's length. *Stipulas* membranous, linear, in pairs. Flower-stalks about two lines long, reflexed after flowering, the *stipulas* serving as an involucre. Petals five, cream-coloured. Fruit in pairs, fold, ribbed at the back, clothed with itary hairs.

3. *B. incana*, of the same, "Fl. Peruv. v. 3. t. 268, A." Spreng. Spec. Umb. 13. t. 5. f. 10.—Hoary. Leaves kidney-shaped, lobed, notched; heart-shaped at the base.

Flower-stalks axillary, aggregate. Tendrils axillary.—Native of Peru and Brazil. Our specimen was gathered in the last-mentioned country, by Commerfon, and is larger than Sprengel's figure, being a foot long, though incomplete. This species seems nearly allied to the last. We discover no tendrils in our specimen.

4. *B. geniculata*. Spreng. Spec. Umb. 14. t. 5. f. 11. (Peucedanum geniculatum; Forst. Prodr. 22. Willd. Sp. Pl. v. 1. 1408.)—Smooth. Leaves nearly orbicular, crenate; wedge-shaped and entire at the base. Umbels terminal, many-flowered.—Native of New Zealand. Stem prostrate, branched. Leaves not half an inch broad. Umbels compound. Fruit unknown. This seems to us a very doubtful *Bowlesia*, and is referred hither merely on account of some resemblance of habit.

BOWLING-Green, in *Geography*. Add—Alfo, a township of Ohio, in the county of Licking, having 379 inhabitants.

BOXBOROUGH, l. 2, for 412 r. 388.

BOXFORD, l. ult., for 925 r. 880.

BOYLSTON, l. ult., for 839 r. 802.

BOYLSTON, *West*, a town of the same state and county, having 632 inhabitants.

BOZRAH. Add—It contains 950 inhabitants.

BRACCIO, plur. **BRACCI**, a measure for cloth in Italy.

BRACHIONUS. Add—See **VERMES** and **WHEEL-Animals**.

BRACHYSEMA, in *Botany*, so named by Mr. Brown, from βραχυς, short, and σημα, a standard, alluding to a striking part of the generic character.—Brown in Ait. Hort. Kew. v. 3. 10.—Clafs and order, *Decandria Monogynia*. Nat. Ord. *Papilionaceae*, Linn. *Leguminosae*, Juss.

Eff. Ch. Calyx nearly equally five-cleft; with a swelling tube. Corolla papilionaceous; standard shorter than the compressed keel, which is equal to the wings. Stalk of the germin minutely sheathed. Style thread-shaped, elongated. Legume tumid, with many seeds.

1. *B. latijulum*. Broad-leaved *Brachysema*. Ait. n. 1. Curt. Mag. t. 2008.—"Leaves ovate, flat. Standard oblong-obovate."—Sent by Mr. Good, in 1803, from the fourth-west coast of New Holland, where it was also gathered by Mr. Brown. A hardy green-house procumbent or pendulous shrub, easily propagated by cuttings, and flowering in the spring. Flowers scarlet, very handsome, axillary, nearly sessile, solitary, sometimes two or three together, their small acute standard yellow at the base; wings and keel full an inch long.

They appear to be other species, not yet introduced into the gardens.

BRACKEN, in *Geography*, a county of Kentucky, having 3451 inhabitants, of whom 295 are slaves.

BRADFORD, col. 2, l. 11, r. In 1811, the houses in the hundred of Bradford were 1766, and the number of persons was 9435; 4269 being males, and 5166 females. The parish of Great Bradford contained 548 houses, and 2989 persons.

BRADFORD, in *Yorkshire*, l. 12. The parish of Bradford contains 13 townships, and in 1811 the township of East and West Bradford contained 1574 houses, and 7767 persons: East Bradford having 725 houses, and 3559 persons; 1663 being males, and 1896 females; and West Bradford having 849 houses, and 4208 persons; 1986 being males, and 2222 being females.

BRADFORD, *East and West*. Add—the former contained, in 1810, 1003; and the latter 1219 inhabitants.

BRADFORD, l. 4, r. 1369; l. 9, r. 1034; l. 12, r. 1302.

BRADYPUS,

BRADYPUS, l. 16, for sloth *r.* bear; l. 20, after megatherium, add—(which see).

BRAIN, *Chemical Analysis of.* For ADIPOCÆ *r.* ADIPOCIRE.

A new and elaborate analysis of the brain has been lately made by Vauquelin; but it must be confessed that his results throw no light whatever upon the manner in which its constituents are combined, or to what its peculiar appearance is owing. The following are the results: 100 parts contain,

Water	- - -	80.
White fatty matter	- - -	4.53
Reddish fatty matter	- - -	.70
Albumen	- - -	7.
Ofmazome	- - -	1.12
Phosphorus	- - -	1.50
Acids, salts, and sulphur	- - -	5.15

100

BRAINTREE, in *Geography.* In 1811, the parish of Braintree contained 508 houses, and 2298 persons; 1082 being males, and 1216 females. The parish of Bocking contained 537 houses, and 2544 persons; 1134 being males, and 1410 females.

BRAINTREE, in America, l. 4, *r.* 850; l. 12, The inhabitants, in 1810, were 1351.

BRAMPTON, l. 20, *r.* In 1811, the number of houses was stated to be 265, and of inhabitants 2043; 920 being males, and 1123 females: 52 families being employed in agriculture, and 394 in trade and manufactures.

BRANDON, l. ult. *r.* In 1811, Brandon parish contained 206 houses, and 1360 persons; 646 being males, and 714 females.

BRANDON, in America, l. 2, *r.* 1375.

BRANDYWINE. Add—containing 1257 inhabitants.—Also, a hundred in the district of Delaware, and county of New-Castle, containing 2257 inhabitants.

BRANFORD. Add—It contains 1932 inhabitants.

BRANTRIM, a township of Luzerne county, in Pennsylvania, containing 904 inhabitants.

BRASAVOLA, in *Botany*, has received its name from Mr. Brown, in memory of Antonius Mufa Bravavolus, or Bravavolo, an Italian physician and botanist, born at Ferrara in 1500. Haller, who inaccurately spells his name *Brassavolus*, speaks of him as not unlearned in books or languages, or in the plants of his own country. His works, which have been often republished, relate chiefly to the *Materia Medica*. Their author visited France in 1528, and died in 1555.—Brown in Ait. Hort. Kew. v. 5. 216.—Clafs and order, *Gynandria Monandria*. Nat. Ord. *Orchideæ*.

Eff. Ch. Calyx and petals distinct, spreading. Lip undivided, with a simple claw. Anther a terminal lid. Masses of pollen eight or more.

We do not feel competent to form an opinion of this genus, having no knowledge but of one species. Mr. Brown, who has more in contemplation, considers the masses of pollen being sometimes more than eight a very remarkable character.

1. *B. cucullata*. Single-flowered Bravavola. Ait. n. 1. (*Cymbidium cucullatum*; Swartz in Act. Nov. Upf. v. 6. 73. Willd. Sp. Pl. v. 4. 100. *Epidendrum cucullatum*; Linn. Sp. Pl. 1350. Curt. Mag. t. 543. *Helleborine floribus albis cucullatis*; Plum. Ic. 173. t. 179. f. 1.)—Stem nearly single-flowered. Lip fringed.—Native of the West Indies. Brought to Kew by admiral Bligh, in 1793. It flowers in the stove, from June to September. The *stem* is

simple, about a span high, sheathed with a few scales, and crowned with one, rarely two, long, very narrow, keeled, fleshy leaves, and as many large, white, long-stalked, nearly scentless, but very elegant, flowers; their drooping calyx and petals, two or three inches long, surrounding the long, pointed, curiously fringed lip.

BRASSIA, thus named by Mr. Brown, in due commemoration of the late Mr. Brads, a skilful botanical traveller and draughtsman, who collected seeds, plants, and dried specimens, on the Guinea coast, for sir J. Banks, Dr. Fothergill, and Dr. Pitcairn, and whose sketches, being most liberally lent by sir Joseph Banks to Dr. Afzelius, in his visit to Sierra Leone, were maliciously damaged, and partly destroyed, out of characteristic and wanton brutality, by some piratical slave-mongers, under the French flag, during the late war, who struck the first blow towards the ruin of the colony. (See SIERRA LEONE.)—Brown in Ait. Hort. Kew. v. 5. 215.—Clafs and order, *Gynandria Monandria*. Nat. Ord. *Orchideæ*.

Eff. Ch. Calyx and petals spreading, distinct. Lip dilated, undivided, nearly flat. Column simple. Anther a moveable lid. Masses of pollen two; divided behind; attached by their middle to a common process of the stigma.

1. *B. maculata*. Spotted-flowered Brassia.—Native of the West Indies. Imported by sir Joseph Banks in 1806. A large and very handsome plant, with broad sheathing coriaceous leaves, and a cluster of large flowers, whose calyx and petals are green, the broad lip white; all beautifully and variously spotted with purple.

BRATTLEBOROUGH, l. 3, *r.* 1891.

BREAD of Bees. See PAIN des Abeilles.

BREAD of Wood. See WOOD.

BREAST, *Inflammation of, in Surgery.* The diagnosis of this disorder is sufficiently obvious, from the presence of such symptoms as are characteristic of inflammation in general, and which are detailed in our account of this subject in a former volume. Inflammation may be confined to the skin and cellular substance of the breast; or it may affect more particularly the glandular part of this organ. According to usually-received opinions, either of these cases may originate from a suppreffion or obstruction of the secretion of milk, rough handling of the breast, external violence, stoppage of the menfes, impediment to the discharge of the lochia, &c. When the inflammation is moderate, it generally terminates in resolution; but when more severe, or improperly treated, an abscess is the consequence. Though considerable indurations are often produced in the breast by attacks of common inflammation, it is but in a limited proportion of cases that such hardness partakes of the true scirrhus or cancerous nature.

The treatment of inflammation of the breast is to be regulated in a great measure by the kind of cause that has given origin to the complaint; a subject which cannot be duly understood without adverting to what has been said in the various medical and surgical articles of this work on the different species of inflammation. Inflammation of the breast is most frequent in women within the first three months after delivery; and the best means of preventing the disorder consists in having the milk drawn or sucked out of the nipple some weeks previously to delivery. But when the inflammation already exists, or threatens to begin, the same plan of drawing or sucking the breast should be pursued; and, together with general antiphlogistic remedies, the surgeon may have recourse to emollient applications, leeches, fomentations, and when the acute stage of the inflammation is over, to gentle friction with liniments, or to the employ-

ment of resolvent plasters. Abscesses are to be treated on the principles explained in the article SUPPURATION.

BRECHIN, in *Geography*. In 1811, the burgh and parish of Brechin contained 769 houses, and 5559 persons; 2514 being males, and 3045 females.

BRECKENRIDGE, a county of Kentucky, containing 3420 inhabitants, of whom 505 are slaves.

BRECKNOCK, l. 1, for *Laucafter r. Berks*; and add—containing 723 inhabitants.

BRECKNOCK, col. 3, l. 4, after parishes, add—and in 1811 contained 718 houses, and 3196 inhabitants; 1433 being males, and 1763 females: 205 families employed in agriculture, and 375 in trade, manufactures, and handicraft.

BRECKNOCKSHIRE, l. 17, r. These, with the hamlets, were peopled in 1811 by 37,735 persons, and contained 7555 houses; 4667 families being employed in agriculture, and 2239 in trade and manufactures.—L. 35. The other rivers are, the Iron, which falls into the Wye above the town of Bulth; the Tawe, which discharges its waters into the Bristol Channel at Swansea; the Taaf; the Llyfni, which passes through Langfor Mere or Llynfavadan, and runs into the Wye at Glaibury; the Meltie or Hiltie, remarkable for its subterraneous passage in one part of its course; the Haplle, celebrated for its beautiful cascade; and the Honddy at Brecknock. The principal lake in this county is *Llynfavadan*; which see.—L. 41. The iron-works of this county are objects of great importance, in connection with its commerce and prosperity. The first of these is at Llangrwyne, in the parish of Llangenau, now forming an appendage to the works at Sirhowy in Monmouthshire: the next works are those in the vale of Clydach, in the parish of Llanelly: there is another in the parish of Llangatock; others are situated near the source of the Rumney river, on the borders of Glamorganshire; and those of Hirwaun, in the parish of Pendergn, at the southern extremity of the county.

BRENTA, in *Commerce*, a liquid measure in some parts of Italy, as at Bergamo.

BRENTFORD. Add—Old Brentford forms a part of Ealing parish, which in 1811 contained 922 houses, and 5361 inhabitants; 2509 being males, and 2852 females. New Brentford is a distinct parish, and contained 297 houses, and 1733 inhabitants; 809 being males, and 924 females.

BRENTWOOD. In 1811, Brentwood contained 218 houses, and 1238 persons; 575 being males, and 663 females.

BRENTWOOD, in *America*, l. 2, r. 905.

BRETUN CAPE, l. 6, for 34 r. 84.

BREWER. Add—By 43 Geo. III. c. 69. every common brewer of strong beer shall take out a licence, for which he shall pay according to the quantity of beer brewed by him within the year, as specified in the act, ending 5th July every year: but every person who shall first become a brewer of strong beer, for every such licence 1*l.* 10*s.*, and within ten days after the 5th of July, after taking out such licence, such further additional sum as with the said 1*l.* 10*s.* shall amount to the duty hereinbefore directed to be paid, according to the number of barrels of strong beer brewed within the preceding year. If he neglect to take out such licence, and to renew it annually, ten days at least before the end of the year, he shall forfeit 5*0*l.** 24 Geo. III. c. 41. And every common brewer of table beer, not being a common brewer of strong beer, shall take out a licence and pay for the same yearly 1*l.*, to be renewed annually. By 42 Geo. III. c. 38. no person not being a common brewer shall be allowed to retail beer at any higher price than 1½*d.* the quart without entering into a recognisance and obtaining a licence as an ale-house keeper, under pain of forfeiting for each offence 50*l.* over and above the penalty

imposed upon selling beer without a licence. By 15 C. II. c. 11. notices of brewing beer or ale shall be given, and also of erecting or altering any implements for this purpose, on pain of 50*l.* By 5 Geo. III. c. 43. the position of any tun, cooler, copper, &c. shall not be altered without notice, under penalty of 20*l.* The officer of excise shall enter and examine suspected places; and if any person oppose him, he incurs a forfeiture of 20*l.* 7 & 8 W. c. 30. No common brewer shall use any pipes or other private conveyances from any copper in his brew-house, &c. on pain of 20*l.* 8 & 9 W. c. 19. 42 Geo. III. c. 38. Search shall be made by the officer, and the penalty of opposing him is 50*l.* No common brewer, innkeeper, victualler, or other retailer of beer or ale, shall keep any private storehouse or cellar for laying any beer or ale, or worts in cask, on pain of 50*l.* 15 C. II. c. 11. 1 W. fl. 1. c. 24. By 42 Geo. III. c. 38. every common brewer who shall lay off any beer, ale, or worts contrary to the 8 & 9 W. III. shall for every such offence forfeit 100*l.* Persons inhabiting a market-town, city or town corporate, or parts adjoining to a city or town corporate, in which there is a common brew-house, who shall suffer liquors to be brewed in their houses, otherwise than for their own families or for purposes of charity or hospitality, and who shall lend out brewing vessels, shall forfeit 50*l.* 22 & 23 C. II. c. 5. Gaugers shall take an account, and obstructing them in the exercise of their office incurs a penalty of 10*l.* and forfeiture of double value for beer, ale, or other specified liquors that have been sold or delivered out, without payment of duty. If any brewer shall bribe the gauger to make a false return he shall forfeit 10*l.*, and the officer so bribed shall forfeit the same sum; 5 C. II. c. 11. By 42 Geo. III. c. 38. the penalty on mixing liquors to imitate beer, and to be mixed with or used as beer made from malt and hops, or selling such liquors, is 200*l.* and forfeiture of liquor and utensils; and the penalty on a brewer's receiving stale beer-grounds, and mixing any liquor with beer, except malt and hops, is 100*l.* Excise officers are authorized to take samples of suspected liquors, search suspected places, and seize forbidden liquors, ingredients, and utensils; and the person in whose custody they are found shall forfeit 100*l.* No common brewer shall carry out any ale or beer to his customers in any city or market-town, before notice given to an officer of excise, but between three in the morning and nine in the evening from March 25 to September 29; and between five in the morning and seven in the evening from September 29 to March 25, on pain of 20*l.* a barrel; 15 C. II. c. 11.

And whereas it is expedient that the quantities to be returned as and for a barrel of beer or ale brewed by the common brewer and the allowances for waste should be in all places the same, it is enacted that after the 5th day of July 1803 every 36 gallons of beer or ale brewed by the common brewers in Great Britain, whether within the weekly bills of mortality or without the same, taken according to the standard of the ale quart four thereof to the gallon in the exchequer, shall be reckoned and returned by the gauger or other officer of excise for a barrel of beer or ale; and the allowances to be made in Great Britain to the common brewer not selling beer, ale, or worts in any less quantity than a whole cask containing 4½ gallons, whether within or without the said limits, for waste by fillings and leakage, or otherwise, out of the returns by the gaugers, or other officers, shall be three barrels upon every 36 barrels, both of strong beer or table beer and ale, and after that rate for any greater or less quantity; 43 Geo. III. c. 69. A common brewer who shall sell beer, ale, or worts in any less quantity than a whole cask containing 4½ gallons, shall forfeit 50*l.* for every such

such offence. And if any person, not being a common brewer, shall retail beer at a higher price than after the rate of 1½d. the quart, ale-houfe measure, without obtaining a licence as a common ale-houfe keeper, he shall forfeit 50l. over and above any other penalty for felling beer or ale without such licence; 42 Geo. III. c. 38. Entries shall be made by common brewers once a week, under penalty of 10l.; and by innkeepers once a month on pain of 5l.; and also ale-houfe keepers, victuallers, and other retailers, shall do the same on penalty of 20s. Beer and ale above 18s. per barrel shall be deemed strong, and at 18s. and under, table beer; 43 Geo. III. c. 81. The 42 Geo. III. c. 38. regulates the price, &c. of table beer, and repeals as to this beer 22 Geo. III. c. 68. The penalty for felling table beer at more than the barrel price, exclusive of duty, is 100l.

BREWERIA, in *Botany*, so named by Mr. Brown, in memory of Mr. Samuel Brewer, a Wiltshire botanist, the companion of Dillenius in a botanical visit to Wales, Anglesea, and the Isle of Man, in 1726, and subsequently one of his most valuable correspondents, especially for the Cryptogamic department. Mr. Brewer spent the latter part of his life at Bradford, under the patronage of Dr. Richardson, and, according to Dr. Pulteney, was living in 1742.—Brown Prodr. Nov. Holl. v. 1. 487.—Clafs and order, *Pentandria Monogynia*. Nat. Ord. *Campanaceae*, Linn. *Convolvuli*, or *Convolvulaceae*, Juss. Br.

Eff. Cl. Calyx in five deep segments. Corolla funnel-shaped, plaited. Style deeply divided. Stigmas capitate. Capsule of two cells, valvular, surrounded by the permanent calyx. Seeds two in each cell.

These are diffuse herbs, not milky; their leaves undivided; flowers axillary, mostly solitary. The genus appears most akin to *Porana*, differing in habit, and in the unaltered calyx of the fruit.

1. *B. linearis*. Linear Breweria. Br. n. 1.—Villous. Leaves linear-lanceolate, folded. Style equally divided nearly to the base.—Gathered by Mr. Brown, in the tropical part of New Holland.

2. *B. media*. Intermediate Breweria. Br. n. 2.—Slightly villous. Leaves lanceolate; obtuse and somewhat heart-shaped at the base. Style divided half way, into two unequal segments.—From the same country. Br.

3. *B. pannosa*. Woolly Breweria. Br. n. 3.—Downy. Leaves ovate, somewhat heart-shaped, densely woolly. Calyx unequal; its outer segments ovate, somewhat pointed. Style in two deep unequal divisions.—From the same country. Br.

We know not whether there be any more species in other parts of the globe.

BREWSTER, in *Geography*, a town of Barnstable county, in the Massachusetts, containing 1812 inhabitants.

BRIBIESCA, *dele*.

BRIDELIA, in *Botany*, a genus separated from *Cluytia* by Willdenow, and dedicated by him to the honour of the great systematic mucologist, Dr. Samuel El. Bridel.—Willd. Sp. Pl. v. 4. 978. Ait. Hort. Kew. v. 5. 444.—Clafs and order, *Polygama Monocia*, or rather *Monadelphia Pentandria*. Nat. Ord. *Tricocca*, Linn. ? *Euphorbia*, Juss. ?

Eff. Cl. Calyx inferior, in five deep segments. Petals five, inserted into the calyx. Stamens with a tubular, columnar base. Styles two, divided. Berry with two seeds. Some flowers want the stamens, some others the germen.

The fruit distinguishes this genus from *CLUYTIA*. (See that article.) Three species only are described, all East Indian.

1. *B. montana*. Mountain Bridelia. Willd. n. 1. (*Cluytia montana*; Roxb. Corom. v. 2. 38. t. 171.)—Stem

erect, without thorns. Leaves obovate-elliptical, entire, smooth.—Native of Coromandel. On the interior mountains it grows to a tree, but on the lower lands is only found of a small size. The *Telingas* call it *Pantinga*. Roxb. The wood is reddish, very hard. Stem short and thick. Branches slender, spreading. Leaves numerous, alternate, two-ranked, an inch and a half long, on short stalks. Flowers small, crowded, axillary. Berry purple, globular, succulent, the size of a pea.

2. *B. scandens*. Climbing Bridelia. Willd. n. 2. Ait. n. 1. (*Cluytia scandens*; Roxb. Corom. v. 2. 39. t. 173.)—Stem shrubby, climbing, without thorns. Leaves oblong-ovate, entire, acute; Downy beneath.—Common on the banks of rivers and water-courses, on the coast of Coromandel, flowering in November and December, and called by the *Telingas* *Doonkyboora*. Roxb. Stem climbing; its branches leafy, flowering at their pendulous extremities. Leaves three inches long; those which accompany some of the flowers diminished almost to bracteas. Berry oval, of a rusty black, the size of a horse-bean. This species was sent to Kew in 1804, by colonel Hardwicke, F.L.S., so well known by his various communications, illustrative of the natural history of India.

3. *B. spinosa*. Thorny Bridelia. Willd. n. 3. (*Cluytia spinosa*; Roxb. Corom. v. 2. 38. t. 172.)—Stem arborescent, erect, thorny. Leaves ovate, acute, entire, smooth.—A tree of considerable size found on the mountains along with the first species, and called by the *Telingas* *Cora-maun*. The bark is a strong astringent; wood hard and durable, dark-coloured; leaves eaten greedily by cattle, and said to destroy worms in their bowels. Roxb. The leaves are three or four inches long. Flowers in terminal, or axillary, interrupted spikes. Berry black, the size of a pea.

BRIDGEWATER, l. ult. r. The parish of Newcastle, higher and lower, contains 157 houses, the former having 40, and the latter 117; and 640 inhabitants, the former including 171, and the latter 469. In the higher, the males are 84, and females 87; in the lower, the males are 210, and females 259.

BRIDGENORTH, col. 2, l. 9, add—In 1811 the borough of Bridgenorth contained 978 houses, and 4386 persons; 2006 being males, and 2380 females: 81 families employed in agriculture, and 870 in trade and manufactures.

BRIDGEPORT, a township of Pennsylvania, in Fayette county, having 280 inhabitants.

BRIDGESTOWN, a town of the district of Maine, in the county of Kennebeck, containing 214 inhabitants.

BRIDGE-TOWN, l. 5, r. 882.

BRIDGEWATER, col. 2, l. 26, add—In 1811 the borough of Bridgewater contained 857 houses, and 4911 persons; 2241 being males, and 2670 females: 87 families employed in agriculture, and 570 in trade and manufactures.

BRIDGEWATER, in America, l. 3, r. 1104; l. 4, r. 2906; l. 5, r. 391; l. 6, r. 5157; l. 10, r. 1154. Add—Also, a township of Luzerne county, in Pennsylvania, having 1418 inhabitants.

BRIDLINGTON, l. ult. r. In 1811 Bridlington contained 849 houses, and 3741 inhabitants; 1706 being males, and 2035 females.

BRIDPORT, l. 39, add—In 1811 the borough of Bridport contained 512 houses, and 3567 persons; 1532 being males, and 2035 females: 20 families employed in agriculture, and 600 in trade and manufactures.

BRIDPORT, in America, l. 3, r. 1520.

BRIGHTHELMSTON, l. ult. r. In 1811 Brighton contained 2077 houses, and 12,012 persons; 5069 being males, and 6043 females.

BRIGHTON, a town of Massachusetts, in Middlesex county, having 608 inhabitants.

BRIMFIELD, l. 3, r. 1325.

BRISTOL. Add—In 1811, this city, with Barton Regis hundred, contained 11,940 houses, and 76,433 persons; 32,842 being males, and 43,591 females.

BRISTOL, in America, l. 2, r. 2753; l. 8, r. 37,168; l. 13, r. 5072; l. 23, r. 2693; l. 29, add—It contains 1428 inhabitants; l. 33, after houses, add—The number of inhabitants, by the census of 1810, was 628; l. 36, after county—having 965 inhabitants; l. 39, r. 1179, add—Also, a township of Pennsylvania, in Berks county, having 1668 inhabitants.—Also, a township of Ohio, in the county of Trumbull, having 202 inhabitants.

BRITAIN, LITTLE, a township of Pennsylvania, in Lancaster county, containing 1708 inhabitants.

BRITAIN, London, a township of Luzerne county, having 404 inhabitants.

BROAD CREEK, a hundred of Delaware, in the county of Sussex, having 3789 inhabitants.

BROCKLESBY, l. 10, after Ballymore, add—(which see,) and *dele* the remaining part of the sentence.

BRODIAEA, in Botany, so named by the writer of the present article, after James Brodie, esq. F.L.S., of Brodie in North Britain, an experienced and liberal British botanist, whose name often occurs in the *English Botany*, and to whom a genus of the patrician order is with great propriety inscribed.—Sm. Tr. of Linn. Soc. v. 10. 1. Pursh 223. (Hooker; Salif. Parad. 98.)—Class and order, *Triandria Monogynia*. Nat. Ord. *Spatheae*, Linn. *Narcissi*, Juss.

Gen. Ch. Cal. none, unless the bractæas be so called. Cor. of one petal, bell-shaped, cut half way down into six nearly equal, oblong, rather spreading segments; throat crowned with three erect scales, shorter than the limb, opposite to three alternate segments. Stam. Filaments three, inserted into the tube between the scales, and opposite to the other three segments, awl-shaped, erect; anthers vertical, linear, shorter than the scales, cloven at each end. Pist. Germen superior, elliptic-oblong, triangular; style cylindrical, nearly the length of the stamens; stigma triangular, three-lobed. Peric. Capsule of three cells and three valves, with central partitions. Seeds numerous, elliptic-oblong, inserted into the inner margin of each partition in two rows.

Eff. Ch. Corolla inferior, tubular; limb regular, in six deep segments; throat crowned with three scales, alternate with the stamens. Capsule of three cells, with numerous seeds.

1. *B. grandiflora*. Large-flowered Brodiaea, or Missouri Hyacinth. Sm. n. 1. Pursh n. 1. (Hooker coronaria; Salif. Parad. t. 98.)—Scales of the corolla undivided. Partial stalks longer than the flowers.—Discovered by Mr. Menzies in 1792, in New Georgia, on the west coast of North America. Governor Lewis is recorded to have gathered this plant on the plains of the Columbia and Missouri rivers, flowering in April and May. It is reported to have bloomed in Mr. Salibury's garden, but is not admitted into Hort. Kew. or the Addenda to that work. The root is bulbous, solid. Leaves two, radical, linear, channelled, near a foot long. Flower-stalk solitary, bearing an unequal, bracteated umbel, of upright, handsome, blue flowers, each near an inch long, with yellow scales, and yellow anthers.

2. *B. congesta*. Crowded Brodiaea. Sm. n. 2. t. 1.—Scales of the corolla cloven. Partial stalks much shorter than the flowers.—Brought by Mr. Menzies, with a coloured drawing, from New Georgia. The flowers are

rather numerous, smaller than the foregoing, and form a dense head, subtended by pointed bractæas.

BROKENSTRAW, a township of Warren county, in Pennsylvania, having 379 inhabitants.

BROMELIÆ, in Botany, the 15th order in Jussieu's system, the 5th of his third class. See JUNCI.

The *Bromelia* are thus defined. Calyx (Corolla of Linnæus) in six, more or less deep, segments, either superior or inferior, equal, or mostly unequal, the three alternate divisions being largest. Stam. six, inserted into the bottom or middle of that part, or sometimes into calycine glands, lying over the germen. Germen simple, superior or inferior; style one; stigma three-cleft. Fruit of three cells, either pulpy and not bursting, or capsular and of three valves; each cell containing one or many seeds. The leaves are sheathing, all for the most part radical. Flowers spiked, panicled, or more rarely corymbose, each accompanied by a spatula.

SECT. 1. *Germen superior*.
Burmansia and *Tillandsia*, with *Puya* of Molina, Juss. append. 447.

SECT. 2. *Germen inferior*.
Xerophyta, *Bromelia*, and *Agave*.
BRÖMSGROVE, in Geography. In 1811, the parish of Bromsgrove contained 1378 houses, and 6932 persons; 3349 being males, and 3583 females: 357 families employed in agriculture, and 1085 in trade and manufactures.

BRONZITE. See MINERALOGY, Addenda.

BROOK, Honey, in Geography, a township of Pennsylvania, in Chester county, with 1073 inhabitants.

BROOKE, a county of Virginia, containing 5843 inhabitants, including 332 slaves.

BROOKFIELD, l. 4, r. 3170; l. 11, for 421 r. 1384; l. ult., add—containing 1037 inhabitants.

BROOKLIME, a town of New Hampshire, in Hillsborough county, having 538 inhabitants.—Also, a town of Vermont, in Windham county, having 431 inhabitants.—Also, a town in Strafford county, in New Hampshire, with 657 inhabitants.—Also, a township of Ohio, in the county of Trumbull, having 345 inhabitants.

BROOKLYN, l. 2, 704 inhabitants; l. ult. containing 1200 inhabitants.

BROOME, a county of New York, including 8130 inhabitants.

BROSELEY. In 1811 this parish contained 1025 houses, and 4850 persons; 2448 being males, and 2402 females: 48 families employed in agriculture, and 856 in trade and manufactures.

BROTERA, in Botany, a name applied to two very different plants, in due commemoration of the Rev. Father Felix Avellar Brotero, professor of botany at Coimbra in Portugal, author of the *Flora Lusitanica*, and several other learned works. The *Brotera* of the late professor Willdenow, Sp. Pl. v. 3, 2399, *Carthamus corymbosus* of Linnæus, appears to us founded on a total misconception of the structure of the flower, in which we can find no character whatever different from *Carthamus*. This genus is, however, adopted in Ait. Hort. Kew. v. 5, 186, according to the general plan of that work, where the editors had no particular object of reformation or illustration in view. The other *Brotera* is published by professor Sprengel, in Tr. of Linn. Soc. v. 6, 151. Its only species is *B. perfica*, brought by Olivier and Bruguiere from Persia. We regret to observe that this is manifestly a HYPERIC (see that article); and we lament that it was, from full confidence in its learned and distinguished author, too incautiously admitted into the Linnæan Transactions, for which

which the writer of this acknowledges himself entitled to a share of the blame.

BROTHERS' VALLEY, in *Geography*, a township of Pennsylvania, in Somerset county, having 1314 inhabitants.

BROUGH. In 1811 this township contained 131 houses, and 758 persons; 369 being males, and 389 females.

BROUGHTONIA, in *Botany*, so called by Mr. Brown, in memory of the late Mr. Arthur Broughton, of Bristol, author of an "*Enchiridion*," or systematic manual, of British plants, published in 1782; and, after his removal to Jamaica, of the *Horius Eastensis*, and of a Catalogue of the Botanic garden in the mountains of Liguanea.—Brown in *Ait. Hort. Kew.* v. 5, 217.—Class and order, *Gynandria Monandria*. Nat. Ord. *Orchideae*.

Eff. Ch. Calyx and petals spreading. Column unconnected, or attached at the base only to the stalked lip. Anther a moveable lid. Masses of pollen four, parallel, divided by complete permanent partitions, and extending at the base into an elastic granulated thread.

Obf. In some instances the base of the lip is elongated into a little tube, attached to the germen.

1. *B. fanguinea*. Blood-red Broughtonia. *Ait. n. 1.* (*Dendrobium fanguineum*; Swartz *Nov. Act. Upf.* v. 6. 82. *Ind. Occ.* 1529. *Willd. Sp. Pl.* v. 4. 132. *Viscum radice bulbosa minus, delphinii flore rubro specioso*; Sloane *Jam. v. 1.* 250. t. 121. f. 2.)—Leaves oblong, in pairs from the top of a bulb. Flower-stalk divided.—This grows on trees and palisades in the woods of Jamaica, forming tufts of leaf-bearing bulbs, the leaves light green, two inches long. *Stalks* radical, a foot high, with a few handsome, corymbose, dark crimson flowers.

This is the only species yet known in our stoves, nor have we an account of any other.

BROUSSONETIA, in *Botany*, (see PAPHYRIUS,) where the history and description of this curious tree are given.

BROWN SPAR, or *Bitter Spar*. See MINERALOGY, *Albenda*.

BROWNFIELD, l. 2, for York *r.* Oxford; l. 3, *r.* 398.

BROWNINGTON, a town of Vermont, in Orleans county, having 236 inhabitants.

BROWNSVILLE. Add—It contains 698 inhabitants.

BRUCHUS, l. 8, *dele* which see respectively, and insert—the insects of this genus are, in general, of a small kind. The *B. granarius* is found among leaves, vetches, and other feeds, the lobes of which it devours. It is about two lines long, of a black colour, and its wing-shells are freckled with white specks; the two fore-legs are reddish, and the thighs of the hind-legs armed with a tooth and forceps. The *B. feminarius* is rather smaller than the preceding, but like it, without the denticle of the hinder thighs. The exotic species are chiefly natives of America.

BRUNNERSTOWN, in *Geography*, a town of Kentucky, in Jefferson county, with 92 inhabitants, of whom four are slaves.

BRUNONIA, in *Botany*, so named by the writer of this, after his highly-valued friend Mr. Robert Brown, F.R.S. librarian to the Linnæan society, no less eminent for acuteness of observation, than for deep botanical science, whose discoveries in New Holland have so often been brought before our readers, and who met with this new and singular genus in that country. The memory of Dr. Patrick Browne, the natural-historian of Jamaica, being already preserved in the *BROWNIA*, (see that article,) it has been found necessary to adopt the above construction, authorised by prece-

dent, to avoid ambiguity.—*Sm. Tr. of Linn. Soc. v. 10.* 365. *Brown Prodr. Nov. Holl. v. 1.* 589.—Class and order, *Pentandria Monogynia*. Nat. Ord. *Aggregate*, or perhaps *Campanaceae*, *Linn. Displacae*, *Juss.? Goodenovia?* Brown.

Gen. Ch. *Cal.* Perianth double, both inferior; outer of four membranous, nearly equal, erect, concave, obtuse leaves; inner of one leaf, rather the longest, turbinate, permanent, with five feathery teeth. *Cor.* of one petal, funnel-shaped, longer than the calyx; limb in five deep, spreading, nearly equal segments, the two upper ones most deeply divided; tube separable into five narrow claws. *Stam.* Filaments five, capillary, weak, inserted into the receptacle; anthers linear, united into a cylinder, the length of the tube of the corolla. *Pist.* Germen superior, roundish; style club-shaped, about twice the length of the filaments; stigma turbinate, obtuse, concealed by two vertical, equal, orbicular, concave, membranous, converging valves. *Peric.* none, except the inner perianth, lined with the membranous base of the corolla, both together enlarged and hardened, and crowned with the five feathery teeth elongated and divaricated, so as to form a seed-crown. *Seed* solitary, covered, ovate, destitute of albumen, with an erect embryo.

Eff. Ch. Corolla funnel-shaped, five-cleft, irregular. Anthers combined. Stigma with a bivalve sheath. Seed one, clothed with the feathery-crowned inner calyx.

The generic distinctions of *Brunonia* are abundantly easy; but to determine its natural order, or affinities, is very difficult, the latter being so many, and so remote from each other, that the plant resembles Horace's imaginary feathered monster, with a horse's neck and human head. Mr. Brown, in the latest view he has taken of the subject, in a most invaluable paper on the natural order of *Compositæ*, *Tr. of Linn. Soc. v. 12.* 132, has pointed out *Brunonia* as a connecting link between that family and the *Goodenovia*; nor are various other links between these very different tribes wanting. With great candour he nevertheless admits whatever favours our idea of its relationship to *Displacæ* and *Globulariæ*, and moreover adverts to circumstances approaching it to the *Stylidæ*, near allies of *Goodenovia*. Two species only have been detected.

1. *B. australis*. Australian *Brunonia*. *Sm.* as above, 367. t. 28. *Br. n. 2.*—Leaves clothed with spreading hairs. Segments of the calyx feathery all over.—Native of the sandy coasts of the fourth part of New Holland. Abundant in Van Diemen's island, and observed also on the opposite shore of New Holland, at Port Phillip, flowering in January 1804. *Mr. Brown. Herb* apparently annual, without a stem, hairy all over, much resembling in habit, colour, and pubescence, the Linnæan *Scabiosa cretica*. *Root* simple, slender. *Leaves* radical, numerous, spatulate, pointed, single-ribbed, entire, tapering at the base, two or three inches long, very hairy. *Flower-stalks* radical, solitary, simple, hairy, especially the lower part, a foot high, each bearing a head of numerous blue flowers, not unlike the Sheep's Scabiosa, *Jafone montana*, but rather larger, and loosely hairy. The head is subtended by numerous, nearly equal, spreading, permanent, hairy bractæ, shorter than the flowers; the inner ones smallest, solitary under each flower.

2. *B. fericea*. Silky *Brunonia*. *Sm.* as above, 367. t. 29. *Br. n. 1.*—Leaves silky with close-pressed hairs. Segments of the calyx with naked coloured tips.—Gathered by Mr. Brown, on the sandy sea-shore at Pine Port, on the east coast of New Holland, just within the tropic, flowering in August 1802. The aspect and pubescence of this species

species exactly answer to *Scabiosa graminifolia*. It differs from the foregoing in having narrower, more numerous, silky leaves, and the flowers differ remarkably in the blunt, coloured, naked points of their inner calyx.

BRUNSVIGIA, so named in 1753, by Heister, in compliment to his patron Charles duke of Brunswick Lüneburg. What were his serene highness's claims to this honour, we know not, nor is HEISTER any authority in such a case (see his biographical article); but we hope all Englishmen will ever have reason to hail the name of Brunsvigia, wherever it appears, and the genus in question, long confounded with *Amaryllis*, being now restored, the name of *Brunsvigia* appears with peculiar propriety in the royal garden of England.—Heist. Brunsv. 2. Ait. Hort. Kew. v. 2. 230. Ker in Curt. Mag. under p. 923*.—Clafs and order, *Hexandria Monogynia*. Nat. Ord. *Spatheacee*, Linn. *Narcissi*, Juss.

Gen. Ch. *Cal.* an oblong, obtuse, compressed, leafy sheath, of two valves, withering. *Cor.* superior, in six deep, lanceolate, recurved, nearly equal segments. *Stam.* Filaments six, awl-shaped, about the length of the corolla; anthers oblong, incumbent. *Pist.* Germen inferior, obovate, with three furrows and as many rounded angles; style thread-shaped, the length and position of the stamens; stigma bluntish. *Peric.* Capsule turbinate, abrupt, with three rounded wings, membranous, somewhat transparent, of three cells and three valves. *Seeds* several, ovate, acute; curved and compressed at the point.

Eff. Ch. Corolla superior, in six deep segments. Capsule turbinate, membranous, with three wings. Seeds several, pointed.

1. *B. multiflora*. Broad-leaved Brunsvigia. Ait. n. 1. (Brunsvigia; Heist. as above, t. 1—3. *Amaryllis orientalis*; Linn. Sp. Pl. 422. Willd. Sp. Pl. v. 2. 58. Jacq. Hort. Schoenbr. v. 1. 38. t. 74. *Narcissus indicus* (Sphaericus; Morif. sect. 4. t. 10. f. 35. *N. indicus*, flore liliceae, sphaericus; Ferrar. Fl. 125. t. 129. 131. 133.)—Leaves tongue-shaped, depressed, smooth. Flowers somewhat irregular, with ascending stamens and style.—Native of the Cape of Good Hope. The bulb is not uncommon in our stoves, but we never heard of its flowering. That deplorable event however happened in the imperial garden at Schoenbrunn, and has enabled the late professor Jacquin to adorn his Hort. Schoenbr. with one of the most splendid botanical figures extant. This is perhaps the most stately of its stately tribe. The large fealy bulb bears five or six obovate-oblong, dark green leaves, lying over each other in two ranks, and usually a foot long, near three inches broad. *Flower-stalk* earlier than the leaves, erect, round, a foot high, crowned with a broad sheath, of two coloured valves, unequal in breadth, accompanying a very large umbel, of about thirty-five rays, spreading in all directions, each six inches long, bearing a solitary erect flower. All the stalks are more or less of a blood red. *Corolla* richly varied with crimson and a kind of orange scarlet; its segments an inch and a half long, acute, converging into a tubular form at the base, spreading in the upper part, and reflexed. *Capsule* two to four inches long, and one broad, pale brown, shining; tapering very much at the base.

2. *B. marginata*. Red-edged Brunsvigia. Ait. n. 2. (*Amaryllis marginata*; Jacq. Hort. Schoenbr. v. 1. 34. t. 65. Willd. Sp. Pl. v. 2. 59.)—Leaves tongue-shaped, depressed, smooth, with cartilaginous edges. Flowers regular, with erect stamens and style.—Native of the Cape, from whence Mr. Masson sent bulbs in 1795. *Leaves* rather narrower than the former, with a hard red border. *Umbel* erect, dense, of many scarlet flowers, with upright stamens

and style, rising high above the reflexed corolla. *Anthers* purple.

3. *B. Radula*. Rasp-leaved Brunsvigia. Ait. n. 3. (*Amaryllis Radula*; Jacq. Hort. Schoenbr. v. 1. 35. t. 68. Willd. Sp. Pl. v. 2. 61.)—Leaves elliptical, depressed, rough with bristly tubercles. Flowers ringent, with declining stamens and style.—From the same country, introduced by Mr. Masson, in 1790. *Leaves* two, scarcely more, three inches long, rough-edged, covered on the upper side with bristle-pointed warts. *Stalks* three or four inches high, sometimes in pairs. *Umbel* of only four or five pink and white flowers, five of whose segments are directed upwards, the fifth deflexed, along with the stamens and style.

4. *B. striata*. Striated Brunsvigia. Ait. n. 4. (*Amaryllis striata*; Jacq. Hort. Schoenbr. v. 1. 36. t. 70. Willd. Sp. Pl. v. 2. 61.)—Leaves elliptic-obovate, erect; densely striated beneath. Flowers nearly regular, with declining stamens and style.—From the same country as all the rest, introduced by Mr. Masson in 1795. Larger than the last, and distinguished by its upright red-edged leaves. *Umbel* of many flowers, whose outside is rose-coloured, inner paler, or whitish, the segments narrow, nearly or quite regular.

BRUNSWICK, in Virginia, l. 3, r. 15, 411 inhabitants, including 9368 slaves; l. 5, r. 4378; l. 6, r. 2254; l. 19, add—containing 143 inhabitants.

BRUNSWICK, North, contains 3980 inhabitants.

BRUNSWICK, South, contains 2332 inhabitants.

BRUNSWICK, in Maine, l. 5, r. 2682.

BRUNSWICK, a township in Berks county, in Pennsylvania, having 1770 inhabitants.

BRUSH CREEK, a township of Ohio, in the county of Highland, containing 551 inhabitants.

BRUSSELS, *Roger of*, r. BRUGES, *Roger of*.

BRUTON, col. 2, l. 2, r. In 1811, the parish of Bruton contained 353 houses, and 1536 persons; 658 being males, and 878 females.

BRUTUS, l. 5, r. Cayuga. Subjoin—This is an excellent township of Cayuga county, about 10 miles long, N. and S., by 5 to 6½ E. and W. The soil is rich and fertile, and well watered: it contains about 330 families, and 182 senatorial electors. It was erected in 1802, from the N.E. part of Aurelius. In 1810 the population was 2030, and the taxable property amounted to 84,514 dollars.

BRYAN, l. 3, add—containing 2827 inhabitants, of whom 2264 are slaves.

BUBALIS. See ANTELOPE.

BUBASTUS, *dele* see DIDYMA.

BUCCO, col. 2, l. 1, after cinereus, *dele* which see, and add—These are all inhabitants of Africa, and the warmer parts of Asia and America. Their head is very long, their bills strong and nearly straight, almost covered with bristles; tail-feathers generally ten. They are a solitary stupid race, living in sequestered forests, and subsisting principally on insects.

BUCEROS. Add—Several other species are mentioned by Dr. Shaw.

BUCHANAN, l. 7, insert—in 1520. Col. 3, l. 9, insert—in 1532; l. 10, r. Caffis; l. 15, r. 1533; l. 18—this happened probably in the year 1537; l. 43, after said—(but without sufficient evidence); l. ult. but one, insert after admired—The next in merit is the 137th, in elegiac verse. Col. 3, l. 19, after country, insert—In 1562, he officiated as classical tutor to the queen, who was then in the 20th year of her age, and who many afternoons perused with him a portion of Livy. About the year 1566, &c.: l. 30, after York, insert—in 1568; l. 35, after VI., insert

—in

—in 1570, when the young prince was only four years of age; l. 43, after reading, insert—when the countess of Mar, hearing him wailing, hurried and took him up in her arms, reproaching the tutor for having laid his hand upon the Lord's anointed. Buchanan is said to have replied in terms that contained a very unceremonious antithesis relative to the part which had received the chastisement. Col. 4, l. 9, after motives, insert—and it likewise evinces his anxiety for forming a patriot king; l. 15, for 5th of December r. 28th of September; l. 23, after Edinburgh—in the cemetery of the Grey Friars. Col. 5, l. 10, after unequal, add—although he maintains the unscientific notion that the earth does not revolve round the sun, he supports his opinion by arguments which must at least be allowed to be plausible; l. 9, from the bottom, after great man, insert—neglected by his ungrateful country, which never afforded his grave the common tribute of a monumental stone. Subjoin—See Irving's Life of Buchanan.

BUCKENHAM. In 1811, the parish of New Buckenham contained 127 houses, and 656 inhabitants; 315 being males, and 341 females. The parish of Old Buckenham contained 200 houses, and 1024 persons; 491 being males, and 533 females.

BUCKINGHAM. In 1811, the borough of Buckingham contained 572 houses, and 2987 persons; 1313 being males, and 1674 females: 232 families employed in agriculture, and 466 in trade and manufactures.

BUCKINGHAM, a county of America, l. 3 and 4, for 1790 r. 1810; for 9779 r. 20,059; for 4168 r. 11,675.—Also, a township of Bucks county, in Pennsylvania, having 1715 inhabitants.—Also, a township in Wayne county, in the same state, having 153 inhabitants.

BUCKINGHAMSHIRE, l. 19 and 20, r. In 1811, this county contained 21,929 houses, and 117,650 persons; 13,933 families employed in agriculture, and 8424 in trade and manufactures.

BUCKLAND, l. 2, for 718 r. 1097.

BUCKS, l. 5, for 25,401 r. 32,371; for 114 r. 11; l. 7, for 27 r. 29.

BUCKSTOWN, a township of Ross county, in the district of Ohio, containing 781 inhabitants.

Buckstrows, l. 3, for 316 r. 4403.

BUENA, in *Botany*, Cavan. Ic. v. 6. 49. t. 571, is a genus of the natural order of *Rubiaceæ*, so named by that author, in honour of Dr. Cosmo Bueno, an eminent writer on the natural history and topography of Peru. There is no certain proof of this genus being distinct from what Ruiz and Pavon had already called *Gonzalagunia*. We are equally unacquainted with both.

BUFFALO. Add—*East Buffalo* contains 2869, and *West Buffalo* 2523 inhabitants.—Also, a township of Pennsylvania, in Washington county, having 1416 inhabitants.—Also, a township in Armstrong county, in the same state, having 1150 inhabitants.—Also, a township of Butler county, with 375 inhabitants.—Also, a township of Ohio, in the county of Guernsey, having 285 inhabitants.—Also, a township of Ohio, in the county of Jefferson, having 696 inhabitants.

BUFFY Coat of the Blood, *Chemical Properties of*. See BLOOD, section *Fibrin*.

BUILDING, col. 10, l. 47, for 42d r. 14th.

BUILTH, or BUALLT, derived from *Bu*, an ox, and *allt*, an eminence, i. e. a wooded eminence, bearing reference to the adjacent country. Col. 2, l. 13, for two weekly r. one good market on Monday; for three r. five; after contains, r. by returns of 1811, 182 houses, and 815 inhabitants; 384 being males, and 431 females. The hundred of Builth

included 1086 houses, and 5788 persons; 2698 being males, and 3090 females: 833 employed in agriculture, and 284 in trade, manufactures, and handicraft.

BULLETT, a county of Kentucky, having 4311 inhabitants, including 976 slaves.

BULLOCK, a county of Georgia, in America, containing 2305 inhabitants, 420 being slaves.

BULLSKIN. Add—containing 1439 inhabitants.

BUMCOMBE, a county of North Carolina, containing 9277 inhabitants, of whom 695 are slaves.

BUMEN. See REGAN.

BUMGALOW, a term used in Bengal for a kind of country-house erected by Europeans.

BUNIUM, col. 2, l. 20, for They r. Ray.

BUPHAGA, l. 6, for legs r. feet.

BUPRESTIS. At the close, *dele* which see respectively; and add—The *B. gigantea* is the largest of this genus hitherto discovered, being two and a half inches long; a native of India, China, and many other parts of Asia; and found also in South America. The European insects of this genus fall far short of the Indian or American species both in size and splendour.

BURCHARDIA, in *Botany*, is thus named by Mr. Brown, in commemoration of Dr. John Henry Burchard, author of a letter to Leibnitz, in 1702, in which the founded principles of botany are developed; the exclusive importance of the parts of fructification, in forming characters, are especially insisted on, and the classification of Linnæus, by the Stamens and Pistils, is anticipated. Heister published this letter, for the first time, in 1750, probably to depreciate the honour of Linnæus. But as the latter could have heard nothing of Burchard's sentiments, he has all the merit of originality, and the attempt to deprive him of this credit, serves only to shew the high estimation in which his performance was held. Heister has named a plant *Burchardia*, but this is *Callicarpa* of Linnæus, so called many years before.—Brown Prodr. Nov. Holl. v. 1. 272.—Clafs and order, *Hexandria Trigynia*. Nat. Ord. *Melanthaceæ*, Br.

Efl. Ch. Petals six, equal, spreading, with a scariferous cell in the claw of each, deciduous. Stamens inserted into the base of the petals. Anthers peltate, posterior. Germen triangular. Stigmas acute. Capsule of three separable boat-like cells, bursting at the inner edge. Seeds numerous, in two rows.

1. *B. umbellata*. Umbellate *Burchardia*. Br. n. 1.—Native of Port Jackson, New South Wales. Root of several thick clustered fibres. Herb smooth. Stem simple, leafy. Leaves linear, with entire sheaths; the upper one half embracing the stem. Umbel simple; its stalks without a joint, and with a single bractea at the base of each. Flowers white. Anthers purple. Brown.

BURGH upon the Sands, l. 4, r. as he was preparing for an expedition against the Scots. Hume.

BURICH. For BUDERICH r. BUDELICH.

BURKE, in *Geography*, l. 2, r. 11,007; l. 3, r. 1433; l. 5, r. 10,747 and 4691; l. 9, add—containing 460 inhabitants.

BURKSVILLE, a town of Kentucky, in Cumberland county, containing 106 inhabitants, of whom 20 are slaves.

BURLINGTON, l. 6 and 7, for 18,095 r. 24,979, and for 227 r. 93; add—It contains 12 townships; l. 13, r. 2419, and 4 slaves.

BURLINGTON, a township of America, &c. l. 3, add—This township is well watered, and abounds with mill-heats; its situation is elevated, and the air salubrious: the population is 3196; the senatorial electors 294, and the taxable property,

property, in 1810, amounted to 178,783 dollars. It has two Baptist meeting-houses, one for Congregationalists, and one for Quakers. The inhabitants are principally farmers.

BURLINGTON, a town of Massachusetts, in Middlesex county, containing 471 inhabitants.—Also, a town of Hartford county, in Connecticut, having 1467 inhabitants.—Also, a township of Lycoming county, in Pennsylvania, having 661 inhabitants.

BURNING, *Extraordinary Cases of*. Col. 3, l. 11, for of the head *r.* and the head; l. 5, for 332 *r.* 1690.

BURNLEY, l. *ult.* after contains, add—by the return of 1811, 807 houses, and 4368 inhabitants; 2129 being males, and 2239 females.

BURRILLVILLE, a town of Rhode island, in the county of Providence, containing 1834 inhabitants.

BURSARIA, in *Botany*, so denominated by Cavanilles, from *burfa*, a purple; because the seed-vessel resembles that of the common weed called Shepherd's-purple.—Cavan. Ic. v. 4. 30. Ait. Hort. Kew. v. 2. 36.—Class and order, *Penstemonia Monogynia*. Nat. Ord.

Eff. Ch. Petals five, inserted into the receptacle. Capsule superior, compressed, of one cell, with four valves. Seeds two, winged.

1. *B. spinosa*. Thorny Burfaria. Cavan. Ic. v. 4. 30. t. 350. Ait. n. 1. (*Itea spinosa*; Andr. Repof. t. 314.)—Native of New South Wales; first raised in 1793, by the late marchioness of Rockingham. This is a thorny, bushy, green-house shrub, flowering from August to December. The leaves are scattered, sessile, narrow-wedged, emarginate, smooth, entire. Flowers numerous, white, small, in copious, aggregate, terminal clusters, of considerable elegance.

BURTON in *Kendal*, l. *ult.* after contains, add—by the return of 1811, 94 houses, and 574 persons; 274 being males, and 300 females. There is another township, named Holme, in the same parish, containing 43 houses, and 283 persons; 137 being males, and 146 females.

BURTON-upon-Trent, l. 4 from the close, add—By the return of 1811, contains 785 houses, and 3979 persons; 1844 being males, and 2135 females.

BURTON, l. 1, for Grafton *r.* Strafford; for 143 *r.* 194. Add—Also, a township of Ohio, in the county of Geauga, having 517 inhabitants.

BURTONIA, in *Botany*, so named by Mr. Brown, in memory of the late Mr. David Burton, a celebrated collector of plants for the Kew garden, under the patronage of Sir Joseph Banks. He died after a short stay in New South Wales; but Mr. Aiton's work evinces the great diligence of this unfortunate traveller. Mr. Salisbury's original *Burtonia* proved an **HIBBERTIA**. (See that article.)—Brown in Ait. Hort. Kew. v. 3. 12.—Class and order, *Decandria Monogynia*. Nat. Ord. *Papilionacea*, Linn. *Leguminosa*, Juss.

Eff. Ch. Calyx deeply five-cleft. Corolla papilionaceous, deciduous; petals nearly of equal length. Germen two-feeded. Style awl-shaped, dilated at the base. Stigma obtuse, beardless. Legume roundish, somewhat tumid. Seeds without any appendage. *Br.*

1. *B. scabra*. Rough-leaved *Burtonia*. Ait. n. 1.

(*Gomphobolium scabrum*; Sm. Tr. of Linn. Soc. v. 9. 250.)—Leaves ternate. Calyx smooth. Style bearded beyond the middle.—Found by Mr. Menzies, on the fourth-went coast of New Holland; and sent to Kew by Mr. Good, in 1803. A green-house shrub, flowering from May to July. The leaves are ternate, sessile, linear, revolute, rough to the touch. Flowers about the ends of the branches, axillary, dull purple when dried. There is no account of their natural colour. We do not perceive any important difference in character, and there is none in habit, between this plant and **GOMPHOLOBIUM** (see that article); but the unpublished species may be more distinct.

BURY, l. 10, after Pelee, add—created a baronet in 1800, who, about the year 1773; l. 15, add—In the course of his prosperity he purchased a seat at Chamber-hall, in the neighbourhood, which he afterwards sold; l. 18, for Bolton in Yorkshire *r.* Bolton-le-Moors in Lancashire; l. 23, *r.* the wheel or fly-stuttle, invented about one hundred years ago by Mr. John Kay, who, on account of the persecution he suffered on this account, was obliged to remove to France, where he died; and the card-making machine, for making several cards at once, invented by Mr. Robert Kay, the son of the former, who died about the year 1804. This machine straightens, &c.; l. 29, after shaft, add—and touching neither the wire nor the leather. The woollen manufactures, consisting of flannels, blankets, and a variety of other articles, were established in this town long before the introduction of the cotton trade, and contributed in no small degree to its prosperity; l. 47, *r.* in 1811, the number of houses in this township was 1562, and the number of inhabitants was 8762; 4219 being males, and 4543 females. The parish of Bury includes six townships, viz. Bury, Elton, Heap, Higher and Lower Tottington, and Walmerley.

BURY *St. Edmund's*, col. 3, l. 3, *r.* In 1811 this borough had 1474 houses, and 7986 inhabitants; 3539 being males, and 4447 females; 164 families employed in agriculture, and 966 in trade and manufactures.

BUSHEL. Add—See **COAL-Busbel** and **WEIGHT**.

BUTE. The shire of Bute, by the parliamentary return in 1811, contains 2047 houses, and 12,033 persons; 5545 being males, and 6488 females; 1216 families employed in agriculture, and 530 in trade, manufactures, and handicraft.

BUTLER, *r.* **BUTTER**, **WILLIAM**.

BUTLER, in *Geography*, a county of Pennsylvania, containing 7346 inhabitants.—Also, a township of this county, having 458 inhabitants.—Also, a township of Ohio, in the county of Columbiana, having 316 inhabitants.—Also, a county of Kentucky, containing 2181 inhabitants, of whom 274 are slaves.

BUTLER, *Chemical Properties of*. See **MILK**.

BUXTON. In 1811 the township contained 180 houses, and 934 inhabitants; 447 being males, and 487 females.

BUXTON, a township of America, l. 5, *r.* 2324.

BYRAM, a town of New Jersey, in the county of Essex, having 1224 inhabitants.

C.

C A E

C A E

CABAL, *l. ult.* after Shaftsbury, insert—lord Ashley.

CABARRAS, in *Geography*, a county of N. Carolina, with 6150 inhabitants, of whom 1234 are slaves.

CABELL, a county of Virginia, with 2717 inhabitants, of whom 221 are slaves.

CABINET, col. 2, l. 47, *r.* whether they be.

CABOS. Add—The former contains 974, and the latter 1003 inhabitants.

CABOS, in *Geography*, a town of Caledonia, in the district of Vermont, having 886 inhabitants.

CACHOLONG. See *MINERALOGY, Addenda.*

CADIZ, in *Geography*, a town of Jefferson county, in Ohio, with 1374 inhabitants.

CADMIUM, in *Chemistry*, the name of a metal. This metal was discovered by M. Stromeyer in the autumn of 1817, while he was officially examining the apothecaries' shops in Hanover.

Cadmium resembles tin in its colour, lustre, softness, ductility, and the found it produces when bent. Its sp. gr. is 8.6359. It melts and volatilizes at a temperature a little lower than zinc. It preserves its splendour in the air, but by heat it is changed into a yellow oxyd, which is not volatile, and which is very easily reduced. This oxyd does not colour borax; it dissolves very readily in acids, and forms colourless salts, from which it is precipitated white by alkalis. The hydrosulphuric acid (solution of sulphuretted hydrogen) precipitates it yellow, like arsenic. Zinc precipitates it in the metallic state.

This is all which at present we know of this metal, except that it was first obtained from the sublimate which concretes in the chimnies of the zinc furnaces of Saxony; and, consequently, that it exists in the ores of zinc there employed. We understand also that it has been detected in some similar ores of zinc in this country.

CAERFILLY, &c. col. 2, l. 49, add—It has a market on Thursday, and six fairs in the year. By the parliamentary returns of 1811, the number of houses in this hamlet of Eglwysilan parish was 196, and of inhabitants 1013, viz. 462 males, and 551 females.

CAERLEON, col. 3, l. 18 from bottom, *r.* The town consists, by the return of 1811, of 170 houses, and 593 inhabitants.

CAERMARTHEN, col. 3, l. 17, after it contains, add—by the parliamentary returns in 1811, 1189 houses, and 7275 inhabitants. The charter allows three markets, viz. on Wednesday, Friday, and Saturday, but the latter is the only one numerously attended by the farmers. It has four fairs in the year, and, &c.

CAERMARTHENSHIRE, l. 7,—others reckon its length 50, and breadth 25 miles. Cary estimates its superficial contents at 512,000 acres; l. 23, The 'Towy is VOL. XXXIX.

much celebrated for its fish; its salmon is highly esteemed; as is also its sewin. The other rivers, not above enumerated, are, the Lougher, Lloghor, or Lycher, which separates this county for some distance from Glamorganshire, receiving in its course the Amman, which united streams discharge themselves into Caermerthen bay, by a wide estuary called the Bury river, navigable for small vessels as high as the town of Lloghor. Another river, denominated Gwendraeth vawr, or great, has its source in a lake at the upper extremity of Mynudd mawr, and joins the sea below Kidwelly: this is joined by Gwendraeth vaeh, or the less. Other rivers are the Pycottwr, which falls into the Dethia, and the Camdwer, which augments the Towy. The river Bran unites with the Towy below Llandoverly; the other tributary streams are, the Sawddy, proceeding from a lake in the Black mountain, and the Cennen, which join the Towy, as well as the Cothy and Gwilly, already mentioned. The Corven and the Taf unite at the village of St. Clears, and run into the Caermerthen bay at Laugharne. The lakes of this county are Llyn Tagwyn, or pwll yr Efcob, or the Bishop's pool, situated at the northern extremity, and on the highest elevation of Mynudd mawr, an extensive bleak common, W. of Llandybie, and occupying a surface about half a mile in diameter. Another lake is situated on the Black mountain, at the foot of the almost perpendicular declivity of the Caermerthen Fan, or beacon, and extending in form of a parallelogram about one mile in its greatest length. The other lakes are two, which communicate by a strait, and appear like one, situated on the banks of the river Cothy, and near the ruins of the abbey of Talley. The mountains are part of Plinlimmon, and on the E. the long chain called the Black mountain, the summit of which, called y Fan, or Ban Sir Gaer, the Caermerthenshire beacon, is the highest ground in the county. The height of this peak has been estimated at about 2600 feet above the level of the sea. It is separated by a chasm from another eminence, of superior altitude, in Brecknockshire. Both are denominated Bannau Sir Gaer, or Caermerthenshire beacons, in the plural, to distinguish them from those called Bannau Brecheingor, or the Brecknockshire beacons. Another mountain lies on the borders of Glamorganshire, called Bettws mountain; it is a chain diverging from the Black mountain, at the upper end of the valley of Tawe, and stretching along the eastern shore of the Amman and Lloghor nearly to the sea:—l. 37 —The number of parishes has been variously estimated; some having reckoned them at 76, others at 85, and others at 78, besides 12 chapelries. The number of market-towns is stated at eight. This county, by the last return in 1811, contained 14,856 houses, and 77,217 inhabitants; 9878 families employed in agriculture, and 5256 in trade and manufactures.

CAERNARVON. Add—In 1811 the parish of Llan-
3 F bcbhg,

beblig, in which it is situated, contained 1900 houses, and 4595 persons; viz. 1982 males, and 2613 females.

CAERNARVON, a township of America, &c. l. 2, add—containing 1084 inhabitants.—Also, a township of Berks county, in Pennsylvania, having 723 inhabitants.

CAERNARVONSHIRE, l. 17, r. In 1811 this county contained 9369 houses, and 49,336 persons; viz. 23,379 males, and 25,957 females: 6667 families employed in agriculture, and 2687 in trade and manufactures.

CAERWENT. Add—The parish of Caerwent, in 1811, contained 60 houses, and 375 persons; viz. 206 males, and 169 females.

CAERWYS. Add—In 1811, the parish of Caerwys contained 209 houses, and 863 persons; viz. 416 males, and 447 females.

CÆSARIA, r. COHAWZY.

CÆSIA, in *Botany*, dedicated by Mr. Brown to the memory of Frederico Cæzio, a young Roman nobleman, illustrious for the patronage and cultivation of science, especially of natural history, who founded the academy of the *Lyneei* at Rome in 1603. This was the first institution of the kind, and is celebrated in various authors of that day. The great Galileo was among its members, as well as that indefatigable botanist Fabio Colonna, better known by his Latin appellation, Columna. This institution died with its noble founder, in 1630; but the scientific associations of Italy, and thence of all Europe, have sprung from its ashes.—Brown Prodr. Nov. Holl. v. 1. 277.—Class and order, *Hexandria Monogynia*. Nat. Ord. *Coronarie*, Linn. *Asphodeli*, Juss. *Asphodelee*, Br.

Ess. Ch. Corolla in six deep, equal, spreading segments, deciduous. Filaments beardless, contracted at each end. Anthers attached by their cloven base. Germs of three cells, with two seeds in each. Style thread-shaped. Stigma one. Capsule scarcely valvular; tumid and lobed at the summit; or club-shaped. Seeds tumid, with an appendage to the scar.

Herbs generally annual, smooth. *Root* of clustered, thick fibres, or oblong knobs. *Leaves* grassy. *Clusters* either divided or simple, with aggregate or solitary flower-stalks, joined under the corolla. *Flowers* whitish, or blue, erect, rarely drooping. *Corolla* becoming spiral after flowering, and soon falling off entire. *Anthers* yellow.

This genus approaches the *Phalangium* of Jussieu, but differs abundantly in the structure of the germs and seeds.

1. *C. vittata*. Striped Cæsia. Br. n. 1.—Flowers drooping. Stamens pendulous, with parti-coloured filaments. Clusters divided or simple. Leaves flattish. Bulbs fasciculated.—Gathered by Mr. Brown at Port Jackson, and Van Diemen's land.

2. *C. parviflora*. Small-flowered Cæsia. Br. n. 2.—Flowers erect. Filaments simple-coloured. Clusters panicled. Root fibrous.—From the same countries.

3. *C. occidentalis*. West-coast Cæsia. Br. n. 3.—Flowers erect. Filaments simple-coloured. Clusters scarcely divided. Leaves thread-shaped, channelled.—Found by Mr. Brown, in the south-west part of New Holland.

4. *C. corymbosa*. Unbranched Cæsia. Br. n. 4.—Common flower-stalk radical, unbranched. Corymb of few flowers. Leaves flattish.—Native of the south coast of New Holland, and of Van Diemen's land.

5. *C. lateriflora*. Lateral-flowered Cæsia. Br. n. 5.—Stem much branched, scaly. Flowers lateral, drooping, mostly solitary. Capsule club-shaped, pendulous, generally single-seeded.—Gathered by Mr. Brown, in the tropical part of New Holland. The filaments are roughish, and the

habit, inflorescence, and capsule differ greatly from all the other species. *Brown*.

CAFFISE, or CAHIZ, in *Commerce*, a measure for corn in Spain, containing 12 fanegas. See FANEGA.

CAFFISO, a measure for oil in Sicily, weighing 12½ rotoli, or about 24 lbs. avoirdupois.

CAHOKIA, in *Geography*, a township of St. Clair county, in the Illinois country, with 711 inhabitants.

CAJEPUT OIL, l. 2,—leaves of a species of the *Melaleuca*, a tree, &c.

CAITHNESS. By the parliamentary returns of 1811, the shire of Caithness contained 4301 houses, and 23,419 persons; viz. 10,608 males, and 12,811 females: 3270 families employed in agriculture, and 838 in trade and manufactures.

CAKILE, in *Botany*, an Arabic name, used by Serapio.—Tourn. Cor. 43. t. 483. Gært. v. 2. 287. t. 141. Willd. Sp. Pl. v. 3. 416. *Brown* in Ait. Hort. Kew. v. 4. 71.—Class and order, *Tetradynamia Siliquosa*. Nat. Ord. *Siliquose*, Linn. *Crucifere*, Juss.

Ess. Ch. Pouch of two single-seeded joints; seed of the uppermost erect, sessile; of the lower pendulous.

Obf. The lower joint is occasionally abortive.

This genus is the real *Bunias* of Linnæus, nor can we see why that name should be changed for the barbarous *Cakile*, though we agree with Mr. Brown in removing hither several species of *Myagrum*, as in the Prodr. Fl. Græc.

CALABOSO, in *Geography*, a town of South America, in Venezuela, situated between two rivers, viz. Guarico to the W. and Orituco to the E. which unite their waters four or five leagues below the town. It is situated in a hot climate, in N. lat. 8° 40', 52 leagues S. of Caraccas, and at about the same distance N. of the Oronoko, and in the year 1804 its population amounted to 4800 persons.

CALADENIA, in *Botany*, from καλοῖ, handsome, and ἀδης, a gland, alluding to the beautiful rows of glands on the lip.—Brown Prodr. Nov. Holl. v. 1. 323. Ait. Hort. Kew. v. 5. 203. (Arethusa; Sm. Exot. Bot. v. 2. t. 104.)—Class and order, *Gynandria Monardria*. Nat. Ord. *Orchideae*.

Ess. Ch. Upper calyx-leaf rather flattened; two lower, with the petals, deflexed under the lip, flat; all glandular at the back. Lip somewhat stalked, with rows of glands on its disk. Style winged. Anther a moveable lid. Pollen powdery.

An elegant tribe of small herbaceous plants, clothed with glandular, intermixed with simple, hairs. *Bulbs* undivided, terminating the descending base of the stem, inclosed in a scaly coat. *Leaf* solitary, nearly radical, mostly linear, enclosed by a sheath at the base. *Stalk* bearing one bractæa, besides those immediately accompanying the one, two, or three inodorous, variously-coloured, flowers. *Anther* most frequently pointed.

Mr. Brown defines thirteen genuine species, from various parts of New Holland. These have, as it were, ringent flowers, the petals nearly equal to the two lower calyx-leaves, and forming with them an under lip, while the upper consists of the upper leaf of the calyx, not quite so flat as the rest. To these are subjoined two species, whose petals are very long, narrow, and directed upwards; and to these, as possibly a distinct genus, the name of *Leptoceras* is given.

Of the true *Caladenia*, the first only, *C. alba*, has been brought alive to England, by Mr. Geo. Caley in 1810, and is marked by Mr. Aiton as a green-house plant, flowering in July and August.—The fifth species, *C. alata*, is probably *Arethusa catenata*, Sm. Exot. Bot. v. 2. 89. t. 104.

CALADIUM, a name used by Rumphius, for some kinds

kinds of *Arum*, and therefore retained by Ventenat for this genus, which is extracted from that.—Venten. Jard. de Cels, 30. Brown Prodr. Nov. Holl. v. 1. 336. Willd. Sp. Pl. v. 4. 4^o. Ait. Hort. Kew. v. 5. 310.—Clafs and order, *Monocotyledonaria*. Nat. Ord. *Piperites*, Linn. *Aroides*, Juss. br.

Eff. cu. Sheath of one leaf; convolute at the base. Spadix covered at the summit with peltate many-celled anthers; glandular in the middle; covered with germens at the base. Stigma umbilicated. Berries of one cell, with many feeds.

This genus, differing from *Arum* chiefly in the *spadix* being covered in all its upper part with *filaments*, except, in some instances, a small naked point, is divided like that, (see *ARUM*.) into three sections, familiarly distinguished. Willdenow has fifteen species in all.

SECT. 1. *Stem none. Leaves compound.* One species.

1. *C. heliborifolium.* Heilebore-leaved Caladium. Willd. n. 1. Ait. n. 1. (*Arum heliborifolium*; Jacq. Coll. v. 3. 217. Ic. Rar. t. 613.)—Leaves radical, pedate, entire.—Native of woods in Martinico and the Caraccas. The flowers are greenish-white, on radical stalks. Leaves a foot in breadth, of eleven elliptic, acute leaflets.

SECT. 2. *Stem none. Leaves simple.* Six species, to which we add one.

2. *C. pinnatifidum.* Pinnatifid Caladium. Willd. n. 2. (*Arum pinnatifidum*; Jacq. Hort. Schoenbr. v. 2. 31. t. 187.)—Stem none. Leaves pinnatifid.—Native of woods at the Caraccas, where this large species grows on rocks and trees. The leaves are two feet long, and nearly as broad, deeply pinnatifid, with great red ribs. Flowers almost sessile; blood-red in their lower half; white, like the *spadix*, above. The rest are,

3. *C. ovatum.* Ovate Caladium. (*Arum ovatum*; see our n. 22. Linn. Sp. Pl. 1371. Karin pola; Rheede H. Mal. v. 11. 45. t. 23.)

4. *C. bicolor.* Two-coloured Caladium. Vent. Cels, t. 30. Ait. n. 2. (*A. bicolor*; n. 10. Curt. Mag. t. 820. Jacq. Hort. Schoenbr. v. 2. 30. t. 186.)—This was long mistaken for *Arum pictum*, Linn. Suppl. 410.

5. *C. nymphifolium.* Water-lily-leaved Caladium. Willd. n. 5. Ait. n. 3. (Wellsia; Rheede H. Mal. v. 11. 43. t. 22.)—Stem none. Leaves peltate, ovate-arrowshaped. Sheath cylindrical, with a lanceolate point, shorter than the *spadix*.—Native of the East Indies.

6. *C. esculentum.* Eatable Caladium, or Indian Kale. Ait. n. 4. (*Arum esculentum*; n. 11. A. minus, nymphææ foliis, esculentum; Sloane Jam. v. 1. 167. t. 106. f. 1.)

7. *C. acre.* Acrid Caladium. Br. n. 1.—Stem none. Leaves peltate, heart-shaped. Spadix obtuse, with a very short, occasional, naked point. Sheath lanceolate, twice as long as the *spadix*.—Gathered in the tropical part of New Holland by Mr. Brown, who remarks that it scarcely differs, except in having *anthers* to the summit of the *spadix*, from the last, which has a manifest acute naked point, and he does not see how the latter is distinguished from *Arum Colocasia*.

8. *C. sagittifolium.* Arrow-leaved Caladium. Willd. n. 7. Ait. n. 5. (*Arum sagittifolium*; n. 16. Jacq. Hort. Vind. v. 2. 73. t. 157.)

SECT. 3. *With leafy stems.* Eight species.

9. *C. scandens.* Climbing Caladium. Willd. n. 8. (“*Culcalia scandens*; Beauv. Fl. Ov. et Ben. 4. t. 3.”)—Climbing. Leaves ovate-oblong, pointed. Spadix longer than the hooded *spatha*.—Native of Benin, on the coast of Africa.

10. *C. feguinum.* Dumb-Cane Caladium. Willd. n. 9. Ait. n. 6. (*Arum feguinum*; n. 26. Linn. Sp. Pl. 1371.)

11. *C. xanthorrhizon.* Yellow-rooted Caladium. Willd. n. 10. (*Arum xanthorrhizon*; Jacq. Hort. Schoenbr. v. 2. 32. t. 188.)—Stem erect. Leaves heart-arrowshaped. Sheath hooded, contracted in the middle, longer than the *spadix*.

12. *C. grandifolium.* Great-leaved Caladium. Willd. n. 11. Ait. n. 7. (*Arum grandifolium*; Jacq. Hort. Schoenbr. v. 2. 32. t. 189.)—Stem taking root. Leaves heart-arrowshaped. Spatha with an ovate hood, not longer than the *spadix*.—On rocks and trees at the Caraccas.

13. *C. arborescens.* Tree Caladium. Willd. n. 12. Ait. n. 8. (*Arum arborescens*; n. 25. Linn. Sp. Pl. 1371.)

14. *C. lacernum.* Jagged Caladium. Willd. n. 13.—“Stem taking root. Leaves heart-shaped, sinuated.”—Parasitical on trees at the Caraccas. Sent by Jacquin, under the above name, to Willdenow.

15. *C. tripartitum.* Three-leaved Caladium. Willd. n. 14. (*Arum tripartitum*; Jacq. Hort. Schoenbr. v. 2. 33. t. 190.)—Stem taking root. Leaves ternate. Footstalks naked. Spadix the length of the ovate-hooded sheath.—From the Caraccas.

16. *C. auritum.* Ear-leaved Caladium. Willd. n. 15. Ait. n. 9. (*A. auritum*; n. 29. Linn. Sp. Pl. 1371. Jacq. Hort. Schoenbr. v. 2. 33. t. 191.)

CALAIS, l. 3, for 43 r. 41, a town of Washington county, in the district of Maine, which by the census of 1810 contained 372 inhabitants.—Also, a town of Caledonia county, in Vermont, containing 841 inhabitants.

CALCIUM, in *Chemistry*, the metallic basis of lime. See LIME.

CALDÁRA DA CARAVAGGIO, POLIDORO, in *Biography*, an eminent painter, was born in the Milanese, and from the humble station of a labourer became an assistant of Raphael in the works of the Vatican, and at length acquired universal celebrity in his imitation of the antique basso-reliefs, which he executed in chiaro-oscuro. His style was in so peculiar a sense his own, that, having formed it, it also perished with him. His design was without manner, compact, and correct. He had the art of transporting himself, says his biographer, into the times of which he represented, the transactions, the costume and rites, so that nothing modern is discerned in his works. Numerous as his performances once were at Rome, scarcely a fragment remains, if we except the fable of Niobe, left in ruins by time and the rage of barbarians. For these losses we are compensated merely by the prints of Cherubino Alberti, and Henry Golzius, who engraved his gods, the Niobe, and the Brennus; and also by the etchings of Santes Bartoli and Gallestruzzi. On occasion of the pillage of Rome by Bourbon in 1527, Polidoro fled to Naples, where he was patronized by Andrea da Salerno, and gained such reputation that he began to form a school; but declining the prosecution of this undertaking, he removed to Sicily. Having exchanged chiaro-oscuro for colour, he painted at Messina a numerous composition of Christ led to Calvary, which has been highly extolled by Vafari; and not long after the completion of this work, he was strangled in bed by a servant, who wished to get possession of his property. His manner, as a colourist, is said to have been dim and pallid. He died in 1543, at the age of 51 years. Pilkington's Dict. of Painters by Eusebi.

CALDWELL, in *Geography*, a town of Essex county, in New Jersey, containing 2235 inhabitants, of whom 54 are slaves.—Also, a county of Kentucky, with 4268 inhabitants, including 570 slaves.

CALECTASIA, in *Botany*, from *κατος*, beautiful, and *ελασις*, an extension, or dilatation, alluding to the elegant star-like expansion of the corolla.—Brown Prodr. Nov. Holl.

v. 1. 263.—Clafs and order, *Hexandria Monogynia*. Nat. Ord. *Junci*, Juff. *Juncæ*, Br.

Eff. Ch. Calyx inferior, tubular, falver-shaped; limb coloured, in fix deep segments. Stamens inferted into the mouth of the tube. Anthers linear, converging, attached by the bafe. Germen of one cell, with rudiments of three erect feeds. Style thread-shaped. Stigma fimple. Capfule membranous, fingle-feeded, enclosed in the hardened tube of the calyx.

1. *C. cyanea*. Blue Calceftafia. Br. n. 1. Bot. of Terra Austr. 77. t. 9.—Found by Mr. Brown, on the fouthern coast of New Holland.—A little fhrub, flowering in December, very much branched, clothed with acerofe leathing leaves. Flowers folitary, at the ends of the fhort branches. Tube of the calyx covered by the sheaths of the leaves; the limb prominent, like a bright blue ftar, of fix equal rays, the three outermoft downy underneath. This pretty genus is not very nearly allied to any other, though fomething like *Aphyllanthes*, but widely different in ftructure, and rather approaching *DASYFOGON*, hereafter to be defcribed.

CALEDONIA, a county of Vermont, l. 2, r. 23; add.—In 1810, it contained 18,750 inhabitants.

CALEIDOSCOPE, or KALEIDOSCOPE, from $\kappa\alpha\lambda\omicron\varsigma$, beautiful, $\omega\delta\omicron\varsigma$, a form, and $\sigma\kappa\omicron\upsilon\varsigma$, to fee, an inftrument recently invented by Dr. Brewfter, and for which he has obtained a patent, for the purpofe of creating and exhibiting an infinite variety of beautiful forms.

The inftrument in its fimpleft form confifts of two reflecting planes, inclined to each other, made either of two plates of glafs, blackened or filvered, or two metallic fufaces, or the two inner fufaces of a folid prism of glafs, or rock-crystal, from which the light fuffers total reflection. The plates may be of any length; but that which is moft convenient will be found to be from five to ten or twelve inches, or they may be made only two, three, or four inches long, provided diftinct vifion is obtained at one end, by placing at the other end an eye-glafs, whose focal length is equal to the length of the reflecting-plane; their breadth fhould be about eight or nine-tenths of an inch when the length is fix inches; but it fhould increafe with the length, in order to have the aperture of the fame angular magnitude. Two edges of thefe reflectors, being made perfectly ftraight, are placed together by a particular contrivance, in fuch a manner, that their inclination, or the angle which they form, is exactly an even aliquot part of a circle, or a fourth, fixth, eighth, tenth, twelfth, fourteenth, &c. part of 360° . When the plates are thus fixed in a tube, and the eye placed at one end, as near as can be, in the line of the interfection of the two planes, it will perceive a circular field of view, compofed of as many luminary fectors as the number of times the angle formed by the reflectors is contained in 360° . Thefe fectors, excepting the one feen by direct vifion, and conftituting the angular aperture of the plates, are a ferief of images of this aperture, formed by fucceffive reflections between the inclined reflectors. The images formed by one reflector from each of the plates lie on each fide of the direct aperture, and are inverted images of that aperture; the next two images formed by two reflections are images not inverted; and fo on throughout the whole ferief, every two direct images being feparated by an inverted one.

From thefe obfervations, it will be feen that the calceidofcope is not an inftrument which produces beautiful forms by the multiplication of fingle forms; for it is demonftrable, that a fymmetrical and beautiful pattern cannot be produced by the repetition of any fingle form: and if it were poffible to conftitute a multiplying-glafs with mathematical perfec-

tion, and free from all the prifmatic colours, it would be impoffible to produce with it an arrangement of fimple forms, marked with fymmetry and beauty. The principle of the calceidofcope, therefore, is to produce fymmetry and beauty by the creation and fubfequent multiplication of compound forms, each of which is compofed of a direct and an inverted image of a fimple form.

The tube which holds the reflecting plates moves in another tube; and upon the outer end of the laft tube is placed a cell, or cap, for receiving a ferief of object-plates, containing fragments of differently-coloured glafs and other fubftances placed at random. When one of thefe object-plates is placed in the cell, the inner tube is pushed in as far as it will go; and the inftrument being held in one hand, the cell containing the object-plates may be removed round with the other, and the eye of the obferver being placed at the other will obferve the irregular mafies of colour arranged in an infinite variety of forms, mathematically fymmetrical, and highly pleafing to the eye.

If the object be put in motion, the combination of images will likewise be put in motion, and new forms, perfectly different, but equally fymmetrical, will fucceffively prefent themfelves; fometimes varying in the centre, fometimes emerging from it, and fometimes playing around it in double and oppofite oscillations. When the object is tinged with different colours, the moft beautiful tints are developed in fucceffion, and the whole figure delights the eye by the perception of its form, and the brilliancy of its colouring.

The effects, of which we have given a general defcription, obviously arife from inverfion and fubfequent multiplication of every object placed before the angular aperture, or the luminous fector feen by direct vifion, and from the perfect junction of all the reflected images. When the object is moved, the inverted images all feem to move in an oppofite direction, while the images not inverted move in the fame direction with the object: and from thefe oppofite motions, as well as from the entrance of new objects, by the revolution or the direct motion of the object-plate, arifes that endless variety of forms which affords fo much gratification to the eye.

In the preceding form of this inftrument, the object muft neceffarily be placed clofe to the end of the reflectors; for if it is removed from this pofition, the fymmetry is deftroyed, and the deviation from a fymmetrical form increafes as the diftance of the object from the reflector increafes. The ufe of the inftrument in this form is, therefore, limited to objects which can be held clofe to the reflector.

This limitation, however, has been fuperfeded; and the ufe and application of the inftrument indefinitely extended by an optical contrivance. A lens of a fhort focal length is placed on the object end of the outer tube, and the inner tube is drawn out till the image of objects, whatever be their diftance, falls exactly on the outer end of the reflectors. When this is the cafe, thefe objects will be arranged into the moft beautiful and fymmetrical forms, in the fame manner as if they had been reduced in fize, and actually placed at the end of the reflectors. In this way, every object in nature may be introduced into the picture formed by the inftrument, and the obferver will derive a new and endless fource of enjoyment by the creation of pictures of natural objects, whether animate or inanimate.

As the calceidofcope is of great ufe in the ornamental arts, particularly to carpet and lace manufacturers, calico-printing, paper-ftaining, jewellery, &c. &c., its adaptation to their purpofe is effected by occasionally furnifhing the inftrument with a ftand, in order that the pattern may be fixed

whilst the art is engaged in copying it. It is also capable of being used with Dr. Wollaston's camera lucida, by which means those who would otherwise be unable to copy the patterns may do it with perfect facility and accuracy. The effects of the instrument may also be exhibited to many persons at once, on the principles of the solar microscope, or magic lantern. The instrument for scientific purposes is occasionally so constructed as to admit of the inclination of the reflectors being varied at pleasure. Under the authority of Dr. Brewster, caleidoscopes of all the different forms are manufactured by the opticians with great accuracy and perfection; but the popularity of the instrument has been such as to induce a great number of individuals, who have been ignorant of its principles, to infringe upon the patent, and impose upon the public a wretched imitation of the original, possessing none of the properties which are essentially necessary to the production of beautiful and symmetrical forms; and in order to justify such proceedings, it became necessary to search out for some combination of mirrors already described, which might have some resemblance to Dr. Brewster's instrument: and the first supposed anticipation of it was found in prop. 13 and 14 of Wood's Optics; but professor Wood, in a letter to Dr. Brewster on the subject, has most handsomely disclaimed having in contemplation the effects produced by the caleidoscope in giving the propositions alluded to. The next supposed anticipation was an instrument proposed and made by Mr. Bradley in 1717, which consisted of two pieces of silvered looking-glasses, five inches wide, and four inches high, jointed together with hinges, and opening like a book. These plates being set upon a geometrical drawing, and the eye being placed in front of the mirrors, the lines of the drawing were seen multiplied by repeated reflections. This instrument had been described long before by Kircher, and did not receive a single improvement from the hands of Bradley. It had been often made by the opticians; but no person ever thought of applying it to any purpose of utility, or of using it as an instrument of rational amusement by the creation of beautiful forms: indeed, from its construction, it is quite incapable of producing any of the singular effects of the caleidoscope. As, however, the similarity between the two instruments is maintained by many persons, either from ignorance or interest; in order, therefore, to render that justice to Dr. Brewster which to us appears his due, we give the following statement of the differences between the two instruments, upon the supposition of their both being applied to geometric lines upon paper.

1. In Bradley's instrument, the length is less than the breadth of the plates.

2. Bradley's instrument cannot be used with a tube.

3. In Bradley's instrument, from the erroneous position of the eye, there is a great inequality of light in the sectors, and the last sectors are scarcely visible.

4. In Bradley's instrument, the figure consists of elliptical, and consequently unequal sectors.

1. In the caleidoscope, the length of the plates must be four, five, or six times their breadth.

2. The caleidoscope cannot be used without a tube.

3. In the caleidoscope, the eye is so placed, that the uniformity of light is a maximum, and the last sectors are distinctly visible.

4. In the caleidoscope, all the sectors are equal, and compose a perfect circle, and the picture is perfectly symmetrical.

5. In Bradley's instrument, the unequal sectors do not unite, but are all separated from one another by a space equal to the thickness of the mirror-glass.

6. In Bradley's instrument, the images reflected from the first surface interfere with those reflected from the second, and produce a confusion and overlapping of images entirely inconsistent with symmetry.

7. In Bradley's instrument, the defects in the eye is so placed, that these junctions of the plates are all rendered visible by the erroneous position of the eye.

5. In the caleidoscope, the equal sectors all unite into a complete and perfectly symmetrical form.

6. In the caleidoscope, the secondary reflections are entirely removed, and therefore no confusion takes place.

7. In the caleidoscope, the eye is so placed, that these defects of junction are invisible.

To which it may be added, that professors Playfair of Edinburgh, and Pictet of Geneva, and the celebrated Mr. Watt, have each of them borne testimony to the dissimilarity of the two instruments, and to the unquestionable claim which Dr. Brewster has to the invention of the caleidoscope.

CALENDAR. To the French calendar, annex—the French have abolished their new calendar, and restored the Gregorian, which was ordered to be used in all their dates after the 1st of January, 1806.

CALEYA, in *Botany*, a very distinct and elegant genus, thus named by Mr. Brown, in just commemoration of Mr. George Caley, an able and accurate botanist, who has for several years been employed by Sir Joseph Banks, in the investigation of the vegetable productions of New South Wales, but whose discoveries are not all admitted into Mr. Brown's work, being, we hope, destined to appear in some more popular, and more amply descriptive, publication.—Brown in Ait. Hort. Kew. v. 5. 204. (Caleana; Br. Prodr. Nov. Holl. v. 1. 329.)—Class and order, *Gynandria Monandria*. Nat. Ord. *Orchideæ*.

Eff. Ch. Flower reversed. Calyx-leaves and petals linear, nearly equal, spreading. Lip stalked, peltate, hollow, opening outwards. Style dilated. Anther a permanent lid. Pollen powdery.

There are two species, *C. major* and *minor*, both found near Port Jackson; the former sent to Kew, by Mr. Caley, in 1810. These are smooth *herbs*, with simple naked bulbs. *Leaf* radical, solitary, linear, sheathed at the base. *Flowers* few, brownish-green; the *lip* and *column* red. The *lip* is moveable, reflexed; but during rain it becomes inflexed over the *column*, which Mr. Brown is doubtful whether to attribute to the diminution of light, or to the irritation of the rain.

CALICIUM, from *καλιον*, a little cup, well expressing the form of the fructification.—Perf. in *Uit. Ann. fasc. 7. 20. Achar. Syn. 55.* "Lichenogr. 39. t. 3. f. 1—8."—Class and order, *Cryptogamia Alga*. Nat. Ord. *Lichenes*.

Eff. Ch. Crust uninterrupted, uniform. Receptacles cup-shaped, cartilaginous, stalked, more or less elevated, containing a compact powdery mass of seeds, forming an even disk.

Acharius defines twenty-five species of this curious and beautiful, though minute and inconspicuous genus of the *Lichen* tribe. They form grey, white, or yellow patches, of various extent, on old wrought wood, or boards, exposed to the

the weather; sometimes on the old bark of trees. The *receptacles* are, most frequently, each elevated on a slender brittle-like *stalk*, usually black, like a horse-hair, and so different from the chalky or granulated *crust* from whence they grow, as to appear altogether parasitical. Their powder when touched stains the fingers. Sixteen species are described and figured in Eng. Bot. especially in vol. xxxv.

CALLICOMA, Curt. Mag. t. 1811. See CODIA.

CALLISTACHYS, or rather CALLISTACHYA. See OXYLOBIUM.

CALNE. The borough and parish of Calne, in 1811, contained 750 houses, and 3547 persons; viz. 1621 males, and 1926 females: 325 families employed in agriculture, and 402 in trade and manufactures.

CALOCHILUS, in *Botany*, from *καλος*, beautiful, and *χιλος*, a lip.—Brown Prodr. Nov. Holl. v. 1, 320.—Clafs and order, *Gynandria Monandria*. Nat. Ord. *Orchidee*.

Eff. Ch. Calyx ringent; two lower leaves under the lip. Petals sessile, smaller, erect. Lip longer than the calyx, sessile, pointed; bearded at the margins and on the disk. Anther parallel to the stigma, permanent.

Herbage smooth. *Bulbs* undivided, naked. *Leaves* few, all on the stem; the lower one channelled, much longer than the rest. *Spike* racemose, lax, with prominent, reddish, rather large *flowers*. Nearly akin to *NEOTTIA*; see that article.

1. *C. campestris*. Br. n. 1.—Lip not much longer than the calyx, with a half-lanceolate point, one-fifth its own length. Column with two glands at the base. Bractæes longer than the germen. Flowers from four to eight.—Gathered by Mr. Brown at Port Jackson, as well as in the tropical part of New Holland.

2. *C. paludosus*. Br. n. 2.—Lip twice the length of the calyx, with a ligulate zigzag point, half its own length. Column without glands. Bractæes shorter than the germen. Flowers from two to four.—Found by Mr. Brown, at Port Jackson.

CALOCHORTUS, from *καλος*, beautiful, and *χορτος*, a grass. Pursh 240.—Clafs and order, *Hexandria Trigynia*. Nat. Ord. *Coronaria*, Linn. *Junci*, Juss. *Melanthacee*, Brown.

Eff. Ch. Corolla in six deep spreading segments; three innermost largest; woolly above, with a smooth spot at the base. Filaments very short, inserted into the base of each segment. Anthers erect, arrow-shaped. Stigmas reflexed. Capsule of three cells.

1. *C. elegans*. Grassy Woolly-flower. Pursh n. 1.—Found by governor Lewis, at the head-waters of the Koolkoolky, North America, flowering in May. *Bulb* solid, globular, eaten by the natives. *Leaf* solitary, radical, grassy, ribbed, nearly smooth, taller than the *flower-stalk*, which is simple, round, smooth, bearing two or three very elegant, drooping, white *flowers*, the size of *Hypoxis erecta*, on slender *partial stalks*, each accompanied by a linear-lanceolate *bractea*. The three inner segments of the *corolla* are covered with long down, and marked with a roundish, smooth, purple spot at their base.

CALOGYNE, from *καλος*, handsome, and *γυνε*, a female.—Brown Prodr. Nov. Holl. v. 1, 579.—Clafs and order, *Pentandria Monogynia*. Nat. Ord. *Campanacee*, Linn. *Campanulacee*, Juss. *Goodenovie*, Brown.

Eff. Ch. Calyx superior, in five deep equal segments. Corolla two-lipped. Anthers separate. Style three-cleft. Stigmas each with a cup-shaped integument. Nectary a gland between the two lower filaments. Capsule imperfectly two-celled. Seeds imbricated, compressed.

1. *C. pilosa*. Br. n. 1. the only species, found by Mr. Brown in the tropical part of New Holland. An annual hairy plant, smelling when dried like our *Antboxanthum*. The *leaves* are cut or toothed; floral ones auricled at the base. *Stalks* axillary, single-flowered, without *bractæes*; reflexed as the *fruit* ripens.

This plant is separated from *GOODENIA*, (see that article,) solely on account of the three-cleft *style*, and three *stigmas*, and Mr. Brown hesitates about the propriety of the measure.

CALOMERIA. See HUMEA.

CALOPOGON, from *καλος*, handsome, and *πογων*, a beard.—Brown in Ait. Hort. Kew. v. 4, 204.—Clafs and order, *Gynandria Monandria*. Nat. Ord. *Orchidee*.

Eff. Ch. Flower reversed. Calyx and petals spreading, distinct. Lip stalked; disk bearded. Style unconnected. Anther terminal, permanent; pollen angular.

1. *C. pulchellus*. Tuberous Calopogon. Ait. n. 1. (*Limodorum tuberosum*; Linn. Sp. Pl. 1345. Curt. Mag. t. 116. *Cymbidium pulchellum*; Swartz Nov. Act. Upf. v. 6, 75. Willd. Sp. Pl. v. 4, 105. Pursh 592. Big. Bot. 208.)—Native of meadows and mossy bogs, in North America, from Canada to Florida, flowering in July. An elegant plant, eighteen inches high, unbranched, with a small, tuberous, white *root*, one sheathing sword-shaped *leaf*, and a simple lax *spike*, of three or four large, beautiful, purple *flowers*, whose *lip* bears a yellow tuft of round-headed fibres. We cannot but think, with Mr. Salisbury, *Parad. 89*, that this is a genuine *Arctostaphylos*, agreeing precisely in habit with *A. bulbosa*. Few orchideous genera are more natural.

CALOSTEMMA, from *καλος*, beautiful, and *στεμμα*, a crown.—Brown Prodr. Nov. Holl. v. 1, 297.—Clafs and order, *Hexandria Monogynia*. Nat. Ord. *Spitacee*, Linn. *Narcissi*, Juss.

Eff. Ch. Petals six. Nectary with twelve segments, bearing the stamens. Berry globose, with one or two seeds. Distinguished from *PANCRATIUM*, as Mr. Brown observes, chiefly by the structure of the single-celled germen and pericarp. The *flowers* are small, not an inch long, either white or purple. The *seeds* germinate in the berry.

1. *C. album*. Br. n. 1.—Leaves elliptic-oblong, mostly solitary. Barren segments of the nectary linear, emarginate.—Native of the tropical part of New Holland.

2. *C. purpureum*. Br. n. 2.—Flower-stalk earlier than the leaves. Barren segments of the nectary triangular.—Found on the southern coast of New Holland.

CALOTHAMNUS, so named from *καθος*, beautiful, and *θαμος*, a shrub, and it well deserves the appellation.—Labill. Nov. Holl. v. 2, 25. Brown in Ait. Hort. Kew. v. 4, 417.—Clafs and order, *Polyadelphia Icosandria*. Nat. Ord. *Hepertidee*, Linn. *Myrti*, Juss.

Gen. Ch. *Cal.* Perianth half-superior, of one leaf, turbinate; limb in four or five short, broad, deciduous segments. *Cor.* Petals four or five, ovate, twice the length of the calyx, and alternate with its segments. *Siam.* Filaments very numerous, in four or five sets, opposite to the petals, the claw of each set flattened, oblong, many times longer than the corolla, some of them either combined together, or partially imperfect, pinnate, or otherwise many-cleft, in the upper part, with capillary segments; anthers terminal, inserted by their base, linear-oblong, undivided. *Pist.* Germen in the bottom of the calyx, small, roundish; style thread-shaped, erect, shorter than the stamens; stigma acute. *Peric.* Capsule coated with the base of the calyx, and firmly united to the branch, roundish, of three cells. *Seeds* numerous, small, oblong.

Eff. Ch. Calyx in four or five segments. Petals four or five. Stamens numerous, very long, in several various sets, opposite to the petals; anthers linear, undivided, vertical. Capsule coated by the calyx, three-celled, permanent. *Seeds* numerous.

Obf. The *stamens* in some species consist of uniform sets, answerable to the number of the *petals*; in others, two or more of those sets are partially combined laterally, the remainder being diminished to simple threads, without *anthers*; and this last is the character of the genus as M. Labillardiere understood and described it. But Mr. Brown has, in conformity to nature and analogy, not limited it so strictly. We adopt his views of the genus, only begging leave to construct the essential character without exceptions, such phraseology being best avoided. The genus before us comes next to BEAUFORTIA, (see that article,) and is full as splendid, differing from it essentially in the structure of the *anthers*, and in having numerous seeds. From MELALEUCA, (see that article in vol. xxiii.) the difference is less striking, but we believe very essential, consisting in the vertical, not incumbent, *anthers*. To this Mr. Brown adds that the *inflorescence* is unilateral.

1. *C. sanguinea*. Blood-red Unequal Calothamnus. Labill. Nov. Holl. y. 2. 25. t. 164.—Flowers four-cleft. Sets of filaments combined; two of them imperfect, distinct. Adult leaves linear-awl-shaped, compressed, smooth.—Native of Lewin's land, flowering in December. A *shrub*, six feet high, with round, scarred branches. Leaves scattered, slender, acute, entire, rather above an inch long; hairy when young. Flowers in small lateral sessile tufts, about the length of the leaves, conspicuous for their blood-red *stamens*, two sets of which unite to form a broad, wedge-shaped, concave body, divided at the top into numerous, vertical, parallel filaments, each bearing an upright linear *anther*; the two remaining sets diminished to simple, awl-shaped threads, without any *anthers*. Capsule small, globose.

2. *C. quadrifida*. Four-cleft Equal Calothamnus. Br. in Ait. n. 1. Sims in Curt. Mag. t. 1506.—Flowers four-cleft. Sets of filaments equal and distinct, with many anthers. Adult leaves smooth, as well as the fruit.—Gathered by Mr. Brown, on the south-west coast of New Holland. Sent to Kew in 1803, by Mr. Good, along with the two following. This bears splendid scarlet flowers, whose beauty however depends on the large *stamens*, an inch and a half long, the *petals* being small, pale, and inconspicuous. The leaves are linear-obovate, or somewhat spatulate, but extremely narrow, hardly more than an inch in length.

3. *C. villosa*. Hairy Five-cleft Calothamnus. Br. in Ait. n. 2.—Flowers five-cleft. Sets of filaments equal and distinct, with numerous anthers. Adult leaves villous, as well as the fruit.—Found by Mr. Brown on the south-west coast of New Holland. A green-house *shrub*, flowering at Kew, from July to September.

4. *C. gracilis*. Slender-leaved Calothamnus. Br. in Ait. n. 3.—Flowers five-cleft. Sets of filaments equal and distinct, with only three anthers to each. Leaves elongated, smooth, as well as the prominent capsule. Stem branched. Native of the same country as the last.

No other species have been hitherto described.

CALOTROPIS, from *καλος*, handsome, and *τροπις*, a keel, alluding to the beauty of the flower, and the keel-shaped leaves which compose its crown.—Brown Tr. of Wern. Soc. v. 1. 39. Ait. Hort. Kew. v. 2. 78.—Class and order, *Penandria Dignia*. Nat. Ord. Contortæ, Linn. *Apocineæ*, Juss. *Aclepiadæ*, Br.

Eff. Ch. Corolla. Crown of the filaments simple, of five keel-shaped leaves, attached lengthwise to the tube of the

filaments; recurved at the base. Masses of pollen ten, smooth, pendulous. Stigma pointless. Follicles tumid, smooth. Erect smooth milky *shrubs*, with broad opposite leaves, and handsome large flowers, in lateral corymbose panicles, inserted between the footstalks. Only two species are described.

1. *C. proceræ*. Bell-flowered Auricula-tree. Ait. n. 1. (*Aclepias proceræ*; Ait. ed. 1. v. 1. 305. Willd. Sp. Pl. v. 1. 1263. Schneev. Ic. t. 18. (See ASCLEPIAS, n. 20.) A. gigantea; Andr. Repof. t. 271. "Zja-raek; Le Brun Voy. 315. t. 184.")—Segments of the corolla spreading.—Native of Persia. A stove shrub impatient of damp and cold, flowering from July to September. The whole plant is glaucous, six or seven feet high, with broad, sessile, entire leaves. Flowers irregularly corymbose, numerous, larger than in most of this tribe, an inch or more in width, of a rich brownish-purple, powdered like an Auricula; pale beneath.

2. *C. gigantea*. Curled-flowered Auricula-tree. Ait. n. 2. (*Aclepias gigantea*; Linn. Sp. Pl. 312, excluding the synonyms of Plukenet and Alpinus. Willd. Sp. Pl. v. 1. 1264. (See ASCLEPIAS, n. 6.) Ericu; Rheede Hort. Mal. v. 2. 53. t. 31.)—Segments of the corolla reflexed, with twisted points.—Native of sandy ground on the coast of Malabar. Very like the foregoing, but the corolla is differently shaped, as expressed in the character, and is said to be variegated with white and purplish-red, smelling like a lily. We beg leave to observe, that if priority of date were to determine generic names, without regard to the found regulations of Linnæus, Mr. Brown's elegant *Calotropis* must give way to Rheede's *Ericu*, as the appellation of this genus, in spite of law, sense, taste, and convenience.

VOL. VI.

CALVERT, in Geography. Add—This county contained, in 1811, 8005 inhabitants, including 3937 slaves.

CALYPSO, in Botany, an elegant classical name of Mr. Salisbury's, from *καλυπτω*, to cover or conceal, not merely alluding to the covering of the stigma, but preserving a poetical analogy between this botanical beauty, so difficult of access, and the secluded goddess, whose life was fabled to be protected miraculously from the observation of navigators.—Salib. Parad. 89. Brown in Ait. Hort. Kew. v. 5. 208. Pursh 593.—Class and order, *Cynandria Monandria*. Nat. Ord. *Orchideæ*.

Eff. Ch. Calyx-leaves and petals all turned upwards. Lip inflated, with a double spur in front. Column winged. Anther a terminal deciduous lid; masses of pollen four.

1. *C. borealis*. Northern Calypso; Salib. Parad. t. 89. Pursh n. 1. (*C. americana*; Br. in Ait. n. 1. Cypripedium bulbosum; Linn. Sp. Pl. 1347. Fl. Lapp. ed. 2. 257. t. 12. f. 5. Sm. Spicil. 10. t. 11. Orchis lapponensis monofida; Rudb. Elyf. v. 2. 209. f. 10. Serapias scapo uniflora; Gmel. Sib. v. 1. 7. t. 2. f. 1.)—Native of Russia, and Ostrobothnia, (Linn.) Nova Scotia, and several parts of the west coast of North America. *Menzies*. Found on the banks of the Columbia river, by governor Lewis. Pursh. Root of a few aggregate bulbous knobs. Leaf solitary, radical, ovate, many-ribbed, spotted. Stalk scaly, three to six inches high, bearing one large, beautiful, crimson flower, with a purplish lip, bearded with yellow. We have in vain sought for any permanent specific difference between the American and European plant.

CALYSTEGLIA, a genus separated by Mr. Brown, Procr. Nov. Holl. v. 1. 483, from *Convolvulus*, and chiefly distinguished by the great size of the two leafy bractæ, including

inclosing the calyx, whence the name, from $\kappa\alpha\lambda\upsilon\zeta$, and $\sigma\tau\upsilon\upsilon$, so cover. *Convolvulus sepium* and *C. Soldanella* of Linnæus, with several others, constitute this genus, which appears to us better omitted.

CALY-YUG, denotes, according to the chronology of the Hindoos, the present or fourth age of the world.

CAMALODUNUM, l. 3, r. Trinouantes.

CAMBERWELL, a parish of Brixton hundred, in the county of Surrey, which includes the hamlets of Dulwich and Peckham, and in 1811 contained 1849 houses, and 11,309 persons; viz. 4854 males, and 6455 females; but since that time much increased in buildings and inhabitants.

CAMBIUM, l. 31, for CORTICAL LAYERS r. CORTEX; l. 39, for PITH and MEDULLARY CANAL r. MEDULLA. Col. 2, l. 5, r. MONOCOTYLEDONES.

CAMBRIA, in *Geography*, a county of Pennsylvania, containing 2117 inhabitants.—Also, a township of the same county, having 868 inhabitants.

CAMBRIDGE, col. 4, l. 7, add—By the return in 1811, the borough and university of Cambridge contained 1901 houses, and 11,108 persons; viz. 5288 males, and 5820 females: 80 families employed in agriculture, and 1600 in trade and manufactures.

CAMBRIDGE, in Washington county, &c. l. 2, r. census of 1810, 6730 inhabitants, and 650 senatorial electors; l. 10, for 2115 r. 2323; l. 38, r. 990.

CAMBRIDGE, a town of Guernsey county, in Ohio, having 474 inhabitants.

CAMBRIDGE, *West*, a township of Middlesex county, Massachusetts, having 971 inhabitants.

CAMBRIDGESHIRE, col. 1, l. *ult.* r. In 1811, this county contained 17,489 houses, and 101,109 persons; viz. 50,756 males, including 2946 local militia, and 50,353 females: 12,831 families employed in agriculture, and 5303 in trade, manufactures, and handicraft.

CAMDEN, a county of North America, l. 3, for 4033 r. 5347.

CAMDEN, a county in Georgia, &c. l. 3, r. containing 3941 inhabitants, of whom 2681 are slaves.

CAMDEN, in the district of Maine, contains 1607 inhabitants.

CAMDEN, a post-township of Oneida county, in the state of New York, watered by the W. branch of Fish creek, containing about 1100 inhabitants, principally farmers from Connecticut.

CAMELINA, in *Botany*, an old name of French origin, used by Dodonæus, but whether it alludes to this plant's being the companion of flax, *Linum*, as Crantz seems to intimate, is hardly worth enquiring.—Crantz *Austr. fasc. 1. 17.* Brown in *Ait. Hort. Kew. v. 4. 93.*—Class and order, *Tetradynamia Siliculose*. Nat. Ord. *Silicquose*, Linn. *Crucifera*, Juss.

Eff. Ch. Pouch nearly ovate, many-seeded: valves tumid. Cotyledons incumbent. Filaments without teeth. *Brown.*

Mr. Brown finds this genus on the *Myagrum fativum* of Linnæus, and the *M. (not Alyssum) austriacum* of Jacq. *Austr. t. 111.* The first is the only *Camelina* of Crantz above cited, who distinguishes it from *ALYSSUM*, (see that article,) by the connection between the *style* and the valves of the *pouch*, the *style* of *Alyssum* being connected with the *partition* only. Mr. Brown's distinction depends chiefly on the position of the *cotyledons*; for every *Alyssum* has not toothed filaments. Of *Myagrum austriacum* we do not feel competent to judge, but we are disposed to keep the *fativum* an *Alyssum*, as in Fl. Brit. and Engl. Bot. t. 1254, unless it could be set apart along with *Alyssum utriculatum* of Linn.

Curt. Mag. t. 130, one species of Mr. Brown's and Lamarck's *Vesicaria*, very different from the original *VESICARIA* of Tournefort; see that article.

CAMPBELL, l. 3 and 4, r. 11,001 and 5368.

CAMPBELL, a town of Kentucky, containing 3060 inhabitants, of whom 438 are slaves.

CAMPBELL-Town. Add—The burgh and parish, in 1811, contained 1010 houses, and 7807 persons; viz. 3367 males, and 4440 females.

CAMPDEN, col. 2, l. 23 from the bottom, add—In 1811, it was stated to contain 273 houses, and 1214 persons; viz. 694 males, and 620 females.

CAMPTON, l. 5, r. 873.

CAMPYNEMA, in *Botany*, so named by Labillardiere, "from $\kappa\alpha\mu\pi\lambda\omicron\varsigma$, curved, and $\nu\eta\mu\alpha$, a filament," see the character.—Labill. *Nov. Holl. v. 1. 93.* Brown *Prodr. Nov. Holl. v. 1. 290.*—Class and order, *Hexandria Trigynia*. Nat. Ord. *Aphrodeles*, but doubtful, *Br.*

Eff. Ch. Petals six, superior, permanent. Filaments and styles recurved. Capsule of three cells, bursting at their inner angle. Seeds numerous, depressed, spongy.

1. *C. linearis*. Br. n. 1. Labill. t. 121.—Native of Cape Van Diemen. A smooth herb, with a root of several tapering fibres. Leaves grassy, alternate, half-clasping the stem. Flowers terminal, erect, either solitary, or from two to four in a lax cluster. Anthers versatile, heart-shaped. Stigmas simple. Seeds in a simple row, attached to the inner angle of each cell. Nothing is said of the colour of the flower.

CANAAN, l. 2, for Lincoln r. Somers; l. 4, r. 1275; l. 7, r. 1810 and 1094; l. 12, add—In 1810, it contained 2203 inhabitants; l. 13, add—with 232 inhabitants.—Also, a township of Wayne county, in Pennsylvania, having 829 inhabitants.

CANAAN, *New*, a town of Fairfield county, in Connecticut, having 1599 inhabitants.

CANAL, col. 14, l. 44, add—The principal interior canals that are already (1818) completed in the United States are, the Middlesex canal, uniting the waters of the Merrimack river with the harbour of Boston, and the canal Carondelet, extending from Bayou St. John, a post of delivery in the Mississippi district, to the fortifications or ditch of New Orleans, and opening internal communication with lake Pontchartrain. The union of this canal by lakes with the Mississippi would, independently of other advantages, enable the government to transport with facility and effect the same naval force for the defence both of Mississippi and lake Pontchartrain, the two great avenues by which New Orleans may be approached from the sea. In 1816 or 1817, the state legislature of New York passed acts, appropriating funds for opening a navigable communication between the lakes Erie and Champlain and the Atlantic ocean, by means of canals, connected with the Hudson river. When this scheme, actually begun, is accomplished, and a communication opened by canals and lakes between lake Erie and the navigable waters of Hudson's river, and also between lake Champlain and these waters, the state of New York will soon become, in itself, a powerful empire.

Sheet Q q, instead of CANAL at the head of the page, insert in col. 1 and 2, CAN.

CANAL, p. 44, col. 2, l. 6 from the bottom, for thereon r. therein. P. 49, col. 1, l. 20, add—Mr. Chapman has lately (viz. in 1816) suggested to the editor, that this method, without complicated collateral aid, not had in contemplation, will be found to be impracticable; because the moment the descending crison entered the lower canal, the equilibrium

equilibrium would be lost, and all counterbalance when the crifton had entered to fuch depth as to allow its contained vefel to go out.

For HARTLEPOOL CANAL *r.* HARTLEY CANAL; for Durham *r.* Northumberland; and for Hartlepool *r.* Hartley.

CANAL, *Bafing floke*, col. 2, l. 3, after commences in, infert—Cooper's meadow, adjoining to the town of Bafing-Peke, and enters the river Wey about two miles above Weybridge; *dele*, l. 3, 4, 5, from Wey to Bafingtoke; l. 18, after Loden, add—The proprietors are prohibited from touching the Loden, or any of the fprings or freams that feed it.

CANANDAQUA, or CANANDAIGUA, l. 11, *r.* In 1810, this township had 415 families, 206 fenatorial electors, and 2302 inhabitants.

CANDARINE, a money of account in China, where 1 tale is = 10 marcs = 100 candarines = 1000 cafh.

CANDLES, *Laws relating to*, col. 2, l. 2, add—By 49 Geo. III. c. 98. duties of culoms are likewise impofed; l. 8, *r. c. 9.*

CANDY, a weight in the Eaft Indies. At Madras the candy is 500 lbs. avoirdupois, = 20 maunds. See MAUND.

CANFIELD, in *Geography*, a township of Trumbull county, in Ohio, having 494 inhabitants.

CANHADA, a liquid meafure in Portugal, 6 canhadas being = 1 pote, *r.* See ALMUDA.

CANICULAR YEAR, c. 2, l. 16, for *r.* on.

CANNA, or CANNE, a meafure for cloth in Italy, and the fourth of France, Spain, &c. each canna at Barcelona being = 61.4 Englifh inches; at Florence, = 93.1 Englifh inches for woollen and 91.7 for filk; at Genoa, = 116.7 Englifh inches; at Majorca, 67.5; at Malta, 81.9; at Marfeilles, 79; at Montpellier, 79.8; at Morocco, 20.1; at Naples, 83; at Palermo, 76.2; at Saragoffa, 81.5; at Touloufe, 71.7.

CANNAHQQUANESING, in *Geography*, a township of Butler county, in Pennsylvania, having 1284 inhabitants.

CANO, l. 3, *r.* 1601; l. 7, after Seville, and under Juan Martinez Montanes; l. 26, infert—In 1643 he removed to Toledo; and upon, &c.

CANTERBURY. This city, by the return of 1811, contained 2093 houfes, and 10,200 inhabitants; *viz.* 4605 males, and 5595 females: 508 families being employed in agriculture, and 1194 in trade and manufactures.

CANTERBURY, a township of America, &c. l. 5, for 1038 *r.* 1526, including 7 flaves; l. 8, add—It contains 1812 inhabitants.

CANTHARIDIN, in *Chemiftry*, a name given by Dr. Thomson to a peculiar principle extracted from cantharides in the following manner.

Boil cantharides in water till every thing foluble in that liquid be taken up. Concentrate the folution by evaporation, and when reduced to a thick fyrup, boil it repeatedly in alcohol, till that fluid ceafes to act upon it. Evaporate the alcoholic folution to drynefs, and digeft the dry refidue in fulphuric ether. When the ether has affumed a yellow colour decant it, and expofe it in an open vefel to fponaneous evaporation. Small cryftalline plates mixed with yellow matter will foon feparate. The yellow matter may be feparated by alcohol, which leaves the cryftals of cantharidin quite pure.

Cantharidin thus obtained exifts in the form of fhining micaceous plates. It is infoluble in water, and in cold alcohol. Boiling alcohol difolves it, but the cantharidin again feparates on the cooling of the alcohol. Ether difolves it, but not in large quantities. It readily difolves in

oils, and when applied to the fkin, acts as a veficatory with great energy. The folution of it in oils is equally efficacious. This principle feems to have been firft feparated by Thouvenel. See CANTHARIDES.

CANTHARIS, l. *ult. dele* which fee refpectively.

One of the moft elegant infects of this genus is the fcarlet cantharis; entirely of a vivid red, except the body, legs, and antennæ, which are coal-black. It is fomewhat more than half an inch in length. The *C. bipupulata* is a beautiful infect, fomewhat fmaller than the preceding, of a very dark but elegant gilded green, with the tips of the wings fluff red, and on each fide of the thorax a triple veficle of a bright red colour, capable of extenfion or retraction at the infect's pleafure, and by the microfcope exhibiting an alternate inflation and contraction, like that of the lungs in the larger animals. This fpecies is found in the middle of fummer on various plants, and particularly on nettles. Shaw.

CANTICLES, col. 3, l. 16, *r.*—The caufes of the apparent, &c.

CANTON, in America, add—and containing 1353 inhabitants.—Alfo, a town of Hartford county, in Connecticut, having 1374 inhabitants.—Alfo, a township of Luzerne county, in Pennsylvania, having 417 inhabitants.—Alfo, a township of Wafhington county, in the fame ftate, containing 1345 inhabitants.—Alfo, a town of Stark county, in Ohio, having 846 inhabitants.

CANTON, in China, l. 17, after houfes, infert—built of brick. Col. 2, l. 1, add—Thefe *fampans*, as they are called, accommodate, at the very loweft computation, 40,000 people: l. 13, after 40,000, add—The accounts of the population of Canton are very various and contradictory. The exaggerated ftatement above given is that of Le Comte. Du Halde estimates it at a million; and Sonnerat, erring in the other extreme, reduces the number to 75,000. But according to data, collected by captain King, in “Cook's Third Voyage,” (vol. iii.) he apprehends, that the city and fuburbs may probably contain about 150,000.

CAOUTCHOUC, in *Chemiftry*. In addition to what has been faid of this fingular fubftance, we may obferve that it has been lately ftated to exift in a great variety of plants, though it has been hitherto ufually confounded with other fubftances. It may be feparated from refinfs by means of alcohol. It may be extracted from the different fpecies of milletoe by water, with which it readily combines, whilft in that fluid ftate in which it exifts in thefe plants. When mixed with gum or extractive, it may be feparated by digefting a part of the plant containing it, firft in water, and then in alcohol, till all the fubftances foluble in thefe liquids be extracted. The refiduum is then to be dried and digefted in four times its weight of rectified petroleum. Exprefs the liquid part by fqueezing the fubftance in a lincn cloth. The liquid is then to be put by for fome days to fettle, and after the clear part has been poured off, the remainder is to be mixed with a third part of water, and diluted. The caoutchouc remains behind.

According to Buchholz, a confiderable proportion of caoutchouc exifts in opium. Maflic alfo is ftated to contain a fubftance very fimilar to caoutchouc.

CAPELAT, or CAPELLAT, a name fometimes given by farriers to a fwelling of a wenny kind, which grows on the hock of a horfe, and on the point of its elbow. It often arifes from bruifes, and in this cafe fhould be bathed with hot vinegar and alum; but when they grow gradually on both heels and elbow, blood is extravafated. When this happens, fuppuration fhould be promoted by rubbing the part with ftimulating unguents; and when matter is formed, the fkin fhould be opened with a lancet, in more dependent

parts towards one side, for avoiding a scar. The subsequent dressings may be turpentine, honey, and tincture of myrrh.
CAPEMAY, in *Geography*, a county of New Jersey, containing 3632 inhabitants, of whom 81 are slaves.

CARAGE of Lime, denotes the quantity of sixty-four bushels.

CARALLIA, in *Botany*, *Carallie* of the Telingas, or natives of Hindoostan; being one of those barbarous names which some modern botanists have ventured to tolerate, but which no classical one can approve.—Roxb. *Coromand.* v. 3. 8.—Clafs and order, *Icandria Monogynia*. Nat. Ord. *Hesperidee*, Linn. *Myrtis*, Juss.

Eff. Ch. Calyx in six or seven segments, superior. Petals six or seven. Stigma three-lobed. Berry of one cell, with a solitary seed.

1. *C. lucida*. Shining *Carallia*. Roxb. as above, t. 211. —Native of the lower region of the Circar mountains. A small, handsome, evergreen tree, flowering in March and April. *Leaves* on short stalks, opposite, elliptical, acute, finely serrated, smooth, four or five inches long, and two or two and a half broad. *Flowers* small, yellow, in little, aggregate, axillary, stalked heads. *Berry* the size of a pea, reddish. *Seed* large, with a strongly curved embryo. Nothing is recorded of the qualities or uses of this plant. It is evidently next akin to *EUGENIA*; see that article.

CARAWAY, *r.* **CARUM**, &c.; at the end of the next article *r.* **CARUM**.

CARBON, in *Chemistry*. The progress of chemical knowledge enables us to state, with greater accuracy and precision, the nature of some of the compounds of carbon, than at the period when this article in the *Cyclopædia* was written.

Carbonic Oxid.—It has been shewn by Gay Lussac, that 100 measures of this gas require for complete combustion 50 measures of oxygen, and that the product is 100 measures of carbonic acid; hence it must be composed of one atom of carbon and one atom of oxygen, or 100 parts by weight will consist of

Oxygen	-	-	-	57.14
Carbon	-	-	-	42.86
				100.00

And its true specific gravity must be .9722, and 100 cubic inches of it must weigh, at a mean temperature and pressure, 29.652 grains. Carbonic oxid has the property of combining with chlorine, and forming a peculiar compound, which its discoverer, Dr. Davy, has named *PHOSGENE gas*; which see.

Carbonic Acid.—When pure charcoal is burnt in oxygen gas, it has been shewn that the original bulk of the oxygen suffers no change. Hence it is obvious, that, by subtracting the specific gravity of oxygen from that of carbonic acid gas, we shall obtain the quantity of carbon existing in it. The specific gravity of oxygen gas is 1.11, and that of carbonic acid 1.52. Hence 100 parts, by weight, of carbonic acid will consist of

Oxygen	-	-	-	72.73
Carbon	-	-	-	27.27
				100.00

which correspond with two atoms of oxygen and one of carbon. See *ATOMIC THEORY*.

Carburetted Hydrogen.—The specific gravity of carburetted

hydrogen, according to Dr. Thomson, is .5555, and 100 cubic inches of it weigh 16.99 grains. It requires for its complete combustion twice its volume of oxygen gas, and produces exactly its own volume of carbonic acid; the only remaining product is water. Hence 100 parts, by weight, of this gas are composed of

Carbon	-	-	-	-	75
Hydrogen	-	-	-	-	25
				100	

which correspond with one atom of carbon and two of hydrogen.

Olefant Gas.—The specific gravity of this gas, according to Dr. Thomson's experiments, is .974, and 100 cubic inches of it weigh 29.72 grs. It requires for its complete combustion three times its volume of oxygen gas, and produces, when burnt, twice its volume of carbonic acid gas, and a certain proportion of water. Hence 100 parts, by weight, of this gas are composed of

Carbon	-	-	-	85.71
Hydrogen	-	-	-	14.29
				100.00

which correspond with one atom of carbon and one of hydrogen.

The curious oil-like compound formed by the union of this gas with chlorine, has been lately examined by MM. Robiquet and Colin. They found that it is composed of one volume of chlorine united with one volume of olefant gas, and of course that its constituents, by weight, are

Olefant gas	-	-	-	16.28
Chlorine	-	-	-	83.72
				100.00

This oily liquid, which Dr. Thomson considers as a sort of *ether*, and hence names it *chloric ether*, burns with a green flame, and at the same time gives out copious fumes of muriatic acid and much foot. Its specific gravity at 45° is 1.2201, water being 1.000. It boils at 152°. At the temperature of 49°, its vapour is capable of supporting a column of mercury 24.66 inches in height. The specific gravity of this vapour was found by experiment to be 3.4434, which very nearly coincides with the above account of its composition. When passed through a red-hot porcelain tube it is decomposed and converted into muriatic acid, and an inflammable gas containing hydrogen and carbon, while a copious deposit of charcoal is found in the tube. It is also decomposed when passed through red-hot oxid of copper.

With respect to the *carbonates*, the numbers representing them will of course require a little adjustment; this can be easily done from the composition of carbonic acid stated above, and from the data given under *ATOMIC THEORY*.

CARBONIC Acid Gas, col. 2, l. 5, add—According to the accurate experiments of Messrs. Allen and Pepys, recorded in the *Phil. Transf.* the weight of a cubic inch of this gas is .464 of a grain. Col. 3, l. 46, *r.* milkiness.

CARDAMOM, l. 2, insert after *Cardamom, angustifolium, grana Paradisa*, &c.

CARDIFF, col. 2, l. 9, insert after *canal*—The town-hall of Cardiff is a respectable modern building, and near it

is the county gaol, built upon Mr. Howard's plan; l. 14.—By the parliamentary return in 1811, the number of inhabitants is stated at 2457. The only manufactory established here is that of iron hoops: the trade, however, is very considerable, in consequence of the numerous collieries up the vale, and the iron and tin works of Merthyr, Melin Gruffydd, &c. the produce of which is conveyed here by the canal for exportation, and which creates a large import trade from Bristol, &c., in shop goods to supply the consumption of the interior country. There are regular passage-boats twice a week from this place to Bristol.

Cardiff is a borough-town, and in conjunction with the contributory boroughs of Cowbridge, Llantrissant, Keafig, Aberavon, Neath, Swansea, and Loughor, sends one member to parliament.

CAREX, col. 4, l. 11, *r. banana*.

CAREYA, in *Botany*, named by Dr. Roxburgh, "after its discoverer Mr. William Carey, a good botanist, and a promoter of natural history in general."—Roxb. Coromand. v. 3, 13. Ait. Hort. Kew. v. 4, 236.—Clas and order, *Monadelphica Polyandria*. Nat. Ord. *Hesperideæ*, Linn. *Myrti*, Juss.

Ess. Ch. Calyx superior, four-cleft. Petals four. Style one. Germen of four cells. Berry with numerous seeds, imbedded in pulp.

1. *C. herbacea*. Herbaceous Careya. Roxb. as above, t. 217. Ait. n. 1.—Herbaceous. Flowers stalked. Outer filaments longest and without anthers.—Native of Rungpore, in Bengal, flowering in February. Root woody, perennial. Stems a span high, annual, round, smooth. Leaves opposite, obovate, crenate, smooth, from four to eight inches long, on short stalks. Flowers terminal, corymbose, few, large and very beautiful, the calyx and petals greenish, tinged with red; the outer row of their innumerable stamens crimson, capillary, two inches long, recurved, without anthers, about twice the length of the obovate petals. Berry brown, the size and texture of a medlar.

2. *C. arborea*. Tree Careya. Roxb. as above, 14. (Pelou; Rheede Hort. Malab. v. 3, 35, t. 36.)—Arborescens. Flowers sessile. Inner filaments shortest, and without anthers.—Native of the valleys, in various mountainous parts of India. A large tree, with obovate, slightly serrated, smooth, deciduous leaves, from six to twelve inches long. Flowers crowded, pale yellow, appearing with the young leaves in March. Fruit the size of a small orange, fetid and nauseous till quite ripe, when the pulp becomes sweetish, but Rheede reports it to be poisonous, which, considering its affinity to *Psidium*, is not credible. Dr. Roxburgh gives no account of this matter, but describes the wood as the colour of mahogany, though less hard and close. The fibrous bark makes tough and durable ropes.

CARGA, a measure for wine and oil at Barcelona, equal to 2½ quarteras.

CARGADOR, in Portugal and Holland, denotes a ship-broker.

CARGILIA, in *Botany*, is dedicated to the memory of Dr. James Cargill of Aberdeen, a contemporary of Caspar Bauhin, in whose *Prodromus*, p. 154, 155, (Mr. Brown by mistake refers to his *Theatrum*,) several descriptions of *Fuci*, communicated by Dr. Cargill in 1603, may be seen.—Brown Prodr. Nov. Holl. v. 1, 526.—Clas and order, *Polygamia Dioecia?* rather *Oöandria Monogynia*. Nat. Ord. *Ebenaceæ*, Juss. Br.

Ess. Ch. Calyx inferior, half-fourcleft. Limb of the corolla four-cleft. Stamens inserted into the base of the corolla; filaments doubled. Germen of four cells, with two seeds in each. Berry globose, closely invested with

the cup-shaped calyx.—Some flowers have fewer, and imperfect, stamens; others only the rudiment of a pistil.

This genus is intermediate between *Diospyros* and *Maba*. See those articles.

1. *C. laxa*.—Leaves oblong, rather wavy, smooth. Calyx of the male flowers four-toothed, half as long as the tube of the corolla. Style in three or four deep segments. Young branches lax.—Found by Mr. Brown in the tropical part of New Holland.

2. *C. australis*.—Leaves oblong, smooth, obtuse, paler beneath; acute at the base.—Calyx of the male flowers four-cleft, as long as the tube of the corolla. Style undivided. Found by Mr. Brown, in New South Wales.

CARL D'OR, a gold coin of Brunswick, of which there are double, single, and half carl d'ors; that since 1802 containing 92 gr. of pure gold, and equal 16s. 3½d. sterling. The double in proportion. See COIN.

CARLIN. Add—See TARO.

CARLISLE, col. 5, l. 27, add—By the return of 1811, the city of Carlisle contained 1658 houses, and 12,531 persons; viz. 5628 males, and 6903 females: 134 families employed in agriculture, and 2301 in trade, manufactures, and handicraft.

CARLISLE, the chief town of Cumberland county, &c.;—l. 6. By the census of 1810, Carlisle borough contains 2491 inhabitants, including 78 slaves.—Also, a town of Middlesex county, in Massachusetts, having 672 inhabitants.

CARMELITES. Add—see Manchester Memoirs, vol. v.

CARN, or CAIRN. See CARNEDDE.

CARNESVILLE. Add—see FRANKLIN.

CAROLIN D'OR, or CAROLIN, a gold coin of Bavaria, Hesse Darmstadt, and Wurtemberg, valued at 11 florins. See COIN.

CAROLINA, *N. and S.* See UNITED STATES.

CAROLINE, l. 4, *r.* 17,544; l. 5, *r.* 10,764; l. 8, *r.* 9453; l. 10, *r.* 1520.

CARORA, l. 2, insert—15 leagues E. of Maracaybo lake, in N. lat. 10°. The town is tolerably well built; the streets are large and on a line; the air is salubrious, though the soil is parched; the inhabitants, amounting to about 6200, live on the produce of their flocks and herds, and employ themselves in tanning and dressing the hides and skins, which are used in the city for boots, shoes, saddles, bridles, and curriery. The surplus of the local consumption is spread over the province, or is conveyed to Maracaybo, Carthagena, and the island of Cuba. They also make, with a kind of fibre (*aloe disticha*,) very good hammocks, which furnish an article of commerce. Depons.

CARPATHIAN MOUNTAINS, l. 22, *r.* Zemnitz.

CARPHA, in *Botany*, so named by sir Joseph Banks and Dr. Solander, from *καρφη*, *dry straw or chaff*, in allusion to the habit of this genus.—Brown Prodr. Nov. Holl. v. 1, 230.—Clas and order, *Triandria Monogynia*. Nat. Ord. *Calamariæ*, Linn. *Cyperaceæ*, Juss. Br.

Ess. Ch. Spikelet single-flowered; scales imperfectly two-ranked, the lower ones empty. Bristles three to six, beneath the gemen, as long as the fertile scale. Style awl-shaped, without a joint, crowning the prismatic nut. Stigmas two or three.

Seet. 1. Spikelets two-ranked. Stigmas three. Nut triangular. Bristles feathery.

1. *C. alpina*.—Spikelets in a corymbose cluster. Bristles six, feathered nearly to the top. Stem leafy, smooth, Leaves rough.—Native of Van Diemen's island.

2. *C. deusta*.—Tuft terminal. Involucrum of two elongated

gated leaves; dilated and membranous at the base. Bristles three, feathery at the base. Stem leafless. Leaves radical, almost bristle-shaped.—Native of Port Jackson.

These, with a non-descript species from Terra del Fuego, constitute, in Mr. Brown's opinion, the genuine genus of *Carpha*, the following being perhaps entitled to form one by themselves.

Sec. 2. *Spikelets awn-shaped. Style elongated, in two divisions. Nut nearly cylindrical.*

3. *C. avenacea*.—Panicle somewhat spiked. Scales with awn-like points. Bristles four, slightly toothed; fringed at the base. Stem roundish, leafy.—Native of the fourth coast of New Holland. *Stamens three.*

4. *C. diandra*.—Panicle dense. Spikelets two-flowered. Scales with awn-like points. Stamens two. Bristles five or six, capillary, toothless; fringed at the base. Stem roundish, leafy.—Found at Port Jackson.

5. *C. claudiflora*.—Spike elongated. Sheaths alternate. Spikelets in pairs, concealed. Stem round, leafy.—Found on the fourth coast of New Holland.

CARRICK. See TRANKEY.

CARTER, l. 1, insert E. Tennessee. Add—It contains 1l. 4s. 6d. See TAX.

CARTERET, in Carolina, &c., l. 3, r. 4823; l. 4, r. 4190 inhabitants, 202 being slaves.

CARTS, *Laws relating to*, col. 3, l. 49, for 1l. 4s. r. 1142.

CARTHAMUS, *Chemical Properties of*. Many experiments have been made on the colouring matter extracted from this plant. The last and most interesting are those of Dufour and Marchais, of which we shall present our readers with a short account.

The flowers of the carthamus contain two colouring matters; a yellow, which is soluble in water, and has hitherto been applied to no use; and a red, which is employed by the dyers, &c., and which constitutes the pigment called *rouge*. The yellow colouring matter readily dissolves in water, but it is difficult to separate the whole of it. Dufour effected this by exposing the carthamus wrapt up in a piece of linen to the action of a stream of water. To separate the red colouring matter, he macerated for an hour the carthamus, after it had been thus washed, in a weak solution of carbonate of soda. Into this solution was put a quantity of cotton, and lemon-juice was then dropped into it till the liquid assumed a fine cherry-red colour. After standing twenty-four hours, the liquid lost its red colour, the whole colouring matter having combined with the cotton, and dyed it red. The cotton was taken out and well washed, to separate a little of the yellow colour adhering to it. It was then put into a very dilute solution of carbonate of soda. This alkali separated the colouring matter from the cotton, dissolved it, and assumed a yellow colour; the cotton being removed and lemon-juice dropped into the solution, a fine rose-coloured powder gradually separated, and at last precipitated. This was the red colouring matter. This red colouring principle is insoluble in water and oils, but is soluble in alcohol and ether. The alkalies also dissolve it, but destroy its colour. When distilled, it yields a little water, scarcely any gas, a little oil, and a portion of charcoal, equal to one-third of the original weight. When this charcoal is burnt it leaves no ashes. One thousand parts of carthamus yielded only five of this red colouring matter, but no less than 268 of the yellow colouring matter above-mentioned. Carthamus also contains a great variety of other substances according to Dufour, many of which, such as alumina, sand, &c., are evidently foreign. It is probably in some such manner as the above that the *pink saucers* are

prepared from carthamus, though we believe the exact process is kept secret.

CARTILAGE, *Chemical Properties of*. See BONE.

CARTONEMA, in *Botany*, from *καρτός*, *stern*, and *νημα*, a filament.—Brown Prodr. Nov. Holl. v. 1. 271.—Class and order, *Hexandria Monogynia*. Nat. Ord. *Compositæ*, Br.

Eff. Ch. Calyx three-leaved, permanent. Petals three, smaller. Filaments equal, permanent, beardless, partly roughish. Anthers oblong, vertical. Style permanent. Stigma bearded. Capsule shorter than the calyx, of three cells and three valves, with central partitions. Seeds one or two, with a dorsal embryo.

1. *C. spicatum*.—Found by Mr. Brown in the tropical part of New Holland. Root perennial, tuberous below the fibres. Herb clothed with lax hairs, much resembling *PHILYDRUM* in appearance. Stem leafy, simple, or slightly branched. Leaves linear, clasping, elongated. Spike terminal, of many yellow flowers, each with two unequal, leafy, permanent bractæ. The habit, as well as the permanent *stamens* and *style*, lead Mr. Brown to suspect some affinity to *Philydrum*. Hence perhaps the true place of that puzzling genus may be discovered.

CARVER, in *Geography*. Add—It contains 358 inhabitants.

CASBIN, insert—or CASWEEN, l. 11, after broad, add—it may still, however, be regarded as one of the largest and most populous towns in the kingdom, and carries on a great trade with Ghilan.

CASEY, a county of Kentucky, containing 3252 inhabitants, of whom 237 are slaves.

CASH, a small coin in China, and India beyond the Ganges. See TALE.

CASHIERING, in *Military Language*. An officer sentenced by a general court-martial, or peremptorily ordered by the king, to be dismissed from the service, is said to be *cashiered*.

CASSAVA, or TAPIOCA, *Chemical Properties of*. This is prepared from the roots of the *JATROPHA manibot*, an American plant. (See *JATROPHA*.) These are peeled and subjected to pressure in a bag made of rushes. The expressed juice is a virulent poison, and is employed by the Indians for poisoning their arrows; but it deposits gradually a white powder, which has all the properties of starch, and which, when washed and dried, is perfectly harmless, and highly nutritive. What remains in the bag also consists chiefly of the same starch. It is dried in smoke, and afterwards pressed through a kind of sieve. Of this substance, the *cassava bread*, so much employed in the West Indies, is made.

CASSINIA, in *Botany*, dedicated by Mr. Brown to his learned fellow-labourer in the study of compound flowers, M. Henry Cassini, two of whose Memoirs on their stamens and style have appeared in the French Journal de Physique, for 1813 and 1814.—Br. in Ait. Hort. Kew. v. 5. 185.—Class and order, *Syngenesia Polygamia-segregata*. Nat. Ord. *Compositæ*, Linn. Br.

Eff. Ch. Partial calyx four-leaved, two-flowered. Florets all perfect. Seed-down chaffy, tufted. Partial receptacle naked.

1. *C. aurea*. Yellow Cassinia.—Native of the fourth coast of New Holland. Br. Seeds were sent to Kew, by Mr. Good, in 1803. The plant is marked as a green-house perennial herb, flowering in July and August, but we have no account of its habit or appearance.

CAST, for BRAHMINS r. BRACHMANS.

CASTELLANO, a weight for gold in Spain, is 50 castellanos

laos being = 400 tomines or 4800 grains. Silver is weighed by the same mark of 50 castellanos, divided into 8 ounces, 64 ochavos, 128 adarnes, 384 tomines, or 4608 grains.

CASTINE. Add—It contains 1036 inhabitants.

CASTLE, NEW. See NEWCASTLE.

CASTLE-CARY, l. 8, add—By the returns of 1811, the parish contained 281 houses, and 1406 inhabitants; 650 being males, and 756 females.

CASTLE-RISING. By the returns of 1811, the borough and parish contained 48 houses, and 297 persons; viz. 148 males, and 149 females.

CASTLETON, l. 9, r. 120c.

CASTLE-TOWN, a township of America, &c. l. 2, which contained, by the census in 1810, 1301 inhabitants, and 121 fenatorial electors. Here are three houses for public worship, and some school-houses.

CASTOR. By the returns of 1811, the parish contained 185 houses, and 1051 persons; 487 being males, and 564 females.

VOL. VII.

CASWELL, l. 3, r. 11,757 and 4299.

CATAHULA, a parish of the territory of Orleans, having 1164 inhabitants.

CATALPA, in *Botany*, a well-founding barbarous name, which Linnæus in Hort. Cliff. 317, could trace no further than the gardeners of that day, nor are we acquainted with its origin or meaning.—Just. Gen. 138. Dryand. in Ait. Hort. Kew. v. 1. 24. Pursh 10.—Clafs and order, *Diandria Monogynia*. Nat. Ord. *Perfonate*, Linn. *Bignonia*, Juff.

Eff. Ch. Corolla five-cleft, irregular. Calyx in two deep segments. Three barren filaments. Capsule of two cells. Seeds with a membranous jagged wing at each end.

1. *C. fyringifolia*. Common Catalpa. Sims in Curt. Mag. t. 1094; and

2. *C. longissima*. Wave-leaved Catalpa. (*Bignonia longissima*, Willd. Sp. Pl. v. 2. 290.) are the two described species. (See BIGNONIA n. 1 and n. 22.) We have heard that Dr. Solander, who was first aware of this genus, and who would certainly never have admitted to unauthorised a name as *Catalpa*, was very desirous of having it called *Solandra*.

CATAWESSY. Add—It contains 1934 inhabitants.

CATHARINE II., col. 3, l. 40, for Persian r. Pruffian.

CAT'S-EYE. See MINERALOGY, *Addenda*.

CATTY, a weight at Canton, in China, and in some parts of India. The catty or gin of 16 lyangs or tales weighs 19 oz. 6 dwts. 4 grs. English troy, so that 10 tales would weigh 5792 English grains. See TALE.

CAVALLO, TIBERIUS, F.R.S., in *Biography*, the son of an eminent physician of Naples, where he was born in 1759. Destined for commerce, he came to England for the purpose of acquainting himself with the principles of commerce in 1771; but literature and philosophy diverted his destination and enjoyed his preference. To those who were engaged in pursuits similar to his own, and to the editor of this Cyclopadia, he was a very useful coadjutor. His publications on a variety of philosophical subjects, and his communications to the Royal Society, were numerous, and are well known; particularly his "Elements of Natural and Experimental Philosophy," 1803, 4 vols. 8vo. He died, much respected and esteemed, and with the editor's sincere regret, in London in 1810.

CAUCUS, a term used in North America for a kind

of electioneering committee; *caucusing*, as it is said, denoting electioneering. Of the origin of this uncouth term we have the following account in Gordon's Hill, of the Amer. Rev. London 1788. "About the year 1738, the father of Samuel Adams, and twenty others who lived in the north or shipping part of Boston, used to meet to make a *caucus*, and lay their plan for introducing certain persons into places of trust. Each distributed the ballots in his own circle, and they generally carried the election. As this practice originated in the shipping part of Boston, *caucus* might have probably been a corruption of Caulker's meeting." See Pickering's American Vocabulary.

CAVEDONA, l. ult. r. 80.

CAVEER, or CABEER, a money of account at Mocha, in Arabia, where accounts are kept in piastras of 80 caveers current.

CAVELLO, a copper coin of Naples.

CAVENDISH, *The Honourable HENRY*, in *Biography*, was the son of lord Charles Cavendish, and born in London in 1731. In literature, mathematics, chemistry, and philosophy, he was eminently distinguished; but his temper and habits were through life singularly reclusive and economical; so that he appeared to those who were not honoured with being his intimate associates to great disadvantage. In early life his fortune was small; but by the retired manner in which he lived, and by subsequent accumulation of property, he died very rich. His library was very valuable; and easy of access to all his literary friends; but it is to be lamented that, in other respects, he was not emulous of following the example and acquiring the reputation of his eminent friend, sir Joseph Banks, the president of the Royal Society, whose Sunday evening meetings he constantly attended, being generally there as well as at the meetings of the Royal Society, where he was almost always present, more ready to hear than to speak. A similar reserve and taciturnity marked his character in all his ordinary social connections and secular concerns. As a philosopher, his ruling temper was not without its beneficial effects. His contributions to the Royal Society, and which may be found in its Transactions, relate to chemistry, electricity, meteorology, and astronomy. This eminent philosopher died on February 4th, 1810, in the 79th year of his age; and at that time was reckoned the greatest proprietor in the Bank of England, his wealth being estimated at nearly 1,300,000 pounds, which he left entirely among his relations.

CAVENDISH, in *Geography*, a town of Windfor county, in Vermont, having 1295 inhabitants.

CAUK, l. ult. add— and BARYTES.

CAULINIA, in *Botany*, so named by De Candolle, in honour of Don Philip Cavolini, an able Neapolitan naturalist, who has illustrated the principal species.—"De Cand. Fr. v. 3. 156." Brown Prodr. Nov. Holl. v. 1. 339. (Poffidonia; König in Ann. of Bot. v. 2. 95. Kerner; Willd. Sp. Pl. v. 4. 947.)—Clafs and order, *Triandria Monogynia*. Nat. Ord. *Aroidæ*, Br.

Eff. Ch. Calyx and Corolla wanting. Filaments dilated, permanent, membranous, bearing the two-lobed anthers externally at the base. Germen superior, single-seeded. Stigma nearly sessile. Pericarp fleshy.

This genus is founded on *Zostera oceanica* of Linnæus, see Cavol. Monogr. translated in Ann. of Bot. v. 2. 77. t. 6. To this Mr. Brown adds a New Holland species, *C. ferrulata*, with three doubtful ones, among which is *Ruppia antarctica*, Labill. Nov. Holl. v. 2. 116. t. 264. We are not informed why this genus supercedes the CAVOLINIA we have already described; see that article.

CAULOPHYLLUM, Michaux Bor.-Amer. v. 1. 204. Pursh 218. See LEONTICE.

CAUSTIC, LUNAR, l. 18, r. revived.

CAUSTIS, in Botany, *καυστις*; scorched hay or corn, alluding to the dry sheaths of the stem, which appear as if burnt.—Brown Prodr. Nov. Holl. v. 1. 239.—Clafs and order, *Triandria Monogynia*. Nat. Ord. *Calamaria*, Linn. *Cyperaceae*, Juff. Br.

Eff. Ch. Spikelets nearly single-flowered. Scales fasciculated, the empty ones numerous. No bristles beneath the germen. Style dilated at the base. Stigmas three or four. Nut tumid, crowned with the bulbous base of the style.

Obf. One species has five *stamens*, a circumstance marked by Mr. Brown as very extraordinary.

These are rigid rushy plants, growing on dry heaths in New Holland. Their *stems* are leafless; round and undivided in the lower part; panicked and semi-cylindrical above; the ultimate branches awl-shaped and leaf-like. The *stems* are clothed with entire withered sheaths, extended on one side into an awl-shaped point, of the same colour. *Spikelets* panicked, small, sometimes dioecious. *Nut* ovate, white, opaque. *Brown*.

1. *C. flexuosa*.—Panicles loose, zigzag; their ultimate branches smooth. Scales of the spikelets smooth.—Found at Port Jackson.

2. *C. dioica*.—Panicles zigzag, rather dense; ultimate branches rough-edged. Scales of the spikelets downy.—Native of the fourth coast of New Holland.

3. *C. pentandra*.—Principal and partial branches stiff. Stamens five.—Found near Port Jackson.

CAWZI, or CAZI, denotes in India a Mahometan judge or justice, who also officiates as a public notary by affixing his seal. This is the same with the officer named Cadi in Turkey.

CAYUGA, in Geography, a county of New York, containing 29,843 inhabitants, of whom 75 are slaves.

CECIL, l. 3, add—in 1810, 13,066 inhabitants, of whom 2469 are slaves. Add at the close—containing 1167 inhabitants.

CEDAR CREEK, a hundred of Suflex county, in Delaware, having 3874 inhabitants, of whom 310 are slaves.

CELEMINE, a corn measure in Spain. See CAFFISE.

CELESTINE Sulphate of Strontian. See STRONTIAN.

CELSIUS, ANDREW, in Biography, an eminent Swedish astronomer, was born at Upsal in 1701, and distinguished by his knowledge of mathematics, and more especially of astronomy, to which his attention was principally devoted. In 1730 he was appointed by the king professor of astronomy, and he contributed very much to the revival of the study of this science in his native country, where it had been much neglected. With this view, he travelled into foreign countries, visiting Germany in 1732, and Italy in 1733. From Bologna he went to Rome; and having an opportunity of measuring the power of light, he concluded from his experiments on this subject, that the light of the moon, at new moon, is eight times weaker than at full moon: and that the light of the sun is 320,000 times stronger than that of the moon; and when in the meridian, thirty times more powerful than in the horizon. From Rome he removed to Paris in 1734, and was there engaged to accompany Maupertuis and other eminent astronomers, who were appointed to measure a degree under the polar circle; a problem of great importance in determining the figure of the earth. To the success of this mission he very much contributed by his journey to London in 1736, in order to procure instruments of Graham's con-

struction, and here he had the satisfaction of being introduced to several scientific persons. On his return from this mission, he was recompensed for his services by a pension of 1000 livres, granted to him by the French government, as well as the quadrants which had been used at Tornea. In 1737 he returned to his own country, where he erected, in his own garden, a turret for the purpose of making observations; but in 1739, in consequence of a dissertation published at Upsal on the importance and utility of such observations, a large public observatory was immediately begun and completed in the following year. Thus furnished with the means of making his observations, he was indefatigable in the use of them, and in the correction of tables which had been before constructed. But on his observations of various kinds, and their practical result, our limits will not allow us to enlarge. His fame was daily increasing, so that he was a member of the Imperial Academy of the Searchers into Nature, of the Academy of Berlin, of the Royal Society of London, and of the Institute of Bologna. He was also secretary to the Society of Upsal, and to the Academy of Sciences at Stockholm. His separate works, as well as his communications to learned societies, were numerous; but his life and labours were terminated by a consumption, in the 43d year of his age, in April 1744. Gen. Biog. Appendix.

CEMENT. Mr. Parkes, in his "Essays," (vol. i. p. 320.) recommends the following fire-clay, as that which he employs, because he has not been able to discover a better; viz. good clay two parts, sharp washed sand eight parts, and horse-dung one part. These materials, being intimately mixed and beaten up with a little water, and the whole afterwards thoroughly tempered like mortar, by treading it for a considerable time with the feet. Mr. Watt's fire-clay, which is a good one, is formed by pounding porcelain clay from Cornwall, and mixing it to the consistence of thick paint, with a solution of borax, in the proportion of two ounces of borax to a pint of hot water.

CENARRHENSES, in Botany, from *κενος*, empty, and *αρρη*, a male, so named by M. Labillardiere, who took the nectariferous glands for alternate abortive stamens.—Labill. Nov. Holl. v. 1. 36. Brown Prodr. Nov. Holl. v. 1. 371. Tr. of Linn. Soc. v. 10. 158.—Clafs and order, *Tetrandria Monogynia*. Nat. Ord. *Proteaceae*, Juff. Br.

Eff. Ch. Petals four, regular, tapering, deciduous. Stamens inserted into the base of each petal. Nectariferous glands four, at the base of the germen, stalked. Germen sessile. Stigma simple. Drupa with a single nut.

1. *C. nitida*. Labill. t. 50.—Native of the southern part of Van Diemen's island. A smooth tree. *Leaves* alternate, stalked, obovate-oblong, shining, distantly serrated, three or four inches in length. *Spikes* much shorter, axillary, solitary, simple. *Flowers* alternate, quite sessile, with a small, broad, acute *bractea* to each.

Mr. Brown has, in our opinion, most happily determined the natural order of this genus, which is nearly allied to PERSONIA (see that article); and his excellent remarks in the Linnæan Transactions, too long for insertion here.

CENIS, col. 2, l. 19, after plain, insert—about six miles long, covered with verdure; l. 46, add—From the highest of these mountains, Hannibal shewed his soldiers the fine country they were going to conquer. The highest point of Mount Cenis is 9261 feet at the grand cross, on the side of Italy 6022 feet.

CENOMYCE, in Botany, from *κενος*, empty, and *μυκη*, a sort of fungus, alluding to the hollowness of the little fungus-like receptacles.—Achar. Syn. 248. "Lichenogr.

105. t. 11. f. 3.—6."—Class and order, *Cryptogamia Algae*. Nat. Ord. *Lichenes*.

Eff. Ch. Frond leafy, cartilaginous, lobed. Receptacles orbicular, coloured, inflated, without a border, on hollow tubular stalks.

This genus contains the *Lichenes pyxidati* of Linnæus, and embraces the *Bæomyces* of Perfoon, and of Acharius in his earlier works; but the latter name now designates another genus, which the reader will find in the present volume. Acharius has forty-two species of *Cenomyce*. Examples of the genus may be seen in Engl. Bot. t. 907. 1393, 1894, 2051, &c.

CENTER of Rotation, col. 6, l. 35, r. $p \times pC$; 1. 63, r. pC .

CENTER, in *Geography*, a township of Columbiana, in Ohio, having 1103 inhabitants.

CENTRANTHERA, in *Botany*, from *κεντρον*, a spur, and *ανθηρα*, an anther.—Brown Prodr. Nov. Holl. v. 1. 438.—Class and order, *Didynamia Angiospermia*. Nat. Ord. *Perfonate*, Linn. *Scrophularina*, Br.

Eff. Ch. Calyx split at one side; its five segments cohering at the other. Corolla funnel-shaped; limb spreading, five-lobed, unequal. Stamens within the tube. Lobes of the anthers spurred at the base. Stigma lanceolate. Capsule with two cells, two valves, and a contrary partition bearing the receptacle of the seeds, at length separating from the valves.

1. *C. hispida*. Br. n. 1.—Found by sir Joseph Banks, in the tropical part of New Holland. An upright bristly herb, with opposite, undivided, narrow leaves, and a terminal spike. Flowers purplish, alternate, nearly upright, each with three bractæe. Capsule ovate, rather pointed, its valves sometimes divided. Seeds minute, with a lax reticulated skin. Albumen but small. Embryo round. Calyx at length separable into two divisions. Akin on the one hand to *Buchnera* and *Euphrasia*, on the other perhaps to *Digitalis*, being also allied to *Sesamum*, but distinguished by the structure of the capsule, and the presence of albumen. The stigma requires further examination. Mr. Brown thinks there is another species found in the East Indies.

CENTRE, in *Geography*, a county of Pennsylvania, containing 10,681 inhabitants.—Also, a township of Butler county, in Pennsylvania, containing 742 inhabitants.

CENTRE-HARBOR, a town of Stafford county, in New Hampshire, containing 349 inhabitants.

CENTROLEPIS, in *Botany*, Labill. Nov. Holl. v. 1. 7. See DEVAUXIA.

CEPHALOTUS, κεφαλωτο, *capitate*, expressive of the glandular head of each of the filaments.—Labill. Nov. Holl. v. 1. 6. Brown Bot. of Terra Austr. 68.—Class and order, *Dodecandria Hexagynia*. Nat. Ord. *Rosaceæ*, Juss. Br.

Eff. Ch. Calyx in six segments, coloured. Petals none. Stamens inserted into the rim of the calyx. Anthers glandular at the back. Germens single-seeded. Styles vertical.

1. *C. follicularis*. New Holland Pitcher-plant. Labill. as above, 7. t. 145. Br. t. 4.—In marshy ground, near King George's found and Prince's Royal harbour, on the south-west coast of New Holland, flowering in December and January. Herb perennial, with scarcely any stem. Leaves at the top of each division of the crown of the root, numerous, crowded, stalked, elliptic-lanceolate, acute, entire, smooth, or slightly hairy, an inch and a half long, intermixed with numerous, stalked, deflexed, inflated, pitcher-like vessels, larger than the leaves; double-winged, and fringed, at the front and sides; tumid and crenate at the margin; more or less closed by a convex ribbed lid. Each is half full of a sweetish watery fluid, in which ants are

generally found drowned, as in *NEPENTHES* (see that article); but these remarkable plants have no other character in common. *Flower-stalks* central, solitary, nearly round, hairy, leafless, twelve or eighteen inches high, each terminating in a dense, compound, obtuse cluster, of small white flowers. The fruit is unknown.

CEPHALUS, a genus of the cartilaginous order of fishes, the species of which have been united with those of the genera *Diodon* and *Tetrodon*; which see. Dr. Shaw has given the following character of this genus: jaws bony; body terminating abruptly, so as to resemble the head of a fish. The species enumerated by Shaw are, *C. brevis*, or tetrodon mola of Linnæus; *C. oblongus*, or *Tetrodon trunculus*, or oblong diodon of Pennant; *C. varius*, with body variegated by whitish undulations and spots; *C. Pallasianus*, the diodon mola of Gmel. Linn.

CERASIN, in *Chemistry*, a name given by Dr. John to a peculiar vegetable substance, which has always been hitherto considered as a variety of gum. Its properties are the following.

It is a solid substance, having the general appearance and taste of gum; though it is usually harder than gum, and not so easily reduced to powder. When put into cold water it imbibes that liquid and swells up very considerably, and becomes semi-transparent and gelatinous, but is not in the least soluble, a property by which it is distinguished from gum. It dissolves in boiling water, but again precipitates as the liquid cools, and remains in the state of jelly. This gelatinous mass may be used like gum to paste together pieces of paper, &c. It is insoluble in alcohol and ether; but cold water, acidulated with either of the mineral acids, dissolves a small portion of it, and if heated, the whole. When an alkaline solution is dropped into the nitric solution of cerasin, a portion only of the cerasin is precipitated. If the liquid be evaporated, the remainder is obtained converted into a peculiar bitter-tasted substance.

Tragacanth gum may be considered as an example of pure cerasin. (See *TRAGACANTH*.) Cerasin also constitutes a portion of the gummy matter that exudes from the prunus *cerasus*, (hence the name,) prunus avium, prunus domestica, xanthera halitilis, &c.

CERATIOLA, in *Botany*, from *κερατιον*, a little horn, alluding to the appearance of the stigma.—Michaux Bor.-Am. v. 2. 221. Willd. Sp. Pl. v. 4. 712. Pursh 21.—Class and order, *Diocia Dianthia*. Nat. Ord. *Ericis* affine? Juss.

Eff. Ch. Male, Calyx none. Corolla none.

Female, Calyx none. Corolla none. Stigma in many unequal segments. Berry with two seeds.

1. *C. ericoides*. Heath-like Ceratiola. Willd. n. 1. Pursh n. 1.—Native of Georgia and Florida, in dry gravelly soil; plentiful on the islands in the mouth of St. Mary's river. Pursh. A small shrub, determinately branched, resembling a heath; young branches finely woolly. Leaves four in a whorl, stalked, linear, revolute, rigid, smooth, about half an inch long. Flowers from small lateral buds, with concave, fringed scales. Anthers large, of two cells, bursting lengthwise. Segments of the stigma often combined into two little horn-like bodies. Berry globular, red, half the size of a pea. Perhaps this might be considered as an *EMPETRUM* destitute of calyx and corolla; see that article. It forms however a better artificial genus than many daily published. We have specimens from Mr. Fraser.

CERIUM, in *Chemistry*, the name of a metal. This metal, or rather its oxyd, is extracted from a Swedish mineral formerly confounded with tungsten, and was first obtained separately by Klaproth, who considered it as a new earth, to which

which he gave the name of *ochroita*. (See OCHROITE.) About the same time this mineral was examined with more attention by Hisinger and Berzelius, who gave it the name of *cerit*, and detected in it a peculiar substance, which they considered as a metallic oxyd, to which they gave the name of *Cerium*, from the planet *Ceres*, then lately discovered by Piazzi. They did not succeed in reducing this oxyd; nor was Gahn, who made the experiment some time afterwards, more successful. Vauquelin, however, who had formerly examined the mineral, turned his attention to the subject a second time, and he succeeded in reducing it so far as to show that its basis is a metal.

In 1814 a new set of experiments was made upon it by Laugier. He appears to have reduced it to the metallic state, but combined with carbon. Oxalic acid, according to Laugier, separates the whole of the oxyd of cerium from iron. The assertion of this chemist, however, that its oxyd is not volatile, has been denied by Dr. Thomson.

To procure the oxyd of cerium in a state of purity, the Swedish chemists employed the following method. The mineral was reduced to a fine powder, and digested in nitric acid till every thing soluble was taken up. The solution was then evaporated to dryness, and the residue dissolved in water. Into this solution ammonia was poured, till every thing precipitable by its means was thrown down. The precipitate being well washed, was redissolved in nitric acid, the acid neutralized, and then tartrate of potash added to the solution. The precipitate thus formed was then heated to redness, well washed with vinegar, and dried, and was considered as pure oxyd of cerium.

The oxyd of cerium, when first prepared, is white; but when it has been heated it becomes reddish-brown. Formed into a paste with oil, and heated in a charcoal crucible, it loses weight: when urged by a strong fire on charcoal, it does not melt but continues in powder. It exhibits, however, brilliant particles, which were proved to be of a metallic nature.

According to Vauquelin and Hisinger, cerium combines with two proportions of oxygen. The protoxyd is white; the peroxyd reddish-brown. The peroxyd contains $1\frac{1}{2}$ times as much oxygen as the protoxyd. The protoxyd, according to Hisinger, is composed of

Cerium	-	100
Oxygen	-	17.41
The peroxyd of Cerium	-	100
Oxygen	-	26.115

From Hisinger's experiments, it appears that the equivalent number for the protoxyd of cerium is 67.5, and of the metal 57.5. But if with Dr. Thomson we suppose the peroxyd to be a compound of two atoms of cerium and three of oxygen, the weight of the atom of peroxyd will be 145.

No compound of this metal with hydrogen, azote, chlorine, nor fluorine is known. The carburet formed by Laugier was a black matter, which took fire spontaneously when exposed to the air. The phosphuret, which appears to have been formed in one instance by Hisinger and Berzelius, was a hard, brown, tenacious substance, which thone in the dark, and took fire when heated.

Hydrofulphuret of ammonia throws down cerium at first of a brown colour, but it becomes deep green if the re-agent be added in larger quantity. When dry, the hydrofulphuret formed is a bright green, and burns when heated, leaving a yellow oxyd of cerium. The colour of the precipitate varies, however, according to the state of oxydation of the cerium held in solution.

No alloy of cerium is known, except one with iron, obtained by Vauquelin; this was white, brittle, and dissolved with great difficulty in nitro-muriatic acid.

Salts of Cerium. *Nitrate of Cerium.*—Nitric acid unites with both the oxyds of cerium; with the white oxyd it combines most readily. The solution is colourless, crystallizes with difficulty, retains an excess of acid, and has a sweet astringent taste. The red oxyd dissolves with difficulty in cold nitric acid, but the solution may be readily effected by heat. The solution is yellow, and if an excess of acid be present, it yields small white deliquescent crystals. Both the nitrates are soluble in alcohol, and are decomposed by heat.

Muriate of Cerium.—This salt exists in the form of small four-sided prismatic crystals of a yellowish-white colour. They are soluble in alcohol, and deliquesce on exposure to the air. When exposed to heat they are decomposed.

Sulphate of Cerium.—Sulphuric acid dissolves the red oxyd of cerium with difficulty. The solution when obtained is of an orange-colour, and yields by evaporation small octahedral and needle-formed crystals of persulphate of cerium. Their colour is partly lemon-colour and partly orange. This salt is not soluble in water without excess of acid. When exposed to the air, the crystals soon assume the form of a yellow powder. Sulphuric acid combines readily with the white oxyd of cerium, especially when in the state of carbonate. The solution is colourless, and readily crystallizes. There is a triple sulphate of potash and cerium.

Phosphate of Cerium.—This is a white powder insoluble in water, but soluble in the nitric and muriatic acids.

Arseniate of Cerium.—This salt is insoluble. There is a soluble superarsenate which does not crystallize.

Acetate of Cerium.—This salt exists in the form of small granulated crystals, readily soluble in water, but sparingly soluble in alcohol, and not altered by exposure to the air.

Oxalate of Cerium.—Oxalic acid and oxalate of ammonia precipitate cerium from its solution. The precipitate with the peroxyd is red, with the protoxyd white. It is not soluble in excess of acid, but readily in ammonia.

Tartrate of Cerium.—The tartrate of potash throws down cerium from its solutions in the form of a white insoluble tartrate. This tartrate, however, is soluble in nitric, muriatic, and sulphuric acids, and also in pure alkalies.

Citrate of Cerium.—The citrate of cerium is insoluble, without an excess of acid, when it is readily soluble. The solution does not crystallize. The other salts of this metal are unknown, or devoid of interest. With respect to these salts in general, it may be observed, that they are either of a white or yellow colour, according to the state of oxydation of the metal, and their solutions have a sweetish taste. The hydrofulphuret of potash, prussiate of potash, and oxalate of ammonia, produce in them white precipitates; while the gallic acid and infusion of galls occasion no precipitate, when added to solutions of their salts.

CERIUM. See MINERALOGY, *Addenda*.

CERNE, or CERNE-ABBAN, l. 36, add.—In 1811 the parish contained 145 houses, and 795 persons; viz. 358 males, and 427 females.

CERUMEN, or Ear-Wax, *Chemical Properties of.* This substance is nearly insoluble in water. Alcohol, when assisted by heat, dissolves five-eighths of the cerumen; the remainder is stated by Vauquelin to possess the properties of albumen mixed with a little oily matter: when the alcoholic solution is evaporated, it leaves a deep orange-residuum of a very bitter taste, having the smell and consistence of turpentine. It melts when heated, evaporates in a white smoke, without leaving any residuum, and in short resembles the *resin of*
lit.

Ule. Ether also dissolves this oily body; but the solution is much less bitter, and lighter coloured. From these and other experiments, Vauquelin considers cerumen as composed of

Albumen,
An infusated oil,
A colouring matter,
Soda and phosphate of lime.

CESAR'S CREEK, a township of Greene county, in Ohio, having 640 inhabitants.

CETIC ACID, in *Chemistry*. A name given by Chevreul to a substance obtained by saponifying spermaceti. It may be procured by adding an acid to a soap composed of spermaceti and potash. Cetic acid is a white solid substance, without taste or smell. It melts at a temperature of about 113°, but does not crystallize on cooling, a circumstance in which it differs from spermaceti. It is insoluble in water, but boiling alcohol dissolves more than its weight of it, and as the solution cools, the cetic acid separates in brilliant lamellar crystals. The solution in alcohol reddens litmus. It combines readily with the different salifiable bases, and forms salts or rather soaps, none of which appear to possess any striking properties.

CETRARIA, in *Botany*, Achar. Syn. 226, a natural, but not very carefully defined genus of *Lichenes*, comprising eleven species, among which are *L. juniperinus*, *glauca*, *nivalis*, and *islandicus* of Linnæus. See LICHENES, n. 19 in the arrangement of Acharius.

CEYLANITE, or PLEENASTE. See MINERALOGY, *Addenda*.

CHACE, col. 2, l. 32, for vizier *r.* veneur.

CHÆTANTHUS, in *Botany*, from *χῆτιν*, a bristle, and *αἶθος*, a flower.—Brown Prodr. Nov. Holl. v. 1. 251.—Class and order, *Dioecia Triandria*. Nat. Ord. *Raffiaceæ*, Br.

This genus is distinguished from *LEPTOCARPUS* (see that article) by the divided *style*, and the minute fetaceous form of the inner scales of the very short calyx. The only species is

1. *C. leptocarpoides*, found by Mr. Brown, on the fourth coast of New Holland.

CHÆTODON, col. 2, l. ult. for Japan *r.* Java. Add—See *TEUTHIS*.

CHÆTODON *Arcuatus*. Add—Perhaps from the Aroo islands in the Moluccas.

CHÆTOSPORA, in *Botany*, from *χῆτιν*, a bristle, and *σπῆρα*, a seed.—Brown Prodr. Nov. Holl. v. 1. 232.—This genus is founded by Mr. Brown, on those species of the *SCHOENUS* of Linnæus, and other authors (see that article), whose seed is subtended by bristles, which are not so long as the *scales* of the flower. Fifteen species are natives of various parts of New Holland, one of which, *C. lanata*, Br. n. 4, is *Schoenus lanatus*, Labill. Nov. Holl. v. 1. 19. t. 20. The rest appear to have been first described by Mr. Brown. *Schoenus compressus* and *rufus* of Fl. Brit. belong to *Chætospora*. See RHYNCHOSPORA for a genus similarly characterized.

CHAIN, col. 2, l. 4 from bottom, *r.* Plate XII.

CHALK, FRENCH, *r.* See SLATE.

CHAMÆDOREA, in *Botany*, from *χαμαί*, dwarf, and *δῶρα*, a gift, because the lower part of the stem yields the flowers and fruit.—Willd. Sp. Pl. v. 4. 800. Ait. Hort. Kew. v. 5. 394.—Class and order, *Dioecia Hexandria*. Nat. Ord. *Palmæ*.

Eff. Ch. Male, Calyx deeply three-cleft. Corolla deeply three-cleft. Rudiment of a style longer than the stamens. Female, Calyx deeply three-cleft. Petals three. Nectary

VOL. XXXIX.

three scales, between the petals and germen. Styles three. Drupa succulent, with one seed.

1. *Ch. gracilis*. Slender Chamædorea. Willd. n. 1. Ait. n. 1. (Borassus pinnatifrons; Jacq. Hort. Schoenbr. v. 2. 65. t. 247, 248).—Native of the Caracæas and of Guiana. An elegant palm, whose trunk is ten feet high, an inch in diameter, very smooth, crowned with alternate pinnate leaves, two feet long, and sending out from near the bottom several long, slender, aggregate spikes, of numerous small yellow flowers; the male ones longest, and pendulous. Fruit scarlet, the size of a pea.

CHAMÆRAPHIS, from *χαμαί*, dwarf, and *ῥαφίς*, a needle, because each of the little short partial flower-stalks bears a very long awn from near its apex.—Brown Prodr. Nov. Holl. v. 1. 193.—Class and order, *Triandria Trigynia*. Nat. Ord. *Gramina*.

Eff. Ch. Calyx of two valves, two-flowered; the outer valve very small. Corolla of two valves. Outer floret male, its outer valve like the inner valve of the calyx: inner female, smaller, membranous. Scales two beneath the germen. Stigmas feathery. Seed inclosed in the hardened corolla.

1. *Ch. bordaceæ*. Br. n. 1.—Gathered by Mr. Brown, in the tropical region of New Holland.—A perennial grass, with two-ranked, linear, straight leaves; their stipula rounded. Spike solitary, resembling *Hordeum*, with imbricated flowers, in two ranks, parallel to the zigzag common-stalk, on short partial stalks, each of which bears, from its infide, near the top, a very long awn. It is closely allied to *Panicum* (see that article), differing chiefly in having three styles, which indeed is extremely peculiar.

CHAMBER, in *Architecture*, l. 5 from the end, *r.* ought not to be, &c.

CHANCEFORD. Add—It contains 996 inhabitants.

CHANCEFORD, Lower, a township of the same county and state, having 818 inhabitants.

CHARLEMONT, a township of America, l. 3, *r.* 987.

CHARLES COUNTY, l. 4 and 5, *r.* 20, 245, including 12,435 slaves.

CHARLES CITY, l. 4, *r.* 5186, and 3023.

CHARLES, *Sr.* Add—Also, a parish of the German coast county, in the territory of Orleans, containing 3291 inhabitants, of whom 2321 are slaves.—Also, a district in Louisiana, containing 3505 inhabitants, including 271 slaves.

CHARLESTON (2d article), l. 5, *r.* 38,468, and 33,714.

CHARLESTON (3d article), insert in l. 1.—city; l. ult. *r.* 1810, 24,711, and 11,671.

CHARLESTOWN, l. 3.—The population is 5283; the senatorial electors 660, by the census of 1810. Here are two Presbyterian or Dutch reformed churches, one for Baptists, one for Methodists, and 30 school-houses; l. 7.—The number of inhabitants in 1810 was 28, including one slave; l. 8.—The number of inhabitants is 1580; l. 14.—The population in 1810 was 1501; l. 27, for 2000 *r.* 4959; l. 41, for 2022 *r.* 1174, including one slave.—Also, a township of Indiana, in Clark county, having 11 inhabitants.

CHARLETON, col. 2, l. 8, by the census of 1810, the number of inhabitants was 1946, and of senatorial electors 227; l. 12, for 1965 *r.* 2180.

CHARLOTTE, l. 5, for 635 *r.* 1679.

CHARLOTTE, a county of Virginia, l. 3, for 10,078 *r.* 13,161, and for 4916 *r.* 7597.

CHARLTON. Add—Also, a town of Worcester county, in Massachusetts, having 2180 inhabitants.

CHARTIER. Add—It contains 1747 inhabitants.

CHARTRES, l. 11, r. 48° 26' 54". E. long. 1° 29' 35".

CHASE, in *Sea-Language*, col. 2, l. 5, r. keeps the chafe.

CHASSIS DE GALERIE, r. CHASSES, &c.

CHATHAM, in America, l. 5, r. 1334; l. 8, r. 208; l. 12, after 1767, add—It contains 3258 inhabitants; l. 14, after Newark, add—Also, a town of Morris county, in New Jersey, having 2019 inhabitants.—Col. 2, l. 2, r. 12,877; l. 3, r. 3635; l. 12, after contains, add 7553; l. 13, r. 48.

CHAUX de Fond, l. 4, r. Locle; l. 6, r. Locle.

CHEESE, *Chemical Properties of*. See MILK.

CHEESE-Press, col. 2, l. 22, insert—*Agriculture, Plate, &c.*

CHEILANTHES, in *Botany*, a genus of ferns, first distinguished from ADIANTUM, (see that article in the present volume,) by professor Swartz, and named from *χειλος*, margin, and *ανθος*, a flower, because the fructification is really inserted into the margin of the frond, not into the scales which conceal it. Such indeed was the idea hitherto conceived of *Adiantum*; but this not being the case with the original and best-known species, *Capillus Veneris*, the generic appellation was properly allowed to remain with that and its allies, under a corrected character.—Swartz Syn. Fil. 126. t. 3. Willd. Sp. Pl. v. 5. 455. Brown Prodr. Nov. Holl. v. 1. 155. Ait. Hort. Kew. v. 5. 526. Sm. Prodr. Fl. Græc. Sibth. v. 2. 278. Pursh 670.—Clafs and order, *Cryptogamia Filices*. Nat. Ord. *Filices annulate*.

Effl. Ch. Capfules annulated, in distinct marginal dots. Involucrum of membranous, distinct, inflexed scales, separating internally.

Dr. Swartz defines sixteen species; professor Willdenow nineteen, the latter disposing the whole in three sections, though marked as two only, according to an inaccuracy we have often noticed in him. The following are sufficient examples.

SECT. 1. *Frond simply pinnate*. One species.

Ch. *micropteris*. Small Cheilanthes. Willd. n. 1. Sw. n. 1. 324. t. 3. f. 5.—Frond pinnate, linear; leaflets hairy, nearly orbicular, with wave-like notches.—Native of Quito. *Fronde* narrow, a finger's length, with several, alternate, slightly stalked leaflets, about a line in diameter.

SECT. 2. *Frond doubly pinnate*. Ten species.

Ch. *pteroides*. Pteris-like Cheilanthes. Willd. n. 2. Sw. n. 12. Ait. n. 1. (*Adiantum pteroides*; Linn. Mant. 130. Pteris orbiculata; "Houtt. Nat. Hist. t. 96. f. 3.")—Frond doubly pinnate; lower branches somewhat compound; leaflets ovate-elliptical, obtuse, rather heart-shaped, finely crenate. Dots crowded. Coverings imbricated. Common stalk polished.—Native of the Cape of Good Hope. A handsome fern, a foot or more in height, with stout, black, shining stalks, and firm dark-green leaflets, half an inch long; paler beneath. This and the following might have been referred to the next section.

Ch. *fuaveolens*. Aromatic Cheilanthes. Willd. n. 5. Sw. n. 6. "Schkuhr Crypt. 116. t. 19." Sm. Fl. Græc. Sibth. t. 966. unpublished. (*Polypodium fragrans*; Linn. Mant. 307. Desfont. Atlant. v. 2. 408. t. 257. Petiv. Gazoph. t. 73. f. 4.)—Frond doubly pinnate, smooth; lower branches more or less compound; leaflets ovate, obtuse, somewhat revolute. Common-stalk thread-shaped, roughish with slender scales.—Found on rocks and old walls in Barbary, Madeira, Cyprus, &c. An elegant little fern, three or four inches high, very fragrant when first dried. The copious hair-like tawny scales of the stalk are sometimes almost entirely wanting.

Ch. *fragrans*. Sweet-scented Cheilanthes. Willd. n. 7. Sw. n. 4. 325. t. 3. f. 6. Ait. n. 2?—Frond doubly pinnate, smooth; leaflets elliptic-lanceolate, obtuse, pinnatifid, with incurved, partly cloven segments. Common-stalk somewhat hairy.—Native of the East Indies, from whence Kœnig sent specimens, which remain unnamed in the Linnean herbarium. The Madeira plant, gathered by the same botanist, is, as Dr. Swartz suspected, a different species, being the *Polypodium fragrans* of Linnæus, our *Ch. fuaveolens*, which is probably also Mr. Aiton's *Ch. fragrans*. The East Indian fern before us is excellently delineated by professor Swartz, and has a more oblong frond, with curiously pinnatifid leaflets, nor can those who have seen both species ever confound them. We are unacquainted with *Ch. odora*, Willd. n. 6.

SECT. 3. *Frond triply or quadruply pinnate*. Eight species. Ch. *dichotoma*. Forked Cheilanthes. Willd. n. 15. Sw. n. 15. 335. t. 3. f. 7.—Frond three or four times pinnate, smooth; leaflets three-lobed, obtuse, somewhat crenate.—Native of mountains in Quito. A span high, slender and delicate, with alternate, wavy, almost capillary branches, and minute round-lobed leaflets.

Ch. *tenusifolia*. Fine-leaved Cheilanthes. Willd. n. 16. Sw. n. 13. 332. "Schkuhr Crypt. t. 125." Br. n. 1. (*Trichomanes tenuifolia*; Burm. Ind. 237. *Dryopteris campestris*; Rumph. Amboin. v. 6. 74. t. 34. f. 2.)—Frond triply pinnate, smooth; leaflets obovate-oblong, slightly crenate; upper ones confluent.—Native of the East Indies. This has the habit of *fragrans* and its allies, but is much larger.

Ch. *dealbata*. White-leaved Cheilanthes. Pursh n. 2.—"Frond triply pinnate; leaflets oval, distinct, crenate or emarginate at the end; white beneath."—On rocks, on the banks of the Missouri, in July. A very delicate small fern, much resembling *Ch. tenuifolia*. Pursh.

CHEKIE, or CHEQUEE, a Turkish weight: that with which gold, silver, diamonds, and precious stones are weighed, is divided into 100 drachms, and the drachm into 16 killots or carats, or 64 grains. A chequee weighs 10 oz. 5 dwts. 3 grs. troy weight; and a drachm 49½ grs. ditto; so that 48 chequees = 41 lbs. troy nearly. The oke is = 4 chequees, or 400 drachms; and the chequee = 11 oz. avoirdupois. The chequee of goats' wool is 800 Turkish drachms, or 5 lbs. 10 oz. avoirdupois; the chequee of opium 250 Turkish drachms = 27 oz. 10 drs. avoirdupois.

CHELMSFORD, col. 2, l. 12 from the bottom, r. 4649 and 822.

CHELMSFORD, in America, l. 4, r. 1396.

CHELSEA, in America, l. 3, r. 594; l. 8, r. 1327.

CHELTHENHAM, col. 2, l. 19 from the bottom, r. 8325; l. 12, r. 1568.

CHELTHENIAM, a township of Montgomery county, in Pennsylvania, having 783 inhabitants.

CHÉMIN CREUX, r. RAVINE.

CHENANGO, a county of New York, containing, by the census of 1810, 21,704 inhabitants, of whom 13 are slaves.

CHEPSTOW, col. 4, l. 48, for wall r. walk. Add—The parish of Chepstow contained, in 1811, 421 houses, and 2581 persons; 1158 being males, and 1423 females.

CHÉRAY, or CHURAY, a weight in Perlia; the batman of Churay being double the batman of Taurus, and weighing 12 lbs. 4 oz. 13 drs. avoirdupois.

CHERBOURG, l. ult. r. N. lat. 49° 35' 31". W. long. 1° 37' 18".

CHERRYFIELD, in *Geography*, a town of WASHINGTON county, in the district of Maine, with 181 inhabitants.

CHERRY-

CHERRY-TREE, a township of Venango county, in Pennsylvania, having 391 inhabitants.

CHESHAM. The parish of Chesham, in 1811, contained 417 houses, and 2071 persons; 924 being males, and 1147 females.

CHESHIRE, col. 2, l. 4 from the bottom, r. 41,187 and 227,031.

CHESHIRE. By the returns of 1811, Aflton-upon-Merley in this county, and in a parish of the same name (omitted in its alphabetical arrangement), appears to have then contained 156 houses, and 918 persons; 467 being males, and 451 females.

CHESHIRE, in America, *dele* l. 5 and 6, and add—and 40,988 inhabitants.

CHESHIRE, a township, &c. l. 3, add—containing 1315 inhabitants. At the clofe, add—It contains 2288 inhabitants.

CHESNUT HILL. Add—containing 1128 inhabitants.

CHEST, in *Anatomy*, l. 2, insert—LUNGS.

CHEST of Viols, dele SIX-STRINGED BASE.

CHESTER, col. 6, l. 17. In 1811, the city of Chester contained 3296 houses, and 16,140 persons; 7007 being males, and 9133 females: 397 families employed in agriculture, and 2296 in trade and manufactures.

CHESTER, in Nova Scotia, l. 8, r. 1534; l. 13, r. 2030; l. 17, r. 2370; l. 30, after affixants, add—It contains 1056 persons; l. 32, r. 40; l. 33, r. 39,596; l. 34, r. 7; l. 57, r. 11,479; l. 58, r. 2743. At the clofe, add—Alfo, a town of Clinton county, in Ohio, having 1254 persons.—Alfo, a town of Burlington, in New Jersey, having 1839 inhabitants.—Alfo, a town of Morris county, in New Jersey, having 1175 inhabitants.—Alfo, a borough of Chester county, in Pennsylvania, having 471 inhabitants.

CHESTER, West, a county of New York, containing 30,272 inhabitants, of whom 982 are flaves.

CHESTERFIELD, col. 2, l. *ult.* In 1811 the parish of Chesterfield contained 951 houses, and 4476 persons; 2025 being males, and 2451 females.

CHESTERFIELD, l. 3, r. 1408; l. 7, r. 1839; l. 15.—It contains 5564 inhabitants, of whom 1639 are flaves; l. 17, r. 9979, and 6015. Add—Alfo, a town of Burlington county, in New Jersey, having 1839 inhabitants.

CHESTER-LE-STREET. In 1811, the township of Chester-le-Street contained 245 houses, and 1726 persons; 800 being males, and 926 females.

CHESTERVILLE, a town of the diftrict of Maine, in the county of Kennebeck, with 430 inhabitants.

CHETWERT, and **CHEWERIC**, two corn meafures in Ruffia; the former or cool being 2 omins = 4 pajacks = 8 chetwicks = 64 garnitz. The latter meafures 1555.92 cubic inches, and contains 5 $\frac{1}{2}$ Winchester gallons nearly. In bufinefs the ufual calculation is, that 100 chetwerts produce 72 quarters, and 1 chetwert 5 $\frac{1}{2}$ bufhels, Winchester meafure.

CHIASTOLITE. See **MINERALOGY**, *Addenda*.

CHICHESTER, in *Geography*. In 1811, the city of Chichefter contained 1083 houses, and 6425 persons; 2878 being males, and 3547 females.

CHICHESTER, *Upper and Lower*. Add—The former contains 437, and the latter 511 inhabitants.

CHICHESTER, l. 4, r. 951.

CHILISQUAQUE. Add—Northumberland county, having 1505 inhabitants.

CHILLIKOTHE. Add—By the census of 1810, it contained 1360 inhabitants.

CHILMARK, l. 3, r. 723.

CHILODIA, in *Botany*, perhaps from *χιλος*, in allusion to its longer and more conspicuous lip.—Brown Prodr.

Nov. Holl. v. 1. 507.—Clafs and order, *Didymia Gymnospermia*. Nat. Ord. *Verticillate*, Linn. *Labiate*, Juff. Br.

Eff. Ch. Calyx two-lipped, with a pair of appendages; tube fringed; upper lip undivided, with an interior transverse rib; lower divided half way. Corolla ringent; upper lip fhorteft, undivided; lower with a large cloven central lobe. Anthers pointlefs, deeply cloven at the bafe.

1. Ch. *feutellariana*. Br. n. 1.—Gathered by Mr. Brown at Port Jackfon, New South Wales. A little fhrub, agreeing with *Proflanthera* in habit, but differing in *calyx* and *anthers*. The leaves are linear, revolute. Flowers axillary, folitary, stalked. We venture to rid the fpecific name of its termination, *oides*, which might be done with advantage in many other fimilar instances.

CHILOGLOTTIS, from *χιλος*, a lip, and *γλωττις*, the tongue, alluding to the tongue-shaped appendage to the lip.—Brown Prodr. Nov. Holl. v. 1. 322.—Clafs and order, *Gynandria Monandria*. Nat. Ord. *Orchidee*.

Eff. Ch. Calyx ringent; two lower leaves under the lip, channelled, with cylindrical points. Lip stalked; glandular in the difk; with a tongue-shaped appendage at the bafe. Column cloven at the top. Anther a terminal permanent lid; the cells clofe together. Maffes of pollen two in each cell, powdery, compressed.

1. Ch. *diphylla*.—Native of Port Jackfon, New South Wales. *Bulbs* folitary, naked, terminating the defending *caudex*. Herb fmooth. Leaves two, oval, many-ribbed, fheathed at the bafe. Flower folitary, reddifh, with a folitary *bractea* half way up the falk. Akin to *CYRTOSTYLIS* and *PTEROSTYLIS*. Brown. See thofe articles.

CHIMBORAZO, l. 9, add—according to Humboldt, its fummit is 21,430 feet above the level of the fea; and confequently a great part is above the circle of perpetual congelation, which, in this latitude alfo under the line, is fituated higher than the fummit of Mont Blanc.

CHINA, col. 3, l. 19 from the bottom, r. Mandfhurs. Col. 24, l. 4, r. fticks or poles.

CHIODECTON, in *Botany, from *χιος*, fnow, and *δεχομαι*, to receive, alluding to the whitenefs of the warts or aggregate receptacles.—Achar. in Tr. of Linn. Soc. v. 12. 43. t. 3.—A genus of cruftaceous Lichens, found on the barks of trees in South America, thus defined.*

Eff. Ch. Warts convex, of the fubftance of the cruft. Receptacles numerous, imbedded in the warts, globular, aggregate, black, powdery throughout.

Two fpecies are defcribed, *Ch. fphærale*, f. 2, and *feriale*, f. 3.

CHIPPENHAM, l. 30.—In 1811, the borough and parifh contained 668 houses, and 3410 persons; viz. 1580 being males, and 1830 females: 145 families employed in agriculture, and 652 in trade and manufactures.

CHITTENDEN, l. 6, r. 1810; l. 24, r. 1820. At the clofe, add—It contains 446 inhabitants.

CHLOANTHES, in *Botany*, *χλωανθεις*, turning green; from the colour affumed by the pale yellow corolla in drying, as is the cafe with the primrose.—Brown Prodr. Nov. Holl. v. 1. 513.—Clafs and order, *Didymia Angiospermia*. Nat. Ord. *Perfonate*, Linn. *Viticee*, Juff. Gen. *Verbenacee*, Juff. Br.

Eff. Ch. Calyx bell-shaped, equally five-cleft. Corolla tubular, ringent; throat dilated; upper lip cloven; lower in three deep fegments, the middle one longeft. Stamens prominent. Stigma cloven, acute. Drupa dry. Nuts two, each of three cells; two lateral cells fingle-feeded; middle one abortive, obliterated.

Downy *ferubs*, with oppofite, fimple, decurrent, linear, bliftery leaves. Stalks axillary, folitary, fingle-flowered,

each with two *bractæas*. *Calyx* rather leafy, revolute at the edges. *Corolla* sulphur-coloured; turned green by drying. *Nuts* tumid in front. *Seeds* with scarcely any albumen. *Brown*.

1. *Ch. strobilidis*. Br. n. 1.—Back of the leaves, and outside of the calyx, snow-white, downy. *Bractæas* in the middle of the flower-stalks.—Native of Port Jackson, New South Wales.

2. *Ch. glandulosa*. Br. n. 2.—Back of the leaves glandular, and clothed, like the outside of the calyx, with scattered hairs. *Bractæas* at the base of the flower-stalks.—From the same country.

CHLORATES, in *Chemistry*. See CHLORINE.

CHLORIC Acid. See CHLORINE.

CHLORINE. This name was given by sir H. Davy to the principle formerly termed OXYMURIATIC Acid, under which head its leading properties are detailed. We have only therefore to notice here some important compounds of this principle lately discovered, especially those with oxygen.

The protoxyd of chlorine, or *euchlorine*, has been already described under the article above alluded to. For its correct composition, see Table II. ATOMIC Theory.

The deutoxyd of chlorine was discovered about the same time by sir H. Davy and the count Von Stadion of Vienna, but Davy's account of it was first published. It may be prepared by mixing together a small quantity of chlorate of potash (not more than fifty grains) in powder, with sulphuric acid, till the whole forms a dry paste of an orange colour. Put this paste into a small glass retort, and plunge the belly of the retort into hot water, and keep it in that position for some time, taking care that the temperature of the water never becomes so high as 212°. A bright yellowish-green gas separates from the paste, which must be received in small glass jars over mercury. This gas is the deutoxyd of chlorine. Its colour, as above stated, is a bright yellowish-green. Its smell is peculiar and aromatic, without any mixture of the smell of chlorine. Water absorbs at least seven times its bulk of this gas. The solution is deep yellow, and has an astringent and corrosive taste, leaving a disagreeable and lasting impression on the tongue. It destroys without previously reddening vegetable colours, provided they are moist. It does not act upon mercury, nor any other combustible substance tried, except phosphorus, which, when introduced into the gas, occasions an explosion, and burns with great splendour. When heated to 212° it explodes with more violence than *euchlorine*, and emits a great light. Two volumes of deutoxyd of chlorine, when thus exploded, are converted into three volumes, according to Davy, which consist of two volumes or four atoms of oxygen and one of chlorine, or *per centum* of

Chlorine	-	-	-	52.94
Oxygen	-	-	-	47.06
				100.00

And its sp. gr. will be 2.361, that of chlorine being supposed to be 2.5. According, however, to the count Von Stadion's analysis, this deutoxyd is composed of one atom chlorine, and only three of oxygen.

Chloric Acid.—The existence of this compound of chlorine with oxygen was suspected by Berthollet, but it was first obtained by M. Gay-Lussac. It is the acid which exists in what was formerly termed *oxymuriate*, but now *chlorate* of potash. It was procured by dissolving the chlorate of barytes in water, and cautiously adding dilute sulphuric

acid to the solution, till the whole of the barytes was separated. The *chloric acid* remained in solution. This acid has a strong acid taste, but no sensible smell. Its aqueous solution is colourless, and reddens vegetable blues without destroying them. By a gentle heat it may be concentrated without being decomposed, or volatilized with the water. When thus concentrated, it has an oily consistency. When the heat is raised, it is partly volatilized, and partly decomposed into chlorine and oxygen. Muriatic acid decomposes it similarly without heat: the nitric acid does not affect it. It combines with the different bases forming *chlorates*, formerly termed *oxymuriates*, the most important of which will be presently described. Chloric acid has been proved to be composed of

Chlorine	-	-	-	47.24
Oxygen	-	-	-	52.76
				100.00

Of one atom chlorine and five of oxygen. See ATOMIC Theory, Table II.

Chlorate of Potash.—This is the best known and most important of the chlorates. See it briefly described under HYPEROXYMURIATIC Acid.

Chlorate of Soda.—This salt was first accurately described by Chenevix. It may be prepared by the same process as the chlorate of potash; but the easiest mode of obtaining it is, to dissolve carbonate of soda in chloric acid. It does not readily crystallize, but its crystals when formed are square plates. Its taste is sharp and cooling. On burning coals it melts into globules, and emits a yellow light. When distilled it gives out oxygen, mixed with a little chlorine, and the salt left behind has alkaline properties.

Chlorate of Ammonia.—This salt may be formed by dissolving carbonate of ammonia in chloric acid, or by mixing a solution of carbonate of ammonia with a solution of an earthy chlorate. It crystallizes in fine needles, and is very soluble in water and alcohol. Its taste is sharp. Thrown on burning coals, it fulminates with a red flame. When strongly heated, it is decomposed, chlorine is evolved mixed with azote and oxygen, and some muriate of ammonia remains behind.

Chlorate of Barytes.—The earthy chlorates are formed with more difficulty than the alkaline. The chlorate of barytes may be formed by pouring warm water on a quantity of the pure earth prepared by Vauquelin's method, and passing a current of chlorine through the mixture. To separate the chlorate from the muriate, which are both equally soluble, and otherwise resemble each other, Mr. Chenevix had recourse to the ingenious expedient of boiling phosphate of silver with the compound solution; thus muriate of silver and phosphate of barytes are formed and easily separated, while nothing but the chlorate of barytes remains in the solution, and may be easily obtained. This salt crystallizes in square prisms, terminated by an oblique face. It dissolves in about four times its weight of cold water. The solution is neither precipitated by nitrate of silver nor muriatic acid. It is insoluble in alcohol. When heated it gives out oxygen gas, and an alkaline residuum is left.

Chlorate of Strontian.—This salt was formed by a process similar to the above, and resembles it in many of its properties, but is deliquescent, and rather more soluble.

Chlorate of Lime, and *Chlorate of Magnesia*, may be formed as above. They are both deliquescent, and very soluble both in water and alcohol.

The metallic *Chlorates* may be formed by dissolving the oxyds

oxyds of the different metals in chloric acid. They do not possess any very remarkable properties, except those common to all the chlorates; viz. of giving out oxygen when heated, and of detonating when thrown on burning coals. The chlorate of silver, mixed with a little sulphur, and struck slightly, fulminates with prodigious violence.

CHLORIODIC ACID. See IODINE and SIMPLE Substances.

CHLORITE. See MINERALOGY, *Addenda*.

CHLORO-CYANIC ACID. See CYANOGEN.

CHLOROPHANE. See MINERALOGY, *Addenda*.

CHLOROPHYTUM, in *Botany*, from *χλωρον*, green; and *φύλον*, a plant, because of the green hue of the flowers, as well as herbage, in the original species.—Ker in Curt. Mag. 1071. Brown Prodr. Nov. Holl. v. 1. 276.—Clafs and order, *Hexandria Monogynia*. Nat. Ord. "*Bromelia*, Juff." Ker. *Aphodelea*, Brown.

Eff. Ch. Corolla inferior, in fix deep, equal, spreading, permanent segments. Filaments thread-shaped, smooth. Style thread-shaped. Stigma simple. Capsule with three deep compressed lobes, three cells, and three valves with central partitions. Seeds several, compressed, with a naked scar.

Herbage smooth. *Root* fasciculated; the fibres occasionally fleshy. *Leaves* radical, ribbed, linear, sometimes lanceolate. *Flowers* racemose green or white, their partial stalks jointed in the middle. *Capsule* membranous, veiny.

1. *Ch. inornatum*. Greenish-flowered Chlorophytum. Curt. Mag. t. 1071. Ait. Epit. 365.—Stem none. Leaves lanceolate, nearly as tall as the stalk. Partial stalks solitary.—Native of Sierra Leone, from whence, and not from the West Indies, its seeds were brought to the late Mr. Fairbairn, at Chelsea, if we mistake not, by Francis Borone, in 1793. It is a stove plant, flowering and seeding in summer. Several radical, many-ribbed, pointed leaves, five or six inches long, paler beneath, are accompanied by an erect, simple or branched, leafless stalk, a span high. *Flowers* pale green, scentless, each with a pointed bractea. *Corolla* spreading, three-quarters of an inch wide.

2. *Ch. laxum*. Loose-clustered White Chlorophytum. Br. n. 2.—"Stem none. Leaves linear, nearly as tall as the stalk. Clusters lax, elongated, simple or divided; partial stalks solitary or in pairs."—Found by Mr. Brown, in the tropical part of New Holland.

3. *Ch. clavatum*. Tall Chlorophytum. (Anthericum elatum; Ait. Hort. Kew. v. 2. 268. Willd. Sp. Pl. v. 2. 138. *Aphodelus foliis planis*, &c.; Mill. Ic. 38. t. 56. *Phalangium elatum*; Redout. Liliac. t. 191.)—Stem much branched, almost leafless, much taller than the linear-lanceolate radical leaves.—Native of the Cape of Good Hope. A perennial green-house plant, flowering in August and September. The flowers are copious, white, smaller than in the first species, solitary and almost sessile.

Mr. Brown mentions a fourth species, found at the Cape, but without any name or character.

CHONDRACHNE, Brown Prodr. Nov. Holl. v. 1. 220, a genus consisting of only one species, distinguished by its inflorescence alone from **CHORIZANDRA**; see that article.

CHORD, col. 2. l. 13, for EO R. ED.

CHORETRUM, in *Botany*, Brown Prodr. Nov. Holl.

v. 1. 354.—Clafs and order, *Pentandria Monogynia*. Nat. Ord. *Santalaceae*, Br.

Eff. Ch. Calyx superior, in five deep, vaulted, coloured segments, each with an interior descending keel, permanent, with a minute five-toothed calycle at the base. Stamens in the hollows of the segments. Anthers with four cells and four valves. Stigma radiated. Drupa?

The only known species are *Cb. lateriflorum* and *glomeratum*, found on the fourth coast of New Holland, rufhy branched shrubs, with minute feathered leaves, and small white flowers, being nearly related to **LEPTOMERIA**; see that article.

CHORISPERMUM, from *χωρις*, separately, and *σπέρμα*, seed, see the character.—Brown in Ait. Hort. Kew. v. 4. 129.—Clafs and order, *Tetradynamia Siliquosa*. Nat. Ord. *Siligoles*, Linn. *Cruciferae*, Juff.

Eff. Ch. Pod of two cells, without valves, separating into single-seeded clofed fragments. Cotyledons flat, acuminate. Stigma simple.

1. *Ch. tenellum*. Purple Chorispermum. Ait. n. 1. (Raphanus tenellus; Willd. Sp. Pl. v. 3. 561. Pallas Voy. v. 3. 741. t. L. f. 3.)—Leaves, as well as pods, smooth; upper ones lanceolate, toothed; lowermost pinnatifid.—Native of defarts near the Caspian sea. A little annual herb, with small purple flowers. Mr. Brown's specific character indicates the existence of another species, not known to us.

CHORIZANDRA, from *χωρίζω*, to separate, and *ανδρς*, a male, because the stamens are individually separated by scales.—Brown Prodr. Nov. Holl. v. 1. 220.—A genus consisting of two species, natives of Port Jackson, nearly akin to **CHONDRACHNE** of the same author, and to the Linnæan **CHRYSITRIX**; see those articles. From the latter it differs in inflorescence and habit. How far they could with propriety be united, we have not materials to form a decisive opinion.

CHORIZEMA, a name of which there have been various explanations, (see Tr. of Linn. Soc. v. 9. 252,) is most probably derived from *χωρίζω*, to separate; but certainly not in allusion, as De Theis supposes, to any division of the fruit. We rather believe the author of this name had in contemplation the separate filaments, of which to few instances were known in papilionaceous flowers, at the time he wrote, and *ημξ* may allude to their *dart-like* figure.—Labill. Voy. Engl. ed. v. 1. 435. Nov. Holl. v. 2. 120. Sm. in Sims and Kon. Ann. of Bot. v. 1. 566. Tr. of Linn. Soc. v. 9. 251. Ait. Hort. Kew. v. 3. 8. (Podolobium; *ibid.* 9.)—Clafs and order, *Decandria Monogynia*. Nat. Ord. *Papilionacea*, Linn. *Leguminosa*, Juff.

Eff. Ch. Calyx five-cleft, two-lipped. Corolla papilionaceous. Style curved. Stigma obtuse. Legume oblong, tumid, of one cell, with many seeds.

1. *Ch. ilicifolia*. Holly-leaved Chorizema. Labill. as above, t. 21. Sm. n. 1. Ait. n. 1.—Leaves alternate, oblong, pinnatifid, with spinous teeth; point entire, longer than the teeth. Bractees close to the flower.—Found by M. Labillardiere, at the foot of the mountains, on the fourth coast of New Holland, flowering in December. Sent to Kew in 1803, by Mr. Good. *Stem* shrubby, hardly a foot high, branching from the root. *Leaves* alternate, sessile, smooth, coriaceous, with sharp spines. *Flowers* in terminal clusters.

2. *Ch. nana*. Dwarf Chorizema. Sims in Curt. Mag. t. 1032. Ait. n. 2. (Pultenea nana; Andr. Repol. t. 434.)—Leaves alternate, elliptic-oblong, bluntish, sinuated, with spinous teeth. Bractees rather distant from the flower.—From the same country. We profit by Mr. Brown's remarks for distinguishing this species, hitherto confounded by us with the foregoing. Its stature is more humble. *Flowers* in lateral clusters, orange, with purple wings, and a short, white, purple-tipped keel. We know not distinctly the colour of *ilicifolia*.

3. *Ch. rhombica*. Few-flowered Chorizema. Br. in Ait. n. 3.—"Leaves entire, flat, pointed; lower ones orbicular, somewhat

somewhat rhomboid; upper elliptic-lanceolate. Stalks with few flowers.—Native of the same country. *Mr. Brown.*

4. *Ch. triloba.* Three-lobed Chorizema. Sm. n. 2. (*Podolobium trilobum*; Ait. Hort. Kew. v. 3. 9. Curt. Mag. t. 1477. *Pultenea ilicifolia*; Andr. Repof. t. 320.)—Leaves opposite, somewhat hastate; entire or toothed, spinous. Clusters axillary, shorter than the leaf. Germs silky.—Found near Port Jackson, New South Wales. (See *PODOLOBIUM.*) Young branches and leaves downy. Flowers copious, yellow, with a red radiating spot, and red keel, the latter nearly as long as the wings.

5. *Ch. scandens.* Climbing Chorizema. Sm. n. 3.—Leaves nearly opposite, elliptical, undivided. Clusters terminal, elongated. Calyx rather hairy.—Found by Dr. White, at Port Jackson. Stem twining. Flowers in loose pendulous clusters, yellow variegated with red.

6. *Ch. sericea.* Silky-leaved Chorizema. Sm. n. 4.—Leaves mostly alternate, elliptical. Clusters axillary, the length of the leaves. Calyx silky. Standard narrow.—Gathered by Mr. Menzies, at King George's sound. Stem twining. Leaves more silky at the back than in *C. scandens*; flowers thrice as large as in that species.

7. *Ch. coriacea.* Leathery-leaved Chorizema. Sm. n. 5.—Leaves roundish-elliptical, abrupt, coriaceous, scattered. Umbels axillary, stalked. Calyx hairy.—From the same country. A stout, upright, rigid shrub. Leaves beautifully veiny; silky beneath. Umbels on silky stalks, much shorter than the leaves.

CHOUT, denotes in India a fourth part; and the *Mahratta* chout is a fourth of the revenues, exacted as tribute by the *Mabrattas*.

CHOWAN, l. 3, r. 5297 and 2789.

CHRISTCHURCH. In 1811 the borough and street contained 303 houses, and 1553 persons; 682 being males, and 871 females.

CHRISTIAN, a county of Kentucky, containing 10,889 inhabitants, of whom 1708 are slaves.

CHRISTIAN d'Or, a Danish gold coin, current in Holstein since 1775, worth about 13 marks lubs, or 26 marks Danish currency.

CHRISTIANA. Add—By the census of 1810, it contained 6698 inhabitants, 47 being slaves.

CHRISTINA, SANTA,—for **CHRISTIANA** r. **CHRISTIANA**.

CHRISTOPHER'S, St., col. 2, l. 13 from bottom, r. W. long. 62° 43'.

CHROMATE of Iron. See **MINERALOGY, Addenda.**

CHROME, or **CHROMIUM**, in *Chemistry*, the name of a metal. (See **CHROME.**) Since that article was written, however, some facts have been ascertained respecting this metal and its compounds, which deserve to be briefly mentioned here.

Chrome seems capable of combining with three different proportions of oxygen, and of forming three oxyds, the *green*, the *brown*, and the *yellow* or *chromic acid*. The *green oxyd* may be formed by exposing chromic acid to heat in close vessels, by which means a portion of the oxygen is expelled. It may be also formed in other modes, as by precipitation; in which case it has a dark green colour, and contains water. In this state it readily dissolves in acids, but if exposed to a heat a little below redness, it becomes ignited, diminishes in bulk, and its colour changes to a lighter green. It is now no longer soluble in acids, though it has lost no weight. The *brown oxyd* may be formed by dissolving the above green oxyd in nitric acid, evaporating the solution to dryness, and exposing the dry mass to heat, till it ceases to give out nitrous fumes. A brown brilliant

powder remains, which is soluble in alkalies but not in acids. It is not improbable, that this will be found hereafter to be a *subnitrate* instead of an oxyd. *Chromic acid*, the third oxyd of chromium, is easily reduced to the state of green or protoxyd, by the action of sulphuretted hydrogen, sulphureous acid, and protoxyds of iron, copper, and tin.

The *chromates* have been already described. The *chromate* of lead is the only one much used, which has been lately employed as a paint with great success.

CHRONOLOGY.

- de division Le Rey, under French colours, taken by the Superb, July 13; l. 31, *dele* from fir Ralph, &c. to lamented. Col. 98, add—
- 1807.—Battle between the French and Russians, in which the latter were defeated, Feb. 7.—Battle of Friedland, in which the Russians were defeated with great slaughter, June 14.—St. Thomas, a Danish island, taken by the English, Dec. 21.
- 1808.—Battle of Vimiera, in which the whole of the French force, under general Junot, was defeated by fir Arthur Wellesley, Aug. 21.
- 1809.—Cayenne taken by the English and Portuguese, Jan. 15.—Battle of Corunna, in which the French were defeated by the English, Jan. 16.—Battle of Oporto, in which the French were defeated by fir Arthur Wellesley, May 11.—Battle of Alpern and Esling between the French and Austrians, with dreadful slaughter on both sides, May 21 and 22.—Pope Pius VII. excommunicated Buonaparte, June 10.—At Raab, Austrians defeated by the French, June 14.—At Wagram, Austrians defeated by the French, July 5.—Battle of Talavera de la Reyna, in which the French were defeated by the English and Spaniards, July 27.—Zante, and the rest of the Seven Islands, surrendered to the British in October.—Buonaparte divorced from the empress Josephine, Dec. 17.—General Jubilee through the kingdom, celebrating the entrance of George III. on the 50th year of his reign.
- 1810.—Islands of Faroe and Iceland taken under British protection, Feb. 12.—Amboyna seized by the English, Feb. 17.—Buonaparte married to Maria Louisa of Austria, April 1.—Isle of Bourbon surrendered to the British, July 10.—Battle of Buzaco, in which the French were repulsed with great slaughter by the allied army under lord Wellington, Sept. 27.—Mauritius surrendered to the British, Dec. 3.
- 1811.—Population of London, Westminster, Borough, and neighbouring districts, appeared to be 1,099,104, being an increase, in two years, of 133,139.—Island of Java surrendered to the British, Sept. 18.—Battle of Ciudad Rodrigo, between the French and allied armies, under lord Wellington, which terminated in an orderly retreat of the latter, Sept. 23.—Cavares and Merida, the French, under general Girard, surprised and routed by general Hill, Oct. 28.
- 1812.—Badajos taken by storm by the British and Portuguese, April 6.—Spencer Percival, prime minister of Britain, assassinated in the lobby of the house of commons, by John Bellingham, May 11.—Battle of Salamanca, in which the French were defeated with great slaughter by lord Wellington, July 22.—Smolensko, the Russians defeated by the French, Aug. 16.—Queen's Town, Canada, the army of the United States defeated by the British, Oct. 12.—Polotk, the French defeated by the Russians, and the place taken by storm, Oct. 20.—The French driven from Dorogobudh by the Russians, under Platoff, with great slaughter, Nov. 7.—At Witepsk, the French, under general Victor, defeated by the Russians, under Witgenstein, with the loss of 3000 men, Nov. 14.—Ney's corps, 12,000 of which laid down their arms, defeated by the Russian general Millandovith, Nov. 17.—At Berezina, the contest terminated in the capture by Witgenstein of a French division of 8800 men, Nov. 28.—Near Wilna, a French column was destroyed by Platoff, when a general and 1000 prisoners were taken, Dec. 11.
- 1813.—Concordat signed between pope Pius VII. and Buonaparte, at Fontainebleau, Jan. 25.—At Bejar, in Spain, the French were defeated by general Hill and the allied Spaniards, Feb. 20.—At Lunenburg, the French were defeated by the united army of Russians and Prussians, with the loss of general Morand, 100 officers, and 2200 privates, and two pieces of cannon, April 2.—At Fort George, on the Niagara, the British were defeated by the Americans, May 27.—At Vittoria, the French, under Joseph Buonaparte, were defeated by lord Wellington and the allied Spaniards, June 21.—Pyrenées, Soult was defeated, with immense slaughter, by lord Wellington and the Spaniards, July 28.—St. Sebastian was taken by storm, by general Graham, July 31.—Before Dredden, the allied army of Austrians, Russians, and Prussians, was defeated by the French, August 28.—At Toplitz, the French were defeated by the allied Austrians, Russians, and Prussians, Aug. 30.—At Dennewitz, the French were defeated with great loss by the Crown Prince of Sweden, Sept. 8.—At a Moravian village on the Thames in Canada, the British were defeated by the Americans, Oct. 5.—At Mockero, a desperate conflict occurred between the French and the allied army of Austrians, Russians, and Prussians, the place having been taken and re-taken five times, terminating in a defeat of the French, Oct. 11.—Before Leipzig, a second general engagement took place, the result of which was, a loss to the French of 10,000 men, in killed, wounded, and prisoners, with 63 pieces of artillery, and the desertion of 17 German battalions, Oct. 18.
- 1814.—At Rothiere, the French, under Napoleon, were defeated by the allied Russians and Prussians, with the loss of 3000 prisoners, and 26 pieces of cannon, Feb. 21.—Bourdeaux entered by lord Wellington, March 12.—At Tarbes, Soult was defeated by lord Wellington, March 20.—Paris entered by the emperor of Russia, at the head of his troops, March 31.—Buonaparte renounced, for himself and heirs, the throne of France, and accepted the Isle of Elba for his retreat, April 5.—The states of Parma, Placentia, and Guelfella, conferred on Maria-Louisa by treaty, April 5.—At Toulouse, the French were defeated by lord Wellington, April 10.—Buonaparte embarked for Elba, April 28.—Treaty of Paris signed by the ministers of the allied sovereigns for the protection of France, May 30.—Pope Pius VII. returned to Rome, and resumed his functions in May.—The emperor of Russia, with the king of Prussia, prince Blucher, and other illustrious persons, entered London amidst great rejoicings, June 8.—Inquisition of Spain restored by Ferdinand VII. July 21.—A grand jubilee on celebrating the peace, and the centenary of the accession of the house of Brunswick, Aug. 1.—Tuscany, after having been ceded to Buonaparte in 1807, restored in 1814.—Washington, in North America, taken by the British, and the principal buildings destroyed by fire, Aug. 24.—Hackney chariots licensed in London, not to exceed 200.
- 1815.—Buonaparte quitted Elba, and landed at Cannes, March 1.—King of Candy deposed, and the sovereignty vested in Great Britain, March 2.—Buonaparte arrived at Fontainebleau, March 20.—Treaties for the maintenance of the treaty of Paris, between England, Russia, and Prussia, signed at Vienna, March 25.—Buonaparte abolished the slave trade, March 29.

- Potofi evacuated by the royalists and entered by the Buenos Ayres army, under general Rondeau, April 5.—Florence evacuated by the Austrians, and entered by the Neapolitans, April 6.—Battle of Waterloo, in which the whole French army, with Buonaparte in command, was defeated by the English and Prussians, with immense slaughter, June 18. (See WATERLOO.)—Buonaparte retired to Paris after his defeat at Waterloo, June 20; and abdicated in favour of his son, June 23.—Paris evacuated by the French and occupied by the allied army, July 3.—Louis XVIII. restored to Paris, and resumed the government, July 8.—Buonaparte failing to fail from Rochfort to America, surrendered himself to captain Maitland of the Bellerophon, July 15.—Army of the Loire, under generals Suchet and Davoust, submitted to the government of Louis XVIII. July 16.—Bourdeaux submitted to the government of Louis XVIII. July 14.—Buonaparte transferred at Torbay from the Bellerophon to the Northumberland, and sailed for the island of St. Helena, decreed by the allied sovereigns to be his residence for life, Aug. 8.—And arrived thither, Oct. 16.—The Museum of the Louvre was dismantled by the allied sovereigns of the treasures of art which had been lodged there in consequence of the depredations of Buonaparte. His pillage in Italy, which was conveyed to Paris, consisted of 66 pieces of sculpture, and 47 capital paintings. Among the former, were the following chef-d'œuvres;—the Apollo, the Antinous, the Adonis, the Dying Gladiators, the Laocoon, the Two Sphynxes, and the Tomb of the Muses. Among the latter, were the principal paintings of Raphael, Perugino, Guercino, Annibal Carracci, Guido, Titian, and Correggio. In the national library were deposited a MS. of Josephus's Antiquities on papyrus, a MS. Virgil of Petrarch, with notes in his hand-writing, and 500 of the most curious MSS. which were in the library of the Vatican.
- 1816.—Treaty with the Nepalese in India, ratified March 15.—Princess Charlotte of Wales married to the prince of Saxe-Cobourg, May 12, the annual sum of 60,000*l.* per annum having been previously settled upon him by parliament.—Declaration of independence of the representatives of the United Provinces of South America in general congress, published at Montevideo, July 19.—Genoa transferred to the king of Sardinia.—Lotteries prohibited, on account of their immoral tendency, by the grand duke of Hesse, October.
- 1817.—Inhabitants of Chili restored to freedom by the Buenos Ayres army under general San Martin in February.—A revolutionary insurrection in Pernambuco in March.—Above 600 petitions for parliamentary reform, presented by sir Francis Burdett, strewn the floor of the house of commons, March 4.—The measure for repealing the penal laws against Catholics, which had been negatived in the house of commons by 213 against 109, June 1, 1810;—and again by 146 against 83, and in the house of lords by 121 against 62, in 1811;—and again in the former house by 300 against 215, and in the latter by 174 against 102, in 1812;—and again in the former house by 251 against 247, May 13, 1813;—and again in the same house by 228 against 147, and in the house of lords by 86 against 60, in 1815;—and again in the house of commons by 172 against 141, and in that of the lords by 73 against 69, in 1816;—and again in the former

house by 245 against 221, and in the latter by 142 against 90, April 1817.—A bill admitting Catholics to promotion in the army and navy passed June 1817.—Loan of twelve millions advanced to the French government by English merchants.

VOL. VIII.

- CHRYSOPRASE. See MINERALOGY, *Addenda*.
- CHUDLEIGH, l. 3, *r.* contains, by the return of 1811, 370, &c. : l. 14, *r.* being 1832.
- CHUKOTSKIJA, for ТЪСНУТСКИ r. ТЧУКСТКИJA.
- CHUMLEIGH, l. 10, *r.* by the return of 1811 is 282, of inhabitants 1340.
- CHURCH-STRETTON. In 1811, the township contained 100 houses, and 398 persons; *viz.* 184 males, and 214 females.
- CHURDER, signifies, in India, a staff-bearer, or an attendant on a man of rank. He waits with a long staff plated with silver, announces the approach of visitors, and runs before his master, proclaiming aloud his titles.
- CHUSISTAN, l. 14, add—Chufistan, or Kuzistan, the ancient Sufiana, is now divided between the territories of the Chab Sheikh, and those that form the government of Shufter. The former extend from the banks of the Tab to the conflux of the Karoon and Abzal, and from the shore of the Persian gulf to a range of hills which skirt the valley of Ram Hormuz to the south. This country, though watered by the Karoon and the rivers Zab and Jerahi, does not abound, as some travellers have asserted, in grain, rice, and dates; the greatest part of it consisting in vast sandy plains and morasses, wholly destitute of cultivation. The most fertile parts are those in the environs of Dorak, the capital, and on the borders of the Hafar and Shat-ul-Arab, which produce dates and rice, and scanty portions of wheat and barley. The northern and western parts of the country afford tolerable pasturage, and here the wandering tribes pitch their tents. The principal towns are, Dorak, Ahwaz, Endian, Masoor, Goban, and Jerahi. Dorak, or more properly Felahi, is situated in low marshy ground, on the banks of two of the branches of the Jerahi. The walls of mud are two miles in circumference, sixteen feet thick, and flanked with round towers. The majority of the inhabitants, amounting to about 8000, prefer living in the suburbs, under the shade of the date-trees. Dorak is the residence of the Sheikh, who has in it a miserable palace. Its manufacture is the abba, or Arabian cloak, which is exported in great numbers all over Persia and Arabia. Ahwaz, or Ahoous, formerly a flourishing city, and capital of a province of the same name, is reduced to a wretched town, containing 600 or 700 inhabitants, situated on the banks of the Karoon, 48 miles S. of Shufter. Endian lies in N. lat. 30° 18', 20 miles from Zeitoon, and 72 from Dorak, occupying both banks of the Tab, and nearly two miles in circuit. This town trades with Bassora and Behaban, and has a population of between 4000 and 5000 souls. Masoor lies half way between Endian and Dorak, in the desert, and two miles from the sea, containing about 700 persons, trading with Bassora and the Arabian coast. The revenues of the Chab Sheikh amount to five lacs of piastrs, or about 50,000*l.* sterling, and he can bring into the field 5000 horse and 20,000 foot. The territories attached to the government of Shufter constitute the finest portion of Sufiana. McKinnier's Persian Empire.
- CHYAZIC ACID, in *Chemistry*. See CYANOGEN.
- CHYLE, and CHYMÉ, *Chemical Properties of*. These have

have been already described under **DIGESTION**, and we have here only to notice briefly the late experiments of Dr. Marcet and Dr. Prout on the subject. These gentlemen were furnished by Mr. Atley Cooper with specimens of chyle and chyme taken from different dogs, some of which had been fed on vegetable and others on animal food. Their experiments coincide almost exactly in every respect, so that it will be necessary only to mention Dr. Marcet's results. 1. The specific gravity of the ferous portion of chyle appears to be between 1021 and 1022, whether formed from vegetable or animal food. 2. The quantity of solid residue, comprehending both saline and animal matter, left by the evaporation of chyle at the heat of boiling water, may be generally stated to vary between 50 and 90 parts in 1000. 3. The quantity of saline matter appears to be about 9 parts in 1000, being the same proportion of salts which is found in all other animal fluids. 4. The chyle from vegetable food appears to yield, by analysis, about three times as much charcoal as that from animal food. 5. The chyle from animal food is much disposed to putrefy, and generally begins to undergo that change in three or four days; while that from vegetable food can be kept for weeks, or even sometimes for months, without undergoing putrefaction. 6. The coagulum of chyle is more inclined to putrefy than the ferous part. 7. The chyle formed from animal food alone is always milky; and in standing, an unctuous white creamy substance collects on the surface: its coagulum is opaque, and has a pink hue. 8. The chyle from vegetable food is commonly transparent, or nearly so, like common serum. Its coagulum is nearly colourless, like an oyster, and no creamy substance rises to the surface. 9. The principal ingredient of the animal matter of chyle is albumen; but besides albumen, chyle, especially when derived from animal food, contains globules of an oily substance, which bears a strong resemblance to cream. 10. By the destructive distillation, chyle gives first a liquor impregnated with carbonate of ammonia, and afterwards a heavy fixed oil. The chyle from animal food yields a greater proportion of both these products, but the residue, whatever the mode of analysis be, contains less charcoal than the chyle from vegetable food. Iron is readily detected in the residue of chyle, mixed with the salts and carbonaceous matter. 11. Chyme from vegetable food yields much more solid matter than any other animal fluid, though it appears to contain rather less saline matter. 12. Chyme contains albumen. 13. It yields about four times as much charcoal as chyle from vegetable food. 14. Neither chyle nor chyme contains any gelatine.

Dr. Prout ascertained the curious fact in different animals, that albumen never exists in the stomach, even when the food is perfectly digested, but that an albuminous principle is formed the moment it enters the duodenum and comes in contact with the bile. He was also induced to conclude, that this albuminous principle becomes more abundant, and more perfectly albuminous, the nearer it approaches the sanguiferous system, so that it seems to undergo important changes between the intestines and thoracic duct. See *Med.-Chir. Transf.* vol. v. and *Annals of Medicine and Surgery*, vol. i.

CICCA, *dele* See **TERME** at the close.

CICUTA. Annex—See **CONIUM**.

CIGOLI, *r. Ludovico CARDI*.

CIMEX, col. 2, l. 35, add—This offensive creature was in a great degree unknown in the days of our ancestors. Its origin is traced to the year 1670, when it was imported among the timber used for rebuilding the city of London after the great fire of 1666; but it was known at a much earlier period than this, though it was much less common

than it is at present. A circumstance is mentioned by Mouffat, which proves that these insects were known at Mortlake, in Surry, in the year 1583. They live entirely by suction, employing for this purpose their sharp and fine trunk or proboscis, which lies in a straight direction beneath the breast. Like the gnat and some other insects, they probably infuse some quantity of irritating fluid into the wound they make before they suck the blood of the animal, which they attack, as the swelling is often very considerable, and attended with severe itching. In winter they conceal themselves behind the walls, wainscot, and in other neglected places; and on return of warm weather they emerge from their concealment. Mr. Baker says, in his "Microscope made easy," that the bug is one of the best subjects for exhibiting a microscopical view of the circulation of the blood.

CIMOLIA, *dele* **PIPE-CLAY**.

CINCHONA, *Chemical Properties of*. Vauquelin some time ago published a set of comparative experiments on all the different species of cinchona which he could procure, in order to determine, if possible, how far they differ from each other, and what the constituents are on which their virtues depend. They may be divided into three distinct sets.

1. Those whose infusions precipitate the infusion of nutgalls, but not that of glue.
2. Those whose infusions precipitate glue, but not the infusion of nutgalls.
3. Those whose infusions precipitate glue, nutgalls, and tartar emetic.

The following Table exhibits the effects of the different re-agents upon all the barks tried. It is difficult, however, as Dr. Thomson has remarked, to determine, in all cases, the real name of some of the specimens, as Vauquelin has not given us the botanical name.

Barks.	Precipitate by Glue.	Precipitate by Tannin.	Precipitate by Tartar Emetic.
Yellow bark	white	—	copious
Quinquina of Santa Fé	reddish	copious	—
Grey quinquina	white	copious	white
Quinquina gris canelle	brown	—	—
Red quinquina	red	—	yellowish-white
Grey quinquina	white	yellow	yellowish-white
Quinquina gris plate	—	—	—
Cinchona pubescens	—	yellow	yellowish-white
Cinchona officinalis	—	yellow	—
Cinchona magnifolia	copious	—	—
Quinquina pitton vraï	—	copious	copious

Barks brought from Peru by Humboldt.

Quinquina of Loxa	copious	copious	copious
Quinquina, white, of Santa Fé	—	—	—
Quinquina, yellow, of Santa Fé	—	copious	copious
Quinquina, red, of Santa Fé	copious	—	—
Quinquina, yellow, of Cuenca	—	—	—
Quinquina, ordinary	copious	copious	copious
Infusion of nutgalls	copious	—	yellow-white
Oak bark	copious	—	—
Cherry-tree bark	—	—	—

It is very probable, that several specimens in the above Table are duplicates, though we have no means of ascertaining this with certainty. All the above barks produced a green colour with iron, and most of them produced a green precipitate with that metal.

The substance which precipitated tannin was brown, of a bitter taste, and less soluble in water than alcohol. It precipitated tartar emetic, but not glue. It resembled the resins in some respects, though it gave out ammonia when distilled. Upon the whole, these experiments, though they establish the fact that differences exist among the various species of cinchona, throw very little light upon the nature of their active ingredient or its mode of operation.

CININNATI, *dele* l. 9 and 10, and after paper, add—The number of public buildings, or dwellings, is from 1300 to 1400; of inhabitants, in 1810, 2540, and in 1817, 8000, all whites; the laws of Ohio prohibiting slavery, and even the settlement of free negroes, in the state, except in certain cases. About 400 houses are built of stone or brick, many of which are three stories high, and in a superior style. The public edifices are of brick. Numerous manufactures are already established, and a very extensive commerce is carried on by river navigation with Pittsburg, New Orleans, and all the western states; and by waggons with the interior country. The manners and drels of the inhabitants resemble those of the English. Cincinnati is said to be the border of the western world, and will probably be the largest city in America at no very distant period. Forty years ago it was the resort of Indians; and the whole surrounding country was a wilderness, full of wild beasts and savages.

CINNAMON STONE. See MINERALOGY, *Addenda*.

CIONE, *ORGAGNA, dele*.

CIPHER, col. 36, l. 35, for syllables *r*. letters.

CIRCAR. At the cloie, add—*Circar* denotes generally the head of affairs, or the state and government, as well as the great division of a province. It is also a name used by Europeans in Bengal to signify the Hindoo writer and accountant, employed by themselves or in the public affairs.

CIRCLE, col. 5, l. 27 from the bottom, for 7854 *r*. 157143. Col. 6, l. 3, *Plate* I. add—of *Astronomical Instruments*. Col. 68, l. 5 from the bottom, for cannot be *r*. cannot but be.

CIRENCESTER, col. 3, l. *penult*. By the return in 1811, the borough of Cirencester contained 902 houses, and 4540 persons; *viz.* 2030 males, and 2510 females: 207 families being employed in agriculture, and 526 in trade and manufactures.

CISTOTOME. See **CYSTOTOMY**.

CITRIC ACID, in *Chemistry*. This acid has been lately analysed by Gay Lussac and Thenard, and still more recently by Berzelius. The results obtained by these able chemists differ considerably, which are partly to be ascribed to the presence of water in the acid analysed by Gay Lussac. (See *ANALYSIS of Organized Substances*.) The following Table exhibits these results.

	Hydrogen.	Carbon.	Oxygen.
Gay Lussac	6.330 +	33.811 +	59.859
Berzelius	3.800 +	41.369 +	54.831

If we consider the numbers of Berzelius as most accurate, citric acid may be supposed to consist of two atoms hydrogen, four of carbon, and four of oxygen, and the weight of an integrant atom will be 72.5. Dr. Thomson, however, is disposed to consider another atom of hydrogen, or three atoms, to be present in citric acid, which supposition he states will render the weight of its integrant atom more accordant with the best analyses of the citrates.

CLACKMANNAN. Add—In 1811, the parish of Clackmannan contained 693 houses, and 3605 persons; *viz.* 1657 males, and 1948 females.

CLACKMANNANSHIRE. By the returns of 1811, this shire contained 1995 houses, and 12,010 persons; *viz.* 5715 males, and 6295 females: 280 families being employed in agriculture, and 893 in trade and manufactures.

CLADIUM, in *Botany, from *κλαδος*; a twig, alluding to its habit.—Browne *Jam.* 114. *Brown Prodr.* Nov. *Holl.* v. 1. 236.—A genus founded on *Schoenus Marifcus* of Linnæus. (See **SCHOENUS**.) This plant grows in the West Indies and New Holland, as well as in Europe. Mr. Brown, who defines thirteen New Holland species, gives the following*

Ess. Ch. Glumes imbricated every way, one or two-flowered; the under ones empty. Germs without bristles or scales underneath. Style deciduous, without a joint at the base. Nut naked and smooth, with a smooth kernel.

CLADONIA, from its twiggy habit, a name given by Hoffmann to a tribe of Lichens, now sunk in **CENOMYCE**; see that article.

CLAIBORNE, in *Geography*, a county of East Tennessee, having 4798 inhabitants, of whom 327 are slaves.—Also, a town of Mississippi territory, in Adams' county, containing 1538 inhabitants, of whom 14 are slaves.

CLAIR, a county of the Illinois territory, containing nine townships, and 5007 inhabitants, of whom 40 are slaves.

CLAIR, St. Add—It is a town of Butler county, having 1180 inhabitants.—Also, a town of Columbiana county, in the same state, having 1003 inhabitants.—Also, a township of Pennsylvania, in Alleghany county, containing 3080 inhabitants.

CLARCKIA, in *Botany, so named by Mr. Pursh, in honour of general Daniel Clarck, the companion of the late governor Lewis, in his botanical travels.—Pursh 260.—Lafc and order, *Obandria Monogynia*. *Nat. Ord. Calycanthemæ*, *Linn. Onagres*, *Juss.**

Ess. Ch. Calyx four-cleft, tubular. Petals four, hastate. Four filaments without anthers. Stigma in four dilated lobes. Capsule inferior, of four cells.

1. *C. pulchella*. Elegant *Clarckia*. Pursh p. 1.—On the Koozkooky and Clarck's rivers. *Governor Lewis*. Biennial, flowering in June. *Stem* erect, a foot or more in height, round, leafy, slightly branched upwards. *Leaves* scattered, sessile, linear, entire, smooth, an inch or two long. *Flowers* axillary, solitary, somewhat stalked, large and handsome, of a fine purple or rose colour. *Petals* in three equal, abrupt, spreading lobes. *Anthers* only four, involute. *Stigma* pale yellow, in four broad, rounded, petal-like lobes.

CLARE, in Suffolk. By the returns of 1811, the parish contained 253 houses, and 1170 persons; *viz.* 591 males, and 579 females.

CLAREMONT, l. 6, *r.* 2094.—Also, a town of Massachusetts, in Hampshire county, having 987 inhabitants.

CLARENDON, a township of America, l. 4, after contents, insert—1797.

CLARKE. Add—The county contains 10,981 inhabitants, of whom 2695 are slaves; and the town has 538 persons, including 239 slaves.

CLARKSBURG. Add—Also, a town of Massachusetts, in Berkshire county, having 231 inhabitants.—Also, a county of Georgia, whose town is Athens, containing 2405 inhabitants, of whom 30 are slaves: its town contains 134, including 4 slaves.

CLAY, in Geography, a county of Kentucky, containing 2398 inhabitants, of whom 141 were slaves in 1810.

CLAY-STONE. See MINERALOGY, Addenda.

CLEAR CREEK, in Geography, a township of Fairfield county, in Ohio, containing 1126 inhabitants.

CLEARFIELD, a county of Pennsylvania, containing a town of the same name, which in 1810 had 875 inhabitants.—Also, a township of Butler county, in Pennsylvania, containing 288 inhabitants.

CLEARING, denotes a method adopted by the city bankers for exchanging the drafts on each other's houses, and settling the differences. In pursuance of this method, at half-past three o'clock in the afternoon, a clerk from each banker attends at the clearing-house, where he brings all the drafts on the other bankers which have been paid into his house during the course of the day; and he deposits them in their proper drawers (a drawer being here allotted to each banker): he then credits their accounts separately with the

articles which they have against him as found in his drawer. Balances are then struck from all the accounts, and the claims transferred from one to another, until they are found wound up and cancelled, that each clerk has only to settle with two or three others, and their balances must be immediately paid either in cash or Bank of England notes. Such drafts as are paid into a banker's too late for clearing, are sent to the houses on which they are drawn to be *marked*, which is understood as an engagement that they will be paid the next day. Kelly's Cambist.

CLEVELAND, in *Geography*, a town of Cayhoge county, in Ohio, having, in 1810, 547 inhabitants.

CLERGY, col. 5, l. 44. By 41 Geo. III. c. 63, no person ordained a priest, or deacon, or being a minister of the church of Scotland, shall be capable of being elected to serve in parliament as a member of the house of commons. Such person's election shall be void; and if after his election he shall be ordained a priest, &c. he shall vacate his seat; and if he sit or vote as a member of the house, he shall forfeit 50*l.* for every day in which he shall sit or vote; provided such prosecution be commenced within twelve calendar months after such penalty shall be incurred. L. 54, after canon law, add—But now by 43 Geo. III. c. 84, certain provisions of 21 Hen. VIII. are repealed, and other provisions made in lieu thereof; and it is enacted, that after the passing of this act (7th July 1803) spiritual persons against whom no action shall have been brought under the recited act are indemnified; and contracts which would have been good after passing this act are valid notwithstanding that act; and proceeding may be had under certain conditions. And any spiritual person may take to farm to himself or to any person or persons, to his use, by lease, grant, words, or otherwise, for term of life or of years, or at will, any messuage, mansion, or dwelling-house, with or without orchards, gardens, and other appurtenances, although not in any city, borough, or town, notwithstanding the said first recited act or any other.

And it shall also be lawful for any spiritual person, having or holding any donative, perpetual curacy, or parochial chapelry, not having sufficient glebe or demesne lands annexed to or in right of or by reason of his benefice or cure, or chapelry, or for any stipendiary curate or unbeneficed spiritual person, with the consent in writing of the bishop of the diocese, to take to farm to himself, or to any person to his use for a limited number of years, any farm or farms, lands, tenements, or hereditaments, that may under all the circumstances appear to such bishop proper to be taken by such spiritual person, for the convenience and accommodation of his hospitality only, without being subject to any pains, penalties, or forfeitures, under the said first recited act or any other: provided that nothing herein contained shall extend to authorize any non-residence of such spiritual person.

CLERMONT, a county of America, l. 5, r. 1810, 9965.

CLIFFORD, a township of Luzerne county, in Pennsylvania, having 675 inhabitants.

CLINTON, l. 12, r. 1810, 8002; l. 13, of whom 29 are slaves.

CLINTON, col. 2, l. 21, after Hallowell, add—containing 1030 inhabitants.—Also, a county of Ohio, containing 2674 inhabitants.—Also, a township of Knox county, in Ohio, including 714 inhabitants.—Also, a town of Georgia, in Jones' county, containing 6023 inhabitants, of whom 13 are slaves.

CLITHEROE. In 1811 this borough contained 299 houses, and 1767 persons; viz. 826 males, and 941 females.

CLITOMACHUS, l. 2, for Carthage r. Athens.

CLOCK. In col. 53, l. 18 from bottom, we have referred to **PYROMETER** for the description of Troughton's new instrument, by which he tries the compensation of his tubular pendulums; but on application both then and recently made to him for permission to describe it, we were informed that this instrument has not yet been completely finished, and consequently not described by him. We can, however, now give our readers some idea of its principle and construction without a drawing. The pendulum is suspended vertically in an enclosed box of wood, made fast to a wall, and heated with lamps placed within; then a horizontal metallic bar, about thirty inches long, has one of its ends inserted through the side of the box into a hole made in the centre of oscillation of the ball, while the middle of it is supported by a short bearing-piece driven into the wall, and projecting a few inches therefrom: on the remote end of this bar, a micrometer-screw is fixed, that adjusts a delicate spirit-level, borne by it; so that whenever the interior end of this horizontal bar is depressed by the elongation of the pendulum, the bubble runs to the exterior end of its tube, and indicates the quantity of elongation by its run, as measured by the micrometer during its re-adjustment; and on the contrary, when a contraction takes place in the pendulum, the bubble runs to the interior end; but when it remains stationary, on the application of heat to the pendulum, it is considered that the compensation is perfectly adjusted. Two thermometers are placed at a distance from each other in the box, and are viewed through slips of glass inserted in the front of the box near the top and bottom, to shew that the heat is equally diffused; and thus the expansion of any simple rod may be taken, while the apparatus is removed sufficiently from the heat applied within the box, while the least quantity of expansion may be ascertained, without danger of error, by means of the micrometrical level. It is hardly necessary to remark, that when a simple rod has its expansion thus ascertained in different degrees of temperature, its inferior end must rest on the inner end of the horizontal bar, while its superior end must be pressed upwards against a pin in the wall instead of being suspended; in which case, a counterpoise must be placed on the horizontal bar near the level, to hold the vertical rod up to its bearing. The peculiar advantage of trying the final adjustment of a pendulum of Troughton's construction for compensation after it has been brought to time, is, that the spring by which the pendulum is suspended is *included* in the determination of the total result of all the contrary expansions; which cannot be said of any other method, except that which results from actual experience, in observing the variations of rate at opposite seasons of the year, which is a tedious method, accomplished only at the expence of much observation and loss of time after each new adjustment.

CLOCK-MAKING, col. 2, l. 13 from bottom, for radii *r*. diameters.

CLOWES, l. 2, for fifteenth r. sixteenth.

CLUNCH. This is also a name given to Stourbridge clay, which lies at a great depth in the earth, under the bed of coal: it is a grey clay, of a sandy nature, and better adapted for making large crucibles and fire-brick than perhaps any in Europe. Parke's Ess. v. i.

CLUPEA ALOSA, col. 2, l. 39, for it is not of *r*. it is one of.

CLYSTERS, in *Farrery*, are of great use in allaying many acute complaints to which horses are subject; and Mr. Clark recommends for this purpose simple clysters of warm water or thin water-gruel. The instrument which

he prefers for administering clysters is a simple bag or ox-bladder, holding two or three quarts, tied to the end of a wooden pipe about fourteen or fifteen inches long, and an inch and a half in diameter where the bag is tied, and tapering to the extremity, where the thickness should suddenly increase, and be rounded off to the point as smooth as possible. The hole through the pipe may be made sufficiently large for admitting the end of a common funnel, by which the liquor may be poured into the bag. Mr. Clark recommends the following clysters for the several purposes to which they are applied. An *emollient* clyster may be composed of two or three quarts of the water-gruel, 6 oz. of coarse sugar dissolved in the gruel, and the same quantity of olive-oil added to it. For a *laxation* clyster, he directs two or three quarts of thin water-gruel, 8 oz. of Glauber's salt (or common salt), and 6 oz. of olive-oil. For a *purging* clyster, he recommends 2 oz. of fenna, two quarts of boiling water, the fenna being infused and the liquor strained off, with the addition of syrup of buckthorn and common oil, of each 4 oz. An *anodyne* clyster may be prepared with one pint of the jelly of common starch, or infusion of linseed, and 1 oz. or about two table-spoonsful of tincture of opium. For a *nutritive* clyster, he directs three quarts of thick water-gruel well boiled; and in some cases milk-gruel might be substituted with advantage. For a *diuretic* clyster, in cases of strangury, or obstructions of the feminary passages, he recommends 1 oz. of castile soap dissolved in two quarts of warm water, and the addition of 2 oz. of Venice turpentine, previously beaten up with the yolks of two eggs.

COACHES, HACKNEY, col. 4, line 8, from bottom, add—By statute 55 Geo. III. c. 159. s. 2. the commissioners are empowered to license hackney chariots; and by an act passed July 11, 1817, the holders of licences may drive either a coach or a chariot under the same licence; provided that they do not at the same time drive more than one, which is to be expressed in the licence, under a penalty of 10*l.* or revocation of the licence.

COAL, col. 13, l. 3 from bottom, for 292 Grey, &c. r. 2192 Grey, &c. Col. 20, l. 12, for easterly r. westerly.

COALBROOK, or COLEBROOK DALE, in *Geography*, a township of Berks county, in Pennsylvania, containing 792 inhabitants.

COBALT, col. 7, l. 6 from bottom, for or r. on.

COBALT, in *Chemistry*, the name of a metal. Some circumstances omitted in their proper place require to be mentioned here.

The specific gravity of pure cobalt, according to Tassaert, is 8.5384; according to Lampadius it is 8.7. It melts at about 130° of Wedgwood's scale, and is not capable of being volatilized by any degree of heat we can excite. Like iron, it is attracted by the magnet, and according to Wenzel is capable of being converted into a magnet, precisely similar in its properties to the common magnetic needle.

There are two oxyds of cobalt, the protoxyd or *blue*, and the peroxyd or *black oxyd*.

The protoxyd dissolves in acids without effervescence, and seems to form the basis of most of the salts of cobalt. According to Rothoff, it is composed of

Cobalt	-	-	-	100
Oxygen	-	-	-	27.36

Proust found the proportion of oxygen considerably less, that is to say, only 19.8 with 100 of the metal; and Klaproth still less, or about 18.0. If, with Dr. Thomson, we

consider Rothoff's analysis most entitled to confidence, the weight of the atom of cobalt will be 36.25.

When the protoxyd of cobalt, newly precipitated from an acid, is dried by heating it in the open air, it assumes a flea-brown colour, which gradually deepens till it becomes black. This is the peroxyd of cobalt. It dissolves with effervescence in muriatic acid, and a great quantity of chlorine is evolved. From the experiments of Rothoff, it appears that this oxyd is composed of

Cobalt	-	-	-	100
Oxygen	-	-	-	36.77

Hence it appears to be composed of two atoms cobalt, and three of oxygen; and on this supposition, the weight of its atom will be 102.5.

COCALICO. Add—containing 4024 inhabitants.

COCAMA, r. see MAYNAS.

COCCINELLA, l. 39, add—These insects are commonly known under the name of lady-birds. The *C. 7-punctata*, or that of a 7-spotted body, makes its appearance in the advanced state of spring and middle of summer, and in every field and garden. One of the most beautiful of the English species is *C. 18-punctata* of Linnæus, which is little more than half the size of the common red bead, and is of a bright yellow colour, with numerous (generally 18) black specks.

COCCIUM, l. 4, r. Ribchester.

COLDSTREAM. In 1811, the parish contained 397 houses, and 2384 persons; 1103 being males, and 1281 females.

COLEBROOK, l. 2, for Grafton *r.* Coos; l. 6, add—containing, in 1810, 325 inhabitants; l. 10, add—In 1810, it contained 1243 inhabitants.

COLEBROOKEA, in *Botany*, so named, by the writer of this, in honour of Henry Thomas Colebrooke, esq., chief judge in the courts for the natives of Bengal, a practical and accomplished botanist.—Sm. Exot. Bot. v. 2. 111.—Class and order, *Didymia Gymnospermia*. Nat. Ord. *Vitices*, Juss.

Eff. Ch. Calyx-teeth five, becoming feathery awns. Seed solitary, bristly. Limb of the corolla unequally five-lobed.

1. *C. oppositifolia*. Opposite-leaved Colebrookea. Sm. as above, t. 115.—Leaves opposite.—Found by Dr. Buchanan, by road sides in Nepal. A downy, slightly aromatic, shrub, with stalked, elliptic-lanceolate, serrated leaves, and terminal, aggregate, whorled spikes, of innumerable minute white flowers.

2. *C. ternifolia*. Three-leaved Colebrookea. Roxb. Corom. v. 3. 40. t. 245.—Leaves three or four in a whorl.—Native of Mysore. The leaves are narrower and more drooping; the spikes much smaller than in the foregoing. Dr. Roxburgh lays the germens are four, sometimes all perfected; the flowers aggregate, with many common bractees.

COLEFORD. In 1811, this tything in Newland parish contained 253 houses, and 1551 persons; 849 being males, and 702 females.

COLERAIN, l. 2, add—containing 834 inhabitants; l. 20, add—Also, a township of Bedford county, in Pennsylvania, containing 1247 inhabitants.—Also, a township of Belmont county, in Pennsylvania, containing 471 inhabitants.—Also, a town of Ross county, in Ohio, having 846 inhabitants.

COLERAINE, l. 3, *r.* and in 1810, 2016 inhabitants.

COLESHILL. In 1811, this parish contained 330 houses, and 1639 persons; viz. 789 males, and 850 females; 119 being employed in agriculture, and 196 in trade and manufactures.

COLICA, or COLIC, in *Ferriery*, a disease to which brute animals are subject; for which Mr. Taplin recommends a ball made of the following ingredients; viz. 1 oz. of pulverized aniseeds; $\frac{1}{2}$ oz. of mithridate; ginger and grains of paradise, of each, in powder, 2 drs.; oil of aniseed and oil of juniper, of each, 1 dr.; and syrup *q. f.*: the ball to be given, according to the state of the disease, every two, four, or six hours. In some cases, a mixture of ginger, pepper, aniseeds, &c. $\frac{1}{2}$ oz. of each, with the addition of a little brandy or gin, will give relief. In flatulent colic, a ball made of 6 drs. or 1 oz. of Venice turpentine, purified opium from 1 to $\frac{1}{2}$ dr., 1 dr. of oil of aniseeds, and 2 drs. of powdered ginger, may be administered every two, three, or four hours, according to the urgency of the symptoms.

COLLEMA, in *Botany*, *coll. y. m. z.*, a glutinous substance. The name appears to have originated with Hill, and is adopted by Hoffmann and Acharius. The latter has only admitted this genus in his two last publications.—Ach. Lichenogr. 129, t. 14. f. 8—11. Syn. 308. Sm. in Engl.

Bot. 2284. (Parmelia, sect. 6; Ach. Meth. 221.)—Class and order, *Cryptogamia Alga*. Nat. Ord. *Lichenes*.

Eff. Ch. Shields orbicular, horizontal, nearly sessile, superficial, with a gelatinous acceffory border.

Acharius reckons up sixty-four species. These are the gelatinous Lichens of former authors. (See LICHENES, sect. 1.) They are all more or less pulpy, olive-green, or blackish; their fronds various in form and direction. Twenty-three British species are figured in Engl. Bot.

COLLEMORE'S RINGE, in *Geography*, a township of America, in the district of Maine, and county of Lincoln, having 40 inhabitants.

COLLETON, a district of South Carolina, containing 26,359 inhabitants, of whom 5238 are slaves.

VOL. IX.

COLLISION, col. 9, three last lines, for Z. r. E.

COLNE. By the return of 1811, this township contained 990 houses, and 5336 persons; viz. 2531 males, and 2805 females; 58 families being employed in agriculture, and 928 in trade and manufactures.

COLONSAY, l. 21, By the last act 786, and the number of houses 138.

COLOUR, col. 12, l. 11, for cold *r.* colour. Col. 22, l. 18, for tube *r.* tub.

COLOURING Principle of the Blood, Chemical Properties of. See BLOOD.

COLUBER, l. ult. *r.* See HYDRUS.

COLUGO, in *Zoology*. See GALEOPITHECUS.

COLUMB, St. In 1811, the parish of St. Columb major contained 410 houses, and 2070 persons; viz. 988 males, and 1082 females; 225 being employed in agriculture, and 108 in trade, &c.: and the parish of St. Columb minor contained 229 houses, and 1126 persons; viz. 550 males, and 576 females; 147 families being employed in agriculture, and 72 in trade, &c.

COLUMBA, a military order, l. 2, *r.* 1379. Add—See DOVE.

COLUMBIA, l. ult. *r.* in 1810, 32,390 inhabitants, of whom 879 are slaves; l. 8, add—It contains 11,242 inhabitants, including 5980 slaves; l. 11, add—It contains 518 inhabitants; l. 31, add—It contains 2057 inhabitants.—Also, a township of Cayuhaga, in Ohio, having 205 inhabitants.

COLUMBIANA. Add—It contains 17 townships, and 10,878 inhabitants.—Also, a town of Kentucky, in Adair county, containing 175 inhabitants, of whom 45 are slaves.—Also, a district of America, containing 24,023 inhabitants, of whom 5395 are slaves.

COLUMBIUM, *Columbic Acid*, in *Chemistry*. See TANTALUM.

COLUMBO, l. 6, *r.* Trincomalee.

COLUMBUS, in *Geography*, a county of North Carolina, containing 3022 inhabitants, of whom 703 are slaves.

COLUMNA, l. 10, for elliptic *r.* epileptic.

COLYTON, l. penult. *dele arms*; l. ult. *r.* 343 and

1774.

COMBINATION, col. 2, l. 8, *dele ec*; l. 38, for $\frac{6-1}{2} r. \frac{6-1}{3}$.

COMBUSTION, *Theory of*, in *Chemistry*. See ACID, and ACIDIFICATION.

COMEPHORUS, in *Ichthyology*, a genus of the apodes, the

the characters of which are, head large, with depressed snout; mouth large, with small teeth; body elongated, compressed, the second dorsal fin surrounded with several long naked rays.

This fish is a genus of Cepede, and referred by Pallas to the genus of callionymus among the jugular fishes. It is a native of the lake Baikal; and from its conformation seems to be capable of swimming swiftly, and of springing out of the water like the flying-fish. See *CALLIONYMUS Baikalensis* of Gmelin's Linnæan system.

COMMIPHORA, in *Botany*, from κομμη, gum, and φέρω, to bear, Jacq. Hort. Schoenbr. v. 2. 66. t. 249, a dioecious octandrous shrub, of which the male only is known, found in Madagascar, and said to produce that kind of elastic gum, of which Fourcroy has given an analysis. More information on this subject is very desirable.

COMMON PRAYER, l. 15, add—2 & 3 Edw. VI.

COMPAGNIE ECOSSEOISE. See GENDARMES, &c.

COMPASS, col. 6, l. 37 and 38, r. See MAGNETICAL DECLINATION, and MAGNETICAL VARIATION.

COMPENSATION, col. 18, l. 30 from the bottom, for but broader r. and narrower.

COMPOSTELLA, l. 2, after capital, insert—(see CORUNNA).

COMPOUNDS, in *Chemistry*, are divided into *primary* and *secondary*.

Primary compounds, according to Dr. Thomson, are those formed by the union of combustibles with the four supporters of combustion, oxygen, chlorine, iodine, and fluorine, and with *cyanogen*. Dr. Thomson also includes under this division certain compounds of combustibles with one another, and with oxygen.

Secondary compounds are those formed by the union of two or more primary compounds. These include the four classes of substances, termed hydrates, salts, hydrofulphurets, and soaps.

COMRE, in *Geography*, a township of Berks county, in Pennsylvania, containing 2017 inhabitants.

CONCORD, l. 10, insert—and had, in 1810, 2396. At the close, add—Also, a town of Grafton county, in New Hampshire, containing 1126 inhabitants. At the close of the next article, add—containing 677 inhabitants; l. 4 from the bottom, after upwards, add—By the census of 1810, the number of inhabitants was 1633.

CONCORD, in Delaware county, add—containing 1061 inhabitants.—Also, a township of Miami county, in Ohio, having 679 inhabitants.—Also, a town of Ross county, in Ohio, containing 1277 inhabitants.

CONCORDIA. Add—Also, a county and parish of the territory of Orleans, containing 2895 inhabitants, of whom 1581 are slaves.

CONEMAUGH, a township of Indiana county, in Pennsylvania, containing 1167 inhabitants.—Also, a township of Somerset county, in the same state, having 381 inhabitants.

CONESTOGA. Add—containing 1506 inhabitants.

CONEWAGO, a township of Adams county, in Pennsylvania, having 531 inhabitants.

CONEWANGO, a township of Warren county, in Pennsylvania, having 448 inhabitants.

CONGLETON, 2 last lines, r. at 944, the inhabitants at 4616, of whom 2023 are males, and 2593 females.

CONGOON, a port of Laristan, in Persia, containing 6000 or 7000 inhabitants, and having an excellent roadstead, where a frigate may ride safely in the most tempestuous weather, and good water and fire-wood be procured.

CONIC SECTIONS, *Lemmas*. Def. I. 1, r. A E; l. 2, D and B; l. 3, A B. Cor. l. 1, r. A E in B; l. 3, B and D and in B; l. 5, D B and d E.

CONNECTICUT. At the close, add—See UNITED STATES.

CONNELSVILLE, l. 2, for Washington r. Fayette; l. 4, r. 93 inhabitants.

CONNIOTT, a township of Pennsylvania, in the county of Crawford, having 285 inhabitants.

CONON, l. 1, for son r. father; l. 2, after Athens, r. who died in the year B.C. 393.

CONOPLEA, in *Botany*, Perf. Syn. Fung. 234, an obscure genus of *Fungi*, consisting of compact, rigid, permanent fibres, generally black or brownish, interperled with powder. Four species are described, found on rotten wood, branches, or leaves.

CONOSTYLIS, from the conical form of the style.—Br. Prodr. Nov. Holl. v. 1. 300. Pursh 224.—Clas and order, *Hexandria Monogynia*. Nat. Ord. *Hemodoraceæ*, Brown.

Eff. Ch. Corolla superior, in six deep equal segments, woolly with branched hairs, permanent. Anthers erect. Style conical, separable into three parts. Stigma simple. Capsule of three cells, bursting at the top, with a triangular central receptacle, and many seeds.

Roots perennial, fibrous. *Stem* scarcely any. *Leaves* sword-shaped, equitant, rough or bristly at the edges. *Stalk* many-flowered, capitate or corymbose, often woolly.

Four species are natives of the fourth coast of New Holland; and one, *C. americana*, of the pine-barrens of New Jersey and Carolina, bearing *flowers* of a golden yellow, in July. The *germen* is almost entirely superior in this species. *Pursh*.

CONSTRUCTION of Boats. The plate referred to under this article has been superseded by Plate XIV. of *Naval Architecture*; and for the description of the latter, as far as it relates to **BOATS**, the reader is referred to the article **WHOLE-MOULDING**.

CONVOCAATION, col. 3, l. 36, after representatives, add—The summons to the convocation must not be confounded with that which we now mention, though the constituent parts are the same; and by modern usage the assembly of both is supposed to have been on the same day. But the one may be easily distinguished from the other by this difference; *viz.* that the convocation is provincial, and summoned by the metropolitans of Canterbury and York; whence the clause, commonly denominated *præmunientes*, (from its first word,) in the writ to each bishop proceeds from the crown, and enjoins the attendance of the clergy at the national council of parliament.

CONWAY, col. 3, at the close—Population in 1811 was 1053; the number of houses 218.

CONWAY, in America, l. 8, r. 1080. Col. 4, l. 1, r. 1784.

COOLING Powers of the Gases. It is difficult to ascertain the precise conducting powers of gaseous substances, as the cooling of hot bodies in gases is influenced by a variety of circumstances besides their conducting properties. Count Rumford found, that a thermometer cooled nearly four times as fast in water as in air of the same temperature. The same philosopher also found, that rarefaction much diminishes the conducting power of air, and that hot bodies cool slowest of all in a Torricellian vacuum. This subject, however, has been investigated more lately with greater precision by Leslie and DaRon. Mr. Leslie ascertained, that the conducting power of all gases is diminished by rarefaction. He has endeavoured to deduce from his experiments,

ments, that the conducting power of air is nearly proportional to the fifth root of its density. Mr. Dalton, however, has rendered it probable, that it varies nearly as the cube root of its density. Vapours of all kinds, and every thing that has a tendency to dilate air, diminish their conducting powers. The conducting powers of common air, oxygen, and azote, as might be expected, are nearly equal. The conducting power of carbonic acid is rather inferior to that of air, but bodies cool in hydrogen more than twice as fast as in common air; and Mr. Leslie has endeavoured to shew, that the actual conducting power of hydrogen is no less than four times greater than that of common air.

Mr. Dalton's experiments were made with a strong phial filled with the gas to be examined, into which he introduced a delicate thermometer through a perforated cube, and observed the time it took to cool 15° or 20° . The following table exhibits the result of his experiments:

	Time of cooling.
Carbonic acid	112''
Sulphuretted hydrogen	} - - - 100'' +
Nitrous oxyd	
Olefiant gas	
Common air	} - - - 100''
Oxygen	
Azote	} - - - 90''
Nitrous gas	
Gas from pit-coal	70''
Hydrogen gas	40''

COOLSPRING, in *Geography*, a township of Pennsylvania, in the county of Mercer, having 521 inhabitants.

COOS, in *Ancient Geography*. Add—See COS.

Coos, in *Geography*. Add—Coos is a county of New Hampshire, containing 24 townships, and 3991 inhabitants.

COPAL. Add—See VATERIA.

COPPER, in *Chemistry*, the name of a metal. Some circumstances omitted in our account of this metal require to be inserted here.

There are two oxyds of copper, the protoxyd of an orange or red colour, and the peroxyd or black oxyd.

The protoxyd was observed by Proust; but Chenevix, who found it native in Cornwall, first accurately described its properties. It may be formed by mixing together 57.5 parts of black oxyd of copper, and 50 parts of copper in a state of powder, formed by precipitating it from muriatic acid by an iron plate. This mixture is to be triturated in a mortar, and put with muriatic acid into a well-stopped phial. Potash dropped into this solution precipitates the oxyd of copper of an orange colour. It may be also formed with much less trouble by adding excess of copper to muriatic acid, and letting the whole remain till the green colour disappears, and the solution becomes dark brown and opaque. In this state, dirty-white crystals like sand are deposited. If potash be added to the brown solution, or a solution of the crystals above-mentioned, the protoxyd is precipitated in abundance. According to Berzelius, this oxyd is composed of

Copper	-	100
Oxygen	-	12.5

Hence the weight of the atom of copper will be 80.

The peroxyd or black oxyd of copper has been already described. It is composed, according to Proust and Berzelius, of

Copper	-	100
Oxygen	-	25

Hence the quantity of oxygen in these two oxyds is as one to two; or the protoxyd may be considered as composed of one atom copper and one of oxygen, and the peroxyd of one atom copper and two of oxygen. From these determinations, the composition and weights of the atoms of the different salts of copper may be accurately estimated.

COPTIS, in *Botany*, from $\kappa\omicron\pi\iota\varsigma$, to divide.—Salisb. Tr. of Linn. Soc. v. 8. 305. De Cand. Syst. v. 1. 321. Pursh. 390.—Class and order, *Polyandria Polygynia*. Nat. Ord. *Ranunculaceae*, Juss.

Eff. Ch. Calyx none. Petals five or six, deciduous. Nectaries as many, hooded. Follicles membranous, stalked, beaked, with many seeds.

1. *C. trifolia*.—Three-leaved Coptis. Pursh n. 1.—Leaves ternate, obovate. See HELLEBORUS, n. 3.

2. *C. asplenifolia*. Fern-leaved Coptis. Pursh n. 2.—Leaves twice ternate, pinnatifid.—Found by Mr. Menzies, on the west coast of North America, and by Thunberg in Japan, this being actually *Thalictrum japonicum* of that author, and of Willd. Sp. Pl. v. 2. 1303! The flowers are greenish.

CORACHIE, in *Geography*, a good sea-port in the country of *Scind*; which see.

CORAL, *Chemical Properties of*. See VERMES.

CORALLORRHIZA, in *Botany*, an old name, alluding to the branching coral-like form of the root.—Hall. Hist. v. 2. 159. t. 44. Brown in Ait. Hort. Kew. v. 5. 209. See CYMBIDIUM.

Eff. Ch. Lip elongated into a spur at the base. Column unconnected. Anther a terminal deciduous lid. Masses of pollen four, oblique.

We do not doubt the propriety of separating this plant, and another of American origin, (see Pursh 593, n. 4.) from *Cymbidium*; but we have some nearly allied *Orchideae* from Nepal, which require to be examined before the limits of *Corallorrhiza* can be clearly defined.

CORDILLERAS. Add—The great body of the Cordilleras, as it extends from Quito northward, approaching the gulf of Mexico, and entering the kingdom of New Granada, is divided into three chains, which are almost parallel, and of which the two lateral branches are covered with sand-stone, and other secondary formations, to a very considerable height. The eastern chain divides the valley of the river Magdalena from the great plains that are drained by the Orinoco and its branches. Inclosed by a circle of mountains belonging to this chain is the high valley of Bogota, the bottom of which is no less than 7460 feet above the level of the sea. The waters of this valley are collected by the single stream of Rio de Bogota, which finds its way through the mountains to the S.W. of the town of Santa Fé: the stream where it leaves the valley is about 144 feet wide; it then enters into a rocky channel not more than 40 feet wide, apparently formed, says M. Humboldt, by an earthquake. From this crevice, the river precipitates itself at two bounds to the depth of 574 feet; and after this fall pursues its course to the Magdalena, about 50 miles, still descending with great rapidity, and at the rate of 150 feet to a mile. The natural bridges of Icoazon are on the western declivity of this ridge. The central chain is the highest of the three, and often attains the limits of perpetual snow, and greatly surpasses it in the colossal summits of Guanneas, Baragan, and Quindiu. The western chain separates the valley of Cauca from the province of Choco, and the coasts of the South sea. This is lower than the others, and rises so much as it approaches the isthmus of Panama, that its course can hardly be ascertained. In our ordinary

ordinary maps, there is no trace of the highest or central chain; and Mr. Arrowsmith's map of America, in 1802, makes the valley of Magdalena occupy the whole interval between the eastern and western chains. The most difficult passage of the Andes is that by the mountain Quindiu. It lies through a thick uninhabited forest, which cannot be traversed, in the finest season, in less than ten or twelve days. The summit of the pass is at the prodigious height of 11,499 feet above the level of the sea, and the passage from ten to sixteen inches in breadth. Humboldt's *Recherches*, &c. by H. M. Williams, 1814.

CORDYLINÉ, in *Botany*, an old name of Van Royen's, from *κόρυδον*, a club or staff, suitable enough to the *Dracena* and *Yucca* to which it was originally applied, and which we presume are included in the genus which now bears it.—Commerf. in Juss. 41. Brown Prodr. Nov. Holl. v. 1. 280.—Class and order, *Hexandria Monogynia*. Nat. Ord. *Aparagi*, Juss. *Apbodelea*, Br.

Eff. Ch. Corolla bell-shaped, in six equal segments, deciduous. Filaments inserted into the throat, awl-shaped, smooth. Anthers versatile, cloven at the base. Stigma three-cleft. Berry globular, of three cells, with several seeds, whose scar is bordered. *Br.*

The stem is shrubby. *Leaves* lanceolate, finely ribbed, elongated. *Panicle* terminal, of numerous, many-flowered, alternate spikes, with two unequal bractees under each flower.

1. *C. cannifolia*. Br. n. 1.—Leaves stalked, pointed. Clusters divided. Outer bractees acute, twice as large as the inner, which hardly equal the partial stalks.—Found by Mr. Brown, in the tropical part of New Holland.

See **DRACENA**, of which our first and second species belong to this genus.

CORFE-CASTLE, l. 29, r. after return—of 1811 was 161, and of inhabitants 744.

CORINTH, a township of America, l. 2, r. 1876.

CORINTHIAN ORDER, l. 8, for convex r. concave.

CORN, col. 3, l. 18 from the bottom, *dele* l. 18 to l. 14.

VOL. X.

CORNEA, *Opacities of*. Opacity of the cornea is one of the worst consequences of obdurate chronic ophthalmia. The slight, recent, and superficial form of the disease is usually known under the name of nebula; and it is preceded by and attended with chronic ophthalmia. The iris and pupil are discernible through a sort of cloudiness, and the patient is not entirely deprived of the power of vision. The veins of the conjunctiva are greatly relaxed, turgid, irregular, and knotty, which change first affects their trunks, and then gradually extends to their ramifications near the union of the cornea with the sclerotic, and ultimately to their most minute branches returning from the delicate layer of the conjunctiva, spread over the front of the cornea. When this happens, a milky albuminous secretion begins to be superficially effused in the interspaces between the red streaks, and the specks thus produced may cover only a part or the whole of the cornea.

The opacity of the cornea sometimes occurring in violent ophthalmies is essentially different from the nebula, and arises from a deep extravasation of coagulating lymph in the cellular texture of the cornea, or from an abscess between its layers. In the treatment of the nebula, the curative indications are to restore the varicose vessels to their natural diameters; and if that be impracticable, to

cut off all communication between the trunks of the most prominent veins of the conjunctiva and those on the cornea. The first object is performed by using Janin's ophthalmic ointment, or the ung. hydrarg. nitrat, together with astringent collyria. The second desideratum is fulfilled by the excision of the fasciculus of varicose veins, just at the base of the opacity, with a pair of dissecting scissors and forceps. With respect to the deeper and more obdurate opacities, which are frequently called *albugo* and *leucoma*, they are consequences of severe acute ophthalmia, though sometimes the effects of an ulcer or wound of the cornea, when they are commonly known only by the latter appellation.

The recent *albugo* may sometimes be dispersed by the same treatment, which is applicable to violent ophthalmia; and when the inflammation has been subdued, the ung. hydrarg. nitrat. is the best local remedy for promoting the absorption of the extravasated opaque lymph. The eye may also be frequently washed with a collyrium, composed of two scruples of the muriate of ammonia, and four grains of verdigrase, in eight ounces of lime-water. The treatment must be continued three or four months before the case is to be abandoned as hopeless. With respect to the *leucoma* arising from a cicatrix, Scarpa sets it down as absolutely incurable.

CORNISH, l. 5, r. 1810, and 1606. Add—Also, a town of York county, in the district of Maine, having 974 inhabitants.

CORNVILLE, a town of America, in the district of Maine, and county of Somerset, having 504 inhabitants.

CORNWALL, col. 8, l. 31, r. 1811; l. 32, r. 37, 973, and 216, 667.

CORNWALL, in America, l. 3, r. 1279; l. 8, add—containing 1602 inhabitants.

CORO, l. 7, after persons, add—The little commerce that is carried on is in mules, goats, hides, sheep-skins, cheese, &c. obtained from the interior of the country, and more particularly from Carora. At the close, r. N. lat. 10° 8' from Paris.

CORSHAM, l. 17, add—By the return of 1811, the number of houses was 478, and that of inhabitants 2395.

CORTLANDTS, a county of New York, having 8809 inhabitants.

CORUNDUM. See **MINERALOGY**, *Addenda*, and *ADAMANTINE Spar.*

CORUNNA. Add—See **COMPOSTELLA**.

CORVUS, col. 2, l. 20, add—The African or Cape raven, described by Le Vaillant, is, according to Dr. Shaw, the only variety worthy of notice.

CORWEN, l. ult. r. 51 Geo. III. 288 houses, and 1417 inhabitants.

CORYSANTHES, in *Botany, from *κόρυς*, a helmet, and *ανθος*, a flower.—Brown Prodr. Nov. Holl. v. 1. 328.—Class and order, *Gynandria Monandria*. Nat. Ord. *Orchideae*.*

Eff. Ch. Calyx ringent; upper lip vaulted, very large; lower in two linear segments, combined with the linear petals. Lip dilated, concave. Anther terminal, of one cell, and two connected valves, permanent. Masses of pollen four. Curious little smooth plants, each with a single bulb, one roundish radical leaf, and a large, deep red, solitary flower. Nearly related to **LYPERANTHUS nigricans**; see that article.

1. *C. fimbriata*. Fringed Helmet-orchis. Br. Terr. Auotr. 78. t. 10.—Lip without a spur, hooded, fringed.—In shady places, under rocks, at Port Jackson. *Br.* Hardly two inches high, its beautiful purple variegated flower subtended

subtended by an almost orbicular, heart-shaped, pointed leaf.

2. *C. unguiculata*. Stalked Helmet-orchis. Br. n. 2.—Lip without a spur, tubular, dilated and oblique. Hood stalked. Flower pendulous.—Found by Mr. Bauer, at Port Jackson.

3. *C. bicakarata*. Double-spurred Helmet-orchis. Br. n. 3. (Corybas aconitiflorus; Salis. Parad. t. 83.)—Lip tubular, with two spurs at the base.—Found near Port Jackson, but, according to Mr. Brown, very rarely, nor does he seem to think it has ever been brought alive to England. We received a specimen in spirits, from Dr. White, about the year 1793: Mr. Brown's remarks on this subject are curious.

COSMEA, a name certainly much improved from *Cosmas* of Cavanilles, Ic. v. 1. 9.—Ait. Hort. Kew. v. 5. 132.—This genus comes next to *Coreopsis*, and we should scarcely scruple to unite them.

COSMELIA, from κοσμεω, to adorn, alluding to its beauty.—Br. Prodr. Nov. Holl. v. 1. 553.—Clafs and order, *Pentandria Monogynia*. Nat. Ord. *Epariidea*, Brown.

Efl. Ch. Calyx leafy. Corolla tubular, bearing the Stamens. Anthers united lengthwise to the fringed tops of the filaments. Nectary of five scales. Capsule with a central receptacle.

1. *C. rubra*. Found by Mr. Brown, in bogs on the south coast of New Holland. An upright *strub*, without scars on the denudated branches. Leaves sheathing at the base. Flowers terminal, bright red, drooping. Calyx accompanied by imbricated leafy bractes. Br.

Nearly akin to *ANDERSONIA*; see that article.

COTAISIS. Add.—This town, called Cotais or Cotatis, is now an inconsiderable place, inhabited by about 80 Jewish, Armenian, and Turkish families. Its rivers are extensive, and it is situated on a beautiful and fertile plain.

COTCHUNG. See DERAGUZ.

COTENTIN for CONTENTIN.

COTOPAXI. This is the loftiest of those volcanoes of the Andes, which in recent epochs have undergone eruptions. Its absolute height, according to Humboldt, is 18,874 feet; so that it is double that of Canigou, and 2600 feet higher than Vesuvius would be if it were placed on the top of the peak of Teneriffe. This is also the most dreadful volcano of the kingdom of Quito, and its explosions are the most frequent and disastrous. The mafs of scoria, and the huge fragments of rock thrown out of this volcano, cover a surface of several square leagues; and would form, if they were heaped together, a colossal mountain. In 1758, the flames rose 2900 feet above the brink of the crater. In 1744, the roaring of the volcano was heard on the borders of the Magdalena, a distance of 200 leagues. In April 1768, the quantity of ashes ejected by the volcano was so great, that in the towns of Haunbato and Tacunga the inhabitants were obliged to use lanterns in walking the streets at noon-day. The explosion in January 1803 was preceded by the sudden melting of the snow which covered the mountain. For twenty years before, no smoke or vapour had been observed to issue from the crater; and in a single night, the subterraneous fire became so active, that at sun-rise the external walls of the cone were heated to such a degree as to appear quite naked, and of the dark colour peculiar to vitrified scoria. At the port of Guayaquil, fifty-two leagues distant, Messrs. Humboldt and Bonpland heard the noise of the volcano day and night, like the continued discharges of artillery.

In this part of the Andes, a longitudinal valley separates the Cordilleras into two parallel chains; the bottom of this valley is 9843 feet above the level of the ocean, so that Chimborazo and Cotopaxi appear no higher than the Col du Geant, as measured by Sauffure. The summit of the mountain of Chimborazo is 21,430 feet above the level of the sea, and therefore a good part is above the circle of perpetual congelation, which, in the latitude almost under the line, is somewhat higher than the summit of Mont Blanc. Humboldt's Researches. See VOLCANO.

COTTAGE, col. 13, l. 15 from the bottom, for feed *r. reed*.

COVENTRY. By the return in 1811, this city contained 3448 houses, and 17,293 persons; viz. 8197 males, and 9726 females: 123 families being employed in agriculture, and 3207 in trade, manufactures, and handicraft.

COVENTRY, in America, l. 4, add—containing 1938 inhabitants; l. 6, *r.* 2928; l. 8, *r.* 162; l. 12, add—In 1810 it contained 178 persons; l. 13, *r.* having 1608 inhabitants.

COUGHING, in *Physiology*. See LUNGS.

COUNSEL, col. 2, l. 5, *r.* the king's premier, &c.

COURONNE des Taffes, an apparatus constructed by professor Volta, in which he arranges the component parts of the galvanic pile in a different form. (See GALVANISM.) This apparatus consists of a set of small glasses, placed sideways of one another, and containing water or some saline solution. Metallic arcs are then procured, having one end composed of zinc, and the other of silver or copper: these arcs are inserted into the glasses in an uniform order; each glass having the zinc leg of one arc, and the copper or silver leg of another arc immersed in the fluid. The zinc and copper legs are not in contact, and they are always to be disposed in the same situation with respect to each other; *i. e.* one is always to be at the right-hand, and the other at the left. The pile and this apparatus operate in the same manner, and their operation is referred by the professor to his new principle (see VOLTAISM), by which he conceived different metals, when placed in contact, to destroy the electric equilibrium, or, in his phrase, to become movers of electricity, producing that electric motion which is supposed to be the primary and essential cause of the galvanic action.

COURT, *University*, col. 2, l. 4, *r.* 14th.

COURUPITA for COURAPITA.

COWBRIDGE. In 1811, the parish contained 158 houses, and 850 persons; 425 being males, and 425 females.

COW-TAIL RIVER. See WAU-CA-HATCHO.

CRACKS, col. 4, l. 15, for bone *r. cone*.

CRAFTSBURY, in *Geography*, a town of Orleans county, in the state of Vermont.

CRAIL. In 1811, the burgh and parish of Crail contained 316 houses, and 1600 persons; viz. 673 being males, and 927 females.

CRANBERRY. Add—Also, a town of Butler county, in Pennsylvania, having 543 inhabitants.

CRANBORNE. In 1811, the parish of Cranborne contained 144 houses, and 816 persons; viz. 429 being males, and 387 females.

CRANBROOK. Add—The parish of Cranbrook, by the returns of 1811, has 511 houses, and 2994 persons.

CRAVEN, l. 4 and 5, *r.* 12, 676, and 5050.

CRAWFORD, a county of Pennsylvania, containing fourteen townships, and 6178 inhabitants.

CRAYFORD. In 1811, the parish contained 233 houses, and 1553 persons; viz. 769 being males, and 784 females.

CREAM,

CREAM, *Chemical Analysis of*. See MILK.

CREDITON, l. 8 from the end, *r.* and the hundred contains, by the return of 1811, 2130 houses, and 10,648 inhabitants; l. 5, after extent, add—But the borough of Crediton contains only 425 houses, and 1846 inhabitants.

CREWKERNE, col. 2, l. 4, for 41 *r.* 51; l. 5, *r.* of houses was 589, and of persons 3021, of whom 1346 are males, and 1675 females; 281 families employed in agriculture, and 308 in trade, &c.

CRIBRARIA, in *Botany*, from its perforated structure, Perf. Syn. Fung. 189; one of those beautiful, though minute, genera of *Fungi*, whose *head* is formed of reticulated fibres, enclosing the powdery seeds. Perfoon reckons up eleven species.

CRICKHOWEL. In 1811, the parish contained 137 houses, and 611 inhabitants. In the hundred of Crickhowel is a Roman encampment, called the Gaer, situated at the extremity of the vale, on a rising ground. The dimensions are much the same with those of Caer-Bannau (see BANNIUM), and it is nearly of a square form. It lies on the Via Julia, which passed in this direction from Caerleon to Caernarthen. We are informed that the old practice of singing carols in the church at cock-crow, or the earliest dawn of the morning, on Christmas-day, is still continued in the church at Crickhowel; but it merits any other appellation than that of a religious rite.

CRICKLADE, l. 14, *r.* 51; l. 15, *r.* 1939, and 2095; l. 16, 10,403; l. 17, 4894, and 5509; 1483 families chiefly, &c.; l. 18, *r.* 411.

CRISTARIA, in *Botany*, from the wings or crests of the aggregate capsules, by which alone it is distinguished from SIDA (see that article).—Cavan. Ic. v. 5. 10. Pursh 453. Sims in Curt. Mag. 1673.—We can hardly assent to the establishment of this genus, its character being entirely artificial, and unaccompanied by any thing discriminative in the habit. The only species mentioned are, 1. *C. glaucophylla*, Cavan. Ic. t. 418. 2. *C. multifida*, which is our SIDA *pterosperma*, the last species but one in that article. 3. *C. coccinea*, Pursh n. 1. Curt. Mag. t. 1673, a native of the dry plains of the Missouri, perennial and hardy in our gardens, adorned with beautiful scarlet flowers. 4. *C. betonicifolia*, Cav. as above, 11, which is *Malacoides betonicae folio*, &c. Feuille. Voy. v. 3. 40. t. 27.

CROMER. At the clove, add—the parish contains, by the returns of 1811, 170 houses, and 848 inhabitants.

CROSBY, a township of Hamilton county, in Ohio, having 981 inhabitants.

CROSS-CREEK. Add—containing 1847 inhabitants.—Also, a township of Ohio, in Jefferson county, having 1152 inhabitants.

CROSS-WORT. Add—and VALENTIA.

CROTALUS, col. 3, l. 19, *r.* to have them come, &c.

CROTALOPHIS, in *Botany*, from *κροτων*, *Croton*, and *οφίς*, *appearance*; but the principle of the name is incorrect, inasmuch as the Greek *κροτων* is our *Ricinus*, to which the genus in question bears no resemblance; and if the *Croton* of modern botanists be intended, such a comparative appellation is contrary to rule.—Michaux Boreal-Amer. v. 2. 185. Willd. Sp. Pl. v. 4. 380. Pursh 206.—Clafs and order, *Monoclea Pentandra*. Nat. Ord.?

Efl. Ch. Male, Calyx in five deep segments. Petals five. Female, Cal. and Cor. like the male. Stigmas divided. Capsule superior, not bursting, with one seed.

1. *C. argentea*. Silvery Crotonopsis. Pursh n. 1. (*C. linearis*; Michaux 186. t. 46. Willd. n. 1. *C. elliptica*; Willd. n. 2.)—Native of North America, in sandy ground near the coast, in the Illinois country and on the Missouri,

flowering in July. *Pursh*. A slender annual herb a span high, with opposite or alternate entire leaves, variable in breadth, and loose spikes of minute white flowers. The pubescence consists of fringed silvery scales, as in *Croton*.

CROUPADE, *r.* See BALLOTADE.

CROW'S NEST, in *Naval Language*, is a kind of box, sufficient to hold a man; generally a cask, fixed near the mast-head, to protect the observer from cold, and enable him to look out for whales, or open pieces of water.

CROYDON. The parish of Croydon, in 1811, contained 1394 houses, and 7801 inhabitants; 3616 being males, and 4185 females: 397 families employed in agriculture, and 662 in trade, &c.

CROYDON. Add—and in 1810, 802 inhabitants.

CROYDON Canal, l. 3, *r.* Surry.

CRUCIROSTRA, CROSS-BILL, in *Ornithology*, a genus of birds of the order Passeres; the characters of which are, beak thick and forked; mandibles, when at rest, inversely curved; nostrils small, rounded, situated at the base of the beak; tongue entire. Mr. Stephens, the continuator of Dr. Shaw's Zoology, mentions and describes two species; one of which, or common cross-bill, with a variable red body, quills and tail-feathers brown, beak externally olive-green, and tail forked; the *Loxia curvirostra* of Linnæus; and the cross-bill with a dull crimson body, wings black, with two white fasciæ, secondary quills white at the tips, and tail black, the *Loxia leucoptera* of Gmelin, and white-winged cross-bill of Latham and Pennant.

CRUSTS, *Animal, Chemical Properties of*. See VERMES.

CRYPHIA, in *Botany*, *κρυφία*, *clandestine*, alluding to the concealed corolla.—Br. Prodr. Nov. Holl. v. 1. 508.—A genus, of which there is perhaps but one certain species, a small thyme-leaved herb, with solitary axillary flowers, found on the south coast of New Holland, intermediate between CHLIDIA and PROSTANTHERA; see those articles. The ringent corolla is shut up in the closed two-lipped calyx. Possibly the flowers were not fully evolved, owing to the climate or season.

CRYPTOCARYA, Brown Prodr. Nov. Holl. v. 1. 402, a genus of the order of Laurine, resembling the Cinnamon-tree in habit, as well as inflorescence, but differing from *Laurus* in having only two cells in each anther, and from the whole order in having the nut concealed, (whence the name,) in the enlarged tube of the calyx, become closed above it at the top. *C. glaucescens* and *obovata* are natives of Port Jackson; *C. triplinervis* of the tropical part of New Holland.

CRYPTOSTEMMA, *κρυπτον*, *concealed*, and *στῆμα*, *a crown*, the scaly crown of the seeds being involved in wool.—Brown in Ait. Hort. Kew. v. 5. 141.—Clafs and order, *Syngenesia Polygamia-frustranea*. Nat. Ord. *Compositæ*; Linn. *Corymbifera*, Juss.

Efl. Ch. Receptacle cellular. Seed-down chaffy, concealed by the entangled wool of the seed. Calyx imbricated.

1. *C. calendulacum*. Marygold Cryptostemma. Ait. n. 1. (*ARCTOTIS calendulacea*; see that article, sp. 1. Jacq. Hort. Schoenbr. v. 2. 16. t. 157.)—Radiant florets undivided. Leaves pinnatifid, toothed; downy beneath.

2. *C. hypochondriacum*. Divided-rayed Cryptostemma. Ait. n. 2. (*ARCTOTIS hypochondriaca*; see sp. 1, β. Willd. Sp. Pl. v. 3. 2348.)—Radiant florets in three or five deep segments. Leaves lyrate, downy.

3. *C. runcinatum*. Dandelion-leaved Cryptostemma. Ait. n. 3.—Radiant florets in three or five deep segments. Leaves runcinate; toothed; downy beneath.

All the species are natives of the Cape of Good Hope, rather

rather tender annuals in our gardens, of no striking appearance.

CRYPTOSTYLIS, *κρυπτός*, concealed, and *στυλή*, a small pillar.—Brown Prodr. Nov. Holl. v. 1. 317.—Class and order, *Gynandria Monandria*. Nat. Ord. *Orchideæ*.

Eff. Ch. Calyx-leaves and petals linear, spreading. Flower reversed. Lip erect, sessile, dilated, undivided; concave at the base, concealing the very short column. Anther parallel to the stigma, subtended at each side by a lobe of the column.

Bulbs clustered. *Leaves* few, radical, stalked, flat. *Flowers* in a terminal spike, dull red, scentless.

1. *C. longifolia*. (Malaxis fulbulata; Labill. Nov. Holl. v. 2. 62. t. 212,) found at Port Jackson, as well as on the fourth coast;

2. *C. ovata*; and 3. *C. erecta*; are the only described species.

CRYSTAL, col. 5, l. 19, for changed *r.* charged.

CRYSTALLOGRAPHY is the science which treats of the form and structure of crystals. (See **CRYSTAL**.) The beautiful symmetrical forms, which frequently occur in the deep recesses of mines or the fissures of alpine rocks, cannot fail to strike the most common observer with surprise. Amidst the almost infinite variety which they present, it will be found, on a more attentive examination, that there are certain definite forms which some minerals most frequently assume, and which are rarely, if ever, seen in other minerals. Hence we might at first be led to infer, that crystallization depends on the definite action of some general law, by which the constituent parts of each mineral species are invariably arranged in the same form. When, however, it is farther discovered that, besides the prevailing forms peculiar to certain minerals, the same species are not unfrequently crystallized in a variety of dissimilar forms, and that minerals of different species often present crystals of the same form, we must retract our first conclusion, and shall be more disposed to believe that the mineral kingdom has not yet emerged from a chaotic state, or that the reign of order is subject to the invasion of disturbing forces, the extent of which we have no means of ascertaining.

The labours of a few enlightened and indefatigable philosophers have recently removed, in a great degree, the obscurity in which this department of science was involved, and have demonstrated that the laws by which the particles of the minutest crystal are arranged act with unerring precision, and are not less regular than those which govern the motions of the planets or the solar system.

Under the article **CRYSTAL** (which see), some account is given of the discoveries of Romé de Lisle, Bergmann, and Häuy. The latter has ably demonstrated that all the varieties of crystalline forms are reducible to a few simple primitive forms, some one of which may be regarded as the nucleus of each crystal, however complicated its form may be. The constituent particles, or what Häuy denominates the *integral molecules*, of all crystals, may be conceived as arranged in rows, and a number of these rows as forming thin laminae or plates. When these laminae are parallel with all the faces or planes of a crystal, they may be removed without changing the form of the crystal; but if the laminae divide in any other direction than that which is parallel to the faces, a change of form will be produced by every division, until at last we obtain a nucleus which is divisible in a direction parallel to its sides.

In the former case, the primitive form is the form of the crystal itself. Thus, if a cubic crystal be divisible only by laminae parallel to its six sides, we may continue diminishing

the magnitude of the crystal, as long as mechanical division is possible without any change of form.

When the laminae of a crystal divide in any other direction than parallel to its faces, it is called a secondary form or derivative crystal.

The primitive forms of all crystals which have been hitherto examined are six.

1. The parallelepiped, bounded by six planes, the opposite planes being parallel. This includes the cube, and varieties of the rectangular prism, the oblique angular prism, and the rhomboid.

2. The octahedron. This is a double four-sided pyramid. When the triangular faces are equilateral, it is called a regular octahedron. (Plate VII. fig. 27, *Crystallography*.) There are, besides this, other varieties of the primitive octahedron, in which the pyramids are longer or shorter than the regular one, or have a rhomboidal base, or a rectangular base, longer in one direction than the other.

3. The regular tetrahedron (Plate VII. fig. 13.) is bounded by four equilateral triangles.

4. The regular hexahedral prism, or equiangular six-sided prism, fig. 5.

5. Rhomboidal dodecahedron, bounded by twelve equal rhombs, fig. 12.

6. The pyramidal dodecahedron, consisting of two six-sided pyramids joined base to base, fig. 14.

The primitive forms which most frequently occur are, the parallelepiped and the octahedron. The tetrahedron and dodecahedron are very rare as primitive forms, though common as the secondary forms of crystals.

The division of secondary crystals by sections in the direction of the laminae is, in some minerals, effected with facility; in others, the joints are indistinct, and require the crystal to be heated and plunged into cold water to make them visible. The direction of the laminae is frequently rendered obvious by turning a mineral slowly round in the sunshine, when the reflections from the internal parts will shew its structure. Where no joints are discoverable, Häuy determines their direction and the form of the primitive nucleus by conjecture, from the appearances offered by the secondary crystal.

The actual mechanical dissection of an hexahedral crystal of calcareous spar, and the extraction of the primitive, is represented in Plate II. figs. 17, 18, 19, 20, *Crystallography*, and is described under the article **CRYSTAL**; but the references are erroneously made to Plate I. figs. 1, 2, 3, 4, 5.

The primitive nucleus is represented fig. 21, E A, O I, G H, A K. The discovery of it in this crystal was first made by the abbé Häuy in looking over the cabinet of M. Defiance, a hexahedral prism of calcareous spar having fallen from the group to which it was attached. M. Defiance made him a present of it. One of the corners being off from the base, he attempted to detach similar corners from the other angles, and after some time he succeeded in bringing to view its rhomboidal nucleus. This first suggested to him the theory of the structure of crystals. The situation of the primitive form, in another variety of calcareous spar, called the dog-tooth spar, may be seen Plate II. figs. 22 and 23. This is described under the article **CRYSTAL**, with the mode of extracting the nucleus; but the reference is erroneously made to Plate I. figs. 6 and 7. The angles of the primitive rhomb are invariably $105^{\circ} 5'$ and $74^{\circ} 55'$. Rhomboids of calcareous spar, indeed, occur with different angular admeasurements; but these are secondary crystals, and will not split in directions parallel to their faces. One of these, with the primitive nucleus, is represented

CRYSTALLOGRAPHY.

represented *fig. 24*. The theory of their formation will be explained as we proceed.

The primitive form is not in all cases the ultimate form to which crystals can be reduced; for where the primitive form is not a parallelepiped, the division parallel to the faces necessarily produces forms which must vary from that of the primitive nucleus. See *Plate V. fig. 56. Crystallography*, which represents the base of a six-sided prism, divided by sections parallel to each of its sides: from this division the ultimate form which we can ever obtain must be that of a triangular prism; for by carrying on the division we may conceive the particles to become smaller, but their form will remain the same. We have therefore obtained the form of the integrant molecule. In parallelepipeds, the form of the nucleus is also that of the molecule itself.

Thus in the cube, as represented *Plate IV. figs. 48 and 49*, the divisions parallel to the sides produce a series of smaller cubes, which must be the form of the integrant molecule. In some instances, the primitive forms themselves admit of division by laminae not parallel to that of the faces, from which must necessarily result a new form of the integrant molecule.

Plate II. fig. 26. represents a primitive rhomboid of tourmaline A E, O I, G H, A K, which is divisible both in the direction of its six faces and in that of the short diagonals A O, I A', A K. These latter sections divide the rhomboid into six tetrahedrons, which are represented surrounding the nucleus. Häuy conceives, that by these divisions, we obtain the form of the integrant molecule, or of the ultimate integrant atom of the crystallized mineral. It has been observed, that no proof can be advanced to confirm this conjecture, except the impossibility of altering the form, how far soever we carry the divisions; and the obvious consequence is, that if these divisions be carried far enough, we must at last reduce the crystal to its integrant particles. It is not, however, necessary to suppose, that the constituent particles themselves have any other form than that of spheres; because all the forms of the integrant molecule, which are the tetrahedron, the triangular prism, and the cube, may be readily conceived to be constructed with four, six, and eight spherical particles, arranged in their forms by crystalline polarity. It deserves attention, that the forms of the integrant molecule are the most simple which can exist among solids with plane surfaces, being bounded respectively by the smallest possible number of sides, *viz.* four, five, and six.

If we conceive the integrant molecules to be arranged in rows, and a number of these rows to be arranged in the same planes, they will form laminae of any conceivable size. Now by a succession of plates increasing in size, the magnitude of the primitive crystal will be increased; but if these laminae decrease in extent by one or more rows of particles, the result will be a change of form, or the production of a secondary crystal. Now the laminae may either decrease on the edges by one or more rows, or may decrease diagonally on the angles by a determinate number of rows, or the decrease may take place in some intermediate direction. These are called by Häuy, decrements on the edges, decrements on the angles, and intermediate decrements. Sometimes decrements take place at once on all the edges, sometimes upon all the angles, and sometimes only on certain edges and angles. In some instances the decrements are uniform, and the same number of rows decrease from the different edges or angles. Sometimes the law of decrement varies from one edge to another, or from one angle to the other; and this happens chiefly when the nucleus has not a symmetrical form, or when it is a parallelepiped, whose

faces differ in the respective inclinations of their faces, or in the measure of their angles. In certain cases, the decrements on the edges concur with those on the angles to produce the same crystalline form. It happens also, that the same edge, or the same angle, sometimes undergoes different laws of decrement that succeed each other; and, finally, there are a great many cases where the secondary crystal preserves faces parallel to those of the primitive form, and which combine with the faces produced by the decrement, to modify the figure of the crystal.

If, in the midst of such a diversity of laws, sometimes acting solitarily, and sometimes in combination upon the same primitive form, the number of ranges subtracted were likewise variable; if, for instance, there were decrements of twenty, thirty, forty, or a greater number of ranges of molecules, of which it is very possible to conceive, the multitude of forms which might exist in each mineral species would be sufficient to appal the imagination, and the study of crystallography would present an immense labyrinth, from which even the assistance of theory could not extricate the learner.

But the force which produces the decrements of ranges appears to have a very limited action. Generally these subtractions take place by only one or two rows of molecules. None have hitherto been found beyond six rows; but such is the fecundity united with this simplicity, that were we to confine ourselves to decrements by one, two, three, and four rows, and to exclude those that are mixed or intermediate, we find that the rhomboid is susceptible of 8,388,604 varieties of crystallization. Doubtless many of these varieties do not exist in nature; but there is reason to expect that discoveries in the field of inquiry will be made for many years to come.

The tetrahedron and the triangular prism, when they occur as integrant molecules, are always arranged in such a manner in the interior of crystals, that, taking them in groups of two, four, six, eight, they compose parallelepipeds. These parallelepipeds are, by Häuy, named *substractive molecules*. They are always substituted in the place of tetrahedrons and triangular prisms in considering the decrements where they produce the secondary forms.

Decrements of the Edges.—The most simple case of change of form produced by the superposition of decreasing laminae, is that which supposes ranges of molecules to be taken away on all the edges of a parallelepiped, in a direction parallel to the edges. Yet this case, so simple in appearance, may give rise to forms of considerable complexity. Thus the rhomboidal dodecahedron (*Plate II. fig. 27.* or *Plate III. fig. 28. Crystallography*) may be formed in this way from a cubic nucleus. If the integrant molecule of this species be a cube, it follows that the primitive crystal EA, O I, and E' A', O' I', is formed by a congeries of cubes. Suppose these cubes of such a size, that an edge of the primitive crystal is composed of a row of seventeen cubes, placed side by side, as represented *fig. 29.* IO, O E: of course each face of the primitive crystal will be a congeries of 289 squares, consisting of so many integrant molecules; and the primitive crystal or cube will be a congeries of 4913 cubes. Let us suppose that a square surface or plate, of the thickness of one integrant molecule, be applied to every face of cube; but that instead of being of the same size as the face of that crystal it is less by a single row of molecules all round; so that the sides, instead of containing seventeen little cubes, contain only fifteen each (*see fig. 29.*); of course this square will contain only 225 little cubes, instead of the 289 that form the surface of the primitive crystal. Upon each of these first plates applied to every face,

CRYSTALLOGRAPHY.

face, let another plate be applied similar to the first, but less than it by a row of integrant molecules; so that each side contains only thirteen squares, and the whole only 169 squares. Let six other plates be applied in succession to each of the faces, decreasing by a row of little cubes all round; so that the sides consist of eleven, nine, seven, five, three, and one squares respectively. It is obvious, that by this process we have raised upon each of six faces of the cube a four-sided pyramid, the faces of which, instead of being smooth, will, by their constant diminution of bulk, represent the steps of stairs. If, however, we conceive the molecules to be extremely small, and the number of decreasing laminae to be increased, the steps of the stairs may be so small as to be imperceptible to the eye, in which case the surfaces of the pyramids will appear smooth.

These pyramids having each four faces constitute twenty-four triangular faces, so that the cube is converted into a new crystal. Instead, however, of having twenty-four faces, the decrements having been equal on each edge, the triangular faces in each adjacent pyramid will be in the same plane, and form together a rhomb, which will be evident from the inspection of *figs.* 28 and 29; the cube will therefore be converted into a rhomboidal dodecahedron. The cubic nucleus $I' I, O O', E E'$, *fig.* 29, is represented with the pyramids raised on three of its faces. When complete, it will have the form represented in *Plate II. fig.* 27. If the decrement had taken place by two ranges on each of the laminae, when applied to the cube the pyramids would have been lower; and their adjacent faces being no longer in the same plane, the secondary crystal would have terminated in twenty-four distinct triangles.

In the example given (*fig.* 29.) it will be seen, that as each of the laminae decreases by one row on each of its edges, *viz.* one on $I O$, and another on the inferior row $I' O'$, and the same on the other edges, it is obvious that the pyramid decreases by two rows in breadth for every row in height; therefore the height will be equal to half the breadth at the base.

The terms *decrement in breadth*, and *decrement in height*, are thus explained by Häuy. Decrements in breadth are those in which the thickness or height of each plate or lamina is only equal to one integrant molecule; and the result of the decrement is by one, two, three, or more ranges in the direction of the breadth.

Decrement in height implies a decrement of one row in breadth on each of the successive plates; but each of these rows may have the thickness or height of two, three, or more molecules. In the latter case, the decrement is said to take place by two, three, or more ranges in height.

These two kinds of decrement are often combined together, of which we have an example in iron pyrites with twelve pentagonal faces. (*Plate III. fig.* 30.) This variety has a cube for the nucleus, as represented *fig.* 31; and may be conceived to be formed, as represented *fig.* 32, by decrements of two ranges in breadth in one direction, and by decrements of two ranges in height in the other. The decrements in breadth by two ranges tend to produce a more inclined face than the decrements by two ranges in height; the consequence resulting is, that the crystal will not terminate in pyramidal points, but in wedges, as is seen at *qp*, *fig.* 32. The structure of this crystal is more particularly described under the article *CRYSTAL*; but for *Plate I. Nos.* 14, 15, 16. *r.* *Plate II. figs.* 30, 31, 32. *Crytallography.*

Another example of decrements on the edges is deserving particular attention: it is afforded by that peculiar kind of crystal of calcareous spar, commonly called dog-tooth spar,

or which Häuy denominates the metastatic crystal. (*Plate II. fig.* 22.) In this crystal, the edges $E O, O I, I K$, where the two opposite pyramids join, coincide with the edges of the primitive nucleus, as may be seen in *fig.* 23. The decrements set out from these edges, and do not take place on the other six edges of the nucleus. Now it is easy to conceive, that the edges of the plates, laid upon the primitive nucleus, form as many triangles, $E s O, I s O, E' s' O$, &c. resting upon the edges from which they set out; and as there are six in number, there will be twelve triangles, six above and six below; and these will all be scalene, in consequence of the obliquity of the edges from which they set out.

With respect to the other edges of the plates of superposition, so far from experiencing any decrement they will increase; because they must always remain contiguous to the axis of the crystal, which is an imaginary line drawn from s to s' . It is from calculation combined with observation, that we must determine the law of decrement on which this dodecahedral form depends. If we suppose a decrement by one range, it may be demonstrated, that the two faces produced on each side of the edge from which the decrement takes place will be in the same plane, and parallel to the axis of the primitive crystal, conditions which do not apply to the present form. The most simple hypothesis is that which supposes a decrement by two ranges in breadth. This will be more clear from inspecting *Plate III. fig.* 33: it represents the upper pyramid of this crystal, placed on the upper planes of the primitive nucleus, which being partly visible, admits us to perceive more clearly the progressive effects of the decrement by two ranges.

Each edge of the nucleus, as $K I, I O, O E$, is divided into ten; from whence it follows, that each face is an assemblage of one hundred small rhombs, which are the exterior planes of so many molecules. This construction requires only eight plates of superposition for each face of the nucleus; and these plates being joined to each other, three and three on the edges, which correspond with the upper edges of the nucleus, form decreasing envelopes, covering each other in succession; the last of which is composed of eight little rhomboids. If we consider the position of the line $E s$, which represents an edge of this pyramid, as it appears to the eye, and $E s'$, such as it really exists, we may observe that the geometrical summit of the pyramid s is placed a little above the true summit s' ; but this difference is imperceptible, on account of the extreme minuteness of the molecules; and for the same reason, the channels or steps upon the pyramid are not visible. There are cases, however, in which the channels may be perceived by the naked eye.

For determining the form of secondary crystals by calculation, it is only necessary to take the decrements at their commencement, in order to have as many planes, which, if we conceive them to be extended until they meet, would form a complete polyhedral crystal; and in this manner we only consider the initial effects of decrements mathematically, a method more simple and expeditious than that of reasoning. It is useful, however, to explain in detail the structure of a crystal, in such a manner as may enable us to arrange a number of small solids similar to primitive molecules to form a nucleus, in an order conformable to that of nature, and thus to imitate the process of crystallization. We shall give another example from that variety of calcareous spar, called by Häuy *equiaxe*.

This variety, the secondary crystal, is a rhomboid, much more obtuse than the nucleus, the greater angle being $114^{\circ} 18' 56''$. It is represented (*Plate III. fig.* 34.) surrounding the nucleus. To extract the latter at once, it is only

CRYSTALLOGRAPHY.

only necessary to make sections cutting through the oblique diagonals of the different faces of the secondary rhomboid. One of the sections, for instance, that which passes through the diagonals drawn from a to t , and from a to u , and which cuts off the solid angle z , coincides with the face a, b, d, f , of the nucleus. But there are six lateral solid angles z, c, y , and t, m, u . We have, therefore, six sections to make, inclined three and three towards each summit; and because the upper solid angles alternate with the inferior, the sections which cut them off preserve the same alternation, and cross in such a manner as to present the six rhomboidal faces of the nucleus.

To conceive the structure of this secondary rhomboid, let us refer to the rhomboidal dodecahedron (*Plate III. fig. 29.*) before described. We have seen that by a decrement of one range in breadth on all the edges, there resulted two triangular faces on each edge, which being in the same plane formed a rhomb, the short diagonal of which is I, O .

Let us suppose, that the nucleus was the primitive rhomb of carbonate of lime (a, b, d, f , *fig. 34.*), and that the laminae of superposition decrease by one range of little rhomboids similar to the nucleus; but the decrements to take place only on the edges a, b, a, f, a, n , which meet at the summit a , and on the opposite edges, which meet at the opposite point d . Then instead of twelve rhombs there will only be six, of which the shorter diagonals will coincide with the edges a, b, a, f, a, n , &c. The other parts of the laminae of superposition, that is, those which are situated near the lower edges, b, d, d, f, f, x , &c. will not undergo any decrement, but will suffer variations that will tend to prolong the faces produced by these decrements, until they intersect each other. From hence it results, that the laminae, instead of preserving the figure of a rhomb, as would have been the case if the decrement had taken place on all the edges, will, as they are further and further removed from the nucleus, pass successively from the figure of a pentagon to that of a triangle.

Fig. 35. A, a, b, d, f , is the face of the same nucleus or rhomb as in *fig. 34.*, and what is said of this face may easily be applied to the others. Suppose this face divided into 81 rhombs, which represent the faces of so many molecules, or 729 in the whole. The first lamina of superposition, which we apply to the face a, b, d, f , will be B , *fig. 35.*, in which U, l, Z, l, d , represent the upper face, and C, U, l, b, X, Z, l, b , the facets of the two upper edges. We must place this lamina in such a manner on the face a, b, d, f , that the point b' shall unite with the point b , the point A' with the point A , and the point B' with the point B . We shall perceive immediately, that the two upper ranges of the face a, b, d, f , *fig. 35.* A , that is, those included between a, b, A, b , on one side, and a, f, B, b , on the other, will remain uncovered, the necessary result of a decrement by one range of molecules. The lamina B is a pentagon resulting from the subtraction of the three little rhombs necessary to complete the rhomb. This subtraction was required, that the lamina by its figure might aid the effect of the decrement, as will be afterwards explained.

The two ranges of rhomboids on each side of the lines D, d', E, d' , are added, that the nucleus may be covered and continue to increase on the edges b, d, f, d, A , *fig. 35.*, which correspond with these lines. These two ranges being sufficient to fill up the void, it is not necessary to add similar ranges towards the adjacent edges of the laminae of superposition, applied on the neighbouring faces. The operation will indicate of itself what is required in these kinds of additions.

The *fig. C*, 35. represents the second lamina of super-

position, which is to be applied to the former in such a manner, that the points l', D', E, d' , shall unite with those which are marked with the same letters in *fig. B*. As the crystal will receive another increase towards the edges, which correspond with F, d', C, d' , we may conceive that instead of one range added on each side D, d', E, d' , *fig. B*, it will be necessary to add two on each of the two lines E, d', C, d' , *fig. C*, 35.

We must place in the same manner, in succession, the two laminae represented D and E , *fig. 34.*; observing that the letters marked with an accent in each figure shall coincide with the same letters not accented in the preceding figure. Beyond the series which answers to *fig. E*, the laminae of superposition will cease to envelope the lower edges of the crystal, and will be reduced to simple triangles, which may be perceived on examining the figures E, F, G, H , whose position will be determined according to the conditions before stated.

The number of rhomboids which compose the laminae being now progressively decreasing, is reduced at last to a single rhomboid d' (*fig. D*, 35.), which being applied on that which is designated by the same letter in *fig. H*, will form the summit of one of the lateral solid angles of the secondary rhomboid. It will now be seen why the laminae of superposition take successively pentagonal and triangular faces as they recede from the nucleus. For example, every lamina, detached from the crystal (*fig. 34.*) by a section which passes any where between the angle z , and the middle of the lines Z, t, Z, u , is necessarily triangular, and has the same structure as P', t, R' , *fig. G*, 35; namely, it is really furrowed at its base, but the ridges are imperceptible on account of their extreme minuteness.

Decrements on the Angles.—To explain the formation of secondary crystals, in many instances it is necessary to admit that the decrements take place on the solid angles. The formation of the regular octahedron formed on the cube is represented *Plate III. fig. 36. Crystallography*, and an account of it given under the article *CRYSTAL*, but the reference is erroneously to *Plate I. fig. 20.*

The effect of decrement on the angles by one range of molecules in breadth is explained in the article *CRYSTAL*, and a reference made to *Plate I. fig. 21*, for which see *Plate II. fig. 21, Miscellany, O, I, O'*; where the face of a cubic nucleus is represented as divided into a number of lesser squares; and *fig. 23, A, B, C, D, E, F, G, H, I*, in the same plate, represent a successive series of plates, or laminae, placed on the cubic nucleus, each decreasing by one row on the angles. These are described under the article *CRYSTAL*, but referred to *Plate I. fig. 23*; by applying that description to the proper figures as here given, the reader will be able to comprehend this case of decrement, where a regular octahedron is formed on a cubic nucleus. The arrangement of the integrant molecules on one of the triangular faces of the octahedron is represented *Plate IV. fig. 37. Crystallography*.

If the decrements on the angles of a cube were to stop before they terminated in a point, there would remain faces parallel with that of the cube, which will be evident from inspecting *Plate III. fig. 36.* The crystal would then have fourteen faces, eight those of the octahedron, and six those of the cube. Nothing is more common than to find such crystals both in iron pyrites and in galena.

As another example of decrements on the angles, let us take the rhomboid (*Plate IV. fig. 38.*), which differs somewhat from the cube. If the plates applied successively upon all the faces of this rhomboid suffer decrements only at the angles contiguous to the summits A and O' , and that these

CRYSTALLOGRAPHY.

these decrements take place by two ranges, then instead of twenty-four faces, only six would be formed; and if we conceive these prolonged till they meet each other, they would conjointly form a very obtuse rhomboid (fig. 39.) encircling the nucleus. The summits A, O', coincide with the summits of the nucleus, from which the decrements commenced, and each of the faces A*ei* corresponds with one of the faces of the nucleus; so that the diagonal which passes through the points *ei* is parallel with the diagonal E I of the nucleus, but somewhat more elevated. This kind of crystal is found among the secondary crystals of oligistite iron-ore.

As a further illustration of the different variations of which the decrements, whether of the superior or inferior angle, are susceptible, let G*g* be any rhomboid whatever (Plate IV. fig. 45.), the summits of which are S*s*. Let S*g*^{g'}, s*G*^{G'}, fig. 46, be a quadrilateral figure formed by cutting through the rhomboid G*g* in the direction of a plane, formed by the two oblique diagonals S*g*^{g'}, s*G*^{G'}, fig. 45, and the edges S*G*, S*g*^{g'}. This quadrilateral figure, termed by Haiüy the principal section of the rhomboid, is divided in the figure into a number of small quadrilaterals representing the principal section of as many molecules. Let S*G*, s*G*^{g'}, fig. 47, be the face of the rhomboid, fig. 45, marked with the same letters, and subdivided into the bases of the molecules of which it is composed. If we suppose that the angle *g*^{g'} undergoes a decrement by a single row of molecules, the small rhomboid represented by *on*z*g*^{g'} will be wanting; hence it is obvious, that the edges of that plate will have the direction *oz*, and that the distance between the angle *g*^{g'}, from which the decrement sets out, and the edge *oz*, will be measured by the femidiagonal of a molecule, or *rg*. If the decrement took place by two ranges, the edge *g*, the first plate of superposition, will correspond with *c*^d, and the distance between it and the angle *g*^{g'} will be measured by the diagonal molecule *gn*. Hence we may conclude, that in the decrements on the angles, the distance between one plate and the succeeding one, which is the same as between the point of departure and the edge of the first lamina, is equivalent to as many femidiagonals of a molecule as there are ranges taken away, as will be further evident by inspecting fig. 37. But in decrements on the edges, the distance between two successive plates is equal to the breadth of as many molecules as are taken away.

This being understood, let us suppose a decrement of two rows upon the angle *g*^{g'}. In that case, the quadrilateral *ncap*, fig. 46, being a section made in the first plate of superposition, the decreasing edge of this plate will coincide with the little edge *en*, since *gn* is the same diagonal as in fig. 47; therefore if we draw the straight line *g*^{g'}*cb*, it will coincide with the face produced by the decrement. But *g*^{g'}*b* being, in this case, parallel to the axis S*s*, as may be demonstrated geometrically, hence it follows that the secondary faces constitute the faces of a prism. If the decrements went on more rapidly, the faces of the secondary crystal would have different angles of inclination to the axis, as will be evident from inspecting Plate IV. fig. 46. If the decrement were by four ranges, for instance, the edge of the first plate of superposition would coincide with the line *yg*; then the line *g*^{g'}*S*' indicates the position of the face produced by the decrement. What has been stated, where the plane is parallel to the axis, holds true with respect to all possible varieties of the primitive rhomboid.

Mixed Decrement is those in which the number of ranges taken away in breadth and height give ratios, the two terms of which surpass unity. As, for example, decrements by two ranges of molecules in breadth, and three in height, or

by three ranges in breadth and two in height, &c. It is easy to see, that the theory may with facility be reduced to that of decrements, in which there is only one row of molecules taken away in one of the two directions.

Intermediate Decrement.—These will be best explained by references to the figures.

Let A*A*' Plate IV. fig. 48. be a parallelepiped of any kind, which undergoes a decrement by two ranges on the angle E O I of its base A E, O I. It is obvious, that the edges of the plates of superposition will have the directions *bc*, *rs*, parallel to the diagonal E I, and so situated that these will be upon the sides O E, O I, two rows of molecules comprehended between the angle O and the line *bc*, and likewise between *bc* and *rs*. But, as has been already said, the plates applied upon the adjacent faces I O, A' K, E O, A' H, undergo likewise auxiliary decrements, which continue the effect of the decrement upon the angle E O I. But such, in this case, are the effects of these decrements, that the edges of the plates applied upon I O, A' K have the directions *cg*, *st*, and those of the plates applied upon E O, A' H, the directions *bg*, *nt*; for since the lower edge of the first plate applied upon E O I coincides with *bc*, and the height of this plate corresponds to that of a single molecule, a little attention will satisfy us, that the plane *bcg*, which, on one part, coincides likewise with *bc*, and, on the other, separates from the base A E, O I by a quantity measured by O*g*, the height of a single molecule, is necessarily parallel to the face produced by the decrement. The same holds with the plane *rst*. From this it follows, that if we suppress the part situated above *rst*, we shall have a solid on which the face *rst* will represent the effect of the decrement which we are considering.

Now the direction *cg*, *st*, of the plates applied upon the face I O, A' K, (and the same may be said of the face E O, A' H,) in consequence of the auxiliary decrements, are neither parallel to the edge, nor to the diagonal of the face, but intermediate between the one and the other. This want of parallelism will become still greater, if we suppose the decrements upon the angle of the base E O I to take place by three or four ranges. This is the kind of decrement to which the name of intermediate has been given. It is obvious, that it may take place in an infinite number of different directions, according as it deviates more or less from its two limits, the parallelism with the edge and the diagonal of the face.

In cases similar to those of Plate IV. fig. 48. we avoid the complication introduced by these intermediate decrements, by supposing them comprehended under the principal decrement. But certain crystals exist in which all the three decrements round the same solid angle are intermediate. In such a case, the simplest of the three is chosen as the principal decrement, and the other two considered as auxiliary. Fig. 49. represents a case of this kind: *cn*, which is the edge of the first of the plates applied upon A E, O I, is so situated, that on the side of O I there are three molecules subtracted, while on the side O E there is only one: *np*, which is the edge of the first plate applied upon I O, A' K, indicates three molecules subtracted from O I, and two from O A': *cp*, which is the edge of the first plate applied upon E O, A' H, shews the subtraction of two molecules on O A', and only one on O E.

It is easy to see, that the decrements take place relatively to the different faces situated round the angle O, as if the molecules that compose the different plates of superposition being united invariably several together, compose other molecules of a higher order, and as if the subtraction took place by single ranges of these compound molecules. Thus there will

CRYSTALLOGRAPHY.

will be on the base $A E, O I$, a decrement of triple molecules by two ranges in height, since on one part, the quadrilateral figure $c O n z$, which represents the base of a compound molecule, is equivalent to the bases of three simple molecules; and on the other, the line $O p$, which corresponds to the height of a plate of superposition, is equivalent to the height of two simple molecules. It is easy to conceive likewise, that the decrement relative to the face $E O, A' K$, takes place by two ranges in height of double molecules; because $c O p x$ contains the bases of two simple molecules, and $O n$ is equal to the length of three simple molecules. In the decrement which takes place upon $I O, A' K$, there is a subtraction of one row of molecules, triple in one direction, and double in the other.

Among these three decrements, the one which it appears natural to adopt as the principal, is the second which takes place upon the face $E O, A' H$; because it is the one whose direction deviates the least from that of the diagonal $E A'$, or because it takes place by double molecules, which is a more simple decrement than the other two.

To give some further examples of intermediate decrements, let us suppose $O I, I' O'$, one of the faces of cubic nucleus (see *Plate IV. fig. 50. Crystallography*); and that the decrement took place on the angles by the subtraction of double molecules: in this case, the edges of the laminae of superposition will be in the direction of the lines $dn, km, ab, cb, \&c.$

Let $E I', \text{fig. 51.}$ be a cubic nucleus, and suppose the decrements are made parallel to the lines km, lm, kr, lr , always by subtraction of double molecules, but in such a manner, that there shall be three ranges taken away in the direction of the breadth, and one in that of the height: in this case, the decrements will be both intermediate and mixed. Suppose also that the edges of the laminae of superposition, situated around one solid angle O , had directions which crossed, so that with respect to the face $O I, I' O'$, the greatest number of the faces of the molecules should be taken away on the side $O I'$; but on the face $E O, O E$, it should be on the side $O O'$, and with respect to face $E A, I O$, it should be on the side $E O$; the effect of these different decrements would produce three faces round each solid angle, which would be situated in an inclined manner with respect to the faces of the nucleus; and because the cube has eight solid angles, the secondary crystal would have twenty-four faces, which would tend to unite four and four, and form the summit of a pyramid round each face of the nucleus. But if we suppose the decrement to cease before these are completed, there will remain six faces parallel to those of the nucleus, and we shall have a polyhedral crystal of thirty faces, as represented *fig. 52.* The angles km, lr , corresponding with those of the nucleus, are rhombs; and the faces $m' n', r o$, are equal and similar trapeziums. This form is that of one of the varieties of iron pyrites.

Suppose intermediate decrements on the two lateral angles of a rhomboid $G G'$, *Plate IV. fig. 47,* and that these decrements take place by ranges of double molecules, parallel to the faces $u m, x y, u' m', x' y'$. It is evident, that these decrements will produce above each rhomb of the primitive nucleus $S G, g' G'$, two faces, which, commencing at the angles $G G'$, will converge towards each other, and come in contact in a line situated above the diagonal $S g'$, but inclined to that diagonal; so that the complete result of the decrement will be the formation of twelve faces, disposed six and six towards each summit. *Plate IV. fig. 53.* represents one of these solids, with its nucleus inscribed. It is a variety of calcareous spar which some-

times occurs. The lines aba' shew the direction of a fracture parallel to the face $G g', G' S$, of the primitive nucleus. It appears from this figure, that the nucleus does not touch the secondary crystal, except by its lateral angles, which are situated in the edges $B S', D s', C t', \&c.$ while in the dodecahedron of Bergmann, represented in *Plate II. fig. 22,* and called by Häuy *metastalle calcareous spar*, the lateral edges of the nucleus coincide with those edges of the secondary crystal that constitute the common basis of the two pyramids, as is evident from inspecting *Plate II. fig. 23.*

Hitherto immediate decrements have been observed only in a small number of instances, but they lead to forms as simple as the other, and give some curious results, which deserve to be studied in a mathematical point of view, without any reference to crystallography.

Compound secondary Forms.—Simple secondary forms are those which proceed from a single law of decrement, the effect of which covers and conceals the nucleus, which only touches the secondary crystal by certain angles or edges. Compound secondary forms are those which are produced by several simultaneous laws of decrement, or by one law which has not reached its limit; so that faces remain parallel to the original faces of the nucleus, which further modify the faces of the crystal.

Suppose, for instance, the law which produces the octahedron from the cube (*Plate III. fig. 36.*) should concur with that from which results the dodecahedron with pentagonal faces. (*Plate III. fig. 31.*) The first of these laws would produce eight faces, which would have for centres the eight angles of the cubic nucleus. Each of these faces, as, for instance, that whose centre coincides with the solid angle O , *fig. 31,* will be parallel to the equilateral triangle, whose sides pass through the points $p s t$, *fig. 34;* in like manner, the centre that coincides with the front O' will be parallel to the equilateral triangle, whose sides pass through the points $s n p$, *Plate IV. fig. 54.* But the second law produces faces situated as the pentagon, cut by the sides of the triangles $p s t, s n p$. Now the section of these triangles upon the pentagon $i O s, O' n$, *fig. 31,* reduces the pentagon to an isosceles triangle, which has the line tn for the base: the two other sides are those which pass through the points $t s, n s$. The same takes place with the other pentagons. Hence it follows, that the secondary crystal produced will be an icosaedron, bounded by eight equilateral triangles, and twelve isosceles triangles. (See *Plate IV. fig. 54.*) This icosaedron occurs in iron pyrites; it is different in its form from the regular icosaedron of geometers: the latter form does not exist among crystals, and cannot be produced by any law of decrement. The same remark applies to the dodecahedron, bounded by twelve regular and equal pentagons.

Another illustration of a compound secondary form is offered in the regular six-sided prism of calcareous spar. (*Plate II. fig. 17.*) From the manner of dissecting this prism, (see *CRYSTAL*), it is easy to conceive that the rhomboidal nucleus, *fig. 21,* has six of its solid angles E, O, I, K, G, H , situated in the middle of the lateral faces of the prism: hence it follows, that these angles are the points from whence the decrements set out from the three plane angles of the rhomb $E O I, E O A', I O A'$, which form the solid angle O ; but it is only necessary to consider the decrements on one of them, supposing the same decrement extends on the two adjacent planes that form the solid angle. Let us then refer all the decrements to the six angles $E O I, E H G, I K G, H G K, O I K, H G O$, the first of which are turned towards the summit A

and the three left to the summit A'. If we suppose a decrement by two ranges of rhomboidal molecules on these different angles, six faces will be produced parallel to the axis, as has been already observed.

The plates of superposition, at the same time that they undergo a decrement towards the inferior angles, will extend by their superior parts, so as to remain always contiguous to the axis, the length of which will progressively be augmented. The small faces produced by the decrements on the angles will gradually increase till they touch each other; we shall then have the solid represented *AA, fig. 20*, where each of these small faces, as *oOo*, is marked with the same letters as the angle to which it belongs, and which is now situated in the middle of the triangle, because it constitutes the point from which the decrements set out. As new plates are applied, the points or line *oo* rise up, and the point *O* sinks down; so that at a certain period we shall have the solid represented *fig. 19*, where the faces produced by the decrements become pentagons *ooi, Oe*.

Let us now suppose a second decrement to concur with the first, and to take place by a single range upon the superior angle *EAI* and the inferior angle *H'AK*, and also on the other faces of the rhomb which form the solid angles *A* and *A'*; the effect of this will be to produce two faces perpendicular to the axis; and when it has reached the point at which these faces cut the six faces parallel to the axis which are produced by the first decrement, the secondary solid will be completed, and will be a regular six-sided prism. (*Plate II. fig. 17.*) It has been already said, that the result is general, whatever be the form of the primitive rhomboid. It may now be seen why, in the mechanical division of the prism, the section *pp, oo*, has the sides *pp, oo*, parallel to each other, and to the diagonal of the nucleus *E, F, fig. 21*. Since the two decrements taking place, one upon the angle *E, O, I*, the other upon the angle *E, A, I*, the plates of superposition ought to have the edges formed by the decrements parallel to the same diagonal, or to *E, I*.

In the case we have been considering, and which is the most common, the axis of the secondary crystal is longer than that of the nucleus; but if we suppose the two decrements to commence at the same time, then the axis of the prism being equal to that of the nucleus, both the lateral angles and the summits of the nucleus would touch the prism, the one on the sides, and the other the bases. If the decrement were to commence on the superior angles prior to the lateral decrements, the summits of the nucleus would then be contiguous to the bases of the prism, whilst its lateral angles would be wholly within the prism, between its planes and axis. This is the case with certain crystals, in which the prism is very short, and resembles an hexagonal plate.

Another remarkable example is offered in that variety of calcareous spar, called by Häuy *analogique*. (See *Plate IV. fig. 55.*) It is composed of twenty-four trapezoidal faces, of which six are vertical faces, as *dabc, d'a'b'c'*, and twelve others, disposed six and six, as *c'pa, and c'p'a''b'*, &c. and six terminal faces, as *pap'*. The vertical trapezoids result from the same law that produces the hexahedral prism (*Plate II. fig. 17.*); the second result from the law which produces the metafacial crystal, *fig. 22*. In comparing *fig. 55* with *fig. 21*, we may see that the vertical faces cut those of the metafacial crystal, so as to interest the lateral solid angles *E, O, I, K*, &c. *figs. 22* and *23*; and, lastly, the terminal faces result from a decrement similar to what produced the equiaxial crystal. (*Plate III. fig. 34.*) *Fig. 55. A, B, C, D*, represents the different trapezoidal faces

of this crystal. Various relations of proportion between their sides and angles are given by Häuy, *Minéralogie*, tom. i. p. 85, 86.

It is a character common to all the primitive forms to be divisible, parallel to their faces. In the parallelepiped, where this division is not joined with some other in a different direction, it leads us obviously to the form of molecule similar to that of the primitive crystal. In the regular six-sided prism, it gives us for a molecule the triangular prism, as has been before observed. (See *Plate V. fig. 56.*) In the octahedrons, it appears to produce two kinds of molecules, tetrahedrons and octahedrons. Häuy, in this case, conceives that the tetrahedron is the integrant molecule, and that the octahedrons are empty spaces between them. The difficulty is removed, by perceiving the molecules to be an assemblage of spherular particles, as we have before observed. The dodecahedron, with isosceles triangular faces, cannot have molecules extracted, without dividing it in directions different from those which are parallel to the face. The cutting-planes must pass through the axis, and through the edges contiguous to the summits, from whence will result irregular tetrahedrons. Some other primitive forms divide also in directions which are not parallel to the faces, as we have seen in the case of the tourmaline. See *Plate III. fig. 26.*

Thus, besides parallelepipeds, there are two other forms which integrant molecules assume, namely, the tetrahedron and the triangular prism; but it deserves particular attention, that the tetrahedral and prismatic molecules are always arranged in such a manner in the interior of crystals, that, taking them in groups of two, four, six, or eight, they compose parallelepipeds, so that the ranges subtracted by decrements are no other than these parallelepipeds; and we may consider such decrements as taking place by one or more ranges of rhomboidal molecules. If, for example, we take the regular six-sided prism (*Plate V. fig. 56.*), suppose one base of this prism divided by sections parallel to its sides into small triangles, which form the bases of the integrant molecule; it is evident that any two adjoining triangles, *A, pi, A, O, i*, compose a rhomb, and by their union the two little triangular prisms to which these bases belong would form by their union a rhomboidal prism or parallelepiped. It is obvious, therefore, that we may conceive the larger prism to be composed of similar rhombs. Now, if we conceive a series of plates piled upon the hexagon *A, B, C, D, F, G*, and which undergo, for example, on their different edges, a subtraction of one range of these parallelepipeds, these edges will successively correspond with the lines of the hexagon *lmnrhbi, kuxygc*, &c. from which we see that the quantity by which each plate decreases is a sum of parallelepipeds, or prisms with rhomboidal bases; and if the decrement attains its limit, we shall have a right six-sided pyramid, which will have for its base the hexagon *A, B, C, D, F, G*. These parallelepipeds, composed of tetrahedrons or triangular prisms, are called by Häuy *subtractive molecules*; and as far as the theory of crystals is concerned, we may conceive all crystals to be composed of parallelepipeds.

Plate V. fig. 58. refers to a particular case described in a note by Häuy (tom. i. p. 96.), to explain the vacancies on the edges *h, c, l, m*; but being of less importance, we proceed to state the observations of M. Häuy on some apparent anomalies in crystallization.

In common crystals, the faces adjacent to each other always form salient and never re-entering angles; but certain crystalline forms exist, which present the latter angles. Let *B, d*, *Plate V. fig. 60.* represent an oblique prism with rhomboidal

CRYSTALLOGRAPHY.

rhomboidal bases, situated in such a manner, that the faces $A D, a d,$ and $C D, c d,$ are vertical, and $B, D,$ are the acute angles of the base, and that these proceed in an ascending direction from A to C . Let us suppose also, that the prism is cut into two equal parts by a plane which passes through the diagonals drawn from B to $D,$ and from b to $d,$ and that the one half remained fixed, whilst the other is reversed without being separated from the former. The crystal will then be presented under the aspect seen in *fig. 61,* where the triangle $\beta, d', e,$ which was one of the halves of the inferior base, *fig. 60,* is now situated in the upper part, *fig. 61,* and forms a salient angle or projecting edge with the triangle $A B D$. Whilst the triangle $B D C,$ *fig. 61,* which was one of the halves of the superior base, *fig. 60,* is transported into the lower part, *fig. 61,* and forms a re-entering angle with the triangle $a b d,$ we may easily conceive that the plane of junction $D B, b d,$ of the two halves of a rhomboid is situated like a plane drawn, formed by a decrement on one range or other of the edges $A a, C c,$ *fig. 60,* and thus the manner in which these halves join is in strict relation with the structure.

Now if we imagine a secondary form, which has for its nucleus a similar prism to the above, and if we suppose that it has been cut in the direction of the plane $D B, b d,$ and that one of the halves has been reversed as in *fig. 61,* the arrangement may be such, that there will still be a re-entering angle at one termination, and a salient angle at the other, resulting from the mutual incidences of the faces produced by the decrements.

In certain cases, the plane of junction on which the two halves of the crystals are joined is situated parallel to one of the faces of the nucleus, and the arrangement does not admit of presenting a re-entering angle opposite to a salient one.

These crystals which are here described are called by Haüy *hemistropes,* or half reversed. Romé de Lisle has called such crystals marles.

Another accident extremely common is the manner in which crystals in groups are inserted into each other. This kind of penetration is subject to many diversities; but on accurate examination, we shall find that they are subject to certain laws always analogous to those of structure, and that these crystals, instead of being precipitated confusedly on each other, have a certain kind of arrangement. In illustration of this, let *Plate V. fig. 62,* be a cube, and $M N R$ an equilateral triangular facet, produced by a decrement of one range round the angle A : let us suppose a second cube modified in the same manner, and attached to the former by a facet resulting from a similar decrement; we shall have the combination represented *fig. 63.*

We may also conceive that one of these cubes, for instance the lower one, is increased in all its dimensions, except in those places where the other forms an obstacle to its progress. As the increment continues increasing, it will more and more envelope the upper crystal, and may finally by covering it entirely. We observe crystals sunk into each other at different degrees of depth, but always in such a manner, that their plane of junction has a position analogous to planes resulting from decrement; so that both follow their common progress to this plane, which serves as their respective limit. Cubes of fluor spar inserted into each other have the laminae of each extended without interruption, until they are stopped by the common plane of junction.

The example here stated relates to a very simple and regular law of decrement. But frequently the laws which determine the plane of junction are more or less complicated, and there are a few which are rather extraordinary. When

two prisms cross towards the middle of their axis, there are two planes of junction which unite crossing each other, as in the mineral called staurotide, and these planes have positions analogous to those which would be determined by the known laws of decrement.

In the preceding theory of crystallography it has been constantly supposed, that the laminae composing crystals of the same species proceed from a common nucleus, undergoing decrements subject to certain laws, on which the forms of these secondary crystals depend. But this, says Haüy, is only a conception adopted to make us more easily perceive the mutual relations of the forms we are treating of. Properly speaking, a crystal taken as a whole is only a regular group of similar molecules. It does not commence by a nucleus of a size proportioned to what it afterwards acquires, or that which we can extract from it by mechanical division; and the laminae which cover this nucleus are not applied successively over each other in which the theory considers them. The proof of this is, that among crystals of different sizes that are often attached to the same support, those which can only be distinguished with the microscope are as complete as the largest; from whence it follows that they have the same structure, that is to say, they have already within them a small nucleus proportioned to their diameter, and enveloped by the requisite number of decreasing laminae to form the faces of the secondary crystal. We must therefore conceive, that from the first commencement a crystal similar to the rhomboidal dodecahedron is already a small dodecahedron, and contains a cubical nucleus proportionally small, and that this kind of embryo continues to increase without changing its form by the addition of new laminae on all the sides, so that the nucleus increases on its part, always preserving the same relation with the entire crystal.

We shall render this idea distinct by a construction which refers to the dodecahedron, and represented by a plane figure. What is said of this figure may easily be applied to a solid, since we can always conceive a plane figure to be a section made in a solid; let $t s, z s',$ *Plate V. fig. 59,* be an assemblage of small squares, in which the square $B N, D G,$ composed of forty-nine squares, represents a section of the nucleus, and the extreme square $l p i b f c s,$ &c. the steps formed by the laminae of superposition. We may conceive that the assemblage commenced by the square $B N, D G,$ and that different piles of small squares are afterwards applied on each of the sides of the central square; for instance, on the side $B N,$ the five squares comprehended between f and $b,$ afterwards the three squares contained between e and $c,$ and then the square z . This progress corresponds with what would take place if the dodecahedron commenced with a cube proportioned to its volume, and which afterwards increased by an addition of laminae constantly decreasing.

But we may also suppose, that the assemblage of molecules commenced as represented *Plate V. fig. 59, C,* in which the square $B N, D G,$ is only composed of nine molecules, and had on each side of it only a single square, $s t, s' z$. If we refer this assemblage in imagination to the solid, of which it is a section, we shall easily perceive that this solid had for its nucleus a cube composed of twenty-seven molecules, and that each face composed of nine squares had placed on the middle one a little cube, so that the decrement of one range is already seen in the initial dodecahedron.

By the addition of new squares, this assemblage will become that of *B, fig. 59,* in which the central square $B N, D G,$ is formed of twenty-five small squares, and supports on each of its sides a range of three squares, besides the terminal squares $s t, s' z$. Here we have already two laminae of superposition instead of one only. Lastly, by a

CRYSTALLOGRAPHY.

further application, the assemblage B, *fig. 59*, will be changed into that of A, *fig. 59*, where we have on each side three laminae of superposition. These different transitions, of which we may continue the series as far as we please, will convey an idea of the manner in which secondary crystals may increase in magnitude and still preserve their form, from which we may judge that the structure combines with this augmentation of volume in such a manner, that the law was already sketched in the nascent crystal, according to which the laminae of superposition successively decrease when the nucleus has attained its greatest dimensions.

The instrument by which the angles of crystals are measured is called a goniometer. For a description of Dr. Wollaston's reflecting goniometer, see GONIOMETER. A more simple instrument was employed by Häuy. (See *Plate VI. fig. 93. Crystallography.*) It consists of a semicircle of brass divided into degrees. At the centre is fixed a pin, upon which slide the two arms A B, G F. The last of these, by means of a screw, may be fixed in any position, so that the distance between the end G and the centre may correspond with the face of the crystal to be measured. The other arm A B is drawn up till the distance between B and the centre corresponds as nearly as possible with the size of the other face of the crystal. It is then turned round till the angle of the crystal to be measured corresponds exactly with the angle B C G; the arm A B then cuts the semicircle in the angle, which corresponds with that of the crystal. This instrument is found to be not sufficiently accurate for delicate observations, but it is truly surprising that Häuy was enabled by it to approximate so nearly to the correct measurement of the various crystals which he has described. The instrument for determining the electricity of crystals (*Plate VI. fig. 92.*) is described in the article MINERALOGY, *Addenda.*

On the Notation of Crystals.—To facilitate and abridge the description of the structure of secondary crystals, Häuy has invented symbols which denote the particular laws of decrement, that produce the various forms that may occur. This mode of notation will be easily understood by a reference to the figures in *Plates V. and VI. Crystallography.* Let *Plate V. fig. 64.* represent any oblique parallelepiped, the faces of which have angles of different measures; let it be the primitive form of some mineral, as felspar. The vowels are to represent the solid angles. The four first, A, E, I, O, are placed at the four angles of the upper base, following the order of the alphabet. The consonants are chosen to designate the edges. The six first are placed on the middle of the edges of the upper base, and upon the two longitudinal edges of the lateral faces, B, C, D, F, G, H. The letters P, M, T, which are the initials of the syllables of the word *Primitive*, are placed in the middle of the upper base, and of the two lateral planes or faces exhibited to view.

Each of the solid angles, or of the six edges marked by letters, is susceptible of undergoing particular laws of decrement, on account of the irregular form of the parallelepiped. For this reason, they are marked each with a different letter. But as the laws of decrement act with the greatest possible symmetry, every thing which takes place with respect to the angles and edges that undergo distinct decrements, takes place also on the angles and edges that are diametrically opposite, and are perfectly equal, but which are not visible, or are not marked. Thus in *fig. 66.* the edges A I, p s, A E, and p u, and the solid angles I and s, O and r, are equal. It is, therefore, only necessary to mark the number of solid angles or edges that have distinct decrements, because these are understood to include all those which take place on analogous edges or angles.

In some cases, it is necessary to indicate the analogous edges and angles; this is done by similar small letters: the angles analogous by A, E, I, O, are represented by *a, e, i, o*, and the same with the edges. But it is seldom necessary to mark these small letters in the figure; it is sufficient to introduce them into the symbol of the crystal, because the place which every one should occupy in the figure may easily be conceived.

To indicate the effects of decrements by one, two, three, or more ranges in breadth, the figures 1, 2, 3, 4, &c. are employed in a manner to be immediately explained; and to indicate the effects of decrements by two, three, &c. ranges in height, the fractions $\frac{1}{2}$, $\frac{1}{3}$, &c. are employed.

The three letters P, M, T, serve to distinguish either the form of the nucleus without any modification when they alone constitute the symbol of the crystal, or the faces parallel to those of the nucleus in the case where the decrements do not reach their limit; and then these letters are combined in the symbol of the crystal with those which relate to the angles or edges that have undergone decrements.

Let us suppose that one of the solid angles O, *fig. 64.* is intercepted by a single additional face. The decrement which produces this face may take place either on the upper base P, or on the plane T, which is on the left of the observer, or on the face M, which is on the right. In the first place, the figure marking the decrement is placed above the letter O; in the second case, the figure is placed on the left-hand, a little above the letter; and in the third case, it is placed on the right-hand. Thus $\overset{1}{O}$ denotes the effect of a decrement by two ranges in breadth, parallel to the diagonal of the base P, that passes through I, E; $\overset{2}{O}$ indicates the effect of a decrement by three ranges in breadth, parallel to the diagonal of the face M, which passes through the angle E; and $\overset{4}{O}$ indicates the effect of a decrement by four ranges in breadth, parallel to the diagonal of the face T, that passes through the angle O.

When the decrement takes place on one of the three other solid angles I, A, E, the observer is supposed to move round the crystal till he is opposite to that angle, or to turn round the crystal till the solid angles E, A, I, are exactly opposite to him; and it is relative to that position that the decrement is said to take place to the right or the left.

For example, if we are speaking of the solid angle A, the figure $\overset{2}{A}$ will represent a decrement by two ranges on the surface A E, *s r*, *fig. 66.* or opposite to T; and $\overset{3}{A}$ will represent the effect of a decrement by three ranges upon the face A I *n r*, opposite to M.

As to the decrements on the edges, those which take place towards the boundary of the upper base B, C, F, D, are expressed by a letter placed above or below the letter as the effects occur above or below the terminal edge, supposing them to set off from the edge to which they are referred, whilst those which take place on the lateral edges are conducted by an exponent placed on the right or the left of the letter, according as they occur in one direction or the other.

Thus $\overset{2}{D}$ expresses a decrement by two ranges proceeding from D towards C; $\overset{2}{C}$, a decrement by two ranges proceeding from C towards D; $\overset{2}{D}$, a decrement by two ranges descending upon the face M; $\overset{3}{H}$, a decrement by three ranges, proceeding from H towards G; and $\overset{4}{G}$, a decrement of four ranges proceeding from G towards the edge opposite to H, or A *r*, *fig. 66.* When it is necessary to denote by a small letter, such as *d*, a decrement upon the edge *u r*, *fig. 66.* opposite to the edge denoted by the capital letter D, *fig. 64.*

CRYSTALLOGRAPHY.

D, *fig. 64*, we must suppose the faces of the crystals reversed. Hence, $\overset{2}{D}$ will express a decrement by two

ranges upon the other base ρ , just as $\overset{2}{D}$ expresses a similar decrement on the base P. For the same reason, c^3 will express a decrement by three ranges proceeding from r , to E O.

If the same solid angle, or the same edge, undergo several successive decrements on the same side, or different decrements which take place on different sides, the letter pointing out the angle or edge is repeated as often as the decrements, varying the figure each time, to make it correspond with the particular decrements denoted. Thus, $\overset{2}{D}$, D, will denote

two decrements upon the edge D, one of two ranges on the base P, and another of three ranges upon the face M; and 2H , H^4 , will denominate two decrements, one by two ranges on the left, the other by four on the right of the edge H.

Mixed decrements are marked according to the same principles, employing the fractions $\frac{2}{3}$, $\frac{3}{4}$, which represent them; the numerator referring to decrements in breadth, and the denominator to decrements in height.

The intermediate decrements are thus described. Let A E, I O, (*Plate V. fig. 67.*) be the same face as in *fig. 66*, but divided into rows or ranges; let us suppose a decrement by one range of double molecules, according to the lines parallel to x y; so that O y measures the double length of a molecule, and O x that of a single molecule.

This kind of decrement is thus expressed, ($\overset{\circ}{O}$, D^1 , F^2 ;) the parenthesis indicates that the decrement is intermediate; $\overset{\circ}{O}$, that it takes place by one range on the solid angle marked by that letter in *fig. 64*; D^1 , that there is one length of a molecule taken away along the edge D; and F^2 , that two lengths are taken away along the edge F.

The written language to denote the symbols, that they may be easily expressed when dictated, would be thus: for O^2 , 3O , read, O two on the right, O three on the left; $\overset{\circ}{O}$, O,

read, O under two, O above four. And the symbol ($\overset{\circ}{O}$, D^1 , F^2 ;) read, in a parenthesis, O under one, D one, F two.

The order in which these letters must be placed to denote a secondary crystal remains to be explained. If the alphabetical order were adopted, there would result a degree of confusion in the picture which the formula presents. It is more natural to conform to the order that would direct an observer in the description of the crystal; that is, to begin with the prism or middle part, and to indicate its different faces as they present themselves successively to the eye; then to pass to the faces of the summit or the pyramid.

Suppose (*Plate VI. fig. 68.*) that variety of feldspar which Häuy calls binary, *viz.* where there are two decrements by two rows each. The primitive form is represented *figs. 64* and *66*. In this form of the crystal, the face I results from a decrement by two ranges on the edge G, *fig. 64*, going towards H; the face M, *fig. 68*, corresponds with M, *fig. 64*; the face T, *fig. 68*, is parallel to T, *fig. 64*; the pentagon x comes by a decrement of two ranges on the angle, corresponding with the angle I, *fig. 64*, and parallel to the diagonal A O. As this decrement does not reach its limit, the summit exhibits a second pentagon P, parallel to the base P, *fig. 64*. All this description may be exhibited by five letters in symbolic language: thus $^2G M T$

$\overset{1}{I} P$ denoting a decrement by two ranges on the edge G, and a decrement by two ranges on the angle I, *fig. 64*.

It is customary, in order to prevent any ambiguity, to place under the different letters that compose the symbol those that correspond to them in the figure. Thus in the

binary feldspar, *fig. 68.* $\overset{2}{G} M T \overset{1}{I} P$ the letters in the line below those of the symbol enable us to compare the symbol with the figure, and thus to decypher the meaning with facility, however complicated it may be.

Where the primitive form has great simplicity, as in the cube and rectangular prism, when the opposite angles are equal, one letter will denote them both, and when the opposite edges are equiangular, the same letter will denote either; for every thing that denotes one of them, takes place also in the other. If, for instance, we suppose *fig. 64*, to become more symmetrical, and that certain solid angles which were before unequal are become equal, they should be marked with the same letter. If, for instance, the primitive form be a rectangular prism, which has oblique-angled parallelograms for its bases, one side of which is longer than the other, *fig. 69*; in this case, we have the angle $O = A$, $I = E$; we may substitute in each case the second letter for the first, as is done *fig. 69*.

If we review the different kinds of parallelograms we shall find them acquire different degrees of simplicity, which occasions new equalities in the angles and edges, and new substitutions of letters. The oblique prism with rhomboidal bases is represented *fig. 70*. The rectangular prism with rectangular bases *fig. 71*. The rectangular prism with rhomboidal faces *fig. 72*. The rectangular prism with square bases *fig. 73*.

The cube is represented *fig. 74*; here only the superior base is marked, because what takes place with respect to this may be applied indifferently to any of the other faces.

The same mode is employed in writing the symbols for these regular forms, only the letters that have the same name and the same figure are not repeated. An example will render this method evident. *Fig. 75*, represents the most common variety of the chrysoberyl, or cymophane, (see CHRYSOBERYL,) the nucleus of which is a rectangular parallelepiped, such as represented *fig. 71*. The symbol of the secondary crystal,

fig. 75, will be $M T \overset{2}{G} G \overset{1}{B} A \overset{2}{3} A$. This variety is called by Häuy annular cymophane.

To understand this expression better, let us mark each angle and edge with a particular letter, as in *fig. 76*. In this case, the symbol would become $M T \overset{2}{G} H \overset{1}{B} E \overset{2}{3} O$; but if we compare *fig. 71*, with *76*, we shall see that $H = G$, $E = B$, $O = A$: hence if we substitute instead of their first letters their equal values, we get $M T \overset{2}{G} G \overset{1}{B} A \overset{2}{3} A$, which becomes the same as the one before given, when the useless repetition of B is suppressed.

From the preceding statement, it is evident that we must not confound such symbols as $^2G G^2$ with $G^2 \overset{2}{G}$; the first symbol indicates the decrements which take place on the face T, *fig. 71*, and on the edge opposite to it, going from the edges G towards those that correspond with them behind the parallelepiped. The second symbol indicates the decrements which take place upon the face M, and which meet each other in the middle of that face. If these two decrements took place simultaneously, these symbols would be $^2G^2$.

CRYSTALLOGRAPHY.

In the preceding symbols, each letter, such as on G^2 or 2G , can only be applied to a single edge situated to the right or left, as the letter is itself; but ${}^2G^2$ applies indifferently to the one edge or the other: hence it is needless to repeat the letter.

If we take *Plate VI. fig. 77.* as another example, and suppose *fig. 70.* to represent its primitive form, we shall have for the symbol of the variety of crystal here represented,

In this symbol, ${}^3G^3$ indicates two distinct faces formed on each side of each edge G , but it is not necessary to place two letters under that symbol, because all the faces situated in the same manner being distinguished by the same letter in the figure; it is sufficient to point out that the symbol ${}^3G^3$ applies to the faces marked with the letter o , and this requires only to write the letter o under the symbol.

From the same principles it follows, that the rhomboidal dodecahedron derived from the cube, *fig. 74.* is expressed

by the symbol $\overset{1}{B} B$. The octahedron derived from the cube is thus expressed $\overset{1}{A} A$.

The rhomboid, supposing it placed in the most natural aspect, so that the two solid angles, composed of three similar plane angles, are in the same vertical line, has, properly speaking, no base, but merely summits, which are the extremities of its axis. Its angles and edges are marked as in *Plate VI. fig. 78.*

If all the lateral angles were indicated by letters, those that are nearest the summit A would have the letter E , and those which are nearest the inferior summit the letter e . As the rhomboid has six faces equal and similar, it is only necessary to consider the decrements relative to one of these faces; as, for example, that marked P , *fig. 78.* because all the others are mere repetitions of this. The decrements which set out from the superior angle A , or the superior edge B , will have the figure indicating the number of ranges placed below A and B . Those which set out from the lateral angles E , will have their figures situated at the side and towards the top of the letter. Those decrements which set out from the inferior angle e , or the inferior edge D , will have the figure placed above the letter e or D .

Suppose, for example, that *fig. 79.* represents the variety of calcareous spar, called analogie by Haüy, its symbol

easy. What has been said of the rhomboid may be applied to the other primitive forms, of which we shall give examples: *fig. 80.* represents the octahedron with scalene triangles; *fig. 82.* the regular octahedron. In placing the figures that accompany the letters in the symbols in *fig. 80.* the figure denoting the decrement is placed below the letter A or B , to represent decrements setting out from the angle A , or the edge B . The figure is placed above for those which set out from the edge D , and at the side for those which set out from the angle E .

If we want to denote a decrement by one range upon all the edges of the regular octahedron, *fig. 82.* we have only to write $\overset{1}{A} A$. To indicate a decrement by one range on all the edges we write $\overset{1}{B} B$. The first of these decrements produces a cube, the second a rhomboidal dodecahedron. In some mineral species, as in the nitrate of potash, the primitive octahedron, which is composed of eight isos-

celes triangles, similar four and four to each, ought to have the position represented as in *fig. 83.*, that the secondary crystal may have the most natural attitude. The edges which join the two pyramids ought to have two of them a vertical direction, as F, F ; and two an horizontal direction, as B . By comparing *figs. 83.* with *fig. 84.* in which the letters are placed as if all the edges and angles had different functions, it will be easy to conceive the arrangement of the letters adopted in *fig. 83.*; for in the present case we have $E=A, D=B, G=F$.

The tetrahedron being always regular when it becomes a primitive form, it will be expressed as in *fig. 85.*, and the decrements marked as in the octahedron.

In the regular six-sided prism, *fig. 86.* the figures are written precisely in the manner already described for the four-sided prism. But it happens sometimes, that three of the solid angles taken alternately are replaced by faces, whilst the intermediate angles remain untouched. In that case, the prism is distinguished as in *fig. 87.* In the rhomboidal dodecahedron, *fig. 88.* each solid angle composed of three planes may be allimated to a summit of the obtuse rhomboid: hence it is only necessary to give letters to one face, as may be seen in the *fig. A A, E E, B B, P*. Where the parts of crystals opposite to those which undergo certain decrements remain untouched, it is easy to mark this peculiarity by zeros. This case belongs chiefly to the tourmaline. One variety of the tourmaline is represented *fig. 90.* and the primitive form *fig. 89.* The prism, which is nine-sided, has six of its faces, namely $s s$, produced by the subtraction of one range upon the edges $D D$, *fig. 89.* and the three others, as l , by the subtraction of two ranges only on three angles e . The inferior summit has simply three faces parallel to those of the nucleus; while on the superior summit the three edges B , *fig. 89.* are replaced each by a facet $n n n$, *fig. 90.* in consequence of a decrement which has not reached its limit. This crystal is represented by the following symbol:

$\overset{2 \cdot 0}{E}$ indicate, the one that the angles E , *fig. 89.* opposite to e , undergo no decrement; the other, that the edges parallel to B remain also untouched. If these edges underwent a different law of decrement, for instance, that which produced a subtraction by two ranges, the symbol would be,

hence it may be understood, that the decrements represented by a capital letter, accompanied with a figure, do not always include similar decrements represented by a small letter of the same name. Thus B does not implicitly imply b , or *vice versa*; it is only when the second letter is not introduced into the symbol with a different figure, or a zero, that we imply that the same decrements take place on the analogous sides or angles.

In the symbol $\overset{1}{D} \overset{2}{e} \overset{2 \cdot 0}{E} P B b$, by $\overset{1}{B}$ is implied a decrement by one range, which takes place only on the edges contiguous to the superior summit A , *fig. 89.*; b indicates a decrement by two ranges, which only takes place on the edges contiguous to the inferior summit. The quantities $\overset{2}{e}$ and $\overset{2 \cdot 0}{E}$ indicate two ranges on the angles e only, and that no decrement whatever takes place upon the opposite angles E .

The preceding illustrations of M. Haüy's mode of denoting the structure of crystals by symbols, are given in detail to enable the student to make a figure of a crystal from the symbol representing the laws of its formation. Shorter rules for enabling the student merely to read and understand this mode of notation will suffice.

1. The letters P, M, T, denote the faces of the nucleus or primitive crystal, or indicate that the faces are parallel to the faces of the primitive crystal marked with the same letters.

2. Every vowel in the symbol indicates a solid angle, marked with the same letter as in the nucleus. Every consonant indicates the edge which has the same letter in the figure.

3. Each letter contained in the symbol is underfoot with the figure belonging to it to represent all the same letters, and the angles or edges which have the same function.

4. Every number joined to a letter indicates a decrement setting out from the angle or the edge denoted by that letter. If the number be a whole one, it indicates the ranges in breadth, supposing each plate to have only the thickness of one molecule. If the number be a fraction, the numerator indicates the number of ranges subtracted in breadth, and the denominator the number of ranges subtracted in height.

5. The number is placed above the letter to shew that the decrement ascends, or below it to shew that it descends, setting out from the angle or edge marked by the letter. If it be placed either on the right or left hand of the letter, it indicates a decrement to the right or left of the edge or angle marked by the letter.

6. When a letter is twice repeated with the same number placed on different sides, as ${}^2G^2G^2$ or $G^2{}^2G^2$, ${}^2A^2A^2$ or $A^2{}^2A^2$, the two edges or two angles which it marks should be considered in the figure in the same relative positions. Thus, ${}^2G^2G^2$ indicates the effect of decrement by two ranges on the edge G situated at the left, and of a similar decrement on the edge G situated at the right.

7. When a letter has the same number both on the right and left side, as ${}^3G^3$, it applies equally to all the edges G. The same applies to the letters which denote the angles.

8. The parenthesis, as, for example, $(\overset{\circ}{O} D^1, F^2)$ indicates an intermediate decrement. The letter $\overset{\circ}{O}$ indicates, that an ascending decrement of three ranges takes place on the angle O; D^1 , that one molecule is subtracted along the edge D; and F^2 , that two molecules are subtracted on the edge F.

9. Every small letter in the symbol indicates the angle or the edge diametrically opposite to that which has the same capital letter in the figure, where the small letter is omitted as superfluous. The letter e is, however, never omitted in the rhomboid; it indicates, according to the principle, the letter opposite to E.

10. When the large and small letters of the same name are introduced into the symbol with different numbers attached to them, the two opposite edges or angles denoted by these letters are conceived to undergo exclusively the law of decrement, indicated by the number attached to the letter.

11. Every letter, whether large or small, marked by a number having a zero attached to it, as $\overset{\circ}{E}$, indicates that the decrement denoted by that number does not take place on the angle or edge which the letter represents.

The above account of the theory of crystallization, and the notation of crystals, may suffice with what has been before given under the article CRYSTAL, to convey ample information of the abbé Haüy's ingenious system, so far as

relates to the structure of crystals, and the symbolic mode of describing the decrements by which the secondary crystals are formed. The figures in Plates II. III. IV. V. VI. *Crystallography*, which we have described, are copied from Haüy's *Traité de Minéralogie*, tom. i., and contain what he has given in illustration of the 'theory of crystallization.' The application of geometry and analysis, to determine the laws of decrement from the measurement of the angles, which has been so ably made in the above-named work by this illustrious crystallographer, would require for its explanation a more ample space than would be consistent with the present article, which is intended to supply what was defective in the explanation of the plates under the article CRYSTAL, and to correct the references that were there erroneously given. (See CRYSTAL.) We omitted to state, that Plate II. fig. 25, represents the secondary rhomb, fig. 24, with the three superior edges, and the three inferior ones cut off or truncated r, r, r, r', r', r' ; by cutting other laminae parallel to each of the faces r, r, r , &c. we shall at length extract the primitive nucleus A E, O I, fig. 24.

CSHATRIYA, or CHATTERIE, denotes in India a man of the second or military cast. See CAST.

CUCKFIELD. In 1811, the parish of Cuckfield contained 300 houses, and 2088 persons; viz. 1063 males, and 1025 females: 251 families being employed in agriculture, and 123 in trade, &c.

CUCKOW-SPIT. Add—This cuckow-spittle encompasses the larva of a species of cicada, which is denominated *C. ipumaria*, or cuckow-spit cicada, from the circumstance of its larva being constantly found enveloped in a mass of white froth adhering to the leaves and stems of vegetables. This froth, called cuckow-spittle, is found during the advanced state of summer, and is the production of the included larva, which, from the time of its hatching from the egg deposited by the parent insect, continues occasionally to suck the juices of the stem on which it resides, and to discharge them from its vent in the form of very minute bubbles, till it covers itself with a large mass of froth, and it is sometimes so overcharged with moisture that a drop may be seen hanging from its under surface. Shaw's Zoology, vol. vi.

CUCULUS, l. 4, add—Dr. Leach, however, observes, that this property does not belong to this kind of feet, which can be considered merely as simple feet, having two toes before and two behind. Col. 2, l. 21, after insects, add—and on larvae or caterpillars; l. 35, add—For the natural history of this bird, see Dr. Jenner's curious paper in the Phil. Trans. for 1788, pt. ii.

CUD-BEAR. See LICHIEN *Tartareus*.

CULLUMIA, in Botany, dedicated by Mr. Brown, to the honour of the late sir John Cullum, bart., an elegant and accomplished scholar and botanist; as well as of his brother the present sir Thomas Gery Cullum, bart. F.L.S. an excellent British botanist, one of the most ardent cultivators of this lovely science, whose friendship alone can be more valued than his various and extensive information.—Br. in Ait. Hort. Kew. v. 5, 137.—Clas and order, *Polygamia-frustranea*. Nat. Ord. *Compositæ*, Linn. *Corymbiferae*, Juss. Eff. Ch. Receptac. cellular. Seeds smooth. Down none. Common calyx of one leaf, covered with imbricated scales.

1. *C. ciliaris*. Fringed Cullumia. Ait. n. 1. (*Berkheya ciliaris*; Willd. Sp. Pl. v. 3, 2273; *Gorteria ciliaris*; Linn. Sp. Pl. 1284. *Carlina foliis imbricatis*, &c.; 151. t. 54. f. 1.)—Leaves ovate, smooth, imbricated, fringed with a double row of bristles, and tipped with a reflexed spine.

2. *C. fetosa*. Recurved smooth-leaved Cullumia. Ait. n. 2. (*Berkheya fetosa*; Willd. *ibid.* excluding *Comme-*
lin's

lin's syn.)—Leaves ovato-lanceolate, smooth, recurved, fringed with prickles.

3. *C. squarrosa*. Recurved awl-leaved *Callumia*. Ait. n. 3. (Berkheya squarrosa; Willd. 2272. "Rohria squarrosa; Thunb. in Act. Soc. Nat. Scrut. Hafn. v. 3, part 1. 100. t. 5.")—Leaves awl-shaped, recurved or spreading, fringed with prickles; furrowed beneath; nearly smooth like the branches.

These are green-houfe shrubs, with yellow radiant *flowers*, all natives of the Cape of Good Hope.

CULLUMPTON. By the return of 1811, the parish contains 600 houfes, and 2917 inhabitants.

CULPEPPER, l. 3, r. 1810, 18,967, and 8312.

CULROSS. In 1811, the burgh and parish contained 279 houfes, and 1611 perfons; viz. 725 males, and 886 females; 78 families being employed in agriculture, and 183 in trade, manufactures, and handicraft.

CUMANA, l. 4, r. Welbes.

CUMBERLAND, l. 23, r. and by the return of 1811, 24,002 houfes, and 133,344 inhabitants.

CUMBERLAND, in Maine, l. 7, r. 24 townships; l. 9, r. 1810, is 42,831.

CUMBERLAND, in New Jerfey, l. 5, r. 12,678, and 42.

CUMBERLAND, a county of Pennsylvania, l. ult. r. 26,757, and 307.

CUMBERLAND, a county of Virginia, l. 3 and 4, r. 9992, and 6102.

CUMBERLAND, a county of N. Carolina, l. 2, r. 9382, and 2796.

CUMBERLAND, a county of Kentucky, l. 1 and 2, r. 6085, and 902.

CUMBERLAND, in Rhode ifland, l. 2, r. 2140.

CUMBERLAND, in Pennsylvania, r. 1591. And at the clofe, after Bedford, add—containing 570 inhabitants.

CUMMINGTON, l. 3, r. 1009.

CURCULIO, l. 17, add—Mr. Marfhall, in his "Entomologia Britannica," enumerates no fewer than 234 Britifh fpecies; l. 27, add—The larva, when properly fried and boiled, is confidered as one of the beft dainties in the Weft Indies. P. 3, C. GRANARIUS, add—See WEEVIL. P. 5, col. 2, NUCUM, add—The various changes which the nut-maggot paffes through, from its introduction into the nut in Auguft to its efcape, are worthy of attention. Dr. Darwin, in his "Botanical Garden," thus beautifully describes the egress of this infect from the cavity of the nut:

"So fleeps in filence the curculio, fhut
In the dark chambers of the cavern'd nut;
Erodes with ivory beak the vaulted fhell,
And quits on filmy wings its narrow cell."

CURD, *Chemical Properties of*. See MILK.

CURIA CLAUDENDA, a writ that lies againft him who fhould fence and inclofe the ground, but refufes or defers to do it.

CURIA Advifare vult, a deliberation which the court fometimes takes, before judgment is given in a caufe, with regard to which there feems to be any point of difficulty.

CURRIE, JAMES, M.D., in *Biography*, diftinguifhed both as a phyfician and a writer, was the fon of an eftablifhed minifter at Kirkpatrick-Fleming, in Dumfrieffhire, in which parish he was born in the year 1756. Originally defigned for commerce, he was educated with that view; but upon a change of his deftination, he commenced, in 1776, a courfe of medical ftudy at Edinburgh; and having graduated in that univerfity, fettled, in 1781, at Liverpool, where he foon rofe to eminence in his profefion and in his literary character. His firft performance as a writer was an

elegant tribute to the memory of his intimate friend, Dr. Bell of Manchester, published in 1785 in the firft volume of the Manchester Tranfactions. His paper on Tetanus, &c. was publifhed in the Memoirs of the London Medical Society, vol. iii. In 1792 he was elected a member of the Royal Society; and his curious paper on the lamentable effects of a fhipwreck, was printed in the Phil. Tranf. for that year. Difapproving of the war between this country and France in confequence of the revolution, he was fuppofed to be the author of an interefing pamphlet, which appeared in 1793 under the title of "A Letter, Commercial and Political, addreffed to the Right Honourable William Pitt, by Jafer Wilfon." In 1797 his medical reputation was much advanced by a treatife in 8vo., entitled "Medical Reports on the Effects of Water, cold and warm, as a Remedy in Febrile Difeafes, &c." by which the practice of effufion of cold water in fevers, fuggelted by Dr. Wright's narrative in the London Journal, was much extended. With a view to the relief of the diftreffed family of the ruffic poet, Robert Burns, with whom he became acquainted in 1792, he publifhed in 1800 an edition of his works, with an account of his life, &c. in 4 vols. 8vo. It is with real regret we farther report, that Dr. Currie's health began to decline in 1804, and that his friends and patients at Liverpool were deprived of the pleafure of his fociety and advice by his removal, towards the clofe of the year, to Clifton and Bath. His diforder, which was of the pulmonary kind, fowewhat abated in confequence of the change of his fituation, and at the commencement of the following year he began to praftife in his profefion with encouraging profpects of fuccels. But it again recurred with alarming fymptoms, and he was under a neceffity of removing to Sidmouth, where his valuable life terminated on the 31ft of Auguft, 1805, in the 50th year of his age. The caufe of literature and fciences, and the interefs of humanity and benevolence, fuffered great lofs by his death.

CURVO, in *Geography*, a townfhip of America, in the diftrict of Maine, and county of Somerfet, containing 275 inhabitants.

CUSERUND, a town of Mekran in Perfia, fituated in a fertile valley, about 21 miles broad, with a river running through it. It contains 500 huts, and a large mud fort. Wheat, rice, and dates, are abundant; and the town belongs to an independent chief, whole revenue is about 1000 rupees a year.

CUSHING, l. 3, r. 532.

CUTIS, *Chemical Properties of*. See INTEGUMENTS.

CYANOGEN, in *Chemiftry*, the name given by M. Gay Luffac to the recently difcovered basis of the pruffic acid, and which he has demonftrated to be a compound of carbon and azote. The name is derived from *κyanos*, blue. Cyano-gen may be obtained by expofing dry pruffiate of mercury in a fmall retort, to a heat rather under rednefs. The falt blackens, and a gafeous fluid is extracted in abundance, which muft be collected over mercury. This gas is cyano-gen. It is colourlefs, and poffeffes the mechanical properties of common air. Its fmell is quite peculiar, and very ftrong and difagreeable. Its fpecific gravity, as afcertained by Gay Luffac, is 1.8064. It is inflammable, and burns with a purplifh-blue flame. It is not decompofed by expofure to a red heat. Water difolves 4½ times its volume, and alcohol 23 times its volume of this gas. It reddens tincture of litmus. Phofphorus, fulphur, and iodine, may be volatilized in it without alteration. Potaffium burns in it, and abforbs it. For complete combuftion, it requires twice its volume of oxygen gas; and the products are twice its volume of carbonic acid, and its own volume of azotic gas. Hence it is obviously

CYANOGEN.

obviously composed of two atoms or volumes of carbon, and one atom or volume of azote, or *per cent.* of

Carbon	-	-	-	70.0
Azote	-	-	-	30.0
				100.0

See *Atomic Theory*, Table III.

Cyanogen is capable of combining with chlorine, and forming an acid which has been named *chlorocyanic acid*. It also combines with hydrogen, forming *hydrocyanic acid*; with sulphur, forming *sulphocyanic acid*; and with iron, forming *ferrocyanic acid*: of each of which acids we shall here give a brief account.

Chlorocyanic Acid.—This is the *oxyprussic acid* of Berthollet, who first demonstrated its existence. Its properties were afterwards more thoroughly investigated, and its true composition pointed out by M. Gay Lussac, who gave it the above name. The acid was formed by M. Gay Lussac by passing a current of chlorine gas through a solution of hydrocyanic acid (prussic acid, see below) in water, till the liquid discoloured indigo dissolved in sulphuric acid. To separate the excess of chlorine, the mixture was agitated with mercury. The chlorocyanic acid was subsequently separated by an ingenious process. A glass cylinder, filled two-thirds with mercury, was filled to the brim with the above mixture, and then inverted into a basin of mercury. The apparatus was put under the receiver of an air-pump, and the exhaustion carried on till the whole of the mercury and liquid was displaced, and the cylinder filled with chlorocyanic acid in a state of vapour. On letting the air again into the receiver the vapour was condensed into a liquid, and thus collected upon the surface of the mercury in the cylinder. Chlorocyanic acid thus obtained is a colourless liquid, having a strong and peculiar odour, which excites such irritation as to induce a flow of tears. It reddens litmus, is not inflammable, and does not detonate when mixed with hydrogen or oxygen. Its solution in water does not precipitate nitrate of silver, nor barytes water. The alkalis absorb it rapidly, but it requires an excess of them to destroy its odour completely. It throws down iron from its solution of a green colour. But some of its compounds appear of a very permanent nature. Gay Lussac has shewn that this acid is a compound of one atom or volume of cyanogen, and one atom or volume of chlorine, united together without change of bulk. Hence it will be composed *per cent.* of

Cyanogen	-	-	-	41.93
Chlorine	-	-	-	58.07
				100.00

And its specific gravity in a state of vapour will be 2.152.

Hydrocyanic Acid.—This was formerly denominated *Prussic Acid*; which see. Hydrocyanic acid may be prepared in the manner pointed out in the above article; but the method more lately recommended by Gay Lussac consists in decomposing the prussiate of mercury by means of muriatic acid in a retort with heat. The products are to be passed through a tube two feet long, the first one-third of whose length is to be filled with fragments of marble, to retain the muriatic acid that may come over, and the remaining two-thirds with dry muriate of lime. A small receiver covered with ice is to be adapted to the end of this tube in which the hydrocyanic acid may be collected on application of a moderate heat to the retort. The properties of this acid are correctly described under *Prussic Acid*. It is a most

virulent poison. From Gay Lussac's experiments, it appears to be composed of one atom or volume of cyanogen, and one atom or volume of hydrogen, united together without condensation. Hence it is composed *per cent.* of

Cyanogen	-	-	-	96.3
Hydrogen	-	-	-	3.7
				100.0

And the specific gravity of its vapour will be .9367.

Hydrocyanic acid cannot be prepared for any length of time without undergoing decomposition, ammonia is formed, and a quantity of chary matter is deposited. Iodine volatilized in this acid suffers no change. Oxygen decomposing it with combustion. Chlorine displaces the hydrogen, and forms chlorocyanic acid. Neither azote, hydrogen, carbon, boron, silica, nor phosphorus, have any known action upon it. Sulphur decomposes it, appearing to displace the hydrogen and combine with the cyanogen, and thus forming sulphocyanic acid. Potassium, sodium, potash, soda, and barytes, combine with the cyanogen and liberate the hydrogen. The vapour of hydrocyanic acid is decomposed when passed through red-hot iron or platinum; also when passed through the peroxid of copper. The peroxid of manganese completely absorbs the vapour of hydrocyanic acid in a few hours, water is formed, but cyanogen is not evolved. When the red oxid of mercury is heated in hydrocyanic acid vapour, so much heat is evolved from the violent action that takes place that the compound is destroyed. If heat be not applied, the vapour is absorbed by the oxid, and when the compound is afterwards submitted to heat, water is disengaged, and the cyanide, or *prussiate* of mercury, as it was formerly termed, is left behind. See further under *Prussic Acid*.

Sulphocyanic Acid.—This is the *sulphuretted cyanic acid* of Mr. Porrett, who discovered it in 1808. It may be formed by dissolving one part of sulphuret of potash in water, and boiling in this solution three or four parts of prussian blue, added at intervals. Sulphuret of iron is formed, and a colourless neutral liquid containing a considerable quantity of sulphocyanic acid combined with potash. This liquid is then to be rendered decidedly acid by sulphuric acid, and the mixture kept at the boiling point for some time. When cold, a little peroxid of manganese is to be added, which will give to the solution a fine crimson colour. This crimson liquid is to be filtered, and a solution composed of two parts of the persulphate of copper and three of the protosulphate of iron is to be added, till the crimson colour disappears. A copious white precipitate, composed of sulphocyanic acid and protoxyd of copper, takes place. The copper may be separated by boiling with a solution of potash, and the sulphocyanate of potash thus formed afterwards decomposed by sulphuric acid; the sulphocyanic acid may be then obtained by distillation in a retort. If any sulphuric acid adheres to it, this is to be separated by a little carbonate of barytes.

Sulphocyanic acid thus formed is a transparent colourless liquid, having an odour as strong, and somewhat resembling acetic acid. Its specific gravity when most concentrated was 1.022. According to Mr. Porrett's analysis, it is composed of

Sulphur	-	-	-	65.2
Hydrocyanic acid	-	-	-	34.8
				100.0

Dr. Thomson seems inclined to consider this acid as composed

posed of cyanogen and sulphur, but it is probable that Mr. Porrett's view of its composition will be hereafter found correct.

The *sulphocyanates* of potash, soda, ammonia, barytes, strontian, lime, and magnesia, are all deliquescent salts soluble in alcohol. The sulphocyanate of soda, lime, barytes, and strontian, are capable of crystallizing, the others are not. The sulphocyanate of alumina is not deliquescent, and readily crystallizes. The sulphocyanate of the protoxyd of iron is colourless, and very soluble. The sulphocyanate of the peroxyd of this metal is of a beautiful crimson colour, deliquescent, and does not crystallize, and this is one of the most striking characteristics of this acid. The sulphocyanate of the peroxyd of copper is a white powder insoluble in water and most acids. The other salts are not remarkable, and consequently possess little interest. The following is a short account of some of the salts formed by this acid.

Ferrocyanic Acid; the Ferruretted Chyazic Acid of Mr. Porrett its Discoverer.—This is the acid which combines with different bases, and forms what were formerly denominated *triple prussiates*, iron being supposed to form part of their base, whereas Mr. Porrett has demonstrated that this metal forms a constituent of the acid itself. This acid may be obtained by the following simple process:—Dissolve in cold water any quantity of the *triple prussiate of barytes*, and for every ten grains of the salt add about 2.5 grains of real sulphuric acid, agitate the mixture and let it aside some time. The barytes will be precipitated in union with the sulphuric acid, and leave the ferrocyanic acid in solution in the water. When obtained, it has a pale lemon colour, and is destitute of smell. It is decomposed by a gentle heat and exposure to a strong light, hydrocyanic acid being formed, and the white triple prussiate of iron deposited. When combined with the different bases, it forms at once the salts formerly termed triple prussiates. It displaces acetic acid from all its combinations without heat, and displaces all other acids when it forms insoluble compounds with the bases to which they were united. Mr. Porrett, from his analysis, concludes that this acid is composed of

Hydrocyanic acid	-	-	63.79
Black oxyd of iron	-	-	36.21
			<hr/>
			100.00

Dr. Thomson, however, from analogy, is disposed to consider it as a compound of cyanogen and iron, but it is probable that Mr. Porrett's views are correct. Most of the *ferrocyanates* have been already described under the different bases, by the old name of the *triple prussiates*. For the most important of these, or the *triple prussiate of iron*, see IRON and PRUSSIAN BLUE.

CYATHODES, in Botany, *κυαθηδες*, cup-like, alluding to the shape of the nectary.—Labill. Nov. Holl. v. 1. 57. Brown Prodr. Nov. Holl. v. 1. 539.—Class and order, *Pentandria Monogynia*. Nat. Ord. *Epacrideae*, Br.

Ess. Ch. Calyx five-cleft, with numerous scales at the base. Corolla funnel-shaped; tube scarcely longer than the calyx, naked and smooth within; limb spreading. Filaments within the tube. Drupa pulpy. Nut with five or ten cells.

Stem shrubby, erect, branched, sometimes almost arborescent. Leaves striated at the back. Flowers axillary, erect, or slightly drooping, small. Nectary a five-toothed cup-shaped disk, beneath the germen.

Mr. Brown differs from Labillardiere in his ideas of the species which properly belong to this genus. He defines

six New Holland species. 1. *C. glauca*, Labill. t. 81; 2. *C. straminea*; 3. *C. dealbata*. All these have some degree of hairiness on the corolla. 4. *C. parvifolia*; 5. *C. oxycedrus*, (Styphelia oxycedrus, Labill. t. 69.); and 6. *C. abietina*, (Styphelia abietina, Labill. t. 68.) These have a smooth corolla. *Ardisia acerifolia*, Gærtn. t. 94, belongs to this second section, and Mr. Brown has seen three South-sea species in the present Joseph Banks's herbarium.

The genus *fer* stands between MELICHRUS and LISANTHE; see those articles.

CYATHUS, *κυαθος*, a cup, Perf. Syn. Fung. 236, a genus of rather small Fungi, to which some botanists have given a still more expressive name, *Nidularia*, (see Sowerb. Fung. t. 29.) The whole plant consists of a leathery cup, containing several lenticular bodies, supposed to contain the seeds, and all together resembling a bird's nest with eggs. Perfoon has seven species.

CYCLOPIA, from *κυκλος*, a circle, and *πους*, a foot, because of the circular form round the stalk of the legume—Venten. Dec. Gen. Nov. 8. Brown in Ait. Hort. Kew. v. 3. 5. (Ibбетtonia; Sims in Curt. Mag. 1259.)—Class and order, *Decandria Monogynia*. Nat. Ord. *Papilionaceae*, Linn. *Leguminosae*, Jul.

Ess. Ch. Calyx five-cleft, unequal; intruded at the base. Corolla papilionaceous; standard furrowed lengthwise; wings with a transverse plait. Stamens deciduous. Stigma bearded at one side. Legume compressed, with many seeds.

1. *C. genifloides*. Narrow-leaved Cyclopia. Ait. n. 1. (Sophora genifloides; Linn. Sp. Pl. 534. Podalyria genifloides; Willd. Sp. Pl. v. 2. 502. Ibбетtonia genifloides; Curt. Mag. t. 1259. Gompholobium maculatum; Andr. Repof. t. 427.)—Leaflets awl-shaped, pointless as well as the calyx. Bractees oblong-ovate, shorter than the flower-stalks. Young branches smooth.—Native of the Cape of Good Hope. A bushy shrub, densely clothed with ternate, sessile, narrow, smooth leaves. The flowers are axillary, large, yellow, with crimson streaks at the base of the standard.

Of the remaining species we have no account.

CYNODON, from *κυνος*, a dog, and *δων*, a tooth, a genus founded by some authors on the *Panicum Dactylon* of Linnæus, a grass known in most of the temperate or warm parts of the globe, to which Mr. Brown adds two tropical New Holland species. See his Prodr. v. 1. 187. This genus is closely related to the *Chloris* of Swartz. See PANICUM, at the end of sect. 1. of that article.

CYNTHEANA, in Geography, a town of Kentucky, in Harrison county, containing 369 inhabitants, of whom 116 are slaves.

CYRTOSTYLIS, in Botany, from *κυρτος*, curved, or convex, and *στυλις*, the style, or column.—Brown Prodr. Nov. Holl. v. 1. 322.—Class and order, *Gynandria Monandria*. Nat. Ord. *Orchideae*.

Ess. Ch. Calyx ringent, pointless. Petals spreading, nearly equal to the lower calyx-leaves. Lip difformal, direct, flat, obtuse, undivided, with two callosities at the base. Anther a terminal permanent lid; the cells close together. Masses of pollen two in each cell, powdery, compressed.

1. *C. reniformis*.—Gathered by Mr. Brown, at Port Jackson, New South Wales. Habit like ACIANTHUS, (see that article,) to which this plant is perhaps too near akin. Leaf kidney-shaped, many-ribbed. Flowers generally turned, or, in one sense, reversed. MALAXIS *lilifolia* (see that article, n. 11) is thought by Mr. Brown to approach this plant in structure of flowers, though different in habit. We have already observed how imperfectly that species, with our *Cordifolia* and *Loeflii*, answer to *Malaxis*.

CY Stantonhe,

CY Stanton, from *κύστις*, a bladder, and *άνθη*, a flower, expressing the appearance of the corolla.—Brown Prodr. Nov. Holl. v. 1. 555.—Class and order, *Pentandria Monogynia*. Nat. Ord. *Eparrideae*, Br.

Eff. Ch. Calyx leafy. Corolla closed, like a lid, splitting transversely; the torn base permanent. Stamens inserted into the receptacle, permanent. Nectariferous scales none. Capsule with many seeds; receptacles pendulous from the top of the central column.

1. *C. sprengeliana*.—Native of Van Diemen's island. A shrub, resembling *Sprengelia*, *Ponceletia*, and *Cosmelia*, except the branches being marked with annular scars after the fall of the leaves. A short-leaved variety grows on the mountain tops, but on their shady sides the plant bears more elongated, spreading, recurved leaves.

CYSTITIS. Inflammation of the bladder is rarely a primary disease, but generally comes on as a consequence of some other affection in the neighbouring parts; or of lithotomy, accidental injuries, &c. The symptoms attending it

are, tension and pain over the pubes, with a frequent desire to make water, difficulty in voiding it, or a total retention, with tenesmus and fever.

The treatment recommended for NEPHRITIS is here also applicable. In particular, venesection, leeches to the hypogastric region, the warm bath, aperient medicines, and emollient clysters, must be employed. When the bladder and peritonium inflame after wounds, or the surgical operation of lithotomy, blisters are often of great service; but bleeding should be first practised. In chronic inflammation and thickening of the bladder, the symptoms and pain may be allayed with anodyne emollient clysters, which are far better than injections into that organ itself. Opium, cicuta, hyocyamus, the uva ursi, &c. with a perpetual blister, may also be tried.

CYSTOTOMY, CYSTOTOMIA, from *κύστις*, the bladder, and *τομή*, to cut, the operation of cutting into the bladder. See LITHOTOMY.

D.

VOL. XI.

DAGESTAN, 1. 2, after Asia, insert—almost entirely mountainous, as its name implies.

DAGOTI. See GAUTHIER.

DALIBARDA, in *Botany*, a genus originally dedicated by Kalm and Linnæus to M. Dalibard, author of the *Flore Parisiensis Prodrômus*, classed in the Linnæan method.—Linn. Gen. ed. 5. 217. Sp. Pl. ed. 1. 491.—It was afterwards reduced to *Rubus*, but is since restored by Michaux and others. (See the two species under *RUBUS*, n. 54 and 55.) The specific names of Michaux are inadmissible, for several reasons.

DALTON, col. 2, l. 15, after government, *dele* to houses in l. 18, and insert—in 1811, the parish of Dalton in Furnels contained four townships; *viz.* Dalton having 156 houses, and 643 inhabitants; Hawcoat having 107 houses, and 583 inhabitants; Irelech with 75 houses, and 445 inhabitants; and Yarle side with 68 houses, and 403 inhabitants.

DALTON, in America, l. 3, r. 779; l. 7, for Grafton r. Coos; l. 8, for 62 r. 235.

DALTONIA, in *Botany*, so named in just commemoration of the Rev. James Dalton, F.L.S., an eminent British botanist.—Hook. and Tayl. Musc. Brit. 80. t. 3.—However desirous we may be to admit this genus, it affords a fresh proof in support of the opinion we have always maintained, that the inner fringes of Mosses give, in general, no found generic characters. Nothing can be less exclusively allied than the two supposed species, either in habit or character. They are, *Neckera splanchnoides*, Engl. Bot. t. 2564; and *N. heteromalla*, Hedw. Crypt. v. 3. t. 15. Engl. Bot. t. 1180. The teeth of their inner fringes, it seems, want the slight connecting base, more or less visible

in several species of *NECKERA* (see that article), and are attached, scarce visibly, to the teeth of the outer fringe.

DAMASONIUM, Schreb. Gen. 242. Willd. Sp. Pl. v. 2. 276. Ait. Hort. Kew. v. 2. 331. Brown Prodr. Nov. Holl. v. 1. 344. See STRATIOTES, n. 4.

DAMGAN. See SUMNUM.

DAMPIERA, in *Botany*, dedicated by Mr. Brown, to the memory of William Dampier, the famous navigator, who first brought one of the species, *D. incana*, Br. n. 7, from the west coast of New Holland, along with several other specimens preserved at Oxford, the earliest botanical tribute from that remote country.—Br. Prodr. Nov. Holl. v. 1. 587.—Class and order, *Pentandria Monogynia*. Nat. Ord. *Goodeniæ*, Br.

Eff. Ch. Corolla two-lipped; tube split at one side; segments of the upper lip auricled at their inner margin. Anthers closely combined. Cover of the stigma naked at the edge. Nut inferior, crustaceous, with a solitary kernel. Dry, downy, perennial herbs, or shrubs, with undivided, alternate, often toothed, coriaceous leaves. Flowers blue or purple. Calyx small, or none. Stamens permanent, sheathing the style.

Thirteen species, from various parts of New Holland, are described, among which is *D. stricta*, *Goodenia stricta*; Sm. Tr. of L. Soc. v. 2. 349. Willd. Sp. Pl. v. 1. 955.

DANA. Add—containing 625 persons.

DANBURY, l. 3, r. 345; l. 8, r. 3606.

DANBY, l. 2, r. 1730.

DANTHONIA, in *Botany*, so named by M. De Candolle, after M. Danthon, a French botanist, is a genus separated by that eminent writer, in his *Flore Française*, v. 3. 32, from *Avena*, on account of the three awns to the outer valve of the corolla, and, as far as we can perceive, for no other reason. He is however followed by Mr. Brown,

Prodr. Nov. Holl. v. 1. 176, who defines eight New Holland species, and mentions having gathered ten or more in Southern Africa; but with a hint that this genus is too near to *Avena*, which it almost entirely resembles. The *aven* being acknowledged very treacherous in grasses, we would presume to offer another hint, that ANISOPOGON (we wish to say nothing of DIPLOPOGON and AMPHIPOGON, see those articles.) may possibly require revision.

DANVERS, l. ult. r. 3127.

DANVILLE, l. 6, r. 432 and 166; l. 9, r. 2240.

DAOURIA. See NERTSKINSKOI.

DARABGERD. Add—Although a great part be in ruins, it is said to contain between 15,000 and 20,000 inhabitants. It is beautifully situated on an extensive plain, and surrounded with groves of orange and almond trees, the juice of which is exported to every part of Persia. Its tobacco is highly esteemed for its mildness.

DARBY. Add—The former containing 966, and the latter 1085 inhabitants.

DARIEN. Add—It contains 107 inhabitants, of whom 10 are slaves.

DARK-RAYS, l. 17, r. see HEAT and RAYS of Heat.

DARLINGTON, l. 6 from bottom, after Darlington, infert—ward, consisting of three divisions, contained 7184 houses, and 39,001 persons; 18,725 being males, and 20,276 females; and the township of Darlington contained 818 houses, and 5059 persons; 2351 being males, and 2708 females.

DARLINGTON, in Carolina. Add—It contained, in 1810, 9047 inhabitants, of whom 2731 are slaves.

DARRYFIELD. Add—See DEERFIELD.

DARTAN, in *Rural Economy*, a kind of scabs or ulcers to which lambs are subject, and which extending to the mouth often prove fatal. The remedy proposed is washing the sores with vinegar, and applying a salve made with equal parts of tar and hog's-lard.

DARTFORD, col. 1, l. ult. r. 1811; col. 2, l. 1, r. 526 and 3177.

DARTMOUTH, l. 31, after houses, infert—in the parishes of St. Petrox, St. Saviour, and Townhall, which form the borough of Clifton Dartmouth Hardness, was 364 houses, and that of inhabitants 3595.

DARTMOUTH, in America, l. 9, for 2660 r. 3219.

DARWINIA, in *Botany*, in memory of the late ERASMUS DARWIN, M.D. the elegant poet, and ingenious botanical physiologist; see that article.—Rudge Tr. of Linn. Soc. v. 11. 299.—Class and order, *Decandria Monogynia*. Nat. Ord. . . .

Eff. Ch. Calyx none. Corolla tubular, funnel-shaped, tumid, with five marginal imbricated segments. Stamens concealed, inserted in two rows into the throat. Anthers kidney-shaped. Germen somewhat oblique. Style prominent. Stigma simple.

1. *D. fascicularis*. Ibid. t. 22.—Found in New South Wales, by Sir Joseph Banks and Dr. Solander. A branched shrub, with crowded needle-like leaves, and terminal dense tufts, of elegant, small, red flowers.

DASYPOGON, from *dasy*, thick and bristly, and *πωγων*, a beard.—Brown Prodr. Nov. Holl. v. 1. 263.—Class and order, *Hexandria Monogynia*. Nat. Ord. *Juncæe*? Br.

Eff. Ch. Calyx inferior, tubular, three-cleft. Petals three, with long claws, connected with the filaments. Anthers incumbent. Stigma simple. Capsule of one cell, not bursting, invelted with the hardened calyx.

1. *D. bromeliifolius*. Br. n. 1. Terr. Austr. 76. t. 8.—Found on the shores of King George's sound, New Holland. Herb one and a half or two feet high, somewhat shrubby,

with rigid, simple, sharply and finely toothed leaves. Flowers in a dense, globular, brittle head. The figure seems to exhibit three seeds.

DATOLITE. See MINERALOGY, *Addenda*.

DAVENTRY, l. 2, r. Fawley; l. 4 and 5, infert—51 Geo. III., 534 houses, and 2758 inhabitants.

DAVID'S, ST. col. 2, l. 3, infert after act—51 Geo. III. In 1811, the number of houses for the parish, containing four hamlets, was 437, and that of inhabitants 1816.

DAVIDSON, l. 2, infert—West Tennessee; l. 6, r. 15,608, and 6305.

DAUM, or DAM, a copper coin in India, equal in value to the fourth part of a rupee.

DAUPHIN, in America, l. 6, for nine r. fifteen; l. 8, for 22,270 r. 31,883, of whom, in 1810, 26 were slaves.

DAWLISH. Add—By the returns in 1811, the parish of Dawlish contained 328 houses, and 1882 persons.

DAWSONIA, in *Botany*, a new and most curious genus of Mosses, dedicated, by Mr. Brown, to our valued friend Mr. Dawson Turner, an eminent English botanist, particularly distinguished by his cryptogamic writings.—Br. Tr. of Linn. Soc. v. 10. 316.—Class and order, *Cryptogamia Mufci*. Nat. Ord. *Mufci*.

Eff. Ch. Fringe a tuft of very numerous, straight, equal hairs, originating from the central column, as well as from the mouth of the capsule. Outer veil of entangled hairs: inner rough at the summit. Capsule flat at one side.

1. *D. polytrichoides*. Br. t. 23. f. 1.—Found by Mr. Brown, on the shady banks of rivers, at the foot of the mountains, near Port Jackson, New South Wales. This moss exactly resembles some of our larger species of *Polytrichum*, (see that article,) while the figure of the capsule approaches *Buxbaumia*. The fringe is totally unlike every thing previously known. The leaves are linear, flat, fringed with sharp teeth.

DAYTON. Add—It contains 1746 persons.

DEAL, col. 3, l. 14, r. 7351, and 1340.

DEAN, MICHEL. In 1811 the parish contained 121 houses, and 535 persons; viz. 270 males, and 265 females: 31 families being employed in agriculture, and 77 in trade, &c.—

DEBENHAM, l. ult. r. 167 and 1224.

DECADIA, in *Botany*, a tree of Amboina and Cochinchina, so named by Loureiro on account of its ten petals.—Loureir. Cochinch. 315. (*Arbor aluminosa*; Rumph. Amb. v. 3. 160. t. 100. Loureiro moreover cites Bohu; Burm. Zeyl. 26, which is also *Laurus ferrata*, floribus spicatis, ex foliorum alis proventibus; ibid. 139. t. 62; Eugenioides; Linn. Zeyl. 192; but this does not agree with the plant of Rumphius.)—Class and order, *Islandria Monogynia*, according to Loureiro, but by his description it belongs to *Polyandria*. Nat. Ord. *Guttiferis affine*. It seems nearly allied to *Elaeocarpus*.

Gen. Ch. Cal. Perianth of three permanent, roundish, hairy, keeled, spreading, unequal leaves. Cor. Petals ten, nearly ovate, somewhat serrated, erect, longer than the calyx; the outer ones largest. Stam. Filaments about 30, almost as long as the petals, into whose bases they are inserted; anthers two-lobed, roundish, permanent. Pist. Germen roundish, superior; style thread-shaped, the length of the filaments; stigma rather thick. Peric. Drupa ovate, rugged, small. Seed an ovate nut, of three cells.

Eff. Ch. Calyx of three leaves, inferior. Petals ten. Drupa with a nut of three cells.

1. *D. aluminosa*, called in Cochinchina *Cây Deung se*, is the only species. This is a middling-sized tree, with a smooth bark and spreading branches. Leaves alternate, stalked, lanceolate, serrated, smooth, of a bright green. Flowers

Flowers in small, nearly simple, clusters, about the ends of the branches, white, minute. Rumphius relates that the bark and leaves, which may be preserved dry for the purpose, are of great use, instead of alum, in dyeing, to improve and fix the red colours afforded by several Indian woods and roots.

DECAGON. Add—See DODECAGON.

DECANDRIA, in *Botany*, from *deka*, ten, and *axis*, a man, the tenth class of the sexual or artificial system of Linnæus, containing such plants as have ten separate or distinct stamens, in the same flower with the pistil. Hence it admits several papilionaceous plants so circumstanced, notwithstanding their natural affinity to others which belong to the seventeenth class, *Diadelphia*, the latter containing only such as have some sort of union or combination in their filaments, and those filaments are moreover of a peculiarly flat membranaceous structure, altogether different from those of proper decandrous flowers. (See *DIADELPHIA*.) The tenth class is divided into five orders, and comprises various natural tribes or families, many of which have allies in other parts of the system, and several of the genera have species whose parts of fructification are irregular in number.

DECASPORA, from *deka*, ten, and *σπορα*, seed.—Brown Prodr. Nov. Holl. v. 1. 548.—Class and order, *Pentandria Monogynia*. Nat. Ord. *Eparideæ*. Br.

Eff. Ch. Calyx with two scales at the base. Corolla bell-shaped; limb loosely bearded. Stamens prominent. Berry with ten seeds.

A genus of elegant *shrubs*, found on the fourth coast of New Holland, with scattered stalked *leaves*, and terminal drooping *spikes* of red *flowers*. *Berries* violet.

1. *D. difflaba*, (*Cyathodes difflaba*; Labill. Nov. Holl. t. 82.), and 2. *D. thymifolia*, are all the species mentioned.

DEDDINGTON. In 1811, the parish contained 252 houses, and 1296 persons; 635 being males, and 661 females.

DEDHAM. In 1811, the parish contained 264 houses, and 1432 persons; 697 being males, and 735 females.

DEEPING-MARKET. In 1811, the parish contained 166 houses, and 899 persons; 426 being males, and 473 females.

DEER, in America, l. 2, r. 674. Add—Also, a township of Westmoreland county, in Pennsylvania, having 2380 inhabitants.

DEER Creek, a town of Ohio, in the county of Pickaway, having 853 inhabitants.

DEER *Isle*, col. 2, l. 1, r. 1057.

DEERFIELD, l. 10, r. 1570; l. 16, r. 1851. Add—Also, a town of Ohio, in Portage county, having 394 inhabitants.—Also, a town of Ohio, in Ross county, having 629 persons.—Also, a town of Ohio, in Warren county, having 1181 persons.

DEERING, l. 3, r. 1363.

DEERINGIA, in *Botany*, in memory of Charles Deering, M. D., author of the *Flora Nottingbamenfis*, a botanist commended by Dillenius.—Brown Prodr. Nov. Holl. v. 1. 413.—Class and order, *Pentandria Monogynia*. Nat. Ord. *Holeraceæ*, Linn. *Amaranthi*, Juff.

Eff. Ch. Calyx in five deep segments. *Cor.* none. Stamens united by an entire membrane. Anthers of two cells. Style deeply three-cleft. Berry superior, with many seeds.

1. *D. celosifoides*. Br. n. i. (*Celofia baccata*; Retz. Obs. fasc. 5. 23. Willd. Sp. Pl. v. 1. 1202.)—Native of New Holland and the East Indies. A smooth weak *shrub*, with alternate *leaves*. *Spikes* axillary and terminal. *Bractææ* three to each flower. *Fruit* pulpy, tumid.

DELAGOA, col. 2, l. 8, r. Kaffers.

DELAWARE. Add—See UNITED STATES.

DELAWARE *County*, l. 4, r. 14734.—In New York, l. 2, r. 20,303 inhabitants, 55 in 1810 being slaves.

DELAWARE *Township*, l. 2, r. 472. Add—Also, a township in Mercer county, in Pennsylvania, having 218 inhabitants.—Also, a county of Ohio, containing seven townships, and 2000 inhabitants.—Also, a township of the same county, having 200 inhabitants.

DELI, a river of Persia, in Schirvan, which has its source in the Lefgean hills, and disembogues into the Caspian sea, about 20 miles S. of the Samur.

DELMER, a township of Tioga county, in Pennsylvania, having 884 inhabitants.

DELOS, col. 6, l. 21, r. ruin.

DEMBEA, col. 2, l. 16, r. Gorgora.

DE MURIS, JOHN, for MURIS, JOHN DE.

DENBIGH, col. 2, l. 45 and 46, r. 617 and 2714.

DENBIGHSHIRE, col. 2, l. 22, r. and 13,078 houses, inhabited by 64,240 persons; 31,129 being males, and 33,111 females: of whom 3447 families are employed in trade and manufactures, and 7973 in agriculture.

DENMARK, a town of America, in the district of Maine, and county of Oxford, containing 436 inhabitants.

DENNIS, l. 4, r. 1739.

DEPTFORD, col. 3, l. 24, r. 1811, 19,833; l. 25, r. 3463.

DEPTFORD, in America, l. 2, add—containing 2978 inhabitants.

DERAGUZ, a district of Khorassan, which, as well as that of Cotchung, is situated between Meshed and Merv. Cotchung is governed by an independent chieftain, who can bring into the field 12,000 men, and who resides in the town of Cotchung, 23 furlongs from Meshed. The district of Deraguz touches on the W. the dependencies of Kelat; on the N. the country of the Turkomans of Tak, sometimes called Attok; and on the E. a branch of the Ashdur Koh. It is the property of Lutf Ali Khan, whose subjects are reckoned the bravest and most polite of the natives of Khorassan; and the soil which they inhabit is so fruitful, that dry grain yields a hundred, and rice four hundred fold.

DERBANE, a beautiful little river which rises in the state of Louisiana, and has its principal source in N. lat. 32° 50'. W. long. 93° 10', and pursues nearly an eastern course of 60 miles, entering Ouachitta from the west. It is navigable about one-half of its course for large boats. Its water, which is very pure, is supplied from numerous springs by many creeks, that are bordered by fine land.

DERBY, col. 6, l. 5 from the bottom, r. 2644, and 13,043.

DERBY, in America, in the census of 1810, probably called Derley by mistake. It has 114 inhabitants.—*L. ult.* r. 2051. Add—Also, a township of Ohio, in Madison county, having 257 inhabitants.—Also, a township of Ohio, in the county of Pickaway, having 475 inhabitants.

DERBY. See DARBY.

DERBYSHIRE, l. 12 and 13, r. 35,658, and 185,487.

DEREHAM, EAST, l. 4 and 5, r. 551 houses, and 2888 inhabitants.

DEREHAM, *W. gl.*, a parish in the hundred of Clackclofe, having 58 houses, and 428 inhabitants.

DERLEY. See DERBY.

DERRY, in America, l. 4, r. 2431; l. 5, 1341; l. 7, 2283; l. 8, 2380.

DESERT,

DESERT ISLAND, *Mout.* Add—Mount Defert contains 1047 inhabitants. See EDEN.

DESMANTHUS, in *Botany*, so called by the late professor Willdenow, who first separated the genus we are about to describe from MIMOSA; see that article, and ACACIA of the present volume. This name seems to be composed of *desma*, a bandage, and *anthos*, a flower; alluding perhaps to the strap-like filaments of the neutral flowers, common to every species.—Willd. Sp. Pl. v. 4. 1044. Ait. Hort. Kew. v. 5. 457.—Class and order, *Polygamia Monœcia*; or rather perhaps *Decandria Monogynia*. Nat. Ord. *Lomentaceæ*, Linn. *Leguminosæ*, Juss.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, tubular, with five teeth. *Cor.* of one petal, funnel-shaped, regular, more or less deeply five-cleft, sometimes of five petals. *Stam.* Filaments ten, rarely but five, capillary, equal, very long; anthers incumbent, oblong. *Pist.* Germen superior, ovate-oblong; style thread-shaped, the length of the stamens; stigma dilated, abrupt. *Peric.* Legume oblong, compressed, of two flat valves, and one cell, separated into several by transverse opposite striations in the valves. *Seeds* numerous, oblong, stalked. Several flowers, below the perfect ones, are neuter, having dilated lanceolate *stamens*, without *anthers*, no efficient *pistil*, and sometimes no *corolla*.

Efl. Ch. Calyx five-toothed. Corolla deeply five-cleft. Stamens definite. Pistil one. Legume of two valves. Some flowers neuter, with dilated, flat, abortive stamens.

Obs. Although the definition of this genus is not so striking as could be wished, it seems to us tolerably natural, being distinguished from *Acacia* by the definite number of its *stamens*, always twice as many as the divisions of the *corolla*, and by the presence of several neuter flowers, in the lower part of each tuft, or spike, known by their dilated, strap-shaped *filaments*, destitute of *anthers*, and more or less different in colour from the perfect flowers. We are nevertheless aware, that generic characters founded on such anomalies or imperfections, are always the least solid; these neutral flowers, apparently created for no end, being doubtless liable to become, according to circumstances, perfect in one organ of impregnation or the other. The habit of the genus before us is pretty uniform, having doubly pinnate *leaves*, with numerous, oblong, obtuse, crowded *leaflets*; axillary, solitary, stalked, oblong *spikes*, of crowded tassel-like *flowers*; and flat, generally broad, elliptic-oblong, smooth *legumes*, whose transverse striations make them resemble the jointed fruit of what now remains as *Mimosa*, but their valves do not split at those striations. As only ten species of *Desmanthus* are described, we shall give the whole. They are all of tropical origin; partly herbaceous, and sometimes annual, with sensitive leaves; partly shrubby.

SECT. I. *Without thorns.*

1. *D. lacustris*. Lake Desmanthus. Willd. n. 1. ("Mimosa lacustris; Humb. and Bonpl. Pl. æquinoct. t. 16.")—Thorns none. First division of the leaves of three pair; second of many pair. Spikes ovate. Stalks bracteated. Stem round, creeping.—Native of marshes in South America. *Root* perennial. *Stem* herbaceous. First divisions of the *leaves* an inch and a half long. *Leaflets* numerous, linear, obtuse at each end. *Spikes* barren in their lower part, each supported by a stalk longer than the foliage, furnished with two or three ovate-lanceolate deciduous *bractææ*. *Legume* oblong, pointed, with from four to six *seeds*. Very nearly related to the following. *Willdenow.*

2. *D. natans*. Floating Desmanthus; or Aquatic Sensitive. Willd. n. 2. Ait. n. 1. Andr. Reppf. t. 629. (*Mimosa natans*; Vahl Symb. v. 3. 102. Roxb. Coro-

mand. v. 2. 11. t. 119. *M. orientalis* non spinosa, rarioribus ramis, floribus spicatis; Pluk. Almag. 252. Phyt. t. 307. f. 4. Neptunia oleracea; Lourcir. Cochinch. 654. "Niti-todda-vaddi; Rheede Hort. Malab. v. 9. 35. t. 20.")—Thorns none. First division of the leaves of three pair; second of many smooth-edged leaflets. Spikes oblong, interrupted. Stalks mostly without bractææ. Stem round, floating, with tufted roots from the lower joints.—Native of fresh-water lakes, pools, and flow streams, in the East Indies, Cochinchina, &c. Loureiro says it is cultivated in the last-mentioned country, as an ingredient in salads, being tender and agreeably sweetish, though not very salutary to the stomach. The plants are tied to stakes, to prevent their being carried away with the stream. The *root* is annual, entirely floating, as well as the round, smooth, branched, leafy *stems*, whose lower joints send forth tufts of compound radicles, their interlicies being often swollen, or spongy, at one side, as if to render the herb more buoyant. *Leaves* alternate, stalked, doubly pinnate, smooth, bright green; secondary divisions from one to two inches long, each of twelve or thirteen pair of elliptical, entire *leaflets*, which fold together slowly when touched; their edges smooth. *Stipulas* membranous, half-ovate, or heart-shaped, obtuse. Common *flower-stalks* generally naked; sometimes furnished with a *bractæa* or two. *Spike* oblong, more or less crowded. *Corolla* greenish. Abortive *filaments* of the lower *flowers* large, lanceolate, yellow, very conspicuous. *Legumes* five or six from each spike, an inch in length, purplish-brown, smooth, elliptic-oblong, pointed. *Seeds* oval, from four to eight, forming a central row, inserted by a slender thread alternately to each margin of the legume. Kœnig sent specimens of the following to Linnæus, but not, as far as we can discover, of the present species; while the information he communicated regarded both species, which possibly he might originally confound, thinking the *triquetras* a variety caused by growing out of the water. However this might be, his *natans* is certainly the present plant, to which alone that name can apply.

3. *D. triquetras*. Triangular-stalked Desmanthus. Willd. n. 3. (*Mimosa triquetra*; Vahl Symb. v. 3. 102. *M. natans*; Linn. Suppl. 439.)—Thorns none. First division of the leaves of two or three pair; second of many rough-edged leaflets. Stipulas pointed. Spikes globose. Stalks bracteated. Stems prostrate; triangular in their upper part.—Native of the dry borders of fields at Tranquebar. *Kœnig* in the Linnæan herbarium. *Root* woody, perennial. *Stems* several, from a span to a foot or more in length, herbaceous, prostrate, rather zigzag, leafy, smooth, somewhat glaucous, scarcely branched; nearly round at the bottom, but triangular above. *Leaves* about half the size of the former, on much shorter stalks, and essentially distinguished, if we mistake not, by the roughness of their edges, caused by small close-pressed bristles. The *stipulas* are obliquely ovate, ribbed, with a tapering bristly point, which we do not find in *D. natans*. *Flower-stalks* not much longer than the leaves, each bearing one or more broad clasping *bractææ*. *Spikes* short and roundish. *Legumes* elliptic-oblong, obtuse, with four, five, or six *seeds*.

4. *D. plenus*. Semi-double Yellow Desmanthus. Willd. n. 4. Ait. n. 2. (*Mimosa plena*; Linn. Sp. Pl. 1507. *M. foliis duplicato-pinnatis, spicarum floribus inferioribus plenis, caule inermi procumbente*; Linn. Hort. Upfl. 145. n. 3. *M. non spinosa, palustris et herbacea, procumbens, flore luteo pleno*; Rel. Hoult. 10. t. 23. *M. n. 2*; Mill. Ic. v. 2. 122. t. 182. f. 2.)—Thorns none. First division of the leaves of three or four pair; second of numerous oblong smooth-edged leaflets. Spikes ovate. Stalks bracteated.

Stem

DESMANTHUS.

Stem prostrate, compressed. Stamens five.—Gathered in stagnant waters at Vera Cruz by Dr. Houffouin, who sent seeds to Miller. The latter records that the *stems*, though naturally floating, grew more erect when the plant was cultivated on dry ground. The *root* is annual, according to Willdenow, Aiton, and Linnæus, who had this species in the stove at Upsal. *Stems* herbaceous, smooth, a little zigzag, a foot or two in length, floating or decumbent, slightly branched. *Leaves* fenestrate, larger than those of *D. natans*. *Stipulas* acute, obliquely and broadly ovate. *Spikes* as large as Common Clover, yellow, recurved, on *stalks* nearly as long as the leaves, bearing two distant, ovate, sheathing *bractæas*. *Stamens* but five, those of many of the lower *flowers* changed to long lanceolate petal-like leaves, which give the flowers a double appearance, and render them truly so, according to the analogy of flowers in general. Hence the specific name given by Linnæus; but this circumstance is common to the whole genus of *Desmanthus*, as above described. In this and similar cases it seems best to retain the original name, as indicating the first known species, and therefore the history of the genus. The *legume* is drawn by Houffouin elliptic-oblong, slightly curved, with a furrow, or double edge, along the back. *Seeds* numerous, ovate. The *leaves* are fenestrate in this and the three preceding.

5. *D. depressus*. Depressed *Desmanthus*. Willd. n. 5. —“Thorns none. First division of the leaves of two pair; second of eight or ten pair of linear obtuse leaflets. Spikes capitate, of a few decandrous flowers. Legumes linear. Stem prostrate.”—Found by Humboldt and Bonpland, in South America. *Root* woody, perennial. *Stems* several, from a span to a foot long, diffuse, smooth; and branched and stalked at the bottom; obscurely quadrangular above. *Spikes* rounded, without *bractæas*. *Legume* an inch and a half long, pointed, with many *seeds*. Akin to the two following, as to the shape of the *spike* and of the *legume*, though easily distinguishable by the specific characters. *Willdenow*.

6. *D. diffusus*. Prostrate *Desmanthus*. Willd. n. 6. Ait. n. 3. (*Mimosa pernambucana*; Linn. Sp. Pl. 1502. M. n. 6. *inermis* decumbens, foliis duplicato-pinnatis, spicis cernuis, floribus pentandris, inferioribus castris; Linn. Hort. Upf. 145. n. 4. *M. americana pigra*, siliquis longis angustis, allium olentibus; Pluk. Amag. 252. t. 307. f. 3.)—“Thorns none. First division of the leaves of four or five pair; second of twelve pair. Spikes capitate, of a few pentandrous flowers. Legume linear. Stem prostrate.”—Native of South America. *Stem* shrubby. Willdenow, who had examined dried specimens, says this species is extremely similar to the following, but differs in having most commonly five primary divisions in the *leaves*, a prostrate *stem*, and only five *stamens*. We have never seen the present species, which probably has not appeared in the gardens since Miller's time, but we venture to transfer the synonymy of Zanoni to the next, on account of the upright stem of his plant. Hence the Linnæan specific name *pernambucana*, taken from Zanoni, becomes peculiarly unsuitable, and is fortunately changed by Willdenow.

7. *D. virgatus*. Upright Angular *Desmanthus*. Willd. n. 7. Ait. n. 4. (*Mimosa virgata*; Linn. Sp. Pl. 1502. Jacq. Hort. Vind. v. 1. 34. t. 80. *M. spuria* di Pernambuco, detta *Mimosa italica*; Zanoni. It. 151. t. 60. *M. inermis*, foliis duplicato-pinnatis, siliquis linearibus glabris; Linn. Hort. Cliff. 209.)—Thorns none. First division of the leaves of four pair; and second of twelve pair. Spikes capitate, of a few decandrous flowers. Legume linear. Stem erect, angular.—Native of South America, where Jacquin observed it in various places; and not of the East Indies, Burmann's *M. virgata* being probably our *D.*

notans, at least according to the synonyms of Plukenet and Rheede, cited by that author. The late professor Jacquin sent seeds of this present species to Kew, in 1774, where it flowers in the stove in July and August. His plant is precisely that of Linnæus, mentioned in the *Hortus Cliffortianus* as of American origin, but confounded with several other things in his *Fl. Zeylanica*, 216, n. 505. *D. virgatus* has an erect shrubby *stem*, with wand-like *branches*, angular when young, but lets so as they become older. *Stipulas* bristle-shaped, with a round aricle. Common *foolstalks* with a round depressed gland between the first pair of subdivisions. *Leaflets* linear, obtuse, fringed, glaucous beneath. *Flower-stalks* the length of the leaves, erect, with small deciduous *bractæas* near the top. *Heads* slightly drooping while young, pale or whitish. Several of the lowermost *flowers* furnished with ten linear, very narrow, almost thread-shaped, abortive filaments, in the place of stamens. *Antibers* of the upper *flowers* roundish, fall two. *Legumes* about five from each head, almost erect, full two inches long, linear, not one-eighth of an inch broad, acute, thick-edged, smooth. *Seeds* very numerous, elliptic-oblong, obliquely disposed in a central row. Miller's remark, cited by Willdenow, after Linn. Mant. 2. 503, does not belong to this species, and is excluded by Linnæus himself in his MSS. Probably it may relate to *D. plenus*.

8. *D. punctatus*. Spotted-stalked *Desmanthus*. Willd. n. 8. Ait. n. 5. (*Mimosa punctata*; Linn. Sp. Pl. 1502. *M. frutescens* media *inermis*, filiquis compressis falcatis et umbellatis, pedunculo longissimo; Browne Jam. 253. *Aeschynomene mitis prima*; Comm. Hort. v. 1. 61. t. 31.)—Thorns none. First division of the leaves of four or five pair; second of many. Spikes ovate. Flower-stalks bracteated at the base. Legume oblong, obtuse, wavy.—Native of Jamaica, from whence it was introduced very early into the European stoves. Our specimen was sent by Dr. Browne to Linnæus. The *stem* is besprinkled with small callous points. *Branches* angular. *Leaves* a span long, with a gland on the common *foolstalk* between the first pair of wings. *Leaflets* about twenty pair, fenestrate, linear-oblong, smooth, obtuse with a small point. *Flower-stalks* scarcely so long as the leaves, each bearing, near the base, two large ovate, or heart-shaped, *bractæas*. *Spike* drooping, ovate, of numerous, crowded, pale *flowers*, the lower ones with thin lanceolate *petals*, in the place of the ten *stamens* of the more abundant upper ones. *Legumes* about three from each *spike*, stalked, horizontal, compressed, oblong, obtuse at each end, with a small terminal point; their length an inch and a half; breadth one-third of an inch. They betray an inclination to split across, like the true *Mimosa*. *Seeds* about twelve, ovate. This species does indeed, as Willdenow observes, much resemble *D. plenus*; but is nevertheless much too different to be confounded therewith.

SECT. 2. *Thorny*.

9. *D. cinereus*. Ash-coloured *Desmanthus*. Willd. n. 9. Ait. n. 6. (*Mimosa cinerea*; Linn. Sp. Pl. 1505. Roxb. Coromand. v. 2. 39. t. 174. *M. n. 215*; Linn. Fl. Zeyl. 96. *Acacia spinosa*, ex alis spicata, foliis pennas avium referentibus; Burm. Zeyl. 3. t. 2. *A. maderaspatana*, minutissimis foliis, aculeis ferocibus, alternis, frondosa; cortice itidem cinereo; Pluk. Amag. 3. Phyt. t. 121. f. 5.)—Branches becoming solitary spines. First division of the leaves about nine pair; second of many. Spikes solitary, cylindrical, drooping; tapering at the base. Legumes linear, curved.—Native of the East Indies; in forests and low barren lands, according to Dr. Roxburgh, who observes that the wood is remarkably hard, but,

owing

owing to the smallness of the tree, of little use. Miller cultivated this plant at Chelsea in 1739, and it is marked by Mr. Aiton, as flowering in the stove about June and July. A low, irregular, rigid *shrub*, with a grey bark, and zigzag branches, whose short, alternate, lateral shoots spread horizontally, and each finally becomes tipped with a hard sharp thorn. These branches bear very fine and delicate foliage, whose very minute oblong leaflets are smooth above, hairy at the back, and appear to be sensitive; their common stalk also is hairy. Spikes axillary, stalked, an inch or two long, swelling upward, obtuse, dense, and many-flowered. Perfect flowers numerous, yellow, with ten stamens, whose anthers are ovate, of two cells, and tipped with a small round gland. The lower flowers, less numerous, are pale rose-coloured, abortive, having ten linear, obtuse, strap-like leaves instead of stamens. Legume falcate, linear, compressed, but not flat, about three inches long, and one-fourth of an inch broad, smooth, obtuse. Seeds ten to fifteen, oblong, yellow.

10. *D. divergens*. Spreading-branched Desmanthus. Willd. n. 10. ("Erget Dimmo; Bruce's Travels, v. 5. 34, with a plate.")—"Branches becoming solitary spines. First division of the leaves of eight pair; second of many. Spikes in pairs, cylindrical, pendulous. Legume twisted."—Native of Abyssinia? A *shrub*, six feet high, with divaricated furrowed branches, besprinkled with white warts. First divisions of the leaves from six to nine pair. Leaflets numerous, linear, angular at the base, and fringed at the edges. Thorns rigid, straight, awl-shaped, sometimes in pairs. Legume linear, contorted. Willdenow, who made this description from a living specimen, says the gardeners call this species *Mimosa divaricata*. But what is so denominated in Donn's *Hort. Cant.* ed. 5. 240, comes from Carolina, and, as far as we can discover, does not occur in *Hort. Kew.* Bruce's figure above quoted was thought by Willdenow to answer exactly to his own garden shrub, except the want of thorns; but as these occur on the older branches only, they might be overlooked. We have not seen specimens of either Bruce's or Willdenow's plant.

DETROIT. Add—The civil district of Detroit, which is one of the divisions of the territory of Michigan, contains, by the census of 1810, 2227 inhabitants, of whom 17 were slaves.

DEVAUXIA, in *Botany*, so named by Mr. Brown, in honour of M. Devaux, author of a dissertation on the natural family of *Junci*, in the *Journal de Botanique*. M. Labillardiere had previously published this same genus under the appellation of *Centrolepis*, from *κεντρος*, the centre, and *λεπις*, a scale; which, giving an erroneous idea of the structure of the flower, it was found necessary to change.—Brown *Prodr. Nov. Holl.* v. 1. 252. (*Centrolepis*; Labill. *Nov. Holl.* v. 1. 7.)—Class and order, *Monandria Polygynia*. Nat. Ord. *Resiiceae*, Brown.

Gen. Ch. *Cal.* Sheath of two concave, keeled, permanent, alternate valves, clasping each other at the base, containing an indefinite number of flowers. *Cor.* of two oblong, membranous valves, sometimes accompanied by small accessory scales. *Stam.* Filament one, capillary, drooping, rather longer than the largest valve of the corolla; anther simple, oval. *Pistl.* Germens several, from three to twelve, ovate-oblong, superior, inserted into one side of a central oblong receptacle, and all turned one way; styles as many, thread-shaped, either distinct at the bottom or combined, spreading or deflexed at the summit; stigmas linear, downy. *Peric.* Capsules as many as the germens, membranous, oval, of one

valve and one cell, bursting along one side. *Seed* solitary, obovate, pendulous.

Eff. Ch. Sheath of two valves, with several flowers. Corolla of two membranous valves. Anther simple. Germens unilateral. Capsules bursting longitudinally, at one side. *Seed* solitary.

This genus, of which we have already spoken as akin to *ALEPYRUM*, (see that article,) consists of small herbaceous plants, growing in tufts, and resembling the lesser species of *Scirpus*. The roots are fibrous and tufted. *Stem* none. *Leaves* radical, bristle-shaped, half sheathing at the base. *Flower-stalks* radical, thread-shaped, undivided, naked. *Sheath* solitary, terminal, its valves either awned or not. Nine species are described by Mr. Brown, as follows.

SECT. 1. *Receptacle scaly.*

1. *D. pulvinata*. Cushion Devauxia.—Receptacle scaly. Styles six or seven, distinct. Sheath pointlets; lower valve rather hispid; upper smooth. Leaves nearly as tall as the flower-stalks.—Gathered by Mr. Brown, in Van Diemen's island.

2. *D. Paterfoni*. Pateron's Devauxia. (*Centrolepis æmula*; Rudge *Tr. of Linn. Soc.* v. 10. 284. t. 12. f. 2.)—Receptacle scaly. Styles eight or nine, distinct. Sheath pointed, many-flowered; upper valve nearly smooth; lower hispid. Adult flower-stalks hairy, as well as the leaves, which are only one-third as tall.—Gathered by Col. Paterfon and Mr. Brown, near Port Jackson, New South Wales. *Leaves* very narrow, an inch long. *Flower-stalks* above two inches high. *Sheath* tumid, scarcely rising above the flowers.

3. *D. strigosa*. Bristly Devauxia.—Receptacle scaly. Styles from five to seven, distinct. Sheath pointed; both valves hispid. Adult flower-stalks smooth, thrice as long as the finely hispid leaves.—Found by Mr. Brown, on the southern coast of New Holland.

SECT. 2. *Receptacle without scales. Sheaths hispid.*

4. *D. tenuior*. Slender Devauxia.—Receptacle naked. Styles four or five, combined at the base. Sheath almost pointlets, bristly as well as the leaves. Flower-stalk slightly hairy.—Found in the island of Van Diemen, by Mr. Brown.

5. *D. Billardieri*. Labillardiere's Devauxia. (*Centrolepis fascicularis*; Labill. *Nov. Holl.* v. 1. 7. t. 1. C. *cuspidigera*; Rudge *Tr. of Linn. Soc.* v. 10. 283. t. 12. f. 1.)—Receptacle naked. Styles two or three, combined at the base. Sheath bristly; with awns nearly as long as the valves. Leaves rather hairy. Stalks smooth.—Native of Port Jackson, as well as of Van Diemen's island. *Brown, Labillardiere*. The numerous bristle-shaped leaves are about an inch and a half long, erect; those which clasp the base of each flower-stalk, which is half as tall again, are toothed at their inner margin towards the base. *Valves* of the sheath twice as tall as the flowers. *Corolla* toothed, obtuse.

6. *D. exserta*. Prominent-flowered Devauxia.—Receptacle naked. Styles from seven to ten, distinct. Sheath pointlets, bristly, not quite so long as the flowers. Stalks and leaves downy.—Gathered by Mr. Brown, in the tropical part of New Holland.

SECT. 3. *Receptacle without scales. Sheaths smooth.*

7. *D. Banksii*. Bankian Devauxia.—Receptacle naked. Styles from eight to ten. Sheath pointlets, very smooth, many-flowered, membranous at the edges. Stalks three or four times the length of the leaves.—Gathered by Sir Joseph Banks, in the tropical part of New Holland.

8. *D. pusilla*. Little Devauxia.—Receptacle naked. Styles six or seven. Sheath pointlets, very smooth, membranous at the edges, with but few flowers. Stalks and leaves

leaves both smooth, and nearly equal in length.—Observed by Mr. Brown, in the tropical part of New Holland.

9. *D. ariflata*. Awned Devauxia.—Receptacle naked. Styles six or seven, combined at the base. Sheath smooth, with longish awns. Stalks two-edged.—Found by Mr. Brown on the southern coast of New Holland.

Mr. Rudge, very commendably anxious to retain, if possible, Labillardiere's original generic name, has, by taking *viscus* for a *prickle*, as it undoubtedly means a *point*, or *sharp spike*, made *Centrolepis* to express a *prickly scale*, alluding to the hispid *sheaths* of some species. But this is not apposite, the scales, or glumes of the *flower*, to which the original name applied, being, in no sense, pointed, or prickly; nor do we see that this name can be forced into any appropriate meaning, the *scales* being acknowledged on all hands not to be central.

DEVIZES, col. 2, l. *penult.* r. 696, and 3750.

DEVONSHIRE, col. 6, l. 11 and 12, r. 62, 318, and 383, 308.

DEW. To this article we shall subjoin some appropriate remarks, selected from an "Essay on Dew, &c." by the ingenious Dr. Wells, lately (*viz.* 1810) republished in an edition of his works, to which is prefixed a Memoir of his life written by himself. To this author it occurred in 1784, that the formation of dew is attended with the production of cold. The same opinion was announced in 1788 by Mr. Wilson of Glasgow (vol. i. Edinb. Transf.), and also by Mr. Six of Canterbury (Phil. Transf. for 1788, and in a posthumous work printed at Canterbury in 1794.) All these writers at first concurred in regarding the cold which accompanies dew as an effect of the formation of that fluid. Dr. Wells, however, upon mature consideration of the subject, was led to suspect that this opinion was erroneous; and his suspicion was afterwards justified by a variety of observations and experiments. Although Dr. Wells agrees, in general, with Aristotle and other writers, and maintains that dew appears only on calm and serene nights, yet this opinion is not universally true; for he frequently found a small quantity of dew on grass, both on windy nights, if the sky was clear or nearly so, and on cloudy nights, if there was no wind; but he never perceived dew on nights both cloudy and windy. Dew, he says, probably begins, in this country, to appear upon grass, (shaded from the sun, during clear and calm weather, soon after the heat of the atmosphere has declined; and it continues to form, in shaded places, after sun-rise; the interval between sun-rise and its ceasing to form being considerably shorter than that between its first appearance in the afternoon and sun-set. If the weather be favourable, however, more dew forms a little before, and in shaded places a little after sun-rise, than at any other time; whereas Muschenbroeck asserts, that dew does not form after the sun has risen. Our author also maintains, in opposition to the opinion of M. Prieur, that dew, after it has once commenced, continues during the whole night, if the weather remain still and serene. During nights that are equally clear and calm, whether they be longer or shorter, dew often appears in very unequal quantities; the quantity of moisture in the atmosphere serving to increase the production of dew; and, accordingly, in equally clear and calm nights, dew is more abundant soon after rain than during a long continuance of dry weather: it is also more abundant in Europe, and in some parts of Asia and Africa, with southerly and westerly winds, than with those which blow from the north and the east. Another circumstance upon which the quantity of dew depends, is the diminution of the weight of the atmosphere; for though the falling of the mercury in the baro-

meter is commonly attended with wind or clouds, both unfavourable to the production of dew, yet the greatest dew observed by our author occurred while the barometer was sinking. M. De Luc also has observed, that rain may be foretold when dew is uncommonly abundant in relation to the climate and season. We have already observed, that dew is commonly more plentiful in spring and autumn than in summer, a fact which our author also has noticed; it is always very copious on clear and calm nights which are followed by misty or foggy mornings; and on a clear morning which succeeds a cloudy night. Heat of the atmosphere, if other circumstances are favourable, occasions a great formation of dew; and upon the supposition of the same clearness and stillness of the atmosphere, more dew is formed between midnight and sun-rise than between sun-set and midnight; the cold of the atmosphere being greater in the latter than in the former part of the night. Our author's experiments serve to shew, that various differences with regard to situation, mechanical state, and real nature of bodies, have a very considerable influence upon the production of dew. As to situation he observes, that whatever diminishes the view of the sky, as seen from the exposed body, diminishes the quantity of dew that is produced; thence the quantity is greater when the exposure to the sky is more complete. There are other circumstances, regarding situation, which serve to augment or diminish the quantity of dew that is produced, when the substances that are used for indicating it are the same.

It is observed farther, that when other circumstances are similar, a difference in the mechanical state of bodies has an effect with regard to the quantity of dew which they attract; and hence it is, that fine raw silk, fine unwrought cotton, and flax, were found to attract more dew than the wool employed by our author in his experiments; the fibres of wool being thicker than those of the other substances just mentioned. Bright metals also attract dew much less powerfully than other bodies: this fact was observed by Muschenbroeck and Dufay; but they erroneously asserted, that dew never appears on the upper surface of bright metals. There are others, and our author in particular, who have known dew to be formed on gold, silver, copper, tin, platina, iron, steel, zinc, and lead. This inaptitude of metals to attract dew is communicated to bodies of a very different nature, which touch or are near to them. Wool, says our author, laid upon a metal, will acquire much less dew than an equal quantity laid upon grass in the immediate vicinity. It is maintained, that the upper surfaces of metals are moist readily and most copiously dewed on those nights and in those parts of the night, during which other substances are the moist readily and the most copiously dewed. All metals, our author remarks, do not resist the formation of dew with the same force. "I saw," he says, "for example, platina one night distinctly dewed, while gold, silver, copper, and tin, though similarly situated, were entirely dry; and I have also several times seen these four metals free from dew, while iron, steel, zinc, and lead, were covered with it."

Our author proceeds to investigate and ascertain the degree of cold connected with the formation of dew. Mr. Wilson, he thinks, is the first philosopher who ever suspected the existence of such a conjunction; though dew is often spoken of as cold by our popular writers. Herodotus mentions it as possessing this quality; Cicero and Virgil apply to it the epithet of "gelidus;" Milton that of "chill;" and Collins that of "cold." With thermometers adapted to the purpose, he has, in serene and still nights, examined the temperature of dewed grass, and con-

flantly found it to be less than that of the air, any where between one inch and nine feet above the ground, the latter being the greatest height at which he ever marked the heat of the atmosphere in these experiments. At the height of four feet above the ground, and in calm and clear nights, he frequently found the grafs seven, eight, or nine degrees colder than the air at that height; several times it was 10° and 11° , and once 12° , colder than the air. In some few observations, the greater coldness of grafs than that of the air began to appear, in clear and calm weather, in places sheltered from the afternoon sun, and yet open to a considerable portion of the sky, soon after the heat of the atmosphere had declined. A similar coldness continued upon grafs in still and serene mornings, for some time after the rising of the sun, in places shaded from its direct light, but otherwise open to the sky. In cloudy nights, particularly with wind, the grafs was never much colder than the air. Sometimes the temperatures were the same; at other times that of the grafs was higher, even when it had been wetted by preceding rain, and when it must have cooled by evaporation. When the night changed from clear to cloudy, though without change as to calmness, a considerable alteration in the temperature of the grafs always ensued, and this change occurred sometimes very suddenly. On one night, the grafs, after having been 12° colder than the air, became 2° colder, the temperature of the air at both observations being the same. On a second night, the grafs became 9° warmer in an hour and a half. On a third night, in less than forty-five minutes the temperature of the grafs rose 15° , while that of the neighbouring air increased $3\frac{1}{2}^{\circ}$. On a fourth night, the temperature of the grafs at half-past 9 o'clock was 32° ; in twenty minutes afterwards it was found to be 39° , the sky in the mean time having become cloudy. At the end of twenty minutes more, the sky being clear, the temperature of the grafs was again 32° . On the connection of fog or mist with cold, Dr. Wells made several experiments, which we cannot recite. He observes, that he has always found on dewy nights the temperature of the earth half an inch or an inch beneath its surface much warmer than the grafs upon it; and the earth at this depth was also almost constantly warmer on dewy nights than the air. Metals, says our author, furnish proofs of the connection of dew with cold in the substances on which it forms superior to that of the neighbouring atmosphere. Upon the whole, our author's experiments, which we cannot minutely detail, shew, that when bodies which had been equally exposed to the night air were examined at the same time, those which were most dewed were the coldest. In the prosecution of experiments with other substances besides grafs, he found that those of the filamentous downy kind were the most productive of cold. Thus, wool of moderate fineness, very fine raw silk, very fine unspun cotton, fine flax, and swan-down, were not only more steadily cold, upon clear and calm nights, than grafs, but also gave rise to a greater degree of cold than was almost at any time observed upon it even in its best state. Wool produced the least cold, and we have found before, that it attracted less dew than silk, cotton, and flax. Fresh, unbroken straw, and shreds of white paper, were found to be a little more productive of cold than wool. The next class consisted of bodies in the state of powder; these were, clean river sand, glass, chalk, charcoal, lamp-black, and a brown calx of iron. Chalk produced the least, and the three last substances produced the greatest cold. Solid substances, exposing to the sky a surface of at least twenty-five inches square, formed a third class, on which our author made experiments. The substances of this description subjected to

trial were, glass, brick, cork, oak-wood, and wax; all of which were found inferior to the filamentous substances. His principal experiments, however, of this kind were made on snow.

The next subject to which Dr. Wells directs his attention is the theory of dew. According to Aristotle among the ancients, and many philosophical writers among the moderns, dew is a species of rain, formed in the lower atmosphere, in consequence of its moisture being condensed by the cold of the night into minute drops. But opinions of this kind have been found erroneous by the consideration of a fact first noticed by Gersten in 1733; viz. that bodies a little elevated in the air often become moist with dew, while similar bodies, lying on the ground, remain dry, though necessarily, from their position, as liable to be wetted, by whatever falls from the heavens, as the former. It was soon afterwards observed by Mufchenbroeck, that metals will be free from dew, while other bodies attract it copiously: hence Dufay concluded, that dew is an electrical phenomenon, since it leaves untouched the bodies which conduct electricity, whilst it appears upon those which cannot transmit that influence. Against this hypothesis several objections have been urged, however plausibly it has been supported. It has been alleged that charcoal, which next to the metals is the best solid conductor of electricity, attracts dew very powerfully; and dew, as we have seen above, frequently forms upon metals themselves. It has also been urged against this hypothesis, that dew forms in different parts of the night, in quantities disproportioned to the degrees of electricity found in the atmosphere at the same time. Thus, it is commonly more copious in the morning than in the evening, though the air is observed to be, in the latter season, more highly electrical than in the former. But another argument applies alike to all the theories which have hitherto been made public on the cause of dew; and this is, that none of them include the important fact, that its production is attended with cold. Mr. Wilson and Mr. Six have indeed maintained, that the formation of this fluid is the cause of the cold that accompanies it. Dr. Wells once held the same opinion; but finding that bodies would sometimes become colder than the air without being dewed, and that when dew was formed, its quantity, and the degree of cold which appeared with it, were very far from being always in the same proportion to each other, he first doubted its truth, and at length became convinced that it was erroneous; and by farther inquiry he was led to conclude, that dew is the production of a preceding cold in the substances upon which it appears; and that it has precisely the same immediate cause as the presence of moisture upon the outside of a glass or metallic vessel, when a liquid considerably colder than the air has been poured into it shortly before. This fact is applied by our author, to the explanation of several atmospheric appearances.

" I. The variety in the quantities of dew, which were found by me upon bodies of the same kind, exposed to the air during the same time of the night, but in different situations, is now seen to have been occasioned by the diversity of temperature, which existed among them.

" II. Agreeably to the opinion of Mr. Wilson and Mr. Six, the cold connected with dew ought always to be proportional to the quantity of that fluid; but this is contradicted by experience. On the other hand, if it be granted, that dew is water precipitated from the atmosphere, by the cold of the body on which it appears, the same degree of cold, in the precipitating body, may be attended with much, with little, or with no dew, according to the existing state of the air in regard to moisture; all of which circumstances are found actually to take place.

" III. The formation of dew, indeed, not only does not produce cold, but like every other precipitation of water from the atmosphere, produces heat.

" IV. In very calm nights, a portion of air, which comes in contact with cold grafs, will not, when the surface is level, immediately quit it, more especially, as this air has become specifically heavier than the higher, from a diminution of its heat, but will proceed horizontally, and be applied successively to different parts of the same surface. The air, therefore, which makes this progress, must at length have no moisture to be precipitated, unless the cold of the grafs which it touches should increase. Hence in great measure it to be explained, why, on such nights as have been just mentioned, more dew was acquired by substances placed on the raised board, than by others of the same kind on the grafs, though it began to form much sooner in the latter than in the former situation, those on the raised board having received air, which had previously deposited less of its moisture.

" A reason is now also afforded, why a slight agitation of the atmosphere, when very pregnant with moisture, should increase the quantity of dew; since fresh parcels of air will hence be more frequently brought into contact with the cold surface of the earth, than if the atmosphere were entirely calm.

" V. Dew, in agreement with the immediate cause which has been assigned by me for its production, can never be formed, in temperate climates, upon the naked parts of a living and healthy human body, during the night; since their heat is never less in this season, in such climates, than that of the atmosphere. I have, in fact, never perceived dew on any naked part of my own body at night, though my attention was much occupied, for three years, with every thing relative to this fluid, and though I had been, during that period, much exposed to the night air. On the other hand, in very hot countries, the uncovered parts of a human body may sometimes, from being considerably colder than the air, condense the watery vapour of the atmosphere, and hence be covered with a real dew, even in the day-time.

" VI. Hygrometers formed of animal or vegetable substances, when exposed to a clear sky at night, will become colder than the atmosphere; and hence, by attracting dew, or, according to an observation of Saussure, by merely cooling the air contiguous to them, mark a degree of moisture, beyond what the atmosphere actually contains. This serves to explain an observation made by M. De Luc, that in serene and calm weather, the humidity of the air, as determined by an hygrometer, increases about, and after sun-set, with a greater rapidity, than can be attributed to a diminution of the general heat of the atmosphere."

Having established the fact, that bodies become colder than the neighbouring air, before they are dewed, and applied this fact to the explication of many atmospheric appearances, we shall now proceed with the author to complete the investigation of his theory with respect to the cause of dew; and hence he avails himself of the discoveries on heat and its radiation, that have been made by professor Leslie, Dr. Herschel, and count Rumford. (See HEAT.) " The experience of most persons," says Dr. Wells, " respecting the communication of heat among bodies in the open air, is confined to what happens during the day; at which time, those that are situated near to one another are always found to possess the same temperature, unless some very evident reason for the contrary should exist. To many, therefore, it may appear incredible, that a perfectly dry body, placed in contact, on all sides,

with other bodies of the same temperature with itself, shall afterwards, without undergoing any chemical change, become much colder than they are, and shall remain so for many hours; yet these circumstances are found to occur in substances attractive of dew, when laid on the surface of the earth, in a still and serene night, and are in perfect agreement with the doctrine of heat, now universally admitted to be just.

" To render this more easy of apprehension, let a small body which radiates heat freely, and possesses a temperature, in common with the atmosphere, higher than 32° , be placed, while the air is clear and still, on a flow conductor of heat lying on the surface of a large open plain, and let a firmament of ice be supposed to exist at any height in the atmosphere; the consequence must be, that the small body will, from its situation, quickly become colder than the neighbouring air. For, while it radiates its own heat upwards, it cannot receive a sufficient quantity from the ice to compensate this loss; little also can be conveyed to it from the earth, as a bad conductor is interposed between them; and there is no solid, or fluid except the air, to communicate it laterally either by radiation or conduction. This small body, therefore, unless it shall receive from the air, nearly as much heat as it has emitted, which, considering the little that can be communicated from one part of the atmosphere to another, in its present calm state, must be regarded as impossible, will become colder than the air, and condense the watery vapour of the contiguous parts of it, if they should contain a sufficient quantity to admit of this effect. But events similar to these occur, when dew appears in an open and level grafs field, during a still and serene night. The upper parts of the grafs radiate their heat into regions of empty space, which consequently send back no heat in return; its lower parts, from the smallness of their conducting power, transmit little of the earth's heat to the upper parts, which at the same time receiving only a small quantity from the atmosphere, and none from any other lateral body, must remain colder than the air, and condense into dew its watery vapour, if this be sufficiently abundant, in respect to the decreased temperature of the grafs.

" This subject may be further illustrated by a reference to what happens in the experiment, which has been used to prove the reflection of cold.

" In the simplest form of this experiment, a small body, the bulb of a thermometer, possessing the temperature of the atmosphere, is placed before a larger cold body, rendered equal in effect to one still larger, by means of a concave metallic mirror. In this situation, the small body radiates heat to the larger, without receiving an equivalent from it, and, in consequence, becomes colder than the air through which its heat is sent, notwithstanding that it is continually gaining some heat, both from the air which surrounds it, and from the walls and contents of the apartment, in which the experiment is made. Dew, therefore, would as readily form upon the thermometer in this experiment, as it would upon one suspended in the open air at night, under a clear sky, provided that the two instruments were equally colder than the atmosphere, and that this was in both cases equally near to being replete with moisture.

" Regarding now as established, that bodies situated on or near to the surface of the earth become, under certain circumstances, colder than the neighbouring air, by radiating more heat to the heavens, than they receive in every way, I shall in the first place offer a few remarks on the extent and use of this occurrence, and shall afterwards apply the knowledge of it to the explanation of several more of the appearances described in the former part of this Essay, and

of some others, which have not hitherto been mentioned by me.

“Radiation of heat by the earth to the heavens must exist at all-times; but, if the sun be at some height above the horizon, the degree of which is hitherto undetermined, and probably varies according to season, and several other circumstances, the heat emitted by it to the earth will overbalance, even in places shaded from its direct beams, that which the earth radiates upwards.

“In a calm and serene night, however, when consequently little impediment exists to the escape, by radiation, of the earth’s heat to the heavens, and when no heat can be radiated by the sun to the place of observation, an immense degree of cold would occur on the ground, if the following circumstances did not combine to lessen it. 1. The incapacity of all bodies to prevent, entirely, the passing of heat, by conduction, from the earth to substances placed upon them. 2. The heat radiated to these substances by lateral objects. 3. The heat communicated to the same substances by the air. 4. The heat which is evolved, during the condensation of the watery vapour of the atmosphere into dew.

“The extent of the effect of all these checks upon the production of cold, by the nightly radiation of heat from bodies on the surface of the earth, cannot, in the present state of our knowledge, be properly estimated; but facts shew that, notwithstanding their operation, the cold originating in this source must be often very considerable.

“I shall add, with the greatest diffidence, a few words upon a final cause of the radiation of heat from the earth at night, and upon some of the circumstances which modify its action, though fully conscious of the danger of error, which is always incurred in the attempt to appreciate the works of our Creator.

“The heat which is radiated by the sun to the earth, if suffered to accumulate, would quickly destroy the present constitution of our globe. This evil is prevented by the radiation of heat by the earth to the heavens, during the night, when it receives from them little or no heat in return. But, through the wise economy of means, which is witnessed in all the operations of Nature, the prevention of this evil is made the source of great positive good. For the surface of the earth, having thus become colder than the neighbouring air, condenses a part of the watery vapour of the atmosphere into dew, the utility of which is too manifest to require my speaking of it. I may remark, however, that this fluid appears chiefly where it is most wanted, on herbage, and low plants, avoiding, in great measure, rocks, bare earth, and considerable masses of water. Its production too, by another wise arrangement, tends to prevent the injury, that might arise from its own cause; since the precipitation of water, upon the tender parts of plants, must lessen the cold in them, which occasions it. I shall observe in the last place, that the appearance of dew is not confined to any one part of the night, but occurs during its whole course, from means the most simple and efficacious. For after one part of the air has deposited its moisture, on the colder surface of the earth, it is removed, in consequence of that agitation in the atmosphere which exists during its stillest states, and gives place to another having its quantity of water undiminished; and, again, as the night proceeds, a portion of air, which had before deposited all the moisture, which circumstances at that time permitted, is rendered fit, by the general increase of the cold of the atmosphere, to give out a fresh parcel, when it comes anew into contact with the ground.

“The first fact, which I shall here attempt to explain, is the prevention, either wholly or in part, of cold, from

radiation, in substances on the ground, by the interposition of any solid body between them and the sky. This evidently appears to arise in the following manner. The lower body radiates its heat upwards, as if no other intervened between it and the sky; but the loss, which it hence suffers, is more or less compensated by what is radiated to it, from the body above, the under surface of which possesses always the same, or very nearly the same temperature as the air.

“No direct experiments can be made to ascertain the manner, in which clouds prevent, or occasion to be small, the appearance of a cold at night, upon the surface of the earth, greater than that of the atmosphere; but it may, I think, be firmly concluded, from what has been said in the preceding article, that they produce this effect, almost entirely, by radiating heat to the earth, in return for that which they intercept in its progress from the earth towards the heavens. For although, upon the sky becoming suddenly cloudy during a calm night, a naked thermometer, suspended in the air, commonly rises two or three degrees, little of this rise is to be attributed to the heat evolved by the condensation of watery vapour in the atmosphere, as was supposed by Mr. Wilson; since, in consequence of the ceasing of that part of the cold indicated by the thermometer, which was owing to its own radiation to a clear sky, the temperature of the atmosphere may seem to increase 2°, or more, notwithstanding that it has received no real addition. Besides, the heat which is extricated by the condensation of vapour, during the formation of a cloud, must soon be dissipated; whereas the effect of greatly lessening, or preventing altogether, the appearance of a superior cold on the earth to that of the air, will be produced by a cloudy sky, during the whole of a long night.

“Dense clouds, near the earth, must possess the same heat as the lower atmosphere, and will therefore send to the earth as much, or nearly as much, heat as they receive from it by radiation. But similarly dense clouds, if very high, though they equally intercept the communication of the earth with the sky, yet being, from their elevated situation, colder than the earth, will radiate to it less heat than they receive from it, and may, consequently, admit of bodies on its surface becoming several degrees colder than the air. In the first part of this Essay, an example was given of a body on the ground becoming at night 5° colder than the air, though the whole sky was thickly covered with high clouds.

“Islands, and parts of continents close to the sea, being, by their situation, subject to a cloudy sky, will, from the smaller quantity of heat lost by them through radiation to the heavens at night, in addition to the reasons commonly assigned, be less cold in winter, than countries considerably distant from any ocean.

“Fogs, like clouds, will arrest heat, which is radiated upwards by the earth, and, if they be very dense, and of considerable perpendicular extent, may remit to it as much as they receive. Accordingly, Mr. Wilson found no difference at night, in very foggy weather, between the temperature of the surface of snow, and that of the air.

“In mists and low fogs it was found by professor Leslie, that the diminution of the sun’s heat is small, when compared with what occurs, when the sky is obscured by a dense body of clouds; and it will, I presume, be readily granted, that the same state of the atmosphere, which allows the heat of the sun to pass copiously, will also give a ready transit to heat radiated by the earth.”

From previous reasoning, the author concludes, therefore, that “fogs do not in any instance furnish a real exception to the

the general rule, that whatever exists in the atmosphere, capable of stopping or impeding the passage of radiant heat, will prevent or lessen the appearance at night of a cold on the surface of the earth, greater than that of the neighbouring air.

“It follows also, from what has been said in this article, that the water deposited upon the earth, during a fog at night, may sometimes be derived from two different sources, one of which is a precipitation of moisture from a considerable part of the atmosphere, in consequence of its general cold; the other, a real formation of dew, from the condensation, by means of the superficial cold of the ground, of the moisture of that portion of the air, which comes in contact with it. In such a state of things, all bodies will become moist, but those especially which most readily attract dew in clear weather. I have had no opportunity, however, of trying this conclusion by the test of observation, since it occurred to me.

“When bodies become cold from radiation, the degree of effect observed must depend, not only on their radiating power, but in part also on the greater or less ease, with which they can derive heat, by conduction, from warmer substances in contact with them. Thus grafs, on a clear and still night, was constantly colder, sometimes very much colder, than the gravel-walk, though a small quantity of sand, placed upon grafs, was always nearly as cold as this substance. In this case, the difference in temperature between the gravel-walk and sand, evidently depended on the different quantities of heat which they received from the parts beneath. A like reason is to be given for dew appearing in greater quantity on shavings of wood, than on the same substance in a more dense and compact form; and for filamentous and downy substances becoming colder than all others, even than lamp-black, which is placed by Mr. Leslie, at the head of the best solid radiators of heat. For the lamp-black exposed by me, being about two lines in depth, possessed, in consequence, a fund of internal heat, which would more readily pass to its cold surface, than the heat of the lower parts of the downy substances would to their upper surface.

“Bodies, exposed in a clear night to the sky, must radiate as much heat to it during the prevalence of wind, as they would do if the air were altogether still. But in the former case, little or no cold will be observed upon them above that of the atmosphere, as the frequent application of warm air must quickly return a heat equal, or nearly so, to that which they had lost by radiation. A slight agitation of the air is sufficient to produce some effect of this kind; though, as has already been said, such an agitation, when the air is very pregnant with moisture, will render greater the quantity of dew, one requisite for a considerable production of this fluid being more increased by it, than another is diminished.”

Theophrastus remarks, and the remark has been confirmed by other writers, that “the hurtful effects of cold occur chiefly in hollow places. If this be restricted to what happens on serene and calm nights, and it does not, I believe, hold true in any other circumstances, two reasons from different sources are to be assigned for it. The first is, that the air being stiller in such a situation, than in any other, the cold, from radiation, in the bodies which it contains, will be less diminished by renewed applications of warmer air; the second, that from the longer continuance of the same air in contact with the ground, in depressed places than in others, less dew will be deposited, and therefore less heat extricated during its formation. It will be seen in the last part of this Essay, that, in the East Indies,

depressions in the earth are artificially made, for the purpose of increasing the cold, which appears in serene nights. On this subject, however, it is to be observed, that if the depressed or hollow places be deep, in proportion to their horizontal extent, a contrary effect must follow; as a cave will occur more or less similar to that which existed in some experiments formerly related by me, in which a small portion of grafs was surrounded by a hollow cylinder.

“An observation closely connected with the preceding, namely, that in clear and still nights, frosts are less severe upon hills, than in neighbouring plains, has excited more attention, chiefly from its contradicting what is commonly regarded an established fact, that the cold of the atmosphere always increases with the distance from the earth. This inferior cold of hills is evidently a circumstance of the same kind, with that ascertained by Mr. Pictet and Mr. Six, respecting the increasing warmth, in clear and calm nights at all seasons of the year, of the different strata of the atmosphere, in proportion as these are more elevated above the earth. As the greater cold of the lower air is the less complicated fact, I shall attempt to explain it in the first place. Mr. Pictet, indeed, furnishes an explanation himself, by ascribing it to the evaporation of moisture from the ground. But to shew that this is not just, it need only be mentioned, that the appearance never occurs in any considerable degree, except upon such nights as are attended with some dew, and that its great degrees are commonly attended with a copious formation of that fluid; since it cannot be thought, that the same stratum of air will deposit moisture on the ground, from an insufficiency of heat, at the very time it is receiving moisture from the ground, in the state of pellucid vapour, as this presupposes, that it is not yet replete with water.”

Aristotle and Plutarch, and of late Mr. Jefferson, (Notes on Virginia,) have observed that dew is much less copious on hills than it is upon plains. In order to account for this fact, we may allow, at first, that the surface of the ground is in both situations equally colder than the air contiguous to it; yet, “as the production of dew must be in proportion to the whole depression of the temperature of the air which furnishes it, below what its heat had been in the preceding day, and as one part of this depression, the general cooling of the atmosphere, is much more considerable on the plain than on the hill, moisture must necessarily be deposited more copiously in the former than in the latter place. If the greater agitation of the atmosphere, and the less quantity of moisture, during clear weather, in its higher region than in the lower, be added, it may readily be inferred, that dew shall sometimes be altogether wanting on a hill, though abundant on a plain at its foot, agreeably to what has been actually observed by Mr. Jefferson.

“The leaves of trees often remain dry throughout the night, while those of grafs are covered with dew. As this is a similar fact to the smallness of dew on hills, I shall in accounting for it do little more, than enumerate the circumstances on which it depends.

“1. The atmosphere is several degrees warmer near the upper parts of trees on dewy nights, than close to the ground. 2. The air in the higher situation is more agitated, than that in the lower. 3. The air at a little distance from the ground, from being nearer to one of its sources of moisture, will on a calm evening contain more of it, than that which surrounds the leaves of elevated trees. 4. Only the leaves of the very tops of trees are fully exposed to the sky. 5. The declension of the leaves from an horizontal position will occasion the air, which has been cooled by them, to slide quickly away, and be succeeded by warmer parcels.

6. The length of the branches of the trees, the tenderness of their twigs, and the pliancy of the footstalks of their leaves, will cause in the leaves an almost perpetual motion, even in flates of air that may be denominated calm. I have hence frequently heard, during the stillness of night, a rustling noise in the trees, which formed one of the boundaries of the ordinary place of my observations, while the air below seemed without motion.

“ Nearly in the same manner is to be explained, why shrubs and bushes also receive dew more readily than lofty trees.

“ Bright metals, exposed to a clear sky in a calm night, will be less dewed on their upper surface than other solid bodies; since of all bodies they will, in such a situation, lose the smallest quantity of heat by radiation to the heavens, at the same time that they are capable of receiving, by conduction, at least as much heat as any others from the atmosphere, and more than any others from the warmer solid substances, which they happen to touch.

“ If the exposed pieces of metal be not very small, another reason will contribute somewhat to their being later and less dewed than other solid substances. For, in consequence of their great conducting power, dew cannot form upon them, unless their whole mass be sufficiently cold to condense the watery vapour of the atmosphere; while the same fluid will appear on a bad conductor of heat, though the parts a very little beneath the surface are warmer than the air.”

It appears from the discoveries of professor Leslie, that the metals differ in their capacities of radiating heat; and hence will arise a difference among themselves with regard to their attraction of dew. Gold, silver, copper, and tin, as we have already said, resist the formation of dew more strongly, than other substances of the same class; but these metals, according to Mr. Leslie, radiate heat the most sparingly. On the other hand, lead, iron, and steel, which, according to the same author, radiate heat more copiously than the former metals, were found by Dr. Wells to acquire dew more readily. The same observations may probably be applicable to platinum and zinc. In the article Dew, we have already taken some notice of the opinion of those who maintain, that it rises from the earth at night. The first trace of this opinion, according to Dr. Wells, occurs in the Hist. Acad. Sci. for 1687. Gersten advanced it anew in 1733. It was embraced by Muschenbroeck and Dufay; though the former soon admitted that dew sometimes falls. Mr. Webster of New England has adopted the same opinion. We refer those who wish to see the arguments for and against this opinion fully stated to Wells's Essay.

Agreeably to another opinion on the origin of dew, that which is found upon growing vegetables, is said to be the condensed vapour of the plants on which it appears. “ But this seems,” says our author, “ to be erroneous for several reasons. 1. Dew forms as copiously upon dead as upon living vegetable substances. 2. The transpired humour of plants will be carried away by the air which passes over them, when they are not sufficiently cold to condense the watery vapour contained in it; unless, which is almost never the case if mist does not already exist, the general mass of the atmosphere be incapable of receiving moisture in a pellucid form. Accordingly, on cloudy nights, when the air, consequently, can never be cooled more than a little below the point of repletion with moisture, by bodies in contact with it, dew is never observed upon any plants, that are elevated a few feet above the ground. 3. If a plant has become, by radiating its heat to the heavens, so cold, as to be enabled to bring the air in contact with it below the point of repletion with moisture, that which forms upon it, from its own

transpiration, will not then, indeed, evaporate. But other moisture will, at the same time, be communicated to it by the atmosphere; and when the difference in the copiousness of these two sources is considered, it may, I think, be safely concluded, that almost the whole of the dew, which will afterwards form on the plant, must be derived from the air; more especially when the coldness of a clear night, and the general inactivity of plants in the absence of light, both lessening their transpiration, are taken into account.

“ An experiment, however, has been appealed to in proof, that the dew of plants actually does originate from fluid transpired by them; that, namely, in which a plant, shut up in an air-tight case, becomes covered with moisture. But this experiment, if attentively examined, will be found to have little weight. First, the inclosed plant being exempt from the cold, which its own radiation would have produced in its natural situation, on a dewy night, will transpire a greater quantity of fluid, than a similar plant exposed at the same time to the open air. Again, the small quantity of air, contained in the case, must soon be replete with moisture, after which, the whole of what is further emitted by the plant will necessarily assume the form of a fluid, whatever may be the condition of the external atmosphere; whereas, during even the clearest night, only a part of the smaller quantity of moisture, emitted by the exposed plant, will be condensed on its surface. In the last place, notwithstanding the circumstances which favour the appearance of moisture upon inclosed plants from their own transpiration, still the quantity observed on them is said to be, for I have made no experiment myself respecting this matter, much less considerable, than what is seen upon plants of the same kind, exposed to the air for the same time, during a calm and serene night.” For several appearances connected with dew, we are under a necessity of referring to the third part of Dr. Wells's Essay.

DEWAN, or DUAN, a term which has various significations in India. It denotes a place of assembly, a native minister of the revenue department, and chief justice of civil causes within his jurisdiction, and receiver general of a province. The term is also used to designate the principal revenue servant under an European collector, and even of a Zemindar. By this title, the East India company are receivers of the revenues of Bengal, under a grant from the Great Mogul. Accordingly Dewannu denotes the office or jurisdiction of a Dewan.

DEWEYSBURG, in *Geography*, a town of Caledonia county, in Vermont, having 200 inhabitants.

DEZPHOUL, a town of Persia, in Kuzistan, or Chuffistan, 28 miles W. of Shuster, containing nearly as many inhabitants as that city, and situated on the eastern bank of the Abzal, on a beautiful and spacious plain. Its only ornament is an elegant bridge of twenty-two arches, erected by command of Sapor, notorious for destroying as well as famous for building cities. The bridge is 450 paces in length, 20 in breadth, and about 40 in height. The piers are made of large stones, and the arches and upper parts of burnt brick.

DIAL-*Work of a Clock*, col. 2, l. 24, for Plate XXIII, r. Plate XVIII.

DIALLAGAGE. See MINERALOGY, *Addenda*.

DIAMOND, col. 4, l. 43, add—With a small portion of oxygen, as Sir Humphrey Davy has lately discovered.

DIAMOND. See DIAMOND, and MINERALOGY, *Addenda*.

DIANA, col. 3, l. 20 from the bottom, for 27 r. 30.

DIANELLA, in *Botany*, a poetical name, in honour of the sylvan goddess Diana, to whom Commerfon in his author thought so beautiful an inhabitant of the woods peculiarly appropriate.

appropriate.—Lamarck *Dict.* v. 2. 276. *Illustr.* t. 250. *Juss.* 41. *Brown Prodr. Nov. Holl.* v. 1. 279. *Ait. Hort. Kew.* v. 2. 276.—Clafs and order, *Hexandria Monogynia*. *Nat. Ord. Coronaria*, Linn. *Aparagi*, *Juss. Aphodelvæ*, Br.

Eff. Ch. Calyx none. Petals fix, spreading. Filaments tumid at the top. Berry of three cells, with many seeds.

Perennial herbs, with fibrous roots, grassy sheathing leaves, and paniced, drooping, blue flowers, woody anthers, as well as the spongy top of each filament, are yellow. The berries are blue, with shining seeds.

Seven species are found in New Holland; three are enumerated in *Hort. Kew.* A few examples will suffice.

D. ensifolia. Sword-leaved Dianella. *Redout. Lil.* t. 1. *Ait. n. 1.* (*D. nemorosa*; Lamarck n. 1. *Jacq. Hort. Schoenbr.* v. 1. 49. t. 94. *Dracæna ensifolia*; Linn. *Mant.* 63. *Sp. Pl.* v. 2. 158.)—Leaves sword-shaped, smooth. Flowers loosely paniced.—Native of the East Indies. A frequent flow plant, about two or three feet high. Leaves an inch broad. Flowers green and white.

D. carulea. Blue Dianella. Br. n. 1. *Ait. n. 2.* *Curt. Mag.* t. 505. *Red. Lil.* t. 79.—Leaves with rough edges and keel. Panicle scarcely subdivided. Flower-stalks aggregate.—Native of Port Jackson, from whence it was brought very early. Leaves about half an inch broad. Flowers deep blue.

D. divaricata. Spreading Dianella. Br. n. 6. *Ait. n. 3.*—Leaves radical, nearly linear, smooth. Panicle repeatedly compound, spreading; ultimate branches zigzag, racemose. Bractæes very minute.—Native of the south coast of New Holland. Br.

DIARBEKIR, infern.—the ancient *Amida*; 1. *ult.* after Rome, infern.—It is said by *McKinnir* to contain 38,000 souls, most of whom are Turks. The elevation of the surrounding mountains, the windings of the Tigris, and height of the walls and towers, with the cupolas of the mosques, give it an air of grandeur superior to that of any other city, which this traveller has visited in this quarter of the world; 1. *ult.* N. lat. 37° 55' 30". E. long. 39° 52'.

DIARBEKIR, l. 2, after Turkey, infern.—and next to that of Erzeroom, the most considerable pachalic of Armenia; l. 21, after *Curdistan*, add—It is situated between the Tigris and Euphrates, and separated from the dependencies of *Merdin* by a small river and a branch of mount *Mafius*. The whole of it is very mountainous and difficult of access; however it is interperfed with narrow and fertile valleys, and abounds with the most beautiful and romantic scenery:—1. *ult.* r. The principal town of this pachalic is *Diarbekir*; which see.

DIASPASIS, in *Botany*, *Brown Prodr. Nov. Holl.* v. 1. 586, a genus intermediate between *Scævola* and *Dampiera*, (see those articles,) but perhaps most akin to the latter.

1. *D. filifolia*, from the south coast of New Holland, is the only species.

DIASPORE. See *MINERALOGY, Addenda.*

DICKINSON, in *Geography*, l. 3, r. 1794.

DICKSON. Add—Also, a county of West Tennessee, containing 4516 inhabitants, of whom 990 are slaves.

DIDACTYLUS, a species of *BRADYPUS*; which see. See also *SLOATH*.

DIGHTON, l. *ult.* r. 1659, &c.

DIGITUS. Add—See *EXTREMITIES.*

DIKE, *OFFA'S*. See *DYKE.*

DIMERIA, in *Botany*, from its double spike.—*Brown Prodr. Nov. Holl.* v. 1. 204.—A grass chiefly distinguished

from *SACCHARUM*, (see that article,) by the flowers being all sessile, on a permanent, not jointed, stalk.

D. acinaciformis was found by *Mr. J. Banks*, in the tropical part of New Holland, and *Mr. Brown* has an East Indian species.

DINAS-MAWDDWY. In 1811, the hundred of *Tallybont* and *Mawddwy* contained 843 houses, and 4287 persons; 1964 being males, and 2323 females: 531 families employed in agriculture, and 200 in trade, &c.

DINGAS. Add—See *SCIND.*

DINGWALL. In 1811, the burgh and parish contained 278 houses, and 1500 persons; 647 being males, and 853 females: 158 families employed in agriculture, and 153 in trade and manufactures.

DINWIDDIE, l. 4 and 5, r. 12,524 inhabitants, of whom 7442 are slaves.

DIOPSIDE. See *MINERALOGY, Addenda.*

DIOTIS, in *Botany*, from the two ears of its calyx, when in fruit.—*Schreb. Gen.* 633. *Willd. Sp. Pl.* v. 4. 368. *Ait. Hort. Kew.* v. 5. 266. (*Ceratoides*; *Tourn. Cor.* 52.)—Clafs and order, *Monocelia Tetrandria*. *Nat. Ord. Holeraceæ*, Linn. *Atriplicis*, *Juss.*

Eff. Ch. Male, Calyx four-leaved. Cor. none.

Female, Calyx of one leaf, with two horns. Style deeply cloven. Seed solitary, hairy at the base, concealed in the clofed calyx.

1. *D. Ceratoides*. Shrubby *Diotis*. *Willd. n. 1.* *Ait. n. 1.* (*Axyris Ceratoides*; Linn. *Sp. Pl.* 1389. *Jacq. Ic. Rar.* t. 189.)—Native of Siberia. A weak shrub, with linear-lanceolate leaves, and crowded inconspicuous flowers, of no beauty.

DIPLACRUM, from *διπλος*, double, and *ακρῖς*, a point. —*Brown Prodr. Nov. Holl.* v. 1. 240.—Clafs and order, *Monocelia Triandria*. *Nat. Ord. Calamaria*, Linn. *Cyperoidæ*, *Juss.*

Eff. Ch. Male, Calyx a chaffy scale, lateral. Cor. none. Female, Calyx of two equal, ribbed, permanent, pointed valves. Stigmas three. Nut spherical, without scales at the base, concealed in the clofed calyx.

1. *D. caricinum*. Br. n. 1.—Native of the tropical part of New Holland. *Banks*. A little grassy bog plant, with a leafy stem, and axillary as well as terminal tufts of flowers. Akin to *SCLERIA* and *CAREX*; see those articles.

DIPLANTHERA, from its apparently double anthers.—*Banks* and *Solander* in *Br. Prodr. Nov. Holl.* v. 1. 448.—Clafs and order, *Didynamia Angiospermia*. *Nat. Ord.* akin to *Solanææ* and *Scrophularinæ*? Br.

Eff. Ch. Calyx three-lobed; lateral lobes cloven. Corolla two-lipped; upper lip inversely heart-shaped, flat. Anthers of two divided, divaricated, linear lobes. Stigma two-lobed.

1. *D. tetraphylla*. Br. n. 1. *Banks Ic. ined.* in *Bibl. Linn.*—Native of the tropical part of New Holland. A tree, with an irregular spreading head, of round downy branches. Leaves four in a whorl, stalked, large, obovate, entire; cloven, and marked with two glands, at the base. Flowers numerous, large, and handsome, yellow, with long prominent stamens and style, in dense terminal panicles. Ripe fruit not known.

DIPLARRHENA, from having only two of the three stamens perfect.—*Labill. Nov. Holl.* v. 2. 117. *Voy. Engl. ed.* v. 1. 169. *Brown Prodr. Nov. Holl.* v. 1. 304.—Clafs and order, *Triandria Monogynia*. *Nat. Ord. Eufatiæ*, Linn. *Irides*, *Juss.*

Eff. Ch. Sheath of two leaves. Three inner segments of the corolla smallest; upper one vaulted. Stamens distinct; two of them converging under the vaulted segment

of the corolla; the third imperfect. Stigma two-lipped, in three deep segments. Seeds depressed.

1. *D. Moraa*. Labell. as above, t. 15. Br. n. 1. (*Moraa diandra*; Vahl Enum. v. 2. 154.)—Native of the fourth coast of New Holland, flowering in May. The flowers are very short-lived, white; their inner segments variegated. This plant differs from *PATERSONIA*, (see that article,) chiefly in the irregularity of its *flower*.

DIPLOPOGON, from διπλος, two-fold, and πογών, a beard.—Brown Prodr. Nov. Holl. v. 1. 176.—Class and order. *Triandria Digynia*. Nat. Ord. *Gramina*.

Eff. Ch. Calyx of two lax, membranous, awned valves, single-flowered. Corolla of two valves; outer with three awns, of which the middle one is twisted, unlike the rest; inner with two awns.

1. *D. fetucosus*. Setaceous Diplopogon.—Gathered by Mr. Brown, on the southern coast of New Holland. A grass perfectly resembling *AMPHIPOGON laguroides*, (see that supplementary article,) in habit and inflorescence, the spike being capitate, and the outermost flowers likewise abortive, composing a kind of involucre. Brown.

DIP-MICROMETER, and **DIP-SECTOR**, instruments invented by Dr. Wollaston, to correct the variation of the real dip from that given in the tables; arising principally from the difference between the temperature of the sea and that of the atmosphere.

DIPODIUM, in *Botany*, from δις, and ποος, alluding to the two separate stalks, or feet, by which the masses of pollen attach themselves to the stigma.—Brown Prodr. Nov. Holl. v. 1. 330.—Class and order, *Gynandria Monandria*. Nat. Ord. *Orchideae*.

Eff. Ch. Calyx-leaves and petals uniform, spreading. Lip three-lobed; disk bearded; base with a short spur. Column semi-cylindrical. Anther a terminal deciduous lid. Masses of pollen solitary in each cell, with an inner lobe, each attached by a separate thread to the gland of the stigma.

Leafless smooth herbs, growing on the ground, with a thick, branching root. Base of the stem sheathed with imbricated scales, more distant on its upper part, where they become bracteas. Flowers numerous, in a simple cluster, purple, very handsome. Two species are mentioned.

1. *D. punctatum*. Dotted Dipodium. Br. n. 1. *Dendrobium punctatum*; Sm. Exot. Bot. v. 1. 21. t. 12.)—Lower scales broadly ovate, acute, without a keel; upper split longitudinally. See *DENDROBIUM*, n. 10.

2. *D. squamatum*. Scaly Dipodium. (*Cymbidium squamatum*; Swartz Orch. in Schrad. N. Journ. v. 1. 76. Ophrys; squamata; Forst. Prodr. 59.)—Lower scales oblong, keeled; upper undivided at the base. Br.—Native of New Caledonia. Very nearly related to the first.

DIPSACEÆ, l. 3, after *cotyledons*, insert—two.

DIPTEROCARPUS, διπτερος, two-winged, and καρπος, fruit.—“Gært. v. 3. 51. t. 188.” Roxb. Corom. v. 3. 10.—Class and order, *Polyandria Monogynia*. Nat. Ord. *Guttiferæ*, Juss. affine.

Eff. Ch. Calyx inferior, five-cleft; two segments subsequently much enlarged. Petals five. Capitule ovate, of one cell. Seed solitary.

1. *D. turbinatus*. Wood-oil Dipterocarpus. Roxb. as above, t. 213.—Native of various countries eastward of Bengal, flowering early in the hot season, and famous for its liquid balsam, much used for painting houses and ships. This is copiously procured by wounding the trunk, and lighting a fire near the part. The tree is very large. Leaves alternate, stalked, ovate, acute, wavy or serrated,

smooth, from four to twelve inches long. Flowers in simple, axillary clusters, large, white, with yellow anthers. Wings of the calyx in fruit erect, oblong, three inches in length.

DISCHARGED WORK. See *PASTE-Work* and *DISCHARGING of Colour*.

DRACOPHYLLUM, in *Botany*, so called from the resemblance of its leaves to *Dracena Draco*.—Labill. Voy. Engl. ed. v. 2. 219. t. 40. Br. Prodr. Nov. Holl. v. 1. 555.—Class and order, *Pentandria Monogynia*. Nat. Ord. *Epariideæ*, Br.

Eff. Ch. Calyx five-cleft. Corolla tubular; limb in five deep spreading segments, beardless. Nectary five scales beneath the germen. Receptacles of the seeds hanging loose from the top of the central column. Br.

Some flowers are six-cleft, as Labillardiere observed in his *D. verticillatum*, found in New Caledonia. Mr. Brown, who met with four species in New Holland, remarks, that Forster's *Eparis longifolia* and *rosmarinifolia*, Prodr. 13, natives of New Zealand, belong to this genus.

DRACUT, l. 2, after county, r. and state of Massachusetts; l. ult. r. 1301.

DRAG. See DROWNING.

DRAMATIC *Musik* of the Greeks, col. 2, l. 5 from the close, r. *makts*.

DRAYTON. Add—The part of this parish that lies in Salop county contained, by the return in 1811, 599 houses, and 3370 persons; the other part, formerly denominated Tylrey, now Drayton-in-Hales, situated in the hundred of North Pirehill, in the county of Stafford, consists of three townships, having 104 houses, and 607 inhabitants.

DRESDEN, in America. Add—It contains 1096 inhabitants.

DRESSING, in *Rural Economy*, and the *Manege*, de-

notes the periodical application of friction, by means of brushes, cloths, &c. to the hides of animals, with a view both to cleanliness and health. (See CURRYING.) Friction on the surface of the body, by means of the curry-comb and brush, contributes to promote the circulation of the fluids, and that insensible perspiration through the pores of the skin, which greatly conduce to the health and activity of the animal. Columella observes, that the bodies of cattle ought to be rubbed down daily, as well as the bodies of men; and frequently it does them more good to have their backs well rubbed down, than to have their bellies filled with large quantities of provender. Of the practice which is so common on the post-roads of throwing pailsful of cold water on horses when they are over-heated at the close of a stage, Mr. Clark speaks doubtfully; although it is said that no bad consequences ensue, probably because they have little interruption of exercise; but he is of opinion, that if they are well rubbed down after exercise, there will be no occasion for washing, or rather drenching them with cold water. See HORSE.

DRIFFIELD, l. 4, r. 399, and 1857.

DRIMIA, in *Botany*, from *δριμύς*, *acid*, alluding to the qualities of the root.—Jacq. Coll. v. 5. 38. Willd. Sp. Pl. v. 2. 165. Ait. Hort. Kew. v. 2. 281.—Class and order, *Hexandria Monogynia*. Nat. Ord. *Coronarieæ*, Linn. *Asphodeli*, Juss.

Eff. Ch. Calyx none. Corolla inferior, bell-shaped, in six deep revolute segments. Stamens inserted into the corolla. Stigma three-lobed. Capsule abrupt, somewhat triangular. Seeds few, oblong.

Five species, from Southern Africa, are described by Jacquin and Willdenow, and figured in Jacq. Ic. t. 373—377. They have scaly *bulbs*, linear-lanceolate *leaves*, coming after the tall, stalked *cluster*, of numerous greenish *flowers*. *D. elata*, Curt. Mag. t. 822, and *D. pusilla*, Jacq. t. 374, are the only ones in Hort. Kew.

DROITWICH, l. *penult.* r. 423, and 2079.

DROMORE, l. 3, r. 1295.

DRONFIELD, l. 4, r. 267 and 1343.

DRYANDRA, in *Botany*, received its name from Mr. Brown, in honour of his friend Jonas Dryander, M.A. a distinguished pupil of the great Linnæus, who succeeded the celebrated Solander in the place of librarian to sir Joseph Banks; and after rendering eminent services to science, died under the roof of his illustrious friend and patron, in October 1810, aged 62. Mr. Dryander has erected to himself a lasting monument in his *Catalogus Bibliothecæ Historico-naturalis Josephi Banks*, the most elaborate and complete work of the kind, and the most perfect specimen of correct execution, that perhaps any department of science can boast. His papers on *Begonia*, *Lindsea*, and other subjects, in the Transactions of the Linnæan Society, richly entitle him to botanical commemoration; to say nothing of his abilities as editor of the first edition, and part of the second, of Mr. Aiton's *Hortus Kewensis*, as well as of Dr. Roxburgh's Plants of Comorandel; or his various services to natural science in other respects. Thunberg had long ago published a DRYANDRA (see our former article); but that proving not distinct from Forster's *Aleurites*, previously established, Mr. Brown has happily chosen a most distinct genus, next akin to BANKSIA, and scarcely less rich in number and beauty of species.—Brown Tr. of Linn. Soc. v. 10. 211. t. 3. Prodr. Nov. Holl. v. 1. 396. Ait. Hort. Kew. v. 1. 219.—Class and order, *Tetrandria Monogynia*. Nat. Ord. *Aggregatæ*, Linn. *Protocææ*, Juss. Brown.

Gen. Ch. *Common Calyx* hemispherical, of numerous, permanent, imbricated scales, many-flowered. *Cor.* of one petal,

DRYANDRA.

petal, in four deep linear segments, at length separating more or less completely, slightly dilated and concave at their summits. Nectary four scales at the base of the germen. *Stam.* Filaments four, very short, inserted into the base of the cavity of each petal; anthers linear-oblong. *Pist.* Germen superior, very small, of two single-feeded cells; style cylindrical, rigid, erect, about the length of the corolla; stigma undivided. *Peric.* Follicle woody, obliquely turbinate, of two shallow cells; the partition unconnected, deeply cloven transversely, elastic. *Seeds* solitary, compressed, oblong, with a lateral crescent-shaped membranous wing. *Common Receptacle* flat, beset with oblong scales or bristles, rarely wanting.

Eff. Ch. Corolla of one petal, four-cleft, bearing the stamens in the hollows of its segments. Nectary four scales at the base of the germen. Follicle woody, of two single-feeded cells, with a cloven moveable partition. Common calyx imbricated, many-flowered. Receptacle flat.

This genus consists of New Holland shrubs, mostly of humble growth; their *branches*, if any, either scattered or umbellate. *Leaves* scattered, pinnatifid or cut, alike in young or old plants. *Flowers* solitary, sessile, terminal, rarely lateral, encompassed with crowded *leaves*, of which the innermost are sometimes diminished, or as it were imperfect, and accompanied at the base with close-pressed *bractes*, some of them occasionally furnished with a terminal appendage. *Style* for the most part hardly longer than the corolla, and not forced into a curve as in *Bankfia*.

We follow Mr. Brown's names and numbers throughout.

1. *D. floribunda*. Many-flowered Dryandra. Ait. n. 1.—Leaves wedge-shaped, deeply and sharply serrated. Calyx-scales striated; the outermost nearly smooth. Tips of the corolla smooth. Stigma obtuse, slightly club-shaped.—Native of Lewin's land, growing on stony hills. Mr. Menzies favoured us with a specimen from King George's sound. This shrub flowers at Kew most part of the year. The *branches* sometimes bear a few long, loose, spreading hairs. *Leaves* sessile, rigid, an inch and a half or two inches long, finely reticulated on both sides, the minute interstices of the veins curiously depressed beneath. *Flowers* terminal, in a close cylindrical head, resembling some *Thistle* or *Serratula*, shorter than the crowded surrounding leaves. *Calyx* brown, of many sharp imbricated scales, the inner ones gradually longest, and hairy. *Corolla* thrice as long, yellow, externally hairy, except at the tips lodging the *stamens*, which are smooth, keeled, obtuse, minutely hooded. Mr. Brown observes that the scales of the *receptacle*, separating the flowers, are sometimes wanting.

2. *D. cuneata*. Wedge-leaved Dryandra. Ait. n. 2.—Leaves wedge-shaped, deeply serrated, spinous, stalked. All the calyx-scales even and silky. Tips of the corolla bearded. Stigma slender-awl-shaped, acute.—Found by Mr. Brown, on stony hills in Lewin's land. He notices two varieties; one with *leaves* scarcely an inch and a half long, whose three terminal teeth are all nearly equal; another, which may possibly be a distinct species, with *leaves* two inches long, whose dilated extremity has the middle tooth shortest, the adjoining sinuses broader.

3. *D. armata*. Acute-leaved Dryandra. Ait. n. 3.—Leaves pinnatifid; lobes triangular, flat, divaricated, straight, spinous-pointed; reticulated with naked veins beneath: the terminal one longer than the next. Branches, and tips of the corolla, smooth. Style downy at the base. Stigma awl-shaped, furrowed.—Found by Mr. Brown, on rocky hills in Lewin's land. Mr. Good sent this species to Kew in 1803, but it has not yet flowered there, nor have we seen a specimen.

4. *D. falcata*. Curve-leaved Dryandra. Br. n. 4.—Leaves pinnatifid; lobes triangular-awl-shaped, divaricated, falcate and recurved, spinous-pointed; reticulated with naked veins beneath: the terminal one shorter than the next. Branches downy. Tips of the corolla, as well as the style, longitudinally smooth. Stigma club-shaped, without furrows.—Found by Mr. Brown, in the same country as the last.

5. *D. formosa*. Splendid Dryandra. Br. Tr. of Linn. Soc. v. 10. 213. t. 3. Ait. n. 4.—Leaves linear, elongated, deeply pinnatifid; lobes unequally triangular, pointles, flat; downy beneath. Calyx-scales hairy; the innermost linear-oblong, reflexed. Receptacle chaffy.—Discovered by Mr. Menzies, near King George's sound. Mr. Brown met with it likewise, in barren ground near the coast of Lewin's land. This truly beautiful species was sent to Kew, by Mr. Good, in 1803, and it is marked by Mr. Aiton as flowering there most part of the year. The *leaves* are stalked, from four to six inches long, and barely one-third of an inch broad, cut to the mid-rib, into numerous, close, regular segments, whose upper margin is direct, lower curved; the under side finely downy, snow-white, turning rusty with age, or long keeping. *Stem* branched, downy. *Flowers* terminal, two or three inches in diameter, embossed in leaves. *Calyx-scales* purplish-brown, striated and naked on the inside. *Flowers* of a tawny yellow, clothed with long shining hairs to the very point. *Style* yellow, stout and smooth. *Stigma* cylindrical, furrowed. *Follicles* small; tapering and hairy at the base; rounded at the margin; gaping widely, overtopped by the linear scales of the *receptacle*.

6. *D. mucronulata*. Pointed-lobed Dryandra. Br. n. 6.—Leaves linear, elongated, deeply pinnatifid; lobes equally triangular, pointed, flat; downy beneath. Calyx-scales downy; inner ones linear, pointed. Receptacle chaffy. *Stem* scarcely branched.—Gathered by Mr. Brown at Lewin's land, in low stony ground.

7. *D. plumosa*. Feather-flowered Dryandra. Ait. n. 5.—Leaves linear, elongated, deeply pinnatifid; lobes equally triangular, pointed, flat; downy beneath; slightly revolute at the margin. Inner calyx-scales with feathery tips. Receptacle without scales.—Discovered by Mr. Brown, on the rocky sides of hills, in Lewin's land. Sent to Kew by Mr. Good, in 1803, but has never blossomed there.

8. *D. obtusa*. Obtuse-leaved Dryandra. Ait. n. 6.—Leaves linear, pinnatifid, longer than the downy recumbent stem; lobes triangular, obtuse; downy beneath; thickened and recurved at the edges. Outer calyx-scales ovate; inner linear-oblong.—Gathered by Mr. Brown in Lewin's land, in dry open situations near the shore. This also was sent to Kew, at the same time as the last, but has never yet produced flowers.

9. *D. nivea*. White-leaved Dryandra. Ait. n. 7.— (“*Bankfia nivea*; Labill. Voy. v. 1. 412.” t. 24. Nov. Holl. v. 2. 118.)—Leaves linear, pinnatifid, about as long as the smooth stem; lobes unequally triangular, acute, pointed; white and mealy beneath; recurved at the margin. Calyx-scales linear-lanceolate, smooth, fringed. Corolla hairy from top to bottom, much shorter than the style.—Gathered by Mr. Menzies at King George's sound; by Labillardiere and Brown in rocky places near the coast of Lewin's land, flowering in December. The *stem* is usually from one to three inches high, greatly overtopped by the very long, narrow, erect *leaves*, which are not quite so deeply pinnatifid as most of the foregoing; each lobe has two or three prominent ribs beneath, and is clothed on that side with a snow-white mealy pubescence, unaltered by time in our original specimen. *Flowers* solitary, sessile among the leaves,

leaves, smaller than those of *D. formosa*, with a purplish-brown calyx, and yellow, or tawny corolla. Style purplish, angular, smooth. *Stigma* small, pyramidal, obtuse, not well represented in the plate; at least not in our English edition. This flowers at Kew from July to September. Mr. Brown notices a variety in which the lobes of the leaves are somewhat divaricated, single-ribbed, and the *stigma* hardly thicker than the *style*.

10. *D. longifolia*. Long-leaved Dryandra. Ait. n. 8. —Leaves linear, pinnatifid, very long, acute; downy beneath; tapering and entire at the base; lobes triangular, ascending, decurrent, recurved at the margin. Calyx-lobes linear, awl-pointed, smooth, fringed. Corolla woolly at the base; downy upwards; rather hairy at the tips. Stem downy.—Discovered by Mr. Brown, on rocky hills in Lewin's land. The pubescence of the backs of the leaves is greyish, not white. This plant was raised at Kew in 1805, but has not yet borne any flowers.

11. *D. tenuifolia*. Slender-leaved Dryandra. Ait. n. 9. —Leaves linear, elongated, pinnatifid, rather abrupt; snow-white beneath; entire at the base, and tapering into a foot-stalk; lobes triangular, decurrent, divaricated, recurved at the margin. Calyx as long as the flowers, downy; outer scales ovato-lanceolate. Corolla almost as long as the style; woolly at the base; smooth upwards; slightly silky at the tips. Stem smooth.—Gathered by Mr. Brown, in heathy ground at Lewin's land. It flowers at Kew from March to May.

12. *D. pteridifolia*. Brake-leaved Dryandra. Br. n. 12. —Leaves deeply pinnatifid, longer than the downy stem; lobes linear, acute, pointed, revolute, dilated at their base. Calyx-scales downy, ovate.—Gathered by Mr. Brown, in Lewin's land, on the stony sides of hills.

13. *D. blechnifolia*. Blechnum-leaved Dryandra. Br. n. 13. —Leaves deeply pinnatifid, longer than the downy stem; lobes linear, obtuse, slightly pointed, three-ribbed, somewhat revolute, scarcely dilated at the base.—Gathered near King George's found by Mr. Menzies, to whom we are obliged for a specimen, without flowers, with which Mr. Brown likewise was unacquainted; but the resemblance of the plant to the last-described, induced him to consider it as belonging to the present genus. The short stem is clothed with dense, soft, rusty pubescence. Leaves resembling a *Cycas* in texture, as well as form, though only a foot high; the early ones smaller, with very broad rounded lobes, clothed beneath with white woolly down; the pubescence of the more full-grown leaf only, in our specimen, is become rusty.

DRYMOPHILA, from *δρυμος*, a grove, and *φίλον*, to love, alluding to its place of growth.—Br. Prodr. Nov. Holl. v. 1. 292.—Class and order, *Hexandria Monogynia*. Nat. Ord. *Smilacae*, Br.

Eff. Ch. Calyx none. Petals six, equal, spreading, deciduous. Stamens inserted into the receptacle. Style deeply three-cleft, revolute. Berry of three cells, with many seeds.

1. *D. cyanocarpa*. Blue-berried Drymophila.—Found by Mr. Brown, in Van Diemen's island. Root perennial, creeping. Stem erect, mostly simple. Leaves twisted. Flowers white, stalked, solitary, axillary or terminal. Br.

DUBASHI, a name applied at Madras to the same person who is denominated Banian in Bengal: it signifies a person who can speak two languages.

DUBLIN, in America, l. 4, r. 1184; l. 8, r. 2194; l. 10, r. 970. Add—Also, a township of Bedford county, in Pennsylvania, having 820 inhabitants.

DUBOISIA, in Botany, in memory of Mr. Dubois, a botanist of the time of Dillenius, who appears, by Ray's

Synopsis, ed. 3, 17, to have had a garden at Mitcham in Surrey, and whose son, or brother, Charles, was an affiduous cryptogamist. His copy of Buxbaum is in our hands.—Br. Prodr. Nov. Holl. v. 1. 448.—Class and order, *Dicladaniam Angiospermia*. Nat. Ord. *Luride*, Linn. *Solanæz*, Brown.

Eff. Ch. Calyx two-lipped, short. Corolla bell-shaped; limb in five deep, nearly equal, segments. Stamens in the tube, with the rudiment of a fifth. *Stigma* capitate, notched. Berry of two cells, with many kidney-shaped seeds.

1. *D. myoporoides*. Br.—Native of Port Jackson. A smooth shrub, with alternate undivided leaves, and white, panicled, axillary flowers, producing little black berries.

DUBUDU. See DUBDU.

DUCHESNEA, in Botany, a genus announced at the end of our article FRAGARIA, and since published in Tr. of Linn. Soc. v. 10. 371. It was supposed to differ essentially from *Fragaria* and *Potentilla*, (with both which the calyx agrees, and with the latter more particularly the *habit*;) in having the compound berry of a *Rubus*. Some garden specimens have led us to suspect an error in botanists who have described the ripe fruit, which in those specimens was certainly that of *Frageira*, a succulent receptacle studded with dry seeds. Whether the latter becomes pulpy at any more advanced period, remains to be proved. Meanwhile this plant stands as *F. indica*, in Ait. Hort. Kew. v. 3. 273.

DUCK CREEK, in Geography, a hundred of Kent county, in Delaware, containing 3600 inhabitants, of whom 167 are slaves.

DUDLEY, l. 3, r. 2621 houses, and 13,025 inhabitants. Add—Dudley is partly in Offlow hundred, Staffordshire, in which Dudley is locally situated.

DUDLEY, in America, l. 2, r. 1220.

DUEL. At the close, add—Duelling, says a late excellent writer, in the modern sense of the word, exclusive of casual frays and single combats during war, was unknown before the 16th century. But we find one anecdote, which seems to illustrate its derivation from the judicial combat. The dukes of Lancaster and Brunwick, having some differences, agreed to decide them by duel before John, king of France. The lists were prepared with the solemnity of a real trial by battle; but the king interfered to prevent the engagement. The barbarous practice of wearing swords as a part of domestic dress, which tended very much to the frequency of duelling, was not introduced till the latter part of the 15th century. Our author says, that he can find only one print in Montfaucon's Monuments of the French Monarchy where a sword is worn without armour before the reign of Charles VIII.; though a few as early as the reign of Charles VI. have short daggers in their girdles. Hallam's State of Europe during the Middle Ages, vol. ii. ch. 9. part i. p. 441. London, 1818.

DUEREN. See DEUREN.

DUFUREA, in Botany, so named in honour of a French botanist.—Achar. Syn. 246. "Lichenogr. 103. t. 11. f. 2." A genus of the order of *Lichenes*, composed of *L. flammeus*, Linn. Suppl. 451. Hoffm. Pl. Lich. t. 3. f. 1; *L. madreporsiformis*, Wulf. in Jacq. Coll. v. 3. t. 3. f. 2; and three other species. The frond is tubular, branched, membranous; *stipules* terminal, with a border from the frond. We must shelter ourselves under the doubt, expressed by the author himself, respecting this genus.

DUKE'S COUNTY, l. 5, r. 3290.

DULVERTON, l. 11, r. 204 and 1035.

DULWICH. Add—See CAMBERWELL and PECKHAM.

DUMBARTON. By the return of 1811, the burgh and parish of Dumbarton contained 363 houfes, and 3121 perfons; 1373 being males, and 1748 females: 93 families employed in agriculture, and 524 in trade and manufactures. The fhire of Dumbarton contained 3218 houfes, and 24,189 perfons; 11,369 being males, and 12,820 females: 1123 families employed in agriculture, and 2689 in trade, manufactures, and handicraft.

DUMBLANE. In 1811, the parish contained 473 houfes, and 2733 perfons; 1272 being males, and 1461 females: 163 families employed in agriculture, and 293 in trade, &c.

DUMFRIES. In 1811, the burgh and parish contained 1445 houfes, and 9262 perfons; 4103 being males, and 5159 females.

DUMFRIESHIRE. By the return of 1811, this county contained 11,660 houfes, and 62,960 perfons; 29,347 being males, and 33,613 females: 3862 families employed in agriculture, and 4435 in trade, manufactures, and handicraft.

DUMMER, l. 2, for Grafton r. Coos; add—contained 7 inhabitants.

DUMMERSTOWN, l. 3, r. 1704.

DUNBAR, in Scotland. The burgh and parish, in 1811, contained 664 houfes, and 3965 perfons; 1661 being males, and 2304 females: 263 families employed in agriculture, and 305 in trade and manufactures.

DUNBAR, a township of Fayette county, in Pennsylvania, containing 2066 perfons, of whom, in 1810, 7 were flaves.

DUNBARTON, l. 3, r. 1256.

DUNDEE, col. 2, l. 7 from the bottom, r. 1811—29,614, and add—the number of houfes 2482.

DUNFERMLINE, col. 2, l. 41, r. 1811—11,649; add—and the number of houfes in the burgh and parish 1810.

DUNKARD, a township of Greene county, in Pennsylvania, having 1055 inhabitants.

DUNKELD. The town and parish, in 1811, contained 126 houfes, and 1360 perfons; 651 being males, and 709 females. The parish of Little Dunkeld contained 637 houfes, and 2982 perfons; 1448 being males, and 1534 females.

DUNMOW, GREAT, col. 2, l. 14 and 15, r. 1811—397—2015.—*Little,* l. 4, add—The number of houfes, in 1811, was 45, and of perfons 264.

DUNNET. In 1811, the parish contained 311 houfes, and 1398 perfons; 638 being males, and 760 females.

DUNSE. In 1811, the parish contained 462 houfes, and 2424 perfons; 1174 being males, and 1250 females.

DUNSTABLE, l. 6, r. 1049; l. 9, r. 475.

DUNSTAPLE. In 1811, the parish contained 296 houfes, and 1616 perfons; 690 being males, and 926 females.

DUODENUM. See **INTESTINES.**

DUPLIN, l. 4, r. 7863—2416.

DURAND, a township of Coos county, in New Hampshire, having 62 inhabitants.

DURBAR, denotes in India the court, hall of audience, or levee.

DURHAM, col. 2, l. 9, r. 29,033—177,625; l. 10, r. 83,671 and 93,954.

DURHAM, in America, l. 4, r. 1772; l. 9, r. 1449; l. 11, for New Haven r. Middlesex; l. 15, r. 1101; l. 17, r. 404.

DURSLEY, l. 15, for town r. parish, 489; l. 16, r. 2580—365 families.

DUTCHESS COUNTY, l. 7, r. in 1810, was 51,363—1262.

DUXBOROUGH, or DUXBURY, l. 5, r. 2201.

DUXBURY, l. 3, r. 326.

DYBERRY, a township of Wayne county, in Pennsylvania, having 318 inhabitants.

DYSART, l. 15, infer—The borough and parish, by the return of 1811, contained 777 houfes, and 5506 perfons. The town of Dyfart contained 136 houfes, and 1578 perfons: the lower, &c.

DYSPHANIA, in *Botany*, *δυσφανία*, *inconspicuous*.—Br. Prodr. Nov. Holl. v. 1. 411.—Clafs and order, *Polygamia Monœcia*, or rather *Diandria Monogynia*. Nat. Ord. *Holeraceæ*, Linn. *Chenopodium affine*, Br.

Eff. Ch. Calyx deeply three-cleft, coloured. Cor. none. Stigma fimple. Capfule turbinate, attached to the feed, and encamped with the enlarged calyx. Moft flowers female.

1. *D. littoralis*. A tropical New Holland herb, fmooth, very diminutive, with alternate entire *leaves*, and axillary tufts of white *flowers*, twenty of which would hardly make the bulk of a pin's head. One only in each tuft is furnifhed with *filaments*.

E.

EAGLE, in *Geography*, a township of Adams' county, in Ohio, containing 801 inhabitants.—Also, a township of St. Clair, in the Illinois territory, having 384 inhabitants.

EAGLE, Bald, a township of Centre county, in Pennsylvania, having 1146 inhabitants.—Also, a township of Lycoming county, in the fame ftate, having 246 inhabitants.

EAGLE Island. Add—Also, an ifland in the diftrict of Maine, and county of Hancock, having 9 inhabitants.

EAR, Diseases of. See **DEAFNESS, TYMPANUM, TUBE, Eustachian,** and **OTALGIA**, the latter of which articles will be found in the *Addenda*.

EARL, in *Geography*, a township of Lancafter county, in Pennsylvania, containing 4218 inhabitants.—Also, a township

township of Berks county, in the same state, having 794 inhabitants.

EARTH, col. 19, l. 12 from bottom, for 7935 r. 3967½, and for 7882 r. 3941.

EARTHEN WARE. See DELF and POTTERY.

EASTBOURNE, l. 13, after parish, insert—which contains 120 houses, and 720 inhabitants.

EAST DISTRICT, a township of Berks county, in Pennsylvania, having 805 inhabitants.

EASTHAM, l. 9, r. 752.

EASTON, col. 2, l. 1, r. 1657.

EASTON, l. 5, r. 1557.

EAST PORT. Add—It contained, in 1810, 1511 inhabitants.

EAST TOWN, l. 2, r. 587.

EAST WHITELAND, l. 2, r. 779.

EATON, l. *penult.* r. 535.

EATONTOWN, a town of Putnam county, in Georgia, having 73 inhabitants.

ECHENEIS, l. 4, add—Or, according to Dr. Shaw, head furnished above with a flat, ovate, transversely fasciated shield, gill-membrane six-rayed, and body without scales.

ECLIPTIC, *Obliquity of*, col. 2, l. 6 from bottom, add—And he found the obliquity of the ecliptic at the summer solstice to be 23° 27' 51", 55, and at the winter solstice 23° 27' 47", 37. The difference he conceives to depend upon refraction. At the observation of the summer solstice in 1812 with the new mural circle, he found the obliquity of the ecliptic to be 23° 27' 52", 25; from that of the winter solstice he deduced it 23° 27' 47", 35.

ECTROSIA, in *Botany*, from *εκτροσις*, an abortion, alluding to the number of abortive florets.—Brown Prodr. Nov. Holl. v. 1. 185.—A genus of grasses, allied to *ELESINE*, (see that article), and to *Chloris* of Swartz, all whose characters require investigation.

EDDINGTON, in *Geography*, a town of America, in Maine and county of Hancock, having 205 inhabitants.

EDDYSTONE, col. 2, l. 1, for 800, r. folio.

EDEN, in America, l. 4, add—containing 657 inhabitants; l. 5, add—containing 224 inhabitants.

EDESSA. Add—Edessa, at present denominated Orfa, after having been the residence of the Courtneys, counts of Edessa, and having been taken by Zenghi or Zingi, was sacked by the Moguls in the 13th century, and by Timur in the 804th year of the Hegira. It is now subject to the grand seignior, and the residence of a pacha of two tails. It is situated in a barren country, 67 miles from Bir, and 232 from Diarbekr. It is surrounded by a stone wall, and defended by a citadel. The houses are well built, and the inhabitants, composed of Turks, Arabs, Armenians, Jews, and Nestorians, are said to amount to about 20,000 souls. The chief ornaments of this city are, a mosque, consecrated to Abraham, and the cathedral of the Armenians, now decayed.

EDGARTON, l. 7, r. 1365.

EDGCOMB, l. 3, r. 1288; l. 9, r. 12,423 and 5107.

EDGEFIELD. Add—It contains 23,160 inhabitants, of whom 8576 are slaves.

EDGEMONT, l. 2, r. 611.

EDINBURGH, col. 7, l. 7, add—By the parliamentary return of 1811, the city and burgh of Edinburgh contained 7110 houses, and 102,987 inhabitants; 43,982 being males, and 59,005 females. The shire of Edinburgh contained 8679 houses, and 45,620 inhabitants; 21,022 being males, and 24,598 females.

EDINGTOWN. In 1811 the parish contained 85 houses, and 417 persons; 195 being males, and 222 females.

EDISTO, r. PONTOX.

EDWARDSIA, in *Botany*, (see that article), is thus defined by Mr. Brown, in Ait. Hort. Kew. v. 3. 1.—Cayk five-toothed. Corolla papilionaceous. Legume with four wings and many seeds.

EFFINGHAM, l. 4, r. 876. Do. l. 5, r. 1004; *dele* including 762 slaves.

EGERIA, or EGERA, the most strongly fortified city of Mingrelia, on the left bank of the Eaguri; populous and well built, and giving name to the whole country about it.

EGGS of *Flies*, l. 6 from the end, for formed, r. found.

EGG, in *Architecture*, l. 4, for plated, r. placed.

EGG HARBOUR. Add—It contains 1830 inhabitants, 22 being slaves.—Also, a town of Burlington county, in New Jersey, containing 931 inhabitants.

EGYPT, col. 6, l. *ult.* for or r. an. Col. 7, l. *penult.* for this r. the.

ECLAÏN, in *Chemistry*, a name given by Chevreul to a principle existing in animal tallows or fats. To obtain it, he dissolved the tallow in alcohol, and suffered the *stearin* (see *STEARIN*) to crystallize; the alcohol was then distilled off, and thus the *clain* separated. Braconnot procured it in a different manner. He submitted the tallow to pressure between folds of blotting-paper, which absorbed the *clain*. The paper was then soaked in water, and again subjected to pressure, by which the *clain* was forced out, and could thus be obtained separately.

Clain thus obtained has much the appearance of a vegetable oil, and is quite liquid at a temperature of 59°. Sometimes it is destitute of smell and colour, but most commonly it possesses both, owing probably to the presence of foreign bodies, from which it is impossible to free it. Chevreul examined the *clain* from the tallow of the human subject, the sheep, the ox, the hog, the jaguar, and the goose, all of which differed slightly from one another. Their specific gravity varied from .913 to .929; those of the human subject and ox being lightest, and that of the goose the heaviest. Those of the sheep, ox, and hog, were nearly colourless, and destitute of smell; all the others were more or less of a yellow colour, and possessed more or less odour. The *clain* of the sheep was most soluble in alcohol, 100 parts of which fluid, specific gravity .7952, dissolved 81.17 of *clain* at a temperature of 167°. The *clain* of the jaguar was least soluble, only 80.89 parts of the *clain* being soluble in the same quantity of alcohol at the same temperature. See further on this subject under *STEARIN*.

ELAOLITE. See MINERALOGY, *Aldenda*.

ELBERT, l. 6, r. 4291 and 45.

ELBERTON, l. 3, add—it contains 58 inhabitants.

ELBURZ, a range of mountains in Khorassan in Persia, which detaches several branches that expand over the country between Aferabad and Meshed, also over a great way to the east and north of that city, form a junction with the ridge of Banian, and finally sink into the desert plains of Khorazan.

ELECTRICAL WELL, *dele*.

ELECTRICITY, *Medical*. (See *MEDICAL Electricity*.) This subject was terminated rather abruptly in the article above referred to, we shall therefore endeavour to supply what was there omitted, or has since been observed upon the subject.

The powers of electricity in removing diseases were much over-rated by the earlier electricians, as for the most part

ELECTRICITY.

part happens with all new remedies. The disappointment to which this necessarily led soon brought it into disrepute, and latterly it has been treated with unmerited neglect. There can be no doubt, however, that when judiciously applied, it is a remedy possessing very considerable powers.

It is not our intention to detail here all the diseases to which electricity and galvanism are applicable, as the remedy, when proper, will be found, for the most part, to be recommended in the different articles treating professedly of such diseases. Our object is merely to describe the best and most approved methods of applying electricity, and to state a few remarkable facts which have been lately observed respecting its use.

Electricity may be applied in the form of *shocks*, *sparks*, or of a *continued stream* or *current*. The first of these forms was generally had recourse to by the older electricians, but it has been long since laid aside, except in particular cases of great general, or local debility. In such cases, the *shock* must be proportioned to the degree of the disease, but the size of the jar employed seldom or never ought to exceed a quart. The second form, or that of *sparks* from the chief conductor, is an excellent mode of applying electricity in many instances. It is, however, much less used than formerly. Sparks may be applied by the medium of balls of brass or other metal, and their strength is determined by the magnitude of the prime conductor, of the balls, and of the machine in general, and by the distance at which the balls are removed from the patient's body. The nearer the balls, the less powerful and more frequent are the sparks, and *vice versa*. The third method of applying electricity is in the form of a *continued stream* or *current*, and this perhaps is the most generally useful and important form of the whole. This method requires a very powerful apparatus. The current is directed through the different parts of the body by means of a simple apparatus placed in contact, or nearly so, with the body, and connected with the prime conductor. Besides these three forms of administering electricity, there is a fourth, which may be considered as intermediate in its nature between the two last; this is the application of what is termed the *electric aura*. It is effected nearly like the last, only the electric fluid is permitted to pass off from *points* of metal or wood placed at some distance from the body, or sometimes instead of *points*, the *edges* of hollow metallic or wooden cylinders, more or less sharp, are employed in a similar manner.

Of these different methods of applying electricity, the two last are undoubtedly in all ordinary cases preferable to the others. They are equally, if not more, beneficial in most instances, if properly applied; and besides have the great advantage of exciting no dread or alarm in the patient, a circumstance which often operates powerfully in deterring timid individuals from having recourse to this remedy, besides being productive of actual injury. These methods, however, as we before observed, require a powerful apparatus, so that the electrician may be enabled to send a very copious stream of the fluid through the whole or any part of the body, if required, as it is chiefly upon this circumstance that the good effects of these modes of applying electricity depend. We would not, however, be understood to recommend these modes of applying electricity exclusively of all others. The application of shocks, and particularly sparks, is often of great use when judiciously employed. Even the alarm they excite may not be without its use in particular cases; but such cases are rare, and the application of the remedy with advantage in these forms requires great judgment and practical knowledge on the part of the medical electrician.

For the phenomena of that modification of electricity termed *galvanism*, and its general effects upon the animal economy, we refer our readers to *VOLTAISM*, where they will find these subjects discussed; we shall therefore chiefly confine our attention here to the exhibition of galvanism as a remedy. The general principles of the application of galvanism differ in no respect from those of the application of electricity, nor do the effects of this form of electricity upon the animal economy differ perhaps in any respect whatever from those produced by common electricity; from the mode, however, in which this variety of the electric energy is excited and brought into action, a little difference in the mode of applying it is necessary. The application of galvanism in the form of shocks and sparks is out of the question. It is always applied in the form of a *continued* or *interrupted stream*, or sometimes in the form of *aura*; hence the conductors generally require to be in contact with the skin of the patient, which should be kept moist. The greater the surface of the conductor in contact with the skin within certain limits, *ceteris paribus*, the greater the effect produced, and *vice versa*. The *interrupted stream*, or that produced by the frequent removal and re-application of the conductor in contact with the skin, or by otherwise breaking the chain of communication, approaches in its nature more to that of the *electric shock* than the *continued stream*, a circumstance which should be kept in mind by the operator. Indeed with an apparatus composed of small plates, the stream requires to be occasionally interrupted, otherwise the effects will be very much diminished. See *VOLTAISM*, last section.

With respect to the magnitude of the battery proper for medical purposes, no very general rule can be given. The greater the number of plates, especially when of small size, the more do the effects produced upon the animal economy resemble those produced by common electricity. Large plates are best adapted for keeping up the *continued stream*, which is doubtless one of the best modes of exhibiting galvanism, and of ensuring its specific operation, if it exerts any. A medical galvanist can seldom require a battery composed of more than fifty or sixty pairs of plates, from four to six inches square, and a greater or less proportion of these must be employed according to the energy of action in the battery, and the circumstances of his patient. Dr. Wilson Philip states, that few patients can bear, for any length of time, more than from eight to sixteen pairs of plates fourteen inches square, when administered as described below. The same author, however, remarks, that patients can often bear double this number, for a short time, before any disagreeable sensation is produced.

Dr. Wilson Philip has lately attempted to shew that the galvanic battery may be substituted for the nervous energy in animals. His experiments on this subject are extremely interesting, and their results led him to employ galvanism as a remedy in several diseases to which it is never judiciously applied. These therefore remain to be briefly noticed.

Asthma and Dyspnea.—Dr. Philip states, that he has employed galvanism in many cases of habitual asthma, and almost uniformly with relief. The good effects began to appear usually from five to fifteen minutes after the application of the remedy. His battery consisted of thirty plates fourteen inches square, more or less of which were employed according to the degree of sensation produced; and his rule was to begin with a low power, and gradually increase it by moving one of the wires from one division of the trough to another. His method of exhibiting it in this disease was to apply two thin plates of metal, about two or three inches in diameter, moistened with water, one to the nape of the neck, and the other to the pit of the stomach,

mach, or a little lower, which plates were connected with the wires leading to the opposite ends of the battery. He directs that the wires should be constantly moved upon the metallic plates, particularly the negative wire, otherwise the cuticle is apt to be injured where they rest. The relief seemed much the same whether the positive wire was applied to the nape of the neck, or the pit of the stomach. The different effects, therefore, ascribed by some to positive and negative electricity seem doubtful. When relief was obtained, nothing appeared to be gained by continuing the operation longer. The galvanism was seldom used more than once a day, except in some severe cases. About a sixth part of those on whom it was tried received a permanent cure. It gave decided relief in all cases, and only failed to give considerable relief in about one-tenth of the whole number of cases.

Similar good effects are stated by Dr. Philip to have been experienced in dyspnoea, provided no inflammatory symptoms were present. Dr. Philip, however, seems to doubt if it will be found useful in spasmodic asthma.

In *Dyspepsia*, likewise, Dr. Philip thinks it will prove an excellent remedy; also in torpor of the liver and biliary ducts; and a recent writer states, that he has found it very advantageous in chronic *hepatitis*, *constipation*, &c. See an Experimental Enquiry into the Laws of the Vital Functions, by Dr. A. P. Wilson Philip.

ELECTROPHORUS, col. 2, l. 19 from bottom, for hair-skin *r.* hare-skin.

ELEOCHARIS, in *Botany*, *ἰδος*, *a marsh*, and *χαρις*, *an ornament or favour*, from its general place of growth.—Brown Prodr. Nov. Holl. v. 1. 224.—A genus separated from *Scirpus* by Mr. Brown; near akin to *Dichromena*, in character, but very different in habit; see those articles. Though the definition is not without exceptions, the genus is thought a natural one by its learned author, embracing *Scirpus palustris*, *geniculatus*, *mutatus*, and *acicularis* of Linnaeus with several others. There are eight New Holland species.

ELEPHAS, col. 10, l. 21 from bottom, for thirteen *r.* three.

ELETTARIA, in *Botany*, so called by Dr. Maton, V.P.L.S., from the Malabar name *Elettari*, or *Ela-tari*, which has always been appropriated to this very plant. If any names of barbarous origin may be retained, and many are now established, even by Linnaeus himself, who in the vigour of his judgment and authority protested against them, the above may well be admitted, for the following reasons. It exclusively belongs to a very important plant, constituting, as far as we know, a genus by itself, and it is perfectly unexceptionable in found and construction, as well as free from all ambiguity. Were this name nevertheless to be finally rejected, we should gladly substitute in its stead that of *Matonia*, in honour of our learned and valued friend, who has first clearly established the genus.—Maton Tr. of Linn. Soc. v. 10. 254. Rheede Hort. Mal. v. 11. 9.—Class and Order, *Monandria Monogynia*. Nat. Ord. *Scitamineae*, Linn. *Canna* Juss.

Gen. Ch. *Cal.* Perianth superior, of one leaf, tubular, cylindrical, elongated, minutely and irregularly toothed at the margin, permanent. *Cor.* of one petal; tube longer than the calyx, cylindrical, slender, curved; outer limb in three equal, oblong, recurved segments, not half the length of the tube; inner a somewhat obovate, large, notched, crenate, undivided lip, with a short claw. *Stam.* Filament

one, rather longer than the claw, stout, erect, with a lanceolate, acute, horizontal lobe, about its own length, on each side at the base, the summit simply notched, without any crest or extension beyond the anther, which consists of two oblong, distant, marginal lobes, about half the length of the filament, attached by their backs, their extremities on a level with the top of the filament. *Pist.* Germen inferior, nearly globular; style thread-shaped, lying close to the filament, between the lobes of the anther; stigma funnel-shaped, small, erect, nearly on a level with the top of the filament. *Peric.* Capsule fleshy, elliptic-oblong, or somewhat ovate, triangular, striated, of three cells, and three coriaceous valves. *Seeds* numerous, roundish, somewhat angular, rough, each with a fine, membranous, evanescent tunic. *Recept.* central, shorter than the capsule when dry, winged with three longitudinal membranes, originally connected with the central ridge of each valve.

Ess. Ch. Anther of two distinct lobes. Filament with two transverse lobes at the base; emarginate and simple at the summit. Outer limb of the corolla in three oblong lobes; inner a single lip. Capsule of three cells and three valves, with a central receptacle. Seeds rough, tunicated.

1. *E. Cardamomum*. Lefler, or Malabar, Cardamom. Maton as above. (*Amomum repens*; Sonnerat Ind. Or. v. 2. 240. t. 136. Rofe. Tr. of Linn. Soc. v. 8. 353. Willd. Sp. Pl. v. 1. 9. A. Cardamomum; White Tr. of L. Soc. v. 10. 230. t. 4, 5. *Alpinia repens*; Sm. Tr. of L. Soc. v. 8. 353, note. Specim. Pharm. Lond. unpubl. 8. A. Cardamomum; Roxb. Monandr. 38. Corom. v. 3. 19. t. 226. Cardamomum minus; Matth. Valgr. v. 1. 25. Camer. Epit. 11. f. 3. Bont. Hist. Nat. 126, the three rounder fruits only. Cluf. Exot. 187. Ger. Em. 1542. Dale Pharm. 276. C. simpliciter in officinis dictum; Bauh. Pin. 414. C. cum siliquis five thecis brevis; Bauh. Hist. v. 2. 205. Eleitari; Rheede Hort. Mal. v. 11. 9. t. 4, 5.)—Capsule ovate-oblong, obtusely triangular. Calyx notched.—Native of the mountainous parts of Malabar, on lofty cloudy hills, flowering when the rainy season begins, in April and May, ripening seed in October and November. *White, Roxburgh.* Root perennial, tuberous, with many fibres. *Leafy stems* from six to twelve feet high, erect, straight, pale green, not red or brownish, at the base. *Leaves* elliptic-lanceolate, pointed, from nine inches to two and a half feet long, and from one to five inches broad, spreading, dark green, smooth, entire; paler and more glossy beneath. *Stipula* emarginate, rounded, smooth. *Panicles* lateral, several from the tuberous base of each stem near the root, a span long, much branched, many-flowered, spreading horizontally on the ground, jointed, smooth. *Bractees* alternate, ovate-oblong, acute, at the base of each partial stalk, withering; *partial* ones solitary, tubular, closely embracing the germen and calyx, almost as long as the latter, and resembling it in shape, but deciduous. Outer limb of the *corolla* green; *lip* white, veined with crimson. *Capsule* when fresh fleshy, smooth, nearly globular, but becoming bluntly triangular, coriaceous, and pale brown, when dry. *Seeds* blackish, gratefully aromatic and pungent, with a flavour of Camphor, esteemed more agreeable and useful in food and medicine, than any others of this tribe. (See *CARDAMOM*, excluding what regards *Cardamomum majus*, &c.) This subject will be found explained under our supplementary article *AMOMUM*. Mr. White, who has given a most accurate and perfect history of this plant and its cultivation, under the name of *Anomum Cardamomum*, in Tr. of Linn. Soc. v. 10, above quoted, speaks of its seeds as “one of the most valuable articles of modern luxury, regarded as a necessary of life, by most of the inhabitants of

Asia—a grateful and falubrious accessory of diet—whose general adoption by the civilized nations of the other quarters of the world is prevented only by its limited importation.” This is certainly quite a new idea to us Europeans, who value this drug merely as a grateful and wholesome stomachic, on which account it becomes an article of commerce, having supplanted all its relatives in the apothecary’s shop. Its general use in Asia, indeed, renders the plant a very important and profitable object of culture, though the harvest, occurring at the most unhealthy season, is not unattended by serious dangers. Fevers, fluxes, the bite of innumerable minute leeches, and the instantly fatal sting of the whip-snake, are mentioned as not uncommon mischiefs, to which is added the caustic quality of a shrubby plant, whose botanical characters have not been ascertained, but whose leaves produce dangerous, and sometimes fatal, ulcerations of the skin. The profit of the Cardamom farms, however, is so considerable, as to overcome all difficulties in their cultivation, and Mr. White thinks they might easily be greatly extended.

2. *E. major*. Greater Oblong Cardamom. (*Cardamomum majus*; Dale Pharmac. 276. Bont. Hist. Nat. 127, the fruit only? *C. majus officinarum*; Bauh. Pin. 413. *C. majus vulgare*; Ger. Em. 1542. Cluf. Exot. 187. Lob. Ic. v. 2. 204. *C. medium*; Matth. Valgr. v. 1. 25. Camer. Epit. 11. f. 2. Barrel. Ic. obf. 1395. t. 971, the longest fruit. *C. cum siliquis five thecis longis*; Bauh. Hist. v. 2. 205. Enfal; Herm. Mus. Zeyl. 66. Zingiber Enfal; Gærtn. t. 12. f. 5.)—Capsule lanceolate-oblong, acutely triangular, with flat sides. Calyx three-lobed.—Native of Java, according to Dale, who remarks that this kind of Cardamom was, even in his time, rarely used, some substituting for it Grains of Paradise, others the *Anomum verum*. (See ANOMUM.) Specimens of this species are indeed, at present, only to be found in the cabinets of collectors. We are persuaded they must belong to the same genus as the Malabar Cardamom. They appear to have a similar panicked inflorescence, and the structure of the fruit, with its central receptacle, coriaceous striated valves, and angular rough or rugged seeds, are the same in this as in the last. These seeds, however, are of a brighter, or reddish hue, and very inferior in flavour, far less powerful and less agreeable. The shape of the capsule is essentially different, being usually thrice as long, and much more acutely and strikingly triangular, flattened at the sides, and more evidently curved. It is similarly crowned with a long, cylindrical, permanent calyx, decidedly three-lobed, whereas that of the former is only crenate, or jagged. This part is unfortunately often rubbed off by those who collect the fruits for sale. If Bontius be right, there is so wide a difference between these two plants in the situation of their flowers, as would almost overturn their generic identity. He gives, under the title of *Cardamomum majus*, a figure with large, terminal, simply racemose inflorescence, which he compares to that of a Hyacinth, describing the plant as taller than a man, with very large leaves, flowers white with a purple limb, and the whole very beautiful. Two capsules, not unlike our plant, though by no means very like it, being represented cylindrical, not triangular, and described as long as the finger, accompany the above figure! We cannot, on mature consideration, think the synonym of Bontius rightly applied. Nevertheless, he speaks of the qualities as agreeing with his *C. minus*, supposed to be our *Anomum Cardamomum*, or *Anomum verum* of old writers, not the preceding *Eleteria Cardamomum*. Clufius, Gerarde, &c. rather copy the fruit from Bontius than from nature, and seem to take the calyx for the stalk.

ELEVATION, *Angle of*, for A R B r. R A B (Plate I. *Mechanics*, fig. 3.)

ELGIN, l. ult. By the return of 1811, the number of houses in the burgh and parish was 962, and of inhabitants 4602.

ELHAM, l. 3 from bottom, insert after London—and the parish contains 174 houses, and 992 inhabitants.

ELOCUTION. Add to the references—ACTION, ARTICULATION, PASSION, PRONUNCIATION.

ELSENBOROUGH, a town in Salem county, in New Jersey, having 517 inhabitants.

ELTHAM, l. 3, r. 285 houses, and 1813 inhabitants.

ELWUND, *Mount*, a range of mountains in Irak, in Persia, most probably the mount Orontes of Diodorus, about twelve miles in length. Near its summit, which is tipped with continual snow, and seldom obscured by clouds, is a beautiful valley, perfumed by a thousand sweet-scented flowers. This mountain is famous in the East for its mines, waters, and vegetable productions. The natives of Hamadan, which is situated at the foot of this mountain, believe that some of its grasses have the power of transmuting the basest metals into gold, as well as of curing any distemper to which the human frame is exposed; and the Indians suppose that it contains the philosopher’s stone.

ELY, col. 2, l. 4, after includes, insert—5977 houses, occupied by 32,443 inhabitants, &c. Col. 4, l. 43, r. 4249; l. 44, r. 928.

ELY, or *Elie*. In 1811 this parish contained 157 houses, and 886 persons; viz. 365 males, and 521 females.

EMBANKMENT, col. 25, l. 4 from bottom, insert—In 1809 about 6000 acres of land were obtained by an embankment of the sea upon Cartmel sands, in Lancashire. The embankment at Tre-Madoc, in Carnarvonshire, was completed in 1811.

EMDEN, in *Geography*, a township in the district of Maine, and county of Somerset, having 351 inhabitants.

EMERY,

EMERY, l. 11, after Tennant, insert—(Phil. Trans. for 1802, p. 401.)

EMETIN, in *Chemistry*, a name given by MM. Majendie and Pelletier to a substance extracted by them from ipecacuanha, and so called because it constitutes the principle to which that root owes its emetic qualities. Emetin may be obtained by digesting ipecacuanha in sulphuric ether, and afterwards in alcohol. The alcoholic solution is then to be evaporated to dryness, redissolved in water, and acetate of lead dropped into the solution. The copious precipitate thus obtained being well washed and diffused through water is then to be expofed to the action of fulphuretted hydrogen. The lead is thus precipitated while the emetin remains dissolved in water; and the liquid being filtered and evaporated to dryness, the emetin will be obtained in a state of purity.

Emetin thus obtained exists in the form of brownish transparent scales. Its taste is bitter and a little acrid, but not disagreeable. It has no smell. At the temperature of boiling water it is not changed. When expofed to a higher heat it does not melt, but swells, becomes black, and is converted into water, carbonic acid gas, a little oil, and acetic acid, but yields no trace of ammonia, which indicates that it does not contain azote. A very spongy and light coal remains. When expofed to the air, emetin undergoes no change, except the air be very damp, when it deliquesces. It diffolves readily in water and alcohol, but not in sulphuric ether. It does not crystallize.

Sulphuric and nitric acids, when concentrated, decompose it. Muriatic and phosphoric acids dissolve it without alteration, and it may be separated from them by saturation with an alkali. Acetic acid is one of the best solvents of it. Gallic acid and infusion of galls precipitate it immediately, as do solutions of most of the metallic salts.

Half a grain of this substance occasions violent vomiting, followed by sleep, and the animal awakes in a state of health. A larger quantity, as twelve grains, or even six grains, produces violent vomiting and sleep, followed by death, which appears to take place in consequence of the severe inflammation of the lungs and intestinal canal, produced by large doses of this solution.

EREMOPHILA, in *Botany*, from *ερημος*, a desert, alluding to its place of growth.—Br. Prodr. Nov. Holl. v. 1. 518.—Class and order, *Didynamia Angiosperma*. Nat. Ord. *Myoporinæ*, Br.

Eff. Ch. Calyx in five deep segments; changed and membranous in the fruit. Cor..... Stigma undivided. Drupa dry, with four cells, and four seeds.

Two rush-like shrubs, *E. oppositifolia* and *alternifolia*, found on the inhospitable south coast of New Holland. Their leaves are semicylindrical. *Flowers* solitary, stalked.

ERACHNE, from *ερα*, wool, and *αχνη*, a byst.—Br. Prodr. N. Holl. v. 1. 183.—Clafs and order, *Triandria Digynia*. Nat. Ord. *Gramina*.

Eff. Ch. Calyx of two equal valves, two-flowered. Florets feffile, of two bearded valves. Nectary of two scales. Stigmas feathery.

A genus of tropical graffes, akin to *Aria*, generally downy; their leaves narrow, flowers panicled. Mr. Brown describes ten New Holland fpecies, none of them in any other author. In fix of them, the outer valve of the corolla has a terminal awn.

ERIE, l. 2, r. 3758; after Erie, add—borough, containing 394 inhabitants, of whom, in 1810, 14 were flaves.

ERIOCHILUS, in *Botany*, from *εριον*, wool, and *χιδος*, a lip, becaufe the dilk of the nectary is downy.—Br. Prodr. Nov. Holl. v. 1. 323.—Clafs and order, *Gynandria Monandria*. Nat. Ord. *Orcbidee*.

Eff. Ch. Calyx ringent; lower leaves stalked, under the lip. Petals smaller, erect. Lip stalked; dilk downy, without glands. Column femicylindrical; fimple at the top. Anther terminal, permanent, pointlefs; cells clofe together. Maffes of pollen four in each.

1. *E. autumnalis*. Br. n. 1. (*Epipactis cucullata*; Labill. Nov. Holl. v. 2. 61. t. 211. f. 2.)—Native of the east and fourth parts of New Holland. *Bull* globular. *Leaf* radical, enclosed in a sheath, with the bafe of the stalk, which is four or five inches high, naked, bearing from one to three white or purplifh flowers. Akin to CALADENIA.

ERIVAN. Add—By various fieges, the laft of which was in the year 1808 by the Ruffians, this town is reduced to a ruinous condition. It has been repeatedly taken both by the Turks and Perfians, and has remained in the poffeffion of the latter from the peace of Nadir Shah in 1748. This city, which gives name to a province bounded on the N. and W. by the Mofian hills, on the S. by the Araxes, and on the E. by the diftrict of Karabaug and Karadaug, is fituated on the banks of the river Zengui, and defended by a fortrefs, of an elliptical form, upwards of 6000 yards in circumference. The N.W. fide of the town is built on a precipice, impending over the river 100 toifes in height; but is furrounded by the fort which is encompassed by two ftrong walls, flanked with towers.

ERKOOH, in *Ornithology*, a bird of Abyffinia, which belongs to a large tribe, differing principally in the beak and horn. The horn is fometimes feen upon the back, and fometimes upon the forehead, above the root of the beak. In the east part of Abyffinia, it is called *Abba Gumba*, in the language of Tigré; but on the western fide of the Tacazzé, it is called *Erkoom*. Its groaning noife gives occasion to the firft of its names. By naturalifts, this bird is called the Indian crow or raven. The colour of the eye is a dark brown, or rather of a reddifh caft; the eye-lashes are large; its length from the tip of the beak to the extremity of the tail is three feet ten inches; the length of the beak is ten inches, and the length of the horn three and a half inches. The colour of this bird is footy-black; the large feathers of the wing are ten in number, milk-white both without and within; the tip of his wings reaches nearly to his tail; and at his neck he has thofe protuberances like the turkey-cock, which are light blue, but turn red upon his being chafed, or when the hen is laying. He feems to prefer running on the ground to flying; but when he is raifed, he flies to a confiderable diftance. Its fmell is rank, and he is faid to live in Abyffinia upon dead carcafes; but this Mr. Bruce conceives to be a miftake, as he never follows the army like birds of prey. His food feemed to be the green beetles that are found upon the tops of the teff, and in order to obtain them, he frequents fields of this grain.

He builds in large thick trees, and if he can, always near churches, and his neft is covered like that of a magpie. Mr. Bruce, in the Appendix to his Travels, has described this bird, and accompanied his description with a drawing.

ERROL, l. 2, for Grafton r. Coos. Add—and in 1810, contained 38 inhabitants.

ERUCARIA, in *Botany*, Gærtn. v. 2. 298. t. 143. Brown in Ait. Hort. Kew. v. 4. 122. See CORDYLO-CARPUS.

ESTLE, a county of Kentucky, containing 2082 inhabitants, of whom, in 1810, 133 were flaves.

ETHER, in *Chemiftry*. The fpecific gravity of fulphuric ether, as recently determined by M. Theodore de Sauffure, is .7155 at 68°; and it boils in vacuo at — 20°, and not at 20°, as ftated in the Cyclopædia. The fpecific gravity of the vapour of fulphuric ether, according to Mr. Dalton, is 2.25; according to M. Gay Luffac, whose experiments were made with great care, it is 2.586, that of air being 1. M. Theodore de Sauffure has lately published an analysis of fulphuric ether: according to this ingenious chemift, it is compofed of

Hydrogen	-	-	-	14.40
Carbon	-	-	-	67.98
Oxygen	-	-	-	17.62
				<hr/>
				100.00
				<hr/>

Which proportions are nearly equivalent to

Olefiant gas	-	-	-	86.05
Water	-	-	-	19.95
				<hr/>
				100.00
				<hr/>

ETHER.

Dr. Thomson, however, seems to doubt the perfect accuracy of this analysis, and supposes rather that it is a compound of four atoms of olefiant gas and one atom of water, which supposition nearly agrees with the specific gravity of the vapour of ether above-mentioned, as determined by M. Gay Lussac. Thus the sp. gr. of olefiant gas being .974—

Two volumes of it will weigh	1.948
The sp. gr. of the vapour of } water is - - - - }	.625
	2.573

which certainly differs but little from 2.586, the true sp. gr. according to M. Gay Lussac.

Nitric Ether.—The properties of this singular substance have been lately investigated by Thenard. This eminent chemist found the following to be the best mode of preparing it. Equal parts of alcohol and nitric acid, of the sp. gr. 1.283, were put into a retort, to the neck of which was luted a glass tube, which was plunged to the bottom of a long narrow glass jar, half filled with a saturated aqueous solution of common salt. From the top of this jar passed another tube, which went to the bottom of another similar jar, filled with the same solution. In this manner, five other similar jars were connected with each other, and from the last a tube passed to a water-trough, to receive the gaseous products in proper vessels. Each of these jars was surrounded with a mixture of snow and salt, to keep it as cool as possible. A moderate heat was then applied to the retort, which produced so violent an effervescence, that it became necessary to moderate it by withdrawing the fire, and applying cold water to the outside of the retort. At the end of the operation, the ether was found floating on the surface of the solution in the different jars, but more especially in the first. It was separated, and to remove the nitrous and acetic acids with which it was contaminated, it was agitated in a close phial with a sufficient quantity of chalk. Thus purified, it possesses the following properties.

It has a slightly yellow colour, and a very strong ethereal odour. Its taste is likewise strong and peculiar. It is rather heavier than alcohol. It is much more volatile than sulphuric ether, the heat of the hand being sufficient to make it boil; hence it produces a very considerable degree of cold by its evaporation. It is lighter than water, and requires about forty-eight parts of that fluid to dissolve it. The solution has an agreeable odour, like that of apples. It is soluble in alcohol in every proportion. It is very inflammable. When kept for some time, both nitrous and acetic acids are formed in it. The same acids also are produced if it be heated, or even agitated with water. It has also the property of absorbing these acids very readily, and acquiring the property of reddening vegetable blues. Its vapour is much more elastic than that of sulphuric ether.

According to Thenard, it is composed of

Hydrogen - - - -	8.54
Carbon - - - -	28.45
Oxygen - - - -	48.53
Azote - - - -	14.49
	100.00

But Dr. Thomson does not seem to place much reliance in the accuracy of this analysis.

Muriatic Ether.—Since the article ETHER was written for the Cyclopædia, this species of ether has been examined

with great care by Gehlen, and still more recently by Thenard, which latter chemist has given the following as the best mode of preparing it.

A retort is to be nearly filled with a mixture of equal bulks of muriatic acid and alcohol, both as strong as possible. To prevent the effects of the violent ebullition which would otherwise take place on the application of heat, a few grains of sand are to be introduced into the retort. From the neck of the retort a tube passes into a glass jar, twice the size of the retort, and furnished with three mouths. This jar should be half filled with water of the temperature of about 70°. Into the second mouth a short tube of safety is to be luted; and into the third, a tube which passes into a water-trough to receive the gas. On the application of heat, the ether escapes in the form of gas. This gas is colourless, does not affect vegetable colours nor lime-water. Its sp. gr. is 2.219, that of air being 1. At the temperature of 64°, water dissolves its own bulk of it. At the temperature of 52°, it becomes liquid ether.

Muriatic ether in its liquid state is colourless like water, very liquid, has no action on vegetable blues, and has the same smell and taste as in the gaseous state. At the temperature of 41°, Thenard ascertained its sp. gr. to be .874. It is much more volatile than alcohol, or even sulphuric ether. None of the usual tests indicate the presence of muriatic acid in it. When burnt, however, a considerable proportion of this acid is disengaged, a fact first observed by Gehlen, and since fully confirmed by Thenard. From Thenard's analysis, it appears that this singular compound is composed of

Muriatic acid - - -	29.44
Oxygen - - - -	36.61
Oxygen - - - -	23.31
Hydrogen - - - -	10.64
	100.

Dr. Thomson is disposed to consider it as a compound of one volume of olefiant gas, and one volume of muriatic acid gas, condensed into one volume; or, what is the same thing, of four atoms olefiant gas, and one atom of muriatic acid. On this supposition, its constituents will be

Five atoms hydrogen	= 6.25
Four atoms carbon	= 30.00
One atom chlorine	= 45.00
	81.25
And the weight of its } atom will be - - }	= 81.25

Hydriodic Ether.—This ether was discovered by M. Gay Lussac. He formed it by mixing together two volumes of absolute alcohol, and one volume of hydriodic acid of the sp. gr. 1.7, and distilling in a water-bath. Hydriodic ether, after being well washed with water, is perfectly neutral. Its odour is strong, and analogous to that of other ethers. In a few days it acquires a reddish colour, which is instantly removed by mercury or potash. Its sp. gr. at 72° is 1.9206. It boils at the temperature of 148³/₁₀°. It is not inflammable, but merely gives out purple vapours when put upon burning coals. When passed through a red-hot tube, it is decomposed, an inflammable carburetted gas is obtained, hydriodic acid evolved, and some charcoal deposited. This ether has not been analysed; but Dr. Thomson is disposed to believe, from analogy, that it has a composition similar to that of muriatic ether, or that

it is composed of four atoms olefiant gas, and one atom of hydriodic acid.

Acetic Ether.—The original experiments of Lauraguais and Scheele have been lately repeated by other chemists, and particularly by Thenard. Thenard succeeded in forming this ether, by repeatedly distilling together very concentrated acetic acid and alcohol. No gaseous product was evolved. The superfluous acid was neutralized by potash, and the ether finally obtained by a cautious distillation of the resulting liquid from acetate of potash. Acetic ether thus procured is limpid and colourless. Does not redden vegetable blues. Possesses a peculiar taste, quite different from that of alcohol. Its sp. gr. at $44\frac{2}{3}^{\circ}$ is .866. It boils at the temperature of 160° . It burns with a yellowish-white flame, and acetic acid is evolved during its combustion. At the temperature of 62° , it requires more than seven times its weight of water to dissolve it. It appears from these and other properties to be a compound of acetic acid and alcohol.

Formic Ether.—This was first formed by Gehlen. It may be prepared precisely in the same way as acetic ether, merely substituting the formic for the acetic acid. Formic ether has an agreeable odour, similar to that of peach blossoms. Its taste is likewise similar, leaving an impression of ants. At a temperature of 63° , its sp. gr. is .9157. It burns with a blue flame, having yellow edges, and at the above temperature is soluble in nine times its weight of water. This ether has not been analysed.

EUCLIDIUM, in *Botany*, from *ev*, *well*, and *κλιδος*, to *shoot up*, because of the firmly-closed seed-vessel.—Br. in Ait. Hort. Kew. v. 4. 74.—Class and order, *Tetradynamia Siliculosa*. Nat. Ord. *Siliculosae*, Linn. *Cruciferae*, Juss.

Eff. Ch. Pouch tumid, of two cells, with evident furrows but not bursting. Seeds solitary. Cotyledons flat.

1. *E. lycium*. Syrian Euclidium. Ait. n. 1. (Anatitica lyciaca; Linn. Sp. Pl. 895. Jacq. Austr. t. 6.)—Pouch rough. Style awl-shaped, permanent. Leaves lanceolate, stalked.—Native of the warmer parts of Europe. What the other species may be we are not informed.

EUDESMA, from *ev*, *well*, and *δυσμος*, *confined*.—Brown Bot. of Terr. Austr. 67.—Class and order, *Polyadelphia Polyandria*. Nat. Ord. *Hesperideae*, Linn. *Myrti*, Juss.

Eff. Ch. Calyx four-toothed, superior. Petals closely united into a deciduous lid, with four furrows. Stamens

in four sets, alternate with the calyx-teeth, combined at the base. Capsule of four cells, opening at the top. Seeds numerous.

1. *E. tetragona*. Br. as above, t. 3.—In exposed barren places near the shore, about Lucky bay, on the fourth coast of New Holland, flowering and bearing fruit in January. Br. A *shrub*, three to five feet high, with square, bordered *branches*. Leaves stalked, ovate-oblong, mostly opposite, coriaceous, four or five inches in length, entire, glaucous, dotted with resinous points. *Umbels* axillary, stalked, of three or four *flowers*, whose numerous white *stamens* spread conspicuously after the lid is fallen. We believe this fine plant is living in the green-house of the Comtesse des Vandes, at Baywater.

EUDIOMETER. See LABORATORY.

EUDIOMETRY. Add—See LABORATORY.

EVELYN, l. 2, insert after Surrey—October 31st; l. 4, for Christchurch r. Bialoi college; l. 5, insert—spent much of his time. At the close of his article, add—For a farther account of the life and writings of this excellent person, we refer to the “Memoirs,” published from original MSS. in 2 vols. by William Bray, esq. Lond. 1818.

EVESHAM, col. 2, l. 10 from the bottom, r. 674 houses, and 3068 inhabitants.

EVESHAM, in America, add—In 1810, it contained 3445 inhabitants.

EUPOMATIA, in *Botany*, from *ev*, *well*, and *πρωματις*, to *shoot up* *with a cover*.—Brown Bot. of Terr. Austr. 65.—Class and order, *Monadelphia Polyandria*. Nat. Ord. *Coandunatae*, Linn. *Annonaceae*, De Cand. Br.

Eff. Ch. Calyx a superior, entire, deciduous lid. Corolla none. Inner stamens dilated, imbricated, without anthers. Styles none. Stigmas numerous, depressed. Berry globose, bordered, with many seeds.

1. *E. laurina*. Br. as above, t. 2.—In mountainous woods, and about great rivers, at Port Jackson, flowering in December and January. A slender *shrub*, from five to ten feet high, very smooth. Leaves alternate, on short stalks, obovate-oblong, acute, entire, coriaceous, four or five inches long. *Flower-stalks* axillary, short, bearing two or three small leaves, and one *flower*, whose numerous, pale yellow, perfect *stamens* spread, in a radiant manner, after the lid is gone, displaying the broad imperfect ones, united with them below, overlapping the *stigmas*. These superfluous intruders are observed, by Mr. Brown, to be usually eaten away by insects. Berry three-quarters of an inch broad. Seeds oval, wrinkled.

EURYALE, the name of one of the Gorgons, adopted here to express the thorny menacing habit of the plant. It might likewise be understood as alluding to the ample area of the leaves.—Salisb. in Ann. of Bot. v. 2. 73. Ait. Hort. Kew. v. 3. 295.—Class and order, *Polyandria Monogynia*. Nat. Ord. *Rhoceae*, Linn. *Hydrocharitides*, Juss. *Nymphaeae*, Salisb.

Eff. Ch. Calyx of four leaves, superior. Petals numerous. Stigma sessile, peltate. Berry crowned with the calyx. Seeds numerous, tunicated.

1. *E. ferox*. Prickly Euryale. Ait. n. 1. Roxb. Corom. v. 3. 39. t. 244. Annela spinosa; Andr. Repof. t. 618.—Native of lakes and ponds in India, to the east of Calcutta. Roxb. This has the habit of a *Nymphaea*. The floating peltate leaves, cloven at the base, are from one to four feet wide; purple beneath; their ribs, veins, and *stalks*, like the *flower-stalks*, *calyx*, and *fruit*, armed copiously with sharp prickles. *Flowers* comparatively small, purple, with yellow stamens. *Fruit* about two inches in diameter. *Seeds*, or *nuts*, the size of a large pea, each in a loose coloured tunic.

tunic. This noble plant has flowered in the duke of Marlborough's aquarium at White Knights. *Annelæa* was the name originally intended by Dr. Roxburgh.

EUSTREPHUS, from *eu*, *well*, and *strephos*, *to turn*, or *twine*.—Brown Prodr. Nov. Holl. v. 1. 281. Ait. Hort. Kew. v. 2. 272.—Class and order, *Hexandria Monogynia*. Nat. Ord. *Asphodelææ*, Br.

Efl. Ch. Corolla in six deep segments; three innermost fringed. Anthers erect. Stigma triangular. Capsule pulpy, of three cells, and three valves, with partitions from their centre. Seeds several; scar crested.

Twining leafy *shrubs*, from the warmer parts of New Holland, with alternate, ribbed, entire *leaves*; simple, aggregate, drooping *flower-stalks*; pale purple elegant *flowers*; yellow *fruit*, and rather large black *seeds*.

1. *E. latifolius*. Ovate Fringe-blossom. Ait. n. 1. Br. n. 1. Curt. Mag. t. 1245.—Leaves more or less ovate. Filaments combined at the base. Tips of the anthers twisted in fading.—Native of New South Wales. Dr. *White*.

2. *E. angustifolius*. Linear Fringe-blossom. Br. n. 2.—Leaves linear-lanceolate. Filaments distinct. Tips of the anthers always straight.—Found within the tropic, as is also the first species. *Mr. Brown*.

EUTAXIA, Br. in Ait. Hort. Kew. v. 3. 16, we scruple to separate from DILLYNIA: it is our fourth species there described.

EUTHALES, from *eu*, *well*, and *halos*, *to flourish* or *blossom*.—Br. Prodr. Nov. Holl. v. 1. 579. Ait. Hort. Kew. v. 1. 363.—Class and order, *Pentandria Monogynia*. Nat. Ord. *Goodeniææ*, Br.

Efl. Ch. Calyx inferior, tubular, in five unequal segments. Tube of the corolla adhering to the germen beneath, split on one side above; limb two-lipped. Anthers distinct. Stigma with a two-lipped cover. Capsule of four valves; two-celled at the base. Seeds imbricated, compressed.

1. *E. trinervis*. Three-ribbed Euthales. Br. n. 1. Ait. n. 1. (Velleia trinervis; Labill. Nov. Holl. v. 1. 54. t. 77. Goodenia tenella; Andr. Repof. t. 466. Curt. Mag. t. 1187.)—From the fourth coast of New Holland. An herbaceous perennial plant, with hairy radical *leaves*, forked radical *flower-stalks*, and handsome golden *flowers* with a dark-purple, central, divided spot.

EWELL, l. 7, r. 1811, 225 houses, and 2135 inhabitants.

EXARRHENA, in *Botany*, from its prominent stamens, in which it seems chiefly to differ from *Myofotis*.—Br. Prodr. Nov. Holl. v. 1. 495.—The only species is *E. suaveolens*, found in Van Diemen's island, a hairy herb, with decurrent *leaves*, and fragrant white *flowers*.

EXECUTION, in *Painting*, col. 4, l. 2, r. Janus.

EXETER, col. 4, l. 23 from the bottom.—The number of inhabitants in the city of Exeter and county of the same, by the return of 1811, was 2879 houses, and 18,896 inhabitants.

EXETER, in America, l. 17, r. 8759.—In Washington county, l. 3, r. 2236, and add—Also, a county of New York, containing 9477 inhabitants.—Also, a township of Berks county, in Pennsylvania, having 1194 inhabitants.

EXTRACT—EXTRACTIVE Principle, in *Chemistry*. Great confusion exists in different chemical authors respecting these terms. Formerly the term *extract* was applied to all those substances which were extracted from plants by means of water or spirits; but of late it has been confined by many to a substance which is supposed to exist in many plants, and which may be obtained tolerably pure from the bark of the cinchona officinalis, according to the experiments of Schrader. Other chemists, however, still use the term *extract* in its original sense; hence Dr. Thomson, to prevent ambiguity, has chosen to distinguish the principle of Schrader by the term *extractive*. The following are the properties of *extractive*, according to Dr. Thomson.

1. Soluble in water, and the solution is always coloured. When the water is slowly evaporated, the extractive matter is obtained in a solid state, and transparent; but when the evaporation is rapid, the matter is opaque.

2. The taste of extractive is always strong, but it is very different according to the plant from which it is obtained.

3. It is insoluble in absolute alcohol and in ether, but soluble in alcohol when it contains water.

4. By repeated solutions and evaporations, the extractive matter acquires a deeper colour, and becomes insoluble in water. This change is considered as the consequence of the absorption of the oxygen of the atmosphere, for which the extractive principle has a great affinity. But if the solution be left to itself, exposed to the atmosphere, the extract is totally destroyed in consequence of a kind of putrefaction which speedily commences.

5. When chlorine is poured into a solution containing extractive, a very copious dark yellow precipitate is thrown down, and the liquid retains but a light lemon colour. These flakes are considered as oxygenized extractive; it is now insoluble in water, but hot alcohol dissolves it.

6. The extractive principle unites with alumina, and forms with it an insoluble compound. Accordingly, if sulphate or muriate of alumina be mixed with a solution of extractive, a flaky insoluble precipitate appears, at least when the liquid is boiled; but if an excess of acid be present, the precipitate does not always appear.

7. It is precipitated from water by concentrated sulphuric acid, muriatic acid, and probably by several other acids. When the experiment is made with sulphuric acid, the fumes of vinegar generally become sensible.

8. Alkalies readily unite with extractive, and form compounds insoluble in water.

9. The greater number of metallic oxids form insoluble compounds with extractive. Hence many of them, when thrown into its solution, are capable of separating it from water. Hence also the metallic salts mostly precipitate extractive. Muriate of tin possesses this property in an eminent degree. It throws down a brown powder, perfectly insoluble, composed of the oxyd of tin and vegetable matter.

10. If wool, cotton, or thread, be impregnated with alum, and then plunged into a solution of extractive, they are dyed of a fawn-brown colour, and the liquid loses much of its extractive matter. This colour is permanent. The same effect is produced if muriate of tin be employed instead of alum. This effect is still more complete if the cloth be soaked in chlorine, and then dipped into the infusion of the extractive. Hence we see that the extractive matter

matter requires no other mordant than oxygen to fix it on cloth.

11. When distilled, extractive yields an acid liquid impregnated with ammonia.

It cannot be doubted, continues Dr. Thomson, that there are many different species of extractive matter, though the difficulty of obtaining each separately has prevented chemists from ascertaining their nature with precision. Watery extracts, when obtained by slow evaporation to dryness, always have an acid taste, and redden litmus. They all yield a precipitate while liquid on the addition of ammonia. This precipitate is a compound of lime and insoluble extractive. Lime always causes them to exhale the odour of ammonia. It has been ascertained, that the extractive principle is more abundant in plants that have grown to maturity than in young plants.

All the extracts prepared by apothecaries are compounds of the extractive principle with several others, even as many as eight or more, according to Dr. Thomson. In short, this department of vegetable chemistry is at present in a very confused and imperfect state.

VOL. XIV.

EYE, *Physiology of the*, col. 6, l. 26 from bottom, for an inch *r.* one-tenth of an inch.

EYE, *Humours of, Chemical Properties of.* Some experiments have been made on these fluids, the results of which defer to be briefly mentioned.

Aqueous Humour.—Mr. Chenevix found the sp. gr. of the aqueous humour of the sheep at 60° to be 1.009. This fluid scarcely affects vegetable blues while fresh. On exposure to heat, a slight coagulum is formed. Tannin occasions a precipitate in it, both before and after boiling. Nitrate of silver likewise produces a precipitate, but no other metallic salt. According to Berzelius, 100 parts of it consist of

Water	-	-	-	98.10
Albumen, a trace	-	-	-	
Muriates and lactates	-	-	-	1.15
Soda with animal matter, soluble	-	-	-	.75
only in water	-	-	-	
				100.

Vitreous Humour.—This possesses very nearly the same properties as the aqueous. Even its sp. gr. is the same, or only a very little heavier. According to Berzelius, it is composed of

Water	-	-	-	98.40
Albumen	-	-	-	.16
Muriates and lactates	-	-	-	1.42
Soda with animal matter, soluble	-	-	-	.02
only in water	-	-	-	
				100.

Cryalline Lens.—The sp. gr. of this is 1.100. When fresh it has little taste. It putrefies very rapidly. It is almost completely soluble in water. The solution is partly coagulable by heat, and gives a copious precipitate with tannin both before and after boiling. According to Berzelius, it is composed of

Water	-	-	-	58.0
Peculiar matter	-	-	-	35.9
Muriates, lactates, and animal	-	-	-	2.4
matter soluble in alcohol	-	-	-	
Animal matter, soluble only in	-	-	-	1.3
water, with some phosphates	-	-	-	
Portions of the remaining in-	-	-	-	2.4
soluble cellular membrane	-	-	-	
				100.

The peculiar matter of the lens possesses all the chemical properties of the colouring matter of the blood, except colour.

The humours of the human eye are composed of the same ingredients as those of the sheep; but they differ in their sp. gr. Thus the sp. gr. of the human aqueous and vitreous humour is 1.0053; that of the crystalline 1.0790. The humours of the eyes of oxen also resemble those of the sheep. The sp. gr. of the aqueous and vitreous humours is 1.0088; that of the crystalline 1.0765. The crystalline of the ox weighed thirty grains. When the whole was pared away, except six grains in the centre, the sp. gr. was found to be 1.194.

Sir H. Davy found the same constituents in the eyes of birds; but the sp. gr. of the vitreous humour in these animals is greater than the sp. gr. of the crystalline.

Pigmentum Nigrum.—This curious substance has been examined by Gmelin. From 500 eyes of oxen and calves he collected 75 grains. Its colour is blackish-brown. It is tasteless, and adheres to the tongue like clay. It is insoluble in water, alcohol, ether, oils, lime-water, and acetic acid. It dissolves in potash and ammonia by the assistance of heat, and is again precipitated by acids. Sulphuric acid dissolves it, and becomes black. Muriatic acid also forms an imperfect solution. Nitric acid dissolves it, and changes its colour to reddish-brown. When distilled it yields water, brown oil, and carbonate of ammonia. The residuum consists almost entirely of charcoal.

EYE, col. 2, l. 6, *r.* In the year 1811, the town and parish consisted of 326 houses, and 1893 inhabitants.

EYEMOUTH. Add—By the return of 1811, the parish contained 115 houses, and 962 inhabitants.

EYNSHAM, or ENSHAM, *l. ult.*—In 1811, the number of inhabitants was 1418, and of houses 246.

FAYSTON, a town of Chillendon county, in Vermont, having 149 inhabitants.

FEARING, a town of Ohio, in Washington county, having 454 inhabitants.

FEATHERS, *dry-pulled, scalded, dele* the reference to *BED*.

FELAHI,

FELAHI, or DORAK, one of the principal towns of Chufitan or Kuzitan, in Persia, founded by Sheikh Soliman when the ancient Dorak, one of the eight cities of Sufiana, was abandoned. It is situated in low marshy ground, on the banks of two of the branches of the Jerahi, surrounded with mud walls, sixteen feet thick and two miles in circumference, flanked at intervals with towers. The inhabitants, amounting to 8000, live chiefly without the walls in the suburbs. This town is celebrated for the manufacture of the abba, or Arabian cloak, which is transported in great numbers all over Persia and Arabia.

FELSPAR. See FELSPAR and MINERALOGY, *Addenda*.

FELUGIA, or ANBAR, in *Geography*, a town in the pachalic of Bagdad, which, under the appellation of Perifabur, is ranked, in the history of the campaigns of Julian, as the head city in Assyria. The city was reduced to ashes, and on its ruins a palace was erected by Soliman the Great, pacha of Bagdad. Pilgrims going to Kerbela generally cross the river at this spot, on a bridge of boats.

FENCE, col. 2, l. 20, *dele* low. Col. 3, *dele* hedge, last word, and the comma in l. 2. Col. 21, l. 4, for thus above *r.* thus formed above; l. 34, 35, for under the plough *r.* into grafs.

FEREDUN, in *Geography*, a small district of Irak, in Persia, behind the S.W. ridge of the mountains of Khonfar, peopled with Georgians and Armenians, brought hither by Abbas the Great. The former, amounting to 1000 families, are Mahometans, who never intermarry with either Persians or Armenians. The capital of the district is Pusahish.

FERGUSON, a township of Centre county, in Pennsylvania, having 1066 inhabitants.

FERMANAGH, l. 2, *r.* 1954.

FERMENTATION, VINOUS, in *Chemistry*. The recent observations of chemists enable us to state with greater precision the changes which fugar undergoes during its conversion into alcohol, than could be done when this article was written for the Cyclopædia.

Sugar is composed, according to Dr. Prout's analysis, of

Hydrogen	-	-	6.66
Carbon	-	-	40.00
Oxygen	-	-	53.33
			= 100.

which correspond with 1 atom of each element.

Alcohol, according to Dr. Thomson, is a compound of about

Hydrogen	-	-	13.04
Carbon	-	-	52.16
Oxygen	-	-	34.80
			100.

which correspond with 3 atoms of hydrogen, 2 atoms of carbon, and 1 atom of oxygen; and carbonic acid gas is composed of

Carbon	-	-	27.27
Oxygen	-	-	72.72
			= 100.

or of 1 atom of carbon and 2 atoms of oxygen.

Hence, if we suppose (for the sake of round numbers) 3 atoms of fugar to be decomposed during the process of

fermentation, they will be converted into 1 atom of alcohol and 1 atom of carbonic acid; for

	Hydrogen.	Carbon.	Oxygen.
1 atom alcohol consists of	3 atoms	+ 2 atoms	+ 1 atom
1 atom carbonic acid gas of		1 atom	+ 2 atoms
which make together	3	+ 3	+ 3

or three atoms of fugar.

Now this determination very nearly coincides with the actual experiments of Lavoisier, and the more recent determination of Thenard, respecting the proportional quantities of these two products obtained by the fermentation of fugar. Thus 100 parts of fugar (as deduced by Dr. Thomson from Thenard's experiments) were converted into

Alcohol	-	-	57.44
Carbonic acid	-	-	42.56
			100.

Whereas the proportions, according to the above calculations, ought to have been

Alcohol	-	-	51.12
Carbonic acid	-	-	48.88
			100.

A coincidence as near as could have been expected, considering the very difficult nature of the experiment.

With respect to the *modus operandi* of ferments, we have nothing to add, but that the subject still remains a mystery. See WINE, and YEAST.

FERRABAAD, in *Geography*, a town of Mazanderan, in Persia, situated at the mouth of a river, 30 miles E. of the village of Meshed Sir, which carries on a small trade in rice, fat-hill, and pottery.

FERRISBURGH, a town of Addison county, in Vermont, having 1647 persons.

FERRUCYANIC ACID, in *Chemistry*. See CYANOGEN.

FERRURETTED *Chyazic Acid*. See CYANOGEN.

FEVRE, or FABRI, JAMES DE. Add—See FABER, JACOBUS STAPULENSIS.

FEZA, in *Geography*, a small town of Persia, 18 furlongs from the capital of Fars or Farflitan, having about 4000 inhabitants, on the banks of a small stream, which is totally absorbed in the irrigation of the gardens and fields adjoining the town.

FIROZEABAD, an ancient city of Fars, in Persia, founded by Artaxerxes Babegon, which became the capital of Firoze Shah, the grandson of Nahirvan. Its ruins occupy a large space in a plain about 17 miles in length, and half as wide. Here are the remains of Attafh Kudda, or fire-temple of Firoze Shah.

FIRUZABAD. See the preceding article.

FISCARD, *l. ult. r. 250.* Col. 2, l. 2, *r. 1811—391—1572; l. 14, dele* lately and received; l. 15, for Fridays *r.* Thursdays; l. 22, *dele* having been recently affixed by the erection of a pier; l. 28, for about fifty *r.* several; l. 29, *r.* from 30 to 100 or more tons burthen; l. 40 and 41, *r.* at a distance near St. David's is a vast, &c.

FISCHERA, in *Botany*, so named by professor Sprengel, in honour of his pupil Mr. Ferdinand Fischer, now curator of the Kazoumoffsky garden, near Moscow.—Spreng. Prodr. Umbell. 27. (Azorella; Labill. Nov. Holl. v. 1. 73.)—Clafs and order, *Pentandria Dignia*. Nat. Ord. *Umbellata*.

Eff. Ch. Fruit ovate, solid, corrugated and mucicated. General and partial involucre of many leaves. Perianth of five deciduous teeth. Petals ovate, undivided.

1. *F. lanceolata*. Lanceolate Fischer. Spr. n. 3. (Azorella lanceolata; Labill. 74. t. 99.)—Leaves linear-lanceolate, keeled.—Native of Port Jackson, New South Wales, *Dr. White*; of Lewin's land, *Labillardiere*. Stem shrubby, twelve or eighteen inches high, with roughish branches. Leaves scattered, numerous, spreading, entire, smooth, an inch and a half long; tapering at the base. Umbels terminal, stalked, compound, many-flowered.

2. *F. ovata*. Ovate Fischer. Spr. n. 4. (Azorella ovata; Labill. 74. t. 100. Trachymene ovata; Spr. Umb. 8.)—Leaves elliptic-ovate, triple-ribbed.—From the same countries. Differs from the foregoing chiefly in the broader shorter figure of the leaves, and the more evident combination of their ribs. We suspect Labillardiere has confounded a more lanceolate variety of the present with his real *lanceolata*.

3. *F. linearis*. Linear Fischer. (*F. linearifolia*; Spr. n. 2. Azorella linearifolia; Cavan. Ic. v. 5. 57. t. 485.)—Leaves linear-awlshaped.—Native of Port Jackson. *Dr. White*. Like the two former in habit, but the small, narrow, heath-like leaves seem to distinguish it, if the foliage of this genus can at all be trusted for specific characters.

We conceive the compound umbels, totally different habit, more oblong less flattened fruit, and other characters above indicated, must keep these plants generically distinct, both from the original *Azorella*, (see *BOLAX*;) and from Mr. Rudge's *TRACHYMENE*, hereafter described, though the learned Sprengel now refers them to the latter. His *T. compressa* (*Azorella compressa*; Labill. t. 101.) appears not well to accord with either, in character or habit. The fruit is broader than long, tumid and reticulated, not rough. Umbels compound.

FLINDERSIA, in *Botany*, in honour of capt. Flinders; commander of the botanical expedition in which Mr. Brown was employed.—Br. Bot. of Terr. Austr. 63.—Clafs and order, *Pentandria Monogynia*. Nat. Ord. *Cedrelee*, Br.

Eff. Ch. Calyx five-cleft, inferior. Petals five. Nectary cup-shaped, bearing the stamens, with five intermediate barren filaments, opposite to the petals. Capsule woody, of five valves, and five cells, with as many loose partitions. Seeds winged, two in each cell.

1. *F. australis*. Br. t. 1.—A tree found on the east coast of New Holland, lat. 23°. Leaves ternate or pinnate, entire. Panicles cymose, downy. Capsules mucicated.

Arbor radulifera, Rumph. Amb. v. 3. 201. t. 129, is supposed to belong to this genus.

FLOAT-STONE. See MINERALOGY, *Addenda*.

FLOOR, in *Building*, col. 2, l. 37, for heading points *r.* heading joints.

FLORAL GAMES, l. 10, add—It is said that Clementina-Isaura, countess of Thoulouse, published an edict that assembled all the poets of France with artificial crowns, dressed with flowers, &c. Warton's Hist. of Poetry, vol. i. p. 467.

FLORIDA, col. 2, l. 1, after Appalachicola, add—and Pearl river, N. by 31° N. lat. and S. by Bayou Iberville, Amite river, and lakes Maurepas and Pontchartrain; extending over 4850 square miles of surface. Soon after the incorporation of this part of W. Florida into the state of Louisiana, it was divided into the four parishes of Baton Rouge, New Feliciana, St. Helena, and St. Tammany. The rivers are, the Mississippi, the Comite, Amite, Tickfah,

Tangipoo, Chifuneté, Bogue Chito, and Pearl. The Comite rises in Wilkinson county, in the Mississippi territory, and, after a course of forty miles, falls into the Amite. The Amite rises in the same territory in Amite county, and having joined the Iberville, falls into lake Maurepas, after a course of 100 miles. The Tickfah rises in the same territory, and after entering W. Florida, becomes much augmented, and pursuing a fourth course of fifty miles falls into lake Maurepas. The Tangipoo rises in the same territory, and running nearly S. 70 miles, falls into lake Pontchartrain. The Chifuneté rises in W. Florida, and pursuing a course of about 60 miles, enters into lake Pontchartrain. The thriving town of Madisonville lies on its banks. The Bogue Chito has its source in the Mississippi territory, and after a S.E. by S. course, enters the PEARL River; which see.

FLORIDA, a town of Berkshire county, in Massachusetts, containing 392 inhabitants.

FLORIN, col. 2, l. 19, after divisions, add—A florin is a silver coin in Holland, Flanders, and Germany, called also “Guilder,” or “Gulden.” Accounts are kept in Holland in guilders or florins of 20 stivers, each subdivided into 16 pfenings. A six-dollar is worth 2½ stivers, and a pound Flemish is equal to 6 guilders; hence, the six-dollar being = 3s. 4d. Flemish, the gilder is = 3s. 4d. Flemish. A gold gilder, with which accounts are kept in the corn-trade, is worth 28 stivers. Among the coins are stamped gold guilders at 28 stivers, untamped do. at 26 stivers. A gold gilder of 28 stivers must weigh 407 Dutch asses, or 301 English grains. In Germany, they have gold florins, or guildens, which are chiefly current in the countries on the banks of the Rhine, passing generally for 2 six-dollars current, and they are to contain 18½ carats of fine gold, 3¾ carats of fine silver, and 1½ carats of copper. The Hanoverian gold florins contain 18¾ carats of gold, 3¾ carats of silver, and 1½ carat of copper. The gold florin is a gold coin in Hanover, and other parts of Germany; but the gold gilder in Holland is a silver coin. See TABLE of Coins under COIN and EXCHANGE.

FLOYD, l. 4, r. 3453 and 113.

FLUATES, in *Chemistry*. See FLUORIC Acid.

FLUGEL-MAN, in *Military Language*, a well-drilled intelligent foldier, advanced in front of the line to give the time in the manual and platoon exercises. The term *Flugel* is derived from the German, and signifies a wing; the man having been originally poited in the front of the right wing.

FLUIDS, *Animal, Chemical Properties of*. The blood is the general source of all other animal fluids, most of which, more or less, resemble it in their properties. The operation by which other fluids are formed from the blood is termed *secretion*. See BLOOD and SECRETION.

Berzelius divides secreted fluids into two classes; namely, the *secretions* properly so called, or the fluids intended to fulfil some ulterior purpose in the animal economy; and the *excretions*, which are directly discharged from the body. The fluids of the former class, according to this distinguished chemist, are all *alkaline*; of the latter, all *acid*. The excretions are, the urine, the perspirable fluid, and the milk; all the other fluids appear to belong to the former class. The alkaline secreted fluids may be divided into two very distinct species. The former of these contains the same quantity of water as the blood, so that the change induced by the nervous influence seems to be confined to that of altering the chemical form of the albuminous materials, without affecting their relative proportions to the water and other substances dissolved in the blood. The bile, spermatic fluid, &c. are of this kind. The latter species consists of fluids, in which the influence of the nervous system has separated a large por-

tion of the albuminous matter, and left the remaining liquid proportionally more watery. The saliva, the humours of the eye, and the effused serum of membranes, are of this species; and in these, the quantities of salts, and in general also of alkali, are the same as in the blood.

The influence of the chemical agent of secretion is therefore, according to Berzelius, chiefly spent upon the albuminous materials of the blood, which seem to be the source of every substance that peculiarly characterises, and is the principal constituent of each secretion, and which is *sui generis*. All the other parts of the secretion seem to be rather accidental, and to be found there only, because they were contained in the blood out of which the secretion was formed.

The *excretions* are of a more compound nature. They all contain a free acid, which is the *lactic*, and in the urine this is mixed with the uric acid. Urine seems to contain only a single peculiar characteristic matter, but milk has as many as three, namely, butter, curd, and sugar of milk. The perspired fluid appears to have no peculiar matter, but to be a mere watery liquid with hardly a vestige of the albumen of the blood, and in short to be the same as the other excreted fluids would be if deprived of their peculiar matter.

An account of most of the animal fluids will be found under their proper heads. The following is a tabular view of the analyses of what have been termed *albuminous fluids*, many of which have been omitted.

Name of Fluid.	Albumen.	Incoagulable matter, &c.	Salts.	Water.
Fluid from spina bifida	.5	.7	1.0	97.8
Liquor pericardii	5.5	2.0	.5	92.0
Ditto	3.0	1.0	1.0	95.0
Fluid from hydrocephalus	.12	.28	1.0	98.6
Fluid from hydropoele	6.85	1.1	0.8	91.25
Liquor amnii	.16	.1	1.4	98.34
Fluid from abscess	4.25	1.0	1.0	93.75
Fluid from a blister	6.0	.14	1.0	92.86
Ditto *	18.	—	4.0	78.0
Albumen ovi	12.0	2.7	0.3	85.00

The above are the results of Dr. Bostock's experiments, with the exception of the fluid from a blister marked *, which is taken from Margueron.

With respect to the nature of the *incoagulable matter and salts*, they are the same as those constantly found in the serum of the blood; we refer our readers therefore to what we have said on this subject under the article BLOOD.

FLUOBORIC ACID, in *Chemistry*. See FLUORIC Acid.

FLUORIC ACID. Since this article was written for the Cyclopaedia, many important additions have been made to our knowledge respecting fluoric acid, which deserve to be mentioned here.

Pure fluoric acid, according to Gay Lussac and Thénard, may be obtained by distilling together in lead vessels a mixture of one part of white fluor spar in a state of powder, and two parts of concentrated sulphuric acid. The lead receivers must be kept as cool as possible by a mixture of common salt and snow or ice.

Fluoric acid thus obtained is, at 32°, a colourless liquid, like water. It remains a fluid between —4° and 60°. Its boiling point has not been determined, but it is low. When exposed to the air it smokes violently, giving out a smell similar to that of muriatic acid, but much stronger. It is very speedily dissipated in the open air, and can only be preserved in metallic vessels. Those best adapted for the purpose are made of pure silver, with air-tight silver stoppers. This acid, according to Davy's experiments, when as concentrated as possible,

possible, contains no water. In this state, its specific gravity is 1.0609. When united to a certain portion of water, its specific gravity becomes as high as 1.250. When a drop is let fall into water, a hissing noise is heard, similar to that occasioned by a hot iron. When a few drops of water are let fall into fluoric acid, it enters into ebullition. A large proportion of water may be added without destroying its fuming property. Care must be taken not to breathe the fumes of this acid, as they are very deleterious. When a drop of it falls upon the skin, it acts as a powerful corrosive, and occasions a sore which does not soon heal.

Respecting the nature of this acid, the opinion of the older chemists, and even of Gay Lussac and Thenard, was, that it is composed of an unknown basis and oxygen. M. Ampere, however, started the notion that it is analogous to muriatic acid, or a compound of hydrogen, and a supporter of combustion, to which the name of *fluorine* has been given; and this opinion has been since supported by Sir H. Davy, and though its truth has not been absolutely demonstrated, yet upon the whole perhaps it is the most probable. On this supposition, fluoric acid is a compound of one atom fluorine, and one atom hydrogen. See SIMPLE BODIES.

Fluoric acid combines with all the bases forming fluorates.

Fluate of Ammonia.—This salt may be formed by saturating pure fluoric acid with ammonia. It is neutral when first formed, but becomes acid when evaporated. It does not crystallize, but when heated, flies off in thick white vapours.

Fluate of Potash.—This salt may be formed in the same manner as the last. It has a very sharp taste, crystallizes with difficulty, is very deliquescent, and of course soluble in water. When heated, it undergoes first the aqueous, and afterwards the igneous fusion. Sulphuric acid decomposes it, driving off fluoric acid in vapour.

Fluate of Soda.—This salt may be formed as above. It has much less taste than fluate of potash. It is not altered by exposure to the air, and is rather more soluble in hot than in cold water. On cooling, therefore, it separates in small crystals, or more frequently in the form of a solid and transparent crust on the surface of the water.

Fluate of Lime.—This salt exists abundantly native. It is called FLUOR SPAR (which see), and is the substance from which this acid is always obtained. It is composed, according to Davy's analysis, of

Fluorine	-	20.	-	100.
Calcium	-	26.25	-	131.25

Fluate of Barytes.—This salt is tasteless, insoluble in water, but soluble in excess of fluoric acid, and likewise in nitric and muriatic acid. It is composed of

Fluorine	-	20.	-	100.
Barium	-	87.5	-	437.5

Fluate of Strontian.—This salt possesses the same properties as fluate of barytes.

Fluate of Magnesia.—This is a tasteless powder, insoluble in water, and scarcely soluble in acids.

Fluate of Ytria, Fluate of Alumina, and Fluate of Zirconia, are likewise white insoluble powders. The

Fluate of Glucina is soluble in hot water, and precipitates in small crystals at the water cools.

It is extremely probable, as Dr. Thomson remarks, that the above salts are in reality *fluorides*, or compounds of *fluorine*, with the metallic bases of the earths.

The metallic fluates are not upon the whole an interesting class of bodies. The *fluates of iron, manganese, zinc, and tin,* are white insoluble powders. The *fluate of cobalt* is of a red colour. The *fluate of lead* exists in the form of brilliant plates. The *fluate of copper*, of small blue-coloured soluble

crystals. The *fluate of mercury* of small lamellar yellow crystals. The *fluate of silver* is very soluble in water, and does not crystallize. It cannot be formed by the direct union of fluoric acid and silver, but it is formed when fluat of mercury is made to act upon silver.

Fluoboric Acid.—Fluorine has the property of combining with boron, and forming an acid which has received the above appellation. It may be formed by mixing together in a retort one part of finely pounded fused boracic acid, and two parts of fluor spar in powder, and twelve parts of sulphuric acid. The heat of a lamp is then to be applied, and the acid comes over in the form of a gas, which must be received over mercury. For this process we are indebted to Dr. John Davy, but the acid itself was first discovered by Gay Lussac and Thenard in 1808.

Fluoboric acid thus obtained is colourless, and possesses the mechanical properties of common air. Its smell is similar to that of muriatic acid, and its taste is exceedingly acid. It instantly gives a red colour to vegetable blues. Its specific gravity, as determined by Dr. Davy, is 2.3709. Water absorbs about 700 times its bulk of this gas, and becomes slightly viscid, like sulphuric acid, and like it requires a high temperature to make it boil. It also chars animal and vegetable substances, and is capable of forming an *ether* when distilled with alcohol. It combines with the different bases, and forms a class of salts called *fluoborates*, which have been little examined. On the supposition that it is a compound of *fluorine* and *boron*, which seems to be the most probable opinion, its composition will be

Fluorine	-	20.	-	100.	-	228.57
Boron	-	8.75	-	43.75	-	100.

Fluofilic Acid.—Fluorine has also the property of combining with *silicon*, and forming a powerful acid. This compound was first discovered by Scheele, but it is to Dr. J. Davy that we are principally indebted for the correct account of its properties. It may be formed by putting a mixture of equal parts of pounded fluor spar and glass into a retort, and pouring over the mixture sulphuric acid sufficient to convert the whole into a paste. Heat is then to be applied, and the acid speedily comes over in the form of a gas, and may be collected over mercury. Fluofilic acid gas is colourless, and possesses the mechanical properties of common air. Its smell resembles that of muriatic acid. It smokes when allowed to escape into the atmosphere. It instantly reddens vegetable blues. Its specific gravity, according to Dr. Davy, is 3.5735. Water absorbs about 263 times its bulk of it, but at the same time it is partly decomposed, and silica is deposited. When passed through liquid ammonia, the whole of the silicon is deposited in the form of silica: this enabled Dr. Davy to effect its analysis, the result of which appears to shew that it is a compound of one atom silicon and one atom fluorine.

The *fluosilicates* have not been much examined. The *fluosilicate of lime* exists abundantly native, and has not hitherto been distinguished from fluor spar. It may, however, be easily recognised by heating it in metallic vessels with sulphuric acid, when it yields fluosilicic acid gas, while fluor spar does not.

FLUORINE. See FLUORIC ACID.

FORDINGBRIDGE, l. 11, *r.* 1811; l. 12, *r.* 445—2259; l. 13, *r.* 281.

FORDOUN. In 1811 this parish contained 513 houses, and 2535 persons; viz. 1197 males, and 1338 females.

FORDYCE, a parish of Bamff county, in Scotland, containing 641 houses, and 2767 inhabitants.

FORFAR, l. 21, *r.* 1811; l. 22, *r.* 759—5652.

FORFARSHIRE. Add—By the return of 1811, this county had 16,135 houses, occupied by 107,264 persons; 48,151 being males, and 59,113 females: 4980 families employed in agriculture, and 13,616 in trade and manufactures.

FORFICULA, col. 2, under *AURICULARIA*, add—The popular dread in which this insect is held, from an apprehension of its entering the cavity of the ear, and piercing the tympanum, is now generally considered as an ancient and vulgar error.

FORMIC ACID, in *Chemistry*. The distinct nature of this acid appears now to be generally admitted by chemists. In its sensible properties, it approaches the acetic acid. But Suerien has shewn, that it has the property of neutralizing much less of alkaline bodies than acetic acid. Gehlen also has shewn, that the formiates of soda and copper, differ altogether from the acetates of the same bases. Berzelius has lately analysed this acid with his usual precision: according to him, it is composed of

Hydrogen	2.84) which nearly cor-	- { 1 atom hydrogen.		
Carbon	32.40) respond with	- { 2 atoms carbon.
Oxygen	64.76				

Hence it appears to resemble oxalic acid closely in its composition.

FUNGI, *Chemical Properties of the*. Braconnot has lately detected three distinct new principles in this class of plants. Two of these are acids, one of which he has denominated *boletic acid*, the other *fungic acid*; the third is a principle neither acid nor alkaline, to which he has given the name of *fungin*. We shall briefly describe here the leading properties of each of these principles.

Boletic Acid.—This was obtained from the juice of the *boletus pseudo-ignarius*. Its colour is white; it is not altered by exposure to the air, and its crystals are irregular four-sided prisms. Its taste is similar to that of tartar. It is soluble in 180 times its weight of water at a temperature of 68°, and in 45 times its weight of alcohol. The aqueous solution reddens vegetable blues. It combines with the different bases forming *boletates*, which have been but little examined. The boletate of ammonia crystallizes in flat four-sided prisms, and is soluble in 26 times its weight of water at 68°. The boletate of potash is very soluble in water, and crystallizes with difficulty. The boletate of lime crystallizes in flat four-sided prisms, and is soluble in about 110 times its weight of water at 72½°. No one hitherto appears

to have repeated the experiments of Braconnot on this acid.

Fungic Acid.—This was extracted from the *boletus juglandis*, and other fungi. This acid is colourless, does not crystallize, has a very four taste, and when evaporated to dryness, deliquesces on exposure to the air. The *fungates* of potash and soda do not crystallize, are very soluble in water, but not in alcohol. The *fungate of ammonia* crystallizes in regular six-sided prisms. The *fungate of lime* is not altered by exposure to the air, and is soluble in about 18 times its weight of water at 73°.

Fungin.—This substance approaches woody fibre in its properties, but seems to be sufficiently distinguished from it by various characters, particularly by constituting a nourishing article of food, and by being less soluble in alkaline leys.

FUNGUS *of the Antrum*, l. 13, for he r. she.

FURCRÆA, in *Botany*, after M. Fourcroy, the great chemist. —Venten. in *Ust. Annal.* v. 19. 54. Ait. *Hort. Kew.* v. 2. 302.—Class and order, *Hexandria Monogynia*. Nat. Ord. *Coronarie*, Linn. *Bromeliæ*, Juss.

GAINSBOROUGH, l. 9 from bottom, for quadrangular r. quadrangle.

GALANGAL, l. 3, add—See ALPINIA, *Addenda*.

GALAPAGOS, col. 1, l. 5 from bottom, for 68° r. 86° or 89°; *dele* the paragraph.

GALARDIA, in *Botany*, Lamarck Dict. v. 2. 590. Illustr.

Illustr. t. 708. Schreb. Gen. 573. Willd. Sp. Pl. v. 3. 2245. Ait. Hort. Kew. v. 5. 129. Pursh 572. Juff. 189. (Virgilia; L'Herit. Monogr.)—Clafs and order, *Syngenesia Polyg-fruſtranea*. Nat. Ord. *Compoſite*.

Eff. Ch. Recept. hemiſpherical, chaffy. Seed-down of many chaffy ſcales. Calyx imbricated, many-leaved, flat. Radiant florets deeply three-cleft.

1. *G. bicolor*. Two-coloured Galaria. Willd. n. 1. Ait. n. 1. Pursh n. 1. (Virgilia helioides; L'Herit. t. 1, 2. Sm. Exot. Bot. v. 1, 71, t. 37.)—Stem branched. Leaves lanceolate. Scales of the feed-down awned, entire.—Found in dry ſandy ſoil, from Canada to Florida. Annual. *Floccers* handſome, orange, variegated with red and purple.

We have already announced this genus under the VIRGILIA now eſtabliſhed. There are two more ſpecies, *G. fimbriata* and *ariflata*, from N. America.

GALEOPITHECUS, COLUGO, in *Zoology*, a genus of the order Primates, the characters of which are, that it has no front teeth in the upper jaw; that thoſe in the lower are fix, ſhort, broad, ditant, and pectinated; that the canine teeth are very ſhort, triangular, broad, ſharp, and ferrated; that the grinders are four, truncated and mucronated with conical protuberances; and that it has a flying ſkin ſurrounding the body, limbs, and tail. For the deſcription of this genus with appropriate figures, naturaliſts are indebted to Dr. Pallas; and it may be found in the Tranſactions of the Academy of Peterburgh for the year 1780. The galeopithecus volans, or flying colugo, is the lemur volans of the Linnæan ſyſtem, and the flying macaeco of Pennant's quadrupeds. It is a native of the Molucca and Philippine iſlands, where it feeds principally on fruits, and almoſt conſtantly reſides on trees. It has two young ones, which are ſaid to adhere to its breasts by the mouth and claws. Its whole length is about three feet, and of the ſame breadth when expanded; the tail is ſlender, and about a ſpan long. Its expanſible ſkin, which enables it to fly, is continued on each ſide from the neck to the fore-feet; thence to the hind-feet, and again to the tip of the tail. It is covered with fur, like the body of the animal; the upper ſide of which is generally of a deep aſh colour: the back, in animals that are full grown, is croſſed tranſverſely with blackiſh lines, having towards the edges a tinge of yellow; and the whole underſide, both of the body and membrane, is of a yellowiſh colour. The head is long, the mouth ſmall, and the tongue fleſhy, broad, rounded, attenuated on the edges, and ciliated with papillæ, and alſo ſlightly beſet with papillæ on its ſurface. The legs are clothed with a ſoft yellow down, and on each foot are five toes, united by a common membrane, and terminating in very ſharp crooked claws. The animal is called by the Indians caguang, colugo, and giguâ. It is a gregarious animal, flies chiefly in the evening, and its body is ſaid to be about the ſize of a cat. M. Geoffroy ſays there are two varieties; viz. one of the colour uſually deſcribed; the other of a fine cinereous or ferruginous colour, vivid on the back and paler beneath, and without any variegations. It is ſuggeſted, that theſe may be merely ſexual differences. Dr. Shaw has availed himſelf of Pallas's deſcription and figure in the firſt vol. of his *Zoology*, to which we refer.

GALINSOGEA, in *Botany*, after the ſuperintendent of the Madrid garden. “Ruiz and Pav. Prodr. 110.” Ait. Hort. Kew. v. 5. 122.—Clafs and order, *Syngenesia Polyg.-ſuperflua*. Nat. Ord. *Compoſite*.

Eff. Ch. Recept. chaffy. Seed-down of many chaffy ſcales. Calyx imbricated.

1. *G. parviſtora*, Cavan. Ic. t. 281.

2. *G. trilobata*, ib. t. 282.—Both natives of South America.

GALIUM, col. 2, l. 34, for dried *r.* freſh.

GALLICIA, New, l. 5, r. Zacatecas.

GALLIPOLIS, a townſhip of Ohio, in the county of Gallia, containing 448 inhabitants.

GALVANISM, col. 3, l. 25, after inch, inſert—a part.

GALVANISM, *Medical*. See VOLTAISM, and particularly ELECTRICITY, *Medical*.

GALVANOMETER, an apparatus conſtructed by Mr. Pepsy, by an alteration in Bennet's electrometer, adapted for meaſuring very minute quantities of electricity, and which perhaps could not be rendered ſenſible by any other means. This apparatus conſiſts of a glaſs cylinder, covered with a lid, which is compoſed of two circular plates of braſs, attached to a cork that fits into the cylinder. To the lid is fixed a thin ſlip of ſilver, the end of which hangs down in the body of the cylinder, and has a pair of gold leaves attached to it; and the whole is fo contrived as to be capable of being moved nearer to, or farther from, the pieces of zinc which ſtart up from the bottom of the cylinder. The pieces of zinc are fo contrived, that the parts of them which project upwards from the bottom of the cylinder may be fixed at different diſtances from each other by means of a ſlide and ſcrew. See a deſcription and figure of this inſtrument in Boſtock's “History of Galvaniſm,” 8vo. 1819.

GAMING, col. 3, l. 30, r. 8 Geo. I.

GARDENING, l. 17, r. Loudon.

GARDINER. Add—containing 1029 perſons.

GARDNER, l. 4, r. 815.

GARGLE, a diſeaſe of horned cattle, which conſiſts of an external hard ſwelling in the dew-lap, which afterwards ſpreads to the breast and throat. For the cure, profuſe bleeding is recommended; and then an opening is to be made in the dew-lap at the feat of the ſwelling, into which

are

are introduced the leaves of bear's-foot pounded; the opening is then sewn with two or three stitches, and thus will be produced a running which will cure the disease; or a common rowel will answer the purpose.

GARRARD. Add—It contains 8926 inhabitants, of whom, in 1810, 2000 were slaves.

GARSTANG, l. 3, r. 178 and 790.

GARUGA, in *Botany*, a very barbarous Indian name.—Roxb. *Corom.* v. 3. 5. Ait. *Hort. Kew.* v. 3. 37.—Class and order, *Decandria Monogynia.* Nat. Ord. *Meliæ*, Juss.

Ess. Ch. Calyx bell-shaped, five-cleft, bearing the stamens and the five equal petals. Stigma five-lobed. Drupa with several nuts.

1. *G. pinnata.* Roxb. t. 208.—A tree found on the mountains of India. *Leaves* serrated. *Flowers* panicked, yellow. *Fruit* aulere, used for pickling. *Wood* soft.

GAS, col. 2, l. 25, after atmosphere, add—will be found under AIR, ATMOSPHERE, &c.; deleted under the head of PNEUMATICS.

GAS, in *Chemistry.* Great revolutions have taken place in the chemistry of the *gases* since this article was written for the Cyclopædia. Not only have their number been increased, but the laws of their combination, expansion by heat, &c. have been further investigated, and in many instances found very different from those stated under the above article. Several of these particulars have been already given under the article *ATOMIC THEORY*, a few others remain to be mentioned here. The following table from Dr. Thomson includes the gases at present known.

1. *Simple gases.* Oxygen, chlorine, iodine vapour, hydrogen, azote, sulphur.
2. *Compound gases.*
 - a. Simple gases combined. Hydriodic acid, protoxyd of chlorine, protoxyd of azote. Muriatic acid, deutoxyd of azote, steam, ammonia.
 - b. Oxygen and a solid base. Sulphuric acid, sulphureous acid. Carbonic oxyd, carbonic acid.
 - c. Hydrogen and a solid base. Cyanogen, sulphuretted hydrogen, olefiant gas, carburetted hydrogen, hydroguret of phosphorus, bihydroguret of phosphorus.
 - d. Fluorine, chlorine, and cyanogen with a base. Fluoboric acid, chloroacetic acid, hydrocyanic acid, chlorocarbonic acid.
 - e. Two solid bases. Sulphuret of carbon.
 - f. Triple or quadruple compounds. Hydriodic ether, chloric ether, sulphuric ether, muriatic ether, alcohol, oil of turpentine.

Combination of Gases with one another.—The important law first observed by Gay Lussac respecting the combination of gaseous bodies, and alluded to in our original article, is now, we believe, nearly universally admitted. This law is, that gaseous bodies always unite with reference to their volumes; that is to say, that either equal volumes of different gases combine together, or one volume of the one, with two, three, or more of the other, and not with any intermediate proportion; and further, that when a gaseous result is obtained by such union, the volume of this is either equal to the united volumes of the two gases, or to half,

one-fourth, or some other submultiple of the original volumes.

The combinations of gases with one another have been arranged by Dr. Thomson under the following heads.

1. Gases that unite by mere mixture, such are: Oxygen with nitrous gas, forming nitrous or nitric acid.—Ammonia with vapour, forming liquid ammonia.—with muriatic acid, forming muriate of ammonia.—with fluoboric acid, forming fluoborate of ammonia.—with fluoallic acid, forming fluoallic acid.—with carbonic acid, forming carbonate of ammonia.—with sulphureous acid, forming sulphite of ammonia.—with sulphuretted hydrogen, forming hydrofulphuret of ammonia.
2. Gases that may be mixed without any striking combination, though they are capable of uniting in certain circumstances, such are: Oxygen with hydrogen, forming water—with carbonic oxyd, forming carbonic acid—with azote, forming nitric acid—with chlorine, forming chloric acid—with sulphureous acid, forming sulphuric acid—with nitrous oxyd, forming nitric acid.—Hydrogen with chlorine, forming muriatic acid—with iodine, forming hydriodic acid—with cyanogen, forming hydrocyanic acid. Chlorine with carbonic oxyd, forming chloro-carbonic acid.
3. Gases which mutually decompose each other when mixed together, such are: Oxygen with phosphuretted hydrogen.—Chlorine with ammonia—with phosphuretted hydrogen—with carburetted hydrogen—with olefiant gas—with sulphuretted hydrogen—with nitrous gas. Sulphuretted hydrogen with nitrous gas—with sulphureous acid.
4. Gases which mix without spontaneous decomposition, but which may be made to decompose each other in particular circumstances, as on the approach of an ignited body, when electric explosions are passed through them, &c. These are more numerous than the preceding, and are as follow: Oxygen with sulphuretted hydrogen—with carburetted hydrogen—olefiant gas—vapour of ether—vapour of alcohol. Nitrous oxyd with hydrogen—with phosphuretted hydrogen—sulphuretted hydrogen—carbonic oxyd—carburetted hydrogen—olefiant gas—vapour of ether—vapour of alcohol—sulphureous acid. Nitric acid with hydrogen, and probably all the preceding combustible gases and vapours—with sulphureous acid. Nitrous gas with hydrogen—with sulphureous acid. Hydrogen with sulphureous acid—with carbonic acid. Vapour of water with carburetted hydrogen—with olefiant gas.

Combination of Gases with Liquids. Gases may be considered with reference to their combination with water and with other fluids. With respect to water, by far the most important of all fluids, gases may be divided into two classes; those that are absorbed in a small proportion, and those that are absorbed in a great. Almost all gases belong to the first class. In the following list of this class, the gases are arranged in the order of their absorption, beginning with the least absorbable: azotic gas—hydrogen gas—arsenical hydrogen—carburetted hydrogen—carbonic oxyd—phosphuretted hydrogen—oxygen gas—nitrous gas—olefiant gas—nitrous oxyd—carbonic acid—sulphuretted hydrogen.

The following laws seem to be pretty well established respecting the absorption of gases by water.

1. When the pressure, temperature, and purity of the water, are the same, water absorbs a determinate quantity of every individual gas.

2. Water of the same temperature always takes up the same bulk of each gas, whatever be its density.

3. The proportion of any gas absorbed by water depends greatly upon the nature of the gaseous residue.

4. The proportion of gases absorbed by water is considerably influenced by the temperature.

All the very absorbable gases belong to the class of supporters, acids, or alkalis. The following is a list of such of them as have been hitherto examined, arranged in the order of their absorbability. Chlorine, cyanogen, sulphureous acid, fluosilicic acid, muriatic acid, fluoboric acid, ammoniacal gas.

When water is saturated with the above gases its bulk is augmented. Thus one cubic inch of water saturated with

	Cubic Inches.
Chlorine becomes	- - 1.002 +
Sulphureous acid	- - 1.040
Muriatic acid	- - 1.500
Ammoniacal gas	- - 1.666

With respect to the absorption of gases by other fluids less is known. It appears, however, that in general alcohol and oils absorb a much greater proportion of gases than water.

Our limits will not permit us to enter upon this subject so much as its importance demands, we must therefore content ourselves with presenting our readers with the following table of the proportions of different gases absorbed by water, according to the best experiments.

TABLE I.—Gases combining with Water in small Proportion.

At a temperature of 60°, 100 Measures of Water	absorb, according to		
	Henry.	Dalton.	Saussure.
Sulphuretted hydrogen	106	100	253
Carbonic acid - - -	108	100	106
Nitrous oxyd - - -	86	100	76
Olefiant gas - - -	—	12.5	15.3
Nitrous gas - - -	5	3.7	—
Oxygen gas - - -	3.7	3.7	6.5
Phosphuretted hydrogen	2.14	—	—
Carburetted hydrogen	1.4	3.7	5.7
Azotic gas - - -	1.53	1.56	4.1
Hydrogen - - -	1.61	1.56	4.6
Carbonic oxyd - - -	2.01	1.56	6.2

TABLE II.—Gases combining with Water in large Proportion.

One Measure of pure Water	absorbs, according to			
	Dalton.	Saussure.	Thomson.	Gay Lussac. Davy.
Chlorine -	2	—	—	—
Cyanogen -	—	—	—	4½
Sulphureous acid	—	43.78	33	—
Fluosilicic acid	—	363+	—	—
Muriatic acid	—	—	516	—
Fluoboric acid	—	—	—	700
Ammoniacal gas	—	—	780	—

Combination of Gases with Solids.—The simple gases are only four, oxygen, chlorine, hydrogen, and azote. Oxygen

combines with all the simple bodies known. Chlorine, with by far the greater number. Hydrogen, with carbon, phosphorus, and sulphur, and some of the metals. Azote, as far as is known, with carbon only.

Of the union of compound gases with solids little is known, and such combinations are very rare.

With respect to the weights of the atoms, specific gravities, composition, &c. of the different gaseous bodies that have been well ascertained, they will be found in the titles appended to the article ATOMIC Theory, to which, therefore, we refer our readers. Other particulars, such as their chemical properties, &c. will be found under their respective heads.

Expansion of Gases by Heat. (See EXPANSION.)—To what has been there advanced we may add, that it is now considered as established, that all elastic fluids expand equally and uniformly by heat; and the following table gives us nearly the bulk of a given quantity of air at all temperatures, from 32° to 212°, by the aid of which the expansion of gases for all other temperatures may be easily ascertained.

Temp.	Bulk.	Temp.	Bulk.	Temp.	Bulk.
32°	1000000	59°	1056249	86°	1112499
33	1002083	60	1058333	87	1114583
34	1004166	61	1060416	88	1116666
35	1006249	62	1062499	89	1118749

GAZANIA, in Botany, perhaps from γὰρ, riches, in allusion to the splendour of the flowers.—Gärtn. v. 2. 451. t. 173. Br. in Ait. Hort. Kew. v. 5. 140. Lam. Illustr. t. 702.—Class and order, Syngenesia Polyg.-frustranea. Nat. Ord. Compositæ.

Eff. Ch. Receptacle without scales. Seeds very hairy. Seed-down of chaffy hairs. Calyx of one leaf.

G. rigens, (Corteria rigens; Linn. Sp. Pl. 1284. Curt. Mag. t. 90.); *G. pavonia*, (Corteria pavonia; Andr. Repof. t. 523.); and *G. subulata*, Br. are the only species; all natives of the Cape of Good Hope. See CORTERIA.

GEAUGA, in *Geography*, a county of Ohio, containing 8 towns, and 2917 inhabitants.

GEDDINGTON, l. ul. This parish consists of 141 houses—r. 651.

GELATINE, in *Chemistry*. This animal principle has been lately analysed by Gay Lussac and Thenard, according to whom it consists of

Hydrogen	-	7.914
Carbon	-	47.881
Oxygen	-	27.207
Azote	-	16.998

100.

Gelatine does not exist in the blood, nor in any known animal fluid ready formed, but appears to be produced by the action of boiling. See BLOOD.

GELONIUM, in *Botany*, Roxb. in Willd. Sp. Pl. v. 4. 831. Ait. Hort. Kew. v. 5. 406.—Clafs and order, *Dioecia Icofanteria*. Nat. Ord.

Eff. Ch. Male, Calyx of five leaves. Cor. none. Stam. twelve or more. Female, Cal. and Cor. like the male. Styles none. Stigmas three, jagged. Capsule of three cells, three valves, with three seeds.

1. *G. bifarium*. Willd. n. 1. Ait. n. 1.—Leaves elliptical, rather acute.

2. *G. lanceolatum*. Willd. n. 2.—Leaves oblong-lanceolate, obtuse.—East Indian trees, with alternate leaves, the tubular stipula of a *Ficus*, and axillary flowers.

VOL. XVI.

GENESEEE, l. 5, r. 1810, and 12,588 persons.

GENEVA, NEW, a township of Fayette county, in Pennsylvania, having 232 inhabitants.

GENEVIEVE, l. 7, add—and district. In 1810, it contained 4620 inhabitants, of whom 988 were slaves. This town is famous for its lead-mines, which occupy an extent of country, commencing about 30 miles W. of the Mississippi, and extending W. and N.W. It was the discovery of these lead-mines that gave rise to the famous Mississippi scheme, projected by Law in 1719, which ruined hundreds of families in France, as they were then supposed to be a silver-mine: and though the bubble burst immediately, yet Du Pratz, who wrote thirty-nine years afterwards, persisted in the error, and speaks of a silver-mine on the Marameg in his account of Louisiana. The Marameg is now called the Marrawal, on a branch of which, called the Negro-Fork, the mines of St. Genevieve are situated. These mines have been worked since about the year 1725, and they belong to a number of proprietors mostly held by grants from the Spanish governors, formerly residing about St. Louis. Bradbury's Travels, &c.

GEODORUM, in *Botany*, from *geos*, the earth, and *doros*, a gift, because, contrary to the nature of most of its nearest allies, this genus grows on the ground, not on trees.—Jackson in Andr. Repof. 626. Br. in Ait. Hort. Kew. v. 5. 207.—Clafs and order, *Cynandria Monandria*. Nat. Ord. *Orchidee*.

VOL. XXXIX.

Eff. Ch. Lip hooded, fessile, not articulated with the column. Calyx and petals uniform, spreading, rather ascending. Anther a terminal deciduous lid. Masses of pollen two, each with a posterior lobe.

G. purpureum, (Limodorum nutans; Roxb. Corom. v. 1. t. 40. Malaxis nutans; Willd. Sp. Pl. v. 4. 93.); *G. citrinum*; Andr. t. 626; and *G. dilatatum*, (L. recurvum; Roxb. t. 39.) ; all East Indian plants, are the only described species. Their leaves are elliptical, many-ribbed; clusters or spikes on radical stalks, pendulous, handsome.

GEOLOGY. (See GEOLOGY.) At the period when that article was written, geology as a science had scarcely excited any considerable degree of interest in this country; and those who were desirous of acquiring a knowledge of the structure of the earth directed their attention more to the exposition of it which Werner had given, than to the actual state of the earth itself. Indeed such was the supposed infallibility of the German professor, and the attachment to theory, that for several years the researches of geologists were undertaken chiefly to make facts coincide with preconceived systems; but in proportion as our knowledge of facts extended, the difficulty of reconciling them with received theories became more and more apparent, and some of the warmest advocates of these theories began to perceive the necessity of describing phenomena as they really exist, without any further attempt to bind nature in the fetters of an artificial system.

The system of Werner (see SYSTEMS of *Geology*) presumes, that all the principal beds of rock, or rock formations, are universal, or, in other words, that each of these rocks encircles the whole earth, like the rind of an onion, and that they are placed over each other in a regular succession, which is the same in every part of the globe. This regular succession is a necessary consequence of another position in the Wernerian system, that the materials of all the different beds of rock were held in solution by water, which covered the globe universally, and at successive periods deposited its contents as the waters retired; hence the *retiring of the waters* is an important part of the system, and is often referred to in some of the articles relating to geology, in the early volumes of the Cyclopædia. Had the strata been deposited from water covering the whole globe, their order of succession in each country would doubtless be the same; but this is not confirmed by experience. The strata are not universal formations, but are of limited extent, and vary much in different parts of the world, and even in different districts of the same country. See ROCKS and STRATA.

Some of the universal formations of Werner occur only in one place, as the topaz rock. The absurdity of describing this rock among such universal formations is so manifestly absurd, that it is astonishing such an arrangement could ever have been admitted. To explain the difference in the order of succession observed in different countries, the German geologist had recourse to what were called *subordinate formations*. These are strata of different kinds, which, it was admitted, might occur in other rocks without any regular order of succession.

By this admission, all variations from the order of succession of rock formations laid down by Werner were supposed to be accounted for. The strata which were not arranged in the Wernerian order were called *subordinate formations*; by such a verbal device, geologists thought they could reconcile to their theory all opposing facts. Mr. Bakewell, in his Introduction to Geology, was, we believe, the first person in this country who ventured publicly to state that many of the supposed universal formations of Werner were local, but of greater or less extent, and that the same regular order of succession was not universal in different countries.

GEOLOGY.

This, we believe, is now admitted by all those who have had the most extensive range of observation.

"The secondary strata are local formations, and some of the upper strata were evidently formed in detached lakes or inland seas. A still more comprehensive view will prove that even all the stratified rocks above the red sand-stone and alpine lime-stone are also local formations, which had their origin in detached hollows or seas of great extent, but which were limited to certain portions of the globe. The observation of travellers in different parts of the world incontrovertibly prove that these formations are local. I am even inclined to consider the red sand-stone and alpine lime-stone as local formations, but of greater extent than any of the strata above them. If this view of the subject were admitted, geologists would be relieved from the great difficulties under which the science labours at present, and it would go far to establish a simple and perspicuous system, which will at once account both for the similarity and diversity of rock formations in various parts of the world. If the mountains were once much higher than at present, it must be admitted, that before the formation of the secondary strata the valleys and hollows were deeper in a far greater proportion, because to the height of the surrounding mountains we must add the whole depth of the secondary strata which were then wanting. By whatever process the secondary strata were formed, the existence of organic remains in them incontrovertibly proves that they were deposited in succession, and the regular manner in which they are spread over each other further proves that the greater part of them were deposited in a fluid medium. As there are incontrovertible proofs that water once covered nearly all the existing continents, it follows, that when the ocean retired, or, which is the same thing in effect, when the dry land emerged from the sea, vast inland lakes or seas would be left at the bottom, of which the secondary strata were formed. As the sea retired further, the higher grounds being left dry, these inland seas or lakes would become contracted, and a number of smaller lakes would occupy the lowest cavities and depressions, in each of which separate depositions of strata might take place. The lower strata would be the most widely spread, and the upper would constitute detached or insulated formations of greater or less extent, in which there might be a great similarity in some situations, and a great diversity in others. Now such is found to be the fact." (Bakewell's Introduction to Geology, 2d ed. chap. x.) This view of the subject, we think, receives much support from the position of the mountain ranges in Europe, as may be seen in Mr. Arrowsmith's excellent map, in which the physical geography is distinctly marked. These ranges form the borders of numerous basins, which must evidently have once been the boundaries of inland seas when the ocean retired from the present continents.

Though great diversity may prevail in the succession of the strata in different parts of the world, yet there are certain rock formations that we may regard as universal, without asserting that they were formed at the same epoch in very distant countries; for it is only where organic remains of the same species occur in rocks that we may infer that their formation was cotemporaneous. In the present state of our information, we may regard granite as the lowest and most extensive rock, forming the foundation of all other rocks or strata, where we have opportunities of tracing their succession. With granite we include gneiss, and also mica-slate, which may be regarded as granite in a schistose form, but with one or other of the ingredients nearly wanting, or occurring in a very small proportion. (See ROCKS, GRANITE, GNEISS, and MICA-SLATE.)

Clay-slate (see SLATE) generally covers the granite, gneiss, or mica-slate, and may be regarded as a universal formation, or, perhaps more correctly, as a general covering of granite, gneiss, and mica-slate. The slate formation contains various anomalous beds of porphyry, compact felspar, lime-stone, hornblende, serpentine, and sienite. (See PORPHYRY, FELSPAR, &c.) No observable regularity has yet been discovered in the succession of these latter rocks in different countries, and some of them may often be observed passing by gradation into each other. They have generally a crystalline structure in the vicinity of granite (see ROCKS), and have not been observed to contain organic remains.

The beds of rock which cover slate appear, many of them, to be a coarser kind of slate, with an intermixture of quartz, or other minerals, until at last they lose the character of slate, and become sand-stone. This coarse slate, in its passage from slate to sand-stone, forms that kind of rock which has been denominated grey wacke or waccé. Various beds of lime-stone occur in the coarser slate. Of these, the most considerable in England is called the mountain lime-stone: it has a subcrystalline structure; it abounds in organic remains in many parts, and contains metalliferous veins, principally of lead and zinc. This lime-stone lies below all the principal coal formations in England and Wales. (See STRATA.) Between this lime-stone, and a dark grey compact lime-stone called lias, occur the coal strata, with the various beds of sand-stone and shale. The order of succession of these beds is not similar in different districts. The lias stratum is the most remarkable in England, both for its regularity and extent, and the organic remains which it contains. The same stratum occurs in Flanders. The strata above the lias were first correctly described by Mr. Farey, whose account we have given in the article STRATA. (See STRATA.) The strata above the lias occur with remarkable regularity over a great part of the eastern side of England, described by Mr. Bakewell, in his Geology, as the 'low district,' extending in a wavy line from Dorsetshire to the county of Durham, and delineated in his map. These strata consist of a succession of beds of roe-stone, or oolite, (see ROE-STONE,) and coarse lime-stone, with thick beds of sand and clay, over which occurs the chalk. These beds are arranged with great regularity compared with the beds that occur between the lias and the mountain lime-stone; but the order of succession and thickness, particularly of the oolite, is variable; for in many parts, beds of vast thickness occur which are not found in other situations, and in some situations the oolite is entirely wanting, and the green sand, instead of covering it, rests immediately on the lias. See Mr. Bakewell's section of the strata, *Plate III. fig. 2. Geology.*

A tabular arrangement of the strata of England, given by Mr. Buckland, professor of mineralogy at Oxford, has recently been published, which we shall present to our readers. At the same time we must observe, that they would be greatly mistaken were they to suppose that the whole of these rock formations had ever been observed in any one situation in England or elsewhere, or that the strata preserve the thickness here given throughout their whole extent. There is no part of England, we believe, in which all the strata here enumerated could be found, were it possible to perforate through them. The table may be regarded as an approximation to the true order of succession whenever several of these formations occur in the same district, and the localities annexed will make it both interesting and useful. Persons who study nature in their closets are disposed to believe, that the thickness of the strata

strata between the chalk near London, and the granite of Devonshire, is much greater than what it really is, taking it for granted that the dip of the strata is always regularly to the east; but this is not the case. A stratum of any considerable extent has waves and irregularities, by which it is generally spread over a large space compared with its true thickness and supposed angle of inclination. A stratum not more than seventy yards in thickness may extend in the line of its dip ten miles or more, and may appear to have a considerable dip when observed in certain situations; and were we to calculate its thickness from the extent of ground which it covers, and from the dip, we might infer that it exceeded two thousand yards or more. More accurate observations will convince us, that the numerous fractures or bendings of the strata in the line of their dip generally spread them over a much wider space than the angle of inclination and thickness would lead us to believe; and the comparison which has been made of sliding a number of books under each other to represent the supposed thickness of the whole strata of England is utterly inapplicable to the case. In sections of particular districts, to represent the arrangement and dip of the strata, it is impossible to delineate the irregularities and wavings of the strata on a small scale. In the section of England by Mr. Bakewell, (see *Plate III. fig. 1. Geology*), the various strata from the German ocean to Cross-fell are represented rising regularly from under each other, like a number of books in a slanting position, it being impracticable to represent on such a small scale all the irregularities of each stratum. In *Plate III. fig. 2.* the section is on a larger scale, and the lias stratum, *d, d, d,* is represented rising from under the green sand *b, b, b,* near Bridport in Dorsetshire, and continued to the valley, *M,* at Axmouth; whereas had not the strata been dislocated by a great number of fractures, as represented in the section, the lias stratum *d* would have terminated or cropped out east of the letter *L*, which represents the situation of the town of Lyme. The aggregate thickness of all the beds of lias cannot be more than two hundred yards, and the regular inclination is at least one yard in twenty, which would make the lowest bed of lias crop out about four thousand yards, or two miles and a quarter west of its first appearance near Bridport.

Plate III. fig. 6. Geology, represents the waving structure of the beds of slate, provincially called shillet in Devonshire. In some situations, as near Moreton, beds of black lime-stone are interposed, and take the twisted form of the slate. Now in passing from Exeter to Dartmoor over the fractured edges of the strata, as represented *fig. 6.* the traveller may cross portions of the same stratum *a, a, a,* repeatedly at a considerable distance from each other, and were he to suppose each of these portions to be a separate stratum, and to calculate accordingly, the thickness of the whole bed of slate, from the red ground on the east, to Dartmoor on the west, he would make it not less than ten miles; whereas in all probability it may not exceed three or four hundred yards. On a smaller scale, the strata are often extended over a large space by fractures in many of the coal districts; by which a bed of coal is brought near the surface several times in the line of its dip, as represented *Plate I. fig. 1. Geology*, and described in the article *COAL*. See *COAL*, and *VEINS, Mineral*.

It too frequently happens, that geological observers measure nature by the standard of their own limited experience in passing through a country, and describe certain rock formations as destitute of organic remains, because they have not found them in travelling through a district. The alpine part of Westmoreland and Cumberland near

the lakes consists of grey wacke, clay-slate, compact felspar, porphyry, sienite, trap, chinkstone, and granite; a thin bed of stratified lime-stone is interposed, and runs through a space of fifteen miles, containing organic remains of coralloids, though the rocks which cover this lime-stone, to a great depth, and the rocks on which it rests, contain no observable vestiges of organic life. Their relative position in the valley of Long Sleddale in Westmoreland, is represented *Plate III. fig. 5. Geology*. The slate which covers the lime-stone appears to dip at an angle of seventy degrees; but on more attentive examination it will be found, that what might be mistaken for regular strata are merely the schistose laminae of the slate arranged in the direction of the cleavage, the dip of the slate being in reality the same as that of the lime-stone on which it rests. Under the lime-stone occurs a bed of horn-stone, resembling compact felspar, but infusible; this is eighty yards thick, and rests on other beds of schist, as represented *Plate III. fig. 5. Geology*. This schist and horn-stone contain no organic remains, and appear to be connected with the granite, which makes its appearance in the adjacent valley at no great distance. The discovery of organic remains under rock formations of great extent which are destitute of them is a circumstance of great interest to the geologist wherever it occurs, and proves the necessity of caution in deciding whether certain rocks were formed prior to the existence of organic beings. Basaltic or trap rocks, whose situation is not conformable with the general dip or position of the strata, and which bear a near similarity to volcanic rocks in appearance and composition, are described under the articles *TRAP*, *ROWLEY-RAGG*, *WHINSTONE*, and *VEINS, Mineral*; and also the article *BASALT, Addenda*; which see. *Plate IV. fig. 2. Geology*, represents the arrangement of a series of columnar and amorphous beds of basalt placed over regular strata in an unconformable position, and intersected by veins or dykes of basalt *b b*, in which the structure is columnar; but the columns or basaltic prisms in these dykes are arranged horizontally.

Fig. 4. represents a basaltic rock on the coast of the county of Antrim, which incloses a bed of chalk that it appears to have broken and enveloped; an effect which seems to require that the basalt should once have been in a melted state like lava. The basalt is represented in the *fig.* immediately beneath the above, as it occurs in veins in another situation on the same coast, cutting through the chalk, and changing it to a certain distance into crystalline lime-stone or marble. See *TRAP* and *WHINSTONE*.

Plate IV. fig. 1. Geology, represents the section of a regular metallic vein, which divides into two, and meets again, leaving an intervening space, filled with earthy minerals called rider. The vein is represented as separated from the rock by a thin lining of clay *c c*, which generally accompanies veins. The intersection of metallic veins in the same plate represents two veins containing the same kind of ore, and having the same dip as *a, a, a,* intersected by a vein of a different kind *b b*, which has cut through and displaced the former; in these instances, the vein *bb* is supposed to be of posterior formation to the veins *a, a, a*. In the same *fig.* is shewn the displacement of a vein without any intersection of other veins. (See *VEINS, Metallic*.) For an account of volcanic rocks, see the articles *VOLCANO* and *VOLCANIC PRODUCTS*, and also *SYSTEMS of Geology*. For an account of the organic remains in rocks, see *PETREFACTS, ROCKS, STRATA*, and *FLEZ ROCKS*. For an account of the organic remains of extinct species of large quadrupeds in alluvial soil, see *MAMMOTH, MASTODON, MEGALONIA*, and *MEGATHERIUM, Addenda*.

GEOLOGY.

A Tabular Arrangement of all the Rock Formations in England.

CLASS I.—Primary Rocks.

Granitic Formation.

N° 1. Granite Gneifs Mica-slate Quartz-rock Marble Trap Serpentine Porphyry Sienite	}	Order of fuceffion variable ; thicknefs unknown.
--	---	---

CLASS II.—Transition Rocks.

Grey Wacke Formation.

N° 2. Lime-ftone Trap Porphyry Grey wacke-ftone Grey wacke	}	Order of fuceffion variable ; thicknefs unknown.
---	---	---

CLASS III.—Secondary Fletz Rocks.

Structure ufually ftratifed, but the Strata much diflocated and inclined.

			Localities.	Greatest obferved thicknefs of the ftrata. Feet.
N° 3-	}	Old red fand-ftone	{ Red, often micaceous fand or fand-ftone, containing fubordinately conglomerate pebbles from the older rocks } { Calcareous concretions in beds and infulated mafes } { Porphyry and trap in beds and mafes }	{ Van Mountain, Brecon - - 2000 } { Heavytree, Exeter } { Thoverton, near Exeter }
First fand-ftone		Mountain, or metalliferous lime-ftone	{ Often a compact coralline mar- ble, alternating with beds of fhale, chert, grit-ftone, and trap }	{ Derbyfhire, four beds, and } { three of trap } 1782
		Mill-ftone grit	{ Coarfe filiceous fand-ftone, with pebbles of white quartz }	{ Crofs-fell, 19 of lime-ftone, 50 } { of grit-ftone, 60 of fhale } 2749 { Yorkfhire, and Derbyfhire - } 260
		Principal coal meafures	- - - - -	{ Newcastle, 82 beds of grit- ftone, fhale, and coal, of which nine of coal are } { wrought } 1482

Strata often lie horizontally on the Edges of the inclined Beds of the laft Formation.

N° 4.	}	Magnefian lime-ftone	{ Yellowifh, fine-grained, and fomtimes of a pink hue } { Fine-grained, red filiceous, fomtimes with pebbles of quartz, and alternating with red marle, containing falt and gypfum }	{ Knarefborough, Bolfover, and } { Sunderland } 300
Second fand-ftone, or grand gypfum, and falt formation		New red fand-ftone, fecond fand-ftone Werner	- - - - -	{ Salop, Lancafhires, Staffor- fhire, Devon, Cambridge, Plains of Cheshire, and Wortershire } 400

GEOLOGY.

		Localities.	Greatest observed thickness of the strata. Feet.		
N ^o 5.					
Oolite formation. Second fretz lime-stone, Werner. Jura lime-stone, Humboldt	Lias.—Blue flaty marle	{ Sometimes bituminous, with their beds of blue, grey, and white argillaceous lime-stone { Rarely oolitic { Contains chert rarely { Sand of inferior oolite micaceous { Sometimes calcareous	{ Lyme, Newark, Whitby - 893 { Radstock, near Bath, and Shepton Mallet { Dunraven, Glamorganshire { Henton, Somerset { Near Bath		
	Inferior bastard oolite	{ Coarse calcareous, slightly oolite with shelly fragments	{ Doulling and Ham-Hill, Somerset		
	Fullers' earth	{ Sterile grey clay, with beds of fullers' earth	{ Near Bath		
	Great oolite.—Durable free-stone	{ Composed of oolitic concretions and shelly fragments, united by a calcareous cement	{ Farley Down, near Bath; and Ketton, Northamptonshire		
	Middle oolite	Stonesfield slate	{ Calcareous siliceous oolite, sometimes passing into sand { With shale and thin beds of coal	{ Coly Weston, near Stamford - 30 { Henton, near Bath - - - 400 { Cleveland Hills, Yorkshire	
		Forett marble	{ Compact, composed of fragments and shells	{ Henton, near Bath, and Long Burton, Dorset	
		Corn brañh	{ Soft earthy lime-stone	{ Witch-Wood Forest, Oxon { Campsfield, Oxon, Malm-bury, and Trowbridge	
		Kelloway rock	{ Coarse sandy lime-stone	{ Vale of Thames, upwards, { Oxon; Oofe, Bedford, downwards	{ 200
		Oxford-forest, or Fen-clay	{ Sterile clay, with septaria	{ Near Abington, Weymouth; Filey, Yorkshire	
		Calcareous grit	{ Siliceous sand and lime	{ Heddington near Oxford; Calne, Wilts; Kirkby Moorùde, Yorkshire	
Upper oolite	Coral rag	{ Loose earthy lime-stone, full of coralline remains	{ Heddington near Oxford; Calne, Wilts; Kirkby Moorùde, Yorkshire		
	Upper oolite	{ Oolitic concretions, and shelly fragments, perishable free-stone	{ Heddington, Calne, New Malton		
	Kimmendge clay	{ Sometimes bituminous	{ Isle of Purbeck, Dorset		
	Portland-stone	{ Calcareo-siliceous free-stone, with beds and nodules of chert	{ Wiltshire, Isles of Purbeck and Portland, near Sandwich		
	Purbeck-beds	{ Strata of sandy clay and marle, alternating with beds of coarse shelly lime-stone	{ Sandwich, Isle of Purbeck		
N ^o 6.					
Green sand-stone formation Third sand-stone of Werner	Iron-sand	{ Contains beds of clay { ————— of ochre { ————— of fullers' earth	{ Haltings, Wealds of Suffex - 500 { Summit of Shotover Hill { Woburn, Bedfordshire		
	Tetfworth clay	{ Lead coloured	{ Vale of Aylebury, and White-horfe, Berkshire	{ 150	
	Green sand	{ Micaceous sandy, and almost black { Sand and sand-stone, with grains of green earth { Alternating, and passing into grey sand	{ Devizes, and White-horfe, Berkshire { Vale of Powfey { Eastburn, Suffex		
	Green sand	{ Sometimes cemented by calcareous earth	{ Maidstone, (Kentish rag)		
	Green sand	{ Containing beds of chert { ————— specks of mora	{ Lyme, Dorset { Black Down		
	Green sand	{ Sometimes cemented by calcareous earth	{ Maidstone, (Kentish rag)		

		Localities.	Greatest observed distance of the strata.	Feet.		
N ^o 7.						
Chalk formation	{	Chalk, marle, malm, or grey chalk	{ Without flint or chert, passing into grey sand Into grey clay	{ Benfon, Oxon, Wiltshire, and Lewes, Suffex Folkstone	} 200	
		Lower chalk	{ With few flints sometimes hard	{ Warmminster, Wilts, and Flam-borough-Head, Yorkshire		} 300
		Upper chalk	{ With many flints, passing into the former, soft enough to mark with	{ Salisbury Plain, and Downs of Suffex		
N ^o 8.						
Formations above chalk	{	Plastic clay	{ Potters' clay, alternating with beds of sand and gravel	{ Blackheath, Reading, Alum-Bay, Isle of Wight	} 1131	
		London clay	{ Lead, coloured with septaria, containing calcareous matter	{ Isle of Sheppey, and Bognor Rocks		} 550
		Fossils same as in the calcaire groifiere of Paris	{ - - - - -	{ Hardwell-Cliff, near Christ-Church, Hants		
		Lower fresh-water beds	{ Sandy argillaceous lime-stone, contains fresh-water shells	{ Headen Hill, Isle of White	} 63	
		Upper marine beds	{ Clay-marle, with marine shells	{ Ditto	} 36	
		Upper fresh-water beds	{ Yellow argillaceous lime-stone, with clay-sand and fresh-water shells	{ Ditto	} 1222	
N ^o 9.						
Trap	Fletz trap	{ Basalt wacke, amygdaloid green-stone	{ Giants' Caulfeway	} 1040		
N ^o 10.						
Alluvium	{	Deluvian detritus	{ Fragments of neighbouring and distant rocks, and with bones not mineralized	{ Generally in valleys		
		Fluviatile detritus	{ Post deluvian, accumulations of mud, sand, and salt Gravel, sand, and mud	{ Deltas of great rivers Channels of torrents and rapid currents		

In the preceding part of the present article we have stated, that this arrangement of the strata may be taken as an approximation to the truth with certain limitations. It must be observed also, that the trap rocks, N^o 9, most frequently occur covering or between many of the lower secondary rocks, precisely similar to what would have been the case had they been formed like volcanic rocks at different and distant epochs. The occurrence of basalt in or over chalk, or any of the formations above the lias, is extremely rare. See SYSTEMS of Geology.

GEORGE, ST., l. 15, add—The hundred of St. George's, in Delaware, contains 2880 inhabitants, of whom 314 are slaves.—Also, a town of Maine, in the county of Lincoln, having 1168 inhabitants.

GEORGE-Town, col. 2, l. 14, r. 1998; l. 29, add—Also, a district of North Carolina, containing 15,679 inhabitants, of whom 13,867 are slaves.

GEORGE, a township of Fayette county, in Pennsylvania, having 2086 inhabitants.

GEORGIA, in America, l. 2, r. 1760.

GERMAN, l. 2, r. 2079.

GERMAN-Town, col. 2, l. 1, r. Mason county, in Kentucky, containing 36, &c.; add—Also, a town of Ohio, in the county of Montgomery, having 1256 inhabitants.

GERRY, l. 3, r. 839.

GEYSERS, celebrated fountains situated on the side of a hill, about 16 miles to the N. of Skalholt; for an account of which we refer to the article UXAHVER.

GEZANGABEEN, or *Persian Manna*. This substance has been lately ascribed by Capt. E. Frederick, of the Bombay Establishment, to be the production of insects. It is obtained, according to the same gentleman, from a small shrub somewhat resembling the broom, on which the insects reside, by beating the bushes with a stick. When first separated, it is a white sticky substance, not unlike hoar frost, of a very rich sweet taste. It is purified by boiling, and then mixed up with rose-water, flour, and pistachio-nuts into cakes, and in this form constitutes the sweetmeat, called in Persia *gezangabeen*, and which by the Persians is highly valued. This substance, in its original state, is said to liquify at a temperature of about 68°. The Persians, however, themselves consider this substance as a spontaneous exudation from the tree on which it is found; hence the term *gezangabeen*, a term meaning literally *juice of the gez*, which is the Persian name of the tree producing it. Thomson's Annals of Philology, vol. xiii. See MANNA.

GHAUT. See GAUT.

GHONI, a large market-town of Mingrelia, carrying on some trade, situated between the Arafcha and the Hippas.

GHURZI, a well-built and populous town of Mingrelia, on the left bank of the Taghuri.

GILBERT, col. 2, l. 32, r. 1759.

GILDER, or GUILDER. See FLORIN.

GILEAD, in *Geography*, a town of Maine, in the county of Oxford, having 215 inhabitants.

GILES, a county of Virginia, containing 3475 persons, of whom 242 are slaves.

GILL, l. 4, r. 762.

GILLINGHAM, l. 4 and 5, r. 875, and 5135.

GILMANTOWN, l. 4, r. 4338.

GILSON, or GILSUM, l. 2, r. 513.

GIRARDEAU, CAFE, a district of Louisiana, containing 3888 inhabitants, of whom 589 are slaves.

GIRVAN, l. *penult.* and *ult.*—In 1811, the number of houses was 533, and of inhabitants 3097, of whom 358, &c.

GISBOROUGH, or GUIBOROUGH, l. 5, r. 1811—435; l. 12, r. 2094.

GLAMORGANSHIRE, last parag.—Glamorganshire is divided into ten hundreds, exclusive of the two towns of Cardiff and Swansea, and 118 parishes, which, in 1811, contained 85,067 inhabitants; 41,365 being males, and 43,702 females: of whom 7915 families were employed in trade and manufacture, and 8217 in agriculture.

GLANCE COAL. See MINERALOGY, *Addenda*.

GLASGOW, col. 2, l. 11 from the bottom, add—By the parliamentary returns of 1811, the city and burgh of Glasgow contained 175,543 houses, and 100,749 inhabitants; 45,275 being males, and 55,474 females: of whom 17,669 families were employed in trade and manufactures, and 544 in agriculture.

GLASS, *Laws relating to*, l. 14, add—By 49 Geo. III. c. 63, the former duties upon crown glass and broad glass were repealed, and new duties were imposed. This act also contains directions and regulations with regard to the construction and use of the annealing arch or oven.

GLASTONBURY, col. 2, l. 42, r. 1811—448; l. 43, r. 2337—121.

GLASTONBURY, in America, l. 2, r. 76; l. 5, r. 2766.

GLOUCESTER, col. 6, l. 6, r. 1811; l. 7, r. 1509—8280; *dele* the next paragraph, and insert—3726 being males, and 4554 females; of whom 1312 families were employed in trade and manufactures, and 12 families in agriculture.

GLOUCESTER, in America, l. 3, r. 5943; l. 21, r. 2319. Col. 2, l. 2, for Woodbury insert—Weymouth; l. 9, r. 19,744; l. 10, r. 74; l. 17, after Philadelphia, add—having 555 inhabitants.—Also, a town of the same county, having 1726 inhabitants.—l. 25, r. 10,427 inhabitants, of whom 5798 were slaves in 1810.

GLOUCESTER, *New*, a town of Maine, in the county of Cumberland, having 1640 inhabitants.

GLOUCESTERSHIRE, col. 2, l. 26, insert after amounted to—52,042, of inhabitants 285,514, of whom 133,192 were males, and 152,322 females; 29,988 families being employed in trade and manufactures, and 20,782 in agriculture.

GLOVER, l. 3, r. 378.

GLUCINA, in *Chemistry*, the name of an earth. (See GLYCINE.) Dr. Thomson, from the experiments of Berzelius and others, estimates the weight of the atom of glucina at 22.5.

GLUCINUM, the metallic basis of *glucina*. When glucina was heated by sir H. Davy with potassium, that metal was converted into potash, and grey metallic particles were observed mixed with the potash, which when put into

water gradually evolved hydrogen gas, and were converted into glucina. This is all we know at present respecting this metal.

GLUTEN, supposed to be the active principle of yeast. See YEAST.

GLUTTON, r. *URSUS Gulo*.

GLYN, l. 4, r. 3417, of whom, in 1810, 2845 were slaves.

GLYPHIS, in *Botany*, from γλυζω, *to emboss*, expressing the appearance of the warty crust.—Achar. in Tr. of Linn. Soc. v. 12. 36. t. 2, 3.—A genus of crustaceous Lichens, of which four species are described and figured, found on the barks of different tropical trees. See CHIONECTON.

Eff. Ch. Warts flattish, of the substance of the crust. Receptacles superficial, numerous, irregular, black, solid, each with a depressed disk, and tumid margin.

The species are, *G. labyrinthica*, t. 2. f. 1. Ach. Syn. 107: *trifoca*, f. 2: *ciatricocosa*, f. 3: *favulosa*, t. 3. f. 1.

GODALMING, l. 2, r. 672, and 3543.

GOFSTOWN, l. 5, r. 2000.

GOLD. See GOLD, and MINERALOGY, *Addenda*.

GOLD, in *Chemistry*. A few particulars lately ascertained respecting this metal deserve to be briefly noticed here.

Sulphur is stated in the Cyclopædia to exert no action on gold, and this is true in ordinary cases. But if an alkaline hydrofulphuret be dropped into a solution of gold, a black powder falls to the bottom, which is found to be a fulphuret of gold; and which, according to the experiments of Bucholz and Oberkampf, is composed of

	Bucholz.	Oberkampf.
Gold	100	100
Sulphur	21.95	24.39

With respect to the oxyds of gold, there are still very great confusion and uncertainty. According to Berzelius, who is one of the most recent experimentalists on gold, the purple oxyd is a compound of 100 gold + 12.077 oxygen; and the protoxyd of 100 gold + 4.026 oxygen. On this supposition, the weight of an atom of gold, as estimated by Dr. Thomson, will be 248.75, and this determination agrees tolerably well with Oberkampf's analysis of the fulphuret of gold above-mentioned. Still, however, these results are by no means satisfactory.

GOLDSINNY, r. *GOLDFINNY*.

GOMPHOSUS, in *Ichthyology*, a genus of fishes of the Thoracici order, instituted by count de Cèpe from the MSS. of Commerfon; the characters of which are, that the jaws are lengthened into a tubular snout, and that the teeth are small, those in front being larger. There are two species, both natives of the Indian seas, *viz.* *G. caruleus*, or *G.* entirely of a blue colour, about the size of a tench, with a blackish cast on the pectoral fins; body arched above, and in a greater degree beneath; snout about one-seventh of the whole fish; upper jaw larger than the lower; the sides of the mouth smooth and blue, head and gill-covers plain, the rest of the body covered with scales, the lateral line through its whole course marked with small streaks like Chinese characters: and *G. variegatus*, or variegated with red, yellow, and blue; a beautiful fish, observed by Commerfon about the coasts of Otaheite.

GOOCHLAND, l. 4, r. 10,203 inhabitants, of whom 5664 were slaves in 1810.

GOODYERA, in *Botany*, dedicated by Mr. Brown, to the worthy memory of Mr. John Goodyer, a Hampshire botanist, celebrated in various parts of Gerard's Herbal, (see ed. 2. 1018, 228, &c.)—Br. in Ait. Hort. Kew. v. 5.

197.—This genus founded on *Satyrium repens*, Linn. we have not as yet ventured to separate from *NEOTTIA*; see that article.

GORHAM, l. 4, r. 2632.

GOSHEN, in America, l. 4, r. 692; l. 7, containing 86 inhabitants; l. 8, r. 1273; l. 10, r. 1641. At the close, add—Alfo, a town of Cheshire county, in New Hampshire, having 563 inhabitants.—Alfo, a town of Lincoln county, in Georgia. See LINCOLN.—Alfo, a township of Columbian county, in Ohio, having 277 inhabitants.—Alfo, a town of Ohio, in Tuscarawa county, having 320 inhabitants.

GOSPURT, col. 2, l. 30, r. 1811—7788; l. 31, r. 1439.

GOSPURT, in America, l. 3, r. 72.

GOTHEBORG, col. 2, l. 5, r. amounted in 1811 to 24,858 persons, &c.

GOULDSBOROUGH. Add—the town contains 471 persons.

GRABS, the name of vessels peculiar to the Malabar coast, generally with two masts, and of 180 tons burthen, but sometimes with three masts, and about 300 tons burthen. They are so constructed as to draw little water, being very broad in proportion to their length, becoming narrow from the middle to the end, and having a prow projecting like that of a Mediterranean galley: others are constructed with a strong deck fixed with the main-deck of the vessel, from which, however, it is separated by a bulk-head that terminates the fore-castle; on the main-deck under the fore-castle are mounted two pieces of cannon, of nine or twelve pounders; the cannon of the broad-side are from six to nine pounders.

GRAFTON, l. 4, r. 1365; l. 8, r. 35; l. 9, r. 28,462; l. 12, r. 931; l. 18, r. 946.

GRAIN, as a weight, l. 11, *dele* bread.

GRAINS of *Paradise*. See AMOMUM and CARDAMOM.

GRAINGER, l. 6, r. 6397 and 537.

GRAMPOUND, l. *penult.* r. 601 and 96.

GRANBY, l. 5, r. 850; l. 8, r. 2696.

GRAND ISLE. Add—It contains 3445 inhabitants by the census of 1810.

GRAND Junction Canal, l. 16 from bottom, for began r. begun.

GRAND View, a township of Ohio, in Washington county, having 463 inhabitants.

GRANLEY, a township of Effex county, in Vermont, having 120 inhabitants.

GRANTHAM. In 1811, the borough and parish contained 673 houses, and 3646 persons; viz. 1677 males, and 1969 females: 61 families being employed in agriculture, and 430 in trade and manufactures.

GRANVILLE, l. 2, r. 15576; l. 3, r. 7746; l. 9, r. 1504.

GRANVILLE, a township of Licking, in Ohio, having 674 inhabitants.

GRAPHITE. See PLUMBAGO, and MINERALOGY, *Addenda*.

GRAVESEND, col. 2, l. 3, r. 3119; l. 4, r. 525.

GRAY, l. 3, r. 1310.

GRAYSON, l. 2, r. 4941 inhabitants, of whom 270 were slaves in 1810; add—Alfo, a county of Kentucky, containing 2301 inhabitants, of whom 103 were slaves in 1800.

GREEN, l. 6, r. 19,536 inhabitants, of whom 367 were slaves; l. 10, r. 12,544; l. 14, r. 6603, of whom 1354 were slaves; l. 16, r. 4567 and 1842; l. 19, r. 1277; l. 23, r. 1497; l. 24, for Franklin county, add—Alfo, a

township in Washington, r. Green, adding after state—with 1708 inhabitants; then add—Alfo, a township of Ohio, in Fayette county, with 290 inhabitants.—In Gallia county, with 421.—In Hamilton county, with 916.—In Jefferson county, with 875.—In Ross county, with 1183.—In Scioto county, with 507.—In Trumbull, with 559.—In Columbian county, with 338 inhabitants; all in the district of Ohio.

GREEN Briar, l. 4, r. 5914 inhabitants, of whom 494 were slaves in 1810.

GREEN Earth. See MINERALOGY, *Addenda*.

GREENE, l. 2, r. 9713 and 655; l. 7, containing, together with Greenborough town, 11,769 inhabitants, the county having 4992, and the town 244 slaves, included in the above number; l. 12.—By the census of 1810, it contains six townships, and 5870 persons.

GREENE, in Pennsylvania. See GREEN.

GREENE, in Maine. See GREEN.

GREENE, a town of Adams' county, in Ohio, having 393 inhabitants.

GREENFIELD, l. 5, r. 1165; l. 7, r. 980; add—Alfo, a township of Bedford county, in Pennsylvania, having 855 inhabitants.—Alfo, a township of Ohio, in Fairfield county, having 744 inhabitants.

GREENLAND, in America, l. 3, r. 592.

GREENLAW, col. 2, l. 2, r. In 1811, it contained 253 houses, and 1260 inhabitants.

GREENOCK, l. 3, after Glasgow, add—The parish, including East, Middle, and West Greenock, contained, in 1811, 1138 houses, and 19,042 persons.

GREENSBOROUGH, in Georgia. See GREEN; l. 6, r. 566.

GREENSBURGH. Add—It contains 132 inhabitants, including 47 slaves.

GREEN-STONE, in *Geology, grunstein*, Werner, a species of granular trap or basalt, composed of hornblende and felspar, and described in our article TRAP. (See TRAP.) It has recently been discovered, that the mineral called augit, or pyroxene with Häuy, is a constituent part of many rocks of green-stone, which confirms still further the similarity between volcanic and basaltic rocks. See VOLCANIC *Products*.

GREENSVILLE, l. 4, r. 6853 inhabitants, of whom 4599 were slaves in 1810.

GREENVILLE, l. 3, r. 13,133 and 2353.

GREENUP, a county of Kentucky, containing 2369 persons, of whom 484 were slaves in 1810.

GREENWICH, col. 4, l. 28 from bottom, r. 16,947 and 2315.

GREENWICH, in America, l. 3, r. 1225; l. 6, add—containing 2858 persons; l. 9, in 1810, 2528; l. 13, add—in 1810, 858 inhabitants; l. 12, r. 3533. Add—Alfo, a township in Berks county, in Pennsylvania, having 1104 inhabitants.

GREENWICH, *East*, l. 3, r. 1530.

GREENWICH, *West*, a township in the same county and state, containing 1519 inhabitants.

GREENWOOD, l. 1, r. Northumberland; l. 2, r. 1028; add—Alfo, a township in Cumberland county, having 1102 inhabitants.

GREGORY, DAVID, l. *ult.* It appears by the inscription on his monument in St. Mary's church, Oxford, that he died Oct. 10, A.D. 1708; and not, as the writer of his life in the *Biog. Brit.* says, in 1710, whence this date is cited. He died at an inn at Maidenhead, in his way to London from Bath, and was buried in this town.

GRENATITE. See MINERALOGY, *Addenda*.

GREY *Antimony Ore.* See MINERALOGY, *Addenda.*

GRIESBACH, JOHN JACOB, in *Biography*, an eminently learned divine of Germany, was born in 1745, in Hesse-Darmstadt; and at the Gymnasium at Frankfort, and the university of Tubingen, acquired that acquaintance with the learned languages, for which he was so distinguished, and which he applied to the most valuable biblical purposes. He fought further means and opportunities for improvement at Halle and Leipsic. In order to acquaint himself with the variety of religious sects, and for the purpose of consulting public libraries, he commenced in 1769 an extensive tour, visiting Holland, England, and Paris. In 1770 he returned to Frankfort, with a view of arranging the stores which he had collected. In 1773 he was appointed professor extraordinary of divinity at Halle; and in 1774-1775 appeared his first great work, which was a critical edition of the historical books of the New Testament in Greek. From Halle he removed to Jena in 1775, and became third professor of divinity. Having previously published several critical dissertations in reference to biblical subjects, he completed, in 1777, his edition of the whole Greek Testament in 2 vols. As his reputation increased, his appointments and labours multiplied. But the great object to which his attention was principally devoted, was the completion of his edition of the New Testament, which appeared in 1803, 4, 6, and 7, in 4 vols. A larger edition, begun in 1796 and finished in 1806, was adapted for sale in England as well as in Germany; and was liberally encouraged by the munificence of the late duke of Grafton. In 1811 professor Griesbach's health began to decline, and in 1812 he was under a necessity of giving up the province of lecturing; and a disorder in the chest terminated his life on the 24th of March 1812, in the 68th year of his age. His corporeal form was athletic, his aspect grave and somewhat austere; but he possessed a kind heart, excellent moral principles, an independent spirit, and universal philanthropy. *Gen. Biog.*

GRIMSBY, l. 19 from bottom, after Grimsby insert—(both borough and parish); l. 18, r. 619 and 2747.

GROGGINESS, in *Farrery*, a stiffness in the foot of a horse occasioned by battering the hoof on hard ground, which is often succeeded by swelling of the leg and contraction of the sinews. A horse that bears altogether upon his heels in trotting is denominated "groggy;" and the defect is generally incurable.

GROTON, l. 3, r. 549; l. 6, r. 449; l. 8, r. 1886; l. 11, r. 4451.

GROTTO, col. 2, l. 36. Add—The grotto in Savoy is a prodigious work, said to have been begun by Cæsar, but principally executed by Charles II. duke of Savoy in 1760. It is a passage cut through the mountain near the delightful valley of Echelles to the length of 5000 yards, and in perpendicular height above 100 feet; it is wide enough for two carriages to pass. About half way is a complete tunnel, running in another direction, 1000 feet long, and 36 feet high, cut by order of Buonaparte for the conveyance of cattle. Six years, both night and day, were devoted to the completion of it.

GRYLLUS. Under genus GRYLLUS, species CRYSTATUS, add—See LOCUST and ACRIDOPHAGI.

GUADALAJARA, col. 2, l. 3, after annually, add—The population is estimated at 75,000, but according to Humboldt 19,500 in 1803, and that of the administration 5,630,500. N. lat. 20° 50'. W. long. 105°.

GUAIAACUM, *Chemical Properties of.* Guaiaicum was

formerly considered as a resin, though in its properties it differs considerably from resins. Guaiaicum always assumes a green colour when exposed to the light in the open air. When heated, it melts and diffuses at the same time rather a fragrant odour. Its sp. gr. is 1.2289. It is very sparingly soluble in water, but imparts to that fluid a greenish-brown colour, and a sweetish taste. Alcohol dissolves it with facility, and forms a deep brown coloured solution. Sulphuric ether also dissolves it, but not in such large proportions as alcohol. It is readily soluble in alkaline solutions. Most of the acids also act upon it with considerable energy; thus sulphuric acid dissolves it, and forms a deep red solution. Nitric acid dissolves it completely with effervescence, and when the solution is evaporated, it yields a very large proportion of oxalic acid, but no artificial tannin. Muriatic acid acts but slightly on guaiaicum. When guaiaicum is submitted to destructive distillation, it yields a little acidulous water, a considerable proportion of brown empyreumatic oil, some gaseous products, and a quantity of charcoal is left on the retort nearly equal to one-third of the original weight of the guaiaicum.

GUANAJUATO, l. 2, r. Quaraçaro, and between 21° 30' and 22° 30' N. lat., and 100° and 105° W. long., extending from N. to S. 75 miles, from E. to W. 85 miles. Humboldt estimates the population of the administration at 517,300, and of the capital, in N. lat. 21°. W. long. 105°, at 41,000.

GUANARA, at the end, r. Depons' &c.

GUAXACA, l. 5, after distance, add—between 16° and 18° N. lat., 98° and 112° W. long.; from E. to W. 230 miles, from N. to S. 175 miles.—l. 32, after persons—that of the province 534,800. At the close—W. long. 96° 25'.

GUERNSEY, a county of Ohio, containing 9 townships, and 3050 inhabitants.

GUGAH, a town of Scind, in the Persian empire, built at the foot of a hill, at the bottom of which runs a small creek in N. lat. 24° 45'. E. long. 68° 7', and containing 600 inhabitants.

GUILDER, or GILDER. See FLORIN.

GUILDFORD, last lines, r. 495 and 2974.

GUILDHALL, l. 3, r. 544.

GUILFORD, l. 2, r. 1961; l. 4, r. 1872.

GUM, *Chemical Properties of.* The best test for gum in solution, according to the experiments of Dr. Thomson, is filicated potash. When added to a very dilute solution of gum, it produces a white flaky precipitate. Gum arabic is composed, according to

	Gay Lussac and Thenard.	Berzelius.
Of Hydrogen	- - 6.93	- 6.788
Carbon	- - 42.23	- 41.906
Oxygen	- - 50.84	- 51.306
	100.	100.

The varieties of gum are very numerous, and probably differ considerably in their chemical properties, though few of them have been examined. (See CERASIN.) It has been remarked by Mr. Barrow, and probably also by others, that all trees which yield gum have an astringent bark.

GUNPOWDER, col. 2, l. 31 from the bottom, after 1326, add—or, as others say, 1354, (Watson's Chem. Eff. vol. i.)

GUN-SHOT WOUNDS. At the end, add—See WOUNDS.

GURIEL, r. a small country of Asia.

GURMSYL, or GURMESSER, meaning a warm climate, a district of Mekran, which is a narrow tract, about five

days' journey N.W. of Noosfley, probably the bed of a river, half a mile wide, between two high banks, fertile in grain, and being watered by the Heermund river, needs little cultivation. The inhabitants are notorious robbers, composed of the outcasts of the surrounding country.

GYMNADENIA, in *Botany*, Br. in Ait. Hort. Kew. v. 5, 191, (*Orchis conopsea* of Linnæus, &c.) is separated from ORCHIS, (see that article,) merely because the glands supporting the pollen, are, as the name expresses, *naked*, or not enclosed in any hood; a character which appears to us not essential.

GYMNETRUS, in *Ichthyology*, a genus of the Thoracici order of fishes; the characters of which are, body very long, compressed; teeth numerous, subulate; gill-membrane four or five rayed; and destitute of anal-fin. The species are, *G. Ascanii*, or silvery *G.* speckled longitudinally with brown points. A native of the northern seas, and probably first described by Ascanius, in his "Icones rerum naturalium," and length ten feet, diameter about six inches; head

short, mouth small, and eyes rather large. This fish is said to be generally seen either preceding or accompanying the shoal of herrings in the northern seas, and therefore is popularly known by the appellation of "king of the herrings." Of this there is a variety, as Dr. Shaw suggests, called the Ruffelian Gymnetrus.

G. argenteo-ceruleococcus, or a blueish-silvery *G.* with oblique, linear, brown bands, and rounded spots, red fins, and four central processes. A native of the Indian seas, and occasionally seen in those of Europe.

G. cepedian is a doubtful species, of a gold colour, shaded with brown. See Shaw's *Zoology*, vol. iv. pt. ii.

GYMNIAS. Add—The site of Gymnias, according to Rennell's "Illustrations of the History of the Expedition of Cyrus, &c." was a town and village, named by others Camufour, and by others Coumbas and Kumakia, which stands on the northern bank of the river Ærakis, about 31 miles below its source, and on the eastern border of Perſia, in the country of the Phasiani.

H.

HACKENSACK, in *Geography*, a town of Bergen county, in New Jersey, having 1918 inhabitants.

HACKNEY, l. 3 from the bottom, *r.* given by Mr. DeCuyper. By the returns of 1811, the parish of St. John, Hackney, contains 2699 houses, and 16,771 inhabitants: but this, like the other villages in the neighbourhood of London, is daily increasing.

HADDAM, l. 3, *r.* 2205; l. 5, *r.* 2537.

HADDINGTON, l. 7, *r.* 1811—1671, and 4370.

HADDINGTONSHIRE, col. 2, l. 36, *r.* 1811—5882, and 31,164.

HADLEY, l. 4, *r.* 509—2592—1811.

HADLEY, l. 5, *r.* 1247.

HAIGH, l. *ult.* *r.* 1811—213—1118.

HAIR, *Chemical Properties of*. See INTEGUMENTS, and WOOL.

HALES-OWEN, in *Geography*. In 1811, the parish contained 1360 houses, and 6888 persons; 3451 being males, and 3437 females: 127 families employed in agriculture, and 1261 in trade, manufactures, and handicraft.

HALESWORTH, l. 4, for township *r.* parish; *r.* 342, and 1810.

HALIFAX, col. 2, l. 5 and 6, *r.* 1811—2151, and 9159; l. 3 from the bottom, *r.* 703; l. *ult.* *r.* 1758; after inhabitants, add—Also, a township of Dauphin county, in Pennsylvania, having 1365 inhabitants. Col. 2, l. 5 and 6, *delete* the numbers; l. 8 and 9, *r.* 15,620—6624; l. *ult.* *r.* 22,133 inhabitants, of whom 9663 were slaves in 1810.

HALLATON, l. 3, *r.* 147, and 598.

HALLOWELL, l. *ult.* *r.* 2068.

HALSTEAD, l. 5 and 4 from the close, *r.* 1811—722—3279

HALTON. In 1811, this township contained 151

houses, and 894 persons; 463 being males, and 431 females.

HALTWHISTLE. In 1811, this township contained 142 houses, and 751 persons; 368 being males, and 383 females.

HAM, l. 6, *r.* 1811—182, and 1267; l. *ult.* after marsh, add—The number of houses, in 1811, was 1344, and of inhabitants 8136.

HAMBATO, l. 3, after Quito, add—See RIOBAMBA.

HAMDEN, l. 4, after Wincasset, add—See HAMPDEN; l. 6, *r.* 1716.

HAMILTON, in Scotland. This town and parish, in 1811, contained 768 houses, and 6453 persons; 2928 being males, and 3525 females: 243 families employed in agriculture, and 1131 in trade, &c.

HAMILTON, l. 3, *r.* 780; l. 6, after Northampton, add—the latter having 1044, the second having 1263 inhabitants; l. 8, add—and others, *r.* 15,258. Add—Also, a township of Ohio, in Trumbull county, having 326 persons.—Also, a township of Ohio, in Warren county, having 1238 inhabitants.

HAMILTONIA, in *Botany*, Ait. Hort. Kew. v. 5, 480. See PYRULARIA.

HAMLETS, TOWER, a particular district in the county of Middlesex, commanded by the constable of the Tower, or lieutenant of the Tower-hamlets, for the service and preservation of that royal fort.

The *Royal Tower-Hamlets* comprehend the militia raised in the district of the Tower, which is divided into two battalions, *viz.* 1st and 2d, officered like other corps belonging to that establishment, and subject to the same regulations.

HAMMERSMITH, l. 3, *r.* 1811—978—7391.

HAMPDEN. Add—containing 1279 inhabitants.

HAMP-

HAMPSHIRE, col. 2, l. 14, r. 1811; l. 15, r. 43,210; l. 16, r. 245,080—118,855; l. 17, r. 126,228.

HAMPSHIRE, in America, l. 7, r. 64—76,275; l. 16, r. containing 9784 inhabitants, of whom 929 are slaves.

HAMPSTEAD, col. 2, l. 8 from the end, r. 1811—842—5480.

HAMPSTEAD, in America, l. ult. r. 1810—738.

HAMPTON, l. ult. r. 1811—229—1984.—In America, l. 2, r. 1274.

HAMPTON, *East*, l. 3, r. 660; l. 9, r. 1810; l. 10, r. 990; l. 18, r. 1840; l. ult. r. 570.

HANCOCK, l. 7, r. 31,031; l. 13, r. containing together with its town 13,330 inhabitants, of whom the slaves in the county are 6278, and in the town 78; l. 19, r. 1049; l. 23, r. 1184; l. 26, r. 311.

HANIFAH, *Abou*, in *Biography*, a celebrated Mahometan doctor of the 8th century, who was the founder of the sect denominated Hanifites, and who was imprisoned at Bagdad by the caliph Almanfor, because he would not subscribe to the doctrine of absolute predestination. He was born at Cufa in the year 700, and died in prison in the 70th year of his age. After his death his doctrine acquired reputation; and in the year 1092 a mausoleum was erected to his memory, and also a college for the votaries of his sect. This brief account of him may not be unamusingly clofed with the following anecdote:—Having received from an adversary a rude blow on his face, he said to the person who thus assaulted him, "I could return you outrage for outrage, but I will not; I could accuse you to the caliph, but I will not; I could pray to God to avenge the affront, but I will not: if the day of judgment were now come, I would pray to God that I might enter heaven with you." *D'Herbelot*, *Bibl. Orient.*

HANOVER, col. 3, l. 6, after Pennsylvania, add— with 63 inhabitants; l. 9, add—the former having 1387, and the latter 2461 persons; l. 14, r. 1171; l. 16, add—containing 2135 inhabitants; l. 22, add—having 3843 inhabitants.—Also, a town of Burlington county, New Jersey, having 2536 persons.—l. 25, r. containing 15,082 persons, of whom 8454 are slaves.

HANOVER, a township of Ohio, in Columbiana county, having 735 inhabitants.—Also, a township of Ohio, in Licking county, having 651 inhabitants.

HANOVER, *New*. Add—Also, a county of New Orleans, having 11,465 persons, of whom 6442 are slaves.

HANOVER, *Upper*, a township in Montgomery county, in Pennsylvania, with 725 inhabitants.—Also, a township in Northampton county, in the same state, having 939 persons.—Also, a township in Beaver county, in the same state, having 1090 persons.

HARAN. Add—This is a town of the pachalic of Orfa, inhabited by wandering Arabs, who were led hither by a plentiful supply of water, and situated in N. lat. 36° 52'. E. long. 36° 5', on a flat sandy plain. See *CHARRÆ.*

HARBOROUGH, col. 2, l. 30, r. 1811—335—1704.

HARDEN. See *HARDIN.*

HARDIN, or HARDEN, r. 7330—893; add—Also, a township of Preble county, in Ohio, having 802 inhabitants.

HARDISTON, a town of Suffex county, in New Jersey, having 1702 persons.

HARDWICK, l. 2, r. 734; l. 4, r. 1657; l. 6, add—containing 2561 persons.

HARDWICKIA, in *Botany*, so called in honour of a most able and indefatigable botanist and zoologist, Col. Thomas Hardwicke, P. L. S. long resident in the East Indies. *Roxb. Corom.* v. 3, 6.—Clafs and order, *Decan-*

dria Monogynia. Nat. Ord. *Lomentaceæ*, Linn. *Leguminosæ*, Juss.

Eff. Ch. Calyx none. Petals five, nearly equal. Legume with one feed.

1. *H. binata.* *Roxb. t.* 209.—Native of the mountains of the coast of Coromandel. A large and handsome tree, yielding valuable timber. *Leaves* alternate, stalked, binate; leaflets unequally elliptical, entire, smooth, from one to three inches long. *Flowers* numerous, rather small, yellowish, in axillary and terminal panicles. *Legume* lanceolate, an inch and a half long. *Seed* wedge-shaped, inferted at the summit.

HARDY, l. 2, r. 5525, of whom 749 are slaves.

HAREWOOD, l. 5, r. In 1811, its five townships contained 2590 houses, and 1315 persons.

HARFORD, l. 3, r. 21,258—4431; add—Also, a township of Luzerne county, in Pennsylvania, having 478 inhabitants.

HARLEM, l. 2, r. 939.

HARLESTON, l. 17, r. 1811; l. 18, r. town and Reddenhall; r. 277—1516.

HARLOW. In 1811, the parish contained 256 houses, and 1695 persons; 883 being males, and 812 females: 191 families employed in agriculture, and 102 in trade, manufactures, and handicraft.

HARMONY. Add—It contained, in 1810, 80 persons.—Also, a township of Ohio, in Champaign county, having 595 inhabitants.—Also, a township of Maine, in the county of Somerset, having 351 inhabitants.

HARP, col. 2, l. 10 from the bottom, for lyre r. liar.

HARPERSFIELD. Add—Also, a township of Geauga county, in Ohio, having 490 inhabitants.

HARPSWELL, a township of America, in Maine, and county of Cumberland, having 1190 inhabitants.

HARRAN. See *HARAN.*

HARRINGTON, l. 3, r. 469; at the clofe, add— It contains 2187 inhabitants.

HARRISON, l. 6, r. 9958 inhabitants, of whom 458 were slaves in 1810; l. 9, r. 7883, of whom 989 were slaves.

Add—Also, a town of Maine, in Cumberland county, having 439 inhabitants.—Also, a township of Ohio, in Pickaway county, having 291 inhabitants.—Also, a county of Indiana, containing 2338 inhabitants; of whom, in 1810, 15 were slaves.—Also, a township of the said county, the other being Exeter.—Also, another county in the same territory, which, with its township, Washington, contains 1257 persons, including 6 slaves.

HARROW, col. 2, l. 9, infert—The town, with the hamlet of Roxath and Sudbury, contains 283 houses, and 1689 inhabitants.

HARROWGATE, l. *penult.* add—The township of Bilfon and Harrowgate contains 286 houses, and 1583 persons.

HARTFORD, l. 3, r. 1831; l. 6, r. Oxford for Cumberland; l. 7, r. 720; l. 12, r. 19; l. 13, r. 447,333.

HARTFORD *City*, l. 11, r. 3955. Add—Hartford, except the city, a township of Hartford county, Connecticut, contains 2048 inhabitants.

HARTFORD, *East*, l. 4, r. 3240.

HARTLAND, l. 5, r. 2352. Add—Also, a town of Hartford county, in Connecticut, having 1284 inhabitants.

HARWARD, a town of Worcester county, in Massachusetts, containing 1431 inhabitants.

HARWICH, l. 3 and 4, r. 1811—564—3732.

HARWICH, in America, l. 4, r. 1942.

HARWINGTON, l. 2, r. 1718.

HASLEMERE, l. 4, r. 146—756.

HASLINGDEN, l. 3 and 4, r. 962—5127.
 HASSELQUIST, l. 5, r. 1722. Col. 2, l. 26, r. 1747;
 l. 32, r. 1749.
 HASTINGS, l. 4, r. 5268—34,826.
 HATFIELD, l. 3, r. 409—2066.
 HATFIELD, l. ult. r. 1811—2677—501.
 HATFIELD, l. ult. r. 805 inhabitants. Add—Also, a town-
 ship of Montgomery county, in Pennsylvania, containing
 652 inhabitants.
 HATHERLEIGH, l. ult. r. 1811—1380, and 223.
 HAVANT, l. 6, r. 1811; l. 7, r. 357, and 1824.
 HAVEN, EAST, l. 3, r. 1209; l. 5, add—containing 30
 inhabitants.
 HAVEN, Fair, a town of Rutland county, in Vermont,
 having 645 inhabitants.
 HAVEN, New, col. 2, l. 2, for 14 r. 18; l. 3, r. 1810
 —37,064 inhabitants, of whom 50 are slaves; l. 17, after in,
 add—1810, 5772 persons; l. 26, add—For some further
 particulars, see NEW HAVEN and UNITED STATES.
 HAVEN, New, a township of New Haven, which, the city
 excepted, contains 1195 inhabitants.
 HAVERFORD, l. 2, r. 754.
 HAVERFORDWEST, l. 19, r. and also seven fairs in the
 year for, &c.; dele on the 7th of July; l. 41 and 42, r.
 1811—3093, and 630.
 HAVERHILL, l. 5, r. 1811—242—1216. Do. in
 America, col. 2, l. 13, r. 2682.
 HAUYNE. See MINERALOGY, *Addenda*.
 HAWARDEN, l. 7, r. 1811—832—4436.
 HAWICK, col. 2, at the close, add—By the return of
 1811, Hawick contained 1163 houses, and 7645 persons.
 HAWKE, l. 3, r. 412.
 HAWKINS, l. 1, r. East Tennessee; l. 4, r. 7643; l. 5,
 r. 930.
 HAWKSHEAD, l. 18 from the bottom, r. 1811—
 149—676.
 HAWLEY, l. 2, r. 1031.
 HAY, l. 4, r. The parliamentary return of 1811 states
 the number of inhabitants to be 1099, and that of houses
 231. It has one market on Thursday, and five fairs. A
 woollen manufacture has lately been established here.
 HAYLING, l. 7, r. 1811—110—620.
 HAYNES, a township of Centre county, in Pennsylvania,
 having 1791 inhabitants.
 HAYTI, a name given by the natives to the island of
St. Domingo (which see). The dimensions are differently
 stated by different writers. Some say, that it extends 140
 or 150 miles in breadth from N. to S., and about 400 miles
 in length from E. to W. Mr. R. Edwards assigns 390 for
 the length: Rainsford says, that it is more than 450. The
 abbé Raynal represents it as 200 leagues in length, and 60,
 in some places 80, in breadth. When the French had this
 island, a proclamation, announcing its independence, was pub-
 lished, signed by Dessalines, Christophe, and Cherveaux,
 dated Nov. 29, 1803. The liberated blacks now determined
 on discarding the appellation which the island had received
 from Europeans, and revising the name of Hayti, by which
 it was designated by the aboriginal inhabitants when first
 visited by Columbus. On the 1st day of the year 1804, the
 general and chiefs of the army, in the name of the people
 of Hayti, signed a formal declaration of independence, and
 took a solemn oath to renounce France for ever, pledging
 themselves to each other, to their posterity, and to the uni-
 verse, to die rather than submit again to her dominion. At
 the same time, they appointed Dessalines governor for life,
 with power to enact laws, to make peace and war, and to
 nominate his successor. One of the first acts of his govern-
 ment was to arrange the return of negroes and mulattoes

from the United States of America. He also treated with
 the British agent for Jamaica, offering to open his ports to
 slave ships, and to allow the people of Jamaica the exclu-
 sive privilege of selling negroes in Hayti; intending
 these not for slavery, but for military service. Some of the
 French inhabitants had remained upon the general evacua-
 tion of the island, confiding in the favour and mercy of
 Dessalines. But their confidence was misplaced; for in a
 few weeks he meditated their destruction, and issued man-
 dates, no less perfidious than cruel, for a general massacre.
 He then proceeded to the subjugation of the few Spaniards
 who inhabited the eastern part of the island, and with laying
 siege to the city of Domingo, which was possessed by a
 small detachment of French troops. In this siege he was
 unsuccessful; and after his return from it, he assumed the
 title of emperor. The empire was divided into six military
 divisions, with a general over each, independent of one an-
 other. The generals of division and brigade composed the
 council of state, and they had a minister of finance, another
 of war, and a secretary of state. All persons decided their
 differences by arbitration, military crimes were subjected to
 special jurisdiction: no predominant religion was admitted,
 nor was the state to provide for the maintenance of any reli-
 gious institution. Marriage was declared to be an act purely
 civil, and divorce in some cases was allowed. In a census,
 taken in 1805, of the inhabitants of the part of the island
 under the power of Dessalines, the returns were about
 380,000, to which some incidental omissions 20,000 were
 added, making the whole number 400,000. The regular
 army consisted of 15,000 men, of whom 1500 were cavalry.
 Considerable attention was paid to the subject of education.
 The young Haytians were generally taught to read and write.
 Dessalines, whilst he possessed several good qualities, was fer-
 ocious and cruel; and at length his atrocious acts of tyranny
 caused an insurrection of the army, which was followed by
 his premature death by violence, on the 17th of October,
 1806. Christophe, who, since the expulsion of the French,
 had been second in command, immediately assumed the
 supreme power. He had been a slave in *St. Domingo* at the
 revolution in 1791, and an early friend and faithful
 adherent of Toussaint, whom he resembled in character.
 Discarding the pompous title of emperor, he modestly defig-
 nated himself "chief of the government of Hayti." He
 made several enactments, and issued proclamations favourable
 to commerce. Petion, however, soon appeared as a candi-
 date for the sovereign power; the struggle between him and
 Christophe was fierce, and in a battle fought January 1st,
 1807, between the two armies, Petion was defeated, and
 saved himself by flight. In a council convened at Cape
 François, a new constitution was published Feb. 17, 1807,
 in which slavery was for ever abolished in Hayti; and the
 government was vested in a chief magistrate for life, who
 appointed his successor. The council of state consisted of
 nine members, two-thirds of whom were generals; so that the
 government approached nearly to an oligarchy. The strug-
 gle for sovereignty still continued, and was carried on for
 several years; many battles being fought, in some of which
 Christophe, and in others Petion was victorious. In the
 spring of the year 1811, Christophe changed the title of
 president for that of king, and the royal dignity was estab-
 lished by a constitutional act in his person and family. In
 July 1816, after Louis XVIII. was restored to the throne,
 commissioners were sent to *St. Domingo*, entrusted with the
 administration of all the affairs of the island, both civil and
 military. These commissioners addressed letters to Chris-
 tophoe, which gave offence. Although the two governments
 which rule the northern and southern districts have not estab-
 lished any relations of mutual amity, they have remained

of a glass plate, whose increase in length would serve as a measure of temperatures.

TABLE III.—*Expansion of Metals.*

Temperature deduced from the Dilatation of Air.	Mean absolute Dilatation of Iron.	Temperature indicated by a Thermometer made of a Bismuth Rod.	Mean absolute Dilatation of Copper.	Temperature indicated by a Thermometer made of a Copper Rod.	Mean absolute Dilatation of Platinum.	Temperature indicated by a Thermometer made of a Platinum Rod.
100°	77.158	100°	77.158	100°	77.158	100°
300°	77.158	372.6	77.158	328.8	77.158	311.6

When we compare these results with those obtained from glass, it is seen that the expansibility of solids referred to an air-thermometer is increasing, and that it is unequal to in each of them.

Our readers will observe, that MM. Dulong and Petit used the centigrade thermometer. See further on this subject under REFRIGERATION.

See an Essay which gained the prize voted by the Academy of Sciences in 1818, entitled *Recherches on the Measure of Temperatures, and on the Laws of the Communication of Heat*, by MM. Dulong and Petit.

Animal Heat.—The above determinations of the specific heats of oxygen gas and carbonic acid by Delaroché and Berard, very much diminish the probability of Dr. Crawford's theory of animal heat. But the most formidable objections to this theory result from the experiments of Mr. Brodie. This gentleman found that when artificial respiration is kept up in the lungs after decapitation, the usual proportion of carbonic acid gas is formed, and the circulation continues nearly as usual, yet that in these animals the heat diminishes more rapidly than in the dead animal in which artificial respiration is not kept up. From these experiments, Mr. Brodie concludes that the production of animal heat is owing to the action of the brain; and not to respiration. See RESPIRATION.

HEATH, in *Geography*, a town of Hampshire, in Massachusetts, containing 917 inhabitants.

HEAVY SPAR. See MINERALOGY, *Addenda*.

HEBRON, l. 2, r. 563; l. 3, r. Oxford for Cumberland; l. 5, add after Portland—containing 1211 inhabitants; l. 8, r. 2002.

HEIDELBURG, l. 4, r. 3532; l. 6, r. 1433. Add—Also, a township in Pennsylvania, in Berks county, having 2808 inhabitants.

HEITSBURY, col. 2, at the close, r. the population of the borough and parish, returned in the year 1811, was 1023; the number of houses 198.

HELEN'S, ST., l. 9, r. 106—658.

HELLAM, a township of Pennsylvania, in York county, having 1410 inhabitants.

HELLENISTS, col. 2, l. 24, r. HELLENISM.

HELMSLEY, l. 5, r. 1811—261; l. 6, r. 1415.

HELSTON, col. 2, l. 2, r. 2297—328.

HEMATIN, in *Chemistry*, the name given by Chevreul to the peculiar matter constituting the colouring matter of the *hamatocyon campechianum*, or logwood.

Hematine may be obtained by digesting, for several hours, logwood-powder in water, of the temperature 125°. The liquid is then to be filtered, evaporated to dryness, and di-

gested for a day in alcohol of the sp. gr. .837. Filter the alcohol, concentrate it by evaporation, then add a little water, evaporate a little further, and leave it to itself. Crystals of hematine are deposited in abundance. Thus prepared, it is in the form of small brilliant crystals, of a reddish-white colour, and a slightly astringent bitter and acrid taste. It is readily soluble in boiling water, and the solution is of an orange-red colour when warm, which becomes yellow as it cools, but heat again restores the original colour. Acids render it at first yellow, then red; sulphureous acid destroys it altogether. The alkalis and alkaline earths give it a purplish-red colour, and in excess appear to decompose it. Most of the metallic oxides unite with hematine, and give it a blue colour. Gelatine throws it down in reddish flocks. The other properties of this substance do not appear remarkable.

HEMEL-HEMSTED. At the close, insert—The population of the parish, by the return of 1811, amounted to 3240, and the number of houses to 638.

HEMIONUS. See EQUUS.

HEMLOCK, in *Geography*, a township of Northumberland county, in Pennsylvania, having 879 persons.

HEMPFIELD. Add—The former contains 3431, and the latter 3444 inhabitants.

HENDERSON, in Kentucky, l. 2, r. 4544; l. 3, r. 1467. At the close, add—containing 159 persons, of whom 47 were slaves in 1810.

HENLEY-upon-Thames, l. ult. r. 1811—522—3117.

HENLEY in Arden, l. 5, r. 1811—242; l. 6, r. 1035.

HENNIKER, a town of Hillsborough county, in New Hampshire, having 1608 inhabitants.

HENRICO, l. 2, r. 9945; l. 3, 4846.

HENRY, l. 4, r. 5611 inhabitants, of whom 1755 were slaves in 1810; l. 6, r. 6652 inhabitants, of whom 1103 were slaves.

HEPATIC, in *Botany*, so named by the earlier botanists and physicians, from a resemblance in the lobes of the leaves to those of the human liver, is restored as a distinct genus from ANEMONE, (see that supplementary article,) by professor De Candolle, in his *Syst. v. 1. 215*, merely because the *involvercum* is placed very near to the flower, (some have thought it an actual perianth), and its leaves undivided. We hesitate to follow our learned friend in this measure, the certain species of *Hepatica* being scarcely more than one or two, so that nothing is gained as to convenience, nor is the character very decisive. These species are,

1. *H. triloba*. Common *Hepatica*. (*Anemone Hepatica*; Linn. Sp. Pl. 758. Sm. Fl. Græc. Sibth. t. 513, unpublished. Fl. Dan. t. 610, not 612.)—Leaves heart-shaped, with three entire lobes.—Native of Europe and North America. A common hardy garden plant, with blue pink, or white, single or double, very early, blossoms. The synonyms are numerous. De Candolle by a casual error cites *Engl. Bot. t. 51*.

2. *H. angulosa*. Angular, or Serrated, *Hepatica*. Lamarck *Dict. v. 1. 169*.—Leaves palmate, with five serrated lobes. Cultivated formerly at Paris, but now lost. It is much to be wished that we could learn more concerning this plant.

3. *H. integrifolia*, with ovate entire leaves and very hairy stalks, found by baron Humboldt in South America, is not clearly an *Hepatica*.

HEPATITE. See MINERALOGY, *Addenda*.

HERAT. Add—The ancient *Aria* or *Artacoana*, capital of Ariana; l. 4, after name, insert—or Herirood; l. 5, after which, add—gives fertility to the plain, 30 miles long and 15 broad, upon which Herat is situated, and which,

which, though surrounded with lofty mountains, is highly cultivated, and covered with villages and gardens. The Herat, or Herirood, afterwards runs, &c.; l. 5, for It r. Herat embraces an area of four square miles, and, &c.; l. 6, add—This castle is of a square form, elevated on a mound, flanked with towers at the angles, and built of burnt brick. The city has a gate in each face, and two in that which fronts the north, and from each gate a spacious and well-supplied bazaar leads up towards the centre of the town. It is well supplied with water, every house almost having a fountain independent of those that are public on either side of the bazaars:—l. 23, add—The residence of the prince is a mean building, having a gallows in the centre of the square, which is situated in its front; and the chief mosque, once a noble edifice, enclosing an area of 800 square yards, is falling into decay. Herat is computed to contain 100,000 inhabitants, 10,000 being Patans, and the rest Afghans, a few Jews, and 600 Hindoos, the last-mentioned of whom are highly respected, and they only possess capital or credit; hence they derive a very considerable influence. The trade of this city, as we have already said, is extensive, and accordingly it is the emporium of the commerce carried on between Cabul, Cashmere, Bucharia, Hindoostan, and Persia. From the former, they receive shawls, indigo, sugar, chintz, muslin, leather, and Tartary skins, which they export to Meshed, Yezd, Kerman, Ispahan, and Tehraun, receiving in return chiefly dollars, tea, china-ware, broad-cloth, coffee, pepper, and sugar-candy; dates and shawls from Kerman and carpets from Ghaen. The staple commodities of Herat are, silk, coffee, and assafœtida, which are exported to Hindoostan. The gardens are full of mulberry-trees, cultivated merely for the sake of the silk-worm, and the adjoining plains produce assafœtida. The winters here are very severe, and the cold often injures the crops; but the fertility of the plain is such that it affords an immense produce both of wheat and barley, and almost of every kind of fruit known in Persia. The cattle are small, but not plentiful, and the broad-tail sheep are abundant. The revenue of this city is estimated at 4½ lacs of rupees. The prince in possession pays a tribute to his Persian majesty of 50,000 rupees a year. N. lat. 34° 12'. E. long. 63° 14'.

HEREFORD. At the close, add—By the return of 1811, Hereford contains 1583 houses, and 7306 inhabitants.

HEREFORD, a township of Berks county, in Pennsylvania, having 1140 inhabitants.

HEREFORDSHIRE, col. 2, l. 7 from bottom, r. 1811—18,572—94,073.

HERKIMER, a county of New York, containing 22,046 inhabitants, of whom 64 are slaves.

HERMINIUM, in *Botany*, a name by which Linnaeus its author seems, in *Phil. Bot.* 171, to allude to Hermes, or Mercury, but without any explanation.—*Linn. Gen. ed.* l. 271. Br. in *Ait. Hort. Kew.* v. 5. 191. *Sm. Compend. ed.* 2. 130.—Class and order, *Gynandria Monandria*. *Nat. Ord. Orchideæ*.

Eff. Ch. Calyx spreading. Petals three-lobed, like the lip, which has no spur. Anther fixed, nearly terminal.

1. *H. monorchis*. Mulk Herminium. (Ophrys monorchis; *Linn. Sp. Pl.* 1342. *Engl. Bot.* t. 71.)—"Radical leaves two, lanceolate."—Native of chalky pastures in Europe. A small plant, with yellowish mulky-scented flowers. No genus is better defined, but we know nothing of any other species indicated by Mr. Brown's specific character.

HERO, *North*, l. 2, of Grand Isle county; l. 3 and 4, r. 1810—552.

HERO, *South*, l. 3, r. 826; l. ult. r. 623.

HERIOT. See HARIOT.

HERTFORD, in America, l. 2, r. 6052—2805.

HERTFORDSHIRE, col. 2, l. 28 and 29, r. 1811—20,345—111,654—55,023—56,631.

HESUS, in *Mythology*. See DRUIDS.

HEXHAM, l. 4. In the year 1811, Hexham parish, divided into four wards, or townships, comprehended 478 houses, and 3518 persons; and Hexham shire, including four quarters or townships, had 251 houses, and 1328 persons.

HEYNE, CHRISTIAN GOTTLÖB, in *Biography*, was born at Chemnitz, in September 1729, and rose from humble life, after struggling with many difficulties, on account of the penury of his condition, to an eminent rank, as a critical scholar and philologist. Although his parents were hardly able to derive a scanty subsistence from their labour, he was sent to school, and made such proficiency in learning, that in his tenth year he was able by teaching others to defray the expences of his own education, and by the assistance of a neighbouring clergyman, he entered himself at a grammar-school; and having acquired a competent knowledge of the Latin and Greek languages, he was sent to the university of Leipzig. Private teaching, however, was his resource for further supplies, and thus furnished he devoted himself to the profession of the law; and industrious in his study of the Roman law and history, he was qualified for reading lectures, which were much approved, on the Roman antiquities. Under the patronage and recommendation of count Bruhl, the Saxon minister, which he obtained by a Latin elegy, he was invited to Dresden, whither he repaired in 1752 with flattering expectations, which were eventually disappointed; so that he was reduced to a state of indigence and distress, without the means of providing either food or lodging. At length necessity compelled him to become a writer, and by one of his performances as a translator of a Greek romance, he acquired that taste for criticism which raised him to that eminence in this department of literature which he afterwards occupied. His next work was an edition of Tibullus, which was followed in 1756 with his first edition of Epictetus. But his prospects, which appeared promising in consequence of his access to the Bruhlean library, were again precluded by the incursion of the Prussians into Saxony, which occasioned the sudden removal of count Bruhl from Dresden, and the dispersion of his library. After some changes of situation, he repaired to Dresden in the year 1760; and in the following year married a lady, named Theresa Weifs, to whom he had for some time been affectionately attached. In 1763 he was invited to Gottingen to supply the vacant professorship of John Matthias Gesner. The subjects of his first academic lectures were, Horace, the Georgics of Virgil, and some parts of the Tragic writers. In 1766 he explained the Iliad, and afterwards the Greek antiquities. His leisure hours, after his first settlement at Gottingen, he employed as a writer and translator. Having been appointed, in 1763, first librarian to the university, he obtained, in 1770, the title of aulic counsellor, and became secretary to the Royal Society of Sciences, and editor of the *Literary Gazette*. In 1771, he collected the papers presented to the society for sixteen years, which had been neglected, and published the first volume of the "*Commentarii Novi*," which was dedicated to the king. The first edition of his *Pindar* appeared in 1773. His "*Catalogue of the Library*," begun in 1777, was completed in 1787, and extended to about 150 volumes in folio. But his opus majus, on which

he bestowed the greatest part of his attention and time, was his edition of Homer, which he began in 1787, and which was presented to the public in 1802. A second edition of his Virgil appeared in 1788; in the revival and improvement of which he derived great assistance from his literary friends, particularly Van Sautan in Holland, and Jacob Bryant in England. During the autumn of this year, he made a tour to Switzerland, and formed an acquaintance with several of the most eminent literary characters in that country; and on his return he was offered the place of chief librarian at Dresden, and a professorship at Copenhagen, both which he declined. The principal object of his attention was the Royal Society of Göttingen, of which he was secretary; and which was enlarged by the admission into the number of its members of several French literati. By means of his reputation and influence, he preserved the society, in 1803, from the miseries incident to a state of war, and from any molestation on the part of the French army. After a tour to Armitadt in 1806, on a visit to one of his daughters recently married, his infirmities increased, so that in 1809 he resigned his office as professor of eloquence. In 1810 he was made a knight of the Westphalian order of the crown, and died in the month of July 1812. Few persons have been more diligent in the improvement of their time than Heyne, or devoted more time in the day to literary occupations, without secluding himself from domestic and social enjoyments. He was twice married; by his first wife he had one son and two daughters, one of whom was married to George Forster, son of the celebrated Dr. John Reinhold Forster, and on his death to Mr. Huber. By his second wife, who was daughter of George Frederick Brandes, anlic counsellor, he had two sons and four daughters. His works were too numerous for recital within our limits. We refer for an account of them to the General Biography, Appendix.

Vol. XVIII.

HICKMAN, in *Geography*, a town of West Tennessee, containing 2583 persons.

HICKUP, l. 7, add—See LUNGS.

HIIETANS, the name of a people of North America, who traverse a region extending from the limits of the state of Louisiana to the Rio Gila, and to the eastern declivity of the Californian coast, within a short distance of the shores of the Pacific ocean. In following the herds of buffalo, which change their pasture with the seasons, they resemble the wandering tribes of Tartars and Arabs, who have no settled residence. Encamped where they find water and their prey, they remain as long as they can obtain a supply. The Hietans have domesticated the horse, and vie with the most civilized people in their management of this useful animal, in mounting it and applying its force to the purposes of chase or war. They are the only people, aborigines of this continent, who seem to have acquired the ability to withstand the shock of cavalry furnished with the principles of European tactics.

HIGHAM FERRERS, col. 2, l. 8, r. 1230, and 6627.

HIGHGATE, in America, l. 3, r. 1374.

HIGHWORTH, col. 2, l. ult. r. Highworth parish, in 1811, contained 480 houses, and 2514 inhabitants.

HILLSBOROUGH, in America, l. 6, r. 49,249; l. 11, r. 1592.

HILLTOWN, l. 4, r. 1335.

HINEKLEY, col. 2, l. 5 from bottom, r. 1811—6098, and 1097.

HINDON. Add—By the returns of 1811, the borough and parish contained 170 houses, and 781 persons.

HINDSDALE, a town of Berkshire, in Massachusetts, containing 822 inhabitants.

HINESBURGH, a town of Chittenden county, in Vermont, having 1238 persons.

HINGHAM, l. 3 and 4, r. 241—1263.

HINGHAM, l. 1, r. Plymouth for Suffolk; l. 7, r. 2382.

HINDSDALE, l. 4, r. 740.

HIRAN, l. 2, r. Oxford for York, and 336; add—Alfo, a township of Ohio, in Portage county, having 171 inhabitants.

HIRUNDO. At the clofe, for SWALLOW r. MIGRATION.

HITCHIN, l. ult. r. 1811, the hundred of Hitchin and and Pirton contained 1529 houses, and 7732 inhabitants.

HOCKSTETT. Add—See BATTLE.

HOCKING, a town of Fairfield county, in Ohio, having 1078 inhabitants.

HODSON, a township of Portage county, in Ohio, having 793 inhabitants.

HOLDEN, l. 3, r. 1072.

HOLDERNESS, l. 4, r. 835.

HOLLAND, in America, l. 4, r. 420. Add—Alfo, a town of Orleans county, in Vermont, having 126 inhabitants.

HOLLES, l. 4, r. 1529.

HOLLISTON, l. ult. r. 1810—989.

HOLLOW SPAR. See MINERALOGY, *Addenda*.

HOLLY, *Mount*, in *Geography*, a town of Rutland county, in Vermont, having 922 inhabitants.

HOLOCENTRUS, in *Ichthyology*, a genus of the Thoraici order of fishes; the characters of which are, habit of the genus Perca; gill-covers scaly, ferrated, and aculeated; and scales, in most species, hard and rough. The species enumerated and described by Dr. Shaw are as follow: *viz.*

1. *With forked or lunated tail.*

SAGO. Silvery-red H. with longitudinal yellow lines on each side, very beautiful, about a foot long, resembling a carp, but of a more square form, and becoming suddenly slender near the tail, eyes large and gold-coloured, scales large, and denticulated at the edges. Native of the Indian, American, and Mediterranean seas, and held in high estimation for the table.

SCHRAETSER. Brownish H. with four longitudinal black lines on each side, silvery abdomen and naked head; the *perca* schraetser of Gmelin's Linnæus. Native of the Danube, and of its tributary streams, esteemed for food.

RADULA. H. with the body lined with white specks; P. radula of Gmelin's Linnæus. Native of India.

GATERINA. Blueish H. with black specks and scattered spots; Sciena gaterina of Gmelin's Linnæus. Native of the Arabian seas, varying in size and colours.

VIRESCENS. Greenish H. with transverse dorsal semidecurrent olivaceous bands, and head streaked with yellow. Native of the Indian seas.

QUINQUILINEATUS. Yellowish H. with brownish back, and body marked on each side by five longitudinal blue lines. Native of Japan.

BENGALENSIS. Subulvous H., silvery beneath, and marked on each side of the upper part by five longitudinal blueish bands, margined with black. Native of Bengal.

TIGRINUS. White H. with the body transversely banded, and fins spotted with black. Native of the Indian seas, and esteemed for the table.

DECUSSATUS. White, with brown back, and body marked by

by two longitudinal and seven transverse brown bars. Native of the American seas.

STRIATUS. Subluteous H. with brownish back, body marked by transverse brown bands, dorsal fin ramentose behind, and marked by a black spot. Native of unknown regions.

ARGENTINUS. Brownish H. with silvery sides. Native of regions unknown.

NIGER. Black H. with extremely minute scales: found about the coast of Cornwall.

ACERINUS. With fourteen soft and seventeen spiny rays in the dorsal fin; perca acerina of Gmel. Linn. Native of the Euxine sea, and esteemed as food.

CÆRULESCENS. Bluish H. with all the fins yellow. Native of the Indian seas.

2. *With undivided or rounded tails.*

VARIEGATUS. Red H. with seven transverse black lines, and the head and abdomen varied with blue streaks: perca marina of Linn. Gmel. Native of the Mediterranean and northern seas.

COTTOIDES. With all the fins marked by two speckled lines. Native of the Indian seas.

PHILADELPHICUS. Perca philadelphia of Linn. Gmel.

GIGAS. Ochraceous H. with brown clouds, three-spined gill-covers, and eleven dorsal spines: perca gigas of Linn. Gmel. Native of the Mediterranean.

FORSKALII. Red H. with four broad transverse whitish bands: perca fasciata of Linn. Gmel. Native of the Red sea.

TAUVINUS. Linear-oblong H. with blackish ferruginous spots: perca Taurina of Linn. Gmel. Native of the Arabian seas.

ONGO. Brown H. with the body marked transversely by elongated spots, and the dorsal, anal, and caudal fins spotted with yellow. A native of Japan.

AURATUS. Gold-yellow H. with red specks. Native of the East Indies.

QUADRILINEATUS. Silvery H. with brownish back, and body marked above by four longitudinal black lines on each side. Native of the East Indies.

FASCIATUS. Green-yellowish H. with transverse brown bands divided beneath. Native of a region unknown.

PUNCTATUS. Yellow H. sprinkled over with black spots and red points. Native of the Brazilian seas.

CALCARIFER. Subargenteous H. with brownish back, large scales, and spotted gill-covers. Native of Japan.

SURINAMENSIS. Brownish H. with subluteous clouds, red head, and anterior gill-covers spine-ciliated. Native of Surinam.

AFER. Oblong-ovate brown H. with small scales and short tail. Native of the coasts of Guinea, in high estimation for food.

JAPANICUS. Red H. with small scales, and blue and yellow irides. Native of Japan.

MEIRA. White H. spotted on all parts with brown. Native of the Japanese seas.

TESTUDINEUS. Subluteous H. with slightly branching brown bands, blue-striped gill-covers, and blackish fins. Native of the northern seas.

MARGINATUS. Bluish H. with brownish back, red fins, and dorsal fin edged on the fore-part with black. Native place unknown.

SÖNNERATHI. Yellowish H. with three transverse silvery bands, edged with brown. Native of the Indian seas.

LANCEOLATUS. Silvery H. transversely banded with

VOL. XXXIX.

brown, and with the dorsal, anal, and caudal fins subblackate. Native of the East Indies.

CÆRULEO-PUNCTATUS. Bluish H. with pale yellow clouds, and deep-brown fins spotted with blue. Native country unknown.

BICOLOR. Bluish H. with irregular white spots. Shaw's Zoology, vol. iv. pt. ii.

HOLT, l. 7, r. 216—1037.

HOLT, l. 1, for Grefford r. of the same name; l. ult. r. 1811—161—813.

HOLYHEAD, l. 5 from latt, r. 1811—539—3005.

HOLYWELL. In 1811, the town of Holywell contained 1313 houses, and 6394 persons; viz. 2925 males, and 3469 females: 117 families being employed in agriculture, and 752 in trade, manufactures, and handicraft.

HOMER, col. 2, l. 23, for Cos r. Jos.

HONEY BROOK, a township of Chester county, in Pennsylvania, containing 1073 inhabitants.

HONITON, l. 16, after act, add—in the borough and parish; l. 17, r. 581 and 2735.

HOPE, col. 2, l. 13, add—Also, a town of the district of Maine, in the county of Lincoln, having 787 inhabitants.

HOPEA, in *Botany*, a fourth genus, (see our former HOPEA,) thus inferred, in Roxb. Corom. v. 3. 7. t. 210. is very nearly allied to DIPTEROCARPUS, (see that article,) though different in the aspect of the flowers.

HOPEWELL, l. 5, after York, having 1577; after Huntingdon, 805; after Washington, 2193; l. 8, r. 1810; l. 9, r. 2565; l. 10, add—containing 1987 inhabitants.—Also, a township of Fairfield county, in Ohio, having 478 inhabitants.

HOPKINS, a county of Kentucky, having 2927 inhabitants, of whom, in 1810, 404 were slaves.

HOPKINTON, l. 2, r. 1345; l. 8, r. 1774.

HOPS, col. 10, l. 28, r. 3250.—*Laws relating to,* l. 5, insert—See also 45 Geo. III. c. 94. 49 Geo. III. c. 98. and the duties that are imposed on hops.

HORNBLÉNDE. See MINERALOGY, *Addenda.*

HORNBLÉNDE Slate. See MINERALOGY, *Addenda.*

HORNSEY, l. ult. r. In 1811, the parish consisted of 147 houses, and 704 inhabitants.

HORNSEY, l. 12 and 13, r. 1811—807, and 3349.

HORN-STONE. See MINERALOGY, *Addenda.*

HORSE, col. 11, l. 22, r. 25, 100. Col. 12, l. 25 from bottom, r. 22f. 105.; l. 21, r. 11f. 55.; add—On the subject of duties on horses, see TAX.

HORSHAM, l. 32, r. In 1811, the borough contained 287 houses, and 1714 inhabitants; and the whole parish, including the borough part, contained 622 houses, and 3839 inhabitants.

HORSHAM, in America, l. 2, r. 938.

HOSPITAL, BRIDWELL, col. 2, l. 18, r. which exceeded the receipt by, &c.

HOVEA, in *Botany*, in memory of Mr. Pantaleon Hove. (See POJRETIA.)—Br. in Ait. H. Kew. v. 4. 275. (Pojretia; Sm. Tr. of L. Soc. v. 9. 304.)—Class and order, *Diadelphica Decandria.* Nat. Ord. *Papilionaceæ*, Linn. *Leguminosæ*, Juff.

Ell. Ch. Calyx two-lipped; upper lip cleft, abrupt. Stamens all connected. Keel obtuse. Legume sessile, roundish, tumid. Seeds two crested.

H. linearis, (very near *H. lanceolata*, Curt. Mag. t. 1624,) a linear-leaved shrub, with bluish-purple flowers, and smooth legumes; and *H. longifolia*, whose leaves are longer, and legumes downy, are the only species in Hort. Kew., both

natives of New South Wales. Our *P. elliptica*, L. Tr. v. 9. 305 may be doubtful.

HOUGHTON-LE-SPRING, in *Geography*, a township in a parish of the same name, and in Easington Ward, in the county of Durham. In 1811, it contained 221 houses, and 1356 persons; viz. 663 males, and 693 females: 44 families being employed in agriculture, and 68 in trade and manufacture. The parish includes 18 townships.

HOWARD, a township of Centre county, in Pennsylvania, having 761 inhabitants.

HOWDEN. In 1811, this township contained 314 houses, and 1812 persons; viz. 830 males, and 982 females.

HOWELL, a township of Monmouth county, in New Jersey, having 2780 inhabitants.

HUBARDTON. See HUBBARTON.

HUBBARD, a township of Ohio, in Trumbull county, having 674 inhabitants.

HUBBARDSTON, l. 3, r. 1127.

HUBBARTON, or HUBARDTON, l. 2, r. 734.

HUDDERSFIELD, l. 27, r. 1811—1871—9671.

HULL, col. 5, l. 9 from bottom, r. 1811; l. 8, 4611; l. 7, 26,792—11,998—14,794.

HULL, in America, l. 1 and 2, for Suffex r. Plymouth; l. 3, r. 132.

HUMITE. See MINERALOGY, *Addenda*.

HUMMOCK, l. 12 from bottom, *dele* the reference (see that article).

HUMOURS of the Eye, *Chemical Properties of*. See EYE.

HUMPHRIES, in *Geography*, a county of West Tennessee, having 1511 persons, of whom 132 were slaves in 1810.

HUNGARY, col. 2, l. 33, after inhabitants (in 1810, 7398, 104).

HUNGERFORD, l. 2 from bottom, r. 1811—167—943.

HUNTINGDON, col. 3, two last lines, r. 1811—522—2397—450.

HUNTINGDON, in America, l. 7, r. 16,778; l. 14, r. 476; after Philadelphia, add—the township contains 1698 persons; l. 22, r. 2770.

HUNTINGDON, *North, South, and East*, three townships, &c. the former containing 2345, the second 1656, and the last 1267 inhabitants.

HUNTINGDON, a township in Luzerne county, in Pennsylvania, having 1114 inhabitants.—Also, a township of Adams' county, in the same state, having 1014 inhabitants.—Also, a township of Adams' county, in Ohio, containing 1375 persons.

HUNTINGDONSHIRE, l. 14, r. 7566 houses, 42,208 inhabitants; 20,402 males, 21,806 females.

HUNTINGTON, l. 3, r. 514.

HUNTINGTON, in Connecticut. See HUNTINGDON.

HUNTSBURG, l. 3, r. 714.

HURD, *Richard*, in *Biography*, an eminent English prelate, was the son of a reputable farmer, in the parish of Teterhall, in the county of Stafford, and born in January 1719-20. After a preparatory school-education, he was sent to Emanuel college in the university of Cambridge, where he was graduated M.A., and was elected a fellow in 1742. In 1744 he received priest's orders. As a writer, he began his career by an anonymous work, which was, "Remarks on a late Book, entitled an Enquiry into the Rejection of the Christian Miracles by the Heathens, by William Weston, B.D. &c.;" and which was highly commended by Dr. Warburton. As a literary critic, he first laid the foundation of his future fame in 1749, by an ano-

nymous publication, entitled "Horace's Epistles to the Pisos, with an English Commentary and Notes;" and also of his fortune by a compliment paid in the preface to Warburton, whom he afterwards resembled, not only in his advancement, but in his mode of thinking and of writing. By his recommendation to Bishop Sherlock, he was appointed, in 1750, one of the Whitehall preachers. In 1751, he published a "Commentary on Horace's Epistle to Augustus," resembling in learning and ingenuity his former commentary. Both these Commentaries were reprinted in 1753, with two dissertations on dramatic poetry and poetical imitation. This volume was dedicated to Warburton in a high style of panegyric; and it was followed, in 1755, by a piece, entitled "Delicacy of Friendship," in which the anonymous author, known to be Hurd, paid homage to his patron by an attack on Dr. Jortin, who, in his "Six Dissertations," had not treated Warburton with that respect to which, in the estimation of his admirers, he was thought to be entitled. By this pamphlet he gained no reputation, and it is said, that in consequence of some remarks on his subservient disposition, he was desirous of suppressing it, though it has been since reprinted in a late edition of his works. His first church preferment was a college living at Thurcaston in Leicestershire, to which he was inducted in 1756, and here he lived for several years in retirement. Soon after Hume's "Essay on the Natural History of Religion" was published, a pamphlet of "Remarks" upon it appeared, of which Hurd was thought to be the author, and which Hume notices in the following terms: "Dr. Hurd wrote a pamphlet against this work, with all the illiberal petulance, arrogance, and scurrility which distinguish the Warburtonian school." These Remarks have been thought to be the joint production of the master and disciple. Hurd's "Letter to Mr. Mason on the Marks of Imitation," published in 1757, is represented by his biographer as "one of the most agreeable and ingenious of the writer's works on elegant criticism." Our author's "Moral and Political Dialogues," which appeared in 1759, contributed to the increase of his literary reputation; and those in particular that relate to the English constitution evince the writer's attachment to Whig principles. In 1762 appeared, without his name, an amusing work, entitled "Letters on Chivalry and Romance," 12mo.; and in 1764 was published another dialogue on "The Uses of Foreign Travel." The several dialogues now recited were published in 1765, in 3 vols. 8vo. introduced with a preface on the manner of writing dialogue. The defence of his patron and friend had in the mean time occasioned a "Letter to the Rev. Dr. Leland of Dublin College;" in which he vindicates Warburton's idea of an inspired language, flated in his "Doctrine of Grace."

Hurd's preferences in the church had not corresponded to his growing literary fame; but in 1765 he was recommended by bishop Warburton and Mr. C. York to the office of preacher at Lincoln's-Inn; and in 1767 he was collated by the bishop to the archdeaconry of Gloucester. In the following year, he was graduated D. D. at Cambridge, and appointed to preach the lectures on prophecy, established at Lincoln's-Inn by Warburton; these were comprised in twelve discourses, which formed a volume of highly valuable theological literature, published in 1772, 8vo. with his explanation of the double sense of prophecy, called by him "a divine artifice." With that excess of ingenuity which in some cases seems to derogate from the simplicity of the gospel, some have been dissatisfied. Having established his reputation both as an elegant writer and an ingenious theologian, Dr. Hurd was promoted without solicitation to the see of Lichfield and Coventry in 1775; and in his first charge to the

the clergy of his diocese, the subject to which he directed their attention was the excellence of the liturgy, inculcating at the same time the duty of submitting all alterations to the wisdom of the church, and thus guarding against that disposition to reform which was manifesting itself among those who formed a considerable party pertaining to the establishment.

In the following year, the learned prelate had the honour of being preceptor to the Prince of Wales and his brother the duke of York. In the same year, he published a volume of sermons preached at Lincoln's-Inn; to which, in 1780, he added two additional volumes, containing a variety of elegant discourses, orthodox with regard to their theology, and conformable to the articles of the church, which he professes highly to venerate. His translation to the see of Worcester took place in 1781, when he was also nominated clerk of the closet; and though he was offered the primacy in 1783, he declined the acceptance of this high dignity. In his retired station at the episcopal seat of Hartlebury, he passed the remainder of his life in attending to the concerns of his diocese, pursuing his literary avocations, and collecting a noble library, which he bequeathed as an heir-loom to the see of Worcester. Of his minor publications, both before and after this period, we shall take no notice; but content ourselves with mentioning his edition of the works of his esteemed friend the bishop of Gloucester, presented to the public in 7 vols. 4to. in 1788; adding afterwards, viz. in 1794, an account of the life, writings, and character of the author. With this performance he terminated his literary labours; and after a gentle and easy decline, he expired, in his sleep, in May 1808, four months after the completion of his 88th year. The literary character of this prelate may be duly appreciated by a perusal of his writings; but with respect to his private character and conduct, we shall adopt the opinion and language of a candid biographer, who says of him, "if a fair abatement be made on account of some literary arrogance and acrimony, probably derived from the same source," (referring to familiarity with the writings of Warburton,) "they will merit unqualified praise. His strict regard to decorum, his liberal courtesy, his warmth of friendship, his moderation and disinterestedness, rendered him equally an object of regard and esteem." Gen. Biog.

HURON, in *Geography*, a town of Cayahuga county, in Ohio, having 424 inhabitants.

HUTCHINSONIA, in *Botany*, dedicated to the memory of the late Miss Hutchins, of Ballylickey, near Bantry, in Ireland, a most intelligent cryptogamic botanist.—Br. in Ait. Hort. Kew. v. 4. 82. Sm. Compend. 98.—Clas and order, *Tetradynamia Siliculosa*. Nat. Ord. *Siliquose*, Linn. *Crucifera*, Juss.

Effl. Ch. Pouch entire; valves tumid. Seeds two in each cell. Filaments simple.

1. *H. rotundifolia*. Round-leaved Hutchinsia. Ait. n. 1. (*Iberis rotundifolia*; Linn. Sp. Pl. 905. Scop. Carn. t. 37.)—Leaves undivided.—Native of mountains in the south of Europe. Flowers rose-coloured.

2. *H. alpina*. Alpine Hutchinsia. Ait. n. 2. fee **LEPIDIDIUM alpinum**.—Leaves pinnatifid. Petals twice as long as the calyx. Style short.

3. *H. petraea*. Rock Hutchinsia. Sm. n. 1. fee **LEPIDIDIUM petraeum**.—Leaves pinnatifid. Petals shorter than the calyx. Stigma sessile.

HYÆNANCHE. See **TOXICODENDRUM**.

HYALITE. See **MINERALOGY**, *Addenda*.

HYDE, l. 4, r. 6029—1882.

HYDEPARK, l. 2, r. 261,

HYDRIODATES, **HYDRIODIC Acid**, in *Chemistry*. See **SIMPLE Bodies**.

HYDROCHLORIC ACID. See **MURIATIC Acid**, and **CHLORINE**.

HYDROCYANIC ACID. See **CYANOGEN** and **PRUSSIC Acid**.

HYDROGEN. For the recent determinations respecting the specific gravity, &c. of this gas, see **ATOMIC Theory**.

HYDROGEN, Arsenical. See **ARSENIC**.

HYDROGEN, Boruretted, the name of a gaseous compound of hydrogen and boron. The existence of such a gas, however, seems somewhat uncertain. Dr. Thomson thinks Gmelin succeeded in forming it by mixing together four parts of iron-filings, and one part of boracic acid, and exposing the mixture to a strong heat for half an hour. When this fused mass was dissolved in muriatic acid, an effervescence took place, and a gas, supposed to be boruretted hydrogen, was extricated; but it was not satisfactorily examined. Sir H. Davy endeavoured in vain to unite boron with hydrogen by heating them together.

HYDRÖGURET of Carbon, Phosphorus, and Sulphur, the names by which some have chosen to distinguish compounds of hydrogen with these respective substances, and which were formerly called *carburetted, phosphuretted, and sulphuretted hydrogen*.

HYDROPHILUS. At the close, add—The genus hydrophilus, like that of dytiscus, has been greatly increased by the persevering researches of modern entomologists. Mr. Marshall enumerates twenty-eight British species.

HYDROPHOSPHORIC Acid, **HYDROSULPHURIC Acid**, **HYDROTHIONIC Acid**, in *Chemistry*, names which have been given, the first to *phosphuretted hydrogen*, the two last to *sulphuretted hydrogen*.

HYGROMETRY, col. 13, l. 22, add—Mr. Leslie's improved hygrometer is composed of a tube of ivory, containing quicksilver, with a glass tube adapted to it, to which a scale of equal parts is attached. When the ivory yields moisture to the air, which it does according to the dryness of the atmosphere, it contracts, and presses the quicksilver higher in the tube;—when it imbibes moisture from damp air, it swells, and allows the quicksilver to subside. Mr. Leslie finds, however, that these variations do not correspond with the real measures of atmospheric dryness or humidity: near the point of extreme dampness, they are much augmented; while they diminish rapidly towards the other extreme. The addition of another scale, therefore, corresponding to this inequality, is necessary; and even with this, it cannot be regarded as either an accurate or delicate instrument.

There are other circumstances, says the professor, connected with evaporation, on which an hygrometer may be constructed; particularly the dilatation imparted to the air by the vapour, and the depression of temperature produced on the humid surface.

On the first of these he has invented an hygrometer consisting of a small tumbler, the mouth flat, having a hole ground through the bottom, in which is cemented a slender recurved tube, like a syphon, containing a portion of coloured oil. A few drops of water being put on a glass plate, and the tumbler being slipped upon this, the included air dissolves moisture proportional to its dryness; and the increased elasticity, thus communicated to the air, causes the column of oil in the tube to ascend. This instrument, however, requires address in its management, which renders it difficult to obtain with it results precisely precise.

On the other principle, Mr. Leslie has constructed what

HYGROMETRY

he regards as the most accurate hygrometer. It is a happy application of the differential thermometer. One of the balls is coated with fine cambric paper, and the paper is moistened with pure water. Evaporation takes place; and, from the cold which accompanies this, the liquid falls in the opposite stem. The extent of its descent is measured by the scale attached. This indicates the degree of cold; this, again, the extent of evaporation; and this, lastly, indicates the relative dryness of the air, the evaporation being proportionally greater as the air is more free from moisture. The full effect is very soon obtained—generally in about two minutes; and it continues permanent under the same circumstances, as long as moisture is supplied to the covered ball.

This ingenious author observes, in consequence of experiments adapted to the purpose, that the condition of the atmosphere, with regard to dryness, is extremely variable.

In our climate, the hygrometer will, during winter, mark from 5 to 25 degrees; but, in the summer months, it will generally range between 15 and 55 degrees, and may even rise, on some particular days, as high as 80 or 90 degrees. In thick fogs, the instrument stands almost at the beginning of the scale: it commonly falls before rain, and remains low during wet weather; but it mounts powerfully in continued tracts of clear and warm weather. The greatest dryness yet noticed was at Paris, in the month of September, when it reached to 120 degrees. But for want of observations, we are totally unacquainted with the real state of the air in the remote and tropical climates.

When the indication of the hygrometer does not exceed 15 degrees, we are directed by our feelings to call the air damp; from 30 to 40 degrees we begin to reckon it dry; from 50 to 60 degrees we should account it very dry, and from 70 degrees upwards we might consider it as intensely dry. A room is not comfortable, or perhaps wholesome, if it has less than 30 degrees of dryness; but the atmosphere of a warm occupied apartment will commonly produce an effect of upwards of 50 degrees.

Mr. Leslie has invented another instrument, which gives indications of the quantity of evaporation from a humid surface in a given time—which he has named the atometer. It consists of a thin ball of porous earthen-ware, two or three inches in diameter, with a small neck, to which is cemented a long and rather wide tube, bearing divisions, each of them corresponding to an internal annular section, equal to a film of liquid that would cover the outer surface of the ball, to the thickness of the thousandth part of an inch. To the top of the tube is fitted a brass cap, having a collar of leather, which, after the cavity has been filled with distilled or boiled water, is screwed tight, to prevent the transudation of the liquid from being so copious as to drop from the ball. Evaporation of the water takes place from the external surface, the instrument being suspended in the air; and the quantity evaporated in a given time, is discovered by the descent of the liquid in the tube. The use of this instrument will require some dexterity, particularly in adjusting the pressure of the collar; and its indications are slow,—but it may often be employed with advantage, where it is of importance to ascertain the actual rate of exhalation.

From a variety of observations on the subject of evaporation he infers, that air has its dryness doubled at each rise of temperature, answering to 15 centesimal degrees. Thus, at the freezing point, air is capable of holding a portion of moisture represented by 100 degrees of the hygrometer; at the temperature of 15 centigrade, it could

contain 200 such parts; at that of 30, it might dissolve 400; and at 45 on the same scale 800. Or, if we reckon by Fahrenheit's divisions, air absolutely humid holds, at the limit of congelation, the hundred-and-sixtieth part of its weight of moisture; at the temperature of 59 degrees, the eightieth part; at that of 86 degrees, the fortieth part; at that of 113 degrees, the twentieth part; and at that of 140 degrees, the tenth part. While the temperature, therefore, advances uniformly in arithmetical progression, the dissolving power which this communicates to the air mounts with the accelerating rapidity of a geometrical series.

The theory of the precipitation of rain, which he founds on this principle, requires, as he says, the assumption, not merely of the mixture of two masses of air at different temperatures, saturated with moisture, but the continued contact of two currents of air under these conditions; as it is thus only that a sufficient quantity of water will be furnished to form that copious precipitation which constitutes rain. And he adds a calculation, founded on the preceding law, which illustrates this, and illustrates exceedingly well, the general theory.

We shall here take occasion to observe, that as the capacity of air for heat is increased by its rarefaction, its disposition to hold moisture in solution appears to be increased by the same cause; and at the same time the removal of pressure, which is the consequence of the rarefaction, facilitates the transition of water into vapour. From these causes, if the hygrometer be suspended within a large receiver, from which a certain portion of air is quickly abstracted, it will sink with rapidity. But the effect is only momentary, for the rarefied air soon becomes charged with moisture, and consequently ceases to act on the wet ball of the thermometer. Hence there is every reason to believe that the higher regions of the atmosphere are drier than those beneath; and, without this condition, Mr. Leslie remarks, our globe must have been shrouded in darkness; for the cold which reigns in the upper strata, would have prevented the humidity from ascending to a great elevation, and have precipitated it in continual fogs or clouds. In the actual state of things, the diminution of temperature, in ascending, predominates at first over the augmented power of aqueous solution; and the air becomes damper till a height be reached, at which the opposite effects of cold and rarefaction are balanced. Above this, which is the proper region of the clouds, the influence of the rarity of the medium exceeds that of the cold, and the air therefore becomes progressively drier, until it melts away into the clear ethereal expanse.

On this principle is founded the very beautiful experiment invented by Mr. Leslie, of causing water to freeze by the cold produced by its own evaporation. The peculiar arrangement for this consists in placing water in a porous earthen cup, suspended within the receiver of an air-pump, and placing, at a short distance beneath it, sulphuric acid in a broad shallow vessel, so that an extensive surface of the acid shall be presented. On rarefying the air, the evaporation of the water is accelerated, and of course the degree of cold produced by that evaporation is increased. This, however, would soon be checked by the presence of the watery vapour; but this the sulphuric acid absorbs, almost as quickly as it is formed; keeps, therefore, the rarefied air always dry; and thus allows the evaporation to proceed with the same rapidity. The temperature, therefore, continues to fall, until the water shoots into crystals of ice; and even after it is entirely congealed, the ice continues to suffer evaporation, until it wholly disappears. See Leslie's Short

Account

Account of Experiments and Instruments, depending on the Relations of Air to Heat and Moisture, 8vo. Edinb. 1814. Edinb. Rev. N^o 48.

HYPERSTONE. See **MINERALOGY**, *Addenda*.

HYPOPHOSPHOROUS ACID. See **PHOSPHORUS**.

HYPOSULPHUROUS ACID. See **SULPHUR**.

HYREUS, in *Ornithology*, a genus of birds of the order Passeres; the characters of which are, beak conic, straight

and ferrated; nostrils ovate; tongue short and obtuse; feet with three toes, two before and one behind. There is one species, *viz.* *H. Abyssinicus*, or black plant-cutter, with the head, throat, and jugulum red, wing-coverts brown, with white margins. It is found in Abyssinia, and, according to Mr. Bruce, it is a solitary species, and subsists on the kernels of almonds and other seeds, which it easily breaks with its strong ferrated beak. It frequents woods, and is called "Guifso batito dimmo-won jerck."

I and J.

JACKSON, l. 2, containing, together with its town Jefferson, 10,569 inhabitants, the slaves in the county being 1789, and in the town 27; l. 3, *r.* West Tennessee, adding—containing 5401 inhabitants, of whom 481 were slaves in 1810.

JACKSONSBOROUGH, l. 2, after Carolina, add—in Scriven county. At the close, add—containing 2663 inhabitants, of whom 2000 were slaves in 1810.

JAFFRAY, l. 4, *r.* 1336.

JAGHIRE, l. 7, after hereditary, add—There are two species of jaghire; one personal, for the use of the grantee; and the other, in fruit, for some public service, commonly for the maintenance of troops.

JAINA, l. *penult.* *r.* Myfore. Col. 2, l. 32, after Jains, add—some say that; l. 34, after distinctions, add—others, however, assert, that they have the same fourfold division into classes or calls.

JAMAICA, in America, l. 8, after inhabitants, add—Also, a town of Windham county, in Vermont, having 996 persons.

JAMBAVANTA, l. 1, for *Sri r. Sri*; l. 5, for *anantara r. avatara*.

JAMES II. col. 3, l. 16, *r.* 5th.

JAMES City, l. 3, *r.* 4094 inhabitants, of whom 2320 were slaves in 1810.

JAMES, Sr. l. 5, after Chester, add—Also, a parish in the county of Acadia, in the territory of Orleans, containing 3935 inhabitants.

JAMESTOWN. Add—Also, a town of Newport county, in Rhode island, containing 504 persons.

JAVA, l. 24, after one, add—(See **BANTAM**.) At the close, add—See *Raffles's Java*.

JAY, l. 1, for *Kennebeck r. Oxford*; l. 7, *r.* 1107. Add—Also, a town of Orleans county, in Vermont, containing 28 inhabitants.

JAYADEVI, l. 4, for *Kari r. Kafi*; l. 7, for *Sina r. Siva*.

ICE, col. 4, l. 43, add—clouds and frequent changes of wind being certain preventives of its formation; l. 44, *Dr. Wells*, in his Essay on Dew, &c. has given an account of

the process described by Mr. Williams, which, from its extent, 300 persons being employed in it, must have been carried on for profit, and of course would be conducted in the most economical manner. "A piece of ground, nearly level, containing about four acres, was divided into square plats, from four to five feet wide, which were furrowed by little mounds of earth, four inches high. In these inclosures, previously filled with dry straw, or sugar-cane haum, were placed as many broad, shallow, unglazed earthen pans, containing unboiled pump water, as they could hold. The air was generally very still, when much ice was formed; wind prevented its formation altogether. In the morning, between five and six o'clock, at which time alone, Mr. Williams made his observations, a thermometer, with its bulb naked, placed on the straw, amidst the freezing vessels, was never found by him lower than 35°; and he has observed ice, when a thermometer so placed was 42°. Another thermometer, suspended five feet and a half above the ground, was commonly 4° higher than that among the pans. It is possible, therefore, that Mr. Williams may have seen ice, a little before sun-rise, when the temperature of the air was 46°. But granting this were the fact, it would not hence follow, that the ice was formed, while the air possessed that heat. For, although the air is generally held to be in all countries colder about sun-rise than at any other time, I know, from my own observations, that this is not always the case in England; and similar exceptions may occur in Bengal."

The formation of ice in the circumstances above specified is ascribed by Sir R. Barker wholly, and by Mr. Williams in great measure, to cold produced by evaporation: and this opinion has been adopted by Bishop Watson, Thompson, Young, Davy, and Lellie. Dr. Wells, however, is of opinion, that they have not fully considered the subject, alleging several reasons against it. He conceives, agreeably to his sentiments respecting the formation of dew (see *Dew*), that the formation of ice in Bengal depends upon the radiation of heat to the heavens. This cause, he says, not only exists, but exists in a degree sufficient for the production or the effect which he attributes to it. To this purpose he observes, that according to Mr. Leslie (on Heat, p. 80.) the power of water to radiate heat exceeds, perhaps, that of

all other substances. Ice, he adds, is chiefly formed in Bengal during the clearest and calmest nights; and on such nights the greatest cold, from radiation, is perceived on the surface of the earth. Moreover, the cold that produces this effect in Bengal appears, in its greatest degree, like cold from radiation in other substances, on those still and serene nights, during which little dew is deposited by the atmosphere. He further adds, that clouds and wind prevent the formation of ice in Bengal; and that the same itates of the atmosphere either prevent, or considerably diminish, the occurrence of cold from the radiation of heat at night by bodies on the ground. From experiments, in procuring ice in the manner of Barker and Williams, Dr. Wells found reason for inferring, that water may freeze at night, in air of a temperature higher than 32° , not only without any loss of weight from evaporation, but with a gain of weight from an opposite process: and he concludes in general, that the formation of ice in Bengal, in the circumstances described by Barker and Williams, must be attributed, in by far the greater measure, if not altogether, to a loss of heat, which the water suffers by its own radiation, while situated in such a manner, that it can receive little heat from other bodies, either by radiation or conduction. Our author, in the course of his experiments, found, that evaporation from water of 32° produces very little cold, even in the day-time; and he thinks it much more probable, that on a clear and calm night, though in a dry winter of Bengal, water at the temperature of 32° will acquire warmth from the formation of dew upon it, than that it will become cold from evaporation.

ICHNEUMON. Add—The characters are, mouth with jaws, without tongue; antennæ with more than thirty joints; abdomen in most species foot-stalked; piercer exerted, with a cylindric-bivalve sheath. The animals of this genus deposit their eggs in the bodies of other living insects, and generally in those of caterpillars. Here they hatch, and the young larvæ, resembling small white maggots, nourish themselves with the juices of the unfortunate animal, and at length the young brood of ichneumon larvæ creep out by perforating the skin in various places, and each spinning itself up in a small oval silken case, changes into chrysalis, the whole number forming a group on the shrivelled body of the caterpillar which had afforded them nourishment, and, after a certain period, emerge in the state of complete ichneumons. The principal species are, *glomeratus*, *puperum*, *ovulorum*, *ramidulus*, *luteus*. See **VESPA**, and **WASP**.

ICHNOCARPUS, in *Botany*, Ait. Hort. Kew. v. 2. 69. See **ISCHNOCARPUS**.

ICTUS SOLARIS, *A Stroke of the Sun*, denotes the effect of a too violent influence of the sun upon the head. It is ranked by Dr. Cullen as a variety of apoplexy, under the name of "Carus ab insolatione."

IDA. Add—The summit of Ida is denominated *Gargarus*; and it affords a level surface, of no great extent, but of an oblong form, with a rudely-built wall around it, in which are small blocks of marble. This inclosure, it is conjectured, may have been a Greek church, or perhaps only a sheep-pen, united for the protection of the flocks in the summer months.

IDOCRASE. See **VESUVIAN**.

IDOLATRY, col. 5, l. 15 from the bottom, for even *r. ever*.

JEDBURGH. In 1811, the burgh and parish contained 669 houses, and 4454 persons; viz. 1957 males, and

2497 females: 399 families being employed in agriculture, and 405 in trade and manufactures.

JEFFERSON. (See **JACKSON**.)—Alfo, a county of the Mississippi, containing 4001 inhabitants, of whom 1792 were slaves in 1810.—Alfo, a township of Clarke county, in the Indiana territory.

JEFFERSON, in Kentucky, l. 3, r. 11,611; l. 4, r. 3746; l. 7,—It contains, together with Louisville, 6111 inhabitants, the slaves in the county being 2080, and in the town 256; l. 9, r. 7309 inhabitants, of whom 783 are slaves; l. 14, r. 197; r. 11 towns with 17,260 inhabitants, of whom 6001 are slaves; l. 14, after Steubenville, add—Alfo, a town of Adams' county, in Ohio, having 494 inhabitants.—Alfo, a town of Fayette county, in Ohio, having 327 persons.—Alfo, a township of Madison county, in Ohio, having 246 inhabitants.—Alfo, a township of Montgomery county, in Ohio, having 1343 inhabitants.—Alfo, a township of Mufkingum county, in Ohio, having 962 persons.—Alfo, a township of Preble county, in Ohio, having 385 inhabitants.—Alfo, a township of Rois county, in Ohio, having 1456 inhabitants.—Alfo, a township of Scioto county, in Ohio, with 258 persons.—Alfo, a township of Geauga county, in Ohio, containing 168 inhabitants.—Alfo, a town in Maine, in Lincoln county, having 1205 inhabitants.—l. 16—Alfo, a county of Virginia, containing 11,581 inhabitants, including 3532 slaves; l. 17, for Grafton *r. Coos*, New Hampshire; do. *r. 197*; l. 19, after Scottville, add—Alfo, a county, containing 161 inhabitants.—Alfo, a township of Greene county, in Pennsylvania, having 1124 inhabitants.—Alfo, a county of New York, containing 15,140 inhabitants.

JERICO, l. 4, r. 1185.

JERSEY, NEW, after the table, add—By the census of 1810, the whole number of its inhabitants is stated to be 245,562, and that of slaves 10,851. See each county, and **UNITED STATES**.

JESSAMINE, l. 2, r. 8219 and 2466.

JET. See **MINERALOGY**, *Addenda*.

JEW, col. 16, l. 9 from the bottom, *r. 110,000*.

ILEUM. See **INTESTINE**.

ILFRACOMBE, l. ult. *r. 434 and 1934*.

ILLINOIS. Add—The Illinois territory, now one of the United States, contains two counties, viz. St. Clair and Randolph: the former comprehending nine townships, and the latter four; and the number of inhabitants in the whole territory is stated, by the census of 1810, to be 12,282 persons, of whom 168 were slaves. See **UNITED STATES**.

ILLORI, a town of Mingrelia, on the left bank of the Enguri, surrounded by a wall.

ILMINSTER. By the return in 1811, the parish contained 364 houses, and 2160 persons; viz. 1022 males, and 1138 females: 121 families being employed in agriculture, and 231 in trade, manufactures, and handicraft.

ILSLEY, l. 2, and East and West Ilesley were returned to parliament, in 1811, as containing 179 houses, and 996 persons.

IMIRETTA, l. 8, after W. add—between the 43d and 44th degrees of N. lat.

IMPIDIMENTS, in *Elocution*. See **LARYNX**, and the references under that article

IMPERATA, in *Botany*, so called after Ferrante Imperato,

perato, a Neapolitan botanist of the 16th century. See SACCHARUM, n. 15.

VOL. XIX.

INCUBATION, *dele* the account of the figures.

INDEPENDENCE, in *Geography*, a town of Suffex county, in New Jersey, containing 1224 inhabitants.

INDIANA. After the table, add—According to the census of 1810, Indiana is divided into five counties, *viz.* Dearborn, having 7310 inhabitants; Clark, with 5670; Harrison in two divisions, having in one 2338, and in the other 1257 inhabitants; and Knox in two cantons, one having 4097, and the other 3848. See UNITED STATES.

INDIANA, in Pennsylvania. Add—Indiana contains nine townships, and 6214 inhabitants.—Also, a township of Alleghany county, in Pennsylvania, containing 692 inhabitants.

INDICATOR, *Honey-guide*, in *Ornithology*, a peculiar genus formed of the *CUCULUS Indicator*; the characters of which are, beak strong, conic, dilated at the base, narrow towards the tip, the upper mandible bent and carinated, the lower one recurved at the tip; nostrils slightly covered with feathers, feet simple, with two toes before and two behind. The external hinder toe longest, armed with a stout claw. See *CUCULUS*, and for Dr. Sparman's account of it, Phil. Transf. vol. lxvii. p. 38.

INDIGO, *Chemical Properties of*. The indigo of commerce is exceedingly impure, and seldom contains more than half its weight of real indigo. Thus, Bergmann could only obtain 47 per cent. of real indigo from the purest specimen he could procure; and more lately Chevreul from the best guatemala could only obtain 45 per cent. The following analysis of Chevreul will give some idea of the substances with which the indigo of commerce is adulterated.

Substances separated by water	{ Ammonia	
	{ Dioxxygenised indigo	12
	{ Green matter	
	{ Bitter matter	
_____ alcohol	{ Green matter	- 30
	{ Red matter	
_____ muriatic acid	{ Indigo	
	{ Red matter	- 6
	{ Carbonate of lime	2
	{ Oxyd of iron and alumina	- 2
	{ Silica	- 3
	{ Pure indigo	- 45
		100

The principal properties of indigo have been already detailed. The effects of nitric acid upon indigo, however, as ascertained by Mr. Hatchett, have been omitted, and are so interesting that they deserve to be mentioned.

Nitric acid acts on indigo with great violence, so as even to set fire to it when concentrated, as was long ago observed by Woulfe. When the acid is dilute, the action is less violent. Mr. Hatchett, however, found, that when diluted with an equal quantity of water, the action of the acid was still so violent as to require further dilution. When the effervescence had nearly subsided, the liquid was placed on a sand-bath for some days, and evaporated to dryness. Water poured upon this residuum dissolved a considerable portion of it, and formed a beautiful deep yellow solution of an intense bitter taste. This solution contains only a very

small portion of oxalic acid; but with a solution of isinglass it forms a copious yellow insoluble precipitate, and hence contains a portion of artificial tannin; with ammonia, crystals precipitate, consisting of *bitter principle* combined with ammonia.

When four parts of nitric acid are poured upon one part of indigo, the pigment soon loses its colour, and is dissolved. The solution becomes yellow, and a thin layer of a resinous-like substance appears on the surface. This substance becomes solid on cooling if the process be now stopped. If it be removed, and the solution be evaporated to the consistence of honey, redissolved in hot water and filtered, potash throws down yellow spicular crystals, consisting of *bitter principle* combined with potash. These crystals have the property of detonating with a purple light when wrapped up in a paper, and struck with a hammer; the resin by treating it with nitric acid may be converted into the same bitter principle. If the process be stopped sooner than the point above-mentioned yellow crystals are obtained, which on sublimation become white, and appear to possess the properties of benzoic acid. Thus it appears, that by treating indigo with nitric acid, it is converted into tannin, oxalic acid, benzoic acid, and *bitter principles*.

INDRA, col. 2, l. 32 and 33, read thus, without a break, and omitting *INDRA Malwa*,—Malwa, the hereditary possession, &c.

INDUSTRY, in *Geography*, a township of America, in Maine, county of Somerset, having 562 inhabitants.

INFLAMMATION of the Breast. See BREAST, *Inflammation of*, in the *Addenda*.

INGA, in *Botany*, an American name, recorded by Marcgraave, and adopted by Plumier. It was sunk in *Mimosa* by Linnæus; but Humboldt and Bonpland having separated from thence the original genus of Plumier, have retained the appellation he had chosen, and they are followed by Willdenow, as well as by Brown and Aiton in *Hort. Kew*. If any barbarous name be tolerated, and they can hardly be all expunged, the present is unexceptionable.—Plum. Gen. 13, t. 19. Willd. Sp. Pl. v. 4. 1004. Ait. Hort. Kew. v. 5. 451.—Clafs and order, *Polygamia Monœcia*; rather *Monadelphia Polyandria*. Nat. Ord. *Lomen-taceæ*, Linn. *Leguminosæ*, Juss.

Ess. Ch. Calyx five-toothed. Corolla tubular, five-toothed. Stamens united into a cylindrical tube. Legume of one cell. Seeds imbedded in pulpy tunics. Some flowers without a pistil.

Obs. If *Mimosa* be divided at all, the present numerous genus may commodiously be separated from it, though the *inflorescence*, and structure of the *flowers*, come, in many instances, very close to *ACACIA*; see that article, as well as *MIMOSA* and *DESMANTHUS*. From the last, *Inga* is truly distinct, in having monadelphous indefinitely numerous *stamens*, no neuter, though many male, *flowers*, and in every instance a very different *fruit*. The greater size of the *leaflets* is characteristic of *Inga*, and they are, for the most part, differently compounded from those of the other genera. Willdenow enumerates fifty-eight species, some of them truly superb in their *flowers*. We shall give examples of this writer's six sections. The *leaves* of this whole genus are compound; none of them sensitive.

SECT. 1. *Leaves twice yoked*. Eleven species.
I. dulcis. Sweet Inga, or Sappan Fruit. Willd. n. 3. Ait. n. 1. (*Mimosa dulcis*; Roxb. Corom. v. 1. 67. t. 99.)
 —Thorns stipular, straight. Leaflets elliptic-oblong, somewhat pointed. Footstalks with three glands. Cluster compound, terminal. Flowers capitate. Legume twisted.
 —Native of the Philippine islands. Cultivated on the coast of

of Comorandel, for the sake of its sweet pulpy red fruit, which is six inches long, wholefome, though rather infipid. *Flowers* fmall, white.

SECT. 2. *Leaves thrice yoked.* Five fpecies.

1. *tergamina.* Martinico Inga. Willd. n. 12. (*Mimosa tergamina*; Linn. Sp. Pl. 1499. Jacq. Amer. 265. t. 177. f. 81. *Acacia frutescens*, &c.; Plum. Ic. 5. t. 10. f. 1, the Linnæan characters tranfposed in the plate.)—Thorns none. Leaflets obovate, obtufe; glaucous beneath. Tufts of flowers on folitary axillary ftalks. Legume ftraight.—Native of Martinico. *Leaflets* an inch long, oblique. *Flowers* purplifh.

SECT. 3. *Leaves pinnate; common ftalk winged.* Thorns none. Twelve fpecies.

1. *vera.* Common Inga. Willd. n. 17. Ait. n. 3. (*Mimosa Inga*; Linn. Sp. Pl. 1498. Inga flore albo fimbriato, fructu dulci; Plum. Ic. 14. t. 25. Arbor; Merian. Surin. t. 51.)—Leaflets about five pair, ovate-oblong, pointed, fmoth, with a gland between each pair. Corolla hairy. Legume furrowed, downy.—Native of South America and the Weft Indies, where the legumes are efteemed for their agreeable fweetnefs.

1. *faftuofa.* Stately Inga. Willd. n. 25. (*Mimosa faftuofa*; Jacq. Fragn. 15. t. 10.)—Leaflets about four pair, ovate, pointed; hairy beneath; with a ftalked gland between each pair. Corolla hairy. Legume hairy, compressed, twifted.—Native of the Caraccas. We have from Dr. Mærtner a fine dried fpecimen, fuch as that from which Jacquin's plate is taken. This is a truly magnificent plant, whole copious large tawny flowers, with long crimfon flames, make a fplendid appearance. The leaflets are from two to five inches long. Legume broad, flat, but containing a fweet pulp, with large oval feeds.

SECT. 4. *Leaves pinnate; common ftalk fimple.* Thorns none. Ten fpecies.

1. *nodofa.* Knobbed Inga. Willd. n. 29. Ait. n. 6. (*Mimosa nodofa*; Linn. Sp. Pl. 1498. *Phaseolus arbo-reus*, &c.; Pluk. Phyt. t. 211. f. 5.)—Leaflets two pair, ovate-oblong, fmoth, unequally divided by the rib; the lower ones fmalleft, with a gland between.—Found in Ceylon and Cochinchina. It appears to have been raifed in the Englifh and Dutch ftoves, but not preferred. The leaflets are from one to two inches long, their two fides very unequal.

SECT. 5. *Leaves conjugate, pinnate.* Nine fpecies.

1. *purpurea.* Purple Inga, or Soldier-buff. Willd. n. 42. Ait. n. 8. (*Mimosa purpurea*; Linn. Sp. Pl. 1500. Andr. Repof. t. 372. *Acacia frutescens*, &c.; Plum. Ic. 6. t. 10. f. 2, the Linnæan character mifapplied.)—Leaflets four pair, obovate, obtufe; unequal at the bafe. Footftalks without glands. Heads of flowers ftalked.—Native of the Weft Indies. The leaflets are half an inch long, fmoth. *Flowers* copious, very confpicuous for their long taflets of crimfon ftamens.

SECT. 6. *Leaves doubly pinnate.* Eleven fpecies; fome thorny.

1. *Saman.* Great Downy-leaved Inga. Willd. n. 49. (*Mimosa Saman*; Jacq. Fragn. 15. t. 9.)—Thorns none. Leaves with fix pair of primary divifions; leaflets five or fix pair, elliptic-obovate, obtufe; terminal ones unequal-fided; all downy beneath as well as their ftalks.—Native of the Caraccas. One of the largeft and ftouteft trees of the *Mimosa* tribe. *Leaves* two feet, or more, in extent, with a depressed gland at every fubdivifion. Legume flat, feven or eight inches long.

INGATESTONE, l. 5, r. 98 and 640.

INSTITUTE, NATIONAL, &c. col. 2, after line 6,

add—By a royal edict, paffed the 26th of March, 1816, the firft clafs refumes the name of the Royal Academy of Sciences, preferring the organization and diftribution in fections.

INVERARY, col. 2, l. 8 and 7 from bottom, r. 103 and 1113.

INVERKEITHING. Add—The burgh and parifh of Inverkeithing, by the laft returns in 1811, contained 581 houfes, and 2400 perfons.

INVERNESS, col. 2, l. 7, 8, 9, r. The burgh and parifh was returned, under the act of 1811, as containing 1672 houfes, and 10,757 inhabitants.

INVERNESS-SHIRE, l. 10 and 11, r. comprehended, in the year 1811, 78,336 perfons, occupying 14,646 houfes; 35,722 being males, and 42,614 females.

INVERURY. In 1811, the burgh and parifh contained 205 houfes, and 907 perfons; 453 being males, and 454 females.

INULIN, in *Chemiftry*, a name given by Dr. Thomson to a fubftance extracted by Rofe, from the *Inula belenium*, or Eleccampane. This fubftance is extracted by boiling the roots in water, and putting by the decoction to cool, when the inulin is deposited in the form of a white powder. Inulin refembles ftarch in its appearance, and fome of its properties. It is principally diftinguifhed from ftarch by feparating from water after boiling in the form of a white powder. Inulin has been found by Dr. John in the roots of feveral other plants.

IOANNA. Add—In 1809, this ifland was vifited by the favages of Madagafcar, called Malagafcars, who laid fiege to the principal town, and destroyed the crops, and thus reduced the inhabitants to the moft deplorable ftate, fo that nearly 200 women and children perifhed of hunger, and numbers of the latter were actually eaten by their parents, fo that thefe favages have nearly defolated the Comora iflands. The once happy and flourifhing ifland of Ioanna, with its 370 towns and villages, fo enchantingly defcribed by fir William Jones, is now reduced to two walled towns, and a population of 5000 fouls.

IOANNINA, a city of Albania, the capital of Ali's dominions, fituated on the welfern banks of a lake of the fame name, at about two miles from its eaftern extremity. In its utmoft length, it may be, perhaps, about two and a half miles, and in breadth nearly a mile. Near the lake it ftands on a flat, but the northern and welfern parts are built on flopes of rifing and uneven ground. A triangular peninfula juts into the lake, and contains the refidence of the pacha, being defended by a fortification at each angle. The entrance into thefe forts is over a draw-bridge. There is one ftreet which runs nearly the whole length of the town, and another that intersects it at right angles, extending to the fortrefs; thefe are the principal ftreets. Many of the houfes are large and well built, containing a court-yard, and having warehoufes or ftables on the ground, and the apartments of the family above. A flight of wooden fteps and a gallery connect the under and upper parts of the houfes. Although gloomy in appearance, with fmall windows latticed with crofs bars of wood, the yard is furnifhed with orange and lemon trees; and the beft houfes communicate with a garden, and the galleries are fufficiently fpacious to allow fcope for walking in rainy weather. The bazaar, or principal ftreet, inhabited by tradesmen, has a flowy appearance; the bizen, or covered bazaar, is of confiderable ufe, and would put one in mind of Exeter Change in London. Befide the palace of the pacha, and two houfes allotted to the fons of Ali, there is another fummer refidence of the vizier's in the fuburbs, at the N.W. end of the town. Beyond the pavilion,

pavilion, there are gardens belonging to the principal inhabitants of Ioannina, most of whom have summer-houses. The population is variously stated: some compute the number of houses at 8000, and others estimate the number of inhabitants at no more than 35,000. From the commercial transactions of this city, the vizier draws a revenue of 250,000 piastres. Hobhouse's Journey through Albania, &c.

IODATES, IODIC ACID, IODIDE, in *Chemistry*. See **SIMPLE Bodies**.

IODINE. This newly discovered elementary substance has been correctly described under **SIMPLE Bodies**, to which, therefore, we refer our readers.

IRIDIUM. See **MINERALOGY, Aldenda**.

IRITIS, or Inflammation of the Iris. Professor Schmidt, of Vienna, first accurately discriminated this disease from other kinds of ophthalmia, and applied to it the foregoing name. The iris often becomes inflamed in consequence of artificial or accidental wounds of the eye-ball. Constitutional syphilis frequently affects the eye, producing a peculiar and characteristic iritis. The iris is the texture, which is the seat of inflammation in the distinct kind of ophthalmia so frequently met with in gouty constitutions. In the rheumatic ophthalmia, the inflammation, though never originating in the iris, frequently extends to it. And, lastly, an inflammation of this membrane sometimes accompanies cutaneous eruptions; particularly those which, though not syphilitic, have succeeded sores of the genitals, and are generally supposed to be connected with the abuse of mercury.

1. In common inflammation of the iris, or *idiopathic iritis*,

besides the common symptoms of ophthalmia, there are changes which occur at the very commencement that indicate the seat of the inflammation. The pupil is contracted, the motions of the iris are less free, and the pupillary opening loses the bright black colour which it naturally possesses. The colour of the iris is next observed to alter; this happens first in the lesser circle, which gets of a darker hue; and afterwards in the greater, which grows green if it has been greyish or blue, and reddish if it has been brown or black. The iris afterwards swells and projects towards the cornea; and the margin of the pupil loses its sharply defined edge, and is turned back towards the posterior chamber. The redness accompanying these changes is by no means considerable, and is at first confined to the sclerotic coat, in which a number of very minute rose-coloured vessels are seen running in straight lines towards the cornea. The pupil, at the same time, loses its circular form, becomes somewhat irregular, and presents a greyish appearance. Examined with a magnifying glass, this appearance is seen to be produced by a substance very like a cobweb, occupying the pupil, and which is soon afterwards distinguished to consist of a delicate flake of coagulable lymph. Into this, the processes or dentations of the margin of the pupil seem to shoot, and it is afterwards found, that at these points adhesions are apt to be established, in consequence of which vision is rendered more indistinct, and only one side or parts of objects can be discerned.

The effusion of lymph into the pupil continues to increase; it is likewise poured into the posterior chamber, and adhesions between the iris and capsule of the lens are formed. The quantity of lymph effused is sometimes so great, as to fall in a curdled form from the pupil to the lower part of the anterior chamber. The pupil, the size of which is considerably diminished, now derives a greyish-white colour from that of the lymph by which it is filled; the morbid sensibility to light, which prevailed at the commencement of the inflammation, is diminished; the powers of vision become gradually more and more limited; and, at length, merely the perception of light remains.

By this time, the redness of the eye has increased, and partly arises from vessels which are now developed in the conjunctiva. The redness is deepest all around the cornea; towards the periphery of the eye-ball it fades. The cornea loses somewhat of its peculiar brilliancy; and lymph now appears to be effused into the substance of the iris; for, while it projects more and more towards the cornea, its fibres are collected into bundles, and its surface exhibits a puckered or plaited appearance. A yellowish-red tubercle then forms on some part of its surface; it is at first small, but enlarges and projects forwards, and, according to Schmidt, is distinctly seen to be an abscess, which finally bursts, and discharges its contents into the anterior chamber. At this period of the disease, a small quantity of blood is sometimes extravasated into the anterior chamber. The inflammatory symptoms now abate, and, as the disease subsides, both the pus and blood in the anterior chamber are absorbed. The shreds of the cyst of the abscess, which were floating in the aqueous humour, in a few days disappear. The anterior chamber regains its transparency; the iris remains permanently expanded; its puckered appearance continues, the pupil is closed, and the power of vision is entirely lost. When the termination is somewhat more favourable, the pupil is not entirely closed, and the iris retains some degree of motion. The piece of coagulable lymph which occupies the pupil is reduced to the state of a thin membrane, which is opaque towards its centre, but somewhat transparent at the edges; the margin of the iris is only adherent

IRITIS.

at some points to this membrane; and vision is impaired, but not destroyed.

Sometimes the inflammation of the iris extends to other textures of the eye. When the cornea is attacked, it becomes cloudy and thickened; and the iris projecting, the two inflamed textures come into contact, and adhere before any visible effusion of lymph takes place. Should the inflammation spread more deeply, and attack the membranes of the lens, and of the vitreous humour, the choroid coat, &c. then the violent symptoms of deep-seated inflammation of the eye take place. Even if the form of the organ is preserved, vision is totally destroyed; but often the eye suppurates, bursts, and almost entirely disappears.

In the *Syphilitic Iritis*, a pale redness all round the cornea is the first symptom which is perceived. It is at first seated in the sclerotic coat alone; but the conjunctiva very soon shares in it, and afterwards becomes even redder than the preceding membrane. However few the vessels may be elsewhere, there is always a broad zone of them all round the cornea, a zone formed at this place, not only by the vascular net-work in the conjunctiva, but by the ciliary vessels on the external surface of the sclerotic. The redness has a peculiar tint; for instead of being bright red, it is brownish, something like the colour of cinnamon. The whole cornea becomes uniformly hazy. The pupil also becomes contracted, and the iris limited in its motions, as in common iritis; but the pupil does not preserve its natural situation. It is removed in a direction upwards and inwards towards the root of the nose, and is irregular. At the same time, the iris loses its natural colour, and projects forwards.

Towards evening, there is always an aggravation of the symptoms; the intolerance of light and painful sensibility of the whole eye increasing, and a gush of tears following every change of light and temperature. At length, a regular nightly pain sets in, of an extremely severe kind, but strictly limited to that part of the cranium which is immediately above the eye-brow. It usually begins between six and seven in the evening, gradually increases, reaches its utmost height about midnight, and then diminishes till about four or five in the morning, when it ceases. After every such attack of pain, the pupil is found more contracted, drawn farther upwards and inwards, the iris more altered both in colour and form, the quantity of lymph increased, and consequently vision more impeded.

Peculiar appearances then take place in the iris; for, either on its pupillary or ciliary margin, or on both, one or more reddish-brown tubercles arise, which have a spongy look. Their growth is pretty rapid. Lardy-looking ulcers sometimes appear on the cornea and white of the eye, or on the eye-lids. Even when syphilitic iritis terminates in the most favourable manner, the eye for a long time afterwards is peculiarly sensible to the influence of cold and moisture. On every exposure to these, the organ becomes morbidly sensible to light, of a reddish colour, and discharges tears. Indeed, frequently for more than a year afterwards, on every sudden change of temperature, a pale violet-coloured zone appears around the cornea, but goes off when the eye has remained for some time exposed to an equal temperature.

In the iritis which appears in conjunction with the eruptions supposed to be connected with the abuse of mercury, the inflammation seems less active than in the other kinds. The pupil is not much contracted, and lymph is less apt to be effused. A vesicle full of yellow matter sometimes rises on the iris, without any other alteration on this membrane than that of colour, the pupil remaining almost unchanged. By the use of proper remedies, this vesicle, even when it seems quite ready to burst, can generally be made

to disappear in a few days, without any rupture taking place. The blood-vessels of the conjunctiva are large and distended, without being varicose; they have a more livid colour than in the iritis of arthritic persons, and run quite to the edge of the cornea.

The treatment of iritis is conducted on the same principles as that of inflammation in general, with one difference, which is deduced from the important fact so well explained by Dr. Farre and Mr. Travers, *viz.* that in iritis, the free exhibition of mercury is the most effectual means of preventing the effusion of coagulating lymph, and promoting its absorption after it has taken place, from which effusion the thickening and adhesions of the iris, the formation of opacities in the pupil, and other mischievous and destructive effects upon vision, are principally derived. According to Mr. Travers, indeed, whatever may be the cause of iritis, mercury is the grand remedy for resisting the progress and consequences of the effusion of lymph in the eye. According to professor Schmidt, of Vienna, general bleeding is necessary only where there is a great degree of symptomatic inflammatory fever. Hence, it is principally in the idiopathic iritis that large bleedings from the arm are requisite. In the syphilitic species, he says, it is never necessary to open a vein. In the arthritic, it is sometimes attended with benefit; but in patients of this description, a small bleeding, repeated next day if necessary, is found to answer much better than a large bleeding at once, even though the constitutional disturbance be considerable. In the *rheumatic iritis*, it is also sometimes highly beneficial to bleed from the arm. Local bleeding, by means of leeches to the forehead, produces the most decided benefit in all the varieties of iritis.

Purgatives, given so as to act copiously, professor Schmidt describes as being useful only in the idiopathic iritis; and as for cold local application, he tells us that they are in all cases quite useless.

In the idiopathic iritis, he recommends us to take sixteen or twenty ounces of blood from the arm; and to repeat the bleeding if circumstances should require it. Six or eight leeches are to be applied to the eye-brow or temple. A smart purgative should then be given. The application of leeches, but in smaller number, should be continued every day, or every other day, until an abatement of the inflammation has evidently taken place. In the first stage of the process, blisters to the temple, or behind the ears, have little or no effect; though sometimes a large one on the nape of the neck seems to be of service. According to Schmidt, the only topical treatment which is admissible is the fomentation of the eye with water made as hot as the patient can bear it, which sometimes procures a mitigation of the violence of the pain. Care, however, must be taken to dry the eye-lids and circumference of the orbit well after using this application.

When the disease passes into its second stage, or that in which the effusion of coagulating lymph commences, mercury is to be given with the views already mentioned. Two grains of the submuriate of mercury, and half a grain of opium, made into a pill, are to be given every evening and morning; or common mercurial frictions may be employed. Externally, professor Beer applies a solution of the oxymuriate of mercury in water, to which mucilage and a considerable quantity of the vinum opii have been added. When this collyrium loses its effect, or the eye cannot bear any fluid application, which is sometimes the case, then he inserts daily between the eye-lids a small quantity of a false composed of two drachms of fresh butter, six grains of red precipitate, and eight grains of extract of opium. According

to the same eminent oculist, frictions once a day over the eye-brow with mercurial ointment, opium being added to it, very much contribute to the absorption of the lymph effused in the posterior chamber.

It is seldom necessary to continue many days the exhibition of mercury; for such is the efficacy of this mineral in producing a removal of the lymph, and clearing away all opacities about the pupil, that in less than eight or ten days these objects are generally effected, and the medicine then may be omitted.

The form of iritis, usually named *syphilitic*, is unquestionably one of those diseases which does not require more mercury for its cure than the common idiopathic iritis; and although it was supposed by professor Schmidt that it could not be radically cured without removing the constitutional disease, modern experience fully proves, that it may often be entirely and permanently relieved by freely exhibiting mercury for only a few days. This is another fact tending to confirm the opinions which have recently been examined and promulgated with so much ability by several of our army surgeons, in relation to the curability of all the forms of syphilis without mercury. For, even in the syphilitic iritis, we are not to imagine that the complaint is stopped and cured by a few grains of calomel, on the principle of eradicating a specific disease: the thing is more rationally explained by the peculiar efficacy of the medicine in producing an absorption of the lymph, which thickens the iris, obstructs the pupil, and even serves for the formation of preternatural adhesions, and new opaque membranes destructive of vision. Besides the use of mercury, however, other means are advisable. When there is severe pain in the eye with violent head-ache, three or four leeches should be applied on the eye-brow, and a mild purgative administered. The nightly attacks of pain, which are so invariably followed by an aggravation of all the symptoms, are most effectually prevented by rubbing into the part just over the eye-brow a small quantity of mercurial ointment with opium, a short time before the pain is expected to begin, and then covering the eye with a folded piece of warm linen. Generally speaking, calomel given in small doses two or three times a day, is the best preparation of mercury for internal exhibition.

The *iritis* which accompanies cutaneous eruptions was thought by Schmidt to be the most easy of cure; local bleedings are said to be in this case strikingly beneficial. According to some writers, when the eruptions have arisen from the previous abuse of mercury, calomel has not the least effect on the accompanying iritis. But at the London Infirmary for diseases of the eye, this form of the disease, though originally it may have been caused by the effects of a mercurial course, is said to be benefited as much as the other varieties of iritis by the exhibition of mercury; a circumstance which no mode of reasoning would ever have led us to anticipate. If, however, it be an unequivocal fact, the voice of experience must direct us in practice, and we must be silent on things which we cannot explain.

The best account of iritis is contained in professor Schmidt's valuable work, entitled "Ueber Nachtaar und Iritis nach Staar-Operationen," 4to. Wien. 1801. Additional information is also published in Beer's "Lehre von den Augenkrankheiten," b. i. p. 450. Wien. 1813. Saunders on Diseases of the Eye, edit. 3. by Dr. Farre; B. Travers, in "Surgical Essays," part i. Carmichael in "Observations on the Symptoms and Specific Distinctions of Venereal Diseases," 8vo. 1818. The Quarterly Journal of Foreign Medicine, N^o 1. contains a well-written analysis of professor Schmidt's work on Iritis; and at the same time that we

acknowledge our obligations to that periodical publication for every thing which is valuable in this article, we cannot refrain from expressing our best wishes for the success of a journal, the principal object of which is to make us acquainted with the contents of all the best modern books which appear on the subject of medical science in different parts of the continent.

IRON, in *Chemistry*. According to the recent determination of Dr. Thomson, the black or protoxyd of iron is a compound of

Iron	-	-	100.
Oxygen	-	-	28.5

Hence the weight of the atom of iron will be 35. The red or peroxyd of iron, according to the same chemist, is a compound of

Iron	-	-	100.
Oxygen	-	-	42.955

Or it is composed of 1 atom iron + $1\frac{1}{2}$ atoms oxygen, or, to get rid of fractions, of 2 atoms iron + 3 atoms oxygen, on which latter supposition the weight of an atom of peroxyd will be 100.

KAYKIYA, l. 4, for Lucins, his half brother *r.* twins, his half brothers.

KAZAMEEN, a town of Persia, in the pachalic of Bagdad, three miles north of Bagdad, and on the western bank of the Tigris, inhabited by about 8000 Persians, who reside here because this town is the burying-place of Imam Moufa Cassim, and Imam Mahomet Tonky, holy men for whom they had great respect, and to whose memory a noble mosque is erected. About nine miles north-west of Kazameen, and at some distance from the river, a pyramidal structure is erected, called by Europeans the Tower of Babel, Nimrood by the natives of Bagdad, and Agerkaf by the Arabians, and supposed by some to be coeval with the remains of ancient Babylon. It is 190 feet high, and 100 in diameter.

KAZARON, or KAZERON, *r.* nearly seventy miles W.S.W. of Schiras, E. long. 51° 43'. This town is situated in a valley about thirty miles long, and seven or eight broad, bounded on the N. by a salt lake, and fertilized by many streams of excellent water. From the depopulation it has suffered, its present inhabitants do not exceed 3000 or 4000.

KEARSARGE GORE, a township of Hillsborough county, in New Hampshire, having 125 inhabitants.

KEENE, l. 3, 1810; l. 4, *r.* 1646.

KEITH. In 1811 the parish contained 755 houses, and 3352 persons; 1391 being males, and 1961 females; 173 families employed in agriculture, and 295 in trade, manufactures, and handicraft.

KELAT, the capital of Balouchistan, &c.; add—It is immediately encompassed by a low mud wall, and contains 4000 houses: the inhabitants are estimated at 7000, of whom 500 at least are Hindoos. The palace of the Khan is seated on a very high hill, and commands a view of the whole place and neighbouring country. The bazaar is well supplied, and the town has the appearance of opulence, being frequented by merchants, and enjoying a considerable trade. N. lat. 29° 6'. E. long. 67° 57'.

KELLY VALE, a township of Orleans county, in Vermont, having 40 inhabitants.

KELSO. In 1811 the parish of Kelfo contained 529 houses, and 4408 persons; 1979 being males, and 2429 females: and the district of Kelfo, comprehending twelve parishes, contained 2173 houses, and 12,378 persons; 5592 being males, and 6786 females: 1268 families employed in agriculture, and 797 in trade, manufactures, and handicraft.

KENDAL, *l. ult.* In the year 1811, Kendal ward contained 2719 houses, and 13,674 persons; and the town of Kirkby Kendal contained 1496 houses, and 7508 persons.

KENERA, l. 9, for there *r.* these.

KENFIG. In 1811, the parish contained 55 houses, and 242 persons; 119 being males, and 123 females: and Higher Kenfig, which is a hamlet in Mengan parish, contained 24 houses, and 129 persons; 69 being males, and 60 females.

KENILWORTH. In 1811 the parish contained 463 houses, and 2279 persons; 1145 being males, and 1134 females: 155 families employed in agriculture, and 264 in trade, manufactures, and handicraft.

KEN-

KENNEBECK, *l. uli*. It contained, in 1810, 32,564 inhabitants.

KENNEDIA, in *Botany*, so named in honour of Mr. Kennedy, the well-known cultivator at Hammermith, whose skill and experience have so much enriched the works of his son-in-law, Mr. Andrews.—Venten. Malmaif. 104. Brown in *Ait. Hort. Kew.* v. 4. 299.—Class and order, *Diadelphia Decandria*. Nat. Ord. *Papilionaceæ*, Linn. *Leguminosæ*, Juss.

Eff. Ch. Standard recurved, distant from the keel and wings. Legume of many single-seeded cells. Seeds crested.

1. *K. rubicunda*. Dingy Kennedy. Vent. t. 104. (*Glycine rubicunda*; Curt. Mag. t. 268. Willd. Sp. Pl. v. 3. 1065. Schneev. Ic. t. 28.)—Leaves ternate, ovate. Stalks mostly three-flowered. Legume very hairy.—Found by Sir J. Banks, in New South Wales. An elegant greenhouse shrub, with downy twining stems, and large flowers, partly-coloured with red and purple.

2. *K. coccinea*. Tufted Scarlet Kennedy. Vent. t. 105, but not of Curtis.—Leaves ternate, obovate. Flowers capitate. Legume nearly smooth.—Gathered by Mr. Brown on the south-west coast of New Holland.

3. *K. prostrata*. Few-flowered Scarlet Kennedy. Br. in *Ait. n. 3*. (*Glycine coccinea*; Curt. Mag. t. 270. Willd. Sp. Pl. v. 3. 1065.)—Leaves ternate, obovate, hairy. Stalks one or two flowered. Stem prostrate.—Native of New South Wales, from whence its seeds were brought about 1790.

4. *K. monophylla*. Simple-leaved Kennedy. Vent. t. 106. (*Glycine bimaculata*; Curt. Mag. t. 263. Willd. Sp. Pl. v. 3. 1067. *G. violacea*; Schneev. Ic. t. 29.)—Leaves simple, smooth, reticulated; somewhat heart-shaped at the base. Flowers racemose. Discovered by Sir J. Banks, in New South Wales. Introduced into England with the last. Flowers violet, with two green spots on the keel.

Mr. Brown appears to have some unpublished species.

KENNET. Add—It contained, in 1810, 947 inhabitants.

KENSINGTON, *l. 4*, 1811—1379—10,886.

KENSINGTON, in America, *l. 4*, r. 781.

KENT, *l. 19*, &c. r. In 1811, Kent contained 62,063 houses, 373,095 persons; 183,500 being males, and 189,595 females.

KENT, in America, *l. 4*, r. 11,450; *l. 5*, r. 4249; *l. 13*, r. 9834; *l. 24*, r. 1794.

KENT, *New*. See *New Kent*.

KENTUCKY. Add—See UNITED STATES.

KERBALA. See *VOLOGESIA*.

KERKUK, or **KERKOOK**, the largest town in the lower Kurdistan, in N. lat. 35° 29', 59 furlongs from Bagdad, and 41 from Mosul, on the road from one place to the other. It was formerly a military station, called by Strabo, Demetrias; and by Ptolemy, Corcura. Its population is estimated at 18,000 souls, Turks, Armenians, Nestorians, Kurds: this estimate, however, is supposed to exceed the truth by 5000. The city is defended by a mud wall, has two gates, seven mosques, fourteen coffee-houses, one hummum, one caravanera, one Armenian church, and twelve pieces of useless artillery mounted on the bastions. In the suburbs, are five mosques, nine small caravaneras, thirteen coffee-houses, three convents, and three Catholic churches. Near it is a number of naphtha pits, which afford an abundant supply of that commodity.

KERMANSRAW, one of the five districts of the province of Irak in Persia; the capital of this extensive and

fruitful district of the same name, and the residence of Mahomet Ali Meerza, the king's eldest son, and the most able and warlike of all the princes of Persia. It is a flourishing town, containing about 12,000 houses, at the extremity of a fine plain, through the centre of which runs the Karafu. It is adorned with many gardens, and fourteen hummums or public halls, four mosques, and yields a revenue of 15,000 tomans a year.

KERRIA, in *Botany*, so named after Mr. William Kerr, a gardener, who has introduced the shrub in question, with many other Chinese plants, into the English gardens.—De Caidolle Tr. of Linn. Soc. v. 12. 156.—Class and order, *Leofandria Polygynia*. Nat. Ord. *Senticofæ*, Linn. *Rosaceæ*, Juss.

Eff. Ch. Calyx in five simple segments. Petals five. Capsules? superior, distinct, single-seeded.

1. *K. japonica*. Japan Kerria. De Cand. (*Rubus japonicus*; Linn. Mant. 245. *Corchorus japonicus*; Thunb. Jap. 227. *Ait. Hort. Kew.* v. 3. 314. *Andr. Repof. t. 587*. Curt. Mag. t. 1296.) See *RUBUS* under n. 38, and *CORCHORUS*, n. 12.—A correct examination of the *germens* has authorised the learned professor De Caidolle to consider this favourite plant as a new genus, though the precise nature of its seed-vessels is not known.

KEW, *l. 4* and *5*, r. 1811—73—560.

KEYNSHAM, *l. 4* and *5*, r. 1811; the parish consisted of 318 houses, and contained 1748 inhabitants.

KHARASM, col. 2, *l. 3*, r. (See *KHIVEA*.)

KHOEE, a town of Persia, in the province of Azerbaijan, 22 furlongs from Tebrez. This town is the capital of a rich and extensive district, and the emporium of a considerable trade carried on between Turkey and Persia. It is said to contain a population of 25,000 souls, and is situated on a plain, famous for a battle fought, in 1514, between Shah Ismael and Selim I. in which 30,000 Persians encountered 300,000 Turks. There is no town in Persia better built or more beautiful than Khoe: the walls are in good repair; the streets are regular, shaded with avenues of trees; and the ceilings of many of the houses are painted with extraordinary taste.

KHONSAR, a town of Persia, in the province of Irak, situated at the base of two ranges of mountains, running parallel with each other, and so close that the houses occupy the bottom and also the declivity of the hills to some height. The town, placed in a beautiful and romantic situation, and formed of houses and gardens, connected by means of its plantations, is about six miles in length, and about one-fourth of a mile in breadth. It contains 2500 families under a chief named Ali Slah, and yields an annual revenue of 5000 tomans, exclusive of the fadir, which generally consists of dried fruits and a kind of cotton chintz. Although they have no corn in the valley, fruit is so abundant, that the inhabitants procure for it every article which they can want or desire. Of their apples, they make a kind of cyder, but it will not keep above a month. The women are celebrated for their beauty and vivacity.

KHORASSAN. Add—Khorassan is a level country, interspersed with sandy deserts, and irregular ridges of lofty mountains; the climate is accordingly various; in some parts temperate, but in others very cold; and the "had-e-Jemum," which blows in the deserts for 40 days in the year, proves instantan-

instantaneously fatal to all who are exposed to it. This province was once populous and flourishing, and adorned with many princely cities. The soil is generally excellent, and produces wine, fruit, corn, rice, and silk in abundance, and of the best quality; but from the successive depredations which it has suffered, its prosperity and commerce have declined; its cities have decayed; and its fertile regions have been changed into solitary deserts. At present the authority of the king of Persia extends only over the cities of Meshed, Nishapur, Turfihis and Tabas. The southern parts, including Herat, are in possession of the Afghans, and some wandering tribes of Patans and Ymucks; and those to the E. and N. belong to the Usbeck Tartars and Tarkomans. Khorassan is separated from Cabul by the mountains of Bamian and Goor. Its rivers are, the Oxus, the Tedzen or ancient Ochus, the Herirood, the Murgah or ancient Margus, the Elter or ancient Siderius, from which the province of Alerabad derives its name, and which runs into the Caspian sea. The provinces of Irak and Khorassan are separated by a deep ravine, which intersects the road leading from Tehraun to Meshed, 22 furlongs E. of the former place. The districts in this direction are, Sumnum, Damgan, and Bistan. The present capital of the Persian division of Khorassan is Meshed. That part of Khorassan which extends from N. lat. 32° 30' to 34° 40', from 56° to 62° E. long., comprehends the following towns and districts, *viz.* Puffing, Zuzan, Turfihis, Turbat, Jam, Kohistan, Nishapur, and Sarukhs. M'Kinnair's Persia.

KIBBAN, furnished Madan from its mines, a town of the pachalic of Diarbekr, larger and more populous than Argunna Madan; situated at the base of a high mountain, and on the verge of a chafm, through which a stream forces its way to the Euphrates, distant about 1½ mile from the town.

KIDDERMINSTER, l. 5 and 6, r. 1811—1348—8038.

KIDWELLY, l. 5, r. 1811—329—1441; l. 10, add—The vicinity is rich in coals and iron-ore, and some iron and tin manufactories have long been carried on here; l. 11, r. condition; l. 13, add—Its markets are held on Tuesday and Friday, and it has three fairs in the year.

KIGES, a town of Ohio, in Gallia county, having 387 inhabitants.

KILBARCHAN. Add—By the parliamentary returns of 1811, the parish contained 360 houses, and 3563 inhabitants.

KILBIRNIE, for Renfrewshire r. shire of Ayr. In 1811, the parish contained 180 houses, and 1088 persons; *viz.* 509 males, and 579 females.

KILBRIDE. Add—In 1811, the town and parish contained 517 houses, and 2906 persons.

KILBRIDE, *West.* In 1811, the parish contained 183 houses, and 1015 persons; *viz.* 462 males, and 553 females: 76 families being employed in agriculture, and 108 in trade and manufactures.

KILKENNY, in America, l. 1, for Grafton r. Coos; l. 2, r. 28.

KILLBUSH, a township of Stark county, in Ohio, having 332 inhabitants.

KILLEARN, for KILLEAM, l. 1, and l. 3, add—In 1811, the parish contained 157 houses, and 997 persons.

KILLINGLY, l. *ult.* r. 2512.

KILLINGWORTH, l. *ult.* r. 2244.

KILMARNOCK, l. *ult.* r. In 1811, the town and parish contained 912 houses, and 10,148 inhabitants, of whom 1363 families were employed in trade and manufactures.

KILMAURS, a parish of Ayrshire, which, in 1811, contained 248 houses, and 1432 persons; *viz.* 685 males, and 747 females: 61 families being employed in agriculture, and 142 in trade and manufactures.

VOL. XX.

KILPATRICK. The parish of New or East Kilpatrick contained, in 1811, 205 houses, and 1643 persons; *viz.* 746 males, and 897 females. The parish of Old or West Kilpatrick contained 370 houses, and 3428 persons; *viz.* 1595 males, and 1833 females. In the former, 81 families were employed in agriculture, and 120 in trade and manufactures: in the latter, 95 families were engaged in agriculture, and 557 in trade, &c.

KILSYTH. In 1811, the parish of Kilsyth contained 626 houses, and 3206 persons; *viz.* 1488 males, and 1718 females.

KILWINNING. In 1811, the parish contained 506 houses, and 3291 persons; *viz.* 1607 males, and 1684 females.

KIMBOLTON, l. 4, r. 1811; l. 5, r. 260—1400.

KINCARDINE. By the parliamentary returns of 1811, the parish of Kincardine, in Monteth, with Thornhill, contained 479 houses, and 2419 persons.

KINCARDINESHIRE, col. 2, l. 8, after Bervie, add—which burgh and parish, in 1811, contained 193 houses, and 927 persons; l. 46, r. 1811; l. 47, r. 5718—27,439; add—12,580 being males, and 14,859 females.

KINETON, l. 12, r. In 1811, the hundred contained 4066 houses, and 19,459 persons; and the parish 166 houses, and 801 inhabitants. Add—See KINGTON.

KING and Queens, l. 3, r. contains 10,989 inhabitants, of whom 6003 were slaves in 1810.

KING George, l. 3, r. 6456, of whom 3876 were slaves in 1810.

KINGHORN. Add—In 1811, the burgh and parish contained 329 houses, and 2204 persons.

KINGSBRIDGE, l. 9, r. 1811—156—1242.

KINGSCLERE, l. 9, r. 1811—398—1863—53 families; l. 15, r. 1137.

KINGSTON, in America, l. 12, r. 324. Col. 2, l. 3, r. 746. Add—Also, East Kington, a township of the same county and state, having 442 inhabitants; l. 12, r. 832.

KINGSTON-upon-Thames, l. *ult.* r. 1811—716—4144.

KINGTON, l. 2, r. Huntingdon; l. 11, r. 1811—1617—329. See KINETON.

KING WILLIAM, a county of Virginia, containing 9285 inhabitants, of whom 5788 were slaves in 1810.

KINGWOOD, l. 1, r. Hunterdon; l. 2, r. 2605—48.

KINROSS, l. 4, r. The number of inhabitants of this parish, in 1811, was 2214, of whom 287 families were employed in trade and manufactures, and 92 in agriculture: the number of houses was 396.

KINROSS-SHIRE, col. 2, l. 9, r. 1811, as containing 1364 houses, and 7245 persons.

KINTORE, l. 11, r. 1811, the burgh and parish contained 218 houses, and 863 persons.

KINTYRE, l. 1, r. six for three; l. 2, six for three; l. 3, after *viz.* add—Argyll, Corrall, Illy, Kintyre, Lorn, and Mull. The first district contained, in 1811, 2702 houses, and 15,637 persons; Corrall, 1212 houses, and 6887 persons; Illy, 2636 houses, and 14,161 persons; Kintyre, 2959 houses, and 18,286 persons; Lorn, 2721 houses,

houfes, and 13,779 perfons; and Mull, 3010 houfes, and 16,834 perfons.

KIRCALDY, col. 2, l. 25, r. In 1811, the number of inhabitants in the burgh and parifh was 3747, occupying 381 houfes, of whom 405 families were employed in trade and manufactures, and 36 in agriculture: the number of houfes in the whole diftrict was 4899, and of inhabitants 31,958.

KIRKBY-LOXSDALE, l. 5, r. In the year 1811, the town contained 271 houfes, and 1368 perfons.

KIRKBY-Moorfide, l. 6, r. 1811—319—1673.

KIRKBY-Stephen. Add—By the return of 1811, the township contained 250 houfes, and 1235 perfons.

KIRKCUDBRIGHT, l. ult. r. In 1811, the number of houfes in the burgh and parifh was 392, and of inhabitants 2763.

KIRKCUDBRIGHTSHIRE, col. 2, l. 8, r. 1811—33,684 perfons; 15,788 being males, and 17,894 females: the number of houfes being 6223.

KIRKHAM, l. 6, r. 1811—424—2214.

KIRKHAM, a township of Amounderness hundred, in Lancashire, part of Kifhen parifh, containing, in 1811, 424 houfes, and 2214 perfons; viz. 1039 males, 1175 females.

KIRKINTULLOCH, l. penult. r. In 1811, the number of houfes was 605, and of perfons 3740; of whom 573 families were employed in trade and manufacture.

KIRK-OSWALD. At the end, add—In 1811, the number of houfes in this township was 116, and of inhabitants 636.

KIRKWALL. Add—The burgh and parifh of Kirkwall contained, in 1811, 287 houfes, and 1715 perfons.

KIRMANSHA. Add—See KERMANSHAW.

KIRRIEMUIR, l. 12 and 13—1811, the town and parifh were returned as containing 955 houfes, and 4791 perfons.

KIRTON, l. 6, r. In 1811, it contained 307 houfes, and 1531 perfons.

KIRTON *Lindfay*, l. 5, 1811—258—1152.

KITTERY, l. 3, r. 2019.

KIZIL-OZAN. Add—This river, called the Golden Stream, is the natural boundary of Irak and Azerbaijan, and, according to Rennell, the Gozan of fcripture.

KNARESBOROUGH, col. 4, l. 15, r. The population of the borough and township, as returned to parliament in 1811, was 4234, occupying 888 houfes.

KNEE, in the *Manege*, add—Broken knees very much depreciate the value of a horfe; and therefore various methods have been propofed for repairing and correcting this injury. Mr. Tepln recommends, firft of all, to wafh the injured parts well with a fponge and warm water, fo as thoroughly to cleanse them from gravel or fand; and then plentifully embrocating them with camphorated lead-water, and bandaging over them a pledgit of towmoiltened with the fame, repeating the operation once or twice, if neceffary. This treatment fhould be continued, that a crust or cicatrix may be formed, which will render unctuous or greasy applications unnecessary. But if the laceration be confiderable, fuppuration will enfue, and fhould be encouraged by a common poultice, and the cure completed by digeftive ointments. Mr. Lawrence propofes to make the hair grow after fuch accidents, by binding a piece of fhcet-lead on the part after the wound is healed; and he alfo mentions a contrivance by which the knees of a valuable horfe may be preferred from this accident. (See HOSE.) He advifes to wafh the wound clean with a linen rag and warm soap-fuds, and having wiped the parts dry to apply brandy. Friar's balfam (compound tincture of benzoin) will, he fays, heal broken knees very fpeedily. A kind of hofe, or boots, is

ufed to defend the legs of race-horfes in travelling; and fome kind of guard, fattened above and below the knee, would be very ufeful to poff-horfes. For broken knees, Mr. Ryding recommends a mixture of 1 dr. of cantharides in fine powder with 1 oz. of olive-oil, which fhould be applied occasionally with the hand to the wounded part. This, he fays, by its gently ftimulating power, will brace the parts, promote the fore, and facilitate the growth of hair.

KNIGHTIA, in *Botany*, fo named by fir Jofeph Banks and Mr. Brown, in honour of Thomas Andrew Knight, eqn the able president of the Horticultural Society, well known by his numerous writings on vegetable phyfiology.—Br. Tr. of Linn. Soc. v. 10. 193.—Clafs and order, *Tetrandria Monogynia*. Nat. Ord. *Proteaceae*, Juff. Br.

Eff. Ch. Calyx none. Petals four, equal, revolute. Stamens inferted above the middle of each petal. Nectary of four glands. Germen feffile, four-feeded. Stigma vertical, club-shaped. Follicle coriaceous, tipped with the ftyle. Seeds winged at the fummit.

1. *K. excelſa*. Br. as above, t. 2.—Found by fir J. Banks, in New Zealand. A large tree, often eighty feet high. Leaves feattered, flalked, elliptic-lanceolate, serrated, five or fix inches long; downy beneath. Flowers red, in denſe lateral cluſters, with red ſtalks. This genus comes very near Aublet's and Schreber's RHOPALA, (ſee that article,) differing only in having four ſeeds winged at the apex, inſtead of two winged all round.

KNOWLTON, l. 2, r. 2064 inhabitants, including 17 ſlaves in 1810.

KNUTSFORD, l. 5 from the bottom, r. In 1811 there were in the township of Nether Knutsford 448 houfes and 2114 perfons, and in Over Knutsford 49 houfes and 243 perfons, of whom in the former township 276 and in the latter 37 were employed in trade, manufacture, and handicraft.

KOM, l. 4, add—It is ſaid to have been built in the year 203 of the Hegira, from the ruins of ſeven towns, which had compoſed a ſmall ſovereignty under Abdalrahman, an Arabian prince:—l. 19, after khan, add—It was taken by the Afghans, when they invaded Perſia in 1722, and completely deſtroyed. Part of it has been ſince rebuilt, but it ſtill appears like a vaſt ruin.

KORASAN, or KHORASSAN. Add—See KHORASSAN.

KORNA. See SHAT-UL-ARAB.

KOUMISS, an intoxicating drink, prepared by the Tartars from mare's milk. See MILK.

KRISHNA, l. 21 and 24 from the bottom, for Gapia r. Gopia; l. 18, for Tafuda r. Yafuda.

KROOK. See REGAN.

KUFA, a kind of boat in uſe on the Euphrates and Tigris; it is perfectly round, made of wicker-work, covered with bitumen, and generally about ſeven feet in diameter.

KUFRI, in *Geography*, a town of Perſia, in the pachlic of Bagdad, between Bagdad and Kerhook, containing about 2000 inhabitants.

KUPRI-ALTUN. See ALTUN-Kupri.

KURMAVATARA, l. 18 from the bottom, for beautiful r. bountiful.

KYANITE. See MINERALOGY, *Addenda*.

KYDIA, in *Botany*, fo called in memory of the late colonel Robert Kyd, firſt director of the Calcutta garden.—Roxb. Corom. v. 3. 11.—Clafs and order, *Monadelphina Dodecandria*. Nat. Ord. *Columniferæ*, Linn. *Malvaceæ*, Juff.

Eff. Ch. Calyx double; outer of four or ſix leaves. Petals five. Anthers in five tufts. Style three-cleft. Capſule of three cells, and three valves. Seeds folitary.

1. *K. calycina*.

1. *K. calycina*. Roxb. t. 215.—Outer calyx four-leaved, longer than the corolla.—Native of the banks of rivulets, in Coromandel and Hindooftan, flowering in the cool season. A tree, with long-stalked, roundish, mealy, slightly three-lobed leaves. Flowers small, white, in terminal panicles.

2. *K. fraterna*. Roxb. t. 216.—Outer calyx six-leaved, shorter than the corolla.—Native of the Circar mountains, flowering in the rainy season. A larger tree than the foregoing. Flowers more conspicuous. Leaves whiter underneath.

LABORATORY. *Woulfe's Apparatus*, Plate V. *Chemistry*.

LAC, in *Coinage*. See LACK and RUPEE.

LACK, in *Geography*, l. 2, r. 1165.

LACKAWANACT, a township of Mercer county, in Pennsylvania, having 379 inhabitants.

LACTATES, in *Chemistry*. See LACTIC Acid.

LACTIC ACID. The description of this acid has been omitted, we shall therefore introduce a brief account of it here.

The lactic acid was first obtained by Scheele from four whey. He considered it as analogous to the acetic acid. Bouillon Lagrange afterwards instituted a series of experiments upon it, from which he drew the conclusion that it is merely acetic acid, contaminated with some saline and animal matter. Four years afterwards, Thenard advanced a similar opinion. Both these chemists, however, had obtained the acid which they examined by distillation, though Scheele had expressly stated that lactic acid, when distilled, was converted into acetic acid. The existence of lactic acid, therefore, was by no means disproved by their experiments. Soon afterwards, Berzelius took up the subject, and in an elaborate set of experiments proved that Scheele's original opinion was correct, and thus fully established the peculiar nature of lactic acid.

Berzelius obtained the lactic acid by the following complicated process. The extract obtained by evaporating whey to dryness was dissolved in alcohol, and mixed with alcohol holding $\frac{1}{75}$ th of its weight of concentrated sulphuric acid in solution, till there was an excess of sulphuric acid present. Sulphate of potash was precipitated. To get rid of the other acids, it was digested over carbonate of lead till the liquid acquired a sweetish taste. By this means, the sulphuric acid, the phosphoric acid, and most of the muriatic acid, were separated; but the lactic acid forming a soluble compound with lead remained in solution. A current of sulphuretted hydrogen gas being passed through the liquid threw down the lead. The liquid was digested over quick-lime till all the animal matter was separated. It now contained only lactic acid, muriatic acid, and lime. A portion of it was freed from lime by means of oxalic acid. This portion was then saturated with carbonate of silver; by means of this solution, the remainder of the liquid was freed from muriatic acid. Finally, the lime was thrown down by means of oxalic acid, so that nothing remained but lactic acid dis-

solved in water. To get rid of a small portion of oxalate of lime which it held in solution, it was evaporated to dryness, and redissolved in water.

Lactic acid thus obtained has a brownish-yellow colour, and a sharp sour taste, which is much weakened by diluting the acid with water. While cold it has no smell, but when heated it acquires a sharp sour odour, not unlike that of sublimed oxalic acid. It does not crystallize, but when evaporated to dryness forms a smooth varnish, which gradually attracts moisture from the air. It dissolves readily in alcohol. When heated it boils, emits a sour smell, and leaves a bulky charcoal, not easily burnt. When distilled it gives out empyreumatic oil, water, acetic acid, carbonic acid, and inflammable gas.

Lactates.—All the lactates are more or less soluble in water, and hardly any of them can be made to crystallize. The lactate of potash and lactate of soda form a light yellow transparent gummy mass, which cannot be easily made hard. The lactate of ammonia has some tendency to crystallize. It forms a gummy mass, which acquires in the air an excess of acidity. When heated, most of the ammonia is driven off. The lactates of barytes, lime, and magnesia, are divided by alcohol into superlactates of those earths which are soluble in alcohol, and into sublactates which are insoluble. The metallic lactates do not possess remarkable properties. There are three lactates of lead; the superlactate which does not crystallize, the lactate which exists in grey crystalline grains, and the sublactate which is insoluble. The lactate of zinc crystallizes.

Dr. Thomson estimates the weight of the atom of lactic acid from Berzelius's experiments at 57.5.

Such are the chief properties of lactic acid and its compounds. We have entered further into the description than we should otherwise have done, on account of the importance of the subject,—the lactic acid existing both in a simple and combined state in most of the animal fluids. See BLOOD, and FLUIDS, *Animal*.

LACTODORUM, in *Ancient Geography*. See TOWER-CESTER.

LACTUCARIUM, a name given by Dr. Duncan to the insipidated juice of the *lactuca sativa*, or common lettuce, and which has been found beneficial in various disorders, especially consumption, as an anodyne, where opium disagreed and could not be taken.

LADY-BIRD. See COCCINELLA.

LAFOURCHE, in *Geography*, a county of the territory of

of Orleans, containing in its interior, and in the parish of Affumung, 4467 inhabitants.

L. AGASCA, in *Botany*, after Don Mariano Lagafca, the worthy pupil, and now successor, of professor Cavanilles at Madrid.—Cavan. in *Ann. de Cienc. Nat.* v. 6. 331. Sims in *Curt. Mag.* 1804. (Lagafca; Willd. *Enum.* 941.)—Clais and order, *Syngenesia Polygamia-fegregata*. *Nat. Ord. Compositæ*.

Eff. Ch. Involucrum a simple row of leaves. Partial calyx five-toothed, single-flowered. Florets tubular, all perfect. Receptacle cellular, very hairy. Seed-down none.

L. l. mollis. Soft-leaved Lagafca. *Curt. Mag.* t. 1804.—Native of Cuba. A tender annual, of little beauty. *Herb* downy, very soft. *Leaves* stalked, ovate, toothed; the lower ones opposite. *Flovers* terminal, white.

LAHORE, l. 10, for Schauguivy r. Shah Jehan.

LAKE, a town of Champaign county, in Ohio, containing 480 inhabitants.

LAKSHMI, col. 3, l. 4, for deities r. deity's wives.

LALESTON, *Higher and Lower*, in *Geography*, form a parish of Newcastle hundred in Glamorganshire. The Higher in 1811 contained 34 houses, and 157 persons; 81 being males, and 76 females: and the Lower contained 62 houses, and 271 persons; 111 being males, and 160 females.

LAMBETH, l. 25, r. 1811—7201; l. 24, r. 41,644, and 4491; l. 27, r. 338.

LAMBOURN, l. 13 and 14, r. In the year 1811, the population of the parish, with its dependent hamlets, *viz.* Blagrove and Halley, Eastbury and Bockhampton and Upper Lambourn, was 2674 persons, and the number of houses 527.

LAMP, APHLOGISTIC. Sir Humphrey Davy, during his researches on flame with the view to the construction of his safety-lamp for coal-mines (see **WIRE-GAUZE**), observed, that a fine platinum wire heated red hot and held in the vapour of ether would continue ignited. Soon after this curious fact was made known, Mr. Ellis of Bath thought of extending the principle, and found that a coil of fine platinum wire, stuck into the wick of a common spirit-lamp (being previously heated), might be kept red hot for any length of time. The lamp so constructed received the appellations of *aphlogistic lamp*, *lamp without flame*, &c.

The platinum wire for this experiment should not exceed $\frac{1}{75}$ th part of an inch in diameter. About twelve coils of this (the coil being about $\frac{3}{16}$ th of an inch in diameter, and as close together as possible without touching) are to be placed upon the wick of a common spirit-lamp, in such a manner that half be on the wick and half above it; the lamp is then to be lighted, and when the wire has become red hot the flame is to be blown out; the wire will then remain red hot for any length of time required, and in a dark room, if properly constructed, will emit a considerable light. Instead of alcohol, ether may be employed, or a similar effect may be produced by sticking the ignited wire into a piece of camphor.

LAMP, Safety, for coal mines. See **WIRE-GAUZE**.

LAMPETER, l. 2, r. 2501.

LAMPIC ACID, in *Chemistry*. The name recently given by Mr. Daniell to an acid generated by the combustion of alcohol, &c. by the aphlogistic lamp.

Sir Humphrey Davy observed, during the combustion of ether in the manner above described, the formation of a peculiar acid pungent vapour, which he considered as a new product. Mr. Faraday soon afterwards described some of the properties of this acid, and more recently Mr. Daniell has given us a more full description. Mr. Daniell prepared

it for his experiments by burning the aphlogistic lamp under an alembic head, and collecting the products; but we understand it may be formed much more readily by passing the vapour of ether through a tube containing platinum wire. The lamic acid, when as pure as possible, is a colourless fluid, of an intensely four taste and pungent odour. Its vapour when heated is extremely irritating and disagreeable, and produces an oppression on the chest, something like that produced by chlorine. It reddens vegetable blues, and decomposes all the earthy and alkaline carbonates. Its sp. gr. when rectified as highly as possible, according to Mr. Daniell, is 1015.

The *Lampates of Potash and Soda* are deliquescent salts, and do not readily crystallize. The *lampate of ammonia* is volatile, and easily decomposed. The *lampate of barytes* readily crystallizes in colourless transparent needles. The *lampates of lime and magnesia* are deliquescent.

The lamic acid has the property, according to Mr. Daniell, of reducing many of the metallic oxys; this is particularly the case with the oxys of gold and mercury. When warm nitrate of mercury, according to Mr. Daniell, is mixed with lamic acid, a metallic shower takes place, and brilliant globules of mercury soon accumulate at the bottom of the vessel.

Mr. Daniell estimates, from his experiments, the weight of the atom of lamic acid at about 64, and considers it as composed of 1 atom hydrogen + 1 atom carbon + 1 atom water. How far these determinations are to be depended upon we cannot say, though we think it probable that they are incorrect.

LANARK, l. ult. r. 1811—5677—658.

LANARKSHIRE, l. 13, r. according to the parliamentary returns in 1811, the population of the county consists of 191,752 persons, occupying 32,040 houses; the males are 88,688, and the females 103,064: the families employed in trade, manufactures, and handicraft, are 27,672, and those employed in agriculture 5387.

LANCASHIRE, l. 21, r. 1811—144,283—828,309; l. 22, r. 114,522; l. 23, r. 23,305. The number of males was 394,104, and that of the females was 434,205.

LANCASHIRE. This county contains several villages and parishes, which, by the prevalence of its manufactures, are become populous, but which our limits will not allow us to mention.

Afston-under-Line (omitted in its proper place) deserves a particular notice as a parish in the hundred of Salford, which in 1811 contained 3042 houses, and 19,052 persons, *viz.* 9146 males, and 9906 females; 213 families being employed in agriculture, and 2737 in trade, manufactures, or handicraft.

Afston-in-Manerfield is also a township in the hundred of Weit Darby and parish of Winwick, which contains 864 houses, and 4747 persons; *viz.* 2342 males, and 2405 females: 163 families being employed in agriculture, and 726 in trade, manufactures, &c.

LANCASTER, col. 4, l. 26 from bottom, r. 1811; l. 25, r. 1694 and 9247.

LANCASTER, in America, l. 5, r. 3927—44. Col. 2, l. 5, r. 592 inhabitants, of whom 3112 were slaves in 1810; l. 7, r. 6318; l. 8, r. 1646; l. 18, add—and by the census of 1810, 5405 inhabitants, including 700 slaves; l. 31, add—Also, a township of the same county, containing 592 inhabitants:—l. 43, r. 1694; l. 44, for Grafton r. Coos; l. 47, r. 1810, and 717.

LANDAFF, l. 2, r. 650.

LANDGROVE, a town of Bennington county, in Vermont, having 299 inhabitants.

LANDSCAPE, *l. penult. r.* wherein. Col. 2, l. 6 from bottom, *r.* aims.

LANESBOROUGH, l. 3, *r.* 1302.

LANGAYA, a genus of serpents, the characters of which are, that it has abdominal plates, caudal rings, and terminal scales. Of this genus there is only one species, differing from all the rest of the serpent tribe in having the upper part or beginning of the tail marked into complete rings, or circular divisions, resembling those on the body of the amphisbæna, while the extreme or terminal part is covered with small scales, as in the genus anguis. This species is called Langaya nafata, or large-fnouted Langaya, has 184 abdominal scales, and 42 caudal rings: it is a native of Madagascar, and was first described by M. Bruguiere of the Royal Society of Montpellier. The natives of Madagascar are much afraid of this serpent, as they conceive it to be very poisonous.

LANGDON, l. 3, *r.* 632.

LANGHOLM, l. 5, *r.* 1811, 2636 persons, occupying 522 houses.

LANGFORD, col. 2, l. 3, *r.* 1811—112; l. 4, *r.* 861.

LANTWIT, MAJOR, a parish of Cowbridge hundred, in the county of Glamorgan, containing, in 1811, 179 houses, and 786 persons; *viz.* 357 males, and 429 females.

LANTWIT, LOWER, a parish near Neath, which, in 1811, contained 116 houses, and 564 persons; *viz.* 265 males, and 299 females.

LAR, l. 6, add—It still contains about 12,000 inhabitants, celebrated for the manufacture of muskets and cotton cloth. It has very handsome buildings, and particularly a bazaar, that is reckoned the noblest structure in Persia. N. lat. 37° 30'. E. long. 52° 45'. See TAREM.

LARISTAN, l. 1, after Persia, add—extending along the Northern shore of the gulf from E. long. 55° to 58°.

LARUS, col. 3, *r.* RIDIBUNDUS.

LASCAR, a term in India; denoting a camp-follower, but applied to native sailors and artillerymen.

LASCO, JOHN. Add—A brief account has already been given of this famous reformer under ALASCO.

LASSUS. See ORLANDO.

LATIMORE, in *Geography*, a township of Adams' county, in Pennsylvania, having 666 inhabitants.

LAUD, l. 10 from bottom, *r.* Stanford.

LAVENHAM, at the close, *r.* 1811—308, and 1711.

LAUGHTER, l. 15, add—See LUNGS.

LAUGHTON, *East*, l. 11, *r.* 1811; l. 12, *r.* 899—184; l. 16, for Whorlston *r.* Potters and Cammings; l. 17, *r.* 1811—127; l. 18, *r.* 582.

LAUNCESTON, col. 2, l. 4 and 3 from the end, *r.* 1811—1758, and 262.

LAUREAT, POET, l. 5, add—In anciently conferring degrees in grammar, which included rhetoric and verification, at our universities, particularly at Oxford, a wreath of laurel was presented to the new graduate, who was afterwards usually styled "Poeta Laureatus." These scholastic laureations seem to have given rise to the appellation:—l. 19, after Edw. IV. insert—who appointed John Kay poet laureat, and who, according to Warton, was the king's first poet under this appellation. The only composition he has transmitted to posterity is a prose English translation of a Latin history of the siege of Rhodes. In the dedication, addressed to king Edward, or rather in the title, he styles himself *hys humble poete laureate*. The same appellation occurs under, &c. At the close, add—Warton's Hist. of English Poetry, vol. i. p. 128.

LAUROPHYLLUS, in *Botany*, an exceptionable compound name.—Thunb. Prodr. præf. n. 16. Willd.

Sp. Pl. v. 4. 1115. Ait. Hort. Kew. v. 5. 481.—Clafs and order, *Tetrandria Monogynia*. Nat. Ord. . . .

Eff. Ch. Calyx four-cleft, inferior. Corolla none. Some male flowers.

1. *L. capensis*. Thunb. Prodr. 31. Willd. n. 1. Ait. n. 1.—Found at the Cape of Good Hope. A tree, with round, brown, shining branches; alternate, oblong, serrated, smooth, coriaceous leaves; and minute flowers, in terminal panicles.

LAUSANNE, in *Geography*, a township of Northampton county, in Pennsylvania, having 157 inhabitants.

LAWSVILLE, a township of Luzerne county, in Pennsylvania, having 169 inhabitants.

LEAD, in *Chemistry*. According to the most recent determinations, *massicot*, or the protoxyd of lead, is a compound of 100 lead + 7,692 oxygen; and the *brown* or *peroxyd*, of 100 lead + 15,384 oxygen. Hence the weight of the atom of lead will be 130, oxygen being 10. From these data, the composition of all the other compounds of lead can be easily estimated. See ATOMIC THEORY.

What is usually called *minium*, or *red-lead*, is a combination of these two oxyds, or of 2 atoms lead + 3 atoms oxygen. *Red-lead* does not appear capable of combining with acids, at least no salt of which it forms a constituent is at present known.

LEAD, page 10, c. 2, l. 3, after gallic, read acid.

LEAD-ORES. See LEAD, and MINERALOGY, *Addenda*.

LEATHERHEAD. In 1811 the parish contained 312 houses, and 1209 persons; *viz.* 580 males, and 629 females: 75 families being employed in agriculture, and 103 in trade, manufactures, and handicraft.

LEBANON, in America, l. 3, *r.* 1810; l. 4, *r.* 1938; l. 8, *r.* 2580; l. 11, 1810; l. 12, *r.* 1808. Col. 2, l. 3, add—containing 1434 inhabitants.—Also, a township in the same county, containing 2473 inhabitants.—Also, a town of Hunterdon county, in New Jersey, containing 2499 inhabitants.

LEBECKIA, in *Botany*, Thunb. Prodr. præf. n. 47. Willd. Sp. Pl. v. 3. 946. Ait. Hort. Kew. v. 4. 261.—Clafs and order, *Diadelphica Decandria*. Nat. Ord. *Papilionacea*, Linn. *Leguminosæ*, Juff.

Eff. Ch. Calyx in five deep acute segments, with rounded sinuses. Stamens all connected. Legume cylindrical, with many seeds.

Thunberg and Willdenow describe three species with simple, and five with ternate, leaves, all shrubs, found at the Cape of Good Hope. Three are in Hort. Kew. *L. contaminata*, *sericea*, and *cytisoides*, all previously referred to SPARTIUM; see that article.

LECANORA, Ach. Syn. 146. "Lichenogr. 77. t. 7. f. 3—7;" a new genus, consisting of 139 species, of the *Lichen* tribe, being the crustaceous species of PARMELIA; see that article.

LECHLADE, l. 16 from bottom, *r.* 1811; l. 15, *r.* 993; l. ult. *r.* 195.

LECIDEA, in *Botany*, Ach. Syn. 11. "Lichenogr. 32. t. 2. f. 1—7." A genus of *Lichenes*, chiefly the *tuberculati* of Linnæus, whose fields have no border from the substance of the *frond* or *crust*, 153 species are now described, whose *fronds* are various.

LEDBURY, col. 2, l. 17, *r.* 1811—3136; l. 18, *r.* 604.

LEDYARD, col. 2, l. 39, *r.* Ochotok.

LEE, in Virginia, l. 6, *r.* 4694 inhabitants, of whom 336 were slaves in 1810; l. 10, *r.* 1329; l. 12, *r.* 1305.

LEE, a long measure in China, rather more than one-third of a mile.

LEEDS, col. 2, l. 25, *r.* 1811, the town and liberty contained

contained, &c.; l. 26, r. 12,249 and 62,534; l. 27, r. 11,739 families were flated, &c.

LEEDS, in America, l. ult. r. Kennebeck for Cumberland; after county, add—containing 1273 inhabitants.

LEEKE, l. 7, r. 1811—832; l. 8, r. 3703.

LEELITE. See MINERALOGY, *Addenda*.

LEGEND, col. 2, l. 34, r. Sybaris. Col. 3, l. 36, for found r. fecret; l. 8 from bottom, r. Coningham.

LEHI, in *Geography*, add—Alfo, a township containing 1188 inhabitants.

LEICESTER. At the clofe, r. 1811, 4609 houfes, 23,146 inhabitants.

LEICESTER, in America, l. 3, r. 609; l. 6, r. 1181.

LEICESTERSHIRE, col. 3, l. 24, r. 1811—150—419; add—of whom 10,801 were males, and 12,345 females; 17,027 families were employed in trade and manufactures, and 11,700 in agriculture. The number of houfes was 30,019.

LEIGH, WEST. In 1811, this township contained 341 houfes, and 1960 perfons; viz. 927 males, and 1033 females.

LEIGHTON-BUZZARD, l. 5, r. 1811—408 houfes, 2114 inhabitants; of whom 187 families were employed in trade and manufacture, and 283 in agriculture.

LEITH. At the end, add—By the parliamentary return of 1811, North Leith had 1085 houfes, and 4875 inhabitants; and South Leith had 838 houfes, (if not a miftake in the number,) and 15,488 inhabitants.

LEMINGTON, or LIMINGTON, l. 2, add—containing 1774 inhabitants.

LEMINGTON-PRIORS, a parifh of Warwickfhire, in the hundred of Knightlow and Kenilworth divifion, contained, in 1811, 125 houfes, and 543 perfons; viz. 275 males, and 268 females. But fince that period, it has been much reforted to as a watering-place refembling Cheltenham; and the number of private houfes, baths, hotels, and public buildings, for the accommodation and amufement of its vifitors, has been very much augmented, and is every year increafing.

LEMNIAN EARTH. See PHRAGIDE.

LEMON, a township of Ohio, in Butler county, having 1308 inhabitants.

LEMPSTER, l. 3, r. 1810 and 854.

LEMUR, col. 3, l. 17 from bottom, r. MACACO.

LENIOR, or LENOIRE, l. 3, r. 5572, of whom 2449 were flaves in 1810.

LENOX, l. ult. r. 1310.

LENS, *Criftalline of the Eye*, *Chemical Properties of*. See EYE.

LEOMINSTER, col. 3, l. 19, r. the population of the borough and parifh, &c.; r. 1811—3238; l. 20, r. 730.

LEOMINSTER, in America, l. 5, r. 1584.

LEONINE, l. 12, after Leonius, add—A French monk of St. Victor, at Marfeilles, about the year 1135; l. 14, after III.—But rhymes in Latin verfes were in ufe much earlier. See Warton's *Hift. of Poetry*, vol. i. diff. ii. At the clofe, add—See RHYME.

LEPANTHES, in *Botany*, from λεπας, bark, and ανθος, a flower, becaufe thefe plants grow on the barks of trees.—Swartz Journ. Aët. Upf. v. 6. 85. t. 5. f. 6. Ind. Occ. 1555. Schrad. Journ. v. 2. 240. t. 2. f. 3. Schrad. N. Journ. v. 1. 100.—Clafs and order, *Gynandria Monandria*. Nat. Ord. *Orchidee*.

Eff. Ch. Calyx ringent; leaves ovate, pointed. Petals linear; elongated at the bafe. Lip none. Style winged. Anther a deciduous lid.

Four Weft Indian fpecies are defcribed, fmall plants,

each with a thick, folitary, roundifh leaf, and one or two clufters of minute flowers.

LEPIDAGATHIS, from λεπις, a feal, and ανθος, a ball, or round aggregation of any kind.—Willd. Sp. Pl. v. 3. 420. Brown Prodr. Nov. Holl. v. 1. 478.—Clafs and order, *Didymia Angiofpermia*. Nat. Ord. *Acanthacee*, Br.

Eff. Ch. Calyx in five deep unequal fegments. Corolla two-lipped. Capfule feffile, of two cells, with a fixed partition. Seeds two in each cell. Br.

L. *criftata*, Willdenow's only fpecies, from the Eaft Indies, bears aggregate, feffile, fealy balls of flowers, chiefly about the crown of the root. The numerous ftems are decumbent, eighteen or twenty inches long, leafy, fquare. Leaves fimple, oblong, rough-edged. Mr. Brown has corrected the character, as above, from various Chinefe and tropical fpecies, in fir J. Banks's herbarium.

LEPIDOLITE. See LEPIDOLITE, and MINERALOGY, *Addenda*.

LEPSIA. Add—It is now called Lipfo.

LERIA, l. 2, after Strabo, add—This little ifland has three harbours, and is faid to produce abundance of the wood of aloes, fo much efteemed in Turkey as a perfume; though others have doubted this fact, on account of the high price of this wood at Conftantinople. In this ifland is a monaftery, and it has a town called Lera.

LERWICK. At the clofe, r. 1811—1049; add—the number of houfes was 252.

LESGESTAN, one of the fmall ftates of Dagheftan, confifting of a ftupendous range of mountains, very long but narrow, and forming the whole N.E. frontier of Georgia. The Lefgi or Lefghans, who inhabit this country, are a wild and favage banditti, divided into different tribes and fpeaking a different dialect. Their houfes are fituated on the loftieft mountains, and on the moft tremendous precipices: they are connected by ftone or wooden bridges, and roads carried through rocks; and they are fupplied with water by pipes or canals cut out of the rocks. The foil is fcanty, and in order to furnifh themfelves with the means of fubfiftence, the furface is increafed to the fummits of the elevated ground by graduated terraces, the intermediate fpace being filled up with rubbifh, and covered with earth. Thefe people are the braveft, as well as the moft turbulent, of all the nations of mount Caucasus, exciting terror in their neighbours, laying wafte their cottages, and carrying away the inhabitants into fervitude. They have long preferved their liberty and independence, and rendered their country inacceffible to any foreign invaders. Moft of them are Mahometans; and the few tribes that continue in ignorance, never change the object of their veneration, which is either the fun, moon, or ftars; or indeed any thing that has made an impreffion on their minds. They hire themfelves to fight the battles of their neighbours, at the price of twelve roubles the campaign, which is to ceafe at the end of three months from the appointed day. They often take different fides, not caring againft whom they fight; and thus it often happens, that the Lefghans falls by the fword of his brother or moft intimate friend. They are lightly drefsed, after the manner of the Tartars, and armed with a gun, piftols, dagger, and fabre. Their women furpafs in fymmetry and beauty all the females of mount Caucasus, and fetch the largeft prices in the markets of Conftantinople. M'Kinnier's Perfia.

LESSERTIA, in *Botany*, named in honour of the late Mr. Stephen Deleffert, to whofe mother Rouffcau's celebrated Letters on Botany were addreffed, and who, like all his family, was no lefs endeared, to thofe who knew him, by perfonal worth than by talents.—"De Cand. Aftagal.

37." Brown in Ait. Hort. Kew. v. 4. 327.—Clafs and order, *Diadelphia Decandria*. Nat. Ord. *Papilionaceæ*, Linn. *Leguminofæ*, Juff.

Eff. Ch. Calyx five-cleft. Standard flat. Keel obtuse. Stigma capitate. Style bearded in front. Legume membranous, without valves.

L. annua, (*Colutea herbaeca*; Linn. Sp. Pl. 1045.), and *L. perennans*, (*C. perennans*; Jacq. H. Vind. v. 3. t. 3.), fee *COLUTEA*, n. 11 and 12; with *L. diffusa*, (*Galega dubia*; Jacq. Ic. Ran. t. 576; are the only species in Hort. Kew. all natives of the Cape of Good Hope, composing a very natural genus.

LETERT, in *Geography*, a township of Gallia county, in Ohio, having 501 inhabitants.

LETTERKENNY, l. 2, r. 1549.

LEVER, col. 2, l. 3, *dele* (See *Plate Surgery*.)

LEVERETT, l. 4, r. 760.

LEVES. At the clofe, r. The population of the rape of Lewes was flated, in the parliamentary return of 1811, to be 18,659 perfons, occupying 2932 houfes.

LEWIS XVI. col. 10, l. 44, r. the fon, Lewis XVII., died very miserably June 8th, 1795, and his filter, Maria Therefa Charlotte, was delivered up in exchange for deputies, December 26th, 1795. The queen was brought to the scaffold on October 16th, 1793, and Elizabeth, the king's filter, May 12, 1794. Col. 11, l. 2, add—Lewis XVIII., on whom the crown devolved after the death of Lewis XVI. and his fon Lewis XVII., retired, during the fubfequent period of the *Revolution*, (which fee, firft to Peterfburg, and was allowed a proceffion by the emperor of Ruffia, April 3d, 1798; he afterwards fought an afylum in this country, and landed at Yarmouth, under the title of the Comte de Lille, October 6th, 1807; and being recalled to the throne of France, made his public entry into London from Hartwell, where he had refided, April 21ft, 1814; and having failed from Dover April 23d, made his entry into Paris May 3d, 1814; but quitted this city again in confequence of the landing of Buonaparte in France, March 21ft, 1815. After the battle of Waterloo, he returned to Paris, and refumed the government, July 8th, 1815.

Lewis, in *Geography*, a county of New York, containing 6433 inhabitants, of whom 4 were flaves in 1810.—Alfo, a township of Ohio, in Clermont county, having 903 inhabitants.—Alfo, a county of Kentucky, containing 2357 perfons.

LEWISBURG, a town of Kentucky, in Mafon county, having 19 inhabitants.

LEWISHAM. In 1811, the parifh contained 1105 houfes, and 6625 perfons; 2923 being males, and 3702 females.

LEWISIA, in *Botany*, in memory of Meriwether Lewis, eq. late governor of Upper Louifiana, the difcoverer of feveral new American plants.—Purfh 368.—Clafs and order, *Polyandria Monogynia*. Nat. Ord.....

LEXAWASCEIN, a township of Wayne county, in Pennsylvania, containing 165 inhabitants.

LEXINGTON, l. 2, add—containing 6641 inhabitants, of whom 1911 were flaves in 1810; l. 19, after univerfity,

add—or college, a Lancafterian fchool, and other well-regulated feminaries; l. 22, r. in 1810, it amounted to 6000, though in 1773 it was merely a hunting camp; l. 28, after Georgia, add—in Oglethorpe county, having 113 inhabitants; l. 34, add—In 1810, the inhabitants were 1052.

LEYDEN, l. ult. r. 1009.

LEYLAND, a township of Leyland hundred, in Lancafhire, which, in 1811, contained 459 houfes, and 2646 perfons; 1263 being males, and 1383 females: 97 families employed in agriculture, and 391 in trade, manufactures, and handicraft.

LIBEL, col. 4, l. 30, *dele* pillory.

LIBERTY, l. 12, r. 6228 inhabitants, of whom 4808 were flaves in 1810. At the clofe—Alfo, a township of Butler county, in Ohio, containing 1790 inhabitants.—Alfo, a township of Ohio, in Delaware county, containing 206 inhabitants.—Alfo, a township of Highland county, in Ohio, having 1120 inhabitants.—Alfo, a township of Ohio, in Trumbull county, having 473 inhabitants.

LICHEN ISLANDICUS, *Chemical Compofition of*. This has been fubmitted to a rigorous and curious analysis by Berzelius. Our limits will not permit us to enter into the details, but the following are the refults:

Syrup	-	-	-	3.6
Bitartrate of potafh, with fome tartrate of lime	-	-	-	} 1.9
and phofphate of lime	-	-	-	
Bitter principle	-	-	-	3.0
Green wax	-	-	-	1.6
Gum	-	-	-	3.7
Extractive colouring matter	-	-	-	7.0
Starch	-	-	-	44.6
Starchy infoluble matter	-	-	-	36.6
				102.0

We prefume in the above analysis the excefs of weight (if not an error) was owing to water.

This indefatigable chemift afterwards examined other fpecies of lichens, fuch as the *L. barbatus*, *L. falfigatus*, and the *L. fraxineus*. He found them all characterized by the prefence of a fpecies of ftarch which poffeffes feveral peculiar properties.

LICHFIELD, l. 4, r. 1811—1010 houfes, 5022 inhabitants, 509 families employed, &c.

LICK, a township of Ohio, in Rofs county, having 334 inhabitants.

LICKING. Add—Alfo, a county of Ohio, containing 7 townfhips, and 3852 inhabitants.—Alfo, a townfhip of the faid county, having 632 inhabitants.—Alfo, a townfhip of Ohio, in Mufkingum county, containing 796 inhabitants.

LIEOU-KIEOU, or Loo-choo, or *Great Loo-Choo*, l. 2, after number, add—or rather innumerable. At the clofe, add—The belt maps are wrong in the fituation of Loo-choo. They place its town between 25° 45' and 27° 53' N. lat. and between 128° 5' and 129° E. long. The ifland is alfo made to extend about 130 miles from N. to S. with an uniform breadth of about 30 miles. Its true direktion is nearly N.E. by N. and S.W. by S.; its length is only 56 miles, and its breadth about 11. The longitude of the western extremity is 120° 34' E., and of its eaftern 128° 19'. The latitude of the S. point is 26° 4½' N. and of the N. point 26° 52½'. See an interefting account of thefe iflands in Capt. Hall's Voyage to Loo-choo, or Edinburgh Rev. N° 58. p. 460, &c.

LIME,

LIME, in *Chemistry*. Lime, according to the recent determination of Dr. Thomson, is a compound of 100 calcium + 38.09 oxygen: hence the weight of the atom of calcium will be 26.25, and of lime 36.25. We expect that the weight of the atom of lime will be hereafter proved to be 37.5. See *ATOMIC THEORY*.

The salt of lime, commonly known by the name of *oxymuriate of lime*, and employed for bleaching, has been recently demeritrated by Dr. Thomson to be a real *chloride of lime*, and not a *chloride of calcium*; that is to say, it is a compound of *chlorine and lime*. (See *BLEACHING, CHLORINE, and OXYMURIATIC ACID*.) Dr. Thomson has also rendered it probable, that barytes, strontian, potash, and soda, as well as many of the metallic oxides, likewise unite with chlorine, and form *chlorides* of their respective bases.

LIMERICK, in America, l. 4, r. 1177; l. 5, r. 1282.

LIMINGTON. Add—with 1774 inhabitants.

LINCOLN, col. 6, l. 4 and 3 from bottom, r. 1811—1813—8861.

LINCOLN, in America, l. 16, after Warren, add—The number of inhabitants, in 1810, was 42,992; l. 22, r. 16,359—2489. Col. 2, l. 3, r. 4555; l. 4, 2212; l. 5, r. 8676—2341; l. 11, r. 109; l. 13, r. 221; l. 15, r. 713. Add—Also, a county of West Tennessee, containing 6104 inhabitants, of whom 720 are slaves.

LINCOLNSHIRE, l. 8, r. 1811—46,368—237,891; l. 9, r. 117,022 males, 120,869 females, 13,184 families; l. 11, r. 29,881.

LINCOLNTOWN. Add—Also, a town of Georgia, in Lincoln county.

LINCOLNVILLE. Add—It contains 1013 inhabitants.

LINE, in *Fortification*. Add—See *FIELD-FORTIFICATION*.

LINGA, col. 2, l. 2, for fire r. fine.

LINLITHGOW, l. ult. r. 1811—4022—535; the country part having 229 houses, and 1465 persons; and the town part having 306 houses, and 2557 persons.

LINLITHGOWSHIRE, col. 2, l. 15, r. 1811—19,451, occupying 3098 houses: the number of males is 8874, and that of females 10,577; of these 1506 families are employed in trade and manufactures, and 1132 in agriculture. Col. 4, l. 18, after town, add—The number of houses in the parish is 352, and of persons 2704.

LINNÆUS, col. 5, l. 24, r. journal. Col. 8, l. 19, r. Caper. Col. 11, l. 12, r. Oeland. Col. 15, l. 7, r. Hammasley.

LINOZOSTIS. Add—See *MERCURIALIS*.

LIQUIDS, *Expansion of*. See *EXPANSION and HEAT*.

LISBON, in America, l. 3, r. 1128. Add—Also, a town of Maine, in the county of Lincoln, having 1614 inhabitants.

LISKEARD, l. 32, r. in the year 1811, the borough and parish were returned to parliament as containing 523 houses, and 2884 persons; the borough having 361 houses, and 1975 persons.

LISMORE. At the close, add—By the returns of 1811, the parish of Lismore, in the district of Lorn, contains 252 houses, and 1323 persons.

LISTERA, in *Botany*, dedicated by Mr. Brown to the memory of the famous English conchologist, Dr. Martin Lister, who wrote several papers on vegetable physiology, in the *Philosophical Transactions*.—Brown in *Ait. Hort. Kew.* v. 5. 201. Sm. *Compend.* 130.—Class and order, *Gynandria Monandria*. Nat. Ord. *Orchideæ*.

Eff. Ch. Calyx and petals spreading. Lip without a spur, cloven, not embraced by the calyx. Column without wings. Anther parallel to the stigma.

L. ovata, and *L. cordata*; see *EPACTIS*, n. 10 and 11. **LITCHFIELD**, l. 2, r. 1847; l. 6, r. 1810—382; l. 9, r. 22; l. 10, r. 41,375; l. 20, r. 4639.

LITHION, *LITHIA*, or rather *LITHINA*, in *Chemistry*, the name of a fixed alkali recently discovered in Sweden, and so called from *λίθος, a stone*, because obtained only from mineral substances. This alkali was first detected by Mr. Arvedson, a young Swedish chemist, and pupil of Berzelius. He obtained it from a mineral found at Utten, in Sweden, and which had been some time before described, and named *petalite* (see *PETALITE*) by M. D'Andrada. He found it likewise soon after in *triphan* (or *spodumene*) and in crystallized *lepidolite*, all minerals from the same place.

Lithina is principally distinguished from the other alkalis by its great capacity for saturating acids. Sir H. Davy has succeeded in reducing it to the metallic state. *Lithium*, as this metallic base may be called, bears a strong resemblance to the other alkaline metals, especially to sodium, to which it seems most nearly allied.

With respect to the salts of lithina, they have not yet been rigorously examined. The *sulphate* crystallizes with sufficient facility, and the crystals contain no water of crystallization. Their solution is not precipitated by the muriate of platinum, nor by the tartaric acid. The *muriate* deliquesces like the muriate of lime, and melts below a red heat. The *nitrate* crystallizes in rhomboids, but readily attracts moisture. The *carbonate* crystallizes in prisms, and the crystals which are commonly very minute are not very soluble in water. The *sulphuret* of lithina is very soluble, and of a yellow colour.

According to Vauquelin, 100 parts of lithina contain 43.5 of oxygen; hence the weight of the atom of lithium will be very nearly 13, and of lithina 23, from which data the composition of all its salts can be easily ascertained.

LITHOMARGE. See *MINERALOGY, Addenda*.
LITHONTRIPTICS. See *LITHOTOMY, and URINARY Calculi*.

LITTLE BRITAIN, l. 14, r. 1700.

LITTLE BEAVER, a township of Beaver county, in Pennsylvania, having 1379 inhabitants.

LITTLE COMPTON, l. 2, r. 1553.

LITTLE CREEK, l. 2, r. 2039; l. 3, r. 3840.

LITTLESTOWN, a township in Adams' county, in Pennsylvania, having 287 inhabitants.

LITTLETON, l. 3, r. 773; l. 5, r. 873.

LIVERMORE, l. 2, r. Oxford for Cumberland; l. 4, r. 1560.

LIVERPOOL, l. 6, r. 1811—94,376—15,589.

LIVINGSTON, l. 4, r. 3575—685.

LLANBADARN VAWR, col. 2, l. 17, exclusive of Aberystwith; l. 18, r. 1811—525—2998. Aberystwith contains 477 houses, and 2264 persons.

LLANBEDER, l. 2, r. Moyddyn; l. 10, for Tuesday r. Saturday; and add—it has nine fairs in the year; l. 21, r. 1811—128; l. 22, r. 692.

LLANDAFF, near the close, r. 1811—199 houses, and 963 inhabitants.

LLANDEILO VAWR, l. 2, infern—Cayo, and r. Perfedd. Col. 2, l. 46, r. The inhabitants of Llandeilo, exclusive of the hamlet of Llandeilo-villa in the hundred of Perfedd, which contains 184 houses, and 776 inhabitants, according to the parliamentary returns of 1811, are estimated at 1103, and the houses at 222.

LLANDOVERY, l. 6. By the returns of 1811, the township

township contained 266 houses, and 1442 inhabitants. Col. 2, l. 5, for Friday *r.* Saturday. Add—It has six fairs in the year.

LLANDRINDOD. Add—In 1811, the parish was returned as containing 32 houses, and 171 inhabitants.

LLAN-ELLY, l. 3, *r.* 1811; l. 4, *r.* 862, and 3891; l. 16, add—This is one of the most thriving places in South Wales. It abounds with excellent coals and iron-ore, extensive iron-works, and also lead and copper works.

LLAN-GADOG VAWR, l. *ult.* *r.* 1811—1964; and add—378 houses.

LLANGOLLEN, l. 4, *r.* 1811; l. 5, add—those of the parish, comprehending three townships, amounted to 612, and the inhabitants to 2897.

LLANNERCH Y MEDD, l. 3, add—the parish of Amlwch contains, by the returns of 1811, 920 houses, and 4210 inhabitants.

LLAN RHAIADAR, col. 2, l. 6 and 7, *r.* 1811—1974; add—414 houses.

LLANRWST, near the clove, *r.* 1811—2502, and 452 houses.

LLANSTEPHAN, col. 2, l. *ult.* *r.* 1811—997—221.

LLANTRISSENT, l. *ult.* *r.* 1811—246—2122.

LLANVYLLING, or LLANVYLLIN, l. *ult.* *r.* 1811; the parish of Llanyvlling contained 291 houses, and 1508 inhabitants.

LLANYDLOES. Add—By the return of 1811, the parish contained 470 houses, and 2386 inhabitants.

LLAUGHARNE, l. *ult.* *r.* 1561; and add—the number of houses was 283.

LOCHE. See COBITIS.

LOCKERBIE. In 1811, the whole parish of Drydale contained 369 houses, and 1893 persons; 904 being males, and 992 females.

LOGAN, l. 2, *r.* 11,591, including 2285 slaves in 1810.

LOGWOOD, *Chemical Properties of.* See HEMATIN.

LONCHURUS for LONCHIURUS.

LONDON, in *Geography*, a town of Rockingham county, in New Hampshire, having 1492 inhabitants.

LONDON Britain, a township of Cheshire county, in Pennsylvania, having 404 inhabitants.

LONDONDERRY, in America, l. 5, *r.* 2766; l. 16, add—containing, in 1810, 637 inhabitants.—Also, three townships in Pennsylvania, one in Dauphin county, having 2411 inhabitants; *dele* the rest of the article, and add—the second in Cheshire county, having 1164 inhabitants; and another in Bedford county, having 486 inhabitants.

LONDONGROVE, l. 2, *r.* 983.

LONG MEADOW, l. *ult.* *r.* 1036.

LONG Sweep, a township of Mercer county, in Pennsylvania, having 998 inhabitants.

LONGTOWN. In 1811 this township contained 173 houses, and 1579 persons; *viz.* 744 males, and 835 females: 169 families being employed in agriculture, and 147 in trade, manufactures, and handicraft.

LONGTOWN, a township of Ewallacy hundred, in the parish of Clodock, and county of Hereford, which, by the returns of 1811, contained 164 houses, and 844 persons; *viz.* 423 males, and 421 females: 124 families being employed in agriculture, and 40 in trade, &c.

LOO-CHOO. See LIEOU-KIEOT.

LOOE, EAST, l. 14, *r.* 1811—128—608.

LOOE, West, l. 13 and 14, *r.* 1811—92—433.

LOSTWITHIEL, col. 2, l. 17 and 18, *r.* 1811; for town *r.* borough and parish—132 houses, 825 inhabitants.

LOTTERLOCH, a town of Orleans county, in Vermont, having 101 inhabitants.

LOUDON, l. 3 and 4, *r.* containing 21,338 inhabitants, of whom 5157 are slaves.

LOVELL, l. 1, for York *r.* Oxford, add—containing 365 inhabitants.

LOUGHBOROUGH. In 1811 this parish contained 1128 houses, and 5400 persons; *viz.* 2612 males, and 2788 females: 186 families being employed in agriculture, and 847 in trade, manufactures, or handicraft.

LOUGHOR, a borough of Wales, in the county of Glamorgan and hundred of Swansea, which in 1811 contained 112 houses, and 473 inhabitants.

LOUIS, ST., l. 23, add—St. Louis forms a district of Louisiana, and in 1810 contained 5647 inhabitants, of whom 740 were slaves.

LOUISA, in Virginia, l. 3 and 4, insert—11,900 inhabitants, of whom 6430 were slaves.

LOUISIANA. At the close, add—According to the census of 1810, Louisiana comprehends the districts of St. Charles, of St. Louis, of St. Genevieve, of Cape Girardeau, of New Madrid, and also the settlements of Hope Field and St. Francis, and also settlements on the Arkansas; and the number of inhabitants is stated at 20,845, of whom 3011 are slaves. See UNITED STATES.

LOUREIRA, in *Botany*, in memory of the venerable Father John de Loureiro, author of the *Flora Cochinchinensis*, who died about the year 1797, at Lisbon.—Cavan. *l.* v. 5, 17. Willd. *Sp. Pl.* v. 4, 866. *Ait. Hort. Kew.* v. 5, 418.—Class and order, *Diocia Monadelphia*. *Nat. Ord.* *Tricocca*, Linn. *Euphorbia*, Juff.

Eff. Ch. Male, Calyx in five deep segments. Corolla bell-shaped, five-cleft. Stamens 8—13, connected at the base.

Female, Cal. and Cor. like the male. Capsule superior, two-lobed, two-celled. Seeds solitary.

1. *L. cuneifolia*. Cav. t. 429. Willd. n. 1.—Leaves obovate-lanceolate, partly three-lobed.—Native of Mexico. *A shrub*, with stalked aggregate leaves, and pale red flowers, from lateral buds.

2. *L. glandulosa*. Cav. t. 430. *Ait. n.* 1.—Leaves heart-shaped, fringed with glands. From the same country. *Stem* shrubby, forked, with forked axillary panicles of male flowers; the stalks of the female ones simple.

LOUTH, col. 3, l. 1, *r.* 1811; l. 3, *r.* 4728—976.

LOWER Alloway's Creek. Add—It contains 1184 inhabitants.

LOWER Chancesford, a township of York county, in Pennsylvania, having 818 inhabitants.

LOWER Dublin, l. 2, *r.* 2194.

LOWER Township, a township of Capeway county, in New Jersey, having 862 inhabitants.

LOWER Penn's Neck. Add—containing 1163 inhabitants.

LOWER Merion, a township of Montgomery county, in Pennsylvania, having 1835 inhabitants.

LOWER, for other articles under the denomination of, see MAHONTOGO, MOHAUS, MOUNT BETHEL, NAZARETH, CHICHESTER, DARBY, PROVIDENCE, OXFORD, SALFORD, SMITHFIELD, and WAKEFIELD.

LYNDON, l. ult. r. 1090.

LYNN, l. 5, r. 4087; add—Also, a township of Northampton county, in Pennsylvania, having 1497 inhabitants.

LYNN-Field, l. ult. r. 509

LYNN-Regis, l. ult. r. 1811—2199—10,259.

LYONS, l. 38, after branches, add—The present manufactures of Lyons consist chiefly of cloths, of gold, silver, and silk, galloons, ribbons, and lace, and the produce of furriers, hatters, and bookfellers, besides those of the working of gold-thread, silk-weavers, dyers, &c. Col. 2, l. 26, add—some reckon the whole population at 150,000.

LYTHIODES. See MINERALOGY, *Addenda*

M.

MACCLESFIELD, l. 6 from bottom, r. 1811—2518—12,299; of whom 2458 families were employed, &c.; l. 3 from the bottom, for that period r. the return in 1800.

MACHIAS, l. 14, r. 1810—1570.

VOL. XXII.

MAC-INTOSH, in *Geography*, a county of Georgia, which, with its town Darien, contains 3739 persons, including in the county 2850, and in the town 107 slaves.

MACKEAN, a county of Pennsylvania, containing Ceres township, and 142 inhabitants.

MACPHERSON, col. 2, l. 29, for Lairy r. Laing.

MACROMETER, an instrument invented by Dr. Wollaston, for measuring directly the distance of inaccessible objects, by means of two reflectors, mounted as in a common sextant, but at a greater distance from each other.

MACROPODIUM, in *Botany*, from the *long foot*, or stalk, of its seed-vessel.—Brown in Ait. Hort. Kew. v. 4. 108.—Class and order, *Tetradynamia Siliquosa*. Nat. Ord. *Siliquose*, Linn. *Crucifera*, Juss.

Eff. Ch. Pod linear, stalked. Cotyledons accumbent. Calyx erect.

1. *M. nivale*. Siberian Macropodium. Ait. n. t. (*Cardamine nivalis*; "Pallas It. v. 2. Append. n. 113. t. U. Willd. Sp. Pl. v. 3. 482.)—Native of Siberia, from whence it was procured for Kew garden, in 1796, by Sir J. Banks. A hardy perennial, flowering in summer. *Herb* smooth, pale green, with oblong, toothed leaves; the radical ones stalked. *Flowers* small, white. *Pods* reflexed. *Willd.*

MACUACO, FLYING, of Pennant, in *Zoology*, the Lemur volans of Linnæus; for an account of which, see GALEOPITHECUS volans.

MACUNGY, l. 2, r. 2420.

MADBURY, l. 4, r. 684.

MADDERING, an operation performed in *Calico*-PRINTING; which fee.

MADDOX, l. 32, *dele* to that of St. Afaph; and for and from thence to r. that of Worcester.

MADELEY, l. 9.—In 1811, the parish contained 1026 houses, and 5076 persons; viz. 2502 males, and 2574 females: 18 families being employed in agriculture, and 747 in trade, manufactures, or handicraft.

MADISON, l. 4, r. 8381 inhabitants, of whom 3970 were slaves in 1810; l. 7, r. 11,587—3000. At the end, add—Also, a township of Maine, in Somerset county, having 686 inhabitants.—Also, a county of New York, containing 25,144 inhabitants, of whom 35 were slaves in 1810.—Also, a township of Ohio, in Guernsey county, having 249 inhabitants.—Another in Highland county, with 430 persons.—Another in Knox county, with 138 persons.—Also, a county of Ohio, containing six townships, and 1603 inhabitants.—Also, a township of Montgomery county, with 426 persons.—Another of Mulkingum county, with 426 persons.—Another of Pickaway county, with 406 persons.—Another of Butler county, with 1228 persons.—Another of Columbiana county, with 539 persons.—Another of Gallia county, having 170 inhabitants.—Another of Scioto county, with 307 persons.—Also, a town of Georgia, in Morgan county, having 124 inhabitants.—Also, a county of the Mississippi territory, having 4699 inhabitants, of whom 948 were slaves in 1810.—Also, a township of Clarke county, in the Indiana territory.

MADRID,

MADRID, in America. At the close, add—The district, by the census of 1810, contains 2103 inhabitants, of whom 287 were slaves.

MAD-RIVER, a township of Champaign county, in Ohio, having 1008 inhabitants.

MAGIC, SUPERSTITIOUS, infer—has been supposed to consist; in l. 2, insert after it—supposed; l. 7, *dele* half.

MAGIC SQUARE, col. 5, l. 18 from bottom, *dele* and.

MAGNESIA, in *Chemistry*. According to the latest determinations, the weight of the atom of magnesia is 25, that of oxygen being 10; from this, the composition of its salts can be easily ascertained. See *ATOMIC Theory*.

Separation of Magnesia from Lime.—We may take the opportunity of mentioning here an ingenious method of effecting this difficult chemical problem lately proposed by Mr. R. Phillips, and originally suggested, we believe, by Mr. T. Cooper. The two earths are to be reduced to the state of sulphate, and then well washed with a saturated solution of sulphate of lime, which readily dissolves, and thus separates the sulphate of magnesia, but which, from its being already saturated, can take up no more sulphate of lime.

MAGNESIAN LIME-STONE. See *MINERALOGY, Addenda*.

MAGNESITE. See *MINERALOGY, Addenda*.

MAGNESIUM, in *Chemistry*, the metallic basis of magnesia. See *MAGNESIA*.

MAGNOTS. At the end, add—See *MAINA*.

MAHNNING, a township of Northumberland county, in Pennsylvania, with 829 inhabitants.

MAHIM, for 17 miles N. of Bombay *r.* 7 miles N. of Bombay fort.

MAHONING. Add—In Indiana county, having 552 inhabitants.—Also, a township of Mercer county, in the same state, having 1316 inhabitants.

MAHONTOGO, *Lower and Upper*, two townships of Berks county, in Pennsylvania; the former having 637, and the latter 489 persons.—Also, a township of Northumberland county, having 1608 inhabitants.

MAID, or MAIDEN. See *VIRGIN*.

MAID, in *Ichthyology*. See *SKATE*.

MAIDEN CREEK, in *Geography*, a township of Berks county, in Pennsylvania, having 918 inhabitants.

MAIDENHEAD, col. 2, l. 8, *r.* 1811—792—161.

MAIDENHEAD, in America, l. 4, *r.* 1810—1086.

MAIDSTONE, col. 3, l. 21, &c. *r.* 1811—9443; *viz.* 4412 males, and 5031 females: of whom 942 families are employed in trade and manufactures, and 437 in agriculture. The number of houses is 1706.

MAIDSTONE, in America, l. 2, *r.* 177.

MAINA, a district of the Morea, including that part of the country anciently called Laconia, that lies between the gulf of Messene and Gythium, bounded on the N. by the highest range of Taygetus, from which a chain of rugged mountains descends to Cape Matapan, the southern termination of the country. It is watered by Pamifus, now the Pirnetza, the broadest river of the Peloponnese. The plains round Calamata, a town towards the N.W., are fertile and well cultivated, abounding with the cactus, a prickly pear, the white mulberry affording food for great numbers of silk-worms, and various fruit-trees. The town is built on a plan that is well adapted for defending the inhabitants against the attacks of the pirates that infest the coast. The government of the Maina, in 1795, resembled that of the Scottish islands in former time. Over each district presided a capitane, whose residence was a fortified tower. Each chief, besides his own domain, received a tithe

from the produce of the land of his retainers; and the different chiefs were independent of each other. Because the Mainots were reluctant to submit to the charact, or poll-tax, they had been repeatedly attacked by the Turks, but without success; when an enemy appeared, the coast was immediately deserted, and the inhabitants retired to the strong holds of Taygetus. Expert also in the use of the rifle, besides the advantages of their situation, they have been able to defy the Turkish forces. Some of the chiefs were found by Mr. Morritt to be tolerably versed in Roman literature, and some capable of reading Herodotus and Xenophon. The laws of hospitality were observed amongst them with the strictest punctiliousness, and letters of recommendation secured to travellers a friendly reception. The religion of the Mainots is that of the Greek church, with all its mummery. Their women were never secluded nor enslaved, and therefore neither corrupted nor ignorant. They distinguished themselves by attention to domestic management, and the education of their children. Instances of conjugal infidelity were rare. In case of necessity, it is said that the Mainots can bring 12,000 men into the field. See *Walpole's Memoirs on Turkey*, &c. 1817.

MAINE, at the close, add—See *UNITED STATES*.

MAINOTS. See *MAINA*.

MAKFIELD *dele*: add—See *WAKEFIELD*.

MAKONGO, one of the states of Loango in Africa, of which Malemba is the port. The king of Makongo, or Malemba, resides inland at a town called Chingale, the Kinkale of the charts.

MALABAR, l. 11, add—The Malabar language prevails on the western coast of Cape Comorin, extending over Travancore and Malabar, formerly named Kerala, as far N. as Nilifuran. See *TOOLAVA*.

MALCOMIA, in *Botany*, named in honour of Mr. William Malcolm, a celebrated cultivator, to whom the English gardens are much indebted.—Brown in *Ait. Hort. Kew.* v. 4. 121.—Class and order, *Tetradynamia Siliquosa*. Nat. Ord. *Silquose*, Linn. *Crucifera*, Juss.

Eff. Cl. Pod nearly cylindrical, of two valves. Stigma simple, acute. Cotyledons incumbent, flat. Calyx closed.

This appears to us a very natural and well-defined genus, though hitherto confounded with *Cheiranthus*. The three species in *Hort. Kew.* are,

1. *M. maritima*. See *CHEIRANTHUS*, n. 14; a pretty annual, frequently and easily cultivated.

2. *M. africana*. (*Hesperis africana*; Willd. Sp. Pl. v. 3. 532. *Leucojum gallicum*, folio halimi; Bocc. Sic. 77. t. 42. f. 1.)

3. *M. littorea*. See *CHEIRANTHUS*, n. 21. (*Leucojum marinum minus*; Chf. Hist. v. 1. 298. f. 2.)

MALDEN, col. 2, l. 12, *r.* 1811; l. 13, *r.* 505—2659.

MALDEN, l. 4, *r.* 1384.

MALEMBO, or MALEMBA. Add—See *MAKONGO*.

MALIC ACID, in *Chemistry*. See *SORBIC Acid*.

MALKOHA. See *PHENICOPHÆUS*.

MALLENDERS, a cutaneous disease, commonly confined to draught-horses: it is an inflammation of the skin below the hock, producing cracks which discharge a fœtid matter. For the cure of this disorder, owing to want of cleanliness and friction, the hair should be clipped, and the parts well washed with soft-soap and water; and Mr. White recommends the following ointment: *viz.* a composition of 2 oz. of wax ointment, 1 oz. of olive-oil, oil of turpentine and camphor, of each 1 dr., and 2 drs. of acetated water of litharge. Mr. Ryding recommends a mixture of 1 oz. of strong quicksilver ointment, and 10 grs. of muriated quick-

silver

silver in fine powder. When this disease occurs above the knee, it is called *fallanders*.

MALLING, WEST, l. 6 and 7 from the bottom, r. 1811—1154—223. Add—In 1811, the number of houses in East Malling was 217, and of inhabitants 1256.

MALMESBURY, col. 2, l. 34, r. 1811; l. 35, 237—1152.

MALPAS. In 1811, the township contained 193 houses, and 938 persons; *viz.* 478 males, and 460 females.

MALTA, a town of the district of Maine, in the county of Kennebeck, having 468 inhabitants.

MALVERN, GREAT, l. 22 from the bottom, r. 1811—1205 inhabitants, occupying 204 houses.

MAMAT, ST. R. S. MAMOT.

MAMMALIA. *See* the account of the plates.

MAMMOTH, or MAMMONT, in *Natural History*. The name of mammoth has been given to two very different animals, whose remains are found in a fossil state; the first, which has been for ages called so by the Russians and Siberians, occurs abundantly on the north part of the ancient continent. It is a species of elephant, the ivory of which is so well preserved as to become an article of commerce. This animal, according to the researches of Cuvier, is a different species of elephant from that of India or Africa, resembling the former the most. The American mammoth, as it has been called, belongs not only to a species distinct from the European mammoth, but from the Indian or African elephant, and from the form of its teeth must be even classed as a distinct genus; he has given it the name of *mastodon*. See *MASTODON*, *Addenda*.

Of the Russian *mastodon* very erroneous accounts have been published, particularly respecting its size. An animal of this kind having been discovered preserved entire in the ice, by a Tungussian fisherman in Siberia, was afterwards described by Mr. Adams; but, according to Cuvier, the great size attributed to it by that gentleman does not accord with the actual admeasurement of the bones, the head weighing, according to this account, four hundred pounds, which brings it nearly to the known size of the fossil elephant. The most remarkable fact stated by Mr. Adams is, that the animal was covered with two kinds of hair; the one red, which was both of a finer and coarser sort; the other was long, black, and bristly. This hair was very abundant. The fact proves two things of importance in the natural history of the mammoth, namely, that it was a different species from living elephants, and that it was sufficiently covered to enable it to live in cold climates. It is a commonly received tradition in Siberia, that these animals are frequently found entire in the ground, from whence the name of mammoth is derived, which signifies an animal that lives in the earth. According to Cuvier, these facts prove that the fossil elephant perished by a sudden revolution of the globe that destroyed the whole species, and which froze the individuals that were then in the northern regions; nor can any reason be advanced why these remains should not continue preserved in the eternal ice of those countries, till discovered by accident, or the hands of man. Those which were overtaken and buried in more southern climates are more decomposed, and their bones have become more or less friable; but this decomposition is the only change which they have undergone; they are neither broken nor rolled, and it may be clearly perceived that they perished where their bones are now found. Many bones of the same species of mammoth, or fossil elephant, have been discovered in different parts of England. We have seen a tooth, one of the molars of these animals, found near Whithy in Yorkshire, which measured seventeen inches round.

The greatest number of the teeth of the mammoth that have been examined resemble at first sight those of the Indian elephant; but, according to Cuvier, the structure, on more attentive observation, will be found somewhat different. In the living species of elephants, the size of the tusks varies with the species, the sex, and the varieties; and as they continue to grow during the life of the animal, age determines their dimensions more than any other cause. The tusks of the African elephant are larger than those of the Indian; they are harder, and preserve their whiteness better. According to Pennant, Mozambique furnishes tusks of living elephants ten feet in length, which are the largest that are known. The degree of curvature in the tusks differs as much as the size; some occasionally occur in a spiral form, and some in that of the letter S. We are unacquainted with the differences that might exist in the curvature of the tusks of the mammoth occasioned by difference of sex or other causes. Many of the tusks have the common degree of curvature, but others have much more curvature than occurs in any living elephants, approaching to a semicircle or half an ellipse divided through its transverse axis. Some tusks of the mammoth are formed spiral, like what sometimes occur among living elephants. The height of the mammoth did not greatly exceed that which the Indian elephants can attain. It is however certain from its remains, that the mammoth differed as much from the Indian elephant as the ass differs from the horse.

The bones of the mammoth, or fossil elephant, are generally found in alluvial soil, near the surface of the ground. They are seldom isolated, but generally mixed with bones of other quadrupeds of known genera; as the rhinoceros, the ox, the horse, and the antelope; and are often accompanied with the remains of marine animals, such as shells, parts of which are attached to the bones. Cuvier states that he has in his possession a jaw-bone covered with millepores and oysters.

The beds which cover the bones of the fossil elephant have seldom any great depth, and are scarcely ever composed of stone. They are rarely petrified, and only one or two instances are quoted where they were incruited with a shelly stone. Often they are only accompanied with fresh-water shells. Every thing appears, says Cuvier, to announce that the cause by which they were buried is one of the most recent that has contributed to change the surface of the globe. It was nevertheless a cause general in its operation, for these fossil bones of elephants are too numerous, and occur in countries too remote and uninhabited to allow us to suppose that they have ever been brought there by man.

The beds which contain and cover these remains shew, that the cause by which the animals were destroyed was water, and in many instances the waters were the same as those of the present day, since they contained the same species of shell-fish. These bones are not waterworn, and therefore have not been transplanted from a distance.

The shells and millepores which adhere to them prove that they remained some time covered only with water. The different species of *mastodon*, the gigantic tapir, and the fossil rhinoceros, lived in the same countries as the fossil elephant, since their bones are found in the same beds and preserved in the same state. Every thing therefore leads us to conclude that the mammoth, or fossil elephant, is an extinct species, though it differs less from existing species than the other remains of quadrupeds that are found in the same situations. In a former part of this work, under the article *MEGATHERIUM*, the discovery of the fossil elephant described by Mr. Adams is more particularly given; but the animal is erroneously supposed to belong to another

(species than the elephant, and the tusks are called horns. (See MASTODON, MEGALONIX, and MEGATHERIUM, *Ad-denda*.) According to Pallas, there is scarcely a river from the Don or the Tanais to Tchutkoinofs in the banks of which the bones of the mammoth are not abundant, and two islands of great size near the mouth of the Indigerika seem entirely composed of these bones mingled with ice, sand, and the bones of the elk, rhinoceros, and other large quadrupeds.

Similar bones are found in Poland, Germany, France, Holland, and Hungary. We have before mentioned that they are found in various parts of England, and no where more abundantly than in the vale of Thames, particularly near Brentford. The teeth and bones have been generally found in alluvial soil over the chalk formation; but in Mr. Bakewell's Introduction to Geology, an instance is given of an entire skeleton having been found in a cavern in the mountain lime-stone near Wirksworth, in Derbyshire, in 1663. Its skull was so large that it is stated to have held four bushels of corn.

MANCHA, LA, l. 1 and 2, r. bounded on the N. by New Castile; *dele* north of.

MANCHESTER, l. 10, add—In 1811, the number of houses in Manchester and Salford was 16,353, and that of the inhabitants 98,573; 44,332 being males, and 54,241 females: of whom 19,639 families were employed in trade and manufactures, and 47 in agriculture.—l. 15, r. the whole population of which, including Manchester, was 138,349.

MANCHESTER, in America, l. 4, r. 1137; l. 7, r. 1502; l. 9, r. 1579; l. 10, r. 978; add—Also, a town of Hillsborough, in New Hampshire, containing 615 inhabitants.

MANÈGE, or MENAGE, denotes an academy, riding-school, or other place for learning to ride, and for breaking horses to their various motions and actions. Also, the exercise itself, or the art of riding, which teaches at the same time to form the horseman and the horse.

MANE-SHEET, in the *Manege*, a covering for the upper part of a horse's head, extending round his neck, with holes for the ears to pass through, and joining to the halter upon the fore-part of the head, and likewise to the surcingle, or long girth, upon the horse's back.

MANGANESE, in *Chemistry*. The specific gravity of manganese, according to Dr. John, is 8.013. A good deal of confusion still exists respecting the oxys of this metal. According to Dr. John, there are three oxys; the *green*, the *brown*, and the *black*. According to Berzelius, there are no less than five. Sir H. Davy could only obtain two, and Dr. Thomson agrees with him in concluding there are but two; namely, the *olive* or *protoxyd*, which combines with acids, and forms the common salts of manganese; and the *black* or *peroxyd*, which is found native. From the experiments of Dr. John and Berzelius, Dr. Thomson fixes the weight of the atom of manganese at 35, and of course that of its protoxyd at 45; from which data, if correct, the composition of its salts may be estimated. The following *erratum* exists in this article in the Cyclopædia. Col. 3, l. 16, for malars r. metals; also in the same col. paragraph 9, at the end of the sentence respecting iron, add—Berzelius has lately shewn, that manganese is a constituent of *cast iron*.

MANGE, a cutaneous disease, incident to many domestic quadrupeds, and attended with an eruption and loss of hair. Its causes, according to Mr. Ryding, are, sudden changes of temperature, hot stables, bad diet, and want of cleanliness. It is also communicated by infection, as when a found horse rubs himself against a stall, in which a mangy horse

had been kept. Its symptoms are, loss of flesh, without any apparent cause, a itaring of the coat, and afterwards eruptions, discharging a thick yellowish matter, which forms a kind of scurf that peels off, and a falling off of the hair. The disorder, though partial at first, soon spreads all over the body, and is attended with an itching, which causes the horse to rub against every thing that comes in his way. It is said, that with attention to cleanliness, an ointment composed of 1 lb. of prepared hog's-lard, $\frac{1}{2}$ lb. of sulphur, 3 oz. of white hellebore in fine powder, and olive-oil in sufficient quantity, rubbed over the affected parts, and repeated after an interval of three days, will after two or three applications complete a cure. Some say, that if the animal's strength will allow it, the cure should be commenced with bleedings, and a ball formed of powdered nitre, powdered rosin, and castile soap, of each $\frac{1}{2}$ oz., 1 drachm of camphor in powder, and honey *q. s.* should be given in the evening. Attention should be paid to diet, exercise, and good grooming; the bowels should be kept in a proper state with mashes, in which 1 oz. of nitre is dissolved; the affected part should be well washed with a strong solution of soft-soap, and afterwards rubbed morning and evening with an ointment composed of 4 oz. of flowers of sulphur, 3 oz. of hog's-lard, and 2 oz. of quicksilver ointment. The ointment may be continued every other day, until the disease is removed. Two or three doses of mild physic are recommended, and then a ball made of Æthiops' mineral, crude antimony in powder, and cream of tartar, of each $\frac{1}{2}$ oz., and honey *q. s.* should be given every night for a month.

In a slight case, strong tobacco infusion with one-third part of stale urine, used for washing the affected parts, will be sufficient; but as an efficacious unguent, the following is recommended; *viz.* $\frac{1}{2}$ lb. of quicksilver ointment, 4 oz. of finely powdered brimstone, 2 oz. of black soap, $\frac{1}{2}$ oz. of crude sal ammoniac, and oil of bays and turpentine *q. s.*; or tar, gun-powder finely pulverized, black soap, and oil of turpentine, of each about equal quantities; the sores may be washed twice a day with a lotion composed of $\frac{1}{2}$ oz. of muriated mercury (sublimate) in powder, diluted in $\frac{1}{2}$ pint of boiling water; or muriated mercury, muriated ammonia (crude sal ammoniac), of each from two to three drachms, and three half pints of boiling water.

MANHEIM, l. 3, r. 1282; l. 5, r. 2207; add—Also, a township in Berks county, having 1354 inhabitants.

MANINGTREE, l. 18, r. 1811; l. 19, r. 1075—217.

MANNA, *Chemical Properties of*. Manna differs from sugar in several remarkable particulars. It dissolves very readily and abundantly in alcohol, and crystallizes on cooling. Nitric acid converts it partly into oxalic, and partly into lactic acid. It does not ferment like sugar, and of course yields no alcohol. The common manna of the shops, according to Fourcroy and Vanquelin, consists of four different ingredients. Pure manna constituting about three-fourths of the whole—a little common sugar—a yellow matter with a nauseous odour, to which the purgative qualities of manna are chiefly owing—and a little mucilage, convertible into lactic acid. Manna seems to be formed during the fermentation of many juices, such as the juices of the onion, melon, &c.

MANNINGTON. Add—containing, in 1810, 1664 inhabitants.

MANTUA, a township of Ohio, in Portage county, containing 243 inhabitants.

MARAZION, l. 15 and 13 from bottom, r. 1811—184—1022.

MARBLEHEAD, l. 4, r. 5900.

MARECHAUSSES, denoted, under the French monarchy, several small bodies of troops, composed of officers and soldiers who had been in service, that continued stationary in the principal towns, for the purpose of aiding the civil magistrate. That in Paris consisted of three companies; viz. the company belonging to the "Lieutenant criminel de Robe au Court," or to that particular court of judicature which was superintended by the provost de la Marechaussée, and which Charles IX. attached to the gendarmerie; and the independent company of mounted police, called "Guet à Cheval;" and the company of the police or foot patrol, called "Guet à Pied," which was again subdivided into two companies, in order that one might do the duty of the quays. These companies were under the immediate direction of the secretary of state for the interior department of Paris.

MARGARIC ACID, in *Chemistry*. This acid exists in the form of pearly scales; hence the name. It was first described by Chevreul, who obtained it by digesting a soap made of hog's-lard and potash in water. Part of the margarate of potash was dissolved, while another part was deposited in the form of pearl-coloured scales. The potash was afterwards removed by muriatic acid, and thus the margaric acid obtained in a state of purity. Margaric acid is pearl-white. It is tasteless, and emits a smell something like white wax. It melts at a temperature of 134°, and crystallizes on cooling into beautiful brilliant white needles. It is insoluble in water, but very soluble in alcohol. It reddens vegetable blues very readily, and combines with all the bases, especially with the alkalies and alkaline earths, forming *salts*, or rather *soaps*. Dr. Thomson, from the experiments of Chevreul, fixes the weight of the atom of this acid at 330.

MARION, l. 2, r. 8884—2771.

MARK ISLAND, a township of Hancock county, in the district of Maine, with few inhabitants.

MARLBOROUGH, col. 2, l. 8 from the bottom, r. 1811—2579; l. 7, r. 445. Col. 3, l. 24, after lady Jane, *dele* unhappily for herself; l. 27, after favourite, r. who died in child-birth of Edward VI.; *dele* who was destined to suffer the fate of her predecessor.

MARLBOROUGH, in America, l. 4, add—containing 4996 inhabitants, of whom 1709 were slaves in 1810; l. 7, r. 1674; l. 12, r. 1810—1245; l. 14, r. 1112. Col. 2, l. 1, r. three; l. 2, after Pennsylvania, r. one in Montgomery county, having 672 inhabitants; and E. and W. Marlborough, in Chester county; the former having 1046, and the latter 917 inhabitants.—Also, a town of Hartford county, in Connecticut, having 720 inhabitants.—Also, a township of Delaware county, in Ohio, containing 177 inhabitants:—l. 5, r. 1832.

MARLOW, GREAT, col. 2, l. 16 and 17, r. 1811—225—1166 persons; add—and its borough to contain 468 houses, and 2799 inhabitants; l. 20, add—in a parish of the same name, which contains 140 houses, and 730 inhabitants.

MARLOW, in America, l. 2, r. 564.

MARPLE, a township of Delaware county, in Pennsylvania, having 649 inhabitants.

MARSELLOIS, *The*, or *Marcellus Hymn*, a national

march, adopted by the French during the course of the Revolution, and regularly played in their armies when they went to battle. It was frequently accompanied, or rather succeeded by the "ça ira," a lively; tune; the former being calculated for slow or ordinary time, and the latter for quick movements. Both are now proscribed.

MARSHFIELD, l. 25, r. 1811—272; l. 26, r. 1415.

MARSHFIELD, in America, l. 4, r. 1364; l. 6, r. 513.

MARSHPEE, l. 3, r. 139.

MARTELLLO, or MORTELLO, *Towers*, denoting small castles erected for the defence of a coast; such are those of Romney Marsh, of the island of Jersey, Halifax in Nova Scotia, &c. Grose derives the term mortello, from *morta*, whence *mota* or *moat*, which formerly signified a castle. Others derive it from the Italian "suonare in campana a martello," to sound the alarm bell, which, in some parts of Italy, is struck by hammers. In old French, the word signifying the same thing, (now *marteau*,) was *martel*, and *martel en tête* was the adage for the rumour of annoyance or alarm.

MARTOCK, l. 2, r. 1623.

MARU. Add—This was the ancient capital of the province of Margiana, founded by Alexander the Great, and afterwards embellished by Antiochus Nicator, who called it Antiochia. It was one of the four imperial cities of Khorassan; its fruits were finer than those of any other place, and the walls were on all sides surrounded with stately palaces, groves, and gardens. It was taken and pillaged by the Uzbeks about 25 years ago; since which time, it has gradually declined, and the population is now reduced to 3000 souls, under the government of Hyder Shah of Bokhara. The revenues of the khan are 20 maunds of grain, and 60,000 rupees annually. It is 88 furlongs from hence to Herat. *Dele* the next article.

MARY, queen of Scotland, l. 2, insert (or 7th). Col. 2, l. 29, after their own, add—This article, says Mr. Chalmers, (*ubi infra*) denuded the Scottish queen, who was heir-prefumptive to the crown of England, of all future pretensions to the crown. The stipulation, he says, ought to have been, not in all times coming, as expressed in the article, but *during the life of Elizabeth*. Considering, moreover, the defective powers of the French negotiators to treat of a matter of that importance, in addition to the wording of the clause, these circumstances created an insuperable objection to the ratification of such a treaty; which treaty was never ratified by the Scottish queen, or by any person under her authority. Col. 4, l. 8, for He r. Darnley; l. 20.—We know for certain, says Mr. Chalmers, that the king was murdered by Murray's faction, and that Morton, Bothwell, and Maitland, were the eminent characters who were attained by parliament for the deed, though many inferior persons, and some of the innocent, were tried and punished for the same crime. But the queen, he says, as she was not one of that faction, was not guilty; and every attempt of Robertson and Laing to establish her privy to this transgression has failed. Col. 6, l. 28, after employers, add—Queen Elizabeth, it has been said, wished to have had Mary put to death privately by poison or by assassination, and actually suggested and expressed her wishes to this purpose, and she thus acted suitably to the declaration made by her on Palm-sunday 1572; viz. "that the queen of Scots' head should never be quiet." At length, when her dark hints or more explicit instructions, communicated to Paulet and Drury her keepers, had failed of producing effect, preparations, &c.; l. 29, after publicly, add—but the privy-counsellors differed in their opinion

opinion concerning the law by which she should be tried, whether it should be the statute of treasons, (25 Edw. III.) or a late act of the 27th of Elizabeth, which had been made for this special occasion. However, the last opinion prevailed. At the close, add—Chalmers's Life of Mary, Queen of Scots, vol. i. 4to. 1818.

MARY, *St. col. 2, l. 8, r. 12, 794; l. 9, 6000; l. 13, add*—in the county of Camden, which see.

MARYLAND. Add—See UNITED STATES.

MARYPORT, *col. 2, l. 5 and 6, r. 1811—322—3134.*

MASHAM, *l. 7, r. 1811—213—1014.*

MASOLES, the name of a militia in Croatia, which is bound to march to the frontiers whenever there appears the least symptom of hostile disposition on the part of the Turks. The private soldiers have lands allotted to them, which they cultivate for their own use, but receive no pay from the public. The officers are paid.

MASON, *l. 7, r. 1077.*

MASSACHUSETTS. Add—See UNITED STATES.

MASTODON, in *Natural History*, a large quadruped, whose bones are found in a fossil state. It was for a long time confounded by naturalists with the mammoth or fossil elephant. (See MAMMOTH, *Addenda*.) Cuvier has ascertained, that the mastodon is not only a distinct animal from the mammoth and the living species of elephants, but that it must be classed as a new genus. Five species of this genus have been at present discovered.

The *great mastodon*, or the animal of the *Ohio*, the bones of which have been found in the greatest abundance near the Ohio river, in the province of Kentucky, in North America, bears a considerable degree of resemblance to the elephant in its tusks and general osteology, the form of the grinders excepted. It had probably a trunk, but this part being more perishable than the bones has not been discovered. Cuvier concludes from its general structure, that it could not have fed itself without the aid of a trunk. Its height did not surpass that of the largest elephant, but its body was longer, and its members were somewhat thicker; its belly was less extended than that of the elephant. Notwithstanding the general resemblance, the structure of the grinders is so different, as to entitle us to class it as a different genus. It fed itself nearly in the same way as the hippopotamus and the wild boar, on the roots and pulpy parts of vegetables; and this kind of food would naturally lead it to moist and marshy ground; but it was not made for swimming, or living under water, like the hippopotamus, but was really a land animal. Its bones are more common in North America than elsewhere, and are more fresh and better preserved than any other known fossil bones. Yet there is not the least reason to believe, according to Cuvier, that there are any living mastodons either in America or elsewhere. The most celebrated place where the remains of the mastodon occur is called *Big-bone Lick*, on the south-east of the Ohio, five miles from the river, and thirty-six miles below the entrance of the Kentucky river, and nearly opposite the great Miami. The place where they occur is a salt marsh surrounded by hills. The bottom of the marsh is a black and fetid mud. The bones are found in the mud and on the borders of the marsh at about four feet below the surface, but they occur also in various parts of North America in marshy situations. In 1805, many bones of these animals were found in the county of Wythe, in Virginia, about five feet under the earth, upon a bed of lime-stone. One of the teeth weighed seventeen pounds. But what renders this discovery the more remarkable is, that a mass of half-ground branches, roots, and leaves,

inclosed in a kind of sack, supposed to be the stomach, was found in the midst of these bones, so as to leave no doubt that these were substances that the animal had devoured. Among the vegetable matter in this sack were distinguished the remains of some plants known in Virginia. The bones of the great mastodon may be said to be common in North America; two nearly entire skeletons were collected by Mr. Peale; one of the largest is preserved in the Museum of Natural History at Philadelphia, the smaller was exhibited in London a few years since. These bones are scarce in other parts of the world; but wherever they have been found, it is at no great depth under the soil, and yet they are but little decomposed. They are not rounded by attrition, and offer proofs that they have not been removed from the places where the animals died. The skeletons found near the river called the great Osages were nearly in a vertical position, as if the animals had simply sunk into the mud and been buried there. According to a letter from Mr. Smith Barton, professor at the university of Pennsylvania, to M. Cuvier, "An intelligent traveller had seen near that river thousands of these bones, and had collected seventeen tusks, some of which were six feet in length, and a foot in diameter; but the greater part of these bones was much decomposed." Mr. Barton sent a grinder to M. Cuvier, so that no doubt can be entertained that the bones belonged to the mastodon. No remains of marine shells have been discovered with the bones of the mastodon, as is the case with those of the mammoth. Mr. Barton thinks, that the salt water of the marshes where they are found has contributed to the preservation of the bones. He states also two instances which appear to prove that from time to time the soft part or flesh of these animals has been dug up; a circumstance which, from the heat of the climate, is much more astonishing than what is stated of the flesh of the mammoth and rhinoceros being found in Siberia. (See MAMMOTH.) The Indians, who discovered five skeletons in 1762, relate, that one of the heads had a long nose above the mouth; Mr. Barton supposes that this was in fact the trunk. Kalm, in speaking of a great skeleton discovered by the savages in a marsh in the Illinois country, says, that the form of its *beak* was still discoverable, though half decomposed; it is probable that this was the root of the trunk.

Some doubts exist whether the mastodon be really an extinct genus, and whether it may not be found living west of the Missouri. The Indians of Virginia, according to Mr. Jefferson, say, that a troop of these formidable beasts destroyed the deer, buffaloes, and other animals created for their use; when the great man above destroyed them all with his thunder, except the largest male, which presenting its head to the thunder-bolts threw them off as they fell, but being at last wounded in the side, it fled towards the lakes, where it lives to this day.

The skeleton of the great mastodon exhibited in England was near eleven feet high. From the size of detached bones, Cuvier conjectures that the animal never exceeded twelve French feet, but its body was much longer in proportion than that of the elephant.

The form of the crown of the molars or grinders is nearly rectangular. The substance of the teeth is of two kinds only, the inner or osseous part, and the outer or enamel, which is very thick, and has no kind of cement or cortical. This very important difference joined with the form brings this animal nearer to the hippopotamus and the pig, than to the purely herbaceous animals like the elephant.

The crown of the grinders is divided by deep open furrows into a certain number of transverse ridges, and these

ridges are again divided into two large irregular pyramidal obtuse points, a little rounded. The crown therefore is fluted with these pyramidal points disposed in pairs; it is however very different from the teeth of carnivorous animals, which have only one principal longitudinal furrow divided into lesser indentations, like a saw. The teeth of the elephant have on the crown several little transverse walls, divided into a number of small tubercles, and these grow flat early, whereas the tubercles or cones on the tooth of the mastodon being much larger, the crown remains long mamillated. It was this circumstance of the grinders being fluted with points that gave rise to the opinion of the mastodon being carnivorous.

The number of grinders, according to Cuvier, are six on each side, three above and three below.

The structure of the jaws indicates that the mastodon had tusks like the elephant or morse. The number of tusks which occur with the teeth further confirms this opinion. A skull was found by Mr. Peale which proves this fact, being furnished with alveoles. The curvature of the different tusks varies as much as in those of the elephant; but M. Cuvier thinks there is no ground for believing with Mr. Peale, that the tusks turned downwards.

The head of the mastodon being of vast size, and rendered exceedingly heavy by the teeth and tusks, which carried the centre of gravity far from the point of support, the neck was therefore necessarily short, like that of the elephant; so that without a trunk it could not have reached the ground with its mouth. Its tusks would also have deprived it of the power of eating on the ground; it is therefore certain that it must have had a trunk like that of an elephant.

From the remains of the mastodon, it appears there were five species, all of which are believed to be extinct.

1. *The great mastodon* that we have been describing.
2. *The mastodon with narrow grinders.* The remains of this species have been dug up at Semore, and many other places in Europe, and also in America.
3. *The little mastodon with small grinders.* This species is much less than the preceding, and was found in Saxony.
4. *Mastodon of the Cordilleras.* This species was discovered in South America by Humboldt. Its grinders are square, and it appears to have been equal in size to the great mastodon.
5. *Humboldean mastodon.* This, which is the smallest species of the genus, was found in America by Humboldt. These five species may be considered as forming a distinct and hitherto unknown genus.

The following are the dimensions of the skeleton of the great mastodon found by Mr. Peale, and placed in the Museum of Natural History in Philadelphia.

	Feet	Inches
Height over the shoulders - - -	11	0
Do. over the hips - - -	9	0
Length from the chin to the rump -	15	0
From the point of the tusks to the end of the tail, following the direction of the curve } In a straight line - - -	31	0
Width of the hips and body - - -	17	6
Length of the largest vertebra - - -	5	8
Of the longest rib - - -	2	3
Of the tusks - - -	4	7
Circumference of one tooth - - -	10	7
	1	6½

The weight of the whole skeleton is 1000 lbs.

MATHEWS, in *Geography*, a county of Virginia, containing 4229 inhabitants, of whom 2098 were slaves in 1810.

MATHIOLA, or rather MATTHIOLA, in *Botany*, Brown in Ait. Hort. Kew. v. 4. 119. See our former

article. Mr. Brown has restored this meritorious name, to designate a new genus of his own, extracted from the more hoary kinds of CHEIRANTHUS, (see that article,) n. 16, 17, 20, 24, 31, 28, and 15. We allow a difference of habit, but fearely perceive a sufficient character.

MATLOCK, l. 14, r. 1811—523—2496.

VOL. XXIII.

MAURICE, l. 4, add—The town contains 2085 inhabitants.

MAURY, a county of West Tennessee, containing 10,359 inhabitants, of whom 2626 were slaves in 1810.

MAWS, ST. In 1811, the parish of St. Just contained 272 houses, and 1639 persons; viz. 751 males, and 888 females: 72 families being employed in agriculture, and 99 in trade, manufactures, and handicraft.

MAYOMBA, or MAJUMBA, *Cape*, a cape on the coast of Africa, in S. lat. 3° 34'. E. long. 11° 13' 36".

MEAD, a township of Crawford county, in Pennsylvania, containing 786 inhabitants.

MEADVILLE, l. 5, after houses, add—457 inhabitants.

MECKLENBURG, l. 2, r. 18,453 inhabitants, of whom 16,264 were slaves in 1810; l. 6 and 7, r. 14,272—3494.

MECONIC ACID, in *Chemistry*. See MORPHIA, and OPIUM.

MECRAN, or MEKRAN, (At the end, Kidge or Kej, add—The population of Mekran is formed of many different tribes and independent chiefs, of which the Balouches are the most numerous; a middle-sized race of men, spare, muscular, and active, and armed with a match-lock, sword, shield, and dagger. The common language of the country is a corrupt Persian, mixed with Scindi, and the Balouches in general are of the Soonee persuasion. Those of the central territories reside mostly in towns; those of the lower countries are scattered over the plains, in hamlets of eight or ten huts, built of branches of palm, and covered with mats. The Balouches take, in general, but one wife, and their chiefs four; they are said to have great influence in the disputes of their tribes. The women of Mekran are allowed to appear indiscriminately in public. Mekran was formerly under the dominion of Nasser Khan, the chief of Kelat; but since his death, in 1795, the authority of his son has ceased, and of the dominions of his father he only retains possession of the fort of Kej. The whole force of the country, it is thought, may amount to about 25,000 men, whom it would be impossible to collect or to induce to concur in action. The revenues of this country are trifling.

MEDFIELD, l. 3, r. 786.

MEDFORD, l. 6, r. 1443.

MEDICAL ELECTRICITY. Since our remarks on *medical electricity* (see *Medical Electricity*) were written, a method has been announced, in some degree new, of exhibiting this remedy, which we shall very briefly notice here. This consists in employing a jar coated on the outside with paper tinsel, and instead of a coating on the inside, having only a spiral coil of wire in contact with its surface. On making the experiment, we find the shock is modified and softened by this contrivance. It appears, therefore, much better adapted for administering what is commonly called *vibratory shocks*, (that is to say, small shocks in very quick succession,) than the jar commonly used for the purpose. We omitted to mention that this method of exhibiting electricity (called *vibratory*) is commonly practised by electricians, chiefly from its requiring

requiring a very small apparatus, and from its being at the same time equal, or nearly so, in effect to a large current of fluid produced from a very powerful machine.

MEDOMAN, in *Geography*, a town of America, in Maine, and county of Lincoln, having 121 inhabitants.

MEDULLIN, in *Chemistry*, a name given by Dr. John to the pith of the *sunflower*, the *lyrynga vulgaris*, &c. and which, according to him, is distinguished by the following properties. It is infoluble in water, alcohol, ether, and oils. It has neither taste nor smell. It is soluble in nitric acid; but instead of forming suberic acid, furnishes a quantity of oxalic acid. Its structure is peculiar, and when burnt it leaves a charcoal having a metallic bronze-like appearance.

MEDWAY, in America, l. 4, r. 1213.

MEERSCHAUM. See MEERSCHAUM, and MINERALOGY, *Addenda*.

MEGALONIX, in *Natural History*, an extinct species of quadruped, about the size of an ox, whose remains were first discovered in Virginia. It was supposed by Mr. Jefferson to be allied to the lion, and hence received its name. According to Cuvier, however, the megalonix and megatherium are nearly allied, and may be considered as belonging to the same genus, which may be placed between the sloth and the ant-eaters, but nearer to the former than the latter. The remains of these animals have hitherto been found only in America, where sloths and ant-eaters at present exist. See MEGATHERIUM, *Addenda*.

MEGATHERIUM. (See MEGATHERIUM.) The animal described in the former part of that article, whose remains were found in Siberia, and noticed by Mr. Adams, was not the megatherium of Cuvier, but the fossil or extinct elephant. (See MAMMOTH, *Addenda*.) The megatherium was of the size of the rhinoceros; its fossil remains have hitherto been found only in South America. The first and most complete skeleton was sent from Buenos Ayres in the year 1789. It was found in digging in alluvial soil, on the banks of the river Luxten, a league S.E. of the village of that name, and three leagues W.S.W. of Buenos Ayres. A second skeleton was sent from Lima to Madrid in the year 1795; and a third was found in Paraguay. This animal differs from the megalonix chiefly in magnitude, being much larger. See Cuvier's description in the latter part of the article MEGATHERIUM.

MEGIDDO, or MEGEDO, in *Scripture Geography*, a city of Manasseh (Joh. xvii. 11. Judg. i. 27.), famous for the defeat of king Josiah. (1 Kings, xxiii. 29, 30.) Herodotus, speaking of this victory, says, Necho obtained it at Magdolor, lib. ii. cap. 159.

MEIGS, in *Geography*, a township of Adams' county, in Ohio, having 835 inhabitants.

MEKRAN. See MEKRAN.

MELDRUM. In 1811, the parish of Old Meldrum contained 411 houses, and 1635 persons; viz. 736 males, and 919 females: 345 families being employed in agriculture, and 86 in trade, manufactures, and handicraft.

MELFORD, LONG, l. 5 and 6, r. 1811—415—2068—951—1117.

MELLIT, in *Ferriery*, a dry scab growing upon the heels of the forefoot of a horse, which is cured by a mixture of half a pound of common honey, and a quarter of a pound of black soap, with four or five spoonsful of vinegar, half an ounce of finely powdered alum, and two spoonsful of fine flour, applied to the affected part, after removing the hair, like a plaster, and suffered to remain five days. If the cure be not completed, the leg, foot, and fore, should be washed, and the same application repeated.

MELMOTH, col. 2, l. 20 and 21, r. thus—The author of 'The Pursuits of Literature' says, "Mr. Melmoth is a happy, &c."

MELROSE, l. 12. In 1811, this parish contained 538 houses, and 3132 persons; viz. 1531 males, and 1601 females: 239 families employed in agriculture, and 251 in trade, &c.

MELTON-MOWBRAY, l. 24 and 25, r. 1811—451—2115.

MENALLEN, a township of Fayette county, in Pennsylvania, having 1228 inhabitants.

MENANGEEBOW, for MENANGEBOW.

MENDHAM. Add—containing 1277 inhabitants.

MERA, l. 14 from bottom, after Linga, add a comma.

MERCER, after acres, add—16 townships, 8277 inhabitants; l. 6, 11, 587 inhabitants, of whom 3000 were slaves in 1810.—Also, a township of Mercer county, having 262 inhabitants.—Also, a township of Butler county, in Pennsylvania, having 588 inhabitants.—Also, a township of Maine, in Somerset county, having 562 inhabitants.

MERCURY, p. 12, col. 2, l. 12 from bottom, for Todd r. Thomfon.

MERCURY. This metal boils, according to Crichton, at 656°; according to Heinrich at 684½°. These differences respecting the boiling point of this metal, as well as those mentioned in the original article, probably arise in part from the mode in which the thermometers employed were graduated. See further on this subject under HEAT.

There are but two oxys of mercury known, and not three, as stated in the Cyclopædia, the *black* or *protoxyd*, and the *red* or *peroxyd*; the first of which, according to Dr. Thomfon's recent determinations, is a compound of 100 mercury + 4 oxygen; and the second, 100 mercury + 8 oxygen. Hence the weight of an atom of this metal will be 250, and from this the composition of its salts may be deduced. (See ATOMIC Theory.) What has been said in our original article respecting *calomel* and *corrosive sublimate*, formerly termed *submuriate* and *oxymuriate* of mercury, is now to be understood, according to the present views of their composition, as applicable to the *protochloride* and *perchloride* of mercury. See further on this part of the subject under CHLORINE.

MERDIN, l. 7. Its inhabitants amount to nearly 11,000 souls; l. 9, add—their number is supposed to be 1500, having several churches, and a patriarch, and besides here are 200 Jews, and also Turks, Arabs, and Kurds. At the end, add—it is 46 furlongs from Diarbekr. It is the frontier of the pæhalic of Bagdad, towards Constantinople, and under the government of a Muffelem, appointed by the pacha.

MEREDITH, l. 4, r. containing 1940 inhabitants.

MERIDEN, a town of New Haven county, in Connecticut, having 1249 inhabitants.

MERION, l. 3, r. 1156—1835.

MERIONETHSHIRE, col. 5, l. 37 and 38, r. 1811—6022—30,924—14,308—16,616—3619—1270.

MERRIMACK, l. 3, r. 1048.

MERTHYR-TYDVIL, col. 2, l. 30, add—in its five hamlets, by the parliamentary returns of 1811, is stated to amount to 11,104 persons, occupying 2264 houses.

MERTON, l. 4, r. 1811; l. 5, r. 135—905.

MERU-SHAH-JEHAN. See MARU.

MESCHID, MASCHID, or *Mesjed*, l. 1, insert—the capital of the Persian division of the province of Khorassan, situated about two furlongs from the ruins of the ancient city of Tous, and celebrated for a very superb sepulchre, containing the relics of Imam Reza, and those of the caliph Haroun ul Rufchid. This city, though a great part of it

it is in ruins, has a population of 50,000 souls. The bazaar is well supplied with fruits and provisions, from the fertile plain on which the city stands. It is surrounded with a strong wall, three furlongs in circumference, and the great bazaar is three miles in length. The city is governed by one of the king's sons, and with the districts belonging to it yields a revenue of 90,000 tomanis. It carries on a considerable trade with Bokhara, Bulkh, Candahar, Yezd, and Herat. Velvets of the finest quality are manufactured here; and its fur pelisses are much esteemed.

MESHED. See MESCHID.

MESHED *Ali*. See NEIFF.

METAL, in *Geography*, a township of Franklin county, in Pennsylvania, having 1236 inhabitants.

METALS, in the *Materia Medica*, col. 2, l. 24, for Todd *r.* Thomson.

METEORIC IRON. See MINERALOGY, *Addenda*.

METHERVAN, in *Geography*, a town of Essex county, in Massachusetts, containing 1181 inhabitants.

METHWOLD, col. 2, l. 4, *r.* 1811—942—174.

METHOXYLON, in *Botany*, a name given by Rottboll, in the Copenhagen Transactions, to the true Sago Palm, described from Dr. Kenig's manuscripts, by Mr. Charles Konig, in *Ann. of Bot.* v. 1. 195. t. 4. This genus appears to differ from Gærtner's SAGUS, (see that article,) in having a *corolla*; which is monopetalous and three-cleft. See SAGO.

MEXICO, col. 15, l. 21 from bottom, add—The industrious researches of the ingenious and philosophical traveller M. Humboldt have established the remarkable fact, that in the whole of the New Continent, there is nothing which indicates the existence of alphabetical writing, nor any very near approach to it. Although the use of hieroglyphic paintings was common among the Toltecs, Aztecs, and other tribes, which, since the seventh century, have appeared successively on the elevated plain of Anahuac, Humboldt suggests, that the progressive perfection of symbolical writing, and the facility with which objects were painted, prevented the introduction of letters. It is alleged, that they have done so for a much longer time with the Chinese.

MIAMI, a township of Clermont county, in Ohio, containing 1670 inhabitants.—Also, a township of Greene county, in Ohio, having 794 inhabitants.—Also, a township of Hamilton county, in Ohio, having 495 inhabitants.—Also, a county of Ohio, containing 6 townships, and 3941 inhabitants.

MICHIGAN. Add—The territory of Michigan includes four districts, *viz.* Detroit, Erie, Huron, and Michilimackic, and by the census of 1810, 4702 inhabitants, of whom 24 were slaves.

MICKLEHAM, col. 2, l. 1, *r.* 1811; l. 2, 416 persons, occupying 54 houses; l. 3, 190—226.

MICROPETALUM, in *Botany*, from the *smallness* of the petals.—“Perf. Syn. v. 1. 509.” Pursh 319. (*Spergularium*; Michaux Bor.-Amer. v. 1. 275).—Clafs and order, *Decandria Tetragynia*. Nat. Ord. *Caryophyllei*, Linn. Juff.

Eff. Ch. Calyx of five spreading leaves. Petals five, minute, undivided; or wanting. Stigmas four, sessile. Capsule ovate, longer than the calyx, of four valves.

1. *M. lanuginosum*. Mich. n. 1.—Densely downy. Flower-stalks solitary. Petals none.—On the mountains of Virginia and Carolina, perennial, flowering in June and July. *Leaves* lanceolate, tapering down into a footstalk.

2. *M. lanceolatum*. Mich. n. 2.—Smooth. Leaves lanceolate, tapering at each end. Flowers panicled. Petals

ovate, very short.—On moist rocks, from Canada to Pennsylvania, perennial, flowering in July. *Stigmas* sometimes only three. *Micbaux*.

3. *M. gramineum*. Mich. n. 3.—Very smooth. Leaves linear. Panicle terminal, lax, slender. Petals lanceolate, as long as the calyx.—About springs and shady rocks, from New York to Virginia, perennial, flowering in June and July. *Pursh*. Resembles *Stellaria graminea*. *Micbaux*.

Mr. Pursh speaks of *Arenaria fasciculata* as probably belonging to this genus, but we know not whether he intends the plant of Linnæus, or of Jacq. *Austr.* t. 182; see *Engl. Bot.* t. 1744.

MIDDLEBOROUGH, l. 3, *r.* 4400.

MIDDLEBURY, l. 6, *r.* 2188; add—Also, a town of New Haven, in Connecticut, having 847 inhabitants.

MIDDLEFIELD, l. 3, *r.* 822.

MIDDLE HERO, a township of Grand Isle county, in Vermont, having 623 inhabitants.

MIDDLESEX, col. 2, l. 4, *r.* 1811—130,613 houses, 953,276 inhabitants; *viz.* 434,633 males, and 518,643 females: of whom 135,398 families are employed in trade and manufactures, and 9088 in agriculture.

MIDDLESEX, in America, l. 5, *r.* 44; l. 6, *r.* 52,789. Col. 2, l. 9, *r.* 8—20,723; l. 10, *r.* 57 were slaves in 1810; l. 14, *r.* 20,383; add—Also, a township of Chittenden county, in Vermont, having 401 inhabitants.—Also, a township of Butler county, in Pennsylvania, containing 568 persons.

MIDDLETON, l. 3, *r.* 541; l. 8, after houses, add—2014 inhabitants.

MIDDLETON, except the city, a township, containing 3368 inhabitants.—Also, a township of Columbiana, in Ohio, having 579 inhabitants.

MIDDLETON, col. 2, l. 23, *r.* 1811; l. 24, *r.* 4422 persons, occupying 805 houses.

MIDDLETOWN, l. 3, add—containing 439 inhabitants; l. 4, add—having 1207 inhabitants; l. 7, *r.* 976; l. 17, *r.* 3849; l. 33, after county, add—containing 948 inhabitants; l. 34, after Cumberland, add—having 2351, and the third in Bucks county, having 1462 inhabitants.

MIDDLEWICH, col. 2, l. 10, *r.* 1811; l. 11, 279—1232.

MIDHURST, l. 8, *r.* In 1811, the borough and parish contained 1256 persons, occupying 196 houses; 60 families being employed in agriculture, 127 in trade and manufactures.

MIEMITE. See MINERALOGY, *Addenda*.

MIFFLIN, l. 4, *r.* nine; l. 9, *r.* this county contains 12,132. Add—Also, a township in Alleghany county, in Pennsylvania, containing 637 inhabitants.—Also, a township of Ross county, in Ohio, with 445 inhabitants.

MILBORNE PORT, col. 2, l. 7, *r.* 1811, l. 8, *r.* population of this borough and parish amounted to 1000 persons, occupying 224 houses; 474 being males, and 526 females: of whom 132 families were employed in trade, and 78 in agriculture.

MILDENHALL, l. 25, *r.* 1811; l. 26, *r.* 2493, occupying 351 houses; 1187 being males, and 1306 females:—278—112.

MILFORD, col. 3, l. 39, 40, *r.* 1811—1961, the number of houses being 352.

MILFORD, in America, l. 2, containing 2095 inhabitants; l. 3, 973; l. 11, containing 2033 inhabitants; l. 18, and 2674 inhabitants.—Also, a town of Hillsborough county, in New Hampshire, containing 1117 inhabitants.—Also, a township of Wayne, in Pennsylvania, having 87 persons.—Also, a township of Somerset county, in the same state, with

with 1180 inhabitants.—Alfo, a township of Butler county, in Ohio, having 1037 inhabitants.

MILFORD, *New*, a town of Litchfield county, in Connecticut, having 3537 perfons.—Alfo, a township of Luzerne county, in Pennsylvania, having 178 inhabitants.

MILK, col. 5, l. 29 from bottom, for oxyfying *r.* offifying.

MILK, *Chemical Properties of.* According to Berzelius, 1000 parts of milk deprived of its cream confift of

Water	- - -	928.75
Curd with a little cream	- - -	28.00
Sugar of milk	- - -	35.00
Muriate of potafh	- - -	1.70
Phofphate of potafh	- - -	.25
Lactic acid, acetate of potafh, with a trace of lactate of iron	- - -	6.00
Earthy phofphates	- - -	.30
		<hr/>
		1000

In the paragraph describing the fermentation of mares' milk by the Tartars, l. 2, after brandy, add—called *Koumifs*.

After the paragraph upon cream, add—Cream of the fp. gr. 1.0244 was found by Berzelius to confift of

Butter	- - -	4.5
Cheefe	- - -	3.5
Whey	- - -	92.0
		<hr/>
		100

After the obfervations on curd, add—*Curd* has many of the properties of coagulated albumen. It is white and folid, and when all the moifture is fqueezed out, it has a good deal of brittlenefs. It is precipitated by acids, and the precipitate confifts of the curd combined with the acid employed. If this precipitate be digefted with carbonate of lime or barytes in water, the acid combines with the earth, remains undiffolved, (fuppofing the fulphuric acid employed,) and leaves the curd in folution. The aqueous folution of curd thus obtained is yellowifh, and refembles a folution of gum. When the folution is boiled in an open vefel, it becomes covered with a white pellicle, precifely as milk does, and acquires the fmell of boiled milk. The membrane is almoft infoluble in water, and appears to be produced by the action of the air on the diffolved curd. With the mineral acids, curd forms the fame compounds as albumen and fibrin do; but the neutral compounds are lefs foluble. A great excefs of acetic acid is required to diffolve curd, and the neutral compound of curd and this acid appear infoluble. According to the analysis of Gay Luffac and Thenard, curd is compofed of

Hydrogen	- - -	7.429
Carbon	- - -	59.781
Oxygen	- - -	11.409
Azote	- - -	21.381
		<hr/>
		100

MILL CREEK, in *Geography*, a township of Hamilton county, in Ohio, having 1334 inhabitants.

MILLEDGVILLE, a town of Georgia, in the county of *Baldwin*; which fee.

MILLVILLE. Add—containing 1032 inhabitants

MILNTHORP, l. 2, *r.* Haverfham; l. 14, after population, add—of the townfhips of Milthorpe and Haverfham; l. 15, *r.* 1811—1438—242 houfes; l. 16, 546—592—129—111.

MILTON, l. 8 and 7 from bottom, *r.* 1811—307—1746.

MILTON, in America, l. 9, *r.* 1264; add—Alfo, a town of Strafford county, in New Hampshire, having 1005 inhabitants.—Alfo, a town of Chittenden county, in Vermont, containing 1546 inhabitants.

MILVERTON, l. ult. *r.* 1811—1637; add—and number of houfes 322.

MINCHIN-HAMPTON, l. 27, *r.* 1811—town and parifh; l. 28, *r.* 3246, and occupying 710 houfes; l. 29, 1523 males, and 1723 females.

MINEHEAD, l. 3, *r.* 144.

MINEHEAD, l. 3, after England, add—By the returns in 1811, the borough and parifh were ftated to contain 255 houfes, and 1037 inhabitants; 443 being males, and 594 females.

MINERAL CAOUTCHOUC. See MINERALOGY, *Addenda*.

MINERALOGY, according to the moft eminent mineralogifts of the French fchool, comprises the ftudy of all inorganic fubftances that exift naturally in the earth, or on its furface. According to this comprehensive definition, water, air, and all ponderable elementary matter, may be claffed with minerals. The German mineralogifts ufe the term *mineral* in a more reftriated fenfe. See MINERALOGY, where is given a hiftory of the progrefs of this fcience, and an outline of the fyftems of Werner and Haiiy. For a more full account of the external characters of minerals, and of the fyftem of claffification introduced by Werner, fee ORYCTOGNOSY: and for the leading principles of cryftallography, on which the fyftem of Haiiy is formed, fee CRYSTALLOGRAPHY, *Addenda*. Under the article SYSTEMS of MINERALOGY, we have given a fummery view of the chemical fyftem of mineralogy recently attempted to be introduced by the diftinguifhed Swedifh philofopher Berzelius.

Mineralogy has fcarcely been cultivated as a regular fcience in Europe longer than fifty years, and in England it has not excited much attention until the prefent century; fince which time our acquaintance with the mineral kingdom has been rapidly extending. We propofe in the prefent article to defcribe thofe minerals which have been recently difcovered, or whose characters have been more accurately known fince the articles were written in which they were defcribed. Many minerals having received feveral different names, we have alfo deemed it expedient to give an alphabetical lift of all the known fpecies of minerals, with references to the particular name under which each is defcribed. This will, we truft, in a confiderable degree, remedy the inconvenience refulting from the ufelefs multiplication of names; an evil which, in this department of fcience, tends greatly to retard the progrefs of ufeul knowledge. To Werner, we are indebted for the firft precife definition of the external characters of minerals; but unfortunately both he and the mineralogifts of the Freyberg fchool have introduced fuch a multiplicity of divifions, fubdivifions, and minute diftinctions into the fcience, with fo many quaint terms to exprefs what was before perfectly definite in the language of common life, that the defcription of the moft intelligible properties is often rendered harfh and obfcure to the ftudent. This is greatly to be regretted, as it prevents many from cultivating mineralogy, deterred by a parade of frivolous diftinctions which affail them in limine.

The

MINERALOGY.

The characters of minerals, arranged according to the Wernerian method, are enumerated under the article **ORYCTOGOSY**; but a selection of the most important ones, with a further definition of some of them, appears necessary to render more complete this department of our work, and to enable the general reader to understand the descriptive language used by mineralogists. The characters of minerals are either *physical* or *chemical*. Physical characters are those properties which can be discovered without decomposing or changing the nature of minerals; under this term we comprise the external characters of Werner, and also some of those properties which are elicited by the action of other bodies on the mineral examined, such as magnetism and electricity.

Chemical characters in mineralogy are those properties which are most easily discovered by the action of heat, of acids, and of various re-agents. It is in this limited sense that these characters are understood by the mineralogist. A complete analysis of minerals belongs to chemistry.

In our enumeration of physical characters, we shall commence with those which depend on the action of light; namely, colour, transparency, lustre, and refraction.

Colour is regarded by the German mineralogists as an important character, and it is that which first arrests the attention of the observer; but in earthy minerals, the colours of the same species are often so various, that this character loses much of its value as applied to them. The colours of minerals, as far as they have been chemically examined, are principally owing to metallic oxids and inflammable matter: the earths, the acids, and the alkalis, in a state of purity, are white or colourless. The colour of earthy minerals may, therefore, be regarded for the most part as arising from accidental admixtures with unimportant ingredients. But in the inflammable minerals and metallic ores, and in a few of the earthy minerals, the colouring matter is as important as the other parts, and generally more so; hence in the latter, the colour varies but little in each species, and is a character of importance precisely in proportion to its simplicity. For an enumeration of the different varieties of each colour, and the minerals in which they are most characteristic, and for change of colour, see **ORYCTOGOSY**.

Transparency, in its different degrees, from perfect transparency, semi-transparency, translucence, and opacity, are terms perfectly intelligible to every reader. When the cloudiness in semi-transparent minerals increases, so that the outline of objects can scarcely be seen, translucency commences, as in common chalcedony.

Double Refraction, or *Duplicating*, is the property which some transparent minerals possess of presenting a double image of an object when seen through them in particular directions, of which calcareous spar, an Iceland crystal, offers a remarkable example. See **CRYSTAL OF ICELAND**.

Opalescence, a term not frequently applied to some minerals, is thus defined by Mr. Jameſon: "Some minerals, when held in a particular direction, reflect from some single spots in their interior a coloured shining lustre; this is what is understood by opalescence: it is distinguished into *simple* and *stellular*; in the latter, the lustre diverges in fix rays in the form of a star, as in the *star-sapphires*."

Lustre.—The lustre of a mineral produced by the reflection of light is of different kinds, and is called metallic, semi-metallic, adamantine, pearly, resinous, and vitreous. Perfectly opaque minerals, as the metals, and most of the metallic sulphurets, reflect the light wholly from the surface without undergoing any refraction, and exhibit the metallic lustre of various degrees of intensity; and the lustre is

increased, and the colour is unchanged, when a scratch is made in them with a knife or file. Minerals having a semi-metallic lustre yield a lighter colour, or have their lustre destroyed when scratched. The adamantine lustre is exhibited by minerals which are translucent, and possess great refractive power; the lustre is reflected from the interior of the mass with great vivacity, and is produced both by reflected and refracted light. Examples, the diamond, sulphur, and the native salts of lead. In these minerals, though the lustre is increased by polishing, yet its particular character is less distinct, owing to the increased reflection of unrefracted light from the surface.

The pearly or nary lustre is well exhibited in some kinds of zeolite, and in kyanite. When it proceeds from fibrous minerals, as in satin spar and fibrous gypsum, it is sometimes called a silky or satiny lustre.

The resinous lustre is well represented by that of pitch: it exists in pitch-stone and resinous flints.

The vitreous lustre is perfectly represented in rock-crystal.

Each of these kinds of lustre may vary in degree from the most splendid, which can be seen at a great distance, to shining, glistening, or glimmering. When entirely destitute of lustre, a mineral is called dull.

The *streak* implies the colour or lustre which a mineral exhibits when scratched with a knife or file: the colour is the same as that of the mineral when pulverized.

Soiling is a character that occurs in some soft minerals, which leave a mark when drawn on the surface of other bodies, or on the fingers, as plumbago, chalk, and redde.

The above are the principal characters depending on the action of light.

Phosphorescence.—Certain minerals give out light when rubbed against each other, as quartz; or when scratched with a knife, as dolomite. Other minerals give out light when thrown on hot coals, or heated iron, as fluor spar; and certain minerals emit light when exposed to the action of the blow-pipe.

Hardness and Solidity.—Solids are the only bodies to which the terms hard or soft can properly be applied. In common language, hardness and fragility are often confounded. A stone that endures many heavy blows before it breaks, is considered as harder than another which requires fewer blows for its fracture; but the property which different minerals have of resisting the point of a knife or file of hardened steel, or the effect produced when a mineral is rubbed on other minerals, or scratched by them, is the most unexceptionable test of their hardness. Thus some minerals scratch crystallized quartz, a stone easily recognized, and whose hardness in that state is always the same; other minerals scratch steel, glass, fluor spar, &c. This method is precise, and gives the real hardness of the parts; whereas striking fire with steel, which is often mentioned as a character, is a vague test, subject to variation from the form of the mineral, the sharpness of its edges, &c.; and soft minerals not unfrequently contain minute grains of harder ones, which will give sparks with steel.

As a knife is the most convenient and portable instrument for determining the hardness of most minerals, except gems, the following judicious observations on the use of it, by Mr. Aikin, are deserving the attention of the student. In fibrous minerals, a scratch directed across the fibres will always indicate a lower degree of hardness than the true one; for the fibrous structure presenting an alternation of ridges and furrows, the knife glances across the intervals, thus interrupting the uniformity of the stroke, and producing a succession of small blows, which rather break down than divide the

MINERALOGY.

summits of the ridges. The hardnæs should, therefore, be tried by a scratch parallel to the direction of the fibres, or, still better, on the surface of the transverse fracture. Another precaution is always to select a second undecomposed specimen to make a trial of the hardnæs, this character being affected sooner than any other by the spontaneous alteration of a mineral. In examining the relative degree of hardnæs of two minerals, by trying which will scratch the other, it is necessary to be aware that the solid angles and edges of the primitive forms are very sensibly harder than those of the derivative forms, or than the angles or edges produced by casual fracture, either of crystals or massive varieties of the same species. This fact has been long known to diamond-cutters, who always distinguish between the hard and soft points of the gem, that is, between the solid angles belonging to the primitive octahedron, and those belonging to any of its modifications, the latter being easily worn down by cutting or rubbing them with the former.

The whole range of hardnæs obtained by the use of the knife may be thus classed. When a mineral does not yield to the point of a knife, it may be called *very hard*, as quartz and flint. When it yields with great difficulty, it may be called *hard*, as feldspar. When a mineral yields more readily than the former, it may be called *semi-hard*, as hornblende and fluor spar. When it is easily scratched with a knife, it is called *soft*, as calcareous spar and barytes. And when it yields to the nail, *very soft*, as gypsum and chalk.

Tenacity.—By this property is understood the relative mobility of the particles of minerals, and the different degrees of coherence. In some metallic minerals, particularly native gold and silver, the particles, though they cohere with great force, are capable of a considerable degree of motion, and may be cut with a knife or extended with a hammer. Such minerals are called *malleable*. When a mineral may be cut into fragile shavings, or coarse grains, adhering to the knife, it is called *sectile*, as in plumbago and soap-stone. When on cutting a mineral with a knife, the particles dart off with a grating noise, it is said to be *brittle*. All hard minerals, and the greater number of semi-hard minerals, are brittle, as quartz and fluor spar.

Frangibility.—By this property is understood the resistance which minerals oppose to the stroke of a hammer before they are broken into fragments. The degrees of frangibility depend partly on the cohesion of the particles, and partly on the structure of the mineral. Frangibility must not be confounded with hardnæs; many soft minerals are more infrangible than hard ones. Quartz is much harder than hornblende, but may be broken with greater facility. The brittle minerals are the most frangible, whilst those which yield to the knife and are sectile are generally very tough; and the malleable minerals, such as native gold, can scarcely be said to be frangible.

A mineral is more easily frangible by a sharp blow from a small hammer, than by a heavier blow from a large hammer; hence this property appears to depend much on elasticity. Some earthy minerals, as beryl, flint, and topaz, are more frangible when first obtained from their native beds, than when they have been exposed for some time to the atmosphere, owing to their containing a portion of moisture which is afterwards evaporated. The degrees of frangibility, from very difficultly frangible to very easily frangible, are enumerated under *ORYCTOGENOSIS*.

Some earthy minerals, and all malleable minerals, bend without breaking, or are flexible; and some minerals are both flexible and elastic, as mica.

Structure of Minerals.—This is the internal arrangement of

the particles of a mineral. The three great divisions of structure are, the *perfectly crystalline*, *imperfectly crystalline*, and the *promiscuous structure*. The perfectly crystalline structure is described under the article *CRYSTAL*; and the Wernerian description of crystalline forms will be treated of in the following section. For the imperfectly crystalline and promiscuous structure, see *STRUCTURE of Minerals*, where these important characters are described. The structure of minerals is ascertained by the number of joints, or determinate directions in which a mineral can be split, or exhibits distinct laminæ. This is called the cleavage by the German mineralogists.

When a mineral splits in one direction, it is said to have a single cleavage, as in mica. The cleavage may be double, as in feldspar; triple, as in calcareous spar; quadruple, as in fluor spar; or six-fold, as in blende and rock-crystal.

The Wernerian system takes no measure of the angles under which the planes or laminæ of a mineral meet, except as being rectangular, equiangular, or oblique. But the angular measurement of the inclination of the planes forms the basis of Häüy's system of crystallography. (See *CRYSTAL* and *GONIOMETER*.) According to Werner, the two-fold cleavage is described either as rectangular, (examples, feldspar and hyacinth,) or oblique, as in hornblende.

In the triple cleavage, the laminæ may intersect each other rectangularly, as in lead-glance or galena; or the cleavage may be oblique, but equiangular, as in calcareous spar; or oblique and at unequal angles, as in heavy spar; or may be partly rectangular and partly oblique, as in selenite.

The four-fold cleavage may either be equiangular and oblique, as in fluor spar and the diamond, or three cleavages may be equiangular and oblique in the common axis of the crystal, and intersected by a fourth, which is at right angles with the axis, as in beryl.

In the six-fold cleavage, all the laminæ may meet under equal oblique angles, as in rock-crystal, or three of the cleavages may form equal and oblique angles in a common axis, and be obliquely intersected by three others, which also intersect the axis in an oblique direction.

Fracture.—This property is carefully distinguished from the structure by Häüy. The fracture is the casual division of the whole into fragments, and depends much on the kind of stroke by which it is produced, whereas the structure exists in the mineral before it is broken. Fracture is either *conchoidal*, which is composed of convex or concave elevations or depressions more or less regular. When regular they have smooth concentric ridges, as in many shells; hence the name is derived. The conchoidal fracture is distinguished according to the magnitude of the elevations and depressions, into large conchoidal, as in obsidian or flint, and small conchoidal, as in pitch-stone. It is further distinguished into deep or flat conchoidal, and into perfect conchoidal and imperfect conchoidal. The conchoidal fracture is characteristic of brittle minerals, which have some degree of lustre and transparency. The *uneven fracture* presents elevations which are commonly irregular and angular. This fracture is most frequent in metallic minerals, and in opaque minerals which have some lustre; it passes into small and imperfect conchoidal, and also into earthy.

The *even fracture* is that kind of surface which shews the fewest inequalities, and these inequalities are flat and never sharply defined. It passes into large conchoidal and splintery.

The *splintery fracture*, improperly so called, denotes a nearly flat surface, on which are numerous small wedge-shaped scales, adhering by their thick end.

The *earthy fracture* is peculiar to opaque earthy minerals,

as chalk. The surface has a number of minute elevations and depressions, which makes it appear rough.

The *hackly fracture* is peculiar to the malleable metals, and consists of short sharp-pointed protruding fibres, which are sometimes only discoverable by the feel.

These different kinds of fracture often pass into each other, and occur together: the most prevalent one must be taken as the characteristic fracture. In minerals which have a crystalline structure, the true or proper fracture is that which is across the direction of the planes. When crystalline minerals are broken, the division taking place more readily in the direction of the planes, the fragments have generally a tendency to a regular form, as cubic, rhomboidal, &c. according to the structure of the mineral from which they are broken.

Imperfectly crystalline minerals break into fragments, which are more or less regular, and contain the following varieties: the wedge-shaped, splintery, specular, and tabular.

Indeterminate fragments, from hard and brittle minerals, which possess no crystalline structure, have sharp edges and angles. In other minerals, the angles and edges are more or less blunt in proportion to their softness and toughness.

External form or shape of minerals is either *indefinite*, *definite*, or *crystalline*.

The *indefinite* or *amorphous*, called by Mr. Jameſon the common external shape of a mineral. This character is applied when a mineral exhibits no appearance of regular planes or laminae, nor any resemblance to well-known natural or artificial bodies. When the mineral forms a thin coat or crust on other minerals, it is called *superficial* or *investing*, which is common to friable or pulverulent minerals. Another variety is called *plated* or *membranaceous*, where the mineral forms thin membranes or flakes not exceeding in thickness common paper. When the three dimensions are not very different from each other, if the bulk is not considerable, the mineral is said to be in pieces, which may be either angular or rounded. If the bulk of an amorphous mineral be considerable, it is called *massive*. An enumeration of Werner's common external forms is given under *ORYCTOGENOSY*; which see.

The *definite* form, or particular external shape, appears in many instances to be derived from crystallization modified or disturbed by other causes. According to Mr. Aikin, many of the definite forms have evidently been occasioned by matter in a semi-fluid state having been exposed to the simultaneous action of crystallization, concentric attraction, and gravitation. To crystallization is owing the minute structure in short prisms or fibres laterally aggregated; to the concentric attraction it is owing that each of these fibres converges towards a real or imaginary centre, forming a curved thick plate of the whole, or several plates in successive coats, like the structure of the onion; and lastly, it is owing to gravitation that these concretions do not form perfect spheres, but are more or less elongated into the mammillary, the reniform, the botryoidal, and the stalactitic varieties. Of particular external forms, a great variety are enumerated. (See *ORYCTOGENOSY*.) The definite form that approaches nearest to the regular crystalline, is the *arborescent* or *dendritic*: it bears a near resemblance to a vegetable spray; hence its name. On minute examination, it will, however, be found to consist of crystals occasionally very perfect, implanted one into another, and branching in different directions. Certain varieties have obtained particular names, as *reticulated* or *reniform*, when the branches intersect like the meshes of a net; and *pedunculated*, when a number of short branches rise parallel to each other, at nearly equal distances, on the same side or on opposite sides of a main branch, as in a comb.

The *crystalline* form of minerals is called by Mr. Jameſon the regular external shape. When a mineral occurs crystallized in a simple form which has received a name in geometry, as the cube, the rhomboid, the octahedron, &c. it is easy to give an idea of it by referring it to that form; but when a crystal presents a great number of unequal planes, or is very complicated, the description becomes difficult without a drawing or model. Mr. Werner has, however, considerably facilitated the mode of describing crystals by considering them as modifications of certain simple forms; and this mode, though not strictly scientific, is found most convenient in practice.

The simple forms, or what he calls the fundamental forms, are, the *cube* (*fig. 1.*); the *rhomboid* (*fig. 2.*); the *prism*, which may have three, four, or a greater number of sides (*figs. 3, 4, 5, &c.*); the *pyramid*, which may have three, four, six, or eight triangular planes (*fig. 6.*); the *table*, which has two equal and parallel planes, which are very large compared with the thickness of the table, and is bounded by an indeterminate number of sides (*figs. 7 and 8.*) The three following forms are very rare. The *icosaèdron*, having twenty equilateral planes (*fig. 9.*); the *dodecaèdron*, having twelve pentagonal faces (*fig. 10.*); and the *lens*, which has two curved faces (*fig. 11.*)

Mr. Aikin is of opinion, that the number of simple forms, or models, to which almost all crystals can be referred, may be reduced to four. The prism, the rhomboidal dodecaèdron (*fig. 12.*), the regular tetrahedron (*fig. 13.*), and the double pyramid formed by two equal and similar pyramids joined together by a common base. The pyramid, like the prism, may have a greater or smaller number of sides, and the edges of the base of each pyramid may be in the same plane, as in *fig. 14.* or set on obliquely, as in *fig. 31.*

These forms, or models, it must be carefully noticed, have no connection with the true primitive forms of crystals (see *CRYSTALLOGRAPHY, Addenda*), but are merely adopted as convenient types for the description of crystals. The changes which these forms are supposed to undergo by truncation and bevelment may take place either on the edges or solid angles of the crystal. As the prism and the cube are the most common forms of crystals, we shall proceed to describe them modified by these changes. The prism, as we have before observed, may have several sides, and may be triangular, or rectangular, as in *fig. 3*; oblique, as in *fig. 4*; or polygonal and equiangular, as in *fig. 5*. The sides are technically called the lateral planes, they are parallel to and surmounting an imaginary axis. The bases at each extremity of the prism are called the terminal planes. The lateral edges are formed by the junction of two contiguous sides or planes, and the terminal edges are formed by the junction of the lateral planes with the base or terminal planes, and the solid angles are formed at the point of junction of the terminal planes with the lateral planes. The cube may also be described as a short rectangular four-sided prism. When a solid angle is removed and one plane is formed in its place, as in *Plate VII. fig. 16*, the crystal is said to be truncated on the angles. When planes are formed on the edges of a crystal, as in *fig. 17*, it is described as truncated on the edges: and when two planes are formed on an edge of the crystal, as in *fig. 18*, it is said to be bevelled on the edges. *Fig. 19* is a three-sided prism bevelled on its lateral edges. When the solid angles of a crystal, or the terminal planes, appear cut off by three or more planes converging to a point, the crystal is said to be acuminated: in *fig. 20*, each angle of the cube is acuminated by three small planes set on the lateral planes; and in *fig. 21*, each angle is acuminated by planes set on the lateral edges. *Fig. 22*, according

MINERALOGY.

to the Wernerian method, is a four-sided prism, acuminated at each extremity by four planes set on the lateral planes.

Fig. 23. is a four-sided prism acuminated by four planes set on the lateral edges. In the second instance, the acuminating planes are rhomboidal; in the first instance, triangular.

Fig. 24. is the equiangular six-sided prism, acuminated at each extremity by six planes set on the lateral planes.

Fig. 25. is a similar prism acuminated by three planes at each extremity set on the alternate lateral planes: and *fig. 26.* is also a similar six-sided prism acuminated by three planes at each extremity, set on the alternate lateral edges. The planes at the opposite extremities in *figs. 25* and *26.* are set in different planes or edges, and are what the Germans call *uneconformable*.

The octahedron, or double four-sided pyramid (*fig. 27.*), is a common form of crystals: it is frequently truncated or bevelled. *Fig. 28.* represents the octahedron bevelled at each of the angles. *Fig. 29.* is a double eight-sided pyramid acuminated by four planes at each extremity, set on the alternate lateral edges of the pyramid, thus forming a crystal with twenty-four faces, a form common in the leucite. The table may be bevelled on the surrounding edges, as in *fig. 30.* but in this figure, the Wernerian mineralogists call the surrounding sides the terminal planes, and the larger sides the lateral planes, a deviation for which there does not appear any sufficient reason, and which is liable to introduce confusion into the description of crystals. Some of the forms here referred to, particularly *figs. 22* and *24.* may be more simply described as four-sided and six-sided prisms, terminated at each extremity by four-sided or six-sided pyramids. The edges of a crystal may sometimes be doubly bevelled, or may be bevelled, and the edge of the bevelment truncated. Such modifications are better described as replacements of the edges by three, four, or more small planes or secondary faces. A very long prism is called a capillary crystal, if the diameter be too small to render the faces distinct. A very short prism, in which the length is very small in proportion to the thickness, may be regarded as a tabular crystal. Most crystals may be very intelligibly described by assuming the fundamental forms of Werner variously modified. We are not, however, to suppose, that Werner himself intended to convey the idea that nature first made crystals complete, and then cut away the angles and edges; he only expresses, by the terms truncation and bevelment, the appearance the crystal presents to the eye. The primitive forms, or the true fundamental forms of crystals, as given by Häuy, are enumerated under the article CRYSTAL; but *Plate VII. Crystallization*, comprises those forms, and also those of the integrant molecule. The primitive forms are, the parallelepiped, including the cube and rhomb (*figs. 1* and *2.*), and the rectangular-table (*figs. 7* and *8.*), the octahedron (*fig. 27.*), the tetrahedron (*fig. 13.*), the hexagonal prism (*fig. 5.*), the rhomboidal dodecahedron (*fig. 12.*), and the dodecahedron with triangular faces (*fig. 14.*). The integrant molecules are, the tetrahedron (*fig. 13.*), the three-sided prism, and the cube (*fig. 1.*)

In nature, we rarely find crystals entirely perfect and symmetrical. If, says Mr. Aikin, the student should imagine that the real crystals of minerals, such as nature presents them, are formed with the precision that characterises the models of the crystallographer, he will in general find himself much mistaken. By far the greater number of crystals are either imbedded in other substances, from which it is difficult to disengage them without much injury, or inhere by one extremity in amorphous or uncrystallized matter of the same nature with themselves. Hence it is, that few prisms occur both terminations of which are entire. Not

unfrequently also crystals, by being formed in narrow clefts, are compressed, or in other ways variously mutilated, and thus perplex even the most skilful mineralogist. Their minuteness too, when the parts are much complicated, is frequently such as to elude the keenest eye and the most adroit use of the goniometer.

It is often by no means easy to distinguish genuine from spurious crystals. The latter are generally supposed to have been formed in cavities occasioned by the decomposition of real crystals. These are called casts. Spurious or supposititious crystals are either casts or incrustations; the latter occurs when a mineral is deposited over a pre-existing crystal and assumes its figure. The crystal either remains forming a nucleus, or it disappears, and the supposititious crystal is hollow.

In the Wernerian oryctognosy, the magnitude of crystals and their mode of aggregation are minutely enumerated. (See ORYCTOGNOSY.) In the last edition of Mr. Jameson's external characters, he defines the *scopiform* or *fascicular* aggregation as "composed of a number of thin prismatic crystals, diverging from their point of attachment, and forming a kind of fasciculus or bundle; example, zeolite." The manipular, or sheaf-like, consists of a number of crystals that diverge towards both ends and are narrower in the middle, thus resembling a sheaf; examples, zeolite and prehnite.

Scalarwise is when many cubical crystals are arranged like the steps of a stair; example, cubes of corneous silver-ore.

The surface of crystals is either smooth or streaked, the streaks sometimes cross longitudinally and sometimes transversely. These streaks are deserving of notice, as they frequently serve to indicate the structure of crystals. See CRYSTALLOGRAPHY, *Addenda*.

Electricity is a character peculiar to a small number of crystallized minerals, that exhibit the positive and negative electricity at their extremities on being heated. This property was first discovered in the tourmaline. (See TOURMALINE.) The points which exhibit electricity are called the electric poles. In order to distinguish these poles from each other, the following simple apparatus is employed. (See CRYSTALLOGRAPHY, *Plate IV. fig. 92. A.*) It consists of a needle of copper or silver, having at each end two small balls *a, b*; this needle, like the common compass-needle, is moveable upon a pivot, having a very fine point, and at the bottom a stand or foot. The needle and stem are insulated by placing the foot on a plate of wax or resin. To use the apparatus, we place one finger on the stem, and present near to the needle a stick of sealing-wax, made electrical by rubbing, then withdraw the finger, and afterwards the stick of sealing-wax, and the needle will be positively electrified; and when a crystal electrified by heat, and held by a pair of small pincers in an insulated handle, as at *B*, is brought so that the positive or negative pole may approach one of the balls *a, b*, it will be attracted or repelled. The electricity of the needle will be perceived a quarter of an hour, or longer, and may be rendered more or less strong by varying the distance at which the stick of sealing-wax is held. It may be proper to observe that many minerals become electric by friction.

Magnetism is a character which occurs principally in ores of iron, or in minerals that contain a portion of iron, or iron in a state of black oxyd.

The above are the most important physical characters, comprising those which are called the external characters by Werner, and those to which he restricts the term physical.

Specific Gravity, or weight, is one of the most important

portant characters of minerals, and is obtained accurately by weighing them in the hydrostatic balance. (See **HYDROSTATICS**.) For most practical purposes, a pair of common gold scales that will turn freely with the tenth part of a grain is sufficiently accurate. The mineral may first be weighed, and the weight be noted, and then it must be suspended by a fine thread, and weighed again in rain or river water, about the temperature of 60°. The original weight of the mineral divided by the difference of the weight will give its specific gravity, or the weight compared with that of water. The heaviest bodies are the metallic, and the metallic ores, which range from about five times the weight of water to seventeen; the latter is the specific gravity of native platinum. The heaviest earthy minerals are the barytic and stromontic earths, and the gems; these range from 3.5 to 4.5. The other solid earthy minerals range from 2. to 3.5, and some few solid minerals are lighter than water, as rock-cork.

The *feel*, whether unctuous, or smooth or dry, meagre or harsh, is a character which serves to distinguish particular minerals. The odour and taste are also characters of particular minerals; some yielding a peculiar odour naturally, as petroleum, or when rubbed, as wine-stone; and others, as the saline, affect the taste. Adhesion to the tongue is also a character possessed by minerals which absorb water. The coldness and sound of minerals are also given as characters by Werner, but they are of little practical value.

Friable minerals are either loose, as when the particles have no perceptible coherence, or are slightly cohering. The particles are in some instances scarcely discernible, and are called dusty particles, as in cobalt crust; in other instances, the particles are large and scaly.

The fluid minerals are few in number, and are characterized by their fluidity, transparency, and lustre.

The remaining characters are purely chemical, except the action of water, and of the atmosphere, which is in some instances chemical, and in others mechanical. Water unites with many of the clays, and renders them plastic; other minerals, as fullers'-earth, fall to pieces in water, without being dissolved, or even rendered plastic. In some cases, minerals absorb water, which alters their transparency and colour. Saline minerals chemically combine with water, and are dissolved. To the absorption of water, is owing the property of adhering, when applied to the tongue before noticed. The action of the atmosphere on minerals is principally effected either by the abstraction or absorption of moisture, and the oxydation of minerals when exposed to the air is for the most part owing to the moisture which it contains.

The chemical characters of minerals are those which the mineralogist can ascertain by the action of acids, or of heat as applied by the blow-pipe, either simply or aided by re-agents. The action of acids is of great use in ascertaining many essential characters of minerals. For this purpose, the muriatic or the nitric acids of moderate strength are most convenient. A minute fragment of the mineral may be placed in a watch-glass, and a few drops of acid poured upon it. The native carbonates effervesce, and are dissolved. Some minerals require to be reduced to a state of powder to shew the action of acids, and are hereby reduced to the form of jelly in a few hours, as zeolite. Other minerals only require to be touched with a glass rod dipped in acid to ascertain their nature.

The blow-pipe is an instrument of very great use to the mineralogist; it has been already described. (See **BLOW-PIPE**.) A blow-pipe which can be carried in the pocket, to be worked when required by the mouth, is by far the

most convenient; but it requires some precautions in the management to render it efficient. The best and clearest directions for this purpose which we have seen are those given by Mr. Aikin.

"Few persons," he says, "are able at first to produce a continued stream of air through the blow-pipe, and the attempt often occasions a good deal of fatigue. I shall make no apology, therefore, for treating this matter somewhat in detail. The first thing to be done is to acquire the habit of breathing easily and without fatigue through the nostrils alone; then to do the same while the mouth is filled and the cheeks inflated with air, the tongue being at the same time slightly raised to the roof of the mouth, in order to obstruct the communication between the mouth and the throat. When this has been acquired, the blow-pipe may be put into the mouth, and the confined air expelled through the pipe by means of the muscles of the cheeks. As soon as the air is nearly exhausted, the expiration from the lungs, instead of being made through the nostrils, is to be forced into the cavity of the mouth; the communication is then instantly to be shut again by the tongue, and the remainder of the expiration is to be expelled through the nostrils. The second, and all subsequent supplies of air to the blow-pipe, are to be introduced in the same manner as the first. Thus, with a little practice, the power may be obtained of keeping up a continued blast for a quarter of an hour, or longer, without inconvenience.

"Much depends on the size of the external aperture of the blow-pipe. If so large that the mouth requires very frequent replenishing, the flame will be wavering, and the operator will soon be out of breath; if, on the other hand, the aperture be too small, the muscles of the cheeks must be strongly contracted, in order to produce a sufficient current, and pain and great fatigue of the part will soon be the consequence. An aperture about the size of the smallest pin-hole will generally be found the most convenient, though for particular purposes one somewhat larger or a little smaller may be required.

"Several varieties of form have been recommended for the blow-pipe: they all have their advantages and disadvantages. Upon the whole, it appears desirable that there should be an expansion of the tube somewhere between the two extremities, both for the sake of collecting and retaining the condensed moisture of the breath, and for producing a regulated pressure, and therefore a regular blast. The nose also should be tipped with a moveable piece for the convenience of giving at least three different sizes of aperture. These conditions being obtained, other circumstances are of small importance, provided neither the bulk nor weight of the instrument be troublesome.

"The fuel for this little reverberatory furnace (as the blow-pipe apparatus may, without impropriety, be denominated) is oil, tallow, or wax, kept in combustion by means of a wick. The oil is the worst, the tallow is better, and the wax is best, not only as being cleaner, and free from any offensive smell, but also as affording a greater heat. The management of the wick too is a matter of some nicety. It should neither be too high nor snuffed too low, and should be a little bent at its summit from the blast of the pipe. All casual currents and drafts of wind ought to be carefully avoided, as rendering the flame unsteady, and very materially impairing its strength. The above conditions being duly complied with, the flame, while acted on by the pipe, will evidently consist of two parts, an outer and inner; the latter will be of a light-blue colour, converging to a point at the distance of about an inch from the nose; the former will be of a yellowish-white colour, and will converge

MINERALOGY.

less perfectly. The most intense heat is just at the point of the blue flame. The white flame consists of matter in a state of full combustion, and calcines or oxygenates substances immersed in it; the blue flame consists of matter in a state of imperfect combustion, and therefore partly deoxygenates metallic oxys which are placed in contact with it.

“The supports of the various substances while undergoing the action of the blow-pipe come next to be considered. Of supports there are two kinds, combustible and incom-bustible. The combustible support (used chiefly for metallic ores) is charcoal. The closest-grained and foundest pieces are to be selected for this purpose; and even the best often split and become rifty after being used for a short time. This will not unfrequently happen in the middle of an experiment, when the melted globule sinks into the cracks, is lost, and the experiment must be begun again. Instead of sticks of charcoal, some persons recommend that the charcoal, after being finely pulverised, should be moistened with a solution of gum tragacanth, and moulded into a convenient form; a plan that well deserves to be fairly tried. Perhaps simply moistening the charcoal-powder, and then submitting it to the action of a very strong screw-press, might be still better. The incom-bustible supports are, metal, glass, and earth, in the use of all which one general caution may be given,—to make them as little bulky as possible. The support always abstracts more or less of the heat, and in many cases, especially when metallic spoons are employed, entirely prevents the flame from producing its due effect. The best metallic support is platina, because it is infusible, and transmits heat to a less distance and more slowly than other metals. A pair of slender forceps of brass, pointed with platina, is the best possible support for non-metallic minerals that are not very fusible. For the fusible earthy minerals, and for the infusible ones when fluxes are used, leaf-platina will be found the most convenient; it may be folded like paper into any desirable form, and the result of the experiment may be obtained simply by unfolding the leaf in which it was wrapped up. Glass supports are slender tubes or rods of this substance. If the mineral to be examined is of a longish or fibrous shape, one end may be cemented to the top of the glass rod by heating it, and in this state it may be further examined with great convenience. Earthen supports are used only for extemporaneous cupellation; they are best made of bone ash, and must of necessity be of a certain bulk, in order to absorb the litharge, and other impurities, which it is the object of this process to separate from the *fine metal*. With regard to the magnitude of the specimens required for examination, no very precise rule can be given; the most fusible, such as some of the metallic ores, may be as large as a small pea, while the more refractory of the earthy minerals should scarcely exceed the bulk of a pin's head.

“The heat that is first applied to investigate the properties of mineral substances should be very slow, not exceeding that which exists on the outside, even of the yellow flame; at this temperature, the phosphorescence is best elicited, and decrepitation for the most part takes place, the fusible inflammables begin to melt, and the metallic and most other mineral salts lose their water of crystallization. The yellow flame will raise a substance to a tolerably full red heat, by which the following effects are produced. Many changes of colour take place, all the yellow ores of iron become red, and the peach-blossom tinge of flowers of cobalt becomes blue; certain earthy minerals lose their water of crystallization or of composition, and exfoliate, as gypsum, or throw up coarse and irregular ramifications, as

prehnite and mesotype. At this temperature, also, carbonate of strontian begins to tinge the flame with its peculiar crimson colour, and muriate of copper with its bright green colour. The roasting of all the metallic ores is best carried on at this heat; sulphur and arsenic are drawn off, and exhibit their characteristic odours; grey antimony melts; native bismuth runs out from the matrix, through which it is disseminated; and pearlspar and spathose iron blacken and become magnetic. In the still higher degree of heat produced at the point of the interior blue flame, although some minerals still continue perfectly refractory, and undergo but little change of any kind, yet the greater part is very sensibly altered. Some, as pearl-stone, enlarge very considerably in bulk at the first impression of the heat, but are with difficulty afterwards brought to a state of fusion. Others become covered with a superficial glazing, and the sharp edges and angles become glossy and rounded off. Others, consisting really, though not visibly, of an intermixture of two substances differing in fusibility, undergo the process of *fritting*, in which refractory grains are dispersed through a vitreous mass. In others, a complete fusion takes place, and produces a spongy opaque semivitreous mass called a slag, or an opaque glass called an enamel, or a more or less transparent or true glass, which latter may vary in texture from compact to porous and spongy or intumescent.

“In examining the habitudes of the earthy minerals with the blow-pipe, no fluxes are required; whereas to most of the metallic ores, fluxes will be found at almost all times a very useful and often a necessary addition. The ores of the difficultly reducible metals, such as manganese, cobalt, chrome, and titanium, are characterized by the colour which their oxys give to glass; in all these cases, therefore, vitreous fluxes must be largely made use of, both to dissolve the earthy matter with which the oxys are generally mixed very intimately, and to furnish a body with little or no colour of its own, which may receive and sufficiently dilute the inherent colour of the oxyd. I say *sufficiently* dilute, because the colour of most oxys is excessively intense, and most persons in their first experiments of this kind, are very apt to obtain ambiguous results in consequence of using too large a proportion of oxyd, that the glass, whether blue, red, or green, appears quite black. With regard to fluxes, the following will, I believe, be found amply sufficient. Where the object is not only to dissolve the oxyd, but at the same time to retain it at a high state of oxydation, the flux employed should be either nitre or a mixture of this with a glass of borax, or, still better, nitrous borax formed by dissolving common borax in hot water, neutralizing its excess of alkali by nitric acid, then evaporating the whole to dryness, and lastly hastily melting it in a platina crucible. For an active, and at the same time non-alkaline flux, boracic acid may be used, or neutral borate of soda; and where a slight excess of alkali is required, or at least does no harm, common borax by itself, or mixed with a little cream of tartar, when a strong reducing flux is wanted, may be had recourse to. For coloured glasses, the proper support is leaf-platina; but for reductions, charcoal. In the latter case, the ore previously roasted, if it contain either sulphur or arsenic, is to be pulverised and accurately mixed with the flux; a drop of water being then added to make it cohere, it is to be formed into a ball, and deposited in a shallow hole in the charcoal, being also covered by a piece of charcoal, if a high degree of heat is wanted. The easily reducible metals, however, may be treated with less ceremony; a bit of the ore being placed on the charcoal, and covered with glass of borax, will, in the space of a few seconds, be melted by the blow-pipe, and converted

MINERALOGY.

converted into a metallic globule, imbedded in a vitreous scoria.

“In all cases where a metallic globule is obtained, it should be separated from the adhering scoria, and examined as to its malleability and other external characters; being then placed a second time on the charcoal, but without flux, it is to be brought to a state of gentle ebullition, during which the surface being oxygenated, will exhale a heavy vapour that condenses on the blow-pipe, or falls down on the charcoal in form of a powder, or of spicular crystals, from the colour and other characters of which the nature of the metal may probably be ascertained. If any suspicion is entertained of a portion of silver or of gold being mixed with the oxydable metal, the button must be placed on an earthen support, and there brought to a full melting heat; by degrees the oxydable metal will become scorified, and will entirely sink into the support, leaving on the surface a bright bead of *fine metal*, if such was contained in the alloy; but the proportion of this last being generally very small, and the entire mass of the alloy often not exceeding a large shot, it is not unfrequently necessary to have recourse to the magnifying glass, to be fully convinced of the presence or absence of fine metal.” Aikin’s Manual of Mineralogy.

The above directions will be found of the greatest use, and are sufficiently ample to make any additional remarks unnecessary. Some German mineralogists have, indeed, arranged under nearly one hundred heads, the different changes produced on minerals by the action of the blow-pipe, and have given elaborate explanations of words known with sufficient accuracy by almost every child of seven years of age. This we regard not as smoothing the paths of science, but as blocking them up with rubbish to impede the progress of the student.

In the mineralogy of Häuy, he has introduced very judiciously what he denominates the *distinctive characters* of minerals, noting the particular characters which serve to distinguish one mineral species from another, to which it has the greatest general resemblance.

New species of minerals have been discovered almost every year since the commencement of the present century, the greatest number of these discoveries have been made in the mines of Sweden. Few, however, of the newly discovered minerals possess properties that entitle them to much notice, and it is highly probable, that as the science of mineralogy advances to perfection, many of these supposed new species will be discovered to be only varieties of species that have been long known.

ACTINOLITE, or *Aëynolite*. Fr. *actinote*. See STRAHLSTEIN.

ACTINOTE, *Amphibole*. See STRAHLSTEIN.

ADAMANTINE Spar, or *Common Corundum*; *Corindon barmophane*, Häuy. See ADAMANTINE Spar.

ADHESIVE Slate, a species of polishing slate, or *polier schiste*. See POLISHING Slate, *Addenda*.

ADULARIA. (See FELSPAR, *Addenda*.) This variety of feldspar was formerly confounded with glassy feldspar. (See GLASSY Felspar, *Addenda*.) Adularia occurs in veins of granite in Bamshire, in the Isle of Arran, and other parts of Scotland. Rolled pieces of adularia having a most beautiful pearly light are found in the island of Ceylon.

AGALMATOLITE, or *Figure-Stone*; *Beldstein*, Werner; *Talc graphique*, Häuy. A mineral which may be regarded as an indurated steatite, or rather, according to Jamelon, as intermediate between steatite and nephrite or jade. It occurs massive; the fracture is splintery, or imperfectly flaty; the colours are greenish-grey, apple-green, or yellowish-brown, and sometimes flesh-red and rose-red. It is

translucent, unctuous to the touch, and yields with ease to the knife, owing to which property it is carved with facility into different figures by the Chinese, and into pagodas, cups, and snuff-boxes. The specific gravity is from 2.6 to 2.8. According to Klaproth, the constituent parts of agalmatolite are,

	from China.	from Nagyag.
Silex	54	55
Alumine	34	33
Lime	—	—
Potash	6.25	7
Iron	0.75	0.50
Water	4	3
	99	98.50

According to Aikin, this mineral occurs at Glyder Bach, Caernarvonshire.

AGARIC Mineral, or *Rock Milk*; *Chaux carbonatée spongieux*, Häuy. See AGARIC Mineral.

AGATE. (See AGATE.) The agate is not a simple mineral, but is composed of various siliceous substances arranged in concentric lamellæ, exhibiting, when cut and polished, zones and angular lines, like fortifications. There is also a kind of agate-breccia, in which angular fragments are cemented by quartz or chalcedony. Agates appear to be formed by siliceous infiltration in the cavities of basaltic rocks, the formation commencing from the surface, and the cavity gradually filling by successive depositions on the sides, until the whole forms one solid nodule. According to the direction of the lines or the structure of agates, they are denominated *ribbon or striped agate*, *fortification agate*, *landscape agate*, *brecciated agate*, *tabular agate*, *jasper agate*, *spotted agate*, *blended agate*, *star agate*, marked with radiated spots; *petrification agate*, fossil-shells and zoophytes are sometimes penetrated or filled with agate. In the variety called *moss agate*, nodules of chalcedony inclose minute arborizations resembling moss, some of which are supposed by mineralogists to be branches of moss suddenly inclosed and preserved in siliceous matter.

ALABASTER, *Calcareous*, or *Calcifer Alabaster*, *Gypsiferous Alabaster*. See ALABASTER and GYPSUM.

ALALITE, *Diopside*, and *Musfite*, a mineral allied to augit; first found in the Alp of La Muffa, near the town of Äla, from whence the names alalite and musfite are derived. See DIOPSIDE, *Addenda*.

ALLANITE, *Cerium allanite*, Fr. an ore of the newly-discovered metal cerium, first analysed by Mr. Allan, and hence called allanite. Its colour is a brownish-black; it occurs disseminated and crystallized in rhomboidal prisms, the angles of which measure 117° and 63° . The internal lustre is shining, and resin-metallic. It is opaque, and yields a greenish-grey streak. It scratches glass, is brittle and easily fragrant. Before the blow-pipe it froths, and melts into a brown slag. It gelatinizes in nitric acid. The specific gravity is from 3.5 to 4. The constituent parts are,

Oxyd of cerium	—	33.9
Oxyd of iron	—	25.4
Silex	—	35.4
Lime	—	9.2
Alumine	—	4.1
Moisture	—	4

112

It occurs in granite in West Greenland.

ALLOCHROITE,

MINERALOGY.

ALLOCHROITE, *idem*, Häüy; *spiny* garnet of Karsten. It is classed with the garnet family by Werner, but is regarded as a distinct species. It occurs massive; the fracture is uneven, passing into conchoidal. Its colours are greenish and yellowish-grey: it is translucent on the edges; internally it has a glistering resinous lustre. It gives sparks with steel. The specific gravity is 3.5. It has hitherto been found only in an iron-mine at Dramman, in Norway. It is less hard and lighter than common garnet. According to Vauquelin, the constituent parts are,

Silex	-	-	-	35
Alumine	-	-	-	8
Lime	-	-	-	30.5
Oxyd of iron	-	-	-	17
Carbonate of lime	-	-	-	6
Oxyd of manganese	-	-	-	3.5
				100

ALMANDINE, regarded as a variety of garnet. See **ALMANDIN**; but for granite *r.* garnet.

ALUM-EARTH, *Alum-Slate*, *Common* and *Glossy*, *Alum-Stone*. See **ALUM**, *Ores of*.

ALUMINITE, *Subsulphate of Alumine*; *Reine thonerde*, Werner; *Alumine pure*, Häüy. This mineral is of a snow-white colour, verging on yellowish-white. It occurs in reniform pieces, it has no lustre, the fracture is earthy, and the confluence between friable and solid. It is opaque, soils slightly, affords a glistering streak, and adheres feebly to the tongue. It feels fine, but meagre. The specific gravity is 1.66. A variety of the same mineral substance occurs at Newhaven in Suffex, filling up fissures in chalk. This variety is white, yields to the nail, and adheres strongly to the tongue. The constituent parts of the foreign aluminite are,

Alumine	-	-	-	32
Water	-	-	-	47
Sulphuric acid	-	-	-	19.25
With a trace of silex, lime, and iron, equal in some specimens to				1.25
				99.5

AMALGAM, *Native*, semifluid and solid. See **MERCURY**, *Ores of*.

AMANTHOIDE, *Capillary*, and *Amanthoide*, *Byssolite*; the latter so called by Saussure. The former appears to be a variety of amianthus; the latter resembles it, but differs from it in chemical composition, if the analysis of Saussure be correct. It is supposed to be hornblende in a capillary form. Häüy.

AMAZON-STONE, green feldspar from South America, which is cut and polished, and sold under that name, because it is found in rolled pieces on the banks of the river of the Amazons.

AMBER, *White* and *Yellow*. The white amber is of a straw-yellow or yellowish-white colour. It occurs massive, and sometimes inclosed in the yellow amber; it is less transparent than yellow amber. See **AMBER**.

AMETHYST, a variety of crystallized quartz. (See **QUARTZ**, and **AMETHYST**.) Werner divides amethysts into two sub-species, common and fibrous. The prevailing colour of the amethyst is violet-blue of different degrees of intensity; but it is sometimes plum-blue and brownish-black; also grey, olive-green, and pistachio-green, which

last colour is very rare. In massive varieties of amethyst, several colours occur together. In crystallization and other properties, the amethyst does not differ from quartz. It contains 97.50 of silex, with a minute trace of alumine, oxyd of iron, and manganese; to these oxyds, no doubt, its colours are owing. Amethysts occur in agate balls in basaltic rocks. Thick fibrous amethyst occurs massive and in rolled pieces; it occurs in agate veins, in the same rocks as common amethyst. A red colour is given to amethysts by the jewellers, by inclosing them in charcoal, which is ignited, and allowed to consume gradually. When the colour is not uniformly diffused, it is exposed in a mixture of sand and iron to a moderate heat, by which it is rendered more uniform.

AMIANTHUS, *Flexible asbestos*; *Amiant*, Werner; *Asbeste amianthe*, Fr. (See **AMIANTHUS**, and **ASBESTUS**.) It is found in serpentine in the Ile of Anglesea, and in the same rock at Portofy in Scotland.

AMPELITE is a bituminous slate, or shale, of which drawing-slate, alum-slate, and slate-clay, are varieties. See **SLATE**.

AMPHIBOLE, hornblende. See **HORNBLLENDE**, *Adenda*.

AMPHIBOLE Lamellaire, common hornblende.

AMPHIBOLE Crystallizée, basaltic hornblende.

AMPHIBOLE Actinote. See **STRAHLSTEIN**.

AMPHIBOLE Fibreux, glassy actinolite. See **STRAHLSTEIN**.

AMPHIBOLE Aciculaire, asbestos actinolite. See **STRAHLSTEIN**.

AMPHIBOLE Blanc et Sycieux, asbestos tremolite, grammatite. See **TREMOLITE**.

AMPHIBOLE Grammatite, common tremolite and glassy tremolite.

AMPHIGENE. See **LEUCITE**.

ANALCIME. See **ZEOLITE**.

ANATASE, or *Orthohedrite*, *Titane anatare*, Häüy. See **TITANIUM**.

ANDALUSITE, *Feldspath aphyre*, Häüy, is of a flesh-red colour, sometimes inclining to pearl grey; it occurs massive or crystallized in rectangular four-sided prisms, with the terminal edges and angles sometimes truncated. The structure is imperfectly lamellar, with a double rectangular cleavage, parallel with the lateral planes of the prism. It is translucent; it scratches quartz with ease, but is rather easily frangible. The specific gravity is 3.16. Before the blow-pipe it becomes white, but is infusible. According to Vauquelin, the constituent parts are,

Silex	-	-	-	32
Alumine	-	-	-	52
Potash	-	-	-	8
Oxyd of iron	-	-	-	2
				94

It occurs in veins in granite, gneiss, and mica-slate, along with feldspar, quartz, mica, and schorl. It was first found in the province of Andalusia. It has since been found in Aberdeenshire. The crystals are generally middle-sized or small, and occur imbedded. It is distinguished from feldspar by its greater hardness, weight, and infusibility; and from corundum by its double rectangular cleavage, and its inferior specific gravity.

ANHYDRITE, or *Anhydrous Gypsum*, a species of gypsum which contains scarcely a trace of water in its composition, and is much harder than common gypsum; the latter (see

MINERALOGY.

(see GYPSUM) contains 22 per cent. of water, and some varieties 38 per cent. There are five varieties of anhydrite: *compact, fibrous, radiated, sparry, and scaly.*

Compact Anhydrite.—Its colours are various shades of white, inclining to small blue, blueish-grey, and is also red and brownish-red. It occurs massive, contorted, and reniform. The contorted variety, from its resemblances to the convolutions of the intestines, was called *tripe-stone*, or *Pierre de tripe*. Compact anhydrite is more or less translucent, is feebly glimmering, has a small splintery fracture, passing into even or conchoidal. The fragments are sharp-edged: it is difficultly frangible. Specific gravity from 2.8 to 2.9. According to Klaproth, the constituent parts are,

Lime	-	-	41.48
Sulphuric acid	-	-	56.28
Water	-	-	.75
			98.51

Fibrous Anhydrite is of a red colour: it occurs massive, and has a delicately fine and parallel fibrous structure. *Radiated anhydrite* has a blue or greyish colour, and is sometimes spotted with red: it occurs massive. The structure is radiated, the surface splendid and pearly: it is translucent and rather hard. Its specific gravity and constituent parts are the same as the former variety.

Sparry Anhydrite, or Cube-Spar; Chaux sulphatée laminaire, Haüy.—The prevailing colour is white, inclining to blue-grey, pale yellow, and red. It is more or less transparent, the lustre splendid and pearly: it refracts doubly. It is crystallized in rectangular four-sided prisms, and in six or eight sided prisms. It also occurs massive. It has a foliated structure, with a cleavage parallel with the sides of a rectangular prism, which is its primitive form. It scratches calcareous spar, but is easily frangible. The specific gravity is 2.9. Before the blow-pipe, it becomes glazed over with a white friable enamel, but does not melt and exfoliate like gypsum. It is met with in the salt-mines in the Tyrol, and in Switzerland, and also in the gypsum of Nottinghamshire. Scaly anhydrite is generally white, inclining to blue or grey: it occurs massive, has a confused foliated structure, and a splendid and pearly lustre. It is translucent on the edges, is easily frangible, and is soft. Specific gravity 2.9. According to Klaproth, the constituent parts are,

Lime	-	-	41.75
Sulphuric acid	-	-	55.
Muriate of soda	-	-	1.
			97.75

It occurs in the salt-mines of Hall in the Tyrol.

ANTHOPHYLLITE. Its colour is between dark yellowish-grey and olive-brown: it occurs massive and crystallized in reed-shaped crystals, which appear to be four-sided prisms longitudinally streaked. The lustre is shining and pearly, approaching to metallic. The structure is radiated. It has a two-fold cleavage parallel with the sides of a rectangular prism. It is more or less translucent, yields to the knife, but scratches glass with difficulty. It is infusible before the blow-pipe. Its specific gravity is 3.2. The constituent parts are,

Silice	-	-	56.00
Alumine	-	-	13.30
Magnesia	-	-	14.00
Lime	-	-	3.33
Oxyd of manganese	-	-	3.
Iron	-	-	6.
Water	-	-	1.43
			97.06

VOL. XXXIX.

This mineral is allied to hornblende: it occurs at Konigsberg in Norway.

ANTHRACITE, or Anthracolite, flaty glance-coal and columnar glance-coal. Anthracite is that species of coal which has a shining lustre approaching to metallic, and burns without smoke. *Kilkenny coal* and *Welfsb culm* are varieties of anthracite. See COAL.

ANTIMONY, Native, and Ores of. See ANTIMONY-ORES, and RED ANTIMONY, *Addenda.*

APATITE. (See APATITE.) *Chaux phosphatée,* Haüy. Werner makes two sub-species of apatite, the common and conchoidal. The latter, or *conchoidal apatite,* has a conchoidal fracture: it has been called *asparagus stone.* Apatite has been discovered in Cornwall, and recently near Bovey in Devonshire. Massive apatite and earthy apatite have received from Werner the names of common phosphorite and earthy phosphorite. Phosphorite has nearly the same constituent parts as apatite, with an addition of a small portion of fluoric acid, about 2.50 per cent.

APHRITE. (See SCHAUM-EARTH.) Aphrite is divided into *scaly aphrite, flaty aphrite, and sparry aphrite.*

APLOMIE, a mineral closely allied to garnet, but is supposed to have a different primitive form of the crystal or that of a cube. (See GARNET.) Aplomie is considered by Jameson as crystallized common garnet.

APOPHYLLITE. See ZEOLITE.

AQUA, Marine. See BERYL.

ARENALITE. See EPIDOTE, *Addenda.*

ARKTIZITE, a name given by Werner to the mineral since called *Wernerite.* See WERNERITE.

ARRAGONITE. (See ARRAGONITE.) Since that article was written, the remarkable anomaly in the crystallization of this mineral has been partly explained by the discovery that it contains a portion of the carbonate of strontian, which is supposed to give a different form to its primitive crystal. The constituent parts, as given by Stromeyer, are,

Arragonite from Molina, in Arragon.

Carbonate of lime	-	-	94.57
Carbonate of strontian	-	-	3.96
Hydrate of iron	-	-	.70
Water	-	-	.30
			99.53

From Bañanes.

Carbonate of lime	-	-	94.82
Carbonate of strontian	-	-	4.08
Manganese and a trace of iron	-	-	.09
Water	-	-	.98
			99.97

Werner divides arragonite into common, columnar, and acicular. Arragonite occurs in trap rocks in various parts of Scotland, and we have acicular crystals of arragonite in lava from Vefnivius.

ARSENATE of Copper. See COPPER-ORES.

ARSENATE of Iron. See IRON-ORE, section *Cube-Ore.*

ARSENATE of Lead. See LEAD, *Ores of.*

ARSENIC, Native. See ARSENIC, *Ores of.*

ARSENIC Bloom. See PHARMACOLITE, *Addenda.*

ARSENIC Oxyd, and Arsenical Pyrites, or Marcasite. See ARSENIC, *Ores of.*

ASBESTUS, Common and Flexible, (see AMIANTHUS and ASBESTUS,) *Asbestos ligniform,* or wood asbestos. Its colour is

4 A wood-

MINERALOGY.

wood-brown, and from its fibrous structure it presents the resemblance of wood.

ASBESTOUS Actinolite. See STRAHLSTEIN.

ASBESTOUS Tremolite. See TREMOLITE.

ASPARAGUS-STONE. See APATITE, *Addenda*.

ASPHALT, flag mineral pitch; *Bitume solide*, Häüy. (See ASPHALTUM.) Asphalt appears to be indurated petroleum: it occurs in veins, intersecting strata connected with coal strata, and near basaltic rocks.

ATACAMITE, muriate of copper. See COPPER-ORES, and SANDY Copper.

AUGITE, Pyroxene, Häüy. (See AUGIT.) Since that article was written, it has been discovered that augite forms a constituent part of many basaltic rocks in Great Britain, and that it is also a common constituent of almost all dark-coloured lava. (See VOLCANIC Products.) Augite occurs crystallized, and in angular and round pieces. The crystals are generally six or eight sided prisms, with dihedral summits. According to Häüy, the primitive form is an oblique rhomboidal prism, the alternate angles of which are $92^{\circ} 18'$ and $87^{\circ} 42'$. The colour of augite inclines to green and greenish-black: it is more or less translucent. Augite has generally a darker colour than olivine, and a greater hardness and specific gravity. They very frequently occur together in basalt and lava. Werner divides augite into four species: *granular augite*, which is opaque, and has hitherto been found only at Arendal in Norway: *foliated augite*, the lustre of which is resinous-vitreous and internally shining, approaching to splendent; it occurs at Etna and Vesuvius, and in the basalt of Bohemia: *conchoidal augite*, which is sometimes of an olive-green colour, and has an imperfect flat conchoidal fracture: and *common augite*. There is also a variety of augite which occurs massive or disseminated, of a deep black colour and opaque; this has been called *flaggy augite*. The term pyroxene, or a franger to fire, given to this mineral by Häüy, is extremely inappropriate, as this mineral forms a constituent part of most dark-coloured lava.

AUTOMALITE, Spinelle zincifere, Häüy. (See RUBY.) This mineral is classed with the spinel-ruby. The specific gravity is from 4 to 4.2: it is remarkable for containing 28 per cent. of oxyd of zinc. It occurs imbedded in talcous slate at Fahlun, in Sweden.

AXINITE. See THUMMERSTONE.

AZURE-STONE, Lazulite, Häüy. See LAZULI LAPIS.

BASALT. See BASALT, *Addenda*, and WHIN-STONE, ROWLEY-Rag, and VOLCANIC Products.

BASALTIC Hornblende, Amphibole crystallizée, Häüy. This mineral is frequently confounded with schorl by the older mineralogists; it has a velvet-black or brownish-black colour; it occurs in irregular six-sided prisms, variously acuminated, but most frequently by flat trihedral pyramids with rhomboidal faces. The structure is lamellar, with joints in two directions parallel to the sides of an oblique rhomboidal prism, the alternate angles of which are $124\frac{1}{2}^{\circ}$ and $55\frac{1}{2}^{\circ}$. It is opaque, and has a splendent and vitreous lustre; it has a fine-grained uneven fracture; it scratches glass; and melts with difficulty into a black glass. The specific gravity is from 3.15 to 3.25. The constituent parts, as given by Klaproth, are

Silice	47
Alumine	26
Lime	8
Magnesia	2
Oxyd of iron	15
Water	.50
	98.50

It occurs in common basalt, in wacke, and in lava; also in some kinds of porphyry. It decomposes more slowly than basalt; hence, according to professor Jamefon, we frequently find crystals of basaltic hornblende dispersed through clay formed by the decomposition of basaltic rocks. See HORNBLLENDE, *Addenda*.

BASANITE, black flinty slate. See SLATE.

BERGMANNITE, a mineral which occurs massive with grey and red quartz at Freidichswan, in Norway, and is classed with scapolite in the felspar family in Jamefon's Mineralogy. Its colours are greenish and greyish-white, or yellowish-grey and muddy flesh-red. It is extremely glistening, with a lustre between pearly and resinous. The structure is delicately fibrous, curved, or diverging. It is faintly translucent on the edges, and scratches felspar. It melts before the blow-pipe without intumescing into a white enamel.

BERYL. (See BERYL and EMERALD.) In Weiss's collection at Vienna, there are two crystals of beryl in a group crossing each other, which are a foot and a half in length, and one foot in diameter. It has been found in alluvial soil, in the upper part of Aberdeenshire, and in the county of Wicklow, in Ireland, imbedded in granite.

BILDSTEIN. See AGALMATOLITE.

BISMUTH, Native. See BISMUTH-Ore.

BISMUTH, Glance, or Sulphuretted Bismuth. See BISMUTH-Ore.

BISMUTH-Ore, Plumbo cupriferosus, has a steel-grey colour, with a pale copper-red tarnish. It occurs disseminated and crystallized in oblique four or six-sided acicular prisms, longitudinally streaked. The crystals are frequently adhering together, and are sometimes curved, and divided by cross rents. The lustre is metallic. The cross fracture is fine-grained and uneven. It yields easily to the knife. The specific gravity is 6.2. Before the blow-pipe, it melts into a steel-grey globule; by continuing the heat, it is partly volatilized, and deposits in the charcoal a yellow powder, after which there remains a red globule, containing a grain of cupriferosus metallic lead, which communicates a blueish-green colour to borax. According to John, the constituent parts are,

Bismuth	43.20
Lead	24.32
Sulphur	12.10
Sulphur	11.58
Nickel	1.58
Tellurium?	1.32
Gold	0.79
	94.89

It occurs near Berezof, in the district of Catharinenburg, in Siberia.

BISMUTH-Ore, Cupreous, or Cupriferosus sulphuretted Bismuth-Ore, has a light lead-grey colour, sometimes steel-grey and tin-white. It occurs massive, disseminated, and in diverging prisms. The lustre is metallic; it is fertile. According to Klaproth, the constituent parts are,

Bismuth	47.24
Copper	34.66
Sulphur	12.58
	94.48

This is a very scarce ore of bismuth.

BISMUTHIC Silver-Ore. See SILVER-Ore.

BITUMEN,

MINERALOGY.

BITUMEN, *Liquid, Tenacious, Solid, Compact, and Elastic.*
See **BITUMEN**.

BITUMINOUS Marle-Slate occurs in beds in the lower stratified lime-stone in various parts of Europe. It has a dark-brown or blackish-grey colour, a glimmering or gliftening lustre, a slaty structure, and is soft, meagre, opaque, and fectile. It frequently contains ores of copper. It is remarkable for the number of petrified fish which occur in it. It also contains fossil remains of shells, corals, and of cryptogamous fresh-water plants. In many of its characters, it appears to resemble the alum-shale of Whitley. It is a frequent mineral in Saxony, Thuringia, Franconia, Bohemia, Bavaria, and in Switzerland.

BITUMINOUS Wood, a variety of brown-coal or wood-coal, in which the fibres of the wood are distinguishable. See **COAL** and **WOOD-Coal**.

BLACK Coal. See **COAL**.

BLACK Chalk, or Drawing-Slate, Ampelite graphique, Fr. occurs in beds, in rocks of the slate formation. It has a bluish or greyish-black colour, a slaty structure, an earthy cross fracture, is dull, meagre to the touch, and leaves a distinct mark on paper. It is fectile, and becomes gliftening in the break. The specific gravity is 2.11. According to Wrglebl, its constituent parts are,

Silex	-	-	-	-	64
Alumine	-	-	-	-	11
Carbon	-	-	-	-	11
Water	-	-	-	-	7
Iron	-	-	-	-	3

It is found at Morilla in Spain, in Brittany, in Germany, and in Italy. It is cut into square pencils, and used for drawing; it is also ground and used in painting. Those varieties which have the darkest colour and the finest earthy texture are to be preferred. The pencils become hard, unless kept in a moist place.

BLACK-JACK, a provincial name for blende.

BLEÑDE, *Black, Brown, and Yellow*, various sulphurets of zinc. See **ZINC-ORES**.

BOG Iron-Ores. (See **IRON-ORES**.) Werner supposes bog-iron, whether in meadows, swamps, or marshes, to be formed by water impregnated with vegetable acid, dissolving part of the iron in the rocks over which it flows, which, being poured into hollows, becomes stagnant, and evaporates. Thus successive depositions are formed, which are at first yellowish earthy, and of little consistence. This is morafs-ore. In course of time, it becomes harder, and the colour passes to brown, forming swamp-ore. After the swamp is dried up, the ore becomes much harder, and passes into meadow-ore, which is covered with soil and vegetation.

BOLE. See **BOLE**.

BOLOGNESE Spar, or Radiated Heavy Spar. See **HEAVY Spar, Addenda**.

BORACIC Acid, Native or Saffoline, is found in saline incrustations on the borders of hot springs, near Saffo, in the territory of Florence. It has a greyish or yellowish-white colour; it occurs in thin crusts or minute pearly scales; it is soft and friable, and is feebly translucent. To the taste, it is slightly bitter and acidulous. It melts easily before the blow-pipe into a transparent globule. According to Klaproth, the constituent parts are,

Boracic acid	-	-	-	86
Ferruginous sulphate of magnesia	-	-	-	11
Sulphate of lime	-	-	-	3
				100

BORACITE, Magnese boratée, Haüy. (See **BORACITE**.) Vauquelin found no lime in this mineral, and supposes it to be a simple borate of magnesia. Boracite is remarkable for its electric properties when heated. The form is generally that of the cube, and those angles which are diagonally opposite are, one positive, and the other negative, forming eight electric poles.

BOTRYOLITE occurs in mamillary or botryoidal concretions, in a bed of gneiss, near Arendal in Norway, associated with quartz, fchoal, calcareous spar, and iron pyrites. Its colours are, pearl-grey, greyish or reddish-white, and pale rose-red. The colours are concentric stripes. It has a delicately fibrous stellular structure, and sometimes a splintery fracture. It has a pearly glimmering lustre internally, is translucent on the edges. According to Klaproth, the specific gravity is 2.88; and the constituent parts are,

Silex	-	-	-	-	36.0
Lime	-	-	-	-	39.5
Boracic acid	-	-	-	-	13.5
Oxyd of iron	-	-	-	-	1.0
Water	-	-	-	-	6.5
					96.5

Earthy botryolite occurs with the above, which has a snow-white colour, and an earthy fracture.

BOVEY Coal. Bituminous wood coal, found at Bovey Heathfield, Devonshire. See **COAL**.

BRONZITE, Diallage metalloide, Haüy. A mineral nearly allied to Labrador hornblende or hyperfene. It has a yellowish-brown or pinchbeck-yellow colour, and a semi-metallic lustre: it occurs massive, and coarsely disseminated: it has a foliated and fibrous structure, with a distinct single cleavage. It is opaque. The specific gravity is 3.2. According to Klaproth, the constituent parts are,

Silex	-	-	-	-	60.0
Magnesia	-	-	-	-	27.5
Iron	-	-	-	-	10.5
Water	-	-	-	-	0.5
					98.5

It occurs in sienite at Glentilt, in Perthshire, and at the Lizard, in Cornwall, intermixed with jade in serpentine.

BROWN Spar, Pearl Spar, or Dolomite Spar; Chaux carbonatée ferro manganesefere, Haüy; *Bitter Spar*, Werner. Its prevailing colours are, milk-white, greyish-white, yellowish-grey, and pearl-grey: it also occurs red, brown, yellow, and black. It occurs both massive and crystallized in oblique rhomboids, and in compressed hexahedrons. The joints are parallel to the faces of an oblique rhomboid, the alternate angles of which measure 106° 18' and 73° 45'. The faces of the rhomb are sometimes convex or concave; it occurs also in lenticular forms. The lustre is shining, and between vitreous and pearly: it is more or less translucent. It yields to the knife, but is harder than calcareous spar. Its specific gravity is from 2.18 to 2.88. It hardens and becomes an opaque brownish-black before the blow-pipe. It dissolves slowly in cold muriatic acid, but with considerable effervescence in hot acid. According to Klaproth, the constituent parts are,

Carbonate of lime	-	-	-	53
magnesia	-	-	-	43
Oxyd of iron and manganese	-	-	-	3
				99

MINERALOGY.

The proportion of manganese and iron is sometimes much greater, and there are several intermediate varieties, which it is difficult to determine whether they are to be classed with brown spar or spar iron-ore. Brown spar occurs in veins along with galena and other ores of lead, in the mines of Cumberland and Northumberland. Fibrous brown spar, both massive and in balls, occurs in veins in Lower Hungary. Columnar brown spar has a splendent lustre and a foliated fracture, but no distinct cleavage can be observed in it. The fragments are wedge-shaped. It has been found at Gerdford in Saxony, and Guanaxto in Mexico. The name brown spar was given to this species because it changes its colour, on exposure to the air, from a light to a dark brown, bordering on black.

BUTTERMILK, Silver. See SILVER-ORES.

BYSSOLITE, a name given by Sauffure to a variety of asbestos actinolite, which occurs in minute acicular diverging crystals, which are elastic. See ACTINOLITE.

CACHOLONG, Quarz agate cacholong, Häüy, is by some mineralogists considered as a variety of milk-white chalcedony, by others as a kind of common opal. Cacholong is distinguished by its milk-white colour, its resinous lustre, its even fracture, and its want of translucency, except at the edges. It sometimes adheres when applied to the tongue. This mineral accompanies flints and chalcedony, and, according to Brongniart, even pitch-stone is sometimes coated with it; hence it is supposed to be the result of alteration in these minerals, produced by an unknown cause, as it is observed passing into them by almost imperceptible gradations. The true cacholongs, which have given the name to this variety, are found near the banks of the river Cach, in Bucharia; they are spread over the fields, but are not rounded; on the contrary, they form tables composed of alternate layers of cacholong and chalcedony. Cacholongs are sometimes cut and employed in jewellery.

CALAMINE. See ZINC-ORES.

CALCAREOUS Spar, crystallized carbonate of lime. See LIME-STONE.

CALC Sinter. See *Stalactical fibrous Lime-stone*, in the article LIME-STONE.

CALC Tufo, or Tuffaceous Lime-stone, a light porous limestone, formed by the deposition of calcareous matter, in calcareous springs, or near lakes or rivers. It frequently encloses the remains of animals or vegetables which have been encased and imbedded in it by successive depositions. See TUFA.

CALP, a name given by Kirwan to a dark ferruginous limestone, agreeing in many of its characters with the English lias. See LIAS, *Addenda*.

CANDLE Coal. Bituminous coal, so called on account of the great light which it affords in burning. See COAL.

CAT'S-EYE, Quarz agate chatoyant, Häüy; by some mineralogists called *falsé opal*. It appears to be a variety of agate occurring like the latter mineral in trap rocks, but remarkable for reflecting a peculiar play of colour, resembling that of the eye of a cat, whence its name; it is used in jewellery, and is generally cut into ring stones. Cat's-eye occurs massive and in loose angular and rounded pieces; its colours are various, inclining most frequently to yellowish and greenish-grey, and sometimes to brown-red and greyish-black. It exhibits a beautiful opalescence when cut in a spherical form, which proceeds from the fibrous structure, and sometimes from the intermixture of amianthus. It is translucent in different degrees; it has a shining vitreo-resinous lustre, a small conchoidal fracture; it scratches quartz. Cat's-eye becomes opaque and spotted by exposure to the

blow-pipe. Its specific gravity is 2.64. According to Klaproth, its constituent parts are,

Silix - - - -	95.00
Alumine - - - -	1.75
Lime - - - -	1.50
Oxyd of iron - - - -	0.25
	98.50

Cat's-eye occurs in the Hartz, in Hanover, in trap, with amianthus, asbestos, axinite, and calcareous spar. It is brought from Ceylon, Malabar, Sumatra, Persia, and Arabia.

CELESTINE, sulphate of strontian. See STRONTIAN.

CERIUM, or Cerite, Cerium oxyd silicifere, Häüy, a new ore of the newly-discovered metal cerium. (See CERIUM.) The colour is between rose-red and flesh-red, and also reddish-brown; when pulverised it is grey; it occurs both massive and disseminated. The fracture is splintery, the lustre glimmering and resinous. Opaque (Jameston), transparent (Aikin). It scratches glass with difficulty; it is brittle and easily frangible. Specific gravity 4.6 to 4.9. Infusible before the blow-pipe, but changes from grey to yellow. According to Klaproth, the constituent parts are,

Oxyd of cerium - - - -	54.5
Silix - - - -	34.5
Oxyd of iron - - - -	3.5
Lime - - - -	1.2
Water - - - -	5.0
	98.7

Cerium occurs in a bed of copper pyrites, situated in gneiss, near Riddarhytta, in Westmannland, Sweden.

CEYLANITE, Pleonaste, Häüy, is classed with the ruby family by Werner: its colours are a muddy dark-blue and greyish-black, which approaches to iron-black; it occurs in grains and in small crystals, either perfect octahedrons or truncated on the edges, or with the angles acumined by four planes, which are set on the lateral planes, also in rhomboidal dodecahedrons. The crystals are smooth and splendent; it is translucent on the edges. The fracture is flat conchoidal; it scratches quartz. Before the blow-pipe, it is infusible. The specific gravity of ceylanite is 3.8. According to Berzelius, the constituent parts are,

Alumine - - - -	27.25
Magnesia - - - -	14.63
Silix - - - -	5.48
Oxyd of iron - - - -	4.26
	51.62

This mineral was first found in the island of Ceylon, where it occurs in the sands of rivers with tourmaline, zircon, sapphire, and iron-sand. It occurs in lava from Vesuvius, with olivine, augit, and mica. It occurs also in basalt, near Andernach, on the Rhine.

CHABASIE and Chabasite. See ZEOLITE.

CHALCEDONY. See CHALCEDONY and QUARTZ.

CHALK. See CHALK, and GEOLOGY, *Addenda*.

CHERT, a variety of horn-stone; it differs from flint principally by being more opaque, and having less lustre; it occurs in nodules and masses in the sand under the chalk formation, and in beds in some mountain lime-stone.

CHIASTOLITE, or Hollow Spar, occurs crystallized in slender rhomboidal prisms, the edges of which are sometimes rounded,

MINERALOGY.

rounded; sometimes four prisms are arranged in the form of a cross. The prisms appear composed of two distinct substances, as if they had once been hollow, and these hollows filled up with clay-slate, nearly similar to what the crystals are imbedded in. The exterior part of the prism is of a greyish-white or reddish colour, and varies in thickness, in some specimens being a mere shell; within this, is a dark-blue or black prism, exactly parallel to that by which it is inclosed. Frequently from each angle of the interior prism a black line or thread proceeds, bisecting the corresponding angle of the white prism, and often terminated by a small black prism. The white part exhibits a lamellar structure, parallel with the lateral planes of the prism: it has a slight glistening lustre, is translucent, and scratches glass. The specific gravity is 2.9. Before the blow-pipe, it fuses into a whitish scoria; the black part affords a black glass. This mineral occurs in acicular crystals in some beds of dark slate in the mountain Skiddaw, Cumberland. The largest crystals are found in clay-slate, near St. Brieux, in Brittany. Some mineralogists consider chialolite as the same substance as andaluite; others class it with common feldspar, and some regard it as a distinct species.

CHLORITE, Talc chlorite, Häuy. This mineral is nearly allied to talc and mica. The prevailing colour is various shades of green; hence it derives its name from the Greek *χλωρος, green*. It is divided by professor Jameson into four sub-species: earthy chlorite, common chlorite, slaty chlorite, and foliated chlorite.

Earthy Chlorite occurs massive and disseminated, and incrusting other minerals, and inclosed in dendritical forms in adularia and rock-crystal. It consists of fine scaly particles closely adhering, and has a glimmering or glistening pearly lustre, and feels rather greasy. The green colour becomes lighter in the streak. The specific gravity is 2.6. Before the blow-pipe, it melts into a blackish slag. According to Vanquelin, the constituent parts are,

Silix	-	-	26.50
Alumine	-	-	18.50
Magnesia	-	-	8.00
Muriate of soda	}	-	2.00
and potash	}	-	43.00
Oxyd of iron	-	-	98.00
			98.00

According to Häuy, the scaly particles are regular hexagonal prisms when viewed with the microscope.

Common Chlorite is a leek or dark-green colour, intermixed with black. It occurs in rocks of various kinds, in beds and veins, either alone, or with quartz, magnetic iron-stone, iron-pyrites, hornblende, actinolite, and other minerals. It is amorphous, has a glimmering lustre, an earthy fracture, and a fine granular, laminated, or scaly structure. Common chlorite is soft, opaque, and greasy. Its specific gravity is 2.8. It occurs in various parts of Scotland, and in Cornwall, Cumberland, and all alpine parts of England.

Foliated Chlorite: Talc chlorite, Häuy.—Its colour is leek-green: it occurs crystallized in six-sided tables, curiously aggregated in cylindrical or conical forms. The crystals are longitudinally streaked. The lustre is resinous, either glistening or shining. The fracture is curvately lamellar, with a single cleavage. It is opaque or translucent at the edges; it is soft, sectile, and rather greasy. The specific

gravity is 2.8. According to Lampadius, the constituent parts are,

Silix	-	-	35
Alumine	-	-	18
Magnesia	-	-	30
Iron	-	-	19
Water	-	-	3
			105

Foliated Chlorite is found in various parts of the continent of Europe, and on the island of Jena, one of the Hebrides.

Chlorite Slate has a greyish or darkish-green colour; it occurs in beds in clay-slate, sometimes associated with talc-slate, into which it passes. It has a glistening resinous lustre, a slaty structure, inclining to scaly. On minute examination, it appears composed of small scales of chlorite closely adhering. Chlorite-slate forms beds in mountains of clay-slate in various parts of the Grampian-hills. It passes into hornblende-slate and clay-slate. The specific gravity is 3.03.

CHLOROPHANE, a variety of fluor spar from Siberia, which gives out a beautiful apple-green light when placed on a heated iron. Pallas mentions a pale-violet blue variety spotted with green, which becomes phosphorescent when held in the hand, and gives out a pale-whitish light; in boiling water, it emits a green light, and at a higher temperature a blue light. See FLUOR SPAR.

CHROMATE of Iron, Fer chromaté, Fr. has a pitch-black colour, with somewhat of an olive tinge superficially. It occurs massive and disseminated, and also crystallized in octahedrons. It has a shining lustre, between resinous and metallic. The fracture is uneven, or imperfectly small conchoidal, and sometimes imperfectly lamellar. It scratches glass, is opaque. The colour of the streak is ashy-grey or brownish. The specific gravity is 4.03. It is rarely magnetic, is infusible, but tinged borax of a beautiful green colour. According to Vauquelin, the constituent parts are,

Chrome of France.			
Oxyd of chrome	-	-	43
Oxyd of iron	-	-	35
Alumine	-	-	20
Silix	-	-	2
			100

According to Klaproth,

Chrome of Storia.			
Oxyd of chrome	-	-	55
Oxyd of iron	-	-	33
Alumine	-	-	6
Silix	-	-	2
Lofs by heating	-	-	2
			98

Chromate of iron occurs in beds and veins, and in imbedded masses, in serpentine and talc-slate. It has been found at Portloy, in Bamshire, and is said to occur in considerable quantities in the Shetland islands. It occurs in the vicinity of Nantes, and in the department of Van. The greatest quantity has hitherto been found in serpentine, in the Bare-hills near Baltimore. The chromic acid

MINERALOGY.

acid obtained from this mineral when combined with lead forms a beautiful yellow pigment, and is now an article of commerce.

CHROMATE of Lead, red lead-ore. See LEAD-ORES.

CHRYSOCOLLA, Earthy Malachite, Criore malachite cryscolle, Fr. See COPPER-ORE.

CHRYSOLOITE, Peridot chrysolite, Fr. (See CHRYSOLOITE.) This gem is the fittest of the precious stones; its colours change by heat. It is brought to Europe from the shores of the red sea. *Jamefon.*

CHRYSOPISE. Apple-green chalcidony coloured by the oxyd of nickel. (See CHRYSOPISE.) It has hitherto been found only in the vicinity of the towns of Glaffendorf, Groebau, and Kofemutz, in Lower Silefia. It is softer than common chalcidony. It is used in jewellery.

CIMOLITE. See CIMOLITE.

CINNABAR, Mercure sulphurée, Häüy. (See MERCURY-ORES.) Besides the localities of cinnabar there enumerated, various mines of cinnabar occur in New Spain. In the kingdom of New Granada, cinnabar is found in three different places in veins, and also in alluvial soil, mixed with gold. In Peru, cinnabar occurs in various parts, particularly near the town of Huancavelica, at the height of twelve thousand feet above the level of the sea. Cinnabar is found in veins near to Sillacara, intersecting alpine lime-stone; these veins, according to Humboldt, at present furnish all the mercury of Peru.

CINNAMON-STONE. This gem was originally found in the sands of rivers in Ceylon. It has been classed with hyacinth, but is a variety of garnet. Its colours are, hyacinth-red inclining to orange-yellow. It is found in blunted-angular or in roundish pieces. It has a shining vitreous lustre approaching to splendent. The fracture is flat and small conchoidal. It is transparent or semi-transparent, but generally full of cracks. It scratches quartz with difficulty. When cut it feels rather greasy. The specific gravity is 3.6. According to Klaproth, the constituent parts are,

Silex	-	-	-	38.80
Alumine	-	-	-	21.25
Lime	-	-	-	31.25
Oxyd of iron	-	-	-	6.50
				97.80

Before the blow-pipe, it fuses into a blackish enamel. When free from flaws it is of considerable value.

CLAY, Porcelain Clay, Potters' Clay, and Slate Clay. See CLAY.

CLAY Iron-stone, Argillaceous Iron-stone; Fer oxydé mafif; Häüy. (See IRON-ORES.) The name has been inappropriately given to this species of iron-ore, as it frequently contains scarcely any alumine or clay in its composition. The following analysis of Defcotels, given in the Ann. de Chemie for 1812, N^o 251, will shew how greatly this species of ore varies in its composition.

	From Blancheland.	Geifantern.	Colebrookdale, Shropshire.
Oxyd of iron	54.0	38.60	50.0
Oxyd of manganese	2.4	1.8	2.6
Silex	12.0	32.0	10.6
Alumine	1.0	4.0	2.0
Magnesia	2.0	4.3	2.4
Carbonic acid and water	24.0	20.0	32.0

In these specimens, the iron was in the state of carbonate;

in others, it exists in the state of oxyd. According to Mr. Jamefon, it would appear that the carbonated iron-stones by decomposition lose their carbonic acid, and are in time converted into the oxydated varieties. In those common clay iron-stones which have a yellow or brown streak, the iron is in the state of hydrate; in those having a red streak in the oxydated state, and in most of the varieties having a grey streak, the iron is carbonated. When the carbonated varieties begin to decay they become soft, and assume a liver or reddish-brown colour. This species of iron-stone, besides occurring in numerous thin strata alternating with coal-shale and sand-stone in the coal formation, occurs in kidney-shaped and rounded nodules. The greatest repository of this ore in Great Britain is in the coal basin extending from Pembrokehire into Glamorganhire, on the borders of the Britol Channel.

CLAY-SLATE, Argillaceous Schistus. See SLATE.

CLAY-STONE is nearly connected with basaltic and porphyritic rocks of the trap formation. It forms the basis of clay porphyries. The colours of clay-stone are blueish and yellowish-grey or yellowish-white, lavender-blue and brownish-red. It is sometimes spotted and striped. It has a fine earthy fracture, sometimes inclining to flaty or conchoidal. The fragments are angular and rather blunt-edged. It is opaque, yields to the knife, and is rather easily frangible. The specific gravity is 2.2. It occurs in various parts of Scotland, in North Wales, and in Shropshire.

CLINK-STONE, Phonolite, Porphyry-slate, Felspath compacte fonore, Fr. has most frequently a greenish-grey colour. It occurs in beds of considerable magnitude in rocks of the trap formation. (See TRAP.) The principal fracture is flaty, with a scaly aspect and a glittering pearly lustre. The cross fracture is splintery and faintly glimmering. It occurs columnar and tabular, is translucent on the edges, and easily frangible. The thin tables yield a metallic found when struck. The specific gravity is 2.8. It melts before the blow-pipe into a grey-coloured glass. According to Klaproth, the constituent parts are,

Silex	-	-	-	57.25
Alumine	-	-	-	23.50
Lime	-	-	-	2.75
Soda	-	-	-	8.10
Oxyd of iron	-	-	-	3.25
Manganese	-	-	-	0.25
Water	-	-	-	3.00
				98.10

This mineral is regarded as principally composed of compact felspar. It passes into basalt, with which rock it is often associated.

COAL, Black and Brown. (See COAL, and COLLIERIES.) The coal called by the Germans glance-ore is described in that article as unflammable or Kilkenny coal. For a further account of it, see GLANCE-COAL, *Addenda.*

COBALT-ORES. (See COBALT.) Earthy cobalt-ore has been found in sand-stone at Alderly-edge, in Cheshire; and other ores of cobalt have recently been discovered in several mines in Cornwall.

COCCOLITE, Pyroxene granuliform, Häüy. A granular variety of augit. (See AUGIT.) The colour is various shades of green. It occurs in slightly coherent granular concretions, has a lamellar structure, a shining vitreous lustre, is more or less translucent, and scratches glass. The specific

MINERALOGY.

specific gravity is 3.3. According to Vauquelin, the constituent parts are,

Silix	50.0
Lime	24.0
Magnesia	10.0
Alumine	1.5
Oxyd of iron	7.0
Oxyd of manganese	3.0
	95.5

COLUMBITE, an ore of tantalum. See TANTALITE.

COMPACT *Felspar*. See FELSPEAR, *Addenda*.

COPPER NICKEL. See NICKEL-ORES, *Addenda*.

COPPER-ORES. (See COPPER-ORES, and PHOSPHATE of Copper, *Addenda*.) The following table of the annual quantity of copper raised in Europe is given in the last edition of Jamefon's Mineralogy, vol. iii. p. 196. The authority is not stated.

Quintals of 100 Pounds.	
England	200,000
Russia	67,000
Austrian dominions	60,000
Sweden	22,000
Kingdom of Westphalia in 1808	17,229
States of Denmark	8,500
Bavaria (including the Tyrol)	3,000
France	2,500
Saxony in 1808	1,320
Prussia after the treaty of Tylit	0,337
Spanish European mines	0,309
	382,195

CORNELIAN. See CHALCEDONY and AGATE.

CORUNDUM, *Corinden*, Fr. The French mineralogists class as varieties of corundum the oriental *ruby*, the *sapphire*, and *emery*. (See these articles.) Though they are principally composed of alumine, they are, excepting the diamond, the hardest of mineral substances, and nearly the heaviest of earthy minerals, the specific gravity being from 3.87 to 4.28. Common corundum, or adamantin spar, has a greenish-white colour: it is sometimes pearl-grey, brown, or red. It is translucent and sometimes nearly transparent, and is doubly refracting. It has a distinct lamellar structure, and splits into rhomboids, the angles of which are 86° 38' and 93° 22'. (See ADAMANTINE SPAR.) This mineral is found imbedded in granite, like felspar, in various parts of India, and also in North America, and imbedded in micaceous schist in Italy.

CROSS-STONE, *Harmotome*, Haüy. See ZEOLITE.

CRYOLITE, *Alumine fluatée*, Fr. This mineral has hitherto been found only in West Greenland. It occurs in two thin layers in gneiss. Its name is derived from the Greek word denoting ice, because this mineral melts almost like ice at a low heat. Its colours are pale greyish-white, snow-white, and yellowish-brown. It occurs massive and disseminated. It has a shining or glistering vitreous lustre, inclining to pearly, and is translucent. The structure is imperfectly lamellar, with joints in three directions parallel to the faces of a rectangular parallelepiped. It is softer than fluor spar, and is easily frangible. The specific gravity is 2.9. It becomes more translucent in water, but does not melt. Before the blow-pipe it first melts, then hardens,

and assumes the appearance of a slag. According to Klaproth, the constituent parts are,

Alumine	24
Soda	36
Fluoric acid and water	40
	100

According to Vauquelin,

Alumine	21
Soda	32
Fluoric acid and water	47
	100

CRYSOBERYL, *Cymophane*, Haüy. See CRYSOBERYL.

CUBE-ORE, *Arseniate of Iron*, *Fer arseniate*, Haüy. See IRON-ORE.

CUPREOUS *Arseniate of Iron*, *Martial Arseniate of Copper*. See COPPER-ORES.

CYANITE, or *Kyanite*; *Sappare*, *Sauffleure*; *Dortheue*, Haüy. See KYANITE, *Addenda*.

DATOLITE, (see DATHOLITE,) is composed of boracic acid, united with lime and flux. It occurs massive and crystallized in oblique four-sided prisms, generally truncated on the edges and angles. The primitive form of the crystal is flated by Hanfmann to be an oblique four-sided prism, with angles of 77° 30' and 102° 30'. It gelatinizes with acids. In the flame of a candle it becomes opaque and friable. Before the blow-pipe it intumesces, and then melts into a globule of a pale rose-colour.

DIALLAGE, *Smaragdit* of Sauffleure; *Diallage verte*, Haüy. Its colours are grass-green and apple-green; it occurs massive and disseminated. The lustre is shining, glistering, and pearly; it is translucent on the edges. Diallage has a lamellar structure, with a two-fold nearly rectangular cleavage, only one of which is distinct. It is rarely so hard as glass. The specific gravity is 3. Before the blow-pipe, it melts into a grey or greenish enamel. According to Vauquelin, the constituent parts are,

Silix	50.00
Magnesia	6.00
Alumine	11.00
Lime	13.00
Chrome	7.00
Iron	6.30
Copper	1.50

Diallage is found in Corfica with sauffleurite, and on Mont Blanc in Switzerland; also in Carinthia and Transylvania. The mixture of diallage and sauffleurite is named *Gabbro* by the Italians, *Euphotide* by the French, and *Verde de Corfica duro* by artists. When cut and polished it has a beautiful appearance, and is made into various articles of ornament.

DIALLAGE *Metalloide*. See BRONZITE, HYPERSTENE, and SCHILLER SPAR, *Addenda*.

DIAMOND, *Diamant*. (See DIAMOND.) In addition to the characters of the diamond given under that article, it may be proper to state, that besides the colours there enumerated, the diamond occurs sometimes blue, red, brown, yellow, and green, with the following transitions. The only variety of blue is indigo-blue, which appears to pass into red. Of red, the varieties are rose-red and cherry-red. From the latter colour it passes into olive-brown, and yellowish-brown, ochre-yellow, orange-yellow, wine-yellow, and

MINERALOGY.

and sulphur-yellow; further into fiskin-green, asparagus-green, pistachio-green, leek-green, and mountain-green, which latter passes into greenish-grey and greenish-white.

The olive-brown passes into blackish-brown, pitch-black, and greyish-black.

Besides occurring crystallized, the diamond is also found in rolled pieces and grains. The crystallizations of the diamond, besides the octahedron and its varieties, are, the perfect tetrahedron; the tetrahedron with truncated angles, or with the angles acumined by three planes, set on the lateral planes; segments of the tetrahedron, either detached or united, forming twin crystals; the rhomboidal dodecahedron, with convex planes or faces; the fame figure somewhat elongated; the dodecahedron, with the planes divided diagonally; an acute double six-sided pyramid, with the lateral planes set on each other, and the apex acumined by six planes set on the lateral planes; a flat double three-sided pyramid, with convex planes set laterally on each other, and the angles of the common base acumined by four planes set on the lateral planes; a flat double three-sided pyramid, on which the lateral planes of the one are set on the lateral edges of the other, and the angles of the common base truncated; a six-sided table, with oblique terminal plates; and lastly, the diamond has been found in a cubic form, either perfect or with the edges truncated, or variously modified.

The surface of the octahedron is either smooth or streaked; the external lustre of the natural diamond is adamantine, and alternates from splendent to glimmering; internally it is highly splendent. It is seldom completely transparent. The black diamonds are nearly opaque. The diamond has a four-fold equiangular cleavage parallel with the planes of the octahedron in this direction; it is rather easily frangible. The diamond scratches all other minerals. Its specific gravity is stated by Mr. Lowry at 3.488. The diamond, besides its other localities, is found in the district of Serro Dofria, in Brasil: it was first discovered there about the middle of the last century, in gullies of torrents, and the beds of rivers, where gold is also obtained, but for a very considerable time, the diamonds being unknown, were disregarded and thrown away. Diamonds occur also in other parts of Brasil, in the rivers Giquitignogna, Riacha Fundon, and Rio de Peixe. See GEM.

DIASPORE is regarded as a variety of wavelite. (See WAVELLITE.) It occurs in curved lamellar concretions easily separable from each other; it has a grey colour, a shining pearly lustre, the angular pieces cut glass. It flies before the blow-pipe, but is infusible. Its specific gravity is 3.43. According to Vauquelin, the constituent parts are,

Alumine	80
Water	17
Oxyd of iron	3
	100

DICHOITE. See IOLITE, *Addenda*.

DIOPSIDE. See ALALITE, *Addenda*.

DIOPHANE, *Emerald Copper Ore*, occurs in crystallized six-sided prisms, acumined by three planes set on the lateral edges: it is translucent, and scratches glass feebly. The specific gravity is 3.3. Häuy. According to Luvitz, the constituent parts are,

Oxyd of copper	55
Silex	33
Water	12
	100

A very small specimen analysed by Vauquelin gave forty-two per cent. of lime. This mineral is found, according to Hermann, in the land of Konguire, 125 leagues from the Russian frontier, where it is associated with malachite and calcareous spar.

DIPYRE. See ZEOLITE.

DISTHENE, or *Kyanite*; *Sappare*, *Sauffleure*. See KYANITE, *Addenda*.

DOLOMITE, a species of magnesian lime-stone, to which the name was given in honour of Dolomieu, the celebrated French Geologist. Mr. Jamefon has classed the different kinds of magnesian lime-stone into one order, which he calls the dolomite family: it contains four species, dolomite, brown spar, mienite, and gurhofite. The dolomite species he has divided into four sub-species, *common dolomite*, *dolomite spar* or *rhomb spar*, *columnar dolomite*, and *compact dolomite* or *magnesian lime-stone*.

Common dolomite occurs in beds in primitive mountains, and frequently contains tremolite. It nearly resembles primitive lime-stone or statuary marble, the *chaux carbonatée sacaroïde* of the French, but may be distinguished from it by the little effervescence which it yields on the application of mineral acids compared with the former. The grains of dolomite are also more loosely adhering than in white primitive lime-stone. The mineralogical characters of common dolomite are given under the article DOLOMITE. Dolomite generally phosphoreces when rubbed in the dark or heated. The constituent parts of different dolomites are given by Klaproth as under:

	St. Gothard.	Apperiones.	Carinthia.
Carbonate of magnesia	46.50	38.00	48.00
Carbonate of lime	52.00	65.00	52.00
Oxyd of manganese	0.25	-	-
Oxyd of iron	0.50	-	-
Loss	0.75	-	20
	100	103	100.20

Flexible dolomite is found in the mountain of Campo Longoman, St. Gothard.

DOLOMITE *Spar*, or *Rhomb Spar*. See BROWN *Spar*, *Addenda*.

DOLOMITE, *Columnar*, occurs in serpentine, in a mine at Mjafs, in Russia, in straight prismatic concretions: its colour is pale greyish-white, the lustre vitreous inclining to pearly. It is feebly translucent. The specific gravity is 2.765. According to Klaproth, the constituent parts are,

Lime	28.20
Magnesia	19.74
Oxyd of iron	0.50
Carbonic acid	39.25
Water	11.31
Loss	1.

DOLOMITE, *Compact*, magnesian lime-stone. See MAGNESIAN *Lime-stone*, *Addenda*.

EGYPTIAN JASPER. See JASPER.

EALALITE, *Fettstein*, Werner; *Piene-graffe*, Häuy. The colours of this mineral are dark-greenish or blueish-grey, and flesh-red; it is translucent in a low degree, and has a shining refinous lustre. The bluish varieties display a peculiar opalescence. It occurs massive, and has a distinct double cleavage. The fracture is uneven. It scratches glass, is rather

MINERALOGY.

rather easily frangible, and melts before the blow-pipe into a white enamel. When pounded it gelatinizes in acids. The specific gravity is 2.58 to 2.61. According to Klaproth, the constituent parts are,

Silex	-	-	-	46.50
Alumine	-	-	-	30.25
Lime	-	-	-	0.75
Potash	-	-	-	18.00
Oxyd of iron	-	-	-	1.00
Water	-	-	-	2.00
				98.50

According to Vauquelin,

Silex	-	-	-	44.00
Alumine	-	-	-	34.00
Lime	-	-	-	0.12
Potash and soda	-	-	-	16.50
Oxyd of iron	-	-	-	4.00
				98.62

This mineral has hitherto been found only in the rock named zircon fenite. (See ZIRCON *Sienite*.) It is classed by Mr. Jameson in the felspar family; but is placed by Werner between jasper and cat's-eye.

ELASTIC *Mineral Pitch*, or *Elastic Bitumen*. Mineral caoutchouc. *Bitume elastique*, Häuy. See BITUMEN.

ELECTRUM, an argenteiferous gold-ore, or native alloy. Its colour is a pale brassy-yellow. It is not soluble either in nitrous or nitro-muriatic acid. It contains, according to Klaproth,

Gold	-	-	-	64
Silver	-	-	-	36
				100

It occurs at Schlangenbergl, in Siberia.

EMERALD, *Emeraude verte*, Häuy. See EMERALD.

False emeralds are sometimes offered for sale, which are either green fluor spar, green quartz, or prase. The emerald of Brasil is sometimes the green tourmaline. The true emerald is harder than quartz. The beryl and the emerald have both the same primitive form of the crystal or the hexahedral prism. The terminal planes of the emerald are rough, those of the beryl smooth. The emerald agrees in chemical composition with the beryl, both containing from thirteen to fourteen parts of the newly-discovered earth glucine; but the colouring matter of the emerald *chrome* is wanting in the beryl. See GEM.

EMERY, *Corindon granulaire*, Häuy. (See EMERY.) This mineral owes its hardness to an intermixture of blue corundum. See ADAMANTINE Spar, and CORUNDUM, *Alundada*.

EPIDOTE. (See PISTAZITE, and THALLITE. Under the latter article, for Arundel in Norway *r. Arendal*.) Epidote occurs at the Malvern-hills in Worcestershire, at Wallow Cragg near Kewick in Cumberland, and near Marazzion in Cornwall.

EPSOM Salt, *Native*, or sulphate of magnesia, occurs as an efflorescence at Hurlet near Paisley, and sometimes is found efflorescent on old walls, and on the surface of different rocks, particularly gypsum, sand-stone, clay, and compact lime-stone.

EUCLARE. See EUCLARE.

FÄHLERZ, Werner; grey copper ore. See COPPER-ORES.

VOL. XXXIX.

FELSPAR. (See FELSPAR.) The name of this mineral appears to be derived from the Saxon term *fell*, a mountain, still used in the northern counties of England; hence felspar, in its original signification, denoted mountain spar. In the mineralogical systems of Werner and Mr. Jameson, the felspar family comprises various species of minerals, which are supposed to be nearly allied to felspar. The felspar species is also divided into *adularia*, *glassy felspar*, *Labrador felspar*, *common felspar*, *dysintegrated felspar*, and *compact felspar*.

Adularia. (See FELSPAR.)—The forms of crystals of *adularia* are the same as those of common felspar. It possesses double refraction. It melts before the blow-pipe into a transparent white glass. *Adularia* occurs in veins in granite and gneiss, in various parts of Aberdeenshire and Bamfshire, in the isle of Arran, and in the granite of Switzerland, France, and Germany. The largest and most beautiful crystals are found in the mountain of Stelia, a part of St. Gothard. Rolled pieces having a beautiful pearly light are collected in the island of Ceylon. The variety which exhibits a strong pearly light is cut in a semi-globular form, and is sold under the name of *morn-stone*, and is usually worn as a ring-stone.

Glassy Felspar occurs always crystallized in broad rectangular four-sided prisms, bevelled on the extremities. These crystals are very much cracked, and always imbedded. It is transparent, and has a splendid vitreous lustre internally. Its other characters agree with *adularia*. It occurs in pitch-stone and trap in various parts of Scotland.

Labrador Felspar. See FELSPAR.

Common Felspar occurs variously crystallized. Häuy enumerates more than twenty of its secondary forms; several of them are represented *Plate I. figs. 8, 9, 10, 11, 12, &c. Crystallography*. The primitive form is an oblique-angled parallelepiped. The structure is perfectly lamellar, with a double, very distinct, rectangular cleavage, and an oblique indistinct cleavage intersecting the two former. The four rectangular planes have splendid faces; the faces of the oblique cleavage are dull. This remarkable character is peculiar to felspar, and may very frequently be observed in the rhomboidal fragments of this mineral. Felspar has been frequently analysed with different results. According to Berzelius, the most probable composition of common felspar, so far as we can calculate it from the many analyses of which we are in possession, is, that the alumine bears the same proportion to the potash as in alum, and that the silica contains three times the oxygen of the base. The following is therefore a comparison between the calculated and experimental results, according to the principles of Berzelius's new system of mineralogy. See SYSTEMS of Mineralogy.

	Vauquelin.	Klaproth.	Rose.	Calculated	Result.
Silica	64	- 62	- 68	- 66	- 66.26
Alumine	20	- 17	- 15	- 17	- 17.61
Potash	14	- 13	- 14	- 12	- 16.13
Lime	2	- 3			
Protoxyd of iron	}	- 1	-	-	1

The lime and protoxyd of iron are regarded as accidental admixtures. Felspar is one of the principal constituent ingredients of many of the rocks called primary, in many of the trap rocks, and many of the lighter-coloured lavas. It forms an essential constituent part of granite, gneiss, sienite, green-stone, and forms the base of many porphyries, and the rock called *subite-stone*. (See WHITE-STONE.) In green-stone, the felspar is often tinged of a green colour, from the admixture of hornblende or augit. In many of the porphyries, it exists in a compact state, or as *compact felspar*. The colours of compact felspar are various shades of white, grey, green, or red. The lamellar

MINERALOGY.

lamellar structure is nearly lost in many of the compact feldspars, particularly in those varieties which have little lustre. When it contains crystals of quartz or feldspar, it constitutes a feldspar porphyry. It forms extensive beds in many alpine districts. It is distinguished from horn-stone by its inferior hardness, fusibility, and its frequent intermixture with hornblende or mica.

Disintegrated Feldspar has generally a greyish-white colour. It occurs massive and in imbedded crystals which have the same form as common feldspar. It is glistening, glimmering, or dull, and soft and sectile. In some instances, it appears to be feldspar in a decomposing state; in others, to be a softer kind of feldspar in an unaltered state.

FIBROLITE, a mineral which occurs with corundum; it has a white or grey colour, is crystallized in rhomboidal prisms, the angle of whose planes are 80° and 100°. It has a fibrous structure, and an uneven cross fracture. Internally it is glistening. Fibrolite is harder than quartz. Its specific gravity is 3.21. According to Chenevix, the constituent parts are,

Alumine	-	-	-	58.25
Silex	-	-	-	38.00
Iron and loss	-	-	-	3.75
				100

FIGURE-STONE. Agalmetolite, or bilditeen.

FISH-EYE-STONE, or ichtyophthalmite.

FLINT. See FLINT.

FLOAT-STONE, *Quarz netique*, Häuy; sometimes called swimming quartz. Its colours are yellowish-white and grey. It is dull, earthy, and friable, absorbs water and becomes translucent. Its specific gravity is less than water, being from 0.448 to 0.793. The constituent parts are,

Silex	-	-	-	91 to 98
Water	-	-	-	6
Carbonate of lime	-	-	-	2
Oxyd of iron and alumine	-	-	-	2

It is found at St. Oien, in the vicinity of Paris, along with flint, and sometimes contains the same petrifications as those found in flint. Flint is sometimes found in the centre of float-stone, and passes into it by gradation. Float-stone may therefore be considered as a porous state of flint.

FLOS FERRI, *Coralloidal Arragonite*, occurs in snow-white dendritical branches, either smooth or incruited with points. It is found in the mines at Dufton Fell, Westmoreland; it is supposed by count Bournon to be formed by sublimation.

FLUOR SPAR, *Flus*, Werner; *Chaux fluatée*, Fr. See FLUOR SPAR.

FOLIATED *Granular Lime-stone*. The name given by Mr. Jamefon to crystalline primitive lime-stone, called by the French *chaux carbonatée sauroide*. See LIME-STONE, and LIME-STONE, *Addenda*.

Fossil-COPAL, or *Highgate Resin*, a resinous substance found in perforating the bed of London clay at Highgate. It appears to be a true vegetable gum or resin, partly changed by remaining in the earth. It gives out a resinous aromatic odour when heated, and melts into a limpid fluid. It takes fire when applied to the flame of a candle, and burns away entirely before the blow-pipe. The colour of fossil-copal is a yellowish-brown: it has a resinous lustre, is brittle, and yields easily to the knife. The specific gravity is 1.046.

FULLERS'-EARTH, *Argile meétrique*, French. See FULLERS'-EARTH.

GADOLINITE. See GADOLINITE.

GALENA, or *Sulphuret of Lead*, *Lead Glance*; *Plomb sulphuré*, Häuy. See LEAD.

GARNET, *Grenat*, French. (See GARNET, *Precious*, and GARNET, *Common*.) The garnet family of Werner and professor Jamefon, in their mineralogical systems, comprises the following minerals, supposed to have an alliance with garnet: leucite, vesuvian, groffular, melanite, allochroite, garnet, granatite, pyrope, and cinnamon-stone. (See these articles in the preceding volumes, and in the *Addenda*.) In the British Museum, these minerals are classed together under the name of granatic substances, whereby the confusion of making the same word represent both the genus and species is avoided.

GLANCE-COAL, *Anthracite*. The coal which has a splendid lustre, and burns without flame. (See COAL.) It is principally composed of carbon, and passes into graphite, or black-lead. Werner divides glance-coal into three sub-species; conchoidal glance-coal, flaty glance-coal, and columnar glance-coal. See COAL.

GLAUBER SALT, *Native Glauberite*; *Sonde sulphatée*, Fr. occurs as a mealy efflorescence in the neighbourhood of some salt lakes, and occasionally encrusting sand-stone and marle-stone. It is sometimes stalaclitic, botryoidal, or crystallized in acicular crystals. According to Reufs, the glauber salt of Eger, in Bohemia, contains

Sulphate of soda	-	-	-	67
Carbonate of soda	-	-	-	16
Muriate of soda	-	-	-	11
Carbonate of lime	-	-	-	5
				99

GLASSY *Feldspar*. See FELSPAR, *Addenda*.

GLASSY *Tremolite*. See TREMOLITE.

GOLD. (See GOLD.) In addition to the localities of gold given under that article, we may state that native gold is found in some of the stream works of Cornwall, and, like the stream tin which accompanies it, was doubtless once a part of the metallic veins that have been destroyed by the natural disintegration of the rocks which these once intersected. We have seen globules of native gold the size of a pea in a matrix of quartz, in the possession of the Rev. Mr. Hennor, of Plymouth.

Native gold was found in alluvial soil in various parts of Scotland, and was once extensively worked at the lead-hills. In the time of queen Elizabeth, it is said that three hundred men were employed in searching for it, and that in the course of a few summers a quantity was collected equal to 100,000l. sterling. Gold was obtained a few years since in a ferruginous sand in Ireland, near Arklow, in the county of Wicklow. One mass of pure gold weighing twenty-two ounces was found, which was the largest piece hitherto discovered in Europe. The total amount of gold exported to Europe annually from the Spanish and Portuguese colonies in America is stated by Humboldt at 45,580 pounds troy, of which 25,000 pounds weight comes from the Spanish colonies; the remainder from the Portuguese, principally from the Brazils, where it is collected by washing the sands of rivers and alluvial deposits. Gold is found almost every where along the feet of these immense mountains which run in a chain nearly parallel with the coast, from 5° to 30° of south latitude. Many of the silver-ores in America are also rich in gold. (See SILVER.)

MINERALOGY.

SILVER.) For a more particular account of these repositories of the precious metals, we must refer our readers to the various travels of M. Humboldt, to whom we are indebted for almost all the correct information we have respecting the European colonies in South America. The quantity of gold and silver imported from these colonies between the years 1492 and 1803, he states at eleven hundred and sixty-six millions in pounds sterling; an amount somewhat exceeding that of the present national debt of England!!

GRAMMATITE, *Tremolite*. See TREMOLITE.

GRANULAR Lime-stone, statuary marble; *Chaux carbonatée sauaricide*, Fr. See LIME-STONE, and LIME-STONE, *Addenda*.

GRAPHIC Gold and Graphie Tellurium. See TELLURIUM.

GRAPHITE. Plumbago or black-lead, (see PLUMBAGO,) has an iron-grey colour, and a glimmering or glistening metallic lustre. It is fertile, and when fresh cut has a lead-grey colour: it is unctuous to the touch, yields to the nail, and leaves a distinct lead-grey mark on paper. Before the blow-pipe it gradually burns away, leaving a portion of red oxyd of iron. According to Berthollet, the constituent parts are,

Carbon	-	-	-	-	90.9
Iron	-	-	-	-	9.1

The graphite of Borrowdale occurs with ochreous and unctuous clay; it is found in nodules and masses of various sizes. The bed in which it is found lies in a rock of grey porphyrite felspar, which has been improperly called grey wacke. Three beds of fealy graphite have lately been discovered in a rock of mica-slate or gneiss, near Buley, in Inverness-shire.

GREEN Earth, *Chlorite zoographique*, French. This mineral, though made a distinct species by Werner, appears to be soft earthy chlorite (see CHLORITE); it generally occurs in cavities or incrusting agates in amygdaloid. It is of various shades of green, is soft and fertile, and adheres slightly to the tongue. The specific gravity is 2.5. Before the blow-pipe, it is converted into a black slag. It is used as a green colour in water-painting. When slightly burned, it affords a beautiful and durable brown.

GRANATE, *Staurolite*, Häüy; the staurolite of some mineralogists. (See STAUROLITE.) This mineral is classed in the garnet family by Werner; but it varies from garnet in the form of its crystal, which is an oblique four-sided prism, truncated on the acute lateral edges. Sometimes it is bevelled on the extremities by two planes set on the lateral edges, and the edge of the bevelment is truncated. The crystals sometimes intersect each other, forming a cross; hence it has been called cross-stone by some mineralogists: but it is a very distinct species from the *harmotome*, or cross-stone, which is a member of the zeolite family. (See ZEOLITE.) The colour of granate is dark reddish-brown. It is infusible before the blow-pipe. The above characters distinguish it from precious garnet. It occurs imbedded in mica-slate, and in talc, generally accompanied with kyanite and precious garnet.

GREY Antimony-Ore. (See ANTIMONY-ORES.) Grey antimony occurs in some of the mines in Cornwall in considerable quantities, particularly at St. Stephen's, Padstead, and Huel bays. It is found also at Glendenning, in Dumfriesshire.

GREY Cobalt-Ore. (See COBALT-ORE.) This mineral is found at Herland and Dolcooth mines, and in some other veins, in Cornwall.

GREY *Manganese-Ore*. See MANGANESE.
GYPSUM, selenite; *Chaux sulfatée*, Häüy. See GYPSUM.

HARMOTOME, *Cross-stone*. See ZEOLITE.

HÄÜYNE, *Latialite*, Häüy. A mineral classed by the German mineralogists with the azure-stone, or lapis lazuli family. It was first discovered in the volcanic rocks of Albano and Praefati, and called *latialite*, from ancient Latium, and was afterwards discovered in the basaltic rock of Andernach, and has been called *Häüyne*, in honour of the celebrated mineralogist Häüy. Häüyne has a sky-blue colour, passing into pale Berlin-blue and blueish-green. It occurs in imbedded grains, and crystallized in minute splendid rhomboidal dodecahedrons. The fracture is conchoidal, passing into uneven; it has a vitreous lustre, is transparent or semi-transparent, scratches glass, and is infusible before the blow-pipe. When pulverized, it gelatinizes with muriatic acid, giving out an odour of sulphuretted hydrogen. The specific gravity is from 3.1 to 3.3. According to Vauquelin, the constituent parts are,

Silice	-	-	-	-	30.0
Alumine	-	-	-	-	15.0
Sulphate of lime	-	-	-	-	20.5
Potash	-	-	-	-	11.0
Iron	-	-	-	-	1
Water	-	-	-	-	17.5

95.0

It has by some mineralogists been classed with sapphire, and described under the name of *saphirin*. It was arranged by Cordier with spinel.

HEAVY SPAR, *Sulphate of Barytes, Baro-Selenite*. This mineral exceeds in weight all other purely earthy minerals, its specific gravity being from 4.3 to 4.49. It occurs both massive and crystallized in many metallic veins. Its colours are various shades of white, yellow, red, greenish-grey, and blue. Crystallized heavy spar is transparent or translucent, and refracts doubly; it has a distinct lamellar structure, and splits into a right-rhomboidal prism, which is its primitive form; the angles of the rhomb are $101\frac{1}{2}^{\circ}$ and $78\frac{1}{2}^{\circ}$. The joint parallel to the base of the rhomb is the most distinct. The lustre is shining, between vitreous and resinous: it yields readily to the knife. Before the blow-pipe it decrepitates violently, and then melts into a hard white enamel. A piece exposed to the blow-pipe, and laid on the tongue, gives the flavour of sulphuretted hydrogen. The powder of some varieties of heavy spar, when calcined, absorbs light, and emits it again in the dark. Sulphate of strontian (see STRONTIAN) is the only earthy mineral with which heavy spar can probably be confounded. White lead-ore may be distinguished from heavy spar, as it is softer, and yields a metallic globule before the blow-pipe. Pure heavy spar consists of

Barytes	-	-	-	-	67
Sulphuric acid	-	-	-	-	33
					100

Mr. Jamefon makes the following varieties of heavy spar, which he classes as sub-species: earthy heavy spar, compact heavy spar, granular heavy spar, lamellar heavy spar, radiated heavy spar, fibrous heavy spar, and prismatic heavy spar; and he divides lamellar heavy spar into three kinds, straight lamellar heavy spar, curved lamellar heavy spar, and disintegrated lamellar heavy spar.

MINERALOGY.

Earthy Heavy Spar occurs sometimes loose, and sometimes cohering in the drusy cavities in veins: it is composed of dull or glimmering dusty particles, which feel meagre.

Compact Heavy Spar occurs massive, disseminated, reniform, semi-globular; it has a coarse earthy fracture, and is sometimes imperfectly foliated; it has a glimmering lustre, is slightly translucent, soft, and easily frangible. It is often marked with dendritic delineations. According to Weit-rumb, it contains

Sulphate of barytes	83
Silex	6
Alumine	1
Water	2
Oxyd of iron	4
	96
	96

In Derbyshire, this mineral is called *caawk* by the miners.

Granular Heavy Spar occurs massive: the structure is finely granular; the fracture of the grains is lamellar. This mineral nearly resembles granular lime-stone, but is much heavier, and does not effervesce with acids.

Lamellar, or Crystallized Heavy Spar, occurs in the following secondary forms. 1. A rectangular four-sided table, either perfect, or with the terminal planes bevelled, and sometimes the angles of the bevelment are truncated. 2. An oblique four-sided table, perfect, or with the angles or edges truncated. 3. A longish six-sided table, either perfect or variously bevelled. 4. Eight eight-sided tables, either perfect, bevelled, or truncated. Curved lamellar heavy spar occurs in distinct concretions, which have a curved lamellar structure.

Fibrous Heavy Spar has a chestnut-brown colour. It occurs in reniform or botryoidal masses, and has a plumose or diverging fibrous structure.

Radiated Heavy Spar, or Bolognese Spar.—Its colours are, smoke-grey, ash-grey, or yellowish-white. It occurs in roundish compressed pieces, which are always covered with marle or clay. The fracture is lamellar in one direction, and in the longitudinal fracture radiated: it is translucent. It is remarkably phosphorescent after being heated and exposed when cool to the light, and carried into a dark room. It was first found at Monte Paterno, near Bologna. Its constituent parts are,

Sulphate of barytes	62
Lime	2
Silex	16
Alumine	14.75
Oxyd of iron	0.25
Water	2
	97

Columnar Heavy Spar: Baryte sulphatée bacillaire, Haüy. —Its colours are, yellowish, greyish, and greenish-white. It occurs crystallized in acicular oblique four-sided prisms, laterally aggregated into columns; the lustre is shining and pearly; it is translucent, and has a lamellar structure.

Prismatic Heavy Spar is heavy spar crystallized in four-sided or six-sided prisms, variously acuminated and modified by bevelments and truncations.

Hepatitis, Baryte sulphatée fétide, Haüy, may be classed as a variety of heavy spar, which possessed the property of yielding a fetid sulphureous odour when heated or rubbed. It occurs in globular masses, from an inch to a foot in

diameter; these masses have a curved lamellar structure. According to John, the constituent parts are,

Sulphate of barytes, with a trace of strontian	93.58
Sulphate of lime	3.58
Oxyd of lime	0.87
Water, carbonaceous matter, sulphur, and alumine	2.00
	100.03

According to Klaproth,

Sulphate of barytes, with a trace of strontian	85.25
Carbon	0.50
Sulphate of lime	6.00
Oxyd of iron	5.00
Alumine	1.00
Loss, including water and sulphur	2.25
	100.00

Hepatitis occurs at Buxton, in Derbyshire.

HELIOTROPE, *Quarz agathe poncée*, Haüy.

HEMATITE, *Black and Brown; Fer oxyde hematite*, Haüy.

HEMATITE, *Red; Fer uligine concretione*, Haüy. See IRON-ORES.

HEPATIC PYRITES, or *Lower Pyrites*. See PYRITES.

HEPATITE. See HEAVY SPAR, *Addenda*.

HIGGATE-RESIN. See FOSSIL-COPAL, *Addenda*.

HOLLOW SPAR. See CHIASTOLITE, *Addenda*.

HONEY-STONE. See MELLITE.

HORN-STONE, a mineral nearly allied in composition to flint, but has a more earthy texture; it received its name from the supposed resemblance to horn. A more opaque variety of flint, which occurs along with flint and chalcodonic flint in the sand strata below chalk, is called chert. (See *CHERT, Addenda*.) This is a kind of horn-stone. Horn-stone is the *petro-silex* of some mineralogists, and under that name is often confounded with *compact felspar*. Indurated slate, which contains a large portion of siliceous iron in its composition, is sometimes called *horn-stone/slate*. Sauffure, under the names of palioptere and neoptere, appears to include both the splintery horn-stone and flinty slate of Werner. Werner divides horn-stone into three sub-species, splintery horn-stone, conchoidal horn-stone, and wood-stone.

Splintery Horn-stone occurs of various shades of grey, red, and green. It is generally massive, but sometimes is found in large balls, and sometimes lenticular, or in the form of crystals, in the cavities where crystals have once occurred, and hence called *supposititious crystals*. The lustre is dull, the fracture splintery; it is more or less translucent, is somewhat less hard than quartz. It is infusible before the blow-pipe, which distinguishes it from compact felspar. The latter mineral is not so hard as horn-stone, and has more lustre. Horn-stone passes into compact felspar, quartz, common jasper, and chalcodonic flint. In these transitions, it is frequently difficult to determine among which of these it should be placed. It forms the basis of horn-stone porphyry.

Conchoidal Horn-stone is glimmering or glitening, with a vitreous lustre; it has a more or less perfect and flat conchoidal fracture. It is harder and less translucent than splintery horn-stone. It occurs massive, globular, and sometimes forms *supposititious crystals*. It is found in veins and beds. Chert appears to belong to this sub-species.

Wood-

MINERALOGY.

Wood-stone, Quartz agathe xyloide, Häüy, is generally various shades of grey, frequently striped or clouded. It occurs rounded, and in the shape of the trunks, branches, or roots of trees; it is generally translucent at the edges, with little or no lustre. The cross fracture is imperfectly conchoidal, the longitudinal splintery and fibrous. Wood-stone is properly wood fossilified, in which the greater part of the vegetable matter has disappeared, and siliceous matter has occupied the place, preserving the form and texture of wood. Some wood is petrified with opal, forming wood opal; and sometimes the mineral matter of petrified wood is quartz, or calcareous earth.

HORNBLENDE, Amphibole, Häüy. The description of this mineral, so important in geology, was omitted in the proper place, and is given here. Hornblende may be divided into common hornblende, basaltic hornblende, and hornblende slate. Häüy, under the term amphibole, classes actinolite with hornblende. (See ACTINOLITE.) Hornblende generally occurs of various shades of dark green passing into black; sometimes common hornblende occurs of various shades of brown. Hornblende has a lamellar structure longitudinally, with a two-fold oblique angular cleavage, parallel to the planes of a rhomboidal prism, the alternate angles of which are $124\frac{1}{2}^\circ$ and $56\frac{1}{2}^\circ$. This is the form of the primitive crystal, and distinguishes it from epidote, which cleaves at an angle of $114\frac{1}{2}^\circ$ and $65\frac{1}{2}^\circ$, and augit or pyroxene, which cleaves at an angle of 92° and 88° . The cross fracture of hornblende is coarse-grained, uneven; it melts easily before the blow-pipe into a greyish-black coloured glass. These characters, together with the cleavage, serve to distinguish hornblende from augit or epidote; its inferior hardness distinguishes it from schorl.

Common Hornblende occurs both massive, disseminated, and crystallized; the crystals are oblique four-sided prisms, aggregated or long flattened prisms, intersecting each other, or confusedly radiated. The structure is lamellar or bladed. The crystals are long and deeply streaked longitudinally. The lustre is shining and pearly. The black-coloured varieties are opaque; the green generally translucent at the edges. It yields pretty easily to the knife, leaving a greenish-grey streak. It is very tough, and becomes indented by the stroke of a hammer. The specific gravity is from 3.26 to 3.28. According to Klaproth, the constituent parts are,

Silex	-	-	-	42.00
Alumine	-	-	-	12.00
Lime	-	-	-	11.00
Magnesia	-	-	-	2.25
Oxyd of iron	-	-	-	30.00
Ferruginous manganese	-	-	-	0.25
Water	-	-	-	0.75
A trace of potash	-	-	-	0.00
				98.25

This mineral occurs forming beds in mountains, or is disseminated, as a constituent part of many compound rocks. It occurs occasionally in granite, gneiss, mica-slate, and slate, and is an essential part of sienite and green-stone. It forms a constituent part of many basaltic and volcanic rocks, but has frequently been confounded with augit. (See VOLCANIC PRODUCTS.) Hornblende occurs abundantly in various parts of Scotland and in England, particularly at the Malvern-hills in Worcester-shire, and at Charwood forest in Leicester-shire, and in Devonshire, Cornwall, and Cumberland.

Basaltic Hornblende, Amphibole schorlique basaltique, Fr. is

distinguished from common hornblende by its velvet-black colour, and more perfect crystallization. It occurs crystallized in unequiangular six-sided prisms, terminated at each extremity by a trihedral pyramid, with rhombic faces. It is sometimes terminated diffusimly at each extremity, and sometimes acuminate by four or more planes. The angles of the cleavage have been already described. Basaltic hornblende has a splendid vitreous lustre. The fracture is fine-grained, uneven, and glittering. It is black, opaque, and scratches glass. It is more fragile than common hornblende, and melts with greater difficulty. The specific gravity is from 3.15 to 3.19. According to Klaproth, the constituent parts are,

Silex	-	-	-	47.00
Alumine	-	-	-	26.00
Lime	-	-	-	8.00
Magnesia	-	-	-	2.00
Oxyd of iron	-	-	-	15.00
Water	-	-	-	0.50
				98.50

It occurs imbedded in basalt, as at Arthur's seat, near Edinburgh, and in various parts of Scotland. It is frequently found in lava, particularly in the lava of Vesuvius. It was formerly confounded with schorl, until Werner pointed out its characters.

Hornblende-Slate occurs in beds in granite, gneiss, and mica-slate; in the latter rocks, it is often much intermixed with mica, and sometimes contains garnets, as is the case near Tyndrum in Perthshire. Its colour is greenish-black. It has in the mass a slaty structure, and is internally laminar or fibrous, and has a glittering or velvet-like lustre. No very well characterized beds of hornblende-slate occur in England.

HORN-MERCURY, Mercure muriaté, Häüy. See MERCURY-Ores.

HORN-SILVER, Argent muriaté, Häüy. See SILVER-Ores.

HUMITE occurs at mount Somma near Naples, in a granular topaz rock, intermixed with brown and olive-green mica and white Häüyne. Its colour is reddish-brown; it occurs crystallized in octahedrons, which are always more or less truncated and bevelled; the planes are frequently transversely streaked; it has a shining lustre, and is transparent; it scratches quartz with difficulty. This mineral was named humite in honour of sir Abraham Hume, by the count de Bournon, who has given the preceding characters of it in his *Catalogue Mineralogique*.

HYACINTH, Zircon hyacinth. See ZIRCON.

HYALITE, Muller glass, Werner; *Quarz concretioné*, Häüy. (See HYALITE.) The specific gravity of this mineral is given in the last edition of professor Jamefon's Mineralogy at 2.47, from Karsten. Its constituent parts are given by Bucholz as under:

Silex	-	-	-	92
Water	-	-	-	6.33
Trace of alumine	-	-	-	
Loss	-	-	-	1.66
				99.99

HYDRATE of Magnesia has a white colour with a greenish tinge; it occurs massive, has a lamellar-bladed structure, a pearly lustre, and is more or less semitransparent, but becomes

MINERALOGY.

comes opaque by exposure to the air. The lamellæ are somewhat elastic; it is soft, and adheres slightly to the tongue. Specific gravity 2.3. It is infusible, but soluble in muriatic acid. According to Vauquelin, the constituent parts are,

Magnesia	-	-	64
Water	-	-	29
Oxyd of iron	-	-	2.5
Silex	-	-	2
			97.5

HYDROPHANE. See OPAL, *Addenda*.

HYPERSTENE, *Labrador Hornblende*; *Diallage metalloide*, Häüy. Its colours are, dark-greyish, brownish, or greenish-black, with generally a pseudo-metallic lustre, reflecting a copper-red, a pinchbeck-brown, or a gold-yellow light. It occurs both massive and disseminated; it has a lamellar structure and a two-fold cleavage, the planes forming angles of 100° and of 80°. It is opaque, and yields a greenish-white streak. It is harder than common hornblende. Its specific gravity is 3.38. Before the blow-pipe it blackens, but is infusible. According to Klaproth, the constituent parts are,

Silex	-	-	54.25
Magnesia	-	-	14.00
Alumine	-	-	2.25
Oxyd of iron	-	-	24.50
Lime	-	-	1.50
Water	-	-	1
Manganese, a trace			
			97.50

Until very recently, this mineral had only been found on the coast of Labrador, where it forms a constituent part of a rock composed of Labrador felspar, and sometimes containing common hornblende and magnetic iron-stone. It has been lately discovered by Dr. Macculloch in sienite, at Lock Scavig in Skye, also near Portofino, and is supposed to exist in many rocks which have hitherto been designated green-stones.

ICHTHYOPHTHALMITE, *Apophyllite*, Häüy. See ZEOLITE.

IDOCRASE, *Vesuvian*. See VESUVIAN.

INDIANITE, a mineral brought from the Carnatic, of which we have the following account by its discoverer the count de Bournon. Its colours are white and grey, its lustre shining; it has a lamellar structure, is translucent inclining to transparent; it scratches glass, but is less hard than felspar; it occurs massive, and is associated with hornblende. Its specific gravity is 2.74. According to Chenevix, the constituent parts are,

Silex	-	-	42.5
Alumine	-	-	37.5
Lime	-	-	15
Iron	-	-	3
A trace of Manganese			
			98

INDICOLITE, Indigo blue, tourmaline. See TOURMALINE.

IOLITE, *Dichroite*, occurs principally crystallized, in small equiangular and equilateral six-sided prisms, which have rough surfaces. The colour is violet-blue, or dull

pruffian blue, but when viewed by transmitted light at right angles to the axis of the prism is a brownish-yellow. The structure is indistinctly lamellar, with joints passing through the axis at right angles to the lateral faces of the prism. The fracture is uneven, passing into conchoidal. It passes from translucent to opaque. Iolite scratches quartz. Its specific gravity is 2.5. It is not affected by acids. Before the blow-pipe, it melts with difficulty into a greenish-grey enamel. This mineral occurs at Cape de Gate, in Spain; it is found imbedded in fragments of gneiss and compact felspar, contained in what is supposed by Cordier to be a volcanic tufa, which contains, besides blocks of scoria, obsidian and basalt. Iolite has also been found in trap at Arendal in Norway.

IRIDIUM, *Native*, has a pale steel-grey colour; it occurs in flat small irregular grains in alluvial soil in South America. It has a shining metallic lustre, a lamellar structure, is brittle and harder than platina. The specific gravity is 19.5. It is proved by Dr. Wollaston to be an alloy of *Irridium* and *Osmium*; which see.

IRON-CLAY is of a reddish or brownish-red; it occurs massive and vesicular, as the bases of some amygdaloids which form beds in basaltic rocks. It is intermediate between basalt and wacke, having less hardness than the former, and more than the latter. It is also more easily frangible than either basalt or wacke.

IRON-FLINT is generally of a brown or brownish-red colour; it is opaque and hard, and has an imperfect conchoidal fracture. It occurs massive in rounded pieces, and crystallized in small equiangular six-sided prisms. Its specific gravity is from 2.5 to 2.8. It is infusible. This mineral appears to be quartz rendered opaque by a chemical combination with iron. According to Bucholz, the constituent parts are,

Silex	-	93	-	92
Oxyd of iron	-	5	-	5.75
Volatile matter	-	1	-	1
Oxyd of manganese			-	1
			99	99.75

Pebbles of iron-flint are used at Worcester for burnishing the gilding in china. They have sometimes been found in considerable quantities in the ploughed fields near Ashby-de-la-Zouch in Leicestershire.

IRON-MICA. Micaceous iron glance, or iron-ore. See IRON-ORES.

IRON, *Native*. See IRON-ORES.

IRON, *Native and Meteoric*, *Fer native meteorique*, Häüy, is the iron which has been observed in various places to fall from the atmosphere. See STONE, *Meteoric*, FALLING STONE, and METEORIC IRON, *Addenda*.

IRON-ORE and *Iron-Stones*. (See IRON.) We shall here enumerate the different species of iron-stone, with the names given to them by the French and German mineralogists.

Iron Pyrites, Common; *Fer sulphuré*, Häüy; *Gemeiner schwefelkies*, Werner. *Capillary Pyrites, Fer sulphuré capillaire*, Häüy; *Haarkies*, Werner. *Cellular Pyrites, Zellkies*, Werner. *Radiated Pyrites, Fer sulphuré radié*, Häüy; *Strahlkies*, Werner. *Hepatic, or Liver Pyrites, La pyrite hepaticque*, Brochant; *Leberkies*, Werner. *Magnetic Pyrites, Fer sulphuré ferreux, ou magnetique*, Häüy; *Magnetkies*, Werner. *Foliated Magnetic Pyrites, Blätlicher Magnetkies*, Werner. For an account of these species, see PYRITES, and IRON-ORE.

IRON-STONE, Magnetic, Common, Fer oxydulé, Häüy; *Gemeiner*

MINERALOGY.

Geneiner magnetstein, Werner. This ore is highly magnetic with polarity. According to Berzelius, it contains

Peroxyd of iron	-	-	71.86
Protoxyd of iron	-	-	28.14
			100

It occurs in various parts of the world, chiefly in primitive mountains; it is found at St. Juit in Cornwall, and Tavistock in Devonshire.

Iron-sand, or *Sandy Magnetic Iron-stone*, *Fer oxydulé titanifère*, Häüy, (see IRON-ORE,) occurs in volcanic and basaltic rocks, forming a component part of many black lavas, and in the sands of rivers. According to Cordier, its constituent parts are,

Iron-sand, Teneriffe.			
Oxyd of iron	-	-	79.2
Oxyd of titanium	-	-	14.8
Oxyd of chrome, a trace	-	-	
Oxyd of manganese	-	-	1.6
Silex and alumine	-	-	0.8
			96.4

According to Thompson,

River Dee, Aberdeenshire.			
Oxyd of iron	-	-	85.3
Oxyd of titanium	-	-	9.5
Arfenic	-	-	1.0
Silex and alumine	-	-	1.5
			97.3

Earthy Magnetic Iron-stone; *Fer oxydulé fuligineux*, Häüy; *Oähriger magnetisenstein*, Werner.—The colour is blueish-black; it is opaque, soft, sectile, and easily frangible. It appears to be common magnetic iron-stone in a state of decomposition. Common magnetic iron-stone and iron-sand are distinguished from iron-glance by the colour of the streak, which is black; but that of iron-glance is red. According to Mr. Jameson, Werner was the first who observed that magnetic iron-stone does not possess the magnetic property when at a depth in the earth, but it acquires it after exposure to the atmosphere.

Specular Iron-ore, or *Common Iron Glance*; *Fer oligiste*, Häüy; *Eisenglanz*, Werner.—This ore, according to different analyses, appears to contain about 90 per cent. of oxyd of iron. See IRON-ORES.

Scaly Red Iron-ore, or *Iron Froth*; *Fer oligiste rouge luisant*, Häüy; *Rother eisenrahm*. *Ochry Red Iron-stone*; *Fer oxydé rouge grassier*; *Ochryger rotherisenstein*, Werner.

Compact Red Iron-stone; *Fer oligiste compacte*, Häüy; *Dichter rotherisenstein*, Werner.

Red Hematite, or *Fibrous Red Iron-stone*; *Fer oligiste concretionée*, Häüy; *Rother glaszkopf*, Werner. See IRON-ORES.

Scaly Brown Iron-ore; *Brauner eisenrahm*, Werner. *Ochry Brown Iron-stone*; *Fer oxydé pulverulent*, Häüy. *Compact Brown Iron-stone*; *Fer oxydé brun compacte*, Fr.; *Dichter braun eisenstein*, Werner. *Brown Hematite*; *Fer oxydé hematite brun*, Häüy; *Brauner glaszkopf*, Werner.—Brown iron-stone is distinguished from red iron-stone by

its red streak and inferior specific gravity: it also contains more water, the brown iron-stone being an hydrate. This ore, according to professor Jameson, makes but indifferent cast-iron, but affords good malleable iron and excellent steel. See IRON-ORE.

Compact Black Iron-stone; *Dichter schwarzeisenstein*. *Black hematite*; *Mine de fer noire compacte*, Fr.; *Schwarzer glaszkopf*, Werner.—When melted with borax before the blow-pipe, it yields a violet-blue glass; hence it is conjectured to contain much manganese.

Sparry Iron-stone; *Chaux carbonatée ferrifère avec manganese*, Häüy.

Clay Iron-stone; *Fer oxydé massif*, Häüy; *Thonisenstein*, Werner. See IRON-ORE, and *CLAY Iron-stone*, *Addenda*.

Reddle; *Argile ocreuse rouge graphique*, Häüy; *Roëthel*, Werner.

Columnar Clay Iron-stone; *Fer argilleux bacillaire*, Fr. *Lenticular Clay Iron-stone*; *Fer oxydé brun granuleux ou lenticulaire*, Fr. (See IRON-ORE.)—The following analyses of this ore is given by Daubuisson, *Journal des Mines*, 1810.

Peroxyd of iron	-	-	73
Water	-	-	14
Silex	-	-	9
Peroxyd of manganese	-	-	1
Lofs	-	-	3
			100

Jaspery Clay Iron-stone. See IRON-ORE.
Reniform Clay Iron-stone; *Fer oxydé geodique*, Häüy.—The constituent parts of this ore are stated by Daubuisson.

Peroxyd of iron	-	-	76	78
Water	-	-	14	13

See IRON-ORE.

Pea-ore, or *Pisiform Iron-ore*; *Fer oxydé globuliforme*, Häüy; *Böhnerz*, Werner. See IRON-ORE.

Bog Iron-ore. See IRON-ORE, and *Bog Iron-ore*, *Addenda*.

Pitchy Iron-ore; *Fer oxydé résinite*.—The pitchy iron described under the article IRON-ORES appears to be a phosphate of iron: later mineralogists describe it as an oxyd and sulphate of iron. It is a rare ore, having been found only in one mine near Freyberg, and in the district of Plifs in Upper Silesia. Its colour is greyish-black, passing into dark liver-brown. It is said to occur forming crusts. It has a splendid or shining resinous lustre. The fracture is imperfectly conchoidal: it is composed of granular distinct concretions: it is translucent on the edges: the streak is lemon-yellow: it is soft. When placed in water, it becomes semitransparent and vitreous. According to Klaproth, its constituent parts are,

Oxyd of iron	-	-	67
Sulphuric acid	-	-	8
Water	-	-	20
			95

Blue Iron-ore; *Blue Iron Earth*; *Fer phosphaté terreux*, Häüy.

MINERALOGY.

Häüy. (See IRON-ORE.) According to Klaproth, this ore contains,

Oxyd of iron - - -	47.50
Phosphoric acid - - -	32.0
Water - - - - -	20
	99.5

Chromate of Iron. See CHROME, and CHROMATE of Iron, *Addenda.*

Cube Ore. See ORES of Iron.

Muriate of Iron, Native, or Pyroslanite, Fer muriatè, Fr. has a liver-brown colour, inclining to pistachio-green. It occurs crystallized in short six-sided prisms. The terminal planes of the crystals are shining and pearly, the lateral planes, when clear, are shining and vitreous. It has a foliated structure and four-fold cleavage, the most distinct of which is parallel with the terminal planes. It is translucent on the edges, and yields a brownish-white streak. Its specific gravity is 3.08. It is insoluble in water, but soluble in muriatic acid, except a small residuum of siliceous earth. Before the blow-pipe, it gives out copious fumes of oxy-muriatic acid. This is a very rare ore of iron.

The following table of the annual quantity of iron raised and smelted in different parts of Europe, is extracted from the second edition of Jameson's Mineralogy, vol. ii. p. 314.

Quintals of 100 Pounds each.

Great-Britain - - -	5,000,000
France - - - - -	4,500,000
Russia - - - - -	1,075,679
Sweden - - - - -	1,500,000
Austria - - - - -	1,010,400
Prussia, after the treaty of Tilsit	322,053
Kingdom of Westphalia in 1808	187,411
Spain - - - - -	180,000
Danish states - - -	135,000
Bavaria and the Tyrol - - -	110,000
Kingdom of Saxony - - -	80,000

The United States of America, without including Louisiana and the Indiana territory, are said to yield 480,000 quintals, and, according to Dr. Bruce, the value of the iron and manufactured articles of iron in the United States is from twelve to fifteen millions of dollars. The annual importation, including bar-iron and every article of iron or steel, is estimated at four millions.

IRIDIUM, an alloy of iridium with osmium. See OSMIUM, *Addenda.*

ISERINE. See TITANIUM.

JADE, *Jade-Nephrite, Fr.* See NEPHRITE, *Addenda.*

JASPER. (See JASPER.) In that article it is stated, that common jasper is exclusively found in veins: this is not strictly correct, for jasper occurs in irregular beds and masses in the argillaceous schistus, which covers the granite of the Grampian-hills in Kincardineshire. Jasper occurs in some of the beds of manganese near Exeter.

JENITE. See YENITE.

JET *Pitch-coal, Jayet, Fr.*, has a black colour, and yields a brownish-black streak. It occurs massive, and in the shape of branches. Jet has a ligneous structure. The fracture is large and perfect conchoidal, with a shining resinous lustre. It becomes electric by friction, and burns with a greenish flame and bituminous odour. Jet, according to the experiments of Dr. Macculloch, contains vegetable extract or

distillation; but when heated under compression, it is converted into true mineral coal. For some account of the localities of jet, see JET.

KAOLIN. See PORCELAIN *Earths, Addenda.*

KYANITE, or *Cyanite; Disthené, Häüy; Sappare, Sauffure.* Its colours are blueish, or grey sky-blue, and pale blueish-green. The white varieties are partially shaded with blue. It occurs crystallized and massive. The form of the crystals are an oblique four-sided prism, with two opposite broad, and two opposite narrow planes. This is the primitive crystal. It occurs also truncated on the two opposite acute lateral edges, forming an hexahedral prism; sometimes all the lateral edges are truncated; and sometimes two prisms are joined by their broader lateral planes, forming a twin crystal. The narrow lateral planes are longitudinally streaked. The lustre is shining and pearly, and that of the broad planes is sometimes splendid. Kyanite has a lamellar structure, with a cleavage parallel to the planes of an oblique tetrahedral prism; that parallel with the broad lateral planes is the most distinct. The structure of amorphous kyanite is more or less curvately lamellar, passing into bladed. It is translucent or transparent; it scratches glass, and is easily frangible. The specific gravity is 3.47 to 3.51. Some of the crystals become positively electric, others negative; hence the name disthene was given to it by Häüy, on account of its double electrical powers. It is infusible before the blow-pipe. According to Klaproth, its constituent parts are,

Alumine - - - -	55.5
Silex - - - - -	43
Oxyd of iron - - -	0.5
	99.0

According to Langier,

Alumine - - - -	55.30
Silex - - - - -	38.50
Lime - - - - -	0.50
Oxyd of iron - - -	2.75
	97.05

It occurs in primitive mountains, in mica-slate, talc-slate, and white-stone. It has been found at Bohem, in Bamfshire, and Damhory, Aberdeenshire. In India it is cut and polished, and sold as an inferior kind of sapphire. Sometimes crystals of kyanite may be seen joined and intermixed with grenolite, (see GRENOLITE,) which shews the near alliance of these minerals, which have also nearly the same chemical composition.

LABRADOR *Felspar.* See FELSPAR.

LABRADOR *Hornblende.* See HYPERSTENE, *Addenda.*

LAPIS-LAZULI. See LAZULI.

LATIALITE. See HAÜYNE, *Addenda.*

LAUMONITE. See ZEOLITE.

LAZMESTONE. See LAZULI.

LAZULITE. See LAZULITE.

LEAD-ORES. (See LEAD, where eleven species of lead-ore are described.) The antimonial lead-ore is called the triple sulphuret of lead. Four other species of lead-ores have since been described; cobaltic lead-ore, native minium, arseniate of lead, and muriate of lead.

Cobaltic Lead-ore has a fresh lead-grey colour, and a shining metallic lustre. It occurs minutely disseminated, and

MINERALOGY.

and in extremely minute crystals, aggregated like mofs; it is opaque, soft, and sectile. Before the blow-pipe it splits into small pieces, and communicates a small blue colour to borax.

Native Minium; Plomb oxydé rouge, Haüy.—It has a scarlet-red colour. It occurs massive and pulverulent; when examined with a lens, it exhibits a crystalline structure, like galena, in which it is generally found. Before the blow-pipe, on charcoal it is first converted into litharge, and then into metallic lead. This mineral is probably produced by the decomposition of galena, which it incrusts. It has been found at Grassington, and other parts of Craven, in Yorkshire.

Muriate of Lead, or Corneous Lead-Ore.—Its colours are greyish or yellowish-white, passing into wine-yellow. It occurs crystallized in cuboidal prisms, either simple, or terminated by tetrahedral pyramids, or bevelled on the edges. It exhibits a lamellar structure, with joints in three directions parallel to the faces of a cuboidal prism; the cross fracture is conchoidal; it has a splendent adamantine lustre; is more or less transparent. It is very soft and frangible. On exposure to the blow-pipe, on charcoal it melts into an orange-coloured globule, and appears reticular externally, and of a white colour when solid; if melted again, it becomes white; and on increase of the heat the acid flies off, and minute globules of lead remain. According to Klaproth, its constituent parts are,

Oxyd of lead	-	-	85.5
Muriatic acid	-	-	8.5
Carbonic acid and water	-	-	6
			100

Arseniate of Lead, or Reniform Arseniate of Lead; Plomb arsenié compacté, Haüy.—Its colours in the fresh fracture are reddish-brown and brownish-red; externally ochre-yellow and straw-yellow; internally the lustre is shining and resinous; the fracture is conchoidal, inclining to uneven; it is opaque, soft, and brittle. The specific gravity is 3.93. This ore has hitherto been found only in one mine near Nertchinsk, in Siberia. It occurs in reniform and tuberos masses; it is insoluble in water. Before the blow-pipe, on charcoal it gives out arsenical vapours, and is more or less perfectly reduced. Its constituent parts are,

Oxyd of lead	-	-	35
Arsenic acid	-	-	25
Water	-	-	10
Oxyd of iron	-	-	14
Silver	-	-	2.5
Silex	-	-	7
Alumine	-	-	2
			95.5

Filamentous Arseniate of Lead, Plomb arsenié filamenteux, Haüy, occurs crystallized in small acicular prisms, or in delicate silky filaments, at St. Foix, in the department of Saône and Loire, in France.

Earthy Arseniate of Lead occurs in crusts, in the same mine with the filamentous. Its colour is yellow; it has an earthy fracture; is soft and friable. This ore has also been found associated with white lead-ore, copper-ores, and quartz, in the hill of Horpice, in Oisans.

VOL. XXXIX.

Indurated Earthy Lead-Ore, Plomb carbonaté teneux, Fr. described as lead-earth under the article LEAD-ORES, has been analysed by John. Its constituent parts are,

Oxyd of lead	-	-	66
Carbonic acid	-	-	12
Water	-	-	2.25
Silex	-	-	10.50
Alumine	-	-	4.75
Iron and oxyd of manganese	-	-	2.25
			97.75

This ore occurs in considerable quantities in some of the mines in Craven, in Yorkshire, and is smelted as a rich ore of lead.

Conchoidal Phosphate of Lead contains a small portion of arsenic and muriatic acid. It differs from green lead-ore, described under the article LEAD-ORE. When crystallized, the planes of the crystals are generally convex. It occurs also stalactitic, reniform, and botryoidal. The colour is orange-yellow, passing into lemon-yellow and red; the fracture is conchoidal; it is translucent; internally the lustre is shining and resinous. Its specific gravity is 7.26. According to Langier, its constituent parts are,

Oxyd of lead	-	-	76.8
Phosphoric acid	-	-	9
Arsenic acid	-	-	4
Muriatic acid	-	-	7
Water	-	-	1.5
			98.3

According to Rose,

Oxyd of lead	-	-	77.5
Phosphoric acid	-	-	7.5
Arsenic acid	-	-	12.5
Muriatic acid	-	-	1.5
			99

This ore has been found in Huel Unity mine, Cornwall.

The greatest quantity of lead is raised in England of any country in Europe. The following table contains the annual amount of lead in quintals from the following countries:

	Lead in Quintals.
Great Britain	250,000
France	60,000
Westphalia in 1809	59,771
Austrian dominions	45,809
Spain	32,000
Prussia, after the treaty of Tilsit	12,992
Saxony in 1808	10,000
Russia	10,000
Bavaria and the Tyrol	400
480,972	

LEELITE, a mineral very recently discovered at Gryphylla, in Sweden, of which we have only the following description. It has a red colour, the lustre and transparency

MINERALOGY.

parency of horn, and the hardness of flint. The specific gravity is 2.71. Its constituent parts are,

Silice	-	-	-	75
Alumine	-	-	-	22
Manganefe	-	-	-	2.50
Water	-	-	-	.50
				100

LEPIDOLITE. (See **LEPIDOLITE.**) When that article was written, it was supposed that this mineral was exclusively found on Mount Hradisko, in Moravia. Lepidolite has since been discovered in Saxony, Sweden, Norway, France, the Island of Elba, and in several parts of Scotland, particularly in lime-stone, near Dalmally, in a slate-quarry at Ballachulish, at the head of Loch Fyne, and at Glenfitt in Perthshire.

LEUCITE, Amphigene, Haüy. See **LEUCITE.**

LIÉCITE, or Yénite. See **YÉNITE.**

LIME-STONE. See **LIME-STONE** and **GEOLOGY, Addenda.**

LITHOMARGE, Friable. (See **LITHOMARGE.**) This variety is characterized by its fealy particles foiling, and low degree of coherance. According to Klaproth, it contains

Silice	-	-	-	32.
Alumine	-	-	-	26.50
Iron	-	-	-	21.
Muriate of soda	-	-	-	1.50
Water	-	-	-	17.
				98

LITHOMARGE, Indurated; Argil lithomarge, Haüy. (See **LITHOMARGE.**) This variety occurs in veins in porphyry, gneifs, grey wacke, and serpentine, and in drusy cavities in basaltic rocks. It is intermediate between steatite and variegated clay, and appears sometimes to pass into meerschaum.

LYDIAN-Stone. See **FLINTY Slate,** and **HORN-STONE, Addenda.**

LYTHRODES, a mineral discovered in Norway, which appears allied to ealolite, and was called lythrodes by Karsten, because when first broken it appears as if spotted with coagulated blood. Its colour is aurora-red, passing into brownish-red or brown; it is occasionally marked with cream-yellow and greenish spots. It occurs massive and disseminated; it has an imperfect foliated structure. The lustre of the surface is resinous and glimmering. The cross fracture is splintery and dull: it is feebly translucent on the edges; it is hard. The specific gravity is 2.5. According to John, the constituent parts are,

Silice	-	-	-	44.62
Alumine	-	-	-	37.36
Lime	-	-	-	2.75
Soda	-	-	-	8.00
Water	-	-	-	6.
Oxyd of iron	-	-	-	1.
				99.73

MACLE, a name given by the French mineralogists to chialtolite or *Hollow spar*; which see.

MADREPOSITE, a variety of black lime-stone, so called on account of its occurring in radiated or diverging prismatic concretions, which are supposed to resemble the stars of madreporae: it has a minute and indistinctly curvedly lamellar structure. When rubbed, it emits a strong smell of

fulpburetted hydrogen gas. Patron suspects that this mineral is faciculated arragonite. According to Klaproth, it consists of

Carbonate of lime	-	-	93.	
Carbonate of magnesia	-	-	0.50	
Carbonate of iron	-	-	1.25	
Carbon	-	-	0.50	
Siliceous sand	-	-	4.50	
				99.75

Other analyses give a small portion of sulphur and manganese.

MAGNESIAN Lime-stone, or Compact Dolomite, has generally a yellowish-brown or yellowish-grey colour, a granular structure, a glimmering or glistening lustre, and dissolves slowly in acids; these characters distinguish it from common lime-stone. The specific gravity is about 2.8. It contains fewer petrifications than most common lime-stones. It occurs in regular strata on the eastern side of England from Nottinghamshire to Sunderland. It occurs also in amorphous masses, and variously contorted beds, and also forming a kind of lime-stone breccia in the red marle. According to Tennant, its constituent parts are,

Yorkshire.				
Lime	-	-	30	
Magnesia	-	-	20	
Carbonic acid	-	-	47	
Alumine	-	-	1	
				98

According to Thomson,

Near Sunderland.				
Carbonate of lime	-	-	56.80	
Carbonate of magnesia	-	-	40.84	
Carbonate of iron	-	-	0.36	
Infoluble matter	-	-	2.	
				100

MAGNESITE, Magnesia carbonatée, Haüy. It occurs in amorphous masses and tuberos spongiform. The fracture is splintery and large, and flat conchoidal. It is opaque, earthy. The colour is yellowish-grey or white, with spots and dendritic delineations of blackish-brown. Magnesite yields to the nail externally, but internally it is harder than calcareous spar; it feels somewhat meagre, adheres to the tongue, and absorbs from nine to ten per cent. of water when immersed in it, and becomes semi-transparent on the edges. It is slowly soluble with effervescence in concentrated muriatic acid. Before the blow-pipe it is infusible, but becomes sufficiently hard to scratch glass. Its specific gravity is 2.88. According to Bucholz, the constituent parts are,

Magnesia	-	-	45.52	to	48
Carbonic acid	-	-	47.00	to	52
Silice	-	-	4.50		
Alumine	-	-	0.50		a trace
Manganefe	-	-	0.50		a trace
Lime	-	-	0.08		a trace
Water	-	-	2.		
			100.10		100

MINERALOGY.

It is found in ferpentine in Moravia, along with meersch-
 chaum and earthy talc. It is distinguished from meersch-
 chaum by its colour, external shape, fracture, meagre feel, and
 weight.

MAGNETIC Iron-Stone, and *Magnetic Pyrites.* See **IRON-
 Stone,** and **PYRITES.**

MALACHITE. See **COPPER-Ores.**

MANGANESE-Ores. See **MANGANESE** and **WADD.**

MARL. See **MARLE.**

MEERSCHAUM. (See **MEERSCHAUM.**) This mineral, of
 which an account is given under the article, appears to be
 hydrate of magnesia combined with flint; it is flated by
 Mr. Jamefon to be fusible on the edges into a white enamel.
 It occurs in veins in the ferpentine of Cornwall. In
 Natolia it occurs in beds under the soil, and from 600 to
 700 men are employed in digging it. When first raised, it
 is soft and greasy, and lathers with water like soap; hence
 it is used by the Tartars for washing. Meersch-
 chaum is extensively manufactured in Turkey into tobacco-pipes,
 which are boiled in oil or wax; afterwards they are baked, and
 then polished.

MERCURY-Ores. See **MERCURY,** and **CINNABAR,**
Addenda.

MESOTYPE. See **ZEOLITE.**

METEORIC, Native Iron; *Fer natif meteorique,* Häüy.
 The colour is pale steel-grey, which inclines to silver-white,
 like platina; it is generally covered with a thin brown crust
 of oxyd of iron; it occurs in racemose or globular masses,
 and also minutely diffeminated in meteoric stones. (See
STONE, Meteoric.) The external surface is smooth and
 glimmering; the internal glimmering or glitening with a
 metallic lustre: it yields a splendid streak, and is malleable
 and flexible, but not elastic. The specific gravity of
 meteoric iron is from 6.48 to 7.57; it is magnetic. Accord-
 ing to Mr. Howard, the constituent parts are,

Iron	-	-	96.5	-	-	96.75
Nickel	-	-	3.5	-	-	3.25

All the meteoric iron which has yet been examined
 contains a portion of nickel; the latter metal is also found in
 most of the meteoric stones. The phenomena attending the
 descent of meteoric iron are precisely similar to those which
 accompany the fall of meteoric stones. In most instances,
 loud detonations and brilliant light or fire-balls have pre-
 ceded the fall. These fire-balls appear to be the metallic
 or mineral matter in a state of vivid ignition. Pliny men-
 tions the fall of a mass of spongy iron from the atmosphere
 in Lucania fifty-six years before the Christian era.
 Avicenna mentions a mass of iron weighing fifty pounds,
 which fell from the air near Lurgea; and Averrhoes says, a
 mass of iron weighing one hundred pounds fell at Cordova
 in Spain. In the year 1164, a shower of iron fell in
 Misina. (Georg. Fabri. Rer. Misina, lib. i. p. 32.) In
 the year 1552 fire-stone or masses of iron fell near Mitsos,
 in Transylvania. And among numerous other instances in
 the year 1751, a fire-ball burst with a loud explosion in
 the bishopric of Agram, in Croatia: two masses of iron fell
 from it; the one, which weighed seventy-two pounds, sunk a
 considerable depth into the earth; and the other, which was
 sixteen pounds, fell on the surface of a meadow, at the dis-

tance of 2000 paces from the former; the larger is still pre-
 served in the Imperial cabinet of Vienna.

Numerous masses of native iron occur in various parts of
 the world, which agree in external appearance and chemical
 composition with those whose descent from the air is well
 attested. Professor Pallas discovered a mass of native iron,
 weighing about 1600 pounds, on the surface of a hill
 between Krasnojark and Abakunsk, in Siberia. It is con-
 sidered as a holy relic by the natives, who believe that it fell
 from heaven.

Several masses of native iron have been met with in
 Mexico; and many years since, a mass of native iron, cal-
 culated to weigh about thirty tons, was discovered in the
 district of St. Jago de Estro, in South America. It lies in
 the middle of a great plain, where no rock or mountain is
 within an hundred miles of it. According to Howard, it
 consists of 90 parts of iron, and 10 of nickel. Similar
 masses have been found in Africa, North America, and the
 East Indies.

MICA. See **MICA.**

MIEMITE, Granular, is a variety of magnesian lime-stone,
 first found at Miemo in Tuscany: it has a light green or
 greenish-white colour; it occurs massive and crystallized, in
 small flat double three-sided pyramids, in which the lateral
 planes of one pyramid are set on the lateral edges of the
 other; the crystals are often joined by the edges, or intersect
 each other. It is translucent, and has internally a splendid
 and pearly lustre. The structure is curvally lamellar. Its
 specific gravity is 2.88: it dissolves slowly in acids. The
 constituent parts are,

Carbonate of lime	-	-	-	53
Carbonate of magnesia	-	-	-	42
Carbonate of iron and manganese	-	-	-	3
				98
				—

Prismatic Miemite occurs in low, small, three-sided
 pyramids, deeply truncated on the edges; it appears to
 contain less magnesia than the preceding.

MILK Quartz, or *Rose Quartz.* See **QUARTZ.**

MINERAL Caoutchouc, or *Elastic Bitumen.* (See **BITU-
 MEN.**) This singular mineral has been hitherto only found
 in the Odin mine, near Caffleton in Derbyshire. According
 to the analysis of Klaproth, it contains in 100 grains,

	Cubic Inches.
Carbonated hydrogen	38
Carbonic acid	4
	—
	Grains.
Bituminous oil	73
Acid water	1.50
Carbon	6.23
Lime	1.50
Silex	.75
Sulphate of lime	.50
Alumina	.25

MINERAL Oil. See **PETROLEUM.**

MINERAL Pitch, *Earthy,* or *Maltha.* See **BITUMEN.**

MINERAL Pitch, *Slaggy,* or *Asphaltum.* See **BITUMEN.**

MISPICEL, *Arsenical Pyrites.* See **ARSENIC,** and **PY-
 RITES.**

MOLYBDENA, or *Sulphuret of Molybdena;* *Molybdene ful-
 phurée,* Häüy; is of a bright lead-grey colour. It occurs
 massive, diffeminated in plates, and crystallized. The form of
 the crystals is a regular six-sided table, or a very short six-
 sided

MINERALOGY.

fided prism, terminated by two low six-sided pyramids. The lustre is metallic and shining. The fracture is lamellar, with a single cleavage parallel with the lateral planes of the table. It is sectile and somewhat flexible, but not elastic. Molybdena is unctuous to the touch, and leaves a mark on paper like plumbago, but on white porcelain it makes a greenish mark. Its specific gravity is from 4.5 to 4.7. Before the blow-pipe it gives out a sulphureous odour, and when urged by the utmost force, it yields a white vapour, and a pale blue flame; in carbonate of foda, it is soluble with violent effervescence. The characters here given, particularly its mark on china, serve to distinguish molybdena from graphite and plumbago. (See MOLYBDENUM, and SULPHUR.) According to Bucholz, its constituent parts are,

Molybdenum	-	-	60
Sulphur	-	-	40
			100

This mineral occurs in some parts of Scotland, and in granite at Coldbeck-fell in Cumberland. It is found also at Huel-Gorland, Cornwall.

MOLYBDENA Ochre is a yellow colour, passing into yellowish-green; it is friable and dull, and occurs incrusting molybdena, on which it is doubtless formed by the decomposition of the latter mineral.

MOON-STONE, a variety of adularia. See ADULARIA, and FELSPAR.

MORASS-Ore. See *Bog Iron-Ore*.

MOUNTAIN Cork, or Mountain Leather; Asbeste troffe, Häüy. It is sometimes called mountain flesh and mountain pader. It occurs in thin flexible plates like leather, or in thicker and less flexible pieces like cork-wood. The colours are yellowish and greyish-white; it yields to the nail, is meagre to the touch, and so light as to swim on water. The fracture is finely and promiscuously fibrous. According to Bergmann, its constituent parts are,

Silice	-	-	56.2
Magnesia	-	-	26.1
Alumine	-	-	2
Lime	-	-	12.7
Oxyd of iron	-	-	3
			100

MOUNTAIN, or Rock Wood, or Ligniform Asbestos; Asbeste ligniforme, Häüy; has a wood-brown colour, and a curved and fibrous fracture resembling wood. It is soft, opaque, and sectile; it is slightly flexible; it feels meagre. According to Jamefon, it is infusible; it is classed by him in the talc family.

MULLER Glafs. See HYALITE.

MURIATE of Ammonia, Native, is a frequent product of volcanoes. See AMMONIA.

MURIATE of Copper. See COPPER-Ores.

MURIATE of Lead, or Corneous Lead-Ore. See LEAD-Ore.

MURIATE of Soda. See ROCK-SALT and SALT.

MUSCOVY Glafs, the large plates of mica, which are generally brought from Siberia. (See MICA.) These plates are erroneously called talc.

MUSSITE, a variety of DIOPSIDE; which see.

NAPHTHA, Bitume liquide blanche, Häüy. See BITUMEN.

NATROLITE. See NATROLITE, and ZEOLITE.

NATRON, Soude carbonatée, Fr. Native carbonate of foda is deposited on the sides of lakes, or on the surface of the ground, and generally containing muriate and sulphate of foda. See SODA.

Radiated Natron, Soude carbonatée aciculaire, Fr. occurs in Africa, and forms a considerable article of commerce. This variety is nearly pure carbonate of foda, containing, according to Klaproth,

Water of crystallization	-	-	22.50
Carbonic acid	-	-	38
Pure foda	-	-	37
Sulphate of foda	-	-	2.50
			100

NEPHELINE, or Sommite. (See SOMMITE.) This mineral occurs in the lava of Vefuvius, and bears a near resemblance to MEIONITE (which see). Nepheline is crystallized in six-sided prisms or tables, but the crystals of meionite are four-sided prisms. The latter mineral is easily fusible, but nepheline melts with difficulty. Nepheline has a four-fold cleavage, three of which are parallel with the lateral planes, and one to the terminal planes of the prism. Transparent pieces of nepheline become cloudy in nitric acid; hence it was named by Häüy from the Greek word νεφέλη, a cloud.

NEPHRITE, or Jade; Jade nephritique, Häüy. The colour is leek-green, passing to greyish-green; it occurs massive. The fracture is uneven and splintery, with a glimmering and somewhat greasy lustre; it is translucent. Nephrite yields to the knife, but scratches glafs; it has a greasy feel, is very tough. The specific gravity is from 2.9 to 3. Before the blow-pipe, it melts into a white enamel. According to Kästner, its constituent parts are,

Silice	-	-	50
Alumine	-	-	10
Magnesia	-	-	31
Iron	-	-	5.50
Chrome	-	-	0.05
Water	-	-	2.75
			99.30

Nephrite occurs in granite veins in the Hartz in Saxony; the most beautiful varieties are from Persia and Egypt. In Turkey it is cut into handles for sabres and daggers. It was formerly believed that this stone had the property of relieving nephritic complaints; hence it has been called nephritic stone. A slaty kind of nephrite is used by the inhabitants of New Zealand for hatchets, and hence has been called axe-stone. Nephrite is nearly allied to serpentine and steatite; there is also a kind of nephrite which is more nearly allied to felspar, and is classed by Mr. Jamefon with the felspar family; it is called saussurite, after the celebrated geologist Saussure, by whom it was first discovered. See SAUSSURITE, *Addenda*.

NICKEL-Ores are, native nickel, copper nickel, and nickel ochre.

Native Nickel has only been found hitherto in the Adolphus mine at Johanngeorgenstadt in Saxony, and at Joachimthal in Bohemia. Its colour is bronze-yellow, but is frequently tarnished greenish-grey, or steel or lead-grey, and occasionally invested with a crust of brown iron-stone. It occurs in capillary crystals, which are either promiscuously or scopiformly aggregated. Internally the lustre is splendid and metallic, externally shining or splendid when untarnished.

MINERALOGY.

untarnished. The cross fracture is even passing into flat conchoidal; it is easily frangible, and rather hard; it is more or less flexible and elastic. Before the blow-pipe, on charcoal it melts into a metallic globule, without any smell of arsenic or sulphur, which serves to distinguish it from capillary pyrites. Native nickel contains the metal nickel with a minute portion of cobalt. See NICKEL.

Copper Nickel, Nickel arsenical, Häuy, has a copper or crimson colour, of different degrees of intensity, and often tarnished grey or black. It occurs massive and disseminated, and sometimes reticulated, botryoidal, or dendritical, and very rarely crystallized in six-sided tables; it has a shining metallic lustre. The fracture is imperfectly conchoidal, passing into granular and uneven. It is usually compact, but sometimes occurs in granular distinct concretions. It yields with difficulty to the knife, and is difficultly frangible. Its specific gravity is from 6.6 to 7.5. Before the blow-pipe it gives out an arsenical vapour, and then fuses with difficulty into a dark scoria, mixed with metallic grains: it is soluble in nitromuriatic acid, forming a dark green liquor, from which caustic alkali throws down a pale green precipitate, which distinguishes it from copper; the precipitate of the latter is a dark brown. This ore is a compound of nickel and arsenic; it occurs in small quantities in the lead-mines of Lead-hills and Wanlockhead, in Scotland, and in various parts of the continent of Europe, generally in veins in primitive mountains: it nearly resembles native copper, but may be distinguished by its brittleness.

Black Nickel-Ore has a greyish or brownish-black colour; it occurs massive, disseminated, and in crusts; it is dull, has an earthy fracture, but becomes resinous and shining in the streak; it soils slightly. In nitric acid it forms an apple-green solution, which lets fall a precipitate of white arsenic. It is rather a rare mineral, and is found in veins with other ores of nickel, and is supposed to be formed by the decomposition of copper nickel.

Nickel Ochre, Nickel oxyd, Häuy, has an apple-green colour, but on exposure to the air becomes greenish-white: it is generally found as a thin coat or crust, and seldom massive or disseminated; it is in loose powder or friable, meagre to the touch, and light. It is infusible before the blow-pipe, but with borax it forms a red colour; in cold nitric acid it remains insoluble. This ore occurs at Lead-hills and Wanlockhead, in Scotland, and in Saxony and France.

NIGRINE. See TITANIUM.

NITRE, Native, Potasse nitraté, Fr. occurs in flakes, crusts, and capillary crystals on the surface of the ground. In many countries, it appears to form at certain seasons of the year. It abounds in many of the plains of Spain, Hungary, the Ukraine and Podalia, and on the walls and floors of chalk caves in France. It is very abundant in India, Egypt, and in some parts of North and South America. See POTASH, Nitrate of.

OBSIDIAN, or Volcanic Glass; Lava vitreuse obsidienne, Häuy. (See OBSIDIANUS LAPIS.) This mineral bears so close a resemblance to dark-green bottle-glass as scarcely to be distinguished from it. Its most common colours are dark-grey or greenish, or brownish-black; it has a vitreous and shining or splendid lustre; the fracture is large and perfectly conchoidal. It passes from transparent to nearly opaque, according to the intensity of the colour; it scratches glass, but is easily frangible. The specific gravity varies from 2.34 to 2.38. The black obsidian of Iceland is said to melt into a pale ash-grey vesicular glass on charcoal; that of Spanish America lost its black colour when exposed to heat, became white, spongy, and fibrous, and increased to seven or eight times its original bulk; hence it appears that some

gaseous substance escapes. Humboldt conjectures, that the gas evolved during the volcanic fusion of obsidian in the interior of the earth, may give rise to the earthquakes that agitate the Cordilleras. According to Abilgaard, the constituent parts of obsidian are given as under:

Obsidian of Iceland.

Silex	-	-	-	-	74
Alumine	-	-	-	-	2
Oxyd of iron	-	-	-	-	14
Loss, supposed to be potash or soda	-	-	-	-	10
					100

According to Collet Descoffols,

America.

Silex	-	-	-	-	72.0
Alumine	-	-	-	-	12.5
Manganese	-	-	-	-	2.0
Potash and soda	-	-	-	-	10.0
					96.5

Some analyses give 1.6 lime, and only 5 of potash and soda.

Obsidian is found in a great many volcanic countries, and also in various parts of the world, where no volcanic fires have existed since the history of man. For a long period it was contended by Werner and his followers, that this mineral was of aqueous origin, but the appearance of obsidian, and the situations in which it occurs, offer decisive proofs of its formation by fire. The mountain de la Castagna, in Lipari, according to Spallanzani, is wholly composed of it, which appears to have flowed in successive currents, like streams of water falling with a rapid descent and suddenly frozen. The obsidian is sometimes compact and sometimes porous and spongy. On the fourth side of the Peak of Tenerife, there is a stream of obsidian several miles in length. In the island of Feliciuda, a current of lava intermixed with obsidian may be traced to the very crater of a volcano. Obsidian appears to be lava suddenly cooled, as it is well known, since the experiments of Mr. Keir, Mr. Watt, and Sir James Hall, that lava or basalt cooled suddenly forms black glass; and we have a specimen of lava from Vesuvius, which flowed in the year 1818, one part of which is compact black lava, the other is a vitreous substance passing from pitch-stone to obsidian. See *VOLCANIC PRODUCTIONS*.

OCTAHEDRITE, Anatase. See TITANIUM.

OLIVINE. (See OLIVINE.) This mineral forms a constituent part of many lavas, and is of frequent occurrence in basaltic rocks. When crystallized, it is in broad rectangular four-sided prisms, which are imbedded, and so easily broken, that it is difficult to ascertain their form; the structure of the crystals is imperfectly lamellar, in a direction parallel with the planes of the prism. Werner considers olivine as a distinct species from chrysolite (see CHRYSOLEITE), with which it is classed by many mineralogists. The colour, lustre, and fracture of olivine and chrysolite, are not precisely the same; olivine is also softer and more frangible than chrysolite. Chrysolite is more transparent, and has a greater specific gravity, being from 3.4 to 3.34; that of olivine is 3.22 to 3.26. Olivine is often much intermixed with augit; it has generally a paler colour and greater transparency than the latter mineral. Olivine is subject to decomposition, and when this commences it exhibits on the surface iridescent colours, but afterwards falls into an earth resembling iron ochre.

OLIVINE-

MINERALOGY.

OLIVEN-ORE, or *Olive Copper-Ore*, arseniate of copper. See COPPER-ORES.

ONYX, a variety of chalcedony with white and grey stripes. See CHALCEDONS.

OPAL, *Quarz resinite opalin*, Haüy. (See GEM.) This mineral is divided into seven sub-species by Mr. Jamefon.

Precious Opal has frequently a milk-white colour inclining to blue, and displays brilliant and changeable reflections of green, blue, yellow, and red. It is translucent or semi-transparent, and when placed between the eye and the light exhibits a beautiful yellow or blue colour. It occurs in veins in clay-porphry, either massive, diffeinated, or in plates; it has a shining or splendent vitreous lustre, a perfect conchoidal fracture, scratches glass, and is easily frangible. Some varieties adhere to the tongue. Precious opal becomes white and opaque before the blow-pipe, but is infusible. The specific gravity is 2.110. According to Klaproth, the constituent parts are,

Silix	-	-	-	-	90
Water	-	-	-	-	10
					100
					100

Hence it appears, that the precious opal is properly a hydrate of pure siliceous earth. This mineral, on account of its beauty, is employed in jewellery, and is held in great estimation. Jewels of opal must be kept with care, as they are easily scratched, and are apt to crack on sudden changes of temperature. Precious opal is found more abundantly at Caschervenitza, near Katschau, in Upper Hungary, than in any other known situation. It occurs there in clay-porphry, and mines of it have been worked for a long period; towards the end of the fourteenth century, about 300 men were employed in these mines. Precious opal is sometimes sparingly found in the basaltic rocks, in the north of Ireland, and in the Faroe islands. The finer varieties of opal are named oriental opal. Taverner, however, informs us, that no precious opal is found in the east, and those which are sold as oriental are brought from Hungary. Those varieties of opal that adhere to the tongue are less translucent than the others, and more dull; but when immersed in water, they become nearly transparent, and acquire a beautiful play of colours. These opals have received various names, as the oculus mundi, hydrophane or changeable opal. They are much prized by collectors. To preserve their beauty, the water in which they are immersed should be perfectly pure, and they should be taken out as soon as they have acquired their full transparency. If these precautions are neglected, the pores become filled with earthy particles deposited from the water, and the hydrophane will remain more or less opaque.

Common Opal differs from precious opal, principally by its inferior lustre and transparency, and the greater variety of its colours, which are either milk-white, grey, yellowish-white, yellow, red, or green. The same specimen never shews more than one colour by reflected light, but the milk-white variety, when held opposite the light, transmits a wine-yellow colour. Common opal occurs massive, diffeinated, and in sharp angular pieces. Internally the lustre is shining, splendent, and vitreous; the fracture is conchoidal; it scratches glass, and is easily frangible. Before the blow-pipe it is infusible. The specific gravity is 2.01 to 2.14. According to Klaproth, its constituent parts are,

	Opal of Koremutz.		of Telkobayna.
Silix	-	98.75	-
Alumine	-	10	-
Oxyd of Iron	-	10	-
Water	-	-	1.00
		98.95	99.50

Common opal occurs in veins of porphry and serpentine, and with chalcedony in basaltic amygdaloid; it is found in some metallic veins in Cornwall. Green common opal is sometimes cut into ring-stones. The yellow variety is also used for jewellery; it has been called *wax opal* and *pitch opal*.

Fire Opal, so called on account of its brilliant red colours and transparency, is properly a variety of precious opal: it has hitherto been found only at Zimapan in Mexico. According to Klaproth, its constituent parts are,

Silix	-	-	-	92.	
Water	-	-	-	7.75	
Iron	-	-	-	25	
					100

Mother-of-Pearl Opal, or *Cacholong*, is a milk-white variety of opal, not unlike mother-of-pearl.

Semi-opal.—Its colours are generally darker and more muddy than those of common opal; sometimes several colours occur together. Semi-opal is massive, diffeinated, reniform, and botryoidal; it has a glistening lustre, is more or less translucent, is hard and easily frangible. The fracture is large and flat, is conchoidal; it adheres to the tongue. The specific gravity is from 2. to 2.18; it is infusible. According to Klaproth, the constituent parts are,

Silix	-	-	-	81	
Alumine	-	-	-	3	
Oxyd of iron	-	-	-	1.75	
Carbon	-	-	-	5	
Ammoniacal waters	-	-	-	8	
Bituminous oil	-	-	-	0.33	
					99.08

Semi-opal occurs in Scotland and the isle of Rum, and in various parts of Europe: it passes into chalcedony and conchoidal horn-stone.

Wood Opal, *Quarz resinite xyloide*, Fr. is petrified wood, penetrated with opal, and is intermediate between common opal and semi-opal. It has a ligneous structure, and is distinguished from wood-stone by its lighter colours, higher lustre, perfect conchoidal fracture, greater transparency, and inferior hardness. Wood-opal is cut into plates, and used for snuff-boxes and ornaments.

Jasper Opal is of various shades of reddish-yellow or reddish-brown; it is sometimes veined and spotted; it has a shining lustre, between vitreous and resinous, and is opaque or feebly translucent at the edges. It is hard, and easily frangible; it occurs massive in large and small pieces, in porphry and in veins. The specific gravity is from 1.86 to 2.07; it is infusible. According to Klaproth, the constituent parts are,

Silix	-	-	-	43.5	
Oxyd of Iron	-	-	-	47	
Water	-	-	-	7.5	
					98

MINERALOGY.

It appears to be common or semi-opal rendered opaque by the great intermixture of oxyd of iron.

ORIENTAL Amethyst, Sapphire, Ruby, Topaz, and Emerald, names given by jewellers to varieties of the sapphire. The blue sapphire is the true or *oriental sapphire*; the violet-blue is the *oriental amethyst*; the red sapphire, the *oriental ruby*; the yellow sapphire, the *oriental topaz*; and the green sapphire, the *oriental emerald*. See **SAPPHIRE**, &c.

ORPIMENT, Red, or Realgar, Sulphure of Arsenic; Arsenic sulphurée rouge, Fr. (See **ARSENIC**.) According to Klaproth, the composition of this ore is,

Arsenic	-	-	69
Sulphur	-	-	31
			100

ORPIMENT, Yellow, is composed, according to Klaproth, of

Arsenic	-	-	62
Sulphur	-	-	38
			100

OSMIUM occurs as a native alloy of the metal fo called with iridium; it is found in grains along with platina in alluvial soil in South America. The greens have a pale steel-grey colour, a metallic lustre, and lamellar structure; it is harder than platina, and brittle. The specific gravity is 19.5. By fusion with nitre, it acquires a dark-black colour, but regains its lustre and colour by heating with charcoal.

PALLADIUM is a native alloy of the metal palladium, with a minute portion of platina and iridium; it occurs in grains along with grains of platina in the alluvial gold districts in Brazil. Its colour is pale-steel grey passing into silver-white; the structure of the grains is divergingly fibrous, the lustre metallic. The specific gravity is 12.148. Lowry. Palladium is infusible; but on the addition of sulphur, it melts with ease by continuance of the heat, the sulphur is dissipated, and a globe of metallic palladium remains. With nitric acid, it forms a deep-red solution.

PARANTHINE. See **SCAPOLITE**.

PEARL-SPAR. (See **BROWN SPAR, Addenda**.) The name pearl-spar has been given to those varieties of this mineral which in colour and lustre have a strong resemblance to pearl, but it often occurs brown, black, and of various colours.

PEARL-STONE, Lave vitreuse perlée, Haüy. (See **PEARL-STONE**.) This mineral is regarded by many mineralogists as a volcanic production; it is frequently intermixed with obsidian, and hence is classed by them as a variety of the latter mineral. It occurs in basaltic and porphyritic rocks, in large and somewhat angular concretions, which are composed of smaller roundish concretions, and those of others still smaller. The surface of the concretions is smooth, shining, and pearly. The colour is grey, passing into pearl-grey and greyish-black. It is translucent on the edges; it scarcely scratches glass, is easily frangible, and is fusible with intumescence before the blow-pipe into a white spongy glass. This mineral has been found near Sandy Bræ, in Ireland, in the island of Iceland, and in Mexico; it was first discovered in Hungary, where it occurs in large beds. It is classed by Mr. Jameson and Werner with obsidian, pitch-stone, and pumice, as forming a member of the pitch-stone family.

PEARL-STONE, Pifolite, Fr. This mineral is composed of

carbonate of lime, slightly coloured yellowish-white or brown by the oxyd of iron; it is properly a calcareous tufa, containing rounded globules, varying in size, from a pea to a hazel-nut; these consist of concentric lamellæ, and often contain in the centre a minute fragment of quartz, feldspar, or granite, and sometimes, but rarely, a double six-sided pyramid of rock-crystal; but in some instances, the centre of the globule is hollow. Pearl-stone occurs in great masses in the vicinity of the hot springs at Carlsbad, in Bohemia; its formation we conceive to be analogous to that of roe-floam, and to be the result of crystallization; the particles included having disposed the calcareous matter to crystallize round them, in the same manner as a thread or fragment of a stone in a saline solution, generally disposes the crystals to shoot round them.

PERGASITE, the name given to a new mineral found at Erby, near Abo, in Finland. The following imperfect account is the only one we have of its character. It has a green colour; its form is an octahedron, with a cleavage in three directions; it is harder than fluor spar. The specific gravity is 3.11. Before the blow-pipe, it melts into a mass with a pearly-white lustre. Its constituent parts are given as under:

Silice	-	-	42.10
Magnesia	-	-	18.27
Lime	-	-	14.28
Alumine	-	-	14.08
Oxyd of iron	-	-	3.52
----- of manganese	-	-	1.02
----- of an unknown metal	-	-	0.33
Fluoric acid and water	-	-	3.90
Loss	-	-	2.59
			100.09

PERIDOT Chrysolite. See **CHRYSOLITE** and **OLIVINE**.

PETALITE, a mineral recently discovered in Sweden; externally, it nearly resembles some varieties of quartz, but the cleavage is two-fold, parallel to the sides of a rhomboidal prism; two of the planes are splendent, and two dull. The planes meet at angles of 100° and 80°, forming a four-sided prism with a rhomboidal base. Its colour is white with a slight tint of pink; it scratches glass, but yields with difficulty to the knife. When exposed to the flame of a blow-pipe it remains for some time infusible, but by continued heat it exhibits a glazed surface, which, on examination with a lens, appears full of minute bubbles. When triturated, the powder has the whiteness of snow. It is partially soluble in highly concentrated nitric acid, losing its colour, and changing to a dingy hue; the acid at the same time becomes clouded. The prussiated alkali threw down a green precipitate, and the solution assumed an amethystine colour, which afterwards changed to brown. The constituent parts of this mineral are stated to be,

Silice	-	-	80
Alumine	-	-	15
Manganese	-	-	3
And a new alkali	-	-	2

This alkali proves to be the oxyd of a new metal. The new alkali has been called lithia and lithion; it has a greater capacity of saturating acids than any other alkali, and forms a class of salts that are remarkably deliquescent. With alcohol, lithion yields a rose-coloured flame, like that communicated by strontian. The metal of lithion bears a strong resemblance to sodium. The alkali found in petalite contains 44.84 oxygen, united to a metallic base.

PETROLEUM, Liquid Bitumen, or Mineral Oil. (See **BITUMEN**.)

MINERALOGY.

BITUMEN.) It is essentially composed of carbon and hydrogen, containing less carbon than the solid bitumens, or than any kind of mineral coal. In Piedmont, Perlia, Japan, and other countries, it is used in lamps, in place of oil, for lighting streets and public buildings; it is also mixed with earth, and burned for warming rooms. In Ava, numerous mines are worked for mineral oil or petroleum, the shafts are sunk through coal strata to the coal from whence the oil issues; it is intermixed with water, and is separated by decantation.

PHARMACOLITE, Arseniate of Lime, Chaux arseniatée, Häuy. Its colours are snow-white and milk-white, sometimes inclining to reddish or yellowish-white. It occurs in small reniform botryoidal and globular masses; sometimes it incrusts other minerals, or is crystallized in small diverging capillary crystals. Externally, it has a silky glimmering lustre; internally, it is shining or glistening. The structure is delicately radiated, either straight, diverging, or stellular, and sometimes fibrous. It yields to the nail, and is easily frangible. The specific gravity is 2.5. According to Klaproth, the constituent parts are,

Lime	-	-	-	25.00
Arsenic acid	-	-	-	50.54
Water	-	-	-	24.46
				100.00

According to John,

Lime	-	-	-	27.28
Arsenic acid	-	-	-	46.58
Water	-	-	-	23.86
				97.72

There is an earthy variety of pharmacolite, which occurs in thin crusts, and is dull and opaque. Pharmacolite is found in veins in granite, with ores of cobalt and native arsenic.

PHOSPHATE of Copper, Cuivre phosphaté, Häuy. Under the ores of copper, one species of this mineral is described, which was the only one then known. Mr. Jarnes makes three sub-species of phosphate of copper; foliated phosphate of copper, fibrous phosphate of copper, and compact phosphate of copper.

Foliated Phosphate of Copper, Cuivre phosphaté rhomboidal, Häuy, has a greyish-black colour externally, but internally is emerald-green, verdigris-green, and leek and olive-green. It occurs crystallized in octahedrons, which are sometimes lengthened or cuneiform; also in rhomboids with small curvilinear faces; the edges and angles are sometimes truncated. The structure is lamellar, the lustre shining, between vitreous and pearly; it is translucent. This ore is insoluble in water, but dissolves without effervescence in nitric acid. Before the blow-pipe, it fuses into a brownish globule, which spreads on the surface of the charcoal by a continuance of the heat, and acquires a reddish-grey metallic lustre. The globule on cooling crystallizes into three-sided and six-sided facets. According to Bucholz, it is a compound of copper and phosphoric acid. It has been found in the neighbourhood of Neufont in Hungary, and at Virneberg, near Rheinbreckenbach, on the Rhine; at the latter place it occurs with fibrous phosphate of copper; the latter mineral is found massive, botryoidal, and in crusts; it has a divergingly fibrous or radiated structure.

Compact Phosphate of Copper, Cuivre phosphaté compacte, Häuy, has the same localities as the foliated sub-species; it

occurs massive, reniform, botryoidal, and incrusting; it has a flat conchoidal fracture, a fibrous structure may sometimes be observed. It contains near 1.81 parts of phosphoric acid united with 68 of copper.

PHOSPHATE of Manganese. See **MANGANESE-Ores.**

PHOSPHORITE, Common, and PHOSPHORITE, Earthy. These minerals have been classed by mineralogists as varieties of apatite; but Mr. Jarnes makes phosphorite a distinct species, which he divides into two sub-species.

Common Phosphorite, Massive Apatite, Aikin; Chaux phosphaté terreuse, Häuy; has generally a yellowish, greenish, or reddish-white colour; it occurs massive, foliaceous, reniform, and incrusting, also crystallized in six-sided tables; it is opaque, soft, and easily frangible. The specific gravity is 2.81. When rubbed in an iron mortar, or laid on hot coals, it emits a greenish light. According to Pelletier, its constituent parts are,

Lime	-	-	-	59.0
Phosphoric acid	-	-	-	34.0
Silex	-	-	-	2.0
Fluoric acid	-	-	-	2.5
Muriatic acid	-	-	-	0.5
Carbonic acid	-	-	-	1.0
Oxyd of iron	-	-	-	1.0
				100.

In part of Eltramadura in Spain near Lagrofanz, it forms whole beds that alternate with lime-stone and quartz.

Earthy Phosphorite consists of dull earthy particles, loosely cohering, and appears to be the preceding mineral in a decomposing state, intermixed with earthy matter. We think the characters and constituent parts of these minerals entitle them to be classed merely as varieties of apatite. The multiplication of species, where no sufficient specific difference exists, tends to retard the progress of useful knowledge, and ought not to be unnecessarily introduced.

PHOSFORMANGAN. Phosphate of manganese. See **MANGANESE.**

PICROLITE, a mineral described by Hanfmann. It is principally composed of the carbonate of magnesia. According to the description of Mr. Jarnes, (*Mineralogy*, vol. ii. p. 537.) its colours are leek-green, mountain-green, or straw-yellow. It occurs massive; internally it is dull or glimmering and pearly. The fracture is long, splintery, which passes by gradation to flat conchoidal. In some instances, it shews a delicate concentric fibrous structure. It sometimes occurs in concretions which are either concealed or have undulating lamellæ. It is translucent on the edges, and is rather hard, and difficultly frangible. It feels meagre, and is infusible. The specific gravity is 2.53. It appears to be allied to ferpentine and talc.

PINITE. This mineral is nearly allied to mica. It occurs crystallized in regular six-sided prisms, which, according to Häuy, is the primitive form. The prisms are sometimes truncated on the edges and angles. Massive varieties of pinite also occur in thick and straight lamellar concretions. (See **PINITE**.) This mineral is found in the granite veins at St. Michael's Mount, Cornwall, and in some parts of Scotland in porphyry.

PIPE-CLAY. See **CLAY**, and **PORCELAIN CLAY, Ad-denda.**

PISTACITE, or Epidote. See **PISTAZITE**, and **EPIDOTE, Ad-denda.**

PITCH-COAL, or Jet. See **JET.**

MINERALOGY.

PITCH-ORE, or *Pitch-blende*, an ore of Uranium. See URANIUM, and PITCH-ORE.

PITCH-STONE, *Resinite*, and *Petro-filix resinite*, Fr. This mineral is named from the striking resemblance which some varieties have in colour and lustre to pitch. Its prevailing colours are dark-green, from which it passes into black, grey, and blue, to brown and red. It is feebly translucent, and has a glitening or shining vitreo-resinous lustre. It occurs massive in veins and beds of considerable magnitude. Pitch-stone is sometimes columnar, and sometimes in thick and wedge-shaped concretions, or in somewhat globular or curved lamellar distinct concretions, and sometimes it has a slaty structure. The fracture is more or less perfectly conchoidal, or passing into splintery. The fragments are angular and sharp-edged. It scratches glass, is rather easily frangible, and is fusible into a grey spongy enamel. Some varieties of this mineral, however, fuse with great difficulty by the blow-pipe. The specific gravity of pitch-stone is about 2.3. According to Klaproth, its constituent parts are,

Pitch-stone of Meiffon.

Silex	-	-	73.00
Alumine	-	-	14.50
Lime	-	-	1.00
Oxyd of iron	-	-	1.00
Oxyd of manganese	-	-	10
Soda	-	-	1.75
Water	-	-	8.50
			99.85

Pitch-stone is found in various parts of Scotland, and in the islands of Rum, Egg, and Arran. It bears a near resemblance to obsidian, or volcanic glass, into which it appears to pass, and also into pearl-stone. It is regarded by many geologists as a volcanic product. Like basalt, it intersects rocks of different formations, from granite to sand-stone, and is intimately associated with basaltic rocks.

PLASMA has generally a dullish-green colour, with yellowish or whitish dots, a glitening lustre, a conchoidal fracture, is translucent, and rather harder than quartz. It consists of about ninety-seven parts of silice, and appears to be properly a green variety of flint. It was considered by the Romans as a gem, and figures were engraved upon it. Most of the specimens in collections were found in the ruins of Rome.

PLATINA. See PLATINA.

PLEONASTE. See CEYLANITE, *Addenda*.

PLUMBAGO. Graphite or black-lead. See PLUMBAGO, and GRAPHITE.

PORCELAIN-CLAY. (See PORCELAIN.) The porcelain-clay of Cornwall occurs in beds of considerable thickness in the parish of St. Stephen's. According to Wedgwood, it consists of sixty parts alumine, and forty of silice. Porcelain clay originates from the decomposition of granitic rocks, abounding in feldspar, and frequently contains portions of quartz and mica. The absence of iron in porcelain-clay is what constitutes one of its most essential properties,—that of remaining white after burning. The Kaolin or Chinese porcelain-clay contains a much larger portion of silice than of alumine.

PORCELLANITE, or *Porcelain Jasper*, (see JASPER,) appears to be formed accidentally by fires in coal-mines, which have indurated and semivitrified beds of coal-shale or slate-clay.

POT-STONE, *Lapis ollaris*; *Talc olaire*, Haüy. (See VOL. XXXIX.)

POT-STONE.) This mineral appears to be indurated talc, passing into serpentine; with the latter rock, it is frequently associated. It has a curved and undulating lamellar structure, passing into slaty. It is very soft, lëctile, and greasy to the feel, is translucent on the edges, and affords a white-coloured streak. It is infusible before the blow-pipe. The analysis of this mineral given by Tromsdorf is,

Silex	-	-	39
Magnesia	-	-	16
Oxyd of iron	-	-	10
Carbonic acid	-	-	20
Water	-	-	10

Near Inverary there is a quarry of talcous slate, some of which appears to pass into pot-stone, and can be turned in the lathe; of this stone, Inverary Castle is built. Pot-stone was extensively used in Upper Egypt for culinary vessels. They were found to resist the action of fire, and did not communicate any taste to the food boiled in them. Quarries of pot-stone were worked on the banks of the Lake of Como from the beginning of the Christian era to the year 1618, when the mountain fell down on the 25th of August, and destroyed the neighbouring town of Pleurs. This town had annually raised stone from these quarries to the value of 60,000 ducats. Pot-stone is also used for lining ovens and furnaces, and is remarkably durable.

PRASE, *Quarz hyalin vert obscur*, Haüy, is translucent green quartz, the green colour being derived from an intimate intermixture of quartz and actinolite. See QUARTZ, and PRASIUS.

PRECIOUS Garnet. See GARNET.

PREINITE. (See PREINITE.) This mineral is divided into two sub-species by Mr. Jameson; foliated prehnite and fibrous prehnite. The prevailing colours are, green, greenish-white, and yellowish-white. It occurs both massive and crystallized in oblique four-sided tables, or in six or eight-sided tables; also in four-sided and six-sided prisms. The crystals are generally attached by their lateral plains, and form diverging groups. The cleavage is single, parallel to the short diagonal of a rhomboidal prism, the planes of which are inclined at angles of 103° and 77°. The lustre is shining and pearly; it is translucent or transparent, scratches glass with difficulty, and intumesces before the blow-pipe. Prehnite was discovered by Mr. Bakewell in a rock basaltic amygdaloid, near Berkley in Gloucestershire, accompanied with green earth and massive lamellar prehnite, or kenpholite. This is the only English locality of these minerals at present known. It was first brought from the Cape of Good Hope.

Fibrous Prehnite has a delicate fibrous structure, either straight, diverging, or stellular. According to Langier, its constituent parts are,

Silex	-	-	42.50
Alumine	-	-	28.50
Lime	-	-	20.40
Soda and Potash	-	-	0.75
Oxyd of iron	-	-	3.00
Water	-	-	2.00
			97.15

Both sub-species of prehnite bear a near resemblance to zeolites, but they do not gelatinize with acids, and they become electric by heating.

PUMICE. See PUMICE-STONE, and VOLCANIC PRODUCTS.
PYCNITE *Schorlite*, or SCHORLACEOUS Beryl. (See Pycnite.)

MINERALOGY.

PYCNITE. The crystals of this mineral are long hexahedral prisms, and are deeply streaked longitudinally. They have a cleavage at right angles to the axis of the prism. Pycnite is now considered by Häuy as a variety of the topaz.

PYRITES. See **PYRITES.**

PYROPE. This mineral is now regarded by Häuy as a variety of the precious garnet, with an accidental portion of magnesia derived from the rock in which it is imbedded.

PYROPHYSALITE. See **PYROPHYSALITE.**

PYROSMAILITE. Native muriate of iron. See **IRON-ORES, Addenda.**

PYROXENE, Augit. See **PYROXENE and AUGIT, Addenda.**

QUARTZ, Quarz hyalin, Fr. See **QUARTZ.**

Common Quartz, Rock Crystal, Amethyst, and Cairngorm Stone, or Clove-brown Quartz, Aventurine Quartz, and Rose or Milk Quartz, are essentially the same mineral substance or pure silic, varying only in transparency or colour, owing probably to a very slight admixture of the other earths or metallic oxys, an admixture which may be regarded as accidental, and which is scarcely appreciable by chemical analysis. According to Bucholz, rock-crystal is composed of 99 $\frac{2}{3}$ of silic. It is probable, however, that many minerals, which have hitherto been classed with quartz from bearing in many characters a close resemblance to it, may contain other ingredients besides silic in such proportions as to constitute them distinct species. This opinion is rendered more probable from the recent discovery of a mineral in Sweden, called petalite, which might easily be mistaken for a variety of quartz, but which contains a considerable portion of alumine, and two parts in the hundred of an alkali heretofore unknown. See **PETALITE, Addenda,** and **Rock-Crystal.**

QUICKSILVER. See **MERCURY, Ores of.**

REALGAR. See **ARSENIC-ORES, and REALGAR.**

RED Antimony Ore. (See **ANTIMONY-ORES,** and **RED Antimony.**) A variety of red antimony-ore, called tinder-ore, is described by Mr. Jamefon as occurring in delicate flexible leaves, which are opaque and friable, foil strongly, and swim on water. Tinder-ore contains a portion of silic.

RED Cobalt-Ore. (See **COBALT-ORES.**) This species of ore is divided by Mr. Jamefon into three sub-species, *earthy red cobalt-ore* or *cobalt ochre, slag red cobalt ochre,* and *radiated red cobalt-ore* or *cobalt bloom; Cobalt arseniate aciculaire, Häuy.* The analysis of this ore by Bucholz gives

Cobalt - - - - -	39
Arsenic acid - - - - -	38
Water - - - - -	23

100

This ore has been found at Alva, in Stirlingshire, and at Tyndrum; also in lime-stone in Linlithgowshire, and at the Dolcoath mine in Cornwall. Slaggy red cobalt ochre has a muddy crimson-red colour, or dark hyacinth-red, which passes into chestnut-brown. It occurs in thin crusts, and is sometimes reniform. It has a shining and resinous lustre, a conchoidal fracture, and is translucent, soft, and brittle.

RED Iron-stone. See **IRON-ORES, Addenda.**

RED Lead-ore, or Chromate of Lead. See **LEAD-ORES.**

RED Manganese-ore. See **MANGANESE.**

RED Silver-ore, or Ruby Silver, where read—before the blow-pipe on charcoal.

REDDLE, Red Chalk, or Red Ochre. See **REDDLE.**

RETINASPHALTUM. See **RETINASPHALTUM.**

REUSSITE, the name given to a salt which occurs in the country round Sedlitz, and at Pilm near Brux. It forms a mealy efflorescence, and is also crystallized in flat six-sided prisms and in acicular crystals. According to Reufs, it consists of

Sulphate of soda - - -	66.04
Sulphate of magnesia - - -	31.35
Muriate of magnesia - - -	2.19
Sulphate of lime - - -	0.42

100

RHOMB Spar. See **BROWN Spar, Addenda.**

ROCK Butter. (See **ROCK Butter.**) This mineral appears to be a sub-fulphate of alumine. It oozes from aluminous rocks.

ROCK Cork; Aßte Trepe, Häuy. See **ROCK Cork.**

ROCK-CRYSTAL. (See **QUARTZ.**) This is the purest variety of quartz. Very large and brilliant rock-crystals occur in various parts of Scotland. The smoke-grey or clove-brown crystals are called cairngorm, from a place in the upper part of Aberdeenshire, where they occur in alluvial soil along with beryl and topaz. The largest rock-crystals hitherto found come from the island of Madagascar. Faujas St. Fond mentions a crystal imported from thence into France, which weighed upwards of one hundred and fifty pounds. Very brilliant groups of rock-crystal occur in Dauphny. Vases of rock-crystal were highly prized by the ancients. A vase, broke by the emperor Nero in a fit of despair, was estimated at 15,000 livres. Different colours may be communicated to rock-crystals artificially, by heating them and plunging them into different-coloured solutions.

ROCK-SALT. (See **ROCK-SALT.**) According to the analysis of Dr. Henry, the rock-salt of Cheffire contains, in 1000 parts,

Muriate of soda - - -	983 $\frac{1}{2}$
Sulphate of lime - - -	6 $\frac{1}{2}$
Muriate of magnesia - - -	0 $\frac{3}{4}$
Muriate of lime - - -	0 $\frac{1}{16}$
Insoluble matter - - -	10

1000

ROCK-WOOD, or Ligniform Asbestos. See **ASBESTUS.**

ROE-STONE, or Oolite; Chaux carbonatée globuliform, Häuy. See **ROE-STONE.**

ROSE Quartz, or Milk Quartz. See **QUARTZ.**

RUBELLITE, called Red Schorl, a variety of tourmaline. See **RUBELLITE,** and **TOURMALINE.**

RUBY, Oriental, or Red Sapphire. See **GEMS,** and **SAPPHIRE.**

RUBY Spinelle. (See **GEMS** and **RUBY.**) The spinel ruby is the common ruby of the jewellers. It differs from the oriental ruby in the form of its crystallization, and contains a portion of magnesia and chromic acid. The former is nearly unmixed alumine. When these two gems are cut, it is, however, difficult to distinguish them. The oriental ruby is harder than spinel. Though the prevailing colour of the common ruby or spinel is red, yet it is sometimes blue-green or yellowish-brown. The carmine-red is called the spinel ruby; the cochineal ruby is called the balais ruby, from Balachan, the Indian name of Pegu, where it is found. The specific gravity varies from 3.50 to 7.30; that of oriental ruby from 3.97 to 4.28. The latter is a true sapphire.

RUTILE,

MINERALOGY.

RUTILE, or *Sphene*; *Titane oxidé*, Häüy. (See **RUTILE**.) This mineral, which appears to be on analysis a pure oxyd of titanium, (see **TITANIUM**), is of a dark blood-red colour, or light-red and brownish-red. It occurs massive, disseminated, membranous, and in crystals. The crystals are rectangular four-sided prisms, oblique four-sided prisms, and also six and eight-sided prisms. The crystals are small and often capillary. It occurs imbedded in drusy cavities, in granite, sienite, gneiss, mica-slate, chlorite-slate and hornblende-slate, and in lime-stone. It has been found in the granite of Cairngorm, the lime-stone of Ramech, and at Craig Cailleach, near Killin, imbedded in quartz, also near Bedgallet, in Caernarvonshire.

RUTILITE, *Titane siliceo calcareo*, or *sphene*. See **RUTILITE** and **SPHENE**.

SAHLITE. (See **SAHLITE**.) *Pyroxene laminaire gris verdâtre*, Häüy. According to Bournon, the primitive form of sahlite is a rectangular four-sided prism, having rectangular bases, which are inclined on the two opposite sides of the prism, so as to form angles of 109° 15', and 73° 45'; hence he considers it as a distinct species from augit. According to Jameson, the cleavages of sahlite are five-fold, one parallel with the terminal planes, two with the lateral planes, and two with the diagonals of the prism; the three first are made with great facility. The cross fracture of sahlite is uneven and dull; that of augit, though uneven, generally inclines to conchoidal, and has a considerable degree of lustre.

SAL AMMONIAC, *Native*; *Ammoniaque muriatée*, Häüy. (See **SAL AMMONIAC**.) This salt is divided into two sub-species by Werner, *volcanic sal ammoniac* and *conchoidal sal ammoniac*. The former occurs in fissures, or coating volcanic rocks, and also in the vicinity of burning beds of coal. The latter occurs with sulphur, in indurated clay, or clay-slate, in Bucharra. According to Klaproth, it contains 2.50 of sulphate of ammonia, with 97.50 of the muriate.

SAPPACE, *Kyanite*; *Disthene*, Häüy. See **SAPPACE**, and **KYANITE**, *Addenda*.

SAPPHIRE, *Telesse*, and *Carindon hyalin*, Häüy. The common forms of the crystals of sapphire are the perfect six-sided pyramid and six-sided prism, or the double six-sided pyramid. These forms are frequently variously modified by truncations on the angles and extremities. (See **GEMS**, **SAPPHIRE**, and **RUBY**, *Addenda*.) The red sapphire is the oriental ruby; it differs a little from the blue sapphire in its constituent parts, which, according to Che-
nevix, are,

Alumine	-	-	-	-	90
Silix	-	-	-	-	7
Oxyd of iron	-	-	-	-	1.2
					98.2

Sapphire occurs in alluvial soil along with pyrope, zircon, and iron-stone, at Podsedlitz and Trziblitsh, in Bohemia; in the banks of the stream Riou, near Expailly, in France; also at Brendole, in the Vicentine, and in Portugal.

SARCOLITE, *Red Zeolite*. See **SARCOLITE** and **ZEOLITE**.

SARDE, *Sardoine*, a reddish-brown cornelian, which appears of a deep blood-red when held between the eye and the light.

SARDONIX is a cornelian composed of white and red layers.

SASSOLIN, *Native Boracic Acid*. See **SASSOLIN**.

SATIN-SPAR, *Chaux carbonatée fibreuse conjointe*, Häüy. See **SATTIN-SPAR**.

SAUSSURITE, *Felspath Tenace*, Häüy; a mineral so called after the elder Sauffure. It was considered by him as nearly allied to nephrite or jade, (see **NEPHRITE**, *Addenda*), but is now classed with the felspar family. It occurs massive, disseminated, and in rolled pieces, in various parts of Switzerland and Norway, Finland, Italy, France, and Savoy, and it forms a constituent part of the well-known rock in Corfica, called the *Verde di Corfica*, which is composed of diallage and saussurite. It occurs with diallage metalloide near the Lizard Point, in Cornwall. The colours are white-grey and green, of various tints; green or yellowish, or greenish-white, are the most prevailing colours. Internally the lustre is dull or faintly glimmering.

The fracture is splintery; but according to Mr. Jameson, an imperfectly foliated structure may be discerned with a double rectangular cleavage. It is faintly translucent on the edges, is extremely tough, and so hard, as to scratch glass; the feel is somewhat unctuous. The specific gravity of saussurite is 3.20 to 3.31. According to Sauffure, the constituent parts are,

Silix	-	-	-	-	44
Alumine	-	-	-	-	30
Lime	-	-	-	-	4
Soda	-	-	-	-	6
Potash	-	-	-	-	0.25
Iron	-	-	-	-	12.50
Manganese	-	-	-	-	0.05
					96.80

According to Klaproth,

Silix	-	-	-	-	49
Alumine	-	-	-	-	24
Lime	-	-	-	-	10.50
Magnesia	-	-	-	-	3.75
Soda	-	-	-	-	5.50
Iron	-	-	-	-	6.50
					99.25

Before the blow-pipe, saussurite melts on the edges and angles; but according to Mr. Jameson is not entirely fusible.

SCAPOLITE, *Paranthine*, Häüy. (See **SCAPOLITE**.) This mineral has been divided by Mr. Jameson into three sub-species; radiated scapolite, foliated scapolite, and compact scapolite. *Foliated scapolite* has a three-fold and rather oblique-angular cleavage; the cross fracture is small and fine-grained, uneven or small conchoidal. This mineral, besides occurring with the other sub-species in Scandinavia, is found along with schorl in granitic masses that are imbedded in compact felspar, or white-stone, on the north-western acclivity of the Saxon Erzgebirge. *Compact green scapolite* is the wernerite of Häüy. It occurs both massive and crystallized in rectangular four-sided prisms, acuminated by four planes set on the lateral edges. Compact red scapolite occurs along with the green sub-species, but is of a blood-red colour. All the varieties of scapolite decay very readily on exposure to the air.

SCHORL, *Tourmaline noir*, Häüy. (See **SCHORL**.) The constituent parts of schorl, as stated by Klaproth, vary
4 D 2 considerably

MINERALOGY.

considerably from the analysis of Gerhard, which we have given, and are,

Silex	-	-	-	36.75
Alumine	-	-	-	34.50
Magnesia	-	-	-	0.25
Oxyd of iron with a trace of } manganefe	-	-	-	21
				92.50

According to Gerhard,

Silex	-	-	-	36.50
Alumine	-	-	-	31.00
Magnesia	-	-	-	1.25
Oxyd of iron with a trace of } manganefe	-	-	-	23.50
				92.25

The crystals of schorl are longitudinally streaked, and have externally a shining lustre. It occurs in the granite rocks of Cornwall, and intermixed with quartz, when it forms a compound rock, known to Cornish miners by the name of *cockle*. Very magnificent crystals of schorl have recently been discovered near Bovey Heathfield, in Devonshire. See TOURMALINE.

SCHILLER-SPAR, *Diallage metallide*, Häüy, occurs most frequently in laminae disseminated in serpentine, and is regarded by some mineralogists as crystallized serpentine. The colours are, olive-green, pinchbeck-brown, and yellowish-brown. The lustre of the principal fracture is splendid and pseudo-metallic; the cross fracture is dull and glimmering. The cleavage is distinct in the direction of the laminae. According to Bournon, the primitive form is a rectangular four-sided prism, in which the bases are set on the broadest lateral planes, forming with them angles of 85° and 95°. The prism is divisible both in the direction of the lateral and terminal planes, but most easily parallel with the latter. Schiller-spar is translucent in thin laminae; it yields a greenish-grey streak, is sectile, and softer than hornblende.

SCHORLACEOUS *Beryl*. See PYCNITE.

SELENITE, or *Crystallized Gypsum*. See GYPSUM.

SERPENTINE, *Noble and Common*. See SERPENTINE.

SHALE, *Coal-Shale and Bituminous Shale*, a name given to the argillaceous strata which accompany coal. These consist of clay more or less indurated and flaty, and intermixed with a portion of carbonaceous or bituminous matter.

SIBERITE, a name given by some mineralogists to *Rubellite*; which see.

SILVER-ORES. (See SILVER.) A species of native silver occurs in Norway, which contains 28 parts in the 100 of gold, and is called *aureiferous native silver*. On account of the gold, its specific gravity is greater than native silver. Its other characters, except the colour, (which inclines to brass-yellow,) agree with *native silver*; which see, under SILVER-ORES.

An ore of silver containing bismuth has been found in one mine on the Schappbach, in the Black Forest. It is called *bismuthic silver*. It is a pale lead-grey, is soft, sectile, and easily frangible. Before the blow-pipe metallic globules ooze out, which, on the addition of borax, unite in one metallic button, which is brittle, and of a tin-white colour. It contains 27 parts of lead, 33 of bismuth, and 15 of sul-

phur, combined with a portion of iron and sulphur, and one part copper.

Corneous Silver-Ore, or *Horn Silver*, is divided by Mr. Jamefon, in the last edition of his Mineralogy, into four sub-species; *conchoidal*, *radiated*, *common*, and *earthy corneous silver-ore*.

Conchoidal corneous Silver-Ore.—Its colours are greyish or greenish-white. It occurs massive in compact lime-stone, at Guantahoyo in Peru; it has an adamantine lustre, and is the purest kind of corneous silver known, containing

Silver	-	-	-	76
Oxygen	-	-	-	7.6
Muriatic acid	-	-	-	16.4

The *radiated corneous Silver-Ore* has a dark-green colour, and, like the preceding, has hitherto been found only in South America.

Common corneous Silver-Ore, (see SILVER-ORES,) has been found in some of the mines in Cornwall, particularly at Huel-Mexico, and in a mine near Peranzabula, on the north-east of Cornwall. In the analysis of this ore, we have stated the constituent parts at 68 of silver, and 28 of muriatic acid; but 6 parts of the latter are oxygen.

Earthy corneous Silver-Ore is very soft, and almost friable. This mineral is an intermixture of corneous silver-ore and alumine.

Earthy Silver-Glance appears to be a decomposing sulphuret of silver. It has a blueish-black colour, and varies from friable to solid; it is dull or glimmering, but yields a metallic streak; it occurs with other ores of silver in veins.

Under the localities of silver in England, in the article SILVER-ORES, for Benallan *r.* Beerallan, Devonshire. One of the richest repositories of silver is the Weal Duchy Mine, on the banks of the Tamar, above Plymouth. Silver-ores occur there in regular veins, but are also disseminated in nodules, through the rock itself, which is killas or clay-late. The ores are, native capillary silver in considerable branches, vitreous silver-ore, black silver, and ruby silver-ore. Under the article SILVER, we have given the annual quantity of gold and silver obtained in Europe, South America, and part of Asia, as given by Humboldt, in kilogrammes, which reduced to the value of the pound sterling is as under:

	Gold.	Silver.
Europe	178,697	468,177
Northern Asia	74,124	192,966
America	2,382,315	7,071,830
	£2,635,136	7,732,973

Total annual value 10,368,109*l.*; a sum not equal to the payment of one-half of the interest of the national debt of Great Britain!

SLATE, or *Slate-Clay*, Werner. See SLATE.

SLATE-SPAR, *Chaux carbonatée nacré*, Fr. (See SLATE-SPAR.) Though this is made a distinct species of the limestone family by some mineralogists, it is composed of carbonate of lime with an admixture of about three or four parts in the hundred of manganese or iron with water, to which probably its nacry lustre may be owing. It occurs in some parts of Cornwall, and in Scotland.

SILIKENSIDES, a name given by the Derbyshire miners to galena or lead-glance, when it forms a smooth polished surface or lining to veins.

SMARAGDITE, green diallage; *Diallage verte*, Häüy. See DIALLAGE.

SOAP-STONE, a variety of steatite, is found in Cornwall, and

and extensively used in the porcelain manufacture at Worcester. It has a milk-white or greenish-grey colour, mottled with a muddy-purple; it is very unctuous to the touch, yields to the nail, and falls to pieces in hot water. Before the blow-pipe, it is friable into a somewhat translucent enamel. According to the analysis of Klaproth, it contains

Siles	-	-	-	45.00
Alumine	-	-	-	9.23
Magnesia	-	-	-	24.75
Oxyd of iron	-	-	-	1.00
Potash	-	-	-	0.75
Water	-	-	-	18.00
				98.73

Under the article **STEATITE**, it is stated to differ from common steatite by the absence of alumine; it should have been by the excess of alumine. Some varieties of steatite scarcely contain a trace of the latter earth.

SODA, *Native*, or *Natron*. See **NATRON**, *Addenda*.

SODALITE. (See **SODALITE**.) This mineral is classed by Mr. Jameson with the feldspar family, on account of its external characters; it differs from feldspar in the proportions of its confluent parts, and soda supplies the place of potash, which is a constituent of most feldspars.

SOMMITE, or *Nepheline*. See **SOMMITE** and **NEPHELINE**, *Addenda*.

SPARRY Iron-stone. See **IRON**, and **IRON**, *Addenda*.

SPECTULAR Iron-Ore. See **IRON**.

SPIENE. See **SPHENE**, **RUTILE**, and **TITANIUM**.

SPINEL. See **GEM**, **RUBY**, and **SPINEL**.

SPODUMENE. (See **SPODUMENE**.) According to D'An-drada, this mineral before the blow-pipe first separates into gold-coloured scales, and then into a kind of powder or ash. It is recently found to contain 8 per cent. of the new alkali lithia.

STAUROLITE, or *Grenatite*. See **STAUROLITE** and **GRENA-TITE**, *Addenda*.

STAUROLITE, the name given by Häuy to staurolite.

STEATITE. See **STEATITE** and **SOAP-STONE**, *Addenda*.

STILBITE. See **ZEOLITE**.

STRIPED Jasper. See **JASPER**.

STRONTIANITE, or *Strontian*; *Strontian carbonatée*, Fr. See **STRONTIAN**.

SULPHATE of Cobalt, of Copper, of Iron, of Lead, of Manganese, of Zinc. See the ores of each of these metals, where the native metallic are described.

SULPHATE of Soda, *Native*. See **SODA**.

SULPHUR, *Common and Volcanic*. See **SULPHUR**.

SULPHURETS, *Native*, are combinations of the different metals with sulphur. See **PYRITES** and the different metals.

SURTURBAND, or *Fibrous Brown Coal*, or *Bituminous Wood*, *Fibreux*, Fr. See **COAL** and **WOOD-COAL**.

SWINE-STONE, or *Fatid Lime-stone*. See **SWINE-STONE**.

TABULAR SPAR. *Spath en Tables*, Häuy. See **TABU-LAR SPAR**.

TALC. See **TALC**.

TANTALITE. See **TANTALITE**.

TELESIA, the name given by Häuy to the sapphiric.

TELLURIUM Ores, and *Tellurium*. See **TELLURIUM**.

THALLITE, or *Epidote*. See **THALLITE**.

THUMMERSTONE, or *Asinite*. See **THUMMERSTONE**.

TILE-ORE, *Earthy and Indurated*, an ore of copper (see **COPPER**); the latter is considered by Werner as an intimate combination of red copper-ore and brown iron ochre, con-

taining from 10 to 50 per cent. of copper; the red varieties contain the greatest quantity of copper. The dark-brown variety, on account of the resemblance of its fracture to pitch, has been called pitch-ore (*Paberz*, Werner.)

TIN-STONE. See **TIN**.

TIN PYRITES, or *Bell-Metal Ore*. See **TIN**.

TITANIUM. See **TITANIUM**.

TOFAZ, *Topaze*, Fr. See **TOFAZ** and **GEM**.

TOURMALINE, *Tourmaline*, and *Le scorbil électrique*, Fr. See **TOURMALINE**.

TREMOLITE, *Grammatite*, Häuy. See **TREMOLITE**.

TRIPOLI, or *Rottenstone*. See **TRIPOLI**.

TUFA. See **TUFA**.

TUNGSTEN. See **TUNGSTEN**.

VARIEGATED Copper-Ore, *Cuivre pyriteux hepatique*, Häuy, a native sulphuret of copper, which has a variegated or iridescent tarnish. See **COPPER-ORES**.

VESUVIAN, *Idocrase*, Häuy. (See **VESUVIAN**.) The primitive form of the crystals of Vesuvian is a right prism with square bases, differing little from the cube. Vesuvian is cut for ornamental purposes by the lapidaries at Naples, and is called the chrysolite of Vesuvius.

UMBER, *Argile ocreuse brun*, Fr. See **UMBER**.

URAN MICA, or *Uranite*, and *Uran Ochre*. See **URANIUM**, *Ores of*.

WACKE, or *Wacken*. See **WACKE**.

WAD. See **WAD** and **MANGANESE**.

WAVELLITE, or *Hydrargillite*, *Dialspore*, Häuy. See **WAVELLITE**.

WHET-SLATE, or *Whetstone-Slate*, *Noverculite*, Fr. See **SLATE** and **WHET-SLATE**.

WHITE Antimony-Ore, *White Copper-Ore*, *White Manganese-Ore*, *White Silver-Ore*, and *White Vitriol or Sulphate of Zinc*. See each of these metals, and *Ores of*.

WITHERITE, or *Carbonate of Barytes*. See **WITHERITE** and **BARYTES**.

WOLFRAM, *Schelin Ferrugine*, Häuy. (See **WOLFRAM**.) This mineral occurs most abundantly in many of the mines of Cornwall, but has not yet been applied to any use.

YENITE, *Lievrit*, Werner. See **YENITE**.

YTTRO-TANTALITE. See **TANTALITE** and **YTTRO-TAN-TALITE**.

ZEOLITE. See **ZEOLITE**.

ZINC. See **ZINC**, *Ores of*.

ZIRCON and **ZIRCONITE**. See **ZIRCON**.

ZOISITE. See **ZOISITE**.

MINGRELIA, l. 12, after gom, add—a kind of paste made of. At the clove, add—According to Reineggs, it contains four millions of fowls, and annually exports 12,000 flaves.

MINKALLI, an African term, denoting a quantity of gold, nearly equal to 10s. sterling.

MINOT, in *Geography*, a town of America, in the district of Maine, and county of Cumberland, having 2020 inhabitants.

MIRZIN, *r. WOLEIN*.

MOBBURY, l. 33, *r. 1811—1890—863 males; 1. 34, 1027 females, 190 families, and 156.*

MOFFAT, col. 2, l. 13, *r. 1811; l. 14, r. 1824 persons, occupying 334 houses; 850 being males, and 974 females.*

MOGO, l. 2, after gulf, add—which has one of the most secure roadsteads in the gulf, formed by Cape Bolitana to the E. and the point improperly called Certes to the W. and capable of holding the largest fleets.

MOHOCKS, a denomination given to a mob of disorderly people, who traversed the streets of London at night,

night, and amused themselves with wounding and disfiguring the men, and indecently exposing the women, in the year 1711. A reward of 100*l.* was offered by royal proclamation for apprehending any one of them.

MOLD, l. 6, *r.* 1811, the parish, &c. 5083 persons, occupying 1026 houses; 2465 being males, and 2618 females: of whom 217 families are employed in trade and manufactures, and 180 in agriculture.

MOLE. See NEVUS.

MOLLIA, in *Botany*, Ait. Hort. Kew. v. 2. 62. See POLYCARPEA and HAGEA.

MOLTON, SOUTH, col. 2, l. 15, *r.* 1811—520—2739.

MOLTOS, *North*, an adjoining parish, containing 329 houses, and 1526 inhabitants.

MOLYBDENA. See MINERALOGY, *Addenda*.

MOLYBDENUM, in *Chemistry*. The specific gravity of this metal, according to Hjelms, is 7.400; but according to Bucholz, who, from the greater heat he employed, obtained it in a more compact state, it is as high as 8.611. According to the experiments of this latter chemist, there are three oxys of this metal, the *brown protoxyd*, the *blue or molybdous acid*, and the *white or molybdic acid*. Dr. Thomson, from the experiments of Bucholz, deduces the weight of the atom of this metal to be 60.

MONAHAN, or MONAGHAN. Add—containing 725 inhabitants.

MONEY. See POLITICAL *Economy*.

MONFALOUT, *r.* See MANFALOUT.

MONKTON, l. 2, *r.* 1248.

MONMOUTH, l. 3, *r.* seven for six; l. 4, *r.* 22,150—1501.—Also, a town of the district of Maine, in the county of Kennebeck, containing 1262 inhabitants.

MONMOUTH, col. 3, l. 37, *r.* 1811; l. 38, *r.* 3503. Add—The number of houses is 661; that of males 1630, and of females 1873, of whom 375 families are employed in trade and manufactures, and 146 in agriculture.

MONMOUTHSHIRE, l. 10.—In 1811, the county was returned as containing 11,766 houses, and 62,127 persons; 30,987 males, and 31,140 females: 5815 employed in agriculture, and 4812 in trade, manufactures, and handicraft.

MONONGALIA, l. 2, *r.* 12,793 persons, of whom 351 were slaves in 1810.

MONOPTERUS, in *Ichthyology*, a genus of fishes of the order Apodes; the characters of which are, that the body is anguilliform, the nostrils placed between the eyes, and the fin caudal. The only animal of this genus hitherto discovered is the *M. Javanicus*, blackish, with a very sharp-pointed tail. It is a native of the Indian seas, and is very common about the coasts of Java, where it is considered as excellent food.

MONROE. Add—containing 5444 inhabitants, of whom 376 were slaves in 1810.

MONSON. Add—containing 1674 inhabitants.

VOL. XXIV.

MONTAGUE, EDWARD, col. 2, l. 8, for five ships *r.* fire-ships.

MONTAGUE, l. 4, *r.* 934.

MONTAGUE. See MOUNTAGUE.

MONTENEGRINS, so called from the Monte Negro, or Black mountain, near Cantaro, have been reckoned amongst the most daring inhabitants of *Dalmatia*; which see. The whole amount of these, who are scattered over mountains, has been estimated at about 60,000. All profess the

Greek religion, but with several remains of superstition. The Morlacs, and other inland tribes of *Dalmatia*, are honest and sincere barbarians, and the drefs of their vaivodes somewhat resembles the Hungarian. The general peace of Europe has restored tranquillity and present security to them.

MONTGOMERY, in America, l. 3, *r.* 2954, of whom 747 were slaves in 1810; l. 6, *r.* 41,214, of whom 712 were slaves; l. 10, *r.* 237; l. 12, *r.* 595; l. 14, *r.* 30; l. 15, *r.* 29,703; l. 16, add—containing 880 inhabitants; l. 17, having 2693 inhabitants; l. 18, *r.* 8430; l. 19, *r.* 1696 slaves; l. 21, *r.* 8409 inhabitants, of whom 1099 were slaves; l. 24, *r.* 17,980—7572; l. 28, *r.* 8026 inhabitants, of whom 2629 are slaves; l. 29, *r.* 12,650 inhabitants, of whom 1691 are slaves. Add—Also, a town of Somerset county, in New Jersey, having 2282 inhabitants.—Also, a township of Franklin county, in Ohio, having 556 inhabitants.—Also, a county of Ohio, containing 7 townships, and 7722 inhabitants.

MONTGOMERY, in Wales, col. 2, l. 35, *r.* 1811; l. 36, the borough and—932—442 males, and 490 females.

MONTGOMERYSHIRE, col. 6, l. *ult.* *r.* 1811—51,931—25,373—26,558. Col. 7, l. 1, *r.* 3164 families; l. 3, *r.* 6369.

MONTICELLO, a town of Georgia, in Randolph county, having 89 inhabitants.

MONTIQUE, a town of Suffex county, in New Jersey, containing 661 inhabitants.

MONTROSE. In 1811 the burgh and parish contained 1064 houses, and 8955 persons; *viz.* 3837 males, and 5118 females: 170 families being employed in agriculture, and 1529 in trade, manufactures, and handicraft.

MONTVILLE, l. 3, *r.* 2187.—Also, a town in Maine, in Lincoln county, with 864 inhabitants.

MONTVILLE *Plantation*, a township of the same, having 130 inhabitants.

MOON, a township of Alleghany county, in Pennsylvania, having 1622 inhabitants.

MOON, *Half*, a township in Centre county, in Pennsylvania, having 560 inhabitants.

MOON, *First* and *Second*, two townships of Beaver county, in the same state, the former having 1035, and the latter 1245 inhabitants.

MOONSHEE, an Indian term signifying a letter-writer or secretary, and applied by Europeans to the native who instructs them in the Persian language.

MOONSTERLING, in *Geography*, a township of Kentucky, in Montgomery county, with 325 persons, of whom 76 were slaves in 1810.

MOORE, a township of Northampton county, in Pennsylvania, having 1108 inhabitants.

MOOSH, the ancient Moxoene, called also Daran, a town of Armenia, occupying a small eminence, washed by the Euphrates, over which is a bridge of fifteen arches: badly built and thinly inhabited; but the adjoining country is fertile and populous. The natives of this district, which is one of the Turkish pachalics of Armenia, are a degenerate race, and said to amount to 80,000 souls; 12,000 of whom are Yezedis. Considerable quantities of tobacco and manna are exported from hence.

MORAYSHIRE, col. 4, l. 32, *r.* 1811—6268—28,108; *viz.* 12,401 males, and 15,707 females: l. 32, *r.* 2635 families; l. 34, *r.* 1886.

MORELAND, l. 2, having 400—the other having 1692 inhabitants.

MORETON-HAMPSTEAD. In 1811 this parish contained 337 houses, and 1653 persons; *viz.* 770 males, and

883 females: 263 families being employed in agriculture, and 43 in trade, manufactures, &c.

MORETON in the *Marshs*. In 1811 this parish contained 194 houses, and 928 persons; *viz.* 457 males, and 471 females: 60 families being employed in agriculture, and 91 in trade, manufactures, &c.

MORETOWN, a town of Chittenden county, in Vermont, having 405 inhabitants.

MORGAN, a town of Orleans county, in Vermont, having 135 inhabitants.—Also, a township of Greene county, in Pennsylvania, having 1621 inhabitants.—Also, a township of Knox county, in Ohio, having 388 inhabitants.—Also, a county of Georgia, having 2294 inhabitants.

MORIEVILLE PLANTATION, a township of Maine, in the county of Hancock, having 224 inhabitants.

MOROKINNEC, *r.* **MOROKINNE** or **MOROTINNEE**.

MOROXYLIC ACID, in *Chemistry*, a name given by Klaproth to an acid principle obtained from a saline exudation from the *morus alba*, collected by Dr. Thompson in Sicily. This exudation contained the acid in question in combination with lime. When separated, it was found to possess the following properties:—It exits in the form of needle-like crystals, having the taste of fucinic acid. It is not altered by exposure to the air. It dissolves readily in water and alcohol, and does not, like the moroxylate of lime, precipitate the metallic solutions. It is volatile, and may be sublimed without change; hence this is probably the best mode of obtaining it in a state of purity. The *moroxylates* are little known, and do not appear to possess remarkable properties.

MORPETH. In 1811 the borough contained 464 houses, and 3244 persons; *viz.* 1470 males, and 1774 females: 77 families being employed in agriculture, and 529 in trade, manufactures, or handicraft.

MORPHIA, the name which has been given to an alkaline principle existing in opium; the description of which, and of the other principles existing with it, will be found under opium. See **OPIMUM**.

MORRIS, l. 3, for five *r.* ten. Col. 2, l. 6, *r.* 21, 828—856 were slaves in 1810.—Also, a township of Washington county, in Pennsylvania, having 1679 inhabitants.—Also, a township of Greene county, having 944 inhabitants.

MORRISTOWN, l. 4, *r.* and in 1810, 3753 inhabitants, 214 being slaves.—Also, a town of Orleans county, in Vermont, having 550 inhabitants.

MORRISVILLE, l. 2, *r.* Bucks; add—having 961 inhabitants.

MORTLAKE. In 1811 the parish contained 346 houses, and 2021 persons; *viz.* 832 males, and 1189 females.

MOSUL, l. 2, after Nineveh, add—though others think that the village of Nunia, on the opposite bank of the Tigris, presents the position of this ancient city. It is situated in the pachalic of Bagdad; *dele* in the province of Diarbekir, situated:—l. 12, insert—The inhabitants are said to amount to 35,000 souls.

MOTACILLA, *r.* **RUBECULA**.

MOTHER-KILL. Add—containing 7445 inhabitants.

MOULTONBOROUGH. Add—It contained, by the census of 1810, 994 persons.

MOUNT HOLLY, l. 3, *r.* 922.

MOUNT Joy, after Lancaster *r.* county, having 1551; at the close, add—having 636 inhabitants.

MOUNT Pleasant, l. 4, add—having 1105 persons.—Also, a township of Wayne county, with 522 persons.—Also, a township of Washington county, having 1165 inhabitants.—Also, a township of the same state, in Westmoreland county,

having 1788 inhabitants.—Also, a township of Jefferson county, in Ohio, with 846 persons.

MOUNT Tabour, a town of Rutland county, in Vermont, with 209 inhabitants.

MOUNT Vernon. Add—containing 1098 inhabitants.—Also, a town of Hillsborough county, in New Hampshire, containing 762 persons.

MOUNTAGU. Add—See **MONTAGUE**.

MOUNTAIN CORK. See **MINERALOGY**, *Addenda*.

MOUNTAINS, col. 7, under *Ireland*, instead of l. 3, insert—Sleibh Donard, a mountain in the county of Down—2500. Col. 13, l. 10, *r.* Varenus.

MUCILAGE, *Chemical Properties of*. See **GUM**.

MUCOUS ACID, in *Chemistry*. See **SACCHARIC ACID**.

MUCOUS Membrane, &c. See **MEMBRANE**.

MUMBO-JUMBO, a kind of bugbear dressed in a mafferade habit, formed of the bark of trees, and suspended upon a tree at the entrance of the Mandingo towns in Africa. It is much employed by the Pagan natives in keeping their women in subjection; for as the Kafirs, or infidels, are not restricted in the number of their wives, every one marries as many as he can conveniently maintain; and as it frequently happens that the ladies disagree, family quarrels sometimes rise to such a height, that the authority of a husband can no longer preserve peace in his household. In such cases, the interposition of Mumbo-Jumbo is called for, and is always decisive. This strange minister of justice, who is supposed to be either the husband himself, or some person instructed by him, disguised in the above-mentioned dress, and armed with the rod of public authority, announces his coming, when called for, by loud and dismal screams in the woods near the town. He begins the pantomime at the approach of night, and as soon as it is dark enters the town, and proceeds to the *hentang* (a kind of stage erected in every town, answering the purpose of a town-hall), at which all the inhabitants immediately assemble. Every married female, not knowing for whom the visit is intended, is alarmed, but when summoned must appear; and the ceremony commences with songs and dances, which continue till midnight, about which time Mumbo fixes on the offender. This unfortunate victim being thereupon immediately seized, is stripped naked, tied to a post, and severely scourged with Mumbo's rod, amidst the shouts and derision of the whole assembly; and it is remarkable, that the rest of the women are the loudest in their exclamations on this occasion against their unhappy sister. Day-light terminates this indecent and unmanly revel.

MUNI, col. 2, l. 3 from bottom, for many-mothered, for *r.* many-mothered fon.

MURÉNA, col. 3, *r.* **MYRUS**.

MURIATE of Ammonia. See **SAL Ammoniac**.

MURIATIC ACID, **MURIATES**, in *Chemistry*. See **CHLORINE**.

MUSCI, col. 8, l. 18, *r.* shrinks; l. 7 from bottom, *r.* efexual.

MUSHROOMS, *Chemical Properties of*. See **FUNGI**.

MUSKINGUM, l. 5, add—This county has 11 townships, and 10,036 inhabitants.

MUSOPHAGA, **PLANTAIN-EATER**, in *Ornithology*, a genus of birds of the Picæ order; the characters of which are, bill stout, triangular; the upper mandible elevated at the base, above the front; both mandibles dentated at the edges; nostrils in the middle of the bill; tongue entire, thickish; feet with three toes before and one behind. This genus is constituted by the blackish-violet plantain-eater, with crimson crown and quill-feathers, and a white stripe beneath the eyes. The bird, which is highly elegant, is

of African origin, and is found in the province of Acra in Guinea, and is said to live principally on the fruit of the mufa or plantain-tree. Dr. Shaw, in the Museum Leverianum, has described this bird as a species of cuckoo, under the name of *Cuculus regius*; but in his Zoology it is a distinct genus.

MUSTELA, col. 3, under B. r. BARBARA, Guiana weasel; l. 3, r. Guiana.

MUSTELIA, in *Botany*, in memory of Mr. Mustel, who wrote, in Phil. Trans. v. 63, some "New Observations upon Vegetation."—Sprengel Tr. of Linn. Soc. v. 6. 152. t. 13.—This plant is said to differ from EUPATORIUM, (see that article,) in having five minute scales accompanying the bristly feed-crown. How far such exist in any *Eupatorium*, or not, and whether they ought to make a generic distinction, merits inquiry.

MYLOCARYUM, from *μυλος*, a mill, and *καρυος*, a nut, alluding to the four spreading wings of the seed.—Willd. Enum. 454. Pursh 303. (Walteriana; Frazer's Cat.)—Class and order, *Decandria Monogynia*. Nat. Ord. *Ericæ*, Juss.

Eff. Ch. Calyx of five leaves. Petals five. Filaments swelling and angular in the middle. Stigma sessile. Capsule winged, of three cells. Seeds solitary.

1. *M. ligustrinum*. Privet-leaved Buck-wheat-tree. Willd.

n. 1. Pursh n. 1. t. 14. Sims in Curt. Mag. t. 1625. Ait. Epit. 371. Sm. Inf. of Georgia, v. 2. 135. t. 68, without a name.—On the dry borders of swamps in Georgia, flowering in May and June. An elegant evergreen *Shrub*, eight to twelve feet high. *Pursh*. Leaves alternate, stalked, obovate, acute, entire. *Flowers* white, sweet-scented, in terminal clusters. *Fruit* pendulous, resembling seeds of Buck-wheat, with three or four wings.

MYOXUS. At the close, add—Dr. Shaw enumerates some other species, such as the Chrysurus, or gilt-tailed D., the M. guerlingus, or guerlinguet, and the African, or earless Dormouse.

MYRIANDRUS. Add—According to Xenophon, it was a Phœnician city, a mart-town, and many merchant-ships lay at anchor before it.

MYRICIN, in *Chemistry*, a name given by Dr. John to the substance that remains after bees'-wax, or the wax of the *myrica cordifolia*, has been heated with alcohol. This substance is insoluble in water, ether, and alcohol, both hot and cold. It is soluble in the fixed and volatile oils, and does not precipitate from the former of these. It melts between 100° and 140°, and is somewhat glutinous, with of the consistency of wax. Its sp. gr. is .900.

MYTHOLOGY of the *Hindoos*, l. 26 from bottom, for stories r. fiores.

N.

NACHITOCHEs, l. 2, after Orleans, add—and in the territory of Orleans; its inhabitants in 1810 being 2870.

NACOGDOCHES, a small town of Louisiana, situated in N. lat. 31° 27'. W. long. 24° 17', on the Arroyo de la Nana, in a beautiful, healthy, well-watered country. This small town, and a few farms in the vicinity, are hitherto the only improvement made by the Spanish emigrants after the revolution of 98 years. A tribe of Indians, called Nadacos, resides about 30 miles N. of Nacogdoches, upon the headwaters of the Angelina, where they were found near a century ago by the French and Spaniards. The Nadacos are a poor inoffensive race, in peace with all their neighbours, both white and black.

NAGA, a name of the Hindoo mythological serpent, otherwise called *Sesha*; which see.

NAGANTEKA, in *Hindoo Mythology*, is a name of the hypogriph Garuda, the vehicle of the god Vishnu. It means the destroyer of serpents. Another of its names is *Superna*; which see.

NAIRIT, is one of the eight regents of the winds, or points of the heavens. He rules the south-west quarter, and is subordinate to Indra, regent of the firmament. (See INDRA.) These rulers of the cardinal and intermediate points are sometimes called *Maru* (which see). See also VIRUPAKSHA, meaning with a disagreeable countenance.

Another of his names is Karbura. He has a *fakti* or consort assigned him, usually named *Nirriti*; which see.

NAIRN, l. ult. for 632 r. 613.

NAIRNSHIRE, col. 2, l. 46, number of houses was 1746, and the inhabitants, &c.

NAKAL, one of the champions of the Hindoo heroic poem, entitled the *Mahabarata* (which see). As that poem is supposed to be allegorical, and to represent the conflicts between man's virtues and vices, Nakal, one of the five sons of Pandu, is said to be a personification of temperance, and is made the twin-brother of Sahadeva, or chastity. Other commentators make them to represent beauty and wisdom. Their mother was Maderi, a wife of Pandu; which see.

NAKSHATRA, in *Astronomy*, is the name given by the Hindoos to the mansions which they assign to the moon. They seem to be the same, though not exactly coinciding, with the lunar stages of the Arabians, which they call *manzil*. The "Nakshatras, or asterisms, marking the moon's path," are twenty-seven or twenty-eight in number. A table of them is given in the ninth volume of the Asiatic Researches, by Mr. Colebrooke, the president of the Asiatic Society. See also the second volume of the same work, together with the Indian zodiac, accompanied by an essay on its antiquity, by sir W. Jones.

The Hindoos ascribe the invention of their solar and lunar

lunar zodiacs to Dakṣha, who is mythologically represented as a son of Brahma, and they then give a free rein to their poetical imaginations, representing the Nakṣatras as the daughters of Dakṣha.

NALA, in *Hindoo Romance*, is a personage of considerable importance, though described as an ape. Others begat by the divine architect *Vṛiṣṭakarma* (which fee); and he is said in the Ramayana to have been the builder of Rama's bridge, usually called Adam's bridge, from the continent to the island of Ceylon, or Lanka. See **CEYLON** and **LANKA**.

NAMUKI, is the name of a friend and companion of Indra, the regent of the firmament.

NANCEMOND. See **NANSEMOND**.

NANDANA, the name of the garden, or city, assigned by Hindoo fabulists for the delightful residence of their demigod Indra, the regent of the firmament. (See **INDRA**.) There are four cities or gardens of this name, and three of them are sometimes said to belong to Ganesa, or Pattear. One of them is called Siva-nandana-puri, the self-delighting city; nandana meaning delightful or happy.

NANDI, in *Hindoo Mythology*, is the name of the bull on which the god Siva rides. The bull, with the Hindoos, is the symbol of divine justice, as it is also of generation or production. See **SIVA**.

NANSEMOND, l. 4, r. 10, 324—4462.

NANTICOKE, l. 2, r. 28, 43 inhabitants, including 192 slaves in 1810.

NANTMILL for **NANTRILL**, l. 2, add—the former contains 1544, and the latter 1188 inhabitants.

NANTUCKET, l. 13, r. 6807.

NARAKA, one of the receptacles for sinners, or hells of the Hindoos. Of these, they have at least seventy-one; and their names are given in the *Inf.* of *Menu*, c. iv. v. 88, 89, 90.

NARAMEDHA, a term in the Sanskrit language signifying the sacrifice of a man. It cannot be doubted that human sacrifices were formerly offered by some tribes of Hindoos, although it is said, and may be reasonably believed, that in these days the practice is wholly discontinued. (See **RENERA**.) To the goddesses Parvati, or Bhavani, the consort of Siva, under her name of Kali, or the *black goddess*, these offerings, it would appear, were usually, if not always, made. The rules and regulations for this horrid sacrifice are laid down in a chapter, emphatically called the sanguinary chapter of the Kalika-Purana, which has been translated by Mr. Blaquiere, and published in the fifth volume of the Asiatic Researches, art. xxiii. No religious rite can be more minutely ordained and detailed.

Although it must appear evident, that human sacrifices were formerly legal and practised among Hindoos, they are most pointedly prohibited in very ancient, as well as in more modern books: such prohibition is, indeed, a farther, and of itself sufficient proof of the existence of the practice. In the Brahma Purana, (see **PURANA**,) every Naramedha, or man-sacrifice, is expressly forbidden; and in the fifth book of the *Sri-Bhagavat*, (see that article,) sir W. Jones has pointed out the following emphatical words: "Whatever men in this world sacrifice human victims, and whatever women eat the flesh of male cattle, those men and those women shall the animals here slain torment in the mansions of Yama, (see **YAMA**,) and like slaughtering giants, having cleaved their limbs with axes, shall quaff their blood." Asiatic Researches, vol. iii.

In the first Veda an emblematical or vicarial sacrifice is ordained, in which men and animals are the victims, but are released after certain ceremonies.

VOL. XXXIX.

NARA-SINGHA, in *Mythology*, is the designation of the fourth avatara or incarnation of the Hindoo deity Vishnu. It means literally *man-lion*, such being the form in which this defect is related to have taken place.

Sir W. Jones furnished that this avatara, and the following of Vamana, (see **VAMANAVATARA**;) were allegorical references to the two presumptuous monarchs Nimrod and Belus, under the names of Hiranyakapuru and Beli, the former name meaning *with a golden axe*, or, according to other authorities, *clad in gold*. *Hind. Panth.* Af. Ref.

The three avatars, or defects of Vishnu on earth, that preceded that which is the subject of this article, were the Matsya or fish, the Kurma or tortoise, and the Varaha or the boar; under each of which words, having the common denomination of avatara postfixed, some account of them will be respectively found. A list of the ten grand defects, or *dasaavatara*, will be found under the article **VISHNU**. This is sometimes written *Nri Sinha*.

NARASINHI, or **NARSINHI**, or *Nrisinhi*, is the name given to the Hindoo goddesses Lakshmi, who became thus incarnated to accompany her lord Vishnu in his avatara or descent of Narasingha, as sufficiently explained under that article, and the others thence referred to.

NARAYANA, is a personification of rather a bold and apparently reprehensible nature. "The waters are called *nara*, because they were the first production of Nara, or the Spirit of God; and since they were his first *ayana*, or place of motion, he is thence named Narayana, or moving on the waters." *Inf.* of *Menu*, c. l. v. 10. See **MENU**.

On the whole, Narayana seems to refer in character more to Vishnu than to any other of the Hindoo deities.

NARAYANI, a name and form of the Hindoo goddesses Lakshmi. In this character, she is considered as the Sakti or consort of Narayana; which fee, and **MATRI**.

NARBETH, l. 9, r. 388.

NAREDA, or **NARADA**, in *Hindoo Mythology*, a personage among the Hindoos, deemed the mythological offspring of Brahma and Saraswati. In the popular histories of Krishna, Nareda is represented as his humble friend, on whom he passes many practical and whimsical jokes, metamorphosing him into a woman, &c. But in more serious books, his character is more corresponding with the magnificence of his origin. He is represented as a wife legislator, great in arms, arts, and eloquence; and, indeed, of such historical celebrity, that his actions are the subject of a Purana, named after him; some account of which is given under **PURANA**. He was also an astronomer, and an exquisite musician. Hence Saraswati, the patroness of science and harmony, is said to have been his mother. He farther invented the vina, a sort of lute, which sir W. Jones remarks as a singular fact, is otherwise called *katechapi*, having the same meaning as *testudo*; and Nareda being also a frequent messenger of the gods, to one another, or to favoured mortals. His character, in these and other points, resembles that of Hermes, or Mercury.

NASH, l. 2, r. 7268—2897.

NASTICK, in *Philosophy*, the name of a sceptical sect of Hindoos. The word in the Sanskrit tongue means *negative*, and is intended to designate those who do not believe the Veda. Individuals of more orthodox sects call the Nasticks, materialists and atheists.

NASTURTIIUM, in *Botany*, (see our former article,) is now adopted to designate the Water-cress and its allies, separated by Mr. Brown from **SISYMBRIUM**, (see that article,) sect. 1.—Br. in *Ait. Hort. Kew.* v. 4, 109.—Class

and order, *Tetradymia Siliquosa*. Nat. Ord. *Siliquosa*, Linn. *Cruciferae*, Juss.

Eff. Ch. Pod nearly cylindrical; valves concave, without rib or keel. Cotyledons accumbent. Calyx spreading.

N. officinale. (Sisymb. *Naturium*; Linn. &c.), with *foliosis, terrestres, amphibium, pyrenaicum*, and *sagittatum*, are the species mentioned in Hort. Kew. We have already described all but *pyrenaicum*, which is a well-known species.

NATICK, *l. ult. r.* in 1810, contained 766.

NATRON. See MINERALOGY, *Addenda*.

NATUNZ, in *Geography*, a town of Persia, in the province of Irak, 63 miles from Isfahan, and 43 from Cahan, situated on a very delightful spot, in a valley surrounded by high and rugged mountains; and famous for the salubrity of its climate, pears, peaches, and handsome females. It has a fort in the centre of the valley, an excellent warm bath, and an old mosque, with a very handsome mineral, said to have been built 300 years ago.

NAVY. Add—having 56 inhabitants.

NAXIA, *l. 10* from bottom, after villages, add—Dr. Clarke (in vol. vi. of his Travels) states the whole population of the island, including women, at 18,000 persons, about 3000 of whom are Latins, and the rest Greeks.

NAZARETH, *col. 2*, at the clove, *l. 34*, add—Lower Nazareth is a township containing 758, and Upper Nazareth is a township in the same county and state, containing 535 inhabitants.

NEATH, *col. 2, l. 5, r. Saturday* for Thursday; *l. 6*, add—It has three fairs; *l. 12, r.* was for is.

NECYDALIS, MINOR, add—in fields and about hedges in the summer months. CÆRULEA, add—in woods during the summer months.

NEEDHAM, *l. 7, r. 1097*.

NEJIFF, or MESHEH ALI, a holy city, being the supposed burying-place of the caliph Ali, a town of the pachalic of Bagdad, nine furlongs from Hilleh, and four miles from Kufa, situated on a hill, at the bottom of which is an artificial lake. It was founded by Alexander the Great, and bore the name of Alexandria, which was afterwards changed into that of Hira, when it became the residence of a dynasty of Arabian princes, who fought under the Parthian banners against the emperors of Rome. Nejiff is not so large as Kerbela, but better built, and defended by a good wall, deep ditch, and lofty towers, lately renewed, under the apprehension of an attack from the Wahabees, who extend their ravages to the gates of the town. The tomb and mosque of Ali occupy an ample space in the middle of the city, and form a handsome structure, within a high wall, which an infidel subjects himself to death for attempting to pass. The governor of Meshed Ali is a Turk, but the population, not easily estimated on account of the constant influx of pilgrims, is like that of Kerbela, chiefly composed of Persian fanatics. The relics of almost all persons of rank are transported from the most remote parts of Persia to be interred either here, or at Kerbela, Kazameen, Koom, or Meshed in Khorassan.

NELSON, *l. 2, r. 13,257—2908*. Add—Also, a county of Virginia, containing 9684 inhabitants, of whom 4678 were slaves in 1810.

NEMESIA, in *Botany*, a name borrowed by Ventenat from Dioscorides, who is said to have applied it to some kind of *Antirrhinum*, we know not in what part of his writings. The present genus is nearly allied to *Antirrhinum*.—Venten. Malmaif. 41. Ait. Hort. Kew. v. 4. 10.—Clafs and order, *Didymia Angiosperma*. Nat. Ord. *Perfonate*, Linn. *Scrophularia*, Juss.

Eff. Ch. Calyx in five deep segments. Corolla spurred

at the base; throat clofed by the palate. Capfule compressed, of two cells, and two boat-like valves; partition linear, covered with feeds.

1. *N. chamædrifolia*. Germander-leaved Nemesia. Vent. n. 3. Ait. 1. (*Antirrhinum macrocarpum*; Ait. ed. 1. v. 2. 335. Willd. Sp. Pl. v. 3. 249.)—Leaves ovate, serrated, stalked. Flowers on axillary stalks, solitary.—Native of the Cape of Good Hope. A perennial, herbaceous, smooth, green-houfe plant, flowering all fummer. *Flowers* deep crimson.

2. *N. bicornis*. Horned Nemesia. Ait. n. 2. See ANTIRRHINUM, n. 24. (*Linaria*; Burm. Afr. 211. t. 75. f. 3.)—Leaves lanceolate, with tooth-like serratures. Clusters terminal, rather lax.—From the same country. Annual. The specific name applies to the *capfule*.

3. *N. fetens*. Fetid Nemesia. Vent. n. 1. t. 41.—Leaves linear-lanceolate; upper ones entire. Clusters terminal, dense. Stem shrubby.—From the Cape. *Flowers* white, streaked with red; palate yellow.

4. *N. linearis*. Linear Nemesia. Vent. n. 2.—Leaves linear, entire, sessile. Clusters corymbose.—Described by Ventenat from Jussieu's herbarium.

NEPANEESE, in *Geography*, a township of Lycoming county, in Pennsylvania, having 298 inhabitants.

NEPER, *col. 1, l. 22* from bottom, for *Neper's rods r. Neper's bones*.

NEPHELINE, or SOMMITE. See MINERALOGY, *Addenda*.

NEPHRITE. See MINERALOGY, *Addenda*.

NERANTEKA, in *Hindoo Mythology*, is the name of a malignant demon, mentioned often in their heroic poems, slain by Krishna, and by other divine warriors. The name generally means destroyer of men.

NERKA, one of the many hells of the Hindoos. See NARAKA.

NEROS, in *Chronology*, an ancient Chaldee period of 600 years, and equal to the Sofos of 60 years multiplied by 10.

NESENPACK, in *Geography*, a township of Luzerne county, containing 460 inhabitants.

NESHANSACK, a township of Mercer county, in Pennsylvania, having 700 inhabitants.

NETCHEZ, or western branch of the Sabine, a river of Louisiana, formed from the united streams of the Angelina, Attoquaque, Nena, and the Atafcoctio. The Netchez, though not so long as the Sabine, exceeds it as to quantity of water. The lands watered by this river, and its tributaries, are of superior quality to the country on the Sabine; but sterile compared with those on the margin of many rivers in Louisiana.

NETTING. Add—The *netting* is used in different parts of a ship; thus, the *boarding-netting* is thrown over the sides, to prevent the enemies boarding. *Bowfprit-netting* is fastened near the outer end of the bowfprit, to the man-ropes or horses, to stow away the fore-topmast-stay-fail and jib. *Breadwork quarter and waist nettings* are used to keep the hammocks in the stantions. *Head-netting* is fastened to the horses in the head and upper rail, to prevent the men from slipping overboard. *Quarter-deck netting* is suspended over the officers' heads, to prevent any thing falling thereon. *Top-netting* is fastened to the rail, shrouds, and top, to preserve the men from falling.

NEWARK, in America, *l. 2*, add—having 88 inhabitants; *l. 12*, add—and in 1810 contained 8008 inhabitants, of whom 366 were slaves.

NEW BRAINTREE, *l. 2*, after Worcester, insert —Maffachu-

—Massachusetts; l. 5, add—in 1810 contained 912 inhabitants.

NEWBURY, or NEWBERRY, l. 2, add—It contained, in 1810, 13,964 persons, of whom 4006 were slaves; l. 3, r. 1796; l. 10, r. 1363; l. 13, r. 5176.

NEWBURY PORT, l. 4, r. 7634.

NEW CANAAN, a town of Fairfield county, in Connecticut, containing 1599 persons.

NEWCASTLE, l. 5, r. 9 hundreds, and 24,429; l. 6, r. 1087; l. 16, add—It contained 2340 inhabitants, including 174 slaves; l. 19, r. 592; l. 26, r. 1232. At the close, add—Also, a township of Mulkingum county, in Ohio, having 370 persons.

NEWCASTLE-IN-EMLYN, col. 2, l. 2, for Saturday r. Friday. Add—A few miles below the town is a beautiful salmon-leap.

NEW CHESTER. Add—containing 895 inhabitants.

NEW DURHAM, a town of Stafford county, in New Hampshire, having 888 inhabitants.

NEW FAIRFIELD, a town of Connecticut, in the county of Fairfield, having 772 inhabitants.

NEW-FANE, l. 3, r. 1276.

NEWFIELD, a town of Maine, in the county of York, with 815 inhabitants.

NEW GRANTHAM. Add—containing 864 inhabitants.

NEW HAMPSHIRE. Add—See UNITED STATES.

NEW HAMPTON, l. 4, add—and contains 1293 inhabitants.

NEW HARTFORD. Add—containing 1507 inhabitants.

NEW HAVEN, in America, l. 4, r. 18; l. 5, r. 1810; containing 37,064 persons. For other particulars, besides those which have been mentioned, see *NEW HAVEN*, and UNITED STATES.

NEWINGTON, l. 3, r. 508.

NEWINGTON, *Stoke*, a village of the county of Middlesex, in the Finbury division of Offstone hundred, and parish of St. Mary's. In 1811 the parish contained 342 houses, and 2149 persons; viz. 890 males, and 1259 females.

NEW KENT, l. 3, r. 6478 inhabitants, of whom 3735 were slaves in 1810.

NEWLIN. Add—containing 780 inhabitants.

NEW LONDON, l. 4, r. 14; l. 6, r. 1810—34,707—77; l. 14, r. 3238; l. 26, r. 692. At the close, add—Also, a township of Pennsylvania, in Chester county, containing 1018 persons.

NEWMARKET, in America, l. 3, r. 1061. Col. 2, l. 1, add—Also, a township of Highland county, in Ohio, containing 978 inhabitants.

NEW MILFORD, l. 7, add—In 1810, the inhabitants were 3537. At the close, add—it has 797 inhabitants.

NEWPORT, in Cornwall. In 1811, the parish of St. Stephen's contained 159 houses, and 896 persons; viz. 433 males, and 463 females.

NEWPORT, col. 1, l. 4, r. 1427; l. 7, r. 16,294; l. 19, r. 7907. Col. 2, l. 9, add—containing 566 inhabitants. Add—Also, a township of Washington county, in Ohio, having 323 inhabitants.

NEWRY, a township of the district of Maine, in the county of Oxford, having 202 inhabitants.

NEWTON, l. 3, r. 1709; l. 5, add—Also, a township in Bucks county, having 902 inhabitants:—l. 8, r. 454; add—Also, a township of Delaware county, in Pennsylvania, containing 601 inhabitants.—Also, a township of Cumberland county, in the same state, having 1312 inhabitants.—Also, a township of Miami county, in Ohio, having 556

inhabitants.—Also, a township of Mulkingum county, in Ohio, having 802 inhabitants.—Also, a township of Trumbull county, in Ohio, having 490 inhabitants.

VOL. XXV.

NEWTON-NOTTAGE, a parish formed by the hamlets of Newton and Nottage, situated in the county of Glamorgan, near the Bristol Channel. In 1811, the former hamlet, at a small distance from Pyle, that lies in the road between Cowbridge and Neath, contained 55 houses, and 254 persons; viz. 117 males, and 137 females: and the latter contained 43 houses, and 217 persons; viz. 107 males, and 110 females.

NEWTOWN, l. 3, containing 2834 persons; l. 14, having 1951 inhabitants; l. 17, and 2082 persons; l. 25, add—See NEWTON; l. 27, add—See also NEWTON.

NEW VINEYARD, l. 1, for Kennebeck r. Somerset. Add—containing 484 inhabitants.

NEW YORK. See *NEW YORK*.

NIAGARA, l. 1, insert—a county, &c.; l. 2, add—the county including 8971 inhabitants.

NIBBED-HOOKS, in *Rope-making*, are iron winches used to hang the yarn on to harden, and to lay small ropes on.

NICHOLAS, l. 2, r. 4898 inhabitants, 509 being slaves.

NICKEL, in *Chemistry*. The weight of an atom of this metal, according to the recent determinations of Dr. Thomson, is 33.75, from which datum the composition of its salts may be easily ascertained. See *ATOMIC THEORY*.

At the end of the article in the Cyclopædia, add—From the experiments of Tuppiti, it appears that preparations of nickel possess poisonous properties.

NICKEL-Ore. See *MINERALOGY, Addenda*.

NICOTIN, in *Chemistry*, the name which has been given to a peculiar principle in the leaves of the *nicotiana latifolia*, or *tobacco*, and to which that plant owes its peculiar properties. This substance was obtained by Vauquelin from the juice, by a process sufficiently complicated. When pure it is colourless. It has an acrid taste, and the peculiar smell which distinguishes tobacco. It occasions violent sneezing. It is soluble both in alcohol and water; the solutions are colourless, and distinguished by the peculiar taste and smell of nicotin. It is precipitated from its solutions by tincture of nutgalls. It is volatile, and somewhat resembles in short the volatile oils in its properties. It possesses poisonous properties. See further in the *Annales de Chemie*, lxxi. 139.

NIGER. Add—It has been supposed that the Niger terminates in the Nile; but this hypothesis, though maintained by several modern travellers, viz. Hornemann, Jackson, &c. is the most unfounded of any, and the least consistent with acknowledged facts. The supposition adopted by Mr. Park is, that the Niger terminates in the river Congo, or, as it is sometimes called, the *Zaire*; which see. Another supposition, respecting the termination of the Niger, is that of a German geographer, Mr. Reichard, published in the “*Ephemerides Geographiques*,” in August 1808, who represents the Niger, after reaching Wangara, as seeking a direction towards the south, and being joined by other rivers from that part of Africa, taking a great turn from thence towards the south-west, and pursuing its course until it approaches the north-eastern extremity of the gulf of Guinea, whence it divides and discharges itself by different channels into the Atlantic; after having formed a great Delta, of which the Rio del Rey constitutes the estuary of the Rio Formoso, and Benin river the western branch,

branch. Park's Travels, vol. ii. Appendix, N° iv. p. clxxxiv.

NILA, in *Mythology*, is one of the many names of the Hindoo goddess Parvati. The word means blue or dark-azure, and is one of the Sankrit names for the Nile, as is also Kali.

NILAKANT'HA, a name of the god Siva, meaning blue-throated, similar to Shitakantha, or Shitakoontha, under which word some account is given of the origin, &c. of the appellation.

NILE, in *Geography*, a town of Ohio, in the county of Scioto, having 396 inhabitants.

NIMMISHITHAN, a township of Ohio, in Stark county, having 385 inhabitants.

NIOBE, in *Ancient Mythology*, was, according to the historians who acquiesce in the authority of Diodorus Siculus and Apollodorus, the daughter of Tantalus, and sister of Pelops. Pelops removing from Phrygia, carried his sister with him to that part of Greece which afterwards took his name; and for the security of his new dominions, married her to Amphion, a prince eminently powerful and eloquent, who fortified Thebes with walls. Niobe became, in consequence of that marriage, the mother of a numerous progeny; and was thus led to despise Latona, who in revenge induced Apollo and Diana to put all her children to death, in the manner related by Ovid and Plutarch. This episode, as it is said by some writers, contains a history no less true than tragical. The city of Thebes was desolated by a pestilence, which destroyed all Niobe's children; and as contagious distempers have been attributed to the immoderate heat of the sun, it was reported that Apollo slew them with his darts. Niobe, after the death of her children, and husband, who, overpowered with grief, destroyed himself, returned to Lydia, and ended her days near mount Sipylus, upon which was seen, according to Pausanias, a rock that, viewed at a distance, resembled a woman in deep melancholy and distress. Sophocles, in his Antigone, says, that this princess was not at first transformed into a stone; but that the gods, at her request, granted her that favour afterwards. The same poet, in his Electra, says, that Niobe sheds tears in a tomb of stone.

NIPPER, in *Rope-making*, is formed of two steel plates, through which the yarn passes from the tar-kettle, which are so adjusted by weights and a lever, that the yarn receives no more tar than is required, and what is squeezed out drops into a trough and returns into the kettle.

NIRRI'TI, is the name of a Hindoo deity, consort or *fakti* of Nirrit or Nairit. (See the latter article.) She shares with her husband the regency of the south-west quarter of the heavens.

NISHAPOUR, anciently the greatest and richest city of Khorassan in Persia, and one of the four royal cities of the province, is seated on a plain, formerly irrigated by about 12,000 aqueducts, which have fallen into decay. It is said to have been founded by Taimuras, and destroyed by Alexander the Great. After the lapse of many years, it was rebuilt by Sapor I., and his statue was seen in it till the Arabs destroyed it. This city was taken in the 548th year of the Hegira by the Tartars, who so completely ruined it, that when the original inhabitants returned to take possession of it, they could not distinguish their own houses. After having regained its former splendour, it was again taken and pillaged by the Tartars under Gengis Khan; so that the present inhabitants do not exceed the number of 15,000. The ruins of the city are nearly ten furlongs in circumference. It is at present

subject to the dominion of the king of Persia, and has nine districts dependent upon it, each of which has about ten walled villages. The fruits are abundant and delicious.

NITRE, *Native*. See MINERALOGY, *Addenda*.

NITRIC ACID, NITRATES, &c. in *Chemistry*. The correct proportions in which azote and oxygen combine, will be found in the tables appended to *Atomic Theory*, to which therefore we refer our readers. We shall only state here the composition of nitric acid, which is 5 atoms oxygen + 1 atom azote: hence the weight of its atom is 67.5, from which datum the composition of the nitrates can be accurately determined.

NIVENIA, in *Botany*, a noble genus, dedicated by Mr. Brown to Mr. James Niven, an intelligent observer and collector of Cape plants, sent out by Mr. Hibbert.—Br. Tr. of Linn. Soc. v. 10. 133. *Ait. Hort. Kew. v. 1. 201.* (Paranomis; *Salif. Parad. at p. 67.*)—Clafs and order, *Tetrandria Monogynia*. Nat. Ord. *Protaceae*, Juss. Br.

Ess. Cl. Corolla four-leaf, regular. Anthers sunk in the concave tips of the segments. Nectary four scales. Stigma vertical. Nut superior. Involucrum of four leaves, containing four flowers: hardened when in fruit.

Ten species are described, all shrubs, natives of hills at the Cape of Good Hope. *Leaves* scattered, doubly pinnatifid, thread-shaped; the upper ones, in six of the species, undivided and flat. *Flowers* spiked, capitate, bracteated, purplish.—Four species are mentioned in *Hort. Kew.*

1. *N. Sceptrum*. (Protea Sceptrum; Linn. Suppl. 116. *Spart. Stockh. Transf. for 1777. 53, not 55, t. 1.*)—Upper leaves obovate or lanceolate, flatfish; simple at the edges. Corolla silky, with close hairs.

2. *N. spathulata*. (*P. spathulata*; Thunb. Prot. n. 58. t. 5.)—Upper leaves broader than long, hooded, bordered. Involucrum obtuse. Corolla bearded. Style smooth. Stigma oblong-clubshaped.

3. *N. spicata*, and 4. *N. crithmifolia*, the latter *P. Lagopus*; *Andr. Repof. t. 243*, have all the *leaves* doubly pinnatifid.

NOBLEBOROUGH, l. 3, r. 1206.

NOCK, the foremoil upper corner of boomfalls, and of flayfalls cut with a square tack.

NOCKAMIXON, l. 2, r. 1209.

NOCTURN, LITURGIC, the divine office of the night, as distinguished from that of the day. The latter consisted of the seven canonical hours, the former of three nocturns, each consisting of several psalms, lessons, &c.; and it was heretofore customary to interrupt the sleep three different times for the performance of them.

NOOTH'S APPARATUS. See LABORATORY.

NORFOLK, col. 2, l. 15, add—By the parliamentary returns in 1811, this county contained 33 hundreds, 3 boroughs, *viz.* King's Lynn, Thetford, and Great Yarmouth, and one city, *viz.* Norwich; 51,774 houses, occupied by 291,999 persons; 138,089 being males, and 153,910 females: of whom 31,454 families are employed in agriculture, and 23,082 in trade and manufactures.

NORFOLK, in America, l. 4, r. 22; l. 6, r. 31,245; l. 8, r. 18,679—5647; l. 4 from bottom, r. 1441.

NORMAN. Add—Also, a square sid of oak, or short carling, fixed through the head of the rudder of East India ships, to prevent the loss of the rudder, in case of its being unshipped. Also, a short wooden bar with a head, used in one of the holes of the windlafs when there is little strain on the cable.

NORRIDGEWOCK, l. 2, add—and county of Somerset; l. 3, r. 880.

NORTH BEAVER. See BEAVER.

NORTH-

NORTH-*West Fort*, a hundred of Suffex county, in the state of Delaware, containing 3203 persons, of whom 382 were slaves in 1810.

NORTH-*West Passage*, l. 15, after Labrador coast, add—nor of the Cortelears of Portugal in 1500, nor of the Cartiers and others from France in 1508 and 1534; nor of Gomez, &c. from Spain in 1524, &c.; nor of fir Hugh Willoughby in 1553, of Richard Chancellor and Steven Burrough in 1555 and 1556:—l. 19, such as Edward Fenton in 1577, Arthur Pet and Charles Jenkinson in 1580, fir Humphry Gilbert in 1583, John Davis in 1585, 1586, and 1587, Cornelis Cornelison, Brands Yfrants, and William Barentz of the United Provinces, in 1594, of Barentz in 1595 and 1596, William Adams in 1596, George Weymouth in 1602, James Hall in 1605-6-7, John Knight in 1606, Henry Hudson in 1607-8-9-10, fir Thomas Baiton in 1612, James Hall in 1612, Gibbons in 1614, Robert Bylot in 1615, Bylot and William Baffin in 1616, Jens Mank, a Dane, in 1619:—l. 41, and, after the failure of Samuel Hearne in 1760, 1770, Constantine John Phipps (lord Mulgrave) in 1770, captain Cook, &c. Col. 2, l. 39, add—our limits will not allow our detailing the voyages of captain (now admiral) Lowenorn, lieutenant Egédes, and lieutenant Rothé, Danes, in 1786 and 1787, nor the travels of Alexander Mackenzie in 1789, nor those of Charles Duncan in 1790 and 1791, nor the discoveries made by the Ruffians on the northern coast of Siberia during the 18th century, nor the voyages for farther discovery, undertaken in the early part of the 19th century by lieutenant Kotzebne 1815 to 1818, of John Ross, David Buchan, William Edward Parry, and John Franklin in 1818. Add to the references—Barrow's Chronological History of Voyages into the Arctic Regions, &c. 8vo. London, 1818.

NORTHAMPTON, col. 9, l. 7, for 1623 r. 1576.

NORTHAMPTON, in America, l. 4, r. 32-38, 145; l. 5, r. 1176; l. 8, r. 710; l. 10, r. 13,082; l. 11, r. 7258; l. 17, r. 7474; l. 18, r. 3350. Col. 2, l. 2, r. 2631. Add at the close—In 1810 it contained 4171 inhabitants.

NORTHAMPTONSHIRE, l. 24, r. 28,318. Add—68,279 being males, and 73,074 females, of whom 12,100 families were employed in trade and manufactures, and 15,235 in agriculture.

NORTHBOROUGH, l. 3, r. 794.

NUX VOMICA, *Chemical Properties of*. MM. Pelletier and Caventou, in analysing the nux vomica and St. Ignatius's bean, observed a new vegetable alkaline substance, having the following properties.

It is slightly soluble in water, very soluble in alcohol, restores the colour of turnsole after it has been reddened with an acid, does not redden turmeric, combines with acids which it saturates, and forms with them crystallizable salts. The discoverers have suggested the name *Vauquelin* for this substance, in honour of the celebrated chemist Vauquelin, who is said to have first discovered the alkaline properties of a substance obtained by him from the *daphne alpina*.

NYCTERUM, in Botany, a genus entirely artificial, made by Ventenat in Hort. Malmalf. 85, out of such species of SOLANUM, (see that article,) as have irregular flowers.—Sims in Curt. Mag. 1801.—M. Dunal has very judiciously, as we presume to think, kept *Solanum* entire.

O.

O I L

OAKHAM, in America, l. 3, r. 848.

OBSIDIAN. See MINERALOGY, *Addenda*.

OCATAHOOTA, in *Geography*, a parish of New Orleans, in Louisiana, resembling in its soil and produce *Ouachitta*; which see.

OCTOMERIA, in *Botany*, *ὀκτώ*, eight, and *μερίς*, a portion, or supply, because of the eight masses of pollen.—Brown in *Ait. Hort. Kew.* v. 5, 211.—Class and order, *Gynandria Monandria*. Nat. Ord. *Orchideæ*.

Fl. Ch. Lip articulated with a kind of claw which bears the petals. Anther a moveable deciduous lid. Masses of pollen eight.

We know not of how many species this genus is composed. One only occurs in *Hort. Kew*.

1. *O. graminifolia*. Grass-leaved Octomeria. *Ait. n. l.* (*Dendrobium graminifolium*; Willd. *Sp. Pl.* v. 4, 135. *Epidendrum graminifolium*; Linn. *Sp. Pl.* 1353. *Helleborine graminea repens biflora*; Plum. *Ik.* 171. t. 176. f. 1.)—Stem elongated, bearing one lanceolate leaf, and a pair of stalked flowers. Root creeping.—Native of the West Indies; imported by rear admiral Bligh, in 1793. Few botanists have gathered or examined this plant. Burmann, without much sagacity, thought it a *Convallaria*.

OGHAM, col. 3, l. 30, for *Dfxtfrb* r. *Dfxtfrb*, and for *bfufdkth* r. *bfufdkth*.

OGLETHORPE, l. 3, containing, with its town Lexington, 12,297 inhabitants, of whom the slaves in the county are 5322, and in the town 113.

OHIO, l. 8, add—Bradbury, in his "Travels," estimates the area of the Ohio state at 43,860 square miles, and its population at 230,760 souls; so that by this statement there was, in 1810, only one inhabitant in one and a half square mile, and allowing 640 acres to the square mile, one inhabitant in every 900 acres. At the close, add—For a later and more correct account of the number of counties and amount of population in this state, see UNITED STATES. Col. 5, l. 3 from bottom, add—This river derives its waters from an area of 108,464 square miles, four times the extent of England and Wales, the surface of which is supposed to be 49,450 square miles, and comprehended between the parallels of 35 and 43 degrees of latitude.

OHIO, county of Virginia, l. 4, r. 8175 inhabitants, of whom 440 were slaves in 1810; l. 6, r. 3682; l. 7, r. 497. Add—Also, a township of Alleghany county, in Pennsylvania, having 832 inhabitants.—Also, a township of Beaver county, in Pennsylvania, having 1128 inhabitants.—Also, a town of Ohio, in the county of Clermont, having 1803 inhabitants.—Also, a town of Gallia county, in Ohio, having 350 persons.—Also, a township of Knox county, in Indiana territory.

OIL of Caraway, l. 1, for *CARUA* r. *CARUM*.

O P A

OIL Creek. Add—Also, a township of Crawford county, in Pennsylvania, having 340 inhabitants.

OLEA, l. 4 from bottom, for *Calyx* r. *Corolla*.

OLEFIANT GAS, *Chemical Composition* of. See ATOMIC THEORY and CARBON.

OLEIC ACID, in *Chemistry*, obtained by Chevreul from a soap made by digesting hog's-lard in potato ley. When this soap is put into water, a portion was deposited in pearl-coloured scales, which was the *margarate of potash*. (See *MARGARIC Acid*.) Another portion, consisting of the *oleate of potash*, mixed with some *margarate of potash*, remained in solution. These two were then separated, and the oleic acid obtained in a state of purity. Oleic acid when pure is an oily fluid, without taste or smell. But most commonly it has a rancid odour, and a yellow or brown colour, somewhat resembling olive-oil. Its specific gravity is .899. Sometimes it remains liquid at 35°, though other varieties of it congeal at 43°, or even higher. When congealed it crystallizes in needles. It reddens litmus with great energy. It is insoluble in water, but very soluble in alcohol. It combines readily with the alkalies and earths, forming salts, or rather soaps, none of which possess very remarkable properties. Dr. Thomson, from Chevreul's experiments, estimates the weight of its atom at 360. It may be obtained from most other animal fats as well as hog's-lard.

OLEY, in *Geography*, a township of Berks county, in Pennsylvania, having 1284 inhabitants.

OLIVINE. See OLIVINE, and MINERALOGY, *Addenda*.

O'M, col. 5, l. 31, for *researches* r. *researchers*; l. 42, r. *monosyllabic*; l. 4 from bottom, *dele* of, and r. one of their. Col. 6, l. 24, r. *composed of a, &c.*

ONELEG, in *Geography*, a township of Ohio, in Tuscawara, having 610 inhabitants.

ONONDAGO, l. 16, r. 25,987, of whom, in 1810, 50 were slaves.

ONSLow, l. 3, r. 6669—2299.

ONTARIO, l. 3, number of inhabitants in 1810 was 43,032, of whom 212 were slaves.

OPETHUS, *TOURACO*, in *Orniology*, a genus of birds of the order of *Picæ*; the characters of which are, beak short, convex above, rather bent, compressed laterally, and denticulated from the middle to the tip; nostrils covered with short silky feathers; feet simple, with two toes before and two behind. One species of this genus is known, which is a native of Africa, and one of the most beautiful of the birds that are found in that quarter of the globe. It feeds on fruits, is easily tamed, and capable, as it is said, of turning its exterior hinder toe either backwards or forwards. This is the *CUCCULUS Parra* of the Linnæan system. Shaw.

OPAL. See MINERALOGY, *Addenda*.

OPELOUSAS,

OPELOUSAS, in *Geography*, a county and parish of the territory of Orleans, containing, in 1810, 5048 inhabitants. This territory presents a great variety of soil, or, if we except the sugar-cane and orange-tree, the cultivation of most valuable vegetables has succeeded. Cotton, indigo, and tobacco, have been and the former now is the staple commodity of the country; to which we may add, cattle, hides, leather, cheefe, beef, and pork.

OPHTHIDIUM, l. 25, add—See Dr. Brouffonnet's description of this fish in the Phil. Transf. vol. lxxi.

OPHIOPOGON, in *Botany*, from *οφις*, a serpent, and *πωγων*, a beard, a translation of the Japanese name, *Riuno Fige*, but the application is not very evident.—Ker in Curt. Mag. 1063. Ait. Hort. Kew. v. 2. 281.—Class and order, *Hexandria Monogynia*. Nat. Ord. *Sarmentaceae*, Linn. *Asparagi*, Juss.

Eff. Ch. Corolla half superior, permanent. Anthers feffile. Stigma simple. Berry with one seed.

1. *O. japonicus*. Japan Snake's-beard. Curt. Mag. t. 1063. (Convallaria japonica; Linn. Suppl. 204. Redout. Lil. t. 80. Mondo; Kempt. Am. Exot. 823. t. 824.)—Native of Japan, where it serves as edgings in flower-gardens. A hardy grassy plant, with clusters of greenish-white flowers, and blue berries. The knobs of the root candied, are esteemed medicinal.

OPIUM, *Chemical Properties of*. M. Derofne, in 1803, published an analysis of opium, in which he announced the existence of a peculiar crystallizable substance to which that drug owes its narcotic properties, whence it was named the *NARCOTIC PRINCIPLE* (which see). Soon afterwards, M. Sertürner published an analysis of the same substance, but the results of the two chemists were so different, as to render both doubtful. This latter chemist, however, pursued the subject, and at length succeeded in separating a peculiar substance from opium, which he denominated *morphia*. It is to this principle that opium owes its narcotic properties; and the *narcotic principle* of Derofne, according to Sertürner, is a compound of morphia, and a peculiar acid called the *meconic*, which opium contains. This latter circumstance, however, has been since called in question by Robiquet.

According to Sertürner, morphia occurs in opium combined with meconic acid. There are different methods of separating morphia from opium. Sertürner effected it by adding acetic acid, and thus forming an impure acetate of morphia. The acetic acid was then separated by ammonia, and the morphia thus obtained purified by means of alcohol. Others, after separating the extraneous matter as much as possible, add at once to the watery solution of opium pure ammonia, to precipitate the morphia, which is to be purified as before.

Morphia thus obtained is crystallized in the form of double four-sided pyramids, whose bases are squares or rectangles, and sometimes of four-sided prisms with trapezoidal bases. It dissolves in eighty-two times its weight of boiling water, and the solution on cooling deposits regular colourless transparent crystals. It is soluble in thirty-six times its weight of boiling alcohol, in forty-two times its weight of cold alcohol, and in eight times its weight of sulphuric ether. All these solutions change the infusion of Brazil wood to violet, and the tincture of rhubarb to brown, thus denoting distinct alkaline properties. They have a bitter and peculiar astringent taste; and the saturated solutions, when rubbed upon the skin, leave a red mark. It acts with great energy on the animal economy. Half a grain being swallowed by a young man of seventeen, produced a flushing in the face and an augmentation of the muscular

energy; another half grain being swallowed half an hour afterwards, occasioned a dull pain in the head, giddiness, stupor, and nausea. A third half grain aggravated the symptoms so much, that Sertürner became alarmed, and made his patient swallow a quantity of vinegar. But the symptoms were rather aggravated and continued all night, though they were removed next morning by the use of magnesia.

Morphia readily combines with the different acids, neutralizes them, and thus forms salts, of the properties of which the following is a brief summary. The carbonate of *morphia* crystallizes in short prisms. The acetate of *morphia* crystallizes, but is very soluble in water. The sulphate of *morphia* is likewise very soluble. The muriate of *morphia* assumes a plumose appearance, and is much less soluble than any of the other salts of morphia. The nitrate of *morphia* crystallizes in prisms.

Dr. Thomson estimates the weight of the atom of morphia, from the experiments of Choulant, at 82.5; but this probably differs considerably from the truth.

Meconic Acid.—This acid may be obtained from the infusion after the morphia has been separated by ammonia as above-mentioned, by adding muriate of barytes as long as any precipitate falls, which is *meconiate of barytes*. To obtain the meconic acid from this salt, M. Choulant triturated it in a mortar with its own weight of glassy boracic acid. This mixture being put into a small glass flask exposed gradually to heat in a sand-bath, the *meconic acid* sublimed in the state of fine white scales or plates.

Meconic acid thus obtained has a strong four taste, which leaves behind it an impression of bitterness. It is readily soluble in water, alcohol, and ether. It reddens the greater number of vegetable blues, and changes the solution of iron to a *cherry-red* colour; when these solutions are heated, the iron is precipitated in the state of protoxyd. This acid unites with the different bases forming *meconiates*. The *meconiate of potash* crystallizes in four-sided tables, and is soluble in twice its weight of water. The *meconiate of soda* crystallizes in soft prisms, and is soluble in five times its weight of water. It seems to effloresce. The *meconiate of ammonia* crystallizes in star-form needles, which when sublimed lose their water of crystallization, and assume the form of scales. The *meconiate of lime* crystallizes in prisms, and is soluble in eight times its weight of water. Dr. Thomson estimates the weight of the atoms of this acid, from the experiments of Choulant, at 27.5; but this can only be considered as an approximation.

Such is a brief account of the principles which chemists have lately detected in opium, and which, from the importance of the subject, we have thought proper to insert here.

ORES, *Chemical Analysis of*. See ANALYSIS.

ORFA, in *Geography*, the present name of the ancient *Edessa* (which see), from which the pachalic of Orfa derives its appellation. This pachalic is almost entirely encircled by the windings of the Euphrates and the river Khabour, and occupies a considerable portion of the most barren part of Mesopotamia. In the early ages of the Roman empire, this division of Mesopotamia bore the name of Osrohoene. It had subsisted 843 years as an independent kingdom, when it was reduced under the form of a province by Caracalla, who led Abgarus, the last of its kings, in chains

chains to Rome. The city of this name, after the expulsion of the princes of Ofrhoene, became a Roman colony, and was regarded as one of the bulwarks of Mesopotamia against the Parthians and Persians. It was the residence of the Courtneys, counts of Edeffa; and fell, together with the adjoining territory, into the hands of Zingi and Sallahaden. In the thirteenth century it was sacked by the Moguls, and by Timur in the 804th year of the Hegira. It is now subject to the grand feignior, and the residence of a pacha of two tails. It is situated in a barren country, 232 miles from Diarbekr, surrounded by a stone-wall, defended by a citadel, and a broad deep ditch. The houses are well built, and the inhabitants, composed of Turks, Arabs, Armenians, Jews, and Nestorians, amount to about 20,000 souls. The chief ornaments of the city are, a magnificent mosque, consecrated to Abraham, and the cathedral of the Armenians, now fallen to decay. On an adjoining mountain are the ruins of a building, called the palace of Nimroud, and several extraordinary subterraneous apartments, apparently very ancient. M'Kinneir's *Perlia*.

ORFORD, l. 4, r. 1265.

ORGAN, col. 8, l. 12 from bottom, r. thoroughly repaired.

ORLAND. Add—It contains 480 inhabitants.

ORLANDO. See LASSUS.

ORLEANS, l. 4, r. 23; l. 10, r. 5830; l. ult. and in 1810 of 1248 persons.

ORLEANS, *New*, l. 3, insert 105 miles, &c.; l. 3, add— or, by the statement of Mr. Darby, N. lat. 28° 57'. W. long. 90° 8'. At the close, add—By the census of 1810, it is stated as comprising the following counties; *viz.* Orleans, German Coast, Acadia, La Fourche, Iberville, Point Coupee, Concordia, Ouachitta, Rapides, Natchitoches, Opelousas, and Arkansas, which include a number of parishes, and a population of 76,556 souls. The city and suburbs of New Orleans contained 17,242, and its precincts 7310: the number of slaves in the former is stated at 5961, in the latter at 4863. Since the census of 1810, there has been a rapid increase of population. Mr. Darby, in his "Description of Louisiana," published in 1816, states, that 1000 may be added for the annual increase, so that the present population may be estimated at more than 23,242 persons. No city perhaps on the globe, he says, presents a greater contrast of national manners, language, and complexion, than New Orleans. The proportion between the whites and men of mixed cast or black is nearly equal. Among the whites, the French are hitherto most numerous and wealthy; next to these are the Anglo-Americans; and lastly, the natives of the British islands. Here are but few Spaniards and Portuguese, some Indians, and dispersed individuals of all the nations of Europe. For a further account, see UNITED STATES.

OSIPEE Gore, a township of the same state and county, having 125 persons.

OTAHETTE, l. 6 from the end, add—From a survey made by captain Wilton in this voyage, he estimates the whole number as not exceeding 16,050 persons; and Turnbull, in his "Voyage round the World," performed from 1800 to 1804, says, that they cannot now be estimated at more than 5000.

OTALGIA, derived from *ous*, the ear, and *algos*, pain, signifies the disorder, which, in plain English, is generally called the ear-ache. The pain may be confined to one ear, or affect both these organs with different degrees of severity. It may be either of a burning, shooting, pricking, piercing, throbbing, or gnawing description; or it may consist of an unpleasant sensation of whispering in the ear, of a ringing of bells (see *Tinnitus Aurium*), a continual humming noise, &c.; the complaint in such instances usually depending upon irritation of the nerves of the organ.

According to the nature and situation of the disease, the pain may affect either the outer part of the ear, the meatus auditorius externus, the cheeks and temples, or the internal parts of the organ, the cavity of the tympanum, the labyrinth, and the auditory nerve itself. Otalgia is divided into several species, which are determined by the nature of their particular causes. Callisen mentions five varieties of the disorder; *viz.* the *otalgia inflammatoria, catarrhalis, purulenta, metastatica*, (a case which the modern doctrines in pathology hardly allow us to admit,) and the *otalgia a corporibus alienis intrusis*.

The inflammatory form of the complaint, when seated in the external parts, is indicated by the common symptoms of inflammation, as heat, swelling, and redness, extending over the lobe of the ear, and the adjoining part of the cheek, attended with a diminution in the diameter of the meatus auditorius, and a consequent dulness in the power of hearing. But when the inflammation is seated in the internal ear, it is accompanied with acute fever, excruciating pain in the deeper part of the organ, exquisite sensibility to the slightest noise, intolerance of sounds, restlessness, sometimes a great deal of delirium, convulsions, syncope, coldness of the extremities, and, according to the accounts of several respectable writers, the disease may even have a fatal termination.

The *otalgia catarrhalis* is preceded by the usual symptoms of a cold, which is very frequently the consequence of an exposure of the head to a current of wind, or of the feet to damp, at a period when they are much heated. This ear-ache is commonly characterized by much milder symptoms than other varieties of the complaint; the swelling of the parts about the ear is not considerable; the noise discharges a vast quantity of mucus; the patient is troubled with cough and tooth-ache; and not unfrequently an enlargement

enlargement of the neighbouring glands is conjoined with the catarrhal swelling of the fauces.

The inflammatory otalgia sometimes terminates in the formation of an abscess, which may be superficial, being then sufficiently manifest from the presence of the ordinary symptoms of a cutaneous collection of matter. In this case, the fever and pain abate as soon as the abscess is opened, or has spontaneously burst, and the pus has been discharged. In other examples, the matter forms more deeply in the cavity of the tympanum, and it either makes its way outward by ulceration of the membrana tympani, or, in a more favorable way, through the Eustachian tube. When the abscess occupies a still deeper situation, that is to say, when the matter collects in the labyrinth, a necrosis of the bones often follows, the abscess either discharging itself into the cavity of the tympanum, or becoming diffused under the pericranium.

The *otalgia cariiosa* may originate from a caries, or rather a necrosis of the temporal bone, or, sympathetically, from a caries of one of the teeth. As the communicating branches of the facial nerve are affected, we see very paralysis of the muscles of the face is a frequent concomitant of this species of otalgia.

The *otalgia from extraneous substances in the ear*, as masses of hardened cerumen, insects, the lodgment of any small body, like a pea, &c. may be suspected from the account which the patient will give of his case; but it may be clearly ascertained by examining the state of the meatus auditorius in a strong light, and by the use of a probe. An obstruction or compression of the Eustachian tube may also become a cause of otalgia, as Callisen asserts, by confining fluids in the tympanum.

From what has been stated, it is obvious that although otalgia may indeed sometimes be an *idiopathic* disorder, it is most commonly only *symptomatic*, in which last circumstance it necessarily requires for its relief the same means which are proper for the cure of the primary disease, of which it is merely the effect.

In otalgia, the prognosis generally differs according to the seat of the disease, its nature and violence, and the ease or difficulty of removing the cause. The following circumstances relative to the prognosis seem to deserve remark.

Young persons usually suffer much more severely from ear-ache than older subjects, and experience more serious degrees of indisposition from the complaint. The internal inflammatory otalgia which produces suppuration affects the trunk of the auditory nerve itself, and discharges its matter within the cranium, may destroy the patient in a few days, if we are to credit the observations of Callisen. A subsidence of the inflammation, as indicated by a remission of the fever and pain, and a speedy evacuation of the matter by the rupture of the abscess, are events which augur a favourable termination of the disorder. When suppuration has occurred in the cavity of the ear, and the abscess uncomplicated with any serious affection has burst and discharged itself through the meatus auditorius externus, the disorder may prove no more dangerous than any other simple abscess. For the most part, after every severe attack of otalgia a degree of deafness remains, and this happens with still greater certainty when the case has been attended with suppuration.

The treatment of the various forms of ear-ache must of course depend upon the nature of the causes of the disorder. In general, however, if inflammation exist in the organ, it is to be opposed by the active employment of antiphlogistic remedies, especially topical bleeding with leeches, venesection, gentle purgatives, and anodyne fomentations. When

matter is collected, the bursting of the abscess should be accelerated with emollient applications, or an opening should be made with a lancet. In such circumstances, the ear should be frequently cleaned by means of injections, which, generally speaking, ought to be of a simple un-irritating kind. Foreign bodies must be extracted. A morbid sensibility in the nerves of the ear must be lessened by suitable internal and external remedies, the use of opium, anodyne fomentations, the exhibition of conium or stramonium, the introduction of a doffel of soft cotton into the meatus auditorius, dipt in a mixture of olive-oil and laudanum, or the tinctura camphoræ, a perpetual blister in the vicinity of the ear, &c.

OTIS, in *Geography*, a town of Berkshire county, in Massachusetts, containing 1111 inhabitants.

OTSEGO, l. 6, r. 38,802 inhabitants, of whom 74 are slaves.

OUACHITTA, a county and parish of the territory of Orleans, which, in 1810, contained 1077 inhabitants. The staples of this territory are, cotton, tobacco, lumber, and peltries. Ouachitta river is not navigable in autumn, when the waters are low, for any vessels above the size of canoes.

OVERTON. Add—Also, a county of West Tennessee, containing 5643 inhabitants, of whom 355 are slaves.

OUGEIN, col. 6, l. 39, for here *r.* yet.

OUNDLE. In 1811, the parish of Oundle contained 362 houses, and 1833 persons; 821 males, and 1012 females: 62 families being employed in agriculture, and 302 in trade, manufactures, and handicraft.

OWHYHEE, col. 2, l. 18. Its height is estimated at no less than 18,400 feet.

OXALIC ACID, in *Chemistry*. The last analysis of this acid is by Berzelius. According to him, it is composed of

Hydrogen	-	-	-	-	-
Carbon	-	-	-	-	2.44
Oxygen	-	-	-	-	33.222
					66.534
					100

which nearly correspond with $\frac{1}{7}$ th atom hydrogen + 2 atoms carbon + 3 atoms oxygen. But there are some doubts if even this determination be correct.

OXFORD, in America, l. 3, r. 1277; l. 5, r. 1453. Col. 2, l. 5, r. 1810, 2470 inhabitants, including 36 slaves; l. 6, r. 973; l. 15, r. 700 inhabitants; and another, called Lower Oxford, with 769 inhabitants.—Also, a township of Ohio, in Guernsey county, having 440 persons.—Also, a township of Ohio, in Tucucarawa county, having 271 inhabitants.

OXYGEN GAS, in *Chemistry*. According to the most recent determinations, the specific gravity of this gas is 1.111; and 100 cubic inches of it, at a mean temperature and pressure, will weigh 33.888 grains. See *ATOMIC THEORY*.

OXYGENIZED ACIDS. M. Thenard has recently been enabled to combine oxygen with acids almost to an unlimited extent, chiefly by means of the peroxyd of barium. His general method was, to dissolve the peroxyd in the acid intended to be oxygenized, and afterwards to separate the barytes by means of sulphuric acid; the oxygen was thus transferred from the peroxyd of barium to the acid, and by repeating the operation he found that additional doses could be added. In this way, he oxygenized the nitric, muriatic, phosphoric, and other acids, and by taking advantage of its other properties, the muriatic acid in particular was oxygenized, even so far as to contain 64 atoms

of oxygen to 1 of muriatic acid. These oxygenized acids combine with the different bases, and neutralize them; but they are by no means permanent, readily giving off their superfluous oxygen upon the application of heat, &c. The oxygenized muriatic acid also is decomposed by the oxyd of silver, chloride of silver is formed, and the oxygen is set at liberty.

By similar methods, M. Thenard has been able to combine additional doses of oxygen with many of the metallic oxyds. See *Annales de Chimie et Physique*, vols. viii. and ix.

OXYMURIATIC ACID. See CHLORINE.

OXYPRUSSIC ACID. See CYANOGEN and PRUSSIC Acid.

PADMA, l. 2, *dele* of.

PAINT, in *Geography*, a township of Fayette county, in Ohio, having 534 persons.—Also, a township of Highland county, in Ohio, with 775 inhabitants.

PAINTING in *Enamel*. Of all the various mediums of painting none is so durable as enamel, since time, which destroys all other things, alters neither its beauty nor its brilliancy; and that this great advantage may not be too easily attained, it may be said, also, that no other method of painting unites in itself so many difficulties in the execution.

Enamel painting differs from every other kind of painting, in employing, as a vehicle for the colours, glass or some vitreous body, to hold the parts together, and fix them to the ground on which they are laid. This being mixed with the colours, and fused or melted by means of heat, becomes fluid; and having incorporated with the colours, forms together with them a hard shining mass. This vitreous body, called flux, is to an enamel picture what oil, gum, or varnish, is in the other modes of painting, as by its means the work acquires its full degree of brilliancy and depth. See FLUX.

The quality of the flux is an object of the greatest consideration to the enamel painter; when it is easily fusible, it is called soft; and when it requires a greater degree of heat, it is called hard: these terms are applied as well to the enamel grounds, and the other vitreous substances employed, as to the fluxes. It is essential that the fluxes compounded with the different colours should be of the same degree of hardness, or nearly so; as otherwise some, from being too soft, would be destroyed by the fire; while others, from having the contrary defect, would not be fixed to the plate, nor acquire their proper colour. It is necessary too, that the plate or enamel ground on which the picture is painted should be harder than the colours; for if they both melted with the same degree of heat, they would necessarily run together, and render the work indistinct.

The ground-work of the enamel plate is metal. Gold and copper are those chiefly employed. For small plates, where great neatness and delicacy are necessary, gold is

preferable, on account of its not blistering round the edges in the fire, as is the case with copper: for large plates, copper is preferred, not only on account of the difference of expence between it and gold, but because it is found from experience to be better: gold being a much softer metal than copper, the plate, if of any size, is not found to retain its original form, in passing through the fire, so well, when made of it, as when it has copper for its basis. The form of the enamel plate is slightly convex; if it were made quite flat, in passing through the fire repeatedly it would become concave. It is on this account that gold is not proper for large plates, being heavier as well as softer than copper: its own weight added to that of the enamel would naturally tend, while in a state of fusion, to sink them in the middle, and render the surface warped and uneven, unless they experienced resistance from the back, which would most probably occasion the destruction of the whole.

When platina was first discovered, it was imagined, from its great difficulty of fusion, that it would be of essential service in the making of enamel plates, but it was found to be useless for that purpose: as, although a plate made of it passed through the fire with its form unaltered in the slightest degree, there was found wanting that union between the enamel and the metal on which it is laid, that is so necessary to ensure its safety, since a slight shock was sufficient to separate them and leave the platina quite free from the enamel. With gold and copper it is quite different, it is hardly possible to free the gold entirely from the enamel, and so strict is its adhesion to the copper, that if broken it invariably brings a lamina of the copper with it. The mode of preparing the enamel plate for painting is exactly similar to that for watch and clock dialling (see ENAMELLING), with this exception, that over the enamel is passed a softer body, a flux for the purpose of incorporating with the colours laid on: this flux should agree with every colour used.

The colours used in enamel painting are all prepared from metals, earths, or other mineral bodies, mixed and melted with certain proportions of flux, which, when fused, discover the colours, and fix them to the plate. The colours of the enamel painter are few, and his palette, when compared to that of other artists, of the most discouraging description, many of them appearing very different before and after passing the fire. This is indeed one of his greatest difficulties, and one which requires the greatest practice to overcome.

PAINTING IN ENAMEL.

overcome. It is true he may lessen it by having by his side a plate on which he has made trial of his colours, and by which he has ascertained their positive colour, and what their various combinations can produce; but it is also necessary that he should have in his mind's eye the effect which the fire will give, and calculate the depth and brilliancy of his work; without this, he will be ever in danger of using one tint for another, and continually subject himself to disappointment.

It is of the greatest importance that the colours should all agree. This will entirely depend on the properties of the fluxes made use of. It would be very desirable that all the colours should be fluxed with the same materials; but as this cannot be, care should be taken that they are not of discordant principles. This disagreement manifests itself by some of the colours destroying the others when mixed, or by occasioning a bubbling of the tint in the fire, and a roughness on the surface when cold.

Some writers on the subject have considered it necessary, that to paint in enamel two sets of colours should be made use of; one hard, for the beginning of the picture; the other soft, for the latter paintings. This idea could only have originated with a person totally unacquainted with the principles of the art, as if it were not more necessary to have the full power of the colours at the finishing than at the beginning of the work: the softness or hardness of the colour depending on the greater or less degree of flux mixed with it, it is evident that in proportion to the quantity of glassy matter mixed, so will the strength of the colour be diminished. It is much better to continue the old mode of using the same colours from first to last, more freely and in greater body in the beginning, and more thinly towards the finish.

It has been said, that the French painters in enamel have discovered the mode of making the colours appear the same before as after passing the fire. If this were really the case, the advantage is not so great as at first sight it seems to be. The disadvantage is not so much the different appearance of the colour, as the want of its proper depth. This is not to be overcome but by the admission of a greater evil. To bear a colour out, an oil must be used, which will not evaporate, and the consequence of this would be, that on its application to the fire corrosion would take place, and the picture must undergo an operation which would much reduce its power before it would be fit for again proceeding with. It is towards the finish of the picture that the enamel painter's greatest difficulties begin; for such is the nature of his colours, that the parts he touches, when it is not necessary to cover the whole, whether he heightens the lights or deepens the shades, appear the same, and much lighter than the general tint. This is an operation which renders great practice and great caution equally necessary.

The principal colours whose tints are most altered by the fire are the reds, and as they are essential in the painting of the flesh, their alteration necessarily affects the whole; as the same colour which after fire becomes a bright carmine, is before that operation of a dirty-brownish hue: this inconvenience may be lessened by exposing the colour to a slight heat, by which it will acquire somewhat of its right tint. Some painters for this purpose have mixed a portion of carmine, or some other colour which is destroyed by fire, with their rose-colours or reds, to render them when painted with the same in appearance as after they are fired: this, to say the least of it, is a very fallacious mode of proceeding, and one which an artist's practice would soon teach him to despise.

The colours used in enamel are few and simple, and from them the different tints should be made by the artist himself, (and not by the colour-maker, as used to be the case,) in the same manner as in any other way of painting. They are, white, yellows, rose-colours or reds, browns, blues, and blacks. The white is prepared from tin; the yellows from silver, antimony, and from some ochres; the rose-colours from gold; the blues from cobalt; and the browns and blacks from iron. A red may be prepared from iron, and a green from copper, but these will not agree with the other colours. A green cobalt has been lately found in some parts of Germany, from which a green may be made, as also one from the chrome; but neither is found to be in any respect better than that which may be made from blue and yellow, and it is therefore unnecessary to encumber the palette with them. No colour should be admitted till, from repeated experiment, it has been found to agree with every other in every possible combination.

The oils employed are essential, and they are such as on application to the fire evaporate with a slight degree of heat; for this purpose, the oil of spike lavender is the best. The oil of amber is used to keep the colours moist for the day's use, as it does not evaporate before exposure to heat. A thick oil of turpentine is likewise used for the purpose of binding the colours together, and making them work more pleasantly; this however must be done with the greatest caution, as if used too freely it will not escape in the fire, and will occasion corrosion.

The last process which the enamel picture undergoes is that of passing the fire: this is done after every painting, and is very often necessary; as without it the artist cannot tell the real state of his work. The fire for this purpose is of the same utility to the enamel painter, as a proof of his plate is to the engraver: it shews him what he has accomplished, and points out to him what remains to be done. The last time of passing through the fire is, as may naturally be supposed, a moment of great anxiety to the artist, as he may, in an instant, witness the destruction of his picture, and see the labour of months rendered unavailing, by the enamel ground opening and shewing a crack across his work. This accident may sometimes be repaired, but never without great labour. The mode of firing the picture is exactly similar to that used in the making of the clock plates. See ENAMELLING.

The history of enamel painting is involved in the greatest obscurity; of its antiquity we have ample testimony in the account which Diodorus Siculus gives of the painted walls executed by the command of Semiramis, in her city of Babylon. At this time, enamel painting had attained the highest eminence to which any art can aspire; when it was made the engine of policy, and the instrument of religion; when it was employed to commemorate the heroic deeds of the living, and celebrate the virtues of the dead. How long it retained this elevation we know not, but it is probable it was esteemed while Babylon remained, and, like that majestic city, was overwhelmed with such entire ruin, as scarcely to leave a wreck behind.

The coloured beads which envelope the mummies, and the painted idols of the Egyptians, prove that this art was not unknown to that extraordinary people; although nothing which exactly deserves the name of painting has descended to us.

To the Greeks it was known, as is evident from their painted vases, which although generally executed in one or two colours, yet furnish some instances in which, departing from this simplicity, they have displayed a variety of colours with great success.

PAINING IN ENAMEL.

By the Romans, if this art were not unknown to them, which, considering their intimate knowledge of the acquirements of the Greeks, is not probable, it was at least unpractised: sculpture with them seems to have superfed painting in the decoration of their vases, the embellishing of their sarcophagi, and for all ornamental purposes.

Some ornaments which have reached our time indicate that the Saxons were not unacquainted with the art of enamel; and in the tomb of Edward the Confessor are many specimens of coloured glass. Other monuments of a subsequent period prove, that the art regularly descended, although with varied success, at different intervals; but in the tomb of Edward III. John of Eltham, and some others of that period in Westminster abbey, are striking instances of the art of enamelling. On the monument of the king, the coats of arms are enamelled in their proper colours on thick plates of copper; and the armour of the warrior is curiously ornamented with an enamelled pattern of blue, white, and gold.

These remarks may be said more properly to relate to the practice of enamelling than to the art of enamel painting, and are only mentioned here to prove that it was never entirely lost sight of; although it was long after that it became enamel painting, as that term is now understood.

In the sixteenth century, ornamental works of considerable dimensions were executed; every one conversant with the arts must be acquainted with the painted dishes called *Raffaelle ware*, copied from the designs of that immortal painter and his disciple *Julio Romano*: these are, strictly speaking, legitimate enamel pictures, executed on a ground prepared as it is at present, and differing only in the shape. They are generally painted in two colours.

Enamel painting seems long to have remained in this state, and there are but few examples where a variety of colours was used until the time of *Petitot*, who died in the latter end of the seventeenth century. He is the first painter in enamel of whom any particular mention is made: he was in this country in the reign of *Charles I.* His pictures are of a small size, not exceeding two or three inches; they are very highly and beautifully finished, but certainly not deserving the distinguishing commendation bestowed on them by *Pilkington*; who says, that if they were magnified to the size of life, the pictures of *Vandyck* would suffer by the comparison. His best pictures were copied from that master, and are of a small size: his portrait of *lady Southampton*, a whole length after *Vandyck*, in the *duke of Devonshire's* collection, the largest picture he ever painted, is certainly not among his best. His works have too much that parti-coloured appearance, for which enamel painting has by persons of true taste been so justly censured. The reputation of *Petitot* was no doubt owing to the novelty of his pursuit, as he has since been much surpassed. His son practised the same art when his father quitted this country, and his pictures are now generally taken for those of his father.

No farther mention is made of enamel painting until the reign of *queen Anne*, when *Boit*, who possessed very little ability, appeared: he did not practise long in this country. He had the honour, however, of instructing *Zincke*, who far surpassed not only his master but *Petitot*. Although his pictures are not so highly finished, his best works have less of that parti-coloured effect, and consequently more the appearance of nature, than those of his great predecessor. *Petitot's* best works were copied from *Vandyck*, those of *Zincke* from *Kneller*. *Meyer*, who chiefly painted in water-colours, commenced enamel painting on the decline of *Zincke*; as he applied but little to this branch of art, he

could not be expected greatly to excel: his principal work, the portrait of the *marquis of Granby*, in the king's collection, though possessed of considerable ability and sweetness in the execution, has too many of the defects of early enamels, and by no means conveys an idea of the style of the great original from whom it is copied, *for Joshua Reynolds*. The best pictures of *Meyer* are inferior to those of *Zincke*. *Spencer's* pictures, as far as they go, are very beautiful both in colour and execution; but he, as well as all other enamel painters, confined his efforts to a very small scale, and either did not wish or thought it impossible to obtain depth and richness; his pictures, therefore, are little more than beginnings. The other professors of this art, of this period, were *Hone*, who afterwards became a portrait-painter in oil, *Spicer*, *Burch*, and *Craft*. *Craft* is only mentioned here to caution future enamel painters against an error into which he fell,—of painting on an enamel ground without the addition of a flux. The flux being softer than the enamel incorporates more readily with the colours, and gives that melting softness to the tints so peculiar to enamel painting. By omitting this, he deprived himself of one of his greatest advantages; and the consequence is, that instead of great delicacy and finishing, his pictures appear hard, crude, and inharmonious.

Stubbs, an animal painter in oil, a comparative anatomist, and eminent as either, was also a painter in enamel. Unfortunately he took up this branch of art on too confined a principle, considering rather its durability than that excellence which alone can render durability truly estimable. His pictures are painted on plates made of *Wedgwood's* ware, and he prided himself on being the maker of his colours, which are, however, of the most ordinary kind. Now, although it is desirable that the artist should know how to make his own colours, it is equally certain, that if he can get them made for him, it is much better to do so than to employ his own time in preparing the means, when it should be directed to the accomplishment of the end. Neither the material on which he worked, nor the colours with which he painted, were calculated to bear more than two or three fires, consequently great perfection could not be expected; and although they might tolerably well answer his purpose for the painting of animals, it is certain that his pictures in oil are in every respect superior to those he executed in enamel.

We have now brought enamel painting down to our own time, when such great improvements have been made by the exertions of a living artist, *Bone*, as to render it an era in the art; that he is living, must be our apology for not entering into a full discussion of his merits: but it must be said, that by his endeavours, aided by the liberal encouragement of that true lover and magnificent patron of the arts of his country, the *Prince Regent*, from a mere mechanical labour, enamel painting has become a highly useful branch of a liberal art; no longer confined to things merely ornamental, no longer differing from every other mode of painting, as much in its effect as process, it now assumes the appearance of highly-finished oil-painting, with the advantage of perpetual durability. As enamel painting from its nature must be always copied, the style of the original should be so scrupulously observed, as to convey an instantaneous recollection of the painter. In this respect, the works of *Bone* are pre-eminent; whether the severity of *Leonardo*, the purity of *Raffaelle*, the glow of *Titian*, or the splendour of *Rubens*, is entrusted to his pencil, each is alike successfully portrayed. To the admirers of that ornament of our country and of the arts, *Reynolds*, this must appear in its full force; and it must afford them great pleasure

pleasure to find, that such close imperishable copies of the rare and justly valued pictures of this great master can thus be transmitted to posterity.

Of the advantages of enamel painting, it would be superfluous to speak, they are so obvious as to occur to the most superficial observer. Its unalterable durability is alone sufficient to counterbalance every disadvantage to which it is subject: to paint for eternity is the peculiar province of the enamel painter. To him the hyperbolical compliment which Pope paid to Jarvis is justly due:

“Beauty, frail flow’r, which every season fears,
Blooms in his colours for a thousand years.”

How often have we mingled pity with our admiration of the fine works of the great masters, colourists in particular, when we have observed the dreadful ravages of time on their pictures. By enamel painting this disadvantage is removed; by means of this art, posterity will become acquainted with the real merits of their predecessors; and those works which must of necessity decay, will be preserved in all their original splendour. How invaluable at present would the portraits of the illustrious characters of Greece and Rome appear! Had enamel painting then been known as it is practised at present, we should not now have to feel their imperfect resemblances in busts and gems.

Thus has this art, sometimes shining forth in full splendour, sometimes nearly merged in obscurity, survived the lapse of ages, and descended to the nineteenth century, whose enlightened policy and liberal patronage will never allow it to be again disregarded; but will employ the talents of the enamel painter in the way which they can be best employed, by preserving for futurity the portraits of our illustrious ancestors, whose deeds have conferred an honour on their country; and in handing down to posterity the resemblances of our great cotemporaries, and in perpetuating the best efforts of native genius. See ENAMELLING.

PALSLEY, col. 4, l. 21, for *salvæ r. salvation.*

PALAUER, an African term denoting a court of justice, or a public meeting of any kind.

PALERMO, in *Geography*, a town of America, in Maine, and county of Lincoln, having 761 inhabitants.

PALLADIUM, in *Chemistry*. According to the recent determinations of Dr. Thomson, the weight of the atom of this metal is 70, oxygen being 10; though this, perhaps, is not to be depended on, but as an approximation.

PALLADIUM. See MINERALOGY, *Addenda*.

PALMA, GIACOPO, in *Biography*, called the *Younger*, to distinguish him from his great uncle, has been styled by Lanzi, “the last painter of the good and the first of the bad epochs of the art of Venice.” He was born in 1544, the son of Antonio Palma, an obscure painter, who first taught him the little he knew, and encouraged him to study the works of others, particularly those of Tintoretto and Titian. At the age of fifteen, he obtained the patronage of the duke of Urbino, who sent him to Rome, and maintained him there for eight years, during which time he employed himself in copying the works of M. Angelo, of Raphael, and above all, of Polidoro, and was employed by the pope to adorn one of the rooms of the Vatican.

On his return to Venice he found but little employment, Tintoretto and Paolo Veronese occupying the places of renown, and being engaged in all the public works. Their disagreement with a celebrated architect and sculptor, named Vittoria, furnished Palma with a patron, who endeavoured

to lower the esteem of his enemies, used his utmost efforts to establish the rival painter, assisted him with his advice, and found him employment. Their united endeavours failed however of success, and Palma was obliged to be contented to hold the third rank in the art till their deaths left him without a rival. He had, in the mean time, painted in competition with them both, and produced very excellent works.

When he was left alone and was much employed, he relaxed from the care and diligence he had formerly used, and his works became slight in execution, so much so that Cesare d’Arpino, remarking upon the slightness of the style in which he painted, observed, that he meant to make some stay at Venice, to learn of him to make such admirable sketches. When price and time, however, were left to his own discretion, in which he did not abound, he produced some works worthy of his former fame; such as the altar-piece at the church of S. Cosmo and Damiano; the celebrated naval battle of Francesco Bembo, in the public palace; the Saint Apollonia at Cremona, &c. The compositions of the younger Palma are more distinguishable for their copiousness than the judgment with which they are conducted, and his design is more bold than correct. His colouring is more vivid than true, but is deservedly admired for its richness, suavity, and freshness.

PALMER, in *Geography*, l. 4, r. 1114.

PALMYRA, a township of Maine, in the county of Somerset, having 117 inhabitants.—Also, a township of Wayne county, in Pennsylvania, having 336 inhabitants.—Also, a township of Knox county, in the Indiana territory.

PALOMINO Y VELASCO, DON ANTONIO, in *Biography*, a Spanish painter, born in Valencia, in 1653. He studied at Cordova in grammar, philology, theology, and jurisprudence: the elements of his art he acquired of Don Juan de Valdes Seal, and to acquaint himself with the styles of the different schools, he went to Madrid in 1678. Here he painted the gallery del Cierzo, and pleased the king and the minister, and in 1688 he was made painter to the king. He was overwhelmed with commissions, for many of which he made only the designs; but whatever was begun and terminated by himself in fresco, or in oil, possessed invention, design, and colour, in the essential, and taste and science in the ornamental parts. His style was certainly more adapted to the demands of the epoch in which he lived, than to those of the preceding one, and probably would not have obtained from Murillo the praises lavished on it by Lucca Jordano.

Palomino may be considered as the Vasari of Spain, as copious, as credulous, and as negligent of dates, too garrulous for energy, and too indefinite for the delineation of character, but eminently useful with the emendations of modern and more accurate biographers.

His literary work is divided into three parts, theoretical, practical, and biographical. The two first bear one title, *viz.* “El museo Pictórico y escala optica.” The third part, distinguished by that of “El Parnaso Español Pintoresco laureado, &c.” Madrid, 1724, though perhaps only intended as an appendix to the two former, is by far the most important and interesting.

PALOU, or PALO, *l. ult.* add—pachalic of Erzeroom, situated on the edge of a mountain and the banks of the Euphrates: the population amounts to about 8000 souls, Turks, Armenians, and Kurds: the river here is very rapid, and from the bad construction of the bridges made of wood, whole caravans have been swept away after the melting of the snow. The district of Palo is four days’ journey in length and two in breadth.

PANDEANS,

PANDEANS, a title given to itinerant companies of Italian musicians, who perform on the Syrinx or Pan's pipes of different pitches with their mouths, and accompany themselves on different instruments with their hands and feet.

The lowest set of reeds (the *septem discrimina vocum* of Virgil) is called the contra bass, or double-bass; the next fagotto, or bassoon; the third, septenary, is the tenor or second treble; and the fourth, or highest range of pipes, the first treble: so that in the aggregate there is a complete scale of four octaves, and they never play in less than three or four parts. The instruments with which they accompany themselves with their hands are the cymbals, the triangles, the double drum beat at both ends, the mezza luna, a Turkish instrument, and the tambour de basque.

The reeds or pipes are fastened under the chin of the performer, and the lip of the player runs from one to the other with seeming facility, without moving the instrument by manual assistance. (*Et supra calamos uno percurrere labro, Lucretius.*) The music which these people perform is very gay and pleasing. One of the company with whom we conversed told us that they were Milanese peasants and villagers, not allowed to stroll into great cities: which accounts for our never having heard them in their own country, nor any of our friends who have made the tour of Italy, and remained there some years.

The use which these ingenious people have made of Pan's pipes, by playing in troops and in different parts, is beating the ancients at their own weapons. The Grecian shepherds of Theocritus, and the Roman of Virgil, contend in dialogue, but never perform in parts.

It will be observed, that some of the performers, particularly the first treble, have more than seven pipes, which enables them to extend the melody beyond the septenary.

PARK, MEXGO, in *Biography*, a celebrated traveller, was the son of a farmer on the banks of the Yarrow, near the town of Selkirk, in Scotland, and born on the 10th of September 1771. After having received the first rudiments of education in his father's family, he was removed to a grammar-school at Selkirk, where he remained for a considerable number of years, and where he was distinguished by his application and improvement. At this early period, though he was sedate, studious, and thoughtful, he manifested traces of that ardent and adventurous disposition which formed his distinguishing character in future life. Preferring the medical to the ecclesiastical profession, for which he was originally designed, he was bound apprentice, at the age of 15, to Mr. Anderfon, a respectable surgeon at Selkirk; and after residing with him for three years, he removed

in 1789 to Edinburgh, where he attended the usual medical lectures during three successive sessions. In this situation he distinguished himself among his fellow-students, by arduous and assiduity in the prosecution of his studies, and by particular attention, during his summer vacations, to botanical pursuits, in which he was assisted by his brother-in-law Mr. James Dickson. Upon his removal to London, this eminent botanist introduced him to Sir Joseph Banks, by whose recommendation he was appointed assistant-surgeon to the Worcester East Indian. In 1792 he failed for Bencoolen, and having availed himself of the opportunities for scientific researches, which this voyage afforded him, the result of his inquiries and observations was communicated, after his return, to the Linnean society, and published in the third volume of their Transactions. Some years prior to this period, a society had been formed with a view of promoting discoveries in the interior parts of Africa, of which we have already given a brief account under the article *AFRICAN Association*; and several persons had been employed in accomplishing the laudable purposes for which this society was established. Among these, we may reckon Messrs. Ledyard and Lucas, major Houghton, and Mr. Hornemann, who fell sacrifices either to the severity of the climate, the fatigue of the service, or the violence of the natives. The Society, though disposed to afford liberal encouragement to any person who was qualified for this undertaking, and who had at the same time resolution sufficient to engage in it, with the prospects which past experience presented to view, found themselves at a loss for a person in every respect fit for this hazardous mission. At this interesting period Mr. Park returned from India, and no person could have been found better qualified for such an adventurous office. Sir Joseph Banks, the distinguished patron of genius and science, had been his friend, and with him Mr. Park was in habits of frequent and intimate intercourse. Thus circumstanced he offered his services, and they were accepted. Having received his final instructions from the Society, he set sail from Portsmouth on the 22d of May 1795, and on the 21st of June landed at Jillifree, a small town near the mouth of the river Gambia, whence he proceeded to Pisania, where he was hospitably received by Dr. Laidley, to whom he had letters of recommendation. For an account of his progress, see the articles *AFRICA* and *AFRICAN Association*. Upon his return, he was received with cordial congratulation, both by his friends and the gentlemen of the African Association; and he was allowed to publish an account of his travels for his own benefit. In the mean while, Mr. Bryan Edwards, secretary of the Association, printed and distributed among the subscribers an abstract of the Travels from Mr. Park's papers. To this abstract was annexed an important Memoir by major Rennell, consisting of geographical illustrations of Park's journey; and this, by Mr. R.'s permission, formed a valuable appendage to the fourth edition of the Travels. In the spring of 1798, government having it in contemplation to obtain a complete survey of New Holland, applied to Mr. Park for this purpose; but the proposed plan was never executed. The remainder of this year was spent by Mr. Park in visiting his friends in Scotland, and arranging the materials of his Travels. Towards the close of this year he returned to London, and devoted the principal part of his time to the correction of his MSS., which he committed to the press in the spring of the year 1799. The work, as soon as it was published, commanded an extensive and rapid sale, both on account of the interesting information which it contained, and the general elegance of its composition. An abstract of Mr. Park's discoveries,

with

with regard to the easterly course and magnitude of the Niger, the large and populous towns and villages that occupy the interior parts of Africa, the discriminating character of the negroes, contrasted against that of the Moors, and the civilization of the inhabitants of the interior, beyond the influence of the slave-trade, compared with that of those who are situated near the coast, and a variety of other particulars relating to the soil and productions of the country, and the manners and habits of its inhabitants, has been already given under the articles AFRICA, MOROCCO, NIGER, &c. so that we need not here enlarge. The curiosity of the public was amply gratified, and the name and work of Mr. Park became singularly popular, though neither the one nor the other altogether escaped censure. The slave-trade was at this time a subject of general reprobation, and attempts were repeatedly renewed for the abolition of it. It was, therefore, natural to imagine, that in a work of this kind, the author would have availed himself of the opportunities which his narrative afforded him, of expressing his decided disapprobation of this nefarious species of commerce: more especially as it was well known to many of Mr. Park's intimate and confidential friends, that in conversation he had frequently declared his abhorrence of slavery and the slave-trade. Nor was it sufficient to allege, as some of his advocates have done, that he considered the abolition of the slave-trade as a measure of state policy; and that it would be improper for him to give an opinion on a subject which was at this time under the deliberation of the legislature. This neutrality on his part, to say the least of it, led persons, who did not know his real sentiments, to reckon him among those who were hostile to the abolition; and his authority was triumphantly appealed to by the advocates of the slave-trade. Whilst he seems to have studiously avoided giving an opinion on the pernicious influence of this trade, he states facts which have been cited and strongly urged in favour of its abolition. In order to account for this kind of inconsistency without impeaching his integrity, we should recollect how he was circumstanced whilst he was preparing and publishing his narrative. "He was then," says a candid biographer, "a young man, inexperienced in literary composition, and in a great measure dependent, as to the prospects of his future life, upon the success of his intended publication. His friend and adviser, Mr. Bryan Edwards," (a West India planter, and a systematic advocate of the slave-trade in the House of Commons,) "was a man of letters and of the world, who held a distinguished place in society, and was besides a leading member of the African Association, to which Park owed every thing, and with which his fate and fortunes were still intimately connected. It is difficult to estimate the degree of authority which a person possessing these advantages, and of a strong and decisive character, must necessarily have had over the mind of a young man, in the situation which has now been described. Suggestions coming from such a quarter must have been almost equivalent to commands; and instead of severely animadverting on the extent of Park's compliances, we ought, perhaps, rather to be surprised, that more was not yielded to an influence which must have been nearly unlimited." Mr. Park is known to have regretted that some parts of his publication, relating to the slave-trade, had been misunderstood, and applied in a sense which it was not intended they should have been. The writer of this sketch of his life knew, from personal intercourse, that he lamented any suspicion of his integrity should attach to this part of his publication; and we can well imagine, that he did not perceive the bias of his mind, or the causes that produced it, which were apparent to every one besides himself. Such a bias

would naturally result from the assistance afforded by Mr. Edwards in the composition of Mr. Park's work, and from the influence attending the connection that subsisted between them. How far Mr. Edwards's assistance might extend, it is difficult to say; but of this we are certain, that it was not such as to affect the authenticity of the work itself, or the literary reputation of Mr. Park; we regret, however, that in deference to Mr. Edwards's judgment or authority, Mr. Park should admit into his narrative some reflections pertaining to the slave-trade, which should have given occasion for concluding that he was friendly to its continuance, or that he should have omitted any favourable opportunity that occurred for expressing in an explicit manner his real sentiments concerning it. But it is now needless to pursue this kind of discussion. The narration of Mr. Park, written as we have reason to believe by himself, entitles him to respect as an author; but he has other more unequivocal claims to grateful and honourable remembrance, as a person who hazarded much in making geographical discoveries, and who maintained in traversing unknown countries, and in very trying situations, a degree of firmness and self-possession that has seldom or ever been surpassed.

After the publication of his Travels, he returned to Scotland in the summer of 1799; and on the 2d of August in that year, he married a daughter of Mr. Anderfon of Selkirk, with whom he had served his apprenticeship. In the month of October 1801, he settled at Peebles, with a full purpose of pursuing his medical profession; but as he devoted much of his time and attention to the poor, the profits of his business were inconsiderable; nor could he forbear wishing for a change of situation that would be more advantageous. His views, however, were directed towards a second African mission. A prospect of this kind was presented to him by a letter from Sir Joseph Banks, soon after the signature of the preliminaries of peace with France, in October 1801; but it was not till the autumn of the year 1803, that a specific proposal was made to him for this purpose. Previously disposed to accept it, he did not long hesitate in announcing his purpose; and, accordingly he took leave of his friends, and left Scotland in December 1803, confidently expecting that he should soon embark for the coast of Africa. A variety of circumstances occurred which threatened the total failure of the expedition; however, in a course of time all difficulties were obviated; the objects and plan of the undertaking were settled to the satisfaction of Mr. Park, and he received a commission from government in January 1805, for conducting and executing it. To himself was granted a brevet commission of a captain in Africa; and to his friend Mr. Alexander Anderfon a similar commission of lieutenant; and Mr. Scott was appointed to attend him as a draftsman. He was empowered to enlist at Goree any number of the garrison that would be necessary for his purpose, not exceeding 45, with such bounties as would induce them cheerfully to accompany him. From Goree he was directed to proceed up the river Gambia, and thence, crossing over to the Senegal, to march by such routs as he should find most eligible to the banks of the Niger. The great object of his journey was to pursue the course of this river as far as it could be traced; to establish a communication and intercourse with the different nations on the banks; to obtain all the knowledge in his power respecting them; and to ascertain various points which he had stated in his Memoir. Mr. Park was empowered to draw for any sum which he might want, not exceeding 5000*l.*

When the preparations for the expedition were completed, Messrs. Park, Anderfon, and Scott, proceeded to Portsmouth,

PARK.

mouth, and being there joined by four or five artificers from the dock-yards appointed for the service, they set sail on the 30th of January 1805, and on the 28th of March arrived at Goree. On the 27th of April 1805, Mr. Park took his departure from Kayee, a small town on the Gambia, a little below Pifania, having previously engaged a Mandingo priest, named Ifaaco, who was also a travelling merchant, and much accustomed to long inland journeys to serve as a guide to his caravan. On the 11th of May, he arrived at Madina, the capital of the kingdom of Woolli, and on the 14th he reached Kuffai, on the banks of the Gambia, where the river is about 100 yards broad, and has a regular tide. On the 18th, he crossed the river Nerico, 60 feet broad four feet deep, flowing at the rate of two miles an hour, and with a heat at two o'clock of 94° Fahrenheit, and arrived at Jallacotta, the first town of Tenda, at sun-set. On the 20th reached Tendico or Tambico, a village belonging to Jallacotta, lat. $13^{\circ} 53'$, half a mile from which is a pretty large town, called Bady. May 21st at eight, halted at Jeningalla, near Bufra or Kabatenda. On the 24th, stopped at Manfara, which consists of three towns, contiguous to each other, and distant from the village of Nittakorra, on the north bank of the Gambia, eight miles due south. Next day entered the Tenda or Samakara wilderness, and halted at Sooteetaba, lat. $13^{\circ} 33' 33''$; after leaving this place, crossed the first range of hills, which afforded a beautiful route and prospect. On the 26th reached Beecreck, lat. $13^{\circ} 32' 45''$, W. long. $10^{\circ} 59'$, where men and bees were attacked by an immense number of bees, who seemed for a time to have completely terminated their journey. Arrived at Sibikillin, after travelling four miles, on the 27th; and on the 28th, arrived at Badoo, a small town, consisting of about 300 huts, near which is another town of the same name; but the two towns are distinguished by the names of Sanfanding and Sanfanba, at each of which customs are demanded of all coffees or caravans, lat. $13^{\circ} 32'$. From Badoo proceeded to Tambacunda, about four miles east of it, and about four miles distant from the river Gambia, south of Badoo: leaving Tambacunda on the 30th, entered the woods, and at dark arrived at Tabba Gee, which was left at day-break the 31st of May, and halted during the heat of the day at a small village, called Mambari. On the 1st of June, arrived at Julifunda, a considerable trading town, containing about 2000 persons, who trade on credit, and are called "Juli," by way of distinction from the Slatee, who trades with his own capital. At this place, lat. $13^{\circ} 33'$, they were exorbitantly taxed by Manfa Kuffan, who is reckoned one of the most avaricious chiefs on the road. On the 4th of June, arrived at Baniferile, a Mahometan town, whose chief, Fodi Braheima, was one of the most friendly men they met with, lat. $13^{\circ} 35'$. The kingdom of Dentila is famous for its iron; and the flux used for smelting it is the ashes of the bark of the kino-tree. On the 7th of June, in prosecution of their journey, crossed the bed of a stream that runs towards the Faleme river, called Samakoo, on account of the vast herds of elephants which wash themselves in it during the rains. At noon of the 8th, reached Madina, and halted by the side of Faleme river; in the evening went to Satadoo, one mile east of the river. On the 10th reached a small town called Shrondo at sun-set; here they were alarmed by a tornado, which was the commencement of the rainy season, and extremely pernicious to the attendants on the expedition.

In the vicinity of this town are some gold-mines, which were inspected, and which afforded occasion for witnessing the expeditious mode practised by the female na-

tives, for separating the particles of gold from the sand. Leaving Shrondo on the 12th, they travelled along the bottom of the Konkodoo mountains, which are very steep precipices of rock, from 80 to 200 or 300 feet high, and at noon reached Dindikoo, near which are gold-pits. On the 13th, they arrived at a small village called Fankia, four miles N.W. from Binlingalla, lat. $13^{\circ} 22' 30''$. On the 15th, they proceeded from Fankia to the delightful village of Toombin, and on the 17th travelled from Serimanna to Fajemmia, a small village, fortified with a high wall, the chief of which is the most powerful in Konkodoo, and has in subjection the whole country from Toombin to the Ba Fing. At Fajemmia, N. lat. $13^{\circ} 35'$, the customs paid to the chief are very high. On the 20th, they arrived at an almost deserted village, called Nealakalla, close to the Ba Lee or Honey river, where they saw two crocodiles and an incredible number of large fish. On the 21st, they passed the village of Boontoonkoooran, and halted for the night at the village of Doog-gikotta; and the next day they observed many very picturesque and rocky hills during their march, and in the evening halted at the village of Falising, situated on the summit of the ascent which separates the Ba Lee from the Ba Fing. On the 23d, they arrived at the village of Gimbia, or Kimbia; and about noon reached Sullo, an unvalled village, at the bottom of a rocky hill, at which place horse-flesh is much valued as food, and where they observed on the adjacent rocks numbers of large monkeys. On the next day, they arrived at Secoba, lat. $13^{\circ} 27' 26''$, and here they halted on the 25th. On the following day, they arrived at the village of Konkromo, about seven miles east of Secoba, W. long. $8^{\circ} 6'$, near the river Ba Fing, a large river quite navigable, and which they crossed in canoes on the 27th; and on the next day, they passed by several heaps of stone, precisely the same with those that are called in Scotland cairns. In pursuing their march, they were alarmed by herds of lions and wolves, and on the 30th, reached a small town, called Kandy. On the 2d of July, they arrived at Koena, a village encompassed by a wall, and where they were terrified by the roaring and assault of several young lions. On the 3d, they arrived, after a march of six miles, at Koombandi; and at sun-set reached Fonilla, a small walled village, on the banks of the Wonda, which they crossed on the 4th in canoes, Ifaaco having had a surprising escape from the seizure of a crocodile. On the 5th, they arrived at a village called Boolinkoomboo, sometimes Moiaharra; and on the 10th, left this village; and eight miles N.E. passed the village of Serrababoo, and a little before sun-set reached Saboofera, (Dooty Matta,) a scattered unvalled village, lat. $13^{\circ} 50'$. From Saboofera, or Mallaboo, they pursued their march on the 11th to Keminoo, or Maniakorro, a walled town, strongly fortified, lat. 14° ; near which the river Ba Lee runs with great velocity, and breaks into small cataracts. This place is notorious for theft and impudence, and they were glad to leave it on the 13th, and to pursue their march by a walled village, called Nummaboo, to the banks of the Ba Woolima, where they arrived on the 19th; and having crossed the river by means of a wooden bridge of singular construction, they reached Mareena on the 21st, where they suffered depredation; and on the 22d, they arrived at Bangalli, six miles from Mareena, a large town, four or five times larger than Maniakorro, and fortified in a similar manner. On the 27th, they arrived at Nummafoolo, a large but much ruined town, and which they left on the 30th. On the

PARK.

31st, they halted at Sobce, a town, the walled part of which serves as a citadel. On the 2d of August, they halted at Balanding; and on the 3d, at Balandoo; and on the 4th reached Koolihori, a town partly walled, but having the greater part of its huts without the walls. On the 6th, they reached Ganifarra, a small beggarly village. On the 9th, they crossed the Ba Woolli, a very deep river, flowing at the rate of four or five miles *per* hour. They pursued their route, until on the 13th, those of them who survived reached Koomikoomi, where they halted; lat. $13^{\circ} 16' 29''$. On the 15th, they reached Doombila, where Mr. Park met with an old friend, Karfa Taura, a worthy negro whom he had known, and whose kindness he had experienced in his former travels. From Doombila, they proceeded on the 18th to Toniba, and from thence they ascended the mountains south of it, till having attained the summit of the ridge which separates the Niger from the remote branches of the Senegal, Mr. Park had the satisfaction of once more seeing the Niger rolling its immense stream along the plains. But this satisfaction was accompanied by the mortifying reflection, that three-fourths of the soldiers had died on their march, and that in their weakly state, they had no carpenters to build the boats in which they proposed to prosecute their discoveries. It was, however, a pleasing consideration, that in conducting a party of Europeans, with immense baggage, through an extent of more than 500 miles, he had always been able to preserve the most friendly terms with the natives; and hence he was warranted to infer, that with common prudence, any quantity of merchandize may be transported from the Gambia to the Niger, without danger of being robbed by the natives; and that this journey may be performed in the dry season, with a probability of not losing more than three or at most four out of fifty. But Mr. Park was unfortunate in undertaking such a journey with the prospect of the rainy season, and the event proved, that this season set in before his journey to the Niger was more than half completed. The effect produced on the health of the soldiers by a violent rain, preceded and accompanied by tornadoes, on the 18th of June, was almost instantaneous; twelve of them at once were dangerously ill, and from this time, the great mortality commenced, which was ultimately fatal to the expedition. When he reached the Niger at Bambakoo, where the river begins to be navigable, on the 19th of August, there remained out of thirty-four soldiers and four carpenters, who left the Gambia, only six soldiers and one carpenter, and the principal persons who composed the expedition, besides Mr. Park himself, were three, *viz.* Mr. Anderlon, Mr. Scott, and Lieutenant Martyn, who were more or less affected by the disease of the climate; the two former very seriously, so that Mr. Scott was left behind at Koomikoomi, and died without reaching the Niger. Mr. Park had been slightly affected, and it is wonderful, that the anxiety and fatigue which he must have experienced did not break down both his spirits and his strength.

Having arrived at the Niger, Mr. Park, and the few companions that remained, embarked in a canoe on the 22d of August, and were borne away by the current at the rate of about five knots *per* hour. The river is at the point of embarkation an English mile broad, and at the rapids, of which there are three principal ones, it spreads out to nearly twice that breadth. On the 23d, they arrived at Marraboo, where they were joined by those who came by land. Ifaaco was immediately dispatched to Segoo, the capital of Bambara, to negotiate with Manfong, the sovereign, for a free passage through his dominions, and

whilst Mr. Park waited for his return, he was seized with the dysentery, that threatened the termination of all his projects. But by the aid of medicine and the advantage of a good constitution, he was soon restored to health. Many difficulties and delays occurred in the negotiation, which was conducted on the part of Mr. Park with singular judgment and address; but at length, after many unfavourable rumours, which kept his mind in a state of distressing suspense, Manfong deputed a messenger to conduct him towards Segoo. Under his escort, he left Koolikorro (N. lat. $12^{\circ} 52'$) on the 13th of September, and enjoyed the beautiful views which his voyage afforded him; "the river," as he says, "being sometimes as smooth as a mirror, at other times ruffled with a gentle breeze, but at all times sweeping us along at the rate of six or seven miles *per* hour." On the 14th, they departed from Deena, where they had lodged, and arrived at Yamina, (lat. $13^{\circ} 15'$) where they halted on the 15th; and on the 16th reached Samee (lat. $13^{\circ} 17'$). A deputation of Manfong's friends visited Mr. Park, in order to hear from himself a statement of his views and purposes in the voyage he was undertaking. His statement was satisfactory to the grantees that had executed this commission, and Mr. Park was assured of permission to pursue his voyage, and of protection from Manfong as far as his power extended. The king and his courtiers were much gratified by the presents which they received on the occasion. Accordingly, on the 26th of September, Mr. Park proceeded from Samee to *Sanfanding*; which see. Here he intended to provide a proper vessel for his further navigation down the Niger; but it was with difficulty that he procured from Manfong and his son, in return for the presents he had given them, two decayed canoes, which merely afforded him materials for constructing with his own hands, and some assistance from one of the surviving soldiers, a flat-bottomed boat, to which he gave the founding title of His Majesty's Schooner, the *Joliba*. In the meanwhile, Mr. Park was informed of the death of Mr. Scott, and he had now occasion to lament the loss of his friend Mr. Anderlon, who died, after a lingering attack of four months, on the 26th of October. The sensibility he expressed on this occasion did honour to his feelings, and yet considering his present perilous situation, and the dreary and discouraging prospects which presented themselves with regard to the projects of his undertaking, he must possess a very high degree of equanimity, firmness, and self-possession. On the 16th of November, the schooner having been completed, and every thing in Mr. Park's power to command being ready for the voyage, he closes his journal; and in the course of the succeeding days previous to his embarkation, which was on the 19th, he wrote several letters to his friends and kindred in England and Scotland. In these letters, we discover traces of that deliberate and inflexible resolution, without effort or ostentation, which proved a distinguishing feature of his character. From this period, we have no strictly authentic information concerning Mr. Park, or the progress and termination of his expedition. In the course of the year 1806, conjectures and reports agitated the public mind; and the agitation was aggravated, by intelligence communicated by the native traders from the interior of Africa to the British settlements on the coast; whence it was concluded, that Mr. Park and his companions were killed. In consequence of these unsatisfactory and alarming rumours, lieutenant colonel Maxwell, then governor of Senegal, obtained permission from government to engage a proper person to investigate and ascertain the truth of these rumours.

rumours. Accordingly, he engaged Ifaaco, Mr. Park's guide, to conduct this business. In January 1810, Ifaaco left Senegal, and returned on the 1st of September, 1811, fully confirming the reports of Mr. Park's death. His journal, including another from Amadi Fatouma, the guide who had accompanied Park from Sanfanding down the Niger, was delivered to the governor, and transmitted by him, after having been translated from Arabic to English, to the secretary of state for the colonial department. From Amadi Fatouma's journal we learn, that the conductors of the expedition went from Sanfanding to Silla, where Mr. Park had ended his first voyage; and that from thence, Mr. Park, Martyn, three other white men, three slaves, and Amadi, as guide and interpreter, nine in number, proceeded in a canoe to Ginne; and as they passed Sibby, or Dibbie, they were attacked by an armed force in three canoes, which they repulsed. Again at Rakbara, or Kabra, they repelled another assault, and in passing Tombuctoo, they resisted another similar attack, escaping by force and by the slaughter of many of the natives. As they advanced, the number of hostile canoes increased, till at length it amounted to 60, and in self-defence they killed a very considerable number of persons; their own number being now reduced by the death of one of the white men to eight. At length having passed Kaffo and Gourmon, and having supplied themselves with provisions, they entered the country of Haouffa. The king of the country having received information from the chief of Yaour, a village in this district, that the white men had departed without giving them any presents, sent an army to a village called Bouffa, near the side of the river, which was posted on the top of a rock that traversed the river, in which rock there was a large cleft or opening, that admitted the water to pass in a strong current; and when Mr. Park arrived at this opening and attempted to pass, he was attacked with lances, pikes, arrows, and stones; against which he for some time resolutely defended himself, till at length, overpowered by numbers and fatigue, and unable to keep up the canoe against the current, Mr. Park laid hold of one of the white men and jumped into the water; Mr. Martyn did the same, and they were drowned in the stream in attempting to escape. One slave was left, and they took him and the canoe, and carried them to the king. Amadi, after having been kept in prison for three months, was released; and obtained information from the surviving slave, concerning the manner in which Mr. Park and his companions had died. Nothing was left in the canoe but a sword-belt, of which the king had made a girth for his horse; and this belt Ifaaco afterwards recovered. Amadi, according to Ifaaco's report, was a good upright man, and delivered the above account to him on oath, nor could he have any interest in deceiving him. From circumstances it is concluded, that Mr. Park died four months after his departure from Sanfanding.

On Mr. Park's disposition and character it is needless to enlarge, after the detail of the principal transactions and events of his life given in this article and the article AFRICA. In private life his conduct was exemplary, as a son, a husband, and a father. As to his person, he was about six feet high, and well proportioned. His whole aspect was interesting, and his corporeal frame robust and active, and fit for great exertion, and for enduring severe hardships. His family consisted of three sons and one daughter, who with their mother survived to lament the loss of him. See the second volume of his Travels, a new edition of which was published in 1816, 8vo. For some other particulars, we refer to the articles AFRICA, NIGER, and ZAIRE.

PATMOS, l. 14, add—Such is the account given by Sonnini; but Dr. Clarke (*Travels*, vol. vi.) informs us, that he visited the library, which is a small oblong chamber, with a vaulted stone roof, and found it to be nearly filled with books of all sizes in a most neglected state; some lying upon the floor, a prey to the damp and worms; others standing confusedly on the shelves, which were printed volumes, some of which were well bound, and in good condition; but neither of the superiors of this college was able to read. At the extremity of the chamber he found a heap of Greek MSS., some of which were of the highest antiquity; amongst other specimens of Grecian calligraphy, the author found a copy of the 24 first dialogues of Plato, written upon vellum, in the same exquisite character, which remained in the hands of his friend professor Porfon until his death. But it is now, with the other MSS. from Patmos, &c. in the Bodlian library at Oxford.

PEDAL HARP. The machinery of this instrument was invented by M. Simon at Brussels, about the year 1760, and was soon adopted in France. In the eighth volume of the folio Encyclopaedia, printed in 1765, it is said, that "the sounds of the pedal harp are more sweet and melodious than those

those of any other fringed instrument played with the naked fingers; that it is more touching and proper to express tenderness and grief than other affections of the heart; that the strings must be moderately struck, otherwise the music would be as confused as on the harpsichord or pianoforte without dampers; and, lastly, the author of the article (the comte de Hogheufenki) says, that the Irish, of all the people in the world, are those reputed to perform the best on the harps of their country.

PEDILUVIUM, in *Medicine*, from *pedes*, the feet, and *lavo*, I wash, a bathing or immersion of the feet in warm water.

The older practitioners resorted to the pediluvium in a variety of diseases upon hypothetical principles; conceiving that, by drawing the blood into the vessels of the feet, it relieved distant organs, as the head or lungs, which were overcharged by a state of inflammation in congestion; hence it was recommended in apoplexy, pleurisy, and other topical affections of distant parts. This doctrine of revulsion, however, as applied to the operation of the pediluvium, is more questionable than under any other application of it; for as, like the general warm-bath, it somewhat accelerates the general circulation, it must be a doubtful remedy in cases where the motion of the heart and arteries is already too great.

The operation of the pediluvium is, in fact, simply that of a partial warm-bath; and its use is at present limited to those disorders in which that more general remedy is indicated; being a more practicable and easy expedient, though necessarily much less effectual in its influence. The most valuable and common application of the pediluvium is at the onset of febrile diseases, while a certain degree of chilliness is present. Used in this state previous to going to bed, it contributes, by moderately exciting the heart and arteries, to equalize the circulation, and determine the blood to the surface, whence a slight diaphoresis often follows its use under these circumstances. Thus the attack of a commencing catarrh or rheumatism is often warded off by the use of pediluvium, aided by other proper means; and to this kind of treatment its operation is probably to be limited. In the more advanced stage of febrile diseases, especially when there is delirium, or a general heat, its advantages are very problematical.

PENDULUM, col. 10, l. 16, add—The latest and most correct experiments that have been made for determining the length of the pendulum vibrating seconds are those of captain Kater. These experiments were performed with a pendulum constructed on the following principle: In illustrating this principle he states, as a known fact, that the centres of suspension and oscillation are reciprocal; or, in other words, that if a body be suspended by its centre of oscillation, its former point of suspension becomes

the centre of oscillation, and the vibrations in both positions will be performed in equal times. As the distance of the centre of oscillation from the point of suspension depends on the figure of the body employed, if the arrangement of its particles be changed, the place of the centre of oscillation will also suffer a change. Suppose then a body to be furnished with a point of suspension, and another point on which it may vibrate, to be fixed as nearly as can be estimated in the centre of oscillation, and in a line with the point of suspension and centre of gravity. If the vibrations in each position should not be equal in equal times, they may be readily made so, by shifting a moveable weight, with which the body is to be furnished, in a line between the centres of suspension and oscillation; when the distance between the two points about which the vibrations were performed being measured, the length of a simple pendulum, and the time of its vibration, will at once be known, uninfluenced by any irregularity of density or figure. This principle being adopted for the construction of the pendulum, the next object of importance is to select a mode of suspension equally free from objection. For this purpose a knife-edge was preferred, and the grounds of preference are briefly stated. The pendulum is formed of a bar of plate brass, an inch and a half wide and one-eighth of an inch thick. Through this bar two triangular holes are made, at the distance of 39.4 inches from each other, to admit the knife-edges. Four strong knees of hammered brass, of the same width as the bar, six inches long, and three-quarters of an inch thick, are firmly screwed by pairs to each end of the bar, in such a manner, that when the knife-edges are passed through the triangular apertures, their backs may bear steadily against the perfectly plane surfaces of the brass knees, which are formed as nearly as possible at right angles to the bar, which is cut of such a length, that its ends may be short of the extremities of the knee-pieces about two inches. Two slips of deal 17 inches long, and of the same thickness as the bar, are inserted in the spaces thus left between the knee-pieces, and are firmly secured there by pins and screws. These slips of deal are only half the width of the bar; they are stained black, and in the extremity of each a small whale-bone point is inserted, for the purpose of indicating the extent of the arc of vibration. A cylindrical weight of brass, in diameter three inches and a half, and an inch and a quarter thick, and weighing about 2 lbs. 7 oz., has a rectangular opening in the direction of its diameter, to admit the knee-piece of one end of the pendulum. This weight being passed on the pendulum, is so thoroughly secured there by means of a conical pin fitting an opening made through the weight and knee-pieces, as to render any change of position impossible. A second weight of about seven ounces and a half is made to slide on the bar near the knife-edge at the opposite end; and this weight may be fixed at any distance on the bar by two screws with which it is furnished. A third weight, or slider of four ounces, is moveable along the bar, and is capable of nice adjustment by means of a screw fixed to a clamp, which clamp is included in the weight. This slider is designed to move near the centre of the bar; and it has an opening, through which may be seen divisions, each equal to one-twentieth of an inch, engraved on the bar; and a line is drawn on the edge of the opening to serve as an index for determining the distance of the slider from the middle of the bar. The knife-edges are made of that kind of steel prepared in India, and called wootz. Their form is triangular, and their length an inch and three-quarters. They were ground on a plane tool, so as to ensure their having a perfectly straight edge. They were then carefully finished on a plane green

hone, giving them such an inclination as to make the angle on which the vibrations are performed about 120 degrees. Before the knife-edges were hardened, each was tapped half-way through, near the extremities, to receive two screws, which being passed through the knee-pieces, drew the knife-edges into close contact with them; the surfaces of both having been previously ground together to guard against any strain which might injure their figure. For the description of the support and other apparatus of this pendulum, illustrated by drawings, and the method of determining the experiments, and certain other observations, our limits require us to refer to the Phil. Transf. for the year 1818, pt. i.

From his experiments and observations, captain Kater concludes, that the length of the pendulum vibrating seconds in vacuo at the level of the sea, measured at the temperature of 62° of Fahrenheit, appears to be

By Sir G. Shuckburgh's standard	-	39,13860	inches.
By general Roy's scale	-	39,13717	
By Bird's parliamentary standard	-	39,13842	

The latitude of the place of observation being 51° 31' 8" north.

PENKRIDGE. In 1811 this township contained 196 houses, and 923 persons; viz. 438 males, and 485 females.

PHÆNICOPHEUS, MALKOKA, in *Ornithology,* a genus of birds of the order *Picæ*; the characters of which are, beak strong and slightly incurved; feet simple, two toes pointing forwards, and two backwards, the outward toe the longest; head naked round the eyes and warted. This genus is readily distinguished from *Cuculus* by the naked and papillated space that surrounds the eyes, and from *Polophilus* by the structure of the hinder toes; the head is somewhat square, and very thick; the wings rather short, and the tail remarkably long. Shaw.

PHANAGORIA for **PHANAGORA.**

PHARMACOPŒIA EQUINA, a dispensatory adapted to the purposes of veterinary practitioners, and designed more especially to comprehend those drugs and medicines that pertain to the diseases of the horse. Such a pharmacopœia is a desideratum in veterinary science. The drugs and preparations that are chiefly used are described, as far as our limits would allow, under their several titles on the disorders to which they are appropriated. The form under which they are most commonly administered is that of balls, under which many of them are recited, and the general method of preparing them described. Veterinary writers have arranged these balls under several denominations, founded on the medical purposes for which they are administered. Accordingly we have *alterative, purging, diuretic, cordial, astringent, restorative,* and *diaphoretic* balls; for the preparation of which a variety of formulæ has been given by modern practitioners.

For *alterative* balls we have the following instructions: Mr. J. Lawrence directs flowers of sulphur and cream of tartar, of each $\frac{1}{2}$ oz., 1 dr. of canella alba in powder, and treacle *q. s.*, half of which ball should be given twice a day on an empty stomach:—*or,* flowers of sulphur, cream of tartar, gum guaiacum and turmeric, of each 2 drs., and 1 dr. of canella alba, may be made into one or two balls with treacle, and given as above:—*or,* prepared antimony and gum guaiacum, of each from 3 to 4 drs. prepared with treacle, may be given every day:—*or,* antimonial *Æthiops*, from 4 to 6 drs., made into a ball with treacle, may be administered every night for a fortnight, and discontinuing it for a week, resumed for another fortnight; which is said to have great effect in the farcy, the mange, and oblitinate dry coughs in horses. Mr. R. Lawrence recommends a ball made of 1 dr. of tartarified antimony, 1 oz. of liquorice-powder, and $\frac{1}{2}$ oz. of Venice turpentine given

given every other night for four or five nights, for horses affected with greafe. Mr. White directs a composition of 6 oz. of levigated antimony, 8 oz. of flowers of sulphur, mixed with treacle, to be made into 8 balls:—or, 4 oz. of powdered rosin, 3 oz. of nitre, 1 oz. of tartarified antimony, mixed with treacle, and divided into 8 balls:—or, 2 oz. of unwashed calx of antimony, 2 drs. of calomel, and 4 oz. of powdered aniseeds, mixed with treacle, and divided into 8 doses:—or, $\frac{1}{2}$ dr. of calomel, 1 dr. of aloes, 2 drs. of Castile soap, 30 drops of oil of juniper, and $\frac{1}{2}$ oz. of powdered aniseeds, made into a ball with syrup, which serves for one dose, and which Mr. W. calls the “mercurial” alterative. Mr. Taplin recommends levigated antimony, flowers of sulphur, and nitre, of each 3 oz., 10 oz. of Castile soap, 3 drs. of oil of juniper, formed into a mass with honey *q. f.*, and divided into 12 balls, and one to be given every morning for three or more weeks, in cases of greafe, after purging with a common ball:—or, milk of sulphur, prepared antimony, cream of tartar, cinnabar of antimony, of each 5 oz., 4 oz. of Æthiops’ mineral, and honey *q. f.*, and the mass divided into 12 balls, one of which should be given every morning, for a month, in the farcy.

Purging balls are prepared, according to the directions of Mr. Taplin, of 1 oz. of focotorine aloes, 2 drs. of rhubarb, jalap, and cream of tartar, of each 1 dr., 2 scruples of ginger, oil of cloves and oil of aniseed, of each 20 drops, and syrup of buckthorn *q. f.* Mr. White orders 5 drs. of focotorine aloes, 2 drs. of prepared natron, 1 dr. of aromatic powder, 10 drops of oil of caraway, with syrup *q. f.*:—or, 7 drs. of focotorine aloes, $\frac{1}{2}$ oz. of Castile soap, 1 dr. of ginger, and 10 drops of oil of caraway, with syrup *q. f.*:—or, 1 oz. of focotorine aloes, 2 drs. of prepared natron, 1 dr. of aromatic powder, 10 drops of oil of aniseeds, and syrup *q. f.* Mr. White assures us, that the second of his compositions is generally sufficient for strong horses, and that he has never had occasion for a more active purge than the last. Mr. Ryding directs 6 drs. of Barbadoes aloes, 1 scruple of ginger, and soft-soap *q. f.*:—or, $\frac{1}{2}$ oz. of Barbadoes aloes, 1 dr. of calomel, and mucilage of gum arabic *q. f.* The first he calls a mild purging ball, and the latter the mercurial purging ball. Mr. J. Lawrence directs 2 or 3 balls to be made of the following ingredients; *viz.* from 12 to 14 drs. of focotorine aloes, from 1 to 2 oz. of cream of tartar, a tea-spoonful of powdered ginger, a table-spoonful of olive-oil, and syrup of buckthorn or treacle, *q. f.* Mr. R. Lawrence, for the same purpose, orders 9 drs. of Barbadoes aloes, and 1 dr. of ginger, to be formed into a ball with syrup or treacle.

Diuretic balls are prepared by Mr. R. Lawrence of $\frac{1}{2}$ oz. of Venice turpentine, 2 drs. of tartarified antimony, and 1 oz. of liquorice-powder, with treacle. By Mr. White, they are made to consist of 4 oz. of Castile soap, and powdered rosin and nitre, of each 2 oz., $\frac{1}{2}$ oz. of oil of juniper, linseed-powder, and syrup *q. f.* This mass for strong horses is divided into 6 balls, but for weak ones into 8:—or, the same balls may be prepared of 4 oz. of Castile soap, 2 oz. of Venice turpentine, and powdered aniseeds, and treacle, *q. f.* so as to form 6 balls:—or, balls from 1 to $\frac{1}{2}$ oz. are prepared, according to Mr. Ryding’s directions, of yellow resin, Castile soap, and Venice turpentine, of each 1 lb. dissolved slowly over the fire and formed into a mass. These balls, he says, are excellent diuretics, and may be given in gripes, swelled legs, greafe, or in diseases of the eye, &c.

Cordial balls are prepared by the same of 2 oz. of grains of paradise, finely powdered, ginger and canella alba, of each $\frac{1}{2}$ oz., aniseeds and caraway-seeds, of each $\frac{1}{2}$ oz., 2 oz. of

liquorice-powder, and honey *q. f.*; to be given occasionally. By Mr. White, these balls are prepared by making a mass with treacle of cummin-seeds, aniseeds, caraway-seeds, of each 4 oz., and 2 oz. of ginger; and they are given in the quantity of about 2 oz.:—or, they may be made of aniseeds, caraway-seeds, moist fennel-seeds, or liquorice-powder, of each 4 oz., ginger and cassia, of each $\frac{1}{2}$ oz., made into a mass with honey, and given in a dose of about 2 oz.

Astringent balls are prepared by Mr. Taplin’s directions of 6 drs. of diacordium, gum arabic, prepared chalk, and Armenian bole, of each $\frac{1}{2}$ oz., 1 dr. of ginger, 40 drops of oil of aniseed, with syrup *q. f.*; they are given in cases of laxness or scouring, and repeated every 6, 8, or 12 hours, as the case may require. For this purpose balls may be prepared of rhubarb, and compound powder of gum tragacanth, of each $\frac{1}{2}$ oz., columbo and ginger, of each 1 dr., 15 grs. of opium, 6 drs. of orange-peel, and syrup of poppies; the ball to be repeated in 12, 18, or 24 hours:—or, 1 oz. of mithridate, Armenian bole, gum arabic, and prepared chalk, of each $\frac{1}{2}$ oz., 2 drs. of ginger, and syrup of poppies, may form a ball.

Restorative ball is formed, according to Mr. Ryding, of $\frac{1}{2}$ lb. of Peruvian bark, 2 oz. of grains of paradise, gentian, and columbo, of each 3 oz., and honey *q. f.*; the mass is to be divided into 16 balls, and one to be given every morning in cases of indigestion or loss of appetite. Mr. Taplin directs a ball for this purpose to be made of 4 oz. of Peruvian bark, 2 oz. of mithridate (or diacordium), canella alba, snake-root, and camomile, of each, in powder, 1 oz., or formed into a mass with honey *q. f.*, and divided into 6 balls, one to be given night and morning:—or, $\frac{1}{2}$ oz. of Venice treacle, 6 drs. of Peruvian bark, columbo, and camomile, of each 2 drs., 25 drops of oil of caraway, and honey *q. f.*

Diaphoretic balls are formed, according to Mr. White’s directions, of 1 dr. of opium, 2 drs. of camphor, 3 drs. of tartarified antimony, $\frac{1}{2}$ oz. of powdered aniseeds, and syrup *q. f.*

PHASIS, l. 9, inferit—it is at the town of Serpanta that it becomes navigable, and after collecting the streams of the plain of Mingrelia, it enters the Black sea. It pursues a course of 500 miles, 40 of which are navigable for large vessels. At its discharge into the sea, it has a small woody island in the midst of the channel.

PHASMA, in *Entomology*, a genus of insects formed from some of the Linnæan Mantes, and differing from that genus in having all the legs equally formed for walking, and without the falciform joint that distinguishes the fore-legs in mantes. The characters are, head large, antennæ filiform, eyes small, rounded; stemnata three, between the eyes; wings four, membranaceous; the upper pair abbreviated, the lower pleated; and feet formed for walking. They feed entirely on vegetable food. The most remarkable is the *P. gigas* or *M. gigas* of Linnæus. It is a native of the island of Ambona. Another extraordinary species is the *P. dilatatum*, described in the 4th volume of the Transactions of the Linnæan Society. Some insects of this genus, as well as those of the mantis, have their upper wings resembling the leaves of trees; nature having thus provided for their security against the attacks of birds, and as well as for the more ready attainment of their prey. The female of the *P. fucifolium* has no under wings.

PHILADELPHIA, l. 6, r. 19; l. 7, r. contained, in 1810, 57,488 inhabitants. Add—Also, the metropolis of Pennsylvania, and now a distinct county, containing 14 wards, and, by the census of 1810, 53,722 inhabitants.

PHILADELPHIA *Stoner*, l. 3, after city, add—in Asia.

PHILIPSBURG, a town of York county, in Maine, with 1427 inhabitants.

PHILOSOPHER'S STONE, l. 23 from the end, *r.* should not encourage.

PHLOGISTON, l. 19, *r.* now said to be separated.

PHOCA, l. 4, *r.* fix (or four, Shaw.)

PHOSPHATE of Copper, in *Mineralogy*. See MINERALOGY, *Addenda*.

PHOSPHORITE. See MINERALOGY, *Addenda*.

PHOSPHORUS, *Phosphoric Acid, Phosphates*, &c. in *Chemistry*. According to the most recent determination of Dr. Thomson, the weight of the atom of phosphorus is 15, that of phosphorous acid 25, and that of phosphoric acid 35. A good deal of doubt, however, still hangs over this principle and its compounds. The *hypophosphorous acid*, discovered by Dulong, and which is formed when phosphuret of barytes is dissolved in water, appears to contain less oxygen than either the phosphorous or phosphoric acid, and was formerly considered as the *protoxyd* or first compound of phosphorus and oxygen. Dr. T., however, is latterly disposed to consider the *hypophosphorous acid* as a compound of 2 atoms phosphorus + 1 atom oxygen; but this is by no means ascertained. We may also observe, that all the best analyses of the phosphates shew that the weight of the atom of phosphoric acid lies between 40 and 45.

We may mention here, that Dulong has observed an acid formed during the slow combustion of phosphorus, composed, as he supposes, of 1 atom phosphorous acid + 1 atom phosphoric acid, and which he has named *phosphatic acid*.

PHYRGIA MINOR, l. 6, *r.* N.W.; l. 26, *r.* Alexandria-Troas. Col. 3, l. 8, *r.* Podarces.

PICÆ. At the clofe, add—See AVES, CLASSIFICATION, and NATURAL History.

PICROLITE. See MINERALOGY, *Addenda*.

PICROMEL, in *Chemistry*. See BLEU.

PIGMENTS. Add—The results of sir Humphry Davy's late experiments on the colours used by the ancients as pigments are as follow. The red colours which they employed he found to be red-lead, vermilion, and iron ochre. The yellows were yellow ochre, in some cases mixed with chalk, in others with red-lead. The ancients likewise used orpiment and mafficot as yellow paints. The blue was a pounded glass, composed of soda, silica, lime, and oxyd of copper. Indigo was likewise employed by the ancients, and they coloured blue glass with cobalt. The greens were compounds containing copper; sometimes the carbonate mixed with chalk; sometimes with blue glass. In some cases, they consisted of the green-earth of Verona. Verdigris was likewise used by the ancients. The purple colour found in the baths of Titus, was an animal or vegetable matter combined with alumina. The blacks were charcoal; the browns ochres; the whites chalk or clay. White-lead was likewise known to the ancient painters.

PILKINGTON, l. 1, after Lancashire, add—in the hundred of Salford, and parish of Prestwich, containing 7353 persons, occupying 1196 houses, of whom 1223 are employed in trade and manufactures, and 166 in agriculture.

PILLORY. This kind of punishment is now abolished in England.

PITCH-STONE. See MINERALOGY, *Addenda*.

PITT, in America, l. 2, add—of whom 3589 were slaves in 1810.

PITSTOWN. Add, at the clofe—containing 694 persons.

PITTSYLVANIA, l. 2, add—of whom 6312 were slaves.

PLANE-TREE, for PLANTANUS *r.* PLATANUS.

PLANET, col. 20, l. 6 from bottom, for 365 days, hours and minutes, *r.* 365 days.

PLANETARIUM, col. 20, l. 34 from bottom, for Jupiter's *r.* Saturn's. Col. 23, l. 15 from bottom, for 23° 32' 59" *r.* 23° 39' 59".

PLAQUEMINA, in *Geography*, a parish of the county of Orleans, in the territory of Orleans, containing 1549 persons. The soil of this parish is well adapted to the cultivation of the sugar-cane, and some of the largest sugar estates yet formed on the Mississippi are within its limits, so that sugar is its staple commodity. The important port of fort St. Philip is one of the defences of Louisiana.

PLASNIA. See MINERALOGY, *Addenda*.

PLATINUM, in *Chemistry*. Dr. Thomson concludes, from the best experiments that have been made on this metal and its compounds, that the weight of its atom is 226.25.

PLATYSTACUS, in *Ichthyology*, a genus of abdominal fishes, instituted by Dr. Bloch, and nearly allied to that of Silurus. Its generic characters are, that it has the habit of ilurus, mouth beneath, bearded with cirri, body scaleless, depressed, tail long, compressed. Dr. Shaw enumerates and describes the following species, *viz.* *cotylephorus*, with six beards, and ventral acetabula, the *Silurus aspredo* of Linneus, a native of the Indian seas and rivers: *levis*, with eight beards and smooth abdomen, differing perhaps only in size from the former: *verrucosus*, or warted brown P. marked above by longitudinal warted lines, with short anal fin, similar to the last, but smaller and of a less elongated form; a native of the Indian seas: *anguillaris*, or eel-shaped brown P., with longitudinal white stripes, and the second dorsal, anal, and caudal fin united, form less broad in front than that of the preceding species, having eight instead of six beards; a native of the Indian seas.

PLEASANT, in *Geography*, l. 2, *r.* 1246. Add—Also, a township in Franklin county, having 159 inhabitants.

PLEASANT, *Mount*. Add—a township in Madison county, having 328 inhabitants.

PLUMSTEAD, l. 2, in Bucks county, having 1407 inhabitants.

PLUTONIUM, in *Chemistry*, a name given by Dr. Clarke to the supposed metallic basis of barytes. See BARYTES and BLOW-PIPE.

VOL. XXVIII.

POGONIUS, in *Ornithology*, a genus of birds of the order Picæ; the characters of which are, beak large, thick, ciliated at the base, with the upper mandible bidentate on both sides, nostrils covered with bristles, feet simple, with two toes before and two behind. Of this genus there are three species, all inhabitants of Africa; *viz.* *fulvirostris*, or groove-beaked, the blue-black P. with throat, neck, belly, and an obscure stripe on the wings, scarlet, sides yellowish, back with a white spot, quills dark-brown, upper mandible with one longitudinal, under with many transverse, grooves; inhabits about the coast of Barbary: *leucirostris*, or smooth-beaked black P., with throat, neck, breast, abdomen, and a stripe on the wings, scarlet, back with a white spot, crown of the head variegated with scarlet; beak smooth, not grooved; the bucca dubius B. of Latham: *vicilloti*, or brown P., whitish beneath, head, neck, throat, and spots on the breast, scarlet; interior wing-quills externally marginal with pale; beak smooth, not grooved. Shaw.

POINT,

POINT, in *Geography*, a township of Northumberland county, in Pennsylvania, having 431 persons.

POINTE COUPEE, a county and parish of New Orleans, containing 4539 persons.

POIRET. See THEOSOPHISTS.

POISON, col. 3, l. 15 from bottom, for *verus r. berus*.

POLAND, col. 9, l. 31, add—From a statistical account of Poland, published at Warsaw, it appears, that this kingdom in its present state contains 1291 square miles, (of 15 to a degree,) 481 towns, 22,694 villages, and a population of 2,732,324 persons, of whom 219,244 are Jews.

POLAND, in America, col. 2, l. 2, r. 850. Add—Also, a township of the county of Trumbull, in Ohio, with 827 inhabitants.

POLARITY of Light. See LIGHT.

POLARIZATION, in *Optics*, a term which has been lately applied to that change which takes place in the direction of rays that pass through certain crystals, and which derives this appellation from its analogy to magnetic phenomena. It was first suggested by the modifications of light discovered by M. Malus (see LIGHT), and has since been investigated with equal ingenuity and diligence by Dr. Brewster. For his numerous communications on this subject to the Royal Society, he was honoured with the Copleyan medal.

POLASKI, in *Geography*, a county of Georgia, containing 2091 inhabitants, of whom 528 were slaves in 1810.

POLE, l. 2, add—the fourth son of the countess of Salisbury, who was cruelly and unjustly beheaded by Henry VIII., and whose father, the duke of Florence, was drowned in a butt of malmsey by his son.

POLOPHILUS, COUCAL, in *Ornithology*, a genus of birds of the order PICÆ, the characters of which are, beak strong, slightly incurved, nostrils straight, elongated, feet simple, two toes pointing forward, the exterior being the largest, two toes turning backwards, the interior furnished with a very long claw. The Coucals, so first called by Vaillant, form a most beautiful tribe of birds. They reside in woods, feed on insects and fruits, and construct their nests in trees, and (contrary to the manners of cuckoos) bring up their young, from which circumstance their generic name is derived. Shaw.

POLYPTERUS, in *Ichthyology*, a genus of the abdominal fishes; the character of which is, that the gill-membrane is single-rayed, and the dorsal fins numerous. This fish constitutes a new and remarkable genus, and was first scientifically described by M. E. Geoffroy, who considered it as forming a connecting link between the osseous and the cartilaginous fishes. It seems most nearly allied to the genus Elox. It is known to the Egyptians by the name of Bichir, among whom it is rare, and supposed in general to inhabit the depths of the Nile among the soft mud. Its flesh is white and savoury, though it is hardly possible to open its skin with a knife; and therefore the fish is first boiled, and its skin drawn off whole. Its specific name is "Niloticus," and it is characterized as the green P., with the abdomen spotted with black. Shaw.

PONT-VOLANT, *dele* the description, and let the reference remain.

PORANTHERA, in *Botany*, from πορος, a pore, and ανθηρ, an anther.—Rudge Tr. of Linn. Soc. v. 10. 302.

—Class and order, *Pentandria Trigynia*. Nat. Ord.
Eff. Ch. Involucrum of eight leaves, many-flowered. Perianth none. Petals five. Anthers of four cells, each

with a terminal orifice. Capsules? three, with numerous seeds.

1. *P. ericifolia*. Rudge as above, t. 22. f. 2.—Native of New South Wales. *Dr. White*. A very extraordinary little plant. *Stem* branched, round, leafy, four to six inches high. *Leaves* scattered, numerous, linear, glaucous. *Flowers* corymbose, minute, white. The dried specimens resemble some small kind of *Lepidium*.

PORCELAIN, col. 24, l. 31, r. in a melted state.

PORCELAIN *Jasper*. See MINERALOGY, *Addenda*.

PORCELLIA, in *Botany*, so called by Ruiz and Pavon, in honour of Don Antonio Porcel, a Spaniard, whom they celebrate, in the highest terms, as a promoter of botanical pursuits. Our reasons for adopting this name, in preference to any other, for the genus we are about to describe, may be found under the article ASIMINA. That we presume to consider the *Asimina* and *Porcellia* of De Candolle as one and the same genus, may require a still further apology, and we shall presently give it, as far as we are able.—"Ruiz et Pavon Fl. Peruv. v. 1. 144. Prodr. 84. t. 16. Dunal Anonac. 85." De Cand. Syst. v. 1. 480. "Perf. Syn. v. 2. 95." Pursh 383. (*Asimina*; Adans. Fam. v. 2. 365. Dunal Anonac. 81. De Cand. Syst. v. 1. 478. Orchidocarpon; Michx. Boreal.-Amer. v. 1. 329. Annonæ spec. Linn. Juss. Gen. Willd. Ait. &c.)—Class and order, *Polyandria Polygynia*. Nat. Ord. *Coadunate*, Linn. *Anonæ*, Juss. *Anonacæ*, De Cand.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, in three deep, equal, ovate, concave, permanent segments. *Cor.* Petals six, unequal, in two rows, sessile, ovate-oblong, spreading, coriaceous; the three innermost either larger or smaller than the rest. *Stam.* Filaments scarcely any; anthers very numerous, nearly sessile on the convex receptacle, oblong, bursting at each side. *Pist.* Germens from three to six, ovate-oblong, sessile; styles none; stigmas obtuse. *Peric.* Berries as many as the germens, sessile, crowded, ovate or nearly cylindrical, more or less succulent, of one cell. *Seeds* numerous, elliptic-oblong, ranged transversely in a single or double row, inserted into the inner margin.

Eff. Ch. *Calyx* inferior, deeply three-cleft. Petals six, ovate-oblong, spreading, in a double row, unequal. Germens oblong. Stigmas sessile, obtuse. Berries sessile, of one cell, with many seeds.

A shrubby or arborecent genus, with oblong, undivided, deciduous leaves, and axillary, nearly solitary flowers, either sessile or stalked, in some instances expanded before the foliage. All the species are natives of the cooler parts of America. The able professor De Candolle separates *Asimina* of Adanson from *Porcellia* of the *Fl. Peruv.*, the latter having its three inner petals rather the largest, the fruit more cylindrical and coriaceous, the seeds in a double row. In *Asimina* the three outer petals are much the largest, and the fruit more ovate. But the seeds are likewise in a double row in one species at least of this genus, the *triloba*, as De Candolle, on the authority of Ehret, admits; and the comparative size of the inner and outer petals, different in different species of *Asimina*, can hardly be much relied on, nor is this admitted by De Candolle among his most essential characters, p. 465. The more or less cylindrical or ovate form of the fruit will not, surely, be insisted on; nor can that of the original *Porcellia* differ essentially in substance from the others, being like them succulent and eatable.

1. *P. nitidifolia*. Shining-leaved Porcellia. —Fl. Peruv. v. 1. 144." De Cand. n. 1.—Leaves ovato-lanceolate, pointed, smooth on both sides. Flower-stalks aggregate. Inner petals rather the largest.—Native of mountainous

tainous woods in Peru. A tall and very handsome tree, forty ells in height, with greyish, rugged, minutely dotted branches. Leaves alternate, on short stalks, oblong-lanceolate, rounded at the base, entire, veiny on both sides, shining above. Stalks axillary, several together, drooping, thickened upwards, each bearing one or more yellowish-white flowers, about an inch in diameter. Berries cylindrical, tumid, rather coriaceous, but juicy and eatable, each marked externally with a longitudinal seam. Seeds oblong-kidney-shaped, compressed, in two rows. The leaves afford a yellow dye.

2. *P. parviflora*. Small-flowered Porcelia. Pursh n. 2. (*Afimina parviflora*; De Cand. Syst. v. 1. 478. "Dunal Anonac. 82. t. 9." *Orchidocarpum parviflorum*; Mich. Boreal.-Amer. v. 1. 329.)—Leaves obovate-wedge-shaped, pointed, clothed with rusty down beneath, as well as the young branches. Flowers sessile. Outer petals longest, scarcely twice the length of the calyx.—In shady woods, near rivers and lakes, from Virginia to Georgia, flowering in April and May. A full shrub, sometimes not above two feet high when in fruit. Flowers small, dark purple. Pursh. Branches smooth, slightly rugged; when young leafy, and covered with reddish pubescence. Leaves on very short stalks; acute at the base; ribbed and downy beneath; smooth and green above. Flowers nearly or quite sessile, coming before the leaves, from the axillary scars of last year's foliage. Their stalks, if any, as well as the outsidings of the calyx and corolla, are clothed with reddish down. Berries two or three from each flower, aggregate, ovate, smooth, rather fleshy, "the size of a plum." De Candolle.

3. *P. triloba*. Three-lobed Porcelia. Pursh n. 1. (*Afimina triloba*; De Cand. Syst. v. 1. 479. "Dunal Anonac. 83." *Annona triloba*; Linn. Sp. Pl. 758. Willd. Sp. Pl. v. 2. 1267. Ait. Hort. Kew. v. 3. 335. A. foliis lanceolatis, fructibus trifidis; Mill. Ic. v. 1. 23. t. 35. A. fructu lutescente levi, serotum arietis referente; Catesb. Carol. v. 2. t. 85. Trew Ehret t. t. 5. Duham. Arb. v. 1. 56. t. 19, 20. *Orchidocarpum arietinum*; Mich. Boreal.-Amer. v. 1. 329.)—Leaves elliptic-oblong, pointed at each end, nearly smooth, as well as the young branches. Flowers stalked. Outer petals roundish-ovate, four times the length of the calyx.—On the overflowed banks of rivers, from Pennsylvania to Florida, flowering in March and April. A small tree. Flowers dark brown. Fruit large, eatable. Pursh. This species, introduced by the celebrated Peter Collinson, is still met with in several curious gardens, like those of Kew, Stion-house, &c. where it produces in the spring large inodorous flowers, an inch and a half broad, with wrinkled dark-brown petals, as represented by Miller. Catesby and Ehret make them of a pale yellowish-green. The leaves, which come forth as the flowers begin to fall, are five or six inches long, and an inch and a half or two inches broad, on short stalks. The flower-stalks are solitary and single-flowered, from one to two inches long, downy with purplish hairs. Berries ovate, yellow, two or three inches long, not perfected in England, eatable, though reported by some persons to have an unpleasant smell. Seeds eight or ten, large, brown, rugged, in a double row, as represented by Ehret. Miller's figure exhibits a single row only. One or two berries only appear to be perfected from each flower.

4. *P. pygmaea*. Dwarf Porcelia. Pursh n. 3. (*Afimina pygmaea*; De Cand. Syst. v. 1. 479. "Dunal Anonac. 84. t. 10." *Orchidocarpum pygmaeum*; Mich. Boreal.-Amer. v. 1. 330. *Annona pygmaea*; Bartr. Trav. t. 1. Willd. Sp. Pl. v. 2. 1268.)—Leaves oblong-lanceolate,

obtuse; wedge-shaped at the base; smooth, as well as the young branches. Outer petals largest, obovate-oblong, greatly exceeding the calyx.—In the sandy fields of Georgia and Florida. The whole shrub not above a foot high. Flowers the size of *Anona squamosa*. Pursh. This is smooth in every part, with very long leaves, and short, single-flowered, solitary, bracted flower-stalks. Flowers white; their inner petals smallest, elliptical and obtuse. De Candolle. Pursh, by a faulty punctuation, makes the inner petals longest.

5. *P. grandiflora*. Large-flowered Porcelia. Pursh n. 4. (*Afimina grandiflora*; De Cand. Syst. v. 1. 480. "Dunal Anonac. 84. t. 11." *Orchidocarpum grandiflorum*; Mich. Boreal.-Amer. v. 1. 330. "Annona grandiflora; Bartr. Trav. t. 2." A. obovata; Willd. Sp. Pl. v. 2. 1269.)—Leaves obovate-wedge-shaped, obtuse; clothed beneath with rusty down, as well as the young branches. Flowers sessile. Outer petals obovate, many times larger than the calyx.—In shady woods, of Georgia and Florida, flowering in May. A small shrub. Flowers very large in proportion, white. Pursh. Older branches smooth, as well as the upper surface of the leaves. Inner petals linear-oblong. Berries smooth, oblong-obovate. De Candolle.

PORTER, in Geography, a small township of the district of Maine, in the county of Oxford, having 292 persons.

PORTLAND, NEW, a township of Maine, in the county of Somerset, having 421 inhabitants.

PORTSBOROUGH. In 1811, the parish of St. Cuthbert's contained 1958 houses, and 38,673 persons; viz. 16,873 males, and 21,800 females: 210 families being employed in agriculture, and 3342 in trade, manufactures, or handicraft.

POTSMOUTH, col. 5, l. 20, for tons *r. cwt.*

POTASSIUM, POTASH, in Chemistry. The most recent determinations make the weight of the atom of potassium to be 50, and that of potash of course to be 60. Potassium, when heated in oxygen gas, combines with a larger quantity of oxygen than exists in potash, and thus forms a compound which is, in fact, a peroxid of potassium. This peroxid is of a yellow colour; when put into water it effervesces, giving off oxygen gas. Phosphorus, sulphur, and carbon, are acidified when brought in contact with it. Hydrogen, when heated with it, is slowly and without combustion converted into water. It decomposes ammonia, converting it into water and azotic gas.

POTT, PERCIVAL, col. 2, l. 27, for 1726 *r. 1736.*

POTZDAM. Add—Potzdam contains (the military not included) 115,426 souls.

POULTICE, in Farriery, is compounded of various ingredients, according to the purposes of its application. Some of the most approved, founded in modern veterinary science, are the following:—The common poultice consists of $\frac{1}{2}$ peck of bran and water, *q. f.* boiled for ten minutes, and then thickened with linseed-meal, having the addition of 3 oz. of hog's-lard: or, $\frac{1}{2}$ peck of fine pollard, 2 $\frac{1}{2}$ lbs. of linseed-meal, and boiling water, *q. f.* adding 2 oz. of hog's-lard. Fermenting poultice is obtained by boiling a quantity of brewer's wort, and throwing into it as much oatmeal as will thicken it; adding, lastly, a tea-cupful of yeast: this is adapted to putrid ulcers, or mortified parts. Saturnine poultice is had by adding to the common poultice 3 drs. or $\frac{1}{2}$ oz. of extract of lead, and mixing them well together: or, 1 oz. of acetated ceruse, (sugar of lead,) 3 quarts of boiling water, with the addition of bran and linseed-meal, *q. f.* A suppurative poultice may be made by stirring a sufficient quantity of common turpentine into
fome

some of the common poultice. An *anodyne* poultice may be prepared in the same way, by adding a sufficient quantity of tincture of opium.

POWATAN, l. 1, r. 8073 inhabitants, of whom 5091 were slaves in 1810.

POYANG, l. 2, add—According to a statement in “Ellis’s Journal of an Embassy to China,” (vol. ii.), this lake is very inferior in extent to the Tung-ting-hoo, in Ho-quang, the one being 180 lees, and the other 800 arois; the lee being rather more than one-third of a mile.

POWDER-CHESTS, l. *penult.* for fixed r. fixed.

PRAIRIE, or MEADOW, a term used in North-West America, to denote a tract of land divested of timber. In travelling W. from the Alleghanies, such tracts occur more frequently, and are of greater extent as we approach the Mississippi. When we proceed to the distance of 2 or 300 miles to the west of that river, the whole country is of this description, which continues to the rocky mountains westward, and from the head waters of the Mississippi to the gulf of Mexico, an extent of territory which probably equals in area the whole empire of China.

PREBBLE, in *Geography*, a county of Ohio, containing 7 townships, and 8304 inhabitants.

PREHNITE. See MINERALOGY, *Addenda*.

PRICE. See POLITICAL Economy.

PRINCE EDWARD, l. 2, after inhabitants, add—of whom 6996 were slaves in 1810.

PRINCE GEORGE, l. 3, insert—of whom 4486 were slaves in 1810.

PRINCE GEORGE, l. 5, insert—of whom 9189 were slaves in 1810.

PRINCE WILLIAM, l. 3, add—of whom 5220 were slaves in 1810.

PRINCESS ANNE, l. 4, insert—of whom 3926 were slaves in 1810.

PRINTING, CALICO, is the art of imparting various colours to plain calicoes, in any form, or according to any pattern that may be desired, by means of certain colourless mordants previously applied to the cloth. This art has sometimes been denominated *topical* dyeing, and the various branches of it are calculated to astonish those who may have the opportunity of witnessing the different processes, without being acquainted with the nature of chemical mordants, and their several uses in the arts.

The art of calico-printing is of great antiquity. Homer speaks of the variegated cloths of Sidon, as having a very splendid appearance; and Pliny describes the Egyptians as accustomed to prepare parti-coloured linens, and observes that these colours were produced after a manner corresponding with our method of topical dyeing. He says the Egyptians began by painting or drawing on white cloths, (doubtless linen or cotton,) with certain drugs, which in themselves possessed no colour, but had the property of attracting or absorbing colouring matters. After which, these cloths were immersed in a heated dyeing liquor; and though they were colourless before, and though this dyeing liquor was of one uniform colour, yet when the cloths were taken out of it soon after, they were found to be wonderfully tinged of *different* colours, according to the different natures of the several drugs, which had been applied to their different parts; and these colours, so wonderfully produced from a tincture of only *one* colour, could not afterwards be discharged by washing; and he considers it as admirable, that the dyeing liquor, which, if cloths of different colours had been put into it, would have confounded them all, should thus produce, and permanently fix *several* colours, being itself only of one colour. Pliny, lib. xxxv. cap. 2.

VOL. XXXIX.

This account contains for plain a description of one of the branches of calico-printing, that no one who is conversant with the present practices can entertain any doubt but that the ancient Egyptians were acquainted with many of the principles of this very curious art. Our readers, who are desirous of further investigating this interesting subject, will find abundant and satisfactory information by consulting the following works: *viz.* Pliny’s “Natural History;” the 26th volume of “Recueil des Lettres Edifiantes, &c.,” Strabo, lib. xv.; Delaval’s “Experimental Inquiry into the Cause of Change of Colours, in opaque and coloured Bodies;” Berthollet’s “Elements of the Art of Dyeing;” vol. i. p. 28; Beckman’s “History of Inventions;” in 4 vols. 8vo.; Mr. Parkes’s “Chemical Essays,” vol. ii. p. 65, &c.; and Dr. Bancroft “On Permanent Colours.” In the above works, abundant testimonies will be found to shew that printed calicoes were not unknown to the ancients; and we have good reason also to suppose that the colours which they imparted to their cloths possessed a considerable degree of permanency, as we know that iron and alum were both employed by them as mordants. It is likewise well known that several ancient nations were acquainted with soda, madder, tin, the juice of the *buccinum*, cochineal (or an insect similar to it), the celebrated Tyrian purple, and other materials, sufficient in the whole to enable them to give a great variety of colours and tints to their several productions.

Our object, however, in this communication, is to give a succinct account of the art of calico-printing as it is conducted at present, and we do not know that we can do better than to copy the greater part of the detail which has been given by Mr. Parkes in his “Essay on Calico-Printing;” in the second volume of his “Chemical Essays;” and which he has very politely allowed us to make use of in any way we think proper.

From this essay it appears, that calico-printing, as an art, is but of modern date in this country, though it has been practised in India, and other parts of the East, from time immemorial. From various accounts it appears, that formerly in India the cotton cloths when brought from the weavers, partly bleached, were worn next to the skin by the dyer and by all his family, during the space of eight or ten days, after which they underwent several macerations in water, with goat’s dung, and were afterwards submitted to frequent washings, and as frequent dryings in the rays of an intense sun-shine. Afterwards they were soaked for some time in the mixture of the astringent fruit of the yellow *myrobolans*, and of curdled buffalo’s milk. When thoroughly impregnated therewith, they were squeezed, dried by exposure to the sun, and then, by pressure and friction, they were made smooth enough for being drawn upon by the pencil with the different mordants.

The first of these mordants was an iron liquor, made by dissolving iron in a mixture of four palm-wine and of water in which rice had been boiled. This liquor was applied to the figures or spots intended to become black, and afterwards the aluminous mordant was applied, commonly by children, with the pencil, to the parts intended to be made red. The pieces were then exposed to the hottest sun-shine, that the parts to which the mordants had been applied might be dried as much as possible; and then they were thoroughly soaked in pits of water, to cleanse them from the superfluous mordants, as well as from the buffalo’s milk, &c.: and lastly, they were dyed in water, with certain roots answering nearly in their effects to those of madder.

It was in this way the manufacture of printed cottons

PRINTING ON CALICO.

was conducted by the Indians in former times. The following is an account of the modern Indian practice, in one particular branch of their manufacture, which Mr. Parkes says he procured from a gentleman who had spent some time in India, and who had taken pains to inquire into their manipulations.

This process relates to the method of printing the fine cotton chintz counterpanes, which the natives call *pallampooors*, and which are manufactured at Madras. These are woven in one piece, from two to four yards square, and are printed, or rather painted, with various designs, and in various colours. Their method is to draw a pattern first on sheets of paper sewn together, of the size of the intended pallampoor; and then to prick out the same in the paper with a sharp instrument. This done, the paper pattern is smoothly fixed upon the cloth, which is previously damped, and a small muslin bag containing some kind of black powder is rubbed over the whole, in order to pass a part of the powder through the pin-holes, and completely mark out the pattern.

The pattern being thus sketched upon the cloth, the paper is removed; and when the outline of the various figures is drawn with a pencil, the piece is considered to be ready for receiving the colours.

One colour is then laid on with a brush made with a tough root of a particular kind of tree, or with the husk of the cocoa-nut; and when this is dry, the piece of cotton is given to a woman to wear, or to use in the family, till it be very much dirtied; in order that it might necessarily undergo a thorough washing, which is thought requisite to prove the goodness and permanency of the colour. Another colour is then laid on in the same manner, and the piece is again submitted to the same trial of wearing and washing. The Asiatics may not be aware of it; but doubtless the long exposure to the air in these cases is the important point, as it is well known that the atmosphere is a prime agent in rendering many colours permanent, which, under a different treatment, would be heavy and fugitive. This is repeated for every colour that is employed;—and when any one of these colours is found to be deteriorated by this treatment, it is printed afresh; and so are all the rest, till the workman is satisfied that all the colours are actually permanent.

This tedious process is adopted, however, only when the manufacturer means to warrant the article; but in all cases, even in those pieces which will not bear washing, the colours are laid on by a brush, as before mentioned.

Whether they are all substantive colours which are thus applied, or whether they use any species of mordants in their fast work, we are unacquainted, as the artists of India observe great secrecy, and are extremely jealous on this subject.

Such are the facts which we have been able to collect respecting the progress of calico-printing from the earliest ages; and also of the present state of the art among the Asiatics. The more difficult part now remains, *viz.* to give a brief detail of the most important processes of our own artists. This, however, we shall endeavour to do with the utmost plainness, and shall not fail to suggest any improvement that may have occurred to us during our inquiries respecting this very interesting and varied branch of manufacture.

We have not been able to ascertain when calico-printing was introduced into this country, though there are various reasons for believing that it is an art, among us at least, but of modern date.

As the whole of this ingenious business, as it is now

conducted, depends upon the proper application of a few compounds called *mordants*, it will be necessary, in the first place, to explain their nature and uses. In doing this, one or two preliminary remarks will assist us.

The colouring substances chiefly employed in this art are divided into two classes, *viz.* *substantive* and *adjective*. A *substantive* colour is one which is capable of itself of producing a permanent dye on wool or woollen cloth; such is the juice of the buccinum, used by the ancients for producing the imperial purple; such are also the woad and indigo employed by the moderns for producing a permanent blue; and we may add the metallic solutions, particularly those of iron, cobalt, gold, platina, and silver, which give various colours, according to the processes by which they are prepared.

It has been proposed to employ this valuable permanent colour for pencilling on fine muslins. In time of peace it might readily be procured in sufficient quantities, and would prove an important addition to the resources of the British calico-printer.

Dr. Bancroft tells us, that the first mention of indigo, as known in England, is in the Act of the 23d of queen Elizabeth, chap. 9, where it is called *Anche*, or *Blue Ind.* Bancroft on Permanent Colours, p. 138.

By *adjective* colours are meant all those which are incapable of giving permanent dyes without the aid of certain intermedia, which form as it were a bond of union between them and the substances intended to be dyed.

These intermedia are what are known by the term *mordants*, and are used for this purpose in very considerable quantities by the calico-printer of the present day.

Several expedients of this kind were employed by the ancients to produce fast, or, more properly, permanent colours, and this appears from the testimony of Aristotle and Pliny. The chief articles in use at present are, the acetate of iron, the acetate of alumina, and the various solutions of tin, all of which should be very carefully and correctly prepared.

We have already given some account of chemical mordants in vol. xxiv. part 1, under the article *MORDANTS*; which see.

When piece-goods are designed to be dyed of one uniform adjective colour, they are first immersed in a solution of one of these mordants, then hung up to dry, and to absorb the oxygen of the atmosphere. When sufficiently exposed to the air, they are washed or dunged, to remove the superfluous mordant; that is to say, that part of it which is not chemically combined with the cloth; and the goods are then submitted to a bath of that particular kind of colouring matter which is to be imparted to them.

The dung of the cow is used in such large quantities by the calico-printer, that it has become an article of great expence. The proportion that is employed is usually about one bushel to one hundred gallons of water, though frequently a larger proportion would be more effectual. The brightness of the colours, and the purity of the whites, are always dependent upon the quantity of the dung employed.

Whenever it is meant that the colour should be partially inserted, the mordant is applied to those particular parts only; so that, when the piece is immersed in the colouring bath, no other place will receive the permanent stain. If a sufficient number of colouring substances should ever be discovered, that have no affinity for any thing but the chemical mordants, the business of calico-printing would be rendered much more easy and simple than it is at present. For though the whole texture of the cloth will be coloured,

PRINTING ON CALICO.

yet having in itself no affinity with the vegetable with which the decoction is impregnated, the whole of the colouring matter will be easily removed by exposure to the air, and the ground of the piece restored to its original whiteness; while those parts to which the mordant was applied, will retain and fix the colours in a way which will be more fully explained hereafter.

Formerly all calico-printers were bleachers; but in the neighbourhood of London these are separate and distinct trades, and the printer either purchases bleached goods for printing on his own private account, or receives the cloth from his customers in a white state; and, when printed, he returns the identical pieces, and is paid so much *per yard*, according to the number of colours, for printing them.

In our opinion every printer should bleach his own goods, for it is impossible always to rely with confidence on the care of those who bleach for hire; and every printer knows that good bleaching is absolutely a necessary preliminary in the production of good printing. Indeed, this is now pretty generally acknowledged in the north of England; for most of the opulent houses in Lancashire and in Scotland, which produce fine work, are bleachers as well as printers.

Oxymuriate of lime is the agent generally employed in bleaching; but it appears to us that some other article might be introduced with advantage. For, as the goods are washed in diluted sulphuric acid when they are taken from the oxymuriate of lime, a sulphate of lime is always formed, which becomes fixed in the fabric, and, acting as a mordant when the pieces come into the madder-copper, occasions an indelible stain, which in very fine goods often impairs their beauty. If oxymuriate of soda were employed, the sulphuric acid would form a soluble salt with the soda, easily removable by washing.

No people have taken more pains to excel in bleaching than the Irish, and their credit is established accordingly. The German linen, we believe, is generally better than theirs; but the Irish has always the preference in foreign markets, owing to their superiority in bleaching and finishing.

A very minute account of the various processes in bleaching has been already given in our 4th vol. part ii. under the article BLEACHING; which see.

By whatever means the bleaching is performed, the printer commences his part of the business in the following manner.

The goods are first *dressed* by singeing off the whole of the nap which is attached to them. This is effected by the following contrivance:—Ten pieces are generally wired together, and wound upon a roller, from whence they are pulled over a hot iron, nearly in the form of half a cylinder, and received upon another roller; from thence they are returned to the iron, which is still kept red, or nearly at a white heat. The use of repeating this process is to remove the nap more effectually than it would be done by passing it only once over.

The next operation is that of *steeping*, which consists merely in soaking the pieces for twenty-four hours in a vessel of weak alkaline ley, at a temperature of about 100°. These operations of singeing and steeping are going on at one and the same time, which effectually prevent any accident that might otherwise arise from the effects of the hot iron.

The goods are then boiled or else bowked in a solution of potash (some workmen prefer to have this alkali in a pure caustic state); they are then well cleansed by thorough washing in wash-wheels, or in stocks, to ensure their being entirely divested of the alkali. The intention of thus treating them with potash, is to remove any grease or im-

purity that may be attached to them, which would otherwise endanger the evenness and uniformity of the colours. This process is called *sbing*.

By some observant calico-printers it has been imagined, that the rendering of the ley caustic is apt to impair the texture of the cloth; and we doubt not but that this has often been the case. Under the eye of the master, however, we are sure that it might be employed with advantage and safety.

It may be remarked, that in weaving calicoes the workman generally greases the reeds, in order to make them move easier. Tallow is also employed for dressing the warp, and this has a baneful effect on all goods which are designed for printing. Wherever this grease is in the cloth, it becomes fixed by the operation of singeing; and if it be not taken out before bleaching, it will not come out afterwards by the usual process of ashing and scouring; for, when the pieces are submitted to a blue vat to be dyed with a uniform self-colour, all those greasy places will be found to have taken the dye in a very imperfect manner. If the calico-manufacturers themselves would make a point of preparing the oleaginous matter for the weavers, and would furnish them with nothing but pure vegetable oils, such as those of rape, linseed, &c., it is very likely that these inconveniences would not occur; for the stain from *vegetable* is not so indelible as that from *animal* oil. To cleanse such goods, various expedients have been adopted, but we apprehend nothing but a solution of caustic alkali can be depended upon. To prove the effect of any method which may be tried, it is a good way to run the pieces through water, and then to pass them from the water so gradually over a roller, as to give the superintendent an opportunity of examining every inch of the surface; and if any part remains greasy, it will be seen at once, for that part will continue dry, while all the rest of the cloth is wet.

There is another way in which the goodness of bleaching might be proved. Let a few of the suspected pieces be run once or twice through a madder-copper, at the temperature of about 180°. This will inevitably mark any part that may be imperfectly bleached; whereas, if the operation has been properly performed, they will come out so little stained, that an intelligent workman, who has been used to a madder-copper, will at once be satisfied that they contain no impurity that can form a permanent mordant.

The next process is one with diluted sulphuric acid. A quantity of soft water having been poured into a leaden vessel, oil of vitriol is gradually added to it, in the proportion of about twenty pounds of oil of vitriol to every hundred gallons of water, which by weight is in the proportion of about one to forty.

When this mixture has been well stirred, it is ready for use. Sometimes it is employed in this state, at others it is heated to 90° or upwards of Fahrenheit, according to the nature of the work to be done, and the goods are immersed in it. They are not suffered to lie in this solution, but are wound by means of a winch over a wooden cylinder, that every part of the cloth may be immersed in the fluid, and exposed alternately to the action of the atmosphere.

This operation is generally continued for about twenty minutes, and is designed to remove any iron-moulds or other stains which the cloth may have acquired. It has also the effect of neutralizing any portion of potash that may have been left in contact with the cloth. The process is called *souring*.

After this operation it is necessary to wash the goods thoroughly, that no part of the acid may be left in them to injure their texture, and this is best effected by means of

PRINTING ON CALICO.

the wash-wheel. The calicoes are then to be regularly and thoroughly dried, which finishes these preliminary operations, known in the trade by the term *preparation*; so that those cloths which have passed through these manipulations are said to have undergone a preparation. Besides the uses already mentioned, there is another advantage attending these processes, *viz.* that the cloth which has undergone this preparation will bleach sooner, the colours will be brighter, and the whites more delicate, than they would have been had they not gone through these previous operations.

The next process is that of *calendering*. Here the goods are passed through a set of rollers, which gives them a gloss, and the appearance of their having been ironed. They are now fit for printing. For copper-plate printing, or cylinder work, the process of calendering is omitted.

In printing fast colours, the artist usually proceeds in this way: he lays the piece of calico, which has been already smoothed by calendering, upon a strong thick table, which is previously covered with a woollen cloth. He then proceeds to apply one or more mordants, as the case may require, for fixing the intended colours. These mordants are applied by means of wooden blocks, with the patterns formed upon them. These blocks were formerly chosen of holly, and the cutting then was a separate branch of the business, and was called *block-cutting*. Of late years, however, a considerable improvement has been made in this part of the business by the introduction of brass or copper; that is, the pattern, instead of being actually cut in the wood, is now formed by means of slender pieces of one of those metals being firmly fixed to the block, so as to produce the pattern intended. This alteration was occasioned by the perishable nature of wood, on account of which every printer incurred great and unnecessary expence. The pattern when thus formed with copper, is not only more lasting, but it has also the advantage of giving greater sharpness and beauty to the impression. When it was customary to use wooden blocks, the patterns were not encahed in the wood, but the wood was cut away in such a manner as to leave the pattern in relief. It will be obvious that this must always be the case in *block-printing*.

When the mordant is ready, it is mixed up either with flour-paste, or with a thick aqueous solution of gum arabic, gum fenegal, or gum tragacanth, and is then spread upon a piece of superfine woollen cloth, strained tight upon a hoop. This is placed within another hoop, covered either with sheep-skin or oil-cloth. These hoops are both so broad as to give to each of them the appearance of a tamarine. That which is covered with the woollen cloth is called a *sieve*, the other a *case*. The sieve within its case is now placed in a small tub of gum-water, and is ready for use.

Flour is an article of considerable consumption with the printers for making paste. Some houses buy twenty barrels of American flour at once. Should it be rusty or four from keeping, it is of little consequence for their use; but they are careful to buy none but such as has been made with found wheat, for if unfound it will be of no value for their purposes.

Gum tragacanth is much dearer than the other gums mentioned above; but notwithstanding this, it must be had for some styles of work, as no other will answer for any of those colours or mordants which are prepared with nitrous acid. A solution of gum fenegal would be coagulated in an instant by any of those preparations. Of late years, an article called British gum has also been much in use for the same purpose; so much so that the making of it has become a distinct trade. It is merely common starch pul-

verized, and then calcined till it assumes a cinnamon-brown colour.

When the apparatus is thus prepared, the mordant is applied by a brush to the surface of the sieve. This is called *teering*.

It should have been remarked, that when a colourless mordant, like the acetate of alumine, is employed, the workman generally mixes a little of the decoction of Brazil wood, or of any other fugitive dye, with it. This is called *lightening*; and is for the purpose of making the pattern more obvious to the workman, that he may see its progress, and the efficacy of the materials, as he proceeds in printing. The manipulation may be thus described.

Taking the block containing the pattern in one hand, the workman applies it gently to the surface of the sieve, so that a sufficient quantity of the thickened mordant may adhere to the figures. When the block is thus charged, he applies it to the calico, and gives it a blow with a small mallet, either slightly or otherwise, according to the nature of the pattern.

This alternate application of the block to the sieve and to the calico, is continued till the workman has gone over the whole piece. In this way, several different mordants are sometimes applied to the same piece of goods. This is indeed always necessary, when the finished piece is intended to contain a variety of colours, the different colours requiring different mordants to fix them and render them permanent.

The calico is now removed to a room called the stove, where a certain degree of heat is given to it by means of flues, which go round the room on the inside, near the floor. In this room, it is generally continued for at least twenty-four hours. This is when common red-liquor has alone been printed; but if citric acid or strong muriate of tin has been employed, less time is sufficient, and for the latter seldom more than half an hour is allowed. The intention of this is to evaporate the acids used in the preparation of the mordants, and which might otherwise injure the texture, and also to fix the base more surely within the fibres of the cloth.

In this operation, an attention to temperature is of the utmost importance. In general the room is kept at about 90°; but an intelligent calico-printer varies this according to the nature of the work under operation. If iron-liquor has been employed in printing the goods, it is an excellent practice to keep them for several days exposed to the atmosphere, after their removal from the stove, as the blacks, pompadours, olives, and indeed every other colour prepared with that metal, will increase in intensity; the goods will clean better in the dung-veffels, as will be explained hereafter, and the colours will rise higher and brighter when they come into the copper of bark or madder. The iron in an acetous solution is in the state of the *black oxyd*; but by exposure to the air it acquires a further dose of oxygen, and the more nearly it is made to approach to the state of the *red* or peroxyd, the more fit it becomes for a mordant in dyeing. It may be worth an experiment to discover whether the colours containing iron would not be better if they were suffered to be only a *very short time* in the stove, but were hung up instead for several days, exposed to a current of air at the temperature of the atmosphere; as the iron would thus acquire the oxygen flower, and consequently would be fixed more firmly within the cloth.

When the pieces have been properly stoved, they are passed, by means of a winch, through water at various temperatures, with a little cow-dung mixed in it. This part

PRINTING ON CALICO.

part of the business was formerly conducted in a very uncleanly and negligent way; but of late years some printers have incurred a considerable expense in the construction of their dunging machines, with cocks for hot and cold water attached to them, and thermometers to regulate the temperature. Those erected by Mr. Wright, a very ingenious calico-printer, at Strines, near Disley, are the most complete of any we have yet seen.

The intention of the dung is to absorb and remove that portion of the mordant which is not actually combined with the cloth, and which otherwise might stain the white or unprinted parts.

We suspect the dung of the cow is serviceable in another way besides that of cleansing, though the printer may not be aware of the nature of its operation. To clean calicoes by immersion in a dung-vessel, may appear to be a strange phrase; but as this is the technical language of the trade, no other could be employed with propriety. It is acknowledged that madder, cochineal, and some other dyes, produce much better colours on woollen than on cotton cloths, owing to the former being of animal, and the latter of vegetable origin. We presume, therefore, that the dung imparts an animal matter to the fibres of the cotton, and that this animal matter acts as an additional mordant, and thus more powerfully attracts the colouring particles of the dye, than the mordants alone would be capable of doing. Berthollet, who analysed the dung of the cow, found in it a substance partaking of the nature of bile.

If a piece of calico, prepared with the acetate of alumine, be divided into two parts, and the superfluous mordant removed from one of them by cow-dung and water, and from the other by water only, though both fluids were at the same temperature, it will be found, on passing the two portions through a decoction of weld or quercitron bark, that the yellow will be much more intense and bright in that which had been submitted to the action of the cow-dung. This is a satisfactory and decisive experiment.

The process of *dunging* is an operation that varies in time from five to forty minutes, according to the style of work. The pieces are then taken to the river or wheel, to be more effectually washed; after this they are passed through tepid water, in order that the workman may be assured that every impurity is removed.

His next care is to provide a copper boiler of pure cold water, in which a sufficient quantity of madder is put, and a fire lighted underneath it. The calicoes, printed and rinsed as above, are now put into this boiler, and from the time they are immersed, the workman never ceases to turn the winch, so as to pass every part of the goods repeatedly through the liquor, till the whole acquires a boiling heat. Indeed, this operation is sometimes continued for ten or fifteen minutes after the bath of madder actually boils, when the pieces are taken out and washed.

Madder is one of the most valuable drugs we have, for a variety of purposes in dyeing and calico-printing; as it is the agent by which the best and most permanent blacks are produced; also the finest purples, and every shade of red from a pale pink to a crimson. But perhaps it may not be generally known that this article improves by age. If a quantity of madder-roots be ground, and then packed tight in a cask, so as to exclude the air, and are kept thus for six months, they will then dye a much better colour, and go much further than they otherwise would have done, had these roots been used as soon as they were ground.

This process, which is called *maddering*, has the effect of imparting all the requisite colours to the goods, by means of one operation, which may be thus explained. While one

mordant precipitates the colouring matter of the madder to a red, another precipitates a different portion of it to a purple, another precipitates it to a black colour, and so of every possible shade, from a lilac to a black, and from a pink to a deep red.

If a portion of weld or bark be added to the madder, every shade from a brown to an orange may be produced; whereas, if weld or bark alone be employed, all colours between a dark olive and a bright lemon can be imparted to the cloth. These changes are all occasioned by the play of chemical affinities, and are due to the improved state of chemical knowledge.

Here it may be worth remarking, that whenever it is of consequence to produce the finest yellows or more delicate lemon colour, it is necessary to dry the pieces in the open air, as the stove would not fail to injure such colours; for stove-drying has always a tendency to convert a yellow to an orange. It is also necessary to be equally careful in the operation of dunging the mordants for these pale yellows; for, should this be done at a higher temperature than 96° or 100° , their beauty will certainly be impaired. There is another advantage in this, *viz.* by dunging at this low temperature, the dyeing may be completed even at 110° or thereabouts, which will give a much livelier colour than where a higher temperature has been employed.

The mordants generally used in calico-printing are acetate of iron for browns, blacks, lilacs, &c. and acetate of alumine for all the different shades of reds and yellows.

Formerly the acetate of iron was made by digesting old iron hoops in four beer, or in very weak vinegar; but of late years it has chiefly been made with the pyroligneous acid, [if wood be submitted to an intense heat, when inclosed in an iron vessel of any kind with a proper aperture to allow the vapour to pass, this vapour on being condensed forms the acid in question, and is now known to be a kind of impure vinegar. The wood in this case is converted into charcoal, of which a great deal is prepared by this process, particularly for the formation of gunpowder.] the oleaginous impurities of which tend, in some cases, to improve the mordant.

Blacks are also produced by the nitrate of iron [nitrate of iron was not applied to calico-printing till within the last fifty years. This discovery formed an important era in the trade, as it afforded the manufacturer the means of varying his styles of work in a multiplicity of ways and forms, which, till then, were entirely unknown,] and gallic acid; the mixture is called chemical black. This nitrate of iron is made by dissolving metallic iron in a peculiar kind of aquafortis. Common aquafortis will not answer for this purpose; for, though it may dissolve the iron with rapidity, part of the metal is apt very soon to precipitate; which not only weakens the colour, but leaves the remainder so acidulous, that there is always a danger of such a preparation injuring the texture of the cloth.

It is, however, necessary to remark, that the black which is formed by this solution of iron, is produced in a different way from blacks in general; for, when common iron-liquor is used for this purpose, it is first printed on the calico; and when it has been sufficiently oxidized by exposure to the air, the goods are boiled in a decoction of madder, which renders such parts as had been printed with the acetate of iron an intense black. But the black from nitrate of iron and galls is applied at once to the cloth, and is not afterwards raised by dyeing.

The calico-printer by using a black ready formed is thus enabled to mix it with other colours, in cases where by dyeing alone it could not be produced, as in conjunction with yellows and olives, raised by weld or quercitron bark.

The

PRINTING ON CALICO.

The acetate of alumine is prepared by a mixture of the sulphate of alumine with acetate of lead, both in a state of solution; so that, on the theory of double decomposition, sulphate of lead is formed, which precipitates, while the acetate of alumine remains in solution.

Since the demand for this article has been increased on account of the extension of the printing trade, it has been prepared from the pyrologeneous acid by means of lime and alum. The following is the method:

The pyrologeneous acid is first passed through a still, to distill it of a portion of the tar which is always dissolved in it; it is then saturated with lime or whitening; and lastly, the acetate of lime thus formed is decomposed by a heated solution of sulphate of alumine. The result of this double decomposition is sulphate of lime, which precipitates, and acetate of alumine, which is drawn from the sediment of the calcareous sulphate, and preserved for use.

And here it may be necessary to caution the manufacturer against a misfortune that may befall him if he be not conversant with the chemical nature of the substances he employs.

Magnesian lime-stone abounds in Derbyshire, and in some of the adjacent counties; and should a maker of acetate of alumine employ such lime in his process, the article which it would produce would in all probability be entirely unfit for the use of the calico-printer. But we must be more explicit.

In employing the common lime in conjunction with alum, a sulphate of lime will be formed, as mentioned above, and this being nearly an *insoluble* salt, will precipitate. But here, sulphate of magnesia would also be formed, which being a *soluble* salt, would remain in solution, and increase the specific gravity of the liquor, a circumstance which would be very apt to occasion the deception which we are anxious should be avoided. If magnesian lime-stone be employed, the liquor will appear good by the hydrometer; but, as it will contain more Epsom salt than acetate of alumine, it will be unfit for every purpose for which it was intended.

While speaking of acetate of alumine, we cannot avoid remarking that the process which has just been described for making this mordant, and which is followed invariably by many of the manufacturers in the North, is extremely improper, on account of the lime which is employed in it, be the lime ever so good, as that earth is very prejudicial to every species of red dye. The true way of making it, though more expensive, is that which was originally pointed out by Berthollet, and which consists in decomposing sulphate of alumine by means of saccharum saturni, or acetate of lead.

In reverting to the remaining processes of the print-work, it must be noticed, that when the goods have passed through the weld or madder-copper, they are usually carried to a boiler containing wheat-bran and water, in which they are winched for a considerable time, for the purpose of freeing the white grounds from the stain which they had acquired from the madder or the weld. This process always impairs, in some measure, the intensity of the colours; [branning has also the effect of giving a pink hue to all madder reds. But it is not generally known what a peculiar richness may be imparted to madder-colours, by raising them with a mixture of bran and madder; that is, by mixing a portion of bran with the madder in the first instance. Mr. Parkes tells us, that he has sometimes produced colours in this way whose brilliancy has astonished him. The operation of the bran in producing this effect will be explained hereafter;] but it is a necessary operation, as there is no other mode so convenient for removing the stain which is always given to the white

part of a print by the madder, the bark, or the weld, which has been used in dyeing it.

It frequently is the case, however, that goods will not bear to be sufficiently branned to clear the whites entirely by that one operation; [the temperature at which the operation of branning is performed, is very important. If bark yellows are dyed at 100°, it is customary to bran such goods at 115° or 120°, as it is a principle always to bran at a higher temperature than the goods are dyed at. Madder-work must be branned at a boiling heat;] such goods, therefore, are partially cleaned in the branning-copper, and are then laid on the grafs for some days, till they become perfectly clean.

But within a few years a new method has been introduced, which consists in immersing the pieces for a certain time in a very weak solution of one of the bleaching salts, such as oxymuriate of potash, soda, or magnesia. [A Scotch house of great consequence had practised this method a considerable time; and in the year 1812, a person visited Lancashire for the purpose of instructing the English printers in the method.] This simple process, which effects in a few minutes what would require more than as many days in grafs-bleaching, is now much practised, and promises very soon to supersede crofting entirely. This is a most important improvement, as some of the large printers formerly required as much land to spread out their goods upon, as would make a farm of a very considerable size.

Besides the kinds of calico-printing already mentioned, there are others which it will be proper to notice in this place. Of these, what is called *resist-work*, is now done in considerable quantities. It is conducted in the following manner:

A certain preparation of copper, mixed either with flour-paste, with gum, or with pipe-clay and gum, is printed on the calico, in any shape or of any pattern that may be desired. [The sulphate, the nitrate, the muriate, and the acetate of copper, have all been employed for preparing the resist-paste; but the sulphate is the best for the purpose; unless a very concentrated solution of the four salts were prepared by successively dissolving each of them in pure water.] When this is sufficiently dry, the goods are repeatedly dipped in the blue vat till they have acquired that depth of tint which may be required; and then, when they are washed, and passed through diluted sulphuric acid, those parts which had been printed with the preparation of copper, are found to be a good white; the preparation having effectually resisted the operation of the indigo, [the art of making an indigo-vat consists in forming such a mixture of lime and sulphate of iron as shall most effectually deoxygenize the indigo; as indigo has no affinity for cloth in its natural or oxygenized state. Hence, those parts of a piece which are printed with a solution of copper will never be dyed blue in one of these vats; because the deoxygenized indigo becomes oxygenated the moment it touches the copper, which parts with its oxygen to the indigo, and occasions it to become insoluble, and consequently incapable of forming a dye. Thus, while sulphate of iron has the power of deoxygenizing indigo, sulphate of copper, or any other salt of that metal, is incapable of retaining its oxygen, whenever it comes in contact with that singular substance in a state of deoxygenization; and it is a curious instance of the different degrees of intensity by which oxygen is held by the different metals;] though all the other parts of the cloth have received a permanent dye. The various deep blue calicoes with white spots or white figures, which are now so common, are generally done in this way; and by a similar management with subsequent dyeing in madder, weld, or bark,

PRINTING ON CALICO.

bark, figures in red or yellow are exhibited upon a blue ground.

In some particular styles of work, the operation of certain colours is refitted by means of flopping out with wax; but this is too expensive a method to be adopted often in these times, when it is the object of every manufacturer to finish his prints at the least possible expence. [In printing those silk handkerchiefs called Bandanas, a process called waxing is still followed. It consists in making a preparation of tallow and rosin very liquid by heat, and in printing it in that state with a block upon the silk. When such goods are passed through the blue vat, those parts which are covered with the tallow and rosin are preserved from the action of the indigo, and remain white, while all the rest is dyed a fast blue. The method afterwards taken to discharge a part of this blue, and produce yellow, orange, &c. will be mentioned hereafter.] Formerly this mode was very generally practised, and wax [in the East Indies wax is still used for preserving the whites in calico-printing] was consumed in very large quantities by this process. [A very singular-looking substance was discovered a few years ago near Stockport, which being handed about from one to another as an undescribed substance, created considerable interest in that neighbourhood. Every body supposing it to be a natural production, specimens of it were sent to a variety of persons into various parts of the kingdom, for their opinion and analysis, and among others a portion was sent to Mr. Parkes. However, after every one had been busily engaged in examination and conjecture respecting this unknown substance, it was announced, that some seventy or eighty years before a calico-work had stood on the spot where the article was found, and that this was nothing more than a large heap of the refuse compound of flour, wax, and gum, above-mentioned.]

The reader will perceive that these *refits* are employed for the purpose of preserving certain parts of a piece white, and of giving other varieties to those goods in which blue is the predominant colour: but if the ground is to be white, and the piece is only to have one small object [a technical term, belonging to this branch of manufacture] in indigo blue, such as a single sprig, then a different management is necessary, and the colour is imparted by a process which is called *pencil-blue*.

Here the indigo is deoxygenized by means of orpiment, which is a sulphuret of arsenic; and formerly, whatever objects were done with it were put in by means of a pencil: hence its name, *pencil-blue*. [Pencil-blue is composed of the following ingredients, *viz.* Ten ounces of indigo finely ground in water; twenty ounces of quick-lime in lumps; the same quantity of potash of commerce, or the impure sub-carbonate of this alkali; and ten ounces of orpiment. These proportions require one gallon of water, and the whole is to be thickened with gum fenegal.] See COLOUR.

Another kind of process remains to be noticed, called chemical discharge-work. Here the cloth is first dyed of some uniform colour, by means of a mixture of iron-liquor, and some one or more of the common vegetable dyeing substances; and calicoes thus prepared are said to be dyed of self-colours. They are then washed and dried; and when properly pressed or calendered, they are fit for receiving any pattern whatever, according to the artist's taste or design.

This is generally effected by means of the mineral acids, which are previously composed for the purpose, by dissolving in them a portion of one or more of the metals, according to the nature of the dye which is intended to be discharged, or of the colour to be produced. In doing this, care is taken that the discharging liquor be made so as to be capable of

dissolving the iron which is contained in the dye, and which is always used in such quantity as to cover, or at least to disguise in a great measure, the other colour or colours which had been employed with it, and at the same time to act as a mordant in beautifying and fixing those colours.

Thus a piece treated with a decoction of Brazil-wood, and dyed black by being padded [by the term *padding* is understood the operation of passing the pieces from a roller through a trough containing a solution of iron, or any other mordant. *Bleaching* is another term used in calico-printing, and is synonymous with padding] with iron-liquor, if, when dried, it be printed with a peculiar solution of tin, the ferruginous portion of the dye will be dissolved, and the printed part will instantly be converted from a deep black to a brilliant crimson.

In the same way an olive-coloured calico, dyed in a solution of iron and a decoction of weld, will as quickly be changed to a bright pale yellow; and the various drabs and flates of every shade which have iron in their composition, will undergo as sudden a change by the same treatment; though the colour of the figures produced on them will depend on the materials with which the cloths were originally dyed. Even the deepest gold colours, or strongest buffs, if produced by iron only, may, by a peculiar preparation of tin, be discharged; and such parts of the cloth as have been treated with this metallic solution will be restored to their pristine whiteness.

By similar management, calicoes dyed of a light blue in the indigo-vat, then run through fumach and coppers, and finished in a bath of quercitron bark and alum, may have figures of a bright green imparted to them. Here the green is originally formed by means of the indigo-vat and the bark, though it is enveloped by the iron of the coppers, which overcomes the other colours, till the solution of tin is applied, which removes the iron from those particular parts, and gives a brilliancy to the remaining colours which they would not otherwise have possessed; the tin being a powerful mordant for the bark, by which the yellow of the green is produced.

Again, a good self-colour may be given to calicoes, merely by dyeing them in fumach and coppers, and then running them through an alkaline solution of annotto; and here the figures produced by the application of a colourless solution of tin will be of a bright orange. But it is needless to enumerate more instances, as the workman accustomed to a dye-house will have little difficulty in varying these in a thousand ways, when he becomes acquainted with the nature of the solution of tin which he employs.

The whole of this, however, refers to that branch of discharge-work only, where all the purposes are attained by dissolving the iron which makes a part of the colour that is intended to be discharged; whereas, the finer and more expensive work is done in a different way, and by a process which it will be necessary for us presently to describe.

In the mean time it may be proper to remark, that there is an objection to the particular kind of chemical discharge-work of which we have been speaking, namely, that it is not perfectly fast; that is, the goods produced in this way will not bear such frequent washing, as those which are done by the bath of madder or bark.

It is certainly an object of great national importance to give a permanency to the calico-printing of the country; [to this end great improvements have lately been made in the method of grinding madder-roots, by separating the inferior parts, and dividing the whole into two or three different qualities. Thus the printer is enabled to apply the finest, which in this way is made equal to Dutch crop-madder,

madder, to his best work, and the other is laid by for inferior purposes:] and a great deal of very excellent printing is now done in various parts of the kingdom, especially the best chintz-work and other furniture patterns. But, in what is called fast-work, there is a great variety of qualities, and some of it little deserves the name of permanent.

The mention of permanent colours reminds us of a very valuable green which was invented a few years ago by a Mr. Illet of London, and which deserves to be noticed by us. This colour, which was secured to him by his majesty's letters patent, was produced by printing ground indigo, mixed with a peculiar kind of solution of tin, and in then fastening the indigo within the fibres of the calico by means of that process, which is well known to printers by the technical designation of *china-blue dipping*. [China-blue is produced thus: Indigo ground fine, and then thickened, is printed upon the cloth, and afterwards it is dissolved, and chemically united to the fabric, by alternate immersion in a solution of sulphate of iron and in lime-water. A description of this process has already been given very much in detail, in our eleventh volume, part ii. under the article *DIPPING, in Calico-Printing.*] After this the goods are to be dyed in a copper of bark or weld, which converts the blue to a green, and the whites are to be cleaned by croft-bleaching, &c.

Upon this very ingenious process, Mr. Parkes has the following observation. "Having," says he, "formed a very high opinion of this invention, I procured several interviews with Mr. Illet, soon after he obtained the patent, and from him was fully informed of the whole process.—This I have since repeated for the purpose of verifying the detail in all its branches; and I am satisfied that it is one of the most beautiful and permanent colours that has ever been fixed upon cotton."

There is, however, another mode of producing very beautiful blues which has been much practised lately, and therefore deserves notice. This consists in printing some solution of iron, and then passing the goods through a very dilute and neutral solution of prussiate of potash. The prussian blue which is thus formed upon the cloth may be rendered tolerably permanent by a variety of expedients, and this by means of any of the yellow dyes may afterwards be formed to any shade of green or of olive.

In returning from these digressions we must not forget to revert to that other kind of discharge-work which we have engaged to describe, and which we will now attempt as concisely as is consistent with perspicuity and correctness.

Here, the agent which is employed is the citric acid, and this is used in various states of concentration according to the purpose to which it is to be applied, and the strength of the ground intended to be discharged. It is chiefly employed for the production of white figures upon self-coloured grounds produced by madder and sundry other dyes. For this intention the acid, in whatever state of concentration it may be, is mixed with either gum or with paste, [when citric acid is used for resist-work, it is always mixed with gum fenegal and pipe-clay. The clay gives it a greater body, and likewise acts mechanically as a resister,] to a proper consistency for the block, the plate, or the cylinder, and from thence it is transferred to the piece; and wherever it attaches, the mordant, whether iron or alumine, is discharged, and a delicate white arises in its stead. [It should be understood, that the discharge is printed upon the mordants before the goods are dyed. In using citric acid for this purpose, a portion of one of the mineral acids is sometimes mixed with it.]

The acid here referred to is produced from the juice of

limes or lemons, and formerly it was not employed by the calico-printer until it was reduced to the utmost point of concentration, and appeared in a crystalline form. Even then, it was not thought sufficiently pure, but was dissolved again, and redissolved and recrystallized, till it became as white and pellucid as any other pure salt in a crystallized state, and was then generally sold for 36s. the pound, at which high price it could only be employed on the best styles of work. Now, however, it is oftener used in the brown, or first rate of crystallization; and some of the larger printers purchase lime juice, and concentrate it themselves; and in many cases, they use it largely both for discharge and resist work, without ever crystallizing it at all. More on this subject may be seen in Mr. Parkes's Essay on Citric Acid, in vol. iii. of the Chemical Essay, page 1—118.

This mention of discharge-work by citric acid, [Mr. Thomson, who has a print-work near Clitheroe, has taken out a patent for discharging the Turkey-red dye by means of the citric and oxymuriatic acids; and the work executed in this way has a very pleasing effect,] reminds us of another species of discharge, which is employed by the printers of Bandana handkerchiefs, and which we are under the promise of noticing before we conclude this memoir.

The agent which these printers employ is the nitrous, and sometimes the nitro-muriatic acid. It is used for the purpose of putting yellow figures upon blue silk handkerchiefs. The following is the process which is principally adopted.

Aqua-fortis, or nitro-muriatic acid, of such a strength as is suitable for the kind of blue which is intended to be discharged, is mixed either with gum tragacanth, or with flour paste, to a proper consistence, and in this form it is printed on the silk, by means of a common block, on which the intended pattern is cut. The consequence of this is, that wherever the acid attaches, there the original colour is discharged, and a yellow dye is produced in its place. The pieces are then steamed, by passing them over a vessel containing boiling water, which gives brilliancy to the colour and finishes the operation.

If a stronger dye than the usual yellow, or even a deep orange be desired, all that is necessary is to immerse the goods, for a moment, in lime-water, or in a solution of lime and potash; and by varying the proportions of these ingredients a great variety of shades may be produced.

Recollecting, however, that this is a paper professedly on calico-printing, we must not deviate too far from the path we have preferred; otherwise, there are many processes in the printing of silks which are curious and interesting, on which we might copiously expatiate. The Bandana handkerchiefs which are printed upon cotton in imitation of India goods, are produced by a very different process, and which we have already described under the article *DISCHARGING of Colour*, in vol. xi. part ii.

Having been speaking of yellows, it may be worth mentioning, that there is a mode of producing yellows on calico which is not very frequently practised, and yet has a very good effect. The process is as follows:

A strong decoction of bark, thickened with gum tragacanth, is to be mixed with a portion of very pure muriate of tin, and this, when printed with the usual management, will produce a colour of great brightness and durability. We mention this the rather, because very many pleasing effects may be obtained by this method which cannot be produced in the usual way, by means of the acetate of alumine, and any of the yellow dyes that may be employed with it.

There is one very important advantage which this mode possesses,

possesses, viz. that should it be necessary to pad a piece in diluted acetate of alumine to obtain a pale lemon ground, the yellow figures, previously done by the above process, will not give out any part of their colour to the second mordant; whereas, whenever a strong yellow has been produced in the common way, the pattern is very apt to spread and become irregular, and oftentimes to stain the ground, when the piece comes a second time into the acetate of alumine.

Observing that the treatise from which we have made such copious extracts, contains no particular directions for the preparation of that superior kind of calico-printing called chintz-work, we applied to Mr. Parkes upon the subject, and he has furnished us with an original communication to supply that deficiency, which is as follows:

The term chintz-work is descriptive of that kind of calico-printing which is employed for beds, window-curtains, and other furniture, and it differs more in the richness and variety of the colours, than in any other circumstance.

In relating the processes by which these beautiful prints are produced, we shall suppose the calico to be already properly bleached and calendered, ready to receive the impressions of the block. The first thing then to attend to is, to apply the mordant for the colour which is intended to be imparted in the first instance. Thus if a black be designed, a mordant of acetate of iron, commonly called iron liquor, is thickened with gum, and printed upon the cloth in any pattern that may have been selected for the purpose. If this same mordant be diluted with water, it will form a proper mordant for a purple; and the same, still further diluted, will, when it comes into the dyeing copper, form a lilac. In this way, all the varieties of shades, from a pale lilac to a strong purple, and from purple to a black, may be produced by acetate of iron diluted with various proportions of water, and then dyed with madder.

In like manner, a colourless solution of acetate of alumine thickened with gum or flour paste, forms a mordant for dark red; if diluted with water it makes a common red; and by diluting it further and further every shade of pink may be produced. Again, by the admixture of acetate of iron, and acetate of alumine, a mordant for chocolate colours, maroons, &c. is formed, either approaching to the purple or the red, according to the admixture; that is, according to the proportion of either of these original mordants which may predominate in the mixture.

When these several mordants have been printed upon the calico, they are allowed to dry for two days or more in a stove or drying-house; they then go through the operation of dunging, which consists in rinsing them in warm water, in which a little cow-dung is diffused, as has been already described. When the pieces are sufficiently dunged, which is not the case till all the superabundant mordants are removed, they are well-washed in clean water, and then boiled in a decoction of madder, until the madder-bath is exhausted. In consequence of different mordants having been applied to the cloth, this one boiling in the madder-liquor will at once produce all the colours above-mentioned. When the pieces are thus dyed, they are to be rinsed in cold water, and laid upon the grafs to bleach. By this exposure to the air for a few days, the whole of the ground to which none of the mordants had been applied, will become perfectly white.

The processes which have now been detailed, will produce what is called *common chintz-work*; but if it be desired to make the goods still richer, by the addition of yellows, bright olives, drabs, &c. the cloth must undergo another series of operations, which may thus be described.

Upon those parts of the calico which still remain white, any of the above mordants may be printed, according to the effect designed to be produced, after which all the preceding managements are to be repeated, except that instead of boiling in a decoction of madder, they are to be immersed for about half an hour, more or less, in a warm decoction of quercitron bark, the *Quercus nigra* of Linnæus; a most important dye-word, introduced by Dr. Bancroft, and which is found to give out a much brighter colour to tepid water, than it does when treated with boiling water, or with water nearly approaching to that temperature.

The effect produced upon these prints by an immersion in a lukewarm decoction of this American bark, will be quite different from that produced by the madder; upon those parts of the cloth where the mordants have been printed which before produced a black, a dark olive only will be apparent, and instead of pompadours will be drabs, and instead of reds we shall have yellows, which will vary in intensity according to the strength of the aluminous mordant.

Again, a further variety may be given to these prints, if the yellow mordant, or acetate of alumine, be applied to any of the colours which have already been dyed with madder; but this must be done before the pieces are immersed in the decoction of bark. This application will convert the reds and pinks into different shades of oranges, and the lilacs into cinnamon colours. By means of these different processes an endless variety may be given to the goods, and a calico-printer of taste will never be at a loss how to produce a pleasing effect, whatever may be the patterns which he has to imprint upon the cloth. This second immersion in the dyeing vessel will, however, give a yellow tinge to the remainder of the whites, but a short exposure on the grafs will obliterate it.

When chintz furniture-prints are designed to have as much variety of colouring as possible, a part of the remaining white is often coloured blue or green, or of any shade between those colours, by a still different process. This is done with what is called pencil-blue, which is a preparation that has already been described. The blue is given by putting in the prepared indigo with a pencil; and the green is produced by pencilling some of the same colour over certain parts of the pattern which has already been dyed yellow. When these colours have been imparted, the printing is said to be finished, and the pieces are hung up to dry for at least twenty-four hours, after which they are rinsed thoroughly in cold water; and when they have been dried with care, they are properly calendered and put up for sale.

Nothing now remains but to notice an improvement which has been made of late years by the introduction of *cylinder-printing*, and which has the advantage of superior accuracy and neatness, as well as of great expedition.

The machines which effect this are rather complicated and expensive; but they are so contrived that the cylinders on which the patterns are engraved, furnish themselves with colour during their revolutions; are kept clean by a steel knife, or *daïor* as it is called, passing over their surfaces the moment they have charged themselves with the thickened colour; and they have such a pressure given to them, either by means of screws or levers, which can be tightened or slackened at pleasure, that the whole surface can be made to deposit its colouring matter with the greatest certainty and exactness on the cloth, while this rolls over it in succession, from one end of the piece to the other.

These cylinders, which are made of copper, are from eighteen to forty-two inches in length, according to the width of the calico to be printed, and three and a half to

five inches in diameter; and these maffy rollers have the patterns enclafed upon their furface, in the fame way as a pattern is cut upon a flat plate of copper, that is intended to be employed in copper-plate printing. As thefe cylinders are made with plates of copper hammered into a circular form and joined by brazing, great lofs has fometimes been fultained by the engraving giving way upon the brazed joint. To obviate this, a patent has been lately obtained for boring the copper cylinder from the folid metal in the modern way of boring cannon.

Many of thefe machines are now contrived fo as to carry two of thefe cylinders, each of which has a trough of colour attached to it, by which means two different colours may be printed on the fame calico, at one and the fame time.

Mr. Adam Parkinson of Manchester has lately invented a machine capable of printing at one time, by means of one cylinder and two furface-rollers, or by two of the former and one of the latter, three diftinct colours.

Thefe machines have not only the excellence of printing more correctly than can poffibly be done by means of the block, but the faving of time and labour which they afford is great indeed. A piece of calico which would take a man and a boy three hours to print with one colour, or fix hours to finifh with two colours, may by this means be done in three minutes, or three minutes and a half, and then much more completely than could even have been imagined before the introduction of this invention.

Befides thefe cylinders there are others which are called *surface-machines*, which contain cylinders of wood, and which have the pattern formed upon their furface in relief, exactly fimilar to the blocks already defcribed. Thefe are employed in particular ftyles of work, efpecially in light ground-work, and for certain kinds of relift and difcharge work.

In light work, the white grounds are apt to be foiled by the cylinders: hence furface-machines were contrived, and thefe are not liable to the fame objection. Cylinder-machines are more commonly employed in thofe ftyles which are full of colour and leave but little white.

It muft be obvious to every one who is acquainted with the fubject, what an amazing facility thefe machines have afforded to the production of printed calicoes; and alfo what an advantage they give to the Britifh printer in foreign markets.

But we cannot conclude without expreffing our fears, that even thefe facilities may eventually be the means of doing a ferious injury to the trade, and of deftroying that confidence in the goodnefs of Britifh prints, which has hitherto been generally felt in every market on the continent, and alfo in every part of the New World, wherever they have been introduced. We refer to that mode of printing which has lately been adopted, and which confifts in precipitating the colouring matter from logwood, and from other *fugitive* dyes, and in printing thefe on the cloth, without any mordant or previous preparation whatsoever. Thoufands of pieces of this fort have been finifhed at the low rate of one penny the yard, including every expence of colour, pafte, and printing. Thefe articles, it will fearcely be credited, are dried up immediately from the printing-machines, and are fhipped abroad, without even being wafhed off.

To *wafh off* is a technical phrafe. It means the foaking and rinfing the pieces in water, in order to difolve and remove whatever gum or pafte had been employed with the colours in printing them.

Such goods, wherever they go, muft produce great dif-

fatisfaction; for they will neither endure the rays of the fun nor moiſture. The firft ſhower of rain to which they may be expofed, will not fail to wafh out the pattern, and reduce them to a worfe ſtate than that of plain white calicoes.

In the reign of queen Elizabeth, an act was paſſed to refrain the uſe of logwood in dyeing, on account of the fugitive nature of its colour; and if this degrading kind of printing be continued, the interference of the legiſlature will again become neceſſary, or the foreign trade will, from this cauſe alone, be entirely loſt to the country.

PRINTING, *Cylinder*. See the preceding article.

PRINTING on *Porcelain*. The art of printing, particularly as it applies to books, has, from its incalculable benefits and vaſt importance, excited at once the profound admiration and gratitude of the world; and this inſtitutable difcovery has been claimed by ſeveral individuals, alike anxious for the honour of giving to mankind at large the advantage of a rapid and economical diffuſion of delight and inſtruction. The *firſt* idea of *types* was very probably given by the *Roman potters*, who were in the habit of ſtamping their names in *raifed* characters on their vafes, &c. The letters on this plan were, in fact, *models* of the types uſed by the firſt printers; and it appears fingular that the idea of adapting ſuch models by the medium of ink, to the common purpoſe of multiplying words and ſentences, ſhould not have come into uſe until about the year 1442.

It will appear, on conſideration, ſtill more fingular, that after the introduction of engraving on wood and copper, (which was in uſe at the ſame time with letter-preſs printing,) the art of transferring impreſſions of ornamental deſigns, from the copper-plate to the ſurface of porcelain or pottery, was not difcovered till about the year 1760.

The Royal Porcelain Works in Worceſter, belonging to Meſſrs. Flight, Barr, and Barr, are the only eſtabliſhment that claims the honour of inventing this admirable and ingenious proceſs. We can find no mention of this art in the annals of this or any other country prior to this period. It was praſtituted with great ſucceſs for many years in the works alluded to; and beſides the demand for home conſumption, large quantities were exported to Holland. In the year 1788, his preſent majeſty Geo. III., and his royal confort the queen, with the princeſ royal, the princeſ Auguſta, and the princeſ Elizabeth, viſited the Worceſter Porcelain Works, and particularly noticed this ingenious branch of the art of decoration. The royal party were much gratified by the compliment paid them, in the ſtriking off impreſſions from two copper-plates with the likenefes of the king and queen, which had previoully been engraved by direction of the proprietors, in order to exemplify the nature of the operation. The ſecret of the printing was, about the year 1781, conveyed from the works at Worceſter into the potteries of Staffordſhire, and has proved of infinite ſervice in extending this branch of national commerce, and affording employment to the numerous population in that part of the country. The common Britiſh blue and white printed earthen-ware is now held in high eſteem in foreign countries, from its cleanly and neat appearance, beſides its being in general uſe at home. This art is certainly beſt confined, as in the preſent day, to the inferior fabrics, ſuch as earthen-ware, as the material on which the print is made is reaſonable, and can be rendered at a price which ſuits the convenience of the conſumer for all common purpoſes. The method, as invented and adopted by the original proprietors of the Worceſter Porcelain Works, is as follows:—The engraved copper-plate having
firſt

first been warmed on the stove, is prepared to receive the colour, which, being previously mixed with oils of a proper consistency, is then rubbed into the engraved lines, and the superfluous quantity of colour is carefully cleaned from the surface of the plate. The paper, which is very thin, and manufactured for the purpose, is then laid on the plate, and delivered to the pressman, who places it on a plank covered with warm flannels, and being fixed between two iron cylinders, it is drawn through by turning a wheel, exactly on the plan practised in taking off copper-plate prints. The paper bearing the clear-coloured impression is now removed from the copper-plate and delivered to the printer, who fixes the piece of porcelain in a vice, to keep it steady; and the printed paper is then rubbed with a wooden tool, covered with flannel, till the impression is completely transferred to the surface of the biscuit, or unglazed porcelain. The operation of rubbing on the impression being completed, the porcelain, with the paper left on the surface, is thrown into a tub of cold water, and in a short time the paper delivers itself, and leaves the print. The ware is now placed out to dry, and is afterwards carried to the kiln, where the impressions are burnt in. It is then dipped in the liquid vitreous substance called the glaze, is burnt a second time, and the colour, which is the oxyd of cobalt, (and most generally used,) comes out a neat blue, perfectly secured under the glaze.

An improved method of printing, comparatively of very recent invention, was introduced under the direction of the late Martin Barr, esq., and is now carried on in the Porcelain Works at Worcester, and is much admired for the excellence of the engravings, and the great beauty of the impressions. On this plan, the printing-press and stove are not necessary, as the engraved plate is charged with a prepared oil by the printer, who cleans the surface of the engraving with the hand; and instead of paper, a *bat of glutinous consistency* is cut out and laid on the copper-plate, and is so ductile as to adapt itself to the form of any vessel intended to be printed; and by the simple pressure of a stuffed leathern ball *with the hand*, produces a perfect impression of the subject *in oil* on the smooth side of the bat. The ware being rubbed dry and clean, the bat is now gently pressed with the leathern ball on the *glazed* surface of the porcelain, and when removed the impression appears complete, *but only in oil*. The colour, in form of a powder, is then lightly moved over the oil impression with a piece of carded cotton, and the print completely cleared of all that is superfluous. The porcelain is afterwards carried to the enamellers, who finish the design by adding some decorations in gold; and it is then passed through the enamelling kiln, where the oil is evaporated by the fire, and the colour, which is always a mineral preparation, unites firmly with the glaze, and becomes perfectly durable as the tints laid on with the camel's-hair pencils by the painters. The great advantage of this plan is, that the engraving can be executed *much finer* for the smooth surface of the *glazed porcelain*, than for the coarser blue and white prints, (which are laid on the *rough unglazed surface*), as the glaze is capable of receiving the *finest touch* the artist can put into his engraved plate. Messrs. Flight, Barr, and Barr, the proprietors of these works, have in consequence introduced beautiful engravings of figures from the antique, besides designs in landscapes, flowers, shells, &c. which reflect no small degree of credit on this branch of the art of printing. Considerable quantities have been exported to the East and West Indies; and where economy is the object of the consumer, this style of decoration suits very

well, however deficient in richness of effect and elegance, to the more elaborate production of enamelled designs, executed in these interesting and highly-respectable works.

PROFLUVIUM, l. 2, for *venenis r. ventris*.

PROJECTION of the Sphere, Orthographic. PROB. I. l. 8, for IC and FG, r. IC.

PROMEROPS, in *Ornithology*, a genus of birds of the order Pezæ; the characters of which are, habit as in the genus Upupa; feet formed for walking; tail lengthened, and in most species cuneated. Dr. Shaw enumerates and describes the following species; *viz. Cæruleus*, or blue P. with black bill and legs; the Upupa indica, or blue promerops of Latham; a native of India: *Cæfer*, or brown P. whitish beneath, with rufescent breast, and very long tail; the Upupa P. or Cæfer P. of Latham, and the Upupa P. or Merops cafer of Linnæus; a native of Africa, and common about the Cape of Good Hope: *Striatus*, or brown P. beneath white, with black undulations and very long tail; Upupa papuensis, or New Guinea brown P. of Latham; native of New Guinea, inhabiting large woods; *Superbus*, or black P. with violet and green gloss, foliated golden shining scapular feathers, and very long tail; the Upupa superba and great P. of Latham; a magnificent species, exceeding all the rest in the splendour and elegance of its plumage; a native of New Guinea: *Paradisæus*, or chefnut P., the Upupa paradisæa of Linnæus and Latham, and crested P. of the latter: *Mexicanus*, or grey P. with green and purple gloss, blueish wings, yellowish belly, and very long tail; Upupa mexicana, or Mexican P. of Latham; a native of Mexico, frequenting mountainous regions, and feeding on various kinds of insects: *Aurantius*, or orange-coloured P., with tail of moderate length and even at the top; the Upupa aurantia, or orange P. of Latham; native of Guiana, frequenting the small islands in the mouth of the river Berbice; Fernandez describes the supposed female of this species under the name of *Cochitotol*: *Erythrorhynchus*, or black P. with green and purple gloss, red bill and legs, and long tail with the feathers spotted with white near the tip; the Upupa erythrorhynchus, or red-billed P. of Latham; an highly elegant species, an inhabitant of Africa.

PROPERTY, LITERARY. (See *LITERARY Property*.)

The state of literary property has been considerably improved since the article on this subject appeared in the body of this work. By the act of 54 Geo. III. c. 156. an absolute term of twenty-eight years copyright has been vested in the author of every book that shall be published after the passing of that act, and in his assigns, and if the author shall survive that period, the copyright is also secured to him for his life. On books that were published before this statute was made, the second contingent term of fourteen years granted by the former acts on this subject, was made absolute in such authors as were then alive, and a life interest was also added if they survived this extension. On this last subject, the court of King's Bench has decided in a recent case, that if the book had become the property of the public at the time the act passed, which was on the 29th July 1814, the benefit granted by the act to the authors of books published before that time, were not meant by the legislature to apply in such instances.

The same act continued the obligation of delivering eleven copies of every book, and of its maps, plates, &c. to the eleven libraries therein mentioned, being the British Museum, Sion College, the Bodleian Library at Oxford, the Public Library at Cambridge, the Library of the Faculty of Advocates at Edinburgh, the Libraries of the four universities of Scotland, Trinity College Library, and the King's Inns

Library at Dublin. This delivery has been felt to be a severe burthen, and several petitions have been presented to parliament by authors as well as publishers of books to be relieved from it. These petitions were in the sessions of 1818 referred to a committee of the House of Commons, which examined many witnesses on the subject, and made a report to the House of the following import:

That it is the opinion of this committee, that it is desirable that so much of the copyright act as requires the gratuitous delivery of eleven copies should be repealed, except in so far as relates to the British Museum, and that it is desirable that a fixed allowance should be granted in lieu thereof, to such of the other public libraries as may be thought expedient.

That if it should not be thought expedient by the House to comply with the above recommendation, it is desirable that the number of libraries entitled to claim such delivery, should be restricted to the British Museum, and the libraries of Oxford, Cambridge, Edinburgh, and Dublin universities.

That all books of prints, wherein the letter-press shall not exceed a certain very small proportion to each plate, shall be exempted from delivery except to the Museum, with an exception of all books of mathematics.

That all books in respect of which claim to copyright shall be expressly and effectually abandoned, be also exempted.

That the obligation imposed on printers to retain one copy of each work printed by them shall cease, and the copy of the Museum be made evidence in lieu of it.

PURPURIC ACID, in *Chemistry*. The name of an acid principle recently discovered by Dr. Prout; produced by the action of nitric acid upon the lithic or uric acid. The beautiful purple substance produced by the action of the nitric acid and heat upon lithic acid, has been long known to chemists. This purple substance is a compound of the acid in question and of ammonia. This acid, which may be

likewise formed from the lithic acid by chlorine and iodine, possesses the remarkable property of forming beautiful purple compounds with the alkalies and alkaline earths. Hence the name of *purpuric acid* has been adopted by Dr. Prout, which was suggested by Dr. Wollaston.

Purpuric acid may be separated from the *purpurate of ammonia* above-mentioned, by the sulphuric or muriatic acids. It usually exists in the form of a light yellow or cream-coloured powder. It is exceedingly insoluble in water, and consequently possesses no taste, nor affects litmus paper, though it readily decomposes the alkaline carbonates by the assistance of heat. It is soluble in the strong mineral acids and in alkaline solutions, but not in dilute acids in general. It is insoluble in alcohol. When exposed to the air it assumes a purple colour, probably by attracting ammonia. Submitted to heat it is decomposed, and yields carbonate of ammonia, prussic acid, and a little fluid of an oily appearance.

The alkaline *purpurates*, as before observed, all form solutions of a beautiful purple colour. They are capable of crystallizing, and their crystals possess some remarkable properties. The *purpurate of ammonia* crystallizes in quadrangular prisms, which when viewed by transmitted light appear of a deep garnet-red, but by reflected light two of the opposite surfaces appear of a beautiful green, while the other two retain their natural red colour. This curious property seems to be possessed by the other alkaline *purpurates*. The metallic *purpurates* are in general remarkable for their solubility, and the beauty of their colours. The *purpurate of zinc* is of a beautiful gold-yellow, the *purpurate of tin* of a pearly-white. The other *purpurates* are all more or less of a red colour.

Dr. Prout thinks it probable, that this acid forms the basis of many animal and vegetable colours. The pink colour of the sediment in the urine of fever seems to be owing to the *purpurate of ammonia*. Dr. Prout also thinks, that some of its salts might be used as paints, and also for dyeing, as they appear to possess strong affinities, especially for animal substances. See *Philosophical Transactions* for 1818.

QUADRUPEDS, col. 6, l. 33 from bottom, add—
See also NATURAL History.

QUARANTINE, that space of time (usually forty days, as the term manifestly implies) which vessels and persons are restricted from having intercourse with other vessels or persons, or with the shore, on their arrival from places subject to the plague or other infectious disease or distemper, or having held communication with ships coming from such places, or on board of which any infectious disease shall have appeared during the voyage.

The public health is a matter of the highest importance, and whoever is sensible of the havoc which the plague and other infectious diseases formerly made in this country, (see PLAGUE,) and considers the prevalence of such diseases in some parts of the globe, how easily they are communicated, and how long the poisonous contagion lies dormant without losing its malignity, will readily assent to the strong necessity that exists for rigorous precautions being adopted, to prevent its introduction into these kingdoms.

Of such common concern, indeed, is the health of large and trading communities, that the chief magistrates (says Blackstone) have the guardianship of the public health, and are empowered to issue such ordinances as may be deemed necessary, either to prevent the introduction of infection from neighbouring or remote countries, or for separating those actually infected by removal, or by cutting off communication with their abode.

In this country, a Board of Health has been instituted, to inquire into the nature of the infection of the plague, and the best mode to counteract its effects; and public ordinances have been made from time to time upon this subject; formerly by proclamation, but latterly by parliament. And such has been the anxious solicitude to frame the laws and orders to obtain the ends desired, that they have at various times undergone laborious revision, and such further regulations and amendments have been introduced as by experience were found to be necessary. Nor has the care and anxiety of the British government stopped here, for their consuls and public functionaries abroad are instructed to convey, with the utmost promptness, intelligence of the appearance of any epidemic distemper in the places where they reside, or in such as are in their vicinity. Government is thereby enabled to issue necessary directions, for subjecting ships and persons arriving from thence, to a more rigid examination and seclusion than might otherwise have been adopted. Governors and commanders have similar local powers and instructions, and are empowered to make such orders, either to regulate or entirely cut off communication with suspected places and vessels as they shall deem necessary. In sea-ports, vessels and their cargoes and crews are subjected, on arrival, to examination; where the two

Q U A

former are aired and purified for a necessary time, and the latter retained a certain number of days, in which time, it is supposed, any infectious disease they might retain, would make its appearance.

In inland places, restraints are likewise imposed for similar purposes, and intercourse thereby cut off by proper means, (usually a cordon of troops drawn round the infected place,) which taking possession of the roads, rivers, and watercourses, effectually prevents infected persons entering the place, as well as others from escaping.

All these measures, though they may appear arbitrary, are founded upon sound policy; and however irksome they may be found by those who are subjected to their operation, yet if they reflect for a moment what dread is created at the very apprehension of approaching persons afflicted with diseases of an infectious or putrid nature, or having even the possibility of harbouring contagion; and what dreadful and painful consequences are known to follow from an unguarded or indifferet exposure, in such cases they will refrain from hastily rushing into society, without submitting to such salutary precautions which are so absolutely necessary, or at least so satisfactory to their fellow-citizens. No doubt the time is tedious, and the places appointed may be but little calculated to afford comfort to or reconcile "*les detenus*;" but when they reflect that thousands may be swept away in a few days, by the introduction of such a malady, it is hoped they will submit with less impatience. One thing which makes the necessity less apparent is, that from the length of time since England has been afflicted with such a calamity, and from the success of the measures that have long been adopted to prevent its introduction, persons in general have no actual knowledge, and still less fear of its dreadful effects, and they perceive with indifference, as it were, an object at a distance, which on nearer approach would almost paralyze their senses.

That persons and commerce may be as little impeded as the nature of circumstances will admit, a certificate is always obtained by persons coming from places where any of these distressing maladies are of frequent occurrence; by this means, the general safety is more strongly secured, as well as less impediment given to the trader and the traveller; because when it declares the country free from any infectious disease or distemper, no further detention is generally required, than is necessary to transmit the case to the consideration of those who are intrusted with the general safety. If on the contrary the certificate states, that an infectious distemper does prevail at such place at the time of their departure, or if no certificate is brought, the examinations are more minute, and the purifications are of longer duration.

It is not intended in this article to say any thing of the nature of infectious diseases; they will be found in the previous work under the heads *Epidemical Diseases, Plague, Yellow*

QUARANTINE.

Yellow Fever, Contagion, &c. to which the reader is respectively referred. A succinct account only will follow of such enactments and orders as have been made with the view of securing the performance of quarantine, and that the necessity and value of these regulations may be more generally known.

Much pains and inquiry have been instituted for considering the most effectual means for preventing the introduction, and of the steps most necessary to be adopted, in case of the sudden appearance of the plague, both with regard to the treatment of the persons and their houses, as well as their dealings and communication with each other; whereby such instructions can on any emergency be immediately issued, as must check the extension and deprive the malady of half its inveteracy and of half its terrors.

Besides this, so much more air has been admitted to large and manufacturing towns than formerly, so much more cleanliness secured by underground drainage, as well as among the lower classes, than in addition to their better condition generally, in point of food, and the treatment of febrile complaints being better understood, its recurrence or virulence must be considerably lessened. Apprehensions and false alarms will, at times no doubt, be created among weak and credulous persons, and it will be most judicious in the local magistracy, immediately to institute rigid inquiry into the rumour, and either to take prompt measures to contradict it, and thereby prevent unnecessary alarm, or to adopt such speedy steps as will secure those deemed infected from having intercourse with others who are in health, until his majesty's privy council can issue such directions as the case may require, which they are specially authorized to do by 45 Geo. III. ch. 10. sect. 12. So much is the privy council on the alert in this respect, that it directed, and deemed prudent for the safety of the community, to have three vessels sunk a few years ago, having cargoes of skins from Mogadore on board, under very strong suspicion of their harbouring the plague.

It will not here be necessary to make an enumeration of the many acts that have been passed respecting quarantine, since they were all repealed, (except so much of the 39 & 40 Geo. III. c. 80. as repealed the former acts,) by the 45 Geo. III. which passed 12th March 1805, and which embodies many of the former provisions and enactments. Three other acts have passed subsequently, (46 Geo. III. c. 98. 50 Geo. III. c. 20. and 51 Geo. III. c. 46.) making further provisions and amendments; and several general orders in council have been published in the London Gazette, by authority of, and in furtherance of those laws; and which have equal force with the laws themselves. Indeed but for the levying of duties, and the infliction of pecuniary penalties and capital punishments, it is conceived acts of parliament would have been unnecessary, for by the common law the king is invested with the care of the public health, and his edict must of necessity have been binding on the subjects residing in or trading to this country. But to return: the 45 Geo. III. c. 10. in the first place, declares what ships, persons, and goods, are liable to the performance of quarantine. They are,

1. All ships and vessels (including his majesty's ships of war) arriving from or having touched at any place, from whence his majesty shall declare it probable the plague or other infectious disease or distemper may be brought, and all persons, goods, wares or merchandize, packets, packages, baggage, wearing apparel, books, letters, or any other articles whatsoever, on board the same. (Act, sect. 10.) [Note. — This is deemed to relate to the outward as well as the homeward voyage. By 5 Geo. III. c. 25. sect. 3.

letters are to be given to the superintendent, who is to dispatch the same in the usual manner, after due precaution.]

2. All ships, vessels, and boats, receiving any person, goods, wares or merchandize, packets, packages, &c. out of such ships, whether they came or were put on board the same, either before or after the arrival of such ships at any port in Great Britain, or the islands of Guernsey, Jersey, Alderney, Sark, or Man, and whether they were bound to Great Britain or not. They are likewise deemed to be liable from the time of the vessels leaving such infected place, or from the time when such person or goods went or were received on board such vessel. (Act, sect. 10.)

3. Ships and vessels importing certain goods, more especially liable to retain infection, (to be set forth in any order in council,) and which may be carried from infected places into other countries, and from thence imported into Great Britain, are liable to all such regulations and restrictions as are made concerning quarantine. (Act, sect. 11.) For the goods, see Clafs 1 and 2.

4. Ships and vessels coming from any place in Europe, without the streights of Gibraltar or America, (where there is not a regular establishment of quarantine,) having on board any goods enumerated in the first class, the produce of Turkey, or Africa within the streights, or West Barbary, and all ships and boats receiving such goods out of such ships, are, together with all persons, (and pilots,) goods, &c. to perform quarantine, as ships coming from the Mediterranean with clean bills of health (which is fifteen days). Order in council, 5th April 1805, sect. 5.

5. But by order of the prince regent in council, 26th April 1817, ships which have sailed from ports deemed liable to infection, to others which are not liable to infection, and afterwards arriving here, shall not be liable to perform quarantine, if they come in ballast, or with a cargo taken in at the last-mentioned port, if the master shall make oath that all the goods of the first and second classes were landed or otherwise discharged at the latter port forty days at least before her arrival in Great Britain, and that no plague, &c. existed on board at any time from the commencement of the outward voyage to the termination of the homeward one; and provided also, that the goods taken on board at the port not liable to infection are not the growth, &c. of any country declared liable to infection; or if any goods of Clafs 1. taken in at a place not deemed liable, shall be the produce of any country deemed liable, then on proof according to the 43d section of order in council of 5th April 1805, that such goods have performed quarantine at one of the foreign Lazarets.

6. Ships and vessels also arriving from any place whatever, under any alarming or suspicious circumstances as to infection, are liable to such regulations and restrictions as are made by any order of his majesty (act, sect. 11.); or by any three of the lords of the council, in case of any unforeseen emergency on any ship arriving with any infectious disease on board, or if any infectious distemper has appeared in the course of the voyage, although she shall not have come from any place from whence his majesty has declared it probable the plague, &c. may be brought. (Act, sect. 12.) And all such ships and boats, and all persons, (including pilots,) goods, wares, &c. whether imported or put on board such ships, boats, &c. as well as on board the receiving ship, shall be obliged to perform quarantine in such places and manner, and for such time, as shall be directed by his majesty's order in council, published in the London Gazette; and that until they have performed and been duly discharged from quarantine, they shall not come or be brought

QUARANTINE.

brought on shore, or go and be put on board any other ship, &c. in order to go on shore, though such ship may not be bound to Great Britain, unless by directions and permission of his majesty in council. And all ships and boats, persons, pilots, masters or commanders, goods, wares or merchandize, coming from such restricted or any infected place, shall be subject to all the rules, regulations, and provisions of the act, and any order in council, and to all pains and penalties, &c. of that act for any breach or disobedience to it, or of any order in council made under its authority. Sect. 10. of the act.

By 46 Geo. III. c. 98. his majesty, or any of the lords of the council, as often as they shall apprehend that the yellow fever, or other highly infectious distemper, prevails in America, or the West Indies, may require every vessel coming from or having touched at those places, to come to anchor at certain places to be appointed by the commissioners of the customs, for the purpose of having the state of health of the crew ascertained before the shall be permitted to enter any port in Great Britain; but the ship shall not be deemed liable to quarantine, unless it shall be afterwards specially ordered under that restraint. Sect. 6.

Shortly after the passing the act of the 45 Geo. III., and under its immediate authority, an order in council was issued, dated 5th April 1805, which declared what places his majesty judged it probable the plague, or other infectious distemper or disease, may be brought from. *They are* by vessels coming from or through the Mediterranean, or from the West Barbary on the Atlantic ocean, and also by the importation of certain goods being the growth or produce of Turkey, or Africa within the freights of Gibraltar or West Barbary, from any port in Europe without the freights, or on the continent of America. And by further order, dated 7th November 1805, it was declared, that an infectious disease might be brought by vessels coming from or having touched at any port in the states of Pennsylvania or New York, but this order has since been annulled.

The Goods deemed most liable to retain infection are set forth in three tables, by sect. 33, 35, and 38 of the order in council, and are as follow :

CLASS I.—Apparel; artificial flowers; baft, or any article made thereof; beads, bracelets, or necklaces, in strings; beds, bed-ticks; books; brooms; brushes; burdets; camblets; canvas; carmenian wool; carpets; cordage not tarred; cotton wool, yarn, or thread, all articles wholly made of or mixed with cotton, silk, wool, thread, or yarn; down; feathers; flax; furriers' waite; goats' hair; gold or silver in thread, cotton, hair, silk, or wool, or any other substance hereinbefore enumerated; program; hats, caps, or bonnets of straw, chip, cane or any other material; hemp; hoofs; horns and horn tips; hair of all sorts; leather; linen; liquor of any kind, in bottles or flasks; lute-strings, catlings, or harp-strings; maps; mattresses; mats and matting; mohair yarn; nets, new or old; paper; packthread; parchment; pelts; plating of baft, chip, cane, straw, or horse-hair; quills; rags; sails and sail-cloth; silks, *viz.* crapes and tiffanies, hulks and knubs, raw silk, thrown or organzine silk, waite silk, wrought silk; skins, hides, and furs, and parts or pieces of skins, hides, and furs, whether undressed, or in part or wholly tanned, tawed, or dressed; sponges; straw, or any article made or mixed with straw; stockings; thread; tow; vellum; whisks; wool, whether raw or anywise wrought; yarn of all sorts.

CLASS II.—Senna; jalap; gum arabic; gum tragacanth; myrrh; opium; scammony; antimony; cantharides; alum; juniper-berries; pomegranates, flowers and seeds; sal nitre;

sal ammoniac; madder; fumach; galls; tobacco; coffee; wood in rappings; cork.

CLASS III.—Grain; pulse, and other feeds in bulk; grain, and other feeds in sacks or casks, or baskets of rush mat; dried fruits in baskets, or packages made of articles enumerated in the first class, or in packages of wood and oil in barrels.

Where vessels are to perform quarantine depends upon circumstances; for if the plague, &c. appears on board any ship *within the freights of Gibraltar*, she is to go to one of the foreign lazarets (at Malta, Ancona, Venice, Messina, Leghorn, Trieste, Genoa, or Marseilles); but if it appears *without the freights*, then she is to go to the harbour of St. Helen's-Tea and North Withel, (two of the islands, called the Scilly islands,) or such places as his majesty shall appoint. (Sect. 13. of the act.) And immediate intelligence shall be given to the commissioners of the customs, and to the privy council, so that measures may be taken for the comfort and support of the crew and passengers, and such precautions used as the case may require; and the ship is to remain there, and none of the crew or passengers are to go on shore, or have any communication with any other vessel; and any person who shall not act conformable hereto, or any directions of the privy council, are to suffer death without benefit of clergy. If the vessel cannot make those islands or other places appointed, or shall be forced by stress of weather to go up either of the Channels, she shall not enter any port in Great Britain, or the islands of Guernsey, Jersey, &c. but shall remain in some open road till the master receives direction from the privy council. Sect. 13. of the act.

The next regulation is, that ships *not having the plague* on board, coming through the Mediterranean, or West Barbary, *without clean bills* of health, (except ships of war, transports, or other vessels in the actual service of government, which are to go to the Motherbank near Portsmouth, in a place marked out with yellow buoys,) and all ships receiving goods out of them, are to perform quarantine at Stangate Creek, and no where else. (Order, sect. 4.) But by order 15th July 1813, ships not having the plague actually on board, (except king's ships, &c.) coming from or through the Mediterranean, or West Barbary, without clean bills of health, bound to the western ports of Great Britain, may perform quarantine at Milford Haven.

The 46 Geo. III. c. 98. sect. 7. authorises his majesty or the privy council to prohibit (by proclamation or publication in the Gazette) any person, ships, or boats from going within the limits of any station which may be assigned for the performance of quarantine by ships without clean bills of health, under the penalty of 500*l.* By orders in council, dated 21st July 1806, and 6th September 1811, it was ordered, that no ship or boat (except quarantine and custom-house boats) should go, but on cases of emergency, within the place at the Motherbank set out with yellow buoys for ships not having clean bills of health; and that ships with clean bills of health ordered to the Motherbank are to go within the compass of the yellow buoys, but separate from his majesty's ships and ships without clean bills.

The two west buoys are placed to the eastward of Wooton Creek, and the two north ones near the Isle of Wight, with another buoy midway between them, and a red buoy as a mark for a burying-place.

By sect. 2. of the order of 5th April 1805, ships (king's ships as well as others) with clean bills of health, Bound to London, Rochester, Faversham, or any creeks or places } are to perform quarantine at Stangate Creek. }
belonging to or within any or }
either of the above ports, }

[*Note.*

QUARANTINE.

[*Note.*—In the case of ships coming from Turkey, and obliged to perform quarantine before their entry into the port of *London*, it is usual for the consignee to fend down persons at his own expence to pack and take care of the goods; and where a consignee had omitted to do so, and the goods were damaged by being sent loose to shore, it was held that he had no right to call upon the master for a compensation. *Dunnage v. Jolliffe*, before lord Kenyon, chief justice, at Guildhall, M. T. 1789.]

— bound to Poole and Scilly, and the ports inclusive,	} St. Ives' Pool, within the harbour of Falmouth.
— bound to Bridgewater and Swansea, and the ports inclusive,	} King's Road and Portlute Pill.
— bound to St. Ives and Aberystwith, and the ports inclusive,	} Milford Haven.
— bound to Jersey, Guernsey, Sark, or Man, or any part of them,	} The Motherbank, or St. Ives' Pool.
— bound to Leith, and all the ports or creeks extending from thence along the eastern coast of Scotland, as far as and including Aberdeen,	} Inverkeithing Bay.
— bound to Glasgow, and all the ports or creeks extending along the western coast of Scotland, as far as and including Wigtoun,	} Holy Loch, in the Frith of Clyde.
— bound to Inverness, and all the northern coast of Scotland, as far as and including Stornaway,	} Inverkeithing Bay, by order 21 July 1806.
— bound to Dumfries and Kirkcudbright, and all the ports and creeks on the south-west coast of Scotland,	} Holy Loch, by order 21 July 1806.
— bound to any port or place on the coasts of England and Scotland, not within any of the before-mentioned limits,	} At the nearest of the above stations to the place to which she is bound; and

Vessels liable to quarantine, and having a *clean bill of health* on board, which are bound to any of the above ports, and have passed the place appointed to perform quarantine, either from the master's ignorance of being liable, or by stress of weather, or other unavoidable circumstance, may, on proof on oath that it was unintentional, and not with the view of avoiding the regulations of quarantine, repair (and shall be compelled to go) to any other place at the discretion of the quarantine assistant, &c. keeping the proper signal flying during the whole time. Order, sect. 6.

When any country or place is known or suspected to be infected with the plague, &c. then, whenever any ship shall attempt to enter any port in Great Britain, or the islands of Guernsey, &c. she shall be visited by the superintendent of quarantine, or proper officer of customs; and the master, upon being desired, (for which purpose he or the pilot is to bring to, under penalty of 100*l.*) shall give a true answer in writing to all such questions and interrogatories as shall be put to him; and if he refuses to make a true discovery in any of the particulars, or if he shall give a false answer, (though not

upon oath,) he shall forfeit 200*l.* (Act, sect. 18.) If it appears by such answers that he is liable, the superintendent shall direct her to repair forthwith to the proper place, and she shall not enter any other place, (except from stress of weather or damage,) and she may be compelled, by all necessary means, (either by firing of guns upon her, or any other kind of necessary force,) to go to the proper place. (Order, sect. 8.) And if the master does not cause such ship to be conveyed to the place appointed, he shall forfeit 500*l.* 45 Geo. III. c. 10. sect. 21.

Vessels *not bound to this country* are not to touch at or attempt to enter any port in Great Britain, or the islands belonging thereto, although they may be ports appointed for performing quarantine (except for orders, or in consequence of stress of weather, or loss or damage at sea); and then the masters are to answer the preliminary questions, and to conform to all such directions, as they shall receive, as well with respect to their continuance at such ports, and departing and repairing to any other place, as to all other regulations, &c. touching quarantine; and if they do not comply, they may be compelled to put to sea; to aid which, the commander, or other officer of his majesty's ships of war, may be called in. Order, sect. 7, and 45 Geo. III. c. 10. sect. 19.

The duration of quarantine depends upon circumstances; as, the country from whence the ship arrives, the kind of goods she brings, the production of a bill of health, or otherwise. And the commencement is to be taken for ship and goods (where the cargo consists of goods of Class I. and II., and goods non-enumerated), when the whole of the two former are removed. (Order, sect. 39.) But if there are no goods of those classes, then from the time of the vessel's arrival at the quarantine station. (Sect. 12.) And for ships without bills of health, but with cargoes not enumerated in the two classes, and not deemed infectious, from the day the quarantine guardians are put on board. Order, sect. 40.

The lords of the council may issue orders for shortening the time of quarantine performed by particular ships, persons, or goods, &c. or for wholly releasing them, absolutely or conditionally, as they shall think fit. 45 Geo. III. c. 10. sect. 12.

The duration for ships performing quarantine is as follows:—

Ships having the plague on board, and arriving under any alarming or suspicious circumstances, the time is left to the discretion of the privy council. 45 Geo. III. sect. 12 and 13.

Ships coming from or through the Mediterranean or West Barbary with clean bills of health, having on board goods of Class I. and II., fifteen days. Order, sect. 12.

Ships arriving without clean bills of health, thirty days. Order, sect. 37—40.

Ships arriving from places in Europe without the freights, or on the continent of America, where there is not a quarantine establishment, bringing goods of the 1st Class, the produce of Turkey, or Africa within the freights, or West Barbary, to perform quarantine for fifteen days. Order, sect. 5.

Ships bringing touched, *i. e.* suspected bills, to perform quarantine for twenty days. Order, sect. 41.

The time for passengers and the crews of vessels performing quarantine is to be governed by the nature of the cargoes of the respective vessels, and whether they come with or without bills of health.

QUARANTINE.

The duration for goods performing quarantine to be as follows:—

Goods of the 1st Class, coming *without clean bills of health*, forty days at the lazaret. Order, sect. 33.

Goods of the 2d Class, coming *without clean bills of health*, thirty days. Order, sect. 35.

Goods remaining after those of the 1st and 2d Class are removed to a floating or land-lazaret, are to perform quarantine for thirty days, and are to be afterwards fumigated. Order, sect. 37.

Goods arriving from or through the Mediterranean, or West Barbary on the Atlantic ocean, in ships not having the plague on board, *without clean bills of health*, to be removed to the floating lazaret at Stangate Creek, and perform quarantine for thirty days. Order, sect. 14. and 40.

Goods coming from those places *with clean bills of health* are to be aired one week in the same ship; except goods of Class I. and II., which are to be removed to the lazaret, and be aired for fifteen days. Order, sect. 13.

Goods coming in ships with *suspected bills of health* to be treated as ships coming without bills of health, except that they are to perform ten days less quarantine. Order, sect.

41. Dried fruits having been shifted from baskets and packages made of articles in Class I., or considered susceptible, if all the persons on board are in health may be delivered in twenty days. Order, sect. 38.

Dried fruits in wood, may be delivered in ten days. Order, sect. 38.

Oil in barrels, the bungs being tarred, and the barrels brushed and dipped in sea-water, may be delivered in ten days. Order, sect. 38.

Grain, pulse, and feed in bulk, or in sacks, or casks, or mats, when shifted, and passed through a sieve, may be delivered in ten days. Order, sect. 38.

And the packages, when made of susceptible articles, are to be sent to the lazaret to perform quarantine, according to the nature of them, or be destroyed at the option of the owner. Sect. 38.

Formerly the 42d clause in the order in council required "the production of a declaration on oath for goods of the 1st Class," when brought from places without the straits of Gibraltar, or on the continent of America, &c. to ascertain their growth, and that they were not the produce of Turkey, &c., but that clause has been suspended by order of 8th Aug. 1810; and they may be admitted without performing quarantine, on the master making oath that no infectious disorder prevailed at the place from whence they sailed, or on oath of the importer that they are not the produce of Turkey, or of any place in Africa within the straits, or West Barbary: but whenever that declaration is produced, the oath of the master or of the importer is not required. Order in Council, 27th Oct. 1818.

Vessels having performed quarantine at any of the foreign lazarets, and producing proper documents to prove that fact, are not required to do so again: nevertheless, such part of the cargo as consists of articles in Class I. are to be taken out and perform quarantine in the usual manner for fifteen days (Order, sect. 43.) But no goods are to be landed or removed therefrom until the master has given notice to the quarantine superintendent, or officer of customs, in order to be laid before the privy council. Landing or removing them, before directions are given, or contrary thereto, subjects the master to the penalty of *200l.* 45 Geo. III. sect. 22.

Having thus stated what ships and goods are liable and required to perform quarantine, and the time for which they are to perform it, we shall proceed to state the manner of

doing it, which is to be by opening and airing in the manner directed by order in council (Act, sect. 29.), according to the nature of the goods, and the articles of which the packages are made.

Goods of the 1st Class, unaccompanied with a clean bill of health, undergo two performances, one *probationary*, the other of longer time and greater precaution. The hatches of the vessel are first to be opened, and as many of the bales as can be ranged upon the deck are to be taken from the hold, (as soon as the pilot and passengers are removed,) and the ends opened, and the contents handled by the sailors, under directions of a quarantine guardian for six days; and after this, any further parcels are only required to be opened and aired for three days, unless any suspicious circumstances arise, and then the time may be extended to four, six, or eight days, so as to complete in the whole twenty-one days, or even a longer time if necessary, and then they are to be conveyed to the lazaret. Order, sect. 32.

In the second performance, or expurgation at the lazaret, all bales of cotton are to be opened from one end to the other, and so much removed as admit the handling and removing the remainder. Rags, raw wool, goats' wool, Carmania wool, and hair, are to be taken out and ranged in heaps of four feet high, and often rummaged. Bales of silk to be opened on one side, from end to end, the cords loosened, and the silk aired for twenty days; then the other side to be opened in like manner for five days more. Cottons, yarn, thread, stuffs, and linen, are to be piled in rows or pyramids, and turned every four days, and completely spread out and suspended on cords for several days. Paper, books, parchment, sponges, and stockings, are to be unpacked and separated, to as to admit thorough airing. Feathers, straw-hats, artificial flowers, coral beads in strings, and brushes, spread out in the same manner. Carpets, furs, hides, and skins to be unbaled, and each piece spread and suspended on cords in the open air, and frequently turned; and all goods packed with straw, cotton, or articles stated in Class I., shall be entirely taken out of the same, opened, and handled, and carefully aired, as well as all other goods in that class, for which no directions are given. Order, sect. 34.

Goods of the 2d Class, unaccompanied with clean bills of health, though less liable to infection, are to be carried to the lazaret, and be unpacked, opened, and aired as much as possible; and by moving them as much as practicable from time to time, so as to admit free ventilation for thirty days. Order, sect. 35 and 36.

Goods not mentioned in those classes, and remaining on board the importing ship, are to perform quarantine for thirty days, by being frequently swept and shifted, so as to admit a free ventilation; at the end of which time, if all the persons on board, and those employed in the expurgation on shore, are well, the ship, goods, crew, and passengers, are to be fumigated and discharged. Order, sect. 37.

There are other regulations and enactments on this subject which it is necessary to notice, and though they relate to the first arrival of the ships, and take effect from that time, yet being rather regulations to ascertain the nature of the voyages, and the state of the crews, and the goods composing the cargo, than any part of the performance of quarantine, this is conceived a proper place to introduce them.

It is manifest, that without the earliest information of the arrival of vessels from countries infected with the plague, &c. and of the kind of goods of which their cargoes are composed, many of the above-mentioned salutary regulations would be useless, either by persons quitting vessels immediately

QUARANTINE.

diately on their arrival, or from having intercourse with other ships, or with the shore, or by breaking bulk and fending goods into the common stock of the country. To this end, the law has imposed the necessity of the masters of ships liable to quarantine shewing proper signals by day and night, by which the quarantine officer and others are apprized of their arrival; and to prevent any abuse herein, for the purpose of covering any smuggling transactions, persons exhibiting them, when not liable to quarantine, are liable to 200*l.* penalty by 45 Geo. III. c. 10. sect. 15. And as persons, especially passengers, may innocently render themselves liable to those penalties, as well as those statutes which affect their lives, it is necessary they should be set out for their information. The severity that has been annexed to the violation of the quarantine regulations is a sufficient proof how irksome the constraint is, and how regardless persons are to the general safety of others, for nothing short of imposing the penalty of death, on a violation of some of the enactments, has been found sufficient to impose respect to the law on this subject.

By 45 Geo. III. c. 10. sect. 14. ships subject to quarantine are required at all times, when they meet any other ship at sea, or shall be within four leagues of the British or Irish coasts, or the islands of Guernsey, Jersey, Alderney, Sark, or Man, to have a signal hoisted, to denote that they are so liable, which they are to keep hoisted so long as they remain in sight of such ship, or are within such limits of the coast, until they shall have arrived at their quarantine port, and been legally discharged. The signals are to be, by day, a large yellow flag at the mast-head; for which purpose, every ship leaving Great Britain for the Mediterranean, or West Barbary, or any place suspected or liable to have the plague, &c. shall be provided with one or more quarantine signal-flags and lanterns, and proper materials and instruments for fumigation and immersion, and shall keep them on board, to be used upon the ship's return (Order, sect. 45.); and if coming without clean bills of health, then with the addition of a large black spot in the centre; and by night a lantern with a light therein, also at the mast-head; on failure whereof, the master is subject to a penalty of 200*l.* (45 Geo. III. c. 10. sect. 14.) Ships actually having the plague on board are to hoist a signal flag of yellow and black, borne quarterly, of eight breadths of bunting at the main-topmast-head; and in the night two lanterns, one over the other, to be kept up when in sight of any other ship, or within four leagues of the coasts or islands, and until arrived at the proper quarantine port, and legally discharged from quarantine, upon penalty of 200*l.* 46 Geo. III. c. 98. sect. 1.

Masters of ships are also further required by sect. 16. of the act of the 45 Geo. III. to give the pilot who shall go on board a written paper containing a true account of the places at which they have touched or loaded on the homeward voyage, and any neglect or refusal, or any false representation, or wilful omission therein, subjects them to the penalty of 200*l.* And by the 46 Geo. III. c. 98. sect. 2. masters of ships that are not liable to quarantine in respect of the place from whence they come, are also to give a true account of all the different articles of their cargoes, under the penalty of 200*l.* And if by proclamation or order in council, ships are liable, as coming from any place mentioned in any order in council, or by reason of bringing any goods mentioned in such order, the pilot is to give the master notice of being liable, so that he may hoist the proper signal, under the penalties of 50*l.* and 100*l.* by the 45 Geo. III. c. 10. f. 16. and 46 Geo. III. c. 98. f. 2. Pilots, not conducting ships to the proper places, (except

prevented by stress of weather, adverse winds, or other accidents,) to forfeit 100*l.* (45 Geo. III. c. 10. f. 17.); and not requiring such paper, 100*l.* by 46 Geo. III. c. 98. f. 2.

Masters knowing any place from which they came, or at which they touched, to be infected with the plague, or any infectious disease, or having any person on board infected with it, and who shall refuse or neglect to disclose the same when examined by the superintendent of quarantine, or officer of customs, and omitting to hoist the proper signals, shall be guilty of felony, and suffer death. 45 Geo. III. c. 10. f. 19.

Masters of vessels ordered to perform quarantine are to deliver to the officer of customs, or quarantine superintendent at the quarantine station, (and which they are required to demand,) their bills of health, manifest, log-book, and journal, under penalty of 100*l.* 45 Geo. III. c. 10. f. 20.

Masters of ships liable to quarantine, although the plague, &c. shall not have then appeared, who shall quit the ship, or suffer any seaman or passenger to quit the same, till they have performed quarantine, (unless by licence or order in council,) shall forfeit 500*l.* And if any person coming in, (or any pilot or other person who may go on board, whether before or after her arrival at any port in Great Britain,) shall afterwards quit her before she shall be regularly discharged, all persons (by necessary force) may compel such person to return on board; and every person fo quitting such ship shall forfeit 200*l.* and be imprisoned six months. 45 Geo. III. c. 10. f. 21.

Such of the passengers and crew of ships not furnished with clean bills of health as may be desirous of performing quarantine in a separate vessel, (to be hired at their own expence,) may, if the superintendent and medical assistant see no objection thereto, do so, and may quit the ship before the hatches are opened and go on board such ship, (a guardian being there placed at their expence) for thirty days (Order, sect. 28.); but their baggage, apparel, and books, for which they have not immediate occasion, shall be sent to a floating lazaret to be aired, and before any passengers or crew shall be discharged, they, their clothes, and effects, shall be fumigated (Order, sect. 31.); but passengers and the crews continuing on board the ship in which they arrived are to remain under quarantine till the ship be discharged. Order, sect. 28.

Pilots may quit the ship and be removed to the hospital ship, after the quarantine guardians are placed on board, provided they come from ships having no suspicious sickness on board; but if otherwise, they are to be sent to the pest-house, or other place appointed for persons so affected, and they are to continue under quarantine until the probationary airing of the goods is finished, when, if they continue well, they are to be fumigated and discharged. But such pilots are not to have communication with any other person, except under the regulations usual in like cases. Order, sect. 37.

If any pestilential accident occurs among the ship's crew or passengers during the probationary airing, (at whatever stage it may happen,) the quarantine of the crew, passengers, and pilot, (if any shall have been on board,) and the goods, is to recommence, and the sick are to be sent to the hospital, or pest, or place provided for persons so afflicted, the external guard to be doubled, and notice immediately given to the privy council. Order, sect. 29.

If any person falls ill, and a medical man is on board, he shall confer with the medical man who comes alongside, the latter keeping ten feet to windward; but if no medical man

QUARANTINE.

man is on board, and it is necessary to visit the sick, the visit shall be made at the ship's boat by the medical attendant in his own boat, keeping to windward ten feet; and if medical aid cannot be administered on board, the sick is to be carried to the pest or hospital ship. Order, sect. 23.

Persons under circumstances to induce a suspicion of having any pestilential disorder, to be removed to the pest or hospital ship; but if it is not infectious, they may be removed to a more commodious apartment in the lazaret, there to complete the remainder of their quarantine. Order, sect. 24.

If any pestilential disorder shall actually discover itself in any ship or lazaret, the person is to be removed with all possible care and dispatch, under the special directions of the superintendent or medical assistant, to the pest-house, and a proper attendant is to be assigned to him, and he shall be visited at a due distance; but if a nearer approach is necessary, some person is to be specially appointed for that purpose. Order, sect. 25.

Passengers and crews may have the assistance of any medical person they may choose from the shore; but if any persons communicate by contact with the sick, they shall perform the like quarantine as the sick. Order, sect. 26.

Persons liable to perform quarantine, and others having had intercourse with them (whether in ships or lazarets), are to be subject to the orders of the superintendent or officer of customs, who are required to enforce obedience to all such orders, and to call in others to their assistance; and they may compel all such persons to repair to the lazaret or ship, and cause all goods liable to quarantine to be conveyed there also; and persons refusing to go, or, who being there, shall escape, shall be compelled by force to return; and persons refusing or neglecting to return, and persons escaping, shall suffer death without benefit of clergy. (45 Geo. III. c. 10. sect. 23.) And may be seized by any constable, headborough, tythingman, or peace officer, or any other person, and be carried before a magistrate or justice of the peace, or such justice may issue his warrant for their apprehension and conveyance to their ship, or to any ship performing quarantine, or to any lazaret from which they have escaped, or for confining them in safe custody (but not in a public gaol) under such restrictions, as to having communication with other persons, as the justice may think proper, (calling to his aid medical advice) until they can be safely removed to some place appointed for quarantine, or until directions can be obtained from the privy council. 45 Geo. III. c. 10. sect. 24.

Persons not infected with the plague, &c. entering the lazaret whilst any person is performing quarantine, are to perform it also, and are not to return without licence or order in council; and, if they shall actually escape before it has been fully performed, they shall suffer death, without benefit of clergy. 45 Geo. III. f. 27.

Persons on board ship, or in a lazaret, may have communication with others by letter, to be collected by a boat, which is to go round at a fixed hour daily, and they are to be dipped in vinegar and put into the fumigating-box, and the covers slit open (Order, sect. 16.); but letters to persons on board are to be taken by the quarantine superintendent only, and no conference is to be had by persons *not* under quarantine with persons who *are* under quarantine (except by permission of or in the presence of the quarantine superintendent or his assistant), nor from any ship, unless the superintendent's boat be present, and then at the distance observed by the superintendent. And to prevent improper or clandestine communication, there is to be a night-watch and row-guard at all the quarantine stations; and the boats belonging

to any floating-lazaret are to be locked to the same; and the boats of the ships performing quarantine are to be taken away, and no use made of them, but for removing goods, from such ship, or upon occasions of necessity, till they are given up when the ship has done performing quarantine. Order, sect. 17.

Assistance and necessaries for ships under quarantine to be found by the superintendent and to be carried to the windward side, and delivered by means of buckets. (Order, sect. 18.) Quarantine guardians are to prevent any goods being delivered from ships without clean bills of health but by an order in writing from the superintendent, such order to be entered in a book and the original returned; and nothing to be conveyed from one ship under quarantine to another, nor any personal intercourse allowed. And a guardian is to go with the lighters and boats, to prevent communication during the transit of the cargo, and to take care that no remnants of cotton, or things of Clafs I. and II., remain in them. And before leaving off work they are to collect and deliver all such articles into the lazaret. Sect. 19 of the Order.

The duty of the quarantine superintendent and officers of the customs may partly be collected from what has gone before; but it is necessary here to observe, that they are, on a ship's arrival, to go off and put the following preliminary questions:—What is the name of the ship? Master? From whence? Where bound? At what port has she touched on the homeward voyage, or what ships spoken with? Whether the plague, or any infectious disease, existed at the time of leaving the port she loaded at? What kind of goods the cargo is composed of, and of what country are they the produce? and whether she brings a bill of health?

If the ship is deemed liable to quarantine, she is then to be directed to the proper quarantine port, where, on arrival, the superintendent is to go to the windward side, (taking medical advice with him, if necessary,) and to see all the officers, crew, and other persons, multered on the gangway, and is to put further questions to them. They are in substance the same as above, except more particular as to the places the vessel touched at during the whole voyage; the respective dates of her arrival at every place, and dates of her departure; the number and conditions of the crew for the voyage, whether any have been sick or died, and the nature of the disease; whether their bedding and clothes were destroyed, or any person employed about them taken ill; if so, when, and what kind of disease; whether any letters or parcels have been received out of any other ship on the passage; of what kind and where delivered, and into what vessel or boat; what pilots she has had; and any particulars respecting British ships loading at the same port from whence she came; their names; where bound, &c. and what British ships were at the places at which she touched; whether any person employed in loading the cargo was taken ill, or any suspicion of the kind; whether the cargo had been long warehoused, or packed, handled, or brought on board by any person affected with the plague: did she touch at the isle of Rhodes, the Morca, or any and what part of Africa; if so, where? and had she any communication with the shore at those places, or with any ship coming from such places; if so, in what manner, and when, and whether the crew of such ship was healthy.

The answers to all these questions are to be taken in writing, and the master to make oath to them, and is to deliver the log-book, manifest, and ship's papers, (which are to be dipped in vinegar and fumigated,) and make oath to the truth of the contents of the former, or in what particular it is not correct; and whether any particular entry

QUARANTINE.

was made soon after the fact, and if not, for what reason; and also to make oath to all the other papers. Sect. 10 of the Order.

If any suspicious circumstances appear in the answers to the above questions, or from any other circumstance, the proper officer is immediately to transmit such answers to the privy council and the commissioners of the customs, and without regard to the bill of health, whether clean or otherwise, is to order such ship to a station distant from all other vessels, and put her under special guard, the more effectually to prevent communication with her. Order, sect. 11.

Ships coming without clean bills of health are to have two quarantine guardians placed on board as soon as the examinations are ended, and she shall have arrived at her proper station. Order, sect. 15.

Guardians are to take care that, after the cargoes are discharged into the lazaret, the holds and between decks are completely swept, and the sweepings burnt. (Order, sect. 20.) And they are to search all lockers and chests, &c. of passengers and crews, so that no goods in List 1 and 2, or any thing liable to infection, remains undelivered, except what the superintendent or medical man declares requisite for daily use; and they are to see all such chests, clothes, and the bedding of the ship daily opened and aired. (Order, sect. 21.) They are also to make daily reports of the state of health of every person on board, and whether the regulations are regularly complied with; and, in case of any impediment, are to give notice to the master, and then to the superintendent, who shall remove the same. Order, sect. 22.

Persons landing or removing any goods, wares, or merchandize, packets, packages, baggage, wearing-apparel, books, or letters, from any ship liable to quarantine, or knowingly receiving the same, are to forfeit, for every offence, not more than 50*l.*, nor less than 10*l.* And persons clandestinely conveying them (or concealing them for that purpose) from any ship actually performing quarantine, or from the lazaret, are to be adjudged guilty of felony, and suffer death without benefit of clergy. Act, sect. 31.

Officers of customs, or other persons embezzling goods, or guilty of any other breach or neglect of duty, in respect of the ships, persons, and goods performing quarantine, shall lose their office or employment, and be rendered incapable to hold the same, or receive a new grant thereof, and shall forfeit 100*l.* And if they shall desert their duty, or wilfully permit any ships, persons, or goods, to depart, or be conveyed out of the lazaret, ship, or other place, unless by permission under an order in council, and if they, or any person authorized to grant certificates of ships having performed quarantine, shall knowingly give a false certificate thereof, they shall suffer death without benefit of clergy; and if they shall wilfully damage any goods under their direction, they shall pay treble damages and costs of suit to the owner. 45 Geo. III. c. 10. sect. 26.

Persons forging, counterfeiting, interlining, or altering, any certificate required by this act, or any order in council touching quarantine, or procuring it to be done, or publishing it as true, shall suffer death without benefit of clergy. 45 Geo. III. c. 10. sect. 30. and 46 Geo. III. c. 98. sect. 8.

After goods have been duly opened and aired, proof thereof shall be made by the oaths of the master of the lazaret or vessel, and one of the guardians or officer of the customs, and the superintendent, shall give a certificate of such proof having been made, and such goods shall not be

liable to any further restraint, either at that or any other port. 46 Geo. III. c. 98. sect. 5.

Ships and persons having performed quarantine, proof is to be made by the oath of the master, and of two other persons belonging to the ship, before the principal officer of customs or justice of peace, at the port where quarantine was performed, or, if at the islands of Guernsey, &c. before two jurats, that such ships or persons have duly performed quarantine, and that they are free from infection. And, upon producing a certificate from the superintendent to that effect, the collector or justice, &c. is required to give a certificate thereof, and thereupon such ships and persons shall not be liable to farther restraint. 45 Geo. III. c. 10. sect. 28.

All forfeitures and penalties incurred against this act may be recovered in any of his majesty's courts of record, or by suit in any of his majesty's courts in the islands of Guernsey, &c. one half to them who shall sue, and the other to his majesty, to be applied towards defraying the expences of erecting and maintaining the lazaret. 45 Geo. III. c. 10. sect. 34.

Actions to be commenced in the name of the attorney-general, or of some officer of the customs, and the former may stop proceedings if he thinks proper, as well as to the officer's share as to the king's moiety. Sect. 35 and 36.

Offences against this act, not being felony, and disobedience to any order in council, for which no specific penalty is provided, may be tried before any two justices of the peace for the county, riding, &c. where such offence happens; and if any person shall be convicted he shall be liable to such penalty, not exceeding 50*l.* for any one offence, or to such imprisonment, not exceeding three months, as shall, in the discretion of the two justices, be judged proper. Such penalty to be applied as directed by sect. 34. 45 Geo. III. c. 10. sect. 38.

Offences contrary to this or any act hereafter to be passed, or of any order in council, notified by proclamation, or published in the Gazette, may be tried in any county within England or Scotland, or in the proper courts in the isles of Guernsey, &c. No attainer of felony to work corruption of blood or forfeiture of goods, &c. 45 Geo. III. c. 10. f. 39 and 42.

In any prosecution for offences against this act, or any act which may hereafter be passed, concerning quarantine, or for any breach of any order in council notified in the Gazette (which is to be a sufficient notice by 45 Geo. III. c. 10. sect. 33.), the answer to any questions or interrogatories put to the master of a ship, may be given in evidence as to the place from which such ship came, or the places at which she touched in the course of the voyage; and where any ship shall have been directed to perform quarantine, the having been so directed shall be evidence that she was liable, unless satisfactory proof shall be produced by the defendant that the ship did not come from or touch at any such place as is stated in the said answer; or that such ship, although directed to perform quarantine, was not liable. And where any ship shall in fact have been put, and shall actually be performing quarantine, such ship shall, in any prosecution, be deemed to be liable, without proving in what manner, or from what circumstances, such vessel became liable. 46 Geo. III. c. 10. sect. 40.

By the 43d section, offenders may plead the general issue, and if the plaintiff is nonsuited, or discontinues his action after the defendant has appeared, or if judgment has been given upon any verdict or demurrer against the plaintiff, the defendant may recover treble costs, and have the like remedy at law as the defendant hath in other cases.

Actions

QUARANTINE.

Actions to be brought within the space of two months after the offence is committed.

Whenever any person is charged with an offence against this or any other act, or in disobedience of any order in council concerning quarantine, and the same shall appear to any judge of the court of King's Bench by affidavit or certificate of an information being filed against such person, he may issue his warrant under his hand and seal, and cause him to be brought before him or a justice of the peace, that he be bound with two sufficient sureties to appear and answer such offence; and if such person shall refuse or neglect to become bound, he may be committed to gaol till he does so give bail, or be discharged by order of the court of King's Bench. The recognizance to be returned and filed in court, and remain in force until such person is acquitted, or until he has received judgment. (Act, sect. 41.) And if he is detained for want of bail, the prosecutor may cause a copy of the indictment to be delivered to him, or the gaoler, &c. with notice thereon indorsed, that if he does not in eight days enter an appearance and a plea of demurrer, an appearance and plea of not guilty will be entered in his name; and upon affidavit being made of such notice, &c. being delivered, the prosecutor may cause an appearance and plea of not guilty to be entered, and such proceedings shall be had as if the defendant had appeared and pleaded not guilty; and if upon a trial the defendant is acquitted the judge may direct his discharge. Act, sect. 41.

Where any examination or answer shall be taken on oath, the persons authorized to take such examinations and oath shall be deemed to have full powers to administer such oath; and if any person swears falsely, or procures others to do so, he shall be deemed guilty of perjury or subornation of perjury. 45 Geo. III. c. 10. sect. 37. and 46 Geo. III. c. 98. sect. 10.

The king may issue directions if the plague breaks out in Great Britain.—The lords of the privy council, in case any infectious disease breaks out in Great Britain, or the islands of Guernsey, &c. may make such order, and give such directions in order to cut off all communication between any person infected, and the rest of his majesty's subjects as shall appear to them expedient for that purpose. 45 Geo. III. c. 10. sect. 12. And if it shall happen that any part of Great Britain or Ireland, or the isles of Guernsey, &c. or France, Spain, Portugal, or the Low Countries, shall be affected with the plague or other infectious disease, his majesty may by proclamation restrain all small boats, and vessels under 20 tons, from sailing out of the ports of Great Britain or the islands, until bond is given by the master, with sufficient sureties for 300*l.*, that such vessel or boat shall not go or touch at any place mentioned in such proclamation, and that the master, crew, or passengers, shall not go on board any other ship at sea, nor receive any person on board at sea from any other ship, nor receive any goods out of any ship. And if any vessel for which such security is required, shall fail before security is given, the shall be liable to forfeiture, and the master and every mariner shall forfeit 20*l.* 45 Geo. III. c. 10. sect. 32.

By the stat. 1 James I. c. 31. if any person infected with the plague, or dwelling in any infected house, be commanded by the mayor or constable, or other head officer of the town or vill, to keep his house and shall disobey it, he may be enforced by the watchmen appointed on such occasions to obey such necessary command, and if any hurt ensue the watchmen are thereby indemnified. And further, if such person goes abroad and converses in company, if he has no plague sore upon him, he shall be punished as a vagabond by whipping, and be bound to his good behaviour. But if he has any

infectious sore upon him uncured, he then shall be guilty of felony. Blackstone, vol. iv. c. 13.

Having thus far given the laws and regulations concerning this matter, we shall state the duties payable by ships performing quarantine, with the exceptions provided by the act; and also the best methods of fumigating ships and houses. It must be apparent, that the nature of the quarantine establishments and maintaining lazarets incur considerable expences, to defray which the duties are to be applied (Act, sect. 8.); and the law 45 Geo. III. c. 10. sect. 3. declares, that it is reasonable the importers should defray the same; and sect. 6. enacts, that the ship-owners may recover of the importers such sums as the tonnage of their goods shall bear to the proportion of the tonnage of the ships. These duties are to be paid upon the ships clearing inwards, and to be computed according to the 26 Geo. III. c. 60. 45 Geo. III. c. 10. sect. 5. They are to be levied and recovered as duties of customs, and although not raised for the purpose of contributing to the revenue, the amount is to be carried to the consolidated fund. Sect. 7.

A Table of tonnage duties payable on ships and vessels, which ships or vessels, or the cargo of which, or any part thereof, shall have performed quarantine in Great Britain, or the islands of Guernsey, Jersey, Alderney, Sark, or Man. 45 Geo. III. c. 10. f. 3.

1. For every ship which shall have arrived from any part of Turkey, or from Africa within the streights of Gibraltar, or in the West Barbary on the Atlantic Ocean, with a clean bill of health, the ton - - -	£ s. d. 0 7 6
2. Do. without a clean bill of health, the ton - - -	0 15 0
3. For every ship which shall have arrived from any place whatsoever, (except from any part of Turkey, &c.) with a clean bill of health, the ton - - -	0 3 0
4. Do. without a clean bill of health, the ton - - -	0 10 0
5. For every ship which shall arrive with any part of the cargo consisting of goods the growth of Turkey, or any place in Africa within the streights, or in the West Barbary, and which shall have arrived from any place whatever, the ton - - -	0 7 6
6. For every ship which shall have so arrived under such circumstances as shall induce his majesty, or the lords of the council, to subject such ship to the like quarantine as ships coming from Turkey with clean bills of health, the ton - - -	0 7 6
7. Ships arriving under such circumstances as shall induce his majesty to subject such ship to the like quarantine as ships coming from Turkey without clean bills of health, the ton - - -	0 15 0
8. For every ship which shall enter inwards in the port of London, an additional duty of per ton - - -	0 1 0

Exempted from the said Duties.

Ships of war, transports, and other vessels employed in the service of government.

Ships or vessels not bound to Great Britain or the islands, and having put in in distress. (Although they should perform quarantine. Opinion of the attorney-general.)

Ships or vessels obliged to perform quarantine only on account of having goods enumerated in the 1st Class on board,

QUARANTINE.

board, and not producing the proper declaration or document as to their growth, &c.

Ships or vessels, with a clean bill of health, in ballast, or whose cargo shall consist wholly of salt, (unless coming from Turkey, or some place in Africa within the straits of Gibraltar, or in the West Barbary.)

Ships and vessels, which with their cargoes shall have performed quarantine in the foreign lazarets, and produce proper documents and vouchers attesting the same. (Or when goods, which have performed quarantine there, and been carried to other countries, are afterwards brought here. Treasury order.)

Ships and vessels rendered liable solely by reason of having received on board by force, and against the will of the master and crew, any person from a vessel coming from or having touched at an infected place. 46 Geo. III. c. 98. sect. 4.

Ships which have failed in ballast from places considered liable to infection, and which shall afterwards bring a cargo from a place not deemed liable to infection. Treasury order.

To prevent as much as possible the plea of ignorance of these laws, the order in council of 5th April 1805 directs, (sect. 44.) that the collector of the port where any vessel shall clear out for the Mediterranean or Barbary coast, or any other place respecting which an order in council is made, shall furnish the master with an abstract of the quarantine regulations, and it is to remain up during the voyage in some conspicuous part of the ship till his return, provided he returns in twelve months.

Ships of war which shall meet any vessel liable to quarantine coming to any port in Great Britain, or the islands of Guernsey, &c. are to take care to prevent the landing of any goods or persons, &c. until they shall be put under the direction of the quarantine superintendent, &c. (Sect. 46.) And the commanders of ships of war, and forts and garrisons on the sea coast, and all justices, mayors, sheriffs, bailiffs, chief magistrates, constables, headboroughs and tythingmen, &c. shall be aiding and assisting to the superintendent of quarantine and his assistants, and to the officers of the customs, and in bringing such ships to the places appointed for performance of quarantine, as well as in the due performance of the same. Order, sect. 48.

The commissioners of the customs are ordered to use their utmost vigilance and care that the regulations of the acts of parliament and orders in council be duly observed (sect. 47.) ; and the lords of the treasury, the lord high admiral, the lord warden of the cinque ports, and the master general and principal officers of the ordinance, his majesty's secretary at war, and the governors and commanders-in-chief of the said isles of Guernsey, &c. are to give the necessary directions herein as to them may respectively appertain. Order in council, sect. 50.

It now remains to state the best mode of fumigating vessels and apartments infected with infectious diseases, and to offer such hints as are applicable to the subject.

Odoriferous woods, gums, sweet herbs, and aromatics, have been recommended as fumigations, but with little certainty as to their effects ; perfumes still less so ; besides which, they rather conceal the mal-aria than correct contagion. The evaporation of common vinegar by heat is often employed as a fumigation, but it is not possessed of much power of diminishing the fetid odour of putrid air. The acetic acid or radical vinegar is better ; its powers are however limited to a small space, and therefore, though it may be useful about the persons of those who attend the sick, it is inadequate to the purification of large rooms.

The stronger and better fumigations are the nitrous or marine acid, and the oxymuriatic acid vapour, the former of which is made thus : half an ounce of nitre reduced to powder and vitriolic acid (oil of vitriol) in equal quantities, mixed in small pots, and placed in various parts of the room.

Oxymuriatic acid, which is most powerful, is prepared thus :

Manganese	-	-	-	-	2 parts.
Common salt	-	-	-	-	4 parts.
Vitriolic acid, specific gravity 1.85	-	-	-	-	3 parts.
Water	-	-	-	-	1 part.

To a small quantity of the mixture of the manganese and salt, (suppose three ounces,) the whole of the water is to be added, (half an ounce,) and to this, in a pot large enough to prevent the ebullition from flowing over, add the vitriolic acid from time to time. This will keep up for twenty-four hours a discharge of the oxygenated muriatic acid, of which the smell is not unpleasant, and the vapour gives no annoyance either the sick or the attendants.

Where houses or hospitals are highly infected with the plague, it will be necessary for them to undergo a stronger fumigation of sulphur, but that being attended with danger should only be done by persons properly acquainted with the manner of doing it ; they should afterwards be white-washed, and the floors well scoured.

It may be stated once for all, that the great object of quarantine laws is the separating of those affected, or suspected to be infected with an infectious distemper, from those who are not, and nothing would be so salutary or absolutely necessary, wherever the plague breaks out, as instantly separating of the sick from those who are well ; and this is best done by removing them to a proper place, rather than suffering them to remain with their family, which too frequently by that means becomes infected also.

Whatever is requisite to be done by way of fumigation will be found at large under that head ; the following precautions are, however, proper to be known.

The clothes of the sick should at all times, when changed, be removed by tongs, and not by handling, and should be put into cold water and boiled for an hour, and afterwards be well washed in washing machines, and then fumigated ; or they may be baked in an oven ; but the safer mode would be to have them destroyed, especially if not valuable.

Those who attend about the person of the sick, as well as the medical men, should remain as short a space of time as is consistent with their duty, and to avoid as much as possible all contact with his person or his bedding, clothes, &c. And they might be furnished with gloves made of oiled silk, as well as dresses made of the same article. The cup or glass out of which he drinks should be immediately plunged into water or vinegar, as well as any article he touches or uses. Whatever he leaves of his meals should be burnt or wholly destroyed. The excrementitious discharges should also be received into cold water, and instantly removed out of the room. If the sick die, he should be immediately wrapped in oiled cloth or a tarpaulin, and be speedily buried at the depth of six or seven feet ; which should be performed, without bustle, in the night time, without toll of bell, to prevent the alarming of others.

With respect to the bed and bedding upon which the sick has died, it would be best to have it burnt immediately ; at all events, it must on no account be used till it has been baked in an oven for twelve hours (being rolled up and removed in a cart with every possible care, that it be as little handled as possible). It should be afterwards exposed to the open air for at least fourteen days before it is again used.

Furniture

Furniture consisting of chairs, bedsteads, &c. should be scoured and fumigated with sulphur and saw-dust for twenty-four hours, first removing every person out of the apartment, as no living creature can exist in the fumes for any length of time.

Houses and apartments should be fumigated in like manner, and be afterwards purified by the admission of as much air as is practicable, and also by scraping and washing the walls with lime-water, and the floors with plenty of cold water.

And lastly, we cannot inculcate too much the fact, that the best preventive of infectious disease, and the surest mode of diminishing the effects of its contagion, is by the free admission of pure air, even in the room of the sick, who, to admit of its free circulation, should not have bed or window curtains, and by the greatest attention to cleanliness. By the removal of the rest of the inhabitants from the sick house to a place of observation, for the space of twenty days, and by the sick being also confined for an equal length of time, having persons appointed to prevent his escape, and to have a nurse assigned to him. Articles necessary for his support must be delivered by means of baskets or planks, as well as those received from the house, and all money received in payment to be dipped in vinegar.

Large assemblies should not be permitted to meet while towns are infected, and the theatres, churches, and markets should be closed; and if these precautions are strictly adhered to, we are confident that if the contagion cannot be wholly prevented, its spreading may be greatly confined, and its malignity considerably lessened.

QUARTZ. See QUARTZ, and MINERALOGY, *Appendix*.

QUASSIN, in *Chemistry*, the name which has been given to a bitter substance extracted from quassia. See BITTER *Principle*.

QUEEN ANNE'S. Add—It contains 16,648 inhabitants, of whom 6381 were slaves in 1810.

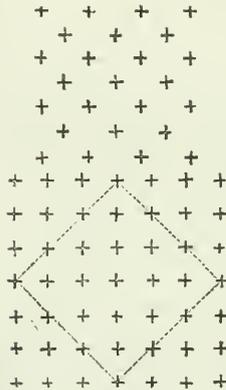

QUEMAKO, a township of Somerset county, in Pennsylvania, having 1302 inhabitants.

QUERCITRON. See QUERCUS *Tinctoria*, and PRINTING on *Calico*.

QUILOA. At the close, add—An island of Quiloa was visited by captain Beaver in 1812. He describes this island, which has been the seat of royal residence, since the foundation of the kingdom, at least 700 years, as being about six miles long and three broad; low and fertile, extending longitudinally across the mouth of a deep bay, having at either end an opening for two arms of the sea, and thus containing a peninsula which projects from the main land, forms two safe and magnificent harbours, capable of containing, in perfect security, the largest fleets. Of the ancient splendour and magnificence that subsisted when the Portuguese first visited this island, not a vestige remains. The present city, if it deserves the name, consists of a number of scattered huts from the borders of the sea to the shore. Here captain Beaver found the deputy of the Imam of Muscat, who controuls the miserable Moors or Arabs who are in possession of the sea-coast, with his half a dozen of soldiers, situated in a round tower, mounting three guns, which pointed directly

to the king's house, and at the distance of a musket-shot from it. By these means, he keeps the king of the extensive kingdom of Quiloa in awe, and levies a tribute in slaves, ivory, gold-dust, and many other articles exported from this part of the coast. The Moorish king is only the nominal sovereign both of the islands and of the shores of the continent.

QUINCUNX, l. 21, add—The notion, however prevalent, that plants thus set have greater scope than when set at the same distance without alternation, is perfectly imaginary: thus below it is evident, that the *square mode* becomes a quincunx when viewed angularly, and the quincunx, in like manner, becomes a square; and the distance of the plants is the same in both.

QUINTAL, col. 2, l. 3, add—The Castilian quintal is divided into 4 arrobas, or 100 lbs.; the lb. into 2 marcos, or 16 oz.; the marc into 8 drachmas, 16 adarmes, or 576 grains. The merchants commonly reckon 100 lbs. Castilian weight equal to 102 lbs. avoirdupois; but the more accurate proportion is as 123 to 125.

QUIRA, or QUIRIA, in *Geography*, a province of the ancient kingdom of Colchos enclosed by the end of the Mossian hills. It is a pleasant and fruitful country, and, from the ruins that still remain, we may conclude, that it was formerly flourishing and populous in an extraordinary degree. The residence of the prince of Quiria is Titi-zighi or Ighina (the ancient Pityus), situated on the shores of the Black sea, with a secure and spacious harbour. The only considerable river of Quiria is the Boas, which rises 30 versts from Titi-zighi, and after a course from E. to W. empties itself into the Black sea.

QUIRILIA, the only river of consequence in Immeria, or, as it is now called, Iberia. It rises in the Soanni ridges and being increased by the snow-streams which descend from the Georgian side of the Caucasus, enters the Phasis, in the neighbourhood of Cotatis.

R.

R A D

RACON, in *Geography*, a township of Gallia county, in Ohio, having 295 inhabitants.

RADIATION of *Heat*, a property of heat or circumstance belonging to it, which has been lately investigated and successfully illustrated by professor Leslie of Edinburgh. There are two modes in which heat is discharged from bodies. A portion is communicated to the contiguous matter, and is slowly diffused through it. Another portion, when the body is placed in an aerial medium, is discharged with rapidity, darts through the air to a distance, and even at that distance, when intercepted, produces a heating effect. This forms what is called the "radiation of heat." Mr. Leslie has discovered the important fact, that different kinds of matter, at the same temperature, discharge very different quantities of heat by radiation. From a metallic surface, the quantity is comparatively small; from a vitreous surface, it is much greater; and it is still more so from a rough spongy surface.

The power of different surfaces in discharging different portions of heat, in this mode, at the same temperature, Mr. Leslie ascribes to the more or less close contact which they admit with the external air; a vitreous surface, for example, admitting of a closer proximity of the air than a metallic surface does, and thereby communicating to it, in a given time, a larger portion of heat. And on the same principle he explains the fact, that those surfaces which are most powerful in thus discharging heat, are also most powerful in arresting and absorbing it; the closer contact into which the heated air comes with the surface on which it impinges, favouring the transfer of its heat; while a surface, to which the heated air does not approach so closely, will in a great measure reflect it with little loss of heat. Hence the discharging and absorbing power are proportional to each other; while the reflecting power is the reverse.

Some important practical applications resulting from these differences are suggested by the author.

A vessel with a bright metallic surface is the best fitted to preserve liquors either long warm, or as a conservatory to keep them cool. A silver pot will emit scarcely half as much heat as one of porcelain; and even the very slightest varnishing of gold, platinum, or silver, which communicates to the ware a certain metallic gloss, renders this new kind of manufacture about one-third part more retentive of heat. The addition of a covering of flannel, though indeed a slow conductor, far from checking the dissipation of heat, has directly the contrary tendency; for it presents to the atmosphere a surface of much greater propulsive energy, which it would require a thickness of

R A M

not fewer than three folds of this loose substance fully to counterbalance. The cylinder of the steam-engine has lately been most advantageously sheathed with polished copper.

The progress of cooling is yet more retarded, by surrounding the heated vessel, on all sides, at the distance of near an inch, with a case of polished tin; and the addition of other cases, following at like intervals, augments continually the effect. With an obstruction of one case, the rate of refrigeration is three times slower, with two cases it is five times slower, with three cases it is seven times slower, and so forth, as expressed by the succession of the odd numbers. By multiplying the metallic cases, therefore, and disposing them like a nest at regular intervals, the innermost could be made to retain the same temperature with little variation for many hours or even days. Such an apparatus would obviously be well calculated for various culinary and domestic purposes.

In the conveyance of heat by means of steam, the surface of the conducting tubes should have a metallic lustre. On the contrary, if it be intended by that mode to warm an apartment, they should be coated on the outside with soft paint, to facilitate their discharge of heat. For the same reason, metallic pots are more easily heated on the fire, after their bottoms have become tarnished or smoked. If a bright surface of metal be slightly furrowed or divided by fine flutings, it will emit heat sensibly faster, because the prominent ridges, thus brought closer to the general atmospheric boundary, will excite the pulsations with augmented energy.

For the experiments which led to this discovery, and the conclusions deduced from it, we refer to his "Essay on Heat," and to a "Short Account of Experiments and Instruments depending on the Relations of Air to Heat and Moisture." 8vo. Edinb. 1814. See **HEAT**. See also **DEW**, **RAYS of Heat**, and **REFRANGIBILITY of Radiant Heat**.

RAM of M. Montgolfier. Add—See **WATER**.

RAMA, or **RAMAH**. Add—This was a common name applied to many places in the Holy Land: and it is suggested (see Clarke's Travels, vol. iv. p. 432.), that the modern village of Bethoor and the modern Rama are the places

places mentioned by St. Jerom, where he says, "Rama et Bethoron et reliquæ urbes nobiles a Salomone constructæ parvi viculi demonstrantur." Rama was a village in the time of Jerom, and the situation of Bethoor is distinctly marked in the Apocrypha, with reference to the plain of Rama. (1 Maccab. iii. 16. 24.) (However, the prophecy of Jeremiah (xxxi. 15.) applied by St. Matthew (ii. 17.) to the murder of the Innocents by Herod is not believed to refer to the place now mentioned, but to another Rama, noticed by Eusebius.) The origin of Rama has been ascribed to the Moslems under Soliman, son of Abdolmelic, who is stated to have built the town with materials from the ruins of Lydda, distant three miles from Rama. But that this is an error may be evinced by reference to the writings of St. Jerom; who speaks of its vicinity to Lydda, and calls it Arimathea, from a prevalent opinion that it was the native place of Joseph, who buried our Saviour. Jerom's testimony, preceding the Mahometan conquest of the country, is sufficient to prove that the city existed anterior to the invasion of Palestine by the Moslems. Nevertheless it is possible that Rama, from having been a small village, might have become a large town under their dominion; nor does there seem much reason to doubt, that this Rama was the village mentioned with Bethoron by St. Jerom, as the only remains of the two cities so named, which were built by Solomon. According to Reland, the oldest writer who mentions Rama is Bernard the monk, who visited the Holy Land in the 9th century. Oriental geographers describe it as the metropolis of Palestine; and it is said that St. George, the tutelar saint of our ancestors in England, suffered martyrdom in this place; though others say, that his relics reposed in a magnificent temple at Lydda or Diopolis. Its distance from Jerusalem, usually estimated at a day's journey, is described as equal to 36 or 37 miles by Phocas; who distinguishes Armatheum, the native place of the prophet Samuel, from Ramola or Rama, with which Adrichomius seems to have confounded it; and places the church of St. George within the latter city; which position, although disputed by Reland and other authors, not only seems to coincide with the testimony given from the Alexiad of Anna Comnena, but also with the evidence afforded by Bernard the monk, who mentions a monastery of St. George near to Ramula. There is not a part of the Holy Land more fertile than the plain around Rama; it resembles a continual garden; but cultivation had been neglected at the time of the arrival of Dr. Clark, the traveller now cited, owing to the dreadful plague with which the whole country had been infested. Rama and Lydda were the two first cities of the Holy Land that fell into the hands of the Christians when the army of the Crusaders arrived. Rama was then in its greatest splendour; a fenced city, abounding in all the luxuries of the East. It was exceedingly populous, and was adorned with stately buildings, and well fortified with walls and towers. The count of Flanders having been dispatched by the princes and generals of the Christian army, with five hundred cavalry, to reconnoitre the place, and to summon the city to surrender, found the gates open: the inhabitants, alarmed by the sudden approach of so powerful an army, had abandoned their dwellings and all their property during the preceding night. In consequence of this, a general rendezvous of the Christian forces took place in Rama, where they remained during three entire days, regaling themselves in the abundance the place afforded. During this time, Robert of Normandy was elected bishop of Rama and Lydda, to which bishopric all the revenues of the two cities and their dependencies were annexed; the

VOL. XXXIX.

whole army joining in thanksgiving to St. George the Martyr, the patron saint of Diopolis and Rama, to whom the auspicious commencement of the enterprise was attributed. Hence probably originates the peculiar consideration in which St. George was held by the inhabitants of England, during the early periods of its history.

RÄMSBURY. By the returns of 1811, the parish of Ramsbury contained 398 houses, and 2095 persons; *viz.* 1028 males, and 1067 females: 248 families being employed in agriculture, and 85 in trade, manufactures, and handicraft.

RÄMSDAL, dele.

RANDOLPH. Add—In 1810, their number was 1170; l. 3 of next article, insert—including 798 slaves.

RANDOLPH, a county of the Illinois (*dele* Indiana) territory, containing four townships; *viz.* Kaskaskia, United States' Saline, Shawanee, and the residue of Randolph county, and 12,282 inhabitants, including 168 slaves.—Also, a township of Montgomery county, in Ohio, containing 936 inhabitants.

RÄPIDES. Add—This is one of the best tracts in Louisiana. No town, except Alexandria, on the right bank of the Red river, has been found, (says Mr. Darby, 1816,) in the parish of Rapides. This place is a thriving little village, and standing at the head of constant boat navigation, is of considerable commercial importance. The staples of the parish are, cotton, timber, beef, pork, and maize; the four first being the principal.

RÄTE, l. 8, for Ireland *r.* India; in Ireland six, legal interest charged by all private banks, though the interest charged by the bank of Ireland for money advanced is 5 *per cent.*

RÄTE of a Ship, &c. col. 2, l. 39, add—About ten years ago, an additional lieutenant was appointed to the line of battle ships. Ships of 50 and 38 guns have four lieutenants: l. 5 from bottom, after lieutenants, insert—ships of 20 guns, and all ships upon the establishment of floops of war, have two lieutenants. Col. 3, l. 14, add—See SHIP.

RÄTE of Ships of War, add—By an order of council, the operation of which commenced Jan. 1, 1817, the following regulations were fixed with regard to rates in the navy; *viz.*

- 1st rate. All three deckers.
- 2d rate. All of 80 guns, and upwards, on two decks.
- 3d rate. All of 70, and under 80 guns.
- 4th rate. All of 50, and under 70 guns.
- 5th rate. All of 36, and under 50 guns.
- 6th rate. All of 24, and under 36 guns.
- 1st rate, 900, 850, and 800 men.
- 2d rate, 700 or 650 men.
- 3d rate, 650 or 600 men.
- 4th rate, 450 or 350 men.
- 5th rate, 300 or 280 men.
- 6th rate, 175, 145, or 125 men.

RÄVA, in *Geography,* a town of the Persian empire, in the pachalic of Bagdad, situated between Kerkesia (the Roman *Circesum*) and Annah (the Amatho of Ammianus Marcellinus), and consisting of about 200 stone houses in the midst of extensive ruins. On the opposite side of the river are the remains of a castle, erected on the summit of a rock.

RÄYUN, a town of Persia, in the province of Ker-man, which, like Tchroot and Mahim, is surrounded by numerous gardens.

RÄADING, a township of Fairfield county, in Ohio, having 789 inhabitants.

RÄALIZE, r. RÄALISE, or RÄALIZE.

RED ANTIMONY-ORE. See MINERALOGY, *Addenda*.
 REDSTONE. Add—the township situated in Fayette county contains 1224 inhabitants.

REEL. See MANUFACTURE of Cotton.

REFRACTION, col. 14, l. 40, for sign *r*. fine.

REFRIGERATION. The following laws have been deduced by MM. Dulong and Petit from their experiments on the cooling of bodies. See HEAT.

1. If the cooling of a body in a vacuum surrounded by a medium whose temperature is constant could be observed, the velocity of cooling would decrease in a geometrical progression, while its temperature would decrease in an arithmetical progression.

2. When the temperature of the medium surrounding a vacuum remains constant, the velocity of cooling for excess of temperature in arithmetical progression decreases as the terms of a geometrical progression diminished by a constant number. The ratio of this geometrical progression is the same for all bodies, and is equal to 1.0077.

3. The velocity of cooling of a body in a vacuum for a constant excess of temperature increases in a geometrical progression, the temperature of the surrounding medium increasing in an arithmetical progression. The ratio of that progression is still 1.0077 for all bodies.

4. The velocity of cooling arising from the simple contact of a gas is entirely independent of the nature of the surface of a body.

5. The velocity of cooling arising from the simple contact of a fluid varies in a geometrical progression, the excess of temperature varying at the same time in a geometrical progression. If the ratio of this second progression be 2, that of the first is 2.35, whatever may be the nature of the gas or its elasticity.

This law may be also expressed by saying that the quantity of heat removed by a gas is in every case proportional to the excess of temperature of a body raised to the power of 1.233.

6. The cooling power of an elastic fluid diminishes in a geometrical progression, while the tension diminishes in a geometrical progression. If the ratio of this second progression be 2, the ratio of the first is 1.366 for air, 1.301 for hydrogen, 1.431 for carbonic acid, and 1.415 for olefiant gas.

This law may be also expressed in the following manner. The cooling power of a gas, *cæteris paribus*, is proportional to a certain power of the pressure. The exponent of that power is 0.45 for air, 0.315 for hydrogen, 0.517 for carbonic acid, and 0.501 for olefiant gas.

7. The cooling power of a gas varies with its temperature in such a manner, that if this gas can be dilated and be made to preserve the same elastic force, the cooling power will be as much lessened by the rarefaction of the gas as it is increased by the heating of it; hence the cooling power of a gas depends in a definite manner upon its tension.

REVOLUTION, *French*. At the close, add—On the 4th of June 1814, the King (Louis XVIII.) came to the two chambers to make a declaration of the constitutional charter; and on the occasion delivered a speech distinguished by its dignity and propriety. On the 1st of March 1815, however, Buonaparte, having escaped from Elba, landed in France, and by rapid and uninterrupted marches hastened to Paris, and resumed his power, March 22, 1815, but his fate was finally determined by the battle of Waterloo; and he made his second abdication, in favour of his son, on the 23d of June 1815; and on the 8th of the following month, the foreign troops entered the capital. Disappointed in his views of settling either in America or in England, he surrendered himself, with a suite of forty persons, to captain Maitland of the Bellerophon, July 15, 1815; and at Torbay he was transferred to the Northumberland, which conveyed him to the island of St. Helena, decreed by the allied sovereigns to be the place of his future abode. Here he arrived Oct. 16, 1815.

Upon his departure from Paris, Louis XVIII. was again restored and fixed by the allied powers on the throne of France.

With respect to the events that have occurred since this article was written, such as the famous battle of Waterloo (see WATERLOO), the total defeat of Buonaparte, his deposition from the government, his removal from the capital, his confinement in the island of St. Helena, the re-establishment of Louis XVIII., the withdrawal of the allied troops, and the measures adopted for the secure and permanent sovereignty of France, under the present dynasty; they are so recent, and our limits are so restricted, that we must refer the reader to documents easy of access for a minute detail and more ample information.

REUSSITE. See MINERALOGY, *Addenda*.

RHEA, in *Geography*, a county of East Tennessee, containing 2504 inhabitants.

RHODE

RHODE ISLAND. Add—See UNITED STATES.

RHUMB, col. 2, l. 20 from the bottom, for right angles *r.* equal angles.

RICCIO, DOMENICO, called *Brufa-Sorci*, in *Biography*, an eminent painter, was born at Verona in 1494, and became a disciple of Giovanni Francesco Caroto, under whose instruction in design and colouring he laid the foundation of his subsequent celebrity. For further improvement he studied the works of Giorgione and Titian at Venice; and his proficiency was such, that his works have been generally admired and fought after, on account of the beauty of his colouring and the attitudes of his figures. Under the patronage of cardinal Gonzaga, by whom he was invited to Mantua, he became a competitor in the exercise of his art with two of the most celebrated masters of his time, Paolo Veronese and Paolo Farinato. In the church of St. George at Verona is a picture by Riccio, which represents the gathering of the manna in the wilderness, and which is accounted a fine composition, and distinguished by the force of its colouring. This matter died in 1567, at the age of 73 years.

RICE, *Chemical Composition of*. Braconnot has lately analysed this grain: according to his experiments, 100 parts consist of

	Carolina Rice.	Piedmont Rice.
Water	5.00	7.00
Starch	85.07	83.80

RICHBOROUGH. The parish of Ash, in which this hamlet is situated, contained, in 1811, 334 houses, and 1685 persons; *viz.* 868 males, and 817 females.

RICHFIELD, a township of Geauga county, in Ohio, having 329 persons.

RICHLAND, l. 4, add—It contains 9027 persons, of whom 5238 were slaves in 1810. At the close, add—Also, a township of Belmont county, in Ohio, having 2831 persons.—Also, a township of Clinton county, in Ohio, having 783 inhabitants.—Also, a township of Fairfield county, in Ohio, having 881 inhabitants.—Also, a township of Guernsey county, in Ohio, having 227 inhabitants.

RICHMOND, in America, col. 2, l. 27, add—of whom 3178 were slaves in 1810; l. 54, add—of whom, in 1810, 2115 in the county, and 1321 in the town of Augusta were slaves. At the close, add—Also, a township of Kentucky, in Madison county, having 366 inhabitants, including 102 slaves.

RINSING, an operation in calico-printing, for an account of which, as well as of *damping*, see PRINTING, *Calico*.

RIO, &c. col. 2, l. 15, *r.* Helen.

RIOT, l. 20, after pillory, insert—(now abolished).

RIVERHEAD, in *Geography*, a village, or liberty, in the parish of Seven-Oaks, and county of Kent, which, in 1811, contained 184 houses, and 1012 persons; *viz.* 474 males, and 538 females.

ROAD, col. 23, l. 11 from the bottom, *r.* 1°, 13°, and 22 yards; l. 9, for 6300 *r.* 7272; l. 7, for 255,150 *l. r.* 294,516 *l.*

ROANE. Add—of whom 670 were slaves in 1810.

ROARING, a disease of horses, well known to jockies and dealers in these animals. It takes its name from a sin-

gular noise which the horse makes in breathing whenever he is put into a brisk motion. It usually accompanies broken wind, or at least is the forerunner of it. Mr. Ryding says, that it is owing to the extravasation of lymph, and its coagulation on the inside of the trachea, or wind-pipe, which thus obstructs respiration: and if this account of it be just, it seems to resemble the *croup* in children. The principal cause is sudden or violent and long-continued exercise. At its commencement, blistering the whole length of the wind-pipe may be of use; but when the disease continues for a length of time, it becomes incurable.

ROBERTSON, in *Geography*, a county of West Tennessee, containing 7270 inhabitants, of whom 1608 were slaves in 1810.

ROBESON, l. 3, add—of whom 1340 were slaves in 1810.

ROCKBRIDGE, l. 4, add—of whom 1724 were slaves in 1810.

ROCKCASTLE. Add—of whom 163 were slaves in 1810.

ROCK-CRYSTAL. See MINERALOGY, *Addenda*.

ROCKDALE, in *Geography*, a township of Crawford county, in Pennsylvania, having 401 inhabitants.

ROCKINGHAM, l. 17, add—of whom the slaves in 1810 were 2114; l. 23, add—of whom 1491 were slaves.

ROCKLAND, a township of Berks county, in Pennsylvania, having 1026 inhabitants.

ROMANO, GIULIO, l. 14 from bottom, for fagacious *r.* falacious.

ROME, in *Geography*, a post-town of the district of Maine, in the county of Kennebeck, with 585 inhabitants.

ROMILLY, Sir SAMUEL, *Knight*, in *Biography*, no less distinguished as a patriot and philanthropist, than for his legal knowledge and practice, has every claim which pre- eminent talents and character can give him to honourable notice in those biographical sketches which this work contains. Descended from a race of ancestors, whose attachment to civil and religious liberty constrained them to sacrifice their property, to abandon their native land, and to seek an asylum from persecution in this country, it was reserved for him to maintain and perpetuate the honour of the family from which he derived his origin. Of his family and its emigration, it will be sufficient to transcribe the following account given by himself in an address to the citizens of Bristol, when they invited him to become a candidate for representing them in parliament. "It has been published in this city that I am a foreigner, and that if you elect me, you will send a foreigner to represent you in a British parliament. Gentlemen, I was born and educated, and have passed my whole life in England, with the exception of a short interval, which was spent in visiting foreign countries. My father too was born and educated in England, and spent his whole life in it; my grandfather, it is true, was not an Englishman by birth, but he was an Englishman by choice. He was born the heir to a considerable landed estate at Montpellier, in the south of France. His ancestors had early imbibed and adopted the principles and doctrines of the reformed religion, and he had been educated himself in that religious faith. He had the misfortune to live soon after the time when the edict of Nantz, the great toleration act of the Protestants of France, was revoked by Louis XIV., and he found himself exposed to all the vexations and persecutions of a bigoted and tyrannical government, for worshipping God in the manner which he believed was most acceptable to him. He determined to free himself from this bondage; and he abandoned his property, he tore himself from his connections, and sought an asylum in this land of liberty,

where he had to support himself only by his own exertions. He himself embarked in trade; he educated his sons to useful trades; and he was contented at his death to leave them, instead of his original patrimony, no other inheritance than the habits of industry he had given them; the example of his own virtuous life; an hereditary detestation of tyranny and injustice; and an ardent zeal in the cause of civil and religious freedom. To him I owe it, among other inestimable blessings, that I am an Englishman. Gentlemen, this is my origin; and I trust that I need not blush to own it."

The father of Sir Samuel was an eminent jeweller, and realized a handsome fortune; his mother, whose maiden name was Garnault, was descended from a family of French refugees; and he being the youngest of nine children, of whom three only attained to maturity, was born in Frith-street, Soho, in the city of Westminster, on the 1st of March, 1757.

In early life he manifested those powers of the understanding, and those affections of the heart, which, under proper direction and assiduous culture, augured his future advancement to eminence of station and character. "He was remarkable," says one of his biographers, "for the benevolence of his disposition, his deep and generous sensibility, his high sense of honour, the quickness of his apprehension, and the extraordinary maturity of his judgment;" combining "great vivacity and a constant flow of animal spirits, with a powerful imagination, a retentive memory, and the strongest and most durable affections; he possessed a correct taste in literature and the fine arts, and retained through life a keen relish for the beauties of nature." It was his good fortune, at an early age, to form an intimacy with the Rev. Mr. Roget, a young gentleman resembling himself in taste and disposition, and afterwards his brother-in-law; to whom he was much indebted, as he himself had the modesty and gratitude to acknowledge, for giving direction to his talents, and a steady impulse to his exertions.

Thus liberally endowed by nature, and aided by the counsel of an intelligent and affectionate friend, he overcame a variety of obstacles which presented themselves in the way of his progress and advancement; and having chosen the profession of the law for the exercise of his talents, he soon exhibited those powers and that persevering application, which, without the advantages of a patrimonial estate, and an education at a public school or university, ensured his future eminence. Having enrolled his name in one of the Inns of Court, and previously acquired some notion of business in the "Six-Clerks' Office," connected with the court to which he directed his views, he was called to the bar in 1783; and from the reputation he gained as an "equity draughtsman," he soon rose to the higher departments of his profession. Upon the removal of Thurlow, Scott, and Mitford, from the chancery court, Mr. R. became a leader, and was retained in almost every cause. "His indefatigable industry, his unwearied patience, his comprehensive acuteness, his deep knowledge of the law, his correct notions of the practice of the court, were all calculated to give due weight to arguments selected with skill, propounded with modesty, and enforced by a chastened eloquence."

Raised to an independence by his own exertions, it was natural for a person of his disposition to seek a domestic establishment; and accordingly in the summer of 1797, whilst he was upon a visit at the seat of the marquess of Lansdowne, he met with a daughter of Francis Garbett, esq. of Knill-Court, in the county of Hereford; a young lady, whose youth and beauty and other amiable qualities engaged his affection, and determined his choice; and to whom he

was married in the following year. This connection opened to his views the prospect of a growing family, and of course induced him to apply to the business of his profession with additional ardour and assiduity. Accordingly when Mr. Fox and Lord Grenville assumed the reins of government in the year 1806, he was nominated solicitor-general, after some suspense about committing to his custody the great seal, and received the honour of knighthood.

It is recorded to the honour of Sir Samuel, as well as to that of his colleague Sir Arthur Pigott, the attorney-general, that, though the press, according to the language of Lord Chatham, was become, during their time, a "chartered libertine," and political contention had arrived at its height, yet with a kind of triumph over all provocations which assailed the administration of this period, no prosecution for libel occurred. Indeed, the mind of Sir Samuel was occupied about a much higher object, which was the reform of the English system of jurisprudence. His first attempt with this view was an amendment of the bankrupt laws, and though he did not succeed to the extent of his wishes, so as to render the freehold estates of persons liable to the bankrupt laws, who might die indebted, assets for the payment of their simple-contract debts, for which he was allowed to bring a bill into the house of commons in 1807, which bill was lost on a division; he nevertheless obtained an act by means of which the debts of traders have been more effectually secured, for the benefit of the public. About this time he acted as a manager at the trial of the late viscount Melville, for high crimes and misdemeanors in his office as treasurer of the navy, which terminated in an acquittal. On occasion of the abolition of the slave trade, which conferred immortal honour on this short-lived administration, Sir Samuel delivered a speech which made great impression on the house: and it is said that one passage of it, which he uttered with an uncommon degree of animation, was honoured by three distinct plaudits. On the dismissal of the ministry, of which he formed no distinguishing a part, he vindicated and applauded their conduct, during the year of their existence; expressing in terms of cordial approbation their decisive measures with regard to the abolition of the slave-trade, and the emancipation of Ireland, as well as their refusal to give the king a pledge not to renew the Roman Catholic question; and deprecating the return of Lord Melville to office, notwithstanding his acquittal, as no one had moved for rescinding the vote against him.

The attention of Sir Samuel, both in and out of office, was much occupied concerning the state of our criminal code, and the adoption of measures for reforming it. He lamented, in common with many other enlightened patriots, that the loss of life should be annexed to a greater variety of actions in England than in any other country in the world, and that criminals of very different descriptions should be subject, by the administration of our laws, to the same kind and degree of punishment. To rectify this anomaly in our jurisprudence appeared to Sir Samuel Romilly to be an object of great importance, in its connection, both with the equity and humanity of legislation, and the prevention of crimes. Accordingly on the 18th of May 1808, he moved for leave to bring in a bill for the repeal of certain objectionable laws; and in this bill he introduced a clause for granting compensation to persons who were unjustly accused and tried. He soon after published a pamphlet, intitled "Observations on the Criminal Law of England, as it relates to capital Punishments, and to the Mode in which it is administered." In this pamphlet, which passed through three editions, he explained his views, and pursued his refutation of the theory of Dr. Paley. "The certainty of punishment,"

ROMILLY.

ment," says this excellent writer, "is much more efficacious than any feverity of example for the prevention of crimes. So evident is the truth of this maxim, that if it were possible that punishment, as the consequence of guilt, could be reduced to an absolute certainty, a very slight penalty would be sufficient to prevent almost every species of crime, except those which arise from sudden gusts of ungovernable passion. If the restoration of the property stolen, and only a few weeks', or even a few days' imprisonment, were the unavoidable consequence of theft, no theft would ever be committed."

Sir Samuel, having actively concurred in the abolition of the slave-trade, could not forbear expressing his indignation, when the house of commons, in the year 1814, took into consideration that article in the treaty of peace which allowed of the prosecution of the slave-trade for a period of five years, and when he found that the ministers of this country had acceded to any convention, in which this was a prominent stipulation. "If," says the biographer whose article we are citing, "the king of France has relaxed on his part, and declared the trade in human beings to be annihilated, so far as concerns his own dominions, it is to Sir Samuel Romilly, and those who supported him on this occasion, that we are to attribute the change."

The subject of this memoir soon afterwards distinguished himself by his opposition to the appointment of a new judge and tribunal for facilitating public business and alleviating the labours of the lord-chancellor. This he considered and represented as an innovation, from which neither the chancellor, nor the suitors of his court, nor the public in general, would eventually derive any advantage. In a pamphlet under the title of "Objections to the Project of creating a Vice-chancellor of England," he announced to the public his opinions on this subject, "the general result of which was, that the new division of chancery into two courts, and the creation of an intermediate court of appeal between it and the house of lords, would tend greatly to enhance the expence of suits 'already grievously and oppressively high,' to multiply the business of the court, and to protract the final decision of causes." "The remedy," he adds, "my lord, which I have to propose, is a very simple one, but I am much afraid, considering the force of several expressions which I find scattered in your lordship's pamphlet, that you will think me disrespectful even in mentioning it. You have, however, really left me no choice. You have imposed upon me the necessity of being deficient in what you will think due respect, in order to avoid the reproach of being deficient in what you have made my duty. The remedy, then, my lord, seems to be, *That the house of lords, like all inferior tribunals, should, when they are pressed with an unusual quantity of business, sit on a greater number of days and at unusual hours, in order to dispatch it.*" His last, and as some have thought his best speech, was delivered, at the close of the last parliament, against the "Alien-bill;" and so powerful were his arguments, that, on his suggestion, the amendments introduced by the lords were thrown out. In this speech, the eloquent senator details and reprobates the measures adopted and pursued by the parliament just expiring, and he closes with the following reflection: "who our successors may be I know not; but God grant that this country may never see another parliament so regardless of the liberties and rights of the people, and of the principles of general justice, as this parliament has been!" However the political opinions of persons may differ, they must concur in admiring the integrity and ardour of the speaker; and

considering it as the last speech which he ever delivered in the national senate, the perusal of it cannot be otherwise than awful and impressive.

No man ever devoted his time and talents to important and useful purposes with greater assiduity and zeal than Sir Samuel Romilly. His professional practice, which was very extensive, demanded a great portion of his time and attention; and yet whenever the public interest required his attendance in the house, he never absented himself on account of any personal engagements. His practice and his parliamentary duties occupied the whole of the day from the morning dawn frequently till midnight; and his publications were the productions of those hours that ought to have been devoted to rest and sleep. It is not at all surprising that talents like his, and so employed, should command general notice and respect. In a former parliament many enlightened and respectable members of the city of Bristol directed their views to him, and wished for such a representative; but other interests prevailed against his abilities and character, and the influence of his friends. At the last general election, he was proposed as a fit representative for Westminster, his native city; and he was chosen in the most honourable manner, without trouble, expence, and solicitation, by a decided majority, and amidst the applauses of an immense body of electors. But a circumstance occurred which rendered the closing period of his life gloomy and distressing, and which disappointed the expectations of his constituents. Lady Romilly, to whom he was affectionately attached, and with whom he had enjoyed a high degree of conjugal felicity, had been for some time in a state of declining health, and his mind was agitated by very distressing and depressing apprehensions on her account. During their residence at their country-house at Tamworth, in Surry, in August 1818, her complaint seems to have abated, and with the flattering hope that her convalescence would be confirmed by the mild air of the Isle of Wight, they accepted an invitation from Mr. and Mrs. Nash, to spend the remainder of the vacation at their hospitable castle at East Cowes, whither they removed in the month of September. Here Lady Romilly's disorder recurred with circumstances of peculiar aggravation; and Dr. Roget, the nephew of Sir Samuel, was summoned to her relief. Her complaint, however, was irremediable; and after various fluctuations, which excited alternate hope and alarm, she died of a dropsy in the chest, in the night of the 29th of October. During the progress of her disorder to its fatal termination, Sir Samuel's mind was kept in a state of constant suspense and anxiety, until at length his sympathy with the amiable sufferer and an apprehension of the uncertain issue of her complaint, disordered his whole frame, deprived him of sleep or scared him with frightful dreams; and it is said, that on one occasion, after having been in a state of great distress, he intimated to a friend, that he felt a burning sensation in his head; and this seems to have been the only occasion on which he made a complaint of this kind. Alarmed about himself, he sought relief, and tried a variety of medicines without any permanent effect. "He frequently expressed his surprize, that his want of sleep did not interfere with his bodily health, that his appetite and digestion continued in full vigour, that no indication of fever existed, and that he felt no uneasy sensation in his head. In conversing with Dr. Roget and Mr. Dumont he dwelt much on this apparent anomaly, and drew from it the most ominous preface, as to the probability of its ending in insanity—an apprehension which unfortunately took deep root in his mind. Although in all other respects he was perfectly in possession of his faculties, yet on this subject his imagination

tion was certainly disordered, and we may trace, in the intensity of this dread, the incipient stage of mental derangement. A striking instance of this feeling appears in one of the testamentary papers written by him about this time, in which he gave particular directions as to the management of his property, the care of his children, and the custody of his person and estate, in the event of his becoming a lunatic. It may be remarked also, that the circumstance of his losing fight, in a great measure, of the primary cause of his grief, and of fixing his attention so much upon his own feelings, was so opposite to his natural disposition, as in itself to constitute a strong feature of aberration." Other circumstances, which occurred on his interviews with his friends, confirm the same observation.

On the morning after lady Romilly's death, when Dr. Roget informed him of the event, he received the intelligence with calmness and resignation, and without any effusion of grief; and prepared to quit the scene of his sorrows at the suggestion of his friends without hesitation or demur. At Murrel-greeu, where they lodged in their way to London, we learn from Dr. Roget, who passed the night in the same room with him, that, although he was in general restless, yet, at intervals, he enjoyed tranquil sleep: nor did he betray, at any period, the smallest sign of impatience or irritability. As he approached London, however, on the following day, his agitation increased, and he once complained to his daughter that his head was disturbed. After his arrival at his own house in town, he ate his dinner with his usual appetite; he then sent for Dr. Marcet, who inquired particularly concerning the state of his head, and was informed by sir Samuel, "that he had no head-ache, nor any uneasy sensation whatever in his head." "The symptoms present were those of a high degree of nervous irritation, unaccompanied by fever or any inflammatory action; but they were of a nature to excite considerable alarm as to the state of his mind. Though he refrained from giving vent to his feelings, it was evident, from his manner and from the expressions which dropped from him, that he despaired of his recovery, in spite of every endeavour to inspire him with hope and comfort." To the use of all means that were recommended for allaying his extreme irritation he objected; alleging, "that he must necessarily pass a wretched night, and that if he were to use any medical prescription, it would only have the effect of taking away all his confidence in the powers of medicine."

During the greatest part of the night, Dr. Roget, who slept in the same room, reports that he was perfectly tranquil and apparently asleep; though in the morning sir Samuel assured him, that he had never, for an instant, dropped asleep.

The next morning the restlessness returned, and was attended with symptoms of fever; the tongue became white during the night, and the pulse at one time rose to 130 in a minute. Upon consulting Dr. Marcet, it was proposed, at his suggestion, to apply ice to the head, and to have recourse to cupping; but before these measures were adopted, Dr. Babington was sent for, and before he arrived the excitement had subsided, and sir Samuel was much relieved by a copious perspiration. Upon consultation it was agreed, that the measures proposed by Dr. Marcet, in existing circumstances, would not be expedient; and other medicines of an active nature were prescribed. These were taken by sir Samuel without reluctance; and he continued tranquil and apparently asleep till about two o'clock. His daughter remained at the side of his bed, who observed upon his awaking, that he became restless and

agitated. Upon being asked whether Dr. Roget should be called, he replied in the negative; but upon a second inquiry, he faintly assented. During the short interval of Miss Romilly's absence, a sudden paroxysm had seized him, hurried him from the bed, and armed his hand against his own life. The razor with which he had inflicted the fatal wound was in his hand when Dr. Roget entered his apartment. Before he expired, as his biographer proceeds in the relation of the melancholy catastrophe, he made signs that he wished to write, but though supplied with pen and ink, nothing intelligible could be collected from his attempts. He then desisted from making them, and joining his hands, appeared, from the movements of his lips and eyes, to be absorbed in fervent prayer. It is hardly necessary to state, that the jury summoned on the coroner's inquest brought in a verdict, "that the deceased had destroyed himself in a state of temporary mental derangement."

Sir Samuel and his lady were interred at the same time, in the same grave, at Knill, the seat of her ancestors, in Herefordshire. The funeral, agreeably to the instructions of his will, was private; being attended only by his nearest relations and most intimate friends. Six sons and one daughter survived to lament the irreparable loss which they sustained. The calamitous event, which thus awfully terminated the life of sir Samuel Romilly on the 2d of November, 1818, in the 62d year of his age, made a deep impression, not only in the circle of his family and friends, but through the country in general. So highly was he respected and esteemed, that, on this melancholy occasion, "the solicitors suspended their practice; the counsel abandoned the courts; while the judge forsook the bench, after he had shed a torrent of tears!" The following singular circumstance is mentioned by his biographer, viz. that in the parish church of St. Bride, Fleet-street, there is a simple undecorated tablet placed against the wall, with an inscription on it to the memory of Mr. Isaac Romilly, F.R.S., who was the uncle of sir Samuel, and who died in 1759, *of a broken heart*, seven days after the decease of a beloved wife. For the materials and authentic documents that have furnished this article, we refer to the "Annual Biography and Obituary for the Year 1819," vol. iii.

ROMNEY, in *Geography*, a town of Grafton county, in New Hampshire, containing 765 inhabitants.

ROOFS, in *Rural Economy*. Add—Roofs of iron have lately been introduced with advantage. Mr. T. Pearfall of Bath has constructed several in the neighbourhood of Bristol and London: and on a comparison of a roof of this kind with that of timber, he observes, that the iron-roof is fixed on the walls *complete* for the covering; that the strength and durability of the iron must be allowed to be superior to those of wood; and that the prevention of fire should not be forgotten. By his statement, the whole expense of such a roof, erected over a brick-kiln near Bristol, 29 feet 3 inches in length, and 18 feet 6 inches in span, appears to have been 18*l.* 6*s.* 11*d.*

ROSAMOND, col. 2, l. 17, *r.* if it cannot be, &c.

ROSS, in Ohio, l. 1, *r.* 16. Add—Also, a township of Butler county, in Ohio, having 1321 inhabitants.

ROSSO of Florence, in *Biography*, called by the French *Maitre Roux*, was born in 1496, and without regular tuition arrived at a considerable degree of eminence in the art of painting. The works of Michael Angelo were his favourite studies, whose style he endeavoured to imitate without fervently following it. Hurried away by a lively imagination and great command of the pencil, he could not attach himself to the study of nature, or the antique, so steadily as he ought; hence, though his works exhibit great brilliancy of invention,

invention, grandeur in their masses, gaiety of colour, and taste in the management of the draperies, they are frequently wild and extravagant in composition and effect.

He exhibited his talents early in life, and painted when very young a large picture of the Assumption of the Virgin for the church of La Nunciata at Florence, which was distinguished by the novelty and intrepidity of its style. He painted several other pictures there, and then went to Rome, where reputation had already forerun him. In that city, he painted an altar-piece for S. Maria della Pace, and the Decollation of St. John for the church of St. Salvati. He remained there till it was sacked in 1527, and then fled to Votterra, where he painted a fine picture for the oratorio of St. Carlo. He went afterwards to Venice, and there painted for Aretin his celebrated picture of Mars and Venus; but not being sufficiently employed in Italy, he accepted an invitation from Francis I. of France, who then emulated the character of an encourager of art and science. By this munificent monarch, Rosso was employed both as an architect and painter, and the building and decoration of the palace of Fontainebleau were intrusted to his care, and he was gratified with a handsome pension, and lived in affluence and esteem, as he was not only an able artist, but a man of literary acquirements, and of polished and agreeable manners.

The unhappy termination of the life of Rosso affords a lesson to those whose minds are inclined to indulge suspicious sensations. He had lived in friendship with one Francesco Pellegrini, a Florentine painter, who was in the habit of visiting him occasionally. Soon after one of his visits Rosso's house was robbed of a considerable sum, and he rashly suspected Pellegrini to be the thief. He accused and prosecuted him, but he having endured examination and the torture, to which he was cruelly put to extort confession without any sign of guilt, was declared innocent. As soon as he was released, the unfortunate Florentine published a just and severe statement of his case, and appealed for justice; to this Rosso had nothing to plead, and to avoid the infamy and remorse to which the injustice he had been guilty of must necessarily subject him, he put an end to his existence by poison in 1541, at the age of 45. The greater part of his paintings at Fontainebleau was destroyed by his rival and successor Primaticcio, to make room for his own productions.

ROSS-SHIRE, col. 2, l. 2, for 13,280 r. 12,829; and after inhabitants, add—viz. 27,640 males, and 33,213 females: 7490 families being employed in agriculture, and 2499 in trade, manufactures, and handicraft.

ROSTRATA. See WHALE.

ROT, DRY, l. 2, add—See BOLETUS. Col. 7, at the close, add—Mr. Robert McWilliam, in a valuable "Essay on the Origin and Operation of the Dry-Rot, with a View to its Prevention or Cure; to which are annexed, Suggestions on the Cultivation of Forest-Trees, and an Abstract of the several Forest Laws, from the Reign of Canute to the present Time," &c. 1818, has demonstratively shewn, that the common practice of felling oak in the spring is an error which ought to be avoided; and that the seasoning of timber is not less important as a means of preventing this disease. This ingenious author considers fungi as a proximate cause of the dry-rot; and as to the origin of fungus, he knows of no sound argument against its having been created, like other vegetables, at the beginning of all things. After many investigations and researches, the cause of vitality has not been satisfactorily ascertained. Dr. Darwin, in his Speculations on the Origin of Microscopic Beings, adopted the incomprehensible doctrine, that their vitality is spontaneous. Buffon, Reaumur, Priestley, Ellis, Ingen-

houz, and many others, have been bewildered in their conjectures and hypotheses respecting this subject. After all, whether the parents of microscopic beings, animal and vegetable, exist universally and invisibly in the atmosphere, according to Dr. Priestley's theory; or whether their vitality be spontaneous, according to the hypothesis of Dr. Darwin, we must admit the fact, that nature suffers no fit recipient for animal or vegetable life to remain void; that microscopic beings of both kingdoms are always ready to seize on every thing which can afford them subsistence; and that fungi find an appropriate nidus in diseased and decayed vegetable matter, more particularly if it continues in a state of moisture and warmth; whence the wood-work and walls of vaults are usually covered with mouldiness or mucor. It has been maintained by writers on this subject, as well as by our author, that fermentation always takes place in the vegetable matter destroyed, previously to the appearance of the fungus; but as all sap-wood, whenever felled and employed either in a green or seasoned state, contains a greater or smaller quantity of saccharine matter, this matter, under certain degrees of continued warmth and moisture, is disposed to run into fermentation. In the process of putrefaction, carbonic acid gas and hydrogen gas are evolved in great abundance; and as carbon and hydrogen are essential constituents in the pabulum of plants (whatever may be the origin of their vitality), we thus obtain some knowledge of their mode of support. To deprive these noxious fungi of the means of subsistence is the great desideratum in the prevention or cure of the dry-rot. Of the fungi which attach themselves to buildings, Mr. McWilliam enumerates the following; viz. mucor or mould, boletus lachrymans, agaricus coriaceus, A. domesticus, and an agaricus resembling Mr. Sowerby's A. bulbosus. These fungi are easily propagated either by seed or root; the latter shooting in various directions will lay hold of timber, and penetrate into its fissures or crevices. In preparing cement for buildings, these vegetable substances should be carefully excluded; as they are sometimes brought with the scrapings of public roads, sometimes in the water from stagnant pools, which contain myriads of seeds that are capable of germination, and only require a favourable temperature to start into life; and whoever considers the facility with which fungi are generated, it seems surprising that any building should be exempt from the ravages of the dry-rot, rather than that some should be attacked by it. Warmth, moisture, and air, are accessory to the germination and support of fungi; but a redundancy of any of the three, according to the present author, will destroy the equilibrium on which their action depends, and the dry-rot will cease till that is restored, when the disease resumes its activity. The range of temperature within the limits of which fungi will vegetate is prodigious. The dry-rot will proceed rapidly at 80°, as is evident from the circumstance of ships returning from tropical climates, almost covered with fungi; at 90°, 100°, 110°, its progress becomes more and more slow, and at 120° it will in general be arrested; but Mr. McWilliam thinks, that no degree of heat short of combustion will destroy, though it may suspend, its corrupting influence. In descending the scale of the thermometer, it is found that the dry-rot proceeds very fast at 50°, more slowly at 40°, and is only suspended at 32°; for no degree of cold with which we are acquainted will destroy the corrupting principle, and prevent its return after the temperature has been raised to 45° or 50°. Hence it is obvious, that the application of mere local and artificial heat can be of little or no avail. The great remedy, or preventive, on which Mr. McWilliam principally relies is, in accordance with the general theory, the free circulation

culatation of atmofpheric air, and the application of heat may be useful as an auxiliary in promoting fuch a circulation. He obferves, that even atmofpheric air itfelf mult be applied with fome difcretion: for if in its paffage through any part of a building which is damp and already affected it fhould become impregnated with noxious gases, and be charged with any of the volatile feeds of fungi, it may do more harm than good. It is neceffary, therefore, *in limine*, to remove the infected materials, the difcovery of which requires a penetrating eye.

Water is likewife a powerful agent in preventing and remedying the ravages of the rot; and many inftances have occurred that prove the antifeptic properties of water acting on wood entirely fubmerged in it. But when water is applied as a fubftitute for air in cellars, vaults, &c. care mult be taken that it does not flagnate, but flow regularly through the drains; in which cafe it will carry off with it much of the carbonic acid gas, which is fo eflential a pabulum to fungi.

The charring of timber is of very ancient ufe, and againft external infection is an admirable prefervative; but when the principles of decomposition are within, it is of very little advantage in refifting them. Paint, when the timber is properly feafoned and dry, is likewife very beneficial. For other interefting particulars relating to this fubject, we mult refer to the author's Eflay.

ROVING. See MANUFACTURE of Cotton.

ROUM. For KALA r. KELA.

ROWEN. Add—of whom 3757 were flaves in 1810.

ROXBURGHSHIRE, l. 23, for 6518 r. 6423; after inhabitants, add—viz. 17,113 males, and 20,117 females: 3763 families being employed in agriculture, and 2487 in trade, manufactures, or handicraft.

RUBY, SPINEL. See MINERALOGY, *Addenda*.

RUDGELEY. In 1811, the parifh contained 453

houfes, and 2213 perfons; viz. 1089 males, and 1124 females; 101 families being employed in agriculture, and 277 in trade, manufactures, and handicraft.

RUMFORD, l. 1, for Cumberland r. Oxford. Add—It has 620 inhabitants.

RUSCOMB MANOR, a township of Berks county, in Pennsylvania, having 932 inhabitants.

RUTHERFORD. Add—of whom 979 were flaves in 1810. Add—Alfo, a county of Weft Tennessee, having 10,265 inhabitants, of whom 2701 were flaves in 1810.

RUTILE. See MINERALOGY, *Addenda*.

RUTLAND, in America, l. 7, r. 17 townfhips.

RYE, *Chemical Compofition* of. This grain has been analysed by Einhoff; according to whom 100 parts of good rye-meal confift of

S.

SABINE, in *Geography*, a river of Louisiana, being a temporary boundary between the United States and the Spanifh internal provinces, and part of the permanent weftern limits of the itate of Louisiana. This river difcharges itfelf into the gulf of Mexico, in N. lat. 29° 23' and W. long. 93° 57', or 10° 57' W. from Washington city. The depth of water at its mouth is not more than four feet on the bar in ordinary tides. This river about 12 miles from its mouth expands into a wide fhallow lake, 10 or 12 miles wide and 25 long, with a bearing N.E. and S.W. At the extremity of this lake, it receives both the Sabine and Netchez. A line of fea-fhell banks is formed along the fhore of the lake between the two rivers, and on

the point on the left fhore of the Sabine, an increafed mount of thefe fhells is found, covered with dwarf trees. About 15 or 20 miles above the lake, wood presents itfelf in larger bodies, and the wood rifes by a flow gradation; and as we advance the woods inclofe the river on both banks, the fream becoming contracted to the width of 150 yards, and fo continuing with little variation as high as the Alabama villages, where it thrieks to 70 or 80 yards in breadth, and it preferves this breadth to N. lat. 32°. The force of the Sabine has not yet been precifely afcertained; nor have any fettlements of civilized people, a fingle family excepted, been yet made on the Sabine. The weftern branch of the Sabine is called *Netchez*; which fee.

SACLACTIC ACID, in *Chemiftry*. This acid has been recently analysed both by Gay Luffac and Thenard, and by

by Berzelius. According to these chemists, it is composed of

	Gay Lussac and Thenard.	Berzelius.
Hydrogen	- 3.62	- 5.105
Carbon	- 33.69	- 33.430
Oxygen	- 62.69	- 61.465
	<hr/> 100	<hr/> 100

Which coincide nearly with 5 atoms hydrogen + 6 atoms carbon + 8 atoms oxygen; according to which, the weight of its atom will be 131.25.

SACO, in *Geography*, a town of Maine, in the county of York, having 2492 inhabitants.

SADDLE RIVER. Add—Alfo, a township, containing 2174 inhabitants.

SADSBURY. Add—Alfo, a township of Lancaster county, in Pennsylvania, having 843 inhabitants.—Alfo, a township in Crawford county, in the same state, having 540 inhabitants.

SAHLITE. See SAHLITE, and MINERALOGY, *Addenda*.

SAL SEDATIVUS, &c. add—after *Sedative* SALT, under SALTS.

SALEM, l. 9, add—This county contains nine townships, and 12,761 inhabitants, including 29 slaves in 1810; l. 24, r. 12,693; l. 52, for two r. three; l. 54, add—and a third in Mercer county, having 470 inhabitants.

SALEM, *New*, a town of Hampshire county, in Massachusetts, containing 2107 inhabitants.

SALEM, *West*, a township of Mercer county, in Pennsylvania, having 660 inhabitants. Col. 2, l. 5, add—SALEM, in Belmont county, Ohio, contains 374.—SALEM, in Cham-

paign county, 1021.—SALEM, in Columbiana county, 839.—SALEM, in Jefferson county, 912.—SALEM, in Tuscarawara county, 442.—SALEM, in Geauga county, 334.—SALEM, in Washington county, 248 inhabitants.

SALFORD. Add—the upper contains 838, and the lower 558 inhabitants.

SALINE, a township of Gallia county, in Ohio, having 262 inhabitants.

SALINES. Add—This town appears from the entrance into Salines bay covered with that white fog, so much dreaded, and so well known in Italy by the name of *mal-aria*. Whenever this phenomenon occurs, the heat upon the island is excessive. Salines, and the towns situated on the E. and N.E. coasts of the island, are subject to such dangerous temperature, that in the months of June and July, persons fall victims to the afflicting malady called by the French Coup de Soleil (a sun-stroke), if they venture out at noon without an umbrella. The great heat experienced upon the eastern coasts of Cyprus is owing to two causes: to the situation of the island with respect to the Syrian, Arabian, and Lybian deserts; and to its mountainous nature, preventing the cooler winds, the west and north-west, from the low shores to the east and north-east.

See CYPRUS.

SALISBURY, a township of Gallia county, in Ohio, containing 460 inhabitants.

SALIVA, *Chemical Composition of*. According to the experiments of Berzelius, 1000 parts of human saliva consist of

Water	- - -	992.9
Peculiar animal matter	- - -	2.9
Mucus	- - -	1.4
Alkaline muriates	- - -	1.7
Lactate of soda and animal matter	- - -	.9
Pure soda	- - -	.2
	<hr/> 1000	

The peculiar animal matter is soluble in water, insoluble in alcohol, and is precipitated by subacetate of lead. Hence it appears to be a species of mucus. What Berzelius has termed *mucus*, Dr. Boileau and Dr. Thomson appear to consider as coagulated albumen.

SALMO ALPINUS. Dr. Shaw suggests, that this is the gilt charr of Pennant, and the next species or Salvelinus is his red charr. TAIMEN, l. *penult.* r. 3½ feet. KUNDSCHA, l. 3, r. 2 or 3. LAVARETUS, add—See GWINIAD. Dr. Shaw supposed that the gwiniaid of Pennant is the S. WARTMANNI; r. LEUCICTIUS. EBENTULUS, or toothless, silvery-olive, salmon, with compressed yellow head, lanceolate red fins, and forked tail: a native of Surinam, where it is highly esteemed as food; r. ANASTOMUS.

SALT, col. 3, l. 31, r. *fibvery* for *ffibvery*. Col. 4, l. 7, r. *fibvery* for *ffibvery*.

SALT, *Lavus relating to*, col. 7, l. 2c, add—Mr. Parkes informs us, that he has made inquiry of one of the most considerable falt-importers, who informs him, that they pay only 5s. 8d. city-duty on the cargo, whether it be five tons or fifty tons of the falt imported.

SALTS, *Supertartrate of Potash*, l. 8, inferit—See TARTRATE.

SALTS, in *Chemistry*. It may be proper to observe here, that a large proportion of the numbers representing the weights of the atoms of bodies given under our article SALTS in the Cyclopædia require correction; for which purpose we refer our readers to the tables appended to *Atomic Theory*, and to the different articles in the *Addenda*, where they will find the most recent determinations.

SALT Creek, in *Geography*, a township of Muskingum county, in Ohio, containing 389 inhabitants.—Alfo, a township of Pickaway county, in Ohio, containing 810 inhabitants.

SALT-Lick Town, l. 1, add—in the county of Pennsylvania, having 994 inhabitants.

SAMI, col. 2, l. 24 from bottom, for *fiction* r. *friction*.

SANBORNTOWN, l. 2, r. Strafford.

SANDERSFIELD, a town of Berkshire county, in Massachusetts, containing 1648 inhabitants.

SANDHURST, near Bagshot, in Hampshire.—The royal military college, part of which is now established at Sandhurst, consists of a *senior* and *junior* department. The *senior* department was established at High Wycombe, in the year 1799, (but has recently been removed to Farnham, in Surrey) for the purpose of instructing officers in the scientific parts of their profession, with a view of enabling them better to discharge their duty when acting in the command of their regiments, and at the same time qualify them for being employed in the quarter-master and adjutant-general's department.

No officer can be admitted into this department until he has completed the twenty-first year of his age, and actually served with his regiment as a commissioned officer for three years abroad, or four years at home. Applications for admission must be made to the governor through the colonel or commanding officer of the regiment to which the individual belongs. Every candidate, previous to admission, must undergo such examination as may be deemed requisite.

The students pay into the funds of the college such sum annually as is determined by the supreme board of commissioners. The present subscription is thirty guineas *per annum*. They are subject to the rules and discipline of the army, as if serving with their regiments.

The studies pursued at this department are as follows:—Mathematics in all its branches; fortification; gunnery; castrametation; military drawing and surveying; the recon-

noiring of ground; the disposition and movement of troops under all the various circumstances of offensive and defensive war; rules for estimating the military resources of a country; and the German and French languages.

There are six professors in this department, *viz.* one mathematics, &c.; one fortification; two military drawing; one French; one German.

Public examinations on points of science are held half yearly, in preference of the collegiate board, upon which occasion one or more members of the supreme board, not being members of the collegiate board, attend. Those officers who have gone through the regular course of studies, and have passed that examination by which they may be duly qualified for staff appointments, receive certificates thereof, signed by the board, and sealed with the seal of the college.

The junior department was first established at Great Marlow in 1802, (but has recently been removed to Sandhurst, near Bagshot), to afford a provision for the sons of officers who have fallen, or been disabled, in the service of their country; and the means of education to the sons of those officers who belong to any regular regiments. It consists of four companies, of 103 cadets each. They are admitted upon three different establishments, *viz.*

1st. Orphan sons of officers who have fallen or been disabled in the service, are admitted free of expence, except in bringing the first suit of uniform on their admission, and keeping up their stock of linen during their residence at the college. They are provided with board, clothing, and education, by the establishment, free of charge.

2d. The sons of officers actually serving in regular regiments of the line, who pay a certain sum *per annum* (from 10*l.* to 60*l.*) according to the rank of their fathers.

3d. The sons of noblemen and gentlemen, who pay 100*l.* *per annum* each.

Applications for admission must be addressed to the governor. — Every candidate previous to admission must pass an examination in Latin and English grammar, and the first four rules of arithmetic. No candidate can be admitted who is under thirteen years of age, or above fifteen.

There are examinations held monthly, which are conducted by the professors of the senior department, to ascertain the progress of each cadet, previous to his removal from one class to another. There are also public half yearly examinations upon the same principle as those at the senior department, previous to the cadets receiving commissions from the college; and, according to their proficiency in the course of studies, they have certificates of qualifications to serve in the army as officers, granted to them by the board of commissioners, in whose presence the examination takes place.

The studies pursued at this department are as follows; — Mathematics; fortification; military drawing; landscape drawing; history, geography, and classics; French; German; and fencing.

There are seven masters of mathematics; four of fortification; five of military drawing; three of landscape drawing; four of history, geography, and classics; six of French; one of German; three of fencing.

Gentlemen cadets are allowed to purchase commissions at any time during their continuance at the college; but no gentleman cadet can be recommended for a commission by private interest until he has made a certain progress in his studies. See WOOLWICH and HIGH WYCOMB.

SANDYSTON, a town of Essex county, in New Jersey, having 703 inhabitants.

SAND-STONE, l. 10, r. to be visible. In other sandstones, the grains, &c.

SANDY CREEK. Add—Also, a township of Mercer county, in Pennsylvania, containing 327 inhabitants.

SANDY Lake, a township of Mercer county, in Pennsylvania, having 403 inhabitants.

SANGUISORBA. Add after *S. officinalis*—Mr. Parkes, in his "Chemical Essays," (vol. v. p. 12.) informs us, on the authority of a tanner, that there is more of the tanning principle in the plant called burnet than in oak-bark. His informant suggested, that it might be cultivated for cattle, which (he says) are fond of it, and ploughed up every three years in order to collect together the root for the purpose of tanning.

SANSANDING. Add—Sansanding is called Badoo, and in Park's last mission to Africa is represented as a small town, consisting of 300 huts; another Badoo, N. of this, is called *Sansamba*. Sansanding is said to contain 11,000 inhabitants; it has no public buildings, except the mosques, two of which, though built of mud, are not inelegant. The market-place is a large square, strewed with articles of merchandize, and crowded with people. Some of the stalls contain nothing but seeds; others, indigo in balls; others, wood-ashes in balls; others, Houssa and Jinnie cloth. Here are also, antimony, sulphur, copper and silver rings and bracelets, amber, silks from Morocco, tobacco and salt, yellow leather, &c. &c. Park's Last Mission to Africa, p. 216.

SAP, *Chemical Composition of*. Add—Dr. Prout has examined the sap of the common vine. He found its sp. gr. did not differ from that of common water. It did not affect litmus paper, and contained but little of solid matter, that 2300 parts of it evaporated to dryness left only one part of residuum, of which about half was carbonate of lime, and the rest a peculiar vegetable matter insoluble in alcohol, with traces of an alkali.

SAPHIES, an African term which denotes certain charms or amulets, which the negroes constantly wear about them. These saphies are prayers, or rather sentences from the Koran, which the Mahometan priests write on scraps of paper, and sell to the simple natives, who regard them as possessing very extraordinary virtues. Some of the negroes wear them to guard themselves against the bite of snakes or alligators; and in this case, the saphie is commonly inclosed in a snake's or alligator's skin, and tied round the ankle. Others have recourse to them in time of war, to protect their persons against hostile weapons; but the common use to which these amulets are applied is to prevent or cure bodily diseases; to preserve from hunger and thirst, and generally to conciliate the favour of superior powers under all the circumstances and occurrences of life.

Similar charms or amulets are common in all parts of Africa, under the different denominations of *domini*, *grigri*, *fetiche*, &c. &c.

SAPPHIRE. See MINERALOGY, *Addenda*.

SARASWATI, col. 2, l. 23 from bottom, for creature r. creative. Col. 3, l. 8, for Jayatri r. Gayatri. Col. 5, l. 11 from bottom, for painted r. pointed.

SARATOGA, l. ult. r. in 1810; add—of whom 107 were slaves.

SARKFOOT. Add—In 1811 the parish of Graintry contained 333 houses, and 1749 persons; *viz.* 797 males, and 952 females.

SAROS, l. 4, add—Berofus used this period, and also *Neros* and *Sofos* (which see), in chronological calculations, and fixing the epochs of his history of Babylon. Ancient authors, however, are not agreed as to the number of years contained

contained in the Saros. Syncellus, after Berofus, Abydenus, Alexander Polyhitor, &c. affirm, that it was a period of 3600 years, which is by no means probable. Dr. Halley agrees with Suidas in identifying the faros with the period of 223 (not 222 of Suidas) synodic lunar months mentioned by Pliny, which amount to nearly eighteen of our years; a period which furnishes an easy method of predicting eclipses within the limits of the error of only half an hour; and the formation of this cycle evinces the skill of the Chaldeans in astronomical computation.

SAVANNAH, 1. *penult.* *inert*—the slaves in the county being 7557, and in the town 2195.

SAUCON, *Lower* and *Upper*, two townships of Northumberland county, in Pennsylvania, the former containing 1074, and the latter 1456 inhabitants.

SAVING-BANKS, or *Banks for Savings*, are institutions which, under this appellation, are of recent origin, and which have been established for the purpose of ameliorating the condition of the lower classes of mankind. Many schemes, of various denominations, have been propoised with a view partly, or wholly, to this object. One of the most ancient of this kind is the institution of male *Friendly Societies*, which was established about a century ago, and which, to a certain extent, counteracted the pressure of poor-rates, and the growth of those baneful habits of dependence which poor-rates are adapted to produce. (See *FRIENDLY Societies.*) These societies, though they partake of the nature of insurances on life and property, by promising certain advantages in the event of certain casualties or contingencies, are, however, preferable to common insurance offices, inasmuch as the members insure each other, and retain all the profits in their own hands for the general advantage. In these societies, there is also a benevolent principle that influences those who form them, and induces them to feel and express a solicitude for each other's welfare. Nevertheless, the benefits derived from them by individual members are often distant, and in their nature uncertain; so that those who have regularly contributed to them for forty or fifty years have not received a shilling from their funds. In the year 1772, baron Maseres published "A Proposal for establishing Life Annuities in Parishes, with a View to the Benefit of the Industrious Poor;" and this was accompanied with the suggestions of some alterations by the Rev. Dr. Price. The ingenious baron recommended to the nation, to obtain a law for enabling the parish-officers in England to grant, upon purchase, to the labouring inhabitants life-annuities, payable out of the parish-rates. The plan was approved by persons of the most distinguished character at that period, and a bill was brought into the house of commons by Mr. Dowdswell, under the auspices of Mr. Burke, sir George Savile, Lord John Cavendish, Mr. Dunning, Mr. Thomas Townshend, and others, for carrying it into effect. The bill was passed, but it miscarried in the house of lords at the second reading. However desirable and excellent this plan might appear in theory, it was not likely to prove effectual; because, for the purchase of the proposed annuities, a sum of money, of great amount to the purchaser, was demanded at once; and it was out of his power to procure it. A scheme somewhat resembling that of a saving-bank was published in 1797 by Mr. Bentham, in Young's "Annals of Agriculture." One part of his plan comprehended an institution which he denominated "A Frugality-Bank." Into this bank he proposed to receive the deposits of the poor, not for the mere purpose of yielding an interest, and being withdrawn when wanted, but to form or purchase an annuity for old age, when

the ability for earning would be destroyed or impaired. He suggested, however, that this superannuation annuity should, either wholly or in part, be converted into any other species of benefit adapted to the exigencies of the owner. *E. gr.* It might be changed into an annuity for an exiling wife, in the event of widowhood, or into an annuity during the nonage of a certain number of children; or it might serve as a pledge for money borrowed; or part of it might be sold for raising a marriage-fund; or it might be simply withdrawn. As no attempt was made for the accomplishment of Mr. Bentham's plan of a frugality-bank, it remained without effect. It is needless to mention, or to detail, the various particulars of a plan submitted to the public by Mr. Bone in the years 1805 and 1806; as it comprehends a great number of objects which lay beyond the attainment of the poor.

It was still a matter of regret that, notwithstanding various schemes that had been suggested, no plan had been devised for securing to the labouring classes a place of safe deposit for the fruits of their industry, so as to encourage them to save, in the years of active exertion, such a portion of their gains as they might be able to spare from their present necessities, so that they might have a resource in the season of misfortune, or in the decline of life; and more especially to afford them the advantage of receiving regular interest for their small savings, on a scale advancing to a certain extent, in proportion to the amount and continuance of their deposits. Of the first establishment of an institution that may properly be called a saving-bank, we have an account in N^o 84. of "The Reports of the Society for bettering the Condition of the Poor." From this report it appears, that a female benefit-club was established on the 22d of October, 1798, at Tottenham, near London, under the patronage of a number of ladies. This institution comprehended within its general design and plan two other objects, *viz.* a fund for loans to prevent the use of pawnbrokers' shops, and a "bank for the earnings of poor children." "Children of either sex," says Mrs. Priscilla Wakefield, an ingenious and benevolent lady, whose pen was employed in the instruction of the public, and whose heart was actuated by a generous concern for benefiting those by whom she was surrounded, "or of whatever age, whether belonging to a member or not, are permitted to bring any sum above a penny to the monthly meeting of the stewardesses, to be laid up in the funds of the society; where their small earnings may accumulate in security, until wanted for an apprentice-fee, clothing, or going to service, or some other important purpose." It is added, "although the children receive no addition to the pittance they deposit in the fund, yet it answers several purposes; it stimulates them to earn and to save that which would probably be idly spent, as of too small importance for care; it often encourages their parents to lay by a little store for them, which they would not have thought of doing, had they not been invited by this opportunity of placing it in safety. It habituates the children to industry, frugality, and foresight; and by introducing them to notice, it teaches them the value of character, and of the esteem of those who, by the dispensations of Providence, are placed above them; and in many instances, it may supply a resource when it is essentially requisite. The success has already exceeded expectation; above sixty children bring their little treasure monthly." The success of this children's-bank gave rise to a more extensive plan in the same place in 1804, called "The Charitable or Benefit Bank." This was begun for the express purpose of providing a safe and profitable place of deposit for the savings of labourers,

SAVING BANKS.

labourers, servants, &c., and opened once a month for receipts and payments. The books were at first kept by a lady; six wealthy individuals were appointed to act as trustees, each of whom agreed to receive an equal part of the sums deposited, and each to be responsible to the amount of 100*l.* for the repayment of the principal with interest. Any sum above 1*s.* was to be received, and, to encourage perseverance, interest at the rate of five *per cent.* was to be allowed for every 20*s.* which should remain a year with the trustees. For every additional 100*l.* it was agreed that a new trustee should be chosen; and thus the loss to the trustees in fulfilling their engagement, with the fluctuation of interest, could not be considerable. The benefits of the institution were to be confined exclusively to the labouring classes; but the residence of the depositors was not restricted. One great advantage attending this plan is, that it holds out to the lower classes fixed advantages, and preserves their little property from that fluctuation of value to which the public funds are liable. This was the first distinct "Bank for Savings," publicly set on foot for the benefit of the lower classes: it was founded by Mrs. Wakefield, and remained for some time under her inspection and management. Mrs. Wakefield was succeeded in the labour of conducting it by Mrs. Powell, who has appointed a treasurer, "to whom," she says, "I account after every monthly meeting, that I may not be responsible *myself* for the money lodged in my hands; and I have the purchases made in the funds placed in the names of two trustees." This excellent female adds, that the benefits resulting from this institution are incalculable, as it has enabled many to save sums which have made them comfortable for life, who would otherwise have spent the money at an ale-house, or lent it to their friends. "I keep," says Mrs. Powell, "the whole of the accounts myself; and carry on the business on so easy and simple a plan, that I have nothing to relate. I merely receive and pay principal and interest the first Monday in every month, for an hour and a half. I have no assistance whatever, except that I send any money I have to the treasurer, and now and then compare his cash-book with my own. The only care I have is to keep the respective accounts correct. I have a ledger, a cash-book, an interest account, and a waste-book.—I call a meeting of the trustees once a year to audit my accounts, and those of the treasurer, which are the counterpart of mine." In July 1817, an act was passed for the protection and encouragement of banks for savings in England; and the several provisions and arrangements of this useful act are minutely detailed in the last edition of Mr. Rose's excellent "Tract on Saving Banks." Societies similar to those of the banks for savings have become of late years very numerous both in England and Scotland; and in England and Wales many of them have opened accounts with the bank of England under the late act of parliament.

Although some few institutions of the same and others of a similar kind had been established soon after the commencement of the present century, yet their increase was slow and inconsiderable until the year 1810; when the Rev. Mr. Henry Duncan, availing himself of one of the provisions of Mr. Bone's plan already mentioned, published an account of it, and proposed that the gentlemen of Dumfriesshire should establish banks for savings in the different parishes of the county. Whilst his zeal was applauded, his recommendation was disregarded. However he steadily persevered, and determined to make the experiment in his own parish; and denominated his new establishment "The Parish Bank Friendly Society of Ruthwell." He so far succeeded,

that at the time of publishing the second edition of his essay, his capital amounted to a sum exceeding 1400*l.* About the beginning of the year 1813, a very respectable and useful society was established at Edinburgh for the suppression of beggars. Mr. J. H. Forbes, an active director of this anti-mendicant society, having acquainted himself, by a perusal of the reports for bettering the condition of the poor, with the plan of the charitable bank at Tottenham, and with the regulations of the servants' fund at Bath instituted in 1808, proposed a plan and adopted regulations for the establishment of a savings' bank in the metropolis of Scotland. From the time of the publication of the first edition of the Essay on Parish Banks, the second Report of the Edinburgh Society, and the Report of the Provident Institution at Bath, saving banks have multiplied to such a degree as to leave no room for doubt that the benefit of the system will be soon communicated to every town and village in Great Britain and Ireland. It does not appear, however, that any institution of this kind of any note was opened in London till the end of January in 1816, when the "London Savings' Bank" commenced its operation. But they are now prevalent through various parts of the city and suburbs. Of their importance and utility none can entertain any doubt; although, like other useful schemes, they may be liable to some objections. The lords' committee in their report on the poor laws, bear the following testimony in their favour. "The committee are decidedly of opinion, from every information they have received, that it is expedient to recommend the adoption of 'Provident or Saving Banks,' as likely to increase the comforts and improve the condition of the poor, and to render them less dependent on parochial relief; which, under the best and most considerate administration of it, can never be so satisfactory to the person who is the object of it, or so consistent with those honourable feelings of pride and independence, which are implanted in the breast of man, as that resource which is the result of his own industry and the produce of his own exertions." The commons' committee also report, "that they have had no difficulty in perceiving how every extension of the poor's fund is in general sure to be followed up by a more than proportional increase of actual poverty;" nor has it escaped their observation, "that the relaxation of *providential* and *economical habits* is sure to go much beyond the capability of any instituted fund to meet the effects of this relaxation." "If your committee have been desirous to recommend some gradual but effectual check to the otherwise certain growth and ultimately inevitable effects of the present system of poor laws, they have not been less attentive to the duty of suggesting every possible means of affording special encouragement and facility to meritorious industry, for rescuing itself from the evils of an habitual reliance on parochial relief; and they have looked to this part of the subject with the more anxiety, from the entire conviction, that in proportion to the aggregate number of persons who are reduced to this unfortunate dependence, must be not only the increase of misery to each individual, but also the moral deterioration of the people, and ultimately from the concurrent tendency of these evils, the insecurity and danger of the state itself. The encouragement of frugal habits would, in any state of society, be an object of importance, but your committee are strongly impressed with the opinion, that, in the present situation of the poor of this country, it is chiefly by the gradual restoration of a feeling of reliance upon their own industry, rather than upon the parochial assessments, that the transition to a more wholesome system can be effected.

"Your committee have the satisfaction of seeing the institutions for the secure and profitable deposit of the earnings of the industrious, which was heretofore projected, are now by the spontaneous exertions of individuals, in actual and successful operation; and from the growth of the system of savings-banks, they are inclined to expect very beneficial results, not only in affording to the industrious poor a secure deposit for their savings, but in familiarizing them with a practice, of which the advantage will be daily more apparent." Both the above cited reports are justified by ample evidence from the testimony of individuals, which is annexed to them. We shall here subjoin an extract from the third report of the "Edinburgh Society for the Suppression of Beggars," 1815. "To improve permanently, and effectually to better the condition of the poor, can be accomplished only by encouraging among them habits of industry, sobriety, prudence, and foresight. The very general adoption of the plan of instituting savings' banks shews, that the genuine and enlightened principles of benevolence are beginning to be well understood, and will be zealously acted upon whenever a proper opportunity occurs; for no scheme seems better calculated for the comfort of the poor than this simple plan for enabling the poor man to lay up in the day of health for the hour of sickness. *It relieves from want without checking industry;—it secures independence without inducing pride;—it removes those painful misgivings which render the approaches of poverty so appalling, and often paralyze the exertions which might ward off the blow;—it leads to temperance and the restraint of all the disorderly passions, which a wasteful expenditure of money nourishes;—it produces that sobriety of mind, and steadiness of conduct, which affords the best foundation for the domestic virtues in humble life.* The effects of such an institution as this upon the character of the people, were it to become universal, would be almost inappreciable." But it would be endless to cite authorities for establishing a principle so universally acknowledged by all whose observation and experience render them competent judges. We are therefore the more surprised to find it asserted in the part of the Supplement to the Encyclopædia Britannica recently published, that "taken by themselves, it is at least a doubt whether savings' banks may not produce as great a quantity of evil as good." See *Annals of Banks for Savings*. London. Richardson, &c. 1818.

SAYBROOK. Add—In 1810 it contained 3994 inhabitants, including 5 slaves.

SCALE of Chemical Equivalents. The description of this ingenious and useful instrument, contrived by Dr. Wollaston, has been omitted in its proper place; but its importance demands that it should be introduced here.

The author states, that he does not offer this instrument as an attempt to correct the estimates that have been formed by others, but as "a method by which their results may be advantageously applied, in forming an easy approximation to any object of our inquiries."

"The means (to use Dr. W.'s own words) by which this is effected, may be in part understood by inspection of the plate, (*Chemistry, Plate XXI. figs. 5, 6.*), in which will be seen the list of substances intended to be estimated, arranged on one or other side of a scale of numbers in the order of their relative weights, and at such distances from each other, according to their weights that the series of numbers placed on a sliding scale can at pleasure be moved, so that any number expressing the weight of a compound may be brought to correspond with the place of that compound in the adjacent column. The arrangement is then such, that the weight of

any ingredient in its composition, of any re-agent to be employed, or precipitate that might be obtained in its analysis, will be found opposite to the point at which its respective name is placed.

"In order to shew more clearly the use of this scale, the plate exhibits two different situations of the slider, in one of which oxygen is 10, and other bodies are in their due proportion to it; so that carbonic acid being 27.54, and lime 35.46, carbonate of lime is placed at 63. In the second figure, the slider is represented drawn upwards, till 100 corresponds to muriate of soda, and accordingly the scale then shews how much of each substance contained in the table is equivalent to 100 of common salt. It shews with regard to the different views of the analysis of this salt, that it contains 46.6 dry muriatic acid and 53.4 of soda, or 39.8 sodium and 13.6 oxygen: or if viewed as chloride of sodium, that it contains 60.2 chlorine and 39.8 sodium. With respect to re-agents it may be seen, that 283 nitrate of lead containing 191 of litharge employed to separate the muriatic acid, would yield a precipitate of 237 muriate of lead, and that there would then remain in solution nearly 146 nitrate of soda. It may at the same time be seen, that the acid in this quantity of salt would serve to make 232 corrosive sublimate, containing 815.5 red oxyd of mercury, or would make 91.5 muriate of ammonia, composed of 62 muriatic gas, (or hydromuriatic acid,) and 29.5 ammonia. The scale also shews, that for the purpose of obtaining the whole of the acid in distillation, the quantity of oil of vitriol required is nearly 84, and that the residuum of this distillation would be 122 dry sulphate of soda, from which might be obtained by crystallization 277 of Glauber's salt, containing 155 water of crystallization. These and many more such answers appear at once by bare inspection, as soon as the weight of any substance intended for examination is made by motion of the slider, correctly to correspond with its place in the adjacent column.

"With respect to the method of laying down the divisions of this scale, those who are accustomed to the use of other sliding rules, and are practically acquainted with their properties, will recognize upon the slider itself the common Gunter's line of numbers (as it is termed), and will be satisfied that the results which it gives are the same that would be obtained by arithmetical computation." See *GUNTER'S Scale*.

This scale may be had at the different mathematical instrument-makers; and we need scarcely add, that the numbers laid down upon it differ a little from those recently determined by Dr. Thomson. These differences, however, are in general very trifling; but should any one prefer using the new numbers, they will find them stated in the tables appended to *ATOMIC Theory*.

SEEING, col. 3, l. 5, add—Dr. Wells, in his “*Essay on single Vision with two Eyes*,” has reduced the principal opinions upon this subject into two classes. The first class comprehends those of Galen, Alhazen, Rohault, Dr. Briggs, and Sir Isaac Newton; all of whom have regarded the question as equivalent to the following one: Why should the mind be affected with only one perception from two impressions upon the external organs of sight, since either of those impressions is of itself sufficient to produce a similar perception? To this question they reply, that the two impressions are united before they are communicated to the mind, and they only differ concerning the manner in which such an union takes place. Against the opinions now stated Dr. Wells objects, that they must be considered as mere conjectures, founded upon certain supposed changes in the brain and nerves, the existence of which, from the nature of the parts, it is impossible either to demonstrate or to refute by experiments; and that no one of them, though admitted to be true, is yet sufficient to explain the phenomena on account of which it was framed. To the second class, Dr. Wells refers the opinions of those who maintain, that an object is seen single by both eyes, because it is seen by each of them in the same external place; and who profess to point out some law, or constant rule of vision, from which this sameness of place is to be derived as a necessary consequence. This view of the question, as our author imagines, was first suggested by Aguilonius, and it has been since adopted by Dechales, Dr. Porterfield, Dr. Smith of Cambridge, and Dr. Reid of Glasgow.

Aguilonius, who has been followed in the same train of reasoning by Dechales and Dr. Porterfield, begins with defining the terms *horopter* and *plane of the horopter*. If a

line be drawn through the point of the mutual intersection of the optic axes, parallel to the interval between the eyes, this from its office is denominated the horopter; and a plane, supposed to pass through this line perpendicular to the plane of the optic axes, is called by Aguilonius the plane of the horopter. According to his statement, it is a law of our constitution, that all bodies which we see with one glance or look, whatever are their real places, appear to each eye to be situated in this plane; and upon this supposition he shews why some should be seen single with two eyes, and others double. For according to a recent opinion, which he has advanced, and which other writers on vision have not contradicted, the two lines of direction in which an object is seen with both eyes, can meet each other only in one point, and therefore all bodies which are really situated in the plane of the horopter, must necessarily appear single, as the lines of direction in which any one of them is perceived by the two eyes, coincide in that plane, and no where else; and all bodies which are not situated in the plane of the horopter must as necessarily appear double, since, in this case, the lines of their visible directions intersect each other, either before or after they pass through it. To this reasoning Dr. Wells replies, that if the visible places of all bodies were contained in the plane of the horopter, they would appear of magnitudes proportional to the angles which they subtended at the eye; *e. gr.* a finger held near to the face would seem as large as the part of a remote building which it might conceal from the sight. But this is contrary to experience, and therefore no reasoning that depends upon it can be admitted.

If it be asked, says Dr. Smith, why, in seeing with both eyes, we do not always see double, because of a double sensation, it is sufficient to reply, that in the ordinary use of our eyes, in which the pictures of an object are constantly painted upon “*corresponding places or points*” of the retinas, the predominant sense of feeling has originally and constantly informed us that the object is single. What he means by “*corresponding points*,” he thus explains: When the optic axes are parallel, or meet in a point, the two middle points of the retinas, or any points which are equally distant from them, and lie on the same sides of them, either towards the right hand or left hand, or upwards or downwards, or in any oblique direction, are called “*corresponding points*.” Accordingly our idea of the outward place of an object is connected with both these sensations; as is manifest by its appearing in two places when its pictures are not painted upon corresponding places of the retinas; which is only a direct consequence arising from our general habit of seeing. If it be asked why, in order to produce single vision, all men agree in directing their eyes toward the object in such a manner as to receive its pictures upon corresponding points of the retinas, since custom might have connected the sensations of any other two points with the information of its unity from feeling? To this objection, suggested by Dr. Reid, the reply may be made in Dr. Smith's own words (vol. i. p. 46.): “*When we view an object steadily, we have acquired a habit of directing the optic axes to the point in view; because its pictures falling upon the middle points of the retinas, are then distincter than if they fell upon any other places; and since the pictures of the whole object are equal to one another, and are both inverted with respect to the optic axes, it follows that the pictures of any collateral point are painted upon corresponding points of the retinas.*”

Dr. Wells is of opinion, that Dr. Smith's hypothesis for the solution of this celebrated question is liable to other objections

SEEING.

objections not so easily repelled. Admitting the fact respecting corresponding points to be true, it may be observed, that if we are taught by *feeling* to see objects single, notwithstanding a sensation in each eye, the informations of the former sense ought to be uniform, or else one set of visual appearances would be associated with different reports from feeling, and no certain mark would be afforded us which of them we should trust. Feeling, as Dr. Smith allows, is not always the predominant, but sometimes the inferior sense; and its informations are not constant and original, but variable and derived. When a difference occurs between the informations of the two senses, it is natural to enquire what rule have we for determining which is most worthy of credit. But supposing that the sense of touch to have originally and constantly informed us that objects are single, it would not follow that we are thence taught to see them also single. For, since the place which an object seems to either eye to possess, manifestly depends both upon its apparent distance and its apparent direction from that eye, if visible place be, in the language of Dr. Smith, only an *idea* of real or tangible place, visible direction must bear the same relation to tangible direction; whence it follows, that we can never have a more accurate knowledge of the direction, in which an object may lie from any part of our bodies, by sight than by touch. Whereas the contrary is proved by facts. Moreover whatever be the direction in which an object may appear to either eye, it cannot be seen in the same place by both, except at some point common to the two directions. Accordingly Dr. Smith says, that when an object is perceived single with both eyes, it is seen at the mutual intersection of the two visual rays; the visible direction of any object coinciding, according to him, with the visual ray, or the principal ray of the pencil which flows from it to the eye. Should we then even allow, that all we know by sight of the places of bodies has been borrowed from feeling, it will still be easy to shew, that the rule of vision for each eye, which he has derived from such experience, that of our seeing objects in the directions of their visual rays, is inconsistent with many of the phenomena of sight with two eyes; and, consequently, that he has left unremoved the chief difficulty of his subject, which was to explain the single appearance of objects to both eyes, from those laws, or rules of vision, which affect each of them singly. For it is a well-known fact, that if two bodies of the same shape, size, and colour, be placed, one in each optic axis, they appear but as one body, provided they be at equal distances from the eyes. Agreeably to the theory of our seeing objects in the direction of their visual rays, this cannot happen, except the united body appear at the intersection of the optic axes. Dr. Smith, accordingly, maintains that it does. In the first place, Dr. Wells appeals to experiment for a direct proof that it does not; and, in the second, he observes, that, as the two bodies in the optic axes appear as one, whether they be situated within or beyond the concurrence of those lines, and as a right line joining the bodies, and extended both ways, appears at the same time to the sight as a right line, it follows, upon admitting the fact which he has denied, that all objects in the plane of the optic axes which are seen in one position and state of the eyes, however near to us, or however remote they may in reality be, must appear to be equally distant, or rather in a line drawn through the concurrence of the optic axes, parallel to the interval between the eyes, and named by opticians the *horopter*. Again, if a right line be made to pass through any part of the plane of the optic axes, at right angles to it, the portions above and below this plane are perceived to be in the same right

line with the point which is situated in it, and the whole appears perpendicular to the plane. But the point in the plane is seen, by the last article or proposition, in the horopter; the whole, therefore, of the perpendicular line must be seen in a plane passing through the horopter at right angles to that of the optic axes; or, in other words, in the *plane of the horopter*, in which consequently all bodies will have their visible places. But this was the very opinion of Agulionius, to which he was probably led by a familiar train of reasoning; though, as a teacher, he might choose rather to ground it immediately upon an original law of our constitution.

Dr. Reid agrees with Dr. Smith in his general principle, but differs from him in maintaining the property to be original by which any two places in the retinas exhibit only one object, while Dr. Smith derives it altogether from custom. They differ also with respect to the meaning of a term; Dr. Smith calling *corresponding points*, such as have the position just mentioned, whether they represent objects single or not; whereas Dr. Reid says, that those points correspond, whatever their position may be, which represent objects single; and he appears to Dr. Wells not always to attend to the double use of the same term, when he speaks of the opinions of Dr. Smith.

Could it be shewn, says Dr. Wells, that the places of the two retinas, which represent an object single when each receives its picture, are not the centres, or such others as are similarly situated, an obvious inference would be, that the single appearance of the object is not occasioned by a property in those places, bestowed upon them for this special purpose by nature; it being reasonable to expect, that such a property should be found, if any where, in those parts of the retinas which are the most like to each other.

Anatomists have commonly taught, that the centres of the spheres, to which the cornea, the ball of the eye, and the two portions of the crystalline belong, are all placed in the same right line, hence called the optic axis, and that this being produced both ways, passes through the centres of the cornea and retina, considered as surfaces. Opticians, on their part, observe, that an object appears single to both eyes, when the axis of each is accurately directed to it; from which they infer, that the centres of the retinas agree in suggesting but one object, though each receives its picture.—Again; since it is known by experience, that, while any object is seen single, to which the optic axes are turned, others at the same distance from the eyes likewise appear so; and since the pictures of these lateral objects fall upon points in the two retinas, equidistant from their centres, and both upon the same side, that is, both to the right or left of the centres, or both above or below them, opticians conclude, that every two places of the retinas, which are similarly situated with respect to the centres, must also agree in exhibiting but one object, though pictures are received by both.

But the whole of this reasoning, says Dr. Wells, is built upon a circumstance in the fabric of the eye, which has been shewn by some of the most eminent anatomists not to have place. For Varolius long ago observed, that the crystalline is not situated in the middle of the eye, but more *inwardly*; and the accurate Zinn has more lately mentioned, that if the eye be divided into a right and left half, the centre of the crystalline will be found in the inner portion. Haller confirms this fact; and Winflow's observation, that the centres of the pupil and iris do not coincide, but that the former is nearer to the nose than the latter, is connected with it; since both Zinn and Haller agree, that

the

SEEING.

the centre of the pupil is placed in the axis of the crystalline, while that of the iris is evidently in the common axis of the cornea and globe. Now, a consequence of this position of the crystalline is, that, contrary to what is universally maintained, no ray of light whatsoever can pass un bent to the retina from the atmosphere, or any other medium differing in refractive power from the aqueous humour. If, then, the line joining the centres of the cornea and globe of the eye be what is called the optic axis, and if it be true, that objects appear single when we direct both these axes to them, it must be evident, to such as are acquainted with the common rules of optics, that the pictures of those objects do not fall upon the centres of the retinas, but more internally; and, therefore, that the centres and all the other points of those membranes, which by the present system are supposed to represent objects single, do in fact exhibit them double.

Admitting, however, that objects are represented single, when their pictures fall upon the centres of the retinas, or upon any other two points which are equally distant from the centres, and both upon the same side, it appears to Dr. Wells, notwithstanding, to be in violation of all analogy, to ascribe this effect, with respect to the points at least, on the right and left sides of the centres, to any peculiar property which they possess from nature. For when anatomists find, in a new species of animals, organs similar in structure to those of others they are already acquainted with, they immediately conclude, that they are also similar in regard to their use. In animals of the same species, they believe with certainty, that the organs they see in one have the same properties as the corresponding organs of another; and, if it be possible, they attribute with greater certainty the same properties to two organs of the like kind, which are found in the same individual. Such is the influence of the rule, that resemblance of property is implied by resemblance of structure. Now it is an universal fact, that if an animal be divided into a right and left half, the corresponding parts of those organs which exist in pairs are found at equal distances from the plane of partition. Thus, for instance, in respect to the eyes, the two optic nerves penetrate their outward coat at the same distance from this plane. Their muscles, blood-vessels, and every other of their component parts and appendages, are arranged in the like manner; those nearest to the dividing plane, or the innermost, in the one, being similar in structure to the innermost in the other, the outermost to the outermost, and the intermediate to the intermediate. It is surely, therefore, natural to expect, that such parts should also be similar in their properties; and we in fact find this similarity to exist, wherever it can be clearly ascertained what the properties are. Every person, for example, admits, that the internal straight muscle of the right eye performs the same office, with respect to that eye, as the other internal straight muscle does with respect to the left eye. What judgment are we then to form of the opinion of Dr. Reid, which attributes the same original properties, or rather the joint possession of one original property, to places in the retinas situated at unequal distances from the general plane of partition; which makes an *external* point in one to correspond, in use, with an *internal* point in the other, and this too by a principle implanted by nature? If such things exist, they may, at least, be said to stand opposed to a most extensive analogy.

To these arguments, *à priori*, against the opinion of Dr. Reid, Dr. Wells adds others derived from a consideration of its consequences: but our limits oblige us to refer for these to the author's own account. If objects, it may

be said, appear single neither from custom, nor from an original property of the eyes, have we not an effect without a cause, and must there not be something wrong in the facts or reasoning which lead to such a conclusion? Dr. Wells replies: Since visible place contains in it both visible distance and visible direction, it is not necessary that the single appearance of an object to both eyes, should depend altogether either upon custom, or an original principle of our constitution; for its visible distance to each eye may be learned from feeling, and its visible direction be given by nature; in which case, the unity of its place to the two eyes, will be owing to neither of those causes singly, but to a combination of both; and this Dr. Wells regards as a sufficient reply.

Dr. Wells proceeds to propose and illustrate his own theory for the solution of the question, why objects are seen single with two eyes; or, in other words, why they appear in the same place to both? The visible place of an object being composed, as he conceives, of its visible distance and visible direction, it becomes necessary, for shewing how it may appear the same to both eyes, to explain in what manner the distance and direction, which are perceived by one eye, may coincide with those which are perceived by the other. He begins with a consideration of the distance. In judging of distance by sight, no person has ever observed, that while an object seemed to one of his eyes at a certain distance, it has appeared to the other to be at a different distance, and from this circumstance alone has been seen double; or, to express the same thing in another way, that while the visible appearance of an object to one eye, covered the visible appearance of the same object to the other eye, the two appearances did not seem entirely to coincide, and make one, but were seen separate by the two eyes. Hence it follows, that the difficulty in finding a true and sufficient cause for the union of the two visible places of one or two objects to two eyes, must therefore consist altogether in shewing, in what manner the two apparent directions may coincide, consistently with the attending phenomena.

From the time of Kepler's discovery of the seat and manner of vision, there have been, says our author, only two theories offered respecting the apparent directions of objects. One is, that they are perceived in the direction of lines passing from their pictures on the retina, through the centre of the eye; the other, that their apparent directions coincide with their visual rays. But both of these theories are inconsistent with the phenomena of single vision with two eyes. For according to neither of them can an object, placed at the concurrence of the optic axes, be seen single, unless we have a most accurate knowledge of its distance; nor will either admit two objects to be seen as one, which are situated in the optic axes, whether on this side, or beyond where they meet, unless the united object be referred by sight to their very point of intersection; both of which conclusions are contradicted by experience. It is evident, therefore, that some other theory of visible direction is required, which shall not be liable to these objections.

Dr. Wells's theory is illustrated in the following propositions, which we can merely state without enlargement: 1. Objects situated in the optic axis do not appear to be in that line, but in the common axis; *i.e.* in a line drawn from the middle of the visual base, through the point of intersection of the optic axes, or parallel to them, if they be parallel to each other. 2. Objects, situated in the common axis, do not appear to be in that line, but in the axis of the eye, by which they are seen. 3. Objects, situated in any line drawn through the mutual intersection of the optic

optic axes to the visual base, do not appear to be in that line, but in another, drawn through the same intersection, to a point in the visual base distant half this base from the similar extremity of the former line, towards the left, if the objects be seen by the right eye, but towards the right, if seen by the left eye. In the application of the theory which Dr. Wells has endeavoured to establish in the preceding propositions, he observes, that, if the question be concerning an object at the concurrence of the optic axes, it is seen single, because its two similar appearances, in regard to size, shape, and colour, are seen by both eyes in one and the same direction, -or, if you will, in two directions, which coincide with each other through the whole of their extent. It therefore matters not, whether the distance be truly or falsely estimated; whether the object be thought to touch our eyes, or to be infinitely remote. And hence we have a reason, which no other theory of visible direction affords, why objects appeared single to the young gentleman mentioned by Mr. Chefelden, immediately after his being couched, and before he could have learned to judge of distance by sight.

When two similar objects are placed in the optic axes, one in each, at equal distances from the eyes, they will appear in the same place, and therefore one, for the same reason that a truly single object, in the concurrence of the optic axes, is seen single. Here again, as the two visible directions coincide in every point, it is not necessary that the united appearance should be judged to be at any particular distance; that it should be referred, for instance, to the concurrence of the optic axes, where the two other theories of visible direction are obliged to place it, in opposition to the plainest observation.

Objects, any where in the horopter, will be seen single, because their apparent directions to the two eyes will then completely coincide. And for a contrary reason, those placed in any other part of the plane of the optic axes will appear double. To make these things evident, let a line pass through the point of intersection of the optic axes and any given object, to the visual base, which is to be produced, if necessary; and let it be called the line of the object's real position. Take afterward, in the visual base, or its production, two points, one on each side of the line of real position, and both distant from its termination there, half the visual base. Lines drawn from these points, through the point of intersection of the optic axes, must consequently contain the two visible positions of the object. But when this is situated in the horopter, the line of real position will coincide with the horopter, and will not therefore reach the visual base, unless at an infinite distance from the eyes. For which reason, the two lines, containing the visible positions of the object, must fall upon the visual base at a like distance, and must consequently be regarded as coinciding with each other. When the object is not in the horopter, the two lines of visible direction will be found, by the same means, not to coincide.

SEGO, col. 2, l. 13, r. Mansong; l. 17, r. Sandfandg.

SELENIUM, in *Chemistry*, the name of an elementary substance recently discovered by Berzelius, and considered by him as a kind of semi-metal. This substance was first mistaken for tellurium. It was obtained from a sulphuric acid manufactory at Griphholm, where pyrites from the mines of Fabun were employed, and which of course contained the substance in question. It also exists in the same mines combined with copper. Selenium has the properties of a metal combined with those of sulphur to so great a degree, that it is difficult to know under which

head to class it, and in short whether it might not be rather considered as a new species of sulphur. In its metallic state it has a brilliant metallic lustre externally, with a tinge of red. The fracture is vitreous, like that of sulphur, but with a very brilliant lustre of a grey colour. It becomes soft at a temperature of 212°, and at a higher temperature it melts; and at a temperature about equal to that at which mercury boils it may be distilled. When in a gaseous state, it is yellow, like sulphur. When sublimed in a large vessel, it is deposited in the form of flowers of a cinnamon colour, but not oxidized. During its cooling, it preserves for some time a certain degree of fluidity, so that it may be moulded between the fingers, and drawn into threads, which are transparent, and of a ruby-red colour when held between the eye and the light; but by reflected light they exhibit a brilliant metallic lustre. It burns with an azure-blue flame when heated with a candle, and exhales a strong odour of horse-radish.

Selenium combines with metals, and generally produces a reddish flame. The alloys are commonly grey, with a metallic lustre. The seleniuret of potassium dissolves in water, without evolving any gas, and produces a red-coloured solution, which has the taste of hydrof sulphuret of potash. When muriatic acid is poured upon this seleniuret, a seleniuretted hydrogen gas is disengaged, which is soluble in water, and precipitates all metallic solutions, even those of zinc and iron. This gas has the odour of sulphuretted hydrogen gas when it is diluted with air, but if it be breathed less diluted it produces a painful sensation in the nose, and a violent inflammation, ending in catarrh, which continues for a considerable time.

Selenium combines with the alkalis both in the humid way and by fusion. These combinations are red. The seleniurets of barytes and lime are also red, but they are insoluble. It also dissolves in melted wax, and in the fat oils; the solutions are red, but have no hepatic odour. There exist also seleniuretted hydrofeleniurets of the alkalis and of the earths.

Selenium dissolves in nitric acid by the assistance of heat; the solution evaporated and sublimed yields a mass crystallized in needles, which is a pretty strong acid. It has a pure acid flavour, and forms peculiar salts with the alkalis, earths, and metallic oxyds. The selenic acid is soluble in water and in alcohol: its combinations with potash and ammonia are deliquescent; the latter is decomposed by fire, water is given out, and the selenium is reduced. The seleniates of barytes and lime are soluble in water. The selenic acid mixed with muriatic acid is decomposed by zinc, and the selenium is precipitated in the form of a red powder; by sulphuretted hydrogen gas an orange-yellow precipitate is formed.

Such is a brief summary of the properties of this curious substance. From the small quantities in which it has hitherto been found, we believe no experiments have been made to ascertain the weight of its atom, &c.

SELKIRK, l. 23 from bottom, for 440 r. 439.

SELKIRKSHIRE. In 1811 this shire contained 1080 houses, and 5889 persons; viz. 2750 males, and 3139 females: 500 families being employed in agriculture, and 363 in trade, manufactures, and handicraft.

SENECA. Add—Also, a county of New York, containing 16,600 inhabitants, of whom 101 are slaves.—Also, a town of Guernsey county, in Ohio, having 300 inhabitants.

SEPOY, a term used in India to denote a native soldier.

SERA-WOLLIES. See KAJAAGA.

SERICA. Add—(See THIBET.) Hugh Murray, esq. in his "Ancient Geography of Eastern and Central Asia,"

published in the Edinburgh Transactions, concludes from the works of Ptolemy and his contemporaries, that Serica was China.

SERMON, col. 4, l. 38, for Buller *r.* Butler.

SERPENTARIUS, or SNAKE-EATER, in *Ornithology*, a genus of birds allied both to Vulture and Falco, but most nearly to the former. The characters are, beak vulturine, tongue pointed, and legs very long. It includes one species, *viz.* the *S. Africanus*, or ash-coloured snake-eater, with the hind-head crested, the tail cuneated, and the middle tail-feathers lengthened. This is the *V. Serpentarius* or Secretary vulture of Latham, and the Falco Serpentarius of Gmelin's Linnæus. The most accurate description is that of La Vaillant, who, in his African travels, had an opportunity of observing it in its native regions. We refer to the 7th volume of Shaw's Zoology. It is an inhabitant of dry open plains in the lower parts of Africa.

SERPENTES.—ATER, l. 1, *r.* is white with black bands.

SEVIER, l. 2, *r.* 4595, and 294.

SHAPLEIGH. Add—containing 2362 inhabitants.

SHARON. Add after Portland—containing 944 inhabitants.—After Litchfield, having 2506 inhabitants.—After Boston, having 1800 inhabitants.—After Norwich, having 1363 inhabitants. Add—Also, a town of Hillsborough county, New Hampshire, having 416 inhabitants.—Also, a township of Franklin county, in Ohio, having 450 inhabitants.

SHARP, GRANVILLE, col. 3, l. 33, for taken up on *r.* taken upon.

SHAT-UL-ARAB, l. 16, *r.* Bamisere and Mesene; l. 20, *r.* Hafar.

SHENANGO. Add—Also, a township of Mercer county, having 634 inhabitants.—Also, a township of Beaver county, having 679 inhabitants.

SHEPEY. Add—The largest parish in this island is that of Minter, which in 1811 contained 840 houses, besides 20 that were not finished, and 5318 persons; *viz.* 2596 males, and 2722 females: 87 families being employed in agriculture, and 1163 in trade, manufactures, or handicraft.

SHILLINGSTONE, or SHILLING OKEFORD, a parish in the west-division of Shafton, in the county of Dorset, which in 1811 contained 75 houses, and 385 inhabitants; 163 males, and 222 females. On the right of the village are two high hills, called Hood and Hawkledon, on which are the remains of an ancient Roman encampment.

SHOES, col. 3, l. 29 from bottom, for felt *r.* left.

SHOREA, in *Botany*, in honour of sir John Shore, lord Teignmouth, late governor of Bengal.—Roxb. Corom. v. 3. 9. Gært. v. 3. 48. t. 186.—Clas and order, *Polyandria Monogynia*. Nat. Ord. *Guttifera*, Juss.

Gen. Ch. Calyx of five imbricated leaves, subsequently enlarged, permanent. Petals five. Capsule superior, of one cell and one valve. Seed solitary.

1. *S. robusla*. Saul-tree. Roxb. t. 212.—Found on the skirts of the northern mountains of India. A majestic tree, whose timber is much used, and next in value to the teak, (*see* *Tectona*,) being stronger, though far less durable. Leaves alternate, stalked, ovate, entire, acute, smooth, from four to eight inches long. Panicles downy, axillary and terminal, of numerous, pale yellow, itary flowers, not an inch wide. Capsule accompanied by five oblong, ribbed, unequal wings, formed of the calyx. This genus is nearly allied to *Dipterocarpus*; see that article.

SHORT CREEK, in *Geography*, a township of Jefferson county, in Ohio, having 1890 inhabitants.

SHORT-SIGHTEDNESS, l. 21, add—For Mr. Ware's observations on this subject, see SPECTACLES.

SHREWSBURY, in America, l. 8, add—of whom 577 are slaves. At the end, add—Also, a township of Lycoming county, containing 294 inhabitants.

SHROUD, l. 3, add—but the statute for this purpose has been repealed.

SHUKUSKU, *r.* or SHUKASHU.

SHUSTER, l. 24, for magnitude *r.* magnificence.

SIBH, a district of the Persian empire, in the province of Mekran, consisting of an extensive plain, governed by a chief, who resides in a small town of the same name. The country, almost destitute of water, though a river, nearly dry, flows through the centre of the plain, is, generally speaking, barren, if we except some groves of date-trees which formerly grew in the bed of the river.

SIDNEY, Sir PHILIP, in *Biography*, the eldest son of sir Henry Sidney, by a daughter of the duke of Northumberland, was born at Penhurst in Kent, in the year 1554. He was named Philip in compliment to the king of Spain, the husband of queen Mary. In very early life he manifested a sedate studious disposition; and he sedulously improved every advantage for gaining knowledge, which he enjoyed, first at Shrewsbury school, and afterwards at Oxford, where he was entered at Christchurch college in 1569, and also at Cambridge. At the age of 18, the queen, according to the then existing custom, granted him a licence to travel abroad; and he first visited Paris, where he was introduced, by his maternal uncle, the earl of Leicester, to sir Francis Walsingham, the English ambassador. Charles IX. who was then king of France, wishing to shew respect to Leicester, and probably with the pernicious design of lulling into security the Protestant party in France, previously to the horrid massacre of St. Bartholomew's, appointed Sidney one of the gentlemen of his bed-chamber. When the fatal day arrived, Sidney, together with several of his countrymen, found a refuge in the house of the English ambassador. Soon afterwards he pursued his tour to Germany; and at Frankfort formed an intimate acquaintance and friendship with Hubert Languet, then resident for the elector of Saxony, whose communications were singularly useful to our young traveller. After visiting Vienna, Hungary, Venice, and Padua, in company with his friend Languet, he returned through Germany and Flanders, and arrived in England in 1575, with those accomplishments, and with his moral principles in untainted purity, which rendered him the admiration and delight of his countrymen. In the following year, being only in the 22d year of his age, he was dispatched as ambassador to the court of Vienna, to condole with and congratulate the new emperor Rodolph II.; and entrusted with a commission to engage the Protestant princes of Germany in a league with each other, or with England. He was also entrusted to demand the repayment of the sum advanced by Elizabeth to the elector palatine. In the discharge of these several trusts, he acquitted himself with singular reputation, and with satisfaction to all the parties concerned in the objects of his embassy. After his return, he received no other honorary recompence besides the office of cup-bearer to the queen. With a temper somewhat irascible, and a high sense of honour, blended in some degree with the spirit of chivalry, few characters in that age were so unexceptionable as that of Sidney. Of his disinterested patriotism, we have a striking instance in his remonstrance addressed to queen Elizabeth on her projected marriage with the duke of Anjou; and such was the estimation in which he was held by the queen, that she did not manifest her displeasure against Sidney, though others suf-
ferred

fered for their interference. Actuated by the spirit of chivalry, he exhibited his skill in military manœuvres at a tournament held, in 1580, in honour of the queen; and in the same year, he asserted his rank as a gentleman, against an insult offered him at a tennis-court by Vere, earl of Oxford. In order to compose his mind, which had been thus disquieted, he retired to the house of his brother-in-law, the earl of Pembroke, at Wilton, and engaged in the composition of his well-known romance, called "Arcadia," which was not published till after his death. In 1581 his name appears as one of the knights of the shire for the county of Kent, and as one of the committee for drawing up acts, with a view to the security of the kingdom against the Pope and his adherents. His "Defence of Poetry," written about this time, contributed more to his literary reputation than Arcadia. Of this treatise one of his biographers says, that it may be "considered as the earliest piece of criticism in the English language worthy of attention, and reckoned by some the best written of his works. In a simple and unaffected style, it displays much learning and judgment, and a true relish of the excellencies of that art which he undertakes to patronize and illustrate." In the year 1583, he married the only daughter and heiress of sir Francis Walsingham, a lady, as it is said, of great beauty and merit. On occasion of being nominated by the prince palatine of the Rhine his proxy at the installation of the garter in 1584, he received from the queen the honour of knighthood; an honour which she was not lavish in conferring. When sir Francis Drake was projecting a secret naval expedition, sir Philip Sidney wished to join him, and with this view to equip a land and naval armament against the Spanish settlements in America; but the queen interposed, and absolutely prohibited the execution of his design. Of his nomination as a candidate for the vacant crown of Poland, upon the death of Stephen Bathori in 1585, we shall say nothing; as one of his biographers has stated several particulars, which render the fact very improbable. In the year just mentioned, sir Philip had a seat in the privy council; and queen Elizabeth determining to assist the Low Countries in their revolt, on condition of their putting into her hands some cautionary towns, indulged his martial disposition by appointing him governor of Flushing. As soon as he had taken possession of his charge, he was made colonel of all the Dutch regiments, and captain of a band of English soldiers. He was soon joined by his uncle Leicester, as general of the auxiliary forces, and sir Philip was appointed general of the horse, under his command. It soon appeared that Leicester was unfit for the trust reposed in him; his nephew was dissatisfied, and endeavoured to allay the discontents which prevailed among the subordinate commanders. Sir Philip in his first exploit, which was the surprize and capture of Axell, in July 1586, without the loss of a man, was singularly successful; but in the month of September he fell in with a convoy sent by the enemy to Zutphen, and having one horse shot under him, he mounted another; and while charging the foe with great vigour, he received a musket bullet above the knee, which broke the bone and penetrated deep into the thigh. On his way from the field to Leicester's camp, whither he was conveyed, he found himself faint and thirsty, and called for water; but as he was preparing to drink, he observed a soldier in the agonies of a mortal wound; he resigned the draught to him, with an expression which entails permanent honour on his memory: "This man's necessity is still greater than mine!" Upon his arrival at Arnhem a mortification ensued, and on the 17th of October, after exhibiting the most unaffected piety, exemplary composure, and self-possession, he expired with tranquillity at the early age of 32

years. His death was universally regretted by his enemies as well as friends, and abroad as well as at home. The queen directed his body to be brought to London, and after lying in state, he was interred with all the solemnity of a public funeral in St. Paul's cathedral; and although no monument was erected over his remains, James, king of Scotland, composed an epitaph to celebrate his memory, and both universities furnished some collections of verses to record his fame. But his name will ever live in the records of history, as "one of those who have reflected the highest honour on his country." Of his "Arcadia," we shall merely observe, that it was one of the earliest specimens of grave or heroic romance; that it was left in scattered fragments of MS., which his sister collected and published; and from this circumstance, it was denominated "The Countess of Pembroke's Arcadia." It became very popular, and was translated into foreign languages. Lord Orford (Horace Walpole) speaks of it very contemptuously; but Dr. Zouch has more candidly and more justly appreciated its value. Biog. Brit. Zouch's Mem. of Sir Philip Sidney. Gen. Biog.

SIDNEY, or SYDNEY, ALGERNON, the second son of Robert, earl of Leicester, by Dorothy, eldest daughter of Henry Piercy, earl of Northumberland, was born in 1621 or 1622, and carefully educated under his father's inspection. In early life he was destined to the military profession, and in 1641 he had a commission in his father's own regiment of horse, when he was appointed lord-lieutenant of Ireland. During the rebellion in that kingdom he entered immediately into active service, and had many opportunities of exhibiting his courage. In 1643, upon the commencement of the war in England between the king and parliament, he obtained permission to return. He and his brother, upon their landing, were intercepted, and placed under guard; and the king, conceiving (justly, as the event proved) that they had been taken by their own contrivance, was much offended; and not without reason, for they both joined the parliamentary army. In 1644, the earl of Manchester appointed Algernon to the command of a troop of horse in his own regiment; and in the following year, Fairfax promoted him to the colonelcy of a regiment of horse. Having been present in several actions, he was entrusted with the government of Chichester. In 1646 he accompanied his brother to Ireland, and was advanced to the post of lieutenant-general of the cavalry and governor of Dublin. For his services in that kingdom he received the thanks of parliament, and returning to his own country was made governor of Dover. Although he was nominated in 1648 a member of the high court of justice for the trial of the king, he was neither present when sentence was pronounced, nor did he sign the warrant for his execution. This part of his conduct, it is supposed, was owing to the particular request of his father; for it appears, from his general conduct, that his principles would not induce him to condemn this act. When he was afterwards a voluntary exile in Denmark, and charged by his father with the violence of his political sentiments, his father writes to this purpose: "It is said that the university of Copenhagen brought their *album* to you, desiring you to write something therein, and that you did *scribere in albo* these words:

"Manus hæc, inimica tyrannis,
Ense petit placidam sub libertate quietem,"

and put your name to it; also, that a minister, being there in company with you, said, 'I think you were none of the late king's judges, nor guilty of his death.' 'Guilty!' said you; 'do you call that guilt? Why, it was the justest and bravest action that ever was done in England, or any

where else." Confidently with the sentiments avowed on this occasion, Sidney actually opposed the designs of Cromwell; and he afterwards refused to act under him and under his successor Richard. During this period he passed a retired life at Penshurst, and employed himself, as it is said, in writing his Discourses on Government. But when the Long Parliament regained its power, Sidney hoping for the establishment of a republic, to which form of government he was ardently attached, became an active partisan, and was nominated one of the council of state. He also accepted the office of one of the commissioners for mediating a peace between Denmark and Sweden, and was actually engaged in this embassy at the period of Charles II.'s restoration. Although he was solicited by general Monk and others to return to England, he could repose no confidence in the royal party, but remained in exile for seventeen years, finding that the few supplies which he received from home were insufficient to support him in a manner suitable to his birth and rank. He was, however, treated with respect and civility in various places, and particularly at Rome; and he employed his many leisure hours in making addition to the ample stock of knowledge which he had already acquired. In 1677 his father, being advanced in life, was anxious to see him, and employed his interest in obtaining the king's permission for his return, to which permission was annexed a pardon for all his past offences. When he afterwards joined in cabals against the court, he incurred the censure of those who were disposed to take offence; and Mr. Hume has charged him with acting counter to the moral principles of gratitude and with a breach of faith: others, however, have vindicated him, alleging that unconscious of guilt he might consider the royal permission to return, after so long an absence, as a reparation of injustice rather than an act of clemency, and that personal obligation ought not to influence his public conduct, when he conceived the great interests of his country in danger. At the time of his return, parliament was urging the king to commence a war with France; but Charles, being a pensioner of the French court, wished from selfish motives to avoid it; but as he was actuated by no sound principles, it was apprehended that he would appear to concur with the wishes of the nation, that he might have a plea for raising supplies, for his own personal gratification, in the prosecution of his pleasures or his designs to render himself arbitrary. The English patriots were averse from war, and some of their leaders intrigued with Barillon, the French ambassador, for preventing it. In the list of those persons in England who were at this time pensioners in France, the name of Sidney appears. When this discovery was made by Sir J. Dalrymple's publication of Barillon's papers, the friends of liberty were astonished and grieved; and they hesitated in admitting this dishonourable charge. In vindication of Sidney some have suggested, that Barillon falsified his accounts of the money with which he had been entrusted; whilst others have satisfied themselves with that persuasion of Sidney's honour and integrity which was founded on his general conduct, and with the assurance that he always adopted and pursued those political measures which appeared to him, all circumstances considered, most beneficial to his country. Upon his father's death, he joined the opposition party without disguise, and offered himself for a seat in parliament; but he was twice defeated by the influence of the court. Thus exasperated, and apprehending the liberty of his country to be in danger, as well as dreading a popish successor, the ardour of his mind urged him to associate with the duke of Monmouth and his party; and in the history of the Rye-house plot

he was charged with being one of six who were promoting an insurrection. But the part which he was supposed to have taken in a conspiracy for assassinating the king was the plea for arresting him, together with Russell and several others, in June 1683. When lord Russell was sacrificed, the next victim selected by the court was Sidney; and he was brought to trial for high treason, before that judge whose infamous character is indelibly recorded in the page of history, chief-justice Jefferies. Lord Howard, who was a disgrace to the title he bore and to that rank in society with which he was connected, was the only direct evidence against him; but the law required two witnesses for conviction on a charge of treason. In order to supply this defect, the attorney-general produced some passages from discourses found in manuscript in his closet, in which the writer maintained the lawfulness of resisting tyrants, and his preference of a free to an arbitrary government; and without decisive proof that they were written by him, or that they were even communicated to any living person, this kind of evidence was admitted, in defiance of law and common sense, as equivalent to the testimony of a second witness. His defence was of no avail, and a servile jury pronounced him guilty. From respect to his family, the disgraceful part of his sentence was omitted, and exchanged for beheading. On the 7th of December he was executed on Tower-hill, at the age of about sixty-one years, delivering to the sheriffs a paper which proved the injustice of his condemnation, and offering a prayer for that "old cause" in which he had been from his youth engaged. This paper was afterwards printed, and made great impression on the public mind. It is given at full length in the *Memoirs of his Life*. He suffered with the firmness, as it is said, of an old Roman. After the revolution one of the first acts was the reversal of his attainder, and his name has been held in high esteem and veneration by all the avowed friends of free government. The following sketch of his character is given by bishop Burnet. "He was a man of most extraordinary courage, steady even to obstinacy, sincere, but of a rough and boisterous temper that could not bear contradiction. He seemed to be a Christian, but in a particular form of his own; he thought it was to be like a divine philosophy in the mind, but he was against all public worship, and every thing that looked like a church. He was stiff to all republican principles, and an enemy to every thing that looked like monarchy. He had studied the history of government in all its branches beyond any man I ever knew; and had a particular way of insinuating himself into people that would hearken to his notions, and not contradict him." Of this character, it is said, in the Notes to the *Memoirs of his Life*, that it was roughly and inaccurately drawn. Sidney's "Discourses on Government" were first printed in 1698, fol. reprinted in 1704 and 1751, and in 4to. 1772 at the expense of Thomas Hollis, esq., with his letters, trial, and memoirs of his life prefixed. Lord Orrery says of them, "they are admirably written, and contain great historical knowledge, and a remarkable propriety of diction; so that his name, in my opinion, ought to be much higher established in the temple of literature than I have hitherto found it placed." *Biog. Brit. Gen. Biog. Memoirs, &c.* prefixed to Hollis's edition.

SIFEDD ROOK. See *ROOD*.

SILENI, l. 20, for *faccho r. Jaccho*; l. 33, for second *r. sixth*.

SILICA, SILICON, in *Chemistry*. From the recent experiments of Berzelius and Stromeyer, the basis of silicium does not appear to be a metal as formerly supposed, but a substance analogous to boron and carbon; hence it has been named

named *filicon*. Little is known, however, of the nature of this substance, except that it is dark-coloured, and will bear a considerable heat without undergoing change, and that it decomposes water, and is converted into filica when brought in contact with that fluid. It is also capable of combining with iron, and probably other metals. Dr. Thomson estimates the weight of the atom of filicon, from the experiments of Berzelius and Stromeyer above-mentioned, at 10, and of filica at 20. The fame chemist also considers filicon to be an acid, and proposes for it the name of *filicic acid*, in which case its compounds must be denominated *filicates*.

SILVER, in *Chemistry*. Dr. Thomson, from the most recent experiments on this metal and its salts, estimates the weight of its atom at 137.5, that of oxygen being 10. See *ATOMIC Theory*.

SILVER Ores. See **SILVER**, and **MINERALOGY**, *Addenda*.

SILURES, col. 2, l. 32, *r.* Wik or Ufk.

SIMIA FATUELLUS, l. 1, for *tailles r.* long-tailed.

SITACA. Add—twelve geographical miles below Bagdad, and nearly opposite to the embouchure of the Dealla river.

VOL. XXXIII.

SITTINGBOURNE, a town and parish of Kent, 40 miles from London, in the road to Canterbury; contained, in 1811, 230 houses, and 1362 persons; 633 being males, and 729 females.

SKIDDAW, l. 15, after *sea*, add—which differs little from 3017 feet, the barometrical measurement of Mr. W. Allen, according to the method proposed by sir H. Englefield. (See *Trans.* of the Geol. Soc. vol. iv. part 2.)

SLATE-SPAR. See **MINERALOGY**, *Addenda*.

SLAVE, col. 2, l. 40, for *Almighty r.* A mighty. Col. 7, l. 19 from bottom, for *American r.* African.

SLAVE-TRADE, *Abolition of the*, col. 2, l. 12, for *principled r.* principled.

SLIDING-RULE. Add—Mr. Bevan has lately published in the Philosophical Magazine an ingenious modification of the sliding-rule. By the inversion of the slider all the usual operations are performed, together with the extraction of the square root, and factors of any given number are found by simple inspection. At the same time, the instrument is reduced to half its usual size.

SMITH, in *Geography*, l. 2, add—of whom 2201 are slaves.

SNORING. Add—See **LARYNX**.

SNOW, col. 2, l. 3 from bottom, *r.* earth, and of bodies on its surface, is prevented from escaping by radiation to the heavens during still or dewy nights. The cause of this additional cold does not, indeed, constantly operate; but its presence, during only a few hours, might effectually destroy plants, which now pass unhurt through the winter. Moreover, while low vegetable productions are prevented, by a covering of snow, from becoming colder than the atmosphere in consequence of their own radiation, the parts of trees and tall shrubs, which rise above the snow, are little affected by cold from this cause: for their outermost twigs, now that they are destitute of leaves, are so small, that they will very seldom become more than 2° colder than the atmosphere. The larger branches too, which, if fully exposed to the sky, would become colder than the extreme parts, are, in a great degree, sheltered by them; and, in the last place, the trunks are sheltered both by the smaller and

larger parts, not to mention that the trunks must derive heat, by conduction through the roots, from the earth kept warm by the snow. In a similar way is partly to be explained, the manner in which a layer of earth or straw preserves vegetable matters in our own fields, from the injurious effects of cold in winter. It may be remarked, however, that a thick covering of snow, while it renders the surface of the earth warmer than it would otherwise be, must occasion the lower atmosphere to be colder, by preventing the passage of the heat of the ground to the air, either by radiation or conduction. Wells's *Ess.* p. 258. See **DEW** and **HEAT**.

SNOWDON, l. 17, after *sea*, add—according to Mr. W. Allen's barometrical measurement, 3595.9 feet.

SOAP-STONE. See **MINERALOGY**, *Addenda*.

SODA. See **SODIUM**. Add—under **NATRON**, l. 5, *r.* Natron, from an erroneous supposition of its being of the nature of nitre, has been by many. Col. 2, l. 35, *dele* vegetable alkali. Col. 4, l. 33, for a further account of barilla, see **CARBONATE of Soda**. Under the article **LEATHER**, l. 17, for a species of salt-petre *r.* a **CARBONATE of Soda**; which see.

SODA, *Sodium*, in *Chemistry*. From the most recent and correct experiments, the weight of the atom of sodium has been estimated by Dr. Thomson at 30, and consequently the weight of the atom of soda at 40, that of oxygen being 10.

SODAIC POWDERS, denote powders which are used as a substitute for soda-water. Professor Brande, in his course of chemical lectures at the Royal Institution, took occasion to observe, that though these powders produce an effervescence when dissolved, arising from the disengagement of carbonic acid, the solution is very different from soda-water, both in its constituent parts and its properties. These powders consist of an alkaline carbonate, either of potash or soda, and a concrete acid, reduced to powder. The acid, though sold as the citric, is in reality the tartaric acid, produced from the substance known as cream of tartar. When the powders are dissolved, the tartaric acid unites with the alkali, and the carbonic acid, or fixed air, immediately escapes, occasioning a momentary effervescence. A salt is formed in the solution, called by chemists the tartrate of potash, or soda: if the former alkali has been used, and the acid is in excess, the salt formed is nearly insoluble, and has a harsh taste, and an irritating effect on the stomach. Thus, a quantity of alkaline tartrate is taken into the system, which rather tends to increase than remove obstructions, and in many instances must be highly injurious. Soda-water, if prepared in the best manner, should contain a very small portion of carbonate of soda, which has a tendency to correct acidity on the stomach; it should contain also about eight times its own bulk of carbonic acid gas, part of which is in a state of loose combination with the water. A considerable quantity of this gas, however, appears to be united by a stronger chemical affinity, and will remain in the water some hours after it is poured out. This gas, acting as a solvent of all the different earths, and various other substances, gives to the soda-water a more diluent and deobstruent efficacy, than is possessed by common water; and to this cause we may ascribe the good effects of soda-water in removing bile and calculary concretions. The carbonic acid, in its concentrated state, as it exists in soda-water, is a more powerful solvent of metallic substances than is generally supposed. On which account the manufacture of soda-water, in vessels of copper, or other metals, ought carefully to be avoided, and too great caution cannot be observed by those who are in the habit of drinking

drinking foda-water, to have it free from any metallic impregnation, or improper admixture.

SODALITE. See MINERALOGY, *Addenda*.

SOMERSET, l. 6, r. 14, 725.

SOONTAARS, a wild and unlettered tribe of Hindoos, who inhabit the district of Ramgur, the least civilized part of the Company's possessions, and who have reduced the detection and trial of persons suspected of witchcraft to a system. For an account of their practices, we refer to the fourth volume of the Asiatic Researches, p. 343. See **BENARES**.

SORBIC ACID, in *Chemistry*. This acid was so named by Mr. Donovan its discoverer, because obtained from the berries of the *mountain ash* (formerly denominated *forbus aucuparia*, but now *pyrus aucuparia*). The juice of the ripe berries is to be strained and mixed with a filtered solution of acetate of lead. The precipitate is then to be separated by a filter, and washed in cold water. A large quantity of boiling water is then to be poured upon the filter, and allowed to pass through the precipitate into jars. After some hours this liquid becomes opaque, and deposits crystals of great lustre and beauty. These crystals are to be boiled for half an hour with 2.3 times their weight of sulphuric acid, specific gravity 1.090, supplying water as fast as it evaporates, and taking care to keep the mixture constantly stirred. While still hot a stream of sulphuretted hydrogen is to be sent through the resulting liquid, which will precipitate the lead, and leave the sorbic acid in solution in the water.

Sorbic acid thus obtained is a transparent colourless inodorous fluid, soluble in alcohol, and in any portion of water. It does not crystallize, nor is it volatile. Its taste is exceedingly acid, and it does not appear to undergo much change when kept.

The *sorbates* of potash, foda, and ammonia, are crystallizable salts, containing an excess of acid. They are soluble in water, but not in alcohol. The *sorbates* of barytes and lime are neutral and white insoluble powders. The sorbic acid combines with lead in three proportions. The *sub-sorbate* is a hard mass or a gritty powder. The *sorbate* is a white powder, which by solution in sorbic acid may be obtained crystallized in beautiful filvry crystals. The *super-sorbate* has a sweet taste, and is soluble in water. The other *sorbates* are little known, and do not seem to be very interesting.

There appears to be a great resemblance between the *sorbic* and *malic* acids. Indeed it has been asserted that they are identical. The *malic* acid having recently been obtained in a more pure state than formerly, has enabled chemists to investigate its properties more completely, and in this pure state it is said in no circumstance to differ from *sorbic* acid.

SOSOS, a Chaldean period of 60 years, which doubled gave the return of the lunar months to within the 20th part of a month. By multiplying this cycle as many times as are necessary to obtain the precise returns of the sun and moon to the same points of the heavens, astronomers found a period of 600 years, called the *Neros*; which see.

SOUND, for Roberts *r.* Robarts.

SOUTHAMPTON, in *Geography*, a township of Cumberland county, in Pennsylvania, having 700 inhabitants.

SOUTH-END. In 1811, the parish of Prittlewell with Milton contained 285 houses, and 1541 persons; 759 being males, and 782 females.

SOUTHWARD, EAST, a township of Pennsylvania, in Philadelphia county, having 726 inhabitants.

SOUTHWARD BRIDGE, an elegant structure designed by Mr. Rennie, and forming a communication between the city

of London and the borough of Southwark, in nearly a straight line between Guildhall and the Bank-side. It consists of three grand arches; the centre arch being 240 feet in span, and each of the side arches being 210 feet. The arches are composed of cast-iron, and the piers and abutments of stone. The estimate of the expence was 287,000*l.*, and that of the tolls, on the supposition that London bridge should be rebuilt, was conjectured to amount annually to 50 or 60,000*l.* The first stone of this bridge was laid in 1815, and it was opened for passengers and carriages in February 1819.

SOWANS, a nutritious article of food prepared in Scotland from the husks of oats, by a process not unlike that by which common starch is made. The husk of the oat after having been separated by the sieve still retains a considerable portion of farinaeous matter. It is mixed with water, and allowed to remain till the water becomes sour. The whole is then thrown upon a sieve; the milky water passes through loaded with starchy matter, which soon sours. The four liquor is poured off, and about an equal quantity of fresh water added. This mixture when boiled forms a very nourishing article of food, and the portion of the four water which still adheres to the starch gives the whole a pleasant acidity.

SPANGLES, *paillettes*, Fr. are small thin round leaves of metal, pierced in the middle, which are sewed on garments, &c. as ornaments. They are prepared by first twisting wire round a rod into the form of a screw; this is then cut into single spiral rings, like those used by pin-makers in forming heads to their pins; and these rings being placed upon a smooth anvil are flattened by a smart stroke of the hammer, so that a small hole remains in the middle, and the ends of the wire which lie over each other are closely united.

The smaller spangles were first made in the French gold and silver manufactories, and imitated in Germany, for the first time, in the beginning of the 18th century. Beckmann's Hist. of Inventions, vol. ii.

SPARROW, in *Agriculture*. Add—It has been suggested, however, that the mischief done by sparrows may be fully compensated by their usefulness in destroying caterpillars; a single pair has been found to consume 40,000 in one season, in feeding their young. We may here add, that in a district in which great pains had been taken to exterminate the moles every vegetable was for a considerable time destroyed by cockchafers, which grubs had been thus preserved by the short-sighted policy of the farmers.

SPARTA, l. 13, for country *r.* city.

SPARTA, col. 2, l. 3, containing 179 inhabitants.

SPAVIN. Add—In healing the blood spavin, Mr. Denny recommends repeated blistering, and afterwards a compress of folded linen, moistened in the following lotion, and confined by a long bandage: Take 4 oz. of fal ammoniac, 2 oz. of acetated ceruse, 2 quarts of vinegar, and 4 of water, mix them. The usual method of treating the bone spavin is by blistering and firing.

SPECULUM, col. 15, l. 23 from bottom, for cord *r.* card.

SPEECH. See LARYNX.

SPERMACETI, *Chemical Properties of.* See CETIC ACID.

SPERMADICTYON, in *Botany*, from *σπερμα*, seed, and *δικτυον*, a net, because of the reticulated tunic of the seeds.—Roxb. Coromand. v. 3, 32.—Class and order, *Pentandria Monogynia*. Nat. Ord. *Rubiaceae*, Juss.

Ess. Ch. Corolla funnel-shaped. Calyx in five deep awl-shaped segments, permanent. Stigma five-cleft. Capsule inferior, of one cell and five valves. Seeds five, each in a latticed tunic.

1. *S. suaveolens*. Fragrant Net-feed.—Discovered by Mr. William Roxburgh, on the Rajamah hills. *Stem* erect, shrubby, with opposite branches; downy when young. *Leaves* opposite, stalked, with triangular intermediate stipules, lanceolate, acute, entire, near a span long, smooth. *Flowers* white, an inch long, delightfully fragrant, copious, in numerous terminal tufts. A very curious and distinct genus, which we hope to see introduced from the Calcutta garden into the faves of England.

SPHAGEBRANCHUS. See SYNBRANCHIUS.

SPRIGE, or SPRIGG.

SPRINGS. Add—See UXAHVER.

STAMMERING. See LARYNX.

STAPHYLINUS, l. 5, add—The larvæ are subterranean, and much resemble the complete animals; l. 15, add—Mr. Marfham, in his "Entomologia Britannica," enumerates no fewer than 87 British species.

VOL. XXXIV.

STARCH, *Chemical Composition of*. Starch has been analysed by three different experimentalists. The following were the results:

	Gay Lussac and Thenard.	T. de Sauffure.	Berzelius.
Hydrogen	6.77	5.90	7.066
Carbon	43.55	45.39	43.481
Oxygen	49.68	48.31	49.453
Azote		0.40	
	100.	100.	100.

Berzelius employed potatoe starch. The other experiments were made with the starch of wheat.

Kirchhoff, a Russian chemist, found, that by boiling starch with dilute sulphuric acid it is converted into fugar; and M. T. de Sauffure has recently discovered, that this change takes place spontaneously when boiled starch is exposed for a considerable length of time to the action of the air.

STATISTICS, a term applied to the topography of a country, and comprehending its population, policy, manufactures, trade, and a variety of other circumstances.

STEARIN, in *Chemistry*. A name given by Chevreul to a substance existing in animal tallows or fats. It may be separated by alcohol, or simply by pressure. Braconnot used the following method: The oil if fluid was congealed, and in this state was subjected to strong pressure between folds of blotting paper. The elain (see ELAIN) was imbibed by the paper while the stearin remained behind in a solid state.

Stearin thus obtained is white, brittle, and something like wax in appearance. It crystallizes in small needles. It has little or no smell. It is tasteless, and produces no effect on vegetable blues. It melts, as obtained from different fats, between 109° and 120°; that from the fat of the duck being most readily melted, and that from human fat the least. It is soluble in water, and combines with the alkalis, forming soaps.

STEBEN, l. 15, add—of whom, in 1810, 87 were slaves.

STIPPLING, l. 7 and 9, *r.* pecks.

STIRLINGSHIRE. In 1811, this shire contained 8910 houses, besides 55 unfinished, and 58,174 persons (including 803 local militia); 27,745 being males (militia in-

cluded), and 30,429 females: 2425 families being employed in agriculture, and 5912 in trade, manufactures, and handicraft.

STIRRUP. At the clove, add—The Roman manners required that young men and expert riders should be able to vault on horseback without any assistance. (Virgil, *Æneid*, l. 12. 288.) In many public places, particularly highways, stones were erected, to which a rider could lead his horse, that he might mount with greater facility. Such stones Gracchus caused to be raised (Plutarch, de Vit. Gracchi); and they were to be found in many cities in the 16th century, especially near the council-house, for the convenience of the members of the council, who at that time did not ride in coaches. It was usual also to have portable stools, which were placed clove to the horse when persons wished to mount: and this gave rise to the barbarous practice of making conquered generals and prisoners stoop down, that the victor might more easily get on horseback, by stepping upon their backs as upon a stool. In this ignominious manner was the emperor Valerian treated by Sapor, king of Persia. Some horses were so taught, that they kneeled until the rider mounted; and warriors had on their spears or lances a step or projection on which they could rest the foot until they got on horseback. (Strabo, lib. iii. Sil. Ital. lib. x.) See ANABATHRA and ANABOLEUS. The first certain account of stirrups, says Beckmann, (History of Inventions, vol. ii.) is in a book written by Mauritius, respecting the art of wars, about the end of the 6th century. Eustathius, the commentator on Homer, informs us, that in his time, *i. e.* the 12th century, stirrups had not become very common; but on a piece of tapestry, of the eleventh century, caused to be engraven by Montfaucon, the saddles of all the horses appear to have stirrups. However, after they became common, it was thought to be an evidence of superior dexterity to ride without them.

STOKES, in *Geography*, a township of Madison county, in Ohio, containing 267 inhabitants.

STONE in the *Bladder*. See LITHIOTOMY, and URINARY Calculi.

STONE, *Mile*. See MILE-STONE.

STONES, *Chemical Analysis of*. See ANALYSIS.

STONY CREEK, in *Geography*, a township of Somerset county, in Pennsylvania, having 943 inhabitants.

STRAFFORD, in New Hampshire, add—divided into 31 townships, &c.

STRAINING. See LUNGS.

STRAND BRIDGE. See WATERLOO.

STRONTIAN, STRONTIUM, in *Chemistry*, the name of an elementary substance or earth, the description of which has been omitted.

Strontian is always found in nature combined with the carbonic or sulphuric acids. (See STRONTIANITE and CELESTINE.) It may be obtained pure from those minerals precisely in the same manner as *barytes* and *lime*.

Strontian thus obtained is in porous masses of a greyish-white colour. Its taste is acrid and alkaline, and it converts vegetable blues to green. Its sp. gr. according to Haffenratz, is 1.647. It does not act so strongly on animal bodies as *barytes*, nor is it poisonous.

Sir H. Davy, led by analogy, subjected it to galvanic influence, and thus succeeded in separating its oxygen and obtaining *strontium*, the metallic basis of strontian. This metal is white, much heavier than water, and bears a close resemblance to *barium* in its properties; when exposed to air or thrown into water, it rapidly absorbs oxygen, and is converted into strontian.

Dr. Thomson, from the recent experiments of Stromeyer and

and others, fixes the weight of the atom of strontian at 65; from which the composition of its salts may be readily estimated.

The salts of strontian require to be briefly noticed. They are in general more soluble than the salts of barytes, but less so than the salts of lime. Most of them are capable of being crystallized. They are precipitated by the sulphates, phosphates, and oxalates. Succinate of ammonia precipitates barytes, but not strontian. When a piece of paper is dipped into a solution of a salt of strontian, it burns with a red flame. The salts of strontian are not precipitated by the prussiate of potash, nor are they poisonous.

Nitrate of Strontian.—This salt crystallizes in six-sided pyramidal dodecahedrons with their apex truncated, so as to have the appearance of hexahedral plates with bevelled edges. Sometimes in eight-sided prisms. It is perfectly transparent. It has a strong pungent cooling taste. Its sp. gr. is 3.006. It is soluble in its own weight of water at 60°, and in little more than half its weight of boiling water. It is insoluble in alcohol. It is not altered by exposure to air. It deflagrates on hot coals. When a crystal of nitrate of strontian is put into the wick of a candle, it communicates a beautiful purple flame.

Muriate of Strontian.—This salt crystallizes in long slender hexagonal prisms. Its taste is sharp and penetrating. Its sp. gr. is 1.4402. It is soluble in less than its weight of cold water, and in any quantity in boiling water. It is soluble in about twenty-four parts of cold alcohol. The crystals do not deliquesce on exposure to the air, except in very damp weather.

Carbonate of Strontian.—This, when precipitated, is a white powder without taste or smell, and soluble in about 1536 parts of boiling water. Its sp. gr. is about 3.66, and it is not altered by exposure to the air.

Sulphate of Strontian.—This salt is tasteless, soluble in 3840 parts of boiling water; readily soluble in sulphuric acid when assisted by heat, and possesses other properties very analogous to the sulphate of barytes.

Phosphate of Strontian.—This salt is likewise tasteless, insoluble in water, and not altered by exposure to the air.

Acetate of Strontian.—This is soluble in little more than twice its weight both of cold and hot water. It may be crystallized, and the crystals are not altered by exposure to the air. It renders vegetable colours green.

The other salts of strontian do not in general possess any remarkable properties. The *oxalate, tartrate, fucinate, and citrate* of strontian, are all more or less soluble in water; the *oxalate* being the least soluble, and the *citrate* the most. The *malate* of strontian is more soluble in water than the *malate* of barytes.

STROUD, in *Geography*, a parish of Kent, part of which is included within the jurisdiction of the city of Rochester (see ROCHESTER); and the other part, in 1811, contained 242 houses, and 1394 persons; 718 being males, and 676 females.

STYLE, in *Painting*, is the manner in which a painter conceives and executes the subjects he adopts; or, in other words, in which he combines the various qualities of a picture. Style is properly divisible into four distinct kinds, *viz.* the grand or sublime, the beautiful, the natural, and the mean. There are indeed several varieties of style which have obtained specific appellations; but they will be found upon examination to combine, in different ways, the qualities peculiar to those above-mentioned; and are justly regarded as vicious in their nature: such are the ornamental and the artificial styles of art, which divert the attention of painters from the more pure application and exercise of their art, and

lead them to adopt fictitious means of attracting attention, by contrast and affectation, by glitter, and an idle display of skill in workmanship, to the neglect of nature and just expression, and sometimes even of common sense.

The object and aim of the grand style is to captivate the imagination. It is the only proper one for the representation of grand and elevated ideas: of subjects which represent the actions of deities, or of heroes, or which relate to the higher qualities of the mind of man: the only just medium whereby the art of painting can embody such ideas as the cultivation of those qualities inspires, and by which alone it can at all pretend to rival the grandeur and effect of heroic poetry. Its characteristics are simplicity and fulness of form and colour; and it is obtained, by adopting only essential parts, avoiding those which add nothing to specific character, and fixing solely upon those general forms which particularly distinguish one race of beings, or one class of natural objects or of actions from another, giving them their greatest possible degree of elevation, even to the verge of extravagance, in undulation of line, and fulness of form. This selection of form and of action requires an appropriate chiaro-oscuro, arranged and combined in broad and simple masses, and painted with a serious tone of colour; in fact, such a combination of the prime qualities of the art, as will most effectually unite in the production of one unmingled emotion.

The grand style does not admit attempts at illusion, or too close an imitation of natural objects; which, when carried to excess, necessarily disturbs that singleness or simplicity of effect required where the object is to produce an elevated tone of thinking. It is not dependent upon size, but may be exhibited on a small scale as effectually as on a large one; witness many of the beautiful bronzes and gems of the ancients, and the effect, as described by Statius, of the statue of Hercules made by Lyfippus, which “though not more than a foot in height, filled the imagination in a manner equal to the Hercules Farnese.” Raphael’s small picture of the vision of Ezekiel is also an effective instance of the truth of this assertion.

STYLE, for that word alone is adopted as significant of the grand art, can only be acquired by those who have made themselves well acquainted with the just proportions and varieties of nature. Its aim being to represent her works with the greatest degree of sublimity commixed with truth, all attempts to produce it without real knowledge must necessarily lead to error, and a species of bombast, instead of expression, yields only deformity. Of this, the works of Gottzius, of Spranger, and the Germans who followed them, are sufficient evidence. And yet such is the rarity of perfection in form among the human or the animal race of beings, that an artist whose aim is to produce grandeur of style must draw largely upon his imagination; and while he touches the verge of impossibility, will find that the difficulty he has to overcome is in uniting the principle on which he depends with propriety. Even Michael Angelo, great and glorious as he was among those who have made it their principal object, has not unfrequently allowed himself to be misled by the wish to aggrandise, and give his contours only redundancy for style; and for the sake of a flowing and varied line, has sometimes given forms of action to muscles which ought to have been represented tranquil.

Of this style, as far as relates to form, the best among the sculptures of the ancients afford the fairest examples, particularly the torso of the Belvidere, the head of Jupiter, the Laocoon, the Apollo, the figures on Monte Cavallo, &c. &c.; and it is a striking feature in the works of Phidias,

dias, though with a chastened impulse, as may be seen in the Elgin marbles. Indeed it appears to have been so perfectly understood among the artists of ancient Greece, that it spread generally in a greater or less degree through all their productions, at least in those of sculpture; and from the few remains of painting left to us, it appears not improbable that the professors of that art were no less masters of its principles. In latter times, among the moderns, the Florentine school made it their principal object of attention; and in the works of Leonardo da Vinci, Fra. Bartolomeo, and more particularly of Michael Angelo, it reached in quality nearly to a level with the taste of those from whom it was adopted. Raphael attempted it in imitation of M. Angelo, and sometimes succeeded, but it evidently was not congenial to his feeling, which inclined to the beautiful and graceful, more than to the sublime; and hence it is that his pictures of the Godhead rarely impress us with sentiments of an exalted nature.

The beautiful style differs from the grand, in that it requires less force of contrast in form and action, and greater softness of colour and effect. Whatever is graceful and animated, void of superfluous parts, and yet essentially characteristic and pleasing in arrangement, combines to form the beautiful. Flowing lines, graceful contrasts, both in form and colour, softened lights and shades, and rich and harmonious colouring, are its principles: on them it depends, and every departure from them necessarily diminishes its quality. It is the fit medium for every subject whose character is adapted to afford pleasure.

As the grand style consists in an elevated view of nature, a conception of perfection almost super-human, built upon the possibilities of creative power, acting upon known and natural forms; so the beautiful also must be sought in the regions of imagination, guided by the knowledge of existing objects, and supported by selection from the varieties of nature. Therefore, in order to comprehend the character of beauty as applied to art, we must consider the perfection of that art, not as consisting in mere imitation of visible objects, but as requiring a separation and choice of parts, an ideal perfection, which, though it belongs to the works of nature in all classes of beings, yet is not to be found entire in any given object. Raphael, when he was painting his Galatea, said in a letter to his patron count Baldassare Castiglione, "that not being able to find perfect beauty upon earth, he was obliged to have recourse to ideal excellence framed in his own mind." But Zeuxis took another method to produce the constellation of perfections recognized in his Helen; viz. by selecting and combining the various beauties of the most beautiful among the virgins of Agriguntum: thus surpassing the works of nature, with materials furnished by herself.

Beauty, it will be easily conceived, is not confined to one given line, or set of lines or colours, in unison or in contact with each other. There is necessarily one general form of the male among men and animals, and one of the female; distinct in their character, and yet each having its appropriate degree of beauty: so there is also a distinction of form among different creatures of the same species. Apollo, Hercules, and a Gladiator, have each distinct qualities which must be maintained in their representatives, whilst grace and beauty are given to their forms and actions: and it would be as great an absurdity to soften each to the merely beautiful, and thus render them similar in form and character; as it is ignorant and gross to trust to that which is characteristic alone for a graceful and agreeable effect.

Though these, which we have specified, be the distinct separations between the grand and the beautiful styles in art,
Vol. XXXIX.

yet either may be rendered more perfect by the addition of the other; and when expression is superadded, then is exhibited the most perfect display of the power of art: and it is this union of the beautiful and characteristic with the grand, which constitutes that mental and energetic application of the art of painting which elevates it above the mechanical arts, and entitles it to the highest pretensions, as it is addressed to the noblest faculties. This is that beau-ideal so much the theme of praise and exultation among the connoisseurs; so universally felt when exhibited, so little understood, and so often the foundation of the grossest follies and deceptions among both artists and amateurs. The former, pursuing the practice of it in theory, often become the dupes of their own imaginary systems; the latter more often impose themselves upon the world as men of worth by the mere cant of its diction, and are screened from discovery by the general want of information concerning the principles and proper objects of art.

In this happy combination of beauty and grandeur the Greeks still remain unrivalled, as far as relates to sculpture, and perhaps single figures in pictures, but we have very little ground for conjecture how far they were able to conduct the principle in extended compositions in painting. Among the moderns, perhaps Parmeggiano in his latter and more perfect works, as his Moses and his Vision of St. Jerome, has effected more than any other painter this desirable union; and most likely had he lived much longer the world would have seen the perfection of the art from his hands; more particularly if he had cultivated expression in the school of Raphael, as successfully as he had the other branches of the art in those of Correggio and M. Angelo. "The name of Correggio," says Mr. Fuseli, "is the synonyme of whatever is graceful and agreeable in painting;" to him we are principally indebted for chiaro-oscuro, and that luminous and harmonious tone of colour, which fascinates and delights the eye by its unity, blended with richness and variety. He may be regarded as the father of the beautiful in modern art, as M. Angelo is of the grand and sublime.

That kind of style which is termed natural is, as its name imports, a mere imitation of the common forms of nature, without that selection which we have pointed out as necessary to the higher styles of art. Of this we have many capital instances among the smaller antique bronzes of Fauns, Nymphs, &c. and in many of the works of Titian in his second manner. Most of the principal portrait painters have almost necessarily adopted it, though that branch of the art admits, when highly practised, of that selection of parts which constitutes the beautiful, and of being treated with dignity and even sublimity, as many of the works of Sir Joshua Reynolds, of Titian, and of Vandÿke, sufficiently prove. In a lower degree, the Dutch and Flemish masters have most successfully wrought in this style, as Jan. Steen, Ostade, Teniers, Rembrandt, Metzù, Terburg, &c. and compensated for the want of higher qualities, by the perfection of their arrangements and execution, and the exactness of their imitations.

Of what is mean in style, it is hardly necessary to speak: examples of it may be found in all early essays; but in none more abundantly than among the works of the artists of the German and Flemish schools of the 16th century. Even in those of Albert Durer, meanness is a never-failing alloy, amidst all the brilliancy of imagination, and activity of mind, they display; deforming actions and expressions otherwise well worthy of esteem, and extending through every part of the compositions, be it of figures, drapery, or back-ground.

Of the four species of style above enumerated, all others
4 O are

are necessarily composed: but there have been some few remarkable aberrations from the ordinary course of art, by painters of uncommon talent, which bid defiance to all classification, and stand alone in their respective spheres. Such are those of Rubens and Rembrandt, of Tintoretto and Salvator Rosa, compounds of all that elevates and degrades; in which the grand and the mean, the beautiful, the natural, and the deformed, go hand in hand; the evil counterpoised by the good, and the whole rendered engaging, in spite of defects, by the skilful display of the master hand which wielded the materials. Such examples, great though they are, ought not to serve as excuses for inattention to settled principles. Who shall say, that if Rubens had been more correct in form, his works would have been less engaging; or, that if Tintoretto had been more pure and true in expression, his productions would not have been more interesting. (See the article PICTURE.) Combinations which will justify such expectations have been formed, and we have seen them in our own great fir Joshua's productions, where fine form, rich and full-toned colour, and just chiaro-oscuro, have been blended in skilful and free execution.

SUCOWIA, in *Botany*, in honour of professor Suckow, a learned botanist, of Heidelberg.—“ Moench. Meth. 265.” Brown in Ait. Hort. Kew. v. 4. 79.—Class and order, *Tetradynamia Siliculosa*. Nat. Ord. *Siliquosa*, Linn. *Crucifera*, Juss.

Eff. Ch. Pouch nearly globular, beaked with the awl-shaped style; valves hemispherical, prickly; cells single-seeded. Cotyledons folded together.

1. *S. balearica*. Minorca Succowia. Ait. n. 1. (Bunias balearica; Linn. Syst. Nat. ed. 12. v. 2. 446. Mant. 429. Jacq. Hort. Vind. v. 2. 68. t. 144.)—Native of Minorca. Given to Kew garden, in 1781, by Dr. Brouffonnet. A hardy annual, flowering in summer. *Stem* branched, a foot high. *Leaves* smooth, elegantly pinnate and lobed. *Flowers* yellow, racemose.

SUFFOLK, col. 6, l. 13, add—In 1811 Suffolk contained 37,227 houses, besides 155 then unfinished, and 234,211 persons; viz. 111,988 males, and 122,223 females: 26,406 families being employed in agriculture, and 15,180 in trade, manufactures, or handicraft.

SUGAR, *Chemical Composition of*. See FERMENTATION.

SUGAR-Loaf, in *Geography*, a township of Luzerne county, in Pennsylvania, having 282 inhabitants.

SULLIVAN, l. 26, insert—including 43 slaves in 1810.

SULPHUR, in *Chemistry*. According to the most recent determinations, the weight of the atom of sulphur is 20, and of sulphuric acid 50; from which data the composition of the compounds of this substance can be accurately ascertained. See *ATOMIC Theory*.

SULPHUR Island, l. 8, add—The sulphur is collected by a few individuals resident on the island solely for that purpose; sent to the Great Loo-choo, and thence exported to Japan and China. N. lat. 27° 56'. E. long. 128° 11'. Ellis's Journal of an Embassy to China. 1818.

SULPHURETTED CHYAZIC Acid. See CYANOGEN.

SULPHURIC ACID. It is stated in our article on this subject, that sulphuric acid cannot exist without water; and that the sulphuric acid prepared at Nordhausen from green vitriol probably differs from common sulphuric acid by containing less water. The fact is, according to Dr. Thomson, that the latter, when most concentrated, contains *no water*

whatever, and consequently a perfectly anhydrous sulphuric acid can exist.

SULPHURIZED MURIATIC Acid, in *Chemistry*. The substance described under this name in the Cyclopaedia is a *chloride of sulphur*. See **CHLORINE**. See also the original article **SULPHUR**.

SULTANABAD. For **TARSHISH** *r.* **TURSHISH**.

SURABHI, col. 2, l. 44, for proferibe *r.* prescribe.

SURRY, in Virginia, l. 4, *r.* 6855.

SURYA, col. 5, l. 24, for drawn *r.* driven.

SUTTEE, l. 3 and 4 from bottom, *r.* thus—out number. As well as meritorious suffering for religion's sake, suicide is in some cases legal, and even commendable.

SUTTON, a village and parish of Surry, in the second division of Wallington hundred, which in 1811 contained 121 houses, and 658 persons; viz. 310 males, and 328 females.

SWADHA, l. 5, for Galaka *r.* Golaka.

SWIMMING Bladders of Fish, *Nature of the Air contained in*. We may introduce here the curious experiments made by Biot on this subject. This gentleman and Mr. Laroche found in general a mixture of azote and oxygen, but no hydrogen or carbonic acid in the swimming bladders of fish; the air-bladders of those fish living near the surface of the water containing least oxygen, and those of fish brought from a great depth the most. The following table exhibits the proportion of oxygen in 100 parts of the air in the different fish examined.

Names of Fish	Proportion of Oxygen.
Mugil cephalus (Linn.)	Quantity indeterminate.
Ditto	do.
Muraenophis helena (Lacepede)	very little.
Sparus annularis (Linn.), female	.09
Ditto, male	.08
Sparus fargus (Linn.), female	.09
Ditto, male	.20
Holocentrus marinus (Lacepede)	.12
Labrus turdus (Linn.)	.16
Sparus melanurus (Linn.)	.20
Labrus turdus (Var. Linn.)	.24
Sciæna nigra, female	.27
Ditto, male	.25
Labrus turdus (Linn.), female	.24
Ditto, male	.28
Sparus dentex (Linn.), female	.40
Sphyræna spet. (Lacepede)	.44
Sparus argenteus	.50
Sparus erythrinus	much.
Holocentrus gigas	.69
Gadus merluccius (Linn.)	.79
Trigla lyra (Linn.)	.87

The depth at which the fish in the preceding table are caught increases gradually, as well as the proportion of oxygen, from the beginning to the end of the table. The trigla lyra is always caught at a very great depth. M. Laroche found, that fishes taken at a depth greater than 150 feet, furnished at a mean about .70 oxygen, while the mean result furnished by the fish caught at less depths was only .29. The same law holds with respect to fresh-water fish. M. Biot's experiments were made near the Balearic islands.

SYCAMORE, in *Geography*, a township of Hamilton county, in Ohio, containing 1552 inhabitants.

TELFAIR, in *Geography*, a county of Georgia, containing by the census of 1810, 744 persons, of whom 218 were slaves.

TELINGA, formerly called the Kalinga, and by the Europeans Gentoo, an Indian language occupying the space to the E. of the Maharrata, from near Cicacoe, its northern, to within a few miles of Pulicat, its southern boundary, with the intervention of a stripe of small dimension. This space was divided into the Andra and Kalinga countries; the former S., the latter N. of the river. At the period of the Mahometan conquest, the southern part of these united provinces seems to have been known to that people by the name of Telingana, and Warankul is the capital of the whole.

TELLURIUM, in *Chemistry*. Add—This metal has the property of combining with hydrogen, forming a gaseous compound, to which the name of *telluretted hydrogen gas* has been given. This compound was discovered by sir H. Davy, and its properties were afterwards investigated by Berzelius.

Telluretted hydrogen may be formed by mixing together oxyd of tellurium, potash, and charcoal, and exposing the mixture to the action of a red heat. It is then put into a retort, diluted sulphuric acid is poured on it, and the beak of the retort is plunged into a mercurial trough. A gas comes over, which may be collected in glass jars previously filled with mercury. This gas is transparent and colourless, and possesses the mechanical properties of common air. It has a strong peculiar smell, something like sulphuretted hydrogen. It burns with a blueish flame, and oxyd of tellurium is deposited. It is soluble in water, and gives that liquid a claret colour. Davy was not able to determine whether it reddens vegetable blues, but in other respects it possesses

possesses the properties of an acid, combining with alkalies, and precipitating most metallic solutions like sulphuretted hydrogen. Chlorine gas immediately decomposes it. The other properties of this gas have not been satisfactorily examined. From the experiments of Ritter, there appears to be a solid compound of tellurium and hydrogen.

Tellurium seems also to have the property of combining with carbon.

TEMPERATURE, col. 2, l. 28, *r.* eminence.

TERRITORY, MISSOURI, col. 2, l. 5, add—It was first discovered by Sebastian Cabot in 1487, and in 1512 visited by John Pontio de Leon, a Spaniard, who endeavoured to form a settlement. In 1684 M. de la Sella, a Frenchman, discovered the mouth of the Mississippi, and built Fort Louis; but being assailed, it was again abandoned. In the year 1698, captain Ibberville sailed to the Mississippi, formed a settlement, and named the country Louisiana. About twenty-two years afterwards, M. de la Suieur also sailed up the Mississippi, and proceeded to the distance of 2280 miles from its mouth. In 1762 France ceded it to Spain; in 1800–1801 Spain ceded it back to France; and by a treaty of April 30th, 1803, the French government sold it to the United States for the sum of fifteen millions of dollars, payable in fifteen years at the rate of one million annually. *Bradbury's Travels*, p. 214.

TEUTHIS, HEPATUS, *l. penult. r. Tang.*

TEWKESBURY, in *Geography*, a town of Hunterdon county, in New Jersey, containing 1308 persons, of whom 66 were slaves in 1810.

THEOPHILANTHROPISTS, a sect which sprung up, flourished, and became extinct in France during the period of the Revolution. It has been said, that the "temple of nature," opened in Margaret-Street, London, in 1776, by the lately deceased David Williams, an active member, if not the founder of the society for the relief of decayed and indigent authors, for worship on Deistical principles, suggested to the unbelievers of France the idea of a ritual and liturgy of deism, which was first carried into execution in the year 1796. The resemblance of the principles of some members of the sect to those of Robespierre, and of its ceremonies to the worship of the goddesses of Reason, has led some persons to represent the Theophilanthropists as partisans of the tyrant, and their meetings as Jacobinical clubs; but the abbé Gregoire (*ubi infra*) has laboured to vindicate them as a body from this charge. The first person who planned the celebration of the rites of natural religion appears to have been D'Aubernon, a romantic enthusiast, who wished to revive a part of the doctrines of the ancient Magi. In his work intitled "Culte des Adorateurs," which is a rubric, a liturgy, and a treatise of morals, eight days are appointed for labour, and the ninth for rest; but the temples were to be constantly open, and the sacred fire kept burning in them with the most religious care. The priests, whose costume was prescribed, were to offer to the Deity grain and fruits of different kinds, salt and oil, and, turning to the four cardinal points, to pour libations and make apostrophes to the elements. The twelve signs of the zodiac were to be painted on the walls of the temple, (or asylum, as it was denominated,) and under each thirty butterflies, to represent the number and shortness of our days. Sacred dances were to be performed at different periods; the elderly men leading off with the matrons, the young men and the virgins following. At funerals a libation was to be poured out to

the manes of the deceased, and the eldest of his relations was to throw water on the fire, addressing the element in a prepared formula. D'Aubernon proposed to denominate his followers "Théoanthropophiles," which appellation was afterwards changed to "Théophilantropes." As the churches had all become national property, the Theophilanthropists applied to the civil authorities for the use of them jointly with the Catholics; and their request was granted, on condition that each party should remove the emblems and decorations of its own worship, while that of the other was performed. We shall not detain our readers with describing their ritual, the dresses of their orators, or the circumstances attending their worship, and their marriage-service, nor shall we detail their moral lesson, or give specimens of their hymns and sacred poetry. This sect did not subsist for a long time; the zeal of its partisans began to decline in the provinces; and it appears, from the registers of a society at Bourges, that their first sitting was held in the cathedral, Feb. 29, 1798; and that on the 18th of August, 1800, their number being reduced to seven or eight, they dispersed, and the Theophilanthropic church of Bourges became extinct two years and a half after its first formation. In about five years, the whole sect had quietly disappeared; the last trace of it being that Chemin, who wrote a work defending their principles, made use of their manual as a school-book in a seminary at Paris, where he taught Latin. See Abbé Gregoire's *Histoire des Sectes Religieuses*, &c. 2 vols. 8vo. Paris.

THOMPSON'S POND, and *Shaker Settlement*, in *Geography*, a township of America, in the district of Maine, and county of Cumberland, having 101 inhabitants.

THORINA, in *Chemistry*. The name of an earth recently discovered in Sweden by Berzelius.

This celebrated chemist first detected thorina in the *Gadolinite* of Korarvet, and afterwards in the *deutofluate of cerium*, and the *double fluate of cerium and yttria*, both minerals found at Fahlun.

Thorina may be obtained from the minerals containing protoxyd of cerium and yttria in the following manner. Precipitate the iron by means of the succinate of ammonia. Thorina when alone is precipitated by this salt, but this is not the case when it is mixed with the other bodies that exist in the fluates of cerium and yttria. After the iron is removed, precipitate the cerium by means of sulphate of potash. Ammonia now precipitates the thorina mixed with yttria. Dissolve them in muriatic acid. Evaporate the solution to dryness, and pour boiling water on the residue, which will dissolve the greatest part of the yttria, but not the whole. Redissolve the residue in muriatic or nitric acid, and evaporate till it becomes as exactly neutral as possible. Then pour water upon it, and boil it for an instant, the thorina precipitates, and the solution contains a dissolved acid. If we saturate this acid, and boil it a second time, an additional portion of thorina is precipitated.

Thorina when separated by the filtre has the appearance of a gelatinous semi-transparent mass. When washed and dried it becomes white, absorbs carbonic acid, and dissolves with effervescence in acids. Though calcined it retains its white colour. After a violent heat it is difficultly soluble in muriatic acid. The solutions in this acid are yellowish, but become colourless when diluted.

The neutral solutions of thorina have a purely astringent taste, which is neither bitter, sweet, saline, nor metallic; a property in which it agrees with zirconia, and differs from all other earths.

Thorina is little soluble in the alkalies or alkaline earths.

It has not yet been reduced to the metallic state. It is infusible *per se* before the blow-pipe, but with borax it melts into a transparent glass. It differs from alumina by its insolubility in hydrate of potash; from yttria by its purely astringent taste without sweetness; and by the property its solutions possess of being precipitated by boiling, when they do not contain too great an excess of acid. It differs from zirconia by the following properties: 1. After being heated to redness, it is still capable of being dissolved in acids. 2. Sulphate of potash does not precipitate it from its solutions, while it precipitates zirconia from a solution containing even a considerable excess of acid. 3. It is precipitated by oxalate of ammonia, which is not the case with zirconia. Sulphate of thorina crystallizes readily, while sulphate of zirconia, supposing it free from alkali, forms when dried a gelatinous transparent mass, without any tendency to crystallization.

Thorina combines with the different acids. The sulphate of thorina is soluble, and yields transparent crystals, which are not altered by exposure to the air, and which have a styptic taste.

The nitrate and muriate of thorina do not crystallize. The carbonate of thorina is very readily formed, the earth having a very great affinity for this acid. None of the other salts of thorina known appear to be capable of crystallizing.

THORN, in *Geography*, a township of Fairfield, in Ohio, having 497 inhabitants.

THORNBURY, a township of Chester county, in Pennsylvania, having 200 inhabitants.

THORNTON, a town of Grafton county, in New Hampshire, containing 794 inhabitants.

THRIPS, col. 2, under VARIEGATA, l. 13, add—The Thrips phylaxus has been supposed to do much injury to wheat, rye, &c. by causing the young flowers to decay, and thus preventing the growth of the embryo grain. Some, however, have disputed this opinion, contending that the thrips does not attach itself to such of the cerealia as are in a perfectly healthy state, but rather to such as are diseased, by having the germina covered with the dust of a very minute fungus, often growing on wheat, &c. and belonging to the genus *Æcidium* or *Lycopodon*, and which appears in the form of a flattish, smooth, irregular exudation of a yellow colour in various parts of the plant. (See on this subject, vols. iii. iv. and v. of the Transactions of the Linnean Society.) The ingenious Mr. Kirby, however, seems convinced, that the thrips is in reality an insect highly injurious to corn, by deriving its nourishment from the embryo grain. Shaw's Zool. vol. vi.

TIC DOULEUREUX, in *Medicine*, an extremely painful disease of the nerves of the face, commonly, if not exclusively, affecting some branch of the fifth pair of nerves, and most frequently the infra-orbital branch, where it passes through the foramen, so named in the cheek.

The complaint commences with slight and almost imperceptible attacks of pain, and generally without any warning; though some patients feel in the affected part peculiar and inexplicable sensations preceding its approach, from which they announce with horror the coming enemy; the patient at the same time enjoying a good or an indifferent state of health. The pain, however, soon becomes most acute, shooting and darting along the various ramifications of the affected nerves. It generally continues from a quarter to half a minute, and never exceeds the space of one minute. It returns at intervals more or less frequent; there being sometimes several paroxysms in a few minutes,

and at other times there are intervals of from fifteen to thirty minutes, or longer. There is no determinate period; we always find the utmost irregularity even in the same patient.

The pains vary in their degree of intensity, at one time exciting the most piercing cries, and distracted writhings and motions in the miserable patient; while at another, they are more bearable. When at the acme of their violence, the parts affected are often convulsed, and sometimes various contortions and grimaces are observable. These are to be distinguished from the convulsive twitchings of the muscles, with which the diseased nerves communicate, and which are occasioned by irritation from the excessive pain; while the contortions and grimaces are voluntary, being caused by the patient's writhing and twisting from the agony of his torture, and may be prevented by a firm resolution to resist any impulse of shrinking from the attack.

The pain does not always confine itself to the seat of the disease, but darts with the rapidity of lightning to the neighbouring parts, shooting in different directions like radii from a centre. It rarely gives warning of its approach, and often the first sign of an attack, is the patient's starting up in a state little short of palsy. In this condition, some patients beat the part with violence, or forcibly rub it with some rough substance till excoriation takes place; and in some instances, they have succeeded in diminishing the intensity of the pain.

The pains are more frequent during the day than in the night, probably from there being fewer causes of irritation; and they are more frequent during conversation than in silence; and still more so, at the time of mastication, when the attacks often succeed each other with such rapidity as to appear like one continued paroxysm, with scarcely one interval of cessation. The eye at times is red, inflamed, and watery, as we sometimes observe in severe tooth-ach. In other cases, it is particularly dry, and in some patients a copious flow of saliva succeeds a paroxysm. In general, only one side of the face is affected with this dreadful malady. But as there are cases recorded in which both sides suffered at the same time, we cannot lay it down as a certain characteristic of the disease. Fouquet observed at Montpellier two women who had both cheeks affected at the same time; and Pujol knew a lady, who, for several months, had the pain in one cheek, which after a while was free from pain; but the other cheek was immediately attacked in the corresponding place, the pain continuing for two months, and then reluming its former position.

When the disease continues for a great length of time with increasing violence, the patient can neither obtain rest by night nor by day. His appetite fails; and, as may be expected, there is some degree of feverishness. But this rarely happens, and only in cases of the utmost severity. The complaint usually terminates without any apparent cause, leaving the patient for a time to enjoy the comforts of life. But whoever has had one attack may with considerable certainty anticipate another; and though he is to-day well, and free from all pain, to-morrow's dawn may usher in a renewal of his torment. So varied is the duration of this affection, and so limited is our knowledge of it, that we can assign no determinate or even probable period for its continuance; and unless a cure is effected it returns at intervals more or less frequent, and with increased violence, till the great final catastrophe, which, however, it does not seem to accelerate. For though Dr. Banisch is said to have died of it, we can place little reliance on the report, and subsequent cases and observations do not corroborate such a supposition.

TIC DOULEUREUX.

Hartenkeil, Hildebrande, and Baldinger, and some other Germans, relate cases of what they call tic douleureux; which, though in some particulars, they resemble that affection, in others differ most materially. The first of these writers describes it as having been very prevalent at Saltzburgh. But the pain was periodical, recurring generally once in twenty-four hours; and sometimes, though rarely, once in twelve hours; often remaining for several hours at a time, and then suddenly departing. These, however, were obviously cases of hemicrania; for that has, in many instances, been observed to attack the patients periodically, and to yield to bark. See HEMICRANIA.

The *predisposing cause* of this disease would seem to be a certain period of life, when the strength begins to fail, the functions to be impaired, and the whole corporeal frame to feel the first signs of approaching decay. We rarely find it commence before the fiftieth year, though two or three cases of an earlier date are recorded. Women do not seem to be more liable to the complaint than men; though Dr. Fothergill, having a great proportion of female patients, imagined they were more predisposed to it; as likewise did Pujol, from their greater sensibility. The latter author (in his Essay, p. 14.) says, "we generally observe in such people as are subject to tic douleureux an excess of mobility, which renders them more or less disposed to hysterical and hypochondriacal affections. Experience, however, teaches us, that people very far removed from excess of sensibility are equally liable to the disease; that women are not more liable to it than men; and that the predisposing period of life is that when the sensibility or mobility of fibre is most defective.

The *exciting causes* are, cold applied to the face in a stream, whether of air or of water; particularly when the patient is fatigued by previous exhaustion. Exposure then to stormy, damp, moist, windy, and tempestuous weather, frequently excites an attack; also external injuries, as blows or contusions on the face. Passions of the mind, as excess of anger or of grief.

The disease being once established in the system, the slightest causes in some individuals will bring on a paroxysm; such as eating, drinking, and talking, or indeed any motion of the facial muscles, or the gentlest touch with a handkerchief, or any other substance to the nose, lips, cheek, &c. of the affected side. Shaving is an operation most particularly shunned and dreaded by the unhappy patient; and often cannot be endured till after a considerable interval of ease. Blowing the nose is absolutely impracticable; or, if attempted, a most pungent and distracting torture attends the performance. M. André, in a work entitled "Observations sur les Maladies de l'Urètre," mentions a very obstinate case of tic douleureux, which he attempted to cure by destroying the nerve that he supposed to be the seat of the disease. He began by laying it bare, and was astonished to find, that every time he touched the denuded nerve, he immediately excited symptoms of the disorder; the paroxysm ceasing in the usual time, and recurring whenever the nerve was touched. This fact is very clear and decisive as to the part affected by the disease, and hence we readily perceive, why the least touch or motion on the surface of the skin produces a paroxysm.

When the pain has continued with frequent accessions for a length of time, a most distressing scene is sometimes witnessed. The patient, whose health at the time is generally good, after desisting from eating and drinking, till the keenness of his appetite, and the intensity of his thirst, are too irresistibly urgent to be longer unrelieved,

attacks whatever food is placed before him with maniac fury and hurried precipitancy; his countenance suffused with crimson, and convulsed and contorted with pain. This horrid conflict does not last long; he soon throws down his knife and fork with desperate violence, obliged to solicit a cessation of pain by a state of inaction.

Treatment of Tic Douleureux.—Of the inefficacy of most medicines in the cure of this cruel disease, we have abundant and melancholy proof. Those which have been said to procure ease are, opium, cicuta, zinc, stramonium, belladonna, argentum nitratum, and arsenic. But the instances in which a cure was effected by their use are very rare; indeed some practitioners, from painful experience, deny their efficacy altogether. All manner of topical applications, from blisters to the smoking extrails torn from living pigeons, have been in vain applied, and baths and bleeding of all sorts.

M. Watson, professor of chemistry in the central school of Vaucluse, relates two cases of tic douleureux arising from venereal causes. The first was of an officer in the French army, aged thirty; the other that of a lady, aged forty. They were both completely cured by a course of mercury. These cases, in some respects, differed from the tic douleureux, but had its most distinguishing characteristic darting pains in the direction of the nerves. We learn nothing more from them, however, than that, where the symptoms of the tic douleureux are excited by the existence of a venereal taint in the habit, they will depart when that taint is overcome by the action of mercury; but it is found from experience, that in ordinary cases, the symptoms are not in the least relieved by the use of mercury. Recourse has next been had to electricity, to magnetism, to actual cautery, and finally, to the section of the affected nerves. Electricity sometimes procures temporary ease, but as frequently increases the pain; though Mr. Blunt, in the Medical Journal, relates the case of a lady afflicted with tic douleureux being cured by electricity. The pain was chiefly seated in the right temple, and the symptoms are so well described as not to be disputed. She was electrified twice in the day for several minutes each time; first with sparks, then with shocks, after having previously endured a long and ineffectual course of powerful medicines. Immediately after the second application of electricity she ventured to eat, and performed that necessary operation without any inconvenience. The pains afterwards recurred very slightly; the electricity was continued; and in the course of a short time, she became entirely free from the complaint. The decided success of this, though a solitary case, in such a dreadful disease, authorises us to hope, that future trials may be made of the application of electricity, which under the direction of an able practitioner is often a very powerful instrument in the cure of disease, and much oftener fails from want of care and assiduity in the application, than from inefficiency in itself as an agent.

The mode of destroying the affected part of the nerves by caustic has been adopted by some practitioners, and said to be attended with success. But, till more experience has better established the utility of such a cruel operation, we cannot recommend its use; it has not been had recourse to in this country; and some cases are related in which it did not succeed, and others in which deformity of the face was the consequence. M. André, however, has tried it, and recommends its general use. In his work will be found an account of the method of operating.

The section of the affected nerve was thought of and tried many years ago in the cure of this disease; and of late years, from a temporary success, some practitioners have confidently asserted, that the cure was effectual and radical; but more recent experience has destroyed the validity of such assertions.

So long back as the year 1768, Veillard published a thesis, in which he decided this question in the negative. "Utrum in pertinacibus capitis, facieque doloribus, aliquid prodesse possit sectio ramorum nervi quinti paris?" Now it is not likely, that he should have treated this important question superficially, but that he would rather collect all the information that at that time could be obtained upon the subject. He mentions two cases where the disease returned after the division of the nerves; and others, in which bad consequences ensued after the operation. Marechal, about the middle of last century, operated twice without success. Pujol was so convinced of its uncertainty, that he would not venture upon it. He has seen the muscles paralyzed, and the face distorted in consequence of the operation. Sabatier relates, that Ritah, surgeon to the king of Poland, performed the operation with success; but the patient, after being free from the complaint for some time, was again attacked with his former pains.

Modern practice seems also to confirm our scepticism in the permanent success of dividing the nerves. We see that what was at first supposed to be the most decisive case in its favour, the operation performed, and the account of it so ably recorded by Dr. Haighton, is now not to be relied upon. Mr. A. P. Cooper has frequently performed the operation with similar present success, but with what permanency time only can determine.

There is a case related by Darwin, in the *Zoonomia*, of a gentleman who first had the second branch of the fifth pair of nerves divided; then the first branch; and thirdly, the remaining third branch. But the patient was not yet relieved. He then had several incisions made across the side of the nose, and ossa nasi, through the masseter muscle to the jaw-bone, through the parotid gland. And lastly, some more twigs from the second branch of the fifth pair, passing into the cheek, and lying between the pterygoideus internus muscle, and the upper part of the lower jaw. These operations were performed by Mr. Cruikshank and Mr. Thomas. The patient, it seems, at length escaped alive and cured. De Haen has divided the suborbital nerve, as have also Moreau and Guerin, without any bad consequences. For the best method of operating, see Dr. Haighton's paper in the medical records.

It appears then, that as yet we know of no certain and radical cure for this painful affection. The section of the nerves promises the fairest; but when it is had recourse to, the patient should be warned of the possibility of the complaint returning, and not amused with the certainty of its being completely cured. Admitting, however, that the disease may return in the course of a few years, the operation is so simple, is attended with so little inconvenience or danger, and the relief in general so complete and instantaneous, that there can be little hesitation on the part of the practitioner in recommending its being performed, when the seat of the disease is accurately ascertained.

Lentin declares, he has had the misfortune to treat, in the course of twenty-seven years, fourteen patients attacked with this painful malady, without radically curing one; and calls upon all practitioners to make public any means they may have found to succeed, either in performing a complete cure, or even a partial relief of the symptoms. The

only remedies from which he experienced any good effects, were the tincture of thornapple, *Datura Stramonium* Linæi, and the sulphureous baths of Meudorf.

A French writer relates a method of taking nutriment for those patients who feel an appetite, but dare not indulge it, on account of the extreme pain; and that is, to suck through a small tube, as a quill, reed, &c. soup, broth, milk, or any nourishing fluid, so gently as not to excite any pain.

TIN-ORE. See COPPER, and MINERALOGY, *Ad-denda*.

TIN, CRYSTALLIZED, a kind of manufacture said to have been accidentally discovered in France by M. Baget, called metallic watering, or *moiré metallique*. It depends upon the action of acids, either pure or mixed together, and in different degrees of dilution, on alloys of tin. The variety of designs resembles mother-of-pearl, and reflects the light in the form of clouds. The process is this:—First, dissolve four ounces of muriate of soda in eight ounces of water, and add two ounces of nitric acid.—Second mixture; eight ounces of water, two ounces of nitric acid, and three ounces of muriatic acid.—Third mixture; eight ounces of water, two ounces of muriatic acid, and one ounce of sulphuric acid. One of these mixtures is to be poured warm upon a sheet of tinned iron, placed upon a vessel of stone-ware: it is to be poured on in separate portions, until the sheet is completely watered; it is then to be plunged into water, slightly acidulated, and washed. The watering obtained by the action of these different mixtures upon tinned iron, imitates very closely mother-of-pearl and its reflections; but the designs, although varied, are quite accidental. By heating the tinned iron to different degrees of heat, stars, fern-leaves, and other figures, are produced; and by pouring one of the above mixtures, cold, upon a plate of tinned iron, at a red heat, a beautiful granular appearance is obtained. These metallic waterings will bear the blow of a mallet, but not of a hammer; hence the invention may be used for embossed patterns, but not for those which are punched. Different colours and shades may be given by varnishes, which, when properly polished, will set off the beauty of the watering. When the tin is upon copper, the crystallization appears in the form of radiations or stars. M. Lewis Felix Vallet obtained a patent for an invention of this kind, upon delivering the following specification, Feb. 5th, 1818. The process of giving the new ornamental surface on metals or metallic compositions, consists in employing those acids and saline compounds and substances which chemically act upon tin, and which, when employed in the manner to be stated presently, give to the metals or metallic compositions to which they are applied the appearance of a crystalline surface variously modified. To produce this effect, the metal or metallic composition ought to be previously tinned, or covered with a thin coat of tin. If the metal be pure tin, it requires no previous preparation. All grease remaining on the tinned surface in consequence of tinning is to be taken off with a solution of potash, soap, or any other alkaline substances. The tin or tinned surfaces should then be washed with pure water, dried and heated to a temperature which the hand can bear. When the surface has thus been cleaned and heated, any of the acids which act upon tin, or the vapours of those acids will cause the desired appearance of crystallization; but I give the preference to the following composition, which may conveniently be laid over with a brush or a sponge. Take one part by measure of sulphuric acid, dilute it with

five parts of water; take also one part of nitric acid, and dilute it with an equal bulk of water, and keep each of the mixtures separate. Then take ten parts of the sulphuric acid diluted in the manner before stated, and mix it with one part of the diluted nitric acid, and then apply this mixed acid to the tin, or to the tinned surface with a pencil or sponge, as above directed, and repeat the application of the said composition for several times successively, or until the result you expect proves satisfactory. When this has been done, the crystalline surface may be covered with a varnish or japan more or less transparent or coloured, or coloured, and lastly polished in the usual manner. Mr. Sbow, of Brunswick-square, purchased this patent, and tin-plates were made under its protection, at the manufactory of Mr. Burnell, at Battersea. But the process being generally known among chemists, the manufacture declined, and the patent, for which a considerable sum was paid, became of little value.

TIN-PLATES. Add—The manufactory for tinning iron-plates was established at Pontypool by major John Hanbury, where he resided until his death in 1734; and the invention of the art has by some persons been erroneously ascribed to him. His monument may be seen in Trevellin church.

TIOGA, in New York. Add—By the census of 1810, the number of its inhabitants was 7899, including 61 slaves.

TIOGA, a county of Pennsylvania, including two townships, and 1687 inhabitants.—Also, a township of the said county, having 803, the other Delmer, having 884 inhabitants.

TISBURY, including the Elizabeth islands, in Duke's county, Massachusetts, contains 1202 inhabitants.

TITANIUM. *Chemical Properties of,* are given under **TITANIUM,** in *Mineralogy.*

TITICACA. Add—See **CHUCUITO.**

TIOBACCO, l. 3, for 1560 r. 1584. See **DRAKE.**

TOBAINA, a township of Cumberland county, in Pennsylvania, having 1799 inhabitants.

TOBY. Add—Also, a township of Armstrong county, in Pennsylvania, having 611 inhabitants.

TOLERATION, l. 18, add—The late abbé Gregoire, in his “*Histoire des Sectes Religieuses, &c.*” observes, that “we must not confound civil and religious toleration. The latter supposes that truth and error are indifferent; which truth can never be, for it is only one; and this being the case religious toleration would be an affront to God, who is truth itself. Civil toleration is that which grants to every one the power of publicly exercising the mode of worship to which he is attached—an inalienable right of every member of society, and which, incorrectly denominated *toleration*, ought to be called *liberty of worship*. It has been already observed, and cannot be too often repeated, that the only authority which the civil magistrate possesses over religious associations is to see that they neither suffer molestation nor molest one another.” Col. 6, l. 13, add—and extended to Ireland by 57 Geo. III. c. 70.

VOL. XXXVI.

TOLLAND. Add—Also, a town of Massachusetts, in the county of Hampton, having 798 inhabitants.

TOOLAVA, an Indian language, which extends from Nilkiram to Sedehagar, S. of Goa.—Also, the name of a country considered as a subdivision of Kérela, which extended from Gocuro, round Cape Comorin, to the river Tumbrapurai in Timnavelly.

TOOMBUDRA, a river of Hindoostan, which is a southern branch of the *Kybbwa*; which see.

TOPASSES, an Indian denomination of native black Christians, the remains of the ancient Portuguese.

TOPHANIA, or **TOFFANIA,** the name of a woman who resided first at Palermo, and afterwards at Naples, and who rendered herself infamous by preparing and administering poison. She sold those drops which from her acquired the name of *Aqua Tophania, Aqua della Toffana*. It was called also *Acquetta di Napoli*, or only *Acquetta*; but she distributed her preparation, by way of charity, to such wives as wished to have other husbands. From four to six drops were sufficient to destroy a man; and it has been asserted, that the dose could be so proportioned as to operate in a certain time. As she was watched by the government, she fled to an ecclesiastical asylum; and when Keyler was at Naples in 1730, she was then living; her life being secure under that protection. It was her practice to distribute her poison in small glass phials, upon which was this inscription, “Manna of St. Nicholas of Bari,” and ornamented with the image of that saint, whose reputation prevented its being particularly examined by the custom-house officers. About the year 1709, Tophania fled from one convent to another; but she was at length seized and thrown into prison. Her imprisonment, as she was under ecclesiastical protection, excited the indignation of the clergy, who endeavoured to raise an insurrection among the people; but they were appeased upon Tophania's confession, that she had poisoned all the springs in the city. Upon the rack she acknowledged her wickedness; her protectors fled, and she was strangled; and in order to infligate the archbishop, her body was thrown, at night, into the area of the convent from which it was taken. Her secret did not die with her; but her poison was secretly prepared and administered at Naples after her death. It was afterwards presumed, from the effects of her poison, that it was a preparation of arsenic. Kayler. Beckmann, *Hist. Invent. vol. i.*

TORPEDO, a kind of destructive machine, invented by Mr. Fulton, to whom we owe the construction of the much more useful naval machine, *viz.* the steam-boat. Add—This submarine mine, however it may give celebrity to the ingenuity of the inventor, will, we trust, for the sake of humanity and the honour of naval conflicts, never be adopted in any civilized nation.

TORRESVEDRAS. Add—This ancient town lies about seven leagues from Lisbon, and is situated in a small plain, about three leagues from the sea, on the river Zigan-dra. It owes its name to the circumstance of there being the ruins of many old towers in its neighbourhood. The principal one, or castle, has been repaired, and serves as a point of defence to the works thrown up at this important pass, which covers two great roads leading to Lisbon from this point, one by Mafra, the other by Euxarra dos Cavalleiros. Although this may be a sufficient description of it in a geographical point of view, we do not think it should be omitted to be here stated, that the celebrated position occupied by the duke of Wellington to cover Lisbon in the fall of the year 1810, took its name from this town, which formed one of the principal points of the line of defence, which was carried across from the Tagus to the sea, presenting a *contour* of about forty miles, of such an imposing nature as to render unavailing all the efforts of an almost overwhelming French army, under one of their most distinguished marshals, to expel the Anglo-Portuguese from
the

the Peninsula. This line of defence (with another about five miles in its rear), stretched from the Tagus at Alhendra to the sea where the Zigadra falls into it, being a direct line of about twenty-six miles. The whole of this most extensive, varied, and gigantic position, was selected and formed under the duke of Wellington's direction, with the most unwearied exertion by those able and scientific engineers the late Sir Richard Fletcher and colonel Chapman, and with the retreat of the French from before it, may be said to have commenced the series of achievements which finally ended in the triumphs of the British army in the heart of France.

TORRINGTON, l. 1, after Connecticut, add—in the county of Litchfield, containing 1586 inhabitants.

TORSK. See *GADUS Brofne*.

TORTURE. At the clofe, add—Torture was abolished in Sweden by order of the king in 1786: in Poland, in 1776; in France by edict, Aug. 16, 1780; in Spain, Aug. 1814; and in Austria, in 1776.

TOURACO. See *CUCULUS* and *ORÆTHUS*.

TOWIACHES, l. 1, insert—(see *PANIS*); l. 5, after miles, add—N. lat. 35° 20'. W. long. 97°.

TOWNSEND, l. 1, add—in the county of Middlesex, containing 1246 inhabitants.

TOWNSHIP, *Upper, Middle, and Lower*, three townships of Capemay county, in New Jersey; the first having 1664, the second 1106, and the third 862 inhabitants.

TRACHYMENE, in *Botany*, from *τραχυς*, rough, and *μηνε*, (as we presume), a membrane, alluding to the roughness of the covering of the seeds.—Rudge Tr. of Linn. Soc. v. 10. 300.—Class and order, *Pentandria Digynia*. Nat. Ord. *Umbellate*.

Eff. Ch. Umbel simple. Involucrum of many leaves. Perianth a flight border. Petals acute, fraight, undivided. Fruit nearly orbicular, compressed, mucicated.

1. *T. incisifolia*. Smooth Trachymene, or Botany-bay Carrot. Rudge as above, t. 21. f. 2.—Stem nearly naked, smooth. Umbels terminal.—Sent, many years since, under the above English name, from Port Jackson, by Dr. White. We have heard that the root is eatable, and like a carrot. The herb is smooth, two or three feet high. Stem round, slender, alternately branched, each of the long, terminal, naked, simple branches bearing a dense, simple umbel, scarcely an inch broad, of numerous, white or reddish, uniform, equal flowers. Leaves of the involucrum awl-shaped, shorter than the umbel, combined at the base. Fruit somewhat heart-shaped, broader than long, mucicated all over, when quite ripe, with crowded, blunt tubercles. One seed is often abortive. The leaves are chiefly radical, flaked, smooth, ternate, with wedge-shaped, three-cleft, notched segments.

2. *T. pilifolia*. Hairy Trachymene.—Stem leafy, hairy, as well as the leaves and footstalks. Umbels lateral.—Gathered by Mr. Menzies, at King George's Sound, on the west coast of New Holland. Whole herb rough with short shaggy hairs. Umbels on stout stalks, from the forks or sides of the stem. Tubercles of the fruit acute, brittle-pointed. See *FISHERIA*.

TRÆTH COCH, or REDWIAHF *r.* REDWÆTH.

TRELLECH, or TRELLECK. Add—In 1811 the town contained 23 houses, and 121 persons; viz. 58 males, and 63 females. The parish of this name, in the upper division of Ragland hundred, consists of the parish division, the town division, and the Grange division: the former contained 131 houses, and 568 persons; 275 being males, and 293 females: and the latter included 20 houses, and 134 persons; 74 being males, and 60 females.

Vol. XXXIX.

TRENTON, l. 6, r. 3000.

TREVETHIN, a populous parish of the county of Monmouth, in the upper division of Abergavenny hundred, which, including Pont-y-pool, contained, in 1811, 466 houses, and 2423 persons; viz. 1211 males, and 1212 females: 123 families being employed in agriculture, and 280 in trade, manufactures, or handicraft.

TRICHECUS—*ROSMARUS*, *r.* *Joufstone*.

TRIDACTYLUS, a species of *Bradypus*; which see. See also *SLOATH*.

TSCHUTSKI. See *CHURSTSKIIJA*.

TURCOMANIA. Add—See *ARMENIANS*.

TURNER, l. 2, add—and county of Oxford, having 1120 inhabitants.

TURNSTILE, in *Fortification*, a kind of barrier, which consists of two or three pieces of timber, formed crossways, and making four or six rays like the spokes of a wheel; the frame is put on a post in the middle of a passage to turn horizontally, so that two of its rays always stretch across the passage, and prevent more than one person at a time from passing the same way.

TUSKARAWA, *r.* TUSCARAWA.

TWEDDELL, JOHN, in *Biography*, an accomplished scholar, whose early fate has been much lamented by all the lovers of literature and the arts, was the eldest son of Francis Tweddell, esq. of Threepwood, in the county of Northumberland, was born on the 11th of June 1769; and after passing through the usual course of preparatory education, was entered at Trinity college, Cambridge, where he distinguished himself by such proofs of original genius as are, perhaps, without example, even in the records of that learned society. As a candidate for university honours, his "Prolusiones Academicæ" attest his success to have been equally brilliant and extraordinary, and supersede the necessity of particular illustration. Mr. Tweddell was elected a fellow of Trinity college in 1792, and soon afterwards entered himself a student of Lincoln's Inn, where he kept his terms, and continued to reside until the year 1795, when he left England to commence his travels on the continent of Europe—and met with that untimely fate which has mixed his ashes with those of the sages and philosophers of Greece. He visited Switzerland, Germany, most parts of the Russian empire, and particularly the Crimea, where his intercourse with professor Pallas was of the most intimate kind, and had so endeared him to that amiable scholar, that the admiration with which he spoke of him partook of the tenderness and affection of a father. From the borders of the Euxine, where his researches were both diligent and productive, he proceeded to Constantinople; and after spending some part of the summer of 1798 under the hospitable roof of Spencer Smith, esq. the English minister, he took his departure for the Grecian islands; and having traversed the provinces of Macedonia and Thessaly, arrived at Athens; where, after a residence of several months, he reached the period of all his learned labours, on the 25th of July 1799.

Mr. Tweddell, independent of the advantages which his own merit secured for him in the countries which he visited, possessed recommendations and facilities of a superior kind for conducting his learned pursuits; and his industry keeping pace with his talents and opportunities, his collections and manuscripts are known to have been extensive and singularly valuable. Perhaps no traveller of modern times has enjoyed in an equal degree the means of investigating the antiquities of Greece.

His remains were interred in the beautiful Doric temple of Theseus at Athens; and his grave was simply a small

oblong heap of earth, like those over the common graves in all our English church-yards, without a stone or inscription of any kind; and his body was carelessly deposited at about three or four feet beneath the surface. The part of the temple where it has been buried is now converted into a Greek church, dedicated to St. George; but as this building is occasionally open and liable to the intrusion of animals, who sometimes seek such retreats, Dr. Clarke and his companions, in their travels to Athens, obtained leave

to take up the coffin, and to have it properly covered; and a Greek epitaph, composed by Mr. Walpole in 1805, has been inscribed on a large block of Pentelician marble from the Parthenon, for recording the merits of the deceased. The completion of this business has been owing to the exertions of lord Byron, and Dr. J. F. Lee, of St. John's college, Cambridge. Clarke's Travels, vol. vi.

TWIGGS, l. 2, add—of whom 642 were slaves in 1810.
TWIST, and TWISTING. See MANUFACTURE of Cotton.

V and U.

V A N

VAMANAVATARA, col. 3, l. 11, for admirer *r.* adviser.

VANDELLIUS, **VANDEL**, in *Ichthyology*, a genus of fishes of the order Thoracici, considered by Dr. Vandell of Coimbra as nearly allied to the genus Trichurus; the characters of which are, body extremely long, sword-shaped, gill-membrane five or six-rayed, and teeth subulate, those in front largest. This fish is the silvery vandell, with forked tail, which occurs, very rarely, in the Mediterranean and Atlantic seas, and sometimes near Lisbon.

VANDER WEYDE, **ROGER**, called Roger of Bruges, in *Biography*, an historical and portrait painter, was born at Bruges about the year 1455, and became the disciple of John Van Eyck, who, at a short period before his death, discovered to him the secret of painting in oil. From this time he distinguished himself by many grand compositions in a large size, and was considered as one of the first Flemish artists who improved the national taste, divesting it in some degree of the Gothic, and manifesting grace in the airs of his heads, as well as correctness in his design. He painted the portraits of several princes, and of many persons of eminence, and obtained a considerable degree of fame and fortune. His paintings in the town-hall of Bruges have been much commended; one of which is formed on the subject of Trajan's justice, executed on one of his soldiers, on the complaint of a mother, whose son had been murdered by him; and that of another is Archambrant, prince of Brabant, stabbing his nephew, who was his next heir, when he himself was near dying, for having ravished a maid of that country.

VAN UTRECHT, **ADRIAN**, was a native of Antwerp, where he was born in 1599, and learnt the art of painting: at first painting peacocks and other fowl for his amusement, in which he so much excelled that he was encouraged to prosecute this branch of his art. The subjects to which his attention was principally directed were fruit, birds, flowers, dead game, and objects of still life; imitating and copying nature, and distinguished by correct drawing, and the colouring of nature. He was deemed next to Sneyden in that style of any of the artists in the Low Countries; and though he was very industrious, he

V E L

could not execute one half of the orders which he received. His manner of pencilling was peculiarly delicate, and gives an uncommon transparency to his colours. Most of his works were engrossed by the king of Spain, so that they became scarce, and they now produce very high prices. This artist died in 1651, at the age of 52 years.

VASSALBOROUGH. Add—containing 2063 inhabitants.

VATICAN. Add—The Vatican, despoiled during the French revolution, can again boast of possessing the Apollo, the Laocoon, the Antinous, and all those fine examples of the exquisite taste and delicate sentiment of that refined people, the Greeks. The Transfiguration of Raffaele, the St. Jerome of Domenichino, and the St. Petronilla by Guercino, since their return from Paris, have been placed in a room by themselves, but inconveniently dark.

VAUXHALL BRIDGE, a bridge over the Thames, extending from Millbank to Smith's tea-gardens, which nearly adjoin Vauxhall Gardens, and connecting the roads branching from that spot to Hyde Park Corner by a straight road and street across Tothill-fields to Eaton-street, Pimlico, and Grosvenor-place. This bridge, constructed by Mr. J. Walker, consists of nine arches of equal span in squares of cast-iron, on piers of rusticated stone, formed of fragments, united by means of Parker's cement. The total width is 809 feet, the span of the arches 78 feet, the height 29 feet, and the clear breadth of the road-way 36 feet. The estimated cost of this bridge was above 300,000*l.*

VELOCIPEDE, **ACCELERATOR**, or *Swift-Walker*, a machine originally invented by baron Charles de Drais, master of the woods and forests of his royal highness the grand duke of Baden, who, in his account of its nature and properties, says, that on a well-maintained post-road, it will travel up hill as fast as an active man can walk; that on a plain, even after a heavy rain, it will move six or seven miles an hour; that, when roads are dry and firm, it runs on a plain at the rate of eight or nine miles an hour, which is equal to a horse's gallop; and that on a descent, its motion is equal to that of a horse at full speed. This machine, the theory of which is founded on the application of a wheel

wheel to the action of a man in walking, consists of two wheels, one behind the other, connected by a perch, on which is placed a faddle for the feat of the traveller. The front wheel is made to turn on a pivot, and is guided in the same manner as a Bath-chair. On a cushion in front, the fore-arm is rested, and by so doing the machine and the traveller are kept in equilibrio.

The management is as follows :—The traveller, having placed himself on the faddle, with his elbows extended, and his body a little inclined forward, must rest his arms on the cushion, and preserve his equilibrium by pressing lightly on that side which appears to be rising. The rudder (if it may be so called) must be held by both hands, which are not to rest on the cushion, but to extend somewhat beyond it, that they may be at full liberty, as they are no less essential to the conduct of the machine than the arms are to the maintenance of the balance of it, for which purpose sufficient dexterity will be soon acquired by attention and practice; then, placing lightly the feet on the ground, long but very slow steps are to be taken in a right line, at first care being taken not to turn the toes out, lest the heels should come in contact with the hind wheel. Dexterity in managing the equilibrium and direction of the machine should be acquired before any attempt is made to accelerate the motion of the feet, or to keep them elevated while it is in rapid motion. This machine will run for a considerable distance while the rider is inactive, and with the same rapidity as when his feet are in motion; and in descent it will surpass the best horses in a great distance, without being exposed to the risks incident to them, as it is guided by the mere gradual motion of the fingers, and may be instantly stopped by the feet. The faddle, as well as the cushion, may be raised or lowered at pleasure, so as to suit the height of different persons. The inventor proposes to construct these machines to carry two persons, and to be impelled by each alternately, or by both at once; and with three or four wheels, with a seat for a lady; besides the application of a parasol or umbrella: and he also proposes to avail himself of a sail, with a favourable wind.

The velocipede has been introduced into this country under letters patent, by Mr. Johnson, a coach-maker in Long Acre, by whom it has been much improved, both in lightness and strength.

VENICE, col. 5, l. 10 from bottom. Add—At the last census, taken about the year 1815, the population was stated to be about 100,000; and it is said to be decreasing.

VENTRILOQUOUS, l. 7, add—and LARYNX.

VOL. XXXVII.

VERMILION, col. 2, l. 20, add—The painter's vermilion is a fictitious cinnabar, made by sublimating a compound of sulphur and mercury.

VERNON, in *Geography*, a town of Tolland county, in Connecticut, containing 827 inhabitants.

VESICULA FELLIS. See LIVER for GALL-Bladder.

VESTIS ANGELICA, for ANGELIC.

VIENNA, in *Geography*, a township of Trumbull county, in Ohio, including 234 inhabitants.

VIOLIN. Add—The art of holding the bow, and of placing and moving it on the strings, is the most difficult and important to incipient practitioners on the violin, which they have to encounter; as upon that depend the force, sweetness, and penetrating power of the tone. They must pay great attention not to press too hard upon the string, so as to make it curve and deviate from a right line; for then

the tone would be harsh and coarse. Neither must the bow be laid too lightly on the strings, as the tone would then whistle and be too feeble. The just point of accuracy in this particular is, to place the hair on the strings in such a manner, that every part of it is in contact with whichever may be wanted. The bow must not act too near the bridge, nor too distant from it, as only dull and unpleasing sounds would be produced.

VIRAJ, l. 11, for her *r. ten*

Cotton, wool, and flax	- - -	45,000,000
Total	-	\$151,400,000

Their present value has not been ascertained, but it appears that the exports of their manufactures amounted in 1811 to a total of \$1,553,000, including those for domestic materials at \$1,321,000, and those from foreign materials at \$232,000; and in 1816 to \$1,755,000, including \$1,415,000 of the former kind and \$340,000 of the latter.

The manufactures from foreign materials were, spirits from molasses, refined sugar, chocolate, gunpowder, brass and copper, with medicines. The manufacture of wool is rapidly extending, as are also those of iron and hemp, and especially the latter, and also that of cotton. The manufacture of gunpowder nearly supplies the home market, which is also the case with regard to coarse earthen-ware, window-glass, glass bottles, and decanters. About a million of bushels of salt are manufactured annually; and salt-petre is largely manufactured in Virginia, Kentucky, Massachusetts, East and West Tennessee. Sugar from the maple-tree is produced in Ohio, Kentucky, Vermont, and East Tennessee, to the amount of nearly 10 millions of pounds annually. West Tennessee and Vermont afford abundance of good coppers: 25 millions of gallons of ardent spirits are annually distilled and consumed in the United States: 400 water and horse mills, working 120,000 spindles, are employed in spinning cotton. The fulling-mills amount to 2000, and the number of looms exceeds 400,000; and the number of yards of cloth, manufactured from wool, cotton, and flax, is about 100 millions. They have 300 gunpowder-mills, 600 furnaces, forges, and bloomeries, and 200 paper-mills.

In the state of Vermont, the chief manufactures are those of iron, lead, pipe-clay, marble, distilleries, maple-sugar, flour, and wool. In Massachusetts, the principal manufactures are, duck, cotton, woollen, cut-nails (by a machine invented in Newbury port, which is capable of cutting two hundred thousand in a day), paper, cotton and wool cards,

UNITED STATES.

playing-cards, shoes, silk and thread lace, wire, snuff, oil, chocolate and powder mills, iron-works, and fitting-mills, and mills for sawing timber, grinding grain, and fulling cloth, distilleries, and glass. In Rhode island, are manufactured cotton, linen, and tow cloth, iron, rum, spirits, paper, wool and cotton cards, spermaceti, fugar, machines for cutting serews, and furnaces for casting hollow ware. In Connecticut, are manufactured silk, wool, card-teeth (bent and cut by a machine to the number of 86,000 in an hour,) buttons, linen, cotton, glass, snuff, powder, iron, paper, oil, and very superior fire-arms. In New York, are manufactured wheel-carriages of all kinds, the common manufactures, refined fugar, potters'-ware, umbrellas, musical instruments, glass, iron, and steam-boats. In New Jersey, are numerous tanneries, leather manufactories, iron-works, powder-mills, cotton, paper, copper-mines, lead-mines, stone and slate quarries. In Pennsylvania, there are valuable collieries on the Lehigh river, distilleries, rope-walks, fugar-houses, hair-powder manufactories, iron founderies, shot manufactories, steam-engines, mill machinery, type-founderies, improvements in printing, and carpet manufactory. In Delaware, there are cotton and bolting cloth and powder manufactories, fulling, snuff, fitting, paper, grain and saw mills. In Maryland, are iron-works, collieries, grist-mills, glass-works, silks, paper-mills, and cotton. In Virginia, are lead-mines, iron-mines, copper-mines, vast collieries, and marble quarries. In Kentucky, are manufactured cotton, wire, paper, and oil. In Ohio, ship-building is carried to a great extent. In North Carolina, the pitch-pine affords excellent pitch, tar, turpentine, and lumber; also iron-works, and a gold-mine, which has furnished the mint of the United States with a considerable quantity of virgin gold. In South Carolina, are gold, silver, lead, black-lead, copper and iron mines, and also pellucid stones of various hues, coarse cornelian, variegated marble, nitrous stone and sand, red and yellow ochres, potters'-clay, fullers'-earth, and a number of dye-stuffs, chalk, crude alum, sulphur, nitre, and vitriol. In Georgia, the manufactures are indigo, silk, and fago. In Louisiana, are manufactured cotton, wool, cordage, shot, and hair-powder.

But the most extraordinary, and perhaps the most important manufacture in the United States, is that of steam-boats; the first application, if not invention, of which is ascribed to Mr. Fulton. It was in the year 1807 that the first steam-boat plied between the cities of New York and Albany; but since that time this mode of navigation has been successfully used in many other rivers of the United States besides the Hudson; so that steam-boats now ascend the Mississippi and Ohio rivers, hitherto nearly unnavigable, except in the direction of their currents. The following table shews the cheapness, as well as expedition, of travelling since food as well as conveyance is included.

	Expence.	Hours.	Miles.
From Philadelphia to New York, by steam-boats and stages	\$10	13	96
New York to Albany, by steam-boats	7	24	160
Albany to Whitehall, by stages	8	12	70
Whitehall to St. John's, by steam-boats	9	26	150
St. John's to Montreal	3	4	37
Montreal to Quebec, by steam-boats	10	24	186
	47	103	699

In the spring of 1817, a steam-boat reached Louisville, in Kentucky, from Pittsburg, in Pennsylvania, dropping down the Ohio. She displayed her power by different

tacks in the strongest current on the falls, and returned over the falls, stemming the current with ease. About the same time, a large steam-boat reached Louisville from New Orleans, laden with fugar, coffee, wines, queen's-ware, railens, fur, steel, lead, &c.; her freight equalling 25,000 dollars.

As for the revenue of the United States we can only collect a few particulars. We observe in general, that the national debt at present does not amount to 120 millions of dollars. Its sinking fund consists of an annual appropriation of \$8,000,000, arising from the interest of the debt redeemed, amounting in 1813 to \$1,932,107, for the sales of public land, equal in that year to \$830,671, and from the duties on imports and tonnage. The revenue of the United States, previous to the late war against England, were derived from duties and taxes on imports, tonnage of ships and vessels, spirits distilled within the United States, and stocks, postage of letters, taxes on patents, dividends on bank-stock, snuff manufactured in the United States, fugar refined here, sales at auction, licences to retail wines and distilled spirits, carriages for the conveyance of persons, stamped paper, direct taxes, and sales of public lands. The revenues have been chiefly derived from duties on imports and tonnage. Internal taxes have been laid at different periods by the Washington administration, but were all discontinued by an act passed April 1802, under the auspices of Mr. Jefferson. The following statement exhibits the estimated receipts and expenditures of the United States at different periods.

Years.	Receipts.	Expenditures.
1791	\$448,913	\$1,718,129
1795	5,954,534	4,359,596
1800	10,777,709	7,411,369
1808	17,068,661	6,504,338
1809	17,773,473	7,414,672
1818	19,550,000	18,850,000
1819	22,950,000	22,880,000
1820	22,320,000	22,910,000

The net amount of revenue received in 1815 was \$50,906,106, being from customs \$37,656,486; internal duties, \$5,963,225; direct tax, \$5,723,152; public lands \$1,287,959; postage, &c. \$275,282. The report of the secretary of the treasury for the year 1816 states, that on the 12th of February 1816, the whole of the public debt, funded and floating, was \$123,630,692; but on the 1st of January 1817 did not exceed \$109,748,272, reducing the debt from Feb. 12th, 1816, to Jan. 1st, 1817, \$13,882,420. The secretary, in his Report of the 5th of December 1817, estimates the expenditure of the year 1818 at \$21,046,331, and leaves a balance in the treasury of \$8,578,648 on Jan. 1st, 1819.

The American capital, consisting of personal property \$2,200,000,000, and of real property \$5,000,000,000, amounts to \$7,200,000,000; the income, \$300,000,000; expenditure, \$450,000,000; national debt, \$1,000,000,000.

The salaries of the principal officers of the federal government are as follow:

	Dollars.
President, per annum	25,000 = 5625l.
Vice-president, ditto	5000 = 1125l.
Secretary of state, ditto	5000
Treasury, ditto	5000
War, ditto	4500
Navy, ditto	4500
Ministers plenipotentiary, ditto	9000 = 1822l. 10s.
Members of Congress, per day	8

Briffled obferves, that the population of the whole United States has hitherto doubled itfelf in lefs than twenty-five years. The New England ftates, he fays, of courfe do not retain their proportion of this increafe, becaufe large bodies of thefe people migrate annually to the weftern country, which has therefore increafed much fafter than the ftates to the fouthward. Kentucky, *e. gr.* has increafed 80 *per cent.* in ten years; Tenneffee, 95; Ohio, 180; Louifiana, 150; Indiana, 800; Missiffippi territory, 160; Illinois territory, 700; Missouri territory, 600; Michigan territory, 600; while of all the Atlantic ftates, the greateft increafe is only 44 *per cent.*, the population growth of New York; and the leaft is, that of Virginia, only 20 *per cent.*; fo that in a few years the ftates will range, if the future be like the paff, as to their aggregate population in the following order, *viz.* New York, Pennfylvania, Virginia, Kentucky, Ohio, North Carolina, Maffachusetts, South Carolina, Tenneffee, Maryland, Georgia, New Jerfey, Connecticut, Vermont, Louifiana, New Hampshire, Indiana, Missouri, Missiffippi, Illinois, Delaware, and Rhode ifland.

VOLTAISM, l. 13.—The general conclufion deduced by Galvani from his experiments was, that the animal body poffeffes an inherent electricity of a fpecific kind, which is connected with the nervous fyftem, and conveyed by means of the metals into the mufcles, fo as to throw them into convulfions. From his difcoveries he formed, with a precipitance that led him into error, a theory of muscular motion, according to which the body contains an apparatus

analogous to the Leyden phial, its different parts being in different ftates of electricity, and the metals forming a connection between them, by which the electricity is equalized. Fowler, in his "Eflay on Animal Electricity," publifhed in 1793, concludes, that the galvanic influence is not referable to electricity, becaufe, for the produktion of the former, the prefence of two different metals appears to be neceffary, while electricity, as proceeding from the electrical machine, is excited by the action of an electric upon a conductor. He alfo endeavours to fhew, fays Dr. Boftock, the ingenious hiftorian of galvanifm, that electricity and galvanifm are not, in all cafes, conducted by the fame fubftances; and he alfo made fome curious obfervations upon the effect of galvanifm on animals not furnifhed with diftinct limbs, fuch as worms of various kinds. In the fame year, 1793, profeflor Volta's communications appeared in the Philofophical Tranfactions of London, who adds to his luminous account of Galvani's difcovery many curious experiments and obfervations of his own. He attempted, and with complete fuccefs, fays Dr. Boftock, to overthrow Galvani's opinion, that the animal body bears an analogy to the Leyden phial, its different parts being in oppofite ftates of electricity. He fugg-fted, that for the produktion of the effect it was effential to have two different metals; and hence he was led to conclude, that the mufcular contractions are produced by fmall portions of electricity that are liberated by the action of the metals upon each other. This action of the metals upon each other is defcribed as deftroying their electrical equilibrium; and by eftablifhing a communication between them, their equilibrium is reftored. This deftruction of equilibrium he confiders as a new law of electricity difcovered by himfelf; and the animal is fuppofed to have no further concern in it, than as being a peculiarly fenfible electrometer, and affording a very delicate teft of the prefence of this difengaged electricity in its paffage from one metal to the other. He alfo eftablifhed another point, *viz.* that the nerve is the organ on which the galvanic influence immediately acts; but he found that if a part of a mufcle be laid upon two different metals, and thefe be made to communicate, a contraction is produced. He alfo confirmed the fact, previously noticed by Fowler, but by independent experiments, that nails and worms could not be made to contract; but that many of the infefts, as butterflies and beetles, were fubject to the influence of the metals. For an account of Dr. Willis's experiments and obfervations, we refer to his paper in the Phil. Tranf. for 1795. Profeflor Volta, profecuting his inquiry into the nature of galvanifm, was led to introduce a new principle into his theory. Having before ftated that two metals were effential to the extrication of the electric influence, he informs us, that their metallic nature may be difpenfed with, provided that the fubftances differ in their power of conducting electricity. Accordingly he divides conductors into the two claffes of dry and moift; the firft including metals and charcoal; the latter, effentially confifting of water, holding various fubftances in folution. In order to form a galvanic circuit, it is neceffary that a body from one of thefe claffes be placed between two bodies from the other clafs: and thus the equilibrium is deftroyed, which is again reftored when the two are united by a conductor. (See GALVANISM.) For further particulars we are under a neceffity of referring to Dr. Boftock's very valuable "Account of the Hiftory and prefent ftate of galvanifm," 8vo. London, 1819.

At the clofe, add—It is natural to conclude, that galvanic electricity would be applicable to medical purpofes, Accordingly we find, that about the year 1804, it was extenfive

tensively employed, more especially in those diseases in which common electricity had been found useful. But the expectations that were formed concerning the efficacy of this powerful agent were generally disappointed. Flattering accounts, however, says Dr. Boitock, (*ubi supra*) of its success in different nervous disorders, in paralytic affections, in deafness, in some kinds of blindness, in the recovery of persons apparently drowned or suffocated, and even in hydrophobia and insanity, were published. But the credit of the proposed remedy was not permanent; and it therefore sunk into disuse. Of late it has again been brought into notice by Dr. Philip of Worcester, who has made trial of it, with beneficial effect, in spasmodic asthma. Boitock's Hist.

UPPER, in *Geography*, a township of Scioto county, in Ohio, having 496 inhabitants.

URFE, HONORE' D', count of Chateauf, and marquis of Vilromery, in *Biography*, was the fifth son of James D'Urfe, a noble family of Forez, originating from Swabia, and born in 1567 at Marseilles, in which city he was educated, and also in the Jesuits' college at Tournon. Although he was first destined to be a knight of Malta, he was diverted from this purpose by his objection to celibacy; and he afterwards obtained a dispensation to marry the wife of his brother Anne, who was separated from her on account of impotence, and became an ecclesiastic. His view

in this marriage was to secure the property of his wife, who was a rich heiress, to his own family; but as he had no children by her he was disappointed in his mercenary purpose, and the connection was unhappy. Thus frustrated in his selfish views, he retired to Piedmont, and devoted himself to letters. He was the author of several publications; but his name has been celebrated as a romance writer, on account of his "Altrée," which was published in five separate volumes, at successive periods, and continued as a performance of general perusal for fifty years. This romance exhibits a picture of human life in its various conditions, and displays ample invention and acquaintance with men and characters under the disguise of pastoral fiction, from which, however, the author often deviates; he furnishes a history of his courtship of Diana de Chateau-Morant, his brother's wife, whom he married, and of the gallantries of the court of Henry IV. Although it was at a former period much read, it is too trifling for instruction and too tedious for amusement. It was often republished, but the best edition is said to be that of Paris in 1753, in 10 vols. 12mo. by the abbé Souhai. D'Urfe died at Villafanche in 1625. His brother Anne was also a writer, and published some poems. Moreri. Gen. Biog.

WATSON, THOMAS, in *Biography*, was born in 1590, and was editor of the second collection of Italian madrigals that appeared in England under the following title: "The First Part of Italian Madrigals Englished, not to the Sense of the original *Dittie*, but after the Affection of the Noate." This collection, as we are told in the title-page, includes "Two excellent Madrigalls of Master William Byrd's, composed after the Italian Vaine, at the Request of the said Thomas Watson." The poet is as much distressed for double rhymes to suit the original stanza and music of these madrigals, as his predecessor, N. Yonge, in a former publication. That madrigal, indeed, which Byrd set, first in four parts, and then in six, seems original English, and is the best of the collection.

This sweet and merry mouth of May,
While Nature waltzes in her prime,
And birds do sing, and beasts do play,
For pleasure of the joyful time;

I chose, the first for holly daie,
And greet Eliza with a ryme:
O beauteous Queene of second Troy,
Take well in worth a single toy.

The editor seems to have been a man of some learning, as well as knowledge in music, as he dedicates the work, in a Latin copy of verses, to the earl of Effex, then at the summit of favour with queen Elizabeth; and addresses Luca Marenzio, from whom most of the madrigals were taken, in another.

WEARE, l. 2, r. Hillborough.

WEBB, senior, in *Biography*, a favourite author of English catches and glees, and one of the most successful candidates for prizes at the catch-club during the most brilliant period of its institution in 1762. See CATCH, and CATCH-CLUB.

WEBB, DANIEL, esq. author of an elegant and ingenious tract, intitled "Observations on the Correspondence between Poetry and Music," 1769, 12mo. This author had acquired considerable reputation by two former dissertations in dialogue; the first, "An Inquiry into the Beauties of Painting;" the second, "Remarks on the Beauties of Poetry;" which had rendered the public willing to receive favourably a third work from the same pen. Much learning, extensive reading, and a classical taste, were manifested in this production, "On the Correspondence between Poetry and Music." It is, however, more metaphysical and less intelligible than his former tracts. The author seems to have conceptions difficult to bring forth, and out of the reach of common language to express. He seems to concur with Rousseau, that "music cannot narrate, nor precisely express or paint any particular passion;"

but it can awaken sensation and sentiments near the truth, and, with the assistance of poetry, can be pointed to a determined affection or passion. It can soothe affliction, it can supplicate, it can animate and rouse our courage, excite hilarity, and generate ideas of grace, innocence, and content, without the interpretation of poetry; but having nothing to imitate in nature, like poetry and painting, imagination must assist in finding similitudes.

The speculations of Mr. Webb are not always free from obscurity, though his language (when not deformed by his fondness for *habb*) is accurate and elegant. He says, that "music cannot give pain, like poetry and painting;" but extreme harsh discords allowed to be occasionally used in counterpoint, give pain to the ear, as intensely as painting and poetry to the eye and the mind. The author's chief illustrations are from Milton; and the work seems more intended to shew the *beauties of Milton*, than the analogies between poetry and music. The expression of music arises more immediately from rhythm than from the arrangement or combination of sound, and many of its imitative beauties, perhaps all, are ideal. Mr. Webb's ideas in general are delicate, refined, and beautifully expressed. But he never ventures to instance a musical composition or single passage which reminds us of practical music; and it does not clearly appear what kind of music he most approves, or indeed what it is that he honours with the name of *music*.

Mr. Webb was one of the first in our country who ventured to say, that counterpoint and complication of parts in dissimilar motion was an enemy to melody and expression; he quotes Algarotti's "Saggio sopra l'Opera in Musica," in confirmation of his opinions; but Rousseau preceded both, in his "Lettre sur la Mus. Fran." published in 1751, when he first developed his idea of "Unité de Mélodie." Mr. Webb's observations, indeed, abound with deep reflections and *belle parole*; but we have not yet discovered what benefit lyric poetry or vocal music can derive from such discussions.

WEIDEMAN, —, came to England about 1726. He was long the principal solo player, and composer, and master for the German flute. He was a good musician, and played so well on the organ, that we remember Handel, at a rehearsal of an oratorio in Covent Garden theatre, desiring him to touch a new organ just finished by the elder Byfield, that he might judge of its effects in different parts of the theatre, in which he was obeyed by Weideman with considerable abilities. But in his productions for the German flute, he never broke through the bounds of that mediocrity to which his instrument seemed confined.

WEIGEL, —, an excellent performer on the violoncello, whom we heard in 1772, at Vienna, in a grand concert given to the first people of that imperial city, and by the best performers that could be selected. Gluck and his niece, a pupil of Millicco, and an enchanting singer, were there, and she sung, sometimes to her uncle's accompaniment on the harpichord only, and sometimes with more instruments, in so exquisite a manner, that we could not conceive it possible for any vocal performance to be more perfect.

Between the vocal parts of this delightful concert, some admirable quartets, by Haydn, were executed in the utmost perfection: the first violin by Startzler, who played the *adagios* with uncommon feeling and expression; the second violin by Ordonitz, a good performer in the emperor's band; the tenor by count Brühl, one of the four sons of the great Saxon minister, an admirable dilettante, and fine performer on several instruments; and the violoncello by Weigel, the subject of the present article. All the performers

formers in this concert, finding the company attentive, and in a disposition to be pleased, were animated to that true pitch of enthusiasm, with which, when musicians are themselves inflamed, they have a power of communicating to others their own order, and of setting all around in a blaze; so that the contention between the performers and hearers on this occasion was only who should please, and who applaud the most.

WEISS, SYLVIVS LEOPOLD, a famous performer on the lute, born in Silesia, travelled into Italy in 1708, in the suite of prince Alexander Sobiesky, who dying at Rome, he was obliged to make his lute bear his expences back into Germany, going first to Breslau and afterwards to Dresden, where he was engaged in the service of the king of Poland, and became the most celebrated lutenist at that time in Europe. Germany has produced many eminent musicians of the name of Weifs; as John Adolphus Faustinus, son of Sylvius Leopold, a lutenist likewise; C. Weifs, a performer on the German flute, who visited London in 1783, an ingenious and curious man, who had improved his instrument, and had many curious peculiarities in his performance.

WELDON, JOHN, an eminent musician, was born at Chichester, learned the rudiments of music of Mr. John Porter, organist of Eton college, and afterwards received instructions from Henry Purcell. He was for some time organist of New college, Oxon. But in 1701 he was appointed a gentleman extraordinary of the Chapel royal; and in 1708 succeeded Dr. Blow as one of his majesty's organists. In 1715, upon the establishment of a second composer's place in the king's chapel, Weldon was the first who filled that station, of which he seemed conscientiously determined to fulfil all the duties; for before he had long been in possession of this office, he gave proofs of his abilities and diligence in the composition of the communion service, as well as the several anthems required by the conditions of his appointment.

He was likewise organist of St. Bride's church in Fleet-street, and of St. Martin's-in-the-Fields.

Besides many favourite songs and solo anthems of the time, Weldon composed two full anthems, which are inserted in Dr. Boyce's second volume; the first is rather too familiar and common; but the second, "Hear my crying, O God," in six parts, is a very pleasing and masterly composition; particularly the first movement. In the second movement, the words *up upon* are unfortunately expressed by notes that succeed each other too rapidly for their easy utterance. The passages of the third and fourth movements seem much worn by forty or fifty years use; however, the pauses at the end of the last strain have a fine effect.

Six of his solo anthems were published about the year 1730; we say *about* that period, as musical chronology is become a very difficult study. The late Mr. Walsh, finding that *old* music-books were like old almanacs, ceased very early in this century to ascertain the time of their birth by dates, which have ever since been as carefully concealed as the age of antiquated virgins.

Weldon's powers of invention and of harmonical combination seem very much limited. His anthems had the advantage of being sung in the Chapel royal by a celebrated singer, Mr. Richard Elford; but now, let who will execute them, they must appear feeble and old-fashioned, unless the embellishments of George I.'s time are changed for those in present use. The truth is, that the fund of original conception or science, which alone can render old music valuable to the curious, long after the style in which it was written is become antiquated and forgotten, was never

very considerable in Weldon's productions. His first anthem, "O Lord rebuke me not," remained long in favour, when well sung in our cathedrals, from its resemblance to the style of Purcell; and the natural and easy flow minuet air to "Turn thee, O Lord, and deliver my Soul," which has so much of a secular song and rondeau in it, that it is remembered with pleasure by the musical part of a congregation, who are more likely to bear it in mind than more serious parts of the service.

The productions of Weldon appear flimsy after those of Crofts; and Dr. Green's after Handel's; yet Green compared with Weldon is a giant; that is, a Handel.

There is a vice of which composers of small resources are often inadvertently guilty, for want of a sincere and judicious friend to tell them of it; and that is, eternal repetition of the same passage, a note higher or a note lower, which the Italians call *rosalia*. This certainly originates in the want of ideas, and yet it may be avoided by attention, though the sheet would not fill so fast. Weldon has indulged himself in these repetitions to a tiresome degree in several of his anthems; but in the ritornel to "Have Mercy upon me, O God," he has iterated the same poor passage a note lower seven times successively!

His song for two voices, "As I saw fair Clora walk alone," was in great favour some years ago; and his air in the Judgment of Paris, "Let Ambition fire thy Mind," is a melody so natural and pleasing, that, like an ever-green in vegetation, it will always be fresh and in season. And there is no air in greater favour than this at present, in the English opera of "Love in a Village," to the words, "Hope the Nurse of young Desire."

This composer died in 1736, and was succeeded in the King's chapel by the late Dr. Boyce.

WELLS, I. I, r. L. and E.

WELLS, in *Geography*, a township of Rutland county, in Vermont, having 1040 inhabitants.

WELSH MUSIC. If incredulity could be vanquished with respect to the account which Giraldus Cambrensis gives of the state of music in Wales during the 12th century, (see GIRALDUS CAMBRENSIS,) it would be by a Welch MS. formerly in the possession of Richard Morris, esq. of the Tower, which contains pieces for the harp that are in full *harmony* or *counterpoint*: they are written in a peculiar notation, and supposed to be as old as the year 1100; at least, such is the known antiquity of many of the songs mentioned in the collection. But whether the tunes and their notation are coeval with the words, cannot easily be proved; nor is the counterpoint, though far from correct or elegant, of so rude a kind as to fortify such an opinion.

Some part of "this MS.," according to a memorandum which we found in it, "was transcribed in the time of Charles I. by Robert ap Huw, of Bodwigen, in the isle of Anglesea, from William Penllyn's Book." The name of William Penllyn is recorded among the successful candidates on the harp, at the *isteddod*, or session of the bards and minstrels, appointed in the ninth year of queen Elizabeth, at Caerwyns in North Wales, where he was elected one of the "chief bards and teachers of instrumental song." The title given to these pieces is "Musica neu Beroeriath;" and a note in English informs us, that the manuscript contains "the music of the Britons, as settled by a congress, or meeting of masters of music, by order of Gryffydd ap Cynan, prince of Wales, about the year 1100, with some of the most ancient pieces of the Britons, supposed to have been handed down to us from the British bards."

This music is written in a notation by letters of the alphabet, somewhat resembling the tablature for the lute; but

WELSH MUSIC.

but without lines, except a single line to separate the treble from the base.

In the notation, double *ff* seems the lowest note; then the first seven letters of the alphabet are written thus, *g*, *a*, *b*, *c*, *d*, *e*, *f*; and the next septenary thus, with a dash over each letter, *f*, *g*, *a*, *b*, *c*, *d*, *e*. If these letters represent the same sounds as at present, we find some such chords as are admitted in modern harmony; but others frequently occur that are mere jargon.

Many of the bases, or accompaniments to the melodies,

9.

begin with the chord of C inverted, *c*. These chords *g*, and melodies are lessons for young practitioners on the harp, and are said to be the exercises and trial-pieces which were required to be performed by the candidates for musical degrees, and for the silver harp. Among the first twenty-four lessons of this kind, some few are easy to decipher, as N^o XI. and XVII., which we shall give here as specimens of this notation, explained in modern musical characters.

WELWIN, or WELWYN. In 1811, the parish contained 192 houses, and 1130 persons; *viz.* 567 males, and 563 females.

WEMYSS. In 1811, the parish contained 565 houses, and 3691 persons; *viz.* 1657 males, and 2034 females. This parish includes Buckhaven, E. and W. Coalowns, Kirkland, Methil, E. and W. Wemyss, and the rest of the parish, containing 116 males, and 117 females.

WENDLING, J. BAPTIST, in *Biography*, an eminent performer on the German flute, in the service of the elector palatine at Mannheim in 1772.

Francis and Charles, brothers, performers on the violin, and Mademoiselle Wendling, a singer, of the same family, were all musical professors of great merit in the same service at the same period.

WENLOCK, LITTLE. In 1811, the parish contained 178 houses, and 941 inhabitants.

WENTWORTH. In 1811, this township contained 226 houses, and 1086 persons; *viz.* 542 males, and 544 females.

WEREMOUTH, MONK'S. In 1811, this parish, consisting of five townships, *viz.* Felwell, Hylton, Monk-Weremouth, Monk-Weremouth Shore, and Southwick, contained 832 houses, and 6504 persons; *viz.* 2837 males, and 3667 females. The township of Monk-Weremouth contained 210 houses, and 1091 persons; *viz.* 457 males, and 634 females: and that of Monk-Weremouth Shore contained 458 houses, and 4264 persons; *viz.* 1815 males, and 2449 females.

WESTBURY, in the county of Salop. In 1811, the township contained 112 houses, and 665 persons; *viz.* 348 males, and 317 females: and the parish, comprehending the chapelry of Ministerley, and the three townships of Westbury, Westley, and Yockleton, contained 417 houses, and 2195 persons; *viz.* 1124 males, and 1071 females.

WESTERLEY. Add—in Washington county, containing 1921 inhabitants.

WESTHAVEN, a town of Rutland county, in Vermont, having 679 inhabitants.

WESTMINSTER ABBEY. Its happy construction for music at the commemoration of Handel in 1784, appeared to be such as not only to overlet all the predictions of ignorance and sarcasm, but the conjectures of theory and experience. By some it was predicted that an orchestra so numerous could never be *in tune*; but even tuning to so noble an organ was for once grand, and productive of pleasing sensations. By some it was thought that, from their number and distance, they would never play *in time*; which, however, they did most accurately, and without the measure being beaten in the usual clumsy manner. By others it was prophesied that the band would be so *loud*, that whoever heard this performance would never hear again; however the sound of these multiplied tones arrived as mild and benign at the ears of the audience as they could from the feeble efforts of a few violins in a common concert-room. And, lastly, that from the immense size of the building, no *single voice* had the least chance of being heard by those who had places remote from the orchestra; but luckily this was so far from being true, that not a vocal breathing, however feeble by nature, or softened by art, was inaudible in any part of the wide-extended space, through which it diffused itself in all directions.

There was, doubtless, great propriety in saluting their majesties at their entrance with the Coronation Anthem, yet we could not help wishing that this performance, so different from all others, had opened with some piece in

which every voice and every instrument might have been heard at the same instant; as such an effect might then have been produced as can never be obtained by gradation. Indeed the most sudden and *surprising* effect of this stupendous band was, perhaps, produced by simultaneous tuning; as all the stringed-instruments performed this task *à double corde*, and these strings being all open, their force was more than equal to that of two stopt-strings upon two different instruments.

It is but justice to Madame Mara, in speaking of the effects of a single voice in this immense building, to record that she had not only the power of conveying to the remotest corner of this expanded structure, the softest and most artificial inflexions of her sweet and brilliant voice, but of articulating every syllable of the words with such neatness, precision, and purity, that it was rendered as audible and intelligible as it could possibly have been in a small theatre by mere declamation.

The happy construction of Westminster Abbey for cherishing and preserving musical tones, by a gentle augmentation without echo or repetition, was demonstrated by no part of the commemoration performance more clearly than in that of Miss Abrams, whose voice, though sweet, of perfect intonation, and good quality, was not regarded as theatrical, but such as the Italians denominate *bella voce de camera*, yet in the solo air, which she sung with her usual taste and expression, her voice was rendered more audible in every part of that immense building, than it had ever been in any concert-room in London.

Giardini, envious of the powerful tone of Fischer's hautbois, which could even rival that of his own violin with all its force and sweetness, used to say that Fischer had an *impudence of tone*, but it never produced a more full, rich, and sweet effect than in the solo parts of Handel's fourth hautbois concerto, which he performed with such taste and propriety, as must have convinced all those who heard him that his excellence was not confined to his own very original and ingenious productions. Indeed, one of the Commemoration wonders seems to have been the perfect manner with which the sweet and grateful tone of his *single* instrument filled the stupendous temple of our holy religion, in the performance of this concerto.

WEST PENN, in *Geography*, a township of Northampton county, in Pennsylvania, having 947 inhabitants.

WESTPHAL, in *Biography*, an eminent music merchant of Hamburg, one of the greatest publishers in Germany during the middle of the last century.

WHERWELL, in *Geography*. In 1811, Wherwell with Westover parish, in the hundred of Wherwell, contained 113 houses, and 543 persons; *viz.* 277 males, and 266 females.

WHIFF. Add—See PLEURONECTES *Punäatus*.

WHITE, JOHN, in *Biography*, a Quaker, at whose shop in Newgate-treet ladies were furnished with straw hats. This worthy man was a great collector of ancient rarities, as well as natural productions of the most curious and extraordinary kind; no one of which, however, was more remarkable than the obliging manner with which he allowed them to be viewed by his friends and examined by strangers. Among his old books and MSS. he was in possession of a very scarce and valuable music-book, which once appertained to Dr. Robert Fayrfax, an eminent English composer during the reigns of Henry VII. and Henry VIII.; it was afterwards in the possession of general Fayrfax, and upon his demise became a part of the Thoreby collection, at the sale of which it was purchased by honest John White.

WHITSTABLE, in *Geography*. In 1811, the parish contained 235 houses, and 1249 persons; viz. 616 males, and 633 females.

WILLIAMSBOROUGH, a township of Burlington county, in New Jersey, having 619 inhabitants.

WILTSHIRE. In 1811, this county contained 37,478 houses, and 193,828 persons; viz. 91,560 males (including the local militia 1662), and 102,268 females: 22,657 families being employed in agriculture, and 14,857 in trade, manufactures, or handicraft.

WIMBLEDON. In 1811, the parish contained 293 houses, and 1914 persons; viz. 891 males, and 1023 females.

WINDHAM, a town of Maine, in the county of Cumberland, containing 1613 inhabitants.

WINTERTON, in Lincolnshire. In 1811, the parish contained 179 houses, and 821 persons; viz. 379 males, and 442 females.

WINTERTON, in Norfolk. In 1811, the parish contained 112 houses, and 494 persons; viz. 254 males, and 240 females.

WITCHCRAFT. Add—Dr. Henry More published a curious tract, entitled “Antidotes against Atheism,” in which he undertakes to prove the being of a God from the existence of witches, and the power which they possess. See his biographical article.

WITHERITE, col. 2, l. 9, add—The known repositories of this substance are very limited; but it has been observed by Mr. Aikin, in great abundance, in the lower part of a lead-mine in Shropshire, where it occurs in irregular masses, which weigh from forty to two or three hundred pounds, imbedded in heavy spar. The miners call this substance “yellow spar;” not that this is its real colour by day-light, but its transparency is so considerable, that if a lighted candle be placed behind a mass of it, the whole will glow with a yellowish light, by which circumstance the miners distinguish it from “heavy spar.” This latter from the looseness of its texture, being in large masses quite opaque. The colour of the witherite is white, with the slightest possible, if any, tinge of yellow; its fracture is hard, striated, approaching to straight foliated; it is for the most part massive. Mr. Aikin observed only one specimen that presented any indications of a regular crystalline form. In other particulars it agrees with the usual description of this substance. 100 parts of this witherite yields,

Transf. of Geolog. Soc. vol. iv. pt. 2.

WITTENA-GEMOTE, l. 14 from the bottom, r. concionators.

WODANIUM, in *Chemistry*, the name of a metal recently discovered by Lampadius. This metal was obtained from a species of pyrites, named by Breithaupt *Wodan-kies*, or wodaun pyrites, formed at Topfchau, in Hungary, and which had hitherto been considered as an ore of cobalt. The specific gravity of this mineral is 5.192. Its lustre is metallic. Its colour dark tin-white, passing

into grey or brown. Hitherto it has only occurred massive, and in that state it is full of cavities. Its fracture is uneven. It is brittle and easily frangible, and in hardness surpasses fluor spar, but is inferior to apatite. This mineral contains about 20 per cent. of the new metal united with sulphur, arsenic, iron, and nickel.

Wodanium has a bronze-yellow colour similar to that of cobalt glance, and its specific gravity is 11.470. It is malleable. Its fracture is hackly; it has the hardness of fluor spar, and is strongly attracted by the magnet. It is not tarnished by exposure to the atmosphere at common temperatures, but when heated it is converted into a black oxyd.

The solution of this metal in acids is colourless; or at least has only a slight wine-yellow tinge. Its hydrated carbonate is likewise white. The hydrate of it precipitated by caustic ammonia is indigo blue.

Neither the alkaline phosphates nor arseniates occasion any precipitate when dropped into a saturated solution of this metal in an acid, neither is any precipitate produced by the infusion of nut-galls. A plate of zinc throws down a black metallic powder from the solution of this metal in muriatic acid. Prussiate of potash throws down a pearl-grey precipitate, &c.

Nitric acid dissolves with facility both the metal and its oxyd, and the solution yields colourless needle-form crystals, which readily dissolve in water.

Such at present is all we know of this metal, and the ore containing it. The name *wodanium* has been given from the old Saxon divinity, *Wodan*.

WOODFORD, in *Geography*, a village in a parish of the same name, in the hundred of Becontree, and county of Essex. In 1811, the parish was returned as containing 310 houses, and 2056 inhabitants; viz. 1051 males, and 1005 females. It is situated on Epping Forest, in the vicinity of Waltham-stow, Wanstead, Layton, &c. which contain a considerable number of well-built houses, admirably adapted for the country-residence of the citizens of London.

WOODVILLE, in *Biography*. Add—Dr. Woodville, always anxious for the promotion of science, and no less disposed to serve the friends whom he esteemed, favoured the editor with several botanical articles for the *Cyclopædia*.

WOOLCOTT, in *Geography*, a township of Orleans county, in Vermont, having 124 inhabitants.

WOOLLETT, WILLIAM, in *Biography*, a very eminent engraver, was born at Maidstone, in Kent, Aug. 27, 1735, and educated in his native town. In early life he exhibited specimens of his graphic talents, which being seen by Mr. Tinney, an engraver, occasioned his being taken by him as an apprentice. His advancement in his profession was very rapid, and so distinguished, that he contributed in a very high degree to the perfection of landscape-engraving. He was also singularly successful in the exercise of his art on historical subjects and portraits. So established and so permanent has been his fame, that the best impressions of his prints, particularly those of “Niobe” and “Phaeton,” “Cebadon and Amelia,” “Cnyx and Alcyone,” “The Fishery,” “Vandyke’s Portrait of Rubens,” “The Death of General Wolfe,” and “The Battle of the Boyne,” whenever they occur in collections, are very highly appreciated.

The world was deprived of this eminent artist at the age of 50. His death, which occurred at his house in Upper Charlotte-treet, Rathbone-place, May 23, 1783, was announced to the public with the following tribute of respect to his memory. “To say he was the first artist in his profession would be giving him his least praise, for he was a good

a good man. Naturally modest and amiable in his disposition, he never censured the works of others, or omitted pointing out their merits: his patience under the continual torments of a most dreadful disorder upwards of nine months was truly exemplary; and he died, as he had lived, in peace with all the world, in which he never had an enemy. He has left his family inconsolable for his death, and the public to lament the loss of a man whose works (of which his unassuming temper never boasted) are an honour to his country." An elegant monument was erected to his memory in the cloisters of Westminster-abbey. Chalmers's Gen. Biog. Diët.

WOOLWICH, col. 3, l. 11.—The cadets, who are instructed at the royal military academy, were sent for some years to the military college, then at Marlow, now at Sandhurst, as a preparatory school; but that plan, being found attended with disadvantages, was abandoned. The institutions at Woolwich and Sandhurst are now therefore entirely independent; and we may add, that they are different in their nature, and are intended for very different purposes. The institution at Woolwich is confined solely to the instruc-

tion of young gentlemen intended for the artillery and engineer service; that at Sandhurst is supplementary, and designed for the instruction of such as are destined to any other branch of the military service of Great Britain. The education at Woolwich is free of expence, except the little that is incurred by the purchase of the first uniform. The cadets at Sandhurst pay a certain sum annually, bearing an assigned proportion to the rank of their parents, and being only free, as we conceive, in cases where the cadets are orphans, or their fathers subalterns.

ZINJAN, in *Geography*, a town of Persia, in the province of Irak, distant 21 miles, and bearing about N.W. by W. of Sultane. This is a large and prosperous town, capital of the extensive district of Klumfeh, under the government of one of the king's sons. From hence to the banks of the Kizilozian, or golden stream, the distance is 71 miles over an uneven country, full of deep ravines.

ZOLLIKOFER, GEORGE JOACHIM, in *Biography*, an eminent German divine and popular preacher, was born at St. Gall in Switzerland, August the 5th, 1730. His father, who was a practitioner in the law, much esteemed for his integrity and piety, took great care of his education, and by his own counsel and example directed the course of his moral conduct; nor were any of his efforts for the proficiency of his son in knowledge and virtue unavailing. As he was intended for the clerical profession, he was removed, at an early age, from the gymnasium of his native town, first to Bremen, and afterwards to the university of Utrecht, where the theological professors were held in high estimation. Our young student, however, soon discovered that a college education was ill adapted to his aspiring mind; as, in his opinion, it was very unfavourable to all exertions of genius and originality of thought, by levelling the distinctions of nature, by restraining the intellectual capacities to a blind veneration for authorities, and preposterously misleading the judgment so as to take the means of instruction for its end. Possessing a native vigour of mind, which distinguished him through the whole course of his life, he resolved, whilst he attended the public lectures with the rest of the scholars, to cultivate his talents and to pursue his inquiries in his own way. Instead of paying implicit deference to systems and summaries of theology, drawn up in technical and scholastic phraseology, he made scripture and reason his guide, and, as he says in a letter to a friend, "I privately applied myself to the Bible, together with a close investigation of ecclesiastical history; for I found it impossible for me to submit to the trammels of the schools, where derivative doctrines are uniformly transmitted, without examination, by the successive tutors from generation to generation, &c." In the other sciences, as well as in theology, he expresses his dissatisfaction with the means of instruction that were then adopted and invariably practised in the public schools. "The little which I know," as this modest man was heard to say, "I was obliged to teach myself, chiefly after I arrived at years of maturity; for indeed I had but a miserable education." This is not the language of pride and pedantry; as his attention was

Z O L

directed to a variety of researches, which, in his youth, the state of education in Germany would furnish him with no extraordinary advantages; and as he is known to have excelled in various departments of general literature and science, besides theology. His attainments in natural history and natural philosophy were very considerable; with the histories, ancient and modern, of the several nations of the world he had cultivated an extensive acquaintance, and in the ancient and modern languages, particularly the Latin, French, and English, he was no ordinary proficient; having made the works of the best poets, orators, and philosophers, the subjects of his particular study. Of Cicero he is said to have been a great admirer; and his eloquence was formed upon the model of that of this celebrated Roman orator. "Oh, my beloved Zollikofer!" says Zimmermann (on Solitude), "what delightful experiences I am constantly feeling of the truth of those lessons you delivered at Leipzig; those truly useful doctrines, which, disregarding a cold and barren theology, inculcate wise and virtuous precepts, that warm and amend the heart. On quitting your auditory, the man of business forgets his vexations, pours his anxieties into the bosom of friendship, surrenders his feelings to the charms of consolation, until his heart is dilated with new hopes and his inquietudes are so far suspended as to enable him to sustain their return with fortitude, or to dispel them with courage. The studious man abandons his recondite and laborious researches, escapes from the labyrinth, and finds in the innocent and simple satisfactions of his family and dependants more real content and happiness than even art and science could afford him." — "Men, in short, of every cast and character, here find by degrees the mind's blest calm, and learn to put on the pure spirit of the gospel of Christ."

Soon after he had finished his academical course, he settled, as a preacher, at Murten in the Pays de Vaud; and in a little while removed to a more considerable place at Monstein in the Grisons, and afterwards to Ifenburg. But neither of these places afforded sufficient range for his talents and zeal; and therefore in the year 1758, at the age of twenty-eight, he accepted an invitation to be one of the German preachers at the church of the evangelically reformed at Leipzig. In this connection he availed himself of the opportunity which his moderate labours afforded him, of giving that perfection to his discourses which was the object of his wishes. Accordingly, the universal approbation which he received on the part of his numerous congregation from his first settlement constantly augmented from

from day to day, and adhered to him to the very last hour of his addressing them. A considerable number of young members of the university eagerly pressed to hear his discourses, learning from him, by example, how a subject should be studied and discussed, in order to contribute, in any remarkable degree, to the advancement of wisdom and virtue among mankind by the oratory of the pulpit.

It is therefore natural to hope, that Zollikofer's genius will continue to operate not only throughout his native country, but likewise over many provinces of Germany, by means of these his disciples, who are thus prepared for diffusing truth, and virtue, and happiness among their fellow-creatures to the latest posterity.

Several volumes of his excellent discourses have for some years been in the hands of the public, and are in high and deserved repute wherever the German language is understood, by all persons to whom religion and virtue are objects of serious concern; to which the number of editions through which they have passed, and which are continually published, bear ample testimony, as well as to the taste and judgment of the times with regard to compositions of this nature. A German writer says, that "Zollikofer was one of the first pulpit orators of his time. His sermons were distinguished by clearness of ideas and warmth of feeling. In regard to form, they were the most complete productions of the kind which had appeared, at that time, in Germany. The diction is copious and varied; the periods harmonious, and the whole acquires great animation from the connection of the ideas and the transitions." Of his theological creed we can form no decided opinion. His discourses are practical, and not controversial; and it must be allowed that whatever were his sentiments on disputed topics, they are adapted to inform the understanding, to impress the heart, and to regulate the temper and conduct. Some have suspected that he belonged to the modern German school of theologians. Professor Eichorn pronounces his eulogy in the following strain: "Zollikofer, on account of the philosophical colouring combined with popularity, which he knew how to give to his discourses, was an orator for the highest ranks. He unfolded the doctrines and principles of Christianity with philosophical accuracy; exhibited them in a concise and impressive manner, clothed in pure and simple language, without artificial ornament; and endeavoured to affect the heart by convincing the judgment."

Zollikofer, considering that psalmody and prayer form an essential part of public worship, undertook to make a collection of spiritual songs for the use of his congregation, on a plan more suitable to the purpose, and more edifying than the old one. In doing this he availed himself of the advice and assistance of his judicious friends, both in regard to the improvement of the forms, and to the proper selection of hymns from the modern poets, particularly Gellert, Cramer, and Klopstock. This performance appeared in the year 1766. His discourses and prayers for the use of public and family worship were published in 1777, and were followed in 1785 by his exercises of devotion and prayers for the private use of reflecting and sincere Christians. The Rev. W. Tooke, F.R.S. has done great service to the cause of rational religion, by the translation of 10 vols. 8vo. of Zollikofer's Sermons, and of his Devotional Exercises in 1 vol. 8vo.

Having said so much concerning the professional character and performances of Zollikofer, we cannot forbear adding a few particulars from the account that lies before us, with regard to his private and social disposition and conduct. "In humility and retirement, he pursued his path of life; never wishing to shine, his only aim was to be useful; because in the exercise of that stern virtue which he taught he

found his supreme delight. The poor and destitute, especially those of his congregation, beheld in him a father and a friend; though his bounty was by no means confined to them, it also extended to those of other communions, relieving them either by his own donations or through application to others."—"His advice, his judgment, his intercession with others, his admonitions, his consolation in misfortune, were at the service of all who applied for them, and he even went before their requests. Young men desirous of knowledge, eagerly sought his acquaintance, and all those who enjoyed that benefit have honestly confessed, that they derived from it material improvement both in heart and mind. Whatever he said was true; every word he uttered might be relied on as conveying the real sentiments of his heart; arrayed in the simple majesty of truth, he sought no other covering: and never did he commend or approve from complaisance any thing that was contrary to the conviction of his own mind, or that he saw could not be approved upon the strictest rules of morality. His gravity was attractive and engaging, charity itself was in its smiles, his conversation entertaining, often animated, his equal cheerfulness amiable and inoffensive, and his raillery, in which he very rarely indulged, the mildest possible. To a very considerable compass of literary attainments and great brilliancy of imagination, were added in the character of Zollikofer, the most undeviating rectitude, the most amiable disposition, and the most prepossessing manners. The whole tenor of his life was one pure, uninterrupted, captivating harmony of virtue, and the sweet enjoyment of the felicities arising from it. Among his other satisfactions he had that of being universally esteemed, as of necessity it could not be otherwise. That happy mixture of seriousness and dignity with gentleness and affability; his own strict course of virtue combined with so much indulgence and candour towards the failings of others; his heartfelt and firm conviction of the great truths he taught, which manifested itself in all his actions, in the whole tenor of his conversation as well as in his discourses from the pulpit, without entertaining the slightest intolerance towards such as differed from him in opinion, or arrogating the smallest superiority over those who possessed not the faculty of thinking for themselves, or of fully comprehending every truth; his unwearied zeal to lead his auditors to the rigorous exercise of virtue, in his demands however never disregarding the rights of humanity concerning what they could or could not do in these or the other circumstances; his impartial estimation of mankind, justly discriminating the opinions and principles upon which they acted, carefully tracing out their good qualities, and heartily rejoicing in every advantageous discovery of that nature—let the reader contemplate all this as combined in the character of Zollikofer, and then pronounce, whether real undissimulated veneration, the general esteem of all ranks and classes of persons must not as inseparably have attended his wisdom and virtue as the shadow follows the substance. Even the wanton wit of those who, in the judgments they pass on the ministers of religion, are not ashamed to set aside the respect that is due from man to man, was awed into silence at the name of Zollikofer."

He was twice married, and in both connections he was truly happy, though both proved childless. For about a year before his death his faculties began to decline, and he wished to resign his office of preacher, and to retire to the place of his nativity in Switzerland; but at the request of his congregation, who for the sake of retaining him expressed their willingness to be satisfied with one discourse in a fortnight, he was induced to remain in his station. At length within a few weeks before his death he was obliged to
devolve

ZOLLIKOFER.

devolve the charge of preaching on another person. His last illness was very painful; but he bore it with the patience of a philosopher, and the resignation of a Christian, looking by a steady eye of faith and hope beyond the grave to a world of retribution. He obtained a release on the 22d of January 1788, and was buried on the 25th. The whole of his numerous congregation, together with some hundreds of young students of the university, and numbers of his auditors of the Lutheran communion, attended his remains to the grave, with every token of unfeigned sorrow.

THE END.

Intestines

The other Plates referred to in the several articles on Comparative Anatomy, comprised in the former part of the Cyclopædia, including the articles FEATHERS, FISHES, HAIR, HORNS, INCUBATION, MAMMALIA, &c. are unavoidably omitted. Dr. Martney, by whom these articles were furnished, has stated, that "he has found it impossible to procure, within any reasonable time, the drawings required for those Plates, in consequence of his removal from London, and of the indispensable occupations attending the laborious duties of his present professorship in the University of Dublin;" the editor has deemed it preferable, upon the whole, in this dilemma, to omit these Plates altogether, rather than to give them in an imperfect and unconnected manner; especially as he could not have given them, even in this defective state, without charging the work with a heavy additional expense, and further delaying its completion to a distant and indefinite period. He has had the less difficulty in coming to this determination, in consequence of no reference to Plates having been made in any of the articles on Comparative Anatomy, since Dr. Martney's removal to Ireland deprived the editor of his assistance in this department.

ASTRONOMY.

- PLATE
 ARMOUR.
 I. Ancient Bronzes
 A. In the Collection of P. Knight, Esq.
 B, C. In the British Museum
 D. In the Collection of P. Knight, Esq.
 II. Armour. Fig. 1, 2. From Denon
 3, 4. the Tuscan Gallery
 5. a Gem
 6. From Sir W. Hamilton's Vases
 7. the Tuscan Gallery
 8. a Bronze in the British Museum
 9a. From the Tuscan Gallery
 III. 9, 10. From Sir W. Hamilton's Vases
 11. From the British Museum
 12. Bartoli's Triumphal Arches
 13, 14. From the British Museum
 15. From Bartoli's Triumphal Arches
 16—19. From the British Museum
 20. From Bartoli's Triumphal Arches
 IV. Ancient Armour
 Fig. 1, 2. Saxon
 3, 4. Danish
 5. Norman
 6. Plate Armour from the Monument of Thomas Beauchamp, Earl of Warwick
 V. Fig. 1. Henry VIII's Armour
 2. Croupiere or Buttcock Armour
 3. Robert Dudley, Earl of Leicester, in Tilting Armour
 4. Half-tilting Habit of Prince Henry
(IV. and V. are on the same Plate.)
 ARTILLERY.
 I. and II. Fig. 1. Arries, or Battering Ram
 2—4. Catapulta, used by Lord Heathfield at the Siege of Gibraltar
 I. Fig. 1—13. Carriages
 II. Fig. 14—20. Carriages
 III. Fig. 21—33. Carriages
 IV. Fig. 34—44. Carriages
 V. Fig. 45—61. Carriages
 Artillery Encampment
(The Plate which has this title, is CAMP, Plate III.)
 ASTRONOMY.
 I. Fig. 1, 2. Aberration
 3, 4. Culmination
 5, 6. Altitude
 7. Refraction of Altitude
 8. Parallax of Altitude
 9*, 10*. Anomaly
 11*. Arc
 12. Area
 13. Argument

PLATE

- II. Fig. 9. General View of the Solar System
 10. Proportional Magnitudes of the Primary Planets
 11. Proportional Magnitudes of the Sun, as seen from the Primary Planets
- III. 14. Armillary Sphere
 15—17. Ascension
 18, 19. Axis
 20, 21. Azimuth
 22. Chronology
 (This Plate is numbered Plate II.)
- IV. Fig. 23—36. Comet
- V. Fig. 37. Commutation
 38—42. Crepusculum
 43. Culmination
 43. Day
 44, 45. Declination
 46. Demi Crofs
- VI. Fig. 47—52. Degree
 53. Degree measured in 1736.
 54. Measured in 1803
- VII. Fig. 55—67. Degree
- VIII. Degree
- IX. Fig. 60. Density
 61, 62. Depreffion
 63. Deviation
 64—66. Diameter
 67. Double Star
 67*. Dichotomy
 68—70. Earth.
 (Infer *Q* above *p* on the right-hand Globe, at the end of the line *CQ*, and infer *S* on the middle of the line *p.p.*)
- X. Fig. 71—73. Earth.
 (Fig. 71. *x.* should be over the Globe on the left of the figure, and *T* under the Globe on the same side, and *t* should be under the Globe on the right.
 Fig. 73. Instead of *d* read *b*, at the bottom of the line *B C*
 74. Ferguson's Eclipsareon.
 (Infer *C* on the brass arch below *c*)
 75. Eclipse.
 (For *C* read *c*, and for *c* read *C*)
 76. Eclipse
 (Infer *b* at the end of the line *A c*)
 77. Eclipse
 (Infer *A* at the upper end of the line *L t*, and dele *C*)
- XI. Fig. 78. Eclipse
 79. Eclipse
 (This figure is, by an error of the press, referred to as fig. 97.)
 80, 81. Eclipse
 (These figures are not referred to, but the theorems to which they pertain, follow immediately after the theorems belonging to fig. 79.)
 82—89. Eclipse
- XI. No. 2. Fig. 90—98. Eclipse
- XII. Fig. 99. Eclipse, Hindû Computation
 100. Mr. Pond's Machine to illustrate the Phenomena of Eclipses
 (The letters of reference have been omitted in this Plate; but the Machine will easily be understood from inspection.)
 101. Ecliptic

PLATE

- XII. Fig. 102. Elevation
 103. Elliptic
 104. Elongation
 105. Epicycle
 106. Equal Altitude
 107—109. Evection
 (The letter *A* is wanting at the top of the line *TBC*. In the theorem (twice) for "the small circle *ACB*," read "*AGB*."
 109.* Equator
- XII. Fig. 100. Ecliptic.
 (The reference to *N V*, fig. 100, should be to *N V*, fig. 102.)
 102. Poles of the Ecliptic, Equator, and Orbs of Venus
 103.* Obliquity of the Ecliptic
 (Referred to as fig. 103.)
 107.* Equation of the Centre
 108. No. 1, 2. Time
 109.** Time
- XIII. Fig. 110—113. Excentric
 114, 115. Galaxy
 (The reference to fig. 114, should be to fig. 115; and the reference to fig. 115, should be to fig. 114.)
 116. Geocentric
- XIV. } Fig. 117. Globe, method of exhibiting Stars,
 XV. } Circles, &c. upon
 118, 119. Construction of a Celestial Globe
 120. Quadrant of Altitude
 121. Construction of a Celestial Globe
 122. Ferguson's Celestial Globe
 123. Planetary Globe
- XV. Fig. 124—138. Gravitation
- XVI. Fig. 138. Heat
 139. Heliocentric Latitude
 140. Hemisphere, Horizon, Tropics
 141. Horizon
 142. Hour
 143—146. Jupiter
 147. Latitude
 148. Reduction
- XVII. Fig. 1. Longitude
 2. Mars
 3, 4. Meridian Line
 5—16. Moon
- XVIII Fig. 1, 2. Nodes
 3. Paracentric
 (The reference to fig. 2. under this article, should be to fig. 3. The figure wants a curved line drawn from *A* to *B* over *q*.)
 4—7. Parallax
 8—14. Moon's Parallax
 15. Venus's Parallax
 16. Particula Exfors
 17, 18. Penumbra
 (Figures 16, 17, 18, are omitted in this Plate, and form Plate XIX. fig. 1, 2, 3, respectively.)
- XIX. Fig. 1. Particula Exfors
 (Referred to as Plate XVIII. fig. 16.)
 2. Penumbra
 (Referred to as Plate XVIII. fig. 17.)
 3. Penumbra
 (Referred to as Plate XVIII. fig. 18.)
 3*—6. Planet

CASTING.

PLATE

- IV. Fig. 40—42. Canal Bridges
(See Plate VI. to which the reference ought to have been made.)
- V. Fig. 36, 37. Locks
38, 39. Gates
- VI. Fig. 40—42. Canal Bridges
- VII. Fig. 43. Swing Bridge
44—47. Rollers, &c. for Ditto
48—52. Navigators' Tools
Map of the Canals, Navigations, and
Railways of Great Britain
(Given in the ATLAS, Vol. VI. of the Plates)

CANDLE MAKING.

- Fig. 1. Apparatus for Dipping
2. Wick Broach
3. Machine for cutting Cotton
4. Tallow Cistern for Mould Candles
5. Mould Frame
6. Mould
7—12. Candle Sticks

CANNON.

- I. Fig. 1. Whole-length Cannon
2. Calcable
3. Muzzle
4. Mortar
5, 6. Sea Ditto
7. Howitzer
8. Land Mortar
9. Sea Mortar
10. Howitzer
11. Mortar
12. Stone Mortar
- II. Fig. 13—16. Cannon Boring
- III. Fig. 17—21. Cannon Boring, &c.

CANTEENS.

- I. Fig. 1. Canteen
2, 3. Crofs-cutting Saw
4, 5. Tenanting or Rebating Saws
6. Bung Stave
7. Boring Machine
8. Center Bit
9. Slider
- II. Fig. 10. Frame
11. Screw Hoop
12. Trufs Hoop
13. Screw Hoop applied to a Canteen
14. Turning the Chime
15. Turning the Head
16, 17. Shears
18. Punching the Hoops
19. Rounding the Ends of the Hoops

CASTING.

- I. Fig. 1, 2. Open Sand Casting
3. Trowel
4. Ramming Tool
5. Lifting Screw
6. Sand Casting between Flasks

CHEMISTRY.

PLATE

- I. Fig. 7—10. Method of Casting Cog Wheels
11—13. Moulds, &c. for Loam Casting

CASTRAMETATION. See CAMP.

CHEMISTRY.

- I. Fig. 1, 2. Cupalo Furnace
I. Fig. 1—5. Still
- II. Fig. 1. Blaft Furnace (For fig. 1. read fig. 6.)
6—9. Iron Smelting Furnace
- III. Fig. 10. Alcohol
10*—13. Alembic
14. Aludel
- IV. Fig. 15—26. Furnaces for the Reduction of Antimony
- V. Fig. 27, 28. Woulfe's Apparatus
VI. Ditto
- VII. Fig. 1—4. Distillation
- VII. Fig. 1—4. Blaft Furnace
- VIII. Fig. 1—4. Ditto
- IX. Fig. 1—6. Ditto
(The reference to Plate IX. fig. 4. under 'his article as "the Ground-plan of arch, pillars, hearth, &c. of a Blaft Furnace," should be to Plate X. fig. 4.)
- X. Fig. 1—10. Blaft Furnace
- X. Fig. 1—3. Blowpipe (See Plate XIV. fig. 5—7.)
- X. Fig. 1. Hope's Eudiometer
(See Plate XXI. fig. 1.)
2. Pepys's Eudiometer
(See Plate XXI. fig. 2.)
- XI. Fig. 1—7. Blow-pipe
XI. Ancient Chemical Characters.
- XI. XII. Blaft Furnace Works, Plan and Section
- XIII. XIV. Blaft Furnace Works
Fig. 1. Section of the Building
2. Dam Stone
3. Dam Plate
4. Tymp Plate
1, 2. Water Regulator
- XIV. Blaft Furnace Works
XIV. Gafometer and Blow-pipe
- Fig. 1. Hydraulic Bellows
2. Air Holder
3. Bell
4. Gas Holder
5. Glafs Blower's Lamp
6. Shoe Lamp
7. Double Blow-pipe
(Fig. 5, 6, 7, are referred to as Plate X. fig. 1, 2, 3.)
- XV. Fig. 1, 2. Air Vault
XVI. Laboratory
Fig. 1. Stand with the Apparatus
2. Retort
3. Acid Holder
4, 5. Receiver
6. Bended Tube
7. Adopter
8. Receiver
10. Nooth's Apparatus
11. Dr. Hamilton's Apparatus

COMPOSITION.

PLATE

- XVI. Fig. 12. Part of Nooth's Ditto enlarged
 16. Pneumatic Trough
 17. Supporter
 18. Eudiometer Tubes
 19. Mercurial Trough
 20. Glafs Jar
 21. Iron Ring Supporter
 22. Volta's Eudiometer
 23. Evaporating Vessel
 24. Mattrafs
 25. Proof Glafs
 26. Precipitating Glafs
 27. Gas Bottle
 28. Muffel
 29, 30. Crucible
 31, 32. Crucible Stands
 33. Cupel
 34. Separatory Funnel
 35. Iron Retort
- XVII. Laboratory
 Fig. 9. Apparatus for the Absorption of Gases
 13, 14. Simplified Gasometer
 15. Pepys's Gasometer
- XVIII. XIX. (No Plates of these Numbers)
- XX. Fig. 1—3. Apparatus for the Distillation of Pyroligneous Acid
- XXI. Fig. 1. Hope's Eudiometer (Referred to as Plate X. fig. 1.)
 2. Pepys's (or Davy's) Improvement of Volta's Eudiometer (Referred to as Plate X. fig. 2.)
 3. Gay Lussac and Thenard's Apparatus
 4. Berzelius's Apparatus for the Analysis of Organic Substances
 5. Dr. Wollaston's Scale of Chemical Equivalents.

CHIARO-SCURO.

(See COMPOSITION, Plate II.)

CHIMNEY-SWEEPING.

(See MISCELLANY, Plate II.)

CLOUDS.

- I. No. 1. Cirrus in different Forms
 2. Cirro Stratus subsiding on Cumuli beneath
 3. Cirrus as seen before Thunder
 4. Cirro Cumulus as seen before Thunder
 5. A Nimbus flanked by Cirro Stratus, and giving an electrical Discharge
 6. A Range of Cumuli passing to Cumulo Strati before Thunder
- II. No. 1, 2. Cirro Stratus
 3. Cirrus passing to Cirro Cumulus
 4. Cirro Stratus, Cumulus, and Cumulo Stratus, grouped

COMPOSITION.

- I. Fig. 1. The "Battle of the Standard," by Lionardo da Vinci

COTTON MANUFACTURE.

PLATE

- I. Fig. 3. The "Creation of Man," the "Transgression at the Tree of Knowledge," and "the Expulsion from Paradise," — Frescoes of Michelangelo in the Sistine Chapel
 4. "Groups of the Last Judgment," by the same Master in the same Chapel
- II. 2. "The Cartoon of Pifa," (or, according to Vafari, its chief Group,) by Michelangelo
 5. "Paul preaching at Athens," from the Cartoon of Raffaele at Hampton Court
 6. "The Group from the Assumption of the Madonna," in the Cupola of the Duomo at Parma, Correggio

CHIARO-SCURO.

1. The simple Principles of Chiaro-Scuro illustrated
 2. The Conduct of Correggio in the Distribution of his Masses of Light and Shade exemplified in one of his Compositions in the Duomo at Parma
 3. An Example from Rubens
 4. Rembrandt

CONICS.

- I. Fig. 1. Ambigenal
 2, 3. Asymptote
 4—10. Cone
 (The reference to truncated cone, fig. 8. should be to fig. 9.)
 12. No. 2. (See fig. 3.)
 20. Abscisse (See fig. 2.)
 31, 32. Axis (See Geometry, Plate IX. fig. 5, 6.)
 33. Asymptote (The figure thus referred to is in Geometry, Plate IX. fig. 4.)
- II. Fig. 1—9. Conic Sections; lines harmonically divided
 10—14. Conic Surfaces
- III. Fig. 15—23. Sections
 IV. Fig. 24—31. Ditto
 V. Fig. 31, 32. Axis (See Geometry, Plate IX. fig. 5, 6.)
 32—43. Conic Sections
- VI. Fig. 44—55. Sections
- VII. VIII. Fig. 1—13. Ellipse
 VIII. IX. Fig. 14—26. Ditto
 X. Fig. 1—12. Hyperbola
 XI. Fig. 13—21. Ditto
 XII. Fig. 1—16. Parabola

COTTON MANUFACTURE.

- I. Fig. 1—6. Calico Printing
 II. Fig. 1—5. Bating Machine
 III. Fig. 1—5. Deviling
 IV. Fig. 1—4. Carding Machine
 V. Fig. 1—4. Drawing Frame
 VI. Fig. 1, 2. Roving Can Frame
 3, 4. Winding Block
 (The number has been omitted on this plate.)
- VII. Roving Frame
 Horizontal Plan of the Machine called the Double Speeder

DIALLING.

- PLATE
VIII. Roving Frame, Double Speeder
Fig. 1—3. Elevation in Front
(*This, like the preceding, is numbered Plate VII.*)
- IX. Fig. 1—6. Water Spinning Frame
- X. Fig. 1—3. Throttle Spinning Frame
- XI. Fig. 1—5. Mule Spinning
- XII. Fig. 1, 2. Reeling
3—5. Machine for winding sewing Cotton into Balls
- XIII. Fig. 1, 2. Doubling Machine
3, 4. Twisting Machine
- XIV. Sections of Messrs. Strutt's Cotton Mills at Belper
Fig. 1. Longitudinal Section
2. Cross Section
3. Section of the Wing

CRYSTALLOGRAPHY.

(*See Plates, Vol. V. NATURAL HISTORY*)

CUTLERY.

- I. Fig. 1. Two Troughs of a Grinding Mill
2, 2.* Tongs for preffing Knife-Handles
3. Preffing Vice
3. Spring Drill
(*This is the only Plate of Cutlery*)

CYCLOID.

Fig. 1—8. (*By mistake these figures have been twice engraved. See ANALYSIS, Plate V. fig. 1—8. to which the reference is made in the letter-press*)

DIALLING.

- I. Fig. 1. Declinator
1.* Ruler of the Declinator
2, 3. Declinator
4. Equinoctial Dial
5. Universal Equinoctial Dial
6, 7. Universal Dial
8—12. Horizontal Dial
13. Vertical South Dial
14. Vertical North Dial
15. South Dial
16. East Dial
17, 18. Polar Dial
19. Dial on three Planes
20. Dials (primary)
21, 22. Vertical declining Dial
23. Inclined Dial
24. Universal Mechanical Dial
(*For fig. 25, 26, see Plate IV.*)
- III. Fig. 27, 28. Cylindrical Dial
29, 30. Portable Dial
31—33. Universal Dial on a Cross
- IV. Fig. 25, 26. (*of Plate II.*) Moon Dial
34, 35. Ring Dial
36. Tide Dial (*See MISCELLANY, Plate XXV. fig. 10.*)
36, 37. Dials constructed by a Globe
38—41. Dialling Cylinder
42. Dialling Scales

ELECTRICITY.

PLATE

DOCKS.

Docks at Liverpool, 1808
Docks at London, 1808

DRAWING.

- I. II. III. Fig. 1, 2. Outlines of the Human Face
3. Shading, Hatching
4, 5. Outlines of the Human Face
6. Shading, Hatching
- IV. Ifis Magna Mater
- V.—VII. (*No Plates of these Numbers*)
VIII. From an original Drawing by G. Pouffin
- IX. Ditto
- X. Landscape from an original Drawing of Claude Lorraine

DRAWING INSTRUMENTS.

- I. Fig. 1—11. Compasses
(*For fig. 5, see Plate TURNING, fig. 29.*)
- I. Fig. 1. Peacock's Delinicator
2, 3. Mifs Edgeworth's Ditto
4, 5. Ramfden's Optigraph, by Jones
6, 7. Wollaston's Camera Lucida
- II. Fig. 1, 2. Oval
3—6. Farey's Elliptograph
7. Douglas's reflecting Protractor

ELECTRICITY.

- I. Priefley's Battery
- I.* Fig. 2. Teyler's Battery
(*This Plate is referred to as Plate I. fig. 2.*)
3. The Frame separate
(*See Plate XV. fig. 7.*)
4. The Whole Battery
(*As this so nearly resembles the Battery represented in Plate I.* it has been deemed unnecessary to give it on a separate Plate.*)
Bell (*See Plate V. fig. 38.*)
- II. Fig. 4—9. Condensers
- III. Fig. 10—20. Dischargers
21—25. Cavallo's doubler
- IV. Fig. 26—37. Electrical Experiments
- V. Fig. 38—50. Ditto
- VI. Electrical Configurations
(*This Plate is not numbered*)
- VII. & XIV. (*One Plate*) Fig. 51, 52. Electrical Experiments. Electrical Flyers
53, 54. Inflammable Air-Pistol
55. Volta's Inflammable Air-Lamp
- Fig. 1, 2. (XIV.) Electrophorus
- VII. Fig. 1, 2. Hawkbee's Electrical Machine
3. Abbe Nollet's Machine
4. Dr. Watson's Ditto
5. Mr. Wilfon's Ditto
- VIII. Fig. 6—9. Electrical Machines
- IX. Fig. 10. Mr. Beccaria's Machine
11. Common Machine
12. Nairne's Ditto
18. Van Marum's Ditto
(*Referred to as on Plate XI.*)

FLAGS.

- PLATE
 X. Fig. 13. Nairne's Machine, with a Perfon electrifying his Shoulders
 14. Ditto, his Leg
 15, 16. Pearfon's Machine
 18. (*See Plate IX.*)
 XI. Fig. 22. Cuthbertfon's Electrical Machine
 (*This is numbered Plate X.*)
 XII. & }
 XIII. } Fig. 1—12. Electrometers
 13—15. (*Plate XIII.*) Ditto
 XIII. Fig. 16—23. Electrometers
 XIV. Fig. 1, 2. Electrophorus
 (*On Plate VII. & XIV.*)
 XV. Fig. 1. Medical Electricity. Machine for electrifying the Teeth
 2, 3. Thunder-Houfe
 4, 5. Torpedo
 6. Brush
 7. No. 1, 2. Infide Connecting Frame of Teyler's Battery
 (*Referred to as Plate I. fig. 3.*)

ENGINE.

- I. Fig. 1—7. Salmon's Weighing Machine
 (*This is numbered Plate II.*)
 II. Fig. 1—3. Cutting Engine, by Hindley
 III. Fig. 1—5. Ditto
 6—12. Rofe Engine, by Holtzapffell and Deyerlien
 IV. Cutting Engine, by Rehe
 V. Fig. 1. Ditto, for Worm Wheels
 2. Annular Wheels
 3. Short Arbor
 4. Engine for Racks
 5. Cutter Arbor
 VI. Fig. 1—6. Cutting Engine, by Rehe, for sharpening Cutters
 VII. Ramfdcn's dividing Engine, Perfpective View
 VIII. Fig. 2—4. Ramfdcn's dividing Engine
 IX. Fig. 5—14. Ditto
 X. Engine for cutting the Screw of Ramfdcn's Circular dividing Engine
 Fig. 1. Elevation
 2. Plan
 XI. Engine for cutting the Screw of Ramfdcn's ftraight Line dividing Engine
 Fig. 1. Plan
 2. Elevation
 XII. Fig. 1—3. Ramfdcn's Engine for dividing ftraight Lines

ENGRAVINGS, EARLY BRITISH.

- Fig. 1. From the front of King Alfred's Jewel
 From the back of King Alfred's Jewel
 2. Impreffion from the engraved Seal of Anfelm, the Primate
 3. Engraved Brafon on the Tomb of William de Fulbourn, in Fulbourn Church, Cambridgefhire

FLAGS.

(*See HERALDRY, Plate VII.*)

FORTIFICATIONS AND TACTICS.

PLATE

FARRIERY—Horfe-Shoeing.

- I. Concave Fore-shoe, or S. Bell's Shoes
 Racing Hind-shoe
 Fore-shoe
 Seated Fore-shoes
 Froft-shoe
 Shoe to prevent cutting
 Hind-shoe
 Fore-shoe with a Joint in the Toe
 (*This is the only Plate of Farriery.*)

FEATHERS.

(*See above, under ANATOMY, COMPARATIVE.*)

FENCES.

- XIX. (*The Plate fo entitled and numbered is AGRICULTURE, Plate XIX.*)

FORTIFICATION AND TACTICS.

- I. II. & IV. Fig. 1. Angle at the Centre
 1. Balfion, &c.
 2, 3. Cavalier
 4, 5. Expence Magazine
 (*These figures have been omitted, as unnecessary in a Work of this nature.*)
 6—14. Field Fortification
 (*See Plate III.*)
 (II.) Fig. 1, 2. Flank of an Army
 (*The writer of this article in the Cyclopadia died without furnifhing the figures. They are not, however, effential to the understanding of the description.*)
 1, 2. Battery
 (*Fig. 1. on Plate II. is the figure referred to in the article Battery, as fig. 21. No. 2. Fig. 2. is the figure referred to as 23. No. 2.)*
 3. Battery en Barbe, or Barbet
 (*Fig. 3. is the figure referred to as Plate III. fig. 25.*)
 III. Fig. 1—4. Echellon.
 5. Enfilade
 6—14. Field Fortifications
 (*Referred to as on Plate I.*)
 (IV. on Plate I.) Fig. 1—3. Breafwork.
 (*These figures have been omitted, as the nature of Breafwork will be fufficiently underftood by the view of the figures of Battery, on Plate II.)*
 4—10. Fort
 V. Fig. 1—6. Construction
 VI. & VII. Fig. 7—14. Ditto
 VIII. Fig. 15. Belidor's Method
 (*This figure is on the Plate marked FORTIFICATION, Plates VI. VII. VIII.*)
 16—19. Crown-work, &c.
 (*The articles in which thefe figures are referred to, were written by Mr. Glennie, and the descriptions were taken from an unpublished work of his own. He died without furnifhing the figures.*)
 V. Fig. 1, 2. Irregular Fortification
 3. Profile of a Fortification
 4. Fortified Place

GEOGRAPHY.

PLATE

- V.* Fig. 5. Regular Fortification besieged
- 6. Glacis
- 7. Gallery
- 8. Gabion
- VI. Fig. 1. Horn Work
- 2. Double Horn Work
- 3—6. Line
- 7. (*The same as fig. 4.*)
- 8. Lunette

II. Fig. 1—5.

SHIP-BUILDING.

(See NAVAL ARCHITECTURE.)
Construction of Boats
(See above, under the head BOATS)

SHIPS.

- I. Fig. 1. Bolton's Machine for drawing Bolts
2, 3. Phillips's Tubes for driving Ditto
4. Ring Rope
5. Bits
5. Application of the Messenger
6, 7. Nippers

SILK MANUFACTURE.

PLATE

- II. Rigging, Plate I.
Fig. 1—15. Knotting
16—24. Hitches
25—32. Bends
33—42. Splices
43—49. Hawser
III. Rigging, Plate II.
Fig. 1—23. Blocks, Pendants, Braces, Stays,
&c.
IV. Rigging, Plate III.
Fig. 1. Standing Rigging
2. Running Rigging
V. Rigging, Plate IV.
Fig. 1, 2. Rigging, and bending the Sails, &c.
VI. First Rate Man of War
Man of War's Barge
Seventy-four
Lugger
Fire Brig
Flat-bottomed Boat
Gun Vessel (the Wolverine)
Man of War's Long Boat
VII. Boats
Pahie
Balza
Corracore
Life Boat
Spring Block, Fig. 1, 2.
(Some of the preceding figures are referred to as on
BOATS, Plate II.)
VIII. Masts. The different Pieces which
compose the Main Mast of a 74 Gun
Ship
IX. Anchors and Buoys
Nun Buoy
Anchor
Kedge Anchor
Floating Ditto
Fire Grapple
Anchor Shoe
Grapple
Can Buoy
Creepers
Jew's Harp
Swivel Ring
Road, or Mooring Anchor
Foul Hawse
Flat Anchor in Use
Fig. 1, 2. Block, Spring
(See SHIPS, Plate VII.)

SURGERY.

- I. Fig. 1—6. Tourniquets, and Amputating Instruments
- II. Fig. 1. Amputating Saw
2. Large Amputating Knife
3. Smaller Ditto
4. Catling
5. Metacarpal Saw
6. Crooked Bistoury
7. Probe-pointed Crooked Bistoury
8. Straight Double-edged Scalpel
9. Tenaculum
10. Aneurism Needle
11. Forceps for taking up the Mouths of Vessels
11. Bone Nippers
- III. Fig. 1—3. Needles for sewing up Wounds
4. Spatula
5. Lancet
6. Eye Probe
7. Caustic Cafe
8. Common Forceps
9. Probe
10. Director
11. Scissors
12. Pocket Tenaculum
13, 14. Female Catheters
16—19. Male Ditto
- IV. Fracture of the Clavicle, &c.
(*This Plate, and the three following Plates, are without numbers.*)
- V. Fracture of the Leg
Splints
Bandages
- VI. Instruments for Lithotomy
Fig. 1. Sound
2—5. Staffs
6. Blunt Gorget
7. Hawkins's Cutting Gorget
8. Mr. Cline's Ditto
9. Mr. Abernethy's Gorget
10—12. Forceps
- VII. Instruments for Lithotomy
Fig. 1. Mr. Earle's Stone Breaker
2. Scoop
3. Mr. C. Bell's Grooved Staff
4. Mr. A. Burn's Knife and Staff
5. Mr. Hunter's Knife
6. Mr. A. Cooper's Ditto
7. Mr. Thomas Blizard's Ditto
8. Frère Coſme's Bistoir Caché
9. Screw for regulating the Blade
Trepanning Instruments
- VIII. Fig. 1. Rodman's Trepanning Instrument
2. Elevator for raising depressed Portions of a Fractured Skull
3. Tripod Elevator
4. Petit's Elevator, improved by Louis
5. Old Conical Saw
6. Trepan

PLATE

PLATE

- VIII. No. 2. Trepanning Instruments
 Fig. 1. Spring Forceps for extracting the Circle of Bone and Fragments
 2, 3. Trephines, with sliding Centre Pins, as made by Savigny
 4. Scalpel
 5. Common Elevator
 6. Mr. Hey's Saw, with curved Edges
 7. Lenticular
 8. Raspatory
 9. Mr. Hey's small straight Saw
 10. Trephine, with half of its sawing edge filed away
 11. Brush for cleaning the Teeth of the Trephine
 12. Mr. Hey's large straight Saw
 13. Centre Pin and Screw Truffles
- IX.
 Fig. 1—3. Common Truffles
 4. Dr. Hulme's Palm Trufs
 5. Mr. Whitford's Ditto
 7. Mr. Salmon's Patent Ditto
 8. Mr. Marrison's Ditto, for Exomphalos
 9—11. Mr. Eagland's Ditto
- X.
 Instruments for the Extraction of Cataract
 Fig. 1. Minute Steel Tenaculum, for extracting Bits of the Capfulæ
 2. Cline's Instrument for dividing the Capfulæ
 3. La Faye's Cytotome for Ditto
 4, 5. Scissars for enlarging the Wounds of the Cornea
 6. Tube for injecting Quicksilver into the Lachrymal Sac
 7—10. Anel's Syringe and Pipes
 11. Ware's Stiles
 12. Wathen's Tubes
 13. Small Lancet for puncturing the Lachrymal Sac
 14. Gibfon's Knife for Lithotomy
- XI.
 Instruments for Couching, and the Extraction of the Cataract
 Fig. 1. Broad Silver Hook for raising the Upper Eyelid
 2. Pellier's Hook for the same purpose
 3. A slender round Couching Needle
 4. Spear-shaped two-edged Ditto
 5, 6. Scarpa's curved Couching Needle
 7. Hey's Couching Needle
 8, 9. The same magnified
 10, 11. Wathen and Phipps's Knives for Extraction
 12. Richter's Knife
 13. Wenzel's Ditto
 14. Ware's Ditto
 15, 16. Knives for enlarging the Wound of the Cornea
 17. Forceps for taking away Pieces of the Capfulæ
 18. Wenzel's Forceps for Ditto, and taking away Fragments of opaque Matter
 19. Needle for dividing the Capfulæ, and Curette for extracting Fragments of the Cataract

SURVEYING.

PLATES. VOL. V.
NATURAL HISTORY.

GENERAL SYSTEMATIC ARRANGEMENT OF THE PLATES OF
NATURAL HISTORY,

INCLUDING THE THREE KINGDOMS OF NATURE, ACCORDING TO THE
SYSTEM OF LINNÆUS.

* * The Arabic Numerals on the Left, denote the Number of the Plates, according to the Systematic Arrangement of them in the Catalogue.

PLATE

ANIMALS.

CLASS MAMMALIA.

ORDER I. PRIMATES.

GENUS HOMO

- 1* *Homo Sapiens*, Rational Man
(See Plates PAINTING)
Anatomical Structure
(See Plates ANATOMY)
- 2* Varieties of *Homo Sapiens*, Rational Man, according to Climate
- α *Americanus*, American Man
β *Europæus*, European
γ *Asiaticus*, Asiatic, (of Palestine)
(of China)
- δ *Afer*, African
(See PAINTING, Plate III.)

GENUS SIMIA.

1. Lettered MAMMALIA, Order I. Primates, Plate I.
- Fig. 1. *Simia Satyrus*, Black Oran Otan, or Outang, *Homo Sylvestris*, var. *Pongo*
2. — var. *Jocko*, Chestnut Outan, or Outang
3. *Simia Troglodytes*, (Gmel.) *Satyrus indicus* Tulpii. *Chimpansee*
4. *Simia Lar*, (Gmel.) Long-armed Ape
Simia longimana, (Schreb.)
5. *Simia Inuus*, Barbary Ape
6. *Simia Sylvanus*, Pigmy Ape

VOL. XXXIX.

PLATE

1. Fig. 7. *Simia Edipus*, Red-tailed Ape
8. *Simia Jacchus*, Striated Ape

GENUS LEMUR.

2. Lettered MAMMALIA, Order Primates, Genus Lemur, Plate II.

- Fig. 1. *Lemur Polje*, Tarsier Lemur
2. *Lemur ecaudatus*, Tailless Lemur, or Maucauco
3. *Lemur murinus*, Murine Lemur
4. *Lemur Catta*, Ring-tailed Lemur, or Maucauco
5. *Lemur tardigradus*, Loris Lemur
6. *Lemur volans*, (Linn.) Flying Lemur, or Flying Colugo?

* GENUS GALEOPITHECUS (*Rufus*) Audebert

GENUS VESPERTILIO.

3. Lettered MAMMALIA, Genus Vespertilio, Plate III.

- Fig. 1. *Vespertilio Vampyrus*, Vampire Bat
2. *Vespertilio auritus*, Long-eared Bat
3. *Vespertilio Spafma*, Cordated Bat
4. *Vespertilio leporinus*, Peruvian Bat
5. *Vespertilio Speërum*, Speëre Bat

ORDER BRUTÆ.

GENUS BRADYPUS.

4. Lettered CLASS MAMMALIA, Order Brutæ, Genus Bradypus

- Fig. 1. *Bradypus tridactylus*, Three-toed Sloth
2. *Bradypus didactylus*, Two-toed Sloth

+ X

GENUS MYRMECOPHAGA.

4. Fig. 3. *Myrmecophaga didaëyla*, Two-toed or small Ant-Eater
 4. *Myrmecophaga tetradaëyla*, Four-toed Ant-Eater
 5. *Myrmecophaga jubata*, Great Ant-Eater

GENUS ORNITHORINCHUS.

- Fig. 6. *Ornithorinchus paradoxus*, Duck-bill
Platypus anatinus, (Shaw,) Duck-billed Platypus

GENUS MANIS.

5. Lettered MAMMALIA, Quadrupeds, Genus Manis
 Fig. 1. *Manis pentadaëyla*, (Linn.) Five-toed Manis, or Short-tailed Manis
 2. *Manis tetradaëyla*, (Schreb.) Four-toed Manis, or Long-tailed Manis

GENUS DASYPUS.

3. *Dasyfus sexcinctus*, Six-banded Armadillo
 4. *Dasyfus novemcinctus*, Nine-banded Armadillo
 5. *Dasyfus duodecempunctatus*, (Schreb.) Twelve-banded Armadillo
Dasyfus unicus, (Linn. et Gmel.) Ditto

GENUS RHINOCEROS.

6. Lettered QUADRUPEDS, Mammalia, Order Bruta, Rhinoceros. Plate.
 Fig. 1. *Rhinoceros unicornus*, One-horned Rhinoceros
 2. *Rhinoceros bicornis*, Two-horned Rhinoceros

GENUS SUKOTYRO.

(A doubtful genus not admitted by Gmelin)

7. Lettered QUADRUPEDS, Genus Sukotyro
 Fig. 1. *Sukotyro Indicus*, Sukotyro
 (From Niezwhoff, the Dutch traveller, and Churchill's Collection of Travels)

GENUS ELEPHAS.

- Fig. 2. *Elephas maximus*, Elephant

ORDER FERÆ.

GENUS TRICHECHUS.

8. Lettered QUADRUPEDS, Class Mammalia, Genus Trichechus
 Fig. 1. *Trichechus Rosmarus*, Arctic Walrus, or Morfe
 2. *Trichechus Manatus*, *β borealis*, Whale-tailed Manatus

GENUS PHOCA.

- Fig. 3. *Phoca Ursina*, Urfine Seal
 4. *Phoca groenlandica*, Harp Seal
 5. *Phoca Vitulina*, Sea Calf, or Common Seal
 6. *Phoca maculata*, Kurile or Spotted Seal

GENUS CANIS.

9. Lettered QUADRUPEDS, Dogs, Plate II. of Order FERÆ

- Fig. 1. *Canis familiaris*, Shepherd's Dog?
 2. *Dingo*, *Australasian*, or New Holland Dog
 3. *Canis familiaris*, var. Pomeranian Dog
Canis β pomeranus, Ditto
 4. *Canis* var. *Sibiricus*, Siberian Dog
 5. Iceland Dog?
 6. var. *Aquaticus minor*, Small Barbet, or Water Dog
 7. var. *Aquaticus*, Great Barbet, or Water Dog

10. Lettered QUADRUPEDS. Plate III. Dogs, Genus XV. Canis

- Fig. 1. var. *brevipilis*, King Charles's Dog
 2. Pyrama
 3. var. *Ægyptius*, Naked or Turkish Hound
 4. *fricator*, Pug-dog
 5. Spaniel
 6. Shock
 7. var. *variegatus*, Small Dane
 8. *leoninus*, Lion Dog
 9. *hybridus*, Roquet

11. Lettered QUADRUPEDS, Plate V. Dogs, Genus XV. Canis

- Fig. 1. var. *Anglicus*, Mastiff
 2. *Molossus*, Bull-dog
 3. Great Danish, or Harlequin-Dog
 4. Dalmatian Dog

12. Lettered QUADRUPEDS, Dogs, Plate IV. of Order Feræ, Genus XV. Canis

- Fig. 1. Old English, or Talbot Hound
 2. Beagle
 3. Harrier
 4. Blood Hound

13. Lettered QUADRUPEDS, Dogs, Plate V. of Order Feræ, Genus XV. Canis

- Fig. 1. Stag Hound
 2. Fox Hound
 3. Larger Terrier
 4. Smooth Terrier
 5. Rough Terrier

14. Lettered QUADRUPEDS, Order Feræ, Genus Canis (No number on the Plate)

- Fig. 1. *Canis Lupus*, Wolf
 2. *Canis Hyæna*, Striped Hyæna
 3. *Canis Mesomelas*, Cape Jackal
 4. *Canis Vulpes*, Common Fox
 5. *Canis Lagopus*, Arctic Fox

GENUS FELIS.

15. Lettered QUADRUPEDS, Plate I. Genus Felis, LIONS

- Fig. 1. *Felis Leo*, Lion, Lions, and Young

PLATE

16. Lettered QUADRUPEDS, Plate II. Order 3, Genus

Felis

- Fig. 1. *Felis Tigris*, Tiger
 2. *Felis Pardus*, Panther
 3. *Felis Leopardus*, Leopard

17. Lettered QUADRUPEDS, Genus Felis, Tigers, Plate II.

- Fig. 1. *Felis Puma*, Congouar
 2. *Felis Lynx*, Lynx
 3. *Felis Uncia*, Ounce
 4. *Felis Caracal*, Persian Lynx
 5. *Felis Onca*, Jaguar
 6. *Felis jubata*, Hunting Leopard

18. Lettered QUADRUPEDS, Plate III. of Order Feræ, Genus Felis

- Fig. 1. *Felis pardalis*, Ocelot
 2. *Felis Tigrina*, Margay
 3. *Felis Serval*, Serval
 4. *Felis Catus*, { Wild Cat
 a ferus, }
 5. *Felis β domesticus*, Tame or domesticated
 6. Tortoisefhell Cat
 7. *Felis γ angorensis*, Angora Cat
 8. *Felis ε caruleus*, Slate-coloured Cat, (Blue or Chartreux.)

GENUS VIVERRA.

19. Lettered QUADRUPEDS, Order Feræ, Genus Viverra (No number on the Plate)

- Fig. 1. *Viverra Zibetha*, Zibet, or Indian Musk Weefel
 2. *Viverra Fossa*, Fossane
 3. *Viverra Ichneumon*, Ichneumon Weefel
 4. *Viverra Naja*, Brazilian Weefel
 5. *Viverra Civetta*, Civet Weefel, or Civet-Cat, African Musk Weefel

20. Lettered QUADRUPEDS, Order Feræ, Genus Mustela (No number on the Plate)

- Fig. 1. *Mustela Lutris*, Sea Otter, Greater Otter
 2. *Mustela Lutra*, Common Otter
 3. *Mustela Foina*, Martin
 4. *Mustela Zibellina*, Sable, or Fisher Weefel

GENUS URSUS.

21. Lettered QUADRUPEDS, Order Feræ, Genus Ursus (No number on the Plate)

- Fig. 1. *Ursus Americanus*, American Bear
 2. *Ursus maritimus*, (Gmel.) Polar Bear
 Ursus marinus, (Pallas) U. Albus, Briff.
 3. *Ursus Gulo*, (Schreb.) Glutton
 4. *Ursus Meles*, Badger

GENUS DIDELPHIS.

22. Lettered QUADRUPEDS, Genus Didelphis, &c. (No number on the Plate)

- Fig. 1. *Didelphis Opossum* (Gmel. Schreb.) Virginian Opossum
 Didelphis Virginiana (Shaw) Ditto
 2. *Didelphis petaurus* (Shaw) *volans*, New Holland Flying Opossum
 3. *Didelphis Murina*, Murine Opossum

PLATE

GENUS MACROPUS.

22. Fig. 4. *Macropus Kangaroo*, a. male, b. female

GENUS TALPA.

23. Lettered QUADRUPEDS, Order Feræ, Genus Talpa, &c. (No number on the Plate)

- Fig. 1. *Talpa Capensis*, Cape Mole
 2. *Talpa longicaudata*, Long-tailed Mole
 3. *Talpa Europæa*, European Mole

GENUS SOREX.

- Fig. 4. *Sorex minutus*, Minute Shrew
 5. *Sorex moschatus*, Musky Shrew
 6. *Sorex araneus*, Fetid Shrew

GENUS ERINACEUS.

- Fig. 7. *Erinaceus Europæus*, Common Hedgehog
 8. *Erinaceus ecaudatus*, Madagascar Hedgehog

ORDER GLIRES.

GENUS HYSTRIX.

24. Lettered QUADRUPEDS, Order Glires, Genus Hystrix (No number on the Plate)

- Fig. 1. *Hystrix cristata*, Common or crested Porcupine
 2. *Hystrix prehensilis*, Brazilian Porcupine
 3. *Hystrix dorsata*, Canadian Porcupine (white variety)

GENUS CAVIA.

- Fig. 4. *Cavia Aguti*, Long-nosed Cavy
 5. *Cavia Magellanica*, Patagonian Cavy
 6. *Cavia Paca*, Spotted Cavy

GENUS CASTOR.

25. Lettered QUADRUPEDS, Order Glires, Genus Castor (No number on the Plate)

- Fig. 1. *Castor Fiber*, Common Beaver

GENUS MUS.

- Fig. 2. *Mus zibethicus*, Musk Rat
 3. *Mus decumanus*, Norway Rat
 4. *Mus musculus*, Common Moufe
 5. *Mus Cricetus*, German Hamster Rat
 6. *Mus burfarius*, Purple Rat or Canada Rat
 7. *Mus capensis*, Cape Mole-Rat

GENUS ARCTOMYS.

26. Lettered QUADRUPEDS, Order Glires, Genus Arctomys, &c. (No number on the Plate)

- Fig. 1. *Arctomys Citillus*, (Schreb.) Variegated Marmot
 2. *Arctomys Empetra*, Canadian Marmot

GENUS SCIURUS.

- Fig. 3. *Sciurus Petaurista*, Taquan, or Taguan flying Squirrel, Sailing Squirrel (Penn.)
 4. *Sciurus getulus*, Barbary Squirrel
 5. *Sciurus vulgaris*, Common Squirrel

PLATE

GENUS MYOXUS.

26. Fig. 6. *Myoxus Muscardinus* (Schreb.), *Mus avellannarius* (Linn.) Common Dormouse.—
(Donov. Brit. Quadr.)

GENUS DIPUS.

27. Lettered QUADRUPEDS, Order Glires, Genus Dipus
(No number on the Plate)

- Fig. 1. *Dipus Jaculus*, Common Jerboa (or Gerboa)
2. *Dipus Sagitta*, Arabian Jerboa
3. *Dipus cafer*, Cape Jerboa

GENUS LEPUS.

- Fig. 4. *Lepus timidus*, Common Hare
5. *Lepus alpinus*, (Pallas) Alpine Hare
(Distinct from the Alpine Hare of Forster in Phil. Transf. vol. lxiii. and Pennant Quadr., the latter being *Lepus variabilis*, Gmel. Donov. Brit. Quadr.)

GENUS HYRAX.

- Fig. 6. *Hyrax Capensis*, Cape Hyrax

ORDER PECORA.

GENUS CAMELUS.

28. Lettered QUADRUPEDS, Order Pecora, Genus Camelus
(No number on the Plate)

- Fig. 1. *Camelus Dromedarius*, Arabian Camel or Dromedary
2. *Camelus Bactrianus*, Bactrian Camel

GENUS MOSCHUS.

29. Lettered QUADRUPEDS, Genus Moschus
(No order or number on the Plate)

- Fig. 1. *Moschus moschiferus*, Thibet Musk
2. *Moschus pygmaeus*, Guinea Musk
3. *Moschus javanicus*, Java Musk

GENUS CERVUS.

4. *Cervus Alces*, Elk

30. Lettered QUADRUPEDS, Genus Cervus
(No order or number on the Plate)

- Fig. 1. *Cervus Tarandus*, Rein Deer
2. *Cervus Elaphus*, Stag or Hart
3. *Cervus Axis*, Spotted Axis

GENUS CAMELOPARDALIS.

4. *Camelopardalis Giraffa*, Giraff, or Camelopard

GENUS ANTILOPE.

31. Lettered QUADRUPEDS, Genus Antelope
(No order or number on the Plate)

- Fig. 1. *Antilope Rupicapra*, Chamois
2. *Antilope Cervicapra*, Antelope
3. *Antilope pygmaea*, Royal Antelope, or Pigmy Antelope
4. *Antilope Grimmia*, Guinea Antelope
5. *Antilope Gnu*, Gnu

PLATE

GENUS CAPRA.

32. Lettered QUADRUPEDS, Genus Capra
(No order or number on the Plate)

- Fig. 1. *Capra Ibx*, Ibx Goat
2. *Capra Aegagrus*, Mountain-cultivated Goat
(Donov. Brit. Quadr.)
3, 4. *Capra Aegagrus*, Domesticated Goat
(Donov. Brit. Quadr.)
5. *Capra Aegagrus*, (var. *membrica*) Syrian Goat
6. *Capra Aegagrus*, (var. *angorensis*) Angora Goat

GENUS ARIES.

33. Lettered QUADRUPEDS, Ovis, Aries
(No order or number on the Plate)

- Aries, Ovis*, Common Sheep
var. South Down Polled Sheep of the improved breeds. From the Stock of the late Duke of Bedford, Woburn

34. Lettered QUADRUPEDS, Genus Ovis, Sheep
(No order or number on the Plate)

- Aries, Ovis*, Common Sheep
Fig. 1. var. Norfolk Breed
2. Hereford Breed

GENUS BOS.

35. Lettered QUADRUPEDS, Bos, Taurus
(No order or number on the Plate)

- Bos, Taurus*, Ox
Fig. 1. var. Scottish Wild Ox, the Bull
2. The Cow and Calf

36. Lettered QUADRUPEDS, Bos, Taurus
(No order or number on the Plate)

- Bos, Taurus*, Common Ox
var. Long-horned or Lancashire Breed

ORDER BELLUE.

GENUS EQUUS.

37. Lettered HORSES, Plate I.
(No order on the Plate)

- Equus Caballus*, Horse
Fig. 1. var. Shetland Poney
2. var. English Cart Horse

38. Lettered QUADRUPEDS, Order VI. Belluæ, Genus 33,
Equus
(No number on the Plate)

- Equus Caballus*, Horse
var. Suffolk Agricultural Punch Horse
var. Suffolk Mare and Foal, from the Stock of the late Duke of Bedford

39. Lettered QUADRUPEDS, Genus Equus
(No order or number on the Plate)

- Equus Caballus*, Horse
Fig. 1. var. Race Horse, Royalist
2. var. The Hunter Skylark

GENUS HIPPOPOTAMUS.

40. Lettered QUADRUPEDS, Genus Hippopotamus
(No number on the Plate)

Fig. 1. *Hippopotamus amphibius*, Hippopotamus

GENUS TAPIR.

Fig. 2. *Tapir Americanus*, Tapir

GENUS SUS.

41. Lettered QUADRUPEDS, Genus Sus
(No number on the Plate)

Fig. 1. *Sus Scrofa*, (*ferus* α) Wild Hog
2. *Sus Babyrousa*, Babyrousa
3. *Sus Ethiopicus*, Ethiopian Hog
4, 5. *Sus Scrofa*, (*domesticus* β) Domesticated Hog

ORDER CETE.

GENUS MONODON.

42. Lettered MAMMALIA, Order Cete, Genus Monodon,
&c.

(No number on the Plate)

Fig. 1. *Monodon Monoceros*, Narwhal, or Narval
(Sometimes Sea Unicorn, or One-toothed Monodon,
so rarely having two teeth, that only a single example
of the kind is known. *Donov. Mus. Vide Donov.
Brit. Quadrupeds*)

GENUS BALENA.

Fig. 2. *Balena Myflecetes*, Great Myflecete, or
Common Whale
3. *Balena Boops*, Pike-headed Whale

GENUS PHYSETER.

43. Lettered MAMMALIA, Order Cete, Genus Physter
(No number on the Plate)

Fig. 1. *Physter macrocephalus*, Blunt-headed Ca-
chalot
2. *Physter*, var. *gibbosus*, (Schreb.) Gibbos
Cachalot

GENUS DELPHINUS.

Fig. 3. *Delphinus Phocæna*, Porpoise
4. *Delphinus Delphis*, Dolphin

ORNITHOLOGY.

CLASS II. AVES.

ORDER ACCIPITRES.

GENUS VULTUR.

44. Lettered Division I. LAND BIRDS, Plate II.

Fig. 1. *Vultur Gryphus*, Megallanic Condur, or
Condor

GENUS FALCO.

2. *Falco Chryfatos*, Golden Eagle
3. *Falco gentilis*, Falcon Gentil
4. *Falco subbuteo*, Hobby

GENUS STRIX.

44. 5. *Strix Bubo*, Great Horned Owl, or Eagle
Owl
6. *Strix flammea*, Common Owl

ORDER PICÆ.

GENUS PSITTACUS.

45. Lettered Division I. LAND BIRDS, Plate I. Order
Picæ

Fig. 1. *Psittacus Macao*, Red and blue Maccaw
2. *Psittacus Alexandri*, Alexandrine Parrot
3. *Psittacus Æstivus*, var. Amazon Parrot
4. *Psittacus garrulus*, var. Ceram Lory
5. *Psittacus Moluccensis*, Great red-crested
Cockatoo
6. *Psittacus Banksii*, Banksian Cockatoo
7. *Psittacus pullarius*, Ethiopian Parrot

GENUS RAMPHASTOS.

46. Lettered Division I. LAND BIRDS, Plate II. Picæ

Fig. 1. *Ramphastos pifceivorus*, Brasilian Toucan
2. *Ramphastos Aracari*, Green Toucan, or
Aracari

GENUS BUCEROS.

Fig. 3. *Buceros Rhinoceros*, Rhinoceros Horn-bill

GENUS BUPHAGA.

Fig. 4. *Buphaga Africana*, African Beef-eater

GENUS CROTOPHAGA.

Fig. 5. *Crotophaga Ani*, (*major*) greater Ani Bird

GENUS GLAUCOPIS.

Fig. 6. *Glaucopis cinereus*, Cinereous Wattle Bird

GENUS CORVUS.

47. Lettered Division I. LAND BIRDS, Picæ, Plate III.

Fig. 1. *Corvus Corax*, Raven
2. *Corvus Pica*, Magpie
3. *Corvus Caryocatactes*, Nut-cracker
4. *Corvus glandarius*, Jay
5. *Corvus cristatus*, Crested Jay

GENUS CORACIAS.

Fig. 6. *Coracias Garrulus*, Roller, (*Garrulous Roller*,
Donov. Brit. Birds)

GENUS ORIOLUS.

48. Lettered Division I. LAND BIRDS, Order II. Picæ,
Plate IV.

Fig. 1. *Oriolus cristatus*, Crested Oriole
2. *Oriolus Baltimoreus*, Baltimore Oriole
3. *Oriolus Perficus*, Black and Yellow Oriole
4. Nest of ditto

GENUS CUCULUS.

Fig. 5. *Cuculus canorus*, Common Cuckow

PLATE

48. Fig. 6. *Cuculus cupreus*, Coppery Cuckoo
7. *Cuculus indicator*, Honey-guide

GENUS GRACULA.

49. Lettered Division I. LAND BIRDS, Order II. Picæ, Plate V.

- Fig. 1. *Gracula Quiscalia*, Purple Grackle
2. *Gracula calva*, Bald Grackle
3. *Gracula Saularis*, Dial Grackle

GENUS PARADISEA.

- Fig. 4. *Paradisea Regia*, King Bird of Paradise
5. *Paradisea Apoda*, Greater Bird of Paradise
6. *Paradisea aurea*, Golden Bird of Paradise

GENUS TODUS.

- Fig. 7. *Todus macrorhynchus*, Great-billed Tody
(This genus should be placed after *Sitta*.)

GENUS TROGON.

50. Lettered Division I. LAND BIRDS, Order II. Picæ, Plate VI.

- Fig. 1. *Trogon Curucui*, Red-bellied Trogon

GENUS BUCCO.

- Fig. 2. *Bucco Lathamii*, Buff-faced Barbet
3. *Bucco Cayanaensis*, Cayenne Barbet

GENUS YUNX.

- Fig. 4. *Yunx Torquilla*, Wryneck

GENUS PICUS.

- Fig. 5. *Picus pileatus*, Pileated Woodpecker
6. *Picus Carolinus*, var. Caroline Woodpecker

GENUS SITTA.

- Fig. 7. *Sitta Europæa*, European Nuthatch

GENUS ALCEDO.

51. Lettered Division I. LAND BIRDS, Order II. Picæ, Plate VII.

- Fig. 1. *Alcedo cristata*, Crested King's Fisher
2. *Alcedo venerata*, Venerated King's Fisher
3. *Alcedo Aleyon*, Belted King's Fisher
4. *Alcedo sacra*, Sacred King's Fisher

GENUS GALBULA.

- Fig. 5. *Galbula paradisea*, Lath. (*Alcedo paradisea*, Gmel.) Long-tailed Jacamar, Paradise Jacamar
6. *Galbula viridis*, Lath. (*Alcedo Galbula*, Gmel.) Green Jacamar

GENUS MEROPS.

52. Lettered Division I. LAND BIRDS, Order II. Picæ

- Fig. 1. *Merops carunculatus*, Wattled Bee-eater
2. *Merops Novæ Seelandiæ*, New Zealand Bee-eater

GENUS UPUPA.

- Fig. 3. *Upupa Pomerops*, Cape Hoopoe

PLATE

52. Fig. 4. *Upupa Epops*, Common Hoopoe
5. *Upupa Erythrorhynchus*, Red-billed Hoopoe

GENUS CERCITHIA.

53. Lettered Division I. LAND BIRDS, Order Picæ, Plate IX.

- Fig. 1. *Cercithia pacifica*, Great hooked-billed Creeper
2. *Cercithia albifura*, Hook-billed Green Creeper
3. *Cercithia coccinea*, Hook-billed Red Creeper
4. *Cercithia cerulea*, Blue Creeper

GENUS TROCHILUS.

- Fig. 5. *Trochilus pelta*, Topaz Humming Bird
6. *Trochilus furcatus*, Leffer-forked Humming Bird
7. *Trochilus puniceus*, Crested Humming Bird
8. *Trochilus ornatus*, Tufted-necked Humming Bird
9. *Trochilus minimus*, Leaf Humming Bird

ORDER ANSERES.

GENUS ANAS.

54. Lettered Division II. WATER BIRDS, Order III. Anseres, Plate I.

- Fig. 1. *Anas atrata*, Black Swan
2. *Anas Olor*, Tame Swan
3. *Anas cygnoides*, Chinese Goose
4. *Anas gambensis*, Spur-winged Goose

55. Lettered Division II. WATER BIRDS, Order III. Anseres, Plate II.

- Fig. 1. *Anas erythropterus*, Bernacle Goose
2. *Anas Canadensis*, Canada Goose
3. *Anas speotabilis*, Grey-headed Duck
4. *Anas Mofibata*, Mulcovy Duck

56. Lettered Division II. WATER BIRDS, Order III. Anseres, Plate V.

- Fig. 1. *Anas tardonæ*, Sheldrake, or Shieldrake
2. *Anas clypeata*, Shoveler
3. *Anas crecca*, Teal
4. *Anas curvirostra*, Hooked-billed Duck, (var. *Donov. Brit. Birds*)
5. *Anas Boschas*, Mallard
6. *Anas Galericulata*, Mandarin Drake

GENUS MERGUS.

57. Lettered Division II. WATER BIRDS, Order III. Anseres, Plate IV.

- Fig. 1. *Mergus Merganser*, Gooferander
2. *Mergus cucullatus*, Crested Merganser
3. *Mergus albellus*, Smew, or Nun
(White Smew, *Donov. Brit. Birds*)

GENUS ALCA.

- Fig. 4. *Alca antiqua*, Ancient Auk
5. *Alca cirrata*, Tufted Auk

GENUS APTENODYTA.

- Fig. 6. *Aptenodyta patagonica*, Patagonian Penguin

NATURAL HISTORY.

PLATE

57. Fig. 7. *Aptenodyta papua*, Papuan Penguin
8. *Aptenodyta minor*, Little Penguin

GENUS PROCELLARIA.

58. Lettered Division II. WATER BIRDS, Order III. Anferes, Plate VI. *Obf.* with six Birds.

- Fig. 1. *Procellaria capensis*, Pintado Petrel
2. *Procellaria fuliginosa*, Sooty Petrel
3. *Procellaria pelagica*, Stormy Petrel
4. *Procellaria gigantea*, Gigantic Petrel

GENUS DIOMEDIA.

- Fig. 5. *Diomedea spadicea*, Chocolate Albatrofs
6. *Diomedea chlororhynchos*, Yellow-nofed Albatrofs

GENUS PELECANUS.

59. Lettered Division II. WATER BIRDS, Order III. Anferes, Plate VI. *Obf.* This is the Plate VI. containing five Birds, both being lettered and numbered alike

- Fig. 1. *Pelecanus Erythrorhynchos*, Rough-billed Pelican
2. *Pelecanus Sula*, Booby
3. *Pelecanus Aquilus*, Frigate

GENUS PLOTUS.

- Fig. 4. *Plotus punctatus*, Spotted Shag
5. *Plotus melanogaster*, Black-bellied Darter

GENUS PHÆTON.

60. Lettered Division II. WATER BIRDS, Order III. Anferes, Plate VII.

- Fig. 1. *Phæton athereus*, Common Tropic Bird
2. *Phæton phenicurus*, Red-tailed T. B.

GENUS COLYMBUS.

- Fig. 3. *Colymbus marmoratus*, Marbled Guillemot
4. *Colymbus arcticus*, Black-throated Diver
5. *Colymbus sinensis*, Chinefe Diver
6. *Colymbus cornutus*, Horned Grebe

GENUS LARUS.

61. Lettered Division II. WATER BIRDS, Order Anferes, Plate IX.

- Fig. 1. *Larus parasiticus*, Arctic Gull
2. *Larus eburneus*, Ivory Gull
3. *Larus marinus*, Black-backed Gull

GENUS STERNA.

- Fig. 4. *Sterna caspia*, (*Sterna Tschegraua*, Lepechin) Caspian Tern
5. *Sterna stolidus*, Noddy

GENUS RYNCHOPS.

- Fig. 6. *Rynchops nigra*, Black Skimmer

ORDER GRALLÆ.

GENUS PHENICOPTERUS.

62. Lettered Order Grallæ, Plate I.
Fig. 1. *Phenicopterus ruber*, Red Flamingo

PLATE

GENUS PLATALEA.

62. Fig. 2. *Platalea ajaja*, Roseate Spoonbill

GENUS PALAMEDEA.

- Fig. 3. *Palamedea cornuta*, Horned Screamer

GENUS MYCTERIA.

- Fig. 4. *Mycteria Novæ Hollandiæ*, New Holland Jabiru

GENUS CANCROMA.

63. Lettered Order Grallæ, Plate II.
Fig. 1. *Cancroma Cochlearia*, Crested Boatbill

GENUS SCOPUS.

- Fig. 2. *Scopus Umbretta*, Tufted Umbre

GENUS ARDEA.

- Fig. 3. *Ardea Pavonina*, Crowned Crane
4. *Ardea Antigone*, Indian Crane

64. Lettered Order Grallæ, Plate III.

- Fig. 1. *Ardea Ciconia*, White Stork
2. *Ardea Dubia*, Gigantic Heron
3. *Ardea exilis*, Minute Bittern
4. *Ardea Egretta*, Great Egret
5. *Ardea Tigrina*, Tiger Bittern

GENUS TANTALUS.

65. Lettered Order Grallæ, Plate IV.
Fig. 1. *Tantalus Loculator*, Wood Ibis
2. *Tantalus melanoptis*, Black-faced Ibis
3. *Tantalus calvus*, Bald Ibis

GENUS CORRIRA.

- Fig. 4. *Corrira italica*, Italian Courier

GENUS SCOLOPAX.

- Fig. 5. *Scolopax leucocephala*, White Headed Curlew
6. *Scolopax phæpus*, Whimbrel

66. Lettered Order Grallæ, Plate V.

- Fig. 1. *Scolopax lapponica*, Red or Lapland Godwit
2. *Scolopax candida*, White red Shank
3. *Scolopax capensis*, Cape Snipe
4. *Scolopax rusticola*, Wood Cock
5. *Scolopax major*, Great Snipe
6. *Scolopax fedoa*, Great or American Godwit
7. *Scolopax limosa*, Lesser Godwit

GENUS TRINGA.

67. Lettered Order Grallæ, Plate V.

- Fig. 1. *Tringa leucoptera*, White-winged Sandpiper
2. *Tringa pugnax*, Ruff and Reeve
4. *Tringa lobata*, Grey Phalarope

GENUS CHARADRIUS.

- Fig. 5. *Charadrius apricarius*, Alwagrim
6. *Charadrius Himantopus*, Long-legged Plover
7. *Charadrius spinosus*, Spur-winged Plover

NATURAL HISTORY.

PLATE

GENUS RECURVIROSTRA.

68. Lettered Order Grallæ, Plate VII.
Fig. 1. *Recurvirostra americana*, American Avocet

GENUS HÆMATOPUS.

- Fig. 2. *Hæmatopus ostralegus*, Oyster catcher (Pied Oyster Catcher, *Donov. Brit. Birds.*)

GENUS GLAREOLA.

- Fig. 3. *Glareola austriaca*, Austrian Pratincole

GENUS FULICA.

- Fig. 4. *Fulica Porphyrio*, Purple Gallinule
5. *Fulica cristata*, Crested Coot

GENUS VAGINALIS.

69. Lettered Order Grallæ, Plate VIII.
Fig. 1. *Vaginalis alba*, White Sheath-bill

GENUS PARRA.

- Fig. 2. *Parra Jacana*, Chefnut Jacana
3. *Parra sinensis*, China Jacana

GENUS RALLUS.

- Fig. 4. *Rallus crex*, Land Rail
5. *Rallus variegatus*, Variegated Rail

GENUS PSOPHIA.

- Fig. 6. *Psophia crepitans*, Gold-breasted Trumpeter

ORDER GALLINÆ.

GENUS OTIS.

70. Lettered Division I. LAND BIRDS, Order 5. Gallinæ, Plate I.
Fig. 1, 2. *Otis Tarda*, Bustard—male 1. female 2.

GENUS STRUTHIO.

- Fig. 3. *Struthio Rhea*, American Ostrich
4. *Struthio casuarius*, Calfowary, or Emeu
5. *Struthio Novæ-Hollandiæ*, New Holland Calfowary

GENUS DIDUS.

71. Lettered Division II. LAND BIRDS, Order 5. Gallinæ.
Fig. 1. *Didus Ineptus*, Hooded Dodo

GENUS STRUTHIO.

- Fig. 2, 3. *Struthio Camelus*, Ostrich—male 2. female 3.

GENUS PAVO.

72. Lettered Division I. LAND BIRDS, Order Gallinæ, Plate III.
Fig. 1. *Pavo cristatus*, Crested Peacock
2. *Pavo cristatus* (var. *varius*), Variegated or Pied Peacock
3. *Pavo cristatus* (var. *albus*), White Peacock
4. *Pavo bicalcaratus*, Iris peacock

PLATE

GENUS MELEAGRIS.

73. Lettered Division II. LAND BIRDS, Order 5. Gallinæ, Plate IV.

- Fig. 1. *Meleagris Gallopavo*, American or Wild Turkey

GENUS PENELOPE.

- Fig. 2. *Penelope cristata*, Guan

GENUS CRAX.

- Fig. 3, 4. *Crax Aleñor*, Curassow—male 3. female 4.
5. *Crax Pauxi*, Cufew

GENUS PHASIANUS.

74. Lettered Division II. LAND BIRDS, Order Gallinæ, Plate V.

- Fig. 1, 2. *Phasianus Gallus*, Wild Cock—male 1. female 2.
3. Ditto, var. *domesticus*, domesticated varieties, Rumpless Cock
4. Ditto, Silky Cock
5, 6. *Hamburgh Cock*—male 5. female 6.
7, 8. *Game Cock*—male 7. female 8.
9, 10. *puffillus* ♂, Bantam Cock—male 9. female 10.

75. Lettered Division II. LAND BIRDS, Order Gallinæ, Plate VI.

- Fig. 11, 12. *Phasianus Gallus*, var. *domesticus*, varieties, Malay Cock—male 11. female 12.
13, 14. Ditto, Dorking Cock—male 13. female 14.
15, 16. Ditto, Frizzled Cock—male 15. female 16.

76. Lettered Division III. LAND BIRDS, Order Gallinæ, Plate VII.

- Fig. 1. *Phasianus Colchicus*, Common Pheasant
2. *Phasianus pitaus*, Gold Pheasant
3. *Phasianus Nycthemerus*, Silver Pheasant
4. *Phasianus Argus*, Argus Pheasant

GENUS NUMIDIA.

77. Lettered Division I. LAND BIRDS, Order Gallinæ, Plate VIII.

- Fig. 1. *Numidia meleagris*, Guinea Hen or Pintado
2. *Numidia cristata*, Crested Pintado

GENUS TETRAO.

- Fig. 3. *Tetrao umbellus*, Ruffed or Ruff-necked Grouse
4. *Tetrao alchata*, Pin-tailed Grouse
5. *Tetrao Canadensis*, Spotted Grouse
6. *Tetrao paradoxus*, Heteroclitus Grouse, or Paradoxical Grouse

78. Lettered Division II. LAND BIRDS, Order Gallinæ, Plate IX.

- Fig. 1. *Tetrao perdix*, Common Partridge
2. *Tetra ferrugineus*, Hackled Partridge

78. Fig. 3. *Tetrao gibraltarius*, Gibraltar three-toed Quail
 4. *Tetrao marylandus*, Maryland Quail
 5. *Tetrao viridis*, Green Quail—male
 6. *Tetrao major*, Great Tinamou
 7. *Tetrao variegatus*, Variegated Tinamou

ORDER PASSERES.

GENUS COLUMBA.

79. Lettered Division I. LAND BIRDS, Order Passeres, Plate II.
 Fig. 1. *Columba chalcoptera*, Bronze-winged Pigeon
 2. *Columba erythroptera*, Garnet-winged Pigeon
 3. *Columba macroura*, Great-tailed Pigeon
 4. *Columba nicobarica*, Nicobar Pigeon
 5. *Columba curvirostra*, Hook-billed Pigeon
 6. *Columba capensis*, Cape Turtle, or Cape Pigeon
 7. *Columba coronata*, Great-crowned Pigeon

GENUS ALAUDA.

80. Lettered Division I. LAND BIRDS, Order Passeres, Plate LXXX.
 Fig. 1. *Alauda capensis*, Cape Lark

GENUS STURNUS.

- Fig. 2. *Sturnus militaris*, Military Starling
 3. *Sturnus undata*, Undulated Starling

81. Lettered Division I. LAND BIRDS, Order Passeres, Plate III.
 Fig. 1. *Turdus Orpheus*, Mocking Thrush
 2. *Turdus Rex*, King Thrush
 3. *Turdus perspicillatus*, Spectacle Thrush
 4. *Turdus crassirostris*, Thick-billed Thrush
 5. *Turdus cyanurus*, Blue-tailed Thrush
 6. *Turdus longirostris*, Long-billed Thrush

GENUS AMPELIS.

82. Lettered Division I. LAND BIRDS, Order Passeres, Plate IV.
 Fig. 1. *Ampelis carunculata*, Carunculated Chatterer
 2. *Ampelis cotinga*, Purple-breasted Chatterer
 3. *Ampelis Pompadora*, Pompadour Chatterer
 4. *Ampelis carnisex*, Red Chatterer

GENUS COLIUS.

- Fig. 5. *Colius capensis*, Cape Coly
 6. *Colius erythropus*, White-backed Coly

GENUS LOXIA.

83. Lettered Division I. LAND BIRDS, Order Passeres, Plate V.
 Fig. 1. *Loxia lineola*, Lineated Grosbeak
 2. *Loxia cucullata*, Crested Dominican Grosbeak
 3. *Loxia philippina*, Philippine Grosbeak
 4. The pendulous Nest of the Philippine Grosbeak
 5. *Loxia Cardinalis*, Cardinal Grosbeak
 6. *Loxia afrilla*, Waxen-billed Grosbeak
 7. *Loxia flabellifera*, Fan-tailed Grosbeak

GENUS EMBERIZA.

84. Lettered Division I. LAND BIRDS, Order Passeres, Plate VI.
 Fig. 1. *Emberiza Paradyca*, Whidah Bird
 2. *Emberiza ciris*, Painted Bunting
 3. *Emberiza Regia*, Shaft-tailed Bunting
 4. *Emberiza provincialis*, Mustache Bunting
 5. *Emberiza americana*, Black-throated Bunting
 6. *Emberiza hortulana*, Oortolan Bunting

GENUS TANAGRA.

85. Lettered Division I. LAND BIRDS, Order 3. Passeres, Plate X.
 Fig. 1. *Tanagra Taitao*, Paradise Tanager
 2. *Tanagra capitalis*, Capital Tanager
 3. *Tanagra Jacapa*, Red-breasted Tanager

GENUS FRINGILLA.

- Fig. 4. *Fringilla ignita*, Fire Finch
 5. *Fringilla flammea*, Crimson-crowned Finch
 6. *Fringilla bengalica*, Blue-bellied Finch
 7. *Fringilla Ptilacus*, Parrot Finch

GENUS PHYTOTOMA.

- Fig. 8. *Phytotoma rara* (*Molina, Hist. Nat. Chili*)
 Chili Phytotoma

GENUS MUSCICAPA.

86. Lettered Order Passeres, Plate VIII.
 Fig. 1. *Muscicapa bicolor*, Black and White Flycatcher
 2. *Muscicapa barbata*, Whiskered Flycatcher
 3. *Muscicapa tyrannus*, Forked-tailed Flycatcher
 4. *Muscicapa malacubura*, Soft-tailed Flycatcher
 5. *Muscicapa flabellifera*, Fan-tailed Flycatcher

GENUS MOTACILLA.

- Fig. 6. *Motacilla cyanea*, Superb Wheat-ear
 7. *Motacilla Madraspatensis*, Pied Wagtail
 (Madras Pied Wagtail)

GENUS MOTACILLA.

87. Lettered Order Passeres, Plate IX.
 Fig. 1. *Motacilla pileata*, Black-headed Warbler
 2. *Motacilla spinicauda*, Thorn-tailed Warbler
 3. *Motacilla succica*, Blue-throated Warbler

GENUS PIPRA.

- Fig. 4. *Pipra rupicola*, Rock Manakin
 5. *Pipra striata*, Striped-headed Manakin
 6. *Pipra leucocephala*, White-capped Manakin
 7. *Pipra punctata*, Speckled Manakin

GENUS PARUS.

88. Lettered Order Passeres, Plate XX.
 Fig. 1. *Parus macrocephalus*, Great-headed Titmouse
 2. *Parus cristatus*, Crested Titmouse

GENUS HIRUNDO.

88. Fig. 4. *Hirundo efculenta*, Efculent Swallow
 5. The efculent Nest of this Swallow
 6. *Hirundo tabitica*, Otabeite Swallow
 7. *Hirundo pelafgia*, Aculeated Swallow
 3. *Hirundo indica*, Rufous-headed Swallow

GENUS CAPRIMULGUS.

80. Lettered Division LAND BIRDS, Order Pafferes,
 Plate LXXX.
 Fig. 4. *Caprimulgus longipennis*, Leona Goatfucker
 5. *Caprimulgus grandis*, Great Goatfucker

ELEMENTARY PLATES

TO ILLUSTRATE

THE CLASSIFICATION OF BIRDS.

Characters of the Feet in the different Orders and Genera.

ACCIPITRES.

Feet formed for affifting the Mandibles in feizing and tearing the prey, being armed with ftrong talons.

89. Lettered ORNITHOLOGY, Elementary Plate I.
 The Feet in *Falco* (*Falco Chryfactus*, Golden Eagle); and Eagles, Falcons, Hawks
 The Feet in *Strix* (*Strix flammea*, White Owl); *Stridula*, *brachyotos*, *pallarina*
 (*The Shrikes belong to this order*)

PICÆ.

* *Feet formed for Perching.*

90. Lettered Plate IV.
 The Feet in *Sitta* (Nuthatch) European Nuthatch
 92. Lettered Plate II.
 The feet in *Corvus* (Crow) Common Crow
Paradifea (Bird of Paradife)
 The fame ftructure prevails in the feet of the genera *Buphaga*, *Oriolus*, *Coracias*, *Upupa*, *Certhia*, *Trochilus*, &c.

** *Feet formed for Climbing.*

90. Lettered Elementary Plate IV.
 The Feet of *Picus* (*P. Martius*, Great Black Woodpecker; *P. Viridis*, Green Woodpecker)
 The Feet of *Mufophagus* (*Mufophage*)
 This ftructure is well exemplified in *Pfittacus* (Parrot), and *Cuculus* (Cuckow), which are familiar examples; and occurs in the genera *Scythrops*, *Ramphafotos*, *Trogon*, *Crotophaga*, *Galbula*, *Yunx*, and *Bucco*.

*** *Feet formed for Walking.*

90. Lettered Elementary Plate IV.
 The Foot of *Alcedo* (King's-fifher)
 The other genera of *Picæ*, which have the feet formed for walking, are *Momotus*, *Buceros*, *Meleps*, and *Todus*.

ANSERES.

Feet formed for Swimming.

91. Lettered ORNITHOLOGY, Elementary Plate III.
 Feet in the genus *Anas* (Goofe, Duck)
Alca (Auk)
Aptenodyta (Penguin)
Pelecanus (Pelican), two fpecies
Colymbus (Grebe), three fpecies
Larus (Gull)
 90. Lettered ORNITHOLOGY, Elementary Plate IV.
 Feet in the genus *Sterna* (Tern)

GALLÆ.

Feet formed for Wading.

91. Lettered ORNITHOLOGY, Elementary Plate III.
 Feet in the genus *Phanicopterus* (Flamingo)
 89. Lettered ORNITHOLOGY, Elementary Plate I.
 Feet in the genus *Platalea* (Spoonbill) *P. ajaja*
 90 & 92. } Lettered ORNITHOLOGY, Elementary Plate IV.
 } and II.
 Feet in the genus *Ardea* (Heron)
 89. Lettered ORNITHOLOGY, Elementary Plate I.
 Feet in the genus *Ardea cinerea* (Grey Heron)
 91. Lettered ORNITHOLOGY, Elementary Plate III.
 Feet in the genus *Recurviroftra*, (Avocet)
 89. Lettered ORNITHOLOGY, Elementary Plate I.
 Feet in the genus *Tantalus* (Ibis) *T. igneus*, Bay Ibis
 91. Lettered ORNITHOLOGY, Elementary Plate III.
 Feet in the genus *Tringa* (Phalarope) *T. lobata*, Scallop-toed *Tringa*
 89. Lettered ORNITHOLOGY, Elementary Plate I.
 Feet in the genus *Charadrius* (Plover, Long-legged P.)
Hematopus (Oyfter Catcher)
Glareola (Pratincole) *P. austriaea*
 91. Lettered ORNITHOLOGY, Elementary Plate III.
 Feet in the genus *Fulica* (Gallinule)
Vignalis (Sheathbill)
 90. Lettered ORNITHOLOGY, Elementary Plate IV.
 Feet in the genus *Rallus* (Rail)

PLATE

91. Lettered ORNITHOLOGY, Elementary Plate III.
Feet in the genus *Rallus* (*Rallus gallinule*)
90. Lettered ORNITHOLOGY, Elementary Plate IV.
Feet in the genus *Parra* (*Jacana*), two species
- GALLINÆ.
Form of the Feet.
92. Lettered ORNITHOLOGY, Elementary Plate II.
In the genus *Otis* (*Bustard*)
Struthio (*Ostrich*) *S. camelus*, Common
or Black Ostrich
Struthio cajuarius, Caffowary
Cereopsis (*Cercops*)
Pavo (*Peacock*) Common P.
Phasianus (*Pheasant*) Common P.
Menura (*Menura*)
89. Lettered ORNITHOLOGY, Elementary Plate I.
In the genus *Tetrao* (*Grouse*), *T. Urogallus*, Great
Grouse. *T. lagopus*, Ptarmigan. *T. tetrix*, Black
Game

PASSERES.

Structure of the Feet.

89. Lettered ORNITHOLOGY, Elementary Plate I.
In the genus *Colius* (*Coly*)
90. Lettered ORNITHOLOGY, Elementary Plate IV.
In the genus *Alauda* (*Lark*), *A. arvensis*, Sky-
lark. *A. obscura*, Dufky Lark
Pipra (*Manakin*)
92. Lettered ORNITHOLOGY, Elementary Plate II.
In the genus *Parus* (*Titmoufe*)
90. Lettered ORNITHOLOGY, Elementary, Plate IV.
In the genus *Turdus* (*Thrush*)
Motacilla (*Warbler*)
89. Lettered ORNITHOLOGY, Elementary Plate I.
In the genus *M. Regulus* (*Gold-crested Wren*)

CLASS AMPHIBIA.

ORDER I. REPTILES.

GENUS TESTUDO.

Marine Turtles.

93. Lettered AMPHIBIA, Plate X.
Fig. 5. *Testudo mydas*, Efulcent Green Turtle
6. *Testudo imbricata*, Hawkbill Turtle
- Land Tortoises.*
- Fig. 1. *Testudo denticulata*, Denticulated Tortoise
2. *Testudo europæa*, Green Speckled Tortoise
3. *Testudo guttata*, Spotted Tortoise
4. *Testudo picta*, Painted Tortoise

PLATE

GENUS RANA.

94. Lettered AMPHIBIA, Plate I.
Fig. 1. *Rana Pipa*, Surinam Toad—*Female with her
young nestling in cellules on the back*
2. *Rana bicolor*, Two-coloured Frog
3. *Rana paradoxa*, Paradoxical Frog, in the
fifth-like former tad-pole state
4. *Rana arborea*, Tree Frog.

GENUS LACERTA.

95. Lettered AMPHIBIA, Plate VIII.
Fig. 1. *Lacerta Salamandra*, Salamander
2. *Lacerta Vittata*, Forked Lizard
3. *Lacerta Chamaeleon*, Chameleon
4. *Lacerta agilis*, Green Lizard
5. *Lacerta lemnifcata*, Eight-lined Lizard
96. Lettered AMPHIBIA, G. Lacerta, Plate IX.
Fig. 1. *Lacerta scincoides*, Australasian Galliwasp
2. *Lacerta chalcides*, Chalcides Lizard
3. *Lacerta apus*, Apodal Lizard

GENUS DRACO.

- Fig. 4. *Draco volans*, Flying Dragon, (*Lacerta vo-
lans*, Flying lizard)

GENUS SIREN.

97. Lettered AMPHIBIA, G. Siren, Plate VI.
Fig. 1. *Siren lacertina*, Eel-shaped Siren
2. *Siren anguina*, Anguine Siren

ORDER II. SERPENTS.

GENUS CROTALUS.

98. Lettered AMPHIBIA, G. Crotalus, Plate II.
Fig. 1. *Crotalus horridus*, Banded Rattle-snake
2. *Crotalus Duriffus*, Striped Rattle-snake

GENUS BOA.

99. Lettered AMPHIBIA, G. Boa, Plate V.
Fig. 1. *Boa constrictor*, Great Boa Serpent
2. *Boa Phyrgia*, Embroidered Boa Serpent
3. *Boa hortulana*, Garden Boa Serpent

GENUS COLUBER.

100. Lettered AMPHIBIA, G. Coluber, Plate IV.
Fig. 1. *Coluber nasicornis*, Horn-nosed Viper
2. *Coluber cerastes*, Cerastes Viper
3. *Coluber najas*, Nagoo or Spectacle Viper

GENUS ANGUIS.

101. Lettered AMPHIBIA, G. Anguis, Plate III.
Fig. 1. *Anguis Corallinus*, Coral Slow Worm
2. *Anguis ater*, Black Banded Slow Worm
3. *Anguis Jamaicensis*, Jamaica Slow Worm

GENUS AMPHIBENÆA.

102. Lettered AMPHIBIA, G. Amphibænæa, Plate VII.
Fig. 1. *Amphibænæa alba*, White Amphibænæa
2. *Amphibænæa fuliginosa*, Fuliginous Amphif-
bænæa

GENUS CÆCILIA.

102. Fig. 3. *Cæcilia tentacula*, Eel-shaped Cæcilia

GENUS HYDRUS.

103. Lettered AMPHIBIA, G. Hydrus
Fig. 1. *Hydrus colubrinus*, Colubrine Hydrus
2. *Hydrus bicolor*, Black-backed Hydrus

GENUS LANGAYA.

- Fig. 3. *Langaya nasuta*, Snouted Langaya

GENUS ACROCHORDUS.

- Fig. 4. *Acrochordus dubius*, Doubtful Acrochordus

ICHTHYOLOGY.

CLASS PISCES.

ORDER APODES.

GENUS MURÆNA.

104. Lettered Order Apodes, Plate I.
Fig. 1. *Muræna anguilla*, Eel Muræna, or Common Eel

GENUS SYNBRANCHUS.

- Fig. 2. *Synbranchus marmoratus*, Marbled Synbranchus

GENUS SPHAGEBRANCHUS.

- Fig. 3. *Sphagebranchus rostratus*, Snouted Sphagebranchus

GENUS GYMNOTUS.

- Fig. 4. *Gymnotus electricus*, Electric Gymnotus

GENUS GYMNOTHORAX.

- Fig. 5. *Gymnotorax muræna*, Eel Gymnotorax
6. *Gymnotorax catenatus*, Chain Gymnotorax

GENUS STOMATEUS.

105. Lettered Order Apodes, Plate II.
Fig. 1. *Stomateus cinereus*, Ash-coloured Stomateus
2. *Stomateus niger*, Black Stomateus

GENUS STYLEPHORUS.

- Fig. 3. *Stylephorus chordatus*, Chordated Stylephorus

GENUS TRICHIURUS.

- Fig. 4. *Trichiurus argenteus*, Silvery Trachiurus

GENUS STERNOPTYX.

- Fig. 5. *Sternoptyx diaphana*, Diaphanous Sternoptyx

GENUS XIPHIAS.

- Fig. 6. *Xiphias gladius*, Sword-fish

GENUS ANARHICHAS.

- Fig. 7. *Anarhichas lupus*, Ravenous Wolf-fish

ORDER JUGULARES.

GENUS TRACHINUS.

106. Lettered Order Jugulares, Plate I.
Fig. 1. *Trachinus major*, Great Weever
2. *Trachinus draco*, Small Weever

GENUS URANOSCOPIUS.

- Fig. 3. *Uranoscopus scaber*, Rough Stargazer

GENUS CALLIONYMUS.

- Fig. 4. *Callionymus dracunculus*, Sordid Dragonet
5. *Callionymus lyra*, Gemmous Dragonet

GENUS GADUS.

107. Lettered ICHTHYOLOGY, Order Jugulares, Plate II.
Fig. 1. *Gadus morhua*, Cod-fish
2. *Gadus carbonarius*, Coal-fish
3. *Gadus minutus*, Poor
4. *Gadus Tau*, Tau Cod-fish

GENUS BLENNIUS.

- Fig. 5. *Blennius maris*, Ocellated Blenny

GENUS KURTUS.

- Fig. 6. *Kurtus indicus*, Indian Kurtus

ORDER THORACICI.

GENUS CEPOLA.

108. Lettered ICHTHYOLOGY, Order Thoracici, Plate I.
Fig. 1. *Cepola Tenia*, Ribband-fish

GENUS ECHINEIS.

- Fig. 2. *Echineis Remora*, Mediterranean Sucking-fish

GENUS CORYPHÆNA.

- Fig. 4. *Coryphæna bippurus*, Common Coryphene
5. *Coryphæna pentadactyla*, Five-spotted Coryphene

GENUS GOBIVS.

- Fig. 3. *Gobius minutus*, Spotted Goby

GENUS COTTUS.

- Fig. 6. *Cottus grunniens*, Grunting Bull-head
7. *Cottus cataphractus*, Mailed Bull-head

GENUS SCORPÆNA.

109. Lettered ICHTHYOLOGY, Order Thoracici, Plate II.
Fig. 1. *Scorpena Scrofa*, Hog Sea-Scorpion
2. *Scorpena horrida*, Horrid Sea-Scorpion
3. *Scorpena antennata*, Antennated Sea-Scorpion

GENUS ZEUS.

- Fig. 4. *Zeus gallus*, American Zeus
5. *Zeus ciliaris*, Filamentous Zeus
6. *Zeus infidator*, Infidious Zeus

GENUS PLEURONECTES.

110. Lettered ICHTHYOLOGY, Order Thoracici, Plate III.

- Fig. 1. *Pleuronectes Zebra*, Zebra Sole
 2. *Pleuronectes Argus*, Argus Flounder
 3. *Pleuronectes plateja*, Plaice
 4. *Pleuronectes bilineatus*, Bilineated Sole

111. Lettered ICHTHYOLOGY, Order Thoracici, Plate IV.

- Fig. 1. *Pleuronectes punctatus*, Dotted Flounder

GENUS CHÆTODON.

110. Lettered ICHTHYOLOGY, Order Thoracici, Plate III.

- Fig. 5. *Chætodon bicolor*, Two-coloured Chætodon
 6. *Chætodon fasciatus*, Banded Chætodon

111. Lettered ICHTHYOLOGY, Order Thoracici, Plate IV.

- Fig. 2. *Chætodon imperator*, Imperial Chætodon
 3. *Chætodon marginatus*, Bordered Chætodon
 4. *Chætodon arcuatus*, Bowed Chætodon
 5. *Chætodon rostratus*, Snouted Chætodon
 6. *Chætodon Teira*, Teira Chætodon

GENUS SPARUS.

112. Lettered ICHTHYOLOGY, Order Thoracici, Plate VII.

- Fig. 1. *Sparus falcatus*, Falcated Gilthead
 2. *Sparus Surinamensis*, Surinam Gilthead
 3. *Sparus fasciatus*, Banded Gilthead
 4. *Sparus chrysurus*, Golden-tailed Gilthead
 5. *Sparus annularis*, Annulated Gilthead
 6. *Sparus mena*, Cackarel

GENUS SCARUS.

113. Lettered ICHTHYOLOGY, Order Thoracici, Plate VIII.

- Fig. 7. *Scarus viridis*, Green Scarus

114. Lettered ICHTHYOLOGY, Order Thoracici, Plate X. & XI.

1. *Scarus cretensis*, Large-scaled Scarus

GENUS LABRUS.

113. Lettered ICHTHYOLOGY, Order Thoracici, Plate VIII.

- Fig. 1. *Labrus microlepidotus*, Large-scaled Wraffe
 2. *Labrus trichopterus*, Hair-finned Wraffe
 3. *Labrus malapterus*, Soft-finned Wraffe
 4. *Labrus maculatus*, Spotted Wraffe
 5. *Labrus punctatus*, Dotted Wraffe
 6. *Labrus melagaster*, Black-bellied Wraffe

GENUS SCIENA.

114. Lettered ICHTHYOLOGY, Order Thoracici, Plate X. & XI.

- Fig. 2. *Sciæna diacantha*, Two-spined Umber, or Sciæna
 3. *Sciæna cirrofa*, Cirrofe Sciæna
 4. *Sciæna punctata*, Dotted Sciæna
 5. *Sciæna plumiera*, Plumier's Sciæna

116. Lettered ICHTHYOLOGY, Order Thoracici, Plate XI.

- Fig. 1. *Sciæna undecimalis*, Eleven-spot Sciæna
 2. *Sciæna lineata*, Lineated Sciæna

GENUS PERCA.

115. Lettered ICHTHYOLOGY, Order Thoracici, Plate IX.

- Fig. 1. *Perca Brasiliensis*, Brazilian Perch
 2. *Perca faxatilis*, Rock Perch
 3. *Perca punctata*, Dotted Perch
 4. *Perca guttata*, Guttated Perch
 5. *Perca maculata*, Spotted Perch
 6. *Perca bimaculata*, Bimaculated Perch

GENUS TRACHYCHTHYS.

116. Lettered ICHTHYOLOGY, Order Thoracici, Plate XI.

- Fig. 4. *Trachyichthys australis*, Australasian Trachyichthys

GENUS GASTEROSTEUS.

- Fig. 3. *Gasterosteus aculeatus*, Stickleback

GENUS SCOMBER.

117. Lettered ICHTHYOLOGY, Order Thoracici, Plate XII.

- Fig. 1. *Scomber sarda*, (*Scomber Scomber*, Linn.) Common Mackerel
 2. *Scomber niger*, Black Mackerel
 3. *Scomber fallens*, Salient Mackerel
 4. *Scomber ruber*, Red Mackerel

116. Lettered ICHTHYOLOGY, Order Thoracici, Plate XI.

- Fig. 5. *Scomber Rotleri*, Rotlerian Mackerel
 6. *Scomber aculeatus*, Aculeated Mackerel

GENUS MULLUS.

118. Lettered ICHTHYOLOGY, Order Thoracici, Plate XIII.

- Fig. 1. *Mullus surmuletus*, Surmullet

GENUS TRIGLA.

- Fig. 2. *Trigla Carolina*, Caroline Gurnard
 3. *Trigla Hirundo*, Swallow Gurnard
 5. *Trigla cataphraetus*, Mailed Gurnard
 4. *Trigla punctata*, Dotted Gurnard

GENUS LONCHIURUS.

117. Lettered ICHTHYOLOGY, Order Thoracici, Plate XII.

- Fig. 5. *Lonchiusus barbatus*, Bearded Lonchiusus

ORDER ABDOMINALES.

GENUS COBITIS.

119. Lettered ICHTHYOLOGY, Order Abdominales, Plate V.

- Fig. 4. *Cobitis fossilis*, Great Loche

GENUS ANABLEPS.

- Fig. 5. *Anableps tetropthalmus*, Four-eyed Anableps

GENUS SILURUS.

- Fig. 1. *Silurus clarias*, Long-bearded Silurus

GENUS *PLATYSTACHUS*.

119. Fig. 6. *Platystachus anguillaris*, Eel-shaped Platystachus

GENUS *LORICARIA*.

- Fig. 2. *Loricaria costalis*, Ribbed Loricaria
3. *Loricaria flava*, Yellow Loricaria

GENUS *SALMO*.

120. Lettered ICHTHYOLOGY, Order Abdominales, Plate III.

- Fig. 1. *Salmo bimaculatus*, Bimaculated Salmon
2. *Salmo fasciatus*, Banded Salmon
3. *Salmo tumbil*, Barred Salmon
4. *Salmo Odoo*, Odoe Salmon
5. *Salmo Gasteropelecus*, Yellow-finned Salmon
6. *Salmo Friderici*, Frederician Salmon
7. *Salmo rhombeus*, Rhombic Salmon

GENUS *FISTULARIA*.

121. Lettered ICHTHYOLOGY, Order Abdominales, Plate II.

- Fig. 1. *Fistularia chinensis*, Chinese Tobacco-pipe Fish
2. *Fistularia tabaccaria*, Spotted Tobacco-pipe Fish

GENUS *ESOX*.

- Fig. 3. *Esox officus*, Bony Gar Fish, or Sea Pike
4. *Esox Belone*, Sea Pike, or Gar Fish
5. *Esox brasiliensis*, Brazilian Pike, or Gar Fish

GENUS *ELOPS*.

- Fig. 6. *Elops Saurus*, Saury Elops

GENUS *ARGENTINA*.

- Fig. 7. *Argentina Sphyræna*, European Argentine

GENUS *ATHERINA*.

122. Lettered ICHTHYOLOGY, Order Abdominales, Plate I.

- Fig. 1. *Atherina Hepsetus*, Common Atherine

GENUS *MUGIL*.

- Fig. 2. *Mugil Tang*, Tang Mullet
3. *Mugil cephalus*, Grey Mullet

GENUS *EXOCETUS*.

- Fig. 4. *Exocetus evolans*, Mediterranean Flying Fish
5. *Exocetus exiliens*, Swallow Flying Fish
6. *Exocetus Mesogaster*, Atlantic Flying Fish

GENUS *POLYNEMUS*.

123. Lettered ICHTHYOLOGY, Order Abdominales, Plate IV.

- Fig. 1. *Polynemus paradysæus*, Paradise Polyneme
2. *Polynemus decadactylus*, Ten-fingered Polyneme

GENUS *CLUPEA*.

123. Fig. 3. *Clupea Thrissa*, Thrissa Herring
4. *Clupea najus*, Nafal Herring

GENUS *CYPRINUS*.

- Fig. 5. *Cyprinus cultratus*, Razor Carp
6. *Cyprinus auratus*, Golden Carp, var.
7. *Cyprinus pboxinus*, Minnow

ORDER BRANCHIOSTEGI.

GENUS *OSTRACION*.

124. Lettered ICHTHYOLOGY, Order Branchiofegi, Genus Ostracion, Plate V.

- Fig. 1. *Ostracion turritus*, Eared Trunk Fish
2. *Ostracion triguter*, Triangular Trunk Fish
3. *Ostracion najus*, Snouted Trunk Fish
4. *Ostracion bicaudalis*, Bicaudate Trunk Fish
5. *Ostracion quadricornis*, Four-horned Trunk Fish
6. *Ostracion cornutus*, Horned Trunk Fish

GENUS *TETRODON*.

125. Lettered ICHTHYOLOGY, Order Branchiofegi, Plate V.

- Fig. 1. *Tetrodon hispidus*, Hispid Tetrodon
2. *Tetrodon ocellatus*, Ocellated Tetrodon
3. *Tetrodon lineatus*, Lineated Tetrodon
4. *Tetrodon lagocephalus*, Hare Tetrodon

GENUS *DIODON*.

- Fig. 5. *Diodon Hystrix*, Porcupine Diodon
6. *Diodon orbicularis*, Round Diodon

GENUS *SYNGNATHUS*.

126. Lettered ICHTHYOLOGY, Order Branchiofegi, Plate VI.

- Fig. 1. *Syngnathus foliatus*, Foliated Pipe Fish
2. *Syngnathus acus*, Great Pipe Fish
3. & 3.* *Syngnathus Hippocampus*, Sea-Horse Pipe Fish

GENUS *PEGASUS*.

- Fig. 4. & 4.* *Pegasus Draconis*, Dragon Pegasus
5. & 5.* *Pegasus natans*, Swimming Pegasus

GENUS *CENTRISCUS*.

- Fig. 6. *Centriscus scutatus*, Mailed Centriscus

GENUS *BALISTES*.

127. Lettered ICHTHYOLOGY, Order Branchiofegi, Plate III.

- Fig. 1. *Balistes vetula*, Old Wife
2. *Balistes maculatus*, Spotted Old Wife
3. *Balistes aculeatus*, Aculeated Old Wife
4. *Balistes monoceros*, One-horned Old Wife

GENUS *CYCLOPTERUS*.

128. Lettered ICHTHYOLOGY, Order Branchiofegi, Plate IV.

- Fig. 1. *Cyclopterus Lumpus*, Common Lump-fucker

PLATE

128. Fig. 2. *Cyclopterus ocellatus*, Ocellated Lump-fucker
 3. *Cyclopterus lineatus*, Lineated Lump-fucker

GENUS LOPHIUS.

- Fig. 4. *Lophius marmoratus*, Marbled Angler
 5. *Lophius Hispidus*, Harlequin Angler
 6. *Lophius rostratus*, Beaked Angler
 7. *Lophius pictus*, Painted Angler

ORDER CHONDROPTERYGII.

GENUS ACIPENSER.

129. Lettered ICHTHYOLOGY, Order Chondropterygii, Plate I.

- Fig. 3. *Acipenser Sturio*, Common Sturgeon
 4. *Acipenser Rubrenus*, Sterlet

GENUS CHIMERA.

- Fig. 2. *Chimera monstrosa*, Sea-monster
 5. *Chimera californicus*, Southern Sea-monster

GENUS PRISTIS.

- Fig. 1. *Pristis antiquorum*, Common Saw-fish

GENUS SQUALUS.

130. Lettered ICHTHYOLOGY, Order Chondropterygii, Plate II.

- Fig. 1. *Squalus glaucus*, Blue Shark
 2. *Squalus Catulus*, Lesser spotted Shark
 3. *Squalus Squatina*, Angel Shark
 4. *Squalus Zygena*, Hammer-headed Shark
 5. *Squalus Zebra*, Zebra Shark

GENUS SPATULARIA.

- Fig. 6. *Spatularia reticulata*, Reticulated Spatularia

GENUS RAJA.

131. Lettered ICHTHYOLOGY, Order Chondropterygii, Plate VI.

- Fig. 1. *Raja diabolus*, Dæmon Ray
 2, 3. *Raja clavata*, Thorn-back
 4. *Raja undulata*, Undulated Ray
 5. *Raja torpedo*, Electric Ray
 6. *Raja rhinobatos*, Long-nosed Ray

GENUS GASTROBRANCHIUS.

132. Lettered ICHTHYOLOGY, Order Chondropterygii, Plates III., IV., V.

- Fig. 1. *Gastrobranchus coecus*, Hag-fish
 2. *Gastrobranchus Dombeyi*, Dombeyan Hag-fish

GENUS PETROMYZON.

- Fig. 3. *Petromyzon marinus*, Marine Lamprey
 4. *Petromyzon flaviventris*, River Lamprey
 5. *Ditto*, the young, shewing the under surface

PLATE

ENTOMOLOGY.

CLASS INSECTA.

ORDER COLEOPTERA.

GENUS SCARABÆUS.

133. Lettered ENTOMOLOGY, Order Coleoptera, Plate I.

- Fig. 1. *Scarabeus Hercules*
 2. *Scarabeus Chorineus*
 3. *Scarabeus Tityus*
 4. *Scarabeus molossus*
 5, 6. *Scarabeus carnifex*, male and female
 7. *Scarabeus sacer*

GENUS GOLIATHUS.

134. Lettered ENTOMOLOGY, Genus Goliathus, Plate I.

- Fig. 1. *Goliathus Cæcius*
 2. *Goliathus magnus*

GENUS LUCANUS.

135. Lettered ENTOMOLOGY, Order Coleoptera, Plate IV.

- Fig. 1. *Lucanus cervus*
 2. *Lucanus inermis*

GENUS DERMESTES.

- Fig. 3. *Dermestes viginti-guttatus*
 4. *Dermestes sex-dentatus*
 5. *Dermestes brachypterus*
 6. *Dermestes pedicularius*
 7. *Dermestes picipes*

GENUS BOSTRICHUS.

136. Lettered ENTOMOLOGY, Order Coleoptera, Plate V.

- Fig. 12. *Bostrichus pubescens*
 1. *Bostrichus polygraphus*
 2. *Bostrichus typographus*
 3. *Bostrichus piniperda*

GENUS MELYRIS.

137. Lettered ENTOMOLOGY, Order Coleoptera, Plate XII.

- Fig. 13. *Melyris viridis*

GENUS PTINUS.

PLATE

GENUS ANTHRENUS.

137. Fig. 2. *Anthrenus Scrophularie*

GENUS SILPHA.

- Fig. 6. *Silpha Germanica*
 7. *Silpha vespillo*
 8. *Silpha thoracica*
 9. *Silpha humator*
 10. *Silpha obscura*
 11. *Silpha quadrimaculata*
 12. *Silpha sinuata*

135. Lettered ENTOMOLOGY, Order Coleoptera, Plate IV.

- Fig. 8. *Silpha hæmorrhoidalis*
 9. *Silpha rufipes*
 10. *Silpha quadri-guttata*
 11. *Silpha marginalis*

GENUS OPATRUM.

138. Lettered ENTOMOLOGY, Order Coleoptera, Plate IX.

- Fig. 1. *Opatrum Jabulofum*

GENUS TRITOMA.

- Fig. 2. *Tritoma rufipes*
 3. *Tritoma pileosa*

GENUS TETRATOMA.

- Fig. 4. *Tetratoma cinnamomeum*
 5. *Tetramona fungorum*
 6. *Tetratoma ancora*

GENUS CASSIDA.

- Fig. 7. *Cassida grossa*
 8. *Cassida lateralis*
 9. *Cassida cruentata*
 10. *Cassida maculata*

GENUS COCCINELLA.

139. Lettered ENTOMOLOGY, Order Coleoptera, Plate XIII.

- Fig. 1. *Coccinella 16-guttata*
 2. *Coccinella oblongo-guttata*
 3. *Coccinella 12-pustulata*
 4. *Coccinella frontalis*
 5. *Coccinella 12-punctata*
 6. *Coccinella 22-punctata*
 7. *Coccinella septem-notata*
 8. *Coccinella 4-pustulata*
 9. *Coccinella punctata*
 10. *Coccinella analis*
 11. *Coccinella parvula*
 12. *Coccinella 6-pustulata*

GENUS CHRYSOMELA.

140. Lettered ENTOMOLOGY, Order Coleoptera, Genus Chrysomela, Plate XIII.

- Fig. 1. *Chrysomela gigantea*
 2. *Chrysomela furinamensis*
 3. *Chrysomela 20-punctata*
 4. *Chrysomela cyanicornis*

PLATE

- Fig. 5. *Chrysomela cyanipes*
 6. *Chrysomela limbata*
 7. *Chrysomela didymus*
 8. *Chrysomela boleti*
 9. *Chrysomela 14-guttata*
 10. *Chrysomela marginalis*
 11. *Chrysomela marginata*
 12. *Chrysomela marginella*
 13. *Chrysomela hannoveriana*

GENUS CRYPTOCEPHALUS.

141. Lettered ENTOMOLOGY, Order Coleoptera, Plate VIII.

- Fig. 1. *Cryptocephalus cordiger*
 2. *Cryptocephalus variabilis*
 3. *Cryptocephalus distinguendus*
 4. *Cryptocephalus lobatus*
 5. *Cryptocephalus obscurus*

GENUS CISTELA.

137. Lettered ENTOMOLOGY, Order Coleoptera, Plate XII.

- Fig. 3. *Cistela pallida*
 4. *Cistela leta*
 5. *Cistela lepturoides*

GENUS CRIOCERIS.

141. Lettered ENTOMOLOGY, Order Coleoptera, Plate VIII.

- Fig. 6. *Crioceris campestris*
 7. *Crioceris punctatus*

GENUS HISPA.

- Fig. 8. *Hispa mutica*

GENUS BRUCHUS.

- Fig. 9. *Bruchus bipunctatus*

GENUS PAUSUS.

- Fig. 10. *Pausus denticornis* (Donov. Ind. Inf.)
 11. *Pausus thoracicus* (Donov. Ind. Inf.)
 12. *Pausus Fichtelii* (Donov. Ind. Inf.)
 13. *Pausus pectinicornis* (Donov. Ind. Inf.)

GENUS CURCULIO.

142. Lettered ENTOMOLOGY, Order Coleoptera, Plate XI.

- Fig. 1. *Curculio bimaculatus*
 2. *Curculio palmarum*
 3. *Curculio elegans*
 4. *Curculio annulatus*
 5. *Curculio imperialis*
 6. *Curculio eremitus*
 7. *Curculio hemipterus*
 8. *Curculio brachypteros* (nigro spinosus)
 9. *Curculio assimilis*
 10. *Curculio rhinomacer*
 11. *Curculio regalis* (Donov. Ind. Inf.)
 12. *Curculio dilineatus*
 13. *Curculio viridis*
 14. *Curculio bachus*
 15. *Curculio betule*

PLATE

GENUS PRIONUS.

143. Lettered ENTOMOLOGY, Order Coleoptera, Plate II.

- Fig. 1. *Prionus longimanus*
2. *Prionus unidentatus*

GENUS CERAMBYX.

- Fig. 3. *Cerambyx imperialis*

GENUS LAMIA.

- Fig. 4. *Lamia quadrimaculata*

GENUS CLYTUS.

- Fig. 5. *Clytus thoracicus*

GENUS SAPERDA.

- Fig. 6. *Saperda collaris*
7. *Saperda nigro-virens*

GENUS RHAGIUM.

- Fig. 8. *Rhagium bifasciatum*

GENUS CICINDELA.

144. Lettered ENTOMOLOGY, Order Coleoptera, Plate X.

- Fig. 1. *Cicindela campestris*
2. *Cicindela sylvatica*
3. *Cicindela flexuosa*
4. *Cicindela sinuata*
5. *Cicindela capensis*
6. *Cicindela littoralis*
7. *Cicindela germanica*
8. *Cicindela riparia*
9. *Cicindela paludosa*
10. *Cicindela aquatica*
11. *Cicindela flavipes*

GENUS DYTISCUS.

145. Lettered ENTOMOLOGY, Order Coleoptera, Plate XII.

- Fig. 1. *Dytiscus piceus*
2. *Dytiscus latissimus*
3. *Dytiscus marginatus*
4. *Dytiscus cinereus*
5. *Dytiscus caraboides*
6. *Dytiscus sulcatus*
7. *Dytiscus minutus*
8. *Dytiscus bipustulatus*
9. *Dytiscus uliginosus*

GENUS CARABUS.

146. Lettered ENTOMOLOGY, Order Coleoptera, Plate XV.

- Fig. 1. *Carabus sexmaculatus*
2. *Carabus sycophanta*
3. *Carabus punctatus*
4. *Carabus auronitens*

PLATE

146. Fig. 5. *Carabus arcarius*

7. *Carabus iboracicus*
8. *Carabus bimaculatus*
9. *Carabus germanus*
10. *Carabus prafinus*
11. *Carabus crux minor*
12. *Carabus semipunctatus*

GENUS TENEBRIO.

147. Lettered ENTOMOLOGY, Order Coleoptera, Plate XI.

- Fig. 1. *Tenebrio gigas*
2. *Tenebrio femoratus*
3. *Tenebrio molitor*
4. *Tenebrio curvipes*
5. *Tenebrio culinaris*
6. *Tenebrio ferrugineus*

GENUS PIMELIA.

- Fig. 7. *Pimelia gages*
8. *Pimelia sepidium*
9. *Pimelia tragostia*

GENUS HELOPS.

- Fig. 10. *Helops lanipes*
11. *Helops fasciata*
12. *Helops fusca*

GENUS LYTTA.

148. Lettered ENTOMOLOGY, Order Coleoptera, Plate VI.

- Fig. 1. *Lytta vesicatoria*
2. *Lytta dubia*
15. *Lytta Schaefferi*

GENUS MELOE.

- Fig. 3. *Meloe proscarabeus*
4. *Meloe variegatus*

GENUS MORDELLA.

- Fig. 5. *Mordella bicolor*
6. *Mordella flava*
7. *Mordella dorsalis*
8. *Mordella frontalis*

GENUS MYLABRIS.

- Fig. 9—11. *Mylabris cichorei*, var.

GENUS STAPHYLINUS.

- Fig. 12. *Staphylinus hirtus*

GENUS FORFICULA.

- Fig. 13, 14. *Forficula gigantea*

149. Lettered ENTOMOLOGY, Coleoptera, Plate III.

Supplementary Plate of the Order Coleoptera*

* This Plate, which we have placed as an Appendix to the Coleoptera tribe, was engraved and published in the Cyclopædia before the Proprietors had determined to under-
Vol. XXXIX.

take the very ample elucidation of the subject, which they were afterwards induced to adopt. The selection of the subjects had been also left at the discretion of the artist ;

PLATE

ORDER HEMIPTERA.

150. Lettered ENTOMOLOGY, Order Hemiptera, Plate I.
Fig. 1. *Blatta orientalis*

GENUS MANTIS.

- Fig. 2. *Mantis bipinosa*
3. *Mantis precaria*
4. *Mantis gongyloides*
5. *Mantis strumaria*

GENUS GRYLLUS.

151. Lettered ENTOMOLOGY, Order Hemiptera, Plate II.

- Fig. 1. *Gryllus Dux*
2. *Gryllus nqfutus*
3. *Gryllus viridissimus minor*
4. *Gryllus subulata*
5. *Gryllus Gryllo-talpa*
6. Larva of *Gryllus*
7. Pupa of *Gryllus morbillosus*

GENUS FULGORA.

152. Lettered ENTOMOLOGY, Order Hemiptera, Plate III.

- Fig. 1. *Fulgora Lanternaria*, in a resting position
with expanded wings
2.
3. *Fulgora candelaria*
4. *Cicada Tibicini*, (*Tettigonia*, Fabr.)
5. *Cicada hematodes*
6. *Cicada stridula*
7. *Cicada phalenoides*
8. *Cicada sanguinolenta*
9. *Cicada taurus*
10. *Cicada spinosa*

PLATE

GENUS NOTONECTA.

152. Fig. 11. *Notonecta glauca*

GENUS NEPA.

153. Lettered ENTOMOLOGY, Order Hemiptera, Plate IV.
Fig. 1. *Nepa grandis*

GENUS CIMEX.

- Fig. 2. *Cimex lectularius*
3. *Cimex aurantius*

GENUS APHIS.

- Fig. 4. *Aphis persica*
5. *Aphis salicis*
6. *Aphis gallarum*

GENUS CHERMES.

- Fig. 7. *Chermes alni*
8. *Chermes luxii*

GENUS COCCUS.

- Fig. 9. *Coccus Fol. Quercus*
10. *Coccus persica*
11. *Coccus hesperidum*
12. *Coccus cataphraëus*

GENUS THIRIPS.

- Fig. 13. *Thrips physapus*
14. *Thrips juniperina*

and these, it must be allowed, were not chosen altogether with that due attention to accuracy which the intricacy of this branch of Natural History demanded. These insects were copied, we understand, from specimens in the very valuable cabinet of Mr. Francillon; but owing to the dispersion of that collection by public sale, the means of comparison has passed away, and the death of the artist then employed, as well as of the zealous proprietor of that collection, has opposed a period to enquire further. The far greater and more costly portion of the Francillonian Cabinet is indeed preserved, being incorporated in the princely cabinet of Alexander McLeay, Esq., a cabinet to which true science is never refused an easy access; but the insects in question having been removed from their respective situations, in Mr. Francillon's drawers, they can be no longer recognized as the specimens from which the figures in this plate are taken; and this, in some few instances at least, it must be confessed, is requisite to enable us to speak of them with certainty. We may observe, moreover, that very few names accompany the articles represented in this Plate of Mr. Edwards; and of those few some are certainly faulty. *Hispa* is doubtful (a true *Hispa* has been since given in Plate 141. fig. 8.). *Bruchus* is erroneous, and appears to

be, with the exception of the antennæ, *Attelabus Coryli*; (a true *Bruchus* is inserted by us in Plate 141. fig. 9.); and his insect named *Attelabus*, has much the appearance of *Mylabris*, except in having pectinated instead of moniliform antennæ: nevertheless this may be a *Clerus*, and allied to *Antiarus*. (See Plate 148. fig. 9.) *Lampyrus* is indifferent; *Cantharis* unintelligible. With these, and some few other exceptions, the Plate should be preserved, as it contains other insects of interest, the repetition of whose figures has been purposely avoided in selecting the materials for the rest of the Plates of Coleoptera.

We believe *Curculio*, No. 1. to be *Curculio bipinosus*; No. 3. to be *Curculio Imperialis*, the Brazilian or Diamond Beetle; No. 4. *Curculio vittata*, of Jamaica; *Cerambyx*, No. 3., *C. Moschatatus*; No. 4. *Cerambyx marginatus*; *Necydalis*, No. 2., *N. cærulea*; *Lampyrus*, fig. 1., *L. vulgaris*, male (having wings); No. 2. the female (being apterous, or without wings); *Elatér*, No. 1., *E. ocellatus*, West Indies; No. 2. is uncertain; but is, no doubt, an *Elatér*, placed on its back, to shew the situation of the pointed sternum in that genus, by striking which upon the breast, the insect is enabled to spring up with instantaneous velocity when laid down in that position.

ORDER LEPIDOPTERA.

GENUS PAPILIO.

154. Lettered ENTOMOLOGY, Order Lepidoptera, Plate I.

- Fig. 1. *Papilio Hebeor*, *Eq. Troës* 1. Upper figure on the left hand
 2. *Papilio Echius*, *Eq. Troës* 2. Right-hand side, middle figure
 3. *Papilio Deiochus*, *Eq. Achiv.* 2. Left-hand side, middle figure
 4. *Papilio Agamemnon*, *Eq. Achiv.* 2. Lowest figure on the left hand
 5. *Papilio Machaon*, *Eq. Achiv.* 3. Lowest figure on the right hand
 6. *Papilio Medon*, *Eq. Achiv.* 4. Upper figure on the right hand
 7. *Papilio Mecystes*, *Eq. Achiv.* 5. Butterfly with erect wings, in the middle of the Plate

GENUS SPHINX.

155. Lettered ENTOMOLOGY, Order Lepidoptera, Plate VII.

- Fig. 1. *Sphinx rustica*. The largest figure in the lower part of the Plate
 2. *Sphinx vitis*. The largest figure in the upper part of the Plate
 3. *Sphinx Eilo*. Shewing the natural erect position of the wings in this family of Sphinges, when they are at rest. Placed on the left hand, towards the middle of the Plate
 4. *Sphinx fuciformis*, (*Sesia*, Fabricius). Upper figure on the left hand
 5. *Sphinx chrysoforboas*, (*Sesia*, Fabricius). Lowest figure in the Plate on the left side
 6. *Sphinx tipuliformis*, (*Sesia*, Fabricius). Smallest figure in the Plate, and placed in the centre, in a flying position
 7. *Sphinx Polymena*, (*Zygena* of Fabricius, *Donov.* Inf. China). Right hand, towards the middle of the Plate
 8. *Sphinx fausta*, (*Zygena fausta*, Fabricius). Bottom figure of the Plate on the right hand

GENUS PHALÆNA.

156. Lettered ENTOMOLOGY, Order Lepidoptera, Plate I. *Phalæna*

- Fig. 1. *Phalæna Atlas* (*Bombyx fam.*), with wings expanded

157. Lettered ENTOMOLOGY, Order Lepidoptera, Plate II.

- Fig. 1. *Phalæna Saturnus* (*Bombyx*)

156. Lettered ENTOMOLOGY, Order Lepidoptera, Plate I.

- Fig. 2. *Phalæna Laocoon* (*Bombyx*)
 3. *Phalæna Luna* (*Bombyx*)
 4. *Phalæna Pavonia* (*Bombyx*)
 5. *Phalæna Tau* (*Bombyx*)

157. Lettered ENTOMOLOGY, Order Lepidoptera, Plate II.

- Fig. 2. *Phalæna Quercifolia* (*Bombyx*), with wings reversed
 3. *Phalæna potatoria* (*Bombyx*)
 4. *Phalæna verficolora* (*Bombyx*)
 5. *Phalæna vinula* (*Bombyx*)
 6. *Phalæna Hebe* (*Bombyx*), with wings deflected

ORDER NEUROPTERA.

GENUS LIBELLULA.

158. Lettered ENTOMOLOGY, Order Neuroptera, Plate I.

- Fig. 1. *Libellula indica*
 2. *Libellula grandis*, (*Æthna* genus, Fabr.)
 3. *Libellula clavata*, (*Æthna*, Fabr.)
 4. *Libellula linearis*, (*Agrion* genus, Fabr.)
 5. *Libellula virgo*, (*Agrion*, Fabr.)
 6. *Libellula puella*, (*Agrion*, Fabr.)

GENUS EPHEMERA.

- Fig. 7. *Ephemera vulgata*

GENUS PHRYGANEÆ.

- Fig. 8. *Phryganeæ varia*

GENUS HEMEROBIUS.

159. Lettered ENTOMOLOGY, Order Neuroptera, Plate II.

GENUS MUTILLA.

- Fig. 11. *Mutilla Americana*, (female)
 12. *Mutilla bengalensis*
 13. *Mutilla rubra*

PLATE

ORDER DIPTERA.

GENUS OESTRUS.

163. Lettered ENTOMOLOGY, Order Diptera, Plate II.
 Fig. 1, 2. *Oestrus equi*
 3. *Oestrus bovis*
 4. *Oestrus ovis*

GENUS TIPULA.

- Fig. 5. *Tipula rivosa*
 6. *Tipula boritorum*
 7. *Tipula variegata*
 8. *Tipula crocata*
 9. *Tipula punctata*
 10. *Tipula atrata*
 11. *Tipula plumosa*
 12. *Tipula peñiniicornis*

GENUS DIOPSIS.

- Fig. 13. *Diopsis ichneumonea*

GENUS MUSCA.

164. Lettered ENTOMOLOGY, Order Diptera, Plate IV.
 Fig. 1. *Musca grossa*, hair of the antennæ naked
 2. *Musca hottenotta*
 3. *Musca bifasciata*
 4. *Musca cupraria*
 5. *Musca vibrans*
 6. *Musca scybalaria*
 7. *Musca solitatis*
 8. *Musca onopordinis*
 9. *Musca stellata*
 10. *Musca fasciata*
 11. *Musca Chamæleon*, (*Stratiomys Chamæleon*, Fabr.)
 12. *Musca morio*
 13. *Musca clavicornis*, (*Ceria clavicornis*, Fabr.)
 14. *Musca scolopacea*, (*Rhagio scolopacea*, Fabr.)
 15. *Musca triangularia*
 16. *Musca analis*, (*Bibio analis*, Fabr.)
 17. *Musca tenax*, (*Syrphus tenax*, Fabr.)
 18. *Musca pendula*, (*Syrphus*, Fabr.)
 19. *Musca florea*, (*Syrphus*, Fabr.)
 20. *Musca lurida*
 21. *Musca vespsiformis*
 22. *Musca noctiluca*
 23. *Musca bilineata*
 24. *Musca uliginosa*, (*Nemotelus uliginosus*, Fabr.)

GENUS TABANUS.

165. Lettered ENTOMOLOGY, Diptera, Plate IV.
 Fig. 1. *Tabanus bovinus*
 2. *Tabanus tropicus*
 3. *Tabanus bromius*
 4. *Tabanus pluvialis*
 5. *Tabanus ruficrus*
 6. *Tabanus cæcutiens*

GENUS CULEX.

- Fig. 7. 7.* *Culex pipiens*, natural size and magnified

GENUS EMPIS.

165. Fig. 8. *Empis forcipata*
9. *Empis borealis*

GENUS STOMOXYS.

- Fig. 10. *Stomoxys rostrata*
11. *Stomoxys irritans*
12. *Stomoxys calcitrans*
13. *Stomoxys pungens*

GENUS CONOPS.

166. Lettered ENTOMOLOGY, Order Diptera, Plate I.

- Fig. 1. *Conops ferruginus*
2. *Conops aculeata*
3. *Conops petiolata*

GENUS ASILUS.

- Fig. 4. *Asilus teutonius*
5. *Asilus gibbosus*
6. *Asilus crabroniformis*

GENUS BOMBYLIUS.

- Fig. 7. *Bombylius major*
8. *Bombylius medius*

GENUS HIPPOBOSCA.

- Fig. 9. *Hippobosca equina*
10. *Hippobosca ovina*
11. *Hippobosca avicularia*
12. *Hippobosca hirundinis*

APTERA.

GENUS TERMES.

167. Lettered Plate V. Aptera

- Termes bellicosus*, Great African White Ant
Fig. 1. Labourers
2. Soldiers
3. King
4. Males, which are furnished with wings
5. 5. Pregnant Females, or Queens
(All the above are represented of their natural size)
6. *Termes bellicosus*, their Nests in the distance

GENUS LEPISMA.

- Fig. 7. *Lepisma Polypoda*
8. *Lepisma punctata*
9. *Lepisma obscura*
10. *Lepisma lineatus*

GENUS PODURA.

- Fig. 11. *Podura Villosa*, Upper and Under Surface

ORDER APTERA.

GENUS PEDICULUS.

168. Lettered ENTOMOLOGY, Order Aptera, Plate IV.

- Fig. 1. *Pediculus humanus*, Human Loufe
2. *Pediculus Aflini*, Afs's Loufe

168. Fig. 3. *Pediculus cygni*, Swan's Loufe
4. *Pediculus corvi*, Crow's Loufe
5. *Pediculus pica*, Magpie's Loufe
6. *Pediculus gruis*, Crane's Loufe
7. *Pediculus Columbe*, Pigeon's Loufe
8. *Pediculus pluvialis*, Plover's Loufe
9. *Pediculus apis*, Bee's Loufe

GENUS PULEX.

- Fig. 10. 10.* *Pulex irritans*, Common Flea, natural size, and magnified

GENUS ACARUS.

- Fig. 11. *Acarus redwivius*, Tick

GENUS TROMBIDIUM.

- Fig. 12. *Trombidium aquaticum*
13. *Trombidium abstergens*

GENUS HYDRACHNA.

- Fig. 14. *Hydrachna geographica*
15. *Hydrachna abstergens*

GENUS NYMPHION.

169. Lettered ENTOMOLOGY, Order Aptera, Plate I.

- Fig. 1. *Phalangium Groffipes*, Linn. (*Nymphion*, Fabr.)

GENUS PYCNOGONUM.

- Fig. 2. *Phalangium balenarum*, Linn. (*Pycnogonum*, Fabr.)
Fig. 3. *Phalangium hirsutum*, Linn. (*Pycnogonum*, Fabr.)

GENUS PHALANGIUM.

- Fig. 4. 4. *Phalangium Cancroides*, (*Tarantula*, Linn. Trans.?) natural size, and magnified
5. *Phalangium cornutum*, (*Scorpio cimicoides*, Fabr.)

GENUS TARANTULA.

- Fig. 6. 6. *Tarantula reniforme*, male and female
7. *Tarantula caudata*

GENUS ARANEA.

170. Lettered ENTOMOLOGY, Order Aptera, Plate II.

- Fig. 1. *Aranea extensa*
2. *Aranea globosa*
3. *Aranea bimaculata*
5. *Aranea fasciata*
6. *Aranea angulata*
7. *Aranea Tarantula*
8. *Aranea avicularia*
9. *Aranea maculata*

The Position of the Eyes in different Tribes of Spiders.

- No. 1. in *Aranea extensa*. No. 2. *Aranea globosa*. No. 3. *Aranea horrida*. No. 4. *Aranea argentata*. No. 5. *Aranea fasciata*. No. 6. *Aranea angulata*. No. 7. *Aranea Tarantula*. No. 8. *Aranea avicularia*. No. 9. *Aranea maculata*

NATURAL HISTORY.

PLATE

GENUS SCORPIO.

171. Lettered ENTOMOLOGY, Order Aptera, Plate III.
 Fig. 1, 2. *Scorpio afer*, Great Scorpion. Upper Surface, No. 1. Under Surface, No. 2.
 3. *Scorpio linearis*, Linear Scorpion. Upper Surface
 4. *Scorpio linearis*, Linear Scorpion. Under Surface
 5. *Scorpio europeus*, European Scorpion

CRUSTACEA.

GENUS CANCER.

172. Lettered CRUSTACEA, Order Cancer, Plate I.
 Fig. 1. *Cancer curicola*
 2. *Cancer fascicularis*
 3. *Cancer Facchino (Dorippe Facchino)*
 4. *Cancer Dormio (Dormio artificiosa)*
173. Lettered CRUSTACEA, Order Cancer, Plate II.
 Fig. 5. *Cancer meneslho (Portunus meneslho)*
 6. *Cancer forceps (Portunus forceps)*
 7. *Cancer mammillaris (Orithyia mammillaris)*
 8. *Cancer lunaris (Matuta lunaris)*
174. Lettered CRUSTACEA, Genus Cancer, Plate III, IV., V.
 Fig. 1. *Cancer depressus*
 2. *Cancer perlatus*
 3. *Cancer perforatus*

GENUS PAGURUS.

175. Lettered CRUSTACEA, Genus Cancer, Plate VII. Entomology
 Fig. 3. *Cancer strigatus (Pagurus strigatus)*
 5. *Cancer dubius (Pagurus dubius)*
176. Lettered CRUSTACEA, Order Cancer, Plate VI.
 Fig. 1. *Cancer arrofor (Pagurus arrofor)*
 2. *Cancer canaliculatus (Pagurus canaliculatus)*
 3. *Cancer excavatus (Pagurus excavatus)*

GENUS ASTACUS.

- Fig. 4. *Cancer variegatus (Astacus variegatus)*
175. Lettered CRUSTACEA, Genus Cancer, Plate VII, Entomology
 Fig. 7. *Cancer fluviatilis (Astacus fluviatilis)*
 4. *Cancer narval (Astacus narval)*

GENUS SQUILLA.

- Fig. 2. *Cancer digitalis (Squilla digitalis)*
176. Lettered CRUSTACEA, Order Cancer, Plate VI.
 Fig. 4. *Cancer ampulla (Gammarus ampulla)*
 6. *Cancer linearis (Gammarus linearis)*
 5. *Cancer mantis (Gammarus mantis)*
 6. *Cancer spinosus (Gammarus spinosus)*
 7. *Cancer paludofus (Gammarus paludofus)*, natural size, and magnified

PLATE

176. Fig. 8. *Cancer linearis (Gammarus linearis)*
 9. *Cancer pulex (Gammarus pulex)*

GENUS SCYLLARUS.

175. Lettered CRUSTACEA, Genus Cancer, Plate VII. Entomology
 Fig. 7. *Cancer Aräus (Scyllarus Aräus)*

GENUS MONOCULUS.

177. Lettered ENTOMOLOGY, Order Aptera, Plate X.
 Fig. 1. *Monoculus quadricornis*
 2, 2. *Monoculus polyphemus*, Upper Surface and Under Surface

GENUS ONISCUS.

- Fig. 3, 3. *Oniscus pfora*, Upper Surface and Under Surface
 4. *Oniscus crassipes*
 5. *Oniscus Oecltrum*
 6. *Oniscus Oceanicus*
 7. *Oniscus aquaticus*
 8. *Oniscus armadillo*

GENUS SCOLOPENDRA.

- Fig. 9. *Scolopendra morfitans*

GENUS JULUS.

- Fig. 10. *Julus terrestris*

CLASS VI. VERMES.

ORDER INTESTINA.

GENUS ASCARIS.

178. Lettered VERMES, Order Intestina, Plate I., II., III.
 Fig. 1. *Ascaris vermicularis*

GENUS ECHINORYNCHUS.

- Fig. 2. *Echinorynchus lucii*
 Head magnified *
 2. *Echinorynchus candidus*
 Head magnified *
 3. *Echinorynchus coryphæna*
 4. *Echinorynchus lineolatus*
 Head magnified *
 5. *Echinorynchus attenuatus*, natural size, and magnified
 6. *Echinorynchus attenuatus*, natural size, adhering to the skin of a fish
 7. *Echinorynchus alba*
 8. *Echinorynchus brunnea*

GENUS LINGULATA.

9. *Lingulata abrupta*, Upper and Under Surface

GENUS FASCIOLA.

- Fig. 2. *Fasciola binodis*, the minute Figures which accompany the larger ones denote the natural Size
 3. *Fasciola Æglefni*, Ditto

NATURAL HISTORY.

PLATE

178. Fig. 4. *Fasciola Scorpii*, the minute Figures which accompany the larger ones denote the natural Size
 5. *Fasciola lucioperca*, Ditto
 6. *Fasciola brama*, Ditto

GENUS TÆNIA.

179. Lettered VERMES, Order Intestina, Plate V.

- Fig. 1. *Tenia folium*, grouped into folds in order to include the whole animal, which is of extreme length, within the limits of the Plate. Found in the human body
 2. The head, natural size, of a specimen twenty feet in length
 3. Head magnified
 7. Two joints retaining the external skin, and shewing the alternate disposition of the oscula along the edges of the joints as they usually appear
 8. Two joints shewing their lateral disposition when they occur on both the margins of each joint, which sometimes happens
 4. A portion of the joints of the natural size divested of the outer skin, and disclosing more fully the alternate lateral oscula, together with the alimentary canals, as they communicate from one joint to the other
 5. The middle system of vessels illustrated in another portion of four joints
 6. Another portion deprived of the outer coating, and displaying all the canals in their relative situation. Vide *Carlisle in Linn. Transf. v. 2.*
Tenia lata. *Carlisle in Linn. Transf. 2.*—
Tenia osculis laterilibus solitariis, *Linn. Amoen. Acad. 2.?*
 10. A portion of several joints exhibiting the oscula, which are disposed in a single series down the center of the joints
 11. Another portion divested of the outer coating, and shewing the stelliform vessels down the center within, and also the lateral alimentary canals. Found in the intestines of mankind
 9. *Tenia canina*, head, and a portion of the body, consisting of the five first joints. Found in the dog.

GENUS GORDIUS.

180. Lettered VERMES, Genus Gordius, Plate IV.

- Fig. 1. *Gordius aquaticus*

GENUS LUMBRICUS.

- Fig. 2, 3. *Lumbricus terrestris*

GENUS HIRUDO.

- Fig. 4. *Hirudo muricata*

5. *Hirudo geometra*. The smaller figures at No. 1. denote the eggs and natural size of the animal: No. 4. magnified shews the animal affixed by the broad pedal-like tail with the body extended horizontally: No. 3. the same contracting into an arched

PLATE

180. Fig. 5. form: No 2. when most contracted, arched, and elevated, preparatory to walking, which it does somewhat in the manner of the larvæ of the Geometra tribe of moths, or as usually described as if measuring the ground like a pair of compasses.

GENUS PLANARIA.

- Fig. 6. *Planaria crenata*. No. 1, 2, 3, 4, 5, shews various positions and contractions of this animal

GENUS SIPHUNCULUS.

- Fig. 7. *Siphunculus nudus*

ORDER MOLLUSCA

GENUS LIMAX.

- Fig. 8. *Limax ater*
 9. *Limax maximus*

GENUS ONCHIDIUM.

181. Lettered VERMES, Order Mollusca, Plate VII.

- Fig. 1, 1. *Onchidium typhae*

GENUS LAPLISIA.

- Fig. 2. *Laplisia depilans*

GENUS DORIS.

- Fig. 3. *Doris argo*
 4. *Doris radiata*
 5. *Doris papillofa*

GENUS APHRODITA.

- Fig. 6. *Aphrodita aculeata*. No. 6. † small, upper surface, right-hand figure
 No. 6. † ditto, under surface, left-hand figure
 No. 6. large size
 7. *Aphrodita squamata*

GENUS NAIS.

182. Lettered VERMES, Genus Nais, Plate V.

- Fig. 1, 2, 3, 4. *Nais serpentina*, highly magnified, the natural size being three quarters of an inch in length, or not exceeding that of the cluster thrown on the duckweed, fig. 5.
 5, 6, 7, 8, 9, 10, 11. *Nais vermicularis*, highly magnified, natural size one-tenth of an inch
 12, 13. *Nais proboscidea*, highly magnified, natural size three-fourths of an inch

GENUS ACTINIA.

183. Lettered VERMES, Genus Actinia, Plate II.

- Fig. 1. *Actinia dianthus*
 2. *Actinia cercus*

GENUS HOLOTHURIA.

184. Lettered ZOOLOGY, Class Vermes, Plate I. of Mollusca

- Fig. 1. *Holothuria elegans*
 2. *Holothuria pentactes*

NATURAL HISTORY.

PLATE

184. Fig. 3, 4. *Holothuria fufus*
 5. *Holothuria pennis*
 6, 7, 8. *Holothuria squamata*. No. 1. upper surface : No. 2. lower surface, in a quiet state : No. 3. with the tentacula expanded
 9, 10. *Holothuria inharens*, No. 1. with tentacula expanded : No. 2. tentacula retracted

GENUS SEPIA.

185. Lettered VERMES, Order Mollufca, Plate VI.
 Fig. 1. *Sepia oëopus*
 2, 3. *Sepia media*. No. 1. upper surface : No. 2. under surface

GENUS MEDUSA.

186. Lettered VERMES, Order Mollufca, Plate IV.
 Fig. 1, 2. *Medufa pulmo*, No. 1. † upper surface, No. 1. under surface
 3. *Medufa campanula*

GENUS ASTERIAS.

187. Lettered VERMEOLGY, Vermes, Mollufca, Plate III. of Asterias.
 Fig. 1. *Asterias Caput medusæ*
 2. *Asterias peginata*
 3. *Asterias spherulata*
 4. *Asterias ophiura*, *a* upper surface, *b* under surface

ORDER TESTACEA.

GENUS CHITON.

188. Lettered CONCHOLOGY, Genus Chiton, Plate IX.
 Fig. 1, 2. *Chiton arundo*
Chiton aculeatus, No. 1. upper surface, No. 2. infide
 3. *Chiton squamosus*
 4. *Chiton olivaceus*, No. 1. outside, No. 2. infide, small

GENUS LEPAS.

189. Lettered CONCHOLOGY, Genus Lepas, Plate XIII.
 Fig. 1. *Lepas anatifera*
 2. *Lepas anserifera*

GENUS PHOLAS.

190. Lettered CONCHOLOGY, Genus Pholas, Plate VIII.
 Fig. 1, 2, 3. *Pholas daëtylus*, No. 1. fide view ; No. 2. the two lateral valves united at the hinge ; No. 3. infide of one of the lateral valves
 4. *Pholas costata*
 5, 6, 7. *Pholas Ariata*, No. 1., the lowest figure, exhibits a fide view of this shell, as composed of several valves ; No. 2., the uppermost figure, shews the testaceous valves at the top or hinge fide of the shell ; No. 3. the manner in which this species of Pholas buries itself into ships' bottoms or other timber

PLATE

GENUS MYA.

193. Lettered CONCHOLOGY, Genus Mya, Plate XI. B.
 Fig. 1. *Mya truncata*

GENUS SOLEN.

191. Lettered CONCHOLOGY, Genus Solen, Plate (no number)
 Fig. 1. *Solen grandis*, the lowest figure in the plate
 2, 3. *Solen radiatus*, No. 1. outside, No. 2. infide, smaller shell
 4. *Solen ßrigilatus*
 5. *Solen vagina*, No. 1. outside, No. 2. of a younger shell, shewing the teeth of the hinge
 6. *Solen enfis*

GENUS TELLINA.

192. Lettered CONCHOLOGY, Genus Tellina, Plate V.
 Fig. 1, 1. *Tellina radiata*, No. 1. outside, No. 2. infide (*Donov. Brit. Shells*)
 2, 2. *Tellina squalida*, No. 1. outside, No. 2. infide (*Donov. Brit. Shells*)
 3, 3. *Tellina fabula*, one valve of this Shell is marked externally with very fine oblique subflexuous striæ, the other smooth or deltitute of striæ (*Donov. Brit. Shells*)
 4. *Tellina bimaculata*, infide and outside (*Donov. Brit. Shells*)

GENUS CARDIUM.

- Fig. 5. *Cardium aculeatum*
 6. *Cardium levigatum*
 7. *Cardium edule*
 8. *Cardium medium*

GENUS MACTRA.

193. Lettered CONCHOLOGY, Genus Mya, &c. Plate XI. B.
 Fig. 2. *Maëtra radiata*

GENUS DONAX.

- Fig. 3. *Donax trunculus*

GENUS VENUS.

- Fig. 4. *Venus iflandica*, No. 1. outside, No. 2. infide

GENUS CHAMA.

- Fig. 5. *Chama Cor*

GENUS SPONDYLUS.

194. Lettered CONCHOLOGY, Genus Spondylus, Plate XVII.
 Fig. 1, 2, 3. *Spondylus gadaropus*. Upper figure on the left hand the usual fize ; upper figure on the right fide shews the infide of both valves ; the lower figure a superb specimen, in point of magnitude, and perfection of the elongated fpires. *Cabinet of Alexander M. Leay, Eq.*

PLATE

GENUS ARCA.

195. Lettered CONCHOLOGY, Genus Arca, Plate VIII.
 Fig. 1, 2. *Arca tortuosa*, No. 1. outside, lower figure. No. 2. inside
 3, 4. *Arca senilis*, No. 1. the outside, lower figure, No. 2. inside, the upper figure
 5, 6. *Arca nodulosa*, No. 1. outside, lower figure, No. 2. inside
 7. *Arca nebulosa*

GENUS OSTREA.
Pecten, or *Scallops*.

196. Lettered CONCHOLOGY, Genus Ostrea, Plate XII.
 Fig. 1. *Ostrea Jacobæ*
 2. *Ostrea subrufa*
 3. *Ostrea nodosa*
 4. *Ostrea lineata*
 5. *Ostrea obscura*
 6. *Ostrea varia*, various sizes
 7. *Ostrea obsoleta*, nat. size (*Donov. Brit. Shells*)

GENUS MYTILUS.

193. Lettered CONCHOLOGY, Genus Mya, &c. Plate XI. B.
 Fig. 6, 6. *Mytilus edulis*, var. *purpureus*, (*Donov. Brit. Shells*,) inside and outside

GENUS PINNA.

197. Lettered CONCHOLOGY, Genus Pinna, Plate VII.
 Fig. 1. *Pinna nigra*, inside and outside, small size
 2. *Pinna muricata*, shewing the byffus or beard
 3. *Pinna rubra*, ditto
 4. *Pinna fragilis*

UNIVALVES.

GENUS ARGONAUTA.

198. Lettered CONCHOLOGY, Order Univalve, Plate IV.
 Fig. 1. *Argonauta argo*, Paperfaior Shell
 2. *Argonauta vitreus*, called the Glassy Nautilus, a shell of unusual rarity

GENUS NAUTILUS.

- Fig. 3. *Nautilus Pompilius*, Great Nautilus.
 4. No. 1. the largest of the ordinary size ; No. 2. young ; No. 3. section of the young shell, shewing the chambers and the siphunculus

GENUS CONUS.

199. Lettered CONCHOLOGY, Genus Bulla, &c. Plate XI. A.
 Fig. 1. *Conus Ammiralis*, var. *Banded Cedo nulli cone*
 2. *Conus Ammiralis*, var. *Curaçao Cedo nulli cone*
 3. *Conus Ammiralis*, var. *Southern Cedo nulli cone*
 4. *Conus Ammiralis*, var. *Seba's Cedo nulli cone*
 5. *Conus Ammiralis*, var. *Marbled Cedo nulli cone*
 * All these varieties are esteemed valuable : some few bear an excessive price ; that known by the name of Lyonet's Shell was reputed to be worth one hundred pounds sterling, or as it has been otherwise stated a much higher sum. The

PLATE

figure in the upper part of the plate represents the most uncommon kind of Cedo Nulli

GENUS CYPRÆA.

200. Lettered CONCHOLOGY, Genus Cypræa, Plate XIV.
 Fig. 1, 1. *Cypræa tigris*, upper and under surface
 2. *Cypræa aurora*, Aurora or Orange Cowry of the South Seas
 3. *Cypræa argus*
 4. *Cypræa Arabica*
 5. *Cypræa annulata*, upper and under surface
 6. *Cypræa fasciata*
 7. *Cypræa maculata*
 8. *Cypræa vespa*
 9, 9. *Cypræa monetæ*, upper and under surface
 10, 10. *Cypræa pediculus*

GENUS BULLA.

199. Lettered CONCHOLOGY, Genus Bulla, &c. Plate XI. A.
 Fig. 6, 6. *Bulla lignaria*, No. 1. the outside. No. 2., the lower figure, shews the mouth

GENUS VOLUTA.

201. Lettered CONCHOLOGY, Genus Voluta, Plate I.
 Fig. 1. *Voluta tornatilis*
 2. *Voluta porphyria*
 3. *Voluta olivæ*
 4. *Voluta pallida*
 5, 5. *Voluta papalis*, No. 1. the back, No. 2. shews the mouth
 6. *Voluta episcopalis*
 7. *Voluta Æthiopica*
 8. *Voluta indica*

GENUS BUCCINUM.

202. Lettered CONCHOLOGY, Order Voluta, &c. Plate II.
 Fig. 1. *Buccinum harpa*
 2. *Buccinum patulum*
 3. *Buccinum maculatum*
 4. *Buccinum strigillatum*

GENUS STROMBUS.

- Fig. 5. *Strombus chiagra*
 6. *Strombus pugilis*
 7. *Strombus lentiginosus*,
 8. *Strombus urceus*

GENUS MUREX.

203. Lettered CONCHOLOGY, Order Univalve, Plate III.
 Fig. 1. *Murex hayfellum*
 2. *Murex longicauda*
 3. *Murex muricatus*
 4. *Murex tulipa*

GENUS TROCHUS.

- Fig. 5. *Trochus niloticus*
 6, 6. *Trochus perspectivus*. No. 1., right-hand figure, shews the convex surface ; No. 2. left-hand, the concave surface or under side
 7. *Trochus pictus*
 8. *Trochus turritus*

NATURAL HISTORY.

PLATE

GENUS TURBO.

199. Lettered CONCHOLOGY, Genus Bulla, &c. Plate XI. A.

- Fig. 7, 7. *Turbo trilineatus*, (Donov. Brit. Shells) smallest figure shews the natural size
8, 8. *Turbo fusiformis*, (Donov. Brit. Shells) ditto

GENUS HELIX.

Fig. 9, 9. *Helix hortensis*

GENUS NERITA.

Fig. 10, 10, 10. *Nerita carena*, the figure on the left hand exhibits the carinated umbilicus

GENUS HALIOTIS.

204. Lettered CONCHOLOGY, Genus Haliotis, Plate VI.

- Fig. 1, 1. *Haliotis Afinum*. The lower figure shews the outside or upper surface of the shell, as the animal moves; the upper figure exhibits the hollow of the shell, when deprived of the animal
2. *Haliotis tuberculata*
3, 4. *Haliotis spadicæ*, outside and inside
5. *Haliotis levigata*

GENUS PATELLA.

* Shell valved within.

205. Lettered CONCHOLOGY, Genus Patella, Plate (blank)

- Fig. 1, 1. *Patella equestris*. The upper figure shews the outside of the shell, which is rugose; the lower one the inside, which is smooth, and furnished with an internal lip or valve in the hollow center
2, 2. *Patella fornicata*. The figure on the left hand exhibits the outside; that on the right hand the inside, with the broad inner lip or valve
3, 3. *Patella striata*. No. 1., the lower figure, shews the striated outer surface; No. 2., the upper figure, the concave hollow beneath, with the inner lip or valve

* * Shell at the Apex perforated.

- 4, 4. *Patella fissura*
5. *Patella fissurella*
6. *Patella græca*
7. *Patella radiata*
8. *Patella lobata*
9. *Patella nimbosa*. The upper figure shews the outside surface; the lower one the hollow cavity, or inside

*** Apex of the Shell entire.

206. Lettered CONCHOLOGY, Genus Patella, Plate XVI.

- Fig. 1. *Patella granatina*. The upper figure shews the outside; the lower one the concave, or inside

PLATE

206. Fig. 2, 2, *Patella Auricula*, two varieties. The figure in the middle of the left-hand margin shews the outer surface; the others the concavity

3. *Patella vulgata*, var.
4. *Patella frigata*
5. *Patella sagittata*
6. *Patella virgata*
7. *Patella anatina*

GENUS DENTALIUM.

207. Lettered CONCHOLOGY, Genus Dentalium, Plate (blank)

Fig. 1. *Dentalium elephantium*

GENUS SERPULA.

- Fig. 2. *Serpula triquetra*, various examples adhering to a Pecten, (*Ostrea*)
3. *Serpula triquetra*, ditto, adhering to the valve of a *Mytilus*
3. *Serpula vermicularis*, intermixed with *S. triquetra*
4. *Serpula vermicularis*, detached
5. *Serpula filiformis*
6. *Serpula reticulata*
7. *Serpula papillofa*
8. *Serpula tortuosa*
9. *Serpula anguina*
10. *Serpula penis*

GENUS TEREDO.

208. Lettered CONCHOLOGY, Genus Tereido, Plate X.

- Fig. 1. *Teredo navalis*, exhibiting the manner in which the timbers of ships' bottoms are sometimes perforated by this destructive creature
2. *Teredo navalis*, a single shell detached from the timber, is shewn at the bottom of the Plate

GENUS SABELLA.

- Fig. 3. *Sabella belgica*
4. *Sabella alveolata*

ELEMENTARY PLATES OF CONCHOLOGY.

UNIVALVES.

209. Lettered CONCHOLOGY, Elementary Plate I.

- Fig. 1, 1, 1. The part denominated the Base of an univalve shell, illustrated by examples selected from different Genera, as in *Dentalium*, *Turbo*
2, 2, 2. the Apex, as in *Dentalium* and *Patella*
3, 3. the Front, as in *Turbo*, *Buccinum*
4, 4. the Back, as in *Turbo*, *Helix*
5, 5. the Sides, as in *Turbo*, *Buccinum*
6, 6, 6. the Body, as in *Helix*, *Murex*
7. the Belly, as in *Nerita*
8. the Whorl, as in *Turbo*
9, 9, 9. the Spire, as in *Turbo*, *Murex*
10, 10. the Sutures of the Spire or Whorl, as in *Murex*, *Turbo*

PLATE

210. Lettered CONCHOLOGY, Elementary Plate II.

- Fig. 11. The part denominated the Pillar or Columella, as in *Murex*
 12, 12, 12. the Aperture, as in *Murex*, *Helix*, *Nerita*
 13, 13, 13. the Lip, as in *Voluta*
 14. the Beak, as in *Murex*
 15. the Canal, as in *Murex*
 16, 16. the Umbilicus, as in *Trochus*, *Nerita*

211. Lettered CONCHOLOGY, Elementary Plate III.

- Fig. 17, 17. The part denominated the Operculum, as in *Trochus*, *Murex*
 18. the Involute Spire, as in *Nautilus*
 19, 19, 19. the Chambers, as in *Nautilus*, the Chambered Patella, and the Ammonite, (found fossil)
 20. the Siphunculus, as in *Nautilus*
 21. the Epidermis, as in *Turbo*

BIVALVES.

- Fig. 22. The part denominated the Bafe of a Bivalve Shell, as in *Venus*
 23. the Summit, as in *Patella*
 24, 24. the Beak, as in *Chama*, (Cor.) *Mytilus*
 25. the Sides, as in *Venus*

212. Lettered CONCHOLOGY, Elementary Plate IV.

- Fig. 26. The part denominated the Margin, or Limb, as in *Tellina*, (cornea)
 27, 27. the Dilk, as in *Venus*, *Tellina*
 29, 29. the Posterior Slope, as in *Macra*, *Tellina*, *Venus*
 30. the Lunule, as in *Venus*, *Tellina*, (a. & b.)
 31, 31. the Cartilage, or Hinge, as in *Tellina*, *Venus*
 32, 32. the Ears, as in *Peeten*, (*Ostreca*, Linn.)
 33, 33. the Ligament Perforation, (Aperture in the upper valve of the Shell through which the ligament of the animal passes, by which it adheres to extraneous substances, as in *Anomia*)

213. Lettered CONCHOLOGY, Elementary Plate V.

- Fig. 34, 34. The Length and Breadth of a Bivalve Shell, as in *Solen*, *Mytilus*
 35. the Infide of a Bivalve Shell, as in *Mytilus*, (*rugosus*)
 36. the Hinge, Suture, and Procefs. Denticulated future, as in *Arca*. Spoon-shaped procefs, as in *Mya*, (*Pratenius*, *Donov. Brit. Shells*)

PLATE

213. Fig. 37. The part denominated the Cicatrix, Imprefion of the Spaces to which the animal-inhabitant of the Shell adheres
 38, 38. the Byffus, or Beard, as in *Mytilus*

MULTIVALVES.

- Fig. 39, 39. The part denominated the Bafe of a Multivalve Shell, as in *Lepas*
 40, 40. the Ligament, as in *Lepas*, (*anatifera*)
 41, 41. the Operculum, as in *Lepas*, (*Balanus vulgaris*)

* * * *Vide article CONCHOLOGY, which these Elementary Plates are intended to illustrate.*

ORDER 4. ZOOPHYTES.

GENUS TUBIPORA.

214. Lettered ZOOPHYTES, Genus Tubipora, Plate I.
 Fig. 1. *Tubipora musica*

GENUS MADREPORA.

* *Consisting of one Star.*

- Fig. 2. *Madrepora fungites*
 3. *Madrepora pileus*
 4. *Madrepora Agathus*
 5. *Madrepora foliaceus*

*** *With numerous united Stars.*

215. Lettered ZOOPHYTES, Plate II.

GENUS ISIS.

216. Lettered ZOOPHYTES, Genus Isis, Plate I.

- Fig. 1. *Isis Hippuris*
 2. *Isis coccinea*

GENUS ANTIPATHES.

- Fig. 3. *Antipathes subpinnata*
 4. *Antipathes Myriophylla*

GENUS GORGONIA.

217. Lettered ZOOPHYTES, Genus Gorgonia, Plate II.

- Fig. 1. *Gorgonia lepadifera*
 2. *Gorgonia ceratophyta*
 3. *Gorgonia americana*
 4. *Gorgonia esferia*

NATURAL HISTORY.

PLATE

218. Lettered ZOOPHYTES, Genus Gorgonia, Plate I.
 Fig. 1. *Gorgonia nobilis*, Red Coral, or Noble Coral
 2. Part of the branch of Gorgonia Nobilis magnified, and exhibiting the animals
 3. *Gorgonia umbraculum*
 4. Portion of a branch magnified
 5. *Gorgonia reticulata*
 6. Portion of a branch magnified

GENUS ALCYONIUM.

219. Lettered ZOOPHYTES, Genus Alcyonium, Plate III.
 Fig. 1. *Alcyonium gorgonoides*

GENUS SPONGIA.

- Fig. 2. *Spongia tubulosa*
 3. *Spongia palmata*
 4. *Spongia prolifera*
 5. *Spongia coronata*

GENUS FLUSTRA.

220. Lettered VERMES, Order Zoophytes, Genus Flustra, Plate VIII.
 Fig. 1. *Flustra foliacea*
 2. *Flustra bombycina*
 2.* A portion of a branch magnified to shew the cells
 3. *Flustra carbasæa*
 3.* Magnified to shew the cells
 4. *Flustra verticillata*
 4.* Magnified to shew the cells

GENUS TUBULARIA.

221. Lettered VERMES, Order Zoophytes, Genus Tubularia, Plate I.
 Fig. 1. *Tubularia magnifica*, Magnificent Tubularia, or Animal Flower
 The figures in this Plate display the animal in its young and full-grown state, and exhibit likewise the full expansion of the tentacula

GENUS CORALLINA.

222. Lettered ZOOPHYTES, Genus Corallina, Plate VI. & VII.
 Fig. 1. *Corallina officinalis*
 2. One of the branches magnified
 3. *Corallina squamata*
 4. A branch magnified
 5. *Corallina incrassata*
 6. *Corallina opuntia*
 7. *Corallina corniculata*
 8. A branch magnified

GENUS SERTULARIA.

223. Lettered VERMES, Order Zoophytes, Genus Sertularia, Plate VIII.
 Fig. 1. *Sertularia frutescens*
 1.* A branch magnified

PLATE

223. Fig. 2. *Sertularia quadridentata*
 2.* A branch magnified
 3. *Sertularia pingler*
 3.* A branch magnified
 4. *Sertularia filicula*
 4.* A branch magnified

GENUS HYDRA.

224. Lettered VERMES, Order Zoophytes, Genus Hydra, Plate V.
 Fig. 1. *Hydra viridis*, Green Polype
 2. *Hydra grisea*, Grey Polype
 3. *Hydra fusca*, Brown Polype
 4, 5, 6. Clusters of the different species, as they live at the roots of aquatic plants immersed in water
 * Those marked with a star are magnified.

ORDER V.

INFUSORIA.

GENUS BRACHIONUS.

225. Lettered ANIMALCULES, Class Vermes, Plate I.
 Fig. 1—6. *Brachionus urceolaris*, in various states of expansion and retraction
 7. *Brachionus striatus*
 8. *Brachionus tripus*
 9. *Brachionus uncinatus*
 10. *Brachionus quadridentatus*

GENUS VORTICELLA.

- Fig. 11. *Vorticella polyppina*
 12. *Vorticella polyppina*, a cluster magnified
 13. *Vorticella anastatica*, the group shewing the manner in which they aggregate in clusters; and also figures of the single-headed, double-headed, and quadruple-headed, separate
 14. *Vorticella pyrraria*, a cluster
 15. *Vorticella opercularia*, a group, shewing the stelliform animal expanded
 16. *Vorticella umbellaria*
 17. *Vorticella digitalis*
 18. *Vorticella nebulifera*

GENUS TRICHODA.

226. Lettered VERMES INFUSORIA, Plate II.
 Fig. 1, 1. *Trichoda sol*, under two appearances
 2, 2. *Trichoda cometa*, three appearances
 3, 3. *Trichoda bomba*, two appearances
 4. *Trichoda trigona*
 5. *Trichoda anas*
 6. *Trichoda urnula*
 7. *Trichoda proteus*

GENUS CERCARIA.

- Fig. 8, 8. *Cercaria Lemna*, in the entirely expanded position it assumes when moving, and two others
 9, 9. *Cercaria inquieta*, extended and subtracted

PLATE

226. Fig. 10. *Cercaria lupus*
11. *Cercaria podura*

GENUS KOLPODA.

- Fig. 12. *Kolpoda pyrum*

GENUS PARAMECIUM.

- Fig. 13. *Paramecium oviferum*
14. *Paramecium cbrystolis*
15. *Paramecium marginatus*

GENUS VIBRIO.

- Fig. 16. *Vibrio anguillula*
17. *Vibrio glutinis*, the smaller figures denote the natural size
18, 18. *Vibrio anfer*, in two positions
19. *Vibrio olor*
20. *Vibrio lunula*
21, 21. *Vibrio paxillifer*, variously connected

GENUS LEUCOPHRA.

- Fig. 22. *Leucopbra cornuta*

GENUS ENCHELIS.

- Fig. 23. *Enchelis punctifera*
24, 24. *Enchelis retrograda*, two figures
25. *Enchelis truncus*
26. *Enchelis caudata*

GENUS VOLVOX.

- Fig. 27. *Volvox globator*
Obs. All the Vermes infusoria are microscopic objects

Addenda to the Zoology.

227. Lettered LIGHT, Luminous Animals

Luminous Animals, *vide* article LIGHT

- Fig. 1. *Nereis noctiluca*, discovered by Vianelli, (nat. size)

2. The fame, greatly magnified
3. A luminous insect, discovered by Riville
4. *Cancer fulgens*, discovered by Sir Joseph Banks, (natural size)
5. *Limulus noctilucus*, discovered by Captain Horsburgh, greatly magnified
6. *Medusa pullucens*, discovered by Sir Joseph Banks, shewn less than the natural size
7. *Pyrosoma atlanticum*, lately discovered by Peron
8. *Medusa lucida*, of Dr. Macartney, the largest he met with
9. *Beroe fulgens*, of Dr. Macartney, the usual size
10. *Medusa scintillans*, of Dr. Macartney, natural size
11. The fame, highly magnified
12. A luminous Animalcule, discovered by Mr. Forster
13. The fame, highly magnified
14. An enlarged view of the inferior surface of the abdomen in the *Lampyrus lucida*, after the integuments had been removed

PLATE

227. Fig. 14. *a.a.a.* The three masses of luminous substance, which are applied to the three last rings of the abdomen

b.b.b. The arrangement of the cellular or interstitial substance on the other abdominal rings, which give the pale colour to the whole belly of the insect

15. Dissection of the common Glow-Worm, exposing the sacs of luminous matter *in situ*, on the last ring of the belly. *a.* The sac on one side
16. One of the sacs of the Glow-Worm taken out and very highly magnified. *a.* The external part of the sac, composed of an interweaving of a spiral fibre. *b.* The luminous substance seen at one end
17. *Elater noctilucus*, with a portion of the shell of the thorax removed to uncover one of the organs of light, of which there are two, one being situated on each side, at the posterior part of the thorax. *a.* The yellow transparent spot of the thorax. *b.* The oval mass of luminous substance surrounded by an irradiation of the interstitial substance. *c.* The ends of the muscles which are on the inside of the thorax
18. The luminous apparatus of the *elater noctilucus*, considerably magnified. *a.* The radiated appearance of the interstitial substance around the oval mass of luminous substance. *b.* The arrangement of that substance when it passes down between the muscles. *c.* The ends of the muscles of the back. *d.* The shell of the thorax
19. *Elater ignitus*. *a.* The yellow part of the thorax. *b.* The small mass of luminous substance, seen on removal of the shell of the thorax

Obs. The preceding objects were those appointed by Dr. Macartney for the explanation of his article on Luminous Animals, which will be found placed under the leading article, LIGHT.

In addition to those, we have, ourselves, conceived the propriety of introducing another figure of the *Nereis* genus, that of Vianelli being, confessedly, very doubtful. This animal is, therefore, not merely introduced by us as a species highly phosphorescent, under certain circumstances, in common with most others of its tribe, but in order likewise to convey a more accurate idea of the *Nereis* genus, than the figure copied from Vianelli will afford. The species we have introduced, is the *Nereis cærulea* of some authors, sanguinea of others; and is, beyond any doubt, a genuine *Nereis* of the Linnæan System.

The figure by Vianelli, is contained in a small tract written in the Italian language, entitled "*Nuove scoperte intorno le luci notturne dell' acqua marina*;" and which, besides being most evidently depicted from a very mutilated object, is entirely different from that included in the third volume of *Annates Academica*, which Linnæus himself gave very shortly afterwards as the same animal: and even this latter, like that of Vianelli, if we mistake not, must have been delineated likewise from

PLATE

an imperfect animal. We have, indeed, a strong suspicion, that the animal represented by Vianelli, cannot be of the *Nereis* genus.

In conclusion of this note, it may not be amiss to add, that no animal has been more indefinitely described than the *Nereis noctiluca*. The only specific character assigned to it in the last edition of *Systema Naturæ* cura a Gmelin, is *Corpore vix conspicuo*, which being applicable to every minor species, can be no criterion of the individual kind that author had intended; and the same vague character occurs again in *Mull. Zool. Prodr.* n. 2623. In the twelfth edition of *Linn. Syst. Nat.* the body of *Nereis noctiluca* is described as consisting of twenty-three joints, which is the number represented in the Plate inserted in *Amoen. Acad.* t. 3. but this distinction is totally at variance with the subject of Vianelli's tract; for in that figure there are no more than about eleven joints in the body, instead of the twenty-three which Linnæus has described.

BOTANY.

Illustration of the Twenty-four Linnæan Classes, according to the Number of the Stamina.

228. Lettered BOTANY, Plate II.

- Fig. 1. Clafs 1. *Monandria*, one stamen, as in *Salicornia*, *Callitriche*, &c.
2. *Diandria*, two stamens, as in *Veronica*, &c.
3. *Triandria*, three stamens, as in *Hordeum*, *Agrostis*, &c.
4. *Tetrandria*, four stamens, as in *Ilex*, &c.
5. *Pentandria*, five stamens, as in *Borago*, *Primula*, &c.
6. *Hexandria*, six stamens, as in *Allium*, *Eriogonum*, *Ornithogalum*, &c.
7. *Heptandria*, seven stamens. *Tricentalis*, *Difandra*, *Aesculus*, *Petrocarya*, *Pancovia*, and *Jonesia* are of this class
8. *Octandria*, eight stamens, as in *Epilobium*, *Oenothera*, &c.
9. *Enneandria*, nine stamens, as in *Butomus*
10. *Decandria*, ten stamens, as in *Sedum*
11. *Dodecandria*, twelve stamens, as in *Sempervivum*; above twelve, and less than twenty stamens, as in some other genera
12. *Icofandria*, twenty or more stamens inserted in the calyx, as in *Mespilus*, *Pyrus*, and some other fruit-bearing plants, including *Fragaria*, *Ribes*, &c.

229. Lettered BOTANY, Plate III.

- Fig. 13. Clafs 13. *Polyandria*, many stamens, and inserted into the receptacle or base of the flowers, as *Papaver* (poppy), *Trollius* (great butter-cup), *Ranunculus*, &c.

PLATE

229. Fig. 14. Clafs 14. *Didynamia*, stamens two long, two shorter, as in *Lamium*, or dead-nettle, &c.
15. *Tetradynamia*, stamens four long and two shorter, as in *Cheiranthus*, or flock gilly-flower, *Sinapis*, *Brassica*, &c.
16. *Monadelphia*, stamens united by their filaments into a kind of tube, as in *Malva*
17. *Diadelphia*, stamens united into two distinct parcels or sets, as in *Pisum*, *Lathyrus*, *Ervum*, &c.
18. *Polyadelphia*, stamens united into more than two distinct parcels or sets, as in *Hypericum* (St. John's wort)
19. *Syngenesia*, anthers united into a cylinder, flowers compound, as in *Leontodon* (dandelion), &c.
20. *Gynandria*, stamens united with or growing out of the petals, as in *Orchis* (bee-flower)
21. *Monoecia*, stamens and pistils in separate flowers on the same plant, as in *Zinnibellia*, *Chama*, &c.
22. *Diœcia*, male and female flowers on distinct plants, as in *Salix*, the willow
23. *Polygamia*, male or female flowers, or both, with hermaphrodite flowers on the same or on different plants, as in *Valantia*, *Brabeium*, *Parietaria*, &c.
24. *Cryptogamia*, fructification concealed, or not distinctly ascertained

Illustration of the Linnæan Orders of Botany, as established upon the Number of the Pistils.

230. Lettered BOTANY, Orders, Plate IV.

- Fig. 1. *Monogynia*, one style or stigma (with five stamens), as in a most extensive number of plants, among which are *Heliotropium*, *Anchusa*, *Borago*, &c.
2. *Digynia*, two styles (with ten stamens), as in *Chrysoplenium*, *Metella*, *Scleranthus*
3. *Trigynia*, three styles (with ten stamens), as in *Silene*, *Stellaria*, &c.
4. *Tetragynia*, four styles, with four stamens, as in *Ruppia*, *Potamogeton*, *Sagina*, &c.; with five stamens, as *Parnassia*, &c.; with six stamens, as in *Petiveria*
5. *Pentagynia*, five styles (with ten stamens), as in *Oxalis*, *Suriana*, *Lycobis*, &c.
6. *Hexagynia*, six styles, as in *Butomus*
7. *Heptagynia*, seven styles (with seven stamens), as in *Septas*
8. *Decagynia*, ten styles (with ten stamens), as in *Neurada* and *Phytolacca*
9. *Dodecagynia*, twelve styles (with twelve stamens), as in *Sempervivum*
10. *Polygamia*, many styles, as in the 1st. 2d. 3d. and 4th. order of Clafs Syngenesia
11. *Gymnospermia*, naked seeds, as in *Ajuga*, *Teucrium*, *Satureja*, &c.

230. Fig. 12. *Angiospermia*, seeds inclosed in a pericarpium or seed-vessel, as in many genera, *Anterrhinum*, *Cybaria*, &c.

231. Lettered BOTANY, Orders, Plate V.

Fig. 13. *Siliculosula*, pericarpium a filicula, as in *Thalassia* (shepherd's purse), *Draba*, &c.

14. *Siliquosa*, pericarpium a siliqua, as in *Raphanus*, *Sinapis*, *Brassica*, &c.
 15. *Polygamia Aequalis*, flowers compound, all the florets hermaphrodite, as in *Leontodon*, *Hieracium*, &c.
 16. *Polygamia Superflua*, florets of the disk hermaphrodite, those of the radius female, as in *Bellis* (garden daisy), *Tussilago*, *Senecio*, &c.
 17. *Polygamia Necessaria*, flowers or florets of the disk male, those of the radius female, as in *Calendula*, *Chrysogonum*
 18. *Polygamia Frustranea*, florets of the disk hermaphrodite, those of the radius neuter, as in *Centaurea*, *Sclerocarpus*, *Rudbeckia*
 19. *Polygamia Segregata*, many partial cups contained in the common calyx, which separate and surround the floscula, as in *Echinops*, *Gundelia*, *Sphaeranthus*, &c.
 20. *Trioccia*, have the polygamy or parts of fructification on three different plants, as in *Ficus*, and also *Ceratonia*
 21. *Felices*, fructification dorsoferous (on the back of the leaf), as in *Asplenium*, *Adiantum*, *Trichomanes*, &c.
 22. *Musci*, anthers without filaments; female flowers distinct and without pistillum: seeds a naked corculum without cotyledon or tunic. With or without a calyptra or veil, as in *Bryum*, *Hypnum*, *Buxbaumia*, &c.
- Obs.* To the order Musci, Gmelin and other botanists add the following (*Hepaticæ*), comprehending *Marchantia*, as the last genus of Musci after *Jungermania*. Linnæus had left it with *Alge*
23. *Hepaticæ*, herbage frondose in general, the fructification originating from what is at the same time both stem and leaf, as in *Marchantia*, *Jungermania*, &c.
 24. *Alge*, root, stem, and leaf, in one, as *Fucus*, *Ulva*, *Lichen*, &c.
 25. *Fungi*, mushrooms, as in *Agaricus*, *Boletus*, &c.

CLASS CRYPTOGAMIA.

Addenda to the Musci, in Illustration of the Fringes of Mosses.

* Furnished with single Fringes.

232. Lettered BOTANY, Plate Fringes of Mosses.

- Fig. 1. *Tetraphis*. Fringe of four teeth, as in *Mnium pellucidum*. These are erect, acute, firm, polished, and permanent
2. *Obolepharum*. Fringe of eight teeth, as in *Bryum albidum*. Capsule without an apophysis
3. *Spachnum*. Fringe of 16 teeth, dilated at the base, approaching each other in pairs.

Capsule cylindrical, standing on a fleshy base or apophysis

232. Fig. 4. *Encalypta*. Fringe of 16 linear upright teeth. Veil ample and bell-shaped

5. *Pterogonium*. Fringe of 16 linear upright teeth. Capsule from a lateral sheath
6. *Grimmia*. Fringe of 16 equi-distant teeth, dilated at the base. Veil cylindrical
7. *Conostomum*. Fringe of 16 tapering teeth, approaching each other in pairs, and all coloring at the points, as in *Bryum tetragonum*, Dickson, *Grimmia conostoma*, Smith Engl. Botany
8. *Dicranum*. Fringe of 16 flat, somewhat inflected teeth, cloven half-way down
9. *Trichostomum*. Fringe of 32 linear straightish teeth, approaching each other in pairs, sometimes joined at the base in pairs
10. *Tortula*. Fringe of numerous linear teeth, spirally and repeatedly twisted together
11. *Syntrichium*. In some species of *Tortula* the teeth are united into a cylinder at the base, pierced with numerous holes, upon which some recent botanists have founded this new genus

** The following Genera are furnished with a double Fringe, some few Species of *Orthotrichum* and one of the *Buxbaumia* perhaps excepted.

Fig. 12. *Orthotrichum*. Capsule terminal. Outer fringe of 16 teeth; inner of 8 or 16 linear ones, sometimes altogether deficient. Veil furrowed

Obs. The fringe is sometimes variable. *Orthotrichum pumilum* has but eight teeth in the outer fringe.

13. *Nekera*. Capsule from a lateral scaly sheath. Outer fringe of 16 teeth; inner of 16 capillary ones. Veil naked and even
 14. *Funaria*. Capsule obovate. Outer fringe of 16 oblique teeth, cohering at the points; inner, of 16 flat teeth. Veil quadrangular
 15. *Buxbaumia*. Capsule oblique, gibbous on one side. Outer fringe of 16 very short teeth; inner, membranous and plaited
- Obs.* In *Buxbaumia foliosa* the outer fringe is scarcely perceptible; it is represented at fig. 16.
17. *Bartramia*. Capsule spherical, furrowed. Outer fringe of 16 awl-shaped teeth; inner, membranous, lacinated. Lip depressed
 18. *Mnium*. Capsule terminal, cylindrical, furrowed. Outer fringe of 16 awl-shaped teeth; inner, membranous, lacinated
 19. *Bryum*. Capsule ovate-oblong, smooth. Outer fringe of 16 teeth, dilated at the base; inner, membranous, toothed. Flowers terminal
 20. *Hypnum*. Capsule ovate-oblong, from a lateral scaly sheath. Outer fringe of 16 teeth, dilated at the base; inner, membranous, variously toothed. Veil smooth
 21. *Fontinalis*. Capsule enveloped in a lateral scaly sheath. Outer fringe of 16 teeth, dilated at the base; inner reticulated
 22. *Polytrichum*. Outer fringe of 32 or 64 flat inflexed teeth; inner, a transverse orbiculus

NATURAL HISTORY.

PLATE

lar membrane, affixed to the teeth of the outer. Veil mostly double; the outer hairy

Vide article FRINGE of MOSSES, by Sir J. E. Smith.

CLASS CRYPTOGAMIA.

Addenda in Illustration of the Genera of Fungi.

Olf. The importance of the Syſtem of Tournefort, the outline of whoſe claffification is here laid down, will be beſt underſtood by thoſe who are aware of the attachment of the French botaniſts, even of the lateſt times, to the method of this early author: a botaniſt, whoſe labours preceded thoſe of Linnæus by nearly half a century.—It has been truly obſerved, that Tournefort is to the French in the ſcience of botany, the foundation-ſtone upon which all their ſyſtems are eſtabliſhed. This predilection in favour of their own ſyſtems, to the excluſion of that the Swediſh naturaliſt founded upon the ſexual organs of plants, may yet have its revolution; but that in the preſent time is more than can be well expected. As the botanical department of this Cyclopædia has been almoſt from the commencement allotted to one of the moſt able profeſſors in the ſcience, it is very far from the intention of the writer of the preſent article to enter into the comparative merits of the prevailing ſyſtems of this time, the Linnæan in Britain, under the auſpices of its many learned advocates, and that of the French, founded on a “natural method” not very diſſimilar from that of Tournefort, and as improved by Juffieu and Gærtner. We only wish to offer ſome apology for the greater number of plates devoted to the ſyſtem of the celebrated corollift M. Tournefort than to the ſexual ſyſtem of Linnæus; the latter being a naturaliſt whom from adoption we may almoſt deem our own, and we muſt confeſs with all his imperfections our moſt favourite author.

The great talents of one of our ableſt and moſt experienced botaniſts at this period, we are well aware have been directed to the advancement of a “natu-

PLATE

ral method* ;” perhaps even we might be almoſt juſtified in terming him one of the great ſupporters of this method, not in this country alone but throughout Europe: while the labours of Juffieu, Jaume St: Hilaire, and others, have gone far towards the formation of a method conſtructed upon the natural affinities of plants, and on their fruits and feeds eſpecially; characters which, with the corolla, calyx, and other organs of the flower conſidered generally, it will be perceived had formed the baſis of that ſyſtem which was laid down by Tournefort.

After what we have advanced upon this intereſting ſubject, it might have been thought adviſable to appropriate other plates to the elucidation of what is underſtood by a natural method; but that, alas! would be impoſſible. Much remains undone, and it is only by a very long and arduous courſe of reſearch and investigation that any ſyſtem of material extent founded on that method is to be expected. “Hitherto,” ſays M. de Candolle, one of its moſt popular promoters, “we have arrived only at the baſis of this ſyſtem, and not at the reſult: it exiſts rather in the converſations of botaniſts than in their books, and remains yet among the number of thoſe opinions which Bacon calls floating.” *Vide De Candolle de Taxonomie.* Under theſe circumſtances, the plates appropriated to the illuſtration of Tournefort's arrangement of Botany will not be thought devoid of intereſt, and may be indeed conſidered of material uſe to the early botaniſt as well as general reader, in unison with thoſe intended for the illuſtration of the claſſes and orders of Botany as laid down and eſtabliſhed by the great Linnæus.

VEGETABLE ANATOMY.

244. Lettered VEGETABLE ANATOMY, Plate I.

Fig. 1—8. Diſſections of the cortex or bark of various plants, of the natural ſize and magnified, deſigned to ſhew the ſtructure of the layers of which they are compoſed, &c.

245. Lettered VEGETABLE ANATOMY, Plate II.

Diſſections explanatory of the diſpoſition of the layers which appear internally in the ſtems or branches: fig. 1, 2, 3. horizontal ſections; fig. 4, 5. perpendicular ſections; fig. 6, 7, 8. ſhew the longitudinal diſpoſition of the veſſels upon ſtripping off the outer bark or cortex

Fig. 9—13. Various appearances and diſſections of the buds of plants. Fig. 14—17. of the flower, &c.

19. A bulbous root, ſhewing the exterior imbrications
 18. A horizontal ſection of a bulbous root, ſhew.

* Robert Brown, Eſq. who, without rejecting the ſexual organs as uſeful auxiliaries, regards more particularly the germination of plants, with the number and form of the Cotyledons, as eſſentially characteriſtic in a ſyſtem founded on a natural claffification.

MINERALOGY.

246. Incribed NATURAL HISTORY, Plate I.

View of Mount Ætna, from Spallanzani's Work.

This is a general view of Mount Ætna, the adjacent country and the sea; and is intended to shew the effects occasioned by the eruption of the volcanic matter at different times. A points out the loftiest summit of the Mount. H is Nicolosi, and marks the Mount Rosso or Red Mountain, formerly a plain, but in 1699, a new vertex opened in it, and discharged the dreadful torrents of lava which overflowed the land, till reaching the sea, it formed the promontory of lava in the sea extending as far as letter Y. G, near this new opening of Ætna, is the mountain Montpelieri or Montpileri

Various other interesting spots are marked in the plate, for which consult the article ÆTNA, *Mount.*

246. Incribed NATURAL HISTORY, Plate II.

A View of the Crater of Mount Ætna.

A A A One edge of the lava of 1787, which issued from the upper crater. B B B the circumference of the crater, with its cleft C C through which the internal part is discernible. D the flat bottom of the crater. E the aperture in the bottom through which the larger column of smoke F F arose. G G is that part of the edge of the crater from which its internal part is best seen. H H is the smaller column of smoke to the north-east. *Vide article Mount ÆTNA for further explanation*

247. Incribed NATURAL HISTORY, Plate V.

View of Mount Vesuvius, as seen from the Bay of Naples. From an original sketch made in the year 1797, by R. Duppa, Esq.

248. Incribed NATURAL HISTORY, Plate IV.

View of the Crater of Mount Vesuvius. Drawn by the same hand, and at the same time as the preceding.

249. MINERALOGY, Plate II.

Bafalt. The Mountain of Aïfa, called La Coupe, or the Col d'Aïfa, near the village Entrague, in the Viverrais, above the torrent of Volant

This plate affords an example of the formation of basaltic columns, and illustrates the hypothesis of the Huttonian system, according to which the basaltic matter has been originally of volcanic origin, and while in a state of fusion cast out of the crater of the mountain. In its progress this lava has formed a wavy channel down the mountain side. According to St. Fond, this is the most remarkable and best characterized crater in all the Viverrais. The ends of the columns may be distinctly seen before the basalt reaches the river.

GEOLOGY.

250. GEOLOGY, Plate I.

Fig. 1. The upper figure in this Plate exhibits the

PLATE

dip, dyke, fault, slip, trouble, &c. described and referred to in the article
COAL

251. GEOLOGY, Plate II.

Fig. 1—10. Sections of various *Strata*

252. GEOLOGY, Plate III.

Fig. 1. *Strata*: being a sketch of the arrangement of the strata through England, by Mr. R. Bakewell. Lat. $54^{\circ} 35'$ to $54^{\circ} 45'$.

2. Section of the strata through part of Dorsetshire and Devonshire, by Mr. R. Bakewell
3. Perpendicular strata
4. Horizontal strata
5. Inclined strata, consisting of greywacke, clay-slate, compact felspar, porphyry, sienite, trap, clink-stone and granite, valley of Long Sleddade, Westmoreland —
6. Undulate strata: shewing the wavy structure of the beds of slate, called shillet, in Devonshire

253. GEOLOGY, Plate IV.

Fig. 1, 1. Metallic veins exemplified, with a " rider," &c.; and also the interfection (or " cutting-off") of metallic veins

2. Columnar and amorphous basalt, intersected by basaltic dykes
4. Lime-stone broken and inclosed in basalt, seen in a basaltic rock on the coast of Antrim

Whinstone dykes, or basaltic veins, passing through chalk, and changing it into marble—under figure 4.

(See article GEOLOGY. *Suppl.* Vol. XXXIX.)

Addenda to the Geological Illustrations.

254. Plate ICHTHYOLITE, or Ichthyological Remains.

Mineralized remains, or impressions of fishes, on black shistose slate, found at Isleben, in Germany

255. FOSSILS, Extraneous, Plate I.

Fig. 1. Mineralized remains of an encrinurus, Encrinurus liliiformis, or " lily-head," in relievo, on a slab of stone

2. Transverse section of the lily-head
3. The lily-head half broken through transversely
4. Bottom of the lily-head, shewing the peduncle by which it is connected to the main stem of the encrinurus

CRYSTALLOGRAPHY.

256. Lettered CRYSTALLOGRAPHY, Plate I.

Fig. 1—7. Various forms of the crystals of adamantine spar
8—16. Ditto of felspar

262. Lettered CRYSTALLIZATION, Plate VII.

Fig. 27. The *Octohedron*, regularly formed
13. The *Tetrahedron*, regularly formed

PLATE

262. Fig. 5. The *Hexabedral prism*, or equiangular six-sided prism
 12. The *Rhomboidal dodecahedron*
 14. The *Pyramidal dodecahedron*, or double six-sided pyramid

257. CRYSTALLOGRAPHY, Plate II.

Fig. 17—21. Mechanical dissection of an *hexabedral crystal of calcareous spar*, and extraction of the primitive crystal, or nucleus

Obf. Lettered fig. 17—21. Plate II. *Crystallography*. Described in article CRYSTAL, Vol. X. Part II. but erroneously referred to as fig 1—5. Plate I.

22, 23. Mechanical division of the *dog's-tooth spar*, erroneously fig. 6, 7. Plate I.

Fig. 24. *Rhomboids of calcareous spar*, a secondary crystal, with the primitive nucleus

260. CRYSTALLOGRAPHY, Plate V.

Fig. 56. The base of the *six-sided prism*, divided by sections parallel to each of its sides, and producing the *triangular prism*, the ultimate form obtained by mechanical division

259. CRYSTALLOGRAPHY, Plate IV.

Fig. 48, 49. The *cube* divided by sections parallel to the sides, and producing a series of smaller cubes, considered as the form of the integrant molecule

257. CRYSTALLOGRAPHY, Plate II.

Fig. 26. The *primitive rhomboid* of the tourmaline, with its dissection. This crystal is divisible both in the direction of the six faces, and in that of the short diagonals; by which latter sections the rhomboid is reduced to six tetrahedrons, surrounding the nucleus, as here represented

Decrements of the Edges of the Crystals.

257. & 258. CRYSTALLOGRAPHY, Plates II. & III.

Fig. 27, 28. The *rhomboidal dodecahedron*, which figure may be formed from a cubic nucleus, by the superposition of decreasing laminae

258. CRYSTALLOGRAPHY, Plate III.

Fig. 29. Congeries of cubes, consisting of integrant molecules, forming the cubic nucleus, with the pyramids raised on three of the faces

257. CRYSTALLOGRAPHY, Plate II.

Fig. 27. The form of the crystal, produced by the combination of these integrant molecules, when complete

Decrement in Breadth and Height.

258. CRYSTALLOGRAPHY, Plate III.

Fig. 30. A crystal of *iron pyrites*, with twelve pen-

PLATE

258.

tagonal faces, in which the two kinds of decrement are combined

Fig. 31. The cubic nucleus of this variety is shewn

32. The formation of the crystal by decrements

33. Decrement of the dog's-tooth spar, (the metastatic crystal of Häuy,) represented complete in Plate 257. fig. 22. The present figure supposes the hypothesis of a decrement by two ranges in breadth. It represents the upper pyramid of this crystal placed on the upper planes of the primitive nucleus, which being partly visible, discloses more clearly the progressive effects of the decrement by two ranges

34. A secondary crystal, which is a rhomboid much more obtuse than the nucleus, is represented as surrounding the nucleus in the variety of calcareous spar, called by Häuy, equiaxe

The nucleus (presumed to be the primitive rhomb of carbonate of lime) progressively dissected to explain its structure

The face at letter A, fig. 35, shews the same face of the rhomb as is represented in fig. 34, but symmetrically divided, and the figure shews the gradual division of the rhomb, by mechanical separation down to letter I d

258. CRYSTALLOGRAPHY, Plate III.

Fig. 36. *Decrements on the angles of a crystal*, shewn in the regular *octahedron* formed on a cube

259. CRYSTALLOGRAPHY, Plate IV.

Fig. 37. The arrangement of the integrant molecules on one of the triangular faces of the octahedron

259. CRYSTALLOGRAPHY, Plate IV.

Fig. 38. Rhomboid crystal

39. Another example of the decrements on the angles, exemplified in the dissection of the *rhomboid*, fig. 38., which differs somewhat from that of the cube, producing a very obtuse rhomboid, encircling the nucleus; found among the secondary crystals of oligite iron ore

Further illustration of the different variations, of which the decrements of the *rhomboid*, both of the superior and inferior angles, are susceptible. The rhomboid is shewn at fig. 45.; the dissections at fig. 46, 47.

Intermediate Decrements.

Fig. 48. A parallelepiped undergoing a decrement, by two ranges on the angle of its base

49. A crystal, in which all the three decrements round the same solid angle are intermediate

50. Another example of intermediate decrement in one of the faces of a cubic nucleus, taking place on the angles, by the subtraction of double molecules

51. The cubic nucleus, marking the decrements parallel to the lines *k m*, &c. by subtraction

tion of double molecules, in such a manner as that three ranges be taken away in the breadth, and one in height; so that the decrements will be both intermediate and mixed

52. A polyhedral crystal of thirty faces, produced by the cessation of decrementation, before the formation of the pyramid round each face of the nucleus
53. Example of intermediate decrements on the two lateral angles of a rhomboid, (as at fig. 47.), the decrements taking place by ranges of double molecules, producing in the complete result a solid of twelve faces, disposed six and six towards each summit, as in one variety of calcareous spar, or double-pointed dog's-tooth spar

Compound secondary Forms of Crystals.

- Fig. 54. A secondary crystal, an *icohedron* bounded by eight equilateral triangles, and twelve isosceles triangles. Occurs in iron pyrites
55. A calcareous spar (*Analogique* of Häüy), composed of twenty-four trapezoidal faces, six of which are vertical, and twelve others disposed six and six. The different trapezoidal faces are shewn in the figure

260. CRYSTALLOGRAPHY, Plate V.

- Fig. 56. The end of the regular six-sided prism, which, for its molecule, presents us with the triangular, or three-sided prism
57. A cubic nucleus divided into its cubic molecules
59. Superior face of the second lamina, A
Ditto, further mechanical division of the integrant molecules, B
Ditto, ditto, C
58. Explanation of vacancies on the edges of a crystal, given by Häüy
60. An oblique prism with rhomboidal bases, so situated that the faces A D, *a d*, and C D, *c d*, are vertical; and B D are the acute angles of the base, and that the latter proceed in an ascending direction from A to C
Intersect this prism into halves, by means of a plane passing by the diagonals, drawn from B to D, and from *b* to *d*, so that the half situated on the left remaining fixed, the other is reversed without being separated, and the figure presented will be as shewn at fig. 61.
62. Another example of grouping, in which crystals are inserted into each other, is extremely common. This combination is illustrated by a cube, and M N r, an equilateral triangular facet, produced by a decrement of one range round the angle A
63. A second cube modified in the same manner, and affixed to the other by its correspondent facet, will afford the double crystal represented

To illustrate the Notation of Crystals.

- Fig. 64. Represents an oblique parallelepiped, the faces of which have angles of different measures
65. The effect of decrement shewn
66. An oblique parallelepiped
67. Primitive molecules
68. Binary form of Häüy
69. Primitive form of a rectangular prism, which has oblique-angled parallelograms for its bases, one of which is longer
70. The oblique prism, with rhomboidal bases
71. The rectangular prism, with rectangular bases
72. The rectangular prism, with rhomboidal bases
73. The rectangular prism, with square bases
74. The cube
75. The most common variety of chrysoberyl, or cymophane, the nucleus of which is a regular parallelepiped, as represented at fig. 71.
76. The prism

261. CRYSTALLOGRAPHY, Plate VI.

- Fig. 77—84, &c. Several figures inserted to illustrate the manner in which the symbols employed in the definition of the various modifications of crystals, by Häüy, and other crystallographers are expressed
80. Octohedron, with scalene triangles
81. Octohedron, another variety
82. The regular octohedron
- 83, 84. The primitive octohedron, composed of eight isosceles triangles similar, four and four each
85. The tetrahedron when become a primitive form
86. The regular six-sided prism
87. The same, in which three solid angles, taken alternately, are replaced by faces, whilst the intermediate angles remain untouched
88. Rhomboidal dodecahedron, in which each solid angle is composed of three planes, and may be assimilated to a summit of the obtuse rhomboid
89. Primitive form of the tourmaline
90. One variety of the tourmaline

* * * By attending to the above claffification, the whole of thoſe Plates of Natural Hiſtory, which the proprietors have allotted to this Cyclopædia, may be readily reduced to numerical order, and be by that means, it is prefumed, more eaſily diſtinguiſhed when required for reference than by the original plan, in which the plates of each ſection were lettered ſeparately from the reſt. They now follow each other, not only in numerical order throughout their whole extent, but alſo in the order of the Linnæan Syſtem, as nearly as the number of plates appropriated to the reſpective Sciences would conveniently allow. The miſcellaneous nature of ſome few plates, which it has been lately thought defirable by the proprietors to introduce, renders it impoſſible to place them ſtrictly in the order of ſyſtem.

ERRATA

ON THE

PLATES OF NATURAL HISTORY.

Some few errors having been committed by the writing engravers in lettering the names upon the plates of Natural Hiſtory, which it will be very defirable to correct, the reader is requeſted to obſerve, that wherever the names upon the plates are found at variance with thoſe inſerted in this printed index, the preference is to be invariably given to the latter; and that the names upon the plates may be corrected by a reference to this index. The following errors occur to us in paſſing over the plates for the purpoſe of compoſing the preſent claffification.

 P. affellatus, r. P. tefellatus
 P. faccinicornis, r. P. pectinicornis
 137. Anthrenus schrophulariæ, r. A. ferophulariæ
 138. Caffida graffa, r. C. groffa
 141. Pausus fichteli, r. P. Fichtelii
 160. S. gigas, r. Sirex gigas
 S. juveneus, r. Sirex juvenus
 S. lobata, r. Spbex lobata
 163. No. 13. Tipula ichneumonea, r. Dioplis ichneumonea
 164. Rhagis scolopacea, r. Rhagio scolopacea
 168. Headlines G. Trombidium, r. G. Trombidium
 12 F. aquaticum, r. 12 Trombidium aquaticum
 13 F. abfurgens, r. 13 Trombidium abfurgens

WORMS.

178. For Headlines for Vermes, Order Inteftata, read Order Inteftina

SHELLS.

192. For Tellina fabulata, read Tellina fabula
 Tellina bimaculata, r. Tellina bimaculata
 202. Headlines for Conchology, Order Volutæ, r. Conchology, Genus Buccinum — Genus Strombus
 226. Paramœcium, r. Paramœcium
 Rolipoda pyrum, r. Kolpoda pyrum

PLATES. VOL. VI.

ANCIENT AND MODERN ATLAS.

PLATE

- I. Ancient Geography—Imperium Car. Mag. ad finem sæculi post Christ. VIII.

A few copies, only, of this Map were published with the parts of the Cyclopædia. The proprietors having afterwards determined to engrave the maps on a larger scale, it was cancelled, and a Map of the World, as known to the ancients, substituted in its stead as the first of the Ancient Atlas.

GEOGRAPHIA ANTIQUA.

TABULA

- I. ORBIS VETERIBUS COGNITUS
 II. Populi, Urbes, &c. in Græcia, Thracia, et Asia, quorum meminit Homerus
 III. Britannia Romana, cum Hibernia et insulis adjacentibus
 IV. Peloponnesus, quæ antea Apia, Pelasgia, et Argos, antequam Romanæ ditionis fuit, &c.
 V. Hellas, sive Græcia Propria, Thessalia et Epirus, antequam Romanæ ditionis fuerunt
 VI. Macedonia et Thracia, antequam Romanæ ditionis fuerunt
 VII. Asia Peninsularis, cum Insulis adjacentibus
 VIII. Ægyptus, provincia Romana Imperialis
 IX. Lybiæ, vel Africæ, ora borealis
 X. Italiæ Regio Alpina, quæ vulgo dicitur Gallia Cisalpina
 XI. Italia Media, vel Italiæ propriæ pars borealis, ante divisionem ab Augusto factam
 XII. Italia Ulterior, cujus pars Australis Magna Græcia, ob Græcorum colonias, dicta, ante divisionem ab Augusto factam
 XIII. Sicilia, provincia Romanorum, cum Insulis adjacentibus
 XIV. Italia in regiones undecim ab Augusto descripta, cum Insulis Corsica et Sardinia
 XV. } Imperium Romanum
 XVI. }
 XVII. Hispania Romana
 XVIII. Galliæ, sicut ab Augusto divisæ, pars meridionalis
 XIX. Galliæ, sicut ab Augusto divisæ, pars septentrionalis. Additur, Gallia qualis fuit in eunte sæculo quinto Æræ Christianæ in 17 provincias dispersita
 XX. Rhætia et Noricum, provinciæ Romanorum

TABULA

- XXI. Germania Magna, quæ nunquam Romanis paruit
 XXII. Terra Filiorum Israelis, antequam in duo Regna dispersita fuit, cum Terra Philistæorum, parte Phœnicæ, &c. Etiam, Judæa et Regiones finitimæ circiter initium Æræ Christianæ.

MODERN ATLAS.

- THE WORLD, Eastern and Western Hemispheres
 The World on Mercator's Projection
 EUROPE
 British Isles
 England and Wales
 Scotland
 Canals, Navigations, and Railways of Great Britain
 Ireland
 Sweden, Denmark, and Norway
 Russian Empire
 North part of Russia in Europe
 South part of Russia in Europe
 The Seven United Provinces
 France
 Spain and Portugal
 Portugal
 Switzerland
 Alpine Country, North Italy
 South Italy
 Prussia
 Germany, East
 Germany, West
 Hungary
 Environs of Constantinople
 ASIA
 Arabia
 Persia
 Hindoostan
 China
 Empire of Japan
 Chart of the East India Islands
 Chart of the Pacific Ocean
 AFRICA
 Ægypt
 Cape of Good Hope
 NORTH AMERICA
 South America
 British Possessions in North America
 United States
 West Indies

INDEX OF THE PLATES.

Containing a List of all the Subjects represented on the Plates, arranged in alphabetical order, and classed under the several Sciences or Departments to which they pertain; together with References to the particular Plate and Figure where each Subject is delineated.

The Roman Numerals denote the *Plate*; the Arabic Numerals, the *Figure*.

AGRICULTURE.

Barn, Common, i. 1.
 Double, i. 2.
 Dutch moveable, i. 5.
 Improved, i. 3.
 Open, i. 4.
 and Threshing Machines, ii. 1—6.
 with moveable floor, and racks for feeding cattle, ii. 7.
 Berne Machine, xxxvii. 1.
 Beverstone Plough, xxxi. 1.
 Blasting Stones, implements for, iii. 1.
 Borers, Draining, xxxvii. 2.
 Breast Plough, or Paring Spade, xxxii. 3.
 Calf Pens, iv. 1, 2.
 Carts, iii. 3—9.
 Cattle Sheds, iv. 3—6. v. 1—8.
 Chaff-cutter, by M'Dougal, vii. 3.
 Salmon's, as made by Rowntree, vii. 1, 2.
 Charles's, Mr., Machine for levelling Land, xxvi. 1, 2.
 Cheese Prefs, viii. 1, 2.
 Cheshire Paring Plough, xxxii. 1.
 Churns, by Hartland, viii. 3. 4.
 by Rowntree, viii. 5—7.
 Coppinger's, Mr., Malt Kiln, xxxvi. 8.
 Corn and Mixed Farm Buildings. See *Farm*.
 Cottage Bed Room, ix. 5.
 Fire-place, ix. 1, 2.
 Staircase, ix. 3, 4.
 Cottages, Farm, vi. 1—14.
 Ornamental, vii. 1—9.
 Couch Grafs Drag, Amos's, ix. 7, 8.
 Rake, by the fame, ix. 9, 10.
 Cultivators, x. 1—5.
 Curd-cutter, iv. 7.
 Cyder Mill, x. 1, 2, 5.
 Prefs, x. 3, 4.
 Dairy Houfes, xii. 1—7.
 at Woburn, xi. 6, 7. xiii. 1, 2.
 Dairy Farm Buildings. See *Farm*.
 Drill Machine, by Salmon, xxv.
 Ducket's Skim Coulter, xxx. 5.
 Embankments, x. xi.
 Earth Buildings. See *Pigs*.
 Fan Machine, xxxvii. 3.
 Farm Buildings, Grafs and Dairy Farms, xiii. 1—5.
 Corn and Mixed Farms, xiv. 1—5.
 Farm Cottages. See *Cottages*.
 Houfes, xv. 1—6.
 Yards, Angular and Circular, Plans of, xvii. 1, 2.
 Square, Plans of, xvi. 1, 2.

AGRICULTURE.

Feeding Houfes for Cattle, iv. 3—6. v. 1—8.
 Fences, xviii.—xxxii.
 Flax, Implements for dressing, &c. xxiii.
 Gates, hangings and fastenings, xxxiv. 1—36.
 Granary, xxiv. 1—5.
 Grafs Farm-Buildings. See *Farm*.
 Harrow, xxvii. 6.
 Sod Cutting Plough, xxvii. 7.
 Grasses, xxxv.
 Grazing. See *Grafs*.
 Harrows, xxvii. 1—6.
 Potatoe, xxxix. 2, 3.
 Hampshire Patent Iron Plough, xxxi. 2.
 Halter cast, Spring Staple for haltering, xxxvii. 4.
 Hay Crib, xxvii. 8.
 Sweep, xxxvii. 5.
 Kentish turn-wright Plough, xxxi. 4.
 Kiln, xxxvi. 1.
 Coppinger's, for Malt, xxxvi. 8.
 Pepper's, for ditto, xxxvi. 4—7.
 Mr. Rawfon's, xxxvi. 2.
 Count Rumford's, for Lime, xxxvi. 1.
 for general use, xxxvi. 3.
 Lactometer, xxxvii. 6.
 Levelling Land, Mr. Charles's Machine for, xxvi. 1, 2.
 Lime Kiln, xxxvi. 1.
 Stone Pounding Machine, xxxvii. 7.
 Malt Kiln, xxxvi. 4—8.
 Mines, draining, xxxviii.
 Mole catching, xxvii. xxix.
 Ploughs, xxix. 1—3.
 Norfolk Plough, xxxi. 3.
 Ox-shoeing Machine, xxxvii. 8.
 Paring Ploughs and Tools, xxxii. 1—9.
 Pepper's, Mr., Malt Kiln, xxxvi. 4—7.
 Pig or Swine Cafe, xxxix. 7, 8.
 Piggery at Woburn, xl.
 Pisé, or rammed earth buildings, implements for, xxxiii.
 1—17.
 Pits, draining, xxxviii.
 Plough for Grafs Sod cutting, xxvii. 7.
 Ploughs, Mole, xxix. 1, 2.
 Paring, xxxii. 1—4.
 Swing, xxx. 1—6.
 Wheel, xxxi. 1—5.
 Ponds, Construction of, xxxix. 1.
 Machine for taking off the Surplus Water, xxxix. 6.
 Potatoe Harrow, xxxix. 2, 3.
 Scoops, xxxix. 4, 5.

INDEX OF THE PLATES.

AGRICULTURE.

Quarries, Draining, xxxviii. 1—5.
 Quendon Barrow, for carrying water, xxxviii. 6, 7.
 Rawfon's, Mr., Kiln, xxxvi. 2.
 Rogers's, Mr., Bean Cultivator, x. 3.
 Rotherham Plough, xxx. 1.
 Rumford's, Count, Lime Kiln, xxxvi. 1.
 Slark's Potatoe Set Scoop, xxxix. 5.
 Small's Chain Plough, xxx. 2.
 Somerville's, Lord, Plough, xxx. 3.
 Double Furrow ditto, xxx. 6.
 Stone Lifting Machine, xxvi. 4.
 Stones, Implements for Blasting, iii. 1.
 Suffolk Iron Plough, xxx. 4.
 Threshing Machines. See *Barns*.
 Water, Machine for raising, xxvi. 5.
 by Sargeant, xxvi. 6.
 Western's, Mr. C., Double Cultivator, x. 4.

ALGEBRA.

Arithmetic, Palpable
 Writing, Ditto.
 Neper's Bones, MISCELLANY, i. 6.

ANALYSIS.

Circle of Circles, Magic, xi. 7.
 Ciffoid, i. 1.
 Conchoid, i. 2—7.
 Construction, i. 8—20. GEOMETRY, ix. 2.
 Cotesian Theorem, ii. 21, 22.
 Crown, ii. 23.
 Cuneus, Parabolic, xiii. 3.
 Curve, ii. 18. 24—26. iv. 1—16.
 Harmonic, ix. 4. No. 2—8.
 Logistic, xi. 4.
 Caulitic, ii. 24.
 Diacaulitic, ii. 25.
 Curvature, iii. 1—13.
 Cycloid, v. 1—8. See also Plate CYCLOID.
 Cylinder, ii. 3, 4.
 Epicycloid, v. 9—11.
 Evolute, vi. 1—10.
 Fluxion, vii. 1—4.
 Function, Analytic, vii. 5—8. GEOMETRY, ix. 3.
 Geometry, Analytic, viii. 1—10.
 Gyration, ix. 1—4. No. 1.
 Harmonic Curve, ix. 4. No. 2—8.
 Helicoid, x. i.
 Inflection, x. 2—7.
 Isoperimetry, ix. 1—17.
 Lemniscate, xi. 1.
 Logarithmic, Atmospheric, xi. 2.
 Curve, xi. 3.
 Logistic Curve, xi. 4.
 Spiral, xi. 5.
 Magic Circle of Circles, xi. 7.
 Square of Squares, xi. 6.
 Locus, xii. 1—23.
 Maxima and Minima, xiii. 1, 2.
 Parabolic Cuneus, xiii. 3.
 Parallelogram, Analytic, xiii. 4.
 Progression, xiii. 5.
 Quadratic Equation, xiii. 6.

ANALYSIS.

Quadratrix, xiii. 7—9.
 Quadrature, xiii. 10—20.
 Ratio, xiii. 21.
 Rectification, xiv. 1—5.
 Sections, following, xiv. 6.
 Solidity, xiv. 7—10.
 Square of Squares, Magic, xi. 6.
 Subtangent, xiv. 11.
 Superficies, xiv. 12—15.
 Tangent, xiv. 16—21.
 Tangent, GEOMETRY, ix. 14—19.
 Variation, NAVIGATION, i. ii. 8, 9.

ANATOMY.

Cranium, xix. xx.
 Ear, Anatomy of, v.—vii.
 Eye, Anatomy of, i.—iv.
 Myology, viii.—xvi.
 Osteology, xvii.—xix.
 Skeleton, xvii. xviii.
 Viscera, xxi.—xxiv.

ANATOMY, COMPARATIVE.

Birds, i.—iii.
 Horfe, i—iv.

ARCHITECTURE.

Abacus, xxi.
 Amphitheatre, ii.—v.
 Annulet, xxi.
 Arch, vi. 1—7.
 Oblique, xxxix.
 of Adrian, ix. 1.
 Constantine, x. 1.
 Severus, ix. 2.
 Titus, x. 2, 3.
 Astragal, xxi.
 Attic Base, i. 1, 2.
 Base, Attic, i. 1, 2.
 Doric, i. 3.
 Ionic, i. 4.
 Basilic, xi.
 Basilica, Roman, from Vitruvius, ii.
 of St. Peter's, ancient and modern, xxv.
 Baths of Caracalla, xxxvi. xxxvii.
 Titus, painting from, xxv.
 Bead, xxi.
 Bridge, Wooden, at Walton, xxxiv.
 Bridges, xxxii.—xxxiv. xxxviii. xxxix. lxx.—lxxviii.
 Cantaliver, xxi.
 Capital, Doric, i. 5, 6.
 Egyptian, xxvi.
 Ionic, i. 7.
 Capitals, Corinthian and Composite, xxvii.
 Caracalla, Baths of, xxxvi. xxxvii.
 Circus of, xii.
 Carpentry, xlii.—xlvii. lviii.—lxxviii.
 Geometrical principles of, lxxix.—lxxxi.
 Carrara, west door of the Cathedral of, xl.
 Cavetto, xxi.
 Centres, lxxvi.—lxxviii.

INDEX OF THE PLATES.

ARCHITECTURE.

Charnsey, viii. & xli.
 Circus of Caracalla, xii.
 Composite Capitals, xxvii.
 Corinthian Ditto, xxvii.
 Order from the Temple of Jupiter Stator, in Rome, xxix.
 Corona, xxi.
 Cyma, xxi.
 Cymatium, xxi.
 Dome, vii. viii. & xli.
 Doors, xxiii. xxiv.
 Doric Base, i. 3.
 Capital, i. 5, 6.
 Order, xviii. a.
 from the Agora, at Athens, xviii. 5.
 Parthenon, xiii.
 a Temple at Selinus, xv. 5.
 a Temple at Delos, xv. 1.
 Ægeſta, xv. 3.
 the Temple of Philip, at Delos, xv. 2.
 Jupiter, at Selinus, xv. 4.
 according to Sir W. Chambers, xvi.
 from the Temple of Jupiter Panellenius, in Ægina, xvii. 4.
 from the Temple of Concord, at Agrigentum, xvii. 3.
 from the Temple of Minerva, at Athens, xvii. 5.
 from the Temple of Theſeus, at Athens, xvii. 2.
 from a Pſeudo-dipteral Temple, at Pæstum, xvii. 1.
 from the Temple of Marcellus, at Rome, xviii. 1.
 from an Hexaſtyle Temple, at Pæstum, xviii. 2.
 from the Temple of Jupiter Nemæus, near Argos, xviii. 3.
 from the Temple of Juno Lucina, at Agrigentum, xviii. 4.
 Echinus, xxi.
 Egyptian Capitals, xxvi.
 Falcia, xxi.
 Fillet, xxi.
 Hindoo Temple in Bahar, xx.
 Hollow, xxi.
 Joinery, xxii.—xxiv.
 Ionic Base, i. 4.
 Capital, i. 7.
 Order, from the Temple of Minerva Polias, at Priene, xxviii.
 Latopolis, Portico at, xxx.
 Liſtel, xxi.
 Modillion, xxi.
 Mouldings, xxi.
 Ogee, xxi.
 Pandroſus, Temple of, at Athens, zix.
 Pannel, xxi.
 Portico at Latopolis, xxx.
 Eastern, of the Parthenon, at Athens, xxxi.
 Roofs, xlii.—xlvii. lviii. lix.
 Scotia, xxi.
 Soffit, xxi.
 Talon, xxi.
 Titus, Baths of, xxv.

ARCHITECTURE.

Torus, xxi.
 Trochilos, xxi.
 Tuſcan Order from the Church in Covent-Garden, xiv.

ARMOUR.

Bronzes, Ancient, i.—iii.
 Carthaginian Armour, iii. 11—14. 16. 18, 19.
 Croupiere, or Buttock Armour, v. 2.
 Daniſh Armour, iv. 3, 4.
 Egyptian Armour, ii. 1, 2.
 Greek Armour, ii. 3—10. 14, 18.
 Henry the Eighth's Armour, v. i.
 Norman Armour, iv. 5.
 Plate Armour of Sir Thomas Beauchamp, iv. 6.
 Roman Armour, iii. 12. 15. 20.
 Saxon Armour, iv. i, 2.
 Sword, Brags, in the British Muſeum, iii. 11. 19.
 Tilting Armour of Robert Dudley, Earl of Leiceſter, v. 5.
 Half Habit of Prince Henry, v. 4.

ARTILLERY.

Aries, or Battering Ram, i.
 Catapulta, ii.
 Carriages, i.—v.

ASTRONOMY.

Aberration, i. 1, 2.
 Altitude, i. 5, 6.
 Parallax of, i. 8.
 Refraction of, i. 7.
 Anomaly, i. 9.* 10.*
 Arc, i. 11.*
 Area, i. 12.
 Argument, i. 13.
 Armillary Sphere, iii. 14.
 Aſcending Nodes, xxi. 4.
 Aſcenſion, iii. 15—17.
 Axis, iii. 18, 19.
 Azimuth, iii. 20, 21.
 Chronology, iii. 22.
 Comet, iv. 23—36.
 Comets, Parabolic Orbits of 72, xxii.
 Commutation, v. 37.
 Configuration, xx. 4.
 Copernican Sphere, xx. 7.
 System, xx. 15.
 Crepuſculum, v. 38—42.
 Culmination, i. 3, 4. v. 43.
 Day, v. 43.
 Declination, v. 44, 45.
 Degree, vi.—viii.
 Demicrofs, v. 46.
 Denſity, ix. 60.
 Depreſſion, ix. 61, 62.
 Deviation, ix. 63.
 Diameter, ix. 64—66.
 Dichotomy, ix. 67.*
 Double Star, ix. 67.
 Earth, ix. 68—70. x. 71.
 Eclipſareon, Ferguson's, x. 74.
 Eclipse, x. 75—77. xi. 78—89. xi. N. 2. 90—98.
 Hindoo Computation, xii. 99.

INDEX OF THE PLATES.

ASTRONOMY.

Eclipse, Mr. Pond's Machine for, xii. 100.
 Ecliptic, xii. 101—103.*
 Egyptian System, xx. 16.
 Elevation, xii. 102.
 Elliptic, xii. 103.
 Elongation, xii. 104.
 Epicycle, xii. 105.
 Equal Altitude, xii. 106.
 Equation of the Center, xii. 107.*
 Time, xii. 108, 109.*⁴
 Equator, xii. 109.*
 Equinox, xii. 110.
 Evection, xii. 107—109. (*one figure*)
 Eccentric, xiii. 110—113.
 Galaxy, xiii. 114, 115.
 Geocentric, xiii. 116.
 Globe, xiv. 117—121.
 Fergufon's Celestial, xv. 122.
 Planetary, xv. 123.
 Gravitation, xv. 124—128.
 Heat, xvi. 138.
 Heliocentric Latitude, xvi. 139.
 Hemisphere, Horizon, Tropics, xvi. 140.
 Northern, i.
 Southern, ii.
 Horizon, xvi. 140, 141.
 Horodictical Quadrant, xix. 8.
 Hour, xvi. 142.
 Jupiter, xvi. 143—146.
 Satellites of, xxi. 3.
 Latitude, xvi. 147.
 Heliocentric, xvi. 139.
 Reduction, xvi. 148. xix. 10.
 Longitude, xvii. 1.
 Magnitudes, proportional, of the primary Planets, ii. 10.
 of the Sun, as seen from ditto, ii. 11.
 Mars, xvii. 2.
 Meridian Line, xvii. 3, 4.
 Moon, xvii. 5—15.
 Moon's Parallax, xviii. 8—14.
 Nodes, xviii. 2.
 Orion, Constellation of, i.
 Paracentric, xviii. 3.
 Parallax, xviii. 4—7.
 of Altitude, i. 8.
 of the Moon, xviii. 8—14.
 of Venus, xviii. 15.
 Particula Exfors, xix. 1.
 Penumbra, xix. 2, 3.
 Planet, xix. 3.*—6.
 Precession of the Equinoxes, xix. 7.
 Prothapherefs, xix. 7.*
 Ptolemaic Armillary Sphere, xx. 6.
 System, xx. 14.
 Pythagorean System, xx. 15.
 Quadrant of Altitude, xiv. 120. xix. 9.
 Quadrant, Horodictical, xix. 8.
 Reduction, Latitude, xvi. 148. xix. 10.
 Refraction, xix. 11.
 of Altitude, i. 7.
 Retrogradation of Planets, xix. 12.
 the Sun, xix. 13.
 Saturn's Ring, xix. 14—16.
 Solar System, ii.
 Sphere, Armillary, iii. 14.

ASTRONOMY.

Sphere, Copernican, xx. 7.
 Ptolemaic Armillary, xx. 6.
 Stars, xx. 9—13.
 System, Copernican, xx. 15.
 Egyptian, xx. 16.
 Ptolemaic, xx. 14.
 Pythagorean, xx. 15.
 Solar, ii. & xxi. 1—4.
 Tychnic, xx. 17.
 Times of the Planets, xxi. 2.
 Trigon, xxi. 5—7.
 Tropics, xvi. 140.
 Tychnic System, xx. 17.
 Velocities of the Planets, xxi. 4.
 Venus, xxi. 8—11.
 Parallax of, xviii. 15.
 Urfa, Major and Minor, CONSTELLATION ii.
 Whirling Table, xxi. 13—22.
 Year, xxi. 12.

ASTRONOMICAL INSTRUMENTS.

Astrrolabe, i. 1.
 Back Staff, i. 2.
 Bird's Quadrant, Graduation of, xviii. 2.
 Bisection of an Arc, xxi. 5.
 Borda's Circle, ii. 4—9.
 Repeating Circle, without reflection, vi.
 Brewster's, Dr., Patent Telescope, xxx. 4.
 Cavendish's, Mr., method of graduating Circles, xviii. 4.
 Quinquesections, xviii. 5.
 Chaulné's, Duc de, method of graduating Circles, xviii. 3.
 Circle, Borda's, ii. 4—9.
 Repeating, without reflection, vi.
 Graduated, with 2 and 3 verniers, iv. 1—4.
 Mayer's, ii. 1—3.
 Mendoza's, iv. 5.
 Ramsden's, v.
 Troughton's English Reflecting, iii. 1, 2.
 Mural, x.
 Portable, ix.
 Repeating, without reflection, vii.
 Wollaston's, viii.
 Clavius's method of graduating a Circle, xxi. 1, 2.
 Cole's Quadrant, xxii. 2.
 Mr., Equal Altitude, xvii. 3.
 Cross Staff, i. 3.
 Davis's Quadrant, i. 2.
 Dial, Star, i. 6.
 Dollond's Portable Equatorial, xi. 5.
 Object Glass Micrometer, xii. 4.
 Refraction Apparatus, xii. 4.
 Dynameters, xxix.
 Elton's Quadrant, i. 8.
 Equal Altitude Instrument, Cotes's, xvii. 3.
 Earl of Hay's, xvii. 4, 5.
 Equatorial Instruments, portable, Dollond's, xi. 3.
 Fayrer's, xi. 4.
 Nairne's, xii. 1.
 Ramsden's, xi. 2.
 Made by ditto for Sir G. Shuckburgh, xv.
 Short's, xi. 1.
 Equatorial, Universal, by Troughton, xiv.
 Equatorial Instrument, Troughton's, at Armagh, xvi.

INDEX OF THE PLATES.

ASTRONOMICAL INSTRUMENTS.

- Equatorial Sector, Graham's, xiii. 1.
 Siffon's, xvii. 1, 2.
- Equatorial Stand of a Telescope, by Smeaton, xiii. 5.
- Fayrer's Equatorial Instrument, xi. 4.
- Fore Staff, i. 3.
- Graduation of Circles, xviii.—xxi.
 Bird's Method, xviii. 2.
 Cavendish's Method, xviii. 4.
 Duc de Chaulné's Method, xviii. 3.
 by Clavius, xxi. 1, 2.
 Graham's Method, xviii. 1.
 by Mafcheroni, xxi. 3—5.
 Troughton's Method, xix. xx.
- Graham's Equatorial Sector, xiii. 1.
 Quadrant, Graduation of, xviii. 1.
 Mural Quadrant, xxiii. 4.
 Zenith Sector, xxxiii. 1.
- Gunter's Quadrant, xxiii. 3.
- Hadley's Octant, xxiii. 1.
- Herschel's, Dr., 40-feet Reflecting Telescope, xxxi.
- Hay's, Earl of, Equal Altitude Instrument, xvii. 4.
- Mafcheroni's Method of graduating a Circle, xxi. 3—5.
- Mayer's Circle, ii. 1—3.
- Mendoza's Circle, iv. 5.
- Micrometer, Object Glafs, Dollond's, xii. 4.
- Microscope, Compound, Theory of, xxiv. xxv.
- Nairne's Portable Equatorial, xii. 1.
- Newton's Quadrant, i. 7.
- Nocturnal, i. 6.
- Object Glafs Micrometer, Dollond's, xii. 4.

 Chords used in Thorough Base, Synopsis of, xxx.
 Canon in Ogni Modo, lxviii.
 Counterpoint, vi.—xx.
 Double, xvii.
 Expression, Marks of, ii.*
 Euclid's Sectio Canonis, lxvii.
 Fingering on Keyed Instruments, xxvii.—xxx.
 Graces and Marks of Expression, ii.*
 Keys, arrangement of a Set of, on Keyed Instruments, i.
 Modulation, xxi.—xxiv.

Kirnberger's examples of, xxiii.
 Rousseau's regular, in C major, xxiii.

Musical Characters, ancient, i.
 Ossian, Hymn of, in Temora, xlv.
 Pathetic Genus, examples of, xxv.
 Romance, Air de Trois Notes, xxxiii.
 Shakes, xxx.
 Thorough Base, ii.—v.
 Time Table, i.*

MUSICAL INSTRUMENTS.

(See also MISCELLANY.)

Æolian Harp, MISCELLANY, xxv. 1.
 Barbiton, Greek, ii. 1.
 Batalaika, Guitar with two strings, ix.
 Been, an Indian Musical Instrument, v. 2.
 Bow, Violin, xiv. 2.
 Bow, Origin of the, viii. 1—5.
 Bugle, xii. 5.
 Ching, Chinese Instrument. MISCELLANY, i. 8.
 Citharistria, i. 2.
 Crowth. MISCELLANY, xxv. 2.
 Fifes, xi. 6, 7.
 Flageolet, English, xi. 8.
 Flute, Common English, xi. 1.
 German, xi. 2.
 Improved, xi. 3.
 Flutes, Double, of the Ancients, ix.
 Gelaika, ix.
 Gong, xi. 9.
 Gondoc Rebec, with three strings, ix.
 Guitar, Spanish, xv. 3.
 Harp, Æolian. MISCELLANY, xxv. 1.
 Bell, x. 4.
 of Brian Boromh, x. 1, 2.
 Greek, ii. 1.
 Silver Prize, x. 3.
 Single, vii.
 Ancient Triple, vii.
 Modern Triple, vii.
 Welsh, vii.
 Hautboy, xi. 4, 5.
 Horn, Hunting, xii. 1, 2.
 French, xii. 4.
 Hunting, of Siberia, ix.
 Indian Musical Instruments, v. 1, 2.
 King, Chinese Instrument, MISCELLANY, i. 9.
 Kit, xiv. 5.
 Lute, Double, i. 3.
 Ancient Metalline, i. 8.
 Lute, xv. 4.
 Arch, xiii. 1.
 Lyre, Ancient, ii. 5, 6. iv. 8. 10.

MUSICAL INSTRUMENTS.

Lyre, Egyptian, iii. 6—10.
 Etruscan, with 7 strings, iv. 7.
 held by Terpsichore, iv. 3.
 Mandola, xiii. 3.
 Mandoline, xiii. 2.
 Mandore, xv. 2.
 Mask of Hercules, ii. 2.
 Thais, ii. 3.
 Masques, Antique Theatrical, i. 6, 7.
 Musicians, Group of, performing an Epithalamium, iii. 1—3.
 Pandean Minstrels, representation of, vi.
 Paltery, iv. 4.

 Forestaff, ASTRONOMICAL INSTRUMENTS, i. 3.
 Meridian, i. 1.
 Meridional Parts, i. (i. & ii.) 2, 3.
 Nocturnal, ASTRONOMICAL INSTRUMENTS, i. 6.
 Quadrant, Hadley's, ii. (i. & ii.) 1—3.
 Sinecal, ii. (i. & ii.) 4.
 Rhumb Line, ii. (i. & ii.) 5, 6.
 Rudder, ii. & iv. 1—4.

INDEX OF THE PLATES.

NAVIGATION.

Sailing, Great Circle, ii. 26—34.
 Current, iii. 3—6.
 Mercator's, ii. 24, 25.
 Parallels, ii. 20—23.
 Plain, ii. & iv. 5—18. ii. 19.
 Traverse, iii. 1, 2.
 Convoy, NAVAL TACTICS, iii. 1—3.
 Tide, i. 4—8.
 Trigonometry, (Plate iii.) iii. 1—5.
 Variation, ii. (i. & ii.) 7—9.

OIL MILL.

Plan and Elevation, by Smeaton

NAVAL TACTICS.

(See NAVIGATION, Plate iii.)

NOTATION.

Ancient Arithmetical Characters

(See MISCELLANY, i. 7.)

OPTICS.

Aberration, i. 1.
 Altitude, iv. 11.
 Angle, i. 2—4.
 Burching's Machine, i. 5.
 Burning Lens, Parker's, ii. 1—3.
 Camera Obscura, iii. 1—7.
 Catoptric Cistula, iv. 1, 2.
 Dioptrics, iv. 2*—4.
 Dispersion of Light, iv. 5—7.
 Eye, v. 2.
 Focus, iv. 8.
 Virtual, v. 1.
 Grinding Machine, v. 3—7.
 Heliofata, vi. 1.
 Hones, Bed of, vi. 2.
 Horopter, vi. 3.
 Incidence, xv. 1.
 Inclination, xv. 1.
 Lens, vi. 5—11. vii. 1—12. viii. 1—12.
 Light, ix. 1—9.
 Looking-glasses, iv. 9.
 Magic Lantern, x. 1—5.
 Magnitude, Apparent, x. 4.
 Micrometer, x. 5—11.
 Herschel's Lamp, xi. 5, 6.
 Malkelyne's, xi. 1.
 Troughton's, xi. 2—4.
 Microscope, xii. 1—12.
 Adams's Compound, xiv. 1—7.
 Culpepper's, xiii. 2.
 Marshall's, xiii. 1.
 B. Martin's, xiv. 5—11.
 Solar, xiii. 6—8.
 Improved, xvi. 1—7.
 Mirror, xv. 2—18.
 Muscæ Volitantes, xv. 18.
 Object Glasses, centering, xv. 19, 20.
 Opera Glass, xv. 21.
 Optical Inequality, xv. 22.
 Optometer, xvii. 1—8.

OPTICS.

Parhelion, xv. 23, 24.
 Pencil of Rays, xvii. 10.
 Place, Optic, xvii. 9.
 Polemoscope, xvii. 12.
 Polyhedron, xvii. 11, 12.
 Polyoptrum, xvii. 13.
 Rainbow, xviii. 1—9.
 Reflection, xvii. 14.
 Reflexibility, xvii. 15.
 Refraction, vi. 4.
 of Light, xviii. 10—24.
 Refrangibility of Light, xix. 1—13.
 Shadow, iv. 10—13.
 Visible, iv. 14—16.
 Vision, iv. 17.

ORGAN.

Church Organ, interior Profile of, ii.
 Keys, Pipes, &c. i.
 Organ, made by Flight and Robson, iii. iv.

PAINTING.

Apollo Belvidere, i.
 Face, Human, diversities of, ii. iii.
 African, iii.
 American, iii.
 Asiatic, iii.
 European, iii.

PANORAMA.

Plates i. ii.

PAPER-MILL.

Plates i. ii.

PERSPECTIVE.

Anamorphosis, i. 1—8.
 Distance of a Vanishing Line, i. 9.
 Line, Horizontal, i. 11.
 Perspective, Theory of, i—xii.
 Point of a Vanishing Line, i. 10.

PISÉ BUILDINGS.

(See AGRICULTURE, Plate XXXIII.)

PLANETARY MACHINES.

Cometarium, i.
 by W. Jones, ii. 1—3.
 Dial for the Equation of the Sun's Center, ix. 1.
 Sun's Declination, ix. 2.
 of mean High Tides, ix. 8.
 for the Moon's Equation of the Center, ix. 4.
 Heliocentric Latitude, ix. 5.
 Horizontal Diameter and Parallax, ix. 7.
 Parallax, ix. 6.
 Reduction of the Ecliptic to the Equator, ix. 3.
 Dials, graduated for shewing Planetary Phenomena, ix.
 Equation Mechanism of a Planet's Orbit, by Huygens,
 iii. 1.

INDEX OF THE PLATES.

TRIGONOMETRY.

Cofines, i. 12.
 Cotangents, i. 15.
 Gunter's Scale, i. 1.
 Secant, i. 4, 16, 17.
 Sector, i. 5—7.
 Sines, i. 4, 10, 11. 18—22
 Spherical Angle, ii. 2.
 Triangle, ii. 3—8.
 Spherics, ii. 9—12.
 Tangent, i. 14. ii. 13.
 Trigonometry, ii. 14—22.
 (*For the figures referred to as on TRIGONOMETRY, Plate III.*
see NAVIGATION, Plate III.)
 Verfed Sines, i. 13.

TURNING.

Lathe, &c.

VOLTAISM.

Battery, &c.

WATER PRESSURE ENGINE, by Smeaton.

WATER WHEELS.

Bread Wheel, Improved, i. 7.
 at the Royal Armoury Mills,
 ii. 4.
 with two Shuttles, ii. 3.
 Buchanan's Wheel and Pentrough, i. 4, 5.
 Burns's Overhot Wheel, ii. 5.
 Chain of Buckets, i. 6.
 Greafing Machine, i. 8.
 Nouaille's Overhot Wheel, i. 3, 4.
 Smeaton's Bread Wheel, i. 1.
 Pentrough, i. 2.
 Water, Method of laying on, ii. 9.

WATER WORKS.

Boulton's Machine for raising Water, i. 2, 3.
 Chrennitz Fountain, i. 14.
 Greave's Bucket Machine, i. 13.
 Hydraulic Ram, i. 4—6.
 Machine for raising Water by the lateral communication of
 a Stream, i. 10.
 Smeaton's, for raising Water at London Bridge
 ii. 1, 2.
 Momentum Pump, i. 1.

WATER WORKS.

Siphon Machine, i. 8.
 Goodwin's, i. 10.
 Spiral Pump, i. 11.
 Water Bellows, i. 15.
 Whitehurst's Machine for raising Water, i. 7.
 Zurich Machine, i. 11.

WEAVING.

Auftin's Engine Loom, i.
 Duff's Draw Boy, &c. ii.

WINDMILL.

Common Vertical Windmill, ii. 1.
 Dutch Windmill, ii. 4.
 Hooper's Horizontal Windmill, i. 1, 2.
 Post Windmill, ii. 3.
 Smock Mill, i. 3—5. ii. 2.

WINDING ENGINE.

Smeaton's Design for a Water Gin for drawing Coals from
 Pits.

WIRE MILL.

Machinery for Wire-Drawing.

WOOLLEN MANUFACTURE.

Carding Engine, iv.
 Gig Mill, v.
 Shearing Machine, iii.
 Spinning Jenny, ii.
 Stubbing Machine, i.

WORSTED MANUFACTURE.

Breaking Frame, i. 5.
 Combs, i. 1.
 Cartwright's Combing Machine, ii. 1—3.
 Gilpin's Combing Machine, i. 4.
 Roving Frame, i. 6.
 Spinning Frame, i. 7.
 Stove, i. 3.

WRITING BY CIPHER.

Characters and Examples, i.—iii.

* * * As only a few of the Plates relating to Natural History are referred to in the articles of the Cyclopædia which they are intended to illustrate, it has been deemed unnecessary to incorporate the subjects of them in the Index. The systematic arrangement and minute analysis of them in the annexed Catalogue will, it is conceived, be found amply sufficient for every purpose of reference and consultation.

THE END.

DIRECTIONS TO THE BINDER.

In making up the Plates of the Cyclopædia into volumes, the first business of the binder must be to arrange the Plates in their several classes, as AGRICULTURE, ALGEBRA, ANALYSIS, &c., and in the order in which they are numbered. He must, however, observe, that some of the Plates are wrongly numbered: which those are, and to what place in the series they must be transferred, he will easily learn from the Catalogue. In some instances he will find two or three Plates numbered alike; and, in others, Plates on which the number has been omitted: in these cases again, he will readily ascertain, from an inspection of the Catalogue, where, and in what order, they are to be placed. In every case, the Catalogue must be his guide, and to this he must rigidly adhere in the arrangement and disposition of the whole of the engravings.

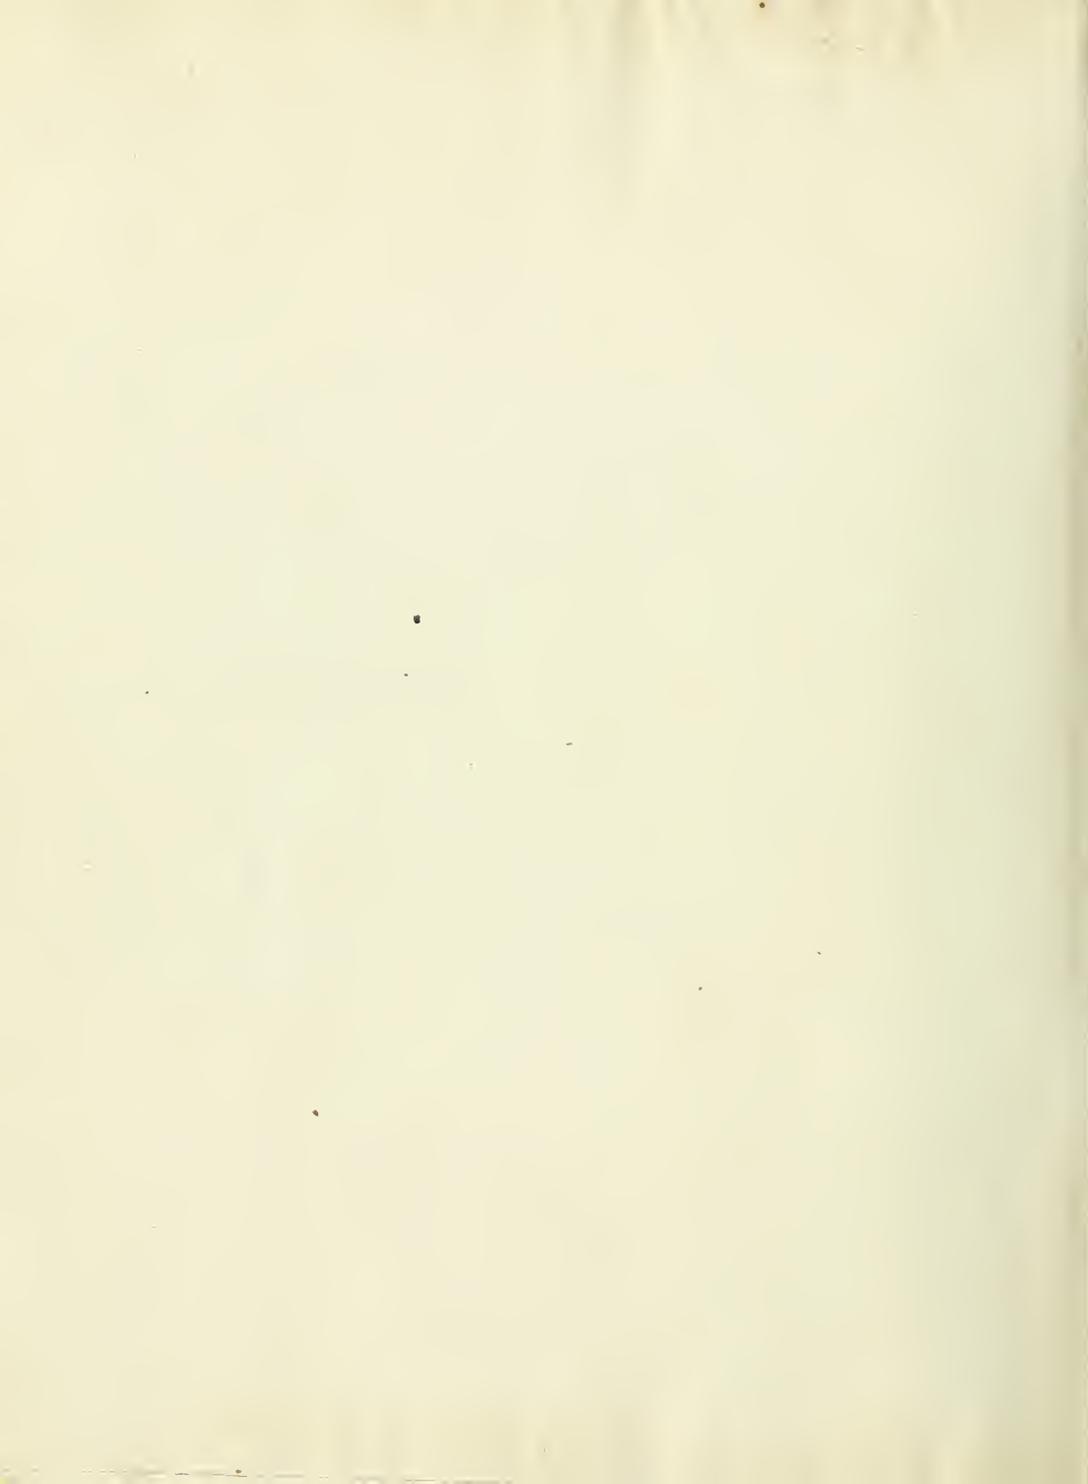

ERRATUM.

The following Plate has been accidentally omitted, both in the Catalogue and in the Index. The Binder is requested to place it immediately after the other Plate of Architecture numbered XV.

ARCHITECTURE, Plate XV.

Doric Order.

- Fig. 1. From the temple of Corinth
2, 3. a Hypæthral Temple at Pæstum
4. the Temple of Minerva at Sunium
5. at Syracuse
