As if to their influence thefe deities owed a repofe in the midft of the ftrms of winter, and by their means were fecured from thofe winds that difturb their submarine retreats, and agitated even the plants at the bottom of the ocean. Such are the accounts given by the Roman and Sicilian poets. Ariftotle and Pliny tell us, that this bird is moft common in the fea of Sicily; that it fat only a few days, and thofe in the depth of winter; and during that period the mariner might fail in full fecurity; for which reafon they were filed *HALCYON-days*. By the poets the king-fifher was alfo made a bird of fong. Virgil ranks it with the linnet:

“Litoraque Aleyonen refonant, Acalanthida dumī.”

Georg. iii. 338.

And Silius Italicus celebrates its mufe, and its floating neft:

“Cum fonat halcyones cantu, nidofque natantes
Inmota gellat, fopitis fluctibus, undā.”

lib. xiv. 275.

But thefe poets have probably transferred to this fpecies the powers of fong that belonged to the alcedo of the philofopher (Hift. An. 892.), which was vocal and perched upon reeds; and which, according to his account, was the leaft of the two, but that both of them have a cyanean back. Belon fuppofes the vocal alcedo to be the greater reed fparrow, *turdus arundinaceus* of Linnæus, a bird of a fine note and converfant among reeds; but Mr. Pennant diffents from his opinion, becaufe the colours of the latter are very plain, and conceives that the alcedo vocalis of Ariftotle is one of the loft birds of the ancients. Some have even doubted, whether the king-fifher of the moderns and the aleyon of the ancients are the fame bird. But the defcription of Ariftotle fufficiently identifies them. The aleyon, fays that philofopher,

philosopher, (lib. ix. 14) is not much larger than a sparrow; its plumage is painted with blue and green, and lightly tinged with purple; these colours are not distinct, but melted together, and shining variously over the whole body, the wings and the neck; its bill is yellowish, long and slender. The habits of these birds also resemble one another. The alcyon was solitary and pensive; and the king-fisher is almost always seen alone, and the pairing season is of short duration. The former was not only an inhabitant of the sea-shore, but haunted the banks of rivers, and the latter has also been found to seek shell-fish and large worms, that abound on the shore of the sea, and in rivulets that flow into it. Alcyon was seldom seen and rapid in its flight; it wheeled swiftly round ships, and instantly retired into its little grot on the shore. The same character belongs also to the king-fisher. The alcyon and the king-fisher have the same mode of taking their prey, by diving vertically upon it. The king-fisher is the most beautiful bird in our climates, as to the richness and luxuriance of the colours of its plumage. It has, says Buffon, all the shades of the rainbow, the brilliancy of enamel, and the glossy softness of silk; and Gesner compares the glowing yellow red, which colours the breast, to the red glare of a burning coal; and yet the king-fisher has strayed from those climates where its resplendent and glowing colours would appear to the greatest advantage. There is a species that is common in all the islands of the South Sea; and Forster, in his observations in Capt. Cook's second voyage, has remarked, that its plumage is much more brilliant between the tropics than in the regions situated beyond the temperate zone, in New Zealand. In the language of the Society islands, the king-fisher is called *Erooro*, and at Otaheite it is accounted sacred, and not allowed to be taken or killed. King-fishers were found not only at Otaheite, but in Huahine and Ulitea, and in the islands that are scattered over the South Sea, though they are more than 1500 leagues distant from any continent. These king-fishers are of a dull green, with a collar of the same about their neck. The islanders entertain a superstitious veneration for them. The chief at Ulitea intreated Capt. Cook's companions, in a very serious tone, to spare the king-fishers and herons of his island, giving permission to kill all the other birds. There are 20 species in Africa and Asia, and eight more that are known in the warm parts of America. The European king-fisher is scattered through Asia and Africa; many of those sent from China and Egypt are found to be the same with ours, and Belon has met with them in Greece and in Thraee. This bird, though it derives its origin from the hottest climates, bears the rigour of our seasons. It is seen in the winter along the brooks, diving under the ice, and emerging with its prey. The Germans have called it *eisvogel*, or ice-bird; and it has been found even among the Tartars and Siberians. The Tartars and Ostiaks use the feathers of these birds for many superstitious purposes. The former use them as love-amulets; pretending that those which float on water will induce a woman who is touched with them to fall in love with the person who thus applies it. The Ostiaks take the skin, the bill and the claws of this bird, and enclose them in a purse; and whilst they preserve this amulet, they think they have no ill to fear. Credulity has admitted and reported many other similar tales concerning the extraordinary powers and virtues of this bird; but it is needless to recite them. Its flesh has the odour of baitard musk, and is unpalatable food. Although these birds are found in cold as well as warm climates, they are often found dead under the ice. M. Daubenton has preserved some of them alive for several months, by feeding them every day with young fry, which is their only proper nourishment; for they reject every other

kind of food; and they may be kept in rooms for some time, provided that they are placed near basons of water full of small fish. Olin describes the method of taking them, at day-break, or in the dusk of the evening, by setting a trap at the edge of the water; he adds, that they live four or five years.

4. *A. crithaca*, *ispida bengalensis* torquata of Brisson, martin-pecheur à front jaune of Buffon, Bengal K. of Albin, and red-headed K. of Latham, is short-tailed; its back is blue, its abdomen yellow, its head and rump purple, its throat and nape white. The bill and the feet are red. This bird is about the size of the last species, somewhat more than six inches long, and is found in Bengal. There is a variety called *A. minor*, or red-headed K. with the head and neck of an orange-red colour.

5. *A. madagascariensis*, martin-pecheur de Madagascar of Buffon, rufous K. of Latham; has a shortish tail, rufous body, white throat, blackish tail feathers; the bill and feet are red. It is five inches and a half long, and inhabits Madagascar.

6. *A. superciliosa*, *ispida Americana viridis* of Brisson, martin-pecheur vert and orange of Buffon, little green and orange K. of Edwards, and supercilious K. of Latham; is green above, white below, with a green band, and yellow eyebrows. It is about six inches long, and found in America. Buffon had it from Cayenne.

7. *A. alcyon*, *ispida cristata carolinensis* of Brisson, alcyon of Ray, king-fisher of Catesby, and belted K. of Pennant and Latham; is long tailed, crested and bluish, with a white abdomen, ferruginous breast, and a white spot before and behind the eyes. There are three varieties, *viz.* *ispida ludoviciana*, martin-pecheur of Louisiana of Buffon, or crab-catcher of Sloane; *ispida Dominicanensis cristata* of Brisson, martin-pecheur hupè de St. Domingue, and jaquacati of Buffon, or American K. of Edwards; and *ispida Brasiliensis cristata* of Brisson, and jaquacati-guacu of Maregrave, Ray and Willughby. This species inhabits America, and seems to migrate from Hudson's Bay to Mexico, where it is eaten, though it has a rank filthy taste. It is about 13 inches long, feeds on fish, nestles in high banks, into which it penetrates in a horizontal direction, lays four white eggs, and hatches in June.

8. *A. torquata*. See ACHALALACILI.

9. *A. capensis*, *ispida capitis bonæ spei* of Brisson, martin-pecheur à gros bec of Buffon; is short-tailed, ash blue, below fulvous, its breast brick-colour, and bill red. It is 14 inches long, and found at the Cape of Good Hope.

10. *A. Senegalensis*, *ispida Senegalensis major* of Brisson, *A. semicærulea* of Forst, martin-pecheur à tête grise of Buffon; is long-tailed, sky-blue, below white, with a hoary head, and coverts of the wings black. There are three other varieties, *viz.* *A.* bluish green, and below yellowish, the crab-eating K. of Latham; the *A.*, with the head and neck obscurely white; and *A.* above sky-blue, below rufous-yellow, and white throat. This species inhabits Arabia and Africa, and particularly the banks of the Senegal, where they are numerous; and the name of the K. is, in the language of the country, Baboucard. The second variety is found in St. Jago and Abyssinia.

11. *A. Smyrnenfis*, Smyrna K. of Albinus and Latham; is long-tailed, ferruginous, with green wings, tail and back. It is found near Smyrna. There are two other varieties, *viz.* the great Gambia K. of Edwards, found in Gambia and Madagascar, 10 inches long; and the great Bengal K. of Albinus, found in Bengal, and on the coast of Malabar; 9 and 10½ inches long.

12. *A. rudis*, *ispida ex albo et atro varia* of Brisson, martin-pecheur piè of Buffon, black and white K. of Edwards and Latham; is short-tailed, black variegated with whitish, and below white. It is 11 inches long, and found in Asia and Africa. This bird is about the size of the Royston crow, and its cry is not unlike that

that of the common crow. 13. *A. da, ispida ternatana* of Latham, martin-pecheur à longs brins of Buffon, Ternate K. of Latham; has the two tail-quills very long, attenuated in the middle, its body dark bluish, and its wings greenish. Seba calls this bird, on account of its beauty, the nymph of Ternate; and he says, that the feathers on the tail are one-third longer in the male than in the female. It is 13 inches long, and inhabits the island of Ternate. 14. *A. purpurina, galbula longicauda* of Brisson, jacamar à longue queue of Buffon, swallow-tailed K. of Edwards, and paradise jacamar of Latham, has the two intermediate tail-feathers very long, the body greenish gold, and the feet feanlory. The bill of this species is quadrangular, acuminate and black, the legs are black, and plumose as far as the toes; the head is violet brown, the throat, neck, and base of the wings are white; the two middle tail-feathers are longer than the others by an inch; the plumage is generally of a dull deep green, in which are distinguished some orange and violet reflections. The female is distinguished from the male by the two middle quills of the tail, which are much shorter, and by its plumage being destitute of the orange and violet reflections. These birds inhabit Guiana, live on insects, fly to great distances, and perch on the tops of trees, go in pairs, not being so solitary and so sedentary as the other jacamars; nor have they the same warble, but a cry or soft whistle, which is heard only at a small distance, and seldom repeated. 15. *A. galbula, galbula* of Brisson, jacaraciri of Maregrave, Ray, Willughby, and Edwards, jacamar of Buffon, green jacamar of Latham; has a wedge-shaped tail, body gold and green, rufous below, and its feet feanlory. The bill is quadrangular, two inches long, acuminate, black, with nostrils ovated at the base, deep blue irides, white chin, sometimes yellowish, stout weak plumose legs, of a greenish yellow colour, and black claws; the plumage is of a very brilliant gold-green, with red copper reflections. The size is about that of a lark, and its length scarcely nine inches; it inhabits the thick forests and damp situations of Guiana and Brasil; it is solitary, and prefers the most sequestered and obscure coverts; it perches on the middle boughs, and remains there alone and at rest for the greatest part of the day and night; its flight is quick, but short, it lives on insects; it has a feeble broken warble, which is tolerably pleasant; and Piso says, that its flesh, though hard, is eaten in Brasil. The savages of Cayenne call this bird venou; and the creoles denominate it colibri des grands bois. 16. *A. orientalis, ispida Indica* of Brisson, eastern K. of Latham, is green, below rufous, head, throat, band of the eye, and tail-feathers sky-blue. The bill is red; the feet and claws black. It is four and an half inches long, and inhabits India. 17. *A. Surinamensis, Surinam* K. of Latham, is short-tailed and blue, whitish below, with a rufous breast, greenish black head, and transverse green spots. Its bill is black, and the back marked with black spots. It inhabits Guiana, nestling in holes near the waters, laying five or six eggs, and living on fish. 18. *A. purpurca, purple* K. of Latham, is below of a reddish gold colour; the head, rump, and tail, are rufous-gold; the back and coverts of the wings bluish-black, the tail-feathers black, and the throat white; the tail and feet are red; a purple line passes from behind the eyes towards the back, terminated by blue. It is about the size of the fourth species, and inhabits India. Of all the kingfishers, M. Buffon says, this is the handsomest and the richest in colours. 19. *A. corulcocephala, blue-headed* K. of Latham, is of a blue-colour, rufous below, with a white throat and blackish tail-feathers. The bill and feet are red; and the crown of the head of a bright blue, stained with waves of a lighter blue. It is four inches long and inhabits

Madagascar. 20. *A. Bengalensis, little Indian* K. of Edwards, and Indian K. of Latham, is bluish-green, rufous below, with brown tail and tail-feathers, and the head marked transversely with blue streaks; the bill is black. It is four and an half inches long, and inhabits Bengal. The little Indian K. of Edwards is a variety, which instead of the rufous ocular band of the former, has two rufous spots. 21. *A. leucorhyncha, ispida Americana caerulea* of Brisson; *A. Americana* or apialtra of Seba, martin-pecheur à bec blanc of Buffon, and white-billed K. of Latham, is of a bluish-green colour, yellowish below, with the head and neck bay-coloured, the tail-feathers cinereous, the tail above blue, and below cinereous. The bill is whitish. It is scarcely five inches long, and inhabits America. 22. *A. Brasiliensis, gip-gip* of Buffon, and Brazilian K. of Latham, is rufous varied with bay, brown and white; below white, with the greater tail-feathers and tail rufous, marked transversely with white spots. The bill and eyes are black, the ocular band, feet, and claws are brown. It is about the size of the lark, and inhabits Brasil. Its cry, gip-gip, resembles the piping of young turkeys. 23. *A. Americana, white and green* K. of Latham, is blackish green, white below, spotted with green, and the space of the breast and throat rufous. The bill is black, a white line passes from its base below the eyes to the occiput; the feet are red; the female has no rufous space at the breast and throat, but the throat is white. It is six inches long, and inhabits Cayenne. 24. *A. bicolor, rufous and green* K. of Latham, is green, rufous-golden below, with a zone waved with white and black on the breast, distinguishing the male, and wings and tail spotted with white. It is eight inches long, and inhabits Cayenne. 25. *A. maculata, ispida Brasiliensis nevini* of Brisson, matuiti of Ray, Willughby, and Buffon, Brazilian spotted K. of Latham; is brown spotted with yellowish, below white spotted with brown, with yellow throat. The bill is red; the feet and claws cinereous. It is of the size of the stare, and inhabits Brasil. 26. *A. Cayennensis, taparara* of Buffon, Cayenne K. of Latham, is blue, below white, with a transverse black band below the back of the head. The upper mandible is black, the lower red, the rump azure, the tail, and tail-feathers with a blue margin, the feet red. This species is numerous, solitary, lays its eggs in holes on the river-banks, is nine and an half inches long, and inhabits Cayenne and Guiana. The time of its incubation is September, and its cry is, carac, carac. 27. *A. atricapilla, black-capped* K. of Latham, is violet-blue, below white, with the head, neck, shoulders, and tips of the wings black, and reddish abdomen. The bill and feet are red. It is ten inches long, and inhabits China. This bird is one of the most beautiful of the kingfishers. There is a variety, viz. *A. Luzonica*, found in the island of Luzon, black above, white below, with a ferruginous abdomen. 28. *A. tuta, respected* K. of Latham, is long-tailed, olive above, white below, with white eye-brows and greenish-black collar. The bill is black, with the inferior mandible white, and the feet are black. It is eight and an half inches long, and inhabits Otaheite, where it is held sacred by the inhabitants. 29. *A. venerata, venerated* K. of Latham, is brown, pale below, with a roundish tail; and the margin of the tail-feathers, wing-coverts, and wing-feathers green. The bill is black, and the feet dusky. It is nine inches long, inhabits the Friendly islands, particularly Apye, and is deemed sacred. 30. *A. sacra, sacred* K. of Latham, is dilute blue-green, below white, with pale ferruginous eye-brows, and the tail and tail-feathers blackish. There are four other varieties, viz. *A.* with white eye-brows, *A.* with head greenish black, pale ferruginous below, and on the nape; *A.* with black head, blue crown, dirty yellow eye-brows, head and abdomen,

and blue wings and tail; and *A.* with a white collar. This species inhabits the Society Islands; the third variety is found in New Zealand; and the fourth, in the Philippine Islands. It is nine and an half inches long, and reckoned sacred by the inhabitants. 31. *A. chlorocephala*, green-headed K. of Latham, is green, with a white neck and black collar, the wings and tail of a sea-green. The bill, under part of the tail, and feet, are blackish. It is nine inches long, and found in Bourou, one of the Molucca islands. 32. *A. carulea*, white-collared K. of Latham, is blue, rufous below, with white eye-brows and collar. It is almost seven inches long, and inhabits India. 33. *A. fusca*, great brown K. of Latham, is crested, olive-coloured, below whitish obscurely striated, with the temples and back of the head dingy white; the tail roundish, of a rusty fulvous, crossed with black waves, and white at the end. The upper mandible is black; the lower white, and black at the base; the female has no crest. The crown of the female and the sides of the chin and neck of both sexes blackish brown; the collar of the female white, and the back olive; that of the male, at its lower part with the rump, pale sea-colour, with a spot of the same in the middle of the coverts of the wings; the tail-feathers of the female greenish-brown; the exterior margin of those of the male blue, but black within, and at their tip, sometimes white at the base, yellow feet, and black claws. This bird is the largest of the kind, its length being 18 inches, and inhabits New Guinea. 34. *A. maxima*, great African K. of Latham, is sub-crested, lead-black colour, pointed with white, with white throat, black neck, and sanguineous breast and abdomen. The bill is black, with linear nostrils, and the feet are very black. It is about the size of a crow, and inhabits Africa. 35. *A. leucocephala*, white-headed K. of Latham, is blue-green, with its head, neck, and under surface white, and wing-quills brown. It is 12 inches long, and inhabits Java. 36. *A. flavicans*, is yellowish below, with the head and back green; the bill red, and the tail blue. It inhabits the island of Ceylon, where it is called by the natives, ten-rou-joulon. This bird is peculiarly dextrous in catching its prey: when it sees the fish in the river it darts upon it and seizes it with its bill, transports it to its nest, subsists a day or two upon the spoil, and spends the whole time in singing. 37. *A. Novæ Guineæ*, New Guinea K. of Latham, is black spotted with white. 38. *A. Ægyptia*, Ægyptian K. of Latham, is brown, with ferruginous spots, and whitish below with cinereous spots. The bill is blackish; the throat ferruginous-white; the upper coverts of the tail wholly white; the tail ashy, the feet greenish, and the claws blackish. It is about the size of a crow, nests in the sycamore and palm-trees, feeds on frogs, fish, and insects, and is found in Egypt. Hasselquist has particularly described this bird. 39. *A. grandis*, great jacamar of Latham, is copper-gold coloured, below ferruginous, with the head and limbs green-gold, and the feet scarfory. 40. *A. tridactyla*, three-toed K. of Latham, is rich and brilliant in its plumage; the upper side of the head and back is of a deep lilac, the feathers of the wings are of a dull indigo, heightened by a border of vivid and shining blue that surrounds each feather; the under side of the body is white; the bill and legs are reddish. It is about four inches long, and inhabits Surinam and India, and the islands of the Indian ocean: Sonnerat found it in the island of Luçon. 41. *A. semicarulea*, is short-tailed, with the hind part of the back; the tail, and the middle of the wings blue, the shoulders black, the head and breast cinereous, and the belly ferruginous. The bill and feet are vermilion. This bird is found near Yemen in Arabia, and is about a span long. Linnæus by Gmelin. Latham, Buffon.

ALCEDO vocalis, a name by which Bellonius, Aldrovandus, and some others have called the reed-sparrow. See the preceding article.

ALCES, in *Entomology*, a species of *LUCANUS*, with exserted mandibles quadridentated at the apex. It inhabits Asia.

ALCES, in *Zoology*, a species of *CERVUS*. See *ELK*.

ALCESTER, or *ALNCESTER*, in *Geography*, an ancient small town of England, in the county of Warwick, situated at the union of the rivers Aln and Arrow; the chief manufacture is needles, and the market-day Tuesday. It is 103 miles north-west of London, and near it is Ragley, a noble seat of the Marquis of Hertford.

ALCHABITUS, in *Biography*, an Arabian astrologer, wrote an introduction to the knowledge of the celestial influences, entitled, "Isagoge ad Magisterium Judiciorum Astrorum," "a Treatise on the Conjunction of the Planets," and another "On Optics." His astrological works were translated by J. Hispalensis, and printed at Venice in 1491, with explanations by Joannes de Saxonia, and in 1521 with the correction of Antony De Fantis, physician of Treviso, in Italy. It is not known at what time Alchabitus lived. Gen. Dict.

ALCHABUR, in *Geography*, a town of Asia, in Diarbekir, upon the Euphrates, in a very agreeable situation, south-east of Aleppo and south-west of Mozul. It serves as a resting-place for the caravans from Bassora. N. lat. 34°. E. long. 57° 54'.

ALCHABUR is also a river of Asia, in the same province.

ALCHAMARUM, a town of Arabia, situated on a high mountain, near the river Ormannus. The access to it is so narrow and difficult, that two men can guard it. The summit of the mountain is very fertile, and affords all necessary supplies to the inhabitants. This is the residence of an Arabian king.

ALCHARISI, *JUDAH*, in *Biography*, a celebrated Jew of the 12th century, was reckoned at the period in which he lived a great poet, and undertook to translate the comments of Maimonides on the Mishra, and his Moreh Nevochim, at the request of the Marilian doctors, who did not understand Arabic.

ALCHATA, in *Ornithology*, a species of *TETRAO*.

ALCHEMILLA, *LADIES' MANTLE*, in *Botany*, a genus of the *tetrandria monogynia* class and order, of the natural order of *senticosæ*, and *rosacæ* of Jussieu. Its characters are, that the calyx is a one-leaved, tubulous, permanent perianthium, with edge flat, divided into eight segments; no corolla; the stamina have erect, awl-shaped, very small filaments on the edge of the calyx, the anthers roundish; the pistillum has an ovate germ, style filiform, of the length of the stamina, inserted at the base of the germ, stigma globular; no pericarpium, the neck of the calyx closing and never opening; the seeds are solitary, elliptic and compressed. There are four species, viz. 1. *A. vulgaris*, common ladies' mantle or bearsfoot, with leaves lobed. This species is frequent in meadows and pastures in England. It is perennial, and flowers in June and July. Horses, sheep, and goats eat it. Cows are said not to be fond of it; and yet Haller, in his Iter Helveticum, informs us, that the astonishing richness of the milk in the famous dairies of the Alps, described by Scheuchzer, is attributed altogether to the plenty of this plant, and that of the ribwort plantain. The whole plant is astringent. In the province of Smolindia, in Gothland, they make a tincture of the leaves, and give it in spasmodic or convulsive diseases. In an epidemic complaint of this kind, which occurred in 1754, it was found of great use. Before this period the infusion, tincture, and

extract of it had been found effectual in milder cases of a similar kind. The root is more austere than the herb, and the virtues are communicated alike to water and spirit of wine. It does not rank among the more powerful astringents, nor does it deserve that high commendation which has been bestowed upon it in hæmorrhages, diarrhœas, the fluor albus, and the healing of wounds. Murray Mat. Med. vol. iii. p. 150. There is a variety of this species, which is the *A. minor* of Hudson, and the *A. alpina pubescens minor* of Plukenet, in which the leaves are more silky, smaller and whiter; and the stems less branching, and the flowers in less clusters. 2. *A. alpina*, cinquefoil or alpine ladies' mantle, with digitate serrate leaves, under silky, grows naturally on the mountains in Yorkshire, Cumberland, Westmorland, North Wales, and the Highlands of Scotland. It is also a native of Sweden, Denmark, the Alps, and other cold parts of Europe; and is admitted into gardens on account of its elegance. It is perennial, and flowers in July. 3. *A. aphanoides*, with many parted leaves and stem erect, is found in New Granada, by Mutis. 4. *A. pentaphyllea*, with leaves quinate, multifid, smooth, grows naturally on the high Alps, as Gothard, Furca, &c. and is only found in some few curious botanic gardens in this country. It was cultivated by Mr. Miller in 1748. These species may be propagated by parting their roots, for which the best time is Autumn. They should have a moist soil and a shady situation. When they are propagated by seeds, they should be sown in Autumn, on a shady moist border, and when the plants come up, they will only need to be kept from weeds.—Martyn's Miller. Dr. Smith (Flor. Brit. vol. i. p. 190.) has added to this genus the *APHANES arvensis* of Linnæus.

ALCHEMIST, a person who professes ALCHEMY.

ALCHEMY, ALCHIMIE, FR. The subject of alchemy occupies so large a space in the humiliating history of the misapplication of brilliant talents, and the wanderings of the human understanding, as to justify and indeed demand a particular enquiry into the causes of its origin, the grounds of its continuance, and the reason of its gradual decline, and at length total retirement from public notice. Instead, therefore, of merely quoting the concise and sarcastic definition given of it by Harris, "Ars sine arte, cujus principium est mentiri, medium laborare, finis mendicare;" (an art without art, originating in falsehood, and proceeding through labour to beggary), we shall treat of it at some length, considering first, the origin of the appellation; secondly, its history; thirdly, the theory and arguments that are alleged in its support; and fourthly, the facts upon which it professes to be established.

I. The word alchemy occurs for the first time in the writings of Julius Firmicus Maternus, who lived in the fourth century, under the reign of Constantine. This, however, is rather the date of the separation between chemistry and alchemy than of the origin of either. The fact seems to be, that a considerable quantity of real chemical knowledge but abundantly mixed, as the custom was, with fable and hypothesis, was possessed by the priests of Egypt; and by these it was communicated, mostly under a promise of secrecy, to the Alexandrian Greeks. It is probable also that as there were several orders of initiation into their sacred rites to be passed through in succession by the aspirant before he was entrusted with their highest mysteries, so there might be a similar rule observed with regard to the communication of the different subjects of the Hermetic philosophy; thus the lowest secrets might be the preparation of the commoner chemical menstrua; the next in order might be the composition of glass and the art of dying, both of which appear, even in the time of Pliny, to have been chiefly practised in

Egypt, and contain at the present day more secrets than any other of our chemical arts; the knowledge of the most efficacious medicines would be esteemed as a proof of still higher confidence; and from the love of mystery inherent in the human mind, the most valuable communications of all would be that mixture of astrology with medical and chemical theories, which, appearing to unfold the secret connection between the great powers of nature, flattered the imagination with the hope of performing things wholly impossible to other mortals. The actual possession and exertion of much lucrative knowledge, and the reputation of still more valuable secrets, would naturally attract the notice of the credulous, the interested, and, if any such existed at that period, of the philosophers, the real disinterested enquirers after science. In process of time, as the influence of the Egyptian priesthood declined by the consequences of the Roman conquest and from other causes, when too the persons entrusted with the secrets of chemistry were considerably increased in number, and were disseminated through all the great cities of the Empire, it would necessarily happen that many from choice or necessity would advance no further in the study than was immediately conducive to their profit, by the refining of metals and the preparation of chemical compounds of general demand and utility, while the more theoretical and mysterious parts of the science would remain in possession of a few. The complicated economy of the Egyptian hierarchy being broken up, and there existing no longer any acknowledged heads of the science, the distinction between chemistry and alchemy would immediately commence. The *chemists*, or artists in chemistry, having no other object in view than pecuniary emolument from the sale of chemical articles, would confine their attention to the improvement of the particular manufactories in which they were engaged. The theoretical chemists or *alchemists*, on the other hand, having in view a certain mysterious unattained and probably unattainable object, would look with contempt on the occupations of the chemist, and would consider themselves as in possession of the only liberal part of the science; their language partly from policy and partly from the want of clear ideas on the subject, would become more and more obscure, and knaves and impostors would creep in among them who would endeavour to indemnify themselves for the ill success of their experiments by frauds and impositions on the unwary. The original difference therefore between chemistry and alchemy seems to have been that the former was a mere art consisting in the preparation of substances by known processes, while the latter proceeding from general principles, either assumed gratuitously or taken up on very inadequate proof, was always aiming through the medium of new and uncertain experiments at the discovery of those powers which were supposed to be characteristic of the sublimer parts of the Hermetic philosophy.

II. It appears certain from the uniformly concurrent testimony of ancient history, that Europe was originally indebted to Egypt for its knowledge of chemical science. This knowledge, however, was but sparingly dealt out to a few of the Greek philosophers, at the expense of much solicitation, and many years of study by the Egyptian priests, as long as that country retained its independence. Afterwards, when by the victorious expedition of Alexander, a race of Greek monarchs was placed on the throne of the Pharaohs, and the foundation of the university of Alexandria had effected a coalition between the arts of Greece and the science of Egypt, chemistry being rendered more accessible, was studied more generally and with increased ardour. The same spirit, however, which pervaded their researches into metaphysics and theology, appears to have

animated their enquiries into the various branches of experimental philosophy; a certain mysterious sympathy was imagined between the metallic substances then known, and the heavenly bodies of our solar system; they were designated by the same names and represented by the same characters. The great intrinsic value also of metals and their still greater conventional importance, especially of gold, silver, and copper, by being adopted as the general representatives of property, naturally engaged a great portion of the attention of chemists; they were submitted to the action of all the known menstrua, they were combined with each other in all proportions, and as lead and copper often contain silver, and silver is found naturally alloyed with gold, but in such proportions as not to be rendered sensible without the aid of chemical analysis, there would often happen in the results of processes an unexpected remainder of one or other of the precious metals. Such an occurrence, flattering at the same time to the two dominant passions of the mind, the love of scientific discovery and the desire of gain, would be eagerly received as a proof of the mutual convertibility of the metals, and would at once cause all those entrusted with the secret to confine their attention to this single object. The same circumstance would also induce a still greater obscurity of language and affectation of mysticism in order to conceal their processes from the knowledge of those who were engaged in similar pursuits; and all confidence in each other being thus interdicted, the science would become retrograde, and much valuable knowledge would entirely perish. The first ages of alchemy produced few writers of reputation; their works are for the most part unpublished, and consist of treatises in Greek by Christian ecclesiastics, of which the following are the principal. "Synesius, on the philosopher's stone." "Zosimus of Panapolis, on the sacred and divine art of making gold and silver," in 24 books. "John, the high priest in the holy city, concerning the holy art." "Theophrastus, on the divine art." "Archelaus, on the same." "Hierotheus, the philosopher, on the philosopher's stone." And "Isaac, the monk, on the discovery of the method of making silver."

The golden age of alchemy most ominously commences with the conquests of Arabian fanaticism in Asia and Africa, the destruction of the Alexandrian library, and the subjection of Europe to the basest superstition and the most profound ignorance. The Saracens lively, subtle, credulous, and nurtured in fables of talismans and the celestial influences, admitted with eager faith the wonders of alchemy, and condescended to receive instruction from the slaves whom they had conquered; the rage of making gold spread through the whole Mahometan world, and in the splendid courts of Almanzor, Haroun al Raschid, and Abdalla Almamoun, the professors of the Hermetic art found patronage, disciples and emolument. Geber, Rhazes, Alfarabius and Avicenna, the most celebrated physicians and chemists of the Arabian school, were deeply tinged with the prevailing insanity. From the 10th to the 13th century little is known concerning the state of alchemical studies; the descendants of the Arabian warriors had begun to acquire a taste for science when their thrones were shaken by the Crusades, and finally overthrown by the desolating deluge of the Turkish barbarians. The arts again retiring from Egypt and Syria, rested for a moment in Constantinople, and then withdrew to the western provinces of Europe. In the 13th century Albertus Magnus, Roger Bacon, and Raymond Lully, appeared as the great revivers of alchemy and chemistry; for from this time, although alchemical pursuits were esteemed the noblest and most important, yet they ceased to occupy entirely the attention of experimental philosophers.

The writings of these able men raised the study of alchemy to a degree of credit which it little merited, especially among the ecclesiastics, who possessed at that time almost all the learning of the age; and even a pope John XXII. was weak enough to assert in his treatise on the art of transmutation, that he had himself made two hundred ingots of gold, of the weight of an hundred pounds each. The 15th century exhibits the same combination of chemistry with alchemy, but in which it is pleasing to discover a great diminution of reserve with regard to the processes of common chemistry, which are for the most part told in sufficiently plain language by the very men who, when treating of alchemy, are utterly unintelligible. The great authors during this period are Isaac and John Isaac Hollandus, George Ripley, and Basil Valentine.

Hitherto alchemy had been confined to the single object of changing the baser metals into silver and gold, and, the materia medica consisting wholly of vegetable and animal preparations, there existed little or no connexion between the chemists and physicians. The prevalence, however, of the leprosy and the rise and rapid progress of the venereal disease, rendered it necessary to have recourse to more potent remedies. The Asiatic practice of physic with regard to the use of mercury was introduced with the happiest effects by Carpus; antimony found an able advocate in Basil Valentine, whose "Currus Triumphalis Antimonii," is a curious mixture of enthusiasm and knowledge.—The credit of the Galenists began to be shaken, and chemistry, by thus associating to itself the most philosophical of the three learned professions, acquired an immense accession of abilities.

The unexpected success which attended the first medical use of chemical preparations, awakened a new hope in the minds of the alchemists; and this was no less than the discovery of an universal medicine, which should heal all disorders, and prolong the duration of human existence to an indefinite period. The great authors of this sect were Paracelsus and Van Helmont, who, by their vigorous use of opium and mercury, effected a number of important cures, impossible to the common Galenical practice of the age. About the same time flourished Henry Cornelius Agrippa, and George Agricola, the first of whom, half knave and half enthusiast, belongs decidedly to the alchemical party; but the latter, though bewildered in youth, by the false philosophy of his time, made ample amends to the cause of true science in his maturer years, by his admirable treatises on metallurgy and mineralogy.

From this time we meet with few authors of reputation who wrote professedly on alchemy, though a kind of half belief in the thing still clung about even the most eminent chemists, and may be clearly traced in their writings. A bold attempt to support the falling cause was made in the beginning of the 17th century by the Rosicrucians, a secret society which originated in Germany, and attracted the attention of the rest of Europe for 25 years. By pretending however to too much, even to more than the ancient chemists, when in the plenitude of their power and influence, ever arrogated to themselves, the fraternity made few converts, and speedily sunk into total discredit. The first philosophical society, for the express purpose of improving natural and mathematical knowledge, was formed at Naples, by Baptista Porta in 1560; and the noble example was followed by most of the other Italian states. The liberal spirit of free inquiry then passing the Alps, established similar societies in England, France, and Germany: the experimental method of philosophizing was introduced by Bacon; public lectures in chemistry began to be instituted; and the principles and facts of alchemy

underwent a severe examination, from the jesuit Athanasius Kicher, which it never afterwards recovered. The most eminent chemists now abjured altogether the researches of alchemy; and it fell ground daily, as well by its own want of evidence, as by the frauds and ignorance of the cheats into whose hands it had fallen. Thus, rapidly declining, it was at length wholly lost to the view of the scientific world, and at present is rarely detected, even by the officers of public justice, to whose care itself, with its ancient associate astrology, has been commended in all the civilized nations of Europe.

III. According to the present theory, each metal is considered as a peculiar chemical element, perfectly undecomposable by any known method, a necessary consequence of which is the utter improbability and hopelessness of all alchemical pursuits; since their object is the composition and decomposition of bodies which are either absolutely simple, or at least as yet incapable of further analysis. This formidable difficulty at the very outset, may well dissuade from all modern attempts at metallic transmutation; but the great fathers of chemical philosophy ought not, in common candour, to be stigmatized as fools or impostors, for strenuously maintaining doctrines which are only, in the present advanced state of the science, self-evidently absurd. In the following summary of the leading theories relative to alchemy, the reader will scarcely expect to find a perfect uniformity and consistency of the several parts with each other, especially when it is considered that they are necessarily collected from a variety of authors differing in abilities, in communicativeness, and in the periods at which they lived.

It appears to have been admitted on all hands, that the metals were compounds of metallic earth and sulphur, (by sulphur was merely understood any pure inflammable substance). This earth being supposed to exist in a larger proportion and less mixed with sulphur in mercury than in any other metal, it came in time to be commonly known by the name of mercurial earth. Gold, as being the most fixed and unchangeable of the metals, was considered as an intimate combination of pure sulphur and mercurial earth, while the other metallic bodies were thought to contain, besides these two essential parts, various impurities. Of this opinion, Geber, Roger Bacon, Ripley, Homberg, &c. were strenuous advocates; and it is especially to the latter of these chemists that we owe the development of this theory, together with a memorable experimental argument in its support. Having exposed regulus of antimony to the action of the great burning-glass of the Duke of Orleans, he found that it increased $\frac{1}{10}$ th in weight, and at the same time became more fixed: a similar effect was produced by exposing mercury to a digesting heat for some days; it was converted into a red powder of greater fixity than the original mercury, had gained in weight, and upon exposure to a red heat was almost wholly volatilized and reconverted into mercury, except a small portion of white hard ponderous metal which remained behind. From this experiment, Homberg deduces the following conclusions: that the pure sulphur of metals is solar light; that it unites with, and increases the weight of all metals that are exposed to its action, except gold; that it gives them a greater fixity; and that, although when loosely combined with mercury it only changes it into a red powder, yet by the further action of heat a part of the mercury becomes saturated with this sulphur, and is converted into a hard fixed metal while the rest is volatilized. To these experiments, important as they were supposed to be at the time of their invention, the superior accuracy of modern

chemistry would object, that the gaseous products were wholly overlooked, and that the fixed metallic residue from the decomposition of the mercurial oxyd, is only a proof of the original impurity of the mercury employed, since no attempt was made by a repetition of the process to effect the fixation of the whole of the mercury. From these and similar experiments, however, the old chemists drew the inferences already mentioned; and by bearing this in mind, it is easy to discover the objects which they had in view, in such of their processes as they condescend to publish in intelligible language. There were supposed to be two methods of making gold, by synthesis and transmutation. The former of these was effected by the direct combination of the pure sulphur of metals and mercurial earth; hence we see the reason of the numberless distillations and digestions, and processes of all kinds for depriving sulphur of its impurities, and bringing it to the last state of rectification or exaltation: hence also the multiplied experiments on quicksilver, in order to give it fixity in the fire: this method however was generally acknowledged to be so difficult, that few alchemists have even pretended to be able to do more than fix the mercury. The art of transmutation was carried much further: it was taken for granted that the object of Nature, in producing metals, was the formation of gold, as being the most perfect of these substances; and that the failure, in all cases, was owing solely to the interposition of certain impurities: it was known also, that the common methods of refining depended on the separation of the precious metals from the baser ones, with which they were mixed and contaminated; the conclusion, therefore, did not seem *a priori*, very extravagant; that, by an improvement in the art of refining, such of the cheaper metals as appeared the most to resemble gold, might be freed from those impurities in which the whole difference between them and gold consisted. Lead, from its specific gravity, and copper, from its colour, were the principal subjects of experiment; and when it is considered that arsenic was not yet discovered to be a metal, and the amazing effects of this substance in disguising the properties of gold, instead of being surprised at the accounts of transmutations, the principal wonder is, that they are not still more numerous and supported by more unexceptionable evidence. The substance capable of effecting this extraordinary change was called the elixir, or medicine of metals, the tincture, the powder of projection or philosopher's stone, a very small portion of which was adequate to the transmutation of a very large proportion of lead or copper; and by using a greater quantity than necessary of this powder, the gold resulting from the operation acquired the property of acting itself as an elixir. Such is the simplest and most consistent theory of the *great work*, as delivered in the writings of the best and most philosophical of the alchemists, nor when its real importance is considered in regard to chemical science and many of the arts, when too it is remembered what numerous and unsuspected sources of error existed at that early period of chemical investigation in which it flourished, and the imposing theory whereby it was supported, shall we lightly stigmatise those who honestly devoted much of their time to the pursuit, with the opprobrious appellation of pertinacious folly.

IV. If we were to enter upon a minute examination of the evidence, by which the principal instances of transmutation are supported, it would extend this article beyond its due limits; the documents besides are so equivocal, and the witnesses so suspicious or incompetent, that the enquiry would but ill repay the trouble: in the room of this, there-

fore, we shall lay down some general considerations, which by their agreement or disagreement with any particular case, will enable us to form a probable judgment of its truth or falsehood. Nor is this, although a summary way of treating the question, unfair or unallowed. In any system that is offered to our belief, if we can point out a fundamental error or contradiction, we may well excuse ourselves from discussing the proofs adduced in favour of detached parts. With what strength of evidence are many stories of apparitions and witchcraft supported, how generally were they believed at the time of their occurrence, and how universally are they slighted and ridiculed at present, not from any new flaw discoverable in the evidence, but from their variance with general principles and experience?

That the philosopher's stone never existed, that no metal has ever yet, by human art, been produced or decomposed, is highly probable, from the convincing proofs which have been afforded by the progress of chemical philosophy, of the fundamental errors, both in fact and theory, to which even the ablest of the alchemists were subject. All chemical knowledge was anciently made a secret of; but by the invention of printing, and the rise of a more liberal spirit of communication, it may be added also, by the superiority of modern over ancient science, all nostrums and mysteries have in a great measure disappeared, and whatever was of sufficient importance to attract general attention, has been added to the stock of general information. In the mean time, alchemy has ceased to be an object of curiosity, not because its end was mean and trivial, but because all its supposed great facts have been resolved into mistakes. The value of the precious metals, instead of diminishing has rather been increasing, the direct contrary to which would have been the case, had they been capable of being produced from any of the baser ones. The professors of alchemy have been chiefly poor, and have in many cases even offered to divulge their secret for a sum of money; that is, being in possession of the art of producing gold ad infinitum, they have offered to communicate this wonderful knowledge for a few ounces of the very substance which they could manufacture by the hundred weight. Some of the alchemists in the dark ages, especially in Germany, who had the unfortunate reputation of possessing the philosopher's stone, were imprisoned by the princes of the country and furnished with chemical apparatus, till they should have purchased their liberty, by producing a certain weight of gold, but not an ounce was ever procured by this method. It is remarkable too, that the most skilful and reputable of the alchemists, although they maintain the possibility of transmutation, and profess to know the method by which it is to be effected, are very far from affirming, that they have themselves actually succeeded in the attempt. Again, if from the best attested instances of gold-making, we exclude those which depend on the suspicious testimony of the alchemists themselves, or the incompetent evidence of men entirely ignorant of chemical science, we shall find the remainder reduced almost to nothing. The royal academy of sciences at Paris, during the first years of its institution, was almost overwhelmed with applications from men who professed to be able to make or deteriorate gold at pleasure; either in this respect deceiving themselves, or in the hope of facilitating their attempts on the public credulity, by the sanction of that learned body: many experiments were in consequence made in their presence, all of which totally failed of success. These repeated detections, like those on the subject of witchcraft, appear to have decided the opinions of phi-

losophers respecting the falsehood of alchemy, and though the wonder of the ignorant is still occasionally called forth on both these subjects, they are no longer considered as worthy of a serious refutation.

ALCHIMELECH, in *Botany*, the Egyptian melilot. Ray.

ALCHINDUS, JAMES, in *Biography*, an Arabian physician, is supposed to have lived about the middle of the twelfth century. His work, "De Medicinarum compositionum gradibus investigandis," was published with the works of Mesue, at Venice, in folio, in 1561, and 1603.

ALCHOLLEA, a kind of food in use among the western Moors, being fleshy meat, pickled, dried, boiled, and potted.

ALCHORNEA, in *Botany*, a genus of the *diocia monadelphia* class and order of professor Martyn, and *monadelphia octandria* of Swartz and Gmelin, the characters of which are, that the calyx of the male is a three or five-leaved perianthium; leaflets ovate, concave, equal, coloured, and deciduous; no corolla; the stamina have eight filaments, equal, scarcely longer than the calyx, slightly connate at the base, anthers ovate and upright; the pistillum is a rudiment: the calyx of the female is a one-leaved, four or five-toothed perianthium, the teeth equal and small; no corolla; the pistillum has a germ twin, superior, styles two, very long and filiform, stigmas simple and acute; the pericarpium is a capsule berried, two-seeded, two-celled, two-valved; the seeds are solitary, large and oblong; there is one species, *viz.* *A. latifolia.*

ALCIATI, ANDREW, in *Biography*, an eminent civilian, was born at Milan in 1492. Having studied the law in the university of Pavia, and in that of Bologna, he commenced the exercise of his profession at Milan in 1517, and became professor of civil law, in the university of Avignon, in 1518. Although his salary amounted to 600 crowns, and the number of his auditors was 800, he left this lucrative and honourable situation in disgust, because the city of Avignon was unable to make a regular payment of his stipend, in 1522, and resumed his first profession at Milan. In 1529, he was invited by Francis I. the king of France, to promote the study of the civil law at Bourges; but impelled by avarice, he successively changed his situation to Pavia, Bologna, and Ferrara, in each of which places he had many scholars and clients, and received ample recompence for his labours. When he was censured by his friends for his frequent changes, he vainly interrogated them, whether they blamed the fun for revolving to enlighten all nations; or, whether, when they admired the fixed stars, they found fault with the planets. But his predominant principle was avarice: and this principle induced him to decline accepting the offer of Paul III. to quit Ferrara and settle at Rome. "Why," said he, "should I, for the uncertain and empty hope of the purple, relinquish the honours of my profession, accompanied with the possession of a rich stipend?" From Ferrara, Alciati returned to Pavia, and in 1550, died of a surfeit, occasioned by excess of eating. He possessed, without doubt, distinguished talents, blended with a considerable degree of selfishness and meanness; and he very materially contributed to the improvement of his profession, introducing a taste for polite literature, and banishing that barbarous humanity, which had before his time prevailed in the lectures and writings of the civilians. Erasmus bestows upon him this high encomium: "The praise which Cicero divides between Scævola and Crassus, when

where he calls the latter the orator best skilled in law, and the former the lawyer who was the most eloquent, is, by the consent of the learned, united to Alciani." His first work was, "An Explanation and Correction of the Greek terms which are used with the Doctors," first published in Italy and afterwards at Strasbourg, in 1515. This was followed by "Paradoxes of the Civil Law," "*Disputationes et Propositiones*," published about the year 1517. "His treatise "*De Verborum Significatione*," was printed at Bourges in 1529. These and many other works on jurisprudence, were published in 1571, in six folio volumes. He also wrote notes on Tacitus, of whose style he says, that energy of language contends with elegance. He also wrote "Emblems" in verse; of which the elder Scaliger says, that "they are entertaining, chaste, and elegant, and not without strength;" and that "the sentiments are such as may be useful, even in civil life." These were published at Augsburg, in 8vo, in 1531; and in 4to, at Padua, with notes, in 1661; and they have been translated into various languages. Other works of Alciani, not included in the first edition, are "*Responsa*," Lugd. 1561; "*Historia Mediolanensis*," 8vo. 1625; "*De forma Romani Imperii*," 8vo. 1559; "*Epigrammata*," 8vo. 1629. A volume of his letters was published at Utrecht in 1697; and in 1695, appeared a letter, which he wrote to a friend who had become a friar, representing the imprudence of his conduct, and exposing, with great spirit, the abuses of monastic life. Gen. Dict. Gen. Biog.

ALCIATI, JOHN PAUL, a native of Milan, distinguished himself in the 16th century, among those protestants who receded to the greatest distance from the Catholic faith, by denying the doctrine of the Trinity, and asserting that Jesus Christ did not exist before he was born of the Virgin Mary. With a view of indulging his speculations and prosecuting his inquiries without molestation, he removed to Geneva. Here he found protestants no less intolerant than papists. From hence the zeal of Calvin in the persecution of Servetus, and the demand of subscription to the formulary of the Italian church at Geneva, obliged him, and others denominated Socinians, to seek refuge in some other country. Accordingly they fled to Poland, where Alciani and Blandrata were very successful in disseminating their opinions. Towards the close of his life, Alciani was reproached with having renounced Christianity, and becoming a Mahometan; but this is probably a calumny, similar to that which has been alleged against others, because they have concurred with the Mahometans in maintaining the simple unity of the divine nature. Calvin and Beza have been very severe in their charges against Alciani, representing him not only as ignorant, but frantic; this, however, is one of those instances in which allowance should be made for that vehemence and invective which are often the result of difference of opinion. Alciani closed his life at Dantzic. In 1564, he published "*Letters to Gregorio Pauli*" against the pre-existence of Christ. Gen. Dict.

ALCIBIADES, an Athenian general, was the son of Clinias, the nephew of Pericles, and lineally descended from Ajax; and as much distinguished by the comeliness of his person and the natural endowments of his understanding, as by his rank and fortune. In early life he manifested those talents and propensities, which duly cultivated and directed would have rendered him eminent and illustrious. But his accomplishments and connections betrayed him into many snares and dangers, which he wanted resolution to avoid. Nature, in him, says Cornelius Nepos, had exerted her utmost force; since, whether we consider his virtues or his vices, he was distinguished from his fellow-citizens. He was

studious and learned, eloquent, aspiring and indefatigable in his pursuits; whatever were the objects to which his views were directed, liberal, magnificent and affable; and he knew when to assume these virtues when they suited his purpose, and to accommodate himself to the times; but when he gave a loose to his passions, he was indolent, luxurious, dissolute, addicted to illicit amours, intemperate and profane. As he entered into life with many advantages, that are adapted to command attention and esteem, he became a very general object of that love, which among the Greeks was sometimes a pure, sometimes an ambiguous, and sometimes a scandalous attachment. It was his felicity to engage the honourable regard and friendship of Socrates; and to his instruction and influence, he was much indebted; and though his preceptor was less successful than he wished, in refraining his vicious inclinations, implanting in his mind good principles, and guiding him to laudable pursuits, his pupil seems never to have totally lost the benefit of his good counsel. Of his vivacity and resolution, when he was very young, the writers of his life have recorded several instances, which indicate his characteristic temper. When he wished to stop a waggon which was passing along the road, and interrupting a play in which he was engaged, and his persuasion had proved ineffectual, he threw himself directly before it and challenged the driver to proceed; and this sudden display of resolution frightened him and made him stop his horses. On another occasion he went into a grammar school, and asked for a volume of Homer, which the master was unable to produce; he gave him a box on the ear and departed; intimating by this action, that a person who was not conversant with Homer was not fit to be a teacher of youth. As an act of frolic, and for the gratification of his companions, he committed the same act of insolence on Hipponicus, a respectable man of rank and fortune; but early on the next morning he went to his house, and being admitted into his presence, stripped himself, and offered his naked body to any chastisement which Hipponicus might think due to him. By this humiliation he not only appeased Hipponicus, but conciliated his esteem, and afterwards obtained his daughter Hipparete in marriage. Alcibiades, as he advanced in years, addicted himself to the chariot-races, and he is said to have been the first person who sent seven chariots at one time to the Olympic games. The magnificence which he displayed on these occasions, rendered him popular in the Grecian states; and at Athens in particular his conduct in various respects became the topic of very general conversation. In order to divert their attention from the more frivolous and faulty parts of his character, he is said to have cut off the tail of a very beautiful dog, which he much valued. The aspiring and active disposition of Alcibiades led him at an early period to military service. His first campaign was in the war which Athens carried on against Potidaea; Socrates attended him, and preserved his life, when, after fighting valiantly, he fell wounded in the field. In the battle of Delium, some years afterwards, he returned the obligation, by guarding Socrates in the retreat, and bringing him off securely. A treaty of peace having been established between the Athenians and Spartans, by the instrumentality of Nicias, who by this event had acquired popularity and influence, the jealousy of Alcibiades was excited, and his ambition led him to overturn the pacific system which Nicias was anxious to preserve. With this view he encouraged the people of Argos to break with the Spartans, and promised them the succour of the Athenians; and he exerted himself in widening the difference that still subsisted between the Laedæmonians and the latter. He also represented Nicias as more attached to Sparta than Athens, and by his eloquence contributed to

subvert his popularity, and to make him odious to the people. When ambassadors arrived from Lacedæmonia, with full powers to terminate all differences, he contrived, by an artifice, to prepossess them in his favour; and to induce them to declare, that though they were deputed to propose an accommodation they were not empowered to bring matters to a conclusion. He then charged them with prevarication, and defeated the object of their embassy. Having so far succeeded, he immediately recommended the cause of the Argives, Mantineans and Eleans, who sought the friendship of Athens; but before any resolution could be adopted, an earthquake happened, which of course dissolved the assembly. When Nicias returned from Sparta, without having succeeded in his negotiations, the Athenians concluded a league with the Argives and the other states above mentioned, for 100 years. Alcibiades was now become so popular, that he was appointed to the command of a fleet which was destined to assist the Argives, and to put an end to the disputes which prevailed in their capital. The disposition of the people with regard to Alcibiades is justly represented by Aristophanes, in his comedy of "The Frogs," (Act. v. sc. 4.) "They hate Alcibiades, says he, and yet cannot do without him." The Misanthrope Timon formed a much better judgment of this conduct of Alcibiades. When he met him as he was coming from the assembly, and observed the respect with which he was treated, he took him by the hand and addressed him; "Go on and prosper, my son; thou dost right in pushing thy fortune, for thy advancement will be the ruin of all these people." The war of Sicily, which soon followed, proved that Timon was not mistaken. The Athenians had long been desirous of establishing themselves in this island. Their ardour was inflamed by Alcibiades, who encouraged the delusive hope, that Sicily would be only their place of arms and arsenal; and that they should proceed from hence to the conquest of Carthage, and make themselves masters of all Africa and the sea, as far as the pillars of Hercules. Nicias and Alcibiades had harangued the people on this subject; but the latter prevailed. A powerful armament was prepared for the expedition; and Alcibiades, Nicias and Lamachus were appointed joint commanders. When every thing was prepared, and the fleet was ready for sailing, several unfavourable omens occurred, which excited in the minds of the people very distressing apprehensions. One of these omens was peculiarly momentous to the fortune of Alcibiades. The Hermæ, or half statues of Mercury, which stood at the entrances of private houses and temples at Athens, were in one night mutilated and destroyed. Alcibiades was suspected of being concerned in this act of impiety, and he was actually charged with having defaced other statues and with having ridiculed some of the sacred mysteries. The fleet, however, sailed; but soon after their arrival in Sicily, Alcibiades was recalled: but having accompanied the messengers as far as Thurium, he absconded and withdrew to Peloponnesus. Being asked, on this occasion, whether he would not rely on his country, with regard to the judgment it might pass on him, he replied, "I would not rely on my mother, lest she should mistake a black bean for a white one," referring to the use of beans in giving suffrages, in which a black bean denoted condemnation. On his non-appearance he was condemned, his property confiscated, and the priests and priestesses were commanded to curse him. Among the latter was Theano, who opposed this decree, alledging, "that she had been appointed priestess, not to curse but to bless." When news was some time after brought to Alcibiades, that the Athenians had condemned him to die, he is said to have declared: "I will make them sensible, that

I am still alive." Alcibiades, in consequence of this event, abandoned the interest of his country, and induced the Spartans to succour the Syracusans, and to declare war against Athens. At Sparta he assumed the Lacedæmonian discipline, and by his versatility of disposition and manners, gained universal esteem. He cut his hair short, bathed in cold water, fed upon coarse bread and black broth, and affected simplicity and gravity of demeanour. He was at the same time active in his exertions, induced several of the cities of Ionia to revolt from the Athenians, and engaged Tissaphernes, the king of Persia's lieutenant, to concur in a league with the Spartans. Whilst he was thus employed he engaged in an intrigue with the wife of the Spartan king, Agis, with the vain ambition, as he pretended, of giving a line of kings to the Lacedæmonians; and Agis became his implacable enemy. He saved his life by taking refuge with Tissaphernes, and in this new situation, he conformed to the luxurious manners of the Persians, and practised adulation to such a degree, as completely to ingratiate himself with the Satrap. By his counsel, Tissaphernes maintained an even balance between the Athenians and Lacedæmonians; and Alcibiades at length contrived to make the friendship of the Persians the means of his own return to Athens. The constitution of the government having been changed, partly by his counsel and agency, from a democracy to an oligarchy, he was recalled by unanimous consent. But before his return, he determined to merit the honour to which he was aspiring by some illustrious exploit. Accordingly, in conjunction with the other Athenian commanders, Theramenes and Thrasylbulus, he took several places and gained several victories over the Spartans and their allies, and then set sail for Athens, with a fleet of 200 ships laden with rich spoils, together with the ships and flags captured from the enemy. A. M. 3597, B. C. 407. His reception was in a very high degree flattering and honourable; and in an assembly of the people, he deplored his misfortunes, which he ascribed to his own evil genius more than to the ill-will of his countrymen; and by his eloquent and pathetic speech he pleased his audience, that crowns of gold were decreed him; he was appointed general by sea and land, with unlimited power; his fortunes were restored to him; and he was absolved by the Eumolpides and Ceryces from all the execrations that had been denounced against him. "As for me," says Theodorus, one of the persons employed in revoking the imprecations, "I have not cursed him, if he has done no evil to his country."

When this pageantry was concluded, he set sail with 100 ships for the island of Andros, which had revolted; and having gained a victory, he departed for Caria in order to raise money, and left the fleet in the charge of Antiochus. Before his return, Lyfander, the Spartan commander, brought on a battle, defeated the Athenian fleet, and slew Antiochus. The consequence of this disaster was discontent at Athens, and the loss of his command. Instead of returning home, he collected a band of soldiers of fortune, and enriched himself by the booty which he took among the Thracian tribes; avoided the fate of the 10 new commanders appointed by the Athenians, most of whom lost their lives, on account of their ill success; and warned the Athenian commanders of the danger to which their fleet was exposed at Ægos-potamos. When Athens was taken by Lyfander, Alcibiades retired to Pitlynia, where he was plundered of part of his property, and from hence he went to Phrygia, and obtained the protection of Pharnabazus the Persian governor. The Athenians, suffering under the oppression of the 30 tyrants, directed their views to Alcibiades; and as soon as the tyrants

wants themselves were apprised of it, they determined upon his death. Critias, one of the number, and formerly an intimate friend of Alcibiades, was active on the occasion; and engaged Lyfander to apply to Pharnabazus for assistance in their purpose. Alcibiades resided at this time in a village of Phrygia, with his mistress Timandra. The soldiers surrounded his house and set it on fire: having in vain attempted to extinguish it he rushed forth, and safely passed through it; but the darts of his murderers were poured upon him from a distance and dispatched him. Timandra wrapped up the body in her own garments, and buried it in a town called Melissa, where the emperor Adrian long afterwards caused a marble statue to be erected to his memory, and a bull to be annually sacrificed on his tomb. His death happened about the 40th year of his age, Ante Christ. 403. Some of his writings were extant in the time of Cicero, Orat. ii. 22.

“It is not easy to say,” says Rollin, in describing the character of Alcibiades, “whether his good or bad qualities were most pernicious to his country; for with the one he deceived, and with the other he oppressed it. In him distinguished valour was united with nobility of blood. His person was beautiful and finely made; he was eloquent, of great ability in affairs, insinuating, and formed for charming all mankind. He loved glory, but without prejudice to his inclination for pleasure; nor was he so fond of pleasure as to neglect his glory for it. He knew how to give into or abstract himself from it, according to the situation of his affairs. Never was there ductility of genius equal to his. He metamorphosed himself with incredible facility, like a Proteus, into the most contrary forms, and supported them all with as much ease and grace, as if each had been natural to him. This convertibility of character, according to occasions, the customs of countries, and his own interests, discovers a heart void of principles, without either truth or justice. He did not confine himself either to religion, virtue, laws, duties, or his country. His sole rule of action was his private ambition, to which he reduced every thing. His aim was to please, to dazzle, and to be beloved; but at the same time to subject those he footed. He favoured them only as they served his purposes; and made his correspondence and society a means of engrossing every thing to himself. His life was a perpetual mixture of good and evil. His sallies for virtue were ill sustained, and quickly degenerated into vices and crimes, very little to the honour of the instructions of that great philosopher, who took no small pains to cultivate him into a man of worth. His actions were glorious, but without rule or principle. His character was elevated and grand, but without connection and consistence. He was successively the support and the terror of the Lacedæmonians and Persians. He was either the misfortune or refuge of his own country, according to his declaring for or against it. In fine, he was the author of an universal destructive war in Greece, from the sole motive of commanding, by inducing the Athenians to besiege Syracuse; much less from the hope of conquering Sicily, and afterwards Africa, than with the design of keeping Athens in dependence upon himself; convinced, that having to deal with an inconstant, suspicious, ungrateful, jealous people, averse to those that governed, it was necessary to engage them continually in some great affair, in order to make his services always necessary to them, and that they might not be at leisure to examine, censure, and condemn his conduct.

He had the fate generally experienced by persons of his character, and of which they cannot reasonably complain. He never loved any one, himself being his sole motive;

nor ever found a friend. He made it his merit and glory to amuse all men, and nobody confided in, or adhered to him. His sole view was to live with splendour, and to lord it universally; and he perished miserably, abandoned by the whole world, and obliged at his death to the feeble services and impotent zeal of one only woman, for the last honours rendered to his remains.” Plutarch in Alcib. Oper. tom. i. p. 191. Corn. Nepos. in Alcib. Thucydides, p. 316, &c. Ed. Duker. Diod. Sicul. tom. i. p. 502-647. Ed. Wesseling. Xenophon, Hellen. lib. ii. Rollin’s Anc. Hist. vol. iii. p. 164-303. Anc. Un. Hist. vol. v. p. 293, &c.

ALCIBIADES, was the name of one of the martyrs at Lyons, A. D. 177. He came originally from Phrygia, and led a very austere life, living upon bread and water: but was afterwards persuaded, in order to avoid giving offence, to partake of all sorts of food promiscuously, and to give God thanks. Lardner’s works, vol. vii. p. 430.

ALCIBIADES, in *Entomology*, a species of *PAPILIO Eques*, with white wings, the anterior bounded by a black margin, the posterior marked below and at their tip with ferruginous black spots, found at Tranquebar.

ALCIBIUM, in *Botany*, a word used sometimes by the ancients as an epithet for a kind of echium, or viper’s bugloss, and sometimes as the name of a peculiar plant.

ALCIDAMAS, in *Biography*, a native of Elæa, in Æolia, was the disciple of Gorgias Leontinus, and contemporary with Isocrates, and lived about 400 years before Christ. Two orations are extant under his name, viz. “Ulyssis contra Palamedem,” published by Aldus, in his edition of the Orations of Æschines, Lyfias, &c. in fol. at Venice in 1513, and by H. Stephens in 1575; and another “Contra Sophistas,” annexed to Aldus’s edition of Isocrates at Venice in 1518. Cicero (Tuscul. lib. p. i. 48, Op. tom. ii. p. 346, ed. Olivet.) mentions Alcidamas as the author of a discourse on the praise of death. Fabric. Bib. Græc. lib. ii. c. 26. tom. i. p. 900.

ALCIDAMAS, in *Entomology*, a name given by Cramer to the *PAPILIO Turnus* of Linnaeus.

ALCIDES, in *Entomology*, a species of *PAPILIO plebejus*, with caudated black wings dotted with blue, ferruginous below, and marked with a yellowish streak; found in Sierra Leona in Africa.

ALCIDES, is also a species of *SCARABÆUS*, with the horn of the thorax bent, bearded below, and unidentated, and the head recurved and naked, found in India.

ALCIDES, in *Mythology*, the surname of Hercules. See *ALCÆUS*.

ALCIDON, in *Ancient Geography*, a river of Triphylia, which rose on the frontiers of Arcadia, and discharged itself into the Jardanus.

ALCIMEDON, a plain of Arcadia, north of Mantinea.

ALCINOUS, in *Biography* and *History*, is represented by Homer as king of the Phæacians, in the island now called Corfu. His subjects were excellent mariners, and much addicted to the dance and song, and every kind of social pleasure; they were employed in conducting the shipwrecked Ulysses, who was hospitably received by Alcinoüs, to Ithaca. The taste of Alcinoüs for horticulture is much celebrated; and his garden, or orchard, is described by Homer as affording an abundance of fruit in quick succession, and also copious streams and pleasant shade. Homer Odyf. lib. vii. v. 108.

Hence we read in ancient geography, of the port, and also of the gardens of Alcinoüs, which pertained to this island.

ALCINOUS, a Platonic philosopher, probably lived about the

the beginning of the second century of the Christian æra, and wrote a perspicuous and elegant "Introduction to the Philosophy of Plato," containing a summary of his doctrine. It was published in Greek by Aldus, at Venice, in 1521 and 1532, 8vo.; and with Ficinus's Latin translation, at Basil, in 1532; and at Paris, in 1562, 4to.; by Charpentier, with a Commentary, at Paris, in 1573; by Heinfius, Gr. and Lat. 8vo., at Leyden, in 1607, and reprinted at Oxford in 1667, 8vo.; and in English, by Stanley, London, in 1655, 1687, &c. Fabr. Bib. Græc. lib. iv. c. 23. vol. iv. p. 40, &c.

ALCIONIO, PETER, a learned Italian, contributed to the revival of letters in the 16th century. He studied the Latin and Greek languages with great diligence, and was for many years corrector of the press to Aldus Manutius at Venice. His learning advanced him to a professorship at Florence, under the pontificate of Adrian VI. He translated many Greek works into Latin, and his translations have been highly commended. He was also the author of many original productions, which prove him to be a man of talents. In his disposition and manners, however, he was chargeable with moroseness and ingratitude, and with intemperance and gluttony. Whilst he unduly valued himself on account of his own performances, he detracted from the merit of others. In the troubles excited at Rome by the Colonnas, he lost his estate; and in the year 1527, when the Emperor's forces took the city, he received a wound as he was going to join the Pope in the castle of St. Angelo; but upon the raising of the siege, he deserted his patron, and united with Cardinal Pompey Colonna, at whose house he sickened and died. His piece on exile, in the composition of which he was reported to have purloined a treatise of Cicero, "de Gloria," which he had found in the library of a monastery, and afterwards destroyed, his "Orations on the taking of Rome by Charles V. and on the knights who died at the siege of Rhodes," are all the original works which he left. The former was printed at Venice, in 1522, in 4to. and again at Leipzig, in 1702, under the title of "Analeceta de Calamitate Literatorum." Gen. Biog.

ALCIPHON, a philosopher of Magnesia, mentioned by A. Antoninus and Suidas, flourished in the time of Alexander the Great. He is different from Alciphron, the sophist, whose age is unknown, who wrote epistles on various topics, of which an edition was published at Leipzig, in 8vo. in 1715. Fabr. Bib. Græc. lib. ii. c. 10. vol. i. p. 425.

ALCIPHON, in *Entomology*, a name given to the *PHALÆNA noctua caricea*, with cinereous wings, white streaks and point in the middle, yellow at the base, and five black points, found in the Indian fig.

ALCIPPUS, a species of *PAPILIO Danaus*, with yellow entire wings, a black margin, and white points, the posterior having a white disc, and black points, found in America.

ALCIS, in *Mythology*, the name of a deity worshipped by the Naharvati, a nation of Germans: and a name given to Minerva by the Macedonians. Tacit. Germ. 43. Liv. 42. 51.

ALCKHAUSEN, in *Geography*, a town of Suabia, belonging to the grand-master of the Teutonic order, in the county of Wehringen.

ALCMÆON, in *Biography*, a physician and philosopher, was born at Crotona, and probably flourished about 500 years before Christ, as he was a disciple of Pythagoras, and attended his lectures. He is said to have been the first person who attempted the dissection of a dead body, and of various animals, in order to examine the structure of the parts and

to have discovered the cochlea, one of the bones forming the organ of hearing. Le Clerc. Hist. de la Médecine, p. 94. He is said by Chalcidius, Haller observes, (Bib. Anat. vol. i. p. 10.) to have attempted a treatise on anatomy, which, however, is lost. The sum of his tenets, as far as they can be collected from scattered fragments, is this: "Natural objects, which appear multiform to men, are in reality two-fold; intelligible natures, which are immutable, and material forms, which are infinitely variable. The sun, moon, and stars are eternal, and are inhabited by portions of that divine fire, which is the first principle in nature. The moon is in the form of a boat, and when the bottom of the boat is turned towards the earth, it is invisible. The brain is the chief seat of the soul, which is in perpetual action and immortal. Health consists in preserving a due mean between the extremes of heat and cold, dryness and moisture." Diogen. Laert. lib. viii. § 83. Clem. Alex. Strom. lib. i. p. 305. Arist. Met. lib. i. c. 5. lib. v. c. 1. Jamblic. Vit. Pyth. c. 23. n° 104. Cicer. de Nat. Deor. lib. i. c. 11. Stob. Ecl. Phys. p. 54, 60, 93. Plut. Plac. Phil. lib. ii. c. 16, 27. lib. iv. c. 17. Fabr. Bib. Græc. lib. vi. c. 9. tom. xii. p. 49. Brucker's Phil. by Enfield, vol. i. p. 401.

ALCMAER, or ALKMAAR, in *Geography*, a town of the United Provinces in North Holland, about four miles from the sea, and 18 miles from Amsterdam. The streets are regular, the houses well built, and it is kept clean and neat by means of its canals. The land about the town was formerly full of morasses, but since it has been drained it is become exceeding good meadow-land, and the town is surrounded by productive orchards and gardens. The town, both within and without, has several beautiful walks. The noble canal that reaches from Alcmaer to Hoorn, was cut towards the beginning of the 17th century. This place was once very strong, and in 1573, obliged the Spaniards to raise the siege, after being encamped before it seven weeks. In the register of this town it is recorded, that in 1637, 120 tulips, with the offsets, sold for 90,000 florins. The butter and cheese that are made in the neighbourhood are reckoned the best in Holland, and furnish considerable articles of trade. N. lat. 52° 28'. E. long. 4° 26'.

ALCMAN, in *Biography*, a Lyric poet, was born at Sardis, or at Sparta, and flourished in the 27th olympiad, about 670 years B. C. Heraclides of Pontus assures us, that he was in his youth a slave at Sparta, and that by his genius and good qualities he obtained his freedom and a high degree of reputation in Lyric poetry. He was a performer on the cithara, and probably sung verses to the flute. Clemens Alexandrinus (Strom. lib. i. c. 16. tom. i. p. 364—365, ed. Potteri.) makes him the author of music for choral dances, and according to Archytas Hermoniacus, cited by Athenæus, (Deipn. lib. xiii. c. 8. p. 600.) Alcman was one of the first and most eminent composers of songs upon love and gallantry. Suidas says, that he was the first who excluded hexameters from the verses that were to be sung to the lyre, which afterwards obtained the title of Lyric poems, and Ælian tells us, that he was one of the great musicians that was called to Lacedæmon by the exigences of the state, and that he sung his airs to the sound of the flute; by which Dr. Burney understands that he taught the Spartan army to perform their evolutions to the sound of this instrument. Alcman, according to Athenæus, was not more remarkable for a musical genius than for a voracious appetite, and Ælian classifies him among the greatest gluttons of antiquity; and his intemperance was probably the cause of the particular disease of which he died. The Spartans erected a monument to him, which subsisted in the time of

Pausanias. Of the many poems attributed to him by antiquity, nothing remains besides a few fragments furnished by citations in Athenæus and other ancient writers, and preserved by Neandrus, H. Stephens, and Ursinus. The name of his mistress was Megaloltrata, a poetess. Alcman used the Doric dialect. Fabr. Bib. Græc. lib. ii. c. 15. tom. i. p. 366. Burney's Hist. Music. vol. i. p. 385, &c. Some have confounded Alcman with Alcmæon, the son of Perithus, of Croton, who, as Clem. Alex. (*ubi supra*) informs us, was the first who wrote a book concerning nature. See also Menægius ad Laertium. viii. 83.

ALCMANIAN, in the *Ancient Poetry*, a kind of lyric verse, or metre, consisting of two dactyls, and two trochees. Such *c. gr.* is

“ Virgibus puerisque cano.”

The word is formed from *Alcman*, the name of an ancient Greek poet, in great esteem for his Erotics, or amorous compositions.

Some authors assign other Alcmæonian verses, composed of three dactyls and a long syllable.

E. gr. “ Munere ketitiamque Dei.”

Others give an Alcmæonian, composed of a dactyl, spondee, and another dactyl, and a long syllable.

E. gr. “ Ne dubita, nam vera fides.”

ALCMENA, in *Mythology*, the daughter of Electryon, king of Mycenæ or Argos, wife of Amphitryon, and mother of Hercules by Jupiter.

ALCMEON, in *Biography*. See **ALCMÆON**.

ALCMEONE, in *Entomology*, a species of the **PAPILIO Danaus**, with rounded wings of the same colour, yellow at the base and white at the tip, found in Malabar.

ALCO, in *Zoology*, the name given to the **CANIS Americanus** of Linnaeus, about the size of a squirrel, with a small head, pendulous ears, curved body, and short tail. There are two varieties, *viz.* the fat alco, yzcuinites-porzotli, canis Mexicanus of Hernandez, or michuacanens of Fernandes, which is extremely fat, head very small, ears pendulous, with the fore part of the head white, and yellowish ears, short neck, arched back, yellow hair, white, short pendulous tail, large belly, spotted with black, white legs and feet, and the female with six conspicuous paps; and the techichi of Fernandes, which is like the small dogs of Europe, except that it has a wild and melancholy air. The first of these approaches the Iceland dog, and the second is perhaps the same animal with the *koupava*, or crab-dog of Guiana, which in figure resembles the fox, and in its hair the jackal; and has been called the crab-dog, because it lives chiefly upon crabs and other testaceous animals.

ALCOBACA, in *Geography*, a town of Portugal, in Estremadura, situated upon a small river near the sea, and surrounded by mountains, in a beautiful situation. It has a celebrated Cistercian abbey, built by Alphonso I. in 1148, which has been the general sepulchre of the kings of that kingdom. It is south-east of Liria, and $6\frac{1}{2}$ leagues north-east of Peniche. This town carries on various manufactures, the oldest of which is in the monastery, established by Pombal. Cambrics and fine lincens are made here, but the woollen manufactory, and that for spinning of wool, which is performed by machinery, are more important. Link's Travels in Portugal, p. 278.

ALCOCK, JOHN, in *Biography*, an English Divine, was born at Beverley, in Yorkshire, and educated in the university of Cambridge, where he took the degree of doctor of laws. His ecclesiastical preferment was rapid, and

he was successively bishop of Rochester, Worcester, and Ely. In 1462 he was appointed master of the rolls; in 1470 a privy-counsellor, and one of the ambassadors to the king of Castile; in 1471 a commissioner to treat with the commissioners of the king of Scotland; and in 1472 lord-high-chancellor of England. He is represented as a prelate of distinguished learning and piety, and also of singular abstinence and purity. He was not only a considerable writer, but an excellent architect, so that he was made comptroller of the royal works and buildings under Henry VII. He improved the palaces of his several sees; founded a school, according to Fuller, at Beverley; and he was also the founder of Jesus college in Cambridge, appropriating to this purpose a nunnery, which was so notorious for incontinence, that the society was called a community of spiritual harlots. This college was first designed for a master, six fellows, and as many scholars; but under the patronage of the bishops of Ely, it has much increased in buildings and revenues, and now consists of a master, 16 fellows, and 30 scholars. Alcock was famous for preaching long sermons; one of his sermons before the university lasted upwards of two hours. He wrote several pieces, *viz.* “ Mons perfectionis ad Carthusianos;” “ Abbatia Spiritus Sancti in pura conscientia fundata;” “ Penitential Psalms,” in English verse; “ Homiliae vulgares;” “ Meditationes pie;” and “ Spousage of a Virgin to Christ.” Besides these he wrote a treatise with the whimsical and punning title of “ Galli Cantus ad confratres suos,” or the crowing of the cock to his brethren; at the beginning of which is a print of the bishop preaching to the clergy, with a cock on each side, and having also a cock in the first page. This prelate died Oct. 1, 1500, at Wisbeach, and was buried at a sumptuous chapel, which he had built for himself, and which, though now neglected, is a noble specimen of his skill in architecture. Biog. Brit.

ALCOER, in *Geography*, a small town of Spain, in New Castile, situated in a fine country, between the Tagus and the river Cuyar. N. lat. $38^{\circ} 55'$. W. long. $4^{\circ} 26'$.

ALCOHOL, *ardent spirit, spirit of wine.* *Alcool, Esprit de vin.* Fr. *Weingeist*, Germ. *Spirito ardente, spirito de vino.* *Acquarzenite*, Italian. The term alcohol is applied exclusively by modern chemists, to the purely spirituous part of all liquors that have undergone the vinous fermentation. As this substance bears a very high importance, both as a chemical agent and in its various combinations, we shall bestow upon it considerable attention.

Alcohol is in all cases the product of the saccharine principle, and is formed by the successive processes of vinous fermentation and distillation. All fermented liquors, therefore, agree in these two points; the one, that a saccharine juice has been necessary to their production; and the other, that they are all capable of furnishing an ardent spirit by distillation.

Various kinds of ardent spirits are known in commerce, such as brandy, rum, arrack, malt-spirits, and the like; these differ from each other in colour, smell, taste, and strength; but the spirituous part, to which they owe their inflammability, their hot fiery taste, and their intoxicating quality, is the same in each, and may be procured in its purest state by a second distillation, which is termed in technical language, *rectification*.

We shall refer the reader to the articles of **FERMENTATION (vinous)**, **DISTILLATION**, and the several species of distilled spirits, for an account of the progressive stages in the formation of alcohol; and we shall here take up the subject with the process of rectification or the second distillation, whereby alcohol is brought to that state of purity

in which its chemical properties are the most conspicuous.

Alcohol, as well as ardent spirits of different kinds, is procured most largely in this country from a fermented grain-liquor, prepared for the express purpose of distillation, from grain, melasses, &c.; but in the wine countries, the spirit is obtained from the distillation of wine; whence the synonymous term, *spirit of wine*. We shall only take the example of brandy, which is the product of the first distillation of wine, and mention the method by which alcohol is procured from it by rectification.

Brandy is a compound of alcohol, water, a colouring extractive matter, and a small quantity of oil. It is to the two last that it owes its peculiar flavour, smell, and appearance, whereby it is distinguished from other distilled spirits. The object of the process of rectification is to separate the first from the other ingredients, and this separation is effected upon the principle that alcohol is the most easily volatilized when a gentle heat is applied, and therefore appears in the first product of distillation, whilst the extractive matter and much of the water remain behind. It is more difficult, however, to get rid of the small portion of oil which brandy contains, as this is soluble in alcohol, and will rise with it in distillation, unless prevented by the means which will be presently mentioned.

The observations of M. Baumé, and his directions for the preparation of alcohol, are so judicious and accurate that we shall here mention them.

The following is the process given by this able chemist: "To procure rectified alcohol, put a quantity of brandy in the water bath of an alembic, and proceed to distillation. Set apart the first product of the distillation when it amounts to about a fourth part of the liquor put into the alembic. Then continue the process till about as much more is obtained, or till the liquor comes over white and milky. Then re-distil the latter product, and mix the first half which comes over with the first part of the former distillation, and continue to distil as long as any spirit comes over. This latter portion may be again distilled, and the first product mixed with the former first products, as before. After each distillation, there remains in the alembic a watery liquor which retains the smell of brandy, but is entirely deprived of inflammable spirit, and is thrown away as useless.

"Having thus procured all the spirit from the brandy, return all the reserved first products to the alembic, and distill with a gentle fire. When about half the liquor has come over, it should be kept apart as pure rectified alcohol; the remainder is to be distilled as long as it is inflammable, and may either be again rectified, or reserved for those purposes where a spirit of inferior strength is required."

The reason given by this judicious chemist for the above process is this: the spirit which first passes over in distillation is the purest, and contains the least portion of gross essential oil; the latter portion, on the other hand, is almost saturated with this oil, and the difference between the two is easily distinguishable when rubbed on the hands; the first product leaves no smell of brandy, but the last gives an odour like the breath of drunkards, who digest their food imperfectly. The quantity of oil, however, varies according to the nature of the brandy; that which is made from wine alone containing the least oil, but that which is procured from wine lees being so full of it as to leave a stratum of the oil swimming on the watery extractive liquor left in the alembic, after all the spirit has been distilled off.

M. Dubuiffon remarks concerning this oil, that the Languedoc brandies contain much more of it than the Cogniac; and that after distilling a large quantity of the for-

mer, the head of the alembic was covered with expanded drops of the oil, which adhered to the vessel. When collected together, and quite cold, they became as stiff as suet, had a chestnut colour, a strong disagreeable taste, and a smell like turpentine.

Various additions have likewise been made to the impure spirit, in order to assist in the separation of this oil. The simplest, and one of the most efficacious is water. This, when added to the oily spirit, turns it milky (as is the case with any other solution of essential oil in alcohol), and by weakening the adhesion between the oil and the spirit, it enables the latter to rise in distillation, unmixed with the former. The chief inconvenience of this addition is, that it weakens the strength of the spirit so much as to require successive rectifications before it can be sufficiently deprived of its watery part.

Chalk, crumb of bread, bran, and other substances, are also added before distillation to the spirit, when oily and ill flavoured; and they all have a good effect in keeping down the matters which contaminate the alcohol, and render the distillation more effectual in purifying it.

Quicklime is still more efficacious, but it much lessens the product of alcohol, alters its nature in some degree, and makes it more penetrating. It would appear, however, that there are some kinds of wine in which the odorous particles are so intimately mixed with the spirituous part, that it is scarcely possible to separate them by simple distillation, however cautiously and skilfully conducted.

The common still with the worm-tube and refrigeratory, is very well calculated for the rectification of spirits, only allowance must be made for the readiness with which ardent spirit, when heated, assumes the state of vapour, and the very great expansion which it then undergoes.

Alcohol, freed from all foreign ingredients but water, and already of considerable strength, may be brought to the specific gravity of 0.825, at the temperature of 60°, by a single distillation, where the heat is moderate and applied very gradually, and the condensation slow. When about a third or half of the spirit is distilled over, the strength of the succeeding portion is diminished, the specific gravity increases, and it becomes more watery, and therefore the first product should be kept apart. This cannot be rendered stronger by any repetition of simple distillation, but it may be still further dephlegmated by means which will be mentioned hereafter.

We shall now proceed to the properties of alcohol.

Alcohol is a colourless transparent liquor, appearing to the eye like pure water. It possesses a peculiar penetrating smell, distinct from the proper odour of the distilled spirit from which it has been procured. To the taste it is excessively hot and burning, but without any peculiar flavour. From its great lightness and mobility, the bubbles which are formed on shaking it subside almost instantaneously, and this is one method of judging of its purity. Alcohol is very easily volatilized by the heat of the hand, it even begins to be converted into a very expansible vapour at the temperature of 55° Fahr: and the quickness of evaporation always produces a considerable cold. It boils at about 165°, and the vapours when condensed return unaltered to their former state. It has never been frozen by any cold, natural or artificial, and hence its use in thermometers to measure very low temperatures.

Alcohol takes fire very readily on the application of any lighted body, the speedier in proportion to its purity. It burns with a pale flame, white in the centre and blue at the edges; this gives but a small degree of heat, and is so faint as to be scarcely visible in bright day-light. It burns with-

out any smoke or vapour, and if strong, leaves no residuum; but if weak, it is extinguished spontaneously, and the watery part remains behind.

Alcohol mixes with water in every proportion. Heat is extricated during the mixture, which is sensible to the hand, even in small quantities. At the same time there is a mutual penetration of parts, so that the bulk of the two liquors, when mixed, is less than when separate. Consequently the specific gravity of the mixture is greater than the mean specific gravity of the two liquors taken apart. The alcohol may be again for the most part separated from the water by distillation with a gentle heat. See GRAVITY (*Specific*.)

Owing to the great affinity which subsists between water and alcohol, this latter has the power of precipitating from their solution various salts dissolved in water. Thus, if some strong alcohol be added to a saturated solution of Glauber's salt in water, a coagulum is immediately produced, consisting of the salt separated from the water in a very divided form, whilst the alcohol and water form a chemical union. This precipitation, however, only takes place in solutions of those salts which are insoluble in alcohol. This circumstance has been very ingeniously applied to the analysis of various saline solutions, and especially to the examination of mineral waters. The power of precipitating some of these salts extends to very dilute solutions. Mr. Kirwan, in his valuable work on mineral waters, has found by experiment that selenium may be completely precipitated from water which contains only one-thousandth of its weight of this earthy salt, by any alcohol whose specific gravity is below 0.850. For further particulars on this subject, we must refer the reader to the article; WATERS (*Mineral, analysis of*).

Alcohol is capable of uniting with a great number of substances, a circumstance which renders its use very extensive in a variety of chemical processes and in analysis. These we shall enumerate.

Some of the weaker acids, such as the boracic and tartareous, are soluble in alcohol without any apparent decomposition, and may be again recovered by evaporating the spirit. The stronger acids, however, exercise a very powerful action on alcohol, and produce several very curious and important compounds, particularly that singular liquor called ETHER. See the articles ETHER, OIL OF WINE, and EFFLUENT GAS.

All the alkalies, when pure, may be dissolved in alcohol, but the fixed alkalies, when combined with carbonic acid,

are not soluble in this menstruum. This affords a very convenient method of procuring the caustic fixed alkalies in a state of purity, and by proper management they may be made to crystallize from their spirituous solution. The colour of a solution of alkali in alcohol is always somewhat red, however pure the alkali be, which is owing to a partial decomposition of the spirit. See the articles POTASH and TINCTURE OF SALT OF TARTAR.

Several of the neutral, earthy, and metallic salts, are soluble in alcohol. It is of some importance in chemical analysis to ascertain the degree of solubility of these salts, and many experiments have been made for this purpose.

The first of any importance are those of M. Macquer. He employed a spirit rectified so far, that a phial holding a Paris ounce of distilled water, at the temperature of 45° Fahr. would contain six gros and fifty-four grains of the spirit. The salts which he employed were previously dried with care, so as to expel their water of crystallization. He poured into a matras upon each of the salts half an ounce of the spirit, and set the vessel in a hot sand-bath. When the spirit began to boil, he filtrated it while hot, and then left it to cool. He then evaporated the spirit, and weighed the saline residuums; and from these he inferred the quantity of salt which the spirit had dissolved.

This method, however, cannot be considered as accurate, as some of the spirit must have evaporated during boiling, and some of the salt must have been deposited in the pores of the filter. Neither would the errors produced in this way be uniform, since it appears that some salts are, in a greater proportion than others, more soluble in hot than in cold spirit.

Wenzel also published a series of experiments, in 1777, on this subject. He varied the heat which he employed, according to the solubility of the salt.

He has, however, been guilty of a great omission in not mentioning the specific gravity of the alcohol which he used, but it may be supposed to be nearly the same as that of Macquer.

Lately, Mr. Kirwan, with that accuracy for which he is so justly distinguished, has given in his treatise on mineral waters, a table of the solubility of certain salts, in which alcohol of different densities is employed, and the temperature properly noticed.

Our readers will find the results of all the above-mentioned experiments in the following Table.

TABLE of the Solubility of SALTS in ALCOHOL.

Salts employed, all deprived of their water of crystallization.	MACQUER.	WENZEL.	KIRWAN.				
	Soluble in 288 grs. of Alcohol, of about 0.84 sp. gr.	Soluble in 240 grs. of Alcohol, of about 0.84 sp. gr.	Soluble in 100 grs. of Alcohol, of different specific gravity.—Heat, from 50° to 70°.				
	Boiling heat used.	Heat various, as specified.	Sp. Gr. 0.9	Sp. Gr. 0.872	Sp. Gr. 0.848	Sp. Gr. 0.834	Sp. Gr. 0.817
	Grains.	Grains.	Grains.	Grains.	Grains.	Grains.	Grains.
Nitrated Potash	4	5 boiling heat	2.76	1.	0	0	0
— Soda	15	23 ditto	10.5	6.	—	0.38	0
— Ammonia	108	214 ditto					
— Lime	288						
— Alumine	—	240 at 54°					
— Magnesia	—	694 boiling					
— Silver	84	100 ditto					
— Iron	4	partly decomposed.					
— Copper	48	240 at 54°					
— Zinc	—	decomposed.					
— Cobalt	—	240 at 54°					
— Bismuth	—	partly decomposed.					
Muriated Potash	5	5 boiling	4.62	1.66	—	0.38	0
— Soda	0	0	5.8	3.67	—	0.5	—
— Ammonia	24	17 boiling	6.5	4.75	—	1.5	—
— Lime	288	240 ditto					
— Alumine	—	240 at 54°					
— Magnesia	—	1313 boiling	21.25	—	23.75	36.25	50.
(dried at 120° by Kirwan.)							
— Barytes	—	—	1.	—	0.29	0.185	0.09
Ditto, ditto, crystallized	—	—	1.56	—	0.43	0.32	0.06
Muriated Iron	36	240 boiling					
— Copper	48	240 ditto					
— Zinc	—	240 at 54°					
Corrosive Sublimate.	204	212 boiling					
Acetited Soda	—	112 ditto					
— Lime	—		2.4	—	4.12	4.75	4.88
— Lead	—	240 at 113°					
— Copper	—	18 boiling					
Arfeniated Potash	—	9 ditto					
— Soda	—	4 ditto					
Oxalic Acidulum	—	7 ditto					

On examining the comparative results given in the above Table, we cannot consider them as very satisfactory, and in some instances we perceive so striking a difference in the results, that it must depend on some more extensive cause than mere casual error. Probably the degree and continuance of heat employed, in drying the salt and expelling its water of crystallization, must have differed considerably in the respective experiments. It would be useless to attempt to explain the cause of difference in all the results, but this shews the great necessity of attending minutely to every particular in such experiments.

The most important of the salts insoluble in highly rectified alcohol are the following—all the sulphats, both of the alkalies, earths and metals; some of the nitrated metals;

some of the muriated metals; and the carbonated fixed alkalies.

A peculiar colour is perceived in the flame of some of these solutions in alcohol when set on fire. The solution of nitre gives a pale yellow flame, that of boracic acid is a faint green, all the solutions of copper burn with a beautiful bright green, and those of nitrated or muriated strontian shine with a deep blood red.

Ammonia, both pure and carbonated, dissolves readily in alcohol. They are generally united by means of distillation, a moderate heat being sufficient to volatilize each. These combinations are principally employed in pharmacy.

Alcohol will readily unite with the carbonic acid gas, and will take up full its own bulk of it at a medium temperature.

perature.—The gas, however, appears to have little or no action on the spirit, since it is expelled from it by heat unaltered.

Neither metals, nor metallic oxyds, nor metallic acids, appear to be in any degree soluble in alcohol.

Sulphur will not contract any union with alcohol by simple digestion either cold or hot; but when they are both reduced to the form of vapour, and then mixed, a true solution is effected, and the result is a very pungent spirit with a strong odour of liver of sulphur, and which becomes milky and deposits the sulphur on dilution with water.

Ardent spirit acts in a slight degree on PHOSPHORUS, and dissolves so much of this inflammable substance as to become slightly luminous in the dark when the solution is dropped into water.

None of the pure earths are soluble in alcohol, and this latter has the power of precipitating lime, barytes, and strontian, from their watery solutions.

It is on the chemical substances belonging to the vegetable kingdom that alcohol exerts its most powerful action as a solvent, and herein consists its very extensive use in pharmacy, in preparing liquors for the table, in some of the arts, and in a very important part of chemical analysis.

Most of the acids belonging to the vegetable kingdom are highly soluble in ardent spirit, such as the tartareous, the citric, the oxalic, and the gallic. In procuring the latter from the gall-nut, alcohol furnishes us with a very elegant and commodious method of separating the acid from the mucilaginous extractive matter with which it is naturally mixed.

The acetic acid, when of the usual strength, simply mixes with alcohol, without producing any decomposition, but chemists have succeeded in forming an acetic ETHER, by employing the acid in its most concentrated state.

Alcohol will readily dissolve SUGAR. Wenzel estimates the quantity at about one-fifth of the spirit. In all the sweet native vegetable juices, such as the sap of the sugar cane and the maple, or the expressed liquor from the parsnip and beet root, the sugar is mixed with a large quantity of a mucilage very little soluble in alcohol. This furnishes a ready method for separating the purely saccharine part, a method which is much employed in the analysis of various vegetables, for the purpose of ascertaining the comparative quantity of sugar which they may be expected to yield to the manufacturer. This solution, when left to spontaneous evaporation, yields minute crystals of sugar, which are at first brown, and require a further purification.

Ardent spirit is an excellent solvent for essential oils, and in general, for the most odorous and inflammable of the vegetable productions. In the essential oil of a plant resides the Spiritus Rector, or the AROMA, that which gives the exquisite perfume to the rose or jessamine. When these odoriferous plants are distilled with alcohol, it rises strongly impregnated with their scent and flavour, and as it takes up no colouring matter it remains perfectly clear as before. Thus, the common lavender water is alcohol distilled off the lavender plant, and holding in solution the essential oil in which the scent resides. The *Distilled SPIRITS* in pharmacy, are similar preparations of alcohol, containing the flavour of spices, aromatics or other substances with which it has been distilled. (See OILS ESSENTIAL).

All the RESINS are highly soluble in alcohol, but scarcely, if at all, in water. These solutions have the peculiar colour, and acrid taste of the resin which they contain. An addition of water renders them all turbid, and from the pure resinous solutions it precipitates almost the whole of the dissolved

contents in the form of thick flakes. The solution of guaiacum affords an example of this.

The GUM RESINS, which are natural mixtures of gum and resin, yield their resinous part to pure alcohol and but little of their gum; water on the contrary dissolves the gum and leaves the resin; but a mixture of alcohol and water will hold both the ingredients in solution. These preparations are called TINCTURES in pharmacy, and they are of considerable use in containing within a small bulk, the medicinal virtues of larger quantities of the ingredients employed.

Artificial resins, or *Resinous EXTRACTS*, are also made by evaporating to dryness solutions of the resinous parts of several vegetables in alcohol.

CAMPHOR is readily and largely soluble in ardent spirit. This solution, when saturated, will let fall almost the whole of the camphor on the addition of water. Camphor also remarkably assists the solution of the resins.

Solutions of resinous substances in alcohol form the basis of the spirit VARNISHES, which when applied in thin layers over any substance, soon dry from the evaporation of the spirit, whilst the resin remains behind furnishing a smooth thin coating to the surface which they are intended to protect.

The fixed oils, when in their simple state, are entirely insoluble in alcohol, but they may be rendered soluble in this menstruum, either when they have been converted into drying oils by the action of metallic oxyds, or when they are united with alkalis in the form of SOAP. A solution of fine soap in alcohol is perfectly colourless and transparent, and will bear dilution with water without becoming turbid. It is employed in medicine as an external application, and is also a good reagent in the analysis of mineral waters to discover the presence of earthy salts. These decompose the soap by double affinity, and produce curdling.

The effect of alcohol on animal substances bear a considerable resemblance to its operation on the vegetable kingdom.

Muscular fibre and the coagulum of blood are not soluble in this menstruum, but are rendered by it hard, contracted, and incapable of putrefaction.

Albumen is equally insoluble in alcohol and is coagulated by it, probably owing to abstraction of the water which held it in solution. Milk is speedily curdled by ardent spirit of every kind.

Alcohol will dissolve WAX, SPERMACETI, BILIARY CALCULI, and the strong scented animal resins or resinous extracts, such as MUSK and AMBERGRIS. This menstruum, however, does not appear to be so extensively applicable to the analysis of animal substances as of those from the vegetable kingdom.

We have already mentioned that alcohol well rectified may be brought to the specific gravity of 0.825 (at 60° temperature) by a simple distillation, where the process is slowly and carefully conducted, and when only the first third, or half of the spirit which comes over is taken. Chemists have, however, been able to bring it to a higher state of dephlegmation, and consequently a less specific gravity. This is done by adding to the spirit in the alembic or still a quantity of a salt which is itself insoluble in alcohol, and which has such a greedy attraction for water as to be able to separate it from the spirit. Boerhaave recommends for this purpose common salt, hot, dry, and decrepitated. He allows the salt and the spirit to stand together for twelve hours, and then to be heated in a water-bath so as to distill off the spirit

by a very gentle warmth. The salt is left moist in the still, and contains much of the water of the spirit employed. Some recommend burnt alum in the room of salt, but the best addition is very dry, hot, carbonated alkali. A highly dephlegmated alcohol may be prepared in this method without the intermediate process of distillation, only then the spirit will be of a reddish colour, and will contain that small portion of caustic alkali which is always mixed with common carbonated potash, and which is soluble in ardent spirit. The following is Boerhaave's process: "Take a clean glass body containing common spirit of wine, and add thereto one-third of its weight of pure and dry potash, (carbonated potash), which immediately falls to the bottom. Shake the glass, and the salt directly grows moist and begins to dissolve at the bottom, whilst a red thin liquor floats above it; the more the vessel is shaken, the more liquid is the lower part of the salt, and the more distinctly separated from the upper liquor, nor is it ever possible to mix them together, but upon resting they will immediately separate into two liquors."

This process may be continued, he adds, by decanting carefully the upper of the two liquors, (which is the alcohol reddened by a little caustic alkali that it holds dissolved) and adding to it more carbonated alkali, till the portion last added will no longer become wet on shaking, a sign that the alcohol is as fully deprived of water as it is capable of being made by means of alkali. As a proof of the high dephlegmation of the spirit by this method, it may be observed, that if a drop or two of water be added to alcohol in which salt of tartar has long remained dry, the alkali immediately becomes moist, and appears to run unctuous from the sides of the vessel.

If the alcohol be *distilled* off the alkaline salt with a gentle heat, the first part which comes over will be about the specific gravity of 0.813 to 0.815, at the temperature of 60°, and this is as high a degree of purity as it has been brought to in the accurate experiments made in this country, by Dr. Blagden and others, for the purpose of ascertaining its specific gravity. (See *GRAVITY specific*.)

M. Lowitz, however, asserts, that he has brought alcohol to the specific gravity of 0.791, chiefly by adding, before distillation, a very large quantity of alkali so as almost entirely to absorb the spirit.

After distillation, the wet alkaline salt which is left may be dried, and again used for the same purpose; but Boerhaave asserts, that after repeating the use of the same alkali for a number of times, it becomes changed in its nature, and unfit for the purpose. This would imply a decomposition of the alcohol, which deserves to be further examined.

Various tests have been devised for ascertaining the purity of alcohol, and the proportion of water which it contains. A spirit, which is very free from water will, when set fire to, burn away without leaving any residue; if it is of moderate strength it will burn for a certain time, and then become extinguished, and leave a portion of water more or less considerable, according to the degree of dephlegmation; if, on the contrary, it is very weak and watery, it will not kindle at all. This test, however, is by no means accurate, since the heat of the burning spirit will drive off part of the water which should be left in the residuum. Another test is, to drop a small quantity of spirit on a small heap of gunpowder and kindle it. The spirit burns quietly on the surface of the powder till it is all consumed, and the last portion fires the powder if the spirit was pure, but if watery, the powder becomes too damp and will not explode. This test, also, is very

inaccurate; for if the powder be drenched with even a strong spirit, it remains too damp to be fired; and if it be only barely moistened, any spirit that will burn will inflame it. A better test is, as we have mentioned, to shake the spirit in a phial with some dry carbonated alkali; but the most accurate of all is to ascertain its specific gravity, and compare it with the density of known quantities of alcohol and water, previously mixed for the purpose of giving a standard of comparison. The very extensive and accurate labours on this subject, conducted by Beaumé, Blagden, Gouvenain, and other eminent scientific men, belong with more propriety to the subject of *SPECIFIC GRAVITY*.

It remains for us to mention the chemical nature of alcohol, and the appearances which attend its decomposition. The remarkable circumstance of a vegetable product burning away, without the smallest trace of smoke or fuliginous vapour of any kind, had long engaged the attention of chemists. Junker and Boerhaave threw much light on the subject by remarking, that the product of the combustion of alcohol was always a quantity of pure water; and this fact was more fully illustrated by the experiments of the illustrious Lavoisier. The ready evaporation of alcohol, and the ease with which its vapour will fill a large vessel, renders it a dangerous experiment to submit a considerable quantity at once to combustion, in oxygen gas confined in any vessel, but this difficulty was surmounted in an ingenious manner. His first experiment was simply to ascertain the quantity of water yielded by the combustion of a given weight of alcohol. This was performed in the following apparatus, contrived by M. Meusnier. See Plates of *CHEMISTRY*, fig. 10.

E F is a worm, contained in the cooler A B C D. To the upper part of the worm E, the chimney G H is fixed, which is composed of two tubes, one within the other, the inner of which is a continuation of the worm, and the outer one is a case of tin-plate, which surrounds it at about an inch distance, and the interval is filled with sand. At the inferior extremity K of the inner tube, a glass tube is fixed, to which is adopted the argand lamp L M, for burning alcohol.

Things being thus disposed, and the lamp being filled with a determinate quantity of alcohol, it is set on fire; the water which is formed during combustion, rises in the chimney K E, and being condensed in the worm, runs out at its extremity F, into the bottle P. The use of the outer tube G H, and of the sand between it and the inner tube, is to prevent the latter which proceeds from the worm, from being cooled during combustion, which would occasion the water, formed by the burning, to fall back on the lamp instead of passing on into the worm.

This apparatus though not perfect, has the advantage of enabling the chemist to operate with larger quantities than can be admitted in the more accurate experiments on combustion, and by it, the above-mentioned chemists were able to establish the important fact, that the quantity of water collected by the combustion of alcohol *very sensibly exceeds the quantity of the alcohol which is consumed*. The product of water must vary according to the strength of the alcohol, and the care of conducting the experiment; but it is so considerable, that from sixteen ounces of ardent spirit, Lavoisier obtained eighteen ounces and a half of pure water. There is besides, however, a large quantity of carbonic acid produced in this experiment which escapes, and cannot be estimated by this apparatus. Some of this gas unites with the water which is collected, and causes it to precipitate lime-water.

Having thus ascertained in a general way the products

of the combustion of alcohol, Lavoisier proceeded to repeat the experiment, in vessels which might determine the result with accuracy. He employed, for this purpose, a large bell glass, holding from 700 to 800 cubic inches, and inverted over a mercurial trough. A small lamp filled with a known weight of alcohol, was introduced under the glass swimming on the surface of the mercury, and the wick was armed with a very minute portion of phosphorus. The atmospherical air within the glass was sucked out by a syphon, till the mercury rose to a certain height which was noted; and the phosphorus on the wick being then kindled by a hot iron, the spirit soon took fire. As the air within the glass would be soon consumed, and the inflammation of the spirit stopped, a constant supply of oxygen gas was sent into the glass through a syphon tube, connected with a reservoir of this gas, and which passed under the mercury into the glass where the combustion was going on. Great precaution was required not to let in more oxygen than was barely necessary to keep up the combustion; otherwise the heat, volatilizing part of the spirit, would have filled the glass with vapour of alcohol, and this mixing with the oxygen, would have suddenly exploded by the combustion. In this, as in other respects, the combustion of alcohol strikingly resembles that of pure hydrogen gas. The experiment was at last stopped by the quantity of carbonic acid generated; and on examining the results, (proper corrections being made for pressure and temperature) it was found, that 93.5 grains of alcohol and 110.32 grains of oxygen had been consumed. The products of these were 93.8 grains of carbonic acid and 106.2 grains of water, which last therefore exceeded by 12.7 grains the quantity of alcohol employed. From these data, and from previous experiments (wherein Lavoisier estimated, that 100 grains of oxygen take up 38.88 grains of carbon, for the production of carbonic acid gas; and that the same quantity of oxygen takes up 17.64 grains of hydrogen for the production of water), he concluded the composition of alcohol to be the following,

Carbon	-	-	-	-	-	28.53
Hydrogen	-	-	-	-	-	7.87
Water already existing in the alcohol						63.6

100

We may observe, however, that the result of this experiment can only be considered as an approximation towards the truth, since the estimation of the component parts of alcohol here given, does not agree with that which is deduced by the same chemist, from the result of vinous fermentation. Neither is there any light thrown on the mode of union between the component parts, and their degree of oxygenation as they exist in the spirit before combustion.

Alcohol has likewise been more directly decomposed without the accession of oxygen gas. Dr. Priestley procured inflammable air by passing the electric spark through spirit of wine. But the most striking experiments on this subject, performed by this excellent philosopher, were the decomposition of spirit by passing it through red-hot tubes, both of earth and metal. He first transmitted two ounce measures of alcohol, reduced to vapour by boiling, through an ignited porcelain tube, and procured 1900 ounce measures of air, "which was all inflammable *without any mixture of fixed air in it*, and which burned with "a blue lambent flame." (We here quote the very words of the author, which the writer of the article ALCOOL, in the *Encyclopædie Methodique*, has made to correspond with the experiments of Lavoisier, by adopting the following

singular translation—*M. Priestley, en faisant passer de l'alcool dans un tube d'argile rougi au feu, en a retiré du gaz hydrogène mêlé de gaz acide carbonique.*) Dr. Priestley's next experiments are still more curious, as they determine the existence of carbonaceous matter in spirit of wine. Having found interesting results from the transmission of the vapour of water through a heated copper tube, he repeated the experiments, only substituting the vapour of spirit of wine for that of water. "In this case," he observes, "the vapour of the spirit had no sooner entered the hot copper tube, than I was perfectly astonished at the rapid production of air. It resembled the blowing of bel-loys. But I had not used four ounces of the spirit of wine before I very unexpectedly found that the tube was perforated in several places, and presently afterwards it was so far destroyed, that in attempting to remove it from the fire, it actually fell in pieces. The inside was full of a black sooty matter, resembling lamp-black." He then varied the experiment by using earthen tubes, placing within them copper filings, and transmitting the vapour of alcohol. The copper was as before, converted into a black friable substance, obviously produced by the addition of carbonaceous matter furnished by one part of the spirit, whilst the other part appeared in the form of a copious stream of inflammable air. It is however by no means the whole of the charcoal of the alcohol which is detained by the copper, for much of it escapes mixed with the inflammable air in the form of fine soot, giving the gas the appearance of a dense black cloud; and when the tube is strongly heated, this volatilized charcoal will give an uniform black coating to any balloon or large vessel in which the gas is received. Dr. Priestley found some other metals to undergo a similar change by the vapour of alcohol, but none in so striking a manner as copper. On heating some of this *charcoal of copper*, as he calls it, in oxygen gas, he found it to burn very readily to a certain point, after which the remainder could not be again kindled. The gas produced by the combustion, was pure fixed air or carbonic acid.

The excellent Dutch chemists, of the Teylerian institution, Van Marum and colleagues, repeated Dr. Priestley's experiments with great accuracy, and found the same results in every essential particular. They employed, as well as Dr. Priestley, Wedgwood's porcelain tubes, which they inclosed in iron tubes to prevent the sudden action of the fire which is apt to crack them. One extremity of the earthen tube received a small retort in which was put the alcohol, and the other entered a metallic serpentine tube, immersed in a refrigeratory, and provided at the further end with a bottle to receive the gaseous products. In the first experiment which was performed, an ounce and a half of alcohol in vapour had been transmitted through the heated copper, and had produced about six cubic feet of inflammable air.

In the second experiment the heat was greater, and the production of the gas more rapid. In all, the copper was reduced to a black and very friable substance, which fell to pieces between the fingers. The proportion of charcoal added to the copper by the experiments, varied at different times apparently owing to the greater or less rapidity with which the process was conducted. Dr. Priestley had united 446 grains of charcoal to 28 of copper, in one instance; and 508 to 19, in another: but the Dutch chemists found a much less proportion of charcoal, being only an addition of 292 grains to 748 of copper in one case, and in another, 180 of charcoal to 612 of the metal. The great difference in the results is, however, of little consequence in attempt-

ing to ascertain by these experiments the exact proportion of the component parts of alcohol, since a large part of the carbonaceous ingredient escapes the copper, and passes over into the vessels which receive the inflammable air, where it either appears in the form of a fine black soot, or remains permanently united with the hydrogen gas. M. Van Marum likewise collected in the bottle connected with the serpentine a quantity of nearly pure water, about equal to half the weight of the alcohol evaporated by boiling, and of the specific gravity of .996. He does not inform us of the strength of the spirit which he used. He confirmed the other part of Dr. Priestley's experiment by burning the *charcoal of copper* in oxygen gas, and procuring pure carbonic acid, whilst the remaining copper still retained a small portion of carbon which could not be consumed. It is worthy of remark, that the inflammable air produced in the experiments of both these eminent chemists was found to be not much more than twice as light as common air, and it probably bears a considerable resemblance to that species of gas, termed, with great propriety by Mr. Crnikhank, *Gaseous Oxid of CARBON*.

The vapour of alcohol transmitted through earthen tubes forms, in particular circumstances, that singular air which has been named *OLEFIANT GAS*.

The uses to which alcohol is applied are numerous and important. In the arts, it is employed largely as a solvent for those resinous gums which form the basis of numerous varnishes and similar applications.

It possesses in the highest degree the cordial, stimulating, and intoxicating qualities of all distilled spirits, and although the less powerful and more grateful of the spirituous liquors, such as rum, brandy, &c. are more peculiarly devoted to the use of the table, the purer ardent spirit, again sufficiently diluted with water, is employed as the basis of many of the artificial cordial spirits and liquors, to which a flavour and additional taste are given by particular admixtures. Similar to this is the use of alcohol in medicine, where it serves as a solvent for the more active parts of vegetables, under the form of tinctures, and it is also employed as an external application, often with considerable success.

The highly antiseptic power of alcohol renders it particularly valuable in preserving particular parts of the body as anatomical preparations.

The gentle, steady, and uniform heat which it gives during combustion, and the absence of smoke or fuliginous vapour of any kind, make it often a most eligible material for burning in lamps.

As a fluid for thermometers, it has the advantage over mercury in not freezing in any known degree of cold, but from its ready volatility in a moderate heat it cannot be depended on with any accuracy, above 90 or 100 degrees.

The expansibility of alcohol is much greater than water; the former being, in a range of temperature from 30 to 100, $\frac{1}{3}$ th of its bulk, and the latter only $\frac{1}{14}$ th.

The use of alcohol in chemical analysis has been already mentioned. As a solvent for some of the earthy and metallic salts, and a precipitant of others, it is peculiarly fitted to assist in the analysis of mineral waters, and saline substances in general; and in the chemical examination of vegetable and animal matter, it furnishes a solvent of very extensive power, possessed of the valuable advantage to the chemist of producing but little decomposition in the substances which it holds in solution, and therefore enabling him to prevent them almost exactly with their native properties and distinctive characters.

VOL. I.

Boerhaave's Chemistry, vol. ii.—Encyclopedic Methodique Art. Alcohol.—Priestley on Air, 2d edition.—Annales De Chimie, tom. xxx.

ALCOHOL is sometimes also used for a very fine, impalpable powder, which women in the East make use of as a kind of *fucus*. Kohol is a general term applied to a substance applied to the eye-ball, on the inside of the eye-lids, in the form of a powder finely levigated. That which is employed for ornament is called simply al kohol, or isphahany; when other ingredients, as flowers of olibanum, amber, and the like, are added, on account of some particular disorders, the kohol is distinguished by some appropriate epithet. Dr. Shaw, in his Travels, speaking of the women in Barbary, says, that none of these ladies think themselves completely dressed, until they have tinged their hair and edges of their eye-lids with *al-ka-hol*, the powder of lead-ore. Lady Montague (Letters, vol. ii. p. 32.) takes notice of this custom among the Eastern women; and in her sprightly manner, she supposes our English ladies would be overjoyed to know this secret. This ore used at Aleppo, called Stibium by the ancients, but very different from antimony, is brought from Persia, and is prepared by roasting it in a quince, an apple, or a truffle, then adding a few drops of oil of almonds, it is ground to a subtile powder on a marble. Of late years the lead ore, brought from England, under the name of Arcifoglio, has been used instead of the isphahany. The quantity of kohol consumed in the East is incredibly great. It has been said by one of their poets, in allusion to the probe used for applying the powder, and the mountains where the mineral is found, "that the mountains have been worn away by a bodkin." This probe or bodkin, called meel, is made of ivory, silver, or wood; it is dipped in water, and when a little of the powder has been sprinkled on it, it is applied horizontally to the eye, and the eye-lids being shut upon it, the probe is drawn between them, leaving the inside tinged, and a black rim all round the edge. The Roman Satyrist alludes to this custom, as well as that of blackening the eyebrows:

"Illa supercilium madida fuligine tactum
Obliqua producit acu, pingitque trementes
Attollens oculos."

JUVENAL, Sat. ii. v. 67, and Casaubon's note.

The kohol is also used by the men for strengthening the sight, and preventing various disorders of the eye, for which purpose different ingredients are occasionally added. It is also applied to the eyes of children, as soon as they are born, and is renewed at the interval of a few days through the several periods of their adolescence. The use of the kohol is of very ancient date. Passages relative to it, in sacred history, may be seen in Shaw, (Travels, p. 229.), Harmer, (Observations, vol. ii. p. 405.), and Lowth's Notes on Isaiah, chap. iii. v. 16. Harmer conceives that the *redness of the eyes*, as it is in our version, which the dying patriarch mentions in blessing Judah, (Gen. xlix. 12.), is to be explained by this usage. Dr. Russell observes, on a passage in Xenophon referred to by Shaw, that blackening the eyes, though a custom among the Medes, was not at that time in use among the Persians; for Cyrus, among other things, seems to have been surprised at the painted eyes of his grandfather Astyages. Cyropæd. lib. 1. p. 8. See Russell's Aleppo, vol. i. p. 111. p. 357. Ed. 1794. From this impalpable powder the name was transferred to other subtile powders, and afterwards to spirits of wine exalted to its highest purity and perfection. See PORPHYRISATION.

ALCOHOL, in the Arabian *Alkohol*, is when a heavy
4 D slow-paced

slow-paced planet receives another lighter one within its orb, so as to come in conjunction therewith.

ALCOHOL Martis, filings of steel reduced to an impalpable powder, by turning it into rust with urine, then levigating it, and mixing it with a large quantity of water; that is, about a gallon to two pounds and a half of filings. After it has stood a quarter of an hour, the upper part of the water is to be poured off, and evaporated to a dryness. The powder at the bottom is to be put into a paper, in the form of a sugar-loaf, and washed, by gradually pouring in hot-water, till it is freed from the urinous salts. With regard to the remaining gross powder, the same process is to be repeated.

Musgrave has a great opinion of this preparation, as a remedy to bring back the gout from the nobler parts to the joints. He prescribes it thus: take of *alcohol martis* from five to ten grains, *theriaci Andromachi* from half a scruple to one dram, mix these with as much syrup of clove-july-flowers, as is sufficient to make a bolus.

ALCOHOLIZATION, in *Chemistry*, the rectification of a vinous spirit.

This is otherwise called *alcoholization*.

ALCOLIZATION, according to Starkey, denotes the circulation of a volatile spirit on a fixed alkali, till such time as out of the two arises one neutral body different from both the former. *Alcoholization* is one way of volatilizing alkalis.

ALCOHOLIZATION is also used for **PULVERIZATION**.

ALCOL, or **ANCOL**, in *Geography*, lies on the coast of Barbary, on the east side of the Cape de Tenes, under which there is a small bay and good road, but open to the north and north-east; so that when a Levant gale is expected, ships should move round the cape to the west-side.

ALCOLA is used by *alchemists*, for the tartar of urine.

Alcola is found in three different forms, *viz.* 1. Resolved, or reduced into an impalpable substance. 2. Sandy, or voided under the appearance of small grains of whitish or reddish sand. 3. Mucilaginous, or viscous.

ALCOLEA, in *Geography*, a small town of Spain, in New Castile, situated in a fine country, a few leagues north of Madrid. N. lat. 40° 40'. W. long. 3° 6'.

ALCOLEA is also a town of Spain, in Andalusia, on the banks of the Guadalquivir, six miles north of Carmona.

ALCOLEA is also another town of Spain, in Aragon, on the confines of Castile, south of Balbastro, and north-east of the river Yzuela. N. lat. 41° 30'. E. long. 2° 14'.

ALCOMENÆ, in *Ancient Geography*, a town of Illyria. Steph. Byz.

ALCOMENÆ was also a town of the island of Ithaca, whence Ulysses was called Alcomeneus.

ALCON, in *Biography*, a surgeon of great eminence in the first century of the Christian æra, acquired considerable wealth in his profession, under the Emperor Claudius. He is said to have been expert in the art of reducing fractured, or luxated bones, and in curing hernias by incision. He is probably the person mentioned by Martial, in the following epigram, lib. xi. ep. 85.

Mitior implicitas Alcon fecat enterocelas,
Fractaque fabrili dedolat ossa manu.

See more of him in Le Clerc's *Hist. de la Medicine*, p. 581.

ALCON, in *Entomology*, a species of *PAPILIO Plebejus*, with entire cærulean wings, brown margin, below cinereous brown, and numerous ocellary points; joining in Austria.

ALCOR, in *Astronomy*, a small star adjoining to the large bright one in the middle of the tail of *URSA major*.

The word is Arabic.—It is a proverb among the Ara-

bians, applied to one who pretends to see small things, but overlooks much greater, "Thou canst see Alcor, and yet not see the full moon."

ALCORAN, or **AL KORAN**, the Mahometan Scripture or Bible, containing the revelations, doctrines, and prophecies, of the pretended prophet Mahomet.

It is vulgarly called *Alcoran*; but the first syllable of the word is nothing more than an article signifying *the*; and therefore the true orthography of the word is *Al Coran*, or *Al Koran*, that is, *the Koran*. It is derived from the Arabic word *karna*, to read, and signifies *the reading*; or what ought to be read. Thus Mahomet gave it this title by way of eminence, in imitation of the Jews and Christians, who call the Old and New Testament, *Scripture*; and the *Bible*, *i. e.* the Book; and *al Dikr*, the admonition.

Besides this peculiar name, the Koran is also honoured with several appellations common to other books of Scripture; as *Al Forkan* from the verb *faraka*, to divide or distinguish, denoting a section or portion of scripture. It is also called *Al Mofhaf*, the volume, and *Al Kitab*, the book, by way of eminence.

It is the common opinion among us, that Mahomet, assisted by one Sergius, a monk, composed this book; but the Mussulmen believe it as an article of their faith, that the prophet, who, they say, was an illiterate man, had no concern in inditing it; but that it was given him by God, who, to that end, made use of the ministry of the angel Gabriel; that, however, it was communicated to him by little and little, a verse at a time, and in different places, during the course of twenty-three years;—'And hence,' say they, 'proceed the disorder and confusion visible in the work;' which, in truth, are so great, that all their doctors had never been able to adjust them. For Mahomet, or rather his copyist, having put all these loose verses promiscuously in a book together, it was impossible ever to retrieve the order wherein they were delivered.

Those twenty-three years which the angel employed in conveying the *Koran* to Mahomet are of wonderful service to his followers: inasmuch as they furnish them with an answer to such as tax them with the glaring contradictions of which the book is full: those contradictions they piously father upon God himself; alledging, that in the course of so long a time, he repealed and altered several doctrines and precepts which the prophet had before received of him.

The Mahometan doctors obviate any objection deduced from these contradictory passages by the doctrine of abrogation; and they distinguish the abrogated passages into three kinds; the *first*, where the letter and sense are both abrogated; the *second*, where the letter only is abrogated, but the sense remains; and the *third*, where the sense is abrogated, though the letter remains. Of the first kind were several verses, which by the tradition of Ans Ebn Malec, were in the prophet's life-time read in the chapter of *repentance*, but are not now extant. Another instance of this kind we trace from the tradition of Abdallah Ebn Masud, who reported that the prophet gave him a verse to read which he wrote down, but the next morning looking in his book, he found it was vanished, and the leaf blank; upon acquainting Mahomet with this circumstance, he was assured by the prophet that the verse was revoked the same night. Of the second kind is the verse called the verse of *flourishing*, which, according to the tradition of Omar, afterwards Khalif, was extant, while Mahomet was living, though it be not now to be found. Of the last kind are observed several verses, in 63 different chapters, to the number of 225; such as the precepts of turning in prayer to Jerusalem, fasting

fasting after the old custom, forbearance towards idolaters, avoiding the ignorant, and the like.

M. D'Herbelot thinks it probable, that when the heresies of the Nestorians, Eutychians, &c. had been condemned by œumenical councils, many bishops, priests, monks, &c. being driven into the deserts of Arabia and Egypt, furnished the impostor with passages, and crude ill-conceived doctrines, out of the scriptures; and that it was hence that the Koran became so full of the wild and erroneous opinions of those heretics.

The Jews also, who were very numerous in Arabia, furnished materials for the Koran; nor is it without some reason that they boast twelve of their chief doctors to have been the authors of this work.

The Koran, it is to be observed, while Mahomet lived, was only kept in loose sheets; his successor, Abubeker, first collected the contents into a volume, not only from the palm leaves and skins on which they had been written, but also from the mouths of those who had committed them to memory; and when the transcript was completed, entrusted the keeping of it to Haphsa, the daughter of Omar, one of the widows of Mahomet, in order to be consulted as an original; and there being a good deal of diversity between the several copies already dispersed throughout the provinces, Ottoman, or Othman, successor of Abubeker, in the 30th year of the Hegira, procured a great number of copies to be taken from that of Haphsa; at the same time suppressing all the others not conformable to the original.

The chief differences, in the present copies of this book, consist in the points, which were not in use in the time of Mahomet and his immediate successors, but were added since, to ascertain the reading; after the example of the Massorettes, who added the like points to the Hebrew texts of scripture.

The Koran is divided into 114 *suras*, or chapters, of very unequal length; which, in the manuscript copies, are not distinguished by their numerical order, though they are actually numbered in Sale's edition, but by particular titles, which, except the initial chapter, are taken sometimes from a particular matter treated of, or person mentioned therein, but usually from the first word of note. Some chapters have two or more titles, occasioned by the difference of the copies. Some of the chapters having been revealed at Mecca and others at Medina, this difference is noted in the title. Several of them are said to have been revealed partly at Mecca and partly at Medina; and as to others, it is not agreed among commentators to which of these two places they belong. The *suras* are divided into little verses, in Arabic, called *ayat*, *signs* or *wonders*, which are all composed in a broken interrupted style, resembling prose rather than verse. Many of these have their particular titles formed in the same manner as those of the chapters.

Beside these unequal divisions of chapter and verse, the Koran is divided into 60 equal portions, called *abzab*, each of which is again subdivided into four equal parts.—But it is more usually divided into 30 sections, named *ajza*, each of twice the length of the former, and subdivided in like manner into four parts. These divisions are for the use of the readers of the Koran in the royal temples, or in the adjoining chapels where the emperors and great men are interred. Of these readers, there are 50 belonging to every chapel, and each reads his section every day, so that the whole Koran is read over once a day. Under the title, at the head of every chapter, except the ninth, is prefixed the following solemn form, called by the Mahometans the *bismillah*, in the name of the most merciful God;

which form, as well as the titles, are considered by some commentators of divine original; though others believe them to be human additions.

This form they constantly place at the beginning of all their books and writings in general, as a peculiar and characteristic mark of their religion; and it is deemed a sort of impiety to omit it. There are 29 chapters of the Koran, which have this peculiarity, that they begin with certain letters of the alphabet; some with a single one, and others with more. These letters are considered as peculiar marks of the Koran; and as concealing profound mysteries, the certain understanding of which, the more intelligent confess, has not been communicated to any mortal, their prophet alone excepted.

There are seven principal editions of the Koran; two at Medina, one at Mecca, one at Cufa, one at Bassora, one in Syria, and the common, or vulgate edition. The first contains 6000 verses; the second and fifth 6214; the third 6219; the fourth 6236; the sixth 6226; and the last 6225; but the number of words and letters is the same in all, *viz.* 77639 words, and 323015 letters.

The Koran is held not only of divine original, but eternal and uncreated, remaining, as some express it, in the very essence of God. The first transcript has been from everlasting by God's throne, written on a table of vast bigness, in which are also recorded the divine decrees, past and future. A copy from this table, in one volume, on paper, was sent down to the lowest heaven, by the ministry of the angel Gabriel, in the month of Ramadan, on the night of power: from whence it was delivered out by Gabriel to Mahomet, in parcels, some at Mecca, and some at Medina; though he had the consolation of seeing the whole once a year, and in the last year of his life twice. Some few chapters were delivered entire, the greater part only in separate periods, which were written down from time to time by the prophet's amanuensis, in such a part of any particular chapter, as he directed. The first parcel that was revealed, was the first five verses of the 96th chapter, which the prophet received in a cave of mount Harah, near Mecca.

Although the Sunnites or Orthodox believe, that the Koran is uncreated and eternal, and Mahomet himself is said to have pronounced him an infidel who asserted the contrary, yet several have been of a different opinion; particularly the sect of the Motazalites, and the followers of Iâ Ebn Sobeh Abu Musa, surnamed Al-Mozdar, who accused those who held the Koran to be uncreated, of infidelity, as assertors of two eternal beings. The dispute, which occasioned much warm contention, was at length compromised by Al Ghazali, who maintained that the original idea of the Koran only is really in God, and consequently co-essential and co-eternal with him, but that the copies are created and the work of man.

The Koran is universally allowed to be written with the utmost elegance and purity of language, in the dialect of the tribe of Koreish, the most noble and polite of all the Arabians, but with some mixture, though very rarely, of other dialects. It is confessedly the standard of the Arabic tongue; and as the more orthodox believe, and are taught by the book itself, inimitable by any human pen; and therefore insisted on as a permanent miracle, greater than that of raising the dead, and of itself sufficient to convince the world of its divine original. Accordingly, Mahomet himself appealed to this miracle as the chief confirmation of his mission; publicly challenging the most eloquent man in Arabia, then abounding with persons whose sole

style and art; it was to excel in elegance of style and composition, to produce even a single chapter that might be compared with it. However, there have not been wanting, even among the Mahometans themselves, those who have asserted that there is nothing miraculous in this book with respect to style or composition, excepting only the prophetic relations of things past, and predictions of things to come; and that if God had left men to their natural liberty, and not restrained them in that particular, the Arabs could have composed something not only equal, but superior to the Koran in eloquence, method, and purity of language. This was the opinion of the Motazalites, and in particular of Al Mezdar and Al Nollam.

The style of the Koran is generally beautiful and fluent, especially where it imitates the prophetic manner and scriptural phraseology. It is concise and often obscure, adorned with bold figures after the eastern taste, enlivened with florid and sententious expressions, and in many places, especially where the majesty and attributes of God are described, sublime and magnificent. Although it be written in prose, yet the sentences generally conclude in a long continued rhyme, for the sake of which the sense is often interrupted, and unnecessary repetitions are too frequently made. But this kind of jingling delights the Arabians; and they are fond of employing it in their most elaborate compositions; which they embellish with frequent citations from the Koran, and allusions to it. To this pomp and harmony of expression, some have ascribed the whole force and effect of the Koran, whilst others suppose, that the sensual pleasures of paradise, which are so often displayed to the imagination of the reader, are the chief allurements to which it owes its efficacy.

“By the advocates of Mahometanism,” says a learned and ingenious writer, “the Koran has been always held forth as the greatest of miracles, and equally stupendous with the act of raising the dead. The miracles of Moses and Jesus, they say, were transient and temporary; but that of the Koran is permanent and perpetual; and therefore far surpasses all the miraculous events of preceding ages. We will not detract from the real merit of the Koran; we allow it to be generally elegant, and often sublime; but at the same time, we reject with disdain its arrogant pretence to any thing supernatural.” “The real excellence of the work is to be referred to natural and visible causes.” Besides the general impressions of admiration and astonishment, which the pretended prophet had produced on the minds of his followers, by the exterior sanctity of his demeanour, and his long and splendid series of victories, Mahomet found, in the language of Arabia, a language extremely loved and diligently cultivated, by the people to whom it was vernacular, “advantages which were never enjoyed by any former or succeeding impostor.” It requires not the eye of a philosopher, to discover in every soil and country a principle of national pride; and if we look back for many ages in the history of the Arabians, we shall easily perceive that pride among them invariably to have consisted in the knowledge and improvement of their native language. The Arabic, which has been justly esteemed the most copious of the eastern tongues; which had existed from the remotest antiquity; which had been embellished by numberless poets, and refined by the constant exercise of the natives, was the most successful instrument which Mahomet employed in planting his new religion among them. Admirably adapted by its unrivalled harmony, and by its endless variety to

add painting to expression, and to pursue the imagination in its unbounded flight, it became in the hands of Mahomet an irresistible charm, to blind the judgment, and to captivate the fancy of his followers.

“Of that description of men, who first composed the adherents of Mahomet, and to whom the Koran was addressed, few, probably, were able to pass a very accurate judgment on the propriety of the sentiments, or on the beauties of the diction: but all could judge of the military abilities of their leader; and in the midst of their admiration, it is not difficult to conceive, that they would ascribe to his compositions every imaginary beauty of inspired language. The shepherd and the foldier, though awake to the charms of these wild but beautiful compositions, in which were celebrated their favourite occupations of love or war, were yet little able to criticise any other works than those which were addressed to the imagination or the heart; to abstract reasonings on the attributes and dispensations of the Deity, to the comparative excellencies of rival religions, to the consistency of any one religious system in all its parts, and to the force of its various proofs, they were quite inattentive. In such a situation, the appearance of a work, which possessed something like wisdom and consistency; which prescribed the rules, and illustrated the duties of life; and which contained the principles of a new and comparatively sublime theology, independently of its real and permanent merit, was likely to excite their astonishment, and to become the standard of future composition.

“In the first periods of the literature of every country, something of this kind has happened. The father of Grecian poetry very obviously influenced the taste and imitation of his countrymen. The modern nations of Europe all possess some original author, who, rising from the darkness of former ages, has begun the career of composition, and tinged with the character of his own imagination the stream which has flowed through his posterity. But the prophet of Arabia had, in this respect, advantages peculiar to himself. His compositions were not to his followers the works of man, but the genuine language of heaven which had sent him. They were not confined, therefore, to that admiration, which is so liberally bestowed on the earliest productions of genius; or to that fond attachment with which men every where regard the original compositions of their country; but with their admiration they blended their piety. To know and to feel the beauties of the Koran, was in some respect to share in the temper of heaven; and he who was most affected with admiration in the perusal of its beauties, seemed most fitly the object of that mercy, which had given it to ignorant men. The Koran, therefore, became naturally and necessarily the standard of taste. With a language thus hallowed in their imaginations, they were too well satisfied, either to dispute its elegance, or improve its structure. In succeeding ages the additional sanction of antiquity or prescription, was given to those compositions which their fathers had admired; and while the belief of its divine original continues, that admiration which has thus become the test and the duty of the faithful, can neither be altered nor diminished.

“When, therefore, we consider these peculiar advantages of the Koran, we have no reason to be surpris'd at the admiration in which it is held. But, if descending to a more minute investigation of it, we consider its perpetual inconsistency and absurdity, we shall indeed have cause for astonishment at that weakness of humanity, which could ever have received such impositions as the work of the Deity.

“The

“The first praise of all the productions of genius is invention, that quality of the mind, which, by the extent and quickness of its views, is capable of the largest conceptions, and of forming new combinations of objects the most distant and unusual. But the Koran bears little impression of this transcendent character. Its materials are wholly borrowed from the Jewish and Christian scriptures, from the Talmudical legends, and apocryphal gospels then current in the east, and from the traditions and fables which abounded in Arabia. The materials, collected from these several sources, are here heaped together, with perpetual and needless repetitions, without any settled principle or visible connection. When a great part of the life of Mahomet had been spent in preparatory meditation on the system he was about to establish, its chapters were dealt out slowly and separately during the long period of 23 years. Yet thus defective in its structure, and not less exceptionable in its doctrines, was the work which Mahomet delivered to his followers as the oracles of God.

“The most prominent feature of the Koran, that point of excellence in which the partiality of its admirers has ever delighted to view it, is the sublime notion it generally impresses of the nature and attributes of God. If its author had really derived these just conceptions from the inspiration of that being, whom they attempt to describe, they would not have been surrounded, as they now are on every side, with error and absurdity. But it might easily be proved, that whatever it justly defines of the divine attributes, was borrowed from our holy scripture; which even from its first promulgation, but especially from the completion of the new testament, has extended the views, and enlightened the understandings of mankind; and thus furnished them with arms, which have too often been ineffectually turned against itself by its ungenerous enemies.

“In this instance particularly, the copy is far below the great original, both in the propriety of its images, and the force of its descriptions. Our holy scriptures are the only compositions that can enable the dim light of mortality to penetrate into the invisible world, and to behold a glimpse of the divine perfections. Accordingly, when they would represent to us the happiness of heaven, they describe it, not by any thing minute and particular, but by something general and great: something, that without descending to any determinate object, may, at once by its beauty and immensity, excite our wishes and elevate our affections. Though, in the prophetic and evangelical writings, the joys that shall attend us in a future state are often mentioned with ardent admiration, they are expressed rather by allusions than similitude, rather by indefinite and figurative terms, than by any thing fixed and determinate. ‘Eye hath not seen, nor ear heard, neither have entered into the heart of man the things which God hath prepared for them that love him.’ 1 Cor. ii. 9. What a reverence and astonishment does this passage excite in every hearer of taste and piety? What energy, and at the same time, what simplicity in the expression! How sublime, and at the same time, how obscure is the imagery! Different was the conduct of Mahomet in his descriptions of heaven and of paradise. Unassisted by the necessary influence of virtuous intentions and divine inspiration, he was neither desirous, nor indeed able to exalt the minds of men to sublime conceptions or to rational expectations. By attempting to explain what is inconceivable, to describe what is ineffable, and to materialize what in itself is spiritual, he absurdly and impiously desired to sensualize the purity of the divine essence. Thus he fabricated a

system of incoherence, a religion of depravity, totally repugnant indeed to the nature of that Being, who, as he pretended, was its object; but therefore more likely to accord with the appetites and conceptions of a corrupt and sensual age.

“That I may not appear,” says the preacher, “to exalt our scriptures thus far above the Koran by an unreasonable preference, I shall produce a part of the second chapter of the latter, which is deservedly admired by the Mahometans, who wear it engraved on their ornaments, and recite it in their prayers.—‘God! there is no God but he; the living, the self-sustaining: neither slumber nor sleep seizeth him: to him belongeth whatever is in heaven and on earth. Who is he that can intercede with him but through his good pleasure? He knoweth that which is past, and that which is to come. His throne is extended over heaven and earth, and the preservation of both is to him no burden: he is the high, the mighty.’ To this description who can refuse the praise of magnificence? Part of that magnificence, however, is to be referred to that verse of the psalmist, whence it was borrowed: ‘He that keepeth Israel, shall neither slumber nor sleep.’ Ps. exxi. 4. But if we compare it with that other passage of the same inspired psalmist, all its boasted grandeur is at once obscured, and lost in the blaze of a greater light. ‘O my God, take me not away in the midst of my days; thy years are throughout all generations. Of old hast thou laid the foundations of the earth; and the heavens are the works of thy hands. They shall perish, but thou shalt endure; yea, all of them shall wax old, as doth a garment; as a vesture shalt thou change them, and they shall be changed; but thou art the same, and thy years shall not fail.’

“The Koran, therefore, upon a retrospective view of these several circumstances, far from supporting its arrogant claim to a supernatural work, sinks below the level of many compositions confessedly of human original; and still lower does it fall in our estimation, when compared with that pure and perfect pattern which we justly admire in the scriptures of truth. It is then abundantly apparent that no miracle either was externally performed for the support, or is internally involved in the composition, of the Mahometan revelation.” White’s Sermons, containing a View of Christianity and Mahometanism, in their history, their evidence, and their effects, p. 256-271. Ed. 2.

The general aim of the Koran was to unite the professors of the three different religions, then followed in Arabia, idolaters, Jews, and Christians, in the knowledge and worship of one God, under the sanction of certain laws, and the outward signs of ceremonies, partly of ancient, and partly of novel institution, enforced by the consideration of rewards and punishments, both temporal and eternal; and to bring all to the obedience of Mahomet, as the prophet and ambassador of God, who was to establish the true religion on earth, and be acknowledged chief pontiff in spiritual matters as well as supreme prince in temporal. The chief point therefore inculcated in the Koran is the unity of God, to restore which the prophet pretended was the chief end of his mission; it being laid down by him as a fundamental truth, that there never was nor ever can be more than one true orthodox religion. The rest is taken up in prescribing necessary laws and directions, frequent admonitions to moral and divine virtues, the worship and reverence of the Supreme Being, and resignation to his will. One of their most learned commentators distinguishes the contents of the Koran into allegorical and literal; under the former are comprehended all the obscure, parabolical, and enigmatical

apocryphical passages, with such as are repealed or abrogated; the latter, such as are clear, and in full force. See MAHOMETANS.

Amongst the Mahometans this book is in the greatest reverence and esteem. The Mussulmen dare not so much as touch the Koran without being first washed, or legally purified; to prevent which, an inscription is put on the cover or label: "Let none touch it but they who are clean." It is read with great care and respect, being never held below the girdle. They swear by it, take omens from it on all weighty occasions, carry it with them to war, write sentences of it in their banners, adorn it with gold and precious stones, and knowingly suffer it not to be in the possession of any of a different religion. Some say that it is punishable even with death in a Christian to touch it: others, that the veneration of the Mussulmen leads them to condemn the translating it into any other language as a profanation; but these seem to be aggravations. The Mahometans have taken care to have their scripture translated into the Persian, the Javan, the Malayan, and other languages; though out of respect to the original, these versions are generally, if not always, interlineated. It has been often published in Europe, in Arabic and in other languages. Maracci published it in Arabic and Latin, at Padua, in 1698, fol. with a partial and often silly confutation. The German translation of Boyfen was printed at Halle, in 1773; the French of Savary, at Paris, in 1782; and the English of Sale, at London, in 1734.

The number of commentaries on the Koran is so large that the bare titles would make a huge volume.—Ben Ofschir has written the history of them, intitled, *Tarikh Ben Ofschir*. The principal among them are, Reidhaori Thaalibi, Zamalichchari, and Bacui.

Beside the Koran which is the basis of the Mahometan faith, they have also a book containing their traditions, which they call *Sonna*.

The Mahometans have a *positive* theology, built on the Koran and tradition; as well as a *scholastical* one, built on reason.—They have likewise their casuists, and a kind of canon law; wherein they distinguish between what is of divine, and what of positive right.

They have their beneficiaries too, chaplains, almoners, and canons, who read a chapter every day out of the Koran, in the mosques; and have prebends annexed to their office.—The *baib* of the mosque is what we call the parson of the parish; and the *sheibs* are the preachers, who take their text out of the Alcoran. See Sale's Translation of the Koran, preliminary discourse.

ALCORAN is also used in a more limited sense, for a portion or chapter of the Koran.

In which sense, the word is synonymous with *sura*.

ALCORAN is also figuratively applied to certain other books full of impieties and impurities.

In this sense we meet with the Alcoran of the Cordeliers, which has made a great noise; wherein St. Francis is extravagantly magnified, and put on a level with Jesus Christ.

ALCORAN, among the Persians, likewise signifies a kind of tower, or steeple, very high and narrow, surrounded without by two or three galleries, one over another; whence the Moravites, a sort of priests, repeat their prayers thrice a day, with a very loud voice; making the tour of the gallery all the while, that they may be the better heard all round.

ALCORANISTS, among Mahometans, those who adhere strictly to the letter or text of the Alcoran, from an opinion of its ultimate sufficiency and perfection. The

Persians are generally Alcoranists, as admitting the Alcoran alone for their rule of faith. The Turks, Tartars, Arabs, &c. besides the Alcoran, admit a multitude of traditions.

The Alcoranists, among Mahometans, amount to much the same with the *textuaries* among the Jews. The Alcoranists can find nothing excellent out of the Alcoran; are enemies of philosophers, metaphysicians, and scholastic writers. With them the Alcoran is every thing.

ALCOUCHETE, in *Geography*, a town of Portugal, in the province of Estremadura, on the fourth coast of the Tagus, ten miles east of Lisbon. N. lat. 38° 55'. W. long. 8° 26'.

ALCOUTIN, a town of Portugal, in the province of Algarve, on the border of Alentejo, defended by a castle, and containing six parishes. It is situated on the Guadiana, and six and one-half leagues north-north-east of Tavira.

ALCOVE, in *Architecture*, a recess in a sleeping room, made for the purpose of receiving the bed. It is also an arched seat in a garden.

The word is derived from the Spanish *alcoba*, which, according to the older Dictionaries of that language, signifies a vaulted cabinet in a chamber, open on one side, without windows, and large enough to contain a bed. The Spanish word is derived from the Arabic *al kubbeh*, the alcove, the place for the bed, and *alkubbeh* is probably from *alkubbaun* the tent, or more probably from *kbaub*, sleep, *alkbaub*, the bed, *alkaab* the cave. The relation of these words is curious. According to the Spanish description an alcove is not unlike a cave or recess in a rock, in which a wandering Arab might make his abode for the night.

Alcoves in ordinary rooms are square recesses conformable to the definition we have given, and are finished in a stile corresponding with the apartments to which they belong, and with flat or vaulted ceilings, as taste may direct, or the height of the alcove may require. But in chambers of greater magnificence, and rooms of parade, they are not always recesses; but more properly a portion of a large apartment separated from the rest by an arch, or ballustrade, a screen of columns, or some other decorations, and elevated a few steps above the general level of the floor. On this elevated platform, a plate bed is usually placed, and sometimes seats and sofas to entertain company. This is what the French architects denominate an alcove. The recess to which the English have appropriated the term, and which is conformable to its primary signification, the French denominate a *niche*, as may be seen in Blondel de la Decoration des Edifices en general. (See Plate I. of Architecture.)

The authors of the Encyclopédie Méthodique are of opinion, that alcoves, were in use among the ancients, and this would be indisputably true if we could receive the term in the lax sense in which they have explained it. But we cannot give the name of alcoves to the enclosures which they mention, consisting of a kind of moveable ballustrade hung round with drapery, and placed in any part of a chamber at pleasure, nor to those draperies supported by terms, or affixed to the wall, which frequently occur in antique basso-relievos. It must be confessed that we know very little of the private apartments of the ancients; yet if a recess for the bed to stand in had been a fashionable feature in a Greek or Roman bed chamber, it is probable that it would have been mentioned by Vitruvius, or others, and especially by Pliny, who is so minute and particular in the description of his Laurentine and Tusculan villas. In each of these villas he describes a small elegant retired closet, furnished with a bed, which by means of glass folding doors and curtains, could be occasionally laid into or separated from the adjoining

ing apartment. These closets appear to have been somewhat similar to alcoves, but they differ essentially from modern alcoves in having windows. The recess discovered by the Abbé Winckelmann, in one of the chambers of Pompeia, in which he conjectures, perhaps rightly, that a bed had been placed, and those recesses which he found on the second story of Adrian's villa, at Tivoli, have better pretensions to the name of alcoves, but something more than a verbal description is wanting to enable us to determine whether they were formed for the express purpose of receiving a bed, or for some other purpose; or whether they were not such accidental recesses as are made by necessity in the arrangement of a building which the architect turns to the best use in his power.

Be this as it may, alcoves, according to the modern manner, undoubtedly originated in Africa, or Asia, for we read of them perpetually in the Arabian stories, and in descriptions of Asiatic palaces and gardens. From Arabia they were introduced among the Spaniards by their Saracen conquerors, and by the Spaniards, after the expulsion of the Moors, at the close of the fifteenth century, into Germany, France, and other nations, as the name they bear in every country sufficiently evinces.

At this time the Spaniards would scarcely have influence enough to make any thing fashionable north of the Pyrenees; but at the period we are speaking of they were held in high consideration, and many of their customs and manners were adopted in the other dominions of Charles the fifth. It is remarkable that in the designs of Palladio, and of several Roman architects of the same age, whose works have been consulted, we find no example of alcoves, from whence it may be inferred that they had not then become fashionable either in Rome or Venice. Whether they were more so in those parts of Italy which were under the dominion of Charles might be an amusing subject of inquiry to an antiquary. It is said that alcoves are still frequent in the houses of the Spanish nobility, and Swinburne mentions two yet remaining in the Royal bedchamber of the Moorish palace of the Alhambra, at Grenada, which are probably the oldest in Europe, though it is uncertain whether their decorations are not of a more modern date, as the apartment was repaired for the use of Philip V. The beds were placed upon raised pavements of blue and white tiles, a fountain played in the middle to refresh the apartment in hot weather, and two small doors behind the alcoves led to the royal baths.

In England, alcoves of every kind have been much in use, but the change of manners, in consequence of the general diffusion of wealth, has nearly banished the most magnificent kind with state beds, and the parade of which they were appendages. Even in private bed-rooms they are now seldom constructed, except to obtain uniformity, or a communication to some other apartment, as they are found less convenient, and by confining the air, supposed to be less healthy to sleep in, than the uncontracted space of the chamber.

ALCOY, in *Geography*, a small town of Spain, in Valencia, at the source of a river of the same name, which traverses the whole province from south-west to north-east. N. lat. $38^{\circ} 45'$. W. long. $0^{\circ} 21'$.

ALCRANES ROCKS lie in a direction north-west from Cape Catoche, the north-east point of the province of Yucatan, on the Spanish main, and about north-north-east from Cape Concededo, the north-west point of Yucatan; extending from N. lat. $22^{\circ} 30'$, to $22^{\circ} 50'$ in breadth, and from W. long. $89^{\circ} 50'$, to $91^{\circ} 10'$ in length.

ALCUDIA, a town of Spain, in Valencia, eight miles north-west of St. Felipe.

ALCUDIA, a small town of Africa, near the Cape of the Three Slaves.

ALCUDIA is also a town of the island of Majorca, on the east coast between Puglierza and Cape de la Piedra, which gives name to a large bay with good anchorage, and a Cape forming the northern limit of the bay. In July and August there is a fishery of coral. N. lat. $39^{\circ} 50'$. E. long. $3^{\circ} 24'$.

ALCUESAR, or ALGUEZAR, a town of Spain, in Aragon, upon the river Vero, north of Balbastro, situated in a fertile country. N. lat. 42° . E. long. $0^{\circ} 10'$.

ALCUIN, or ALBINUS FLACCUS, in *Biography*, flourished towards the close of the eighth century, and was famous for his genius and erudition. He was born in the north of England, and educated at York, under the direction of archbishop Egbert. Some say that he received part of his education in early life from Venerable Bede, but as he survived him about 70 years, others have disputed this fact. Egbert appointed him keeper of the curious library which he had founded at York; and he was also deacon of the church in this city, and abbot of Canterbury. In 793 he was sent on an embassy by Offa, king of Mercia, to the emperor Charlemagne, who conceived so high an opinion of him, that he solicited him to settle in his court, and to become his preceptor in the sciences, as well as to assist him in settling some ecclesiastical disputes that agitated the country at that period. Accordingly he instructed the emperor in rhetoric, logic, mathematics, and divinity, and was in such high esteem at court that he was called, by way of eminence, "the emperor's delight." Charlemagne likewise employed his learned favourite to write several books against the heretical opinions of Felix, bishop of Urgel, in Catalonia, who maintained that Jesus Christ was the son of God, not by nature but by adoption; and Alcuin accompanied the emperor in 794 to the council of Frankfort, which consisted of 300 bishops, and of which he was admitted a member. Although this council decreed, that Jesus Christ, as man, ought to be called the proper, not the adopted, son of God, the dispute was continued; and Felix being allowed to defend his opinion before an assembly of bishops at Aix la Chapelle, in 799, Alcuin was employed as his opponent, and performed the office to the entire satisfaction of the emperor and other attendants, and to the conviction of Felix and his followers, who were thus induced to abandon their errors and to accede to the opinion of the church. Alcuin performed other services on behalf of religion. He wrote commentaries for explaining the scriptures, but chiefly with a view to the investigation of their mystical meaning; he corrected the errors of the Latin translation in common use; and the first German translation of the scriptures has been ascribed to his direction and superintendence. He was also appointed, in concurrence with Paulus Diaconus, to compile, from the writings of the fathers, homilies or discourses upon select portions of scripture, which the ignorant priests of that period might commit to memory, and recite to the people. Alcuin, under the patronage and with the assistance of Charlemagne, contributed very much to the advancement of learning, by establishing public schools, particularly in France. Cave (*Hist. Lit. tom. i. p. 637.*) says, that France was indebted to Alcuin for all the polite learning of which it boasted in the eighth century and the following ages. The universities of Paris, Tours, Fulden, Soissons, and many others, were indebted to him for their origin and increase; those of which he was not the superior and founder,

being

being at least enlightened by his doctrine and example, and enabled by the benefits he procured for them from Charlemagne. A German poet, cited by Camden, thus extols the merit of Alcuin in introducing literature into France :

- “ Quid non Alcuino, facunda Latetia, debes !
 Insaurire bonas ibi qui feliciter artes,
 Barbariemque procul solus depellere, cepit.”
- “ Let Gallia's sons, nurtur'd in ancient lore,
 To Alcuin's name a grateful tribute pay ;
 'Twas his, the light of science to restore,
 And bid Barbaric darkness flee away.”

Dr. Warton, however, (Hist. of English Poetry, vol. i. diss. 2.) cautions us against forming “ too magnificent ideas of those celebrated masters of science, who were thus invited into foreign countries to conduct the education of mighty monarchs, and to plan the rudiments of the most illustrious academies. Their merits are in a great measure relative. Their circle of reading was contracted, their systems of philosophy jejune ; and their lectures rather served to stop the growth of ignorance than to produce any positive or important improvements in knowledge.” After Alcuin had spent many years in the most intimate familiarity with the greatest prince of his age, he obtained, at length, with great difficulty, in 801, leave to retire from court to his abbey of St. Martin's, at Tours. Here he kept up a constant correspondence by letters with Charlemagne ; from which it appears, that both the emperor and his learned friend were animated with the most ardent love to learning and religion, and constantly employed in contriving and executing the noblest designs for their advancement. The emperor often and earnestly solicited him to return to court, but no arguments could induce him to quit this honourable retreat where he was employed in the education of the youth of the school which he had founded in this city ; and where he died on Whit Sunday, in the year 804. He was a person of distinguished piety and learning, and reckoned by William of Malmibury the best English divine after Bede and Aldhelm. He composed many treatises on a great variety of subjects, in a style much superior with respect to purity and elegance to that of the generality of writers in the age in which he flourished. Besides his poem, “ De pontificibus et Sanctis Ecclesie Eboracensis,” first discovered by Mabillon, and published by Dr. Gale among his “ Quindecim Scriptores ;” his other writings are extremely voluminous. They consist of commentaries on the Bible, homilies, lives of saints, theological and metaphysical discussions, epistles, verses, and treatises on orthography, grammar, rhetoric, and music ; they are recited in the Biog. Brit. and by Cave, (*ubi supra*) and amount in number to 53 ; and an edition of them was published by Duchesne, at Paris, in folio, in 1617, and at Ratisbon in 1777. Some additional pieces are enumerated by Dupin. It has been said that Alcuin advised Bede to publish his ecclesiastical history, and furnished materials for it ; but the assertion is contradicted by chronology ; this work having been published in 731. There was another Alcuinus, or Albinus, abbot of St. Austin's church at Canterbury, the cotemporary of Bede, who died three years before him. By this Alcuin Bede was urged to publish his history, and assisted with communications. Biog. Brit. Henry's Hist. vol. iv. p. 33—40. 8vo. Mosheim's Eccl. Hist. vol. iv. p. 254, &c. 8vo.

ALCYON. See HALCYON.

ALCYON, or ALCYONIUM, in Ornithology, a name given by the ancients to the *ispida* or king-fisher, and also a species of the ALCEDO.

ALCYON, a name given by Brown to the PELECANUS *aquilus*.

ALCYONE, in Entomology, a species of the PAPILO *Nymphalis*, with dentated brown wings, with yellow bands, the anterior having two ocelli on both sides, and the posterior marbled below ; found in the mountains of the southern parts of Russia.

ALCYONIUM, in the Linnæan system of Zoology, a genus of Zoophytes ; the characters of which are, that the animal grows in the form of a plant ; the stem or root is fixed, fleshy, gelatinous, spongy, or coriaceous, with a cellular epidermis, penetrated with stellated pores, and shooting out tentaculated oviparous hydræ. The number of species, mentioned and characterized by Gmelin, is 28 ; viz. 1. *A. arborcum*, with woody stem, obtuse branches, and pores in the form of pimples, found in Norway, White and Indian seas, sometimes of the human height. 2. *A. exos*, with stem arborescent, coriaceous, crimson-coloured, above ramous, and with stellated papillæ, called by several authors the sea-hand, and found at the bottom of the Mediterranean sea. 3. *A. epipatrum*, with stem, cavated, fleshy, and reddish : the finger-shaped sea-pen of Ellis, and sea mad-apple of Rondeletius, found in the Mediterranean, about four inches long, and of the thickness of the finger. 4. *A. agaricum*, with stem filiform, and reniform pileus, kidney-shaped purple sea-pen of Ellis, found in the sea, washing the coast of Carolina. 5. *A. digitatum*, stemless, oblong, coriaceous, and rugose, dead-man's hand, or dead-man's toes of Ellis ; the tethya of Rumphius, and fucus palma marinus of C. Bauhin, found in the European sea, encrusting testaceous fish and stones. 6. *A. jeblosseri*, roundish and stupose, penetrated with ray-like stars, the alcyonium ramosum lividum, &c. of Solander and Ellis, the ura marina of Gesner, the botryllus stellatus of Gaertner, found on the coast of Corawall, brown or ashy, and covering other bodies. 7. *A. lycurium*, globose, fibrous, yellow and warty, the tethya spherica of Donat, found in the Mediterranean, and at the Cape of Good Hope, about the size of an orange and cartilaginous. 8. *A. bursa*, sub-globose, pulpos and green, the sea-orange of Marfilli, found in the English and Mediterranean seas, about the size of a middling apple, and coriaceous. 9. *A. cydonium*, roundish, spongy, yellow and smooth, found in the African, Mediterranean, and Northern seas, affixed to rocks and corals, and sometimes loosened by the agitation of the waves. 10. *A. ficus*, obovated, pulpos and livid, the sea-fig of Ellis, and sea-lungs of Ray, the alcyonium tuberosum of J. Bauhin, found in the Mediterranean and English seas, very rarely among fossils, of an olive colour, and within granulose. 11. *A. gelatinosum*, polymorphous and gelatinous, the alcyonium luteum gelatinosum polymorphum of Solander and Ellis, spongia ramosa, &c. of Parkinson, fucus gelatinosus of Hudson, and fucus nodosus and spongiosus of Ray, found in the European ocean and the icy sea, adhering to the algæ, stones, shell-fish, &c. 12. *A. manus diaboli*, polymorphous, perforated with obtuse protuberances, found in Iceland. 13. *A. massa*, yellow, spongy, patulous, with five radiated small stars, and black center, found in the sea of Norway. 14. *A. cranium*, tuberiform, white and bristly, found in the Norway sea. 15. *A. rubrum*, crustaceous, soft, sprinkled with reddish scattered spots, found in the Norway sea. 16. *A. mammillifium*, whitish, coriaceous, with convex mammillæ, and the center hollow and substellated, found in the American sea. 17. *A. ocellatum*, ferruginous, coriaceous, with rugose subcylindric cellules, and radiated ocellated apices, found adhering to rocks, with twelve rays of stars, in the island

of St. Dominica. 18. *A. tuberosum*, yellowish and tuberos, with the apices frequently subdivided, and tubulous pores, found adhering to rocks in the island of Mauritius. 19. *A. gorgonoïdes*, cinereous, sandy-fleshy, with radiated warty cellules, found, with 12 rays of cellules, adhering to corals and rocks, in the island of Curassoa. 20. *A. asbestinum*, with a roundish stem, and oblong pores scattered over every part of it, found, in the sea washing the American coast, very porous, whitish and within rose-coloured. 21. *A. alburnum*, white, very ramous, attenuated and subdivided, with tubulous terminal pores, found in the Indian sea. 22. *A. papillosum*, crustaceous, with large papillæ thickly set and convex, the boletus marinus of Marigli. 23. *A. conglomeratum*, gelatinous, convex, with conglomerated fingers, and terminal mouths without teeth, found in the Cornish seas. 24. *A. aspidioides*, crustaceous, coriaceous, with dispersed papillæ, and two subdentated mouths, found in the Cornish seas. 25. *A. synicum*, with many cylindric fleshy stems, and an orifice stellated at the apex, found on the northern shore of Spitzbergen. 26. *A. vermiculare*, green, ramous, with cylindric obtuse pyramidal branches, found on the rocks of the island of Nisita, opposite to Neapolis. 27. *A. stellatum*, with two stellated terminal mouths. 28. *A. corniculatum*, with four stellated mouths, encompassing a papilla, and four small erect terminal horns, found in the sea of Holland.

From a series of experiments made by Mr. Hatchett, on a few species of alcyonium, viz. asbestinum, ficus, and arboreum, he was led to conclude, that they were all composed of a soft, flexible, membranaceous substance, slightly hardened by carbonate, mixed with a small portion of phosphate of lime. Phil. Transf. for 1800. P. ii. p. 364.

ALCYONIUM is also a name given, with various epithets, to the TUBIPORA *musica* of the Linnæan system, and also to several species of MILLEPORA.

ALCYONIUM is also a name given by Lloyd to a peculiar kind of fossile coral, of the ASTROITES kind, found in Wales. It is very plentiful in that country, and puts on the appearance of a sort of marble, being bedded in a marbly matter for its matrix. Phil. Transf. N^o. 252.

ALCYONIUM MARE, in *Ancient Geography*, a name given to that part of the gulf of Corinth, which stretched itself between the western coast of Bœotia, the northern coast of Megaris, and a small part of Corinth, as far as the promontory of Olmia.

ALCYONIUM was also the name of a lake in Corinth, of unfathomable depth, and which Nero attempted unsuccessfully to found. Bacchus is said to have descended to hell through this lake to bring back Semele. Near this lake was a temple constructed by the Oropians to Amphiarus, the Sorcerer. Pausanias. Ed. Kuhnii. p. 200.

ALDABARAM, in *Osteology*, a name given by some to the sesamoide bones of the great toe.

ALDAN, in *Geography*, a river of Siberia, which rises in the mountains of Okhotsk, on the borders of China, N. lat. 55° 50', and E. long. 125° 14', and taking a north-east course to lat. 63°, changes its direction to west-north-west, and at N. lat. 63° 25', E. long. 128° 24', joins the Lena.

ALDARU, in *Botany*, a name given by Avicenna, Serapion, and other Arabian writers, to the LENTISK tree.

ALDBOROUGH, in *Geography*, a sea-port town of England, in the county of Suffolk, deriving its name from the river *Alde*, near it, and pleasantly situated between the sea on the east and a high hill on the west, on which the church stands. The fishery of this town in the season is considerable, and near it there is a quay, with warehouses for the fish, and conveniences for drying those of the north sea. Herrings and sprats are the principal objects of attention;

and it is said that this is the only place for curing red sprats. The town is corporate, and sends two members to parliament. Its markets are on Wednesday and Saturday. It is 94 miles north-east of London. N. lat. 52° 16'. E. long. 1° 42'.

ALDBOROUGH is also a market town in the West Riding of Yorkshire, on the river Ouse, 15 miles north-west of York, and 208 miles north of London. N. lat. 54° 15'. W. long. 0° 20'. It sends two members to parliament. It was formerly a Roman station, called *Ijurium Brigantum*, and probably the capital of the Brigantes. Its market day is Wednesday.

ALDE, or OLDE, a small island on the west-coast of Norway. N. lat. 61° 25'. E. long. 5° 9'.

ALDE, HENRY VAN, in *Biography*, a painter who flourished in 1650, and excelled in portraits.

ALDEA Gallega, q. d. *Gallician village*, a small market town of Portugal, in Estremadura, situate in a kind of island formed by the Tagus, north of Setuval, and south-east of Lisbon. On an eminence, a league from Aldea Gallega, is a church dedicated to Nossa Senhora Ateliya, our lady of the watch-tower; to which the negroes in Lisbon annually make a pilgrimage; and this black procession is attended by a great concourse of people. N. lat. 38° 45'. W. long. 8° 31'.

ALDEA el Muro, or del Poco, a town of Spain, in Old Castile, on the frontiers of Aragon.

ALDEA del Rio, a town of Spain, in the province of Andalusia, and district of Cordova, situate on an eminence, to the south of the Guadalquivir; eight miles north-west of Cordova.

ALDEA river is on the coast of Brazil, in about S. lat. 19° 40'. W. long. 40° 5', on which stands the town and port of Reys Magos. There is a large cape to the south of it.

ALDEA de Trinidad, lies on the coast of Brazil, called Paraguay, to the north-east part of the gulf of Santos, in S. lat. 24° 30'. W. long. 46° 30'.

ALDEAS bay is about 16 leagues north-east from Cape Negro, on the southern part of the west coast of Africa, in S. lat. 15° 25'. E. long. 11° 25'. The bay is small but secure; and European ships, trading to the coast for slaves, frequently touch at it.

ALDEBAC, in the *Materia Medica* of the ancient Arabian physicians, the name by which they have called BIRD-LIME, and which they reckoned among the vegetable poisons.

ALDEBARAN, in *Astronomy*, the Arabian name of a fixed star, of the first magnitude, in the eye of the constellation TAURUS, or the bull; and hence popularly called the bull's eye. For the beginning of the year 1800 its

Right ascension was	-	-	66° 6' 51", 10
Annual variation in AR.	-	-	0 0 51, 31
Declination	-	-	16 5 52, 00 N.
Annual variation in decl.	-	-	0 0 8, 3

ALDEBERT, or ADELBERT, in *Biography*, a native of France, who, in the eighth century, deluded the people by pretended visions and revelations. He exercised episcopal dignity without the authority of Boniface, the pope's legate, and among other irregularities, with which he was chargeable, both as to his principles and conduct, he forged a letter, addressed to the human race, which he pretended to have been written by Jesus Christ, and to have been transmitted to him by the archangel Michael. He also remitted sins without confession, and required his followers to quit the churches, and to worship God in houses which he erected in the fields, and to kneel before crosses which he placed in woods and near fountains. His popularity

was the cause of sedition and tumult among the eastern Franks. He was condemned at the instigation of Boniface by the pontiff Zachary, in a council held at Rome, A. D. 748, and thrown into prison, where he probably ended his days. His forged letter was published by Stephen Baluse, in the second vol. of the "Capitularia Regum Francorum." Mosheim's Eccl. Hist. vol. ii. p. 273.

ALDEGO, in *Geography*, a river of Italy, which rises near Montebello in the Vicentin, and joins the Adige in the estates of Venice, near Zevio.

ALDEGRETTUS, or ANDREGHETTUS, in *Biography*, of a noble family at Padua, taught medicine at that university 34 years, and died of the plague in the year 1631, aged 58 years. He published "Luis Venerea perfectissimus tractatus ex ore Herculis Saxonie, Patavini Medici clarissimi." 1597. 4to. See Astruc de Morbis Venereis, p. 917.

ALDEGREVER, HENRY, a considerable engraver and painter, was born at Zoult in Westphalia, in 1502. He is said to have studied under Albert Durer, at Nuremberg, whose style he copied. The mechanical part of his engraving is very neat, and executed entirely with the graver, in the style of Albert Durer. The light parts upon his flesh are rendered soft and clear, by the addition of small long dots, which he has occasionally interspersed with judgment. His drawing of the naked figure is more correct than that of the old German masters, and he has less of that stiff taste which appears in the best of their works. It is observed, however, that his figures of men are more correct than those of his women. His heads are in general very expressive, and his other extremities well marked, but sometimes rather heavy. As a painter also, he is spoken of very highly, and considered as nearly if not altogether equal to his master, Albert Durer. His principal works are his own portrait and several others, such as those of Knipperdolling, Melancthon, &c.; the history of Susannah and the two elders; Dives and Lazarus; the passion of Christ; the labours of Hercules; several Madonnas; many historical subjects; a variety of Goldsmith ornaments, very beautifully engraved; and some few nudities, amongst which is the society of Anabaptists. There is only one etching attributed to this master, which is Orpheus playing on a violin, and Eurydice seated at the foot of a tree, dated 1528. It has been observed, that Aldegrever would have been very eminent in his profession, if in early life he had been introduced to a knowledge of the antique, and a more intimate acquaintance with the Roman masters. This artist has been erroneously called Aldergraft, and his Christian name has been Albert instead of Henry; but his name upon his own portrait is Aldegrever. The time of his decease is not known; but the last date which appears upon his prints is 1558. The number of his plates amounts to no less than 350. Strutt.

ALDEN, FORT, in *Geography*, is situate in Cherry-valley, in the state of New York.

ALDENAHR, a small town of Germany, in the circle of the Lower Rhine, in a prefecture of the same name, and in the archbishopric of Cologne, situate on the river Ahr, eight leagues south of Cologne. N. lat. 50° 35'. E. long. 6° 43'.

ALDENAUI, a small town of the Lower Rhine, and archbishopric of Cologne, in a prefecture of the same name, 10 leagues south of Cologne. N. lat. 50° 29'. E. long. 6° 39'.

ALDENBERG, a town in the circle of Westphalia and duchy of Berg, four leagues north-east of Cologne.

ALDENBORG, a town of ancient Ruslad, now Old Ladoga, which lies in the government of St. Petersburg.

ALDENBURGH, a town in the circle of Upper Saxony, and duchy of Anhalt Bernburg, two miles north of Bernburg.

ALDENHOVEN, a town of the circle of Westphalia, and duchy of Juliers, three miles west-south-west of Juliers.

ALDER-tree, in *Botany*. See BETULA.

ALDER, *black*. See RHAMNUS.

ALDERAIMIN, or ADERAIMIN, in *Astronomy*, the Arabian name of a star of the third magnitude, in the left shoulder of the constellation Cepheus, marked α by Bayer.

ALDERBURGH, in *Geography*, a considerable manufacturing village of England, in the county of Wilts. two miles and a half south-east of Salisbury.

ALDERHOLM, an island of Sweden, at the mouth of the river Gelle, in the gulf of Bothnia, formed, as is also Islandsholm, by the three branches of this river. This island is distant 80 miles north from Stockholm, and has a dock, arsenal, warehouses for deals, &c., and carries on a considerable trade.

ALDERMAN, among our ancient Saxon ancestors, was the second of the three orders or degrees of nobility.

The word, in its original, is *ealdorman*; compounded of *ald*, *old*, or *aldor*, *elder*, and *man*, q. d. *elderman*.

Atbeling was the first rank of nobility, *alderman* the second, and *thane* the lowest.

It appears, says Mr. Hume (*Hist.* vol. i. p. 476, 8vo.), from the translations of the Saxon annals and laws, and from king Alfred's translation of Bede, as well as from all the ancient historians, that *comes*, in Latin, *alderman* in Saxon, and *earl* in Dano-Saxon, were quite synonymous; and it also appears, (*Id.* p. 201.), that the aldermen or governors of counties, who, after the Danish times, are often called earls, were admitted into the wittenagemot, or great council of the nation, and gave consent to the public statutes. The bishop, together with the alderman or earl, presided in the county-courts, or shiremotes, where all causes, ecclesiastical as well as civil, were decided; but they had no further authority than to keep order among the freeholders and interpose with their opinion. The aldermen received a third of the fines levied in these courts; and as most of the punishments were then pecuniary, this perquisite formed a considerable part of the profits belonging to the office. The alderman, or earl of a shire, appears to have been a person of the highest dignity and greatest power among the Anglo-Saxons; and therefore this office was commonly enjoyed by the thanes of the largest estates and most ancient families. Possessed both of the civil and military government of his shire, the alderman was a little king within his own territories, and assumed the titles of sub-king and prince in subscribing charters and other deeds. When he appeared at the head of the military forces of his shire in times of war, he was called a duke or hieretogen, which signify a general or commander of an army; and was indeed a high and potent prince. In the most ancient times of the Anglo-Saxon government, the aldermen, or earls, were appointed by the king, but towards the conclusion of this period, these great officers seem to have been elected by the freeholders of the shire, in the shiregemote or county-court. To enable them to support their dignity, they enjoyed certain lands, called the earl's lands, besides the fines above-mentioned and several other perquisites. The office of earl was so far from being hereditary in the most ancient period of the Anglo-Saxon government, that it was held only during the good pleasure of the sovereign, and their own good behaviour. But towards the conclusion of this period, the great earls were most commonly, though not always, succeeded by their sons in their earldoms.

earldoms. This, however, was owing to the increasing power of the aristocracy, and to the prodigious wealth and influence of a few great families, rather than to any formal change in the constitution. Henry's Hill, vol. iii. p. 342.

It must be observed, however, that among our Saxon ancestors, there were several magistrates who bore the title of alderman. Among them there were *aldermannus totius Angliæ*, *aldermannus regis*, *comitatus*, *civitatis*, *burgi*, *castelli*, *hundredi*, *five wapentacorum*, & *veronæ de moriam*.

According to Spelman, the *aldermannus totius Angliæ*, seems to have been the same officer who was afterwards styled *archidiaconi justitiarius Angliæ*, or chief justice of England; the *aldermannus regis* seems to have been an occasional magistrate, answering to our justice of assize; and the *aldermannus comitatus*, a magistrate who held a middle rank between what was afterwards called the earl, and the sheriff; he sat at the trial of causes with the bishop; the latter proceeding according to ecclesiastical law, and the former declaring and expounding the common law of the land.

ALDERMAN, in the English *Polity*, an associate to the mayor, or civil magistrate, of a city or town, for the better administration of his office.

The aldermen are an order of magistrates, in our cities, and most of the municipal or incorporate towns, who form a kind of council, and regulate things relating to the policy of the place.—They sometimes also take cognizance of civil and criminal matters; but that very rarely, and only in certain cases. Their number is not limited; but in some places is more, in some less, from six to twenty-six. Out of these are annually elected the mayors, or chief magistrates of places; who, at the expiration of their mayoralty, return again into the body of the aldermen, whose delegates they were before. The twenty-six aldermen of London preside over the 26 wards of the city. When one of them dies or resigns, the wardmote chuse a successor, who is admitted, and sworn into office, by the lord-mayor and court of aldermen. All the aldermen are justices of the peace, by a charter of 15 Geo. II. The aldermen of London, &c. are exempted from serving inferior offices; nor shall they be put upon assizes, or serve on juries, so long as they continue to be aldermen. 2 Cro. 585. See **COURT**.

Formerly there were also aldermen of the merchants, of hospitals, of hundreds, &c. See **SENATOR**.

ALDERNEY, in *Geography*, a small island in the English channel, belonging to Great Britain, about four miles in length from east to west, separated from Cape la Hogue, on the coast of France, by a narrow strait, called the "Race of Alderney," and distant from it about three and an half leagues. This strait is very dangerous in stormy weather, more especially when two currents meet; otherwise it has sufficient depth of water for the largest ships, so that through this strait the French fleet made their escape after their defeat at la Hogue, in 1692. To the west-north-west, are the dangerous rocks called the "Caskets," and the rocks called "Barroches," are close to the west end of Alderney. On the east, for a mile, are several rocks, and a bank of sand at the distance of a league; east of this is the Race, and round the rocks on the west is the passage to Jersey Island. Alderney, called by the French Aurigny or Orniay, is a healthy island, fruitful in corn and pasture, and remarkable for a fine breed of cows. The inhabitants live together, for greater security, in a town of the same name; consisting of about 200 houses, and their number is about 1000. The harbour, called Crabby, lies on the south side at some distance, and is only fit for small vessels. Alderney, as well as the islands of Jersey, Guernsey, Sark, and their appendages, were parcels of the duchy of Normandy, and though

united to the crown of England by the first princes of the Norman line, are governed by their own laws, which are for the most part the ducal customs of Normandy, collected in the book intitled, "le Grand Coutumier." The king's writ, or process from the courts of Westminster, is there of no force; but his commission is not bound by common acts of our parliaments, unless particularly named. All causes are originally determined by their own officers, the bailiffs and jurors of the islands; but an appeal lies from them to the king in council, in the last resort. Blackst. Com. vol. i. p. 107. N. lat. 49° 50'. W. long. 2° 15'.

ALDERNEY CATTLE, a breed of cattle, probably first imported from the island of the same name, in general fine-boned, but small and ill-made, and of a light red or yellowish colour. Cows of this breed are most frequently met with about the seats of the opulent, probably from their milk, though smaller in quantity, being more rich in quality than that of most other kinds, and yielding a larger portion of cream and butter from the same measure, which is of a beautiful yellow colour, and fine flavour. They are much inclined to fatten, and their beef has a fine grain and is well talled, but rather more yellow or high coloured than that of some more perfect breeds. The author of the treatise on live-stock remarks, that they are a breed of cattle too delicate and tender to be much attended to by the British farmer, and not capable of bearing the cold of this island, especially the more northern parts of it, without being greatly injured by it. See **CATTLE**.

ALDESCUS, in *Ancient Geography*, a river which, according to the periphus of Dionysius Periegetes, discharged itself into the Euxine sea.

ALDIAFERA, in the Arabian *Astronomy*, denotes a fixed star of the third magnitude, in the Lion's mane.

ALDHELM, or **ADEL**, *St.*, in *Biography*, an eminent scholar and promoter of literature in the seventh century, and the nephew or near relation of Ina, king of the West Saxons, was born at Caer-Bladon, now called Malmesbury in Wiltshire; and educated under Maildolphus, an Irish Scot, at the place of his nativity, as well as in France and Italy under Theodore, archbishop of Canterbury, and under Adrian, the most learned professor of the sciences, who had ever been in England, or under Albin, the pupil of Adrian. After the death of Maildolphus, who had instituted a school at Malmesbury, Aldhelm succeeded him, and built a stately monastery, of which he himself was the first abbot. When the kingdom of the West Saxons was divided, upon the decease of Hedda the bishop, into two dioceses, *viz.* Winchester and Shireburn, Aldhelm was promoted by Ina to the latter, which comprehended Dorsetshire, Wiltshire, Devonshire, and Cornwall. At Rome, whither he went to be consecrated by pope Sergius I., he is said to have reproved the holy father for his incontinence; but Bale reproaches him with not having informed his conscience on this occasion. The monkish authors have recorded some extraordinary instances of his charity and self-denial; they have ascribed several miracles to him; and they report, that by his prayers he lengthened a beam in the church, which the builder had cut too short, and that he hung his garments to dry in the rays of the sun, which supernaturally supported them. It is of much greater importance, however, to contemplate his literary character and writings. It is evident, says Dr. Henry, from his works, which are still extant, that he had read the most celebrated authors of Greece and Rome, and that he was no contemptible writer in the languages, in which these authors wrote. In the different seminaries, where he was educated, he had acquired a very uncommon

Book of knowledge, and became famous for his learning, not only in England, but in foreign countries; so that several learned men sent him their writings, for his perusal and correction; particularly prince Arivil, a son of the king of Scotland, who intreated him to give his pieces the last polish, by rubbing off the Scotch rust. Camden says, that he was the first Saxon who wrote in the Latin language, both in prose and verse; and he composed a book for the instruction of his countrymen in the profody of that language. Although another writer preceded him in Latin versification, it is certain, says Dr. Warton, (Hist. of English Poetry, vol. i. diff. 2.) that Aldhelm's Latin compositions, whether in verse or prose, as novelties, were deemed extraordinary performances, and excited the attention and admiration of scholars in all other countries. A learned contemporary, who lived in a remote province of a Frankish territory, in a letter to Aldhelm, has this remarkable expression,—“*Vestra Latinitatis panegyricus rumor;*” has reached us, even at this distance. Venerable Bede gives the following character of him: that, “he was a man of universal erudition, having an elegant style, and being wonderfully well acquainted with books, both on philosophical and religious subjects.” King Alfred the Great declared, that Aldhelm was the best of all the Saxon poets, and that a favourite song, which was universally sung in his time, near 200 years after the author's death, was of his composition. The character of Aldhelm is thus drawn by an ancient chronicler: “he was an excellent harper, a most elegant Saxon and Latin poet, a very skilful chanter or singer, a ‘*doctor egregius,*’ or doctor of singular merit, and admirably versed in the scriptures and the liberal sciences.” It is related of him, that when he was abbot of Malmesbury, having a fine voice and great skill in music as well as poetry, and observing the backwardness of his barbarous countrymen to listen to grave instructions, he composed a number of little poems, which he sung to them after meals in the sweetest manner; and by these means they were gradually instructed and civilized. William of Malmesbury bears this testimony concerning him, that his style is less lively than may be desired by those who are more attentive to language than matter; but if you examine his writings attentively, you will find in them Grecian acuteness, Roman elegance, and English dignity. After Aldhelm had governed the monastery of Malmesbury about 30 years, he is said to have retired to Shireburn, of which he had been consecrated bishop in 705, and where he died, May 25, A. D. 709. His treatise against the mistakes of the Britons concerning the celebration of Easter, was the means of reconciling many of the Britons to the Catholic usage on this point. He also wrote several other treatises on various subjects, the titles of which are recited in the Biog. Brit.; some of which are lost, and others published by Martin Delrio, at Mentz, in 1601, in 8vo., and by Cassias in the Bibliotheca Patrum. His book, written partly in prose and partly in hexameter verse, in praise of virginity, dedicated to Ethelburga, abbess of Barking, was published among Bede's Opuscula. Biog. Brit. Henry's Hist. vol. iv. p. 10—13, 8vo. Cave Hist. Lit. &c. vii. vol. i. p. 575, ed. Oxon.

ALDHUN, ALDHUNUS or ALDWINUS, the first bishop of Durham, was promoted to the see of Lindisfarne or Holy Island, in 990, the 12th year of the reign of king Ethelred. The legends of the time say, that he was admonished by heaven to quit this station, in which he was harassed by the incursions of the Danish pirates; and that he and the monks, who accompanied him, took with them the body of St. Cuthbert, which had been buried there 113 years, and after wandering about for some time, settled at Danelm, now called Durham, where he established a city and a ca-

thedral church. Before this time, the town consisted only of a few scattered cottages, and the spot which he selected for the establishment of his colony was covered with wood, which was soon cleared away by the bishop and his followers. In three years the church was completed and dedicated to St. Cuthbert, whose bones were deposited within its walls. From this time the episcopal see was fixed at Durham. Alfred and Edward, the sons of king Ethelred, were educated by this prelate; and when their father was driven from the throne by Swain, king of Denmark, he conducted them, together with queen Emma, into Normandy, to duke Richard, the queen's brother, A. D. 1017. In the next year the bishop was so affected with the news of the defeat of the English by the Scots, that he died a few days after, having enjoyed the prelate 29 years. Aldhun was of a noble family, but, according to Simeon of Durham, was more ennobled by his virtues and religious deportment. Biog. Brit.

ALDII, in *Antiquity*, servants who attended their masters in expeditions to the wars. They were otherwise called *Aldiones*, *Aldionii*, and *Aldionarii*.

ALDPORT, in *Geography*, an ancient name for Manchester.

ALDRED, in *Biography*, an English prelate of the 11th century, was a man of an enterprising and ambitious spirit, and gradually rose from being a monk of Winchester and abbot of Tavistock, to the see of Worcester and the archbishopric of York. Four years after he was promoted to the see of Worcester, which he obtained in 1046, he took a journey through Hungary to Jerusalem, the first adventure of the kind which any Englishman had performed; and upon his return he was deputed by Edward, the Confessor, on an important embassy to the emperor Henry II. On his arrival in England, after some stay in Germany, where he acquainted himself with the church discipline, which he introduced into his own country, he procured the administration of the see of Wilton for three years, during the absence of its bishop, and that of Hereford for four years, after the death of its incumbent. In 1061 he was advanced to the archbishopric of York, and allowed, as it has been said, by means of bribery, to hold the see of Worcester in commendam. Pope Nicholas II., having heard of his simoniacal practices, not only refused him the pall, for which he applied, but deprived him of his other preferments, but being robbed in his way home over the Alps, he was under a necessity of returning to Rome, and by the bold interference of earl Tolli, the pope was prevailed upon to grant him the pall, on condition of his resigning the see of Worcester. Afterwards the king, considering the depredations which the see of York had suffered by the incursions of the Barbarians, permitted Aldred to retain 12 towns or manors belonging to the see of Worcester for his own use. Others, however, say, that he detained them by violence and injustice. The following instance of resolution, and of priestly arrogance, is recorded by his panegyrist Stubbs. The high sheriff having intercepted some provisions, which the archbishop's servants were conveying to the palace at York, and seized them for the king's use, Aldred, instead of seeking legal redress, sent a deputation of clergy and citizens to demand restitution, and enforced the demand by threats of excommunication. Upon the sheriff's refusal, the archbishop, with a train of ecclesiastics, hastened to the king, who was then sitting in council at Westminster, and abruptly addressed him in this imperious language. “Hear me, William! when thou wert an alien, and God had permitted thee, for our sins, and through much blood, to reign over us, I anointed thee king, and placed the crown upon thy head with a blessing; but now, because thou deservest it not, I will change that blessing into a curse against thee, as

a persecutor of God and his ministers, and a breaker and contemner of those oaths and promises, which thou madest unto me before the altar of St. Peter." The king was astonished and terrified, threw himself at the feet of the archbishop, and anxiously entreated to know what offence he had committed. When the nobility who were present expressed their indignation at the prelate's insolence, and at his suffering the king to lie at his feet; "let him alone;" said the archbishop; "let him lie; he is not fallen at my feet, but at the feet of St. Peter." At length he raised the king and delivered his complaint; upon which an order was issued, that the goods should be fully restored, and the prelate was sent away loaded with rich presents.

Aldred's versatility of principle was sufficiently manifest in his conduct under the changes of government that occurred during the latter part of his life. When his patron Edward was dead, he assisted Harold in obtaining the crown. On the arrival of William the Norman, when Stigand, archbishop of Canterbury, refused to crown him, Aldred fell in with the stream, and performed the ceremony. Upon the Danish invasion, when the citizens of York, and others, declared for prince Edgar Atheling's title, the archbishop sickened at the news, and died Sept. 10, 1069, just before the Danes landed; and was buried in the cathedral church of York. Biog. Brit.

ALDRICH, or ALDRIDGE, ROBERT, was bishop of Carlisle, in the reigns of Henry VIII., Edward VI., and Mary, and of course accommodated his principles to the changes of the times. He was born at Burnham, in Buckinghamshire, educated at Eton school, and elected scholar of king's college, Cambridge, in 1507, where he took the degree of master of arts. At this time Erasmus styled him "blandæ eloquentiæ juvenis." Leland has also celebrated him for his admirable parts and learning. In 1529 he was incorporated bachelor of divinity at Oxford, and in 1530 he was licensed as doctor in the same faculty. He successively became archdeacon of Colchester, canon of Windsor, and regent of the order of the garter, and at length, in 1537, bishop of Carlisle. He died March 25, 1555, at Horn-Castle, in Lincolnshire, which was a house belonging to the bishops of Carlisle. He wrote several pieces, such as "Resolutions concerning the Sacraments," "Answers to Queries, concerning the Abuses of the Mass," "Various Epigrams," and "Resolutions," of some questions relating to bishops and priests, and other matters, tending to the reformation of the church, begun by Henry VIII. Biog. Brit.

ALDRICH, HENRY, an eminent divine and polite scholar, was born at Westminster, in 1647, and educated in the college school, under the famous Busby. In 1662 he was admitted into Christchurch college, Oxford, where he continued, in the several situations and with the appropriate commendations of a diligent student, useful tutor, and excellent master, to the day of his death, Dec. 14, 1710. Having passed through the gradations of bachelor of arts in 1666, and master in 1669, he took orders, and became an eminent tutor in his college. In 1681 he was installed canon of Christ church, and in the same year accumulated the degrees of bachelor and doctor in divinity. During the reign of James II. he bore a conspicuous part in the controversy with the papists, and published several tracts; ranking, according to bishop Burnet, (Hist. of his own Times,) among those eminent English clergymen, "who examined all the points of popery, with a solidity of judgment, a clearness of arguing, a depth of learning, and a vivacity of writing, far beyond any thing that had before that time appeared in our language." Soon after the Revolution, viz. in 1689, Dr. Aldrich was installed dean of Christchurch, in which high station he behaved in the most

worthy and exemplary manner, and exerted himself in promoting learning, virtue, and religion. By his skill in architecture he improved the buildings of the college; and that part of it called Peckwater quadrangle, so deservedly admired, was designed by him. The parish church of All Saints, in Oxford, and the chapel of Trinity College, which he designed, are further specimens of his architectural knowledge. In order to excite and cherish a taste for polite literature, he annually published some piece of an ancient Greek author, as a new year's gift to the students of his house. The works of this kind which he edited were "Xenophontis Memorabilia," Gr. and Lat. Oxon. 1690, 8vo.; "Xenophontis Sermo de Agesilao," Gr. and Lat. Oxon. 1691, 8vo.; "Aristotæ Historia LXXII. Interpretum," Gr. and Lat. Oxon. 1692, 8vo.; "Xenophontis de re equestrilibus," Gr. and Lat. Oxon. 1693, 8vo.; "Epictetus et Theophrastus," Gr. and Lat. Oxon. 1707, 8vo.; "Platonis, Xenophontis, Plutarci, Luciani Symposia," Gr. Oxon. 1711, 8vo. He wrote likewise a system of Logic, intitled "Artis Logicæ Compendium," Oxon. 1691, 8vo.; and "Elements of Geometry," in Latin, never published. He was also concerned in Gregory's Greek Testament, printed at Oxford in 1703, fol. He wrote notes on Havercamp's edition of Josephus, and in concurrence with bishop Sprat, he revised the MS of Lord Clarendon's History of the Rebellion. The tracts which he published in the popish controversy were, "A Reply to two Discourses, lately printed at Oxford, concerning the Adoration of our Blessed Saviour in the Holy Eucharist," Oxford, 1687, 4to.; and "A Defence of the Oxford Reply, &c." Oxford, 1688, 4to.

Dr. Aldrich amused his academic leisure with music and poetry. His abilities as a musician rank him, in the opinion of competent judges, among the masters of the science. He composed many services and anthems for the church service, and adapted English words to many of the motets of the Italian masters, some of which are frequently sung in our cathedrals as anthems. He established a musical school in his college, and at his decease bequeathed to it a most capital collection of church music. Although he chiefly applied himself to sacred music, yet being of a cheerful temper, and possessing a fund of humour, he occasionally diverted himself by producing pieces of a lighter kind. For the entertainment of smokers, to which fraternity he belonged, he composed a smoking catch to be sung by four persons whilst they were smoking; and he was also the author of the popular catch "Hark the bonny Christ church bells." As a Latin poet, Aldrich is entitled to some distinction. Two elegant pieces written by him are contained in the "Musæ Anglicanæ;" one on the accession of William III., the other on the death of the Duke of Gloucester. The following epigram, intitled, "Causæ Bibendi," is also inscribed to him:

"Si bene quid memini, causæ sunt quinque bibendi,
Hospitis adventus, præsens sitis, atque futura,
Aut vini bonitas, aut quælibet altera causa."

Thus translated: "If on my theme I rightly think,
There are five reasons why men drink:
Good wine, a friend, because I'm dry,
Or lest I should be by and by,
Or any other reason why."

The candour of Aldrich's temper, and the moderation of his principles, may be inferred from his having been appointed by William III. in 1689, one of the commissioners for preparing matters towards introducing alterations in the service of the church, and accomplishing a comprehension with

with the dissenters; but the want of information has always prevented the discovery of the truth. Besides the preference above-mentioned, he has published the living of Vespa in 1703, and in 1711 was often professor of chemistry in Rome. In 1711, he died at his college, leaving a good name behind him, without any memorial in the cathedral.

His manner was hardy; his easy pleasure; his attention to a good method; and to the credit of his college; his exertions for the improvement of learning; and the power which he had of a kind of reputable talents; various accomplishments and amiable qualities, unite to transmit his name with honour and posterity." *Biog. Brit.* Burney's and Hawkins's *Bib. of Music.* *Gen. Biog.*

ALDROVANDA, in *Botany*, a genus of the *pentandria pentagynia* class and order; the characters of which are, that the calyx is a five-parted, erect, equal, permanent perianthium; the corolla has five petals, oblong, acuminate, of the length of the calyx, and permanent; the stamina have filaments of the length of the flowers, and simple anthers; the pistillum has a globose germ, styles very short, and obtuse stigmas; the pericarpium is a globose capsule with five blunt angles, five-valved, one-celled; and the seeds are ten, longish, fixed to the inner wall of the pericarpium. There is one species, *viz.* *A. vesiculosa*, lenticula of Plukenet, and bucarda of Aublaine, which is found in marshes, both in Italy and India, with bladders like *utricularia*, but in bunches. Martyn.

ALDROVANDI, ULYSSES, in *Biography*, a celebrated naturalist, sometimes called the *Modern Pliny*, was born of a noble family, at Bologna, in 1522, and pursued his studies partly at his native place and partly at Padua. The truth of his religious opinions having been suspected, he travelled to Rome in 1550, for the purpose of vindicating himself; and there he took the advantage of studying the antiquities of the place, and drew up a treatise on the ancient statues, which was published in the work of his friend Lucio Mauro, on Roman antiquities. On this occasion he likewise became acquainted with Rondelezio, whose researches into the history of fishes gave him a taste for the knowledge of nature. Upon his return to Bologna he engaged in the study of Botany, and went to Pisa to obtain assistance from professor Ghisi. Having graduated in physic at Bologna in 1553, he was in the following year appointed to the chairs of philosophy and logic, and to the lectureship of botany, and by his interest the botanical garden of Bologna was founded in 1567. The duties of his profession, to which he sedulously attended, did not prevent his devoting his time and property to the important objects of collecting books, conducting an extensive correspondence, and taking journeys, with a view to obtain information concerning every branch of natural history. He also expended large sums, and involved himself in pecuniary difficulties, in the design of forming a museum of rare and curious productions, and in employing the best artists in delineating them. He not only caused to be delineated the external face of the objects he describes, but frequently gives anatomical accounts of their internal structure, with the uses of the parts; more especially of birds, in which he made some valuable discoveries. As the result of this labour and expence, he published four folio volumes with plates: three on ornithology, and one on insects. One volume on bloodless animals, and another on fishes, were likewise composed by him. The rest, making the whole number 13 volumes, and treating on serpents, quadrupeds, monsters, metals and trees, were compiled after his death, principally from the materials which he had collected. For the titles of the several treatises, see Haller's *Bib. Botanica*, *Anatomica*, and *Medica*, under the art. *Aldrovandus*. Notwithstanding the liberal assistance which he received in the execution of his extensive and magnificent plan, the expence

of it ruined his fortune and exhausted all his resources so completely, that he died, in 1605, after having lost his sight, as it is said, at the hospital in Bologna, at the advanced age of 83 years. Haller says, that he quarrelled with the apothecaries and physicians of Bologna, and was expelled the college of physicians. To liberality he bequeathed his immense collection, and it formed the basis of the museum now existing at Bologna, where his memory is held in great and deserved honour. Although his industry and zeal seem to have exceeded his judgment, and his works are defective in arrangement, and abound with superfluous and dubious matters, yet natural history is greatly indebted to his diligence and liberality. Buffon calls him the most laborious and learned of all the naturalists, and commends the plan and distribution of his work, and the exactness of his descriptions. Bayle observes, that antiquity does not furnish us with a design so extensive and laborious as that of Aldrovandus with regard to natural history. Pliny, he says, has treated of a greater number of subjects, but he only touches them lightly, and says but little upon any thing, whereas Aldrovandus has collected all he could meet with. His *Hortus Siccus*, or collection of dried specimens of plants, which filled sixteen large folio volumes, was existing, Haller says, near a century after the collection was formed. Besides his manuscripts in natural history, he left various writings in almost every other department of the arts and sciences. His praises are celebrated by Barberini, afterwards pope Urban VIII. in the following epigram:

"Multiplices rerum formas quas pontus et æther,
Exhibet et quicquid promit et addit humus,
Mens hæc, spectant oculi, dum cuncta sagaci
Aldobrande tuus digerit arte liber.
Miratur proprios solers industria fœtus
Quamque tulit mali se negat esse parent,
Obstupet ipsa simul rerum fœcunda creatrix,
Et cupit esse suum quod vidit artis opus."

"The various forms that swim the watery plains,
Whatever the earth's capacious womb contains,
The trees and herbs that on her face appear,
And all the wing'd inhabitants of air,
In thy stupendous work collected lie,
To feast the soul, and strike th' astonish'd eye.
Her own productions industry no more
Dares own, but wonders at the fruit she bore;
And fruitful nature at thy deeds amaz'd,
Wishes her own those works thy art has rais'd."

Gen. Dict.

ALDUABIS, or ALDUA DUBIS, now **DOUX** or **DOUBS**, in *Ancient Geography*, a river of Celtic Gaul, which rose in Mount Jura, and separating the Sequani from the Helvetii, and running through Burgundy, or the Franche Comte, almost encompassed Besançon, and fell into the Saone, near Chalons. The word is formed of Aldua, the Alde, and Dubis, the Doux, the names of two rivers which unite near Montbeliard.

ALDUDES, in *Geography*, mountains that are part of the Pyrenées, in Lower Navarre, between Pampeluna and St. Jean Pic de Port.

ALE, a kingdom of Africa, in Guinea, to the south of Senegal, and almost opposite to Cape Verd. Its capital, which is the residence of the king, is Yagog. N. lat. 13°. W. long. 12° 46'.

ALE, a river of Scotland, which runs into the Tiviot, three miles north-north-west of Jedburgh.

ALE, in *Ancient Geography*, a town of Asia, upon the coast of Syria, between Pedalia and Selinus.

ALE,

ALE, a popular fermented drink, made from malt and hops; and chiefly distinguished from beer, another potable liquor made from the same ingredients, by the quantity of hops used therein; which is greater in beer, and therefore renders the liquor more bitter, and fitter for keeping. For the method of brewing ale, see BREWING. The brewers also distinguish pale, or fine ale, brown ale, &c. Their several properties, effects, &c. see under MALT-Liquor.

The art of making an infusion of corn, and particularly of barley, similar to our ale, seems to have been known and practised in very ancient times among those people who lived in climates that did not afford grapes. It seems to have passed from Egypt into those western nations, which were settled by the colonies that migrated from the east. The zythum and curmi, mentioned by Tacitus, as the beverage of the ancient Germans, are supposed by Matthiolus to correspond to our ale and beer. Diodorus Siculus says (lib. iv. c. 26. tom. i. p. 370.) that the Gauls, who lived in a country that produced neither grapes nor olives, made a strong liquor of barley, which they called Zythus. The natives of Spain, the inhabitants of France, and the aborigines of Britain, used this liquor, under the different appellations of *caelia* and *ceria* in the first country, of *cerevisia* in the second, and of *curmi* in the last; all which names literally denote the *strong water*.

After the introduction of agriculture into this island, ale or beer was substituted for mead, and became the most general drink of all the British nations which practised that art, as it had been of all the Celtic people on the continent. "All the several nations, (says Pliny, H. N. xiv. 29. tom. i. p. 729.) who inhabit the west of Europe, have a liquor with which they intoxicate themselves, made with corn and water, *fruge malida*. The manner of making this liquor is somewhat different in Gaul, Spain and other countries, and it is called by many various names; but its nature and properties are every where the same. The people of Spain, in particular, brew this liquor so well, that it will keep good for a long time. So exquisite is the ingenuity of mankind in gratifying their vicious appetites, that they have thus invented a method to make water itself intoxicate." The manner in which the ancient Britons and other Celtic nations, made their ale is thus described by Isidorus, (Orig. lib. xx. c. 2.) and Orosius, (lib. iv. p. 259.), cited by Henry (Hist. of England, vol. ii. p. 364, 8vo.): "the grain is steeped in water, and made to germinate, by which its spirits are excited and set at liberty; it is then dried and grinded; after which it is infused in a certain quantity of water; which, being fermented, becomes a pleasant, warming, strengthening, and intoxicating liquor." This ale was most commonly made of barley, but sometimes of wheat, oats, and millet. Geopon. lib. vii. c. 34. p. 203. This liquor is of such antiquity in England, that we find mention of it in the laws of Ina, king of Wessex. Ale was the favourite liquor of the Anglo-Saxons and Danes, as it had been of their ancestors, the Germans. Tacitus, de Mor. Germ. c. 23. Before their conversion to Christianity, they believed that drinking large and frequent draughts of ale was one of the chief felicities which those heroes enjoyed who were admitted into the hall of Odin. Amongst the liquors provided for a royal banquet, in the reign of Edward the Confessor, ale is particularly specified. In Scotland and Wales they had two kinds of ale, called common ale and spiced ale; and their value was thus ascertained by law: "if a farmer hath no mead, he shall pay two casks of spiced ale, or four casks of common ale, for one cask of mead." By this law, a cask of spiced ale, nine palms long, and 18 palms in diameter, was valued at a sum of money equal in effect to 7*l.* 10*s.* of our present money; and a cask of common ale, of the same dimensions, at a sum equal to 3*l.* 15*s.* Hence it appears,

that common ale was at this period an article of luxury among the Welsh, and that it could only be obtained by the great and opulent. Wine at this time seems to have been unknown even to the king of Wales, as it is not mentioned in their laws; though Gualdus Cambrensis, who flourished a century after the conquest, informs us, that there was a vineyard in his time at Maenarper, near Pembroke, in South-Wales. Henry's Hist. vol. iv. p. 393. By a statute of 35 Henry III. in 1272, mentioned by Hume (Hist. Eng. vol. ii. p. 224.), a brewer was allowed to sell two gallons of ale for a penny in cities, and three or four gallons for the same price in the country. But the first assize of ale was fixed by the famous Stat. 51 Henry II.

The following method for preserving ale from turning sour in long voyages, was first published by Dr. Stobbs (Phil. Trans. N^o 27.), and experience has evinced its utility. To every runlet of five gallons, after being placed in a cask on ship-board not to be stirred any more, put in two new-laid eggs whole, and let them lie in it. In a fortnight or a little more, the egg-shells will be entirely dissolved, and the eggs become like wind-eggs enclosed only in a thin skin; after this the white is preyed on, but the yolks are not touched or corrupted; and by these means the ale has been so well preserved, that it was found better in Jamaica than at Deal.

The duties on ale and beer make a considerable branch of the revenue in England. They were first imposed in 1643, when the excise was first established, again by Car. II. and have been continued by several subsequent acts of parliament. By 27 Geo. III. c. 13, for every barrel of beer or ale, above six shillings a barrel, (exclusive of the duty hereby imposed, and not being two-penny ale, nor table beer) the brewer shall pay eight shillings; and for every barrel of six shillings, or under, (exclusive of the duty) one shilling and fourpence; and for every barrel of beer or ale above six shillings the barrel (exclusive of the duty), and not exceeding 13*s.* (33 Geo. III. c. 23. s. 1.) commonly called table beer, brewed by common brewers, according to 22 Geo. III. the brewer shall pay three shillings; and for every barrel of two-penny ale three shillings and fourpence.

The saccharine matter extracted from the farinaceous seeds, of which ales are made, and subjected to a fermentation analogous to that of wine, imparts to our ales a quantity of alcohol; and they have, therefore, in general, the cordial, exhilarating, intoxicating, and sedative qualities of wine. But their effect, in these respects, depends partly upon the quantity and condition of the saccharine matter that is employed, and partly upon the management of the fermentation to which they are subjected. Barley is chiefly employed for the purpose of making ales, though it might be prepared from any of the cerealia; and this selection is very properly made, because its germination is most easily conducted, and under its germination it gives out its sugar most readily, and in greatest quantity. Ales, made in the ordinary manner, will be stronger or weaker according to the quantity of the saccharine matter that is used; and this will be greater or less according to the quantity of well-ripened farina in the barley that is employed, according to the mode in which it is malted, according to the proper and complete extraction of the saccharine matter by water, and according to the dissipation in a greater or less degree, of a quantity of the superfluous water. The other qualities of ales, besides their strength or weakness, will depend upon the conduct of the fermentation. As the infusion of malt or wort, is not so well disposed to fermentation as the juices of fruits, it will require the addition of a ferment; and afterwards the conduct of the fermentation will be very much the same with that of wines; at first very active, and then slowly protracted for a long time: but however ale is managed,

naged, its fermentation is not so capable of being rendered so complete and perfect as that of wine. In most ales there is probably a large portion of unassimilated farinaceous matter, which of course renders ales more nourishing than wines, and they are, *ceteris paribus*, more liable to accefcency in the stomach than wines. It has been commonly supposed, that the viscidty of worts is never entirely corrected by the fermentation; and therefore that ales are more apt than wines to fill the vessels of the human body with viscid fluids; but Dr. Cullen thinks that this circumstance deserves little attention, as it is probable that the power of the gastric fluid, and of the fermentation which happens in the stomach and intestines, reduces the whole nearly to an equality in respect of fluidity. Cullen's Mat. Med. vol. i. p. 418, &c.

ALE, *cerevisia*, is also a denomination given to divers medicated liquors, or diet-drinks, of which ale is the basis or vehicle. The medicated ales make a large article in our old dispensaries. Such are the *cerevisia oxydrica*, for the eyes; *cerevisia anti-arthritis*, against the gout; *cerevisia cephalica*, for the head; *cerevisia epileptica*, &c.

ALE, *gill*, is prepared by infusing the dry leaves of gill or ground-ivy, in malt-liquor; which hereby becomes impregnated with the virtues of that simple; and is therefore reputed absterfve and vulnerary, good in disorders of the breast, and against obstructions of the viscera.

ALE, *Dr. Butler's purging*, is prepared of polopody, fena, sarsaparilla, aniseeds, scurvy-grass, agrimony, and maiden-hair, put up in a bag, and hung in a vessel of ale.

We also meet in some dispensaries with syrup of ale, made by boiling that liquor to a consistence; which has been used against obstructions in the kidneys, and the fluor albus.

ALE-BEER. See BEER.

ALE-BERRY, is ale boiled with bread and mace; sweetened, strained, and drunk hot.

ALE-CORNER, an officer in the city of London, whose business is to inspect the measures of the public houses. There are four of them: and they are chosen by the common-hall of the city.

ALE-HOUSES must be licensed by justices of the peace, who take recognizances of the persons licensed, viz. 10*l.* each, and of their sureties, 5*l.* each, that they will not suffer unlawful gaming, nor other disorderly practices in their houses. By 35 Geo. III. c. 113. every person, excepting those who sell ale in fairs, who shall sell by retail ale or beer without licence, is liable to a penalty of 20*l.* for the first offence, and for the second shall moreover be incapable of being afterwards licensed to keep an alehouse, with all costs. The licence is granted on the first of September, or within twenty days after, at a general meeting of the justices for the division to which he belongs, upon his producing a certificate to his character, unless, by living in a city or town-corporate, this last circumstance is dispensed with, and continues in force for one year only. Ale-house keepers, selling ale in short measure, are liable to a penalty not exceeding 40*s.* and not less than 10*s.* and likewise to a fine of 10*s.* for permitting tipping, &c. 26 Geo. II. c. 41. 29 Geo. II. c. 12. 5 Geo. III. c. 46. 30 Geo. III. c. 38. and 32 Geo. III. c. 59. By the last act no person can sell wine by retail to be drunk in his own house, who has not an ale-licence.

ALE-MEASURE. See MEASURE.

ALE-SILVER, a rent, or tribute, yearly paid to the lord-mayor of London, by those who sell ale within the city.

ALE-TASTER, is an officer appointed and sworn, in every court-leet, to take heed that there be a due size, and goodness of bread, ale, and beer, sold within the jurisdiction of the leet.

ALE is used by some of our ancient English writers, and particularly in composition with other words, for festival.

Thus, bridal or bride-ale is the feast in honour of the bride or marriage; leet-ale in some parts of England denotes the dinner at a court-leet of a manor for the jury and customary tenants; lamb-ale is used for an annual feast at lamb-shearing; Whitsun-ale is the name by which in the midland counties the rural sports and feasting at Whitsuntide are denominated; and church-ale was a feast established for the repair of the church, or in honour of the church-saint, &c. See Warton's Hist. of English Poetry, vol. iii. p. 128.

Church-ales, as they are described by Pierce, bishop of Bath and Wells, in his answer to the inquiries of archbishop Laud, are when the people go from afternoon-prayers on Sundays to their lawful sports and pastimes in the church-yard, or in the neighbourhood, or in some public-house, where they drink and make merry. By the benevolence of the people at these pastimes many poor parishes have cast their bells, and beautified their churches, and raised stock for the poor.

Clerk-ales, or lesser church-ales, were so called because they were for the better maintenance of the parish clerk; and there is great reason for them, says his lordship, for in poor country parishes, where the wages of the clerk are but small, the people thinking it unfit that the clerk should duly attend at church, and not gain by his office, send him in provision, and then come on Sundays and feast with him, by which means he sells more ale, and takes more of the liberality of the people, than their quarterly payment would amount to in many years; and since these have been put down, many ministers have complained to me, says his lordship, that they are afraid they shall have no parish clerks. A *bid-ale* is when a poor man, decayed in his substance, is set up again by the liberal benevolence and contribution of his friends at a Sunday's feast. The people were fond of these recreations, and the bishop recommends them, as bringing the people more willingly to church, as tending to civilize them, and to compose differences among them, and as serving to increase love and unity. But the justices of the peace were of a different opinion, and signed a petition to the king, in which they declare that these revels had not only introduced a great profanation of the Lord's day, but riotous tipling, contempt of authority, quarrels, murders, &c. and were very prejudicial to the peace, plenty, and good government of the country, and therefore they pray that they might be suppressed. Two judges in the western circuit, in 1653, made an order for suppressing them; but Laud complained to king Charles I. of their invading the episcopal jurisdiction, and they were summoned before the council, reprimanded, and enjoined to revoke this order at the next assizes. Neal's Hist. Puritans, vol. i. p. 567, 4to.

ALEA, in *Roman Antiquity*, signifies, in general, games of chance. They were forbidden by the Cornelian, Publician, and Titian laws, except in the month of December. Hor. Od. iii. 24. 58. Martial, iv. 14. v. 85. xiv. 1. These laws, however, were not strictly observed. The character of gamblers, *aleatores* or *aleones*, was held infamous. Cicer. Cat. ii. 10. Pliny, ii. 27.

ALEA, in a more limited sense, is applied by Roman writers to a particular game played with dice, in a pair of tables, somewhat after the manner of our back-gammon, or trictrac. Instead of our men, they played with white and black stones, which were moved this way or that, as the dice directed.

Alea in this sense appears to have been the same game with what the Greeks called *pettia* and *chivia*; the Romans sometimes *tabula*, *tessera*, and XII. *scripta*.

ALEA, the surname of Minerva, given to her by Aleus king of Arcadia.

ALEA, in *Ancient Geography*, a town of Arcadia, south-east of Stymphalus. It was founded by Aleus, and had three

three considerable temples, viz. those of the Ephesian Diana, of Minerva Alea, and of Bacchus. The feast of Bacchus, called *Skierna*, was celebrated every third year; and Pausanias relates, that on this occasion they privately scourged the women at the altar of this deity.

ALEA was also a town of Thessaly, and another of Spain, where Steph. Byz. places the Carpetani.

ALEANDER, JEROME, in *Biography*, was born in 1480, and distinguished himself in the 16th century by his violent opposition to Luther and the Reformation. Lusher says he was a Jew, probably on account of his accurate acquaintance with the Hebrew language; but Bayle shews that he was descended from a Catholic family of distinction in Istria. His memory was singularly retentive, and enabled him to acquire not only the Hebrew, Greek and Latin, but also many modern languages. According to Luther, who is contradicted by Bayle, he was at Rome in the pontificate of Alexander VI. and was secretary to the infamous Cæsar Borgia. It is acknowledged, however, that he was invited to France by Lewis XII. in 1508, to teach the Belles Lettres in the university of Paris. In this situation he was so much esteemed, that he attracted the attention of Leo X. and by the recommendation of this pontiff he became secretary to the cardinal de Medici; and afterwards succeeded Acciaiuoli as librarian of the Vatican. In 1519 he was sent by Leo as his nuncio into Germany; and in the diet of Worms he declaimed for three hours against the doctrine of Luther. Although he declined the contest to which Luther challenged him, he had influence sufficient to obtain an edict, which he himself drew up, for burning his books and proscribing his person. In 1531 he was again nuncio in Germany, and attempted, though unsuccessfully, to dissuade Charles V. from making a truce with the Protestants in this country. Having been created cardinal by Paul III. in 1537, he was sent a third time into Germany, where, as the pope's legate, he exerted himself in checking the progress of the Reformation. Upon his return to Rome he died in 1542, in consequence of taking too many unnecessary medicines, and just as he was finishing a large work against all the professors of literature, which was never published. The works which he has left are a Greek and Latin Lexicon, printed at Paris in 1521, fol. and a Greek Grammar, printed at Strasburg in 1517, 8vo. Luther represents Alexander as a man destitute of principle, of violent passions, insatiable avarice, and licentious conduct; but he was an adversary, and allowance should be made for the feelings and language of resentment. Erasmus speaks with respect of his learning, but complains of his unsteadiness as a friend, of his want of veracity, and of the injury which he suffered from his accusations. Aleander's mortification at seeing the progress of heresy, notwithstanding his utmost efforts to restrain it, is emphatically expressed in the epitaph, which he composed for his own tomb.

“Καθάρων εκ αεων, ου πιπυρομαι αν επιμαρτυς
Πολλων, αντερ ιδεν αλγον ην θανατον.”

“Not unreluctant I resign my breath,
For to behold life's ills is worse than death.”

Gen. Dict.

ALEANDER, JEROME, the *Younger*, the nephew of the former, was by profession a civilian, and a writer of some distinction in the 17th century. He was secretary first to Bandini, and afterwards to Barberini at Rome, and a member of the literary academy denominated Humourists; for which society he wrote several pieces, and one on the device adopted by the society. In the way of his profession he wrote “Commentaries on the Institutes of Caius;” and as an antiquarian he wrote a piece intitled, “Explicatio antiquæ ta-

bula Marmoræ Solis effigie exsculptæ,” &c. printed in 4to. at Rome, in 1616, and at Paris in 1617. He also wrote Italian and Latin poems, and some pieces on ecclesiastical affairs. His death, which is said to be owing to excess of eating, happened in 1631; and his funeral, which was magnificent, was conducted and attended by his associates of the academy. Gen. Dict.

ALEATORIUM, in *Roman Antiquity*, was the place where they played at *alea*.

The aleatorium was near the *spharisterium*; that the sportsmen, when tired with the *pila*, or more robust exercises, might refresh themselves in the aleatorium.

ALEBECE, in *Ancient Geography*, a town of Gaul, supposed to be the same with Albæce.

ALEBUS, a river of Spain.

ALEC, in *Ichthyology*, a name given by Gaza, in his commentaries on Aristotle, to the fish called by that author *mauris*, and by Ovid *menerela*. It is of the SPARUS kind.

ALEECOST. See TANACETUM.

ALECTO, in *Mythology*, one of the three Furies, daughter of Acheron and Night, or of Pluto and Proserpine; she is represented with vipers about her head and wings, and armed with vipers, scourges, and torches. The name denotes envy, or that which has no rest; being derived from *α priv.* and *λεγω, I rest*. See a fine description of this Fury in Virgil. *Æn.* vii.

ALECTO, in *Entomology*, a species of SPHINX, with the fore wings grey above, and the posterior red, with a black base and margin; found in India.

ALECTOR, in *Ornithology*, a species of CRAX, with a yellow cere, black body, and white belly.

ALECTORIA, derived from *αλεκτωρ, a cock*, in *Natural History*, a stone said to be found in the stomach, liver, or rather gall-bladder of old cocks.

It is ordinarily of the figure of a lupine, and seldom exceeds the bigness of a bean. It has abundance of virtues attributed to it, but most of them are fabulous.

This is otherwise called *alektorius lapis*, sometimes *alektorolithos*, in English the cock-stone.

The more modern naturalists hold the *alektorius lapis* to be originally swallowed down, not generated in the stomach or gizzard of cocks and capons.

ALECTORICARDITES, compounded of the Greek *αλεκτωρ, cock*, and *καρδια, heart*, in *Natural History*, a name given by Plot to a figured stone resembling a pullet's heart, with the fat near the basis of it, and the coronary vessels descended from it.

ALECTORIUS lapis, is used for a small species of *bufonites*, or disjunct segment of a palate of a fish, approaching to the nature of the *cheledonius lapis*.

ALECTOROLOPHUS, in *Botany*. See BARTSIA, PEDICULARIS, and RHINANTHUS.

ALECTOROMANTIA, from *αλεκτωρ, a cock*, and *μαντιαι, divination*, in *Antiquity*, an ancient kind of divination, performed by means of a cock.

This art was in use among the Greeks; and the usual manner of it was this. A circle was made on the ground, and divided into twenty-four equal portions, or spaces: in each of which spaces was written one of the letters of the alphabet, and upon each of these letters was laid a grain of wheat. This done, a cock was turned loose in the circle, and careful observation was made of the grains he pecked. The letters corresponding to those grains were afterwards formed into a word; which word was to be the answer desired.

It was thus that Libanius and Jamblichus sought who should succeed the emperor Valens; and the cock answering to

to the spaces $\Theta F O \Delta$, they concluded upon Theodore, but by a mistake, instead of Theodolus. The truth of this story is disputed.

There are also other species of alectromantia: in some the augury was taken from the crowing of the cock, wherein regard was had to the time of the day, whether before noon or after; to which some added the consideration of the sign the sun was in, and the motion of the moon. Others speak of a kind of alectromantia performed by help of a ring. Phil. Trans. N^o 162.

ALECTRA, in *Botany*, a genus of the *didynamia angiosperma* class and order: its characters are, that the calyx is 7-erianthium, one-leaved, two-lipped, upper lip two-cleft, lower three-cleft; the clefts ovate, obtuse, shorter than the tube; the corolla one-petalled, tubular; the tube gradually widened; the border expanding, five-parted; the parts broad-lanceolate, obtuse; the stamina, four filaments, inserted into the tube, filiform, bearded, of the length of the tube, two of them a little shorter, anthers twin; the pistillum, a germ ovate, style filiform, of the length of the filaments, stigma incurved, a little thicker than the style, and of the same length, striated on both sides; the pericarpium, a capsule, ovate, obtuse, twin, smooth, two-celled and two-valved; the seeds solitary and ovate. There is one species, viz. *A. Capensis*, a native of the Cape of Good Hope, in grassy places near rivers, flowering in November and December, and growing black in drying. Martyn.

ALECTRUONURUS *gramen*. See **FESTUCA**.

ALED, in *Geography*, a river of Wales, in Denbighshire, which runs into the Elwy.

A-LEE, in *Sea-Language*, the situation of the helm, when it is pushed down to the lee-side of the ship, in order to put the ship about, or lay her head to the windward. See **HARD-LEE**.

ALEFCHIMO, in *Geography*, a balia or district of the island CORFU, situate on the coast, containing 28 villages, and 10,000 people.

ALEGAMBE, PHILIP, in *Biography*, a learned Jesuit, was born at Brussels in 1592; and having finished his education, entered into the service of the duke of Ossuna in Spain, and accompanied him to Sicily. After he assumed the habit of a Jesuit at Palermo in 1613, he taught philosophy at Gratz in Austria; and became professor and doctor of divinity in 1629. During this period he travelled through Germany, France, Spain and Italy, as tutor to the son of the prince of Eggenberg, a favourite of the Emperor Ferdinand II. and attended him as confessor, in 1658, in his embassy to pope Urban VIII. When this mission was finished, he was retained at Rome by the general of the Jesuits as secretary of the Latin dispatches to Germany, and afterwards appointed president of spiritual affairs, and auditor of confessions in the professed house. He died of the dropsy in 1652. His chief work was a "Bibliothèque des Auteurs Jésuites," printed at Antwerp in 1643; and at Rome, by Sotuel, in 1675. Gen. Dict.

ALEGER, a name given to an inferior sort of vinegar, made of ale, or malt liquor, instead of wine. Power has given a description of the eels in *aleger*. V. Power, Exper. Philos. Obs. 3. p. 32.

ALEGRANZA, in *Geography*, one of the smaller of the Canary islands, situated at the north-east end of the Lancerota, one of the larger.

ALEGRE, a town of France, in the department of the Upper Loire, and district of Puy-en-Velay, five leagues south-east of Brioude, and four north-east of Puy-en-Velay.

A. LEGRETE, a town of Portugal in Alentejo, upon the river Caia, with the title of a marquise, and containing

about 900 inhabitants; 2½ leagues south-east of Pont-Alegre, N. lat. 39° 6'. W. long 6° 36'.

ALEGRINUS, JOHN, in *Biography*, cardinal and patriarch of Constantinople, was a native of Abbeville in Picardy. He was legate à latere in Spain and Portugal, and died in 1240. His works were formerly in estimation, but are now disregarded.

ALEHOOF, in *Botany*. See **GLECHOMA**.

ALEI, in *Geography*, a river of Russia, which runs into the Oby on the left side of it.

ALEIPIHA, from *αλειπω*, *I anoint*, in the *Materia Medica* of the ancients, a word used for all fatty bodies whatever. The oils of vegetables, and the fat of animals were all called by this general name. But these simple substances were not the only ones called by it, for it is very frequently used to express any sort of medicated oil impregnated with aromatic vegetables; but its general acceptation in this sense, was for such compositions as were intended to anoint the body; and therefore they were properly only vegetable or animal fats impregnated with the lighter parts of plants, and not clogged with an addition of powders, or with wax, or any thing of that kind, which might have given them the consistence of ointments. The ancient physicians were very fond of these compositions, which they applied either to some diseased part only, or to the whole body, and after they had made the patient use the warm bath to relax and open the pores.

ALEIUS CAMPUS, in *Ancient Geography*, a plain of Cilicia, placed by Strabo to the east of Sarus, between Adana and the sea. It is so called from Bellerophon's wandering and perishing there, after being thrown off Pegasus.

ALEKSEVSKI, in *Geography*, a town of Russia, in the government of Simbirk, 30 leagues south south-east of Simbirk. N. lat. 53° 15'. E. long. 50° 14'.

ALEKSIIEPSKOE, a town of Russia, in the government of Saratov, 37 leagues north-east of Saratov.

ALEKSIN, a town of Russia, in the government of Tula on the Oeca, nine leagues north-east of Kaluga. N. lat. 54° 44' E. long. 36° 44'.

ALEMA, a city of Gilead, beyond Jordan, mentioned 1 Maccab. v. 26; and perhaps the same with Helmon-Deblatain.

ALEMAN, Louis, in *Biography*, was born in 1390, and advanced rapidly through several gradations of ecclesiastical preferment to the archbishopric of Arles. He was much respected by Louis III. king of Naples, who, on his account, confirmed the privileges granted to the city of Arles; and he was honoured by pope Martin V. who had employed him in several services, with the dignity of cardinal. After the death of Martin V. he embroiled himself with pope Eugenius IV. by holding the council of Basil, of which he was president, in contradiction to his wishes; and he was excommunicated by this pontiff. He was again restored to his communion and dignities by pope Nicholas V. and sent as his legate into Lower Germany. On his return to his diocese, he was usefully employed in reforming the clergy, and instructing the people. He died at Salon in 1450, and was canonized. With the virtues of an ecclesiastic he united the talents of a statesman. Nouv. Dict. Hist. Gen. Biog.

ALEMAN, LOUIS AUGUSTINE, was born at Grenoble in 1653, where he followed the profession of an advocate. His works were, "Remarks of M. de Vaugelas on the French Language," with a preface by himself; "New Observations, or a Civil War in France upon Language," 12mo. Paris, 1683; "Monastic History of Ireland," 12mo. Paris, 1690; "Historical Journal of Europe for the Year 1694." Nouv. Dict. Hist.

ALEMANNI, ALLEMANNI, or ALEMANS, in *Ancient Geography*

Geography and History, the denomination of a body of Suevi, who appeared on the banks of the Mein, and in the neighbourhood of the Roman provinces, in quest either of food, of plunder, or of martial glory, about the year 214, or the 4th of the reign of the emperor Caracalla. Dion. Cass. lib. lxxvii. p. 1350. Añnius Quadratus, an original Roman historian, cited by Agathias, (lib. i. c. 5.) informs us, that this hasty army of volunteers, which coalesced into a great and permanent nation, was composed of many different tribes, and on this account assumed the name of Alemanni, or *All-men*, i. e. men of all nations, to denote at once their various lineage, and their common bravery. They consisted chiefly of Suevi, who, in process of time, were joined by several other German nations and some Gauls; for we are told by Tacitus, that a considerable number of Gauls, abandoning their own country, went to settle beyond the Rhine, in that territory which had formerly belonged to the Suevi. Aurelius Victor, St. Jerom, and other writers place them between the Danube, the Upper Rhine, and the Mein, in the present duchy of Wirtemberg. They were numerous and warlike, and were chiefly celebrated for fighting with great dexterity and bravery on horseback. Their abhorrence of slavery was so great, that even those who were taken prisoners by Caracalla chose rather to die than to be sold for slaves: for when they were actually sold, they not only destroyed themselves, but some of them dispatched also their children. Dion. Cass. lib. lxxvii. p. 86. Their government was monarchical; and the objects of their worship were the same with those of the other German nations. Caracalla, in consequence of a victory which he gained over the Alemanni, in the year 214, was distinguished by the surname of Alemannicus. In 234, the 13th year of the emperor Alexander Severus, the Alemans, accompanied with other German nations, passed the Rhine, took possession of the forts on the banks of the river, and ravaged Gaul. Alexander, returning from Persia, hastened to the banks of the Rhine, and as the Alemans had repassed the river upon the news of his approach, he ordered a bridge to be thrown over, proposing to attack them in their own country. But being assassinated by the mutinous soldiery, at the instigation of Maximinus, this business devolved upon his successor. Accordingly Maximinus pursued them with great slaughter, and took many of them prisoners, with great spoil of corn and cattle; and the advantages he gained were thought to be so considerable, that the senate conferred upon him and his son the title of Germanicus. In the year 256, the fourth of Valerian's reign, the Alemanni made an unexpected irruption into Gaul, and laid waste the country; whilst those who dwelt on the banks of the Danube penetrated through the Rhetian Alps into the plains of Lombardy, advanced as far as Ravenna, and displayed the victorious banners of barbarians almost in sight of Rome. A large army was suddenly convened, at the appearance of which the Alemanni were terrified, and retired into Germany laden with spoil. On another occasion 300,000 of this warlike people are said to have been vanquished in a battle near Milan, by Gallienus, at the head of only 10,000 Romans. Whether we give credit to the relation of this victory or not, Gallienus seems to have formed an alliance with the Alemanni, and protected Italy from their fury, by marrying Pipa, the daughter of a king of the Marcomanni, a tribe of the Suevi, often confounded with the Alemanni. A party of them was defeated by Claudius in 268, and compelled to save themselves by a precipitate flight into their own country. As soon, however, as they heard of the death of Claudius, they prepared for again invading Italy; 40,000 horse appeared in the field, and the number of the infantry doubled that of the cavalry. Their first objects were a few cities

on the Rhetian frontier; but as they proceeded they enlarged their views, and they traced a line of devastation from the Danube to the Po. Aurelian, A. D. 270, having collected an active body of troops, marched with silence and celerity along the skirts of the Hercynian forest; and when the Alemanni, laden with the spoils of Italy, arrived at the Danube, the Roman army, which lay concealed, intercepted their return. The dismayed barbarians, enclosed by the Roman legions, and reduced to a condition abject and distressed, sued for peace. Their ambassadors were received by Aurelian with every appendage of dignity; and when they were ordered to rise and allowed to speak, they attempted to extenuate their conduct, and demanded a large subsidy, as the price of the alliance which they offered to the Romans. The emperor's reply was stern and imperious. He treated their offer with contempt, and their demand with indignation; and dismissed them with the choice only of submitting to his unconditional mercy, or awaiting the utmost severity of his resentment. Aurelian, being suddenly called away into Pannonia, committed the destruction of the Alemanni, either by sword or by famine, to his lieutenants. But the barbarians made their escape, and returned towards the mountains of Italy. As soon as the emperor heard that they had liberated themselves, and were ravaging the territory of Milan, he hastened to march to the relief of Italy. The Alemanni, in the mean while, had spread themselves from the Alps to the Apennines; and, by a desultory war, the force of the enemy remained unsubdued. Three considerable battles are mentioned, in which the principal force of both armies was obstinately engaged. In the first battle, fought near Placentia, the Romans received so severe a blow, that the immediate dissolution of the empire was apprehended. But the firmness of the emperor restored in some degree the honour of his arms. The second battle was fought near Fano in Umbria; and here the Alemanni were totally and irretrievably defeated. The flying remnant of their host was exterminated in a third and last battle near Pavia; and Italy was rescued from the inroads of these barbarians. During the alarm which preceded the decisive battle of Fano, the Sibylline books were consulted, A. D. 271; and the ceremonies which were enjoined were punctiliously observed. "These superstitious arts, says Mr. Gibbon, however puerile in themselves, were subservient to the success of the war; and if, in the decisive battle of Fano, the Alemanni fancied they saw an army of spectres combating on the side of Aurelian, he received a real and effectual aid from this imaginary reinforcement." The emperor Probus, A. D. 277, delivered Gaul from the invasion of the Germans, and recovered 70 flourishing cities, which had been oppressed by those barbarians, who, since the death of Aurelian, had ravaged that great province with impunity. Probus pursued his Gallic victories, passed the Rhine, compelled nine of the most considerable princes of Germany to repair to his camp, to fall prostrate at his feet, and to accept such conditions as he thought proper to dictate: and in order to raise a bulwark against their future inroads, he constructed a stone wall of considerable height, and strengthened it by towers at convenient distances. From the neighbourhood of Newstadt and Ratibon on the Danube, it stretched across hills, vallies, rivers, and morasses, as far as Wimpfen on the Neckar, and at length terminated on the banks of the Rhine, after a winding course of near 200 miles. Within a few years after the death of Probus, this wall was overthrown by the Alemanni. In 287 they made another incursion into Gaul, but were defeated by Maximian, who in the following year passed the Rhine, and laid their country waste wherever he came with fire and sword. Dioclesian also at the same time entered Germany

through Rhetia, and is said to have extended the confines of the empire to the source of the Danube. In the year 291 the Burgundians seized on part of the country belonging to the Alemanni; and in 301 Constantius Chlorus, the father of Constantine the Great, gained a signal victory over them, on which occasion the Alemanni are said to have lost 60,000 men. Notwithstanding this loss, they did not long remain quiet; for in 310 they again crossed the Rhine, and ravaged the neighbouring provinces; but Constantine marching against them, defeated them in a battle, and obliged them to quit their booty and repass the Rhine. Some say he was called Maximus on account of this victory. In the 18th year of Constantius's reign, the Alemanni again attempted to make an incursion into Italy; and having advanced as far as the lake of Constance, the emperor marched against them, and put them to flight. In the course of the same year another body of them, breaking into Gaul with the Franks and Saxons, took and plundered above 40 towns on the banks of the Rhine, and among these was the city of Cologne, which they almost entirely ruined. They were at length driven out of Gaul by Julian; but assembling near Strasburg, he marched against them, A. D. 357; and after victory had remained for some time in suspense, the Alemanni were entirely defeated, and driven completely out of Gaul. Julian ravaged the countries of the Alemans and their allies for some time, and granted them a truce for ten months. When the truce expired, he passed the Rhine on a bridge of boats, entered their country, and compelled them to sue for peace. Upon the death of Julian they again ravage Gaul; defeat the Romans in a pitched battle, but were afterwards defeated by Jovinus in three battles, A. D. 366. In the close of the following year they again rally, and pass the Rhine; but Valentinian gains a signal victory over them. In 369 Valentinian invades their country; and in 374 concludes a peace with their king Macrianus. In 378 they again pass the Rhine, and waste the neighbouring provinces, but are defeated with great slaughter by Gratian. In 388 they submitted to Maximus, who had usurped the empire in Gaul, and agreed to pay him a yearly tribute. In the reign of Honorius a colony of the Alemanni was allowed to settle in that part of the present Switzerland, which is separated by mount Jura from the Franche Comté, and by the lake of Geneva and the Rhine from the present Savoy and province of Vienne. About the year 411 the country bordering on the lake Lemanus, or the lake of Geneva, was, according to Servius, inhabited by the Alemanni. In 477 Audoacrius, king of the Saxons, and Childeric, king of the Franks, marched against those who had settled among the Alps, and put many of them to death. Upon the destruction of the western empire, the Alemanni subdued that part of Gaul, which is now known by the name of Alsace, where they settled. These were joined by their countrymen in Germany, and those who dwelt between Mount Jura and the lake of Geneva; and in 496 entered Germania secunda, and wasted the country; but they were overcome by Clovis, king of the Salian Franks, and dispersed. Those who settled in Alsace and near the lake of Geneva acknowledged him for their king. Others took refuge in Rhetia and Noricum, where they were allowed by Theodoric, king of Italy, to reside. Many of them were transplanted by the same prince into Italy, and the rest were permitted to settle between the Alps and the Danube. From this time the Alemanni had no king of their own; but continued, as they were dispersed in several countries, subject partly to the Ostrogoths, who were masters of Italy, and partly to the Franks, who had dominion in Gaul. When the Ostrogoths ceded their territories out of Italy to the children of Clovis,

the Alemanni, those excepted whom Theodoric had transplanted into that country, submitted to the Franks. Gibbon's History, &c. vol. i. p. 417, &c. Vol. ii. p. 21, &c. Anc. Un. Hist. vol. xvii. p. 288—299.

ALEMANNIA, or ALFMANIA, in *Ancient Geography*, a name given to Germany, which was not known before the time of the Antonines, and then applied only to a part of it. The appellation is derived from the ALEMANNI.

ALEMBERT, JOHN LE ROND D', in *Biography*; an eminent mathematician and philosopher, and an elegant writer, was born at Paris, November 16, 1717. His surname D'le Rond was derived from that of the church near which he was exposed as a foundling by his mother, who is said to have been Mademoiselle Tencin, sister of the Abbé, afterwards Cardinal, Tencin. His father Des-touches Canon, hearing of his situation in the house of a glazier, with whose wife he was put to nurse, yielded to the impulse of affection and duty, and took measures for his future subsistence and education. In acquiring the first rudiments of education among the Jesuits, he manifested signs of those extraordinary powers, by which he was afterwards distinguished. At the age of 10 years, his schoolmaster declared that he had nothing further to teach him; and during his attention to theological studies, he composed at a very early period, "A Commentary on the Epistles of St. Paul to the Romans," which led the Jesuits to expect, that he would be an able champion in their cause, and become a second Paschal. But pursuing his education at the college of Mazarin, he transferred his attention from theology to mathematics, in which he found greater satisfaction, and in the knowledge of which he afterwards excelled.

Upon leaving the college, he retired to the house of his nurse, for the purpose of enjoying a tranquil retreat, and of prosecuting his studies without interruption. He hoped likewise to testify his gratitude for her former kindness by sharing with her the means of subsistence with which he was provided, and thus contributing to the increase of her domestic comfort. In this obscure situation he lived for many years, with the greatest simplicity, and derived satisfaction to himself from administering to the happiness of those with whom he was connected. His hostess had no just conception of the extraordinary talents of her guest; and she could not help occasionally considering him as still an object of compassion. "You will never," said she one day to him, "be any thing but a philosopher; and what is a philosopher but a fool, who toils and plagues himself, that people may talk of him after he is dead?" With a view to the improvement of his fortune, or rather of the means of comfortable subsistence, he followed the advice of his friends in directing his attention, first, to the law, in which he took his degrees, and afterwards to medicine; but his attachment to mathematics prevailed over every other consideration, and induced him to decline the advantage which he might reasonably expect to derive from any other lucrative profession. At the age of 24, in 1741, he attracted notice by correcting the errors of Reyneau's "Analyse Démonstrée," which was a work of high estimation in the department of analytics; and he was admitted a member of the Academy of Sciences. He then assiduously examined the path in which a body moves in passing obliquely from a rarer into a denser fluid; and this investigation, which he satisfactorily prosecuted, engaged him in extending his views to the forces of moving bodies. The result of his speculations was, his "Traité on Dynamics;" (*Traité de Dynamique*, 4to, Paris, 1743. Ed. 2. 1758.) in which he separates into two parts the action of the moving powers, and

and considers the one as alone producing the motion of the body, in the second instant, and the other as employed to destroy that which it had in the first. This principle had been applied by M. d'Alembert, so early as the year 1744, to the theory of the equilibrium, and the motion of fluids, (*Traité de l'Équilibre et du Mouvement des Fluides*, Paris, 1744. Ed. 2. 1770.) and the discovery of it was succeeded by a new calculus, the first essays of which were published in a "Discourse on the General Theory of the Winds," (*Reflexions sur la Cause Generale des Vents*, Paris, 4to, 1747.) which the academy of Berlin honoured with the prize-medal in 1746; and at the same time the author was elected an honorary member. This work was dedicated to the king of Prussia, who was terminating a glorious campaign by an honourable peace, in the three following Latin verses:

"Hæc ego de ventis, dum ventorum ocyor alis
Palantes agit Aulriacos Fredericus, et orbi,
Insignis lauro, ramum prætendit olivæ."

"Swifter than wind, while of the winds I write,
The foes of conquering Frederic speed their flight;
While laurel o'er the hero's temple bends,
To the tir'd world the olive branch he sends."

From this time d'Alembert was ranked among the philosophical friends of Frederic. In 1747 our mathematician applied his new calculus of "Partial Differences," to vibrating chords, and the propagation of sounds. In 1749, he suggested a method of applying his principle to the motion of any body of a given figure; and he also resolved the problem of the precession of the equinoxes; determining its quantity, and explaining the phenomenon of the nutation of the earth's axis, discovered by Dr. Bradley, ("Recherches sur la Précession des Equinoxes, et sur la nutation de l'axe de la Terre, dans la Systême Newtonien," 4to, Paris, 1749.) In 1752 he published a treatise on the "Resistance of Fluids," ("Essais d'une nouvelle Théorie du Mouvement des Fluides," 4to, Paris, 1752.) and about the same time, in the memoirs of the academy of Berlin, "Researches concerning the Integral Calculus." In the same year he published "Elements of Music," designed to explain the principles of Rameau, ("Elémens de Musique, Théorique et Pratique, suivant les principes de M. Rameau éclaircis, développés, et simplifiés, 1 tom. 8vo. a Lyon.") Other pieces, published at various times, in the memoirs of the Academies of Paris and Berlin, were collected under the title of "Opuscules Mathématiques, ou Memoires sur differens sujets de Geometrie, de Méchaniques, d'Optiques, d'Astronomie," in 9 vols 4to. Paris, from 1761 to 1773. He also wrote "Recherches sur differens Points importants du Systeme du Monde," Paris, 1754 and 1756, 3 vols. 4to. His "Elémens de Philosophie," was printed in 1759. Besides these separate publications, the Memoirs of the Academy of Paris contain the following pieces, *viz.* "Précis de Dynamique," 1743; "Précis de l'Équilibre et de Mouvement des Fluides," 1744; "Methode générale pour déterminer les Orbites et les Mouvements de toutes les Planetes, en ayant égard à leur action mutuelle," 1745; "Précis des Reflexions sur la Cause Generale des Vents," 1750; "Précis des Recherches sur la Précession des Equinoxes, et sur la Nutation de l'axe de la Terre dans le Systême Newtonien," 1750; "Essai d'une nouvelle Théorie sur la Resistance des Fluides," 1752; "Précis des Essais d'une nouvelle Théorie de la Resistance des Fluides," 1753; "Précis des Recherches sur les differens Points importants du Systême du Monde," 1754; "Recherches sur la Précession

des Equinoxes, et sur la Nutation de l'axe de la Terre, dans l'Hypothese, de la dissimilitude des Meridiens," 1754; "Reponse à un Article du Mémoire de M. l'Abbé de la Caille, sur la Théorie du Soleil," 1757; "Addition à ce Mémoire," 1757; "Précis des Opuscules Mathématiques," 1761; "Précis du troisième volume des Opuscules Mathématiques," 1764; "Nouvelles Recherches sur les verres Optiques, pour servir de suite à la Théorie qui en a été donnée dans le volume 3^e des Opuscules Mathématiques," premiere mem. 1764; "Nouvelles Recherches sur les verres Optiques, pour servir de suite à la Théorie qui en a été donnée dans le troisième volume des Opuscules Mathématiques," seconde mem. 1765; "Observations sur les Lunettes Achromatiques," 1765; "Suite des Recherches sur les verres Optiques," troisième mem. 1767; "Recherches sur le Calcul Integral," 1767; "Accident arrivé par l'explosion d'une meule d'Emouleur," 1768; "Précis des Opuscules de Mathématiques," 4^e & 5^e vols. leur analyse, 1768; "Recherches sur les Mouvements de l'axe d'une Planete quelconque dans l'Hypothese de la Dissimilitude des Meridiens," 1768; "Suite des Recherches sur les Mouvements, &c.," 1768; "Recherches sur le Calcul Integral," 1769; "Mémoire sur les principes de la Mech." 1769.

The Memoirs of the Academy of Berlin contain the following pieces, *viz.* "Recherches sur le Calcul Integral, 1^e partie," 1746; "Solution de quelques problemes d'Astronomie," 1747; "Recherches sur la Courbe que forme une Corde tendue, mise en vibration," 1747; "Suite des Recherches sur le Calcul Integral," 1748; "Lettre à M. de Maupertuis," 1749; "Addition aux Recherches sur la Courbe que forme une Corde tendue, mise en vibration," 1750; "Addition aux Recherches sur le Calcul Integral," 1750; "Lettre à M. le Professeur Formey," 1755; "Extr. de Differ. Lettres à M. de la Grange," 1763; "Sur les Tautochrones," 1765; "Extr. de Differ. Lettres à M. de la Grange," 1769. The Memoirs of Turin, contain "Differentes Lettres à M. de la Grange, en 1764 & 1765," en tom. iii. of these memoirs, and "Recherches sur Diff. Sujets de Math." en tom. iv.

The numerous and valuable productions above recited, entitle d'Alembert to rank among the most celebrated mathematicians of the age. But he is no less distinguished by his genius, judgment, and taste, than by his mathematical knowledge; and he is deservedly regarded in France as one of the first writers of that nation. To him the original design of the French Encyclopedia has been generally ascribed; a work which was begun in 1750 by d'Alembert, Diderot, Voltaire, and many other learned men, and which has contributed in a very eminent degree to the diffusion of knowledge. Many of the most valuable articles in mathematics, history, and polite literature, were composed by M. d'Alembert; and the preliminary discourse, concerning the rise, progress, connections, and affinities, of the various branches of human knowledge, will be ever considered by the best judges as the evidence of a well-informed and comprehensive mind, as a specimen of judicious arrangement and correct criticism, and also as a model of just thinking and good writing. Besides the valuable store with which he furnished this treasure of universal science, his talents were displayed in many separate publications on subjects of classical and polite literature. His "Translation of select parts of Tacitus," ("Traduction de divers morceaux de Tacite,") in 2 vols. 12mo. affords, says one of his biographers, an elegant specimen of his learning; and his "Memoirs of Christina queen of Sweden," is a masterly piece of biographical writing, in which the author evinces his acquaintance

acquaintance with the rights of mankind, and his courage in asserting them. His "Essay on the Intercourse of Men of Letters, with Persons high in rank and office," exposed the mean servility of the former, and the insolent tyranny of the latter. A lady of the court, who heard the author blamed for exaggerating the despotism of the great, and the submission which they require, observed; "If he had consulted me, I could have told him still more of the matter." These pieces, with other essays on subjects of polite literature, "Eloges" on Bernouilli, Terrasson, Montesquieu, Mallet and Dumarfais, and "Elements of Philosophy," were collected into 5 vols. 12mo. about the year 1760, and published under the title of "Melanges de Littérature, d'Histoire, et de Philosophie." In 1765, M. d'Alembert published his "Dissertation on the Destruction of the Jesuits," (*De la Destruction des Jesuites.*) in 12mo. Paris; a work which not only ridicules, with the keenest satire, the disciples of Ignatius Loyola, but treats with just severity their adversaries, and which exposed the writer to many opprobrious and unmerited reflections. In the year 1772, he was chosen secretary to the Academy of Sciences; and soon after this honour, he formed the design of writing the lives of all the deceased academicians from 1700 to 1771, as a continuation of the "History of the Academy," published by Messrs. Pellisson and d'Olivet. This design he executed in three years, by composing 70 *Eloges* or panegyrics, comprised in 6 vols. 12mo. and published at Paris in 1787, under the title of "Histoire des Memoires de l'Académie Française, morts depuis, 1700, jusqu'en 1771." "This collection, notwithstanding some inequalities of style, is justly admired: it abounds with lively portraits, amusing anecdotes, ingenious parallels, and just reflections."

As soon as M. d'Alembert engaged in the design of publishing the Encyclopedia, he emerged from obscurity, and became an object of attention, not only in the circle of his friends, to which he had hitherto been confined, but to the public at large. Whilst many approved and commended both the design and the execution of it, the freedom with which several articles were written, was condemned by others, and subjected M. d'Alembert, as well as others of his colleagues, to considerable obloquy. However, his literary merit was now thought sufficient to entitle him to royal patronage. In 1756 the interest of the minister, Count D'Argenson, obtained for him a pension of 1200 livres. In 1762, he was invited by the empress of Russia to undertake the education of her son, the Grand Duke, with the offer of a salary of 100,000 livres, and other privileges: but this lucrative and honourable office, though enforced a second time by a letter under the empress's own hand, his attachment to his country and friends, and his preference of literary leisure, induced him to decline. The next year he was invited to an interview with the king of Prussia at Wesel: when they met, the king affectionately embraced him; and enquiring of the philosopher, "whether the mathematics furnished any method of calculating political probabilities?" M. d'Alembert replied, "That if such a method existed, it could be of no use to a hero, who could conquer against all probability." The king offered him the presidency of the Academy of Berlin, vacant by the death of Maupertuis. But though the ferment, occasioned in France by some articles in the Encyclopedia, and especially that of Geneva, and the odium he had personally incurred, might have led him to seek an asylum in the court of a philosophical prince, he declined accepting the flattering proposal; nevertheless a correspondence subsisted between the king and him as long as he lived. The letters are published in the "Posthumous works of the

king of Prussia." This correspondence, and that with Voltaire and other eminent persons, his constant intercourse with learned foreigners, as well as distinguished characters at home, and his influence in the academy, concurred to give importance to M. d'Alembert; and though he was called the *Mazarin* of literature, candour leads us to believe that his influence was owing more to his talents, learning, and virtues, than to artful management, and supple address. His abhorrence of superstition and priestcraft, it must be allowed, drove him into the extreme of infidelity; and he was not only lax in his religious principles, but on some occasions indecorous in his mode of attacking doctrines that have been generally received even amongst those who have been accustomed to think freely on the subject of religion. He seems to have adopted that system of deified nature, which bereaves the world of a designing cause, and presiding intelligence; and his zeal in propagating the free notions he had imbibed, actuated by his enmity to the jesuits and clergy, and animated by intercourse with confidential friends of the same description, sometimes received a check, and required a lesson of moderation even from the philosopher Frederic. "The eccentricity of his opinions," says a liberal biographer, "did not, however, destroy the virtues of his heart. A love of truth, and a zeal for the progress of science and freedom, formed the basis of his character: strict probity, a noble disinterestedness, and an habitual desire of obliging, were its distinguishing features. Many young people, who discovered talents for science and learning, found in him a patron and guide. To worthy men, even in adversity and persecution, he was a firm and courageous friend. To those who had shewn him kindness, he never ceased to be grateful. Gratitude induced him to dedicate two of his works to two ministers, when they were in disgrace, the Count d'Argenson, to whom he owed his pension, and the Marquis d'Argenson, who had given him many proofs of respect and esteem. When in early life, Mad. de Tencin, informed of his singular talents, came to him, and fondly caressing him, discovered to him the secret of his birth: "What do you tell me!" he cried out: "Ah! you are but a step-mother; it is the glazier's wife who is my mother." Through life he retained for his nurse the affectionate sensibility of a grateful son. He remained in her house near 30 years; and did not leave it till in 1765, after a long illness, his physician represented to him the necessity of removing to a more airy lodging. His health being recruited, he continued to occupy his honourable station among philosophers, till the 29th of October, 1783, when, in the 66th year of his age, he expired; leaving behind him the reputation of amiable virtues and eminent talents. Perhaps no character has ever appeared, which has more completely exemplified the union of strong mathematical genius with an elegant taste for polite literature." His eulogium by Condorcet is published in the "Hist. de l'Acad. Royale des Sciences," 1783. Monthly Rev. vol. lxxvi, p. 238. Nouv. Dict. Hist. Hutton's Math. Dict. Gen. Biog.

ALEMbic, *Limbec, Alambic*, Fr. An alembic is one of the numerous articles of DISTILLATORY apparatus. In the English laboratories and manufactories its use is almost superseded by the retort and still; but on the continent, especially in France, it continues to be the favourite vessel for distillations in the large way. The French indeed appear to have no word in their language synonymous with the English one still, and hence the difference between these two vessels is but very imperfectly noticed even in their best authors. As distillation depends on the separation of the volatile from the more fixed parts of a compound by the action of fire, it is obviously essential to

every apparatus for this purpose that it should consist of at least two parts; the one for the reception and heating of the matter to be distilled, and the other for the collection and condensation of the more volatile part when in a state of vapour. Of all the vessels destined to this use the alembic is the simplest and the most ancient.

Both Dioscorides and Pliny mention the *αμβίξ* (ambix) which is described by the latter of these writers, as a hemispherical iron cover, luted upon the earthen pots in which mercury was procured by the distillation of cinnabar: it is probable, however, that the ambix was in the time of Pliny a mere plain still, without any beak or gutter, since he mentions the mercury being wiped off in small drops from the inside of the vessel, the necessity of which manipulation would be superseded by the invention of a beak. The alchemists having adopted this instrument, prefixed the Arabian article *al* to its name, and made considerable alterations in its form. Their object in all distillations and digestions being to separate, as much as possible, the most volatile products from those that are less so, they imagined that the greater distance which the vapour had to pass through, in its passage from the boiler to the condenser, the more perfectly would the spirit or quintessence be dephlegmated; for this purpose the body of the alembic was made of a globular form, terminating above in a long narrow neck, to the end of which was luted the capital; (Chemistry, plate iii. fig. 10. A. the body, B the neck, C the capital) sometimes for the purpose of more effectually keeping down the impure particles, the neck was bent in a zig zag or spiral direction. The characteristic difference between an alembic and a still seems to be in the construction of the head or capital, which in the alembic is contrived not merely to collect, but to condense the vapour; whereas, the corresponding part of a still serves merely to collect the vapour, which is transmitted in an elastic state through the beak, and condensed in the worm. In the figure already referred to, the distance between the body and the capital is so great, that much of the heat must be given off from the vapour before it arrives in this part; the mere refrigerating power, therefore, of the atmosphere is amply sufficient to condense the vapour into drops on the inner surface of the capital, which, trickling down into the channel or gutter at the bottom, are delivered by the beak into any vessel placed to receive them. The length and narrowness, and convolution of the neck were, however, found to condense so much of the vapour before it reached the capital, as to render all processes, in which it was employed, unprofitably tedious; besides requiring so high a heat as to alter and injure the products very considerably; the neck was therefore shortened and made wider, and as in consequence of this the vapour came into the capital more heated than before, it was necessary to substitute a more powerful refrigerating cause to the casual and varying action of the external air; with this intention, the capital of the metallic alembics was inserted into a vessel of water, (fig. 11.) called a refrigeratory, and thus the alembic, as far as concerned the number and general disposition of its parts, was completed.

The glass and earthen-ware alembics soon received all the perfection of form which their materials would allow: the body, instead of being a globe with a long neck, was altered into a cucurbit; and the capital assumed a more conical shape; the two parts of the apparatus were also fitted closely into each other, by grinding with emery. The irregular expansion and contraction of glass by heat, rendered the use of a refrigeratory impossible, so that

when distilling briskly, it is necessary to cover the capital with cloth soaked in cold water and frequently renewed: thus requiring a constant attention, besides running the risk of cracking the cucurbit, by a drop of cold water falling upon it from the head. On this account, the glass alembic is but little employed, although capable, when skilfully managed, of distilling a much larger quantity in a given time, than a retort of equal capacity. (Fig. 12. A the body of the cucurbit, B the capital, C the channel, D the beak.)

The metallic alembics being formed of more manageable substances, and being appropriated to large processes, in which economy of time and fuel was of great importance, invited and obtained a number of valuable improvements. The most considerable of these are due to Baumé, a representation of whose alembic, as further improved by Chaptal, is given in fig. 13. This vessel is composed of three parts; the one marked A is the boiler, being a hollow cylinder of tinned copper, of equal diameter at top and bottom, but bulging out into a shoulder at *g*, by which it is suspended over the furnace; in this part are fixed two handles *a a*, and a short pipe *f*, fitted with a cork, for the purpose of supplying water or any other fluid, without the necessity of taking the apparatus to pieces. B is a cucurbit or *halcum maris* made of tin, of a cylindrical figure, with two handles, and a collar on the outside, which fitting into the inner groove *b*, of the boiler, supports it when suspended within this last. The third part of the apparatus is the capital, a section of which is represented at C: *s* is the collar, by which it is fixed on the inner groove *b*, of the cucurbit B; *k* is the proper capital, in shape a short cone, made of tin, terminating at its base in a circular channel *l*, slightly inclined towards the beak *m*. Surrounding the capital, and closely foldered to it is the refrigeratory *o*, made of copper, and accommodated in shape to the capital; at the bottom is a large stop-cock *p*. For the distillation of water, or of spirits from the wash, where a brisk boiling heat is required, the liquor is put into the boiler, and the cucurbit is omitted; but for the rectification of alcohol and other similar processes, the substance to be distilled is to be put into the cucurbit, and the boiler being filled with water, the heat is conveyed through the medium of this fluid, and of course is more moderate and equal.

Most of the French brandies are prepared in alembics, whereas all British spirits are manufactured in stills; the advantage of the alembic is that less fuel is required, and the spirit is but little exposed to the risk of becoming empyreumatic. Its disadvantage consists in being less expeditious, and in requiring greater accuracy in the temperature of the refrigeratory; if too cold, the vapour is in part condensed before it touches the inside of the capital, and falls back into the boiler; if too hot, a portion of vapour escapes into the air; a greater proportion also of water is required for the condensation of a given quantity of vapour, than where a worm and still is made use of. Encycloped. Method. Art. Alembic.—Beaumé Elements de Pharmacie.—Macquer's Dict.—Boerhaave's Chemistry.

ALEMBROTH, SALT OF. This term, the use of which is derived from the alchemists, has been successively applied to a variety of preparations and native salts. The general idea which the word seems to convey, is that of a flux or solvent, either to assist in the fusion of metallic ores and earths, or to dissolve obstructions, and attenuate viscid humours in the human body, when employed medicinally. A peculiar earth, found at mount Olympus in the island of Cyprus, was called alembroth, which was

said to be of a nitrous and aluminous nature, and was at first employed in metallurgy as a flux. Probably, however, it was a native fixed alkali, as the terms *nitrous* and *aluminous* were formerly applied in a very loose manner to signify any thing of a saline nature, and the artificial preparations of alembroth salt, given by the old writers of pharmacy, all contain a fixed alkali.

ALEMBROTH SALT is still retained in chemical nomenclature, and is now employed exclusively to express that compound salt which arises from the union of corrosive mercurial muriat with muriated ammonia. The ammoniacal salt remarkably increases the solubility of the mercurial, and a solution of the alembroth salt is generally the form in which the corrosive sublimate is given internally in diseases which require the use of this active medicine. See MERCURY, (*muriate of*.)

ALEMDAR, an officer in the court of the Grand Seigneur, who bears the green standard of Mahomet, when the sultan appears in public on any solemn occasion.

ALEMETH, in *Scripture Geography*, a city in the tribe of Benjamin.

ALEMPIGNON, in *Geography*, a lake of North America in Canada, north of lake Superior.

ALEN, in *Geography* See ALEN and AHLEN.

ALEN, a river of North Wales, which runs into the Dee, near Wrexham. Alen is also a river of Germany in Lower Saxony, in the district of Calenberg, which rises in mount Soelling, in the district of Corvey, and runs into the sea.

ALEN, VAN, or OOLEN, *John*, in *Biography*, a painter of fowls, landscape, and still life, was born at Amsterdam in 1651, and died in 1698. He had no ready talent for invention, but he possessed a very extraordinary imitative genius, so that, in the touch and peculiar tints of colour, he could mimic the work of any master in any style; and as the works of Melchior Hondekoeter were in the greatest repute, he applied himself particularly to imitate and copy his works, which he did so exactly, that connoisseurs were at a loss to determine, whether any picture was Van Alen's or Hondekoeter's. By this practice he gained both money and reputation. Pilkington.

ALENBY, in *Geography*, a town of Norway, 50 miles south of Drontheim.

ALENCON, a city of France, and capital of the department of Orne, situate on the river Sarte, in an extensive and fruitful plain, which abounds with all sorts of corn and fruit, hemp and pasture. It has a well-fortified castle, and several public buildings. The number of inhabitants was some years ago computed at 10,000. Its commerce consists of linen, lace called *point d'Alençon*, ferges, stuffs, leather, &c.; and it has three markets every week. In its vicinity are stones fit for building, and others called flints of Alençon. It is eight leagues north of Moñs, 25 south-west of Rouen, and 35 south-west of Paris. N. lat. 48° 25'. Long. 0°.

ALENÇON is also a small town of Dauphinè, in the generalty of Grenoble.

ALENDIN, a town of Africa in the empire of Morocco.

ALENIO, JULIUS, in *Biography*, was born at Brescia, in Venice, travelled into the Eastern countries, and arrived at Maca, in 1610, where he taught mathematics. From thence he went to China, where he was employed for 36 years in the propagation of Christianity. He is said to have been the first who planted the Christian faith in Xansi, and to have built several churches in the province of Fokien. He died in 1649, and left several works in the Chinese language. *Biog. Dict.*

ALENQUER, in *Geography*, a town of Portugal, in Estremadura, situate on an eminence near a small river, which falls into the Tagus. It is said to have been built by the Alans, being anciently called *Alenker rana*, *i. e.* the temple of the Alans. It contains about 2500 inhabitants, is a marquisate, and has 13 parishes belonging to its district.

ALENSTEIG, a town of Germany, in the archduchy of Austria; four miles south of Bohemish Waidhoven.

ALENT, a town of the archduchy of Austria, four miles west-north-west of Baden.

ALENTAKIE, or ALENTAK, a province of Esthonia, upon the gulf of Finland; the capital of which is Narva.

ALENTEJO, or ALEMTEJO, one of the largest but least populous provinces in Portugal, situate between the rivers Tagus and Guadiana, and extending from the mountains of Algarve on the south, to the frontiers of Estremadura on the north, and from the sea and Tagus on the west, to the borders of Spanish Estremadura and Andalusia on the east. Its length from north to south is computed at 36 leagues, and its breadth from east to west is nearly the same. It is called Alemtejo, *i. e.* alem do rio Tejo, *q. d.* beyond the river Tagus, because it lies in that direction with regard to Estremadura and the countries further north. It contains four cities, the chief of which is Evora, 105 towns, 358 parishes, and about 339,355 inhabitants. The towns are very populous; but there is a scarcity of villages, which contribute most to cultivation; and another cause of its scanty population is its always having been the theatre of war between Spain and Portugal. It contains a great number of fortresses, maintains ten regiments of infantry and four of cavalry, which are constantly recruited here, and form a fourth part of the military establishment of the whole country. The lands in this province are far from being well cultivated, being sown only once in three years; though some of our geographers represent it as a fertile province, and call it the granary of Portugal. Its principal products are wheat and barley, and in many places it also affords grapes, olives, and other fruits, as well as game and fish. Some parts yield marble and gems. In this province there are three kinds of soil, *viz.* fertile black solid fat earth, which is found in the red clay of Elvas, Campomayor, Olivença, Fronteira, Estremoz, Beja, and Serpa; a lighter earth mixed with a little sand, which forms the soil round Evora and Arrayolos, where the bad kinds of wheat, barley and rye, succeed very well, and cork trees and evergreen oaks also grow; and a sandy barren soil, which forms the heaths of Cantarinho, Ponte de Sor, Monte Argil, Tances and Vendas Novas, a tract of country about 30 leagues in circumference. At present these heaths, which afford beautiful varieties of heath plants and evergreen shrubs, serve only as pasture for goats; though the clayey soil is very capable of cultivation; as are also marshy tracts which might be drained. The rivers in Alemtejo, particularly in winter, are very rapid, and do much damage. There is a small chain of mountains in this province, about seven leagues long, and two and one-half broad, which runs between the city of Evora and the town of Estremos, and which in reality belongs to the chain of Toledo. The commons are generally covered with cistus, which is used in some parts for heating ovens, and in other parts as pasture for cattle. The whole province is full of vagabond beggars, who beg or steal by day, and at night sleep in the huts of the husbandmen. The nobility keep large herds of sheep and goats, and thus prevent the heaths from being cultivated. The prosperity of this province is impeded also by the luxury of the peasantry, by the number of fast-days, and of religious houses, and by the badness of the roads. The Upper Alemtejo

Alemejo would export, and consequently grow, much more corn, if there were but roads for its conveyance. See Link's Journey through Portugal, p. 150—164.

ALEOS, in *Ancient Geography*, a river of Asia, to the west of Smyrna, according to Pliny. To the waters of it was attributed the virtue of making the hair and skin to grow on different parts of the body.

ALEPPO, in *Geography*, the metropolis of Syria, is deemed, in importance, the third city in the Ottoman dominions. Although it is much inferior to Constantinople and Cairo with regard to situation, magnitude, population, opulence, and courtly splendour, it may be reckoned superior to both these cities in the salubrity of its air, the solidity and elegance of its private buildings, and also the convenience and neatness of its streets. With respect to commercial advantages, it has much declined, but still continues to maintain a trade that is far from being inconsiderable. In Arabic, Aleppo is called *Haleb*, to which is usually added the epithet *Al Shabba*. According to the fabulous history of the Arabian writers, who trace the origin of this city to the migration of the patriarch Abraham into the land of Canaan, who rested for some time on the hill, where the castle of Aleppo is now situated, the appellation *Haleb* is derived from the circumstance of his distributing milk to the poor of a neighbouring village. Their frequent repetition of the words "Ibraheem haleb," or "Abraham has milked," gave occasion, as it is said, to the name *Haleb*, which was conferred on the town that was afterwards built on this spot. The same history refers the epithet *Al Shabba* to a pied cow, which the populace distinguished by its lowing in the herd of the patriarch. Goltius and others, with much greater probability, deduce this term, which denotes a variegated grey and white colour, from the colour of the soil and of the buildings. Some have supposed that Aleppo was the Zobah of Scripture; but it was, more probably, the Bercea of the Greeks. Aleppo is situated, according to celestial observations (see *Conn. des Temps*, 1792.) in N. lat. 35° 11' 25" and E. long. 37° 9', at a considerable height above the level of the sea, near the river *Korwick*, which runs in a small stream to the west of the city. Its distance from Scanderoon or ALEXANDRETTA, the nearest sea port, is in a straight line between 60 and 70 miles, but in the caravan road between 90 and 100 miles. It is encompassed, at the distance of a few miles, by a circle of hills, which are in general rocky, scantily provided with springs, and totally destitute of trees, but affording good pasture for sheep and goats. Within this circle, there are hills and hillocks, which are intersected by plains and little valleys; the soil of which is in some parts of a reddish or black colour, rich and fertile, but in general whitish, shallow, and mixed with many small stones. This city, including its extensive suburbs, occupies eight small hills, the intermediate vallies, and a considerable extent of flat ground, comprehending in the whole a circuit of about seven miles; though the city itself is not above three and one-half miles in circumference. The wall that surrounds it, which was built, or at least repaired by the Mamaluke princes, is neglected and mouldering into ruin. Besides this wall, the city was formerly defended by a wide and deep ditch, which is now filled with rubbish or converted into garden grounds. It has, at this time, nine gates, two to the south, two to the east, two to the north, and three to the west. One of the northern gates, formerly called the Jews' gate, which the son of Saladin changed into Bab al Nafer, or Gate of Victory, was once, according to the Missionaries, the residence of the prophet Elisha, and it has lamps which are kept constantly burning

in commemoration of that saint. The castle, which stands on a hill near the north-east corner of the city, and which is encompassed by a broad deep ditch, about half a mile in circumference, may be distinguished at a considerable distance; but a traveller, approaching from the west, can see scarcely any other part of the city, till he gains the brow of one of the hills within two or three miles of the gates; and thus it becomes an extensive and striking object. The mosques, the minarets, and numerous cupolas, form a splendid spectacle, and the flat roofs of the houses which are situated on the hills, rising one behind another, present a succession of hanging terraces, interspersed with cypress and poplar trees.

Aleppo is, in general, a well-built city, and the houses within are grand and handsome. The streets are better disposed and broader than those of eastern cities; they are well paved and remarkably clean, and they have a commodious foot-way, on each side, raised half a foot above the other part. The mosques in Aleppo are numerous; of which seven or eight are reckoned magnificent, though none have more than a single minaret, or steeple, whence the people are summoned to prayers. These minarets were first annexed to the mosques, as it is said, by Al Waleed, who succeeded to the Caliphate, in the 86th year of the Hegira. Into these mosques none but Moslems are permitted to enter; and at Aleppo, it is only one of them into the courtyard of which Jews and Christians are allowed admission. The public edifices, next in importance to the mosques, are the KHANES, or CARAVANSARIES, intended principally for the accommodation of strangers, and partly as warehouses for goods. The BAZARS, or Markets, are lofty stone edifices, arranged in the form of a long gallery, arched above or roofed with wood. Of these the principal are situated close to one another, in that part of the city that is contiguous to the great khane; and others are distributed through several parts of the town, and the suburb called Bankusa, where the corn-market is kept. The streets, in which are shops, for the necessaries of life, are also called bazars, and they are defended from the sun by mats spread on wooden rafters, projecting from each side. The bazar gates are regularly shut at sun-set, and watchmen, provided with a pole and a lamp, are stationed for the night within them. These gates are secured merely by wooden locks and keys. There are also gates and watchmen in the principal streets, and by these the town is secured from nocturnal brawls and depredations. The natives, who are habitually sober and regular, retire to their habitations at an early hour, and the dread of being carried by the patrol to the Seraglio, restrains the most riotous from drunken frolics. The public baths, or hummums, do not contribute much to the embellishment of the city, as their fronts to the street are very simple; but the coffee-houses, which are spacious and handsome, and dispersed through all quarters of the town, attract the notice of strangers. They are gaudily painted, and furnished with matted platforms and benches; and those of the better sort have a fountain in the middle, with a gallery for musicians. At certain hours of the day the coffee-houses are full of company, though they are not frequented by persons of the first rank. The dwelling-houses of Aleppo comprehend the seraglios, or palaces, the houses of the opulent merchants, and the habitations of the middling and ordinary people. The seraglio, in which the Bashaw of Aleppo usually resides, is situated near the castle, and is a very ancient and extensive building, surrounded by a strong and lofty wall. The gates of this edifice lead to several interior courts, which are destined for barracks, stables, an hippodrome, and various other offices. The principal build-

ing contains apartments for the bashaw, his harem, household officers, and pages. It consists of three courts, one of which is the divan, where the bashaw gives public audience. The whole of this building is much neglected, and if it had not been originally a very substantial edifice, it would long ago have been in ruins. There are five or six other seraglios of more modern date, that are much smaller, well built, and gaudily decorated; they were erected at different periods by former bashaws, and belong to their heirs. They are now occasionally let to such governors as do not chuse to reside in the old seraglio, and to other officers of the Porte, who visit Aleppo on public business. Other buildings, constructed on the same plan with these, though not denominated seraglios, are occupied by the principal agas and effendees.

The roofs of all the houses, those that have domes excepted, are flat, and plastered with a composition of mortar, tar, ashes and sand, which in time becomes very hard. These flat roofs, or terraces, are separated by party walls, and most of the natives sleep on them in the summer. The Franks, who live near one another, have doors of communication, and by means of their own and the bazar terraces, can make a large circuit without descending into the street. The natives have no intercourse by the terrace, and guard by high walls against being overlooked.

To the lower class of strangers, as Arabs, Kurds, and other Turks of foreign extraction, and Armenian Christians, there is appropriated a kind of accommodation, called Keifaria, which is a large area, surrounded by a number of mean, low houses, each consisting of two or three rooms. Other buildings, in the form of a close or court, allotted to weaving and other manufactories, are called by the same name.

The castle of Aleppo is deemed, by the natives, absolutely impregnable; but its walls and turrets are in so bad a state, that a few cannon would soon demolish them. It is, however, of importance as a magazine for military stores in times of war with Persia, for the awe of the city, and an asylum to the magistrates in case of insurrection; as a prison for state criminals, and a place of execution for the Janizaries, when condemned to die. The Aga of the castle is immediately dependent upon the Porte, and subject, only in certain cases, to the bashaw. He commands a numerous garrison; and the private men, with their families, lodge in the castle.

The fuel used at Aleppo is wood and charcoal; and that which is employed in heating the bagnios renders them a public nuisance. This consists chiefly of the dung of animals, the filth of stables, and the pairings of fruit, which, both in drying and burning, are very offensive. Cow dung is seldom used in the city, but by the Arabs and peasants it is used not only as fuel, but for forming a kind of flat pan in which they fry their eggs. Camel and sheep's dung with brushwood, or the stalks of such plants as grow in the Desert, are the common fuel. At Aleppo, in one of the suburbs called Mafhirk, they have a glass manufactory, and a tannery to the south-west of the town near the river. Their slaughter-houses are situated in an airy field, in the skirts of the suburbs, towards Bankusa, and their principal flesh market is in the suburb called Iideida. They have several lime-kilns near the walls, on the south-west of the city, and a manufactory of cartgut half a mile to the south, which occasionally emits a very offensive stench. Within the walls, they have only one public burial ground besides several private cemeteries; but without the walls the burial grounds are of wide extent round the town, and the white tombs and grave

stones, viewed at a distance, add to the rocky sterile appearance of the country.

The city is supplied with water by means of an aqueduct from two springs, at the distance of about eight miles to the north. This aqueduct, which is said to be coeval with the city, was repaired by the empress Helena, the mother of Constantine, and again repaired and enlarged by the son of Saladin, in 1218. It supplies with water a range of gardens, formed on its banks, and called the gardens of Babullah, which is the name of an adjoining village, and the water is distributed through the grounds by means of small intersecting channels dug in the earth; and regulations are established for its communication in due proportion to different persons. This tract of gardens extends about 12 miles, and generally belongs to some effendee or aga, possessing sufficient authority for the protection of his tenants, or forms a part of some religious estate. The whole extent of these gardens is subdivided into square or oblong fields, bordered with dwarf trees, flowering shrubs, and taller trees, such as the plane, weeping willow, ash, and white poplar. Within these inclosures are cultivated mad-apples, melons, and cucumbers, with a variety of esculent roots, cabbages and greens for the kitchen; in others, cotton, tobacco, fesamum, palma christi, and lucern; and some are sown with barley, which is used in the spring as green fodder for the horses. Among these inclosures are large plantations of pomegranate, plum and cherry trees, and sometimes groves, composed of the various fruit trees which the country produces. The gardens, those of Babullah excepted, are supplied from the river by means of Persian wheels. In most of the gardens, there are summer-houses, furnished with fountains, and with kiosks, or a kind of balconies, projecting over the river. The Aleppo gardens are spoken of with rapture by the natives. They supply the city with greens, and fruits, and contribute both to the health and amusement of the inhabitants, by affording scope for exercise and a pure air.

In the vicinity of the city are many extensive quarries, which afford a gritty stone, when first dug easily cut and indurated by exposure to the air; and the more ancient of these quarries have subterraneous excavations of great length, which serve the Bedoween Arabs for winter habitations, as stables for the camels, and as dens of debauchery to the Janizaries. The marble of Aleppo is of a yellowish colour, but by rubbing it with oil and exposing it to the moderate heat of an oven, it is made to resemble the red marble of Damascus. Aleppo is supplied with salt from an extensive plain at the distance of about 18 miles, called the valley of salt, or salt lake.

Aleppo, though encompassed by hills, is well ventilated, and enjoys a pure penetrating air, which is reckoned so salubrious, that from the end of May to the middle of September, the inhabitants are accustomed to sleep exposed in their terraces, without receiving any injury. The spring here commences early in February, when the fields are covered with an agreeable verdure; the almond tree blossoms about the middle of the month, and is soon followed by the apricot, peach and plum. Early in May the corn begins to be yellow; and a few weeks bring on the harvest, and when the grain has been plucked up by the roots, the whole country bears a parched and barren aspect. Some showers commonly fall in the beginning of June; but from the middle of this month to the middle of September, it is extraordinary to see any rain. The heat of July and August is mitigated by the westerly breezes; but when these fail, the weather becomes extremely hot. When the wind blows from the north, north-west,

north-west, east, north-east, or south-east, the heat is extremely oppressive, and the air is dry and scorching, as if it proceeded from an oven. The eyes, lips, and nostrils are parched, and it produces a lassitude, attended with an oppression at the breast, of which the natives are not less sensible than the Europeans. It is usual to exclude these hot winds by shutting the doors and windows. They do not, however, occur every year, nor do they produce such fatal effects as the desert wind, named *SIMOOLY*. At the end of August the Nile clouds, as they are called, make their appearance, and are often attended with dew. About the autumnal equinox the air is refreshed by showers, which are termed the first rains, and are usually preceded by irregular gusts of wind that raise the dust in vortices. These are succeeded in 20 or 30 days by the second rains, which are more plentiful than the first, and after them the weather becomes variable and much cooler. The transition from the Autumn to the Winter is slower than that from Spring to Summer. The trees retain their leaves till the beginning of December, and the most delicate persons have no fires till the middle of this month. The rigour of winter commences about the middle of December, and lasts forty days; but though there is almost always some frost in winter, many years pass without snow. The narcissus is in flower during the greatest part of the winter, and violets and hyacinths are plentiful in January. Although violent storms of wind are rare at Aleppo, squalls accompanied with heavy showers, and sometimes with thunder, are frequent in the Spring and Autumn. Lightning, unaccompanied with thunder, is frequently seen in the night during the months of September and October; and it is sometimes seen in Summer; but the nocturnal sky, in the hot months, is almost always serene, exhibiting a glorious scene to the astronomer, who may indulge his study, and at the same time enjoy the cool air on the terrace. There are few years in which earthquakes do not occur at Aleppo; but they are generally slight and do no injury.

The nature of the soil near Aleppo has been already mentioned: in the more distant plains, it consists of a reddish, sometimes of a blackish, light mould, and produces the fruits of the earth in great abundance. The fields near the city yield, in consequence of much manure, two or three crops of different kinds every year; but without manure, they are sown only once a year with different sorts of grain alternately, but are seldom suffered to remain fallow. They begin to plough in September; and the plough is drawn by one or two small cows, or by a single ass, in furrows so straight, that one would imagine a line must have been used in tracing them. They sow wheat, barley, lentils, chickens, beans, chickling, small vetch, a small green kidney bean, and Indian millet. The earliest wheat is sown about the middle of October, and barley so late as the end of February. They seldom use the harrow; the grain being covered by reaping the plough along the edge of the furrow; in sandy soil, they sow first, and then plough. The barley harvest commences in May, about 10 or 14 days before that of the wheat, and early in June corn of every kind is taken off the ground. Amongst the reapers in Syria, a custom prevails of accosting a passing traveller and presenting to him a handful of corn, with a general shout; and a small present is expected in return. The corn, when reaped, is carried on asses to the summit of the nearest hill, and being laid on hard even ground, it is separated from the chaff, not by threshing, but by means of a sledge fixed on two or three rollers, and armed with several iron rings, with serrated edges, so sharp as to cut the straw. This machine is drawn by oxen, mules, or asses, and driven by a man seated on the sledge, and as it

passes circularly over the corn spread beneath, the grain, by repeated operation, is trodden out, while the straw is chopped by the iron rings. The chaff and bruised spikes are then separated from the grain, by throwing up the whole into the air with wooden shovels, when the wind blows moderately. The spikes that have been imperfectly trodden are again submitted to the sledge. When the grain has been afterwards more perfectly winnowed and separated from the straw, it is thrown together in a large heap, and is then divided in a stipulated proportion between the husbandman and the landlord. The cattle employed in the harvest are left unmuzzled at the heap, as the Scripture mentions. See Lowth's Com. on Isaiah, ch. xxviii. v. 27. 28. Notes, p. 130. The grain is then removed to granaries, which are subterraneous grottoes, with one round opening at top, which, when the magazine is full, is shut close and covered with earth, and thus completely concealed from the enemy. The corn is chiefly ground in mills wrought by mules, though there are some water-mills upon the river Kowick, and among the lower people by hand-mills. Wind-mills are unknown.

The olives produced at Aleppo resemble the Spanish olives, but are not so large, and the annual produce of them is inconsiderable. The city is supplied with oil from other parts, and particularly from Edlib and adjacent villages, where the olive plantations are more extensive. Large quantities are employed in making soap, and the ash employed in this manufacture are brought from the Desert by the Arabs. The gardens afford several varieties of grapes; those that are ripe appear in the market in September, but the vintage is not at its height till the middle of November. The dried fruit of the vine affords part of the food of the inhabitants; it is eaten with bread and used in sherbets; a large quantity of raisins is also consumed in the distillery, carried on both by Turks and Christians. Aniseed is added in the distillation, and the spirit, which is very strong, is called *araki*. The inspissated juice of the grape is much used by the natives; it is called *dibs*, and much resembles coarse honey in appearance. It is brought to town in goat skins, and serves for the common people instead of honey. The pistachio tree is diligently cultivated, and the nuts reckoned superior to those of any other part of the world. Pliny (lib. xiii. c. 5. lib. xv. c. 24.) says, that pistachios were first brought from Syria into Italy, by Lucius Vitellius, in the reign of Tiberius; and Galen (De Alim. Facult. lib. ii. c. 30.) mentions Bercea as famous for that fruit in his time. Large quantities are exported from hence to Europe. The nuts of the wild pistachio are brought to town from the mountains; the tree not growing near Aleppo. The white mulberry is common in the gardens, and brought to market in May, and the fruit of the red mulberry, which is not ripe till two months later, is delicious. Very little silk is made at Aleppo; that which is exported from hence to Europe, by way of Scanderoon, is chiefly the produce of Antioch and the adjacent mountains, or it is brought to Aleppo from places more distant. The pomegranate is common in all the gardens, and is ripe towards the end of August. The markets are plentifully supplied with several varieties of figs; but the middle sized yellow fig is the most esteemed. The gardens also produce other fruits, as cherries, apricots, peaches, plums, apples, pears, quinces, cornelian cherry, almonds, walnuts, hazelnuts, jujubes and sumach; the former of these two last being much valued as a medicine, and the latter as an ingredient in cookery. Oranges, lemons, and citrons, were formerly produced in the orchards of Aleppo; but as they are not now

cultivated, it has been inferred from this circumstance, that the winters in Syria are now more rigorous than they were in former times, and this is the opinion entertained by the natives. Among the vegetables which form part of the diet of the inhabitants, the mad-apple (*Solanum Melongena* of Linnæus), of which there are three varieties, claims a principal place. Their other esculent vegetables, we shall not recite. Of the vegetables produced in the fields without culture there are capers, borage, common mallow, sorrel, dandelion, water cress and truffles. Savory is much used to give a relish to their bread.

The number of inhabitants at Aleppo has been computed at 300,000; but Dr. Russell conjectures, that they do not now exceed 235,000, of whom 200,000 are Turks, 30,000 Christians, and 5000 Jews. M. d'Arvieux (*Memoires*, tom. vi. p. 454, Paris, 1735.) makes the whole number of houses and public buildings in 1683 to amount to somewhat more than 14,100, and the number of dwelling-houses 13,360. From an account preserved by Dr. Russell, and supposed to be obtained from the office of the Mohassil, the number of houses in 1752, amounted only to 10,742; so that, if these accounts be just, there had been a decrease from 1683 to 1752 of 2,628 houses. M. Volcy observes, that as this city is not larger than Nantes or Marseilles, and the houses consist only of one story, it is not probable that the number of inhabitants should exceed 100,000. The language universally spoken by the natives is the vulgar Arabic; and the Turkish, which is spoken by people of condition, and which is the court language used in the seraglio, is said to be corrupted by the concourse of strangers from the northern provinces. The people are generally of a middle stature, rather meagre than corpulent, and neither vigorous nor active. Their complexion is naturally fair, their hair black, or of a dark chestnut colour, and their eyes for the most part black. The females affect to appear full and plump; they use no stays, and wear their girdles very loose. The men gird themselves tightly with a broad belt, and a long shawl cincture. The people that are exposed to the sun become swarthy.

The men dress in the long eastern habit, and during six months in the year wear furs. Under the furs their garments consist of a silk or linen shirt, and drawers, wide trowsers of red cloth, to which are sewed socks of yellow leather, serving for breeches, stockings, and within doors, for shoes; but in walking, they use slippers without heels. They also wear a waistcoat, called a kumbaz, that comes lower than the knee, and a long vest reaching down to the heels, which covers all, and is named a dulaman. Above the dulaman, they have a long Persian shawl, and a belt under the waistcoat, and to this cincture they attach a small dagger or knife, and with men of business it serves to support a silver inkhorn. For an account of the turban, see **TURBAN**. The Abai is a silk, or camelot gown, with large sleeves, laced down the seams with a narrow gold lace, which is worn in summer instead of the kurk, or loose gown trimmed with furs. Abai is the name of the ordinary vestment of the Arabs. The dress of the ladies in many respects resembles that of the men. But their dulaman and kumbaz sit closer to the shape, and not folding over the breast, leave the neck uncovered. Instead of the costly, long-haired furs of the men, they use sable or ermine, and they are formed in a different fashion. The ladies are fond of thick long hair; and their head-dress, consisting of a warm cloth cap, under cotton and muslin, which compose the rest of the attire, is much warmer than that of the men. They wear ear-rings, a necklace, or collar, of gold, large clumsy gold bracelets, on the wrist and ankles, a string of zechins close to the hair,

on the forehead, and another, very long, across the body in the manner of a sash. Both sexes wear rings on the fingers, and some women wear them on the toes. The use of rouge is very little known; but the women tinge their fingers, hands, feet and toes, of a dusky red or yellow colour, by means of a paste formed of the powdered leaves of henna and water. See **ALCANNA**. The hands and feet are afterwards covered with another paste, composed of flour and water, with crude sal ammoniac and quicklime, which changes the colour into a sort of black or very dark green. They also tinge the inside of the eye-lids with a powder, called kohol. See **ALCOHOL**. The women apply another composition called khatat, to the eye-brows, which tinges them of a fine black colour, and makes the hair smooth and glossy. It is the custom with the men to let the beard grow, after a certain age, or after performing the pilgrimage to Mecca, and much pains are bestowed upon dressing it; but many of the Turks wear whiskers only. Some conceal the appearance of grey hair by tinging the beard with a black or red dye; the practice, however, is not deemed reputable, and is not common. Persons of both sexes use a variety of perfumes, composed of musk, sandal wood, and spikenard, which they sew up in small bags and carry in the breast pockets. Women of every class, when they go abroad, wear thin yellow boots, reaching up half the leg, and over these yellow babooge or slippers, or in wet weather wooden clogs, called kabkal. They never appear in the streets without their veils. The ordinary Aleppo veil is a linen sheet, covering the whole habit from head to foot, and concealing the whole face, except one eye. The veils of the Christians and Jewish women, are formed of plain white calico, which the Turkish women checker with blue and red, and the Jewish women have one arm free, somewhat in the manner of the Scots plaids.

As to the ordinary diet at Aleppo, it consists of a considerable proportion of animal food, which is cut in small pieces and blended with rice, herbs, and strong sauces. The lower people live mostly on rice, butter, milk, new cheese, greens and summer fruits, with a very small proportion of mutton. Their ordinary bread is formed into flat cakes, and made of wheaten flour, not well fermented and ill baked. Loaves of a superior quality are strewed over with the seeds of scumum, or fennel flower. The **PILAW** and **BURGIE** are common dishes. M. d'Arvieux remarks, that a greater quantity of fruit is consumed at Aleppo, than in any three cities in Europe of equal size. The butter brought to Aleppo is made of the milk of goats, cows, sheep, and buffaloes, and is churned in goat-skins, and thus brought to market. Coffee, without sugar or milk, is in use among people of all ranks; this is drank constantly after meals, and in all familiar visits presented with the pipe. It was introduced into Syria about the middle of the 16th century. See **COFFEE**. Tobacco is smoked immoderately by all the men, and by many of the women. Their tobacco is brought from different parts of Syria, particularly from Latachia, and is much milder than the American. See **TOBACCO**. The tobacco pipes are made of the twigs of cherry-tree, almond, rose or jasmine, dexterously straightened and bored, in length from three to six feet, and decorated with silver or gilt ornaments, with mouth-pieces of amber or ivory; the bowl is made of reddish clay and often changed. See **KALIAN** and **NARGEELI**. The practice of taking snuff, though the Porte, about the year 1760, granted a monopoly for making and vending Rappee snuff at Aleppo, is much less common than that of smoking. The custom of taking opium is held at Aleppo almost equally scandalous with

with that of drinking wine, and is practised by few openly, except by persons regardless of their reputation. The bagnio, or hammam, is much resorted to by persons of both sexes. The people of Aleppo in general lead a sedentary life. Dancing is not reckoned a genteel accomplishment for people of condition, and even among the vulgar it is seldom practised, unless by such as make it their trade. Chefs, and a kind of back-gammon, which they are said to have learned from the Persians, are played by both sexes. They have two other games unknown in England, called *mankala* and *tab-waduk*. The former is played by two persons, and the success depends chiefly on memory and a readiness in counting. The latter is a mixed game; the movement of the pins on the board being determined by casting four small flat sticks, on one side white and black on the other. They are particularly described by M. d'Arvieux and Niebuhr. The Turks play merely for amusement; gaming being prohibited by the Koran. The natives of every denomination observe very regular hours. They rise with the sun, and are in bed between nine and ten at night. The women never appear in the street after it is dark. The coffee-houses, as we have before observed, are not frequented by persons of the first rank, but by all others indiscriminately. They are entertained by a band of music, a puppet-show, and a story-teller. The Aleppens have, in general, a correct ear, and are fond of music. The instrumental music is of two kinds; martial and loud, intended for the field, and the other less sonorous, adapted to the chamber. A band of music, belonging to the castle, smaller than that of the bashaw, performs regularly twice a day from the battlements; and the bashaw's band performs also twice a day in the court of the seraglio. The feasts of the natives, who are frugal in their domestic economy, have every appearance of plenty and hospitality; and all great entertainments are commonly attended by a set of buffoons, who are partly musicians, and others, who for hire assume the character of professed jesters.

The first class of the inhabitants of Aleppo consists of Turks, comprehending all Mahometans, and they amount according to Russell, to about 200,000. These are a mixed race, partly descended from those who inhabited the city before it was subdued by the emperor Selim in 1516; partly from such as came to settle in the new conquest, and from others drawn thither by commerce from most of the Ottoman provinces. They are united under the same government and belong to the sect of **SONNITES**. The merchants at Aleppo are numerous, and some of them are esteemed opulent. The trades are divided into different companies, under their respective masters, or sheiks or sheiks. The mechanics are, in general, industrious and frugal; and the Aleppens possess the art of tent-making unrivalled; the tents for the sultan and great officers of the Porte being usually made in this city; and many hands are employed in the silk and cotton manufactures. The keisarias, or small mean houses, in the city and suburbs, are inhabited by a considerable number of Arabs. These are called Bidowens or **BEDOWINS**, and the men are employed in various kinds of manual labour.

In the suburbs of Aleppo there are many families of **TURKMANS**, who are a stout hardy people, chiefly employed in agriculture, or as camel drivers in the caravans; and there are also a great number of **KURDEENS**, who are similarly employed.

With regard to nuptial contracts and ceremonies at Aleppo, they are similar to those generally observed among the Turks. When a matrimonial engagement is projected, the proposal is intimated to the mother of the intended bride, and the relations on both sides proceed to make the necessary inquiries. If the result prove satisfactory, the young woman

is formally demanded of her parents by the father of the young man. Substitutes are then appointed to stipulate the necessary conditions; and these proxies adjust the sum to be paid to the bride's father, with other articles of the marriage contract. When the money is paid, the contract is regularly signed and sealed, and then the Cadi grants his licence for the marriage. About ten days before the wedding, the bride is invited by her female relations to the bagnio, and there she is entertained till the day preceding the marriage, when they proceed to apply the henna. At Aleppo it is customary for the father of the bride to make some addition to what is paid by the bridegroom, and to lay it out for the benefit of his daughter; but among the Bidowen inhabitants and in the villages, the father usually retains a part of what he received for his daughter; and in this respect they may be said to sell their daughters. This custom of purchasing wives is practised by all the oriental Christians, as well as the Turks, and appears from the sacred writings, to have been the ancient practice. Accordingly, among the Arabs, daughters constitute the riches of a family. On the nuptial day, the women go in procession from the bridegroom's house to fetch the bride, who is brought home amidst the acclamations of the women, accompanied by her mother, and several other female relations. The procession is in the day time, and at Aleppo, they do not carry tapers, as some travellers have reported. On their arrival in the house, the remainder of the day is spent in feasting and music. When the bride, covered with a veil of red gauze, and dressed in her wedding garment, has been introduced to her husband, the relations withdraw, and continue singing and feasting till morning; and the nuptial rejoicings last several days. The mother for the most part suckles her child, unless prevented by incapacity, and the child is seldom kept at the breast less than two years, sometimes three or four; and the mother often suckles during the whole time of pregnancy. During the first week the child is swaddled, and then dressed in clothes which are more loose and easy; and as soon as they are able, they are left at liberty to crawl about on the carpet. When children can support themselves, they are usually carried astride on the shoulders; and the expression used by Isaiah, ch. lx. v. 4, upon which bishop Lowth comments (Notes on Isaiah, p. 258.), *וַיֵּלְכּוּ בְּעַלְצָמַיִם* is literally that which is now used by the Arab women. The difference of carrying a child in the bosom or on the shoulder, referred to Is. xlix. 22, and noticed by Harmer (Obs. on Scripture, vol. ii. p. 366.), may be owing to their different age, without regard to sex.

In the funeral ceremonies practised at Aleppo, the women perform a conspicuous part. When a person is dangerously ill, one or two sheiks are employed to read portions of the Koran, and to pray by the bed-side. At the approach of death, the attendants turn the face of the dying person towards the keblah, that is, towards Mecca. When he expires, the women in the chamber give the alarm, by shrieking as if they were distracted, and are soon joined by all the other females in the harem. This conclamation is termed the *Wulwaly*, and is so shrill as to be heard, especially in the night, at a prodigious distance. Schultens in his Commentary on Job x. 15, (tom. i. p. 278.), considers the Arabic *Wulwaly* as corresponding to the Hebrew *וֹלְוֹל* and to the Greek *ωλολυζω* and *ωλολυζει*, and he supposes that the former Greek word was applied in a joyful sense. However, the Arabic *wulwaly* is applicable only to distress and affliction, and seems to have a greater affinity to the latter term than to the former, which was commonly used by the Greeks on sacred or joyful occasions. See Mark, v. 38. Plutarch refers to this practice in his account of Portia's fainting

fainting on the day of Cæsar's death, when her maids, apprehending that she was dead, wailed over her. (Brutus, Oper. tom. i. 991.) We also learn from Cicero, (*de legibus*, lib. ii. oper. tom. iii. p. 221, ed. Olivet.), that the extravagant exclamations of women at funerals was prohibited by the twelve tables. See PRÆFICÆ. In a few hours the corpse is prepared for interment by ablution, and by stopping all the natural passages with cotton, sprinkling parts of it with a powder composed of spikenard and other aromatic herbs, and wrapping it up in a cotton winding-sheet. Over the bier, at the head of which is fixed a batoon, on which the man's turban, or the attire of the female head, is placed, is thrown a black pall, and over this the best wearing apparel of the deceased. The funeral procession is attended by the acquaintance and kindred of the deceased: a number of the sheiks, some of whom incessantly repeat Ullah, Ullah, and others chant verses of the Koran; and one person is the chief mourner, who manifests her grief, real or fictitious, by the most extravagant and frantic cries and gestures.—Other mourners are sometimes hired, who, at intervals, join in the general wulwaly. A funeral service is performed by the imam in some neighbouring mosque, and the corpse is then deposited in the grave, in a reclining posture, with the head to the west, and the face turned towards Mecca. A handful of earth is then thrown by the imam, or sheik, after a funeral service, into the grave, which is also done by others who stand near, and who at the same time pronounce a short benediction; after which the grave is filled up. The funeral service in use among the Kurdeens is very laconic, and is as follows: "If thou hast taken away, thou shalt restore; if thou hast given, it shall be restored to thee; and if thou doubtst this, thou shalt now be convinced." The funeral service, recited by the imam at the grave, is as follows: "O man! from earth thou wast at first created, and to the earth thou dost now return: this transitory abode being the first step of thy progress to the mansions of eternity. If, in thy actions in life, thou hast been beneficent, God will pardon thy transgressions; and if thou hast not, still the mercy of God has no bounds. But remember what thou didst profess in this world, that God is thy Lord, and Mahommed thy prophet—and thy belief in all the prophets and apostles, and that God's forgiveness is amply extended." The sepulchre is visited by the near relations on the third, seventh, and fortieth day after the interment: they also celebrate the anniversary: solemn prayers are offered at the tomb for the repose of the deceased, and victuals and money are distributed to the poor. The tomb is bestrewed by the women, in their visits, with flowers and aromatic herbs; and the wulwaly is repeated. The men make no alteration in their dress as a mode of mourning; but the women lay aside their jewels, dress in their plainest garments, and wear on the head an embroidered handkerchief of a dusky brick-dust colour. They commonly mourn 12 months for a husband, and six for a father.

The governor of Aleppo is usually a vizir bashaw, or a bashaw with three tails; though sometimes the province is conferred on an inferior bashaw of two tails. He seldom remains in office for more than 12 months at a time, though the office may be renewed in the same person; and instances occur, in which he has been continued for several successive years. The regular revenue of the bashaw is barely sufficient to defray two-thirds of his annual expence, including the sums which he is obliged to remit to Constantinople, in order to secure the interest of friends at the Porte. To this circumstance is owing the nefarious practice of making *avarias* upon the people, or raising money by false pretences, in order to supply the deficiency. According to M.

d'Arvieux, the bashaw's regular salary was 80,000 dollars, or above 8,300 *l.* of which 35,000 is allowed for the maintenance of his troops, consisting of 4 or 5000 men. But by extortions, presents, and other means, they raise their revenue to 200,000 dollars, or about 25,000 *l.* In 1769, the revenue of the bashaw fell short, of 200,000 dollars, though *avarias* were as common as ever. In 1783, Volney gives nearly the same account with d'Arvieux; but he mentions an instance of one bashaw, who, within 12 or 13 years, raised, by extraordinary extortions, in 15 months, 160,000 *l.*

A *cadi*, or judge, appointed by the Porte for one year, is sent annually from Constantinople, who brings with him his principal officer. A deputy, called *Naib*, sits in the outer court, to hear inferior causes, while affairs of moment are decided by the *cadi* in person. There are three or four subordinate tribunals in different parts of the town, which are farmed of the *cadi* by certain *effendees*, who, under his authority, determine petty suits; but from these an appeal lies to the superior court of the *cadi*, or the great *Mah-kamy*, which is the name of the old palace, where he resides. The *cadi* has no established salary; but he finds means to raise a handsome revenue, though not merely from the legal perquisites of office, which, however, are very considerable. The *mufti* is nominated annually by the Porte; and he gives a *fitwa*, or an opinion upon all cases that are laid before him; for which his fee is little more than a shilling. The *nakub*, or chief of the *shereefs* or *greenheads*, is nominated at Constantinople, and either annually confirmed, or changed. He judges in particular cases, and to his tribunal the *shereefs* are amenable. The *mohaffil*, formerly called *difter-dar*, is reckoned the second person of the city in the civil line, and is usually appointed by the *Divan*, a temporary governor on the demise of the bashaw, till orders are received from the Porte. He is farmer-general of the land-tax, the customs, and the capitation-tax; his influence is extensive; he is much courted by the *agas* or land-renters, as well as by the merchants; and he lives splendidly. Volney states the *mohaffil's* annual farm at 40,000 *l.* besides 4 or 5000 *l.* which he is obliged to pay to the officers at the Porte. The bashaw, *mohaffil*, *cadi*, *mufti*, *nakub*, and *fardar* or *aga* of the *janizaries* are, by their offices, members of the *DIVAN*, or council. The *janizaries* of Aleppo are mostly persons who live in a domestic manner, in the exercise of their respective trades. They have no pay, but being enrolled in one of the *odas* or chambers at Constantinople, they enjoy in time of peace several privileges and exemptions. In war-time they are liable to be called out, and are obliged to provide themselves with arms, and to march to the camp at their own expence, as they receive no regular pay till they arrive there. Out of these is formed a city guard, under the command of the *fardar*, who holds his appointment from the *janizary* *aga* of Constantinople. They have a peculiar dress, and the attendants of the *fardar*, when he appears abroad, as well as himself, are distinguished by particular turbans.

These *janizaries* were formerly subject to regular exercise and discipline; but within the last 60 or 80 years, says Volney, there no longer remains the slightest trace of their ancient good order. When the bashaw or *pacha* abuses his authority, they are always the first to erect the standard of sedition. The Turkish government revenges itself, it is true, by ordering the most active mutineers to be strangled; but, on the first opportunity, the *janizaries* create other chiefs, and affairs return to their usual course. The *pachas*, thus thwarted, have taken foreign soldiers into their service, who have neither friends nor families in the country. These are

of two forts cavalry and infantry. The cavalry, who alone merit the name of soldiers, assume for this reason the appellation of *Daoula* or *Deleti*, and likewise that of *Delibalthes* and *Lawend*, from whence we have formed *Leventi*. Their arms are short sabres, pistols, muskets, and lances. They wear a kind of felt cap, nine or ten inches high, without any projecting rim; and their saddles are made in the English manner. In the rest of their clothing and accoutrements, they resemble the *MAMALUKES*. Indeed, they are more like banditti than soldiers, and frequently act as such. Almost all the cavalry in Syria are *Turkmans*, *Curds* or *Carmanians*, who, after exercising the occupation of robbers in their own country, seek employment and an asylum near the person of the pacha; and they often lay waste the country and pillage the peasants by open force. The infantry are a corps in every respect inferior to the former. Within the last 50 or 60 years, the peasants of *Tunis*, *Algiers*, and *Morocco*, have, under the name of *Mograbians*, or *Men of the West*, sought employment in Syria and Egypt; and they compose the infantry of the pacha. Their whole accoutrements and baggage are confined to a rusty firelock, a large knife, a leathern bag, a cotton shirt, a pair of drawers, a red cap, and sometimes slippers. Their pay is about 10s. and 10d. per month, out of which they furnish themselves with arms and clothing; but they are maintained at the expence of the pacha. The pay of the cavalry is double, besides which each horseman has his horse and ration, which is a measure of chopped straw and 15 pounds of barley a day. These troops are divided by *bairaks* or colours, consisting of about 10 men each, under the command of an *aga*, who reduces their number in order to purloin their pay. The superior *agas* tolerate this abuse, and the pacha overlooks it for the sake of the emolument derived from this species of fraud.

On the demise of a bashaw, the *mohassil* takes possession of his effects till a *capugi-bashaw*, from Constantinople, comes to receive them in the name of the sultan. The estates of merchants, and of other private persons, descends to the heirs, agreeably to established laws, which allow a certain portion only to be devised by will, and the *cadi* is supposed to see strict justice done to the heirs. The property of merchants, strangers, who die in the public *khans*, is subject to the inspection and care of the *mohassil*, who detains it till it is claimed by the legal heir.

Crimes of a capital kind are very rare at Aleppo. The usual capital punishments are hanging, beheading, strangling, and impaling. Janizaries are strangled, not with a bow-string, but by a cord put round the neck, and then twisted with a stick in the manner of a tourniquet. The bodies of all who are executed remain for some days exposed to public view. Theft is uncommon; when it occurs, it is sometimes punished by amputation of the hand, but more commonly with the *bastinado*, which is performed with rods about the size of a small walking-stick; and this is the usual punishment for offences of an inferior kind. Banishment to the island of Cyprus, and the maritime towns of Syria, is chiefly employed for removing turbulent members from the city or the *divan*.

The *agas* are those who chiefly farm the lands; and the peasants are entitled to one-third of the produce, from which are annually deducted a part of what may have been advanced by the *aga* to stock the farm, and also a certain proportion of the *avanas*, that are from time to time imposed on the villages. These peasants are simply clothed, indifferently lodged, and live chiefly on coarse bread, *leban*, or a preparation of milk, pulse, barley and melons; but seldom taste animal food. However, habit and ignorance

mitigate the rigour of their condition, which they bear with patience, exercising out of the scanty pittance of the fruits of their labour, a spirit of hospitality.

The Europeans, or Franks, as they are called, residing at Aleppo, are English, French, Venetian, Dutch, and Tuscan, or Imperial subjects. The language in common use is the Italian. The English factory consists of a consul and 10 merchants, a chaplain, chancellor, physician, and an officer named a *chaufe*, who walks before the consul, carrying a staff tipped with silver, and takes care of all letters and dispatches. The number of English houses in 1772 was reduced to four, and in 1783 to two. There are two druggomans or interpreters, Greek natives of Aleppo, who speak the Italian, but can seldom read or write any other language, besides the Arabic and Turkish. They have salaries from the *LEVANT COMPANY*. Two janizaries are also kept in constant pay, who attend at the house of the consul, and walk before him when he goes abroad. The French factory is more numerous than the English, each merchant having a clerk or writer, or a person under that title, who afterwards becomes a partner in the house. The residence of the French in the Levant is limited to a certain number of years, after they take the name of factors, or merchants; and they are therefore sent early in life from *Marseilles*, under the denomination of *Scrivains*, and they evade taking the name of factor after they have a share in the business, that they may prolong their stay in the country. The number of French houses of trade was reduced in 1772 to six, or seven, the number in 1783. The consul has his chancellor, *chaufe*, and janizaries, and maintains the same state with the English consul; but he has precedence on all public audiences, on account of the prior establishment of the French factory at Aleppo. Under the protection of the consul are two or three French surgeons, who practise physic; the druggomans are French subjects of the Levant, or native Frenchmen. Besides the merchants, a number of French subjects find their way here, and by intermarriage with the native Christians, produce a half French race, called *mezza razza*. There are four convents, under the protection of the French consul. The Dutch consul, being the sole person of that nation at Aleppo, exercises also the profession of a merchant; but the English and French consuls are prohibited engaging, directly or indirectly, in commerce. However, since the year 1772, the Dutch consul has regular appointments, without benefit of trade. The Venetians were established at Aleppo before any other European nations. For several years preceding 1751, the Venetians had no consul, but they, as well as the Tuscans, were under the protection of the French or the English; but soon after 1754, a consul of their own nation came to reside at Aleppo. The emperor appointed a consul there in 1784, who was a rich Jew merchant, and who shaved his beard to assume the uniform and the sword: Russia has also very lately sent one. The houses of the Franks are as commodious as their situation in the *khans* will admit; and their tables are well supplied. Although they have little or no social intercourse with the Turks, they live together in harmony. The English gentlemen keep excellent horses, and usually take an airing every day; in the month of April they retire to the gardens, in the vicinity of *Babullah*, where they reside till towards the end of May, coming to town for business in the morning, and returning at night. The French natives at Aleppo are equally protected by government, and they enjoy considerable privileges. The consular houses are respected as sanctuaries: the officers of justice cannot enter the houses of

private merchants without permission; the custom on goods is very favourably rated; and in all suits at the makkany court, above the amount of an inconsiderable sum, they have a right to decline the competency of the court, and to remove the cause to Constantinople. In consequence of the regard publicly paid by the government to the Europeans, they are commonly treated with civility by people of all ranks.

The Christian inhabitants at Aleppo are said by Russell to amount to 22,000; of which number the Greeks compose 12,500; the Armenians 6750; the Syrians 3750; and the Maronites 3030; and the remainder consists of strangers, occasionally resident in the city. Each of the four Christian nations has a church, and enjoys perfect toleration under the Mohammedan government. The Greek nation was once opulent and flourishing; but it has long declined, and is now reduced to a very low condition. This decline is ascribed partly to the decay of commerce, and principally to the contests that have subsisted between those who adhere to the patriarch of the Greek church, and those who acknowledge the supremacy of the pope. The Greek language is almost obsolete at Aleppo. The ARMENIANS are divided into two parties, the orthodox and the schismatic; besides their own language, they speak the Arabic and Turkish; but their church service is performed in the learned Armenian, which is different from the language vulgarly spoken. The Syrians of Aleppo are mostly reconciled to the Romish church. The MARONITES are more connected with the Franks than the other sects. They acknowledge the supremacy of the pope, and have added many rites, borrowed from the church of Rome, to their own. Divine service is performed in Arabic. The native Christians have no monasteries at Aleppo, but contribute towards the support of several in ancient Lebanon and its vicinity. For the regulation of expences, and the transaction of business at the seraglio, each of the Christian nations has a public agent or wakeel; who, being elected in an assembly of the principal persons of the respective nations, is confirmed in his office by the bashaw, and invested by him with a pelice, as a mark of honour. The turban, usually worn by the Christians, differs somewhat in form from that of the Turks, and the sash is blue and white striped; their slippers are red, and their dress is, upon the whole, more plain. In their mode of eating, they generally imitate the Turks. Their women, when they appear abroad, wear a veil of white linen, and keep more at home than the Turkish ladies. They are extravagant in the article of dress, which varies in some circumstances from the Turkish fashion. They are more formal in their address, and their courtesy borders too much on servility. The men are generally rather fawning than affable; but those in easy circumstances are hospitably social. Those of them who have obtained protection, under the appellation of honorary interpreters, are distinguished by a peculiar furred cap and yellow slippers.

The computed number of Jews at Aleppo, says Russell, is about 5000. They have one synagogue, which possesses a MS of the Old Testament, which, as they pretend, is of high antiquity. For its antiquity, they urge the concurrent tradition of their rabbies, and their submission to its authority in disputed passages, and also a prayer at the end of it for the preservation of the temple; from which they conclude, that it must have been written before the expedition of Titus, their prayers afterwards having been offered up for the restoration, and not the preservation of the temple of Jerusalem. A specimen of this MS was examined by Dr. Kennicott, who did not find sufficient reason for as-

cribing such high antiquity to it as the Jews do. The Jews are distinguished by their violet-coloured babcoge and their turban, which is lower than that of the Christians. Few of them apply either to manufactures, or to manual trades: most of them are bankers or merchants; the others are brokers, grocers or pedlars. The established banker of the seraglio is a Jew, and the private bankers of most of the grandees are likewise Jews. The Jews are generally more sober than the Christians. The lower people live chiefly on bread, pulse, herbs, and roots, dressed with the expressed oil of sesamum; and they are of all people the most slovenly and dirty. Some of the women are handsome, but the proportion of such is small. Their head-dress differs considerably from that of the Turkish and Christian ladies; and is commonly richly decked with pearls. Their boots and slippers are of a violet colour. Their veil is white, and in the presence of strangers they always wear it. The chief priest of the Jews is, by way of eminence, called the Khakan; and the priests are distinguished from the other Jews by the size and colour of the turban, and by the long wide sleeves of their outer garments. The khakan exercises temporal as well as spiritual authority, and his decisions are generally more respected than those of the bishop are by the Christians, but his civil jurisdiction is very limited.

The state of literature at Aleppo is much degenerated from that of ancient times, when it was more respectable. There are indeed public day-schools adjoining to some of the principal mosques, but their colleges for students in advanced life are few in number, and poorly encouraged. They are more properly seminaries of pedantry and superstition than of science, and they are chiefly frequented by the studious of the poorer class, who dedicate themselves to the service of the mosque. Grammar and school-divinity are the subjects chiefly taught at college. The effendees, who assume an appearance of respect for learning, have no liberal notion of science. Astronomy, which was once a favourite study among the Arabs, is at present wholly neglected. Although they have books on the subject in their libraries and some instruments, yet so little is known of the science at Aleppo, that a person who is found capable of calculating eclipses has, on this account, the reputation of a most profound astronomer. Almanacks are seldom constructed at Aleppo, but are brought thither from Constantinople or Cairo. As to mathematical studies, they are little attended to by the modern Arabs; nor have natural history and the experimental part of philosophy made any progress amongst them for several centuries. History is little regarded by the literati at Aleppo. Their knowledge of distant states, and of the revolutions of empire in the western world is very partial and imperfect; and even their own history, before the appearance of their prophet, remains in great obscurity. Their geographical knowledge also lies within very narrow bounds; nor have they any good maps, except such as have been imported from Europe. Superstition has banished painting from Syria, and music, degraded by fashion to a mercenary profession, is rather tolerated than encouraged: poetry, which was formerly much cultivated among the Arabs, has very perceptibly declined and languished; so that the modern Aleppo bards never attempt any performance beyond a dirge, a ballad, or an epigram. Although the medical practitioners at Aleppo are numerous, their knowledge of medicine is superficial, perverted by prejudice, and accompanied with pedantic affectation, arrogance and obstinacy. A very competent judge affirms their general practice to consist in specious trifling. Their knowledge of anatomy is

is acquired by reading, and not from dissection; and both anatomy and physiology remain precisely in the state in which they were transmitted by Galen. Their ignorance of the circulation of the blood leaves them quietly in possession of the ancient doctrines, which were held sacred before that important discovery. With a copious *Materia Medica*, and a large collection of compound remedies, their practice is confined to a few official preparations. The precious stones, pearls, bezoar, and leaf gold are in high esteem. The principal cordials are the confections of *Alkermes* and *Hyacinth*. The few chemical preparations that are in use are brought from Constantinople, and the Aleppo pharmacy is chiefly confined to the distillation of simple waters, and the preparations of syrups, conferves and decoctions; for spirituous waters, tinctures and elixirs are proscribed by the law of Mohammed. Some few individuals, however, are to be found, who are not only more learned, but in their practice sagacious, active and rational; and who, allowing for the disadvantages under which they labour, are entitled to merit in their profession. Surgery is less cultivated than physic.

Of the quadrupeds found in Aleppo and its vicinity, we may mention two varieties of the cow, buffaloes, two varieties of sheep, as many of the goat; wild hogs, gazelles or antelopes; two sorts of hare, the hedge-hog, the jerboa; four varieties of the camel; three varieties of the ass; various breeds of mules, horses, dogs, cats, varieties of mice, the mole, two varieties of bats, foxes and wolves; an animal called the sheeb, the hyæna, the lynx, and the panther. The markets of Aleppo are plentifully supplied with poultry; the cock and hen, turkeys, geese, ducks and pigeons. They have also abundance of game in the different seasons, &c. Dr. Russell has given an ample catalogue of the ornithology of Aleppo. The conspicuous situation of Aleppo brings thither a great number of sea-birds, and affords the curious a singular amusement. If, from the terraces after dinner, a motion be made of throwing bread, numerous flocks of birds, which were floating in the air, at a height which rendered them invisible, will descend and fly about the place: having been accustomed to receive morsels of bread which have been scattered for amusement. For an account of the carrier pigeons of Aleppo, see *CARRIER pigeon*.

The river Kowick supplies several species and varieties of fish; but it does not afford a sufficient quantity for the Aleppo markets: so that the Christians, in their great lent, are supplied from the rivers Orontes and Euphrates, from the lake of Antioch, and also from another lake near Marash. Amongst the reptiles, we might enumerate the frogs, which abound on the banks of the Kowick, and from the croaking of which it is said to have derived its name. These are of a large size, and so delicious, that some European epicures have declared it was almost worth while to make a journey to Syria, for the sole purpose of regaling on them. The Kowick also furnishes a particular kind of crab, (*cancer fluviatilis*) which is much esteemed. This river likewise affords tortoises in abundance. The silk-worm is a most material object to Syria, being the chief source of its commerce with Europe. The bee is also of great importance, on account of the consumption of honey and wax. Among the noxious animals, the scorpion is the principal. The scolopendra, snakes and serpents, are found in Aleppo and its vicinity. Few houses are exempt from bugs, fleas, and musquitoes. The common fly and horse fly are troublesome; but of the insect tribes, the locust is the most dreadful in its depredation: this sets all the defensive arts of man at defiance; and de-

stroy, in a few days, the beautiful verdure of extensive tracts of cultivated country. Dr. Russell has given a catalogue of the reptiles, serpents, insects, and worms that are found in this country, and also a catalogue of Aleppo plants, with apposite remarks.

The epidemical diseases most prevalent in Aleppo are continual fevers, intermittent and remittent fevers, regular and anomalous, erratic fevers, commonly attended with diarrhoea; the dysentery, quinzy, plury, peripneumony, rheumatism and ophthalmia. The sporadic and chronic diseases are, with few exceptions, nearly the same as in Britain. Those which are most common at Aleppo, are pulmonary complaints, spitting of blood, and consumptions, obstructions of the abdominal viscera, cachexy, jaundice, dropsy, inguinal ruptures, the hemorrhoids and worms. The tinea is common, and various other cutaneous eruptions; but the true or confirmed leprosy is now become obsolete in Syria. The venereal disease is also very common in this country. The Europeans soon after their arrival at Aleppo are subject to a fever, which has been distinguished by the name of *foea*, or *goote*. The disease attacks but once; and the English are rather more liable to it than the Provençals and Italians. The natives of Aleppo and European strangers, after some residence here, are subject to a singular kind of eruption; which, from the supposed time of its duration, is denominated the botch of a year, or the ring-worm or pimple of Aleppo; but by the Europeans and Turks, *il mal d'Aleppo*, the Aleppo evil, and the Aleppo ulcer. No part of the body or limbs is exempt from this eruption, but it most commonly fixes on the face and leaves a scar, with which almost all the inhabitants are disfigured. Volney suspects that it proceeds from the quality of the water. Dr. Russell has particularly described it; and he observes, that the mercurial plaster was the most efficacious remedy. The most calamitous and destructive disease to which Aleppo and its vicinity have been subject is the *PLAGUE*. The means which are practised by the Europeans for their preservation, consist either in a retreat from the city, or in shutting themselves up in their town-houses, in such a manner as effectually to prevent all intercourse or communication, by which the infection might be received from without. Besides the common regulations adopted by the Europeans at Aleppo, and which have the function of long experience, Dr. Russell recommended some further precautions, which we shall here transcribe for the information of those who have no access to his comprehensive and valuable work. The first of these precautions is, in the general regimen of life, to guard against excesses of all kinds, violent passions of the mind, and immoderate evacuations. 2. In respect to diet, not to live more sparingly than at other times, nor to lessen the quantity of wine: perhaps one or two glasses extraordinary might rather be beneficial; and the free use of acid liquors (such as very weak four punch) was, in the summer, found not only grateful to the palate, but salutary. 3. Never to venture abroad in the morning fasting. 4. When in the chamber of the sick, or in passing near a corpse, or any thing suspected of infection, carefully to avoid swallowing the saliva; and, at the same time, to breathe through the double folds of a handkerchief moistened with plain vinegar, or vinegar impregnated with rue. 5. To restrain inspiration as much as possible, while employed in examining the pulse, or such other circumstances of the sick as require drawing close to the bed; and upon coming out of the chamber, to wash the mouth, face and hands with vinegar. 6. On the return home, after visiting the infected, or

passing through the Bazars, to undress and expose the clothes in the open air; and before dressing in fresh clothes, to wash once more with vinegar. 7. The only preservation used internally, was a large dose, twice a day, of extract of bark; drinking after it a draught of wine and water, acidulated with elixir of vitriol. These precautions, observed by the Doctor himself, were attended with success.

Aleppo, slightly defended by the ruined walls and towers of its castle, and exposed to the approaches of assailants by the rising grounds that environ it, is a place of no importance in time of war, though it be the key of Syria to the north: but, considered as a commercial city, it is the emporium of Armenia, and the Diarbekir; sends caravans to Bagdad and into Persia; and communicates with the Persian Gulf, and India by Basia, with Egypt and Mecca by Damascus, and with Europe by Scanderoon or Alexandria and Latakia. Commerce is here principally carried on by barter. The chief commodities are raw or spun cotton, coarse linens, fabricated in the villages, silk stuffs, manufactured in the city, copper, coarse cloths like those of Rouen, goat's hair, brought from Natolia, the gall-nuts of the Curdestan, the merchandize of India, such as shawls and muslins, and pistachio nuts of the growth of the neighbourhood. The articles supplied by Europe are the Languedoc cloths, cochineal, indigo, sugar, and some other groceries. The coffee of America, though prohibited, is introduced, and serves to mix with that of Mocha. Ruffell's Natural History of Aleppo, 2 vols. 4to. 1794, passim.—Volney's Travels into Syria, &c. vol. ii. p. 139, &c. For the coins, weights, and measures of Aleppo, see SYRIA.

ALEPPO, OLD, NOW KINNASREEN, the ruined remains of the ancient CHALCIS, of which there are vestiges of the foundation of walls without a single house standing. This ancient city surrendered on capitulation to the Saracens, in the 17th year of the Hegira, A. D. 630, soon after their invasion of Syria.

ALEPPO, BASHAWLICK or PACHALIC of, one of the five pachalics of Syria, is a province of great extent, reaching eastward from the bay of Scanderoon to the banks of the Euphrates, and from 40 miles north of the city, extending about 50 miles to the south east. But it is not now nearly so extensive as it was in former times. Khillis, which was formerly dependent on Aleppo, is erected into a distinct province, on account of the frequent depredations of the Kurdeens, who inhabit the neighbouring mountains; and since the year 1752 an alteration has taken place with respect to Bylan, which, together with Caramoot, Scanderoon, Byas, and the adjacent mountains, has been put under the government of a native of Bylan, who for that purpose was created a bashaw of two tails. At present the pachalic on the north is bounded by the village Bailik, situated in the road to Aintab, eastward, by the Desert, Bab at the distance of ten hours east-north-east, and Haglah, about the same distance to the south-south-east, being among the last inhabited villages: on the south it is bounded by the Great Desert, between the skirts of which and the west, or west north-west, are situated the most fertile and populous parts of the forest. Sirmeen is the last town southward; and Antioch, with its dependencies, may be reckoned the western boundary, which, till a late period, reached to the sea: Scanderoon and Byas being then the two frontier maritime towns. About one half of the villages which stood formerly on the books of the province, are said to be totally deserted. Many of the inhabitants of this mountainous tract acknowledge scarcely any authority but that of their own chieftains; and the champaign, in many places, is either desert, or only occupied transiently by the wander-

ing tribes of Turkmans, Begdelees, and Rushwans, from the north, or by the Bidoweens and Chingana; who, though they pay an annual tribute, can hardly, in other respects, be reckoned subjects of the province. The oppression of the agas, the destructive marches of the grandees through the province, and the roving of the Russian troops of Levants out of pay, oblige the peasant tenants to remove; so that vast tracts of the beautiful plains in the bashawlick, are shamefully overrun with thistles, whilst the mountainous parts, better secured from oppression, are finely cultivated, full of people, and present on every side thriving hamlets.

Such is the account given of this pachalic by Dr. Ruffell. Volney describes it, as extending from the Euphrates to the Mediterranean, between two lines, one drawn from Scanderoon to Beer, along the mountains, the other from Beles to the sea by Mare and the bridge of Shogar, and as consisting of two plains, that of Antioch to the west, and that of Aleppo to the east: the north and sea coast being occupied by considerably high mountains, known to the ancients by the names of Amanus and Rhofus. The soil of this pachalic is generally fat and loamy: the greatest part of the lands lies waste, and the traces of cultivation are scarcely discernible in the environs of the towns and villages.

Those European merchants, who have resided at Aleppo 20 years, have witnessed the depopulation of the greater part of the environs of the city. The traveller sees nothing in this and other pachalics of Syria, but houses in ruins, cisterns rendered useless, and fields abandoned. Those who cultivated them are fled into the towns where the population is absorbed, and where the individual conceals himself among the crowd from the rapacious hand of despotism. Its principal produce consists of wheat, barley, and cotton, which are found in the flat country: in the mountains they cultivate the vine, mulberry, olive, and fig-trees. The sides of the hills, towards the sea-coast, are appropriated to tobacco, and the territory of Aleppo to pistachios. The pasturage is abandoned to the wandering Turkmen and Curds. For other particulars, see the article of ALEPPO. Ruffell's Hist. vol. i. p. 314. 339. Volney's Travels, vol. ii. p. 139, &c.

ALER, a river of Siberia, which joins the Atiga at Aleurska.

ALEREA, *Ardantes*, in *Ancient Geography*, a city of Gaul, belonging to the Bituriges Cubi, and placed by M. d'Anville between Ernodurum and Argentomagus.

ALERIA, a town of Corsica, situated on an eminence in the east side of the island, near the mouth of the river Rotanus, according to Ptolemy. Herodotus (lib. i. c. 165. p. 78.) mentions it under the name of Alalia, and says it was founded by the Phocæans. Diodorus Siculus (lib. v. c. 13. tom. i. p. 340.) calls it Καλαρίς, Calaris, and says that it was built by the Phocæans. Sylla established a colony in it, and, on this account, has been represented as its founder. It is now in ruins, and altogether abandoned on account of its unhealthy situation, though in former times it has been a considerable city, and the see of a bishop.

ALERION, in *Heraldry*. See ALLERION.

ALES, ALEXANDER, in *Biography*, a divine of Augsburg, was born at Edinburgh, April 23d, 1500, and having made a considerable progress in the school of divinity, engaged in the controversy of the day against Luther. He also took a part in the dispute with Patrick Hamilton, and endeavoured to profelyte him to the catholic religion; but in the progress of the conference, he himself began to entertain doubts, which were increased by the constancy of this Scots martyr at the stake. The persecution he suffered drove him into Germany, where he was at length converted to the protestant

ant faith. Encouraged by the national change of religion, which took place on the marriage of Henry VIII. with Anna Bullen, he removed to London in 1535: and here he was highly esteemed by Cranmer, Latimer, and Thomas Cromwell. When these favourites lost their interest at court, Ales retired to Germany, and was appointed professor of divinity by the elector of Brandenburg, at Frankfort upon the Oder, in 1540. Upon some disgust he withdrew to Leipzig, where he was chosen professor of divinity, and where he died in March 1555. He was much esteemed by Melancthon, and is extolled by Camerarius as a very great divine, a subtle disputant, and a man of distinguished worth and learning. He wrote Commentaries on the Gospel of St. John, and the Epistles to Timothy; an Exposition of the Psalms; a Justification against Oslander; on the Trinity; and an Answer to the thirty-two Articles of the Louvain Divines. Gen. Dict.

ALESA, ALOESA, or HALESIA, in *Ancient Geography*, a very ancient city of Sicily, built, according to Diodorus Siculus (lib. xiv. c. 16. tom. i. p. 651.), by Archonides of Herbita, about the 2d year of the 94th Olympiad, or 403 years before Christ. It stood, he says, upon an eminence, about eight stadia from the sea; near the place, as Fazellus conjectures, where the city of Caronia now stands, on the river Alesus, or Fiumi di Casonia. The inhabitants were called Alesini and Helesini, and, as Diodorus and Cicero inform us, were exempted by the Romans from taxes. Near Aloesa was a fountain, which, as Solinus pretends, used to bubble up at the sound of a flute, so that it could not be kept within the basin.

ALESBURY, in *Geography*. See AYLESBURY.

ALESENI, in *Ancient Geography*, a people of Arabia, whom Strabo places in Babylonia towards the Persian gulf.

ALESHAM, or AYLSHAM, in *Geography*, a town of England, in Norfolk, near the river Thyrn; 12 miles north from Norwich, and 121 north-north-east from London.

ALESIA, or, as it is sometimes written, ALEXIA, in *Ancient Geography*, a considerable town of Celtic Gaul, belonging to the Mandubii, situated, according to Cæsar, (Bell. Gall. lib. vii. c. 68.) on a high hill, washed on two sides by two rivers, and of such antiquity, that Diodorus Siculus (lib. v. c. 24. tom. i. p. 349.) ascribes the building of it to Hercules in his war against Geryon. It was so strongly fortified, that when Cæsar besieged and took it, Velleius Paterculus represents the undertaking as more the work of a god than of a man. After Cæsar destroyed this city, it was rebuilt, and maintained a considerable rank under the Roman emperors. Pliny (H. N. tom. ii. p. 669.) says, that the art of silversmithing the ornaments of horses was invented in this city. It is supposed to be the present *Allise*. The mountain on which it stood is said to be Mount Auxois, which is 150 toises high, and the foot of it is washed by two rivers, *viz.* the Oze and the Ozerain.

ALESIAS, a village of Laconia, in the road from Therapnes to Taygetas, where, as Pausanias informs us (lib. iii. Lacon. c. xx. p. 260.), Myles, the son of Lelex, first taught the art of grinding corn by a mill; and where an heroic monument was erected to Lacedæmon, the son of Taygetas.

ALESIIUM, a town of Greece, in the interior of the country, at some distance south-east from Elis.

ALESONE, in *Geography*, a town of European Turkey, 20 miles north-west of Larissa.

ALESORNE, a town of France, in Languedoc, in the generality of Toulouse and diocese of Lavaur.

ALESSANDRIA. See ALEXANDRIA.

ALESSANO, a small town and bishop's see of Naples,

in Italy, in the district of Otranto; 12 miles south-south-west of Otranto. N. lat. 40° 12'. E. long. 18° 14'.

ALESSI, GALEAZZO, in *Biography*, a famous architect, was born at Perugia, in 1500, and arrived at such eminence, that he was applied to from France, Spain, and Germany for plans of public buildings. His plan for the monastery and church of the Escorial was preferred to those of the ablest architects in Europe. Genoa has acquired the denomination of *superb*, partly from the buildings which he has erected in it. He died in 1572. Nouv. Dict. Hist.

ALESSIO, ALESSIS, or LISSUS, in *Geography*, a town of European Turkey, in Albania, on the Adriatic gulf, near the mouth of the Drin, and 16 leagues south-west of Albanopolis. This is the see of a bishop, suffragan of Durazzo; and it is famous for having the tomb of Scanderberg, king of Albania, who died in 1467. N. lat. 41° 48'. E. long. 29° 29'.

ALESUS, in *Ancient Geography*. See ALFSA.

ALESUS, *Sanguinaria*, a river of Italy, in Etruria.

ALET, Lat. ALFETA or ELEFETA, in *Geography*, a city of France, in the department of the Aude, and district of Limoux, situate at the foot of the Pyrenees, on the river Aude. Before the Revolution it was the see of a bishop, suffragan of Narbonne, and the diocese contained 80 parishes. It is 15 leagues south-west of Narbonne, and 175 south of Paris. N. lat. 42° 59'. E. long. 2° 6'.

ALETA, in *Ancient Geography*, a town of Dalmatia.

ALETON, signifies meal, as Erotian and Hesychius explain it. It seems derived from *αλεω*, to grind, and to import the meal of any sort of corn. The word is frequently used by Hippocrates.

ALETRIS, formed from *αλετρωω* or *αλεω*, to grind, in *Botany*, a genus of the *hexandria monogynia* class and order, of the natural order of *lilia* or *liliaceæ*, the *coronariæ* of Linn. and *asphodeli* of Juss. Its characters are, that it has no calyx; that the corolla is one-petalled, ovate-oblong, hexangular, funnel-shaped, semiflexid, very much wrinkled, the divisions lanceolate, acuminate, spreading, erect, and permanent; the stamina have awl-shaped filaments of the length of the corolla, inserted into the base of the divisions, the anthers oblong and erect; the pistillum is an ovate germ, the style subulate, of the length of the stamens, and stigma trifid; the pericarpium is an ovate, three-cornered, acuminate, three-celled capsule; and the seeds are very many. Professor Martyn enumerates eight, and Gmelin nine species, *viz.* 1. *A. farinosa*, American A, stemless, leaves lanceolate, membranaceous, flowers alternate, which grows in North America, and was cultivated here in 1768, by Mr. Miller. The natives frequently use it as a beehive and incisive in coughs and in the pleurisy. 2. *A. capensis*, waved-leaved A, veltheimia of Gleditsch, stemless, leaves lanceolate waved, spike ovate, flowers nodding; a native of the Cape of Good Hope, flowering with us from November to April, and brought here in 1768, by Mr. W. Malcolm. 3. *A. glauca*, stemless, leaves lanceolate glaucous, flowers nodding with a spreading border; a native of the Cape of Good Hope, flowering in January, and introduced in 1781, by Mr. G. Wynch. 4. *A. uvaria*, aloe uvaria of others, great orange-flowered A, stemless, scape longer than the sword-shaped keeled leaves; a native of the Cape of Good Hope, cultivated at Chelsea in 1707, and flowering in August and September in large spikes of a fine appearance. There is a variety with narrower leaves, and longer spikes of flowers. 5. *A. pumila*, small orange-flowered A, stemless, scape shorter than the linear sharply-keeled leaves; a native of the Cape, introduced in 1774, and flowering from September to November. 6. *A. hyacinthoides*, stemless, leaves lanceolate, fleshy, flowers germinate; having two varieties, reckoned by La Marek as distinct species;

viz. *A. zeylanica*, Ceylon A. or aloe, with some of the leaves subulate and compressed; and *A. guineensis*, Guinea A. or aloe, with all the leaves lanceolate, of which the *katu-kapel* of Rhed is considered by La Marek as a variety. The first of these is common in gardens, where exotic plants are preserved; the second was cultivated here in 1690; its flowers, which attend its whole length, are of a clear white, but seldom continue in beauty more than two or three days; and it never produces seeds in England. 7. *A. fragrans*, sweet-scented A., caulescent, leaves lanceolate, loose; found in Africa, and cultivated in 1768 by Mr. Miller. 8. *A. cochinchinensis*, caulescent, leaves lanceolate-linear, reflex, flowers panicle; cultivated in the gardens of Cochin-China, where it is a native; the juice of the leaves are used to dye green, and the flowers are eaten. The eighth species of Gmelin is *A. japonica*, stemless, with leaves petiolated, ovate-lanceolated, seven-nerved, and spiked flowers. The ninth species is *A. curtea*. The second, third, fourth, and fifth species are referred by Willdenow to the genus *Veltheimia*.

Culture. The first species may be preserved through the winter under a hot-bed frame. The roots of the second sort must be planted in pots filled with light earth, and sheltered in winter in a dry airy glass-case. In May they may be placed abroad in a sheltered situation, and often refreshed with water in warm weather. The fourth sort is sufficiently hardy to live abroad in mild winters, when planted in a warm border and dry soil. It is propagated by seeds, sown in pots, and sheltered under a hot-bed frame; the plants, when they come up in spring, should be gradually exposed to the open air; and when they are large enough, some may be planted in pots, and others in a warm border, where they should be sheltered during the ensuing winter. The Ceylon, Guinea, and sweet-scented species are too tender to live through the winter in England, unless they are placed in a warm stove; and they will not produce their flowers, if the plants are not plunged into a tan-bed. The creeping roots of the Ceylon and Guinea sorts send up many heads, which should be cut off in June, and, after having been laid in the stove for a fortnight, that the wounded part may heal, they should be planted in small pots of light sandy earth, and plunged into a moderate hot-bed of tanner's bark, giving them but little water till they have put out good roots; they should then be treated like other tender succulent plants, and be never set abroad in summer. The seventh species is easily propagated from the side heads, which it puts out after flowering.

ALETUM, **GUICH-ALET**, in *Ancient Geography*, a town of the Gauls, mentioned in the *Notitia Imperii*, and placed by M. d'Anville upon the sea-coast, north-west of the territory of the Rhedonnes. It was formerly a bishop's see, which, in the 12th century, was transferred to St. Malo, about a mile from it.

ALEVAIA, in *Geography*, a river of Siberia, which runs into the Penzinskoi sea. N. lat. 62°. E. long. 157° 14'.

ALEURITES, *Αλευρίτις*, *farinaceous*, of *αλευρον*, *meal*, parts of the tree having a meal scattered over them, in *Botany*, a genus of the *monocia monadelphia* class and order, of the natural order of *trilocosa*, and *euphorbia* of Jussieu; the characters of which are, that the flowers are male and female: the calyx of the male is a perianthium, three-cleft, very short, the clefts ovate and obtuse; the corolla has five petals, oblong, spreading, obtuse, much longer than the calyx; the nectary has five scales somewhat cornered, very short, at the bases of the petals; the stamens are numerous filaments, connate into a conic columnar receptacle, the anthers roundish. The female flowers are few, in the same corymb; the calyx, corolla, and nectarium as in the male, but larger; the pistillum has a

germ conic superior, the style none, the stigmas two, very short; the pericarpium a large, globose, two-seeded berry; the seeds are two, globose, coated with a double bark. There is one species, *viz.* *A. triloba*, which is a tree of the islands of the South Sea.

ALEUROMANCY, **ALEUROMANTIA**, derived from *αλεωρον*, *meal*, and *μαντευσις*, *divination*, in *Antiquity*, is the same with what was otherwise called *Alphitomantia* and *Crithomantia*, and means an ancient kind of divination by means of meal or flour.

ALEURSKA, in *Geography*, a town of Siberia, at the conflux of the Agila and Aler, 64 miles north-east of Nerchinsk.

ALEUTIAN, or **ALEUTSKY ISLANDS**, a group or chain of islands, on the north-east of Kamtschatka, and near the continent of America, belonging to Asiatic Russia. These islands were partly discovered by Behring in 1741, and the rest at several periods since his time. The most considerable of them amount to 40 in number, and they may be justly considered as a branch of the Kamtskadale mountains continued in the sea. Some have erroneously included BEHRING'S-ISLAND and the COPPER-ISLAND in this group; but they are usually distinguished from them. South-east of the Copper-island, within 150 or 200 versts between the 54th and 55th degrees of north latitude, lie three small islands, known by the names of AT-TAK, SHEMA, and SEMITSHI; and these, with a few others, were denominated by the Russians *Aleutskie Ostrova*, because a bold rock, in the language of these parts, is called *aleut*. In the sequel this name was extended to the whole chain; though a part of it, namely, as far as the island Yamblak, is named the *ANDREANOFSKOI*, and the rest, lying further towards America, the *FOX-ISLANDS*. The Russian charts divide the long Archipelago, known under the name of the Aleutian and Fox-islands, into several Archipelagoes under different names. On these Aleutian islands, and on upwards of 300 leagues of coast, which extend beyond the polar circle, the indefatigable Russians have formed those numerous settlements or factories that support the fur-trade, from which the empire of Russia derives such great advantages in its commercial concerns, and exchanges with the empire of China. This Archipelago, known, in the most extensive sense, by the collective name of the Aleutian-islands, forms with the north-west coast of America and the north-east coast of Asia a large basin of about 1,200 leagues in circuit, which communicates towards the south with the great Boreal ocean, by as many straits as the islands form channels between them; and towards the north, under the 66th parallel, with the Arctic Frozen Ocean, by Behring's strait alone. The survey of these islands, more anciently discovered by the Russians, and of the adjacent parts of the two continents, was made by Captain Cook in his third voyage in 1778. If the Russians, then, can deservedly claim the priority of the discovery, no one can withhold from the adventurous and persevering Captain Cook the glory and the merit of having fixed the distance of the two continents, and their respective extent, to the east for Asia, and to the west for North America; and, by his researches and observations, of having opened a career to the navigators of the European nations, who should be desirous of availing themselves of the benefits which the discovery of these coasts presents to the speculations and enterprizes of commerce. We shall here add, that in ascending towards the north-west, Cook made Behring's Mount St. ELIAS towards the latitude of 60° 30'. He anchored in a large bay, which he named PRINCE WILLIAM'S sound; and thence steering again to the south-west, he discovered and ascended a river, on which, after his death, the gratitude of his nation imposed the name of COOK'S RIVER.

RIVER. He then coasted the east shore of the peninsula of ALASKA, and touched at the island of OONALASCHKA, which is separated from the south-west point of the peninsula only by the island of OONFEMAK: these two islands are the nearest to the continent, and the most eastern of that Archipelago, or long chain of islands of various sizes, which extends from east to west, on a line bending towards the south, to within 350 leagues of the main land, if we consider BEHRING'S island as the extremity of the chain. Capt. Cook extended his course into the north of Behring's basin, and made alternately the coasts of America and Asia; in the former he perceived the outline of a large bay, which he called BRISTOL BAY; and standing toward the middle of the basin, he saw the MATWEIA island of the Russians, which he named GORE'S ISLAND, and further to the northward he distinguished the islands called CLERKE'S ISLANDS. To the east-north-east of these, on the continent of America, he discovered NORTON found; he then passed BEHRING'S strait, and advanced into the Arctic Frozen Ocean, as far as the parallel of $70^{\circ} 44'$. A plain of ice obstructed his progress nearer towards the pole. Here he might say with the poet Regnard, when he reached the northern rocks of Lapland:

“Hic tandem stetimus nobis ubi desuit orbis.”

From comparing Cook's progress northwards with that of Captain Phipps it appears, that the ocean is navigable much further towards the north, between Europe and America, than between America and Asia; for Captain Phipps, in his “Voyage to the North Pole,” reached very near the 81st parallel, whereas Captain Cook could not penetrate beyond the latitude of $71^{\circ} 10'$. See Marchand's Voyage round the World in 1790, 1791 and 1792, by Fleurieu, Vol. i. Introduction passim. A Russian expedition for making discoveries in the north-east sea was proposed by Catherine II. in 1784, and the conduct of it entrusted with Capt. Billings, an Englishman, Capt. Behring, the grandson of the Behring already mentioned, and some others. After wintering at Kamtschatka, these navigators explored, in the summer of 1790, the whole chain of the Aleutian islands, which seem to be of volcanic origin; and they proceeded to explore the large eastern islands explored by Capt. Cook, Oonalaschka and Kadjak, the bay of Cape St. Elias, &c. and returned to winter at Kamtschatka. In the summer of 1791 they renewed their search for a northern passage through the Frozen Ocean, and pursued their route from Gore's and Clerke's islands to the continent of America. From the account of their expedition, published at Gottingen by Blumenbach, we learn, that a principal ornament of the ladies of the Aleutian islands consists of a pair of the long tusks of a wild boar, cut down to a smaller size, which are stuck into two holes, one on each side of the under lip, from which they project, and give the wearer an appearance similar to that of the Walrus; and this is considered as a beauty almost irresistible. In these islands, when they were first discovered, more than 60 families were found, whose language had no relation either to that of Kamtschatka, or to any of the oriental languages of Asia; it is a dialect of the language spoken in the other islands adjacent to America, which seems to indicate that they have been peopled by the Americans, and not by the Asiatics. They have no wood in these islands besides that which is floated to them by the sea, and this wood seems to come from the south; for the camphor-tree of Japan has been found on the coasts of these islands. The inhabitants of these islands are, in proportion to their dimensions, tolerably numerous, and they are at present tributary to the Russian empire. See *Fox-islands*.

ALEXANDER THE GREAT, in *Biography and Ancient*

History, was the son of Philip, king of Macedon, by Olympias, daughter of Neoptolemus, who was son of Alectas, king of Epirus. He was born at Pella, the capital of Macedonia, in the first year of the 106th Olympiad, B. C. 356. His natural disposition, which is said to have been excellent, was betimes corrupted by the mercenary adulation of his first preceptor, Lyfimachus, the Acarnanian; and neither the counsel and example of Leonidas, his mother's relation, nor the instructions of Aristotle, were sufficient to counteract its pernicious effects. It was, however, a singular advantage to Alexander that he was placed under the tuition of this great philosopher. Soon after his birth Philip wrote to Aristotle, informing him, that he designed to place this son that was just born under his instruction. “I return thanks to the Gods,” says he, “not so much for having given him to me, as for his having been given during the life of Aristotle; and I may justly promise myself, that you will make him a successor worthy of us both, and a king of Macedonia.” Accordingly, at the proper season, he invited his attention to him by the offer of a considerable stipend, and he afterwards recompensed it by rebuilding Stagira, the native place of Aristotle, which he had destroyed; reinstating the inhabitants, who had fled from it, or who had been made slaves; and assigning them a fine park in its vicinity for their pleasures and assemblies. The pupil seems to have conceived an early and affectionate attachment to his master, whom he thought himself bound to love as much as if he had been his father; and to this purpose he declared, “That he was indebted to the one for living, and to the other for living well.” His progress in every kind of science corresponded to the natural talents which he possessed, and to the distinguished attention and abilities of his tutor. He devoted himself with singular assiduity to the study of metaphysics, mathematics, and morals; he was no less solicitous to be a master of rhetoric, both in the theory and practice of it; and to his solicitude in this respect we owe Aristotle's treatise on rhetoric, which, with a jealousy altogether unbecoming a great character, he requested the author not to communicate to any but himself. His taste for classical literature is likewise manifest in the very ardent esteem which he professed for Homer, whose poems he denominated, as Pliny (H. N. lib. vii. c. 29. tom. i. p. 391.) informs us, “the most precious production of the human mind.” He particularly admired the Iliad, which might probably contribute to give his mind a decided direction to military glory. The passage, we are told, which pleased him most, was that (Il. iii. v. 172.) which represents Agamemnon as “a good king and a brave warrior.” He had also a taste for the arts in general; he knew their importance and utility; and music, painting, sculpture, and architecture flourished in his reign, because they found in him a competent judge, and, as some say, a munificent protector. In his exercises he distinguished the useful from the fanciful; in his diversions he declined whatever was unmanly; and in his studies he despised whatever was trivial or pedantic. In early life he manifested a genius and disposition formed for great and splendid actions. Emulation and ambition were the predominant passions both of his youthful and riper years. When he conversed with the Persian ambassadors at his father's court, at the age of no more than seven years, the subjects of his enquiry were, not the palaces and retinue of their king, but the character and manners of their sovereign, the number and discipline of his army, the road that led into Upper Asia, and “the number of days' march from Macedonia to Susa.” When he was requested to enter his name among the Olympic competitors, he replied, “So I would, if I were to have kings for antagonists.” On occasion of his taming the famous horse Bucephalus, which none

of his father's goods would venture to mount, Philip was provoked, that he said to him, "My son, seek a kingdom more worthy of thee, for Macedonia is below thy merit." Besides the qualities which we have recited, the youth of Alexander was distinguished by temperance, chastity, and self-command.

His dutiful respect for his mother, whom Philip divorced, produced a disagreement between him and his father; and it was increased by a suspicion, which they entertained, that he would be disinherited, and one of Philip's children, by another wife, preferred to him. However, before this period, when he was 16 years of age, he was appointed regent of Macedonia during his father's absence; and his conduct manifested such prudence and bravery, that he was afterwards employed in several military enterprises, in which he behaved with great honour to himself, and singular satisfaction to Philip, whose life he had preserved by his resolute and seasonable interposition. In the battle of Chæronea, at the age of 18, he signalized himself by his valour, and greatly contributed to the victory. Before Philip undertook his projected expedition into Asia, he recalled his son from Epirus, whither he and his mother had retired, and was apparently reconciled to him: but when his father was assassinated by Pausanias, whom he had grievously offended, Alexander and his mother were suspected of being privy to the conspiracy. The suspicion, however, seems to have been groundless; and the first act of his reign was the just punishment of the murderers. In the 20th year of his age, B. C. 336, he succeeded to the throne of Macedon; and commenced his military career by marching into Thessaly to overawe the Greeks, who were disposed to emancipate themselves from the Macedonian yoke, and by causing Attalus, who encouraged their revolt, to be put to death. Having succeeded in this enterprize, he marched into Thrace, defeated the Triballi, who inhabited the modern Bulgaria, and drove them beyond the Danube; he also made the Getæ to fly at his approach; subdued several barbarous nations, and established a treaty of peace, in which the Celtes, a fierce and high-spirited people, and others, were comprehended. During his absence in these expeditions, the cities of Greece, infligated by the eloquence and influence of Demosthenes, formed a powerful alliance against him. The report of his death had induced the Thebans to revolt; and, having murdered two officers of the Macedonian garrison, they were preparing to besiege the citadel. Alexander, receiving intelligence of this event, hastened to Greece, B. C. 335, passed the Straits of Thermopylæ, and entered Bœotia before the Thebans were undeceived as to his death. To those who accompanied him he spoke in the following manner: "Demosthenes, in his orations, called me a child when I was in Illyria and among the Triballi; he called me a young man when I was in Thessaly; and I must now shew him, before the walls of Athens, that I am a man grown." The city of Thebes, which was bravely defended by the inhabitants, animated by a love of liberty, was at length taken by storm, with a dreadful slaughter: the buildings were razed, the house of Pindar, the poet, excepted from a respect to its owner; the inhabitants were sold for slaves, and the lands distributed among the soldiers; this conduct struck the Greek states with terror. Athens sent a deputation to Alexander, imploring his clemency; but he demanded the surrender of ten orators, whom he supposed to have been the chief instruments in forming the league which Philip his father had defeated at Chæronea. On this occasion Demosthenes recited to the people the fable of the Wolves and the Dogs; in which it is supposed, "that the wolves told the sheep, that if they desired to be at peace with them, they must deliver up to them the dogs who

were their guard." Alexander having relented, by the interference of Demades, whom he had honoured with his friendship, waved the enforcement of his demand. Having re-established the tranquillity of Greece he went to Corinth, where his office of generalissimo was recognized and settled. At Ægæ he held a grand council of state and war, in order to deliberate upon his expedition into Asia. Antipater and Parmenio recommended delay, but Alexander had formed his purpose; and having offered sacrifices, and entertained his friends with feasts, and distributed among them the crown-lands, Perdiceas asked him what he reserved for himself? "Hope," replied Alexander. "The same hope ought therefore to satisfy us," was the rejoinder of Perdiceas. Accordingly he assembled his army, and prepared for his march into Asia. When one of his attendants asked him why he succeeded so well in quelling the dangerous tumults in Asia, he answered, "It was by delaying nothing."

In the 22d year of his age, B. C. 334, Alexander crossed the Hellespont into Asia, with an army of about 30,000 foot, and 4 or 5000 horse. Parmenio, who commanded the infantry, passed over with the greatest part of the army from Sestos to Abydos; and Alexander crossed first the Strymon, afterwards the Hebrus, and after 20 days march arrived at Sestos. Having prepared for his expedition by a variety of superstitious ceremonies, to which he was attached, he proceeded to Ilium, where he sacrificed to the heroes buried in the neighbourhood, and particularly to Achilles, to Minerva, and to the ghost of Priam. In his march he preserved Lampfacus, which he had determined to destroy on account of its adherence to the Persians; and this he did in consequence of the interposition of Anaximenes. "I swear solemnly," says Alexander to Anaximenes, who met him on the road, and the object of whose interview he suspected, "that I will not do what you desire me." "My request, then," said the old man, smiling, "is, that you would burn Lampfacus." The Persians collected a large force to meet him on the banks of the river Granicus, May 22, B. C. 334; but, after an obstinate resistance, they were routed with great slaughter. The consequence of this victory was the surrender of Sardis, the chief town of Lydia, and the possession of the whole country as far as the river Hermus.

Alexander proceeded to Ephesus, and restored the democracy; and by an edict he established the popular government in all the Greek cities. At Miletus, which he besieged and took, he dismissed his fleet, and advanced to the siege of Halicarnassus, which was abandoned by the Persians, and then to Tralles, which he took and levelled with the ground. Having demolished Halicarnassus, he appointed Ada, who claimed the title of queen of Caria, and who delivered up to him Alinda, governess-general of all Caria; and this conduct induced many of the princes of the Lesser Asia to revolt from the Persians, and to put themselves under his protection. Alexander ingratiated himself with the army, by permitting the soldiers who were married to spend the winter with their wives in Macedonia; a practice conformable to the law of Moses, (Deut. xxiv. 5.) and which Aristotle probably learnt of some Jew, and recommended to his pupil. Whilst the king was busily preparing for the next campaign, an attempt was made upon his life by the corruption and treachery of an officer of his army; but it was discovered and prevented from taking effect.

The next campaign was opened early in the spring; and Alexander, taking possession in his march of the cities of Lycia and Pamphylia, proceeded to Phrygia; and at Gordium, the capital, he was desirous of seeing the famous chariot to which the Gordian knot was tied. The oracle had foretold, according to an ancient tradition of the country, that the

man who could untie it should possess the empire of Asia : Alexander, persuaded that this prediction related to himself, after many fruitless trials, exclaimed, "It is no matter which way it be untied," and cut it with his sword. Having subdued Paphlagonia and Cappadocia, he advanced by haily marches into Cilicia, and arrived in the country called Cyrus's Camp. Through a narrow strait, called the Pass of Cilicia, he marched with his army to Tarsus, where Parmenio arrived just in time to prevent its being set fire to by the Persians. Alexander, heated and fatigued by this rapid march, plunged into the river Cydnus, which ran through this city, and was instantly seized with a shivering, which his attendants thought would prove fatal to him. His danger alarmed the whole army, and they expressed their apprehensions with lamentation and tears. In these circumstances, and whilst the speedy arrival of Darius was expected, Alexander consulted his friends and physicians, and intimated to them that the condition of his affairs would not admit either of slow remedies or timid physicians. "A speedy death," says he, "is more eligible than a slow cure." Philip, an Acarnanian, one of his physicians, who tenderly loved him, and had attended him from his youth, offered to give him a dose, which would be speedy in its effects, and desired three days to prepare it. In the mean while Alexander received a letter from Parmenio, who had been left in Cappadocia ; the purport of which was to bid him beware of Philip, because Darius had bribed him by the promise of a thousand talents, and his sister in marriage. But his confidence in a physician, whose fidelity he had experienced from his infancy, prevailed over his fears, and removed all his doubts. The contents of the letter he did not divulge. When Philip came to administer his medicine, Alexander took it from under his bolster and gave it Philip to read ; at the same time, fixing his eyes on the physician, he swallowed the draught without hesitation, or without discovering the least suspicion. The effects of the medicine were very violent, but the skill of the physician prevailed, and his fidelity was proved. Alexander recovered, and in three days presented himself to the joyful gratulations of the army.

During this interval Darius was on his march, and Alexander advanced to meet him near Issus, in the month of October, B. C. 333. The army of Darius consisted of 600,000 men ; but by insatiable counsels, and a vain confidence in the number of his forces, he had quitted an open and level country, and prepared to engage in a close and mountainous situation, where his multitude could only embarrass him in action. Victory was for some time obstinately disputed ; Alexander received a wound in his thigh ; but at length the Persian emperor fled, and his immense army was thrown into confusion. A dreadful carnage succeeded, and the tent of Darius, with his mother, wife, and daughters, came into the possession of the conqueror. When Alexander had performed the offices of duty and compassion to the dead and wounded, he entered the tent where the queens were lodged, accompanied only by his favourite Hephæstion. The queens, mistaking Hephæstion for the king, paid their respects to him as such ; but as soon as Syligambis, the mother of Darius, had discovered the mistake, she fell prostrate at the feet of Alexander, and begged his pardon. The king raised her from the ground, and said to her, "Dear mother, you are not mistaken ; he also is an Alexander." Alexander, after this respectful visit, declined exposing himself to the danger of human frailty, and solemnly resolved never to see the queen of Darius any more. At this time, the fourth year of his reign, Alexander was young, victorious, and free, or unengaged in marriage, as has been observed of Scipio on a like occasion—

"Et juvenis, et cœlebs, et victor."

After this victory, Alexander pursued his march to Syria. Parmenio went to Damascus, and possessed himself of the treasures of Darius. The king proposed to visit Tyre, that he might have an opportunity of sacrificing to the Tyrian Hercules : but the Tyrians resolved not to admit a Macedonian within their gates. Alexander was incensed, and determined to besiege the city ; and this siege, one of the most famous which history records, lasted for seven months ; at length the place was stormed and utterly destroyed. The king, on this occasion, incurred deserved reproach by his cruelty towards a people, who had only offended by bravely defending their country. Thousands were put to the sword, two thousand were crucified, and the rest sold for slaves. After having depopulated the city, he colonized it anew, and boasted of being the founder of a city which he had ruined. This event took place, August 20th, B. C. 332.

From Tyre Alexander proceeded to Jerusalem, with the intention of punishing the Jews for affording relief to the Tyrians during the siege ; but on his approach he met Jaddua, the high priest, in his pontifical habit, accompanied by the priests in their sacred vestments, and the people clothed in white. When the procession drew near, Alexander bowed before the priest, and paid him religious adoration ; alledging to Parmenio as the reason of this conduct, that the figure of a person in such habit had appeared to him at Dium, in Macedonia, and assured him of the divine guidance, and of ultimate success in his expedition. After this interview, Alexander accompanied Jaddua to Jerusalem, sacrificed in the temple, and conferred great favours on the Jewish nation. Such is the account given by Josephus, but the whole is rejected as fabulous by many judicious writers. Considering, however, the superstitious temper of Alexander, and his friendly conduct to the Jews, it is not altogether improbable. From Jerusalem Alexander proceeded to Gaza, besieged it, and took it by storm : from Gaza he marched to Pelusium, left a garrison in it, and sailed up the Nile. He afterwards marched through the deserts to Heliopolis, and crossing the river, he arrived at Memphis, where he offered pompous sacrifices not only to the Grecian gods, but to the Egyptian Apis. From Memphis he sailed down the river to the sea, and fixed on the place where he proposed to build a new city, which has since become so famous under the name of Alexandria. Here he formed the design of visiting the temple of Jupiter Ammon, situate on an oasis in the midst of the Lybian deserts. The senior priest of this temple flattered him with the title of the son of Jupiter, which Alexander joyfully accepted ; and he was farther assured that he should be the monarch of the world. From this journey, which had proved so successful, he returned as from a triumph ; and from this time, in all his letters and decrees, used the following style : "Alexander, king, son of Jupiter Ammon."

During his abode at Memphis, he settled the affairs of Egypt ; and in the spring marched towards the east against Darius. In his way to Tyre, which was the place appointed for the general rendezvous of his forces, he heard that Andromachus, whom he had appointed governor of Syria and Palestine, had been massacred at Samaria ; and, in order to avenge this audacious act, he put those that were concerned in it to death, banished the rest from Samaria, supplied their place with a colony of Macedonians, and divided part of their territories among the Jews.

From Tyre he directed his march to Thapsacus, and having passed the Euphrates, he advanced towards new conquests. On his march he was informed of the death of Statira,

Statira, the captive queen of Darius: and this event detained him, till he had visited Syzigambis, administered suitable consolation, and performed the funeral obsequies of the dejected queen in the most splendid and magnificent manner. Darius, though his mind harboured suspicions of a dishonourable kind, that were equally unjust, was much gratified by the tokens of respect which Alexander had rendered to his queen and family, and renewed propositions of peace. On a former occasion, during the siege of Tyre, he had made very advantageous proposals, which Parmenio wished him to accept; declaring, that he would agree to them if he were Alexander. "And so would I," replied Alexander, "were I Parmenio." Darius now offered him all the provinces between the Euphrates and the Hellespont: but Alexander had more extensive views in his career of glory and ambition. Darius prepared for battle, and pitched his camp near a village called Gaugamela, in a plain at some distance from Arbela. Alexander, at the sight of his formidable army, consulted soothsayers, offered up victims to Fear, and joined in prayers addressed to Jupiter, Minerva, and Victory. These ceremonies being ended, he went to bed, and slept soundly through the whole night. Parmenio awaked him in the morning, and expressing his surprize that he should be able to sleep so calmly, just as he was going to fight a battle in which his whole fortune was at stake: Alexander addressed him—"How could it be possible for us not to be calm, since the enemy is coming to deliver himself into our hands?" The army of Darius consisted of 600,000 foot, and 40,000 horse; some say of upwards of a million of men: but that of Alexander of no more than 40,000 foot, and 7 or 8000 horse. The Persians were totally routed: Parmenio, who was in great danger, was rescued by Alexander in person; and they both joined in the pursuit of Darius, and, passing the river Lycus, marched to Babylon, which was instantly delivered by Mazæus, the governor, into his hands. According to Arrian, the Persians on this occasion lost 300,000 men, besides those who were taken prisoners; but the loss of Alexander did not amount to more than 1200 men. Such was the issue of this battle of Arbela, fought in October, B. C. 331, which decided the fate of Asia.

From Babylon Alexander marched towards Susa, where he found treasures of various kinds, and of great value. Here he left Darius's mother and children; and having reduced the Uxii, whose country lay near Susa, and extended to the frontiers of Persia, he forced his way through the Persian straits, and arrived at Persepolis. Having destroyed the royal palace, to which he and his companions in the season of debauch and plenty, and at the request of Thais the courtesan, and Ptolemy's mistress, set fire, and plundered the city, he pursued Darius first to Ecbatana, the capital of Media, and then as far as Rhages, a city one day's journey from the Caspian straits. But his progress was interrupted by the news of the death of this ill-fated and unhappy monarch, who was murdered by a conspiracy of his own subjects. Having settled the government of Parthia, he reduced Hyrcania, dispersed the Mardi, took possession of Zadracarta, the capital of Hyrcania, where for 15 days he celebrated solemn games, and offered magnificent sacrifices to the gods of Greece, and then entered Aria, and reduced the whole province to submission.

The relaxed discipline and unrestrained luxury which the manners of the Persians produced in an army flushed with success, terminated in faction and discontent, and even in a conspiracy against the life of Alexander. Philotas, the son of Parmenio, was forced by torture to confess his guilt, and punished with death; and his condemnation was soon fol-

lowed by the assassination of the father, at the age of 70 years, and after a life faithfully and zealously devoted to the service of his prince. The death of both Parmenio and Philotas, upon a suspicion of guilt, and without any direct proof, alienated the affections of the army from Alexander, and produced such a degree of dissatisfaction and disgust, that he separated those who were disposed to sedition from others, and proceeded without further delay to action. Having passed through Drangania, Arachosia, and the country of the Arimaspi, all which submitted to his arms, he arrived at a part of Mount Caucasus, called Paropamisus, where his army endured much toil and hardship; and where Bessus, whom he was pursuing, had laid waste the country, in order to deprive him of provisions and forage. This Bessus was a principal agent in procuring the death of Darius, and he had assumed the imperial purple, under the title of Artaxerxes. Alexander having found an opening that led into Media, directed a city to be built there, which he called Alexandria; and he also founded several other towns in its vicinity. From hence he penetrated into Bactria, and took Aornos and Bactra, the two strongest cities of the country: he then passed the river Oxus in pursuit of Bessus, who, although deserted by 7 or 8000 Bactrians, had withdrawn with a few adherents over this river to Nautacus, a city of Sogdiana. When Alexander arrived at a small city inhabited by the BRANCHIDÆ, he was guilty of an act of savage cruelty, which fixed an indelible stain on his memory. The fact, though omitted by Arrian, is related by Curtius (lib. vii. c. 5. tom. ii. p. 520. Ed. Snakenb.) and referred to by Strabo (lib. xiv. tom. ii. p. 787.). Here Bessus, despoiled of all the ensigns of royalty, and stripped even of his garments, was brought in chains to Alexander; who, having ordered his nose and ears to be cut off, delivered him up to Oxatres, the brother of Darius, by whom he was sent to Ecbatana, where he suffered a cruel death: some say that he was crucified. Plutarch relates, that being fastened by his limbs to trees which were bent together, he was torn asunder by their elastic force, when they were allowed to return to their natural position.

Alexander pursued his march to Maracanda, the capital of Sogdiana, known by the modern name of Samarcand, and by long and dangerous stages advanced to the river Iaxartes, erroneously called by Arrian, Curtius, and others, Tanais. On the side of this river he was surprized by the barbarians, who, rushing suddenly from their lurking holes in the mountains, and fighting with bows and slings, killed many of the Macedonians, and took others prisoners. The king himself was wounded in the conflict; but the barbarians were at length overpowered and defeated with great slaughter. Soon after this transaction he formed a treaty with the Abian Scythians, who, from the time of Cyrus, had lived in freedom and independence, and who were distinguished by the equality and liberty that subsisted among them, and by their love of poverty and justice. Whilst he was forming a plan for building a city on the river Iaxartes, in order to curb the nations he had already conquered, and those he intended to subdue, he was diverted from the execution of his design by the revolt of the Sogdians and Bactrians; and, directing his arms against their combined forces, he took and destroyed in a few days seven of their cities. The capture of Cyropolis, which was one of them, and which was the greatest and most populous of the whole country, was vigorously resisted by the inhabitants; but it was at length taken, and razed to the very foundations. In these different sieges the enemy are said to have lost above 120,000 men; and in one of them Alexander, as well as Craterus and many of his principal officers, were wounded. He then returned to the Iaxartes, marked

marked a space of about three leagues in circumference, and built a city, which was called Alexandria. In less than 20 days the ramparts were raised, and the houses built; and, in order to people it, he ransomed all the prisoners he could find, settled in it several Macedonians, who were worn out in the service, and permitted many natives of the country, at their own request, to inhabit it. His next conflict was with the Scythians, whom he defeated with difficulty, and to whom, as he had other objects in view, he granted a peace on their own terms. The Sææ, who were a powerful nation, submitted to him, and, by an embassy, requested his friendship.

At this time Alexander received a reinforcement of upwards of 16,000 men from Macedonia and Greece, and was thus enabled to subdue all those who rebelled; and, to curb them for the future, he built several fortresses in Margiana. But he was gradually throwing off both the habit and manners of a Macedonian prince, and assuming those of an eastern despot. He was also surrounded by a number of sycophants, who are, and ever will be, says one of his biographers, the bane of princes, and the curse of nations. These, by indulging his humour and soothing his passions, precipitated him into extravagances of conduct, and deprived him of that equanimity and moderation, which were necessary for preserving the acquisitions he had made. One faithful friend declined concurring in this general adulation. At a banquet which succeeded the sacrifices performed at the anniversary festival of Bacchus, the honour of which Alexander had transferred to the Dioscuri, *i. e.* to Castor and Pollux, some of the attendants extolled the actions of the Macedonian prince above those of Castor and Pollux, and even of Hercules. Clytus remonstrated, alledging, that "he could not bear to hear such indignities offered to the gods, or the credit of ancient heroes undervalued, to tickle the ears of a living prince." As to Alexander's actions, he allowed they were great and glorious, but he maintained that they were not supernatural; that the army had shared in them, and that they had a right to participate in the praise belonging to them. Alexander was indignant; and as Clytus proceeded in the same strain, and affirmed that he had preserved the life of the king at the battle of the Granicus, stretching out his arm and saying, "this hand, O Alexander, saved thee;" the king rushed upon him, and endeavoured to kill him, but was prevented by the interposition of friends. At length, however, when his friends retired, he seized a lance, or long Macedonian pike, and laid Clytus dead on the spot. His passion soon subsided, and reflecting on the deed he had perpetrated, he indulged excessive grief, refused food for three days, neglected his apparel, and, as some say, would have slain himself with the pike that killed Clytus. Flattered, however, by the army, and perverted by the detestable doctrine of Anaxarchus of Abdera, the sophist, who taught him, "that let a sovereign prince do what he will, all his actions are just and lawful," he soon became more composed and tranquil; and lectures of this kind were more acceptable to his mind, already corrupted, than the honest and moral discourses addressed to him, with a view of settling his mind, by Callisthenes, the disciple and relation of Aristotle. His servile attendants renewed their adulation, attempted to persuade him that he was more than man, and that it was unjust and disloyal in his subjects not to own his divinity; and some of the most officious of them, amongst whom Anaxarchus was the chief, endeavoured to engage the Greeks as well as the Asiatics to pay him adoration. Alexander was pleased; and was highly provoked by a speech of Callisthenes, who attempted to awaken in his mind more sober

thoughts. His reasoning was ineffectual; and it was determined that when the king drank to any guest, he should immediately rise, adore him, and having received a kiss from the king, depart.

The several circumstances that have been now recited, produced a new conspiracy against the king; and the conspirators, being discovered, were stoned to death by the army. Callisthenes was apprehended, and, as some say, carried about in chains, till he died a natural death, but according to others, he was first racked and then crucified. The death of Callisthenes, says Seneca (*Nat. Quæst. lib. vi. c. 23.*), is an eternal reproach to Alexander, and a crime of so horrid a nature, that no quality, however excellent, nor military exploit, however illustrious, can ever efface its infamy. In favour of Alexander it is said, that he killed many thousand Persians; that he dethroned and killed Darius, the most powerful king of the earth; that he conquered innumerable provinces and nations, penetrated as far as the ocean, and extended the bounds of his empire from the most remote part of Thrace to the extremities of the east. In answer to each of these particulars, "Yes" says Seneca, "but he murdered Callisthenes;" a crime of so heinous a nature, that it entirely obliterates the glory of all his other actions.

The only strong hold which the rebels still retained was the Sogdian rock, or the rock of Oxus, into which Oxyartes, the Bactrian, had conveyed his wife and family. It was defended by Arimazes, with 30,000 soldiers under his command, and furnished with provisions for two years. It was deemed by its situation impregnable; and therefore, when Alexander, before he commenced the siege, summoned the garrison to submit, the commander insulted him, and asked "whether Alexander, who was able to do all things, could also fly; and whether nature, on a sudden, had given him wings?" Alexander was highly exasperated, and selected from the mountaineers in his army 300 of the most active and dexterous, directing them to seek a path to the top of the rock; to which the greater number of them at last ascended by means of wedges and ropes. When Alexander perceived the appointed signal, he sent a message to the commander, summoning him to surrender, and informing him, "that he had now a corps of winged soldiers." The whole Macedonian camp resounded with the shout of "victory," and the Barbarians surrendered the place at discretion. Alexander's resentment was invincible, and regardless of the dictates of humanity, he ordered Arimazes and the principal nobility of the country who sought shelter in his camp to be scourged with rods, and afterwards to be fixed to crosses at the foot of the rock. After the reduction of Sogdiana, he marched into the country of the Paratacæ, where was another fortress, called the rock of Chorians, which was also deemed impregnable. After the siege was begun, Chorians, the commander, was induced by Oxyartes to surrender it; and having been enrolled in the number of Alexander's friends, he was entrusted with the charge of it, and in return for this honourable treatment, supplied the Macedonian army with provisions. On one of these occasions, Roxana, the daughter of Oxyartes, who was esteemed the most beautiful woman in Asia, after the death of the wife of Darius, fell into the hands of the conqueror; and such was the influence of her charms, that he publicly espoused her.

India was the next object to which Alexander directed his attention. Accordingly he dispatched a herald to Taxiles, and the other princes on this side the river Indus, enjoining their submission; and Hephestion, with part of the army,

was dispatched to join Taxiles and the rest of the Indian princes, who were come out to meet them, and to reduce the country as far as this river. This commission was easily and speedily executed. Alexander bent his march towards the river Choaspes, and reduced several places in his progress, among which Andaca was one of the most considerable. He proceeded against the Aspîi and Assaceni, whom he successively defeated, notwithstanding obstinate resistance; but having invested Magaza, the capital of the latter people, he was wounded in the siege, and the army was repeatedly repulsed. At length, however, the Indians were compelled to submit; and by an act of perfidy, which Diodorus Siculus severely condemns, they were all put to the sword. Plutarch also reproaches the king for this barbarous action. Ora and Bazara, and the rock of Aornus, to which the inhabitants of the latter place retired, were next reduced; and Alexander proceeded to the river Indus, where Hephæstion and Perdicas had already provided a bridge of boats for the passage of the army. Having refreshed his troops in the territory of his friend and ally, Taxiles, Alexander passed the Indus, B. C. 327; and advanced forward to the Hydaspes, known in modern times by the name of the Betah or Chelum, or, according to the orthography of Major Rennell, Behut and Ihylam, where Porus with a large army lay encamped to dispute his passage. When he approached the banks of this river, he found that the people with whom he had to contend were not to be subdued so easily as the Persians, and other Asiatics. The Indians were not only a very tall and robust, but also a very hardy and well disciplined people; and their king Porus, a prince of high spirit, invincible courage, and good conduct. Alexander, however, after encountering great difficulties, on account of the inundations to which the Indian rivers are subject at the time of his march, which was Midsummer, or about the height of the rainy season, passed the Hydaspes; and having vanquished a detachment under the command of the son of Porus, who was slain in the action, he encountered Porus himself at the head of 4000 horse, 30,000 foot, 300 chariots and 200, or as Q. Curtius says (lib. viii. 13.) 85 elephants. The dispute, though short, was very bloody. Porus behaved with singular prudence and intrepidity; but the Indians were completely routed after a great slaughter. Porus, compelled to submit, was conducted to Alexander, who received him with respect, and treated him with kindness. When he was asked "how he wished to be treated?" Porus replied, "as a king." "That for my own sake," said Alexander, "I shall do." "And therein," rejoined Porus, "is comprehended all that I can ask." Alexander gave him his liberty, restored his kingdom with additional provinces; and Porus, in return, became his true friend and constant ally. For perpetuating the remembrance of this victory two cities were built; one called Nicæa, and the other Bucephala. Passing the river Acesines, he entered the territories of another Porus, and in pursuit of him crossed the Hydraotes; and having conquered the whole kingdom of this prince, he gave it to Porus his ally. In the midst of this success Alexander received advice, that the Cathi, Oxydracæ, and Malli, the most warlike nations in India, were confederated against him, and had assembled a great army. He determined immediately to attack them; and though they made a vigorous defence, they were put to flight; and soon after, their city of Sangala was taken by storm and razed. He then prepared to pass the Hyphasis, having nothing in view, as Arrian says, but to seek new enemies. Here he was told that after passing this river, he must travel 11 days through deserts, and that he would then arrive at the Ganges, the

largest river in India; and that farther in the country were the Gangaridæ and Pratiî, who were collecting a great force in order to oppose his entering into their dominions. Rumours of this kind were spread through the army, and produced no inconsiderable degree of discontent and murmur. Unable to allay the ferment that was prevailing among the troops and to satisfy them, that they had any object in view which could warrant their being led on to new difficulties and toils, he was constrained to terminate his progress, and to prepare for his return. When his purpose was made known to the army, he was saluted with loud acclamations and received the thanks of his followers; "because," they said, "he who was invincible had suffered himself to be overcome by their prayers." On the banks of the Hyphasis, the modern Beyah, which were the limits of his conquests, he caused to be erected 12 altars, on which sacrifices were offered. These altars, if we may believe the biographer of Apollonius Tyanaeus, were still remaining, with legible inscriptions, when that fantastic sophist visited India, 373 years after Alexander's expedition. Philostrat. vita Apollon. lib. ii. c. 43. ed. Olearii.

Having exhibited public shows in the Grecian manner, he added all the conquered country to the dominions of Porus, and began his retrograde march towards the river Hydraotes. From thence he proceeded to the Acesines, and marched on to the Hydaspes, proposing to embark on the river Indus, and to pass by this river to the ocean. Whilst he was marching near these rivers, he observed many crocodiles, and that the country produced beans like those of Egypt; and hence he inferred, that he had discovered the source of the Nile, and prepared a fleet to sail down the Hydaspes to Egypt. Strabo. Geog. lib. xv. p. 1020. This circumstance shews, that the knowledge of the Greeks, in his age, did not extend beyond the limits of the Mediterranean. The breadth of the Panjab, as it is now called, through which Alexander passed, from Ludhana on the Setlege to Attock on the Indus, is computed to be 259 geographical miles, in a straight line; and his march, computed in the same manner, did not exceed above 200 miles. But in his advance and return, his troops were so spread over the country, and all his movements were so exactly measured and delineated by men of science, whom he kept in pay for the purpose, that he acquired a very extensive and accurate knowledge of that part of India.

Having prepared a fleet, consisting of 80 vessels of three banks of oars, and about 2000 lesser ships and transports, and having offered sacrifices to the gods, he embarked, and at the signal of the sound of a trumpet the fleet began to move. Having arrived at the confluence of the Acesines with the Hydaspes, where these united streams roll with great rapidity into the Indus, many of his vessels were lost, he himself was in danger, and Nearchus, the commander of the fleet, not a little perplexed. When the danger was past, and the fleet and army were joined, Alexander went on shore; and began his march through a desert country, in order to reduce the Malli and Oxydracæ, who were raising forces to oppose him. He surprised them, unprepared and unexpected his arrival; many of them were slain in the field, and the rest fled into the city and shut the gates. In storming their principal city, Alexander, with a romantic valour, which approached to fool-hardiness, scaled the walls, and leaped down into the city, accompanied by only three of his guards. Whilst he personally encountered a severe attack, he was wounded, and fainted through loss of blood; two of his guards, who were themselves wounded, covered him with their shields; till the soldiers from without ascended the walls, threw themselves into the city, and by an act of

the most undaunted resolution, rescued their sovereign; though, when he was carried out upon his shield to the camp, his recovery was very doubtful. As soon as he was able, he rejoined his forces and was received in the camp with great joy.

His first thoughts were now directed to the increase of his fleet; and having accomplished this object, having given order for erecting a city in the commodious situation afforded by the confluence of two great rivers, and having conferred upon Oxyartes, the father of his wife Roxana, the government of Paropamisus, with some additional territories, he embarked on board his fleet and continued his voyage. But as he proceeded, he was occasionally employed in reducing some Indian princes, who were either negligent in paying him the attention and respect to which he conceived himself intitled, or who actually took up arms against him. Of this number were Musicanus, the sovereign of one of the richest and most populous kingdoms in India; Oxycanus, another Indian prince, who was taken prisoner, and Sambus, whose capital Sindomana opened its gates to receive him. Musicanus afterwards revolted; and Alexander directed him to be carried back into his own dominions, to be there crucified, together with all the Brachmans who were about him, and who had instigated him to this revolt. The king next sailed to Patala, the modern Tatta, an island formed by two branches of the river Indus, where he ordered an haven and convenient docks to be constructed for his ships; and when he had careened his fleet, he sailed down the right-hand branch of the river towards the ocean. As they approached the sea, they were exposed to great danger for want of skilful pilots; and therefore, after having gratified his vanity by entering the ocean beyond the Indus, performing religious rites in honour of Neptune, and surveying two small islands, he returned to Patala. Having surveyed the other branch of the Indus, and found a place of safety for his fleet, he gave directions to Nearchus to conduct the fleet, by the ocean, at the proper season, through the Persian gulf, up the river Tigris, to meet him and his army in Mesopotamia; and he departed with the army in order to march back by land to Babylon. From the researches of Major Rennell we learn, that the distance of that place on the Hydaspes, where Alexander fitted out his fleet, from the ocean, cannot be less than a thousand British miles. Considering the various operations by which he was retarded, and the slow navigation of such a fleet as he conducted, it is no wonder that he was above nine months before he reached the ocean. When we attend to the various movements of his troops, the number of cities which they took, and the different states which they subdued, he may be justly said to have explored the countries through which he passed.

Alexander, having left Patala, crossed the Arabis, and marched through the country of the Oritze, whose capital he seized and converted into a new and noble city, which he committed to the government of Hephæstion. He then pursued his arduous march through Gedrosia; and in the whole of his progress suffered much from sickness, excessive heats and fatigue, and also from famine and thirst; so that he brought back from India scarcely the fourth part of his army, which had consisted of 120,000 foot, and 15,000 horse. In these circumstances, trying and distressing as they were, he maintained an invincible resolution and patience, and by his example encouraged the perseverance of his troops. Having rested and refreshed his army at the capital of Gedrosia, he prepared his march into Caramania, a very plentiful country, where his attendants were amply recompensed

for the hardships and fatigues they had endured. Here he punished those governors who were charged with mal-administration, some of whom were put to death; and redressed the various grievances which the people had suffered during his absence. He then continued his march through Caramania, and was joined by Nearchus, his admiral; and turning aside to Persia, he visited the tomb of Cyrus, at Pasargadæ; ordered Orlines, the governor of Persia, who was charged with many atrocious crimes, to be crucified, and placed Pucestas, who had saved his life in a city of the Malli, in his room; and commanded Baryaxes, a Mede, who had usurped the title and tiara of king, to be put to death. In these marches Calanus, an Indian brachman, who had accompanied Alexander, finding his health declining, requested to have a funeral pile prepared; on the top of which he stretched himself at full length, and remained without voice or motion in the midst of the flames.

At Susa, to which Alexander next marched, he put to death Abulites and his son Oxathres, who were charged with enormous crimes in the administration of public affairs; and he attempted to unite the Macedonians and Persians by forming alliances between the noblest families of Persia and the principal persons of his own court; and he himself set them an example by taking two wives of the royal blood of Persia, *viz.* Statira, the daughter of Darius, and Paryfatis, the daughter of Ochus. He also bestowed fortunes on those Persian ladies of high rank, who were married to his own principal officers. He likewise paid the debts of his army, and conferred rewards and promotions on those who had signalized themselves in his service, without distinction of country.

Alexander, having still a curiosity to see the ocean, and to explore the maritime parts of his empire, went down from Susa upon the river Eulæus; and having crossed the Persian gulf to the mouth of the Tigris, went up that river to the army, which was previously encamped, under the command of Hephæstion, on its banks, near the city of Opis. Here he issued an edict that those Macedonians, who were either unable or unwilling to make any more campaigns, might have their discharge, and return home, and that those who chose to remain with him should be duly encouraged. This edict which was intended to please the army, produced a contrary effect, and excited a mutiny, which was quelled by extraordinary resolution and intrepidity. Whilst the soldiers surrounded the tribunal on which he was seated, all clamouring for their discharge, reproaching him with the favours which he had conferred on the Barbarians, and insolently telling him, that his father Ammon and he might go and subdue the world by themselves, he leaped into the midst of them, ordered his guards to seize 13 of the ringleaders, whom he pointed out, and commanded their immediate execution. This act terrified them into silence and submission; and then remounting his tribunal, he pointed out to them, in an eloquent speech, the justice of his own conduct and the folly of theirs. He afterwards promoted the Persian nobility to the principal commands in his army; and by thus seeming to transfer his confidence to them, he humbled the Macedonians, and induced them to deliver up the authors of the sedition, and earnestly to seek reconciliation and favour; which they obtained, and which were succeeded by a solemn festival at which 9000 persons were present.

At Ecbatana, whither he next went, he offered sacrifices, and exhibited sports and games; which were followed by a royal banquet; but his joy on this occasion was unexpectedly interrupted by the sudden illness and death of Hephæstion.

From Ecbatana he marched against the Cossæans, and subdued them: and he then pursued his course towards Babylon, where he formed a variety of projects, for improving the city and extending his dominions. He proposed invading and conquering Arabia, draining the Babylonian fens, and constructing in the city a basin, capable of containing a thousand galleys. But before he could execute any of these grand schemes, he was seized with a fever, which, as some say, was occasioned, or at least aggravated, by excess of drinking, and which in a few days terminated in his death. He died on the 21st of April, in the second year of the 114th Olympiad, B. C. 323, after he had lived 32 years and eight months, and reigned 12 years and eight months. When his principal courtiers, perceiving his death to be inevitable, asked him to whom he left the empire, he answered, "to the most worthy:" and when Perdiccas enquired at what time they should pay him divine honours, he replied, "when you are happy;" and having pronounced these words, he expired. When Alexander's corpse had been embalmed after the manner of the Egyptians and Chaldeans, Aridæus, his bastard brother, who had been declared king, was appointed to convey it to the temple of Jupiter Ammon. Two whole years (see *Ælian*. lib. xiii. c. 30. tom. ii. p. 898.) were employed in preparing for this magnificent funeral, which made Olympians bewail the fate of her son, who having had the ambition to rank himself among the gods, was so long deprived of burial, a privilege allowed to the meanest of mortals. The funeral procession, conducted by Aridæus, was singularly splendid; and some of our readers may probably be amused by the following brief account of it. It was preceded by pioneers, who cleared the way; and it consisted first and principally of a superb chariot in which the remains of the king were conveyed. The naves and spokes of the axle-trees of this carriage were covered with gold, and their extremities, made of gold, represented the muscles of lions biting a dart. It was drawn by 64 mules, harnessed to four draught-beams or poles; and these mules were adorned with crowns of gold, and collars enriched with precious stones and golden bells. On the chariot was erected a pavilion of solid gold, 12 feet wide and 18 feet long, supported by Ionic columns; and the inside was ornamented with jewels, disposed in the form of shells. The circumference was beautified with a fringe of golden net-work, to the threads of which were suspended large bells, the sound of which might be heard at a great distance. The external decorations consisted of four relieves. The first represented Alexander seated in a military chariot, with a splendid scepter in his hand, and surrounded on one side with a troop of Macedonians in arms, and on the other with an equal number of armed Persians; and these were preceded by the king's equestraries. In the second were seen elephants harnessed, with a band of Indians seated before, and a band of Macedonians, seated behind, and armed for battle. The third exhibited several squadrons of horse in military array. The fourth represented ships prepared for battle. The entrance of the pavilion was guarded by golden lions. The four corners were adorned with statues of gold, representing victories, with trophies of arms in their hands. Under the pavilion was placed a square throne of gold, adorned with the heads of animals, with golden circles round their necks, and to which were attached crowns, glittering with the most brilliant colours, and such as were carried about at the celebration of sacred solemnities. At the foot of the throne was placed the coffin of Alexander, formed of beaten gold, and half filled with aromatic spices and perfumes; and the coffin was covered by a pall of purple, wrought with gold.

The arms of the Monarch were disposed in the manner in which he used to wear them, between the coffin and the throne. The outside of the pavilion was covered with purple flowered with gold; and the top terminated in a large golden crown, resembling a cluster of olive branches. The rays of the sun, which darted on this diadem, as the chariot moved, caused it to emit a kind of rays resembling those of lightning. The chariot was followed by the royal guards, armed and magnificently arrayed. Among the numerous attendants and spectators, who were assembled on this occasion, Ptolemy advanced, with a numerous guard of his best troops, as far as Syria, to meet the procession. He prevented their depositing the corpse in the temple of Jupiter Ammon, and caused it to be conveyed, first to the city of Memphis, and thence to Alexandria. Here he reared a magnificent temple to the memory of Alexander, and rendered him all the honours which were usually paid to demi-gods and heroes by Pagan antiquity. Freinshemius, in his supplement to Livy (lib. cxxxiii. c. 65. tom. vi. p. 910. ed. Drakenb.), relates, after Leo Africanus, who lived in the 15th century, that the tomb of Alexander was to be seen in his time, and that it was revered by the Mahometans, as the monument not only of an illustrious king, but of a great prophet.

As to the issue of Alexander, we may observe in general, that by Barsina, or Arsinoe, the daughter of Artabazus, and the widow of Memnon, a lady of great beauty and merit, he had a son named Hercules, who was afterwards murdered; by Roxana, the best beloved of his wives, he had a posthumous son, named Alexander, who for a time enjoyed the title of king; by Cleophes, queen of part of India, he had a son named Alexander, who succeeded his mother in her kingdom; by Statira, the daughter of Darius, he had no children, nor by Parysatis, the daughter of Ochus.

As to the extent of the Macedonian empire, and the distribution of it after his death; see *EMPIRE*.

As to his person, Alexander was of a middle size, with his neck somewhat awry, with full eyes, and a fierce majestic countenance. Either through taste or vanity he would never suffer any portraiture to be formed of him except by the greatest artists of his age; Praxiteles in sculpture, Lyssippus in cast metal, and Apelles in painting.

As to his talents and character, they have been differently appreciated by his biographers. From his more ancient biographers, whose memoirs are in a great measure lost, sixe posterior writers have compiled the history of his life, namely, Diodorus Siculus, Plutarch, Arrian, Q. Curtius, and Trogus, abridged by Justin. The Baron de St. Croix, in his "Critical Inquiry into the Life of Alexander the Great by the ancient Historians," which first appeared in the memoirs of the French Academy of Inscriptions and Belles Letters, and obtained the premium of that society in 1772, and of which Sir R. Clayton published an English translation, with notes and observations, in 1793, has appreciated the merit and veracity of these historians. Historians, says another writer, have considered him either as an enterprising and successful prince, the glory of whose great actions scarcely suffered the blemishes in his personal conduct to be seen, which is the light in which Arrian has placed him; or they make his virtues and vices alike conspicuous, which seems to have been the view of Curtius. Philosophers and moral writers have dealt more strictly with him, and have therefore seldom run into high panegyrics, Plutarch only excepted; who in his orations on the fortune and virtue of Alexander, speaks as a rhetorician. The Satirist Lucian hath described him with great spirit and with consummate judgment; but

he seems to have kept his eye too closely on the latter scenes of his life, when his fortune, not his merit, was at its greatest height. It is justly observed by Livy (lib. ix. c. 18.), that Alexander appears very different, according to the times or seasons in which we consider him. He discovers in him a kind of double Alexander; the one wise, temperate, judicious, brave, intrepid, but at the same time prudent and circumspect; the other immersed in all the wantonness of an haughty prosperity; vain, proud, arrogant, fiery; softened by delights, and abandoned to intemperance and excesses; in a word, resembling Darius rather than Alexander, and having made the Macedonians degenerate into all the vices of the Persians, by the new turn of mind, and the new manners he assumed after his conquests. M. Rollin, guided by this clue, contemplates him in two different periods of his life, and corresponding aspects of his character: first, from his youth to the battle of Issus and the siege of Tyre; and secondly, from that victory to his death. In the first period, we acknowledge and admire a happy disposition, cultivated and improved by education. He had a great, noble, and generous soul, which was delighted in bestowing favours and doing service. He was also actuated by a high degree of emulation and love of glory; he was betimes accustomed to exercises of body and mind, and to a sober and temperate mode of living. No prince in the world had a nobler education than Alexander; so that he was conversant in eloquence, poetry, polite learning, the whole circle of arts, and the most abstracted and sublime sciences; and in the progress of his years he was a favourer and promoter of literature and the arts, and attached to his train poets, orators, and philosophers. Under Aristotle he enjoyed singular advantages of instruction; nor was he insensible of their value; and he rendered essential service to science by the presents which he conferred on his preceptor, for enabling him to pursue his enquiries in natural history. He also employed men of talents of every description, and liberally rewarded them. In the early life of Alexander we perceive and admire the judgment manifested in his conversation with the Persian ambassadors; the wisdom with which he acted as regent during his father's absence, and by which he pacified the feuds that had broken out in Macedonia; and the valour by which he distinguished himself in the battle of Chæronea. The first years of his reign were, perhaps, all circumstances considered, the most glorious of his life. At 20 years of age, he appeared intestine feuds, subjected foreign enemies, disarmed Greece, when most of its states were combined against him; and in three years accomplished the plan which his father had projected. For effecting these purposes intrepidity and prudence, courage and presence of mind, those qualities which form the character of the true hero, were indispensable. In the former part of his expedition against Darius, the same qualities are manifest. When he was scarce 20 years old, with dangers, domestic and foreign, threatening him, with a treasury not only exhausted but encumbered with debts, with an army much inferior to that of the Persians, Alexander turns his eyes towards Babylon and Susa, and projects the conquest of a vast empire. The swiftness of the execution corresponded to the wisdom of the project. Having gained the affection of his officers by an unparalleled liberality, and the attachment of his soldiers by condescension and affability, he astonished his enemies by bold enterprises, terrified them by examples of severity, and won them by acts of humanity and clemency. The passage of the Granicus, followed by a famous victory; the two celebrated sieges of Miletus and Halicarnassus, exhibited to Asia a young conqueror, to whom no part of military sci-

ence was unknown. When he allowed to those whom he conquered, and who readily submitted, the enjoyment of their liberties and ancient laws, observers were led to believe, that the conqueror had no other view than to make nations happy, and to procure them an easy and lasting peace. The two battles of Issus and Arbela, with the siege of Tyre, proved, that Alexander possessed the qualities of a great foldier; skill in chusing the field of battle; presence of mind in issuing proper orders even in the heat of action; courage animated by pressing dangers; impetuous activity, tempered and guided by caution and circumspection; and an invincible firmness and constancy, neither disconcerted by unforeseen obstacles nor discouraged by difficulties. The circumstance which raises Alexander above most conquerors, and, as it were, above himself, was his conduct toward the mother, wife, and daughters of Darius; all of them princesses, whose beauty was not to be paralleled through the whole of Asia. If this conduct towards the family of Darius had been accompanied with the grant of a peace, which he supplicated on terms so humiliating to himself, and so advantageous to Alexander, the conqueror would have risen still higher in our esteem. Alexander, it is said, had a soul capable of friendship; he endeared himself to his officers and soldiers, by his attention and familiarity; he grieved for them when they were sick, rejoiced in their recovery, and participated in whatever befel them.

If we follow Alexander to the second period of his history, after the battle of Issus, we shall see the virtues and noble qualities of this prince degenerate on a sudden, and make way for the greatest vices and the most brutal passions. Was ever enterprise more wild and extravagant than that of crossing the deserts of Libya, and interrupting the course of his victories, in order to purchase a title, that of the son of Jupiter Ammon, which, in reality, only served to render him contemptible. The drunkenness and debauchery to which he addicted himself, and the follies and crimes of which he was guilty in his seasons of intoxication, degrade his character, and expose it to just abhorrence and contempt. What shall we say of his marking his footsteps with fire and blood, of his burning cities and slaughtering their inhabitants? of his burning Persepolis, murdering Clytus, putting Philotas to the torture, disgracing Parmenio, an old, tried, faithful friend, and putting both father and son to death, and of permitting Callisthenes, the philosopher, to die in a dungeon, or in a worse mode? what apology can be made for his wanton cruelties? the devaluation of whole countries, the slaughter of millions of inhabitants, the crucifixion of an Indian prince, and the punishment of many Brahmims, whose only crime had been that of encouraging their countrymen to defend their liberties against a lawless invader? well might the Gentoo annals call him "a most mighty robber and murderer." How justly does the author of the first book of Maccabees characterize him, by saying that "he butchered kings," *εφαζε βασιλευς της γης*. His debaucheries, his abominable revellings, his more than Asiatic luxury, his Sardanapalian effeminacy, were so flagrant, that his warmest encomiasts have not been bold enough to deny nor even to palliate them.

As to his magnanimity and generosity, which have been wonderfully extolled, these, upon close examination, would probably appear to be the fruits of that same vain-glorious ambition, which was the main source of all his actions. His liberal presents to writers and artists were the price of the grossest adulation; the most pitiful scribbler, if he was lavish in his flattery, was as lavishly repaid for his grateful incense; and a Chærilus, a Cleo, and an Agis, (the very dregs.

drugs of their respective countries, as Q. Curtius calls them) were as sure of being recompensed as an Aristotele or a Xerophon, and were preferred by this famous hero, even to his own relations and generals. He was not less liberal to singers, harpers, and pipers; on whom he bestowed at one carousal, above 10,000 talents, as we may naturally suppose, for chanting his bloody victories and refounding his praise.

If we examine his character as a warrior and a conqueror, and trace his military exploits to their moving spring; it is natural to direct our enquiry to the justice of the war in which he engages, without a regard to which he is not a conqueror and a hero, but an usurper and a robber. If we allow that the Persians were the avowed enemies of the Greeks, what right had Alexander over the great number of nations who did not even know the name of Greece, and had never done or designed him the least injury? The Scythian ambassador spoke justly, when he said: "What have we to do with thee? we never once set our foot in thy country. Are not those who live in woods allowed to be ignorant of thee, and the place from whence thou comest? Thou boastest, that the only design of thy marching is to extirpate robbers; and thou thyself art the greatest robber in the world!" To the same effect was the answer of the pirate, when Alexander questioned him, what right he had to infest the seas? "The same that thou hast to infest the universe; but because I do this in a small ship, I am called a robber; and because thou actest the same part with a great fleet, thou art entitled a conqueror." Upon the principle now stated, what idea ought we to form of Alexander's last conquests? Was ever ambition more extravagant, or rather more furious, than that of this prince? It is related that Alexander, when he was told by Anaxargus the philosopher, that there was an infinite number of worlds, wept in thinking, that it would be impossible for him to conquer them all, since he had not yet conquered one. Val. Max. lib. viii. c. 14. Is it wrong in Seneca, (Nat. Quest. lib. iii. in pref.) to compare these pretended heroes, who have gained renown no otherwise than by the ruin of nations, to a conflagration and a flood, which lay waste and destroy, or to wild beasts who subsist merely by blood and slaughter? Alexander, continues this writer, (De Benef. lib. i. c. 13.) an unjust robber from his youth, a cruel ravager of provinces, an infamous murderer of his friends, makes his happiness and glory to consist in rendering himself formidable to all mortals; forgetting that, not only the fiercest animals, but even the vilest, make themselves feared by their poisons. If the conquests of Alexander are examined in themselves separately from their moving spring, we shall find that they are frequently effected by a kind of valour nearly allied to a boldness that is blind, rash, and impetuous; that has no other guide besides a senseless ardour for false glory and a wild desire of distinguishing itself by any methods, let them be ever so unlawful. To form an accomplished general, prudence must soften and direct the too fiery temper of valour; as this latter must animate and warm the coldness and slowness of prudence. Do these characteristics belong to Alexander? When we follow him to sieges and battles, are we not perpetually alarmed for his own safety, and that of his army? and do we not conclude, that they are every moment upon the point of being destroyed? Plutarch, in pronouncing the eulogy of Alexander, as an accomplished hero, gives a long detail of the various wounds he received; and intimates, that his courage was thus rendered more conspicuous. But it has been observed in praise of Hannibal, that he was never

wounded in all his battles. It ought also to be observed, in estimating the character of Alexander, as a conqueror and warrior, what Livy has suggested (lib. ix. c. 17.), who were the enemies with whom he combated. "Had he marched," says this writer, "against the Romans, he would soon have found, that he was no longer combating against a Darius, who, encumbered with gold and purple, the vain equipage of his grandeur, and dragging after him a multitude of women and eunuchs, came as a prey rather than as an enemy; and whom Alexander conquered without much blood, and without wanting any other merit, than that of daring to despise what was really contemptible. He would have found Italy very different from India, through which he marched in a riotous manner, his army quite stupified with wine; particularly when he should have seen the forests of Apulia, the mountains of Lucania, and the still recent footsteps of the defeat of Alexander his uncle, king of Epirus, who there lost his life." Alexander, therefore, partly owed his conquest to the weakness of his enemies. After all it cannot be denied, that Alexander possessed very great qualities: but they were those which were fitted to inspire admiration rather than esteem; while the worst rendered him a pest of mankind, and resembled him, as an excellent biographer observes, "to one of those baleful meteors, which dazzle as they fly, but ruin where they fall." He possessed talents, says Dr. Robertson, (Hist. America, vol. i. p. 20.) which, notwithstanding the violent passions that incited him, at some times, to the wildest actions and the most extravagant enterprizes, fitted him not only to conquer, but to govern the world. If we throw into the scale of his errors and vices, the presumptuous idea he entertained of his merit; the high contempt he had for other men, not excepting his own father; his ardent thirst of praise and flattery; his ridiculous notion of fancying himself the son of Jupiter; of ascribing divinity to himself; of requiring a free, victorious people to pay him a servile homage, and to prostrate themselves ignominiously before him; his abandoning himself so shamefully to wine; his violent anger, which rises to brutal ferocity; the unjust and barbarous execution of his bravest and most faithful officers, and the murder of his most worthy friends in the midst of feasts and carousals: Can any one, says Livy, (lib. ix. c. 17.) believe, that all these imperfections do not fully the reputation of a conqueror? But Alexander's frantic ambition, which knew neither law nor limits; the rash intrepidity with which he braves dangers, without the least reason or necessity; the weakness and ignorance of the nations, totally unskilled in war, against whom he fought; do not these enervate the reasons for which he is thought to have merited the surname of *Great*, and the title of *Hero*? Rollin, in closing the estimate of Alexander's character, observes, that we do not find that he possessed the first, the most essential and most excellent virtues of a great prince, so as to be the father, the guardian, and shepherd of his people; to govern them by good laws; to make their trade, both by sea and land, to flourish; to encourage and protect arts and sciences; to establish peace and plenty, and not suffer his subjects to be in any manner aggrieved or injured; to maintain an agreeable harmony between all orders of the state, and make them conspire, in due proportion, to the public welfare; to employ himself in doing justice to all his subjects, to hear their disputes and reconcile them; to consider himself as the father of his people, consequently as obliged to provide for all their necessities, and to procure them the several enjoyments of life. He adds, Alexander seems possessed of such qualities only as are of the second rank

rank, those of war, and these are all extravagant. They are carried to the most rash and odious excess; and to the extremes of folly and fury; whilst his kingdom is left a prey to the rapine and exactions of Antipater, and all the conquered provinces abandoned to the insatiable avarice of the governors, who carried their oppressions so far, that Alexander was forced to put them to death. And as for his own soldiers, when they had plundered the wealth of the east, they became so licentious, so debauched, and abandoned to vices of every kind, that he was under a necessity of paying their debts, amounting to fifteen hundred thousand pounds. Although the Romans held Alexander's memory in great veneration, it is very doubtful whether, in the virtuous ages of the commonwealth, he would have been considered as so great a man.

Upon the whole, if an impartial person of good sense reads Plutarch's Lives of Illustrious Men with attention, they will leave such a kind of impression on his mind, as will make him consider Alexander one of the least valuable among them. But how strong would the contrast be found had we the lives of Epaminondas, of Hannibal, and of Scipio? How little would Alexander appear, set off with all his titles, and surrounded by all his conquests, even if considered in a military light, when compared with those heroes, who are truly great, and worthy of their exalted reputation! Diodorus Siculus, lib. xvii. tom. ii. p. 160.—253. Ed. Wesseling. Plutarch. Oper. tom. i. p. 664.—707. Ed. Xyland. Q. Curtii de Rebus gestis Alex. Mag. Pafsim. Ed. Snakenb. Arriani Exped. Alexandri. Pafsim. Ed. Gronov. Strabo. Geog. tom. i. & ii. Ed. Amst. 1707. Rollin's Anc. Hist. book xv. vol. iv. and v. Anc. Un. Hist. vol. vii. p. 280—437. 8vo.

ALEXANDER SEVERUS, the Roman emperor, was born at Acra, in Phœnicia, according to one account, in the year 208, but, according to another preferred by Gibbon, Dec. 12, 205. His father was a Syrian, and became a consul. His mother was Mamaea, daughter of Julia Mæsa, the sister of Julia, wife to the emperor Severus; and as another daughter of Mæsa was married to Heliogabalus, Alexander, or Alexianus, which was his family name, was first cousin to that emperor. His mother, who was a woman of excellent talents and character, and who is supposed to have imbibed Christian principles, paid particular attention to his education, and employed such persons for this purpose as were eminent for their probity and learning. His application and improvement corresponded to his advantages; and every day was devoted to literary acquirements, and to martial exercises. With a robust and graceful form and considerable mental accomplishments, he combined a mild, humane, and generous temper, so that he not only abhorred every kind of cruelty, but made it his chief study to please and oblige his parents and relations, and even his domestics. When Mæsa, his grandmother, perceived the approaching termination of Heliogabalus's career of profligacy, she embraced a favourable opportunity of persuading him to adopt Alexander. Accordingly he assumed this name instead of that of Alexianus, with the addition of Severus, and was invested with the title of Cæsar, A. D. 211. The young prince soon gained the affections of the people to a degree which excited the jealousy of the emperor; and he therefore resolved to destroy the envied and dangerous competition, either by corrupting the manners, or by taking away the life of his rival. Mamaea and her mother defeated his design in both these respects; and by means of the Prætorian guards, whose attachment they had secured, Heliogabalus's attempt against the honour and life of the young Cæsar terminated in his own premature and

ignominious death. By these guards Alexander was advanced to the throne, A. D. 222. The senate concurred, and immediately invested him with the various titles and power, annexed to the imperial dignity. At the same time they offered him the name of Antoninus, and the surname of Great; but these he modestly declined. Alexander was a dissident and dutiful youth, of only 17 years of age; the reins of government were in the hands of his mother and grandmother; and after the death of the latter, Mamaea remained the sole regent of her son and of the empire. With her consent he married the daughter of a patrician, who afterwards became the object of her jealousy and cruelty, and was banished by her illigation, which Alexander durst not oppose, into Africa. It has been said, indeed, by Lampridius, that the father was detected in a conspiracy, and that the repudiation of the daughter was the consequence of his crime. But Herodian represents him as innocent. Under her direction, and with the approbation of the senate, a council of state was appointed, consisting of 16 of the wisest and most virtuous senators. At the head of this number, as prætorian præfect, was Ulpian, distinguished by his knowledge and respect for the laws of Rome; and the prudent firmness of this aristocracy restored order and authority to the government. The city, by their influence, was purged from the superstition and luxury, which Heliogabalus had introduced; his worthless creatures were also removed from every department of public administration; and their places were supplied with men of virtue and ability. Learning, and the love of justice, became the only recommendations for civil offices. Valour, and the love of discipline, were the only qualifications for military employments. But the most important object of Mamaea's sollicitude was that of forming the character of the young emperor. His excellent understanding encouraged cultivation, and led him duly to value the advantages of virtue, the pleasures of knowledge, and the necessity of labour. The natural mildness and moderation of his temper preferred him from the assaults of passion and the allurements of vice. His unalterable affection for his mother, and his respect for the wife Ulpian, guarded his unexperienced youth from the poison of flattery. As Mamaea had probably embraced the profession of Christianity, it is no wonder that Alexander was very indulgent to the Christians, and would not suffer them to be persecuted on account of their religious tenets. He himself seems to have been well acquainted with the Christian morals; for he frequently repeated the golden rule of the gospel, "Do as you would be done by;" caused it to be inscribed over the gates of his palace, and on several public edifices: and observed it in his own conduct, with the greatest exactness.

"The simple journal of his ordinary occupations," says a popular historian, "exhibits a pleasing picture of an accomplished emperor, and with some allowance for the difference of manners, might well deserve the imitation of modern princes. Alexander rose early: the first moments of the day were consecrated to private devotion, and his domestic chapel was filled with the images of those heroes, who, by improving or reforming human life, had deserved the grateful reverence of posterity. But, as he deemed the service of mankind the most acceptable worship of the gods, the greatest part of his morning hours was employed in his council, where he discussed public affairs, and determined private causes, with a patience and discretion above his years. The dryness of business was relieved by the charms of literature; and a portion of time was always set apart for his favourite studies of poetry, history, and philosophy. The works of Virgil and Horace, the republics of Plato and Cicero,

formed his taste, enlarged his understanding, and gave him the noblest ideas of man and government. The exercises of the body succeeded to those of the mind; and Alexander, who was tall, active, and robust, surpassed most of his equals in the gymnastic arts. Refreshed by the use of the bath and a slight dinner, he resumed, with new vigour, the business of the day; and, till the hour of supper, the principal meal of the Romans, he was attended by his secretaries, with whom he read and answered the multitude of letters, memorials, and petitions, that must have been addressed to the master of the greatest part of the world. His table was served with the most frugal simplicity, and whenever he was at liberty to consult his own inclination, the company consisted of a few select friends, men of learning and virtue, amongst whom Ulpian was constantly invited. Their conversation was familiar and instructive; and the pauses were occasionally enlivened by the recital of some pleasing composition, which supplied the place of the dancers, comedians, and even gladiators, so frequently summoned to the tables of the rich and luxurious Romans. The dress of Alexander was plain and modest, his demeanour courteous and affable: at the proper hours his palace was open to all his subjects: but the voice of a crier was heard, as in the Eleusinian mysteries, pronouncing the same salutary admonition; "Let none enter these holy walls, unless he is conscious of a pure and innocent mind."

His mother, though a princess of sound judgment and good disposition, and though he owed many of the excellencies he possessed to her wisdom and attention, was more fond of pomp than himself; and did not approve the plainness and popularity of his behaviour. "Take care," said she to him one day, "you weaken not your authority, and render it contemptible." "I render it," he answered, "more secure and more durable." Whilst he was strict, and sometimes severe, in his administration of public justice, and in the punishment of those who oppressed the public, he was naturally mild and gentle: and though he practised rigid economy, and exercised self-denial in every thing that pertained to his own gratification, he was liberal and beneficent. In the course of his reign he made three general distributions of provisions to the people, and three largesses in money to the soldiers. To the indigent and distressed he gave lands, slaves, cattle, and all necessary implements of husbandry; rightly judging, that this mode of exercising his liberality was more beneficial and less humiliating than the giving of gold and silver. If he granted pecuniary assistance, it was by way of loan; and he established a bank, where all who wanted money found it at a moderate interest, and on some occasion he lent without interest. It was a saying of this emperor; "Imperium in virtute, non in decore;" *i. e.* "The majesty of the empire consists in virtue, and not in an ostentation of riches." Although he was very religious, his offerings in the temples were not magnificent. He often repeated the words of Persius (*Sat. ii. v. 69.*) "In sancto quid facit aurum?" "What has gold to do with sacred things?" His respect for virtue extended to the dead, as well as to the living. Accordingly he collected in Trajan's square the statues of the deified emperors of Rome, and of the famous Roman commanders, and adorned them with inscriptions, setting forth their great exploits and eminent virtues. In his palace he had two chapels, in which the principal objects of his veneration were ranged in two classes, the one destined to virtue, and the other to talents. In the first were placed the good emperors, among whom he very erroneously ranked Alexander the Great; and next to them the wise men, by whose useful lessons mankind had been benefited; and here were

blended Abraham, Orpheus, Apollonius Tyaxæus, and Jesus Christ. The second chapel was destined to military heroes, and men conspicuous in the republic of letters, Achilles, Cicero, Virgil, whom he called the Plato of the poets, and some others. In order to encourage the progress of letters and of science in general, he allotted pensions to rhetoricians, grammarians, physicians, architects, men skilled in mechanics, and even to aruspices and astrologers. He established schools for all these arts, and provided for the instruction of the poor without expence to them. His life, however, has not been free from blemishes. His deference for his mother was considered as carried to a culpable excess, more especially as she, with all her good qualities, was addicted to vanity and avarice. He gave her name to several buildings, which, as we learn from Ammianus Marcellinus (*lib. xxviii. p. 372.*), they retained in the fourth century; and caused her to be honoured with the titles of Augusta, mother of her country, of the armies, and of the senate. He was also charged, and not altogether without foundation, with being of a suspicious and inquisitive temper; and with being inclined to vanity; which latter weakness he indicated by his avidity of praise and his affectation of being regarded as a Roman and of the family of Marcelli, and not a Syrian. His timidity likewise betrayed him into imbecility of conduct; particularly with reference to the prætorian guards, who by their mutiny produced a civil war in Rome, that lasted three days, and that terminated in the massacre of Ulpian. Although this wise man, who was the friend of the laws and of the people, sheltered himself from the seditionary rage of this class of persons in the emperor's palace, and was murdered even in his presence, he had not resolution sufficient to avenge this atrocious crime in the manner it deserved. Such indeed was the weakness of government, that the tyranny of the army threatened with instant death his most faithful ministers, provided that they were only suspected of an intention to correct their intolerable disorders. The historian Dion Cassius, who had commanded the Pannonian legions with a spirit of ancient discipline, and whom the emperor recompensed by appointing him his colleague in the consulship, was compelled to retire, by his advice, from the city, and to spend the greatest part of his consulship at his villas in Campania, and the remainder of his days in Bithynia, his native country. *Dion. Cass. Hist. lib. lxxx. p. 1371.*

On another occasion, however, he manifested a becoming firmness and magnanimity. When some of the soldiers at Antioch had excited a sedition in the legion to which they belonged, and interrupted his mild expostulations by their clamours, he addressed them in the following dignified and spirited language: "Reserve your shouts, till you take the field against the Persians, the Germans, and the Sarmatians. Be silent in the presence of your sovereign and benefactor, who bestows upon you the corn, the clothing, and the money of the provinces. Be silent, or I shall no longer stile you soldiers, but *citizens*; if those indeed who disclaim the laws of Rome deserve to be ranked among the meanest of the people." When their brandished arms threatened even his person; "your courage," resumed the intrepid emperor, "would be more nobly displayed in the field of battle; *me* you may destroy; you cannot intimidate; and the severe justice of the republic would punish your crime, and revenge my death." The clamour continuing, the emperor, with a loud voice, pronounced the decisive sentence: "*Citizens*, lay down your arms, and depart in peace to your respective habitations." Such was the effect of the sentence, that the clamour was instantly silenced; the soldiers confessed their crime, and supplicated forgiveness; nor were they restored to their rank in the army, till he had punished with death those

those tribunes, whose connivance had occasioned the mutiny. The grateful legion served the emperor, whilst living, and revenged him when dead. The difference of his temper and conduct on the occasions above recited must be ascribed to the different vigour of mind, which he possessed in his youth and in his riper age. When he became capable of taking the government into his own hands, and of exerting his genius and courage, no prince could more effectually command the awe, as no one ever more deserved the love, of his soldiers. It was a frequent declaration of Alexander, "the soldier does not fear his commanders, unless he be fed and clothed, and has some money in his purse." And whilst he furnished them with mules and camels to carry part of their baggage in their marches, he used to say, "that he took more care of his soldiers than of himself, because it was on them that the welfare of the republic depended;" and he perfected the plan which other emperors had concerted for securing to the troops a decent and comfortable retreat in their old age.

Whilst Artaxerxes, the restorer of the Persian monarchy, was preparing to invade the Roman dominions, Alexander sent ambassadors in order to dissuade him from engaging the two empires in a long and dangerous war. The message was received with contempt; nor did any of Alexander's remonstrances avail to prevent the Persian monarch from ravaging Mesopotamia and entering Cappadocia. The emperor, therefore, resolved to march against him in person. In the spring of the year 233, Alexander, with an army of the prætorian guards and part of the hardy legions of Europe, advanced towards the frontiers of the Roman dominions to meet the great king, which was the haughty style assumed by Artaxerxes in his embassies; whose force consisted, as history, scarcely credible, reports, of 120,000 horse, clothed in complete armour of steel, of 700 elephants, with towers filled with archers on their backs, and 1800 chariots armed with scythes. Of the event of the battle which ensued, historians have given very contradictory accounts. Herodian asserts, and Mr. Gibbon acquiesces in his account, that the plan of Alexander for the conduct of the war, however judiciously concerted, totally failed. The emperor himself, influenced by his mother's counsels, and perhaps by his own fears, deserted the bravest troops and the fairest prospect of victory; and after consuming in Mesopotamia an inactive and inglorious summer, led back to Antioch an army diminished by sickness and provoked by disappointment. But the Persian monarch, in several obstinate engagements against the veteran legions of Rome, lost the flower of his troops; and instead of expelling the Romans from the continent of Asia, found himself unable to wrest from their hands the little province of Mesopotamia. Crevier and many other modern writers chuse rather to follow Lampridius, whose account is entirely different from that of Herodian. The Persians, says this last author, were totally defeated, and Alexander approved himself an intrepid soldier and a skillful general. The great king fled before his valour; an immense booty and the conquest of Mesopotamia were the immediate fruits of this signal victory. Alexander, it is said, having taken care to guard Mesopotamia with several well garrisoned forts, returned to Rome, A. D. 234, to give the senate an account of his exploits, and was received by persons of all ranks with the greatest demonstrations of joy; and obtained a signal triumph. His triumphal car was drawn by four elephants; the air resounded with acclamations, and the shouting attendants unceasingly exclaimed, "Rome is happy, whilst she sees Alexander alive and victorious."

Soon after his triumph, Alexander, accompanied by his

mother, marched against the Germans, who had passed the Rhine, and who were making incursions into every part of Gaul. Upon his arrival in Gaul, he sent ambassadors to the barbarians in order to treat with them; and if Herodian may be credited, to purchase peace, which he preferred to the precarious issue of a war. Having passed the winter in the neighbourhood of the Rhine, he employed himself in introducing discipline among the licentious legions of Gaul. His attempts for this purpose produced discontent in the army, which were aggravated by a person, originally a barbarian of mean origin, whose father was a Goth and mother an Alan, and who had been raised from the lowest station to the rank of a general officer. This person was proclaimed emperor by the seditious soldiers; and made his way to the throne by the massacre both of Alexander and his mother. This event happened on the 19th of March, A. D. 235, when Alexander was in his 27th year, and after he had reigned 13 years. The untimely death of Alexander was universally regretted. The soldiers, who were not concerned in the plot, manifested their resentment by a speedy vengeance in immediately killing the murderers of their prince. The senate decreed both to him and his mother divine honours; appointed for them altars, priests and sacrifices; and instituted, in honour of the deceased emperor, an annual feast, which was celebrated on the first of October, the day of his nativity. Crevier's Rom. Emp. vol. viii. Book xxiv. p. 279—350. Anc. Un. Hist. vol. xiii. p. 432—449. Gibbon's Hist. vol. i. p. 238, 240, 337. vol. ii. p. 450.

ALEXANDER ÆGEUS, a disciple of Sosthenes, and preceptor of Nero, by whom he is said to have been corrupted, is known as the author of a commentary on Aristotle's Meteorology; which has been attributed to Alexander Aphrodisæus. Suidas. Fab. Bib. Græc. lib. iii. c. 11.

ALEXANDER ÆTOLUS, a grammarian of Pleuron, in Ætolia, was a contemporary of Aratus, and celebrated among the seven writers of tragedy, called the *pleias* in the time of Ptolemy Philadelphus. He also wrote elegies, cited by Athenæus (lib. xiv. p. 699.), and other poems, commended by Servius on the 10th Æneid of Virgil, and referred to by Athenæus (vii. p. 283, 296.) Suidas. Fabr. Bib. Græc. lib. ii. c. 19.

ALEXANDER APHRODISÆUS, so called from a city of Caria, where he was born, was an eminent philosopher of the school of Aristotle, about the close of the second or beginning of the third century. He was appointed public professor of the Aristotelian philosophy under the Roman emperors, Septimius Severus and Caracalla, either at Athens or Alexandria, and dedicated the first fruits of his labours, which is an excellent treatise, "On Fate," asserting the doctrine of Divine Providence, to these emperors. He was supposed to have so well understood the speculations of his master, and to have so satisfactorily explained them, that he was respected by his contemporaries as an excellent preceptor, and followed by succeeding Aristotelians among the Greeks, Latins and Arabians, as the best interpreter of Aristotle. He obtained the appellation of "The Commentator," on account of the number and value of his Commentaries. Hottinger and Herbelot affirm, that Arabic translations of his commentaries are still extant. In his book concerning the soul, he maintained, that it is not a distinct substance by itself, but the *form* of an organized body: he denied its immortality, and asserted, that to maintain the possibility of its existing separately from the body, was as absurd as to say that two and two make five. The works of this philosopher still extant are his book "De Fato," published from the press of Aldus, at Venice, in 1534, with a translation by Grotius, 12mo. at Amster-

dam, in 1643; and in London, with a new Latin translation, in 1683, 8vo.; his Commentaries on Aristotle's Topics, Analytics, Metaphysics, Physics, Rhetoric, &c. first published at Venice, in the 16th century, and many of them afterwards reprinted in different places; but since the study of Aristotle has been neglected, his best commentator is forgotten. The principal of his medical works is his "Treatise on Fevers," translated into Latin by Valla, of which Haller has given an analysis; Bib. Med. Pract. vol. i. p. 227. Fabr. Bib. Græc. vol. iv. c. 25. Brucker's Philos. by Enfield, vol. ii. p. 104.

ALEXANDER, CORNELIUS, surnamed *Polyhistor*, on account of the numerous histories written by him, a celebrated historian and grammarian, was born, according to Suidas, at Miletus; but, according to others, at Cotyræum, a city of Phrygia, and having been a slave, was sold to Cornelius Lentulus, to whom he was preceptor; and from whom he obtained his freedom and the name of Cornelius. He flourished about 80 years before Christ. From Suidas we learn, that he was the disciple of Crates, and that he was at Rome in and before the time of Sylla. He perished in the flames of his house at Laurentum; and his wife became distracted by the event, and hanged herself. Suidas further adds, that he wrote innumerable works; and particularly five books concerning Rome, in which he says, that a Hebrew female, called Moso, was the author of the Hebrew law. His works in history and philosophy are cited by Plutarch, Laertius, and other ancient writers. Clemens Alexandrinus (Strom. lib. i. tom. i. p. 396, ed. Potteri) cites a book concerning the Jews, in which Alexander mentions letters of Solomon to Vaphres, king of Egypt, and to the king of the Phœnicia of the Tyrians, and their respective answers. He refers also (tom. i. p. 538.) to remarks made by Alexander on the mode of living in use among the Indian Brachmans; he reports (tom. i. p. 357.) from a book of Alexander concerning the Pythagoric Symbols, that Pythagoras was a disciple of Nazarus, an Assyrian, erroneously supposed by some to be the same with the prophet Ezekiel, and that he had also received instruction from the Galli and Brachmans. Eusebius, (in his Præp. Evang. lib. ix. c. 17.) makes a long extract from Alexander's book concerning the Jews, and extols the author's well-known great ingenuity and various learning. This is probably the work referred to by Justin Martyr, in his "Exhortation to the Greeks," when he mentions those who represent Moses as the leader of the Jews. Plutarch (de Musica, Op. tom. ii. p. 1132.) and Athenæus (lib. xi.) speak of him as a writer in music; and his acquaintance with natural history may be inferred from Pliny's frequent references to his works. Fabr. Bib. Græc. lib. v. c. 38. tom. ix. p. 439.

ALEXANDER PSEUDOMANTIS, an artful and profligate impostor, was born at Abonotichos, in Paphlagonia, and practised his delusions in the reign of the emperor Aurelius, towards the close of the second century. He possessed by nature a variety of talents and accomplishments, by the misapplication of which he was qualified for imposing upon the credulity of the vulgar. Destitute of principle, he engaged with a countryman and disciple of Apollonius Tyanæus, who, under the mask of a medical profession, exercised the trade of an impostor and magician, and deluded those who applied to him by pretending to reveal secrets in concerns of love, and of lost and hidden property. Alexander was an useful servant and an apt scholar; and when his master died, practised his lessons and followed his trade. Such was his success, that he infatuated a rich Macedonian woman, and induced her to follow him and his associate from Bithynia to Macedon and to Pella, and to contribute by her fortune to their support. Having procured, in the neighbourhood of

Pella, one of those large serpents, which are perfectly harmless and very tractable, and with which that country abounds, they determined by means of this animal to establish an oracle, which should impose upon those persons who were eager to gain the knowledge of futurity, and who by their credulity were susceptible of delusion. In their way to Abonotichos, the proposed scene of their operations, they visited Chalcedon and formed a party, by whose assistance they had access to the temple of Apollo, where they hid tablets of brass on which it was written, that Æsculapius, with his father Apollo, would soon make Abonotichos the place of their residence. The inhabitants of this place were so completely deluded, that they laid the foundation of a temple to Æsculapius, with whose presence they expected soon to be honoured. Alexander, by a pretended oracle, caused himself to be declared a descendant of the hero Perseus, and the son of Podalirius, which his stupid countrymen believed, though they well knew that his father and mother were persons of the meanest condition. With a dress and accompaniments, suited to this high original, he entered his native town. Having hidden a goose's egg, in which he had put a young serpent, near the foundations of the temple, and having previously performed a variety of superstitious ceremonies, he went with a crowd of attendants in search of his egg; and when he had found it, he declared that Æsculapius, who was worshipped under that form, was actually arrived, and the people received him with acclamation. Alexander proceeded with his imposture by exhibiting his serpent, prepared for the purpose, to the deluded multitude, who believing him possessed of the power of working miracles, and misled by his affected enthusiasm, were suitably disposed for every thing that followed. From Abonotichos the delusion spread through all the neighbouring nations, and the people hastened from Galatia, Bithynia, and Thrace, to see the new god, whom the prophet called Glycon. Money was procured to finish the temple, and the god was to make it the place of his abode, and to give oracular answers to those who consulted him. The oracle was consulted by a billet, which Alexander contrived to open secretly; and he adapted the answer to the purport of its contents. By degrees he made his god pronounce oracles with his own voice, by the assistance of a person that was concealed behind him; and these oracles were delivered only to the rich and powerful. This practice became a gainful trade, and the impostor derived from it a yearly income, which amounted to 7 or 800 thousand drachmas, and which enabled him to live sumptuously, and to pursue those debaucheries to which he was inclined, and to which he had been habituated from his youth. It was not long before the reputation of this profligate reached Rome; and Rutilianus, a superstitious senator of the first rank, was deceived by him, and thus the number of those who consulted him was prodigiously augmented. Rutilianus, who believed the doctrine of the transmigration of souls, desirous of being informed under what form he had lived in former ages, and whose soul he now possessed, received an answer which served the impostor's purpose, and which gave him such influence over the credulous senator, that he consented to marry his daughter, and conceived himself to be exalted to the rank of the gods. Lucian, who blends fiction with his humorous account of Alexander's impostures, relates, among other instances of his delusion, the following incident. Rutilianus, having procured for him access to the emperor, he delivered an oracle, commanding that, in the war between Marcus Aurelius and the Quadi and Marcomanni, two lions should be thrown alive into the Ister, with spices and a sacrifice, and promising, that the consequence would be victory, glory and peace. The order was executed,

and the lions, who swam on shore into the enemies' country, were destroyed; but the Romans were soon afterwards totally defeated. Alexander, for preserving his reputation, calmly said, that the oracle had foretold a victory, but had not declared whether it would happen to the Romans or their enemies.

Amidst the successes of Alexander, he found himself attacked by two classes of adversaries, who determined to unmask his imposture. These were the Christians and the Epicureans. In order to counteract their influence, he began the ceremony of the pretended mysteries, which he instituted in imitation of the Eleusinian, with proclaiming, "Hence all Christians;" and the choir rejoined, "Hence all Epicureans." He also often repeated, that Pontus was full of Atheists and Christians, and that these enemies of the gods ought to be stoned; and what he advised, he endeavoured more than once to execute. Lucian, who once endeavoured to ensnare him, had nearly lost his life in the attempt. The impostor, however, determined to destroy him; and with this view he received him politely, and, at his departure, made him presents, and furnished him with a vessel and rowers. When he was at sea, he observed the pilot weeping, and disputing in a mykerious manner with the seamen. At length the honest pilot disclosed the secret, and with great concern informed Lucian, that he had received orders to throw him into the sea; but that he had lived with honour for 60 years, and that he could not prevail with himself to render his old age infamous, and to incur the displeasure of the gods by murder. Lucian was put on shore, and escaped the villainy of the impostor. This delusion lasted 20 years; but it is said, that Alexander terminated his life in a tragical manner; being destroyed by worms, which proceeded from a mortification in the foot, leg and thigh. Lucian's Alexander seu Pseudomantis apud oper. tom. ii. p. 207. Crevier's Rom. Em. vol. vii. p. 346—357. See imposture and truth admirably contrasted in the character and conduct of St. Paul, and this Alexander, by Lord Lyttelton in his "Conversion, &c. of St. Paul," Works, vol. ii. p. 54, &c. 8vo.

ALEXANDER, the *Sophist*, was born in Seleucia, a city of Cilicia, and educated under Favorinus, Adrian's great favourite, who taught him the art of speaking, in which he excelled, and for which he is highly commended by Philostratus. The first office he sustained was that of ambassador from Seleucia to the emperor Antonine; and he was afterward interpreter for the Greek tongue to M. Aurelius. He spent the greatest part of his life in the schools of Antioch, Rome and Tarsus; and he visited almost all the parts of Egypt. Whilst he was at Athens he acquired great fame by the extemporaneous orations which he delivered, and received very distinguished tokens of favour from Herod. He died, as some say, in Gaul, but according to others in Italy, at the age of 60, or by some accounts, 68 years. Philostratus de Vitis Sophistarum, apud oper. p. 570. ed. Olearii.

ALEXANDER TRALLIAN, a learned and ingenious physician of Tralles, a city of Lydia, flourished at Rome in the time of the emperor Justinian, about the middle of the sixth century. Friend is very copious in his account, and profuse in his encomiums on the works of this great man, whom he considers as one of the best practical physicians among the ancients.

Like Hippocrates he travelled over various countries, over Italy, France, Spain, and Egypt, to improve himself in knowledge; and is said to have acquired a competent acquaintance with the languages of the different countries through which he passed. He invented several compositions,

and improved many of those in common use. He was liberal in administering preparations of iron, internally, which before his time was little, if at all, done. He followed the practice of Hippocrates and Galen, though not fervidly, but as preferring it to that of Aëtius and Oribasius, with whose works he appears to have been well acquainted. He was not however free from some of the errors of the age in which he lived, being credulous and superstitious, and having great faith in charms and amulets. He has given no account of the diseases peculiar to women, which Friend justly thinks, considering the general estimation he was in, and the extent of his practice, is very singular.

His works were first printed in Greek by Robert Stephens, at Paris, 1548, in folio; in Greek and Latin, at Basle, 1556, Julian. Guinthero Interprete. For an account of various other editions, see Haller's Bib. Med. Pract. vol. i. p. 305.—Haller's edition was printed at Lausanne, in 1772.

ALEXANDER JANNEUS, king of the Jews, was the third son of Hyrcanus, and succeeded his brother Aristobulus in the year before Christ 106. Queen Salome, the widow of Aristobulus, took him and his two brothers out of prison, and placed Alexander on the throne. His fourth brother endeavoured to deprive him of the crown, and was put to death; but the youngest, whose name was Absalom, was favoured with his protection, as long as he lived. Alexander, being a subtle and warlike prince, began his reign with leading an army against Ptolemais; but his own dominions being invaded during his absence by Ptolemy Lathyrus, he was obliged to raise the siege and return to defend them. On the banks of the Jordan he was defeated, with the loss of 30,000 men, besides those that were taken prisoners, and if he had not been succoured by Cleopatra, Lathyrus would have forced his way into Judæa. Alexander, after an interview with Cleopatra at Ptolemais, returned to Jerusalem; and having recruited his broken army, he marched against Gadara and took it. He next proceeded against Amathus, and reduced it after a very short siege; but he was soon obliged to relinquish it in consequence of a defeat by Theodotus, the son of Zeno, tyrant of Philadelphia, in which he lost many men, his baggage, and the whole of the treasure which he had taken possession of at Amathus. The next place against which he directed his arms was Gaza, which had afforded protection and assistance to Lathyrus; and on this account, as soon as the town was betrayed to him, he revenged himself on the inhabitants after leading them to expect clemency and moderation, by abandoning them to the fury of his soldiers. However, this act of vengeance, executed with singular severity, provoked the citizens to resist to the utmost of their power; so that he lost of his own men as many as he destroyed of the enemy. He then reduced the city to a heap of ruins. On his return to Jerusalem, the people, exasperated by the Pharisees, who were constantly caballing against him, insulted him with the most opprobrious language, exclaiming that such a slave as he was unworthy of either the pontifical or regal dignity, and proceeded even to violence against his person. Although he took effectual measures to secure himself from further insult and injury, he was wearied with their clamours and marched out of Jerusalem, in order to gratify his inclination for war. Having taken and destroyed the city of Amathus, he proceeded against the Arabians, whom he subdued, and then laid the Moabites and Mountaineers of Gilead under tribute. Near Gadara he fell into an ambush, and it was with great difficulty that he escaped and regained his own capital. During his absence, his inveterate enemies, the Pharisees, had

caused a rebellion, which brought on a civil war, that lasted six years. Demetrius, surnamed Eucærus, assisted the rebels with a considerable force; and after some previous skirmishes Alexander was defeated, and forced to retire for shelter to the mountains. This defeat, however, induced the Jews who had joined Demetrius to desert him, and join the army of Alexander; and Demetrius, alarmed by this defection, left Judæa. This circumstance afforded Alexander an opportunity to march against the rebellious Jews; but though he defeated them in every engagement, the fury of their resentment continued till a decisive battle put an end to the war. In this last action he cut off the greatest part of their army, and drove the rest into Bethome, which he besieged and captured. Josephus, who being a zealous Pharisee, may possibly have exaggerated, informs us, that he caused 800 of the principal captives to be carried to Jerusalem, where they were all crucified at the same time and place; and that whilst they were hanging on the crosses, he ordered their wives and children to be butchered before their faces. It is added by the historian, that a banquet was prepared for himself and his concubines, so near to this horrible scene, that they might behold and enjoy the torture and distress of the sufferers. After this event, the rebels dispersed; nor were the Pharisees able to make any effort against him as long as he lived. The succeeding years of his life were employed in extending his conquests through Syria, Idumæa, Arabia and Phœnicia; and in establishing his character as a warlike and victorious prince. His return to Jerusalem, after an expedition of three years' continuance, was the occasion of loud acclamations on the part of his subjects. But from this time he devoted himself to drinking and other debaucheries; which at length brought on a quartan ague, that prevailed till the day of his death, which happened about three years after his return. His ambition for making new conquests still continued; but his strength being exhausted both by fatigue and intemperance, he died in his camp before Regaba, a fortress in the Gerasene territory beyond Jordan, which he was besieging, in the 27th year of his reign, in the year before Christ 79. He left two sons, Hyrcanus and Aristobulus; but decreed by his will, that his wife Alexandra should govern the kingdom during her life, and appoint for her successor either of them, according to her own pleasure. Alexandra, by conciliating the Pharisees, according to the advice of her husband, secured their influence with the people; so that they celebrated the funeral of the deceased king with great pomp, and confirmed her as a sovereign administratrix of the nation. Her eldest son Hyrcanus was appointed high priest, and the direction of all affairs of importance was committed to the Pharisees. Their resentment against those who had opposed them in the late reign still continued; and they contrived every method that was practicable for destroying them. This conduct, to which they saw no end, induced them to assemble, and with Aristobulus at their head to wait on the queen and to implore her protection. The queen, having surrendered herself and the government to the Pharisees, could devise no means for their liberty, that were likely to be effectual. At length she complied with their request, and consented that they should disperse themselves into places where she had garrisons. In the year before Christ 70, Alexandra was seized with a disorder which threatened her life; and when Aristobulus perceived her danger, he repaired to his friends, in the garrisoned towns, and they arranged themselves in great numbers under his standard; hoping that he would exert himself for abolishing the odious and oppressive tyranny of the Pharisees, and well knowing, that no service

of this kind could be expected from his brother Hyrcanus, who had been educated by his mother in a blind submission to this sect. The Pharisees were alarmed, and accompanied Hyrcanus to the queen, in order to represent what had occurred, and to demand her assistance. The impaired state of her health would not admit of her interference, and having left the care of the government to them, she appointed Hyrcanus her heir general, and soon after expired. Accordingly he took possession of the throne, and raised an army to oppose his brother, who was supported by the people. A battle near Jericho decided the quarrel. Hyrcanus, abandoned by the greatest part of his troops, who went over to his brother, was obliged to fly to Jerusalem, and afterwards to seek an asylum in the castle of Baris, whilst his partisans, who were chiefly of the sect of the Pharisees, took refuge in the temple. In a little while they, as well as Hyrcanus, submitted to Aristobulus, and in the year before Christ 69, he obtained both the high-priesthood and the crown. Josephus Ant. lib. xiii. c. 12—15. tom. i. p. 666—675. Bell. Jud. lib. i. c. 4. tom. ii. p. 59—62. Anc. Un. Hist. vol. iii. p. 114—123. Rollin's Anc. Hist. vol. viii. p. 4—11.

ALEXANDER, BALAS, king of Syria, was, as some say, the natural son of Antiochus Epiphanes, but according to others, a young man of mean extraction at Rhodes, named Balas, suborned by Heraclides, at the instigation of Ptolemy, Attalus, and Ariarathes, to personate the son of Antiochus Epiphanes, and under that title, to lay claim to the crown of Syria, in opposition to Demetrius. After he had been acknowledged by the three kings above-mentioned, Heraclides, who conducted the imposture, took him to Rome, in the year before Christ 153, and together with him Laodicea, the real daughter of Antiochus Epiphanes, and presented them to the senate, who received them graciously, and passed a decree in their favour; though, as Polybius asserts, (Legat. cxlii. p. 966.) the whole city was convinced of the imposture. The senate not only acknowledged Balas under the assumed name of Alexander, but decreed, that their allies should assist him in his endeavours for recovering the rights of his father. Thus countenanced by the Roman senate, he landed in Syria, and found no difficulty in raising troops, which, together with the succours afforded him by Ptolemy, Attalus and Ariarathes, enabled him to make himself master of Ptolemais, the reduction of which induced a great number of persons who were disaffected to Demetrius to join him. Demetrius and Alexander were competitors for the favour and support of Jonathan, who had succeeded Judas Maccabæus in the command of the Jewish forces, and strove to outvie each other in their alluring offers. Alexander, however, prevailed; and with him Jonathan formed an alliance. These two competitors took the field at the head of their respective armies; and though Alexander was defeated, he maintained his ground; and being supplied by his powerful allies with fresh succours, he succeeded in a second battle, in which Demetrius was killed, before Christ 150. Alexander, having gained possession of the whole Syrian empire, sent an embassy to Egypt, demanding Cleopatra, the daughter of Ptolemy, in marriage; and the king not only complied with his request, but attended her in person, and the nuptials were solemnized at Ptolemais in a very splendid and magnificent manner. Alexander could not bear his elevation and prosperity, but became indolent and debauched, and committed the management of his affairs to a profligate and tyrannical favourite, whose name was Ammonius, and who conducted himself with a degree of despotism and cruelty, which exposed him

and his master to the hatred of the whole nation. Demetrius, the eldest of the deceased king's sons, availed himself of this opportunity for recovering his right; and was acknowledged by Apollonius, governor of Cælefyria and Phœnicæ. When Alexander was roused out of his lethargy, and perceived the danger of his situation, he applied to his father-in-law, Ptolemy, for assistance; and he marched to his relief with an army, which the author of the second book of Maccabees compares to the sand of the sea-shore. Upon his arrival at Ptolemais he was informed, or as others say, he pretended, that Alexander was plotting against his life, and that Ammonius had charged himself with the execution of this detestable scheme of treachery. Ptolemy complained to the king of Syria of this plot, and demanded the criminal to be delivered up to him; but Alexander refusing to comply, Ptolemy concluded that he was privy to the design, and that Ammonius was only executing his master's orders. Upon this real or feigned plea, Ptolemy determined to turn his arms against his son-in-law, and sent ambassadors to young Demetrius, offering him his daughter Cleopatra, the wife of Alexander, and promising to settle him on the throne of his ancestors. Demetrius accepted the offer, and when the news of this event reached Antioch, Ammonius was put to death by the populace; but the inhabitants of the city refused to declare in favour of Demetrius. However, such was the hatred they had conceived against Alexander, that they entered into a confederacy against him, and opened their gates to Ptolemy, offering to put the crown on his head. This prince, says Josephus, knowing how to set bounds to his ambition, rejected the proposal, and with singular self-denial and generosity, declared, that he could not, without the most flagrant injustice, place himself on the throne of Syria, by excluding the lawful heir. He proceeded to recommend Demetrius by an eulogy on his character, and by pledging himself as guarantee for his future conduct, at the same time undertaking to assist him, and to teach him the art of governing. These disinterested representations of Ptolemy had the desired effect. Demetrius was proclaimed king of Syria, and placed on the throne of his ancestors. Alexander, who was then in Cilicia, assembled a numerous army and advanced to Antioch. Ptolemy met him, and a bloody engagement ensued, in which Alexander was defeated; and his adherents abandoning him, espoused the cause of Demetrius. Upon this Alexander fled to Arabia, and seeking refuge in the house of Zabdiel or Zabel, or as Diodorus Siculus (in Excerpta Photii cod. 244.) calls him, Diocles, was murdered by his treacherous host. Ptolemy was wounded mortally by Alexander's friends; and when the head of the murdered prince was brought to him as a present from the Arabian, the joy he felt on the occasion soon put an end to his life. Demetrius, without any further opposition, took possession of his father's dominions, and styled himself from this victory *Nicator*, or the conqueror. Alexander Balas had reigned, according to Josephus, five, but according to the history of the Maccabees, six years, reckoning from the 160th year of the æra of the Seleucide to the 167th, which was the first year of the reign of Demetrius Nicator. This happened in the year before Christ 145. Such is the account which Josephus gives of the troubles of Syria, and the death of Alexander Balas. But the author of the history of the Maccabees varies much from him, especially in what relates to the character of Ptolemy Philometor, whom Josephus highly commends; whereas the author of the first book of the Maccabees represents him as an ambitious and perfidious prince, who trampled under foot the most sacred laws of nature and

justice, to raise himself on the ruins of his son-in-law. Josephus Ant. lib. xiii. c. 2. 4. tom. i. p. 634—643. Diodorus Sic. tom. ii. p. 592. 1 Maccabees xi. 4—12. Arc. Un. Hist. vol. viii. p. 224—233.

ALEXANDER, bishop of Jerusalem, was a disciple of Pantænus and Clement of Alexandria, towards the close of the second century, and distinguished in his maturer years by the firmness and zeal with which he maintained his Christian profession at a period of severe persecution. In the 12th year of the emperor Severus, A. D. 204, when he was bishop of the church in Cappadocia, he was imprisoned for his profession of the Christian faith; and his fidelity and fortitude on this occasion induced the church at Jerusalem to chuse him as colleague to Narcissus, whose advanced age of 116 years rendered him incapable of performing the duties of his office. His imprisonment seems to have continued from the year 204 to the year 211, at which time it appears from a letter written by him to the church of Antioch he was not released from confinement. About this time, however, or soon after, he visited the church at Jerusalem, and was promoted to the bishopric of that church. Of the revelation and visions which are said to have preceded his election, it is not necessary to give any account in this place; as they are not likely to obtain much credit. His known character and tried integrity obviously recommended him to this choice, and he approved himself worthy of it by a course of service and suffering that lasted 39 years. When the persecution of the Christians was renewed under the emperor Decius, Alexander, now venerable for his old age and grey hairs, as Eusebius expresses himself, was summoned to the governor's tribunal at Cæsarea, and about the year 250, avowing his profession, before the tribunal, he was cast into prison, where his confinement and sufferings terminated in his death, A. D. 251. From the fragments of his history that remain, and that are chiefly preserved by Eusebius in his "Ecclesiastical History," (p. 212. 216. 222. ed. Vales.), we learn, that Alexander erected a library at Jerusalem, which continued in his time, and furnished materials for his history. It appears also from the testimony of Origen, with whom Alexander was intimate, that he was not only eminently pious and devout, but peculiarly distinguished by his humility, meekness and gentleness; that he was a frequent and agreeable preacher; that he was a person of competent knowledge and learning, having been educated by Pantænus and Clement, and maintaining an intimate friendship with Origen and Clement, two of the most learned men that ever lived, and that he was also a patron of learning. We are also indebted to him for his glorious testimony to the truth of the Christian religion, and his own remarkable example of steadiness in the faith of Christ, of which he made two confessions before heathen magistrates, at the distance of above 40 years from each other, for the last of which he suffered an imprisonment, under which he made a happy end. And certainly the succession of bishops and churches in the land of Judea, where the preaching, miracles and sufferings of Christ and his first apostles, are placed by the evangelists, under so many difficulties and troubles, affords a strong argument for the truth of those great and extraordinary facts, upon which the Christian religion is founded. Lardner's Works, vol. ii. p. 391—397. Cave. Hist. Liter. Sæc. iii. tom. i. p. 100. ed. Oxon.

ALEXANDER, bishop of Alexandria, succeeded Achilles in this see, in the year 312 or 313. In his time commenced the Arian controversy, in which he appears to have engaged with an ardour that was blended with a very considerable degree of bitterness of spirit. He calls Arius and his fol-
lowers

lowers apostates, enemies of Christ, and impious; and adds, that they had done their utmost to exceed all past heresies, and to approach nearer to Antichrist; accordingly he excommunicated them from the church. He is called, however, by Theodoret (Ecl. Hist. p. 7. ed. Vales.) the "Great Alexander," and "a very excellent defender of the evangelical doctrine." Alexander was present at the council of Nice in 325, and died at Alexandria, before the end of that year, or some time in 326, within five months after the breaking up of the council, or after his return home from it. His writings consisted of epistles sent to bishops in several parts of the world, which, according to Epiphanius, (H. lxx. n. 4.) amounted to 70 in number, and were extant in his time. Of these two now remain; one in Socrates (Hist. Ecl. lib. i. c. 6. p. 10. ed. Vales.) addressed to the bishops of Alexandria, and another in Theodoret (H. E. lib. i. c. 4. p. 8.) to Alexander, bishop of Byzantium, with fragments of some others. Fabr. Bib. Grec. tom. viii. p. 341. In these epistles several books of the New Testament, particularly St. Paul's epistles, are frequently quoted, and the epistle to the Hebrews was received by Alexander as Paul's. He expresses a high respect for the scriptures, which he calls "divine;" and though he professes great regard to the wisdom and piety of ancient writings, near the days of the apostles, he seems not to have considered them as decisive and of authority in matters of religion, as he has not frequently cited them. Lardner's Works, vol. iv. p. 103—105. Cave H. L. tom. i. p. 173.

ALEXANDER, of Lycopolis, a city of Thebais, was, as Fabricius (Bib. Græc. tom. v. p. 290.) supposes, first a Heathen and Manichee, and afterwards a Catholic Christian, in which opinion Cave (De Scriptoribus Ecl. incertæ ætatis, p. 2. H. L. tom. ii.) concurs, and a writer, probably of the fourth century. Photinus calls him archbishop of Cyropolis; but Beaufobre argues, that he was a mere Heathen or Pagan philosopher, and Tillemont adopts the same opinion. Dr. Lardner observes, that if he was ever a Manichee, he must have been at that time a Christian, as the Manichees were Christians; but it is not easy to determine what he was afterwards, when he wrote against them. This excellent writer inclines to think that he was a Gentile, and places him at the year of Christ 350. He seems to have been well acquainted with the Manichees and other Christians; and to have had some knowledge of the scriptures of the Old and New Testament, to which he occasionally refers. He expresses himself, with respect and commendation, concerning Christ and the Christian philosophy, which he represents as "simple, and intended, by plain precepts, without nice disquisitions and intricate reasonings, to promote virtue among all sorts of men, and even among the lower ranks, and common people." He was evidently, says Lardner, a learned and rational man. His work, intitled, "προς τας Μανιχαϊκας δοξας;" "against the opinions of the Manichees," was published in Gr. and Lat. by Combèsius, in tom. ii. Auctionarium Patr. Græc. Novissimum, at Paris, in 1672, fol. It is extant also in MS. in the Cæsarean library. Fabricius, *ubi supra*. Cave. H. L. *ubi supra*. Lardner's Works, vol. iii. p. 384. vol. viii. 349—351.

ALEXANDER was the name of one of the martyrs of Lyons, A. D. 177. He was a Phrygian by nation, and by profession a physician; he had lived many years in Gaul, and was known almost to all men for his love of God and boldness in preaching the word. When he stood before the tribunal, to which he was cited, he boldly confessed that he was a Christian; upon which the enraged president condemned him to the wild beasts. When he had undergone

all the instruments of torture in the amphitheatre, which were invented to torment him, and his associate Attalus, they were both run through with a sword. Alexander neither sighed, nor said any thing at all: but in his heart conversed with God. Such is the account given by Eusebius, Ecl. Hist. lib. v. c. 1. p. 163. ed. Valeii.

ALEXANDER, BENEDICTUS, of Verona, physician to the emperor Maximilian, taught anatomy and medicine with great reputation, et maxima frequentia auditorum, Castallanus says, at Padua, towards the end of the 15th century. Of him we have the following, "Alexandri Benedicti physici Anatomie, five Historia Corporis Humani, ejusdem collectiones seu aphorismi, 1527." The dedication to the emperor is dated 1503. This work has been several times reprinted. See Bibliog. Anat. Specimen Jacobi Douglas, p. 60. Also, Pet. Castallani Vitæ Illustr. Medicorum, p. 159.

ALEXANDER, MASSARIAS, of Vicenza in Italy, practised medicine there for twenty-five years. In 1578, he was made principal of the college of medicine at Venice. Having held this office, with great reputation, nine years, he went to Padua, ubi senio confectus, Douglas says, obit, 1598. This physician was used to say, "se malle cum Galeno errare, quam cum recentioribus vera dicere." He left a treatise, "De Urinis et pullibus," published 1608, at Frankfurt, and "Opera Medica," published at Lyons, 1634. Douglas Bibliog. Spec. p. 197.

ALEXANDER, bishop of Lincoln, in the 12th century, was by birth a Norman, educated under his uncle, bishop of Salisbury, and by his interest promoted to the episcopal see in 1123. Having been accustomed in early life to a splendid mode of living, he affected a degree of state, and indulged to expences which were suitable neither to his character nor fortune. Henry of Huntingdon, in the dedication of his history to him, which is penned in the language of servile adulation, calls him "the flower and top of the kingdom and nation;" and he informs us, that at the court of Rome he was styled "the Magnificent." St. Bernard, in a letter addressed to him about a year before his death, acts the part of a more honest friend, and cautions him "not to be dazzled with the lustre of secular grandeur, nor to look upon any worldly advantage as permanent; nor value his fortune more than himself; to guard against the flattery of prosperity, for fear of a turn of misfortune, which will last longer; not to be charmed with the transient satisfactions of life; for that scene will quickly be shut up, and make way for another both lasting and uncomfortable." He also advises him "not to deceive himself with any distant prospect of death; for such delusive hopes lead directly to danger and surprise, and are the likeliest way to hurry a man into the other world without preparation." In the course of his life these prudent and salutary lessons did not seem to have been duly regarded by the ostentatious prelate. In imitation of the barons and some of the bishops, he built three castles; one at Banbury, another at Sleaford, and a third at Newark. He likewise founded two monasteries. King Stephen was, not without reason, offended by these stately edifices and strong fortresses; and when he determined to take the castles from the barons, he seized that at Newark; in consequence of which the bishop was imprisoned for seven months, and with difficulty obtained his liberty. From this time he employed his thoughts and time in ornamenting his church, which he had rebuilt with a stone roof the year after his consecration; increasing the number of its prebends, and augmenting its revenue with several manors and estates; and at length he rendered it the most stately and flourishing of any in the kingdom. He went twice to Rome, viz. in 1142 and

1144; and after his first visit, he returned as the pope's legate, and called a synod, in which he published several useful canons. In 1147 he visited the pope in France; and there fell sick, so that he returned with difficulty to England, where he soon died, in the 24th year of his prelacy. *Biog. Brit.*

ALEXANDER I. pope, was a Roman by birth, and bishop of Rome during the reigns of Trajan and Adrian, from the year 109 to the year 119. He is said to have introduced the use of holy water and other ceremonies. He was enrolled as a martyr, and canonized as a saint. *Bower's Hist. Popes, vol. i. p. 21.*

ALEXANDER II. pope, was a native of Milan, of the name of Anselm, and removed from the see of Lucca to that of Rome, in the year 1061. He was elected pope by the influence of Hildebrand, who was at the head of the ecclesiastical faction at Rome, in opposition to the empress Agnes, widow of Henry III. who was regent during the minority of her son Henry IV. and who supported the lay-faction, in the contest that subsisted between the clergy and laity. By her influence Cadalous, bishop of Parma, was elected pope, under the name of Honorius II. The dispute was terminated by a council at Mantua in 1064, and Alexander, by a signal triumph of the church over the civil power, was declared lawful pope. The discipline and privileges of the clergy were the principal objects of this pontiff's attention; and the subordinate instrument of conducting his measures was Peter Damien, a monk, and a zealous defender of the monastic orders. Having acquired a power thus paramount to every other, Alexander laid hold of every opportunity that occurred for interposing in the secular concerns of kingdoms and princes. With a view of extending the influence and increasing the emoluments of the papal see, he sanctioned the project of William, duke of Normandy, for the conquest of England; denounced excommunication against Harold as a perjured usurper; and sent William a consecrated banner, and a ring with one of St. Peter's hairs in it; thus, as Hume says (*Hist. vol. i. p. 186.*) "covering over safely all the ambition and violence of that invasion with the broad mantle of religion." His views were accomplished; William succeeded; the authority of the pope was confirmed; and his legates, till this time unknown in England, exercised arbitrary power.

Alexander extended his authority to other countries as well as to England. He not only prohibited the young emperor from divorcing his wife Bertha, but, in 1073, summoned him to appear at Rome, and to account for his conduct in the disposal of church benefices for providing his army with supplies. Henry was indignant; but the dispute was closed by the death of the pope in 1073. The increase of papal tyranny, under the direction of Hildebrand, to whom this pope was subservient, and by whom he was succeeded, discriminates his pontificate. Many of his letters on public affairs are extant; and one of them, addressed to the bishops of Spain for the purpose of restraining the cruelties which they exercised towards the Jews, does honour to his humanity. For an account of these letters, amounting in number to 45, see Dupin's *Ecll. Hist. vol. iv. p. 29*; and also *Bower's Hist. Popes, vol. v. p. 224.*

ALEXANDER III. Pope, was born at Sienna, where he was bishop under the name of Roland, and succeeded Adrian IV. in 1159. At the time of his accession to the papal chair, Frederic I. was making vigorous attempts for reducing the power of the Roman see; and cardinal Octavian was elected pope under the name of Victor IV. in opposition to Alexander. After the death of Victor, in 1164,

cardinal Guy was chosen by the influence of the emperor, and denominated Paschal III. But the whole interest of the Roman clergy was excited in favour of Alexander, who, in the former pontificate, had been compelled to retire into France, and he now returned to Rome, and was restored to his see. Councils were summoned to settle the dispute. The council of Wurtzburg, convened by the emperor in 1166, produced an union of the nobility and clergy in support of the rights of Paschal; and the council of Lateran, called by Alexander in 1167, deposed the emperor, and abrogated the oath of allegiance by which his subjects were bound to him as their lawful sovereign. At length an appeal was made to the sword; and though Frederic was at first successful, and upon the death of Paschal procured the election of John, Abbot of Strum, as his successor, under the name of Calixtus III., he was in the issue obliged to give up the contest, and in a treaty of peace, made with Alexander at Venice in 1177, to acknowledge him as lawful pontiff. The pride of Alexander knew no bounds on occasion of this triumph. When Frederic was prostrate at his feet, he addressed him with the words of the Psalmist, "Thou shalt tread upon the lion and adder; the young lion and the dragon thou shalt trample under foot;" and when the emperor replied, "Not to you, but to Peter;" the pope answered, "To me, and to Peter." This story is discredited by some writers, but believed by others, and the truth of it is confirmed by concurring circumstances, for which we refer to Dupin. After the establishment of Alexander, he treated his rival Calixtus III. with condescension and kindness, and appointed him to the see of Benevento. The pope, securely seated in the papal chair, directed his attention towards securing the independence, and maintaining the prerogatives and privileges of the triple crown; and in order to prevent the disorders likely to arise in future from equal factions, he obtained a canon in the third council of Lateran, held at Rome in 1179, which enacted, that the right of election to the pontifical dignity should not only be vested in the cardinals alone, but that two-thirds of the votes of the electors should be necessary for rendering it legal. Thus the people, and even the Roman clergy, were entirely excluded from all participation in the honour of conferring this important dignity. At this council, the right of recommending and nominating to the faintly order was taken away from councils and bishops, and canonization was ranked among the greater and more important causes, the cognizance of which belonged to the pontiff alone. In this year he exercised that tyranny over princes, which had been usurped by the popes from the time of Gregory VII. in conferring the title of king, with the ensigns of royalty, upon Alphonso I. duke of Portugal, by an arrogant bull, in which he treats him as a vassal. Whilst he was in France, he had supported the cause of Thomas Becket against his sovereign Henry II., and in 1164, when the constitutions of Clarendon, which asserted the king's jurisdiction over the clergy, were sent to him for confirmation, he rejected and annulled them. When Becket was banished, he received him kindly; obtained for him a pension from the French king, abrogated the sentence that had been passed upon him; reinvested him with his dignity, and appointed him his legate in England. After the murder of this arrogant prelate, Alexander, who had kept the king in awe during the whole of the contest, by the terror of excommunication, compelled him to undergo a very severe penance; and having forgiven him, issued bulls at his desire, against his son, and canonized the archbishop. Alexander, as a rigorous defender of the catholic faith,

lish, exerted his power on a variety of occasions, and with a severity which no circumstances can justify. With a view of restoring order and tranquillity in the church, he convoked a solemn and numerous assembly of the clergy in 1164, in which the licentious rage of disputing about religious matters was condemned; and in the council of Lateran, of 1179, a spiritual war was declared against heretics, and more particularly against the ALBIGENSES.

Having enjoyed the uncontested and undisturbed possession of the pontifical chair scarcely four years, Alexander III. died in the year 1181, with the character of having exhibited more proofs of ambition to obtain, than of moderation in exercising, the supreme ecclesiastical authority. Dupin, *Ecccl. Hist.* vol. iv. p. 116. Bower's *Popes*, vol. vi. p. 11. Mosheim, vol. ii. p. 481. vol. iii. p. 53, &c. Hume's *Hist.* vol. i. p. 381, 396, &c.

ALEXANDER IV. pope, was Raynald or Roland, bishop of Ostia, and succeeded Innocent IV. in 1254, at the time of the contest between the Guelphs and Gibellines. The right of the Roman see to the disposal of the crown of Sicily was supported by a war, in the pontificate of Innocent IV. against Mainfroy or Manfred, regent for Conradine, the son of the emperor Conrad; and this pope, in order to engage the assistance of a powerful ally, had conferred the crown on Edmund, the second son of Henry III. of England. Alexander IV. pursued the plan of his predecessor, and published a crusade against Sicily, and for defraying the expences of it, induced Henry to levy a tenth on all ecclesiastical benefices in England for three years. Upon the demand of farther supplies, though it was enforced by a legate and a threat of excommunication, Henry resisted; and the nominal possession of the crown reverted to Alexander; but Mainfroy having defeated the crusaders became the real possessor of it, A. D. 1258. This pontiff was equally unsuccessful in his attempts to oppose the progress of Ezzelin or Ecelin, who, at the head of the Gibellines, and on the part of the heirs of Frederic II., had made himself master of Lombard. The pope's army was defeated, and his legate imprisoned. In defiance of the banner of the cross, and anathemas fulminated by the apostolic see, Ezzelin pursued his victories; and Mainfroy kept possession of the throne of the two Sicilies, which he had usurped.

Alexander, in the exercise of his ecclesiastical authority, maintained the cause of the mendicant dominican friars, against the members of the university of Paris, who refused to admit them to a participation of the rights and privileges of their society; and he condemned a book written by William de Saint Amour, one of the doctors of the Sorbonne, and entitled, "The Perils of the Last Times," in which the character of the dominicans was described, and their pride, hypocrisy and licentiousness, indirectly but cruelly censured. In the council of Arles, held in 1260, he condemned another book, written by the abbot Joachim, under the title of "The Everlasting Gospel;" and at the same time proscribed those who, under the denomination of JOACHIMITES, had adopted the doctrine which this book promulgated. Differences of another kind having arisen between the states of Venice and Genoa, a council for settling them was summoned to meet at Viterbo; but in the mean time Alexander IV. oppressed by the dissensions of the church, and by the vexation which his ineffectual attempts for composing them produced, closed his life in the year 1261. "He appears to have been a narrow-minded bigot, more concerned to preserve and enlarge the privileges of a monastic order, than to correct abuses and encourage improvements." Dupin, *Ecccl. Hist.* vol. v. p. 50, 118, 138, &c.

Bower's *Popes*, vol. vi. p. 225. Cave H. L. tom. ii. p. 303. Hume's *Hist.* vol. ii. p. 173, &c.

ALEXANDER V. pope, was born in the isle of Candia, about the year 1339. His original name was Philargo, and his parents were poor, that in his childhood he was under a necessity of begging his bread. An Italian monk took him under his protection and instruction, and procured his admission into his order of friars minors. By his recommendation he became a student at Oxford, and afterwards took his degree of doctor in divinity at Paris. Having passed through several gradations of preferment, being first bishop of Vicenza, then of Novara, and at length archbishop of Milan, cardinal, and legate of pope Innocent VII. in Lombardy, he was unanimously elected pope by the cardinals, at a council in Pisa, in the year 1409. This pontiff was good-humoured and liberal; and having no needy relations and dependants, for whom he was under an obligation of providing, he had the means of extending his generosity to those that were connected with the church, particularly to the mendicant orders of monks, who were distinguished by his patronage and favour. Such was his munificence during his pontificate, that he used to say, "When I became a bishop, I was rich; when a cardinal, poor; and when pope, a beggar." He seems, however, to have counteracted the mildness and liberality of his natural disposition by the orders transmitted to the archbishop of Prague, enjoining him to proceed with rigour against Huss and his followers. This zealous reformer, confiding in the known candour of the pontiff, instead of personally appearing at Rome, in compliance with the summons that had been sent him, commissioned two friends to plead his cause, saying, on his own part, "I appeal from Alexander ill-informed, to Alexander well-informed." When Alexander proposed to visit Rome, where he was expected, he was persuaded by Balthasar Cossa to accompany him to Bologna. Whilst he was at this city he died, as some say, by the contrivance of Cossa, in the year 1410, having possessed the papal see little more than ten months; and Cossa, by his influence with the cardinals, and a recommendation from Louis of Anjou, king of Sicily, was chosen to succeed him. Dupin, *Ecccl. Hist.* vol. v. p. 8, &c. Bower's *Popes*, vol. vii. p. 123.

ALEXANDER VI. pope, was born in 1431, at Valencia in Spain, and by the interest of his uncle, pope Calixtus III. was appointed cardinal in 1455; and afterwards archbishop of Valencia, and vice-chancellor of Rome. The emoluments of this last office enabled him to maintain the state of a prince, and supplied him with the means of licentiousness and extravagance, to which he was addicted from his youth. Under pope Sixtus IV. he was legate in Spain; and at last by assuming a sanctity, which his conduct did not justify, and by bribing the cardinals, he was elected, at the age of 61, to succeed pope Innocent VIII. in 1492. He then changed his original name of Roderic Borgia for that of Alexander VI. By Vanozza, a Roman lady, with whom he had continued an illicit connection for many years, he had five children. His second son was Cesar Borgia, who was a monster of debauchery and cruelty, and who is said to have quarrelled with his elder brother for the favour of his sister Lucretia, and to have killed him, and thrown his body into the Tiber. Notwithstanding his infamous character he was the favourite of his father, who trampled with contempt on every obstacle, which the demands of justice, the dictates of reason, and the remonstrances of religion laid in his way, in order to aggrandize his children, and enrich himself. In his political connections he was faithless and treacherous; and formed alliances with the purpose of violating them. Having engaged

Charles VIII. in an enterprize for the conquest of the kingdom of Naples, he entered into a league with the Venetians and with Maximilian, to rob him of the fruits of his victory; and, after having obtained a large remittance from the sultan Bajazet, in order to enable him to carry on war against this king of France, he delivered up to him Zizom, the brother of Bajazet. His perfidy was only exceeded by his hypocrisy; for, notwithstanding his notorious vices, he proposed to the Christian princes to march at the head of an army against the Turks; and under this pretext he issued a bull for a jubilee in 1500, by which he contrived to enrich his treasury. Of his presumption, as well as of his hypocrisy, we have a curious specimen in his division of America between the Spaniards and the Portuguese. For this purpose he appointed that a line, supposed to be drawn from pole to pole, a hundred leagues to the westward of the Azores, should serve as a limit between them; and, in the plenitude of his power, he bestowed all to the east of this imaginary line upon the Portuguese, and all to the west of it upon the Spaniards. At the same time he professes, that zeal for propagating the Christian faith, which was the consideration urged by Ferdinand in soliciting a bull for this purpose, was his chief motive for issuing it. In consequence of this bull, a great number of Franciscans and Dominicans were employed, with the avowed design of instructing and converting the Americans, both in the isles and on the continent.

The profligate career of this execrable hypocrite and tyrant was continued till the year 1503, when the poison which he and his son Cæsar had prepared for others, and particularly for Adrian, a wealthy cardinal, who stood in the way of their avarice and ambition, by a happy mistake, terminated his own days. Some writers, amongst whom is Voltaire, have disputed this account of Alexander's death; but Guicciardini and other reputable historians attest it. The life and actions of this pontiff shew, says Mosheim, that there was a Nero among the popes as well as among the emperors. The crimes and enormities which history has imputed to this papal Nero, evidently prove him to have been not only destitute of all religious and virtuous principles, but even regardless of decency, and hardened against the very feelings of shame. Besides other instances of infamous licentiousness with which he is chargeable, he is accused of incest with his own daughter. And though it may be possible that the malignity of his enemies may have forged false accusations against him, and in some instances exaggerated the horror of his real crimes, yet there is upon record an authentic list of undoubted facts, which, by both their number and atrocity, are sufficient to render the name of Alexander VI. odious and detestable in the esteem of such as have the smallest tincture of virtuous principles and feelings. His insatiable avarice is pointedly expressed, says one of his biographers, in the following lines:

“Vendit Alexander claves, altaria, Christum,
Vendere jure potest; emerat ille prius.”

“Christ's altars, keys, and Christ himself,
Were barter'd by this pope for self:
But who shall say he did not well?
That which he bought, he sure might sell.”

Dupin's Eccl. Hist. vol. vi. p. 14. Bower's Popes, vol. vii. p. 328. Gen. Dict. Gordon's Life of Alex. VI. by Gordon. Amst. 1732. Mosheim's Eccl. Hist. vol. iii. p. 431. Robertson's America, vol. i. p. 162. 8vo.

ALEXANDER VII. pope, was born of the illustrious family of Chighi, at Sienna, in 1599, and recommended by

the marquis Pallavicini to pope Urban VIII. Having been inquisitor at Malta, and legate at Ferrara, he was nuncio in Germany, and employed at Munster in conducting the conferences that were intended to restore the peace of Europe. Some writers relate, that at this time he had formed the design of abjuring popery, and embracing the protestant religion, but that he was deterred from executing his purpose by the fate of a civilian, who had been poisoned on a similar account; and that he was confirmed in his religion by the elevation to the cardinalship. Upon his return from this embassy, he was appointed bishop of Imola, in Romagna, and afterwards cardinal and secretary to the pope. His next advancement was to the papal chair, to which he was introduced by the unanimous suffrage of the 64 cardinals, which he contrived to obtain by that dissimulation and address, of which he is said to have been complete master. After his election, in 1655, he ordered his coffin to be placed under his bed in his apartments in the Vatican, that it might serve to him as a memento of mortality; when he was robed in the pontifical habit, he appeared to have a hair-cloth under his shirt; and when a wealthy female, signora Olympia, waited upon him with congratulation, he dismissed her with a cold repulse, saying, “It is not decent for a woman to enter the dwelling of the father of the church.” That the whole of this appearance of humility and self-denial was a farce, was sufficiently verified by his future conduct. The distinguishing feature of his character, next to his craft and dissimulation, was an attachment to his relations, for whom he provided by all the offices and honours which he could command. His zeal for religion, and his concern for terminating the wars which distracted the Christian world, seem to have subsided after his elevation to the pontificate: nor did he take any pains to conciliate the crowns of France and Spain. The five propositions of Jansenius, which contained the sum of his doctrine, had been condemned by Innocent X.; but the Jansenists had contrived to evade this sentence by a subtle distinction, which allowed them to acknowledge that these propositions were justly condemned by the pope; but at the same time to maintain, that they were not contained in the book of Jansenius in the sense in which they were condemned. The benefit of this artful distinction they were not permitted long to enjoy. At the instigation of their enemies, Alexander VII. the successor of Innocent, issued a bull, in 1656, declaring, that the five propositions which had been condemned were the tenets of Jansenius, actually contained in his book. He proceeded, in 1665, to send into France the form of a declaration to this purpose, which was to be subscribed by all those who aspired to any preferment in the church. This declaration produced the most deplorable divisions and tumults. It was vigorously opposed by the Jansenists, who maintained, that in matters of fact the pope was fallible, especially when his decisions were personal, and not confirmed by a general council; and, consequently, that they were under no obligation to subscribe this papal declaration, which had merely for its object a matter of fact. Notwithstanding this unwise and intolerant bull, Alexander is said to have been liberal in his sentiments; to have disapproved the severities exercised towards the Vaudois in Piedmont, and to have treated the protestants who visited Rome with condescension. It is further related, that when some English gentlemen presented themselves at his feet to pay him the customary homage, upon finding that they were protestants, he courteously said, “Rise, you shall not commit what you think an idolatry: I will not give you my blessing, but I pray God you may be worthy to receive it.” To the Jesuits this pontiff manifested a peculiar partiality; for though Innocent X. had, in 1645, condemned the indulgence which these artful missionaries had

shewn to the Chinese superstitions, Alexander virtually annulled, in 1656, the sentence of his predecessor, and allowed the Chinese converts the liberty of performing several of the rites to which they had been accustomed, and to which they were principally attached.

Alexander VII. whatever were his principles and personal character, approved himself a friend to literature and the fine arts, and expended considerable sums in promoting them. He embellished the city of Rome, and erected the magnificent college, "Della Sapienza," which he furnished with a fine library, and a botanial garden. He appointed six new professorships, and increased the salaries of the former professors. As an author, this pontiff has been highly extolled by his panegyrists; a volume of Latin poems, entitled, "Philomathi Musæ juveniles," consisting of heroic, elegiac, and lyric verses, and a tragedy under the title of "Pompey," after the model of Seneca, written in his youth, whilst he was a student at Sienna, was published in folio, at the Louvre, in 1656. Alexander VII. died in the year 1667, with a higher reputation for talents than for honesty, as Bayle says, more lamented by the Jesuits than the Jansenists. Mosheim's *Ecl. Hist.* vol. v. p. 26—99—214. Bower's *Popes*, vol. vii. p. 483. *Gen. Dict.*

ALEXANDER VIII. pope, originally called Peter Ottoboni, was born at Venice in 1610; and having studied at Venice and Padua, was made a bishop and cardinal by Innocent X.; and, at the age of 79, succeeded Innocent XI. in the papal see. Instead of devoting the powers which he had acquired at this late period of life to the service of religion, his thoughts were chiefly employed in providing for his relations, and accumulating upon them honour and wealth. Accordingly one of his domestics being asked by this pontiff what the people said of him, replied, that they said, "He lost no time in the advancement of his family." Right," says the pope, "for I have only half an hour left of the four and twenty." His indifference with regard to compromising the dispute that subsisted between France and the court of Rome, was considered by the French court as an evidence of his disposition to yield to the claims of the clergy of France; and he found panegyrists who extolled his liberality. But they found themselves deceived, when, at the close of his life, he issued a bull of execration against every thing that had been done to the prejudice of the pope's authority in the assembly of the clergy of France in 1682. Having enjoyed the honour and emoluments of his station 15 or 16 months, he died in 1691, with "a character stained with the reproach of avarice and duplicity." *Gen. Dict.* Bower's *Popes*, vol. vii. p. 490.

ALEXANDER, an abbot of Sicily, was an historian of the 12th century. He wrote four books of the life and reign of Roger, king of Sicily; printed at Saragossa in 1578, and inserted in the collection, intitled, "Hispania illustrata." Dupin. *Ecl. Hist.* vol. iv. p. 181.

ALEXANDER CELISENUS, abbot of Ceglie, was an historian, who flourished in the reign of Roger, king of Sicily, between the years 1102 and 1154, and recorded the actions of this reign. His dates are incorrect. Voss. de *Lat. Hist.* lib. ii. c. 53.

ALEXANDER, bishop of Hierapolis, flourished about the year 431. He was deputed by John of Antioch to attend the council of Ephesus, and to defend the cause of Nestorius, to whom he was zealously attached; and on that occasion he signed the excommunication of Cyril: but as Cyril and his party prevailed, he was himself expelled from his see, and sent into exile in Egypt. Several of his letters are extant among the "Ephesian Epistles," cited by Lupus. *Cave. H. L.* vol. i. p. 418.

ALEXANDER AB ALEXANDRO, so called, because his Christian and family names were Alexander, was born at Naples in 1461. He relinquished the practice of the law, to which he was at first devoted, because, in the exercise of this profession, his integrity was in danger of being corrupted; and he preferred a small fortune, in the tranquillity of retirement, and with the approbation of his own mind, to the pursuit of gain, with the hazard of his conscience. Against the power and favour of the great, he himself says, an advocate would find it impossible to support his clients; and the issue of suits depended not so much on the justice of the cause, as on the will and favour of an indolent or corrupt judge; so that it was fruitless to study with diligence and labour controverted points of law, with the varieties of its cases; and he adds, that the provisions of law, though wisely contrived, were often iniquitously set aside and perverted. To such circumstances, and with these views and apprehensions, he acted honourably in declining a profession, which he could not exercise at the period, and in the country in which he lived, with advantage to those by whom he was employed, and without incurring self-reproach. From the works of the ancients, to which he had been accustomed to direct his attention, he made a collection of passages relating to the history and customs of the Greeks and Romans, which he arranged in six books, under the title of "Dies Geniales;" a work which manifests more learning than judgment or taste. An edition of this work, with notes of various writers, was published in two volumes, 8vo. at Leyden, in 1673. The author appears to have been credulous and superstitious, as he gives a strange account of dreams and spectres, and of haunted apartments in his house at Rome. He died in this city about the year 1523. *Gen. Dict.*

ALEXANDRO AB ALEXANDRO, proto-medicus of Sicily, in which island he was born early in the 15th century; left a work on the duties and privileges of the office he held, which was afterwards published: "Constitutiones et regulata jurisdictionis Regii protomedicatus Siciliæ elucidata, scripta" Haller says, circa A. 1429, edita Panormi, 1564, 4to. a I. Phillippo Ingrassia.

ALEXANDER NOEL, or NATALIS, a Dominican friar, and one of the most laborious writers of the 17th century, was born at Rouen, in Normandy, in 1639. Having been admitted into the order of Dominican friars, in 1655, he went to pursue his studies in philosophy and divinity, at the great convent in Paris; and was appointed, at the completion of his studies, to teach philosophy in the same convent. He continued in the exercise of this office for 12 years; and declining that of a preacher, he devoted himself entirely to the study of the scriptures and ecclesiastical history, and was created a doctor of the Sorbonne in 1675. By Colbert, the minister, with whose esteem he was honoured, he was introduced to his son, who was afterwards archbishop of Roan; and in this connection he enjoyed the advantage of those conferences that were held in an assembly of persons of the most distinguished learning, formed by the minister for the improvement of his son. These conferences led him to conceive the design of writing an ecclesiastical history. The first volume of this work, which he executed with great assiduity, and which was intitled, "Selecta Historiæ Ecclesiasticæ capita, et in loca ejusdem insignia Dissertationes Historiæ, Chronologicæ, Dogmaticæ," was published in 1676. It consists of 26 volumes in 8vo, the last four of which were not published till 1686. In the first volume he gives a history of the first age of the church, with an account of the persecutions which it suffered, the succession of popes, the heresies which arose, and the councils which condemned them, the writers in favour of Christianity, and the kings and emperors who reigned during the

the first century. To this volume are annexed 28 valuable and much esteemed dissertations, upon such points as have been the subjects of dispute in history, chronology, criticism, or doctrine. The history of the second century was published in 1677 in two volumes, and to it are subjoined three dissertations against M. Daille with regard to fasting, lent, confirmation, and the use of the fathers; and another dissertation concerning the time of celebrating Easter; and he also treats of the version of the Septuagint, &c. &c. The third century was published in 1678; and in three dissertations he has collected what relates to the life, manners, ordination, fall, errors, and defenders of St. Cyprian. The history of the fourth century, compiled in three volumes, and containing 45 dissertations, was printed at Paris in 1679. In the three following years he published his history of the 5th, 6th, 7th, 8th, 9th and 10th centuries; and that of the 11th and 12th centuries in 1683; and in these volumes there are several excellent dissertations. His sentiments on the subjects of some of these dissertations exposed him to the resentment of the court of Rome, which issued out a decree against his writings in 1684. Nevertheless, he published in the same year, in three volumes, the history of the 13th and 14th centuries, in which he continued to defend the rights of kings against the pretensions of that court, though he vindicates those princes who employed fire and sword against the Albigenses. He at last completed this work in 1686, by publishing four volumes, containing the history of the 15th and 16th centuries. The history of the Council of Trent occupies the greatest part of the last volume. Of this voluminous work, containing many curious particulars, there have been many editions. In 1689 he published a work of the same kind upon the Old Testament, in six volumes in 8vo. which extends from the creation of the world to the birth of Christ, and which period he has divided into six ages. From 1678 to 1680 he also published several other dissertations. In 1689 our author published his "Theologia Dogmatica et Moralis secundum Ordinem Catechismi Concilii Tridentini, in quinque libros tributa," *i. e.* "Positive and moral Divinity, according to the order of the Catechism of the Council of Trent, in five books;" printed at Paris in ten volumes in 8vo. and at Venice in 1698. But another volume having been added in 1701, this work was printed at Paris, in two volumes in folio, in 1703, with a collection of Latin letters. He also published, in 1704, Commentaries on the four Gospels; in 1710, upon St. Paul's and the seven Canonical Epistles; and he also wrote a Commentary upon the Prophets Isaiah, Jeremiah, and Baruch, which was never printed; and he likewise published several other treatises, which we shall not recite. His application, as we may naturally conceive, was intense; and towards the latter part of his life he was afflicted with the loss of his sight, which he bore with great calmness and resignation. He died in 1724, in the 86th year of his age. His piety, humility, and disinterestedness rendered him the object of general esteem. Gen. Dict.

ALEXANDER, of Paris, a French poet, flourished in the 12th century, and was born at Bernai, in Normandy. He removed to Paris, and became, in some measure, the founder of French poetry. He adopted verses of 12 syllables, as best adapted to heroic subjects. His poem of "Alexander the Great," was favourably received in the court of Philip Augustus: it is a sort of metrical version of a life of Alexander then current, intermixed with facts alluding to the history of France at that period. The sense of some passages is strong, and the versification harmonious. Some have supposed that the name of Alexandrines, applied to lines of 12 syllables, has been taken from this work, in reference either to its author or its object. Gen. Biog.

ALEXANDER, DOM JAMES, a Benedictine of the congregation of St. Maur, was a native of Orleans. He died in 1734, at the age of 82 years, and left a treatise on "Elementary Clocks," in 8vo. Biog. Dict.

ALEXANDER, NICHOLAS, a Benedictine of the congregation of St. Maur, was born at Paris, and died at an advanced age, at St. Denys, in 1728. He is known by two useful works, *viz.* "Physic and Surgery for the Poor," Paris, 12mo. 1738; containing a collection of select and cheap remedies for both internal and external ailments; and "A Botanical and Pharmaceutical Dictionary;" in which are found the principal properties of such mineral, vegetable, and animal substances as are used in medicine. He was devout and charitable, and devoted his knowledge of medicine and his property to the relief of the poor. Biog. Dict.

ALEXANDER DE SAINT ELPIDIO, so called from a town in Umbria, general of the Augustine hermits, and archbishop of Ravenna, lived at the beginning of the fourteenth century. He was the author of a treatise "On the Jurisdiction of the Empire and the Authority of the Pope;" written at the request of John XXII. and printed at Rimini, in 1624. Cave H. L. tom. ii. Append. p. 16.

ALEXANDER, WILLIAM, an eminent poet and statesman, the son of Andrew Alexander of Menstrie in Scotland, was born in 1580. Having finished his education, he travelled as tutor, or rather companion, to the Duke of Argyle; and upon his return he lived in retirement, and finished his poetical complaint of an unsuccessful address to his first mistress, which he entitled, "Aurora." Having amused himself for some time with amorous verses, he removed to the court of King James VI. where he sustained the character of a private, but learned and accomplished gentleman. In this more public situation he found leisure for exercising his poetical talents; and he now directed them to grave and moral subjects, with a view to the direction of princes and rulers, in a series of tragedies, formed upon the Greek and Roman models, at least in their chorusses between the acts. One of these, on the story of Darius, was published at Edinburgh in 1603. This tragedy, with three others, *viz.* Cræsus, the Alexandrian, and Julius Cæsar, were published in 1607, under the title of "The Monarchick Tragedies." Our author wrote some other poems of a political nature; particularly his "Parænesis" to prince Henry, communicating important and useful lessons to an heir of royalty. He also wrote a supplement to complete the third part of Sir Philip Sidney's Romance, which was published in 1613, when the author was sworn one of the gentlemen-ushers of the presence to Prince Charles. In 1614 he printed a poem, intitled, "Dooms-day;" and in this year he was knighted by King James, and made master of the requests. At this time he commenced his political career; and, having projected the settlement of a colony at Nova Scotia, in America, he obtained a grant of that country, by his Majesty's royal deed, in 1621. King Charles, on his accession, encouraged the scheme, and Sir W. Alexander published a pamphlet, reciting the advantages which would accrue from it to the nation. The author was made lieutenant of Nova Scotia; and an order of knights baronet was founded in Scotland in the first year of the king's reign, whose aid was appropriated to this settlement, on condition that each should have a portion of land assigned him in the new plantation. Sir William had also the privilege of coining small copper-money. The design, however, failed; Sir William sold the whole country to the French for 5 or 6000*l.* and in the conduct of the whole transaction he incurred some degree of reproach. King Charles, however, continued to favour him; and convinced of his talents and fidelity, made him secretary of state for Scotland in 1626; and in 1630, a

peer of that kingdom, by the title of Viscount Stirling. In 1633 he was raised to the dignity of Earl of Stirling, at his Majesty's coronation, in the palace of Holyrood-house. He discharged the office of secretary of state with great reputation till his death, in 1640. About three years before his death was published a new edition of his poems, viz. "The Four Monarchick Tragedies," "Dooms-day," "The Parænesis," and "Jonathan," an heroic poem, which was now first published. The style and versification, particularly of the plays, are polished, and the plans, as far as the subjects are concerned, improved. The author's tragedies and other poems were well received at the time of their first publication. King James called the author his "Philosophical Poet;" and Michael Drayton commends them; calls the author "My Alexander," and wishes to be known as the friend of a writer, "whose muse was like his mind;" and John Davies of Hereford, in a book of epigrams, published about the year 1611, praises the tragedies of the author; and says, "that Alexander the Great had not gained more glory with his sword than this Alexander had gained by his pen." Mr. Addison, after perusing the several works of the author, testified his approbation of them, by saying, "That he had read them over with the greatest satisfaction." "They compose," says a biographer of unquestionable judgment, "a very respectable portion of the literature of that age; though their gravity and prolixity are not much suited to the taste of the present." It does not appear that his plays were ever acted. They are rather dramatic poems for perusal in the closet. Biog. Brit. Gen. Biog.

ALEXANDER NECKAM, or NEQUAM, an eminent English writer of the 12th and 13th centuries, was born at St. Alban's, in Hertfordshire, and pursued his studies, with successful assiduity, in the universities of Italy and France. At Paris he was esteemed a prodigy of genius and learning; and applauded as an excellent philosopher, a profound divine, and a good rhetorician and poet, considering the age in which he lived. His school at Paris, where he read lectures in 1180, was thronged with scholars. About the year 1186 he returned to England; and, having become a canon-regular of the order of St. Augustin, he was made abbot of Exeter in 1215, and died in 1227. His epitaph, written after the old monkish manner, in Latin rhyme, is as follows:

"Eclipsa patitur sapientia, Sol sepelitur;
Cui si par unus, minus esset sicile fauus:
Vir bene discretus, et in omni more facetus,
Dicitur erat Nequam, vitam duxit tamen æquam."

The sense is this:—

"Learning's eclips'd, the Sun himself's obscur'd;
Our loss were less, had he left one superior;
Accomplish'd was his mind, his manners pleasing,
And though his name was ill, his life was good."

He wrote several works, which are preserved in MS. in the libraries of England and other countries; such as "Commentaria super quatuor Evangelia;" "Expositio super Ecclesiasten;" "Expositio super Cantica;" "Elucidarium Bibliothecæ," in which are some expressions inconsistent with the doctrine of transubstantiation; "Laudes divinæ Sapientiæ," which is the same with the work, "De Naturis rerum;" and contains, amongst a variety of other matter, a large account of the three cities most celebrated for learning, Athens, Rome, and Paris. Gen. Dict. Cave. H. L. tom. ii. p. 286.

ALEXANDER I. king of Scotland, was the son of Malcolm III. and succeeded his brother Edgar in 1107. His

character was distinguished by a degree of vigour and impetuosity, which gave him the appellation of "the fierce;" and which, though previously concealed by his piety and devotion, discovered themselves on his accession to the throne. His conduct both in the northern and southern parts of the kingdom was so severe, that he awed the insurgents into submission; but a conspiracy was at length formed against his life, and the traitors, who were engaged in the execution of it, obtained admittance into his bed-chamber at night, whilst he lodged at a castle in the Carle of Gowrie. Alexander, after having killed six of them, made his escape. Having reduced his own kingdom to order, he visited his brother-in-law Henry I. of England, and assisted him in terminating a difference between him and the Welsh. He closed his reign in enacting and enforcing civil and ecclesiastical regulations, died a bachelor in the 17th year of it, and was succeeded by his younger brother, David. Mod. Un. Hist. vol. xli.

P. 45.

ALEXANDER II. king of Scotland, succeeded his father William the Lion, in 1214, in his 16th year. His attempt to recover the possession of Northumberland was retaliated by a destructive expedition into Scotland, conducted by John, king of England. Whilst John was thus employed, Alexander reduced Northumberland; and, being forced to discontinue his pursuit of the English king, who was burning the towns, ravaging the country, and advancing towards the capital, he entered England by the way of Carlisle, which he took and fortified, and proceeded as far as Richmond, in Yorkshire, retaliating upon the adherents of John severities similar to those which his own subjects had suffered. But his progress was impeded, and he was compelled to return through Westmoreland to his own kingdom.

In 1221, he married the princess Joan, eldest sister of Henry III. of England, who contributed to preserve peace between the two kingdoms. After her death in 1239, they were again embroiled; but by the mediation of the earl of Cornwall, Henry's brother, and the archbishop of York, they were again reconciled. Alexander, in his voyage to quell some commotions that were excited in Argyleshire, fell sick, and being put on shore on an island called Kernerey, on that coast, died, in the 51st year of his age, and 35th of his reign. His successor was his son by his second queen, the daughter of Egelrand de Coucy, one of the most powerful of the French nobility. Mod. Un. Hist. vol. xli. p. 77.

ALEXANDER III. king of Scotland, was son of the preceding, and succeeded his father at the age of nine years, in 1249. His marriage with Margaret, the daughter of Henry III. of England, was soon after solemnized in the presence of the two courts at York. On this occasion Alexander paid homage to Henry for his English possessions; and, on being pressed to perform his homage for the crown of Scotland, he declined it. Alexander, upon his return to Scotland, found that the Cummins, a family of very great influence, had formed a strong party against his English connections, under the plea that Scotland was never any better than a province of England; and both the king and queen were committed to close custody in the castle of Edinburgh, where they were debarred from seeing any company, or associating with each other, and prohibited from all concern in the government. When Henry heard of their situation, he determined to relieve them, and for this purpose assembled his military tenants at York, and marched to the borders; and by his emissaries, whom he dispatched to the castle of Edinburgh, released the royal pair, and afterwards dispossessed the usurpers. The king then assumed the exercise of the regal power; and, as soon as he was of age, pardoned the Cummins and their adherents, upon their submitting to his authority.

authority. However, in 1263, Haquin, king of Norway, appeared on the coast with a fleet of 160 ships, to make good his pretensions to the Western Islands; and, disembarking his troops, made himself master of the castle of Ayr, and advanced into the country. Alexander, having assembled an army, met him at a place called Largs; and, after a long and doubtful contest, the Scots army was victorious. Of the Norwegians, 16,000 are said to have perished in the field, and the Scots lost 5000. The ships of Haquin were so much wrecked the day after the battle, that he could scarcely procure a vessel to carry him and a few friends to the Orkneys, where he soon after died of grief. His son and successor, Magnus, concluded a treaty with Alexander; and, in consideration of his receiving 1000 marks of silver in two years, and an annual payment of 100 marks for ever after, renounced all claim to those islands. As a further cement of friendship, Margaret, Alexander's daughter, was betrothed to Eric, the son and heir of Magnus. In 1256, Alexander and his queen repaired to the English court, where they were sumptuously entertained; and when the queen was delivered, they both returned to their own kingdom. During the war between Henry and his barons, Alexander assisted him with 5000 men, and preserved the northern fortresses against all their attempts. Upon the accession of Edward I. to the throne of England, Alexander, with his family, was present at his coronation, and soon after paid him homage for his English estates. In the parliament, held at Westminster in 1282, Alexander attended as the first peer of England. In 1283 he lost his son Alexander, in the 20th year of his age; and his death was soon followed by that of his sister, the queen of Norway, who left an only daughter.

Alexander, having no surviving issue besides his infant princefs, was urged by the nobility and the states of the kingdom to marry; and in compliance with this request, he was married to Isabella, daughter to the Count of Dreux in France. This excellent prince was soon after killed, whilst he was hunting, by his horse's rushing down a high precipice, A. D. 1285, in the 45th year of his age, and the 37th of his reign. He was succeeded by Margaret, his grand-daughter, and heir of his crown, who did not long survive him. Scotland was now in a very critical state. Edward I. was acquiring an influence in the kingdom, which no other English monarch ever possessed, and revived the claim of sovereignty, to which his father Henry had never pretended. The death of Alexander was, therefore, much regretted; and the services he had performed to the kingdom demanded a tribute of respect to his memory. He had introduced many excellent regulations of government; he had divided the kingdom into parts, in each of which he occasionally resided, with a view of preserving the public peace, and for the purpose of more easily administering justice to all ranks of people; and he had greatly contributed to diminish the burdens of the feudal system, and to restrain the licence and oppressions of the nobility. The death of Alexander III. forms a remarkable æra in the Scottish history. Mod. Un. Hist. vol. xli. p. 79, &c.

ALEXANDER, king of Poland, was a younger son of Casimir, and as duke of Lithuania, elected from motives of policy to succeed Albert in 1501. The archbishop of Gnesna hesitated for some time in assisting at his coronation; and absolutely refused to concur in the ceremony for his queen, the princefs of Muscovy, because she adhered to the doctrines of the Greek church. This indignity was resented by her father, who, in consequence of it, laid siege to Smolensko, but, upon the arrival of Alexander, relinquished the enterprise, and concluded a truce for six years. The fatigue of this expedition so much affected Alexander, that he fell

into a chronic disorder, which only terminated with his life. During his illness, the Moldavians and Tartars made an irruption into Lithuania; and Alexander was carried in a litter, at the head of his army, to oppose them. The two armies met near Wilna, and after a severe contest, in which 20,000 Tartars fell, the Poles were victorious. Alexander received the news of this victory whilst he was dying; and, making signs to express his gratitude, he expired in 1506, at the age of 45, after a reign of five years in Poland, and 13 in Lithuania. In his stature he was short and robust; his visage was long, his eyes sparkling, and his carriage majestic. His genius was heavy, his taciturnity very remarkable, but his sentiments were generous and humane. He was a great patron of the liberal arts, and profuse in his grants under this character, and particularly to musicians; so that his donations were revoked, and a law was passed, called Statutum Alexandrinum, which prohibited the king from disposing of the revenue without the consent of the senate or diet. Mod. Un. Hist. vol. xxx. p. 410.

ALEXANDER NEVSKOI, or NEFSKY, grand duke of Russia, both a saint and hero of that country, was born in 1218, and distinguished by his strength and courage, and by the vigour of his character. He was betimes inspired with a passion for conquest by the incessant wars in which his father Yaroslaf was engaged with the Tartars and Mongulls. Upon the death of Feodor, his elder brother, he became sole viceroy of Novogorod. He married a princefs of the province of Polotzk; and for the purpose of defending his government against the attacks of the Tschudes or Esthonians, he drew a line of forts along the river Shelonia, which falls into the Ilmen lake. While Yaroslaf was engaged with the Tartars in 1230, a combined army of Swedes, Danes, and knights of the Teutonic Order, formed an expedition against Novogorod, and landed from their ships on the banks of the Neva. Alexander, after receiving a haughty embassy, determined to risk the event of a battle. Having implored the assistance of heaven in the presence of his people, he prepared for an engagement. The attack was begun at six in the morning, and the two armies were closely engaged during the whole day. When night put an end to the contest, the field of battle was covered with the bodies of the slain. This battle, in which Alexander is said to have wounded with his own sword the king of the northern nations, is embellished with a variety of fictions; but the event of it was highly honourable to the courage and success of the young prince. From the river Neva, near which the battle was fought, he obtained the surname of Nevskoi. The remainder of his life was employed in exertions of valour and activity against the invaders of his country. He defeated the Tartars in several contests. In 1245 he raised the siege of Novogorod, and gained a victory over the Germans, Danes, and Tschudes, on the borders of the Peipus lake. After his father's death he paid a visit to the Tartar khan, who acknowledged, that though he had heard much to his praise, he far exceeded every thing that had been reported concerning him. In 1252, upon his return from a second visit to the khan, he ascended the throne as grand prince of Vladimir. With a very considerable force he now undertook an expedition against Sweden, and coming off victorious, he so far conformed to the then subsisting practice of war, as to ravage all the countries which he had captured, and returned to Russia with a multitude of prisoners, and heaps of spoil. On occasion of a difference which happened between the Russians, and particularly the inhabitants of Novogorod, and the Tartars, with respect to the humiliating and burdensome tribute which was exacted by the latter, Alexander, in 1258, attempted to pacify the discontented, and to induce

them to submit, without resistance, to a superior power. In order to give effect to his conciliatory endeavours, he took the national payment on himself, and thus acquired the complacency of the Novogorodians as well as of the Tartars. But discontents continuing to prevail, and resistance having arisen to a degree so alarming in several places, that the Tartarian collectors were massacred; the Tartars were exceedingly exasperated against the Russians, and the Russian princes were commanded to appear before the khan. Alexander undertook the hazardous business of attempting, by a personal interview, to avert the khan's wrath on account of the murder of his deputies. After a delay of twelve months he at last succeeded, and obtained a promise that the khan would forgive what had happened, and forego his purpose of raising an army; and in his return home he died suddenly at Gorodetz, in the year 1262, with circumstances that render it extremely probable, that in the camp of the khan poison had been administered to him shortly before his departure. For his various and signal services, and acts of valour, which in those days were deemed miraculous, the grateful admiration of his countrymen raised him to the rank of one of the national saints. Peter the Great, availing himself of the veneration that was paid to the memory of this distinguished hero, founded, in 1712, a monastery near his new city of Petersburg, on the spot which was reported to have been the scene of Alexander's victory; and in 1723 he caused the bones of the great duke to be brought thither. This monastery has been gradually enlarged by several sovereigns since the time of Peter; and the late empress has built a magnificent church within its walls, and a sumptuous mausoleum for herself and her descendants. The shrine of the saint, which was caused to be made by Elizabeth, is of massy silver. The order of knighthood of St. Alexander Nevskoi was instituted by Peter the Great in 1722; but as he died before the knights were appointed, this was done by Catherine I. in June 1725. The badge of this order is a golden eight-pointed star, enamelled with red, with the figure of St. Alexander in armour on horseback. At the four corners of the cross are as many gold spread-eagles, crowned. A broad, deep red, watered ribbon is worn over the left shoulder; the motto is in Russian characters, signifying, "For labour and patriotism." The feast is held on the 30th of August. The monarch and the knights attend mass at Kazan church, and go a pilgrimage on foot to the monastery of the saint, at the distance of three versts, and attend mass again before his silver shrine, and then return to the winter palace, where they partake of a sumptuous dinner, under a discharge of cannon. In 1790 the number of knights amounted to 122. Tooke's Life of Cath. II. vol. ii. p. 373. Cox's Travels into Russia.

ALEXANDERS, in *Botany*. See SMYRNIUM.

ALEXANDREA *Mons*, in *Ancient Geography*, a mountain of Mysia, on the sea-coast, forming a part of Mount Ida, where Paris pronounced judgment on the three goddesses. Strabo.

ALEXANDRETTA, now called *Scanderoon* by the Turks, in *Geography*, is the port of Aleppo in Syria, and situated in the gulf of Ajazzo, near the sea coast. N. lat. 36° 35' 10". E. long. 36° 20'. Its nearest distance from Aleppo, in a straight line, is between 60 and 70 miles; but the usual road for caravans, through Antioch, is computed to be between 90 and 100 miles.

Ancient and modern travellers, from Moryson and Teixeira to Volney, concur in representing the wretched condition of this village, which owes its existence, as the habitation of human beings, to its being the port and road that lead to Aleppo. In this road vessels anchor on a solid bot-

tom, so that their cables are not liable to chafe; and from hence merchants convey their goods as speedily as possible, by means of their factors, to Aleppo and other places. In winter this harbour is incommoded by a wind, called by the French sailors "Le Raguier," which rushes from the snowy summits of the mountains, and forces the ships to drag their anchors several leagues; and ships are prevented by tempestuous winds from entering the harbour for three or four months. The road to Aleppo by the plain is also infested by curd robbers, who conceal themselves in the caverns of the adjacent rocks, and plunder the strongest caravans. Besides, such is the situation of this port, that it is environed on three of its sides with a fenny plain, and on the fourth side by the sea. On the east side, beyond the fen, is a high mountain, which intercepts the rays of the sun, and the remote mountains on the north side have the same effect, so that the stagnant waters and mephitic exhalations produce an epidemic disorder, which prevails from May to September, and which is fatal to the inhabitants and to the crews of the ships during their stay in this place. This disorder is an intermitting fever of the most malignant kind, accompanied with obstructions of the liver, which terminate in a dropsy; and, at the time when this fever is most prevalent, ships have frequently lost all their men in two months; and "the place," as Moryson (*Travels*, p. 250.) long ago observed, "is infamous for the death of Christians." Some years ago, says Mr. Volney, the merchants of Aleppo, disgusted with the numerous inconveniences of Alexandretta, wished to abandon that port, and remove the trade to Latakia. They proposed to the pacha of Tripoli to repair the harbour at their own expence, on condition of his indemnifying them from all duties for ten years. Regardless of any future advantages that might accrue to his country from this plan, and of which he was not likely to participate, their proposal was rejected, and the European factors were obliged to remain at Scanderoon. The only curiosity of the place, it is said, that is shewn for the amusement of strangers, consists of six or seven marble monuments, sent from England, on which is read the following inscription: "Here lies —, carried off in the flower of his age by the fatal effects of a contagious air." It is added, that the languid and yellow aspect, livid eyes, and dropsical symptoms of those who shew these monuments, plainly indicate that they are not likely long to escape the same fate. To a village, however, called Beylan, situate on a high hill, about four leagues distant, and abounding with fresh water and excellent fruits, the inhabitants retire, and here they find no inconsiderable relief. The plain of Antioch, which lies at some distance, is watered with a number of streams and canals, and abounds with most of the necessaries of life, particularly with cattle, which are driven there to fatten. This port has a governor and some few soldiers, and is defended by an old castle; but as it is insufficient to resist any force, it is somewhat surprising that the pirates, who swarm on this coast, never attempt it. The aga has, for some years past, applied the duties of the custom-house at Alexandretta to his own use, and rendered himself almost independent of the pacha of Aleppo. In former times the CARRIER pigeon, *Columba Tabellaria* of Linnæus, was employed by the English factory to convey intelligence from Scanderoon of the arrival of the company's ships in that port. The practice has been disused for many years; but Dr. Russell (*Hist. Aleppo*, vol. ii. p. 203.) informs us, that when it subsisted, the pigeon performed the journey in two hours and a half.

ALEXANDRIA, now called *Scandaria*, the ancient capital city of Lower Egypt, was built by Alexander the Great, in the year 332 before Christ. It was situated on the Mediterranean between the Lake Mareotis and the beauti-

tiful harbour formed by the Isle of Pharos, about 12 miles west of the Canopic branch of the Nile, in N. lat. $31^{\circ} 10'$. and E. long. $30^{\circ} 19'$. It is probable, says a popular historian, that the opposition and efforts of the republic of Tyre, which gave Alexander so long and so severe a check in the career of his victories, led him to perceive the vast resources of a maritime power, and suggested to him an idea of the immense wealth which the Tyrians derived from their commerce, especially that with the East Indies. As soon, therefore, as he had accomplished the destruction of Tyre, and reduced Egypt to subjection, he formed the plan of rendering the empire, which he designed to establish, the centre of commerce as well as the seat of dominion. With this view he founded a great city, which he honoured with his own name, near one of the mouths of the river Nile, that by the Mediterranean sea and the vicinity of the Arabian gulf, it might command the trade of both the east and west. He had no sooner conceived the design than he hastened to execute it. Accordingly he himself drew the plan of the intended city, and fixed upon several places where the temples and public squares were to be erected. It is said, that as there were no instruments at hand proper for this purpose, a quantity of meal was scattered over the ground, and that thus the circuit of the walls was marked out: and it is added that Aristander, the king's soothsayer, interpreted this new mode of determining the site of the walls as a presage of the abundance which would distinguish the city. The situation of Alexandria, it must be allowed, was selected with such discernment, that it soon became the chief commercial city in the world; and in this respect the design of its founder was fully accomplished. During the subsistence of the Grecian empire in Egypt and in the east, and amidst all the successive revolutions in those countries, through a period of about 1800 years, from the time of the Ptolemies to the discovery of the navigation by the Cape of Good Hope, commerce, particularly that of the East Indies, continued to flow in the channel, which the sagacity and foresight of Alexander had prescribed. Although some part of the Indian commerce was conducted by means of the river Oxus and the city of Samarcand into the Caspian sea, and thence by land to Trapezond, and passing to the Euxine and other neighbouring seas, centered in the city of Corinth; yet a considerable part of it, especially such as was carried on at the coast of Malabar and in the Persian gulf, came up the Red Sea; and goods which were landed at Elam, now Suez, were conveyed over land to the Nile, and then by water to Alexandria.

This city, says a modern traveller, was a league and a half long by one-third in breadth, which made the circumference of its walls about four leagues. Quintus Curtius (lib. iv. c. 8. tom. i. p. 221.) makes them 80 stadia, or a little more than nine miles. According to Pliny (H. N. lib. v. c. 10. tom. i. p. 258.) they were 15 miles. Strabo (lib. xvii. tom. ii. p. 1143.) makes the length of the city 30 stadia, and the breadth between seven and eight stadia; and Diodorus Siculus (lib. xvii. tom. ii. p. 590. Ed. Wessel.) makes the circuit 96 stadia, or somewhat more than 11 miles; and he says, that the city was peopled by 300,000 free inhabitants, besides at least an equal number of slaves. The Lake Mareotis bathed its walls on the south, and the Mediterranean on the north. It was intersected lengthwise by straight parallel streets. This direction left a free passage to the northerly wind, which alone conveys coolness and salubrity into Egypt. A street two thousand feet wide began at the gate of the sea, and terminated at the gate of Canopus. It was decorated by magnificent houses, by temples, and by public buildings. In this extensive range the eye was never tired with admiring the marble, the porphyry, and the obelisks, which were destined

at some future day to embellish Rome and Constantinople. This street, the handsomest in the universe, was intersected by another of the same breadth, which formed a square, at their junction, half a league in circumference. From the middle of this great place the two gates were to be seen at once, and vessels arriving under full sail from the north and from the south. A mole of a mile in length, called *Hepta Stadium*, stretched from the continent to the Isle of Pharos, and divided the great harbour into two. That which is to the northward preserved the name of the founder, and was called the Great Port. A dyke, drawn from the island to the rock on which Pharos was built, secured it from the westerly winds. The other was called *Eunostos*, or the Safe Return. The former is called at present the New, and is the port to which the vessels of Europe resort; the latter is the Old Harbour, and is that to which those only from Turkey are admitted: a bridge that joins the mole to the city served for a communication between them. It was raised on lofty pillars sunk into the sea, and left a free passage for the ships. The palace, which advanced beyond the promontory of *Lochias*, extended as far as the dyke, and occupied more than a quarter (a third or fourth, says Strabo), of the city. Each of the Ptolemies added to its magnificence. It contained within its inclosure the museum, an asylum for learned men, groves and buildings worthy of royal majesty, and a temple where the body of Alexander was deposited in a golden coffin. Perdiccas, it is said, undertook to convey the body of Alexander to the temple of Jupiter Ammon, agreeably to the will of that prince; but Ptolemy, son of Lagus, carried it off, and placed it in the palace of Alexandria. The infamous Seleucus Cibyactes violated this monument, carried off the golden coffin, and put a glass one in its place. In the great harbour was the little island of Anti-Rhodes, where stood a theatre and a royal place of residence. Within the harbour of Eunostos was a smaller one, called Kibotos, or Cibotus, *q. d.* the harbour of the arch, dug by the hand of man, which communicated with the Lake Mareotis by a canal. Between this canal and the palace was the admirable temple of Serapis, and that of Neptune, near the great place where the market was held. Alexandria extended likewise along the southern banks of the lake. Its eastern part presented to view the Gymnasium, with its porticoes more than 600 feet long, supported by several rows of marble pillars. Without the gate of Canopus was a spacious circus for the chariot races. Beyond that the suburb of Nicopolis ran along the sea shore, and seemed a second Alexandria. A superb amphitheatre was built there, with a race-ground, for the celebration of the Quinquennialia, or feasts that were celebrated every fifth year. Such is the description, says Savary, (Letters on Egypt, vol. i. p. 29.) left us of Alexandria by the ancients, and above all by Strabo.

This famous city, second only to Rome itself, was built by Dinocrates, a celebrated architect, who acquired great reputation by rebuilding the temple of Diana at Ephesus, which Herostatus had burnt.

Alexandria owed much of its celebrity as well as of its population to the Ptolemies. Ptolemy Soter, one of Alexander's captains, who, after the death of this monarch, was first governor of Egypt, and afterwards assumed the title of king, made this city the place of his residence, about 304 years before Christ. This prince founded an academy, called the *Museum*, in which a society of learned men devoted themselves to philosophical studies, and the improvement of all the other sciences; and he also gave them a library, which was prodigiously increased by his successors. He likewise induced the merchants of Syria and Greece to reside in this city, and to make it a principal mart of their commerce.

commerce. His son and successor, Ptolemy Philadelphus, pursued the designs of his father, and completed the tower of PHAROS, brought thither the image of the god Serapis from Pontus, and erected the famous temple of SERAPION, and improved the ALEXANDRIAN *Library*. He also continued the CANAL, projected and begun by Necoos, and carried on by Darius Hystaspis, which was intended for joining the Nile to the Red Sea, and had the glory of completing it. Ptolemy Euergetes imitated the example of his predecessors, encouraged trade, and contributed to the wealth of Alexandria, and the prosperity of the kingdom. But the affluence that was thus produced occasioned luxury and licentiousness, so that the voluptuousness of Alexandria became proverbial: "Ne Alexandrinis quidem permittenda deliciis." Quintilian. For about 300 years, from the commencement of the reign of Ptolemy Soter to the death of Cleopatra, Alexandria continued in subjection to the Ptolemies; but most of them devoted themselves to various kinds of indulgence and pleasure, became effeminate and dastardly, and by their example contributed to that corruption and relaxation, which prevailed among their subjects, and ultimately terminated in the ruin of this famous city. Ptolemy Physcon, in particular, was a monster of vice and cruelty. About the year B. C. 136, he put to death or banished most of those persons who had been in favour with his brother Philometor, and who had been employed during his reign, and permitted his foreign troops to plunder and massacre at discretion. Many of the inhabitants of Alexandria, terrified by his savage conduct, and in order to avoid his cruelty, retired into foreign countries, and left the city almost a desert. Of these there were grammarians, philosophers, geometricians, physicians, musicians, and other masters in the liberal sciences, who disseminated the polite arts and general science through Greece, Asia Minor, and the islands, and indeed to every place whither they fled. In order to supply the places of these fugitives, Ptolemy caused proclamations to be made in all the neighbouring countries, that persons of any nation, who were desirous of settling at Alexandria, should receive suitable encouragement. The proposal was accepted by many, and the houses and privileges which belonged to the former inhabitants were assigned to these new settlers, and thus the city was re-peopled. About this time Scipio Africanus the younger, and other Romans, were deputed on an embassy to Alexandria; and Justin says of him, that whilst he visited and considered with curiosity the rarities of Alexandria, he was himself a sight to the whole city; "Dum inspicit urbem, ipse spectaculo Alexandrinis fuit;" so different were his aspect and manners from those of the Alexandrians. The new inhabitants, whom Ptolemy had invited into the city, soon found reason to dislike their situation, and to hate their new sovereign. Cruel and timid as he was, he determined to massacre all the young men of the city; and for this purpose he caused the Gymnasium, or place of exercise in which they were assembled, to be invaded by his foreign troops, and put them all to the sword.

When Julius Cæsar, B. C. 48, in his pursuit of Pompey, landed at Alexandria, he found the city in great commotion, without law and without government. Having arbitrated between Ptolemy XII. and Cleopatra, and decreed that they should reign jointly in Egypt, Pothinus instigated the Alexandrians to resist the decree, and to concur in driving Cæsar out of the city. Accordingly he brought 20,000 troops to effect his purpose, but Cæsar supported the attack; and in order to prevent any injury from their fleet, to which they next had recourse, he caused it to be set on fire, and possessed himself of the tower of Pharos, which he garrisoned. Some of the vessels that were on fire came so near, that the flames

caught the houses adjoining to the quay, and spread through that quarter of the city, which was called *Bruchion*, and consumed the library that was placed there, consisting of 400,000 volumes. In a decisive battle with the whole army of Ptolemy, Cæsar, assisted by a considerable body of Jews, obtained a complete victory. Ptolemy, in endeavouring to make his escape in a boat, was drowned in the Nile; and Cæsar returned to Alexandria, which, together with the whole of Egypt, submitted to the victor. Before he left this city, he confirmed all the privileges which the Jews enjoyed, in gratitude to them for their assistance, and ordered a column to be erected, in which these privileges were engraven, with the decree that confirmed them. The emperor Caligula was inclined to favour the Alexandrians, because they manifested a readiness to confer divine honours on him; and conceived the horrid design of massacring the chief senators and knights of Rome, A. D. 40, and then of abandoning the city, and of settling at Alexandria. At this time the Jews who inhabited this city, and who had continued to enjoy the privileges of citizens, granted to them by Alexander, under the Ptolemies, and who had obtained a confirmation of them from Julius Cæsar, became obnoxious to the Alexandrians. Their number, as they occupied two parts in five of the city, and amounted in the whole of Egypt to a million, and also the prerogatives that distinguished them, excited envy and jealousy, and their fellow-citizens wanted only a pretence for destroying them. They had been for some time restrained from doing them injury; but under the government of Flaccus, A. D. 40, who permitted the statues of Cæsar to be set up in the oratories of the Jews, they were grievously oppressed. He took occasion, in consequence of some dissensions and seditions that occurred, to publish a decree, by which, without offering them a hearing, they were declared strangers in Alexandria; he also restricted them to one of the five districts into which the city was divided; and their houses, which they were compelled to abandon, were plundered, whilst, destitute of any settled abode, they were obliged to wander about the fields and the sea-shore, without shelter, property, and even the means of subsistence. Those who fell into the hands of their enemies were tortured in the most cruel manner, and destroyed by a lingering and painful death. The streets, market-places, and theatres were deluged with blood; neither sex nor age was distinguished; and none, says Philo (Leg. ad Caium) were spared. This writer assigns no other cause for these barbarities than the rage and fury of the Alexandrians. When Flaccus was recalled, the Jews obtained some respite; but they were soon alarmed by the order of Caius to have his own statue set up in the temple of Jerusalem. In the mean while they sent a deputation to the emperor, at the head of which was Philo, to petition the restoration of their citizenship and of their oratories. Before the object of their embassy was settled, Caius died; and Claudius declared in favour of the Jews, whom he re-established in the possession of all the privileges they had enjoyed in Alexandria from the time of the foundation of that city. When Adrian visited Egypt, A. D. 130, he expressed a great dislike of the manners and dispositions of the Egyptians in general, and of those of the inhabitants of Alexandria in particular. In a letter written from thence, and addressed to the Consul Servian, he says, "the city of Alexandria is rich and powerful, with great trade, which produces plenty. Nobody is idle there; some blow glass, others make paper; many are employed about linen and making of cloaths; all have some trade. All, whether Jews or Christians, acknowledge but one God, their interest. I wish that this city, by its grandeur and riches, the first of all Egypt, was furnished with better inhabitants.

Nothing equals their ingratitude; I have granted them every thing they could desire; I have restored their ancient privileges; I have given them new ones; in consequence of this they were grateful to me when present; but I had scarcely turned my back when they insolently attacked my son Verus, and I believe you know what they have said of Antoninus, &c. &c." For Nero the Alexandrians built baths in the city, when they expected a visit from him in his way to Egypt; and because Cæcina Tuscus, the son of his nurse, whom he had made præfect of Egypt, presumed to make use of them, he was condemned to banishment. To Alexandria belonged the honour of being the first place where Vespasian was acknowledged and proclaimed, A. D. 69, and the emperor remained here whilst his generals and armies were fighting against Vitellius; and though he came hither for the purpose of starving Italy, by preventing its supplies of foreign corn, yet as soon as he heard of the death of Vitellius, and that Rome had submitted, the best ships of Alexandria were immediately laden with corn, and ordered to sail for their supply. Whilst Vespasian continued in this city, he received ambassadors from the Vologeses, who offered him 40,000 Parthian horse; but peace was then restored to the Roman empire. During his stay in this place he was no favourite with the Alexandrians. They were fond of pomp and magnificence, and Vespasian loved simplicity. They had flattered themselves with the hopes of receiving a gratification, because they had been the first who acknowledged him for emperor; but on the contrary they were harassed with imposts, either new, or levied with uncommon rigour. The Alexandrians revenged themselves with sneers and sarcasms, calling him *Cybiofates*, a name which they had formerly given to one of their kings, who was sordidly avaricious; but heaven, if we credit some Pagan writers, distinguished him by miracles. The emperor Severus, in his visit to Egypt, A. D. 202, granted the Alexandrians a council, the members of which had the title and privileges of senators, and assisted in the administration of public affairs, and thus mitigated the rigour of the despotic government of the præfect instituted by Augustus. He also changed several laws in their favour; and they erected a column as a monument of their gratitude, called by Abulfeda the *Pillar of Severus*. It has already appeared that the Alexandrians were inclined to be sarcastic, and that they deserved the character given to them by Herodotus, who says, that they loved to be merry at the expence even of their princes. In the case of Caracalla, whose vanity they ridiculed, because, though he was of small stature, deformed, and destitute of every kind of military merit, he had compared himself to Achilles and to Alexander, their raillery was productive of very serious consequences. Whilst the Alexandrians were preparing to receive him with joy and magnificence, when he visited the temple of Serapis, and the tomb of Alexander, he was meditating cruel retaliation. In the midst of peace, and on the slightest provocation, he issued his commands for a general massacre, A. D. 215. From a secure part of the temple of Serapis, he viewed and directed the slaughter of many thousand citizens, as well as strangers, without distinguishing either the number or the crime of the sufferers; since, as he coolly informed the senate, all the Alexandrians, those who had perished and those who had escaped, were alike guilty. Dion. (lib. lxxvii. p. 1307.) represents it as a cruel massacre; Herodian (lib. iv. p. 155.) says, that it was also perfidious. The massacre was accompanied with the plunder both of temples and houses; and all strangers, except merchants, were driven from the city. The societies of learned men, who were maintained in the Museum, were abolished; and the different quarters of the city were separated from each

other by walls and towers to prevent all communication between them. However, this desolation was but a temporary evil; for Caracalla being soon after killed, Alexandria recovered its splendour by its own resources, and soon became again the second city of the empire. Under the reign of Gallienus, Æmilian, who had been præfect of Egypt for some years, assumed the Imperial purple, on occasion of a violent sedition, which terminated in a ruinous war. All communication between the different quarters of Alexandria was cut off, and it was easier, says St. Dionysius, to go from one end of the world to the other than from Alexandria to Alexandria. The streets were filled with blood, the dead bodies putrified, and, by their infection, brought on the plague. Æmilian, in vain, endeavoured to appease the people. They were exasperated against him, and attacked him with stones and darts; upon which, in order to avert the imminent danger that threatened him, he declared himself emperor. The soldiers and the people, happy in the prospect of being rescued from the yoke of Gallienus, acknowledged his sovereign authority. At length he was attacked and defeated by Theodotus, the minister of Gallienus's vengeance. Upon this he retired to the Bruchium, a quarter of Alexandria, and sustained a siege, in which St. Anastasius and St. Eusebius, intimate friends, and afterwards bishops of Laodicea, were admired for their ingenious charity in comforting and relieving the unhappy besieged, who perished with hunger. Anatolius was shut up in Bruchium, and Eusebius remained with the Romans. The former, moved with compassion to the wants and misery of the besieged, applied to the latter in order to obtain amnesty for those who should leave the garrison and surrender themselves. Having succeeded in his application, he immediately proposed surrendering the place, and making peace with the besiegers. The answer was, that no peace should be made. Anatolius then proposed, that all who were of no service should leave the place in disguise, and they were kindly received and seasonably supplied by Eusebius. Æmilian was afterwards taken by Theodotus and sent to Gallienus, who ordered him to be strangled in prison. The various misfortunes that befell Alexandria so depopulated this great city, that, after these calamities, the number of its inhabitants, from four to fourscore years of age, was not equal to that which had been usually reckoned before of those who were between 40 and 70. This difference was known by the registers that were kept for the gratuitous distribution of corn. Eusebius, *Ecl. Hist.* vii. 21. Dioclesian, A. D. 296, marched against Achilleus, who had usurped the government of Egypt; and, having driven him to Alexandria, besieged the city, cut off the aqueducts which conveyed the waters of the Nile into every quarter of that immense city, and rendering his camp impregnable to the sallies of the besieged multitude, he pushed his reiterated attacks with caution and vigour. After a siege of eight months, Alexandria, wasted by the sword and by fire, implored the clemency of the conqueror, but it experienced the full extent of his severity. Many thousands of the citizens perished in a promiscuous slaughter, and there were few obnoxious persons in Egypt, who escaped a sentence either of death, or at least of exile. Eutropius, ix. 24. Orosius (vii. 25.) says, that he gave up the city to be plundered. As an apology for the severity of this emperor, it has been alledged that the seditions of Alexandria had often affected the tranquillity and subsistence of Rome itself, and that his severity was counterbalanced by salutary regulations. In 302 he established, for the benefit of this city, a perpetual distribution of corn. Constantine, with a view of establishing his new city of Constantinople, distributed every day 80,000 bushels

of corn brought from Alexandria; and he employed the Alexandrian fleet in victualling New Rome, as it was called, leaving to Old Rome only that of Africa. Socrat. ii. 13. Alexandria suffered in common with other places by the violent and destructive earthquake which shook the greatest part of the Roman empire, July 21st, A. D. 365; and this city annually commemorated this fatal day when 50,000 persons had lost their lives in the inundation.

It was in Alexandria chiefly that the Grecian philosophy was engrafted upon the stock of ancient oriental wisdom. The Egyptian method of teaching by allegory was peculiarly favourable to such an union: and we may well suppose that when Alexander, in order to preserve by the arts of peace that extensive empire, which he had obtained by the force of arms, endeavoured to incorporate the customs of the Greeks with those of the Persian, Indian, and other eastern nations, the opinions as well as the manners of this feeble and obsequious race would, in a great measure, be accommodated to those of their conquerors. This influence of the Grecian upon the oriental philosophy continued long after the time of Alexander, and was one principal occasion of the confusion of opinions which occurs in the history of the Alexandrian and Christian schools. Alexander, when he built the city of Alexandria, with a determination to make it the seat of his empire, and peopled it with emigrants from various countries, opened a new mart of philosophy, which emulated the fame of Athens itself. A general indulgence was granted to the promiscuous crowd assembled in this rising city, whether Egyptians, Grecians, Jews, or others, to profess their respective systems of philosophy without molestation. The consequence was, that Egypt was soon filled with religious and philosophical sectaries of every kind; and particularly, that almost every Grecian sect found an advocate and professor in Alexandria. The family of the Ptolemies, as we have seen, who after Alexander obtained the government of Egypt, from motives of policy, encouraged this new establishment. Ptolemy Lagus, who had obtained the crown of Egypt by usurpation, was particularly careful to secure the interest of the Greeks in his favour, and with this view invited people from every part of Greece to settle in Egypt, and removed the schools of Athens to Alexandria. This enlightened prince spared no pains to raise the literary, as well as the civil, military, and commercial credit of his country. Under the patronage first of the Egyptian princes, and afterwards of the Roman emperors, Alexandria long continued to enjoy great celebrity as the seat of learning, and to send forth eminent philosophers of every sect to distant countries. It remained a school of learning, as well as a commercial emporium, till it was taken, as we shall see in the sequel of this article, and plundered of its literary treasures by the Saracens. Philosophy, during this period, suffered a grievous corruption from the attempt which was made by philosophers of different sects and countries, Grecian, Egyptian, and Oriental, who were assembled in Alexandria, to frame, from their different tenets, one general system of opinions. The respect which had long been universally paid to the schools of Greece, and the honours with which they were now adorned by the Egyptian princes, induced other wise men, and even the Egyptian priests and philosophers themselves to submit to this innovation. Hence arose an heterogeneous mass of opinions, under the name of the *ELECTIC philosophy*, and which has been the foundation of endless confusion, error and absurdity, not only in the Alexandrian school, but among Jews and Christians; producing among the former that specious kind of philosophy, which they called their *CABBALA*, and among the latter innumerable corruptions of the Christian faith. The Alexandrian school is celebrated

by Strabo (lib. xvii.) and by Ammianus (xxii. 6.) Brucker's History of Philosophy, by Enfield, vol. i. p. 500.

At Alexandria there was, in a very early period of the Christian æra, a Christian school of considerable eminence. St. Jerom says, the school at Alexandria had been in being from the time of St. Mark. Pantænus, placed by Lardner at the year 192, presided in it. St. Clement of Alexandria succeeded Pantænus in this school about the year 190; and he was succeeded by Origen. Lardner's Works, vol. ii. p. 203. As the extensive commerce of Alexandria, and its proximity to Palestine, gave an easy entrance to the new religion, it was at the school of this city that the Christian theology appears to have assumed a regular and oriental form: and when Adrian visited Egypt, he found a church composed of Jews and Greeks, sufficiently important to attract the notice of that inquisitive prince. The theological system of Plato was introduced into both the philosophical and Christian schools of Alexandria; and of course many of his sentiments and expressions were blended with the opinions and language of the professors and teachers of Christianity. See *PLATONISM*.

The city of Alexandria, which had maintained its reputation for power and wealth, as well as for literature and science, for nearly 1000 years, and which had been successively held in subjection by the Ptolemies, the Romans, and the Greek emperors, was at length captured by the Saracens, and in process of time totally ruined. In the year 638, Amrou, the general of Omar, invaded Egypt; and in the following year he commenced the siege of Alexandria. This siege is perhaps the most arduous and important enterprise in the annals of Saracen conquests. The first trading city in the world was abundantly replenished with the means of subsistence and defence. Her numerous inhabitants fought for the dearest of human rights, religion and property; and the enmity of the natives seemed to exclude them from the benefit of peace and toleration. The sea was continually open; and if Heraclius had been awake to the public distress, fresh armies of Romans and barbarians might have been poured into the harbour, to save the second capital of the empire. A circumference of 10 miles would have scattered the forces of the Greeks, and favoured the stratagems of an active enemy; but the two sides of an oblong square were covered by the sea and the lake Mareotis, and each of the narrow ends exposed a front of no more than 10 furlongs. The efforts of the Arabs, however, were not inadequate to the difficulty of the attempt and the value of the prize. The faithful natives devoted their labours to the service of Amrou; and in every attack his sword and banner glittered in the van of the Moslems. The general, having been released from a temporary captivity, into which his imprudent valour had betrayed him, advanced towards the city doomed to destruction. At length, after a siege of fourteen months, and the loss of 23,000 men, the Saracens prevailed; the Greeks embarked their dispirited and diminished numbers; and the standard of Mahomet was planted on the walls of the capital of Egypt, Dec. 22, A. D. 640. "I have taken," said Amrou to the caliph, "the great city of the west. It is impossible for me to enumerate the variety of its riches and beauty; I shall content myself with observing, that it contains 4000 palaces, 4000 baths, 400 theatres or places of amusement, 12,000 shops for the sale of vegetable foods, and 40,000 tributary Jews. The town has been subdued by force of arms, without treaty or capitulation, and the Moslems are impatient to seize the fruits of their victory." According to the Arabian historians, Alexandria, at this time, consisted of three cities, *viz.* *Menna*, or the port, which included Pharos and the adjacent parts; *Alexandria*, properly so called, where the modern Scanderia stands; and *Nekitay*, or

the Necropolis of Josephus and Strabo. The commander of the Faithful, on this occasion, rejected the idea of pillage, and directed his lieutenant to reserve the wealth and revenue of Alexandria for the public service and the propagation of the faith; the inhabitants were numbered; a tribute was imposed; the zeal and repentment of the Jacobites were curbed; and the Melchites, who submitted to the Arabian yoke, were indulged in the obscure but tranquil exercise of their worship. The intelligence of this disgraceful and calamitous event afflicted the declining health of the emperor, and Heraclius died of a dropsy about seven weeks after the loss of Alexandria. Under the minority of his grandson, the clamours of a people, deprived of their daily sustenance, compelled the Byzantine court to undertake the recovery of the capital of Egypt. In the space of four years the harbour and fortifications of Alexandria were twice occupied by a fleet and army of Romans. They were twice expelled by the valour of Amrou. But the facility of the attempt, the repetition of the insult, and the obstinacy of the resistance, provoked him to swear, that if a third time he drove the infidels into the sea, he would render Alexandria as accessible on all sides as the house of a prostitute. Faithful to his promise, he dismantled several parts of the walls and towers, but the people were spared; and the Mosque of *Mercy* was erected on the spot where the victorious general had stopped the fury of his troops. For the fate of the library, see *ALEXANDRIAN library*.

Under the domination of the Arabs, Alexandria gradually lost its splendour. In the year 924 it was taken by the Magrebians, two years after the destruction by fire of its great church, called by the Arabs *Al Kaisaria*, or *Casarea*, which had been formerly a Pagan temple, erected by queen Cleopatra, in honour of Saturn. The city was soon abandoned by the Magrebians, and in 928 the possession of it was again resumed. But when their fleet was afterwards defeated by that of the Caliph, the Magrebian general, *Abul Kasem*, retired from Alexandria, leaving in it a garrison of 300 men, who with the remaining inhabitants were removed by the Caliph's admiral, *Thmaal*, to an island in the Nile called *Aboukir*. According to Eutychius, more than 200,000 of the wretched inhabitants perished this year.

In the year 875 the old walls had been demolished; its extent contracted to half its ancient dimensions, and those walls were built which exist at the present day. This second Alexandria, which may be called, says Savary, that of the Arabs, presented by the disposition of its streets the form of a chequer. It had preserved a part of its public places and of its monuments. The Pharos still existed; and Alexandria in its decline still presented an air of grandeur and magnificence that excited admiration.

Of the prosperity and wealth of Alexandria, as the emporium of commerce, we may form an idea by this single circumstance; that, after the defeat of Zenobia, a single merchant of this city, undertook to raise and pay an army out of the profits of his trade. Such were its resources, and the advantages derived from its commerce, that notwithstanding the tributes that were exacted from it by the Greeks and Romans, and the oppressions it suffered from the Saracens, it successively recovered its prosperity; and even in the 13th century, its old mart began to revive, and its port became again the center of commerce. But the dominion of the Turks, and the discovery of the Cape of Good Hope, in 1499, completed its ruin, and from that time it has fallen into decay. The Alexandria of the Arabs was miserably depopulated. Its large buildings fell into ruins, and under a government which discouraged even the appearance of

wealth, no person could venture to repair them; and mean habitations were constructed, in lieu of them, on the sea coast.

The present state of Alexandria affords a scene of magnificent ruin and desolation. In the space of two leagues, enclosed by walls, nothing is to be seen but the remains of pilasters, of capitals, and of obelisks, and whole mountains of shattered columns and monuments of ancient art heaped upon one another, and accumulated to a greater height than that of the houses. The famous tower of PHAROS has been long since demolished, and a square castle, without taste, ornament, or strength, called *Farillon*, erected in its place. The mole which joined the continent to the isle of Pharos is enlarged, and is now become a part of the main land. The island of Anti-Rhodes is in the middle of the present town, and is discoverable only by an eminence covered with ruins. The harbour *Kibotos* is choaked up. The canal which conveyed the waters of lake Marcotis has disappeared. This lake itself, through the negligence of the Turks in preserving the canals which conveyed the waters of the Nile, is no longer in existence, but is entirely occupied by the sands of Lybia. The CANAL of Faoué, the only one which at present communicates with Alexandria, and without which that town could not subsist, since it has not a drop of fresh water, is half filled with mud and sand. Under the Roman empire, and even under the domination of the Arabs, it was navigable all the year, and served for the conveyance of merchandize. Its banks were shaded with date trees, covered with vineyards, and adorned with country houses. At present it has no water till about the end of August, and its supply is hardly sufficient to fill the cisterns of the town. The fields adjoining to it are deserted; the groves and gardens that surrounded the ancient city have disappeared, and without the walls there are only a few scattered trees, some sycamores and fig-trees, some date and caper trees, and kali, that hide the burning sands, which would be otherwise insupportable to the sight. Nevertheless, every trace of ancient magnificence is not obliterated. Some parts of the old walls are yet standing; and they are flanked with large towers, at the distance of about 200 paces from each other, and with smaller intermediate ones. Below are magnificent casemates, which may serve for galleries in which to walk. In the lower part of the towers is a large square hall, whose roof is supported by thick columns of Thebaic stone; and above this are several rooms, over which are platforms more than 20 paces square. The reservoirs, vaulted with much art, and extending under the whole town, are almost entire at the end of 2000 years. Of Cæsar's palace there remain only a few porphyry pillars, and the front, which is almost entire, and appears very beautiful. The palace of Cleopatra was built upon the walls facing the port, having a gallery on the outside, supported by several fine columns. Towards the eastern part of the palace are two obelisks, vulgarly called *Cleopatra's Needles*. They are of Thebaic stone, and covered with hieroglyphics; one is overturned, broken, and lying under the sand; the other is on its pedestal. These two obelisks, each of them of a single stone, are about 60 feet high, by seven feet square at the base. Towards the gate of Rosetta are five columns of marble, on the place formerly occupied by the porticoes of the Gymnasium. The rest of the colonnade, the design of which was discoverable 100 years ago by Maillet, has been since destroyed by the barbarism of the Turks. *Pompey's pillar*, and the *Catacombs*, at half a league distant to the southward of the town, still engage the attention of travellers. The canal of the Nile, already mentioned, is about 70 paces from Pompey's pillar; and on the top of the hill is a tower, in which a sentinel is

placed, who gives notice, by a flag, of the ships that are coming into port. From this hill may be seen the sea, the whole extent of the city, and the parts in its vicinity. On the sea-coast there is a large basin, cut out of the rock that forms the shore, having on its sides two beautiful saloons that are hewn out by the chisel with benches across them. A canal of a zig-zag form, for the purpose of stopping the progress of the sand by its different windings, conveys into them the water of the sea, pure and transparent as crystal. The water rises a little above the walk, when a person is seated on the stone bench, and the feet rest on a fine sand. The waves of the sea dash against the rock and foam in the canal. The swell enters, raises you up, and leaves you; and thus alternately entering and retiring, furnishes a constant supply of fresh water, and a coolness, which is grateful and delicious under a burning sky. This place is vulgarly called the *Bath of Cleopatra*; and some ruins indicate its having been formerly ornamented.

The *modern Alexandria* is built near the brink of the sea on a kind of peninsula, situate between the two ports above-mentioned. The new port, assigned to Europeans, is clogged up with sand, which renders the entrance into it both difficult and dangerous, and in stormy weather endangers the bilging of the ships; and the bottom is rocky, so that the cables soon chafe and part; and thus vessels are driven against one another, and are sometimes lost. An instance of this kind happened in March 1773, when more than 40 vessels were dashed to pieces on the mole by a north-west gale. Similar accidents have also happened at different times; and under the Turkish government, which, as it is said, ruins the labours of past ages and destroys the hopes of future time, no provision is likely to be made for preventing their occurring again. The other port, or the Eunostus of the ancients, to the westward of the Pharos, is called the port of Africa; it is much larger than the former, and lies immediately under part of the town of Alexandria. It has much deep water, though many ships are continually throwing their ballast into it; and without doubt it will be at length filled up and thus joined to the continent. Christian vessels are not suffered to enter this port; and the only reason is, least the Moorish women should be seen taking the air in the evening at open windows, and this has been thought sufficient to induce Christian powers to submit to the restraint, and to overbalance the constant loss of ships, property and men. The houses at Alexandria, like those of the Levant, have flat terrace roofs; they have no windows, and the apertures which supply their place are almost entirely obstructed by a wooden lattice projecting, of various forms, and so close, that the light can hardly force a passage. In those countries, more than any where else, such inventions, which transform a mansion into a prison, are real *jealousies*, as Sonnini calls them, or window-blinds. Narrow and awkwardly disposed streets are without pavement, as the city is without police; no public edifice, no private building arrests the eye of the traveller; and on the supposition that the fragments of the old city had not attracted his attention, he would find no object in the present town that could supply matter for a moment's thought. Turks, Arabians, Barbareques, Cophts, Christians of Syria, and Jews, constitute a population which, according to Sonnini, may be estimated at 5000, as far as an estimation can be made in a country where no register of any thing is kept. Commerce attracts thither besides, from all the countries of the east, strangers whose residence is very transient. This motley assemblage of persons of different nations, jealous of and almost always hostile to each other, would present to the eye of the observer a

singular mixture of customs, manners and dress, if a resort of thieves and robbers could repay the trouble of observation. The present Alexandrians are, like their predecessors in former times, chargeable with a proneness to sedition, which is awed and restrained by the severity of their government. The British and French nations carry on a considerable commerce with Alexandria, and have each a consul residing there. Some Venetian ships also sail thither yearly, under the colours and protection of France. The subjects of those kingdoms who have no consul here are subjected to a tax by the Grand Seignior; but the Jews indemnify themselves for this disadvantage, by selling their commodities cheaper than other foreigners can afford to do; and they are also favoured by the farmers of the revenues, who know that the Jews have it in their power to lessen the quantity of merchandize that comes into their port, for the period of two years, which is the duration of their farm. The language spoken at Alexandria is the Arabic; but most of the Alexandrians, and those in particular whom commerce leads into an intercourse with the merchants of Europe, speak likewise the Italian. The *morecco* or *lingua franca*, which is a compound of bad Italian, Spanish and Arabic, is likewise spoken in this place. The government of Alexandria is like that of other places in *EGYPT*; and is conducted by an aga, who has under him a kadi and sub-basha, all nominated by the chief basha. It has a small garison of soldiers, part of which are Janizaries and Assassins; who are haughty and insolent, not only to strangers but to the mercantile and industrious part of the people. These are lodged in the *farillons* or castles that guard the port, where the aga or governor that commands them also resides. But though the Pharos, according to established regulations, ought to be garrisoned by 500 janizaries, it has never half that number, and not more than four cannons for its defence. The whole of the fortifications might easily be beat down by a single frigate; but a foreign army would experience great difficulty in maintaining possession of Alexandria for want of water; as the city has not any besides that which is conducted by canals into their reservoirs at the time of the overflowing of the Nile; so that it would be necessary to conquer the whole country, or at least those parts that lie on the banks of the river. Alexandria was taken by assault on the fourth of July, 1798, by the French army, under the command of Bonaparte, the present prime consul of France; after putting to flight the Arabs and Mamelukes who defended it, and killing about 300 of them. The troops, that were left in possession of the town, when the army began its march across the Desert, having been forbidden, under penalty of death, from entering the houses or mosques of the Turks, or committing any violence on their persons, or those of their families, built huts of palm-branches without the city, to shelter themselves from the sun. The men of science, who accompanied the army, were lodged in the houses of the few Europeans resident at Alexandria, but a dozen of them were crowded together in one chamber, under the heat of a torrid climate. Miserably supplied both with food and water, molested with the stings of insects, and surrounded with filth and wretchedness, they at the same time contemplated in a city, once renowned for industry, commerce and activity, nothing but ruins, barbarism and poverty; stupid-looking citizens, with long pipes, indolently sitting in the public places, half starved and naked children, and the forms of bare-footed women, in blue serge gowns, and black stuff veils, flying the approach, or turning away with precipitation, whenever they met a Frenchman. The French beheld every where monuments of antiquity, but every where misplaced pillars

pillars of granite, inscribed with Egyptian hieroglyphics, strewed the streets, or divided by the law, served for their holds and benches; marble and porphyry bases and capitals, baths and catacombs, were found in ruins, with nothing entire but a bath of black granite, destined for the museum of Paris; the pillar of Pompey, and the obelisk of Cleopatra, which were yet in good preservation. When the blockade of the port by the English fleet, after the famous battle of *Aboukir*, cut off the communication with Rosetta, and the supply of water was thus impeded, Bonaparte caused the canal which led from Rhamania to Alexandria, across a desert of 40 miles, to be cleansed; by which means not only this city received a larger supply of water and provisions, but the artillery was conveyed more expeditiously and conveniently by water to the general deposit at Giza, than it could have been by land. Bonaparte also drew plans for the better defence of the port of Alexandria and the city of Cairo; he also formed a great establishment for the mechanical arts; and with the concurrence of the scientific men who attended him formed a national academy, called the *INSTITUTE*. In the year 1801, Alexandria was taken by the English army, under the command of General Hutchinson, the news of which was announced soon after the preliminaries of peace between England and France were signed, by the respective agents of the two countries; by one article of which Egypt is to be delivered up to the Sublime Ottoman Porte. Alexandria is situated in N. lat. $31^{\circ} 11' 20''$. E. long. $30^{\circ} 16' 30''$. Nautical Almanac. According to Bruce (*Travels*, vol. i. p. 16.) N. lat. $31^{\circ} 11' 32''$. E. long. $30^{\circ} 17' 30''$. Anc. and Mod. Un. Hist. Rollin's *Anc. Hist.* Savary's *Letters on Egypt*, vol. i. letter 2. Sonnini's *Travels through Upper and Lower Egypt*. Gibbon's *Decline*, &c. of the Rom. Emp.

ALEXANDRIA was also a name given to several other cities; viz. a city of Arachosia, on the river Arachotus, the Alexandropolis of Isidore (Stephanus), and by some thought to be the modern Cabul:—another of Gedrosia, both built by order of Alexander the Great; (Pliny, H. N. lib. vi. c. 23.)—A third of Aria, near the lake Arius, according to Ptolemy; but according to Pliny (lib. vi. c. 23.) on the river Arius, built by Alexander, who settled a colony of Macedonians there. (Strabo, lib. xv. Ammianus lib. 22.)—A fourth in Bactriana, so called, says Pliny, (lib. vi. c. 23.) from its builder.—A fifth, an inland town of Carmania, built also by Alexander, and mentioned by Pliny, Ptolemy and Ammianus.—A sixth, in the country of the Dahæ, in Sogdiana, (Isidorus Characenus.)—A seventh, in India, at the confluence of the Acesines and Indus, (Arrian, lib. v. c. 15.)—An eighth, built by Alexander the Great, between Issus and the Straits which lead from Cilicia into Syria, called also ALEXANDRETTA, and now Scanderoon.—A ninth, in Margiana, which was built by Alexander, and rebuilt, after it was demolished by the barbarians, by Antiochus, the son of Seleucus, and called Antiochia of Syria, and also Seleucia, watered by the river Mergus; 70 stadia in circuit, according to Pliny (lib. vi. c. 16.); who adds, that, after the defeat of Crassus, Orodes conveyed the captives to this place.—A tenth of the Oxiana, in Sogdiana, built by Alexander on the Oxus, near the confines of Bactria, (Pliny lib. vi. c. 16.)—An eleventh, built by Alexander, at the foot of Mount Paropamisus, which was called Caucasus, (Pliny, lib. vi. c. 23.)—A twelfth, in Troas, called also Troas and Antigonion, ordered to be erected by Alexander, in commemoration of Troy, which had long ceased to exist. Antigonus, one of his lieutenants, laid the foundations of it, and gave his name to the city; but the name of Alex-

ander was restored by Lyfimachus, who afterwards possessed, embellished and extended it. Having passed under the dominion of the Romans, it became, under Augustus, one of the handsomest cities of the east. Under Adrian, Herodes Atticus constructed a superb aqueduct, some few traces of which are still to be seen. The walls of the city, of the houses, of the temples, and of other monuments, are built of a hard shelly stone. The marble of Paros and that of Marmora are common here, and also several sorts of granite. Near the rivulet to the south of the city are two springs of mineral waters, resorted to by the Turks and Greeks, which are recommended for disorders of the skin, the leprosy, and syphilis. The harbour is of narrow extent, and almost cloaked up with sand. History does not mention the epoch in which this city was destroyed. It had no existence when the Turks established themselves in this country. The environs present a fruitful soil, forming a plain, in which the *velani* oak grows in abundance, and without culture. The ruins of this city are six leagues to the south of Cape Sigæum. Olivier's *Travels*, &c. vol. ii. p. 46.—A thirteenth Alexandria, built by Alexander on the Jaxartes, bounding his victories towards Scythia.—A fifteenth in Adiabene, mentioned by Pliny, and as Hardouin suggests, designed to perpetuate the remembrance of the defeat of Darius.—A sixteenth on the northern coast of the island of Cyprus, south of the promontory of Calinusa.—A seventeenth in Palestine, on the river Scham, to the south of Tyre, near the sea.

ALEXANDRIA, or ALLESANDRIA, surnamed *Della Paglia*, because the inhabitants use stubble for fuel instead of wood, or because the Germans contemptuously called it *Palearis*, or a fortress of straw, a city of Italy, in the district of Alexandrin or Alessandrino, belonging to the duchy of Milan, has a castle, and is situated in a marshy country, on the river Tenaro. It was built in honour of pope Alexander III. in 1170, and is said to have 12000 inhabitants. By this pope it was made a bishopric, suffragan of Milan, with several privileges annexed to it. The citadel is strong, but the fortifications are mean. It was ceded to the duke of Savoy in 1703; taken by prince Eugene, after three days' siege, in 1706, by the French in 1745, and retaken by the king of Sardinia, to whom it belongs by the treaty of Utrecht, in 1746. It is 38 miles east of Turin, and 37 south-south-west of Milan. N. lat. $44^{\circ} 48'$. E. long. $8^{\circ} 39'$.

ALEXANDRIA, a town of New Russia, in the government of Ekatarinoflaf, on the confines of Poland, 70 miles west of Ekatarinoflaf, and 150 south-west of Kiow. N. lat. $48^{\circ} 25'$. E. long. $32^{\circ} 54'$.

ALEXANDRIA or ALEXANDROW, a town of Poland, in the palatinate of Volhynia, upon the river Horin, 50 miles east-north-east of Lucko.

ALEXANDRIA, a township in Grafton county, N. Hampshire, in America, containing 298 inhabitants; incorporated in 1782.

ALEXANDRIA, a township in Hunterdon county, New Jersey, containing 1503 inhabitants, including 40 slaves.

ALEXANDRIA, a small town in Huntingdon county, Pennsylvania, on the Frankstown branch of Juniatta river, 192 miles north-west of Philadelphia.

ALEXANDRIA, formerly called *Belhaven*, a city of Virginia, situate on the southern bank of the Patowmac river, in Fairfax county, about five miles south-west from the Federal city, and 290 from the sea; N. lat. $38^{\circ} 45'$. W. long. $77^{\circ} 10'$. Its situation is lofty and pleasant, and the streets are laid out upon the plan of Philadelphia. It contains 400 houses, well built, and 2748 inhabitants. It bids fair, from the advantages of its situation, to be one of the most thriving commercial places on the continent.

ALEXANDRIA, Patriarch of, in *Ecclesiastical History*. See PATRIARCH.

ALEXANDRIAN, in a particular sense, is applied to all those who professed or taught the sciences in the school of Alexandria.

Thus, Clemens is called *Alexandrinus*, or the Alexandrian, though some say he was born at Athens: the same epithet is applied to Apion, born at Oasis; and to Aristarchus, by birth a Samothracian. The chief Alexandrian philosophers were Euclid, the famous geometer, the two ancient astronomers, Aristillus and Timocharis, Eratosthenes, Apollonius Pergæus, Conon, Hipparchus, Ctesibius, Heron, Possidonius, Pappus, Theon, Hypatia the daughter of Theon, Ptolemy; and Philoponus and Didymus, the last mathematicians of this school. To these we may add Ammonius, Plotinus, Origen, Porphyry, Jamblichus, Sopater, Maximus and Dexippus.

ALEXANDRIAN is more particularly understood of a college of priests, consecrated to the service of Alexander Severus, after his deification.

ALEXANDRIAN Copy, is a manuscript, consisting of four volumes, in a large quarto, or rather a folio size; which contains the whole Bible in Greek, including the Old and New Testament, with the Apocrypha, and some smaller pieces, but not quite complete. This manuscript is now preserved in the British Museum, where it was deposited in 1753. It was sent as a present to King Charles I. from Cyrillus Lucaris, a native of Crete, and patriarch of Constantinople, by Sir Thomas Rowe, ambassador from England to the Grand Seignior, in the year 1628. Cyrillus brought it with him from Alexandria, where, probably, it was written. In a schedule annexed to it, he gives this account; that it was written, as tradition informed them, by Thecla, a noble Egyptian lady, about thirteen hundred years ago, a little after the council of Nice. He adds, that the name of Thecla, at the end of the book, was erased; but that this was the case with other books of the Christians, after Christianity was extinguished in Egypt by the Mahometans: and that recent tradition records the fact of the laceration and erasure of Thecla's name. The proprietor of this manuscript, before it came into the hands of Cyrillus Lucaris, had written an Arabic subscription, expressing that this book was said to have been written with the pen of Thecla the martyr. Various disputes have arisen with regard to the place whence it was brought, and where it was written, to its antiquity, and of course to its real value. Some critics have bestowed upon it the highest commendation, whilst it has been equally depreciated by others. Of its most strenuous adversaries, Wetstein seems to have been the principal. The place from which it was sent to England was, without doubt, Alexandria, and hence it has been called *Codex Alexandrinus*. As to the place where it was written, there is a considerable difference of opinion. Mattheus Muttis, who was a contemporary, friend and deacon of Cyrillus, and who afterwards instructed in the Greek language John Rudolph Wetstein, uncle of the celebrated editor of the Greek Testament, bears testimony, in a letter, written to Martin Bogdan, a physician in Bern, dated January 14, 1664, that it had been brought from one of the 22 monasteries in Mount Athos, which the Turks never destroyed, but allowed to continue upon the payment of tribute. Woide endeavours to weaken the evidence of Muttis, and to render the testimony of the elder Wetstein suspicious; but Spohn, in his edition of the "Notitia Codicis Alexandrini," p. 10—13, shews, that the objections of Woide are ungrounded. Allowing their reality, we cannot infer, that Cyrillus found this manuscript in Alexandria. Before he went to Alexandria he spent some time on Mount Athos, the repository and manufactory of manu-

scripts of the New Testament, whence a great number have been brought into the West of Europe, and a still greater number has been sent to Moscow. It is therefore probable, independently of the evidence of Muttis, that Cyrillus procured it there either by purchase or by present, took it with him to Alexandria, and brought it thence on his return to Constantinople. But the question recurs, where was this copy written? The Arabic subscription above cited clearly proves, that it had been in Egypt, at some period or other, before it fell into the hands of Cyrillus. This subscription shews that it once belonged to an Egyptian, or that during some time it was preserved in Egypt, where Arabic has been spoken since the seventh century. Besides, it is well known that a great number of manuscripts of the Greek Bible have been written in Egypt. Woide has also pointed out a remarkable coincidence between the Cod. Alex. and the writings of the Copts. Michaelis alleges another circumstance as a probable argument of its having been written in Egypt. In Ezekiel xxvii. 18. both in the Hebrew and Greek text, the Tyrians are said to have fetched their wine from Chelbon, or, according to Bochart, Chalybon. But as Chalybon, though celebrated for its wine, was unknown to the writer of this manuscript; he has altered it by a fanciful conjecture to *αινον εκ χηβρον*, wine from Hebron. This alteration was probably made by an Egyptian copyist, because Egypt was formerly supplied with wine from Hebron. The subscription, before mentioned, ascribes the writing of it to Thecla, an Egyptian lady of high rank, who could not have been, as Michaelis supposes, the martyress Thecla, placed in the time of St. Paul: but Woide replies, that a distinction must be made between Thecla martyr and Thecla proto-martyr. With regard to these subscriptions we may observe, with a learned writer (Marsh), that the true state of the case appears to be as follows: "Some centuries after the Codex Alexandrinus had been written, and the Greek subscriptions, and perhaps those other parts where it is more defective already lost, it fell into the hands of a Christian inhabitant of Egypt, who not finding the usual Greek subscription of the copyist, added in Arabic, his native language, the tradition either true or false, which had been preserved in the family or families to which the manuscript had belonged, "Memorant hunc codicem scriptum esse calamo Theclæ martyris." In the 17th century, when oral tradition respecting this manuscript had probably ceased, it became the property of Cyrillus Lucaris; but whether in Alexandria, or Mount Athos, is of no importance to the present inquiry. On examining the manuscript he finds, that the Greek subscription is lost, but that there is a tradition recorded in Arabic by a former proprietor, which simply related that it was written by one Thecla a martyress, which is what he means by "memoria et traditio recens." Taking therefore upon trust, that one Thecla the martyress was really the copyist, he consults the annals of the church to discover in what age and country a person of this name and character existed, finds that an Egyptian lady of rank, called Thecla, suffered martyrdom between the time of holding the council of Nicæa and the close of the fourth century; and concludes, without further ceremony, that she was the very identical copyist. Not satisfied with this discovery, he attempts to account for the loss of the Greek subscription, and ascribes it to the malice of the Saracens; being weak enough to believe that the enemies of Christianity would exert their vengeance on the name of a poor transcriber, and leave the four folio volumes themselves unhurt." The learned Woide, who has himself transcribed and published this manuscript, and must be better acquainted with it than any other person, asserts, that it was written by two different copyists; for

for he has observed a difference in the ink, and which is of greater moment, even in the strokes of the letters. The conjecture of Oudin, adopted by Wetstein, that the manuscript was written by an Acœmetæ, in the judgment of Michaelis, worthy of attention, (See ΑCΩΜΕΤÆ) and he adds, that this conjecture does not contradict the account that Thecla was the copyist, since there were not only monks but nuns of this order.

The antiquity of this manuscript has been also the subject of controversy. Grabe and Schulze think that it might have been written before the end of the fourth century, which, says Michaelis, is the very utmost period that can be allowed, because it contains the epistles of ATHANASIUS. Oudin places it in the tenth century. Wetstein refers it to the fifth, and supposes that it was one of the manuscripts collected at Alexandria in 615, for the Syriac version. Dr. Semler refers it to the seventh century. Montfaucon (Palaog. Græc. i. p. 185.) is of opinion, that neither the Cod. Alex. nor any Greek manuscript, can be said with great probability to be much prior to the sixth century. Michaelis apprehends, that this manuscript was written after Arabic was become the native language of the Egyptians, that is, one, or rather two centuries after Alexandria was taken by the Saracens, which happened in the year 640, because the transcriber frequently confounds M and B, which is often done in the Arabic: and he concludes, that it is not more ancient than the eighth century. Woide, after a great display of learning, with which he examines the evidence for the antiquity of the Cod. Alex. concludes, that it was written between the middle and the end of the fourth century. It cannot be allowed a greater antiquity, because it has not only the *τιτλοι* or *κεφαλαια* majora, but the *κεφαλαια* minor, or Ammonian sections, accompanied with the references to the canons of Eusebius. Woide's arguments have been objected to by Spohn, in p. 42—109, of his edition of the "Notitia Codicis Alexandrini." Some of the principal arguments advanced by those who refer this manuscript to the fourth or fifth centuries are the following: the epistles of St. Paul are not divided into chapters like the Gospels, though this division took place so early as 396, when to each chapter was prefixed a superscription. The Cod. Alex. has the epistles of Clement of Rome; but these were forbidden to be read in the churches, by the council of Laodicea, in 364, and that of Carthage, in 419. Hence Schulze has inferred, that it was written before the year 364; and he produces a new argument for its antiquity, deduced from the last of the 14 hymns found in it after the palms, which is superscribed *υμνος ευθιμος*, and is called the grand doxology; for this hymn has not the clause *αγιος ο θιος, αγιος ισχυρος, αγιος αθανατος, ελεησον ημας*, which was used between the years 434 and 446; and therefore the manuscript must have been written before this time. Wetstein thinks that it must have been written before the time of Jerom, because the Greek text of this manuscript was altered from the old Italic. He adds, that the transcriber was ignorant that the Arabs were called Hagarenes, because he has written, 1 Chron. v. 20, *αγοραισι* for *Αγαραιου*. Others alledge that *αγοραισι* is a mere erratum; because *Αγαρειων* occurs in the preceding verse, *Αγαρηις* in 1 Chron. xxvii. 31, and *Αγαρηου* in Pl. lxxxii. 7. These arguments, says Michaelis, afford no certainty, because the Cod. Alex. must have been copied from a still more ancient manuscript; and if this were faithfully copied, the arguments apply rather to this than to the Alexandrian manuscript itself. It is the hand-writing alone, or the formation of the letters, with the want of accents, which can lead to any probable decision. The arguments alledged to prove that it is not so ancient as the fourth century, are such as these. Dr. Semler thinks,

that the epistle of Athanasius, on the value and excellency of the Psalms, would hardly have been prefixed to them during his life. But it ought to be recollected, that Athanasius had many warm and strenuous advocates. From this epistle Oudin has attempted to deduce an argument, that the manuscript was written in the tenth century. This epistle, he says, is spurious, and could not have been forged during the life of Athanasius, and the tenth century was fertile in spurious productions. Again, the Virgin Mary, in the superscription of the Song of the Blessed Virgin, is stiled *θεοτοκος*, a name which Wetstein says betrays the fifth century. Further, from the probable conjecture, that this manuscript was written by one of the order of the Acœmetæ, Oudin concludes against its antiquity; but Wetstein contents himself with asserting, that it could not have been written before the fifth century, because Alexander, who founded this order, lived about the year 420. From this statement, pursued more at large, Michaelis deduces a reason for paying less adoration to the Cod. Alex. than many eminent critics have done, and for the preference that is due, in many respects, to ancient versions, before any single manuscript, because the antiquity of the former, which is in general greater than that of the latter, can be determined with more precision.

As to the value of this manuscript, it has been differently appreciated by different writers. Wetstein, though he denotes it by A, the first letter of the alphabet, is no great admirer of it, nor does Michaelis estimate it highly, either on account of its internal excellence or the value of its readings. The principal charge which has been produced against the Alexandrian manuscript, and which has been strongly urged by Wetstein, is its having been altered from the Latin version. It is incredible, says Michaelis, who once agreed in opinion with Wetstein, but found occasion to alter his sentiments, that a transcriber who lived in Egypt, should have altered the Greek text from a Latin version, because Egypt belonged to the Greek diocese, and Latin was not understood there. On this subject Woide has eminently displayed his critical abilities, and ably defended the Greek manuscripts in general, and the Codex Alexandrinus in particular, from the charge of having been corrupted from the Latin. Griesbach concurs with Woide, in his "Symbolæ Criticæ," vol. i. p. 110—117; and both have contributed to confirm Michaelis in his new opinion. If this manuscript has been corrupted from a version, it is more reasonable to suspect the Coptic, the version of the country, in which it was written. Between this manuscript and both the Coptic and Syriac versions, there is a remarkable coincidence. Griesbach has observed, that this manuscript follows three different editions: the Byzantine in the Gospels, where its readings are of the least value; the Western edition in the Acts of the Apostles, and the Catholic Epistles, which form the middle division of this manuscript, and the Alexandrine in the Epistles of St. Paul. The transcriber, if this assertion be true, must have copied the three parts of the Greek Testament from three different manuscripts, of three different editions. It is observable, that the readings of the Cod. Alex. coincide very frequently, not only with the Coptic and the old Syriac, but with the new Syriac and the Ethiopic; and this circumstance favours the hypothesis, that this manuscript was written in Egypt, because the new Syriac version having been collated with Egyptian manuscripts of the Greek Testament, and the Ethiopic version being taken immediately from them, have necessarily the readings of the Alexandrine edition.

This manuscript, as we have already observed, consists of four volumes: the three first of which contain the Old Testament, the fourth the New Testament, together with the

first Epistle of Clement to the Corinthians, and a fragment of the second. In the New Testament there is wanting the beginning as far as Matt. xxv. 6. ο κρητος αρχηται; likewise from John vi. 50, to viii. 52, and from 2 Cor. iv. 13, to xii. 7. The Psalms are preceded by the epistle of Athanasius to Marcellinus, and followed by a catalogue, containing those which are to be used in prayer for each hour, both of the day and of the night; also by 14 hymns, partly apocryphal, partly biblical, the eleventh of which is an hymn in praise of the Virgin Mary, entitled *προσευχη Μαρίας της θεοτοκος*: the hypotheses Eusebii are annexed to the Psalms, and his canones to the Gospels. This manuscript has neither accents nor marks of aspiration; it is written with capital, or as they are called, uncial letters; and there are no intervals between the words, but the sense of a passage is sometimes terminated by a point, and sometimes by a vacant space. Although abbreviations are not very numerous, yet this manuscript abbreviates *αθη, απο, λαβιδ, διος, ιουδας, ισραηλ, κυριος, μητηρ, πατηρ, ερανος, πνευμα, εταρος, σωτηρ, υιος, χριστος*; and it has also other marks of abbreviation. Dr. Semler supposes, that the more ancient manuscripts from which the Cod. Alex. was copied, had a much greater number; from a false method of decyphering which marks, he explains many errors committed by the copyist of the latter. See his Note 33 to Wetstein's Prolegomena. Of these abbreviations, and the points annexed to certain letters, which before appeared unintelligible; and of the large initial letters, which are sometimes placed in a very extraordinary manner; and of other particulars, a full account may be seen in Woide's Preface, who has given a very accurate description of the manuscript in general. No manuscript has been more frequently and more accurately collated; and it was supposed, that the last extracts, made by Wetstein, would have rendered future labours of this kind superfluous; but Woide informs us, that Wetstein is chargeable with several omissions and errors, and has admitted into his collection of readings the mistakes of Mill. We are now in possession of a perfect impression of this manuscript, accompanied with so complete and so critical a collection of various readings, as is hardly to be expected from the edition of any other manuscript. Dr. Woide published it in 1786, with types cast for the purpose, line for line, without intervals between the words, as in the manuscript itself: the copy is so perfect a resemblance of the original, that it may supply its place: its title is "Novum Testamentum Græcum Codice MS. Alexandrino qui Londini in Bibliotheca Musei Britannici asservatur descriptum." It is a very splendid folio, and the preface of the learned editor contains an accurate description of the manuscript, with an exact list of all its various readings, that takes up no less than 89 pages, and each reading is accompanied with a remark, in which is given an account of what his predecessors, Junius, Walton, Fell, Mill, Grabe, and Wetstein, had performed or neglected. Those who are desirous of further information concerning this manuscript, may consult the Prolegomena of Mill, Grabe, Wetstein, and Woide. See also Michaelis's Introduction to the New Testament, by Marsh, vol. ii. part i. p. 186—209. part ii. p. 648—660.

ALEXANDRIAN *Library*, called by Livy "Elegantia regum curaque egregium opus," was first founded by Ptolemy Soter, for the use of the Academy, or Society of learned men, which he had founded at Alexandria. Beside the books which he procured, his son Ptolemy Philadelphus added many more, and left in this library at his death a hundred thousand volumes; and the succeeding princes of this race enlarged it still more, till at length the books lodged in it amounted to the number of seven hundred thousand volumes. The method by which they are said to have collected

these books was this: they seized all the books that were brought by the Greeks, or other foreigners, into Egypt, and sent them to the Academy, or Museum, where they were transcribed by persons employed for that purpose. The transcripts were then delivered to the proprietors, and the originals laid up in the library. Ptolemy Evergetes, for instance, borrowed of the Athenians the works of Sophocles, Euripides and Æschylus, and only returned them the copies, which he caused to be transcribed in as beautiful a manner as possible; the originals he retained for his own library; presenting the Athenians with 15 talents for the exchange, that is, with three thousand pounds sterling and upwards. As the Museum was at first in the quarter of the city called Bruchion, the library was placed there; but when the number of books amounted to four hundred thousand volumes, another library, within the Serapeum, was erected by way of supplement to it, and on that account called the daughter of the former. The books lodged in this increased to the number of three hundred thousand volumes; and these two made up the number of seven hundred thousand volumes, of which the royal libraries of the Ptolemies were said to consist. In the war which Julius Cæsar waged with the inhabitants of Alexandria, the library of Bruchion was accidentally, but unfortunately, burnt. But the library in Serapeum still remained, and there Cleopatra deposited the two hundred thousand volumes of the Pergamean library, with which she was presented by Mare Antony. These, and others added to them from time to time, rendered the new library of Alexandria more numerous and considerable than the former; and though it was plundered more than once during the revolutions which happened in the Roman empire, yet it was as frequently supplied with the same number of books, and continued for many ages to be of great fame and use, till it was burnt by the Saracens in the 642d year of the Christian æra. Abulpharagius, in his history of the 10th dynasty, gives the following account of this catastrophe. John Philoponus, surnamed the Grammarian, a famous Peripatetic philosopher, being at Alexandria when the city was taken by the Saracens, was admitted to familiar intercourse with Amrou, the Arabian general, and presumed to solicit a gift, inestimable in his opinion, but contemptible in that of the barbarians; and this was the royal library. Amrou was inclined to gratify his wish, but his rigid integrity scrupled to alienate the least object without the consent of the Caliph. He accordingly wrote to Omar, whose well known answer was dictated by the ignorance of a fanatic. "If these writings of the Greeks agree with the Koran, or book of God, they are useless, and need not be preserved; if they disagree, they are pernicious, and ought to be destroyed." The sentence of destruction was executed with blind obedience: the volumes of paper or parchment were distributed to the four thousand baths of the city; and such was their number, that six months were barely sufficient for the consumption of this precious fuel. Since the dynasties of Abulpharagius have been given to the world in a Latin version, this tale, as Mr. Gibbon (Hist. vol. ix. p. 440.) calls it, has been repeatedly transcribed; and every scholar, with pious indignation, has deplored the irreparable wreck of the learning, the arts, and the genius of antiquity. "For my own part," says this Historian, adopting the scepticism of Renaudot (Hist. Alex. Patriarch, p. 170.) "I am strongly tempted to deny both the fact and the consequences; the fact is indeed marvellous." "Read and wonder!" says the Historian himself; and the solitary report of a stranger who wrote at the end of six hundred years in the confines of Media, is overbalanced by the silence of two annalists of a more early date, both Christians, both natives of Egypt, and the most

most ancient of whom, the patriarch Eutychius, has amply described the conquest of Alexandria. But this curious anecdote will be vainly sought in the annals of Eutychius, and the Saracenic history of Elmacin. The silence of Abulfeda, Murtadi, and a crowd of Moslems, is less conclusive from their ignorance of Christian literature. The rigid sentence of Omar is repugnant to the sound and orthodox precept of the Mahometan casuists: they expressly declare, that the religious books of the Jews and Christians, which are acquired by the right of war, should never be committed to the flames; and that the works of profane science, historians or poets, physicians or philosophers, may be lawfully applied to the use of the faithful." See *Reland de Jure Militari Mohammedanorum*, in the third volume of *Dissertations*, p. 37. The reason for not burning the religious books of the Jews or Christians, is derived from the respect that is due to the name of God. It should be considered, however, that the positive evidence of an historian, of unquestionable credit as Abulpharagius, cannot be set aside by an argument merely negative. Mr. G. acknowledges, that "a mere destructive zeal may perhaps be attributed to the *first* successors of Mahomet." His references to A. Gellius (*Noctes Atticæ*, l. vi. c. 17.) Ammian. Marcell. (l. xxii. c. 16.) and Orosius (l. vi. c. 15.), as speaking of the Alexandrian libraries in the *passé*, are foreign from the purpose; for these writers only refer to the destruction of books at Alexandria in the time of Julius Cæsar; after which, large libraries must have been continually accumulating, during the long period in which the schools of philosophy flourished in that city. Brucker's *Hist. Philos.* by Enfield, vol. ii. p. 228. On the subject of this article, see Ammian. Marcellin. l. xxii. c. 16. p. 266. Ed. Gronov. Dion. Cass. l. xlii. 38. tom. i. p. 327. Ed. Reimari. Ed. Haverc. Plut. in Anton. op. vol. i. p. 943. Newton's *Disc. on the Prophecies*—Works vol. vii. p. 357. 8vo. *Anc. Un. Hist.* vol. viii. p. 166.

ALEXANDRIN, in *Geography*, a small district of Italy, in the duchy of Milan, in the environs of ALEXANDRIA *della Paglia*, to which it owes its name.

ALEXANDRIN, or ALEXANDRIAN, in *Poetry*, the name of a kind of verse, which consists of twelve, or of twelve and thirteen syllables, alternately; the rest, or pause, being always on the sixth syllable.

It is said to have taken its name from a poem on the life of Alexander, entitled, the *Alexandriad*; written, or at least translated into this kind of verse by some French poets; though others will have it so denominated from one of the translators, Alexander Paris.

This verse is thought by some very proper in the epopee, and the more sublime kinds of poetry; for which reason it is also called *Heroic Verse*.

It answers in our language to the hexameters in the Greek and Latin; though, according to some, it rather answers to the *senarii* of the ancient tragic poets.—Chapman's translation of Homer consists wholly of Alexandrians.

The advantages of the Alexandrian verse, are its keeping the rhimes from coming so near, and consequently hindering them from being so much perceived. To this may be added, that coming nearer to the nature of prose, it is fitter for theatrical dialogue, and supplies the office of the ancient iambics better than any other verse in rhyme.

ALEXANDRINUS, JULIUS, in *Biography*, born at Trent, in the early part of the 16th century, was physician

to the emperor Charles V., and afterwards to Maximilian II. by whom he was highly esteemed. He also acquired reputation as a poet, particularly for his *Pædotrophia*, a poem, published at Zurich, 1559, 8vo.

His medical works, which are numerous, and principally compiled from the ancients, or written in defence of the doctrine of Galen, are of little value. For their titles see Eloy's *Dictionnaire Historique de la Médecine*. He died at Trent, his native city, in the year 1590, aged 84 years, and was honoured with the following epitaph:

Cæsaribus si quis multos inservit annos,
Acceptus magnis principibusque fuit,
Te, Juli, vatem possum medicumque sateri,
Doctrina in cujus gratia tanta fuit.

ALEXANDROV, in *Geography*, a town of Kuban Tartary, in the Russian government of Caucasus, 16 leagues west north-west of Ekaterinograd.

ALEXANDROV, a town of Russia in the government of Vladimir, 16 leagues west of Moscow. N. lat. 55° 45'. E. long. 38° 44'.

ALEXANDROVSKAIA, a fortress of Russia in the government of Ekaterinoslav, 36 leagues north-east of Cherson. N. lat. 47° 35'. E. long. 35° 14'. This is also the name of another fortress in the same government, 23 leagues north-west of Cherson.

ALEXICACUS, compounded of *αλεξω*, *I drive away*, and *κακον*, *evil*, is something that preserves the body from harm or mischief, and alexicacus amounts to much the same with alexiterial.

ALEXICACUS, in *Antiquity*, was an attribute of Neptune, whom the tunny fishers used to invoke under this appellation, that their nets might be preserved from the *ξίφια*; or sword-fish, which used to tear them, and prevent the assistance which it was pretended the dolphins used to give the tunnies on this occasion. It was also an epithet of Hercules, as the defender of men.

ALEXINTA, in *Geography*, a town of European Turkey in Servia, six leagues north north-east of Nissa.

ALEXIPHARMIC, in *Medicine*, expresses that property which a remedy, either simple or compound, hath to resist or destroy every thing of a poisonous or malignant nature. The word is derived from *αλεξω*, *arceo*, *I expel*, and *φαρμακον*, *poison*.

The ancients had a notion, that there was poison in all malignant diseases, and in the generality of those whose cause was unknown. Whence alexipharmic became a denomination for all remedies and antidotes against malignant diseases, and for ANULETS.

The study of poisons and antidotes appeared at an early period among the physicians of Greece and Rome, and continued as long as the Greek physic lasted; and hence has arisen the number of antidotes and theriacs so frequently mentioned by those ancient writers. But their compositions for the correction of poisons were equally injudicious and unsuccessful. Modern physicians, and particularly the Galenists, adopting the ideas of the ancients, have transferred them from the case of poisons taken into the body, to that of noxious powers arising from contagion, or in any other way. The cure of the diseases proceeding from these, they have, therefore, attempted by the correction or expulsion of the morbid matter, and they have administered medicines for this purpose, under the titles of alexipharmics and alexiterials.

Alexiterial, cardiac, antidote, alexipharmic, and counter-poison.

poison, are all terms nearly of the same signification; and so are theriacs, upon the supposition of their being fitted to expel the poison of animals.

Alexipharmics are ordinarily divided into such as are general; and those more particular, supposed only to combat some particular disease.—But this division is founded more on speculation than experience.

Alexipharmic medicines, in general, are aromatic and pungent to the taste.—Among the rest, it is true, there are some acid plants and juices; but these are only reckoned in the number, on account of their use in malignant and colliquative fevers.

Alexipharmics chiefly act by exciting or increasing a diaphoresis, or perspiration; or by supporting the vigorous motion of the heart and arteries, which is always diminished in malignant diseases unattended by inflammation. In this latter sense wine may be reckoned among the principal alexipharmics. These medicines are also esteemed preservatives against malignant and pestilential fevers; but they are to be used with caution.

It is dangerous to administer alexipharmics to young people of plethoric habits, without previous evacuations; and Celsus advises only to promote a sweat, when the marks of one approaching are evident.

Alexipharmics are denominated proper correctors of opium, when it produces sickness, nausea, &c. They are also serviceable in those diseases which proceed from external cold, and obstructed perspiration; as catarrhs, rheumatisms, fluxes, coughs, and glandular tumours. Alexipharmics make a large class of medicines; but the principal ones are these: 1. Of the animal kingdom, hartshorn, bezoars, and the bones and teeth of different animals. 2. Of the vegetable kingdom, the leaves and flowers of all the aromatic plants, especially such as are umbelliferous. 3. Of the mineral kingdom, the different preparations of antimony, the dulcified spirit of vitriol, together with alcohol in all its forms and combinations. It does not appear, says Dr. Cullen, that the medicines given under the titles of alexipharmics and alexiterials are in any respect suited to expel morbid matter. So far as they are adapted to this purpose, they are diaphoretics or sudorifics, and should be cautiously used. The terms, therefore, he thinks, should be expunged from the writings on the *Materia Medica*: for, though the medicines may be useful, yet when they are given under the false idea which the terms imply, they may lead to an erroneous practice. Cullen's *Mat. Med.* vol. i. p. 165.

ALEXIPPUS, in *Biography*, one of the physicians to Alexander the Great, and in high esteem, as Plutarch informs us, with that prince.

ALEXIS, MICHAELOWITZ, or MIKHULOVITCH, in *Biography and History*, czar of Russia, succeeded his father Michael Theodorovitch in 1646, at the age of 15 years. He was immediately crowned by the direction of Morosof, who became his prime minister, and engrossed to himself the whole power of government. In order the more effectual to secure his influence with the czar, he married him to one of the daughters of a nobleman of small fortune, attached to his interest, and took the sister for his own wife. Although Morosof was in some respects an useful minister, by his attention to the army, by strengthening the frontiers against Poland and Sweden, and by erecting manufactories for arms, none of these services were sufficient to compensate the oppression which the people suffered under his administration. These grievances at length, viz. in 1648, produced an insurrection at Moscow, and the people demanded justice against Morosof and his confederates.

Two of their principal oppressors were put to death, and the minister escaped merely by the intercession of the czar himself. About this time appeared an impostor, the son of a linen draper of Wologda, who under various pretences laid claim to the throne. Neither the Swedes nor the Poles, whom he endeavoured to interest in his cause, afforded him any support; and after a short course of extravagance and profligacy, he fell into the hands of the Russians, who, after in vain attempting to obtain from him a confession by torture, put him to a cruel death. When these tumults were appeased, Alexis assumed the government, and exhibited promising tokens of capacity and vigour. Having settled a dispute between Russia and Sweden by an embassy to queen Christina, he directed his attention to Poland, and offered to employ his army in subduing the Cossacks, on condition of their conferring upon him the vacant crown. But the interest of France prevailing in favour of Casimir, the brother of Uladislaus their late king, Alexis declared war against the Poles, and assisted by the Cossacks, succeeded in recovering Smolenskow, Wilna, Kiow, and the province of Czernichow, which had been ceded to the Russians by the late peace. Poland being at this time, viz. in 1656, invaded by Gustavus, king of Sweden, with a formidable army, Alexis made a truce with that kingdom; and as the Swedes had appropriated to themselves the duchy of Lithuania, which the czar looked upon as his conquest, he marched his army into Carelia, Ingria and Livonia. At length, however, he thought it advisable, in 1658, to conclude a three years truce with Sweden; which, in 1661, was confirmed into a peace by the treaty of Cardis. By this treaty it was agreed, that, disregarding all that had passed between the two powers, every thing should remain as it had been settled by the treaty of peace made at Stolbova in 1617. The war of Alexis with Poland terminated more honourably for Russia. An armistice for 13 years, agreed upon at Andrussof in Lithuania was the forerunner of a complete pacification, which was effected in 1686, and which restored to the empire Smolensko, Severia, Czernichow, and Kiow. The king of Poland likewise relinquished the supremacy he had hitherto asserted over the Cossacks to the czar; and these people became now a protected relative of the Russian empire. Notwithstanding this favourable issue of the czar's contest with the Poles, a formidable domestic rebellion obstructed the operation of the plans which he was pursuing for the good of his country. This was occasioned, in 1669, by Stenko (Stephen) Radzin, whose brother had been hanged by order of Dolgoruchi, the Russian commander; and as he had thus infringed upon the liberty of the Cossacks, they made this a pretence for arming against their sovereign, though there is reason to believe that ambition was the ruling principle of Radzin. Whatever was the motive, a civil war was the consequence, which was carried on with various success, and equal cruelty on both sides. Radzin gained possession of Altrachan, and being joined by a multitude of peasants, who murdered their lords, his army at one time amounted to 200,000 men. This rebellion was not suppressed till the year 1671, when Radzin was betrayed into the hand of the czar, and executed. The affairs of Poland, and the measures which Alexis had taken for making himself protector of the Cossacks, produced a misunderstanding between the Grand Signior and the czar, which terminated in actual hostilities. Alexis endeavoured to engage all the Christian potentates in his dispute, and to form a league against the Turks; and with this view he sent ambassadors to several of them, and one to Rome, who refused

refused to degrade himself by kissing the pope's toe. He returned with fair promises, and no other succour. Alexis joined with the Poles, and the Turkish conquests were stopped by the great commander Sobiesky. At the vacancy of the crown of Poland, he proposed his son for king, and to unite that kingdom with his own; but the electors preferred Sobiesky. Jealousies arose in the progress of the war with the Turks between Russia and Poland, and they terminated in the conquest of the whole Ukraine by the Poles. Alexis did not live to see the end of this war; for his death happened in 1676, at the early age of 46; and it is supposed that he fell a victim to the empirical remedies of an old Polish woman, in whom he reposed greater confidence than in his physicians. Alexis had claims of various kinds on the esteem and gratitude of his country. He not only restored, by his successful wars with Poland, the provinces that had been wrested from the empire, and laid a foundation for a sovereignty over the Cossacks, but he was equally attentive to the internal improvement of the country. He caused an epitome of several sciences to be translated into the Russian language, and took pleasure in perusing it: he collected the laws of the various provinces of his empire into one body, and by the advice of the nobility, clergy, and burghers, made laudable attempts in legislation: he introduced several new manufactures, particularly those of silk and linen, and encouraged the trade of the country: he added two suburbs to Moscow, and built several market towns, which he peopled with Poles and Lithuanians: he brought several large deserts into a state of culture and population, by settling in them the prisoners taken in war; he formed a design, executed by his son Peter, of maintaining fleets in the Caspian and Euxine seas, and of making the Russians acquainted with the art of constructing ships, and with maritime commerce: he received ambassadors from Persia, China, and Asia; and was the first czar who maintained a close correspondence with the principal European powers. The mildness of his government allured Germans, Dutch, Italians, and about 3000 Scotsmen into Russia. By augmenting the power of the crown he prepared for the general improvement of a country, like Russia, possessed by a powerful and barbarous aristocracy. He instituted a private chamber for the trial of offences against himself, and though he proceeded cautiously in his examination, he executed justice with rigour on the guilty, and generally in a private manner. With small revenues, he nevertheless contrived, by œconomy and prudence, to maintain a large army and a magnificent court, and left his treasury rich. Alexis had formed many useful projects; but death prematurely carried him off in the 47th year of his age. Under him the Russian empire made some progress in civilization; and he traced out a variety of important plans which his son Peter the Great improved and executed.

Alexis loved his people, and was a father to them: he studied their happiness, and made his government as easy to them as possible. He loved justice and peace: and, though valiant, never made war but when he could not avoid it. He endeavoured, in the progress of his reign, to repair the ills which his favourites and ministers had occasioned in his youth, and at the commencement of it, by abusing his confidence. Upon the whole, he was one of the greatest princes of his time. By his first wife he had two sons and four daughters; and by his second wife Natalia, the daughter of Nariskin, a captain of hussars, one son, *viz.* Peter, who succeeded him, and one daughter. *Mod. Un. Hist.* vol. xxxi. p. 424—462. *Tooke's History of Russia*, vol. ii. p. 14—30.

ALEXIS, a famous statuary, mentioned by Pliny, N. H. tom. ii. p. 649.

ALEXIS, a Greek comic poet, uncle to Menander, who flourished in the time of Alexander the Great, about 363 years before the Christian Æra. Fragments of this poet may be found in "*Vetullissimorum Græcorum Bucolica Gnomica*," &c. Crispin, 1570, 16to.

ALEXIS, WILLIAM, a benedictine monk, in the abbey of Iyra, was living in 1500, and has left several pieces of poetry, which were esteemed in their time. The principal are "*Four Chants-Royaux*," 4to. "*Le Passe-tems de tout hommes et de toute femmes*," Paris, 4to. and 8vo., translated from a work of Innocent III. and describing the miseries of man, from the cradle to the grave. "*Le grand blason des faulces amours*," 16to. and 4to.; a *Dialogue on the evils occasioned by love.* *Biog. Dict.*

ALEXIS, a *Piedmontese*, was born of a noble family, and by his early application acquired the knowledge of the Latin, Greek, Hebrew, Chaldee, Arabic, and other languages. Alexis is supposed to be a feigned name; and the real name of this author, who wrote in the beginning of the 16th century, is apprehended to be Hieronymus Ruscellai; and he is said to have died in 1565. It has been generally asserted, though it be not strictly true, that he was the first person who mentioned ULTRAMARINE. His receipt, however, has been followed since that time as the best and most certain. His work "*De Secretis*," furnishes materials for the technological history of inventions. It was printed for the first time at Milan, in 1557; though Beckman apprehends that the first edition must have been of an older date. A French translation was printed at Antwerp in 1557. "*The Secrets of Alexis*," London, 1558, is mentioned by Ames in his "*Typographical Antiquities*," p. 296. Wecker, a physician at Colmar, translated this book into Latin, and enlarged it with additions, under the title of "*De Secretis Libri xvii.*" The first edition, according to Haller, was printed at Basle, in 1559, 8vo. Many editions of it have since appeared. The last, by Zwinger, was published at Basle in 1753. Alexis, it is said, urged by a curiosity to be acquainted with the secrets of nature, collected as much as he could during his travels for 57 years, and valued himself on concealing them; but when he was 82 years of age, he saw a poor man, whose disorder proved fatal, because he had not discovered an effectual remedy, of which he was possessed; upon which his conscience so troubled him, that he became a hermit; and in his solitary retirement, arranged his secrets in an order fit for publication. *Gen. Dict.* Beckman's *Hist. Inventions*, vol. ii. p. 351.

ALEXIS, in *Entomology*, a species of *PAPILIO Plebejus*, with caudated brown wings, and a cærulean band under the posterior; found in India.

ALEXITERIAL, in *Medicine*, a term of the same import with alexipharmic; but chiefly applied to the milk-water of that name, and remedies against the poisonous bites of animals.

But it is said by some authors that alexiterials differ from alexipharmics: thus, alexipharmics signify medicines against poisons taken internally; whereas alexiterials are remedies against the poisons of venomous animals inflicted externally.

ALEXIUS I. COMNENUS, in *Biography and History*, emperor of the East, was the son of John Comnenus, the brother of the emperor Isaac, and born at Constantinople, A. D. 1048. He was endowed by nature with the choicest gifts both of mind and body; these were cultivated by a liberal education, and exercised in the school of obedience

and adversity. Alexius, and Isaac, his elder brother, distinguished themselves in the war against the Turks, and adhered to the emperor Michael Ducas, till he exchanged the empire for a monastic habit and the title of archbishop of Ephesus. On this occasion Alexius offered his services to Nicephorus Botaniates, the successor of Michael; and with a noble frankness addressed him: "Prince, my duty rendered me your enemy; the decrees of God and the people have made me your subject. Judge of my future loyalty by my past opposition." His fidelity and valour, as well as his humanity, were sufficiently evinced by his victorious exploits against the three rebels, Ursel, Bryennius and Basilarius, who disturbed the peace of the empire. But his refusal to march against the fourth rebel, the husband of his sister, cancelled the merit and the memory of his past services; and the two brothers, driven into rebellion and supported by the army, succeeded in deposing Botaniates. Isaac, though the elder brother, was the first to invest Alexius with the name and ensigns of royalty, and being saluted emperor by the army, he marched immediately against Constantinople, which he took and plundered; and the fleet was induced by the influence of George Palæologus, to declare in his favour. Botaniates resigned the empire, and Alexius, without further contest, ascended the throne, A. D. 1081. Having compensated for the plunder of the churches and monasteries at Constantinople, by every penance compatible with the possession of the empire, he prepared for restraining the conquests of the Turks, who had seized on several provinces, and threatened to subvert the empire. The Turks, however, made overtures of peace, which were accepted by Alexius, in consequence of the hostilities that were meditated against him in the west by Robert Guiscard, duke of Puglia and Calabria. Robert, having landed at Buthrotum, in Epirus, and having advanced to Dyrrachium or Durazzo, which was defended by a garrison under the command of George Palæologus, was there met by Alexius with a large army. In a general action, which he commenced against the advice of his wisest captains, Oct. 18, A. D. 1081, he sustained a defeat, which was attended with great loss, and followed by the surrender of Durazzo, Feb. 8, A. D. 1082. Alexius was assiduous in raising new levies, and in order to obtain necessary supplies, he presumed, in a manner very offensive to the ecclesiastics, to borrow the superfluous ornaments of the churches. He also formed an alliance with Henry, emperor of Germany, who invaded Calabria, and whose progress demanded the hasty return of Robert. Bohemund, the son of Robert, was appointed his lieutenant in the east; but after reducing several places in Illyricum, he was constrained, by a mutiny in the army, to repair to his father in Italy. In October, A. D. 1084, Robert resumed the design of his eastern conquests, and made a second expedition into Greece. Alexius, apprehending an attack, had obtained a very considerable succour to his naval forces from the republic of Venice. By the union of the Greeks and Venetians, the Adriatic was covered with an hostile fleet; but by the vigilance of Robert and the concurrence of favourable circumstances, the Norman troops were safely disembarked on the coast of Epirus. The dominion of the sea was disputed in three engagements, in sight of the island of Corfu; in the two former, the skill and numbers of the allies were superior; but in the third, the Normans obtained a final and complete victory. On this occasion, Anna Comnena, the daughter of Alexius, and the writer of his life, deploras the loss of 13,000 of his subjects or allies. But in the isle of Cephalonia, the projects of Robert were fatally blasted by an epidemical disease; and he himself, in the 70th year of his age, expired in his tent; not without the suspicion of

poison, which public rumour imputed to his wife, or to the Greek emperor, Alexius, who had trembled for his empire, and now rejoiced in his deliverance. The Normans withdrew their forces from Greece, and tranquillity was restored. This war was succeeded by another with the Scythians, who passing the Danube, laid waste a great part of Thrace, and were guilty of many horrid cruelties. The generals of Alexius, who were first employed in opposing them, sustained several defeats; but they were at length completely subdued, with a very general slaughter, by the emperor himself. His next attention was engaged by the Turks, and again by the Scythians; but Alexius, having terminated his contests with both these enemies by a peace, returned to Constantinople; where he was informed, that the Western Christians were making great preparations for the recovery of the Holy Land, at that time possessed by the Turks and Saracens. At the council of Placentia, held March, A. D. 1095, the ambassadors of Alexius appeared to plead the distress of their sovereign and the danger of Constantinople, which was divided only by a narrow sea from the victorious Turks, the common enemies of the Christian name; and the relief of Constantinople was included in the larger and more distant project of the deliverance of Jerusalem. The emperor's ambassadors had solicited a moderate succour, perhaps of 10,000 soldiers; but when the Crusaders arrived, A. D. 1096, he was astonished by their number, and fluctuated between hope and fear, between timidity and courage. His conduct was irresolute and ambiguous, and he has been charged by the Latin writers, with the basest treachery. His gifts and promises, however, insensibly soothed the fierce spirit of the Western strangers; and as a Christian warrior, he rekindled their zeal for the prosecution of their holy enterprize, which he engaged to second with his troops and treasures. By his skill and diligence, Alexius prevented the union of any two confederate armies, at the same moment, under the walls of Constantinople; and he contented himself, either from pride or prudence, with extorting from the French princes an oath of honour and fidelity, and a solemn promise, that they would either restore, or hold, their Asiatic conquests, as the humble and loyal vassals of the Roman empire. Nice was the first object of attack on the part of the Crusaders, and the means of conquest were supplied by the prudence and industry of Alexius; he guarded with jealous vigilance this important conquest, and the city was delivered up to his lieutenant. When the crusaders afterwards took possession of Antioch, they elected Bohemond prince of that metropolis, alledging that Alexius had violated his agreement, and under various pretences, declined affording them the least assistance. The consequence of this appointment was a war between Bohemond and Alexius, who fitted out a powerful fleet, which obtained a complete victory over that of the Crusaders, near Rhodes. He also retook Laodicea, which Bohemond had appropriated to himself, as prince of Antioch. Alexius, by his endeavours to stop the progress of the Christian princes in the East, incensed the pope and the people to such a degree, that they considered him as an enemy to the Christian name, and supplied Bohemond with large succours to oppose him. Bohemond, thus aided, laid siege to Durazzo; but the place held out till the war was concluded by a negotiation. Alexius, disengaged from this contest, marched in person against the Turks, who renewed their incursions as far as Nice, and defeated them with great slaughter. They returned, however, the next year, and being dispirited by successive defeats, they sued for peace and obtained it. The remaining part of the life of Alexius was devoted to the purpose of healing the divisions, which at that time rent the Greek church. After
a long

a long reign of 37 years, Alexius died, A. D. 1118, and was succeeded in the empire by his son John Comnenus.

Of the character of this emperor the Greek and Latin writers have given a very different account. In the biography of his daughter, the celebrated Anna Comnena, it is lost in a vague confellation of virtues, and the perpetual strain of panegyric and apology awakens our jealousy to question the veracity of the historian and the merit of the hero. On the other hand, the Latin writers, who have written the history of the holy war, represent him as a monster of perfidy. The circumstances of the times in which he lived, whilst they afford a display of his political wisdom and military valour, furnish some apology for the dissimulation and artifice to which he occasionally recurred. To his relations and friends he was grateful and liberal; and to his enemies tolerant and forgiving. At the head of his armies he was bold in action, skilful in stratagem, patient of fatigue, ready to improve his advantages, and capable of rising from his defeats with inexhaustible vigour. The discipline of the army was revived, and a new generation of men and soldiers was created by the example and precepts of their leader. In his intercourse with the Latins, he was patient and artful; and he contrived with superior policy to balance the interests and passions of the champions of the first Crusade. In a long reign of 37 years, he subdued and pardoned the envy of his equals; the laws of public and private order were restored; the arts of wealth and science were cultivated; the limits of the empire in Europe and Asia were enlarged; and the Comnenian sceptre was transmitted to his children of the third and fourth generation. Yet the difficulties of the times betrayed some defects in his character; and have exposed his memory to some just or ungenerous reproach. His happiness was interrupted, and his health was impaired by public cares; the patience of Constantinople was fatigued by the length and severity of his reign; and before he expired, he had lost the love and reverence of his subjects. Although he had applied the riches of the church to the service of the state, and thus incurred the displeasure of the clergy; yet they applauded his theological learning and ardent zeal for the orthodox faith, which he defended with his tongue, his pen, and his sword. His character was degraded by the superstition of the Greeks; and whilst he founded an hospital for the poor and infirm, he ordered the execution of an heretic, who was burnt alive in the square of St. Sophia. The sincerity of his moral and religious virtues was suspected by his intimate associates. In his last hours, when he was pressed by his wife Irene to alter the succession, he raised his head, and breathed a pious ejaculation on the vanity of the world. The indignant reply of the empress, says a popular historian, may be inscribed as an epitaph upon his tomb: "You die, as you have lived—*an hypocrite.*" *Anc. Un. Hist. vol. xv. p. 136—151. Gibbon's Hist. vol. ix. p. 83, &c. vol. x. p. 294. vol. xi. p. 45, &c.*

ALEXIUS II. succeeded his father Manuel, as emperor of the East, in 1180, at the age of 12 years. His mother Maria, a princess of Antioch, assumed the government during the minority of her son, and his education was neglected, that she might retain her absolute authority. During this period, ANDRONICUS, who had long aspired to the empire, attempted to attain the object of his ambition. Having, notwithstanding the profligacy of his character, gained a considerable degree of popularity, he was declared protector of the empire during the minority of Alexius; and when he had caused the young prince to be solemnly crowned, he contrived to be chosen his colleague in the empire. Notwithstanding a solemn oath, that he accepted the dignity

merely for the purpose of protecting the young emperor and supporting his authority, he soon caused him to be murdered; and strangling him with a bow-string, terminated his life in the third year of his reign, and 15th of his age. *Anc. Un. Hist. vol. xv. p. 157—160.*

ALEXIUS III. ANGELUS, obtained the empire of the East, A. D. 1195, by the exclusion of his brother Isaac Angelus, whom he threw into prison and deprived of sight. Indolent and devoted to pleasure, he committed the conduct of public affairs to his wife Euphrosyne, who oppressed the people, and sold the chief offices of state to the highest bidder. In 1202 he released his brother Isaac, and called his son Alexius, who was then about 12 years of age, to the court, and treated him as his child. But the young prince, aided by his sister Irene, wife to Philip, emperor of Germany, escaped from Constantinople, and landed safe in Sicily. Philip, by means of his ambassadors, engaged the French and Venetians in his support. A treaty for this purpose having been concluded between them and Alexius, the army of these united powers embarked for Corfu, which was the place of rendezvous; and proceeded to Constantinople. Upon their approach the usurper escaped; and in 1203 the young prince was associated with his father Isaac in the empire, and crowned with extraordinary pomp and solemnity. The usurper, who had fled to Zagora, a city of Thrace, at the foot of mount Hæmus, after various adventures, fell into the hands of his son-in-law, Theodore Lascaris, against whom he had instigated the Turks, who put out his eyes, and shut him up in a prison at Nice, in Asia, where he died some years after. *Anc. Un. Hist. vol. xv. p. 195—168—173. Gibbon's Hist. vol. i. p. 185, &c.*

ALEXIUS IV., the son of Isaac Angelus, was crowned associate with his father in the empire in 1203. The price of his rescue and advancement to the throne involved him in difficulties that were insuperable. This was no less than the submission of the Eastern empire to the pope, the succour of the Holy Land, and a contribution, as soon as he was invested with the crown, of 200 thousand marks of silver. After his accession to the throne, he prevailed on the Marquis of Montferrat, at the price of 1600 pounds of gold, to lead him with an army round the provinces of Europe; but upon his return, as his father was despised on account of his infirmities, he was hated as an apostate, who had renounced the manners and religion of his country. His secret covenant with the Latins was divulged or suspected. The people, and especially the clergy, were devoutly attached to their faith and superstition; and every convent, and every shop, resounded with the danger of the church and the tyranny of the pope. Whilst complaints were muttered against the emperor and his government, and quarrels were fomented between the Greeks and Latins, Constantinople was visited with a calamity which might be justly imputed to the zeal and indiscretion of the Flemish pilgrims. A conflagration spread, during eight days and nights, above a league in front, from the harbour to the Propontis, over the most populous regions of the city. By this outrage the name of the Latins became still more unpopular. Upon the return of Alexius, his youthful mind hesitated between gratitude and patriotism, between the fear of his subjects and that of his allies. By his feeble and fluctuating conduct he lost the esteem and confidence of both; and whilst he invited the Marquis of Montferrat to occupy the palace, he suffered the nobles to conspire, and the people to arm, for the deliverance of their country. The Latins, regardless of his critical situation, repeated and enforced their demands, and reminded the emperor, with menace and insult, of his own

own engagements and of their services. The threats of the Latins concurred with the dissatisfaction of the Greeks in exciting a tumult among the people; of which a prince of the house of Ducas, surnamed Mourzoufle, perfidiously availed himself to cause a vacancy of the throne. Alexius, hurried by the arts of this false friend into a prison, was seized, stripped and loaded with chains; and, after talking some days the bitterness of death, he was poisoned, or strangled, or beaten with clubs, A. D. 1204. The emperor Isaac Angelus soon followed his son to the grave; if, indeed, he survived his death. *Anc. Un. Hist.* vol. xv. p. 168. *Gibbon's Hist.* vol. xi. p. 225.

ALEXIUS V. DUCAS, surnamed *Mourzoufle*, on account of the close junction of his black and shaggy eye-brows, was, according to Ducange, second cousin of young Alexius, whom he betrayed and dethroned, and succeeded to the empire on his death. The people having advanced him to the throne, he found it necessary to prepare for the defence of the metropolis of the empire. The princes of the Crusade renewed their claims, and pitying the fate of Alexius, the late emperor, to which, indeed, they themselves had contributed, resolved to revenge his death. Accordingly they mustered all their forces in Asia, crossed the Straits, and closely besieged the Imperial city, both by sea and land. Mourzoufle, who was a man of warlike valour and experience, made a vigorous defence; but in a nocturnal assault, he was overpowered; the city was taken and plundered, and the capture of it was attended with a dreadful slaughter. The emperor made his escape in the night with Euphrosyne, the wife of the late usurper Alexius Angelus, and her daughter Eudoxia, for whose sake he had abandoned his lawful wife. This happened, A. D. 1204. Mourzoufle sought an asylum in the camp of his father Alexius, in Thrace, and was at first received with smiles and honours; but as the wicked can never love, and should rarely trust, their fellow-criminals, he was seized in the bath, deprived of his eyes, stripped of his troops and treasures, and turned out to wander an object of horror and contempt to those who with more propriety could hate, and with more justice could punish, the assassin of the emperor Isaac and his son. As he was privately passing over into Asia, he was seized by the Latins of Constantinople, and condemned, after an open trial, for the murder of young Alexius, to an ignominious death. His judges, having dehailed the mode of his execution, resolved, that he should ascend the Theodosian column, a pillar of white marble, 147 feet high, and be cast down headlong from its summit, and dashed in pieces on the pavement, in the presence of a great multitude of spectators. *Anc. Un. Hist.* vol. xv. p. 169. *Gibbon's Hist.* vol. xi. p. 225, 252, &c.

ALEYN, CHARLES, an elegant historical poet, in the reign of king Charles I., was educated at Sidney college, Cambridge, and afterwards settled as usher in a grammar school in London. In 1631 he published two poems, entitled, "The Battails of Cressley and Poitiers, under the fortunes and valour of king Edward III. of that name, and his sonne Edward, prince of Wales, named the Black." Having left the school in which he was usher, he was domestic tutor to the son of Sir Edward Sherburne, afterwards clerk of the ordnance and commissary general of the artillery to king Charles, at the battle of Edgehill. In this situation he wrote another elaborate poem, in honour of king Henry VII, and that important battle which gained him the crown of England. This poem was published in 1638, and entitled, "The historie of that wife and fortunate prince Henrie, of that name the seventh, king of England; with that famed

battaille, fought between the said king Henrie and Richard III., named crook-back, upon Redmore, near Bosworth." He died about the year 1640; before which time he published a translation, "The History of Eurialus and Lucretia," from a story found among the Latin epistles of Æneas Sylvius. *Biog. Brit.*

ALEZONNE, in *Geography*. See ALESORNE.

ALFABUCELLIS, in *Ancient Geography*, a place of Italy, assigned by Ptolemy to the Marit.

ALFACAR, in *Geography*, a town of Spain, five miles north-east of Grenada.

ALFANDEGA DE FE, a small district of Portugal, in the province of Traz-oz Montes, containing 15 parishes.

ALFANDIGA, the name of the custom-house at Lisbon.

ALFAQUES, among the Spanish Moriscoes, were the clergy, or those who instructed them in the Mahometan faith. The alfaques differed from the *Morabites*, who answered to monks, or religious, among Christians.

ALFAQUES, or ALFACQS, in *Geography*, a sea-port town of Spain, in the province of Catalonia, on the coast of the Mediterranean, situate on an island of the same name at the mouth of the Ebro, three leagues south of Tortosa.

ALFAQUES, a town of Africa, in the kingdom of Tunis.

AL-FARABI, or ABU NASSR, in *Biography*, a native of Balch Farab, a town of Asia Minor, called by the Turks Otrar, was a celebrated philosopher of the school of Bagdad, and flourished in the 10th century. His parents were opulent, but he preferred the study of philosophy to the acquisition or possession of affluence. He studied mathematics and medicine, but chiefly excelled in logic. Such were his talents and learning, that great men and princes were emulous to confer upon him honours and emoluments. But Al-Farabi declined every offer of this kind, and preferred, either through his love of philosophy or from a natural gloominess of temper, solitude, and an abstemious life. During winter, he constantly slept on straw, his countenance was always sorrowful, and he found consolation in nothing but philosophy. Lamenting the imperfection and vanity of human life, and dreading intercourse with the world as destructive of innocence, he employed his time in study, and devoted his whole attention to the perusal of the writings of Aristotle. He wrote 60 distinct treatises on the Aristotelian philosophy, which were popular and much read among the Arabians, and also among the Jews. Many of his books were translated from Arabic into Hebrew. The subjects on which he principally treated were logic, metaphysics, and physics. Among his writings on the last of these subjects are mentioned treatises on optics and astronomy. *Abulf. Dyn.* ix. p. 208. *Pococke*, p. 372. *Fabric. Bib. Gr.* vol. xiii. p. 265. *Brucker's Hist. Philos.* by Enfield, vol. ii. p. 239.

ALFARO, in *Geography*, a town of Spain, in the province of Old Castile, on the south side of the Ebro, and on the borders of Navarre, nine miles north-west of Tudela.

ALFAS, small islands of the Red Sea, over against the west side of Arabia Felix. They are only inhabited occasionally by the Moors, who come thither from other islands for the sake of the pearl fishery. N. lat. 17° 10'. E. long. 45° 44'.

ALFATERNA, in *Ancient Geography*. See NOCERA.

ALFAYATES, in *Geography*, a town of Portugal, in the province of Beira, situate on an eminence, near the confines of Spain, is walled and guarded, but contains only one parish,

parish, and about 500 inhabitants: distant 150 miles north-east from Lisbon. N. lat. 40° 9'. W. long. 5° 42'.

ALFDOUCH, a name given by the Moors to a sort of vermicelli, which they make of flour and water, and which they are very fond of in their entertainments.

ALFECCA, or ALFETA, in *Astronomy*, a name given to the star commonly called *lucida corone*.

ALFEIZERAO, in *Geography*, a town of Portugal, in Estremadura, is a small place lying on the sea, and contains about 700 inhabitants.

ALFELD, a town of Germany, in the circle of Lower Saxony, and bishopric of Hildesheim, situate on the Leine, 30 miles south of Hanover, and 15 south of Hildesheim.

ALFELD, a town of Germany, in the circle of the Lower Rhine, four miles north of Neidenau.

ALFELDHA, a mountain of Persia, in the province of Kirman, 12 leagues south of Sirgian.

ALFENUS, VARUS, in *Biography*, a Roman Civilian, was a native of Cremona, and a disciple of Servius Sulpitius. He flourished about the year of Rome, 754, or the first of the Christian æra. Horace mentions him as a person who had been brought up in the mechanical occupation of a shoemaker, or, as others say, a barber; and who had quitted this humble station for a profession in which he had acquired reputation.

“ ——— Alfenus vafer, omni
Abjeto instrumento artis, clausaque taberna,
Sutor erat; sapiens operis sic optimus omnis
Est opifex, sic rex solus.” SAT. lib. i. sat. iii. v. 130.

“ Shuffling Alfen, though he lost his awl,
And threw away his last, and shut his stall,
And broke his threads, yet was a cobbler still:
Thus every tradesman, if he hath but skill,
Is wise, and therefore only king.” CREECH.

Ammianus Marcellinus refers to Alfenus, (lib. xxx. c. 4. p. 458. ed. Gronov.) as a person whose authority was held in high estimation in matters of law. Aulus Gellius also, citing his works, (lib. vi. c. 5.) speaks of the author as a diligent inquirer into antiquities; “Rerum Antiquarum non incuriosus.” He wrote 40 books of Digests, which are mentioned in the index of the Pandects, and several books of Collections. Paulus, the Civilian, made an abridgment of his works. Some say that he was a consul, and an old Scholiast on Horace says, that he was buried at the public expence. If this be the case, Alfenus, without enriching himself by his profession, had acquired an honest reputation, and exhibits an encouraging example to those who possess talents, for rising from a lower sphere of life to eminence by professional merit. Gen. Dict.

ALFERE, in *Geography*, a town of Arabia, 24 leagues south of Medina.

ALFET, in *Ancient Customs*, signified a large caldron, which contained boiling water, in which a person accused plunged his hand and arm as far as the elbow, by way of trial or purgation.

ALFIDENA, in *Geography*, a town of Naples, in the province of Abruzzo Citra, 15 miles south-south-east of Sulmona; famous in the war of the Samnites.

ALFONSUS, in *Biography*. See ALPHONSUS.

ALFORD, MICHAEL, an English Jesuit, was born in London, in 1587, and entered into the society in 1607. Having studied theology and philosophy in Spain, and at Louvain, and having resided some years at Rome, he returned to England, where he was arrested, but afterwards released.

From that time he remained in England for 30 years as a missionary from the society. He died at St. Omer's, in 1622, and left two treatises in ecclesiastical history, viz. “*Britannia illustrata*,” printed at Antwerp, 1641, in 4to.; and “*Annales Ecclesiastici Britannorum*,” printed also at Antwerp. Gen. Biog.

ALFORD, in *Geography*, a town of England, in the county of Lincoln, about six miles from the sea, 23½ north of Boston, and 140½ north of London. It has a market on Tuesday, and two fairs on Whit-Tuesday and Nov. 8, for cattle and sheep. It has a spring, which contains a purging salt, and has been recommended in the fever, jaundice, and other glandular obstructions, and also in disorders of the kidneys and bladder. N. lat. 53° 30'. E. long. 0° 15'.

ALFORD, a township of America, in Berkshire county, in the Massachusetts, containing 577 inhabitants, 145 miles west from Boston.

ALFORDSTOWN, a small town in Moor county, North Carolina.

ALFRAGAN, AHMED EEN KOTHEIR AL FARGANI, or, as others call him, MOHAMMED EEN KITIR AL FORGANI, in *Biography*, a celebrated Arabian astronomer, was born at Fergan, in Sogdiana, now Samarcand, and flourished in the beginning of the ninth century, under the Caliphate of Al-Mamon. His work in Arabic, entitled, “*The Elements of Astronomy*,” consists of 30 chapters or sections, and is formed upon the principles of Ptolemy, whom the author often cites. Of this work we have a Latin translation by Johannes Hispalensis, in the 12th century, printed at Ferrara, in 1493, and at Nuremberg, in 1537, with a preface by Melancthon; another by James Christman, from the Hebrew version of James Antoli, at Frankfort, in 1590, to which the editor added an ample commentary, in which he compares the calendars of the Romans, Egyptians, Persians, Syrians, and Hebrews, and shows the correspondence of their years; and a third, which is the best, by Golius, with the Arabic text and valuable notes on the first nine chapters, printed in 1669, at Amsterdam, in 4to., after the death of the editor, which he did not live to finish. Mod. Un. Hist. vol. ii. p. 202. Hutton's Mat. Dict. vol. i. p. 63.

ALFRED, or ÆLFRED the Great, in *Biography*, the glory of our Saxon monarchs, was the youngest son of Ethelwolf, king of the West Saxons, and was born at Wantage, supposed to be Wantage, in Berkshire, in the year 849. Ethelwolf, being a man of great piety, sent Alfred to Rome, when but five years of age, to receive confirmation, some say regal unction, from the hand of pope Leo the Tenth; who, on performing the sacred rite, bled him his son, and foretold, it is said, his future greatness.

His three elder brothers, Ethelbald, Ethelbert, and Ethelred, having regularly succeeded to the throne, and died after short reigns, Alfred assumed the sovereignty, and was crowned at Winchester, in 871. He had given early and manifest proofs of courage and ability; though his inclinations are known to have rather disposed him to the calm pleasures of literature, than the tumult of war. But scarcely had he time to attend his brother to the grave, ere he found occasion to fight for the crown to which he had succeeded; for the Danes had poured innumerable multitudes into the island; and in that very year eight battles were fought between them and the Saxons. The strength of the latter was almost wasted, while that of the former was constantly renewed, after every loss, by fresh shoals of their countrymen. At length a bloody engagement took place at Wilton, in Wiltshire; where, though the king was defeated with some
loss,

loss, yet so great was the dread in which the Danes stood of Alfred's military fame, that they made a treaty with him, and retired from his dominions into those of the king of Mercia. Soon after, however, they broke their faith; for, meeting on the road to Mercia a body of English horse, advancing in an unprepared manner, as they relied on the late treaty of peace, they slew the greater number of them, and took possession of Exeter. The king presently marched against them with what forces he could collect, and besieged them there. At this juncture Alfred's fleet engaged a numerous one of the enemy, sunk many, and dispersed the rest; which, attempting to gain some of the English ports, were driven on the coasts and wholly lost. The Danes now again sued for peace, and gave hostages; but in 877, having obtained new reinforcements, they entered Wiltshire in such numbers, and so wearied out the Saxons, that the latter could no longer be persuaded to make head against them. Some retreated into Wales; others submitted to the usurpers; and Alfred himself found it necessary to be governed by circumstances. He, therefore, assumed a disguise, the most likely to conceal him; not giving up either his hopes or his courage; but waiting for a proper opportunity to recover his throne, and restore to their liberties his sorely oppressed people.

Having properly disposed of his family, and settled a mode of communication with his tried and faithful friends, he engaged himself in the service of his own neat-herd, to take the care of his cows. After and other ancient writers relate, as a proof how completely Alfred was disguised, that one day the good woman of the house set a cake before the fire to bake, where the king was busily employed in trimming his bow and arrows; on coming back, and finding it burnt, through neglect of turning it in her absence, which she supposed he would have done, she chid him very severely for his inattention; and told him, that though he could not turn the cake, she knew he was ready enough to eat it. We find, however, that Alfred soon left this station; and with his wife and some of his most valued friends, found a safe retreat in the isle of Æthelingey (Athelney), in Somersetshire, which was secured by vast morasses around it, and accessible only by one very obscure passage. The following story, which we receive from William of Malmesbury, has been cited to shew the extremities to which this most illustrious monarch was now reduced. A pilgrim came to his castle and requested alms. The queen informed Alfred, that they had only one small loaf remaining, which was insufficient for themselves and their friends, who were gone abroad in quest of fish and other food, though with small hopes of success. "Give the poor man one half of the loaf," said the king: "he that could feed 5000 men with five loaves and two fishes can certainly make that half of the loaf suffice for more than our necessities." The man was relieved accordingly; and the king's benevolence was recompensed by the early arrival of his people with an unexpectedly ample store of fresh provisions. [A beautiful painting from this subject, by Mr. West, was presented by the venerable Alderman Boydell some years since to the stationers company; in the court-room of whose hall it still remains an honourable specimen of the artist's talents, and a lasting memento, among many others, of the liberality of the donor.]

When the king had been about a year in this retreat, being informed that some of his subjects, under the brave Odun, Earl of Devonshire, had routed a great army of the Danes, killed their chiefs, and taken their magical standard, he issued letters, giving notice where he was, and inviting his nobility to come and consult with him. Before they came to a final determination, however, Alfred, disguised as an

itinerant harper, strolled into the enemy's camp; where, without suspicion, he was admitted not only to the tents of the common soldiers, but even into those of the chief Danish commanders. Having examined every thing with great accuracy, he retired again to Æthelingey, and summoned with all privacy his faithful subjects to meet him in arms at Brexton, in the forest of Selwood, in Wiltshire. They obeyed the summons; and, fired with the hopes of liberty, fell upon the Danes with incredible alacrity, at a moment when the latter had not the least suspicion of a foe, and imagined Alfred to be a mere fugitive from them.

The attack was made at Æthendune, now Eddington. Those of the enemy who escaped from this battle possessed themselves of a neighbouring castle, or fort, almost ruined, which they fortified immediately, and in which they were quickly besieged by the victorious Saxons; but, after a long and close siege, the Danes were forced to surrender at discretion. Alfred, however, treated them like a merciful prince, giving up to such of them as should embrace the Christian religion, the whole kingdom of the East Angles, on condition that they should oblige the rest of their countrymen to quit the island, and prevent, as far as they were able, the landing of any more foreigners. For the performance of these articles he took hostages; and when, in pursuance of the treaty, Guthrum, the Danish chief, came, with thirty of his chief officers, to Alfred, to be baptized, the king answered for him at the font, gave him the name of Æthelstan, and adopted him for a son. His friends and himself were nobly entertained for twelve days, and then dismissed with royal presents.

One advantage the Saxons derived from these Danes turning Christians; which was, that now they kept their oaths, and removed into the country which had been assigned to them, where they quietly settled themselves.

In 884 a new swarm of Danes landed in Kent, and laid siege to Rochester; but the inhabitants boldly defended the place till the king, reaching them with an army, compelled the enemy to raise the siege, and return once more to France.

Alfred, having now some leisure, resolved to repair, re-fortify, and re-people the ancient city of London, which he had lately recovered from the Danes; and meant to keep as a frontier. Accordingly, he placed a garrison in it, and made Æthered governor thereof, whom he had created Earl of Mercia, and to whom he gave his daughter Æthelseda in marriage.

After some years of rest, however, Alfred was again called into the field; for the Danes, being soundly beaten in the west of France, in 893, came with a fleet of 250 sail on the east coast of Kent, and, landing, fixed themselves at Appledore. Shortly after came another fleet up the Thames, consisting of 80 vessels, and, having landed the soldiers, built a fort at Middleton, now Milton. Alfred drew together a considerable army; but, before he marched toward the enemy, compelled the Danes settled in Essex and Northumberland, to give him hostages for their good behaviour. He then moved toward the invaders, and prudently pitched his camp on a spot between the enemy's two armies, thereby preventing their junction. A great body, however, moved into Essex, and thence, crossing the river, came into Surry, at Farnham; in which county, the king's forces met and defeated them.

Amid these contests, the Danes of Northumberland, in breach of their oath, and notwithstanding the hostages which they had given, equipped two fleets, one of 100, the other of 40 vessels, and came to Exeter, which place they besieged. Alfred lost not a moment in opposing this new enemy. Having left some forces at London to make head

against Hastings (Hæsten), and the other Danes, he marched suddenly to the West ; and, falling on the rebels before they were aware, pursued them to their ships with great slaughter. The enemy, sailing next to Suffex, began to plunder the country near Chichester ; but the order which Alfred had every where established sufficed here, without his presence, for the defence of the place ; and the rebels, meeting with a new repulse, in which many of them were killed, and some of their ships taken, were obliged again to put to sea. They now failed to join Hastings, the Danish chief, at Beamsfleet, in Essex, who, thus strengthened, and encouraged by the absence of the king, ravaged all the lands belonging to Alfred in Mercia. The troops which the king had left in London for the security of that place, now, in turn, took their advantage of the absence of the Danish chief on his incursions in the Mercian district, suddenly attacked Beamsfleet, and carried the place by storm, in which they found Hastings's wife and his two sons, who had been lately baptized. These they made prisoners, and sent to Alfred ; who, with a greatness of soul unparalleled in those times, returned them to Hastings, with this message, " I make no war upon women and christians." Hastings, returning from his pillaging expedition, gave up all for lost, and once more sued for peace ; which Alfred, with his usual clemency, granted, on his giving fresh hostages for his fidelity in time to come.

Before Alfred had time to recruit himself, another Danish leader, whose name was Laf, came with a great army out of Northumberland, and destroyed all before him. Having invaded North Wales, plundering or destroying every thing, this army divided itself, one body returning to Northumberland, the other marching into Essex, and taking possession of a small island called Mereveg (Mersey). Here, however, they did not long remain ; for, having parted, some sailed up the river Thames, and others up the Lea-Road ; where, drawing up their ships, they built a fort not far from London, which proved a great restraint upon the citizens, who went in a body and attacked it, but were repulsed with great loss. This obliged the king, when harvest-time came, to encamp with a body of troops in the neighbourhood of the city, in order to cover the reapers from the incursions of the Danes. Riding one day by the side of the river Lea, a thought struck him, that by narrowing the channel and cutting some trenches, and thus turning the course of the stream, he might render the Danish ships useless, by leaving them on dry ground. This was promptly executed ; the pagans, struck with astonishment and dismay, quitted their ships and camp, and fled to Quatford, where they were finally broken and subdued. Such of the Danish ships as could be got off, the Londoners carried into their own road ; the rest they burnt and destroyed.

The Danes, ever unquiet, in a short time began again to invade the territories of the West Saxons, both by land and sea ; but their chief enterprizes were in the way of piracy, under the command of Sigefert, a Northumbrian, who, well acquainted with Alfred's naval preparations, had framed vessels of a new construction, higher, larger, and swifter than the English ; but the king, improving on his invention, caused a number of galleys to be built with all possible expedition, of still greater bulk, swifter in sailing, and loftier than those of the Danes, some of them carrying 60 rowers. With these, falling upon the enemy while they were exercising their ravages in the West, he took twenty of their ships ; and, having tried all the prisoners at Winchester, he gave judgment that they should be hang'd as piratical mur-

derers and enemies of the human race. The well-timed severity of this execution, together with the excellent posture of defence every where established, restored complete tranquillity in England for the three remaining years of Alfred's reign, which he chiefly employed in establishing and regulating his government for the security of himself and his successors, and the ease and benefit of the people at large.

" His mighty genius (says Sir W. Blackstone) prompted him to undertake a most great and necessary work, which he is said to have executed in as masterly a manner. No less than to new-model the constitution ; to re-build it on a plan that should endure for ages ; and out of its old discordant materials, which were heaped upon each other in a vast and rude irregularity, to form one uniform and well-connected whole. This he effected, by reducing the whole kingdom under one regular and gradual subordination of government, wherein each man was answerable to his immediate superior for his own conduct and that of his nearest neighbours : for to him we owe that master-piece of judicial polity, the subdivision of England into tithings and hundreds, if not into counties ; all under the influence and administration of one supreme magistrate, the king : in whom, as in a general reservoir, all the executive authority of the law was lodged, and from whom justice was dispersed to every part of the nation by distinct, yet communicating, ducts and channels ; which wise institution has been preserved for near a thousand years unchanged, from Alfred's to the present time. He also, like another Theodosius, collected the various customs that he found dispersed in the kingdom, and reduced and digested them into one uniform system or code of laws, in his *Sombee, or liber judicialis*. This he compiled for the use of the court-baron, hundred and county-court, the court-leet, and sheriff's tourn ; tribunals which he established for the trial of all causes civil and criminal, in the very districts wherein the complaint arose : all of them subject, however, to be inspected, controlled, and kept within the bounds of the universal or common law, by the king's own courts ; which were then itinerant, being kept in the king's palace, and removing with his household in those royal progresses which he continually made from one end of the kingdom to the other. The Danish invasion and conquest, which introduced new foreign customs, was a severe blow to this noble fabric : but a plan, so excellently concerted, could never be long thrown aside. So that, upon the expulsion of these intruders, the English returned to their ancient law ; retaining, however, some few of the customs of their late visitants ; which went under the name of *Dane-Lage* : as the code compiled by Alfred was called the *West-Saxon-Lage* ; and the local constitutions of the ancient kingdom of Mercia, which obtained in the counties nearest to Wales, and probably abounded with many British customs, were called the *Mercen-Lage*. And these three laws were, about the beginning of the eleventh century, in use in different counties of the realm : the provincial polity of counties, and their subdivisions, having never been altered or discontinued through all the shocks and mutations of government, from the time of its first institution ; though the laws and customs therein used, have often suffered considerable changes."

Than Alfred, no man could be a more absolute monarch ; for, besides that he was the legal inheritor of the crown, he had won it by his sword, having fought 56 set battles by sea and land (eight of them in one year), and enlarged his dominions beyond what any of his ancestors possessed. But, though thus absolute, he soon shewed, that he desired not to

establish a tyranny, nor to infringe the liberties of his people, for the welfare of whom he proved his concern by the measures which he took to promote it. To him (as we have ta'en from Blackstone) we owe many of those advantages which render our constitution dear to us; but, above all, we owe to him, as it has been commonly supposed, the *trial by jury* (see *JURY*); and it is obvious to remark, what a spirit of mercy discovers itself throughout all his laws, and how great a regard is paid to the lives of his people; for in them recourse is not had to bloodshedding for every minute offence: a particular well worthy of notice and imitation!

“So strange and sudden a change (says Sir John Spelman) did Alfred's institutions produce in the kingdom, that whereas before there was no travelling without arms, there was soon not only safe passage, but all places became so secure, that when the king (for experiment's sake) caused golden bracelets to be hung up in the cross-ways, they seemed to deride the passenger, for no man durst lay his hands on them. Virgins might safely travel any where alone. Nay, saith Ingulphus, if one left his money all night in the highway, he might come the next morning, and be sure to find it whole and untouched.”

This glorious monarch seemed designed by providence for the period in which he lived, whether we view him in a military or a civil capacity, to rescue from total ruin a nation on the brink of destruction, assailed from without by powerful enemies, and within by sloth, ignorance, and the want of almost every virtue. He was not deficient in any qualification that might render him beloved by his subjects, and dreaded by his enemies. Though of a weak bodily constitution, his mind was active, vigorous, and enterprising, and fitted to animate every branch of good government. He it was who first taught us to defend ourselves by a naval force, now the glory of our country and the terror of the world! His public virtues (says Mr. WIFE) were worthy of the imitation of princes, and his private life was not stained with any vice; he was a tender husband and parent, the friend and companion of men of letters, learned himself, affable, generous, and, to conclude the whole, eminently pious. He erected public schools in different parts of the kingdom; founded, or at least repaired, the university of Oxford, gave preferment to none but such as had made some proficiency in knowledge; and having thus reigned upwards of 28 years, the delight of his own subjects, and the admiration of all Europe, he died the 28th October, A. D. 900, as some historians state; but the variations are many between this and the following year.

That so great and good a prince should not have had his actions recorded by any one among the learned of his own subjects must appear surprising. This task, however, was left to be performed by a stranger (ASSER), taken as it were from among his enemies, a people whose hatred to the Saxon name was notorious; for such at that time were the Welsh. This historian has not, perhaps, written with the elegance of more modern times; yet his life of Alfred is certainly far above what could be expected from the rudeness of the age in which he lived. His descriptions are nervous and spirited; and he conveys to us an image of the most perfect and accomplished monarch that ever graced the English throne.

It has been observed of Alfred, that, had he not been a king, he would have been eminently distinguished as a grammarian, a rhetorician, a philosopher, an historian, a musician, and architect. Of his original writings and translations the following account has been collected:

1. The first book, mentioned by Bale, is “*Breviarium quoddam collectum ex legibus Trojanorum*, lib. i. A breviary collected out of the laws of the Trojans, Greeks, Britons, Saxons, and Danes, in one book.” Leland saw this book in the Saxon tongue, at Christ-church in Hampshire. Comment. de script. p. 150.—2. “*Visi-faxonum leges*, lib. i. The laws of the West-Saxons in one book.” Pitts tells us, that it is in Bene't college library, at Cambridge.—3. “*Instituta quædam*, lib. i. Certain Institutes.” This is mentioned by Pitts, and seems to be the second capitulation with Guthrum. Brompt. chr. col. 819.—4. “*Contra iudices iniquos*, lib. i. An invective against unjust judges, in one book.”—5. “*Acta magistratuum suorum*, lib. i. Acts of his magistrates, in one book.” This is supposed to be the book of judgments mentioned by Horner: and was, in all probability, a kind of reports, intended for the use of succeeding ages.—6. “*Regum fortunæ variæ*, lib. i. The various fortunes of kings, in one book.”—7. “*Dicta sapientum*, lib. i. The sayings of wise men, in one book.”—8. “*Parabolæ et sales*, lib. i. Parables and pleasant sayings, in one book.”—9. “*Collectiones chroniconum*; Collections of chronicles.”—10. “*Epistolæ ad Wulfsigium episcopum*. Epistles to bishop Wulfsig, in one book.”—11. “*Manuale meditationum*. A Manual of meditations.”

As to his translations, they were these: 12. “*Dialogus D. Gregorii*. A Dialogue of St. Gregory.”—13. “*Pastorale ejusdem Gregorii*. The Pastoral of Gregory.”—14. “*Hormestam Pauli Orosii*, lib. i.” Of this work an English translation was published by Mr. Barrington in 1772, with *Ælfred's Anglo-Saxon*.—15. “*Boetius De Consolatione*, lib. v. Boetius's Consolations of philosophy, in five books.” Dr. Plot tells us, king *Ælfred* translated it at Woodstock, as he found in a MS. in the Cotton library. Nat. Hist. of Oxfordshire, chap. x. sec. 118.—16. “*Asserii sententiæ*, lib. i. The sayings of Asserius, in one book.”—17. “*Martianæ Leges*, lib. i. The laws of queen Martia, widow of Guthelinus, in one book.”—18. “*Malmutinæ Leges*, lib. i. The laws of Malmutius, in one book.”—19. “*Gesta Anglorum Bedæ*, lib. v. The Deeds of the English, in five books, by Bede:” a copy of which is in the public library at Cambridge, with the following distich. (*Spelman's Life of Ælfred*, p. 211.)

Historicus quondam fecit me Beda latinum,
Ælfred rex Saxo transtulit ille prius.

20. “*Æfopi fabulæ*. *Æfop's fables*,” which he is said to have translated from the Greek both into Latin and Saxon.—21. “*Psalterium Davidicum*, lib. i. David's Psalter, in one book.” This was the last work that the king attempted, death surprising him before he had finished it; it was however completed by another hand, and published at London in 1640, in quarto, by Sir John Spelman.

Besides all these, Malmesbury mentions his translating many Latin authors; and the old history of Ely asserts, that he translated the Old and New Testaments. Malmib. De Gest. Reg. Ang. p. 45. Hist. Elen. lib. ii.

The foregoing article has been chiefly compiled from Biog. Brit.—Hume.—Blackstone.—Spelman.—And WIFE's *Annales Ælfredi Magni*.

ALFRED, an English bishop, was a monk of Malmesbury, of the order of St. Bennet, and preferred to the see of Exeter. He flourished in the 10th century, and was one of the most learned men of his time. He wrote a treatise, “*De Naturis Rerum*,” “*The Life* of

of Adelmus," and "The History of his own Abbey." Biog. Dict.

ALFRED, of *Beverley*, an ancient historian, wrote his "Annales," published by Hearne, between the years 1148 and 1150, and borrowed his account of the British kings from Geoffroy of Monmouth. Biog. Dict.

ALFRETTON, in *Geography*, a small market town of England, in the county of Derby, is said to have been founded by king Alfred. It has a considerable corn market on Friday. It is 15 miles north of Derby, and 141 $\frac{1}{2}$ north of London.

ALFTER, a borough, citadel and feignory in the electorate of Cologne and prefecture of Bonn, belonging to the counts of Salm-Reifferscheid.

ALGA, in *Natural History*, a species of millepora, with thin semicircular laminae, forming horizontal leaves; the millepora lichenoides of Solander and Ellis, found, of a red, purple, yellow and whitish colour, on the shores of Cornwall.

ALGÆ, in *Botany*, an order or division of the *cryptogamia* class of plants.—It is one of the seven families or natural tribes into which the vegetable kingdom is distributed in the *Philosophia Botanica* of Linnæus; the 57th order of his *fragmentis* of a natural method; and the second genus of the section *marinæ aut fluviales*, in the class *aspermæ vulgo habitæ* of Tournefort.

The plants belonging to this order are described as having their root, leaf, and stem entire, or all one. The whole of the sea weeds and various other aquatic plants are comprehended under this division.

From their admitting of little distinction of root, leaf, or stem, and the parts of their flowers being equally incapable of description, the *genera* are distinguished by the situation of what is supposed to be the flowers or seeds, or by the resemblance which the whole plant bears to some other substance.

The parts of fructification are either found in saucers or tubercles, as in *lichens*; in hollow bladders, as in the *fuci*; or dispersed through the whole substance of the plants, as in the *ulvæ*. The substance of the plants has much variety; it is flesh-like or leather-like, membranaceous or fibrous, jelly-like or horn-like, or it has the resemblance of a calcareous earthy matter.

Mr. Valley has lately shewn that some of the plants that belong to this order possess a high degree of irritability.—Withering's Arrangement of British Plants, vol. i. p. 369.

Lamarck distributes the algæ into three sections: the first comprehends all those plants, whose fructification is not apparent or seems doubtful. These commonly live in water, or upon moist bodies, and are membranous, gelatinous, or filamentous. To this section he refers the byssi, conserva, ulva, tremella and varec. The plants of the second section are distinguished by their apparent fructification, although it be little known, and they are formed of parts which have no particular and sensible opening or explosion at any determined period; their substance is ordinarily crustaceous or coriaceous. They include the tassella, ceratosperma and lichen. The third section comprehends plants, which have their fructification very apparent, and distinguished by constituent parts which open at a certain period of maturity for the escape of the fecundating dust or seeds. These plants are more herbaceous, as to both their substance and their colour, than those of the other two sections, and are more nearly related to the mosses from which they do not essentially differ. Their flowers are often contained in articulated

and very elastic filaments. To this section are referred the riccia, blasia, anthoceros, targiona, hepatica, and jungermannia. In the Linnæan system the algæ are divided into two classes, *viz.* the *terrestres* and *aquaticæ*. The former include the anthoceros, blasia, riccia, lichen, and byssus; and the latter are the ulva, fucus, and conserva. The fructification of the algæ, and particularly of those called aquaticæ, is denominated by a judicious botanist, the *opprobrium Lottanicorum*. See observations on this order of plants by Dr. Goodenough and Mr. Woodward in the Linnæan Transactions, vol. iii. p. 84, &c.

ALGÆ, in *Ancient Geography*, an inland city of the island of Eubœa, called by Strabo, the Euboic Algæ, and also Æges, to distinguish it from two other cities of that name, one in Achaia, near the river Cratis, the other in Æolis. He conceives, that from this place, in which was a temple of Neptune, the ÆGEAN Sea derived its name. See ÆGÆ.

ALGÆ, a port of Italy, which Antonine places three miles from Centumcellæ.

ALGAGLIOLA, a sea-port town of Corsica, defended by a castle, situated upon a rock, was almost destroyed by the mal-contents in 1731, but soon afterwards rebuilt. N. lat. 42° 20'. E. long. 9° 45'.

ALGAIRA, or ALIARA, in *Geography*, a river of Spain, joins the Cabriel, before its conflux with the Xucar.

ALGALA, or ALGALIE, in *Surgery*, the Arabian name of a hollow curved instrument employed for drawing off the urine, or searching for a stone, by introducing it into the bladder. The more common appellation of this tube is CATHETER or SOUND, which see.

ALGARDI, ALESSANDRO, in *Biography*, an eminent artist, both as a sculptor and architect, was born at Bologna in 1598, and became a disciple of Julius Cæsar Conventi, under whose instruction he acquired a reputation in sculpture little inferior to that of Michael Angelo Buonaroti. He also frequented the school of the Caraccii, where he probably learned the art of engraving; his style, resembling that of Augustino Caracci, being slight and free, and his execution with the graver bold and open. Having studied at Mantua and Venice, he visited Rome in 1625, and became acquainted with Domenichino, by whom he was recommended to the statuary work of the chapel Bandini, which he was painting. For some years he was chiefly employed in repairing antiques and modelling for goldsmiths; but his talents and reputation procured him superior work. Among his performances may be recounted a statue of St. Philip de Neri, in the sacristy of the fathers of the oratory at Rome; his group of the decollation of St. Paul for the Barnabite church at Bologna, and the tomb of Leo. XI. at St. Peter's. One of his capital performances was a bas-relief in this cathedral, representing the story of Attila, 32 feet by 18, which was the labour of four years, and which gained him universal applause, with the honour of knighthood and the golden cross. His bronze figure of Innocent XI. is reckoned the finest of the statues of the popes in Rome. A crucifix likewise, called, by way of distinction, Algardi's crucifix, has been much celebrated, and often copied by many of the principal artists. He was assiduous and quick in execution, but becoming corpulent and infirm, he was under a necessity of recurring to the assistance of his pupils, of whom he formed an eminent school. He died in 1654, at the age of 52 years. His disposition was lively, his conversation pleasant, and his manners irreprouchable. He lived in celibacy, and left his property to his sister. His works, which are held in high estimation, though the air of his head

is thought to be artificial and studied, and he is somewhat of a mannerist in the folds of his draperies, are chiefly at Rome and the neighbouring villas. Two plates, supposed to be his, are "Christ upon the Cross," a large upright plate, and "the Deliverance of the Souls from Purgatory," a small oval. Strutt. Gen. Biog.

ALGAROTTI, *Powder of*, in *Chemistry*, is a white oxyd of antimony, procured by adding pure water to the butter or oxydurate of antimony, whereby the metallic oxyd is precipitated. This, when thoroughlyedulcorated and dried, forms the powder of algarotti, and is a very perfect oxyd of antimony. It was first applied, as an internal medicine, by *Algarotti*, an Italian physician. It is not now to be found in the later pharmacopœias of the London college, but if it were of any advantage to increase the number of antimonial medicines, it might deserve notice from the ease with which it is prepared, and the apparent uniformity of its composition. It is retained by the Edinburgh pharmacopœia, and in several parts of the continent as the basis of the emetic tartar, or tartarized antimony. See ANTIMONY, *muriate and tartrate of*.

ALGAROTTI, FRANCIS, in *Biography*, was born at Padua in 1712, and finished his studies in the university of Bologna. He commenced his travels at an early period, and in his visit to England acquired a predilection for the Newtonian philosophy, which led him to write his "Newtonianismo par le Dame;" or, "Newtonianism for the Ladies," dated at Paris in 1736. This popular work is formed upon the model of Fontenelle's "Plurality of Worlds," and is equally instructive and amusing. At Berlin Algarotti was kindly received by Frederick, king of Prussia, who conferred upon him the knighthood of the order of Merit, the title of count, and the post of chamberlain. By Stanislaus, king of Poland, who admitted him into his court, he was appointed a privy-counsellor. His character was that of a man of letters, a philosopher, and one of the first connoisseurs in Europe in the arts of music, painting, sculpture, and architecture. He contributed much to the improvement of the Italian opera, and wrote verses in his own language replete with sentiment and imagery. An associate at Berlin represents him, somewhat in the style of satire, "as full of wit, affectation, and self-love; a Frenchman in genius, an Italian in character, disagreeable in society, often exposed to royal witticisms, and receiving them as tokens of favour." After his return to Italy he died at Pisa, May 24, 1764. The mausoleum which he erected for himself indicates both his taste and his vanity. The epitaph for his tomb was written by himself; "Hic jacet Algarottus, sed non omnis." A collection of his works, in Italian, was published at Leghorn in 1765, in four volumes, 8vo. They consist of his dialogues on the philosophy of Newton, of essays on the fine arts and on commerce, of dissertations on subjects of language, of historical disquisitions, and of miscellanies, literary and philosophical. An edition of them, in French, was published at Berlin in 1772, in eight vols. 8vo.; and they have been also translated into English and other languages. They display genius and profound reflection, but are thought by competent judges deficient with respect to nature and simplicity. He designed and engraved, for his amusement, several plates of heads in groups, one of which, containing 13, in the antique style, is dated Feb. 15, 1744. Nouv. Dict. Hist. Strutt.

ALGARVA, in *Geography*, the most southern province, anciently a kingdom of Portugal, is bounded on the south and west by the ocean, and hence formerly called *Cuneus* or *wedge*, on the east by Andalusia, from which it is separated

by the Guadiana, and on the north by a ridge of hills, called Serra de Algarve and Serra de Monchique, which divides it from Alentejo. The greatest length of this province is about 90 miles, and its greatest breadth is about 28. The city of Lagos is properly the chief town of Algarva, though Tavira is now the residence of the governor, and Faro possesses the greatest part of its trade. According to the last enumeration in 1780, this small kingdom contained 93,472 inhabitants, of whom 6521 were husbandmen, and 5575 labourers. It lies close to the sea, and is well cultivated; but this cultivation does not extend more than two leagues inland, beyond which are desert hills. Corn is not grown in sufficient quantity for the consumption; the oil that is produced here is reckoned the best in Portugal, and exported. The wine is white, and good. Figs constitute the principal produce of Algarva, and it also abounds with almonds, particularly about Tavira, which are exported. This is the only province of Portugal from which dried figs are exported. Oranges are also cultivated, especially in the vicinity of Monchique and Faro; and these, together with oranges and Spanish reeds (*arundo donax*), are exported from Faro to England. Algarva, it is said, is the only country, Greece excepted, where CAPRIFICATION is practised; for there are some varieties of figs, which are very excellent, that fall to the ground immature, unless they are punctured by the gnats. The common people live principally on fish, and are very poor, because the province, though capable of great cultivation, is shamefully neglected. A quantity of tunny-fish is taken on the coast, and particularly in the neighbourhood of Lagos and Cape St. Vincent, and salted in May and June; the colour of it resembles that of smoked beef; and a storehouse for it is opened at Lisbon, where it is found to supply the place of cod. The inhabitants, in general, are less refined and polite than the other Portuguese, but they are celebrated through the country for their wit and shrewdness. They are also considered as the best mariners in Portugal; and on this account many of them emigrate, and most of the boatmen at Lisbon come from this province. The mountains that separate this province from Alentejo, rise in height as they approach the north, and consist of argillaceous slate and sand-stone. They are arid and barren, and only bear the cistus ladaniferus, with two other kinds of cistus. The province is for the most part surrounded by lime-stone mountains, which exhibit few, if any, traces of cultivation. Olive-trees and fig-trees, and also the caob-tree (*ceratonia siliqua*) grow abundantly in the corn-fields, and afford a pleasant shade. The fan palm (*chamærops glabra* of Linnæus) is very plentiful throughout the whole of this province; and its fan-shaped leaves are used for making the baskets in which figs are packed. Link's Travels through Portugal, p. 432, &c.

ALGAS, a river of Spain, which runs into the Matarana, near Nonaspe, in Aragon.

ALGATRANE, a sort of pitch found in the bay formed by the point of the Cape of St. Helena, on the south of the Isle of Plata.

ALGAU. See ALGOW.

ALGAVAREIA, the language anciently spoken by the Moors of Spain, which was a sort of Arabic, and was contradistinguished from the *Aljamia*.

ALGAZEL, in *Biography*, a learned Arabian, about the beginning of the 12th century, was a native of Tos, or Tus, in Asia, and celebrated among the Mahometan theologians for his numerous treatises in defence of the Mahometan religion, against the Jews and Christians; particularly for his "Demonstration of Islamism," and his "Treatise on the

Unity of God." But he was suspected of heresy, and one of his pieces, entitled, "the Resurrection of the Law of Science," was condemned after his decease, because it censured some of the indulgences of the Islamic law; and if any copy of it was found within the Saracenic empire, it was ordered to be burned. He also wrote a treatise "On the Opinions of Philosophers;" and another, entitled, "The Destruction of Philosophers." After living in great splendour as a public preceptor at Bagdat, he distributed his riches among the poor, assumed the habit of a hermit, and retired to Mecca. From Mecca he travelled into Syria and Egypt, and staying some time at Cairo, and afterwards at Alexandria, he returned to Bagdat, where he died. Pococke Spec. Hist. Arab. p. 371. Herbelot, p. 362. Leo Afr. c. 12. Brucker's Hist. Phil. by Enfield, v. ii. p. 243.

ALGAZEL, in *Zoology*. See ANTILOPE.

ALGEBRA, a general method of resolving mathematical problems, by means of equations: or, it is a method of computation by symbols, which have been invented for expressing the quantities that are the objects of this science, and also their mutual relation and dependence. These quantities might probably, in the infancy of the science, be denoted by their names at full length; these, being found inconvenient, were succeeded by abbreviations, or by their mere initials. And, at length, certain letters of the alphabet were adopted as general representations of all quantities; other symbols or signs were introduced to prevent circumlocution, and to facilitate the comparison of various quantities with one another; and, in consequence of the use of letters or species, and other general symbols, or indeterminate quantities, algebra obtained the appellation of *specious, literal, and universal ARITHMETIC*.

The term, *algebra*, is of Arabic original; but its etymology has been variously assigned by different writers. Among the Arabians, from whom it was immediately transmitted to us, this science was denominated *al-giabr almocabalah*; and as *giabara* signifies to *restore*, and *kabala* to *compare* or to *oppose*, the nouns formed from these words, with the prefix *al*, denote the science of *restitution* and *comparison*, or *resolution* and *equation*; and thus understood, they express its nature with sufficient precision. Accordingly, Lucas de Burgo, the first European author on algebra, calls it the *rule of restoration* and *opposition*. Others, however, have derived it from *Geber*, either the name of a celebrated mathematician, to whom they ascribe the invention of the science; or from the word *geber*, which forms, with the particle *al*, the appellation *algebra*, signifying, according to Golius, in his Arabic lexicon, a reduction of broken numbers or fractions to integers. Herbelot says, that *geber* or *gibr* is never used by the Arabs for algebra, without adding the word *mokabelah*; but Dr. Ruffell (*Hist. Aleppo*, v. ii. 107.) observes, that, at Aleppo, and also in books, *al Gibr* is used sometimes alone, as well as in conjunction with *mokabelah*. This science has been distinguished by other names, besides algebra. Lucas de Burgo calls it *Parte maggiore*, or the greater art, by way of contradistinction to common arithmetic, which is denominated *Parte minore*, or the lesser art. The Italians called it *regola de la cosa*, or *rei*; *cosa* with them signifying *res*, or *thing*, and being used in the same sense with *radix*, or root; whence proceeded the terms rule of *cos*, and *cosic* numbers, denoting the root, square, cube and other powers. Other Italian and Latin writers have called algebra *regula rei et census*, or the rule of the root and square; *census* being used for improvement, or the square. By a corruption of *census* were formed *zenzus*, for the square, and the term *zenzic* applied

to the square root. Hence also the characters \mathcal{Z} , \mathcal{S} , \mathcal{H} , deduced from the letters *r*, *z*, *c*, became the symbols of *res*, *zenzus*, and *cubus*; or, in our mode of expression, the root, square and cube; just as R and $\sqrt{\quad}$, formed from *R*, *r*, are with us the signs of radicality. Wallis's Algebra, c. i. p. 3.

Some authors have defined algebra, as the art of resolving mathematical problems; but this is rather the idea of ANALYSIS, or the analytic art in general, than of algebra, which is only a particular branch of it. Algebra, duly considered, consists of two parts, *viz.* the method of calculating magnitudes or quantities, represented by letters or other characters, and the mode of applying these calculations to the solution of problems. When algebra is applied to the solution of problems, all the quantities that are involved in the problem are expressed by letters, and all the conditions that serve to denote their mutual relation, and by which they are compared with one another, are signified by their appropriate characters, and they are thus thrown into one or more equations, as the case requires: this is called *synthesis*, or *composition*. When this has been done, the unknown quantity is disengaged by a variety of analytical operations from those that are known, and brought to stand alone on one side of the equation, whilst the known quantities are on the other side; and thus its value is investigated and obtained. This process is called *analysis* or *resolution*: and hence algebra is a species of the analytic art, and is called the modern analysis, in contradistinction to the ancient analysis, which chiefly regarded geometry and its application.

The origin of algebra, like that of other sciences of ancient date and gradual progress, is not easily ascertained. The most ancient treatise on that part of analytics, which is properly called algebra, now extant, is that of Diophantus, a Greek author of Alexandria, who flourished about the year of our Lord 350, and who wrote 13 books, though only six "Arithmeticonum," of them are preserved, which were printed together with a single imperfect book on multangular numbers, in a Latin translation by Xylander, in 1575, and afterwards in Greek and Latin, with a Comment, in 1621 and 1670, by Gaspar Bachet, and M. Fermat. Tolosæ, fol. These books do not contain a treatise on the elementary parts of algebra, but merely collections of some difficult questions relating to square and cube numbers, and other curious properties of numbers, with their solutions. In his prefatory remarks, addressed to one Dionysius, for whose use Diophantus probably wrote, he recites the names and generation of the powers, the square, cube, 4th, 5th, 6th, &c. which he calls *dynamis*, *cubus*, *dynamodinamis*, *dynamocubus*, *cubocubus*, according to the sum of the indices of the powers, and he marks those powers with the Greek initials; and he expresses the unknown quantity by $\alpha\epsilon\delta\mu\epsilon\zeta$; or the number, simply marking it in the solutions by the final σ ; and denoting the monades, or indefinite unit, by μ° . In his researches on the multiplication and division of simple species, he shews what powers they produce, and observes that minus ($\lambda\sigma\psi\iota\varsigma$) multiplied by minus, produces plus ($\upsilon\pi\alpha\rho\lambda\iota\varsigma$), and that minus multiplied by plus produces minus: the mark which he uses for minus is \uparrow or the \downarrow inverted and curtailed; but he has no mark for plus, expressing it by a word or conjunctive copulative. Supposing his reader acquainted with the common operations, *viz.* addition, subtraction, multiplication and division of compound species, he proceeds to remark on the preparation of the equations that are deduced from the questions, which we call reduction of equations, by collecting like quantities together, adding quantities that are minus, and subtracting those that are plus, called by the moderns transposition,

transposition, so as to bring the equation to simple terms, and then depressing it to a lower degree by equal division, when the powers of the unknown quantity are in every term: which preparation or reduction of the complex equation, being made, or reduced to what we call a final equation, this author proceeds no further, but merely says, what the root, or *re: ignota*, is, without giving any rules for finding it, or for the resolution of equations; thus intimating, that rules for this purpose were to be found in some other work, either of his own or of some other person. The chief excellence of Diophantus's collection of questions, which seems to be a series of exercises for rules which had been elsewhere given, is the neat mode of substitution or notation, which being once made, the reduction to the final equation is easy and obvious. This work indicates much accurate knowledge of the science of algebra, in some of its most abstruse parts. But as the author reduces all his notations to a simple equation, or a simple quadratic, it does not appear how far his knowledge extended to the resolution of compound or affected equations.

Algebra, however, seems not to have been wholly unknown to the ancient mathematicians, long before the age of Diophantus. We observe the traces and effects of it in many places, though it seems as if they had intentionally concealed it. Something of it appears in Euclid, or at least in Theon upon Euclid, who observes that Plato had begun to teach it. And there are other instances of it in Pappus, and more in Archimedes and Apollonius. But it should be observed, that the analysis used by these authors is rather geometrical than algebraical; this appears from the examples of it that occur in their works; and therefore, Diophantus is the first and only author among the Greeks, who has treated professedly of algebra. Our knowledge of the science was derived, not from Diophantus, but from the Moors or Arabians; but whether the Greeks or Arabians were the inventors of it has been a subject of dispute. It is probable, however, that it was much more ancient than Diophantus, because his treatise seems to refer to works similar and prior to his own. Abulfaragius, an Arabic historian, in one place ascribes the invention, or rather the arrangement of the principles and rules of the science, to Diophantus; and from him we learn that the arithmetic of Diophantus was translated into Arabic by Mahomet Ben-Yahya Baziani: but in another place he seems to ascribe it to Mahomet Ben Musa, who is said to have lived about the year 850 or 900, and who was the first of the Arabs by whom this science was cultivated. Cardan attributes the invention of it to this Arabian, and apprehends that he obtained the appellation of Geber from this art. See *Bib. Arab. et Hisp.* tom. i. p. 370. cited by Ruffin in his *Hist. of Aleppo*, vol. ii. p. 409. Stevinus is of opinion that this science, and other parts of mathematics, were much more ancient among the Orientals, than any learning they derived from the Greeks. Dr. Wallis adopts the sentiments of those who think that the Arabs derived this science, as well as the knowledge of numeral figures, from the Persians, and originally by their means from the Indians; and he alledges, as a presumptive evidence of their not having derived it from the Greeks, that the name they give it, viz. *al-giabr w'al-mokabala*, seems to have no affinity with any Greek name. We may here add, that some vestiges of algebraical calculation have been discovered among the Brahmans; particularly rules for the solution of certain arithmetical questions, with which it would seem that nothing but algebra could have furnished them. *Asiatic Researches*, vol. ii. p. 468. note. 487, 495. But wherever algebra was invented or first cultivated, the science, and also the name of it, were transmitted

to Europe, and particularly to Spain, by the Arabians or Saracens, about the year 1100, or somewhat sooner. Italy seems to have taken the lead in the cultivation of this science, after its introduction into Europe: and Lucas Pacioli, or Lucas de Burgo, a minorite Franciscan friar, was the first author on the subject, who wrote several treatises in the years 1476, 1481, 1470, 1487, and 1509; but his principal work, entitled, "*Summa Arithmetica et Geometria, Proportionumque et Proportionalitatum*," was published in Italian at Venice, in 1494, and again in 1523. In this work he mentions several writers, and particularly Leonardus Pisanus, placed by Vossius about the year 1400, or a little sooner, and said to be the first of the moderns who wrote of algebra, from whom he derived his knowledge of those sciences; and from the treatise of Leonard, not now extant, the contents of that of Lucas were chiefly collected. The age of Leonard of Pisa has been usually fixed to the end of the 14th century. But it now appears by a manuscript of this algebraist, discovered in a library of Italy, by M. Targioni Tozzetti, and communicated to M. Cossali, a canon regular of Parma, that he lived two centuries before this period, or at the commencement of the 13th century: and of course that Italy is indebted to him for its first knowledge of algebra. His proper name was Bonacci, and he was a merchant, who traded in the sea ports of Africa, and the Levant. Being ambitious of obtaining an acquaintance with the sciences that flourished amongst the Arabs, and particularly that of algebra, he travelled into their country. Accordingly his arithmetic was published in 1202, and a new enlarged edition of it appeared in 1228. At this time, however, algebra was not a part of arithmetic, but was distinguished from it by the title of "*Ars Magna*," or "*Arte Maggiore*." From the manuscript above-mentioned it appears, according to Cossali's account of it, that Leonard had penetrated deeply into the secrets of the algebraic analysis; that he was particularly acquainted with the analysis of problems similar in kind to those of Diophantus, and with the resolution of equations of the second degree; and that he had written a treatise, entitled "*De Numeri Quadrati*," which is not extant, but which Cossali has restored from some fragments of Lucas del Burgo. This Leonard, therefore, must not be confounded with another called Camillus Leonardus of Pefaro, author, as it is said, of a book entitled, "*Liber desideratus canonum æquatorum motuum caelestium sine calculo, &c.*" Pifaur. 1496, 4to. Montucla *Hist. Math.* tom. ii. p. 716. This Leonard of Pisa made long voyages into Arabia and other eastern countries, in order to gain the knowledge of the mathematics. Montucla (tom. i. p. 536.) mentions two other persons who previously to this discovery were thought to have preceded Leonard in this department of science, viz. Paul dell'Abaco, who lived towards the end of the 14th century, and who is supposed by Ximenes, to have been the first person in Italy who used algebraic equations; and also Profdocimo Belmando, or Beldomando, of Padua, who was supposed to have shared with Leonard the honour of introducing into Italy the knowledge of algebra. His book, entitled, "*Dell'Algoritmo*," was printed in 1483, but dated at the beginning of the 15th century. Lucas informs us, that algebra came originally from the Arabs, and never mentions Diophantus; from which circumstance it has been inferred that this Greek author was not then known in Europe. From the book of Lucas de Burgo, we learn, that the knowledge of the Europeans in his time, or about the year 1500, extended no further than to quadratic equations, of which they used only the positive roots; that they admitted only one unknown quantity; that they had no marks or signs for

either quantities or operations, excepting some few abbreviations of the words or names; and that the art was merely employed in resolving certain numeral problems. If the science had been carried further in Africa than quadratic equations, which was probably the case, as we may infer from an Arabic manuscript, said to be on cubic equations, deposited in the library of the university of Leyden, by Warner, the Europeans had at this period obtained only an imperfect knowledge of it. The publication of the works of Lucas de Burgo promoted the study, and extended the knowledge of algebra; so that about the year 1505, Scipio Ferreus, professor of mathematics at Bononia, in Italy, discovered the first rule for resolving one case of a compound cubic equation. The next Italian, who distinguished himself by the cultivation and improvement of algebra, was Hieronymus Cardanus, of Bononia, who published nine books of his arithmetical writings, in 1539, in Latin, at Milan, where he practised physic, and read lectures on mathematics; and in 1545, a tenth book, containing the whole doctrine of cubic equations. Cardan denominates algebra, after Lucas de Burgo and others, "Ars Magna quam vulgo Cossam vocant," or "Regulæ Algebraicæ," and ascribes the invention of it, on the authority of Leonard of Pifa, to Mahomet, the son of Moses, an Arabian. He adds, that this supposed inventor left four rules or cases, which perhaps only included quadratic equations; that afterwards three derivatives were added by an unknown author, supposed by some to have been Lucas Pacioli, and afterwards three other derivatives for the cube and sixth power, by another unknown author; all which were resolved like quadratics; that then Scipio Ferreus, about 1505, found out the rule for the case "cubum et rerum numero æqualium," or, as it is now written, $x^3 + bx = c$, which he represents as a thing admirable; that the same discovery was made in 1535, by Tartalea, who, after earnest intreaties, disclosed it to him (Cardan); and that he and his former pupil, Lewis Ferrari, much augmented and extended the cases; and that all the demonstrations of the rules are his own, except three of Mahomet for quadratics, and two of Ferrari for cubics.

To Cardan's treatise on cubic equations is annexed, "Libellus de Aliza Regula," or the Algebraic Logisticks, in which he treats of some of the more abstruse parts of arithmetic and algebra, especially cubic equations, with many additional attempts for the solution of the irreducible case, $x^3 = bx + c$.

From a minute and accurate detail of the contents of Cardan's treatise, given by Dr. Hutton, it appears, that the improvements in algebra, communicated by this author, are as follow. To the rules furnished by Tartalea for resolving these three cases of cubic equations, *viz.* $x^3 + bx = c$, $x^3 = bx + c$, and $x^3 + c = bx$; he has added rules for all forms and varieties of cubic equations, demonstrating these rules geometrically, and fully discussing almost all sorts of transformations of equations in a manner before unknown. Cardan also appears to have been well acquainted with all the real roots of equations, both positive and negative, or, as he calls them, true and fictitious, both of which he occasionally used. He has also shewn that the even roots of positive quantities are either positive or negative; that the odd roots of negative quantities are real and negative; but that the even roots of them are impossible, or nothing as to common use. He also well knew the number and nature of the roots of an equation, partly from the signs of the terms, and partly from the magnitude and relation of the co-efficients. He also knew that the number of positive roots is equal to the

number of changes of the signs of the terms; that the co-efficient of the 2d term of the equation is the difference between the positive and negative roots; that when the second term is wanting, the sum of the negative roots is equal to the sum of the positive roots; how to compose equations that shall have given roots; that changing the signs of the even terms changes the signs of all the roots; that the number of roots failed in pairs; or that the impossible roots, as they are now called, were always in pairs; to change the equation from one form to another, by taking away any term from it; and to increase or diminish the roots by a given quantity. It appears also, that Cardan had a rule for extracting the cube root of such binomials as admit of extraction; that he often used the literal notation *a, b, c, d, &c.*; that he gave a rule for biquadratic equations, suiting all their cases; and that, in the investigation of that rule, he made use of an assumed indeterminate quantity, and afterwards found its value by the arbitrary assumption of a relation between the terms; that he applied algebra to the resolution of geometrical problems; and that he was well acquainted with the difficulty of the irreducible case, and that he devoted much time and attention to the solution of it; and that, though he did not completely succeed, he laid down rules for many particular forms of it, and shewed how to approximate very nearly to the root in all cases whatever.

Tartalea, or Tartaglia, of Brescia, was a contemporary of Cardan, and published his book of algebra, entitled, "Questi è Invenzioni diverse," in 1546, at Venice, where he resided as public lecturer in mathematics. This work was dedicated to Henry VIII. of England, and consists of nine books, the last of which contains all those questions that relate to arithmetic and algebra. These questions comprehend exercises of simple and quadratic equations, with complex calculations of radical quantities, evincing the skill of the author in the science of algebra. He retained the notation or forms of expression used by Lucas de Burgo, calling the 1st power of the unknown quantity "cosa," the 2d power "censa," the third "cubo," &c.; and he expressed the names of all the operations in words, without any contractions, except the initial R for root, or radicality. What is most remarkable in this collection of questions is the discovery of the rules for cubic equations, together with the various circumstances that attended it. The first two of these were discovered by Tartalea in 1530, *viz.* those for $x^3 + ax^2 = c$, and $x^3 = ax^2 + c$; and the rules for the other two cases, *viz.* $x^3 + bx = c$, and $x^3 = bx + c$, were discovered, in 1535, at Venice. Under question 31, we have an account of the correspondence between Tartalea and Cardan on the subject of cubic equations, and on the manner in which Cardan drew from him his discoveries relating to them; for a more particular account of which, see the biographical article **CARDAN**. Tartalea published at Venice, in 1556, &c. a very large work, in folio, on arithmetic, geometry, and algebra; the latter of which is imperfect, and extended no farther than quadratic equations, his death having prevented his completion of it.

The contemporaries of Tartalea and Cardan were Michael Stifelius and Scheubelius. The "Arithmetica integra" of Stifelius was printed at Norimberg in 1544, and is, says Dr. Hutton, an excellent treatise on arithmetic and algebra. The invention of the science is ascribed by this author to Geber, an Arabian astronomer. The improvements of Stifelius and other Germans beyond those of the Italians, recited in Cardan's book of 1539, were as follow. He introduced the characters +, -, $\sqrt{\quad}$, for plus, minus, and root, or radix; and the initials 2, 3, 4, 5, 6, &c. for the powers 1, 2,

3, 4, 5, &c. He treated all the higher orders of quadratics by the same general rule. He introduced the numeral exponents of the powers, $-3, -2, -1, 0, 1, 2, 3$, &c. both positive and negative, as far as integral numbers, but not fractional ones; called them by the name *exponents*, exponent; and taught the use of exponents in the operations of powers; and he used the literal notation A, B, C, D, &c. for so many different unknown and general quantities.

John Scheubelius, professor of mathematics at Tubingen, in Germany, published several treatises on arithmetic and algebra. From one of them, entitled, "Algebrae compendiosa facilisque Descriptio, qua depromuntur magna Arithmetices miracula," printed at Paris in 1552, which Dr. Hutton has analysed, it appears, that he was the first modern algebraist who mentioned Diophantus, to whom writers, as he says, ascribe this art; that his characters and operations are much the same with those of Stifelius, but that he used \mathcal{R} for 1 or the 0 power; and prefixes the numeral coefficients. He treats merely of two orders of equations, *viz.* simple and quadratic equations, though, he says, they may be of infinite degrees; and he uses for the square root $\sqrt{\quad}$; for the cube root $\sqrt[3]{\quad}$; and $\sqrt[4]{\quad}$ for the 4th root. He gives the four fundamental rules in the arithmetic of surds; in squaring the sum or difference of the surds he sets the root to the whole compound; and this root, called by Cardan, "radix universalis," he denominates "radix collecta;" but when they may be reduced to a common surd, he unites them into one number. He proceeds in a similar manner with cubic surds and 4th roots. He remarks the different kinds of binomial and residual surds, corresponding to the several irrational lines in the 10th book of Euclid's Elements; and gives the following general rule for extracting the root of any binomial or residual $a \pm b$, in which one or both parts are surds, and a the greater quantity, *viz.* that the square root of it is

$$\sqrt{\frac{a + \sqrt{a^2 - b^2}}{2}} \pm \sqrt{\frac{a - \sqrt{a^2 - b^2}}{2}},$$

by examples. As he takes no notice of cubic equations, it is probable that though they were known in Italy he had not heard of them in Germany.

Robert Recorde, in England, published the first part of his arithmetic in 1552, and the second part in 1557, under the title of "The Whetstone of Witte, which is the seconde parte of Arithmetike; containing the Extraction of Rootes, the Cossike Practise, with the Rule of Equation; and the Workes of Surde Numbers." What is principally new in this work comprehends the extraction of the roots of compound algebraic quantities, the use of the terms binomial and residual, and the use of $=$, as the sign of equality.

The Algebra of Peletarius was printed at Paris in 4to. in 1558, under this title, "Jacobi Peletarii Cenomani, de Occulta Parte Numerorum, quam Algebra vocant. Lib. duo." This work, containing an account of rational and irrational or surd quantities, is an ingenious treatise on those parts of the science that were then known, cubic equations excepted; and the discoveries or improvements of the author are the following, *viz.* that the root of an equation is one of the divisors of the absolute term; that trinomials may be reduced to simple terms by multiplying them by compound factors; and that a series both of square and cube numbers may be constructed by addition only, that is, by adding successively their several orders of differences.

Peter Ramus wrote his Arithmetic and Algebra about the year 1560. He expresses the powers by l, q, c, b, g , the initials of *latus, quadratus, cubus, and biquadra-*

tus; and he treats only of simple and quadratic equations. In 1567, Peter Nonius, or Nunez, a Portuguese, published his Algebra in Spanish, though he informs us in an epistle, dated 1564, that it had then been written 30 years before in Portuguese. He proceeds no further than quadratic equations. The Algebra of Raphael Bombelli was published at Bologua, in 1579, in the Italian language, but was written some time before, as the dedication bears the date of 1572. Among other writers on this science he particularly mentions Diophantus, whose Greek work had been found in the Vatican library; and he adds, that he and Antonio Maria Pazzi Reggiano, professor of mathematics at Rome, had translated five out of the six books which were then extant; and that they had found in the said work frequent citations of the Indian authors. Hence, they inferred, that this science was known among the Indians before the Arabians became acquainted with it. Such references, if they actually existed, would serve to determine the controversy relating to the origin of this science; but they do not now remain in the work, nor are they mentioned by any other writer. In his work Bombelli has very well explained the rules and methods of former writers; but, except the trisection of angles by means of a cubic equation, and his mode of notation, he has not introduced any new invention or improvement. In this notation he uses the initial R for root, with q or c after it for quadratic or cubic, &c. root; p for plus, and m for minus. He calls the unknown quantity *tanto*, and marks it thus 1; the 2d power 2, its cube 3, and the highest powers 4, 5, &c. denoting all the

powers, which he denominates dignita, or dignity, by their exponents set over the common character \sim . Christopher Clavius, who follows Stifelius and Schubelius in his notation and method, without scarcely any variation, wrote his Algebra about the year 1580, which was published at Orleans in 1608. Simon Stevinus, of Bruges, published his Algebra soon after his Arithmetic, which appeared in 1585; and both were printed in an edition of his works in 1634, with notes and additions by Albert Girard. The peculiar inventions contained in this ingenious and original work are as follow. The author invented a new character, *viz.* a small circle \circ for the unknown quantity; and he also improved the notation of powers by numeral indices, first applied to integral exponents by Stifelius, which Stevinus inclosed within a circle, thus, \circ , $\textcircled{1}$, $\textcircled{2}$, $\textcircled{3}$, &c. or the 0, 1st, 2d, 3d, &c. powers of the quantity \circ ; and he further extended them to fractional and all other sorts of exponents; so that $\textcircled{\frac{1}{2}}$, $\textcircled{\frac{1}{3}}$, $\textcircled{\frac{1}{4}}$, &c. are the square, cube, 4th roots, &c. and $\textcircled{\frac{2}{3}}$ is the cube root of the square, and $\textcircled{\frac{3}{2}}$ is the square root of the cube, &c. Stevinus also extended the use and notation of co-efficients, making them to comprehend fractions, radicals, and all sorts of numbers. He distinguished a quantity of several terms by the general appellation of a multinomial; and denoted all nomials whatever by particular names, expressing the number of their terms as binomial, trinomial, quadrimomial, &c. He also proposed one general method for a numeral resolution of all equations whatever.

About the same time with Stevinus appeared Francis Vieta, who contributed more to the improvement of algebraic equations than any former author. His algebraical works were written about the year 1600; some of them were not published till after his death in 1603; and all his mathematical works were collected by Francis Schooten, and printed in 1646 in folio. The two books, which contain his chief improvements in algebra, are intitled "De Æquationum

Recognitione, et Emendatione;" and were not published till the year 1615, by Alexander Anderson, an ingenious Scotsman, with various corrections and additions. Vieta's improvements comprehend the following particulars. He first introduced the general use of the letters of the alphabet to denote indefinite given quantities. Accordingly he expresses unknown quantities by the vowels A, E, I, O, U, Y, and the known ones by the consonants B, C, D, &c. He also invented many terms and forms of expression which are in present use; as co-efficient, affirmative and negative, pure and affected or affected, unciæ, homogœnum adfectionis, homogœnum comparationis, and the line or vinculum over compound quantities, thus $\overline{A + B}$: And his method of arrangement is to place the homogœnum comparationis, or absolute known term on the right-hand side alone, and all the terms that contain the unknown quantity, with their proper signs, on the other side. He somewhat improved the rules and modes of reduction for cubic and other equations; he shewed how to change the root of an equation in a given proportion; he deduced the cubic and biquadratic, &c. equations from quadratics, not in Harriot's way by composition, but by squaring and otherwise multiplying certain parts of the quadratic; and as some quadratic equations have two roots, the cubic and other equations raised from them will also have two roots and no more. In this way Vieta perceived the relation which the two roots bear to the co-efficients of the two lowest terms of cubic and other equations, when they have only three terms, namely, by comparing them with similar equations thus raised from quadratics; and, *vice versa*, what the roots are in terms of such co-efficients. He also made some observations on the limits of the two roots of certain equations; he stated the general relation between the roots of certain equations and the co-efficients of the terms, when the terms are alternately plus and minus, and none of them are wanting, or the roots all positive. He extracted the roots of affected equations by a method of approximation similar to that for pure powers; and moreover, he gave the construction of certain equations, and exhibited their roots by means of angular sections.

In the History of Algebra, Albert Girard, an ingenious Dutch or Flemish mathematician, already mentioned, as the editor of Stevinus's arithmetic, who died about the year 1623, deserves particular notice, on account of his work, entitled, "Invention Nouvelle en l'Algebre, tant pour la Solution des Equations, que pour reconnoître le nombre des Solutions qu'elles reçoivent, avec plusieurs classes qui sont nécessaires à la perfection de ceste divine Science;" printed at Amsterdam in 1629, 4to. From an analysis of this work, it appears that Girard was the first person who understood the general doctrine of the formation of the co-efficients of the powers from the sums of the roots, and their products, &c. He was also the first who understood the use of negative roots in the solution of geometrical problems; who spoke of the imaginary roots, and understood that every equation might have as many roots real and imaginary, and no more, as there are units in the index of the highest power, and who applied the denomination of *quantities less than nothing* to the negative: and he was the first person who discovered the rules for summing the powers of the roots of any equation.

The next person who claims particular notice in the history of this science is Thomas Harriot, who died at the age of 60 years in 1621, and whose Algebra was published by his friend Walter Warner, in 1631. The book is a folio volume, and entitled, "Artis Analyticæ Praxis, ad Æquationes Algebraicas nova, expedita, et generali methodo, resolvendas;" a work, says Dr. Hutton, in all parts of it,

shewing marks of great genius and originality, and the first instance of the modern form of algebra in which it has ever since appeared. On the foundation laid by Harriot, says Dr. Wallis (Algebra, p. 126.) Des Cartes, without naming him, hath built the greatest part, if not the whole, of his algebra or geometry; without which, as he adds, "that whole superstructure of Des Cartes (I doubt) had never been." A summary of Harriot's improvements is as follows: He introduced the uniform use of the small letters *a, b, c, d, &c.* expressing the unknown quantities by the vowels *a, e, &c.* and the known ones by the consonants *b, c, d, f, &c.* joining them together in the form of a word to represent the product of any number of these literal quantities; and prefixing the numeral co-efficient, separated from the quantity connected with it by a point, thus *5. bbc*. For a root, he placed the index of the root after the radical mark $\sqrt{\quad}$, as $\sqrt[3]{3}$; for the cube root. He also introduced the characters \rhd and \lhd for greater and less; and in the reduction of equations, he arranged the operations in separate steps or lines, setting the explanations in the margin on the left hand, for each line. In these respects he introduced and established the form of algebra as it now exists. He also shewed the universal generation of all the compound or affected equations, by the continual multiplication of so many simple ones, or binomial roots; thus plainly exhibiting to the eye all the circumstances of the nature, mystery and number of the roots of equations, with the composition and relations of the co-efficients of the terms; from which many of the most important properties have been since deduced. He also improved the numeral extraction, or extraction of the roots of all equations, by clear and explicit rules and methods, drawn from the foregoing generation or composition of affected equations of all degrees.

Oughtred, contemporary with Harriot, was born about the year 1573, and died in 1660. His "Clavis" was published in 1631. In this work he chiefly follows Vieta, in the notation by the capitals A, B, C, D, &c. and in the designation of products, powers and roots, with some few variations. To him we owe the separation of decimals from the integers after this manner, $21\text{—}56$, and having the decimals annexed without a denominator. In algebraical multiplication Oughtred either joins the letters in a word, or connects them by the sign \times , introducing for the first time this character of multiplication; thus, $A \times A$, or AA , or Aq ; but he omits the vinculum of Vieta. He also introduces many useful contractions in the multiplication and division of decimals; such as that of inverting the multiplier for reducing the number of decimals, and abridging the work, that of omitting one figure at a time, of the divisor, and that of dividing by the factors of a number instead of the number itself, and many others. He states proportion thus, $7.9 :: 28.36$; and denotes continued proportion by $\frac{a}{b} \frac{c}{d}$. With respect to the genesis and analysis of powers he follows Vieta; and he furnishes a table of the powers of the binomial $A + E$ as far as the 10th power, with all their terms and co-efficients, or unciæ, an expression which he adopts from Vieta. He gives particular directions for the reduction of equations, corresponding to their various forms: he uses the letter *u* after $\sqrt{\quad}$, for universal, instead of the vinculum of Vieta: and he observes, that the signs of all the terms of the powers of $A + E$ are positive, and those of $A - E$ alternately positive and negative. He subjoins many properties of triangles and other geometrical figures, and the first instance of applying algebra to geometry, so as to investigate new geometrical properties; and after the algebraical resolution of each problem, he commonly deduces and gives a geometrical construction adapted to it. He gives also a good tract

tract on angular sections; and concludes the work with the numerical resolution of affected equations, in the manner of Vieta, but more explicit.

In 1637 Des Cartes first published his geometry, which may be considered as an application of algebra to geometry, and not as a separate treatise on either of these sciences. As Dr. Wallis has manifested too great a degree of partiality to our countryman Harriot, and ascribed to him discoveries which had been made by Vieta and others; and as Bombelli and M. de Gua, in the Memoirs of the Academy of Sciences for 1741, cited in the last edition of the Encyclopedie, have deviated far into the other extreme, in unduly extolling the discoveries of Vieta, and those of Des Cartes, to the prejudice of Harriot, we shall avail ourselves of the analysis of Dr. Hutton in giving a particular account of the improvements and inventions of Des Cartes, that our readers may be able to form their own judgment in this controversy. Montucla indeed seems to have given an impartial account of the discoveries both of Harriot and Des Cartes, intermixed with reflections, which some may think less candid than they ought to have been, on our illustrious countryman Dr. Wallis. Hist. des Mathem. tom. ii. p. 106—186. This excellent historian of the mathematical sciences acknowledges, that Des Cartes might possibly have been indebted to Harriot, though he thinks it very probable that the principal discoveries of his geometry were anterior to the date of the work of the English analyst. It ought however to be recollected, that the work of Harriot was posthumous, that he lived to the age of 60, and that his discoveries, at a period when the spirit of enquiry was excited, might have been communicated to men of science, between whom an intercourse subsisted, long before he died. Montucla, by way of balancing the account between Des Cartes and Harriot, or rather between Wallis and the partial advocates of Des Cartes, intimates, that if Des Cartes was indebted to Harriot, the latter was under no less important obligations to Vieta, whose works were published before the year 1600. To strengthen the presumption that this might have been the case, he alleges, on the authority of Sherburn, the translator of Manilius, that Vieta had for some time employed an English secretary, or amanuensis, whose name was Nathaniel Torporley: and as this Torporley was frequently in familiar intercourse with Harriot at the table of the Duke of Northumberland, he suggests the probability of his having communicated the ideas and manuscripts of Vieta, of which he was the depositary to Harriot.

The geometry of Des Cartes (Apud Opera. tom. iii. Francof. ad Moenum, 1695, 4to.) consists of three books. The first is entitled, “De Problematibus, quæ construi possunt, adhibendo tantum rectas lineas et circulos.” In this book the author shews how to accommodate arithmetical computation to geometrical operations. For this purpose he assumes a line to represent unity, and then, by means of proportionals, teaches the method of multiplying, dividing, and extracting of roots by lines. He proceeds to explain his mode of notation, which is not different from that of other authors. Assuming a and b for two quantities, their sum is expressed by $a + b$, their difference by $a - b$, their product by ab , their quotient by $\frac{a}{b}$, the square of a by aa or a^2 , its cube by a^3 , &c. the square root of $a^2 + b^2$ by $\sqrt{a^2 + b^2}$, and the cube root by $\sqrt[3]{c - a^3 - b^3 + abb}$, &c. He then shews, as Stifelius had done, that there must be as many equations as there are unknown lines or quantities, and that all of them must be reduced to one single equation, by extermin-

nating all the unknown letters except one; so that the final equation will appear in the following forms, the character \propto being substituted for $=$ or equality, and the highest term or power being on one side of the equation, and the other terms with their proper signs on the other side:

$$\begin{aligned} x &\propto b, \text{ or,} \\ x^2 &\propto -ax + b^2, \text{ or,} \\ x^3 &\propto +ax^2 + b^2x - c^3, \text{ or,} \\ x^4 &\propto +ax^3 + b^2x^2 - c^2x + d^4, \text{ \&c.} \end{aligned}$$

Having defined plane problems, or such as can be resolved by right lines and circles, described on a plane superficies, and having in the final equation only the 2d power of the unknown quantity, he constructs such equations or quadratics by means of the circle, and thus geometrically investigates the positive root or roots. But if the lines, by which the roots are determined, neither cut nor touch, he observes that the equation in this case has no possible root, or that the problem is impossible. This book closes with the algebraical solution of the celebrated problem, considered by the ancients, which is that of finding a point, or the locus of all the points, from which if a line be drawn to meet any number of given lines in given angles, the product of the segments of some of them shall have a given ratio to that of the rest.

The second book is entitled, “De Natura Linearum Curvarum.” This is the first treatise of the kind on curve lines produced by the moderns. The nature of the curve is here expressed by an equation, containing two unknown or variable lines, and others that are known or constant, as $y^2 \propto cy - \frac{cxy}{b} + ay - ac$. See CURVE. We have in this

book a discovery of importance, as it is the first step towards the arithmetic of infinites; and that is the method of tangents, or of drawing a line perpendicular to a curve at any point, which is an ingenious application of the general form of an equation, generated in the method of Harriot, that has two equal roots, to the equation of the curve. See TANGENT.

The third book, entitled, “De Constructione Problematum Solidorum, et Solida excedentium,” commences with remarks on the nature and roots of equations; and the author observes, that they have as many roots as dimensions; and he shews, after Harriot, that they may be obtained by multiplying a certain number of simple binomial equations together, as $x - 2 \propto 0$, $x - 3 \propto 0$, and $x - 4 \propto 0$, which produce $x^3 - 9xx + 26x - 24 \propto 0$, in which equation x has three dimensions, and also three values, viz. 2, 3, and 4. He here remarks, that some equations have their roots false, or, as he expresses it, less than nothing, called by us negative, and these he contradistinguishes to those that are true or positive, which Cardan had before done. E. G. Let $x + 5 \propto 0$ be multiplied by $x^3 - 9xx + 26x - 24 \propto 0$, and we shall have $x^4 - 4x^3 - 19xx + 106x - 120 \propto 0$, in which equation three roots, viz. 2, 3, and 4 are true, and one, viz. 5, false. From the generation or composition of equations by multiplication Des Cartes naturally deduces their resolution, depression, or decomposition, by dividing them by the binomial factors which composed them; and hence he observes, that this divisor is one of the binomial roots, and that there can be no more roots than dimensions, or than such as form with the unknown quantity x binomials that will exactly divide the equation, as Harriot had before shewn. Our author adverts to other properties, most of which had been noticed before; e.g. that equations may have as many true roots as the terms have changes of the signs $+$ and $-$, and as many false

false ones as successions of the same signs; which had before been partly shewn by Cardan and Vieta from the relation of the co-efficients and their signs, and more fully by Harriot. Hence Des Cartes was led to adopt Cardan's method of changing the true roots to false, and the false to true, by merely changing the signs of the even terms. He then directs his attention to other reductions or transmutations taught by Cardan, Vieta, and Harriot; such as increasing or diminishing the roots by any quantity, taking away the second term, and altering the roots in any proportion, and thus extricating the equation from fractions and radicals. Having observed (p. 76.) that the roots of equations, both true and false, may be either real or imaginary, which imaginary roots were first noticed by Albert Girard, as in the equation $x^3 - 6xx + 13x - 10 = 0$, that has only one real root, viz. 2; he proceeds to the depression of a cubic equation to a quadratic or plane problem, &c. that it may be constructed by the circle, by dividing it by one of the binomial factors, which, in Harriot's method, compose the equation. As Peletarius had shewn that the simple root is one of the divisors of the known term of the equation, and Harriot had observed that this term is the continual product of all the roots; Des Cartes tries all the simple divisors of that term, till he finds one of them, which connected with the unknown quantity x by $+$ or $-$, will exactly divide the equation: and the same process serves for higher powers than the cube. But when a divisor cannot be found in this way, in order to depress a biquadratic equation into a cubic one, he gives a new rule for dissolving it into two quadratics, by means of a cubic equation, in the following manner (p. 79, &c.): Let the given biquadratic equation be $+x^4 + px^2 + qx + r = 0$;

And suppose it composed of these two others, viz.

$$\begin{cases} +xx - yx + \frac{1}{2}yy \cdot \frac{1}{2}p \cdot \frac{q}{2y} = 0, \\ +xx + yx + \frac{1}{2}yy \cdot \frac{1}{2}p \cdot \frac{q}{2y} = 0 : \end{cases}$$

in which two quadratic equations the sign of $\frac{1}{2}p$ must be the same with the sign of p in the given equation; and in the first of them, having $-yx$, the sign of $\frac{q}{2y}$ must be the same with that of q or $+$; and in the second quadratic, having $+yx$, its sign must be $-$; and *vice versa*. Then find the root

$\frac{yy}{qq}$ of the following cubic equation, viz. $y^6 \cdot 2py^4 + \frac{pp}{4r}yy - qq = 0$, in which the sign of $2p$ is the same with that of p in the given biquadratic, but the sign of $4r$ contrary to that of r in the same equation; and the value of y , deduced hence, and substituted for it in the two quadratic equations, and their two pairs of roots being taken, these will be the four roots of the proposed biquadratic. *E. G.* Let the biquadratic be $x^4 - 4xx - 8x + 35 = 0$, for which must be substituted $y^6 - 8y^4 - 124yy - 64 = 0$; because the quantity called p being in this case -4 , $-8y^4$ must be substituted for $2py^4$, and r being $+35$, $\frac{+16}{-140}yy$, or $-124yy$,

must be substituted for $\frac{pp}{4r}yy$; and q being 8 , $-qq$ will be -64 . And so of others. In the same manner, says Des Cartes, may equations of the 6th power be reduced to those of the 5th, and those of the 8th power to those of the 7th, &c. The investigation of this rule is not given by Des Cartes; but it has been evidently done by assuming indeterminate quantities after the manner of Ferrari and Cardan, as co-efficients of the terms of the two quadratic equations, and after multiplying the two together, determining their values by comparing the resulting terms with those of the proposed

biquadratic equation. Des Cartes, after these reductions, in order to simplify and depress the equations as much as possible, proceeds to give the construction of solid and other higher problems, or of cubic and higher equations by means of parabolas and circles; observing, that the false roots are denoted by the ordinates to the parabola lying on the contrary side of the axis to the true roots; and he closes the book with illustrating these constructions by various problems concerning the trisection of an angle, and the investigation of two or four mean proportionals.

Of the improvements contained in this work, it is observed by Dr. Hutton, that Des Cartes, with a view to the more easy application of equations to the construction of problems, mentions many particulars concerning the nature and reduction of equations, and states them in his own language and manner, which is usually more clear and explicit than that of others, and frequently accompanied with his own improvements. Here he chiefly followed Cardan, Vieta, and Harriot, and especially the last; explaining some of their rules and discoveries more distinctly, and with some little variation in the notation, in which he puts the first letters of the alphabet for known, and the latter letters for unknown quantities, a^3 for aaa , &c. and ∞ for $=$. But Herigone had two years before used the same numeral exponents. Des Cartes explained or improved most parts of the reduction of equations, in their various transmutations, the number and nature of their roots, true and false, real and imaginary, as he calls them, or as they are denominated by Girard, involved; and also the depression of equations to lower degrees. His inventions and discoveries comprehend the application of algebra to the geometry of curve lines, the construction of equations of the higher orders, and a rule for resolving biquadratic equations by means of a cubic and two quadratics.

Fermat, who published Diophantus's arithmetic with valuable notes, was a contemporary of Des Cartes, and also a competitor for some of his most valuable discoveries. This ingenious mathematician, before the publication of Des Cartes's geometry, had applied algebra to curve lines, expressed them by an algebraic equation, and by them constructed equations of the 3d and 4th orders; and he had also discovered a method of tangents, and a method de maximis et minimis, approaching very nearly to the method of fluxions or increments, in the manner of treating the problems as well as in the algebraic notation and process. Fermat was also distinguished by his knowledge of the Diophantine problems.

At the period to which we have now referred, algebra had acquired a regular and permanent form; and from this time the writers on the whole, or detached parts of this science, became so numerous, that the limits of this article will scarcely admit our reciting their names and publications, and much less doing justice to the improvements which this branch of mathematical science derived from their performances. In the course of our biographical articles, and on other occasions, we shall endeavour to supply the defects of the present cursory notice.

The geometry of Des Cartes engaged the attention of several mathematicians in Holland, where it was published; and also in France and England. Francis Schooten, professor of mathematics at Leyden, was one of the first cultivators of the new geometry; and in 1649 he published a translation of Des Cartes's geometry, from the French into Latin, with his own commentary and notes by M. de Beaune. In 1659, appeared an enlarged edition in two volumes, with several additional pieces by De Beaune, Hudde, Van Heuraet, De Witt, with some tracts by Schooten the editor. Rabuel, a jesuit, published an elaborate commentary on the same work;

work; which was enriched with notes by James Bernouilli, and printed at Basil. Huygens also directed his attention to the algebraic analysis, and his inventions are cited by Schooten, who was his pupil. Slufius, canon of Liege, published in 1659, "Mefolabum, seu duæ medix proportionales per Circulum, et Elliptin, vel Hyperbolam, infinitis ratiõibus," a new edition of which appeared in 1668, containing much valuable matter relating both to algebra and geometry.

But before the time of Des Cartes, as well as after the publication of his geometry, algebra engaged the attention of mathematicians. In 1619 several pieces of Van Collen, or Ceulen, were translated from Dutch into Latin, and published at Leyden, by W. Snell; one of which is a particular treatise on Surds. In 1621, Bachet published an edition of Diophantus with notes, and Fermat's edition, with additions, appeared in 1670. The same author published, in 1624, a treatise of mathematical recreations under the title of "Problemes plaisans et delectables." Herigone, in 1634, published at Paris the first course of mathematics, in 5 vols. 8vo; containing a treatise on algebra, and bearing, says Hutton, evident marks of originality and ingenuity, in which he uses the notation by small letters, introduced three years before by Harriot; he also expresses plus by +, minus by -, and | for equality, with other abbreviations. In his notation of powers and roots, he annexes to the letter the numeral exponents. Cavalerius, in 1635, published his "Indivisibles," and introduced a new æra in analytical science and new modes of computation. He was followed in 1640 by Roberval, whose improvements in analytics were published in the early volumes of the memoirs of the Academy of Sciences, by De Billy, who published in 1643, "Nova Geometriæ clavis Algebra," and in 1670, "Diophantus redivivus;" and by Renaldine, who, in 1665, published in 4to, "Opus Mathematicum," both ancient and modern, with mathematical resolution and composition, enlarged and republished in folio, in 1662, 1667, and 1682, under the title of "Ars analytica Mathematicum, in tres partes distributa, &c." This author uses the parentheses ($a^2 + b^2$) as a vinculum. In 1655, Dr. Wallis published his "Arithmetica Infinitorum," which greatly improved the Indivisibles of Cavalerius, and led the way to infinite series, the binomial theorem, and the method of fluxions. The "Algebra Rhonii, (or Rahnii) Germanicæ," was published in 1659, and translated into English in 1668, by Mr. Thomas Brancker, with alterations and additions, by Dr. John Pell, who used a peculiar method of registering the steps of an algebraic process by means of marks and abbreviations in the margin, explaining each line or step, as Harriot had before done in words at length. Hemeling was also the author of a German work, resolving 600 questions, published in 1684. Mr. Kineckhuysen, in 1661, published a treatise of algebra in Dutch, which Sir Isaac Newton, when professor of mathematics at Cambridge, used and improved, and which he designed to republish, with his method of fluxions and infinite series, but was prevented by the accidental burning of some of his papers. In 1667 Jacob Ferguson published his "Labyrinthus Algebrae," in 4to, Dutch; and in 1679, De Graaf gave a course of mathematics, in the same language and size. In 1665 or 1666, Sir Isaac Newton made several of his most valuable discoveries, though they were not published till a later period; such as the binomial theorem, the method of fluxions and infinite series, the quadrature, rectification, &c. of curves, the investigation of the roots of all sorts of equations, both numeral and literal, in infinite converging series, the reversion of series, &c.

M. Frenicle, in 1666, communicated several tracts concerning combinations, magic squares, triangular numbers, &c. which were printed in the early volumes of the Memoirs of the Academy of Sciences. In 1668, Mercator published his "Logarithmotechnia," in which he gives the quadrature of the hyperbola, by means of an infinite series of algebraic terms, found by dividing a simple algebraic quantity by a compound one; which operation was now first made public, though Newton had before expanded all sorts of compound algebraic quantities into infinite series. The demonstration of Mercator's quadrature of the hyperbola by the same series, was published in this year, by James Gregory, in his "Exercitationes Geometricæ;" and in the same year Lord Brouncker published in the Philosophical Transactions, his quadrature of the hyperbola by another infinite series of simple rational terms, of which he had been in possession since the year 1657, when Dr. Wallis announced it to the public. His series for the quadrature of the circle had been published by Wallis in his "Arithmetica Infinitorum." In 1669, Dr. Barrow published his "Optical and Geometrical Lectures," abounding with profound researches on the dimensions and properties of curve lines, and containing his method of tangents, by a mode of calculation similar to that of fluxions or increments, and little differing from it, except in the notation. In the 13th lecture, (p. 277. Stow's Edit.) the subject of which is equations, he adopts a new method of explaining their nature, different from that of Vieta, who illustrates it by the analogy of the terms, or that of Harriot and Des Cartes, by multiplying them into one another. His method of explaining them depends upon the description of lines adapted to each; and thus he investigates the nature and number of their roots, and the limits of their magnitudes, considering the subject as a branch of the maxima and minima.

The "Elements of Algebra" were published by John Kersey in 1675, in 2 vol. folio, containing the illustration of the science and of the nature of equations, the explication of Diophantus's problems, and many additions concerning mathematical composition and resolution, from Gheraldus. This work, says Hutton, is very ample and complete. The first part appeared in 1673, and the second in 1674. In 1675 Prefset published his "Nouveaux Elemens des Mathematiques," to which the author, with a presumption hardly excusable, has prefixed a dedication of the work to God Almighty. In 1677 Leibnitz discovered his "Methodus Differentialis," or made a variation in Newton's fluxions or extended Barrow's method, of which he gave the first instance in the Leipzig acts for 1684. See FLUXIONS. In the same acts for 1682, he communicated an improvement of infinite series, and a simple series for the quadrature of the circle. An amplification of Wallis's arithmetic of infinites was published in folio, in 1682, by Ismael Bulliald, entitled, "Opus novum ad Arithmetica Infinitorum." Tschirnhausen, in 1683, communicated a memoir in the Leipzig acts, proposing the extraction of the roots of all equations in a general way; but his method did not succeed. Baker's "Clavis Geometrica Catholica, Geometrical Key, or Gate of Equations unlocked," was published in Latin and English in 1684. This was an improvement of Des Cartes's construction of all equations under the 5th degree, by means of a circle and parabola for all equations, any diameter being used instead of the axis of the parabola. Dr. Wallis's "Treatise of Algebra, both Historical and Practical, shewing the original, progress, and advancement of it from time to time," was published in 1685, in folio. In 1687, Dr Halley communicated in

the Philosophical Transactions the construction of cubic and biquadratic equations, by a parabola and circle, with improvements of the methods of Des Cartes, Baker, &c.; and also a memoir on the number of the roots of equations, with their limits and signs. M. Rolle, in 1690, published in 4to, "Traité d'Algebre;" in 1699, "Une methode pour resoudre les questions indeterminées;" and in 1704, "Memoirs sur l'inverse des Tangents," and some other pieces. Joseph Raphson, in 1690 published his "Analysis Æquationum Universalis," which is a general method of approximating to the roots of equations in numbers. His "History of Fluxions" was published in English and Latin in 1715. Dechaes published his "Cursus seu Mundus Mathematicus," in 4 vols. folio, in 1690. About the year 1691, &c. De Lagny published many pieces on the resolution of equations in numbers; and in 1693 appeared a little volume, entitled, "Synopsis Algebraica, opus posthumum Johannis Alexandri." An ingenious tract on the numeral extraction of all roots, without any previous reduction, was communicated in the Philosophical Transaction, by Dr. Halley in 1694. This tract is annexed to some editions of Newton's Universal Arithmetic. Craig published, in 1694, in 4to, his treatise, "De fig. curvil. quadraturis et locis geometricis," in which he proposed new formulæ for the construction of equations; and this method was improved by Herman in 1737, in Mem. of Petersburg. Mr. John Ward of Chester, published in 1695, "A Compendium of Algebra;" and in 1706, the first edition of "The Young Mathematician's Guide," which has been much used. In 1696 the "Analyse des Infiniment Petits," of the Marquis de l'Hopital, was published, and a posthumous treatise by the same author, entitled, "Traité Analytique des Sections Coniques, et le Construction des lieux Geometriques," was published in 1707. Mr. Ab. Demoivre, in 1697, and succeeding years, furnished the Philosophical Transactions with various papers, containing improvements in algebra: in 1697, a method of raising an infinite multinomial to any power, or extracting any root of the same; in 1698, the extraction of the root of an infinite equation; in 1707, an analytical solution of certain equations of the 3d, 5th, 7th, &c. degrees; in 1722, of algebraic fractions, and recurring series; in 1738, the reduction of radicals into more simple forms; and in 1730 he published "Miscellanea Analytica de Seriebus et Quadraturis," containing great improvements in series, &c. Mr. Richard Sault published, in 4to, "A new Treatise of Algebra, applied to numeral questions, and geometry; with a converging series for all manner of affected equations," which series is Raphson's method of approximation, which had been lately published. In 1698 Hugo d'Omer published his "Analysis Geometrica, &c." in which, by combining the algebraic analysis of the moderns with that of the ancients, he resolved in an elegant and simple manner many curious problems. In 1699 Hyac. Christopher published at Naples, in 4to, a tract, entitled, "De Constructione Equationum." Ozanam's algebra, containing the Diophantine analysis, was published in 1702, his mathematical dictionary in 1691, and his course of mathematics, in 5 vols. 8vo, in 1693. In 1705, Dr. Harris, the author of the "Lexicon Technicum," published a small piece on algebra and fluxions. M. Guisnè published, in 1705, his "Application de l'Algebre a la Geometrie," in 4to. In 1706, Mr. Jones published his "Synopsis Palmariorum Matheos," which is an useful compendium of the mathematical sciences; and in 1711, he published in 4to, a collection of Sir Isaac Newton's papers, entitled, "Analysis per quantitatum series, fluxiones, ac differen-

tias; cum enumeratione linearum tertii ordinis." The first edition of Newton's "Arithmetica Universalis, five de Compositione et Resolutione Arithmetica liber," was published by Whiston in 1707; and many editions have been published since. It is of course included in Horsley's edition of Newton's works. This treatise was the text book of the author at Cambridge; and though not designed for publication, it contains many very considerable improvements in analytics; particularly in the nature and transmutation of equations; the limits of their roots; the number of impossible roots; the invention of divisors, both surd and rational; the resolution of problems, arithmetical and geometrical; the linear construction of equations; the approximation to the roots of all equations, &c. Commentaries have been published on this work for the assistance of beginners, by S'Gravafande, Castillon, Wilder, &c. The "Analyse Démontrée" of Reyneau, was published in 4to. in 1708, and in 1714, "La Science du Calcul," and reprinted with additions in 1736, under the title of "Usage de l'Analyse," &c. In 1709 an English translation of Alexander's algebra was published, with an appendix, by Humphry Ditton. In 1715, Dr. Brooke Taylor published his valuable work, entitled, "Methodus Incrementorum;" and in the Philosophical Transactions for 1718 an improvement of the method of approximating to the roots of equations in numbers. M. Nicole, in 1717, communicated, in the Memoirs of the Academy of Sciences, a tract on the calculation of finite differences, and in following years various other tracts on the same subject, and also on the resolution of equations of the third degree, and on the irreducible case in cubic equations. Ronayne, in 1717, published a treatise on algebra; and in the same year Mr. James Stirling published a work of improvement on analytics, entitled, "Lineæ tertii Ordinis;" and in 1730, "Methodus Differentialis; five tractatus de summatione et interpolatione serierum infinitarum;" with great improvements on infinite series. Maclaurin, in 1726 and 1729, gave, in the Philosophical Transactions, tracts on the imaginary roots of equations, and afterwards his "Algebra," was published from his posthumous papers, with its application to curves. S'Gravafande's algebra, with a commentary on Newton's Un. Arithm. appeared in 1727; and in 1728 Mr. Campbell communicated, in the Philosophical Transf. an ingenious paper on the number of impossible roots of equations, and the papers of Maclaurin and Campbell were annexed to Gravafande's edition of the "Arithm. Univ." at Leyden in 1732. Leccchi, a Jesuit, published the "Arithm. Univ." with an imperfect commentary, in 3 vols. 8vo. in 1752. Wolfius's algebra was published in 1732, in his "Elementa Matheos Universalis." in 5 vols. 4to. Mr. John Kirkby's arithmetic and algebra were published in 1735, and in 1748 his doctrine of ultimators. Several improvements in series, and other parts of algebra, are contained in Mr. Thomas Simpson's "Essays," published in 1740, in his "Dissertations," 1743, and in his tracts, 1757; and also in his "Algebra," first printed in 1745, and in his "Select Exercises," in 1752. In 1740, Saunderson's "Elements of Algebra," were published in 2 vols. 4to. M. de la Caille, published in 1741, "Leçons de Mathématiques; ou Elemens d'Algebre et Geometrie;" and in the same year M. de Gua, in the Memoirs of the Academy of Sciences, communicated two articles on the number of positive, negative, and imaginary roots of equations, with an historical account of the improvements in algebra, in which he severely censures Wallis for his partiality, whilst he himself is, at least, equally faulty. M. Clairaut published his "Elemens d'Algebre," in 1746, in which he has many improvements,

improvements, particularly with reference to the irreducible case in cubic equations. A fifth edition of this valuable treatise, with notes and additions, was published at Paris in 1797, in 2 vols. 8vo. He has also several papers on analytics, in the Memoirs of the Academy of Sciences. In 1747, M. Fontaine gave, in the same memoirs, a paper on the resolution of equations, and other papers in subsequent memoirs. In 1748, Mademoiselle M. G. Agnesi, published at Milan in Italian, "Analytical Institutions, in 2 vols. 4to. M. Castillon, in 1761, published in 2 vols. 4to, Newton's Universal Arithmetic, with an ample commentary. In 1763, Mr. Emerson published his "Increments," and in 1764 his "Algebra." Mr. Landen published his "Residual Analysis," in 1764, his "Mathematical Lucubrations," in 1765, and his "Mathematical Memoirs," in 1780. M. Euler published his "Elements of Algebra," in the German language in 1770, and in 1774, a French translation was published, by J. Bernouilli, with the analysis of indeterminate problems, by M. de la Grange. An English translation was published in 1797, in 2 vols. The memoirs of Berlin and Petersburg abound with various improvements on series and other branches of analysis by this celebrated mathematician. Dr. Waring, late of Cambridge, has communicated several valuable papers to the Philosophical Transactions, and many of his improvements, are contained in his separate publications, particularly the "Meditationes Algebraicae," published in 1770; the "Proprietates Algebraicarum Curvarum," in 1772; and the "Meditationes Analyticae," in 1776. The first of these publications deserves particular notice. The first chapter treats of the transformation of algebraical equations into others, of which the roots have given algebraical relation to the roots of the given equations. The limits and number of impossible and affirmative and negative roots of algebraical equations are the subjects of the second chapter. The third chapter comprehends the investigation of the roots of equations or irrational quantities, which have given relations to one another, the resolution of equations, &c. &c. The fourth chapter is principally conversant concerning more algebraical equations and their reduction to one; and the fifth chapter treats of rational and integral values of the unknown quantities of given equations. Francis Maferes, Esq. claims honourable mention, not only as an original writer, who has contributed to the explanation and improvement of some of the most abstruse and yet most interesting branches of algebra and analysis, but on account of the labour and expence which he has bestowed on the publication of the "Scriptores Logarithmici," in three vols., 4to., 1791, 1796, containing many curious and useful tracts, which are thus preserved from being lost, and many valuable papers of his own on the binomial theorem, series, &c. After this detail, for which we are in a considerable degree indebted to the research of Montucla and Dr. Hutton, many authors who have, in separate treatises or in occasional essays, contributed to the improvement of algebra in general, or some particular branches of it, or who have published treatises on the science, still remain unnoticed; and we must content ourselves with merely mentioning Franciscus Caligarius, Rudolphus, Adam Gigas or Riscu, Buto, R. Wentworth, Ant. Maria Floridus, Lazarus Schonerus, Bernard Salignac, Leonard, Digges, and Robert Norman, in the 16th century, Christopher Clavius, in 1608, Georgius Heneschius, in 1609, Sebastian Kurtz, Coignet, Lalouberre, Degraave, Mefcher, the Bernouillis, Malbranche, Welis, Dodson, Manfredi, Regnault, Rowning, Hammond, Lorgna, Hellins, de la Grange, de la Place, Bertrand, Kuhnus, Hales, Maskelync, Vince, Wood, Manning, Freud, Bonnycastle, &c. &c. &c.

Algebra is a peculiar kind of ARITHMETIC, which takes the quantity sought, whether it be a number, or a line, or any other quantity as if it were granted; and by means of one or more quantities given, proceeds by a train of deduction, till the quantity at first only supposed to be known, or at least some power of it, is found to be equal to some quantity or quantities which are known, and consequently itself is known.

Algebra is of two kinds, *numeral* and *literal*.

Algebra, numeral, or *vulgar*, is that which is chiefly concerned in the resolution of arithmetical questions. In this, the quantity sought is represented by some letter or character; but all the given quantities are expressed by numbers. Such is the algebra of the more ancient authors, as Diophantus, Paciulus, Stifelius, &c. This is thought by some to have been an introduction to the art of keeping merchants' accounts by double entry.

Algebra speciosus, or *literal*, or the *new algebra*, is that in which all the quantities, known and unknown, are expressed or represented by their species, or letters of the alphabet. There are instances of this method from Cardan and others about his time; but it was more generally introduced and used by Vieta. Dr. Wallis (*Algebra*, p. 66.) apprehends, that the name of specious arithmetic applied to algebra is given to it with a reference to the sense in which the Civilians use the word species. Thus, they use the names Titius, Sempronius, Caius, and the like, to represent indefinitely any person in such circumstances; and cases so propounded, they call species. Vieta, accustomed to the language of the civil law, gave, as Wallis supposes, the name of species to the letters A, B, C, &c. which he used to represent indefinitely any number or quantity, so circumstanced as the occasion required.

This mode of expression frees the memory and imagination from that stress or effort, which is required to keep several matters, necessary for the discovery of the truth investigated, present to the mind; for which reason this art may be properly denominated metaphysical geometry. Specious algebra is not like the numeral, confined to certain kinds of problems; but serves universally for the investigation or invention of theorems, as well as the solution and demonstration of all kinds of problems, both arithmetical and geometrical. The letters used in algebra do each of them separately represent either lines or numbers, as the problem is either arithmetical or geometrical; and together, they represent planes, solids, and powers more or less high, as the letters are in a greater or less number. For instance, if there be two letters, *ab*, they represent a rectangle, whose two sides are expressed, one by the letter *a*, and the other by *b*; so that by their mutual multiplication they produce the plane *ab*. Where the same letter is repeated twice, as *aa*, they denote a square. Three letters *abc*, represent a solid or a rectangular parallelepiped, whose three dimensions are expressed by the three letters *abc*; the length by *a*, the breadth by *b*, and the depth by *c*; so that by their mutual multiplication, they produce the solid *abc*.

As the multiplication of dimensions is expressed by the multiplication of letters, and as the number of these may be so great as to become inconvenient, the method is only to write down the root, and on the right hand to write the index of the power, that is, the number of letters of which the quantity to be expressed consists; as a^2 , a^3 , a^4 , &c. the last of which signifies as much as *a* multiplied four times into itself; and so of the rest. But as it is necessary, before any progress can be made in the science of algebra, to understand the method of notation, we shall here give a general view of it.

In algebra, as we have already stated, every quantity, whether it be known or given, or unknown or required, is usually represented by some letter of the alphabet; and the given quantities are commonly denoted by the initial letters, *a, b, c, d, &c.* and the unknown ones by the final letters, *u, w, x, y.* These quantities are connected together by certain signs or symbols, which serve to shew their mutual relation, and at the same time to simplify the science and to reduce its operations into a less compass. Accordingly the sign $+$ plus or more, signifies that the quantity, to which it is prefixed, is to be added, and it is called a positive or affirmative quantity. Thus, $a + b$ expresses the sum of the two quantities a and b , so that if a were 5, and b , 3, $a + b$ would be 5 + 3, or 8. If a quantity have no sign, $+$ plus is understood, and the quantity is affirmative or positive. The sign $-$, minus or less, denotes that the quantity which it precedes is to be subtracted, and it is called a negative quantity. Thus $a - b$ expresses the difference of a and b : so that a being 5, and b , 3, $a - b$ or 5 - 3 would be equal to 2. If more quantities than two were connected by these signs, the sum of those with the sign $-$ must be subtracted from the sum of those with the sign $+$. Thus, $a - b + c - d$ represents the quantity which would remain, when c and d are taken from a and b . So that if a were 7, b , 6, c , 5, and d , 3, $a + b - c - d$ or 7 + 6 - 5 - 3, or 13 - 8, would be equal to 5. If two quantities are connected by the sign \propto , as $a \propto b$, this mode of expression represents the difference of a and b , when it is not known which of them is the greatest.

The sign \times signifies that the quantities between which it stands are to be multiplied together, or it represents their product. Thus, $a \times b$ expresses the product of a and b ; $a \times b \times c$ denotes the product of a , b , and c ; $\overline{a + b} \times c$ denotes the product of the compound quantity $a + b$ by the simple quantity c ; and $\overline{a + b + c} \times \overline{a - b + c} \times \overline{a + b}$ represents the product of the three compound quantities, multiplied continually into one another; so that if a were 5, b , 4, and c , 3, then would $\overline{a + b + c} \times \overline{a - b + c} \times \overline{a + b}$ be $12 \times 4 \times 8$, or 384. The line connecting the simple quantities and forming a compound one, placed over them, is called a vinculum. Quantities that are joined together without any intermediate sign form a product; thus ab is the same with $a \times b$, and abc the same with $a \times b \times c$. When a quantity is multiplied into itself, or raised to any power, the usual mode of expression is to draw a line over the quantity and to place the number denoting the power at the end of it, which number is called the index or exponent. Thus, $\overline{a + b}^2$ denotes the same as $\overline{a + b} \times \overline{a + b}$ or second power, or square, of $a + b$ considered as one quantity; and $\overline{a + b}^3$ denotes the same as $\overline{a + b} \times \overline{a + b} \times \overline{a + b}$, or the third power, or cube, of $a + b$. In expressing the powers of quantities represented by single letters, the line over the top is usually omitted; thus, a^2 is the same as $a \times a$ or $a \times a$, and b^3 the same as $b \times b \times b$, and $a^2 b^3$, the same as $a \times a \times b \times b \times b$. The full point and the word into, are sometimes used instead of \times , as the sign of multiplication. Thus, $\overline{a + b} \cdot \overline{a + c}$, and $\overline{a + b}$ into $\overline{a + c}$, signify the same thing as $\overline{a + b} \times \overline{a + c}$, or the product of $\overline{a + b}$ by $\overline{a + c}$.

The sign \div is the sign of division, as it denotes that the quantity preceding it is to be divided by the succeeding quantity. Thus, $c \div b$ signifies that c is to be divided by b ; and $\overline{a + b} \div \overline{a + c}$, that $\overline{a + b}$ is to be divided by $\overline{a + c}$. The mark $)$ is sometimes used as a note of divi-

sion; thus, $a + b) ab$, denotes that ab is to be divided by $a + b$. But the division of algebraic quantities is most commonly expressed by placing the divisor under the dividend with a line between them, like a vulgar fraction. Thus, $\frac{c}{b}$ represents the quantity arising by dividing c by b , or the quotient, and $\frac{a + b}{a + c}$ represents the quotient of $a + b$ divided by $a + c$. Quantities thus expressed are called algebraic fractions. See FRACTIONS.

The sign $\sqrt{\quad}$ expresses the square root of any quantity to which it is prefixed; thus $\sqrt{25}$ signifies the square root of 25 or 5, because 5×5 is 25; and \sqrt{ab} denotes the square root of ab ; and $\sqrt{\frac{a + b + c}{d}}$ denotes the square root of $\frac{a + b + c}{d}$, or of the quantity arising from the division of $a + b + c$ by d ; but $\sqrt{\overline{a + b + c}}$, which has the separating line drawn under $\sqrt{\quad}$, signifies that the square root of $a + b + c$ is to be first taken, and afterwards divided by d ; so that if a were 2, b , 6, c , 4, and d , 9, $\sqrt{\overline{a + b + c}}$ would be $\frac{\sqrt{36}}{9}$ or $\frac{6}{9}$; but $\sqrt{\frac{a + b + c}{d}}$ would be $\sqrt{\frac{36}{9}}$ or $\sqrt{4}$, which is 2.

The sign $\sqrt[\quad]{\quad}$ with a figure over it is used to express the cubic or biquadratic root, &c. of any quantity; thus $\sqrt[3]{64}$ represents the cube root of 64 or 4, because $4 \times 4 \times 4$ is 64; and $\sqrt[3]{ba + cd}$ the cube root of $ba + cd$. In like manner $\sqrt[4]{16}$ denotes the biquadratic root of 16, or 2, because $2 \times 2 \times 2 \times 2$ is 16, and $\sqrt[4]{ab + cd}$ denotes the biquadratic root of $ab + cd$; and so of others. Quantities thus expressed are called radical quantities, or SURDS; of which those, consisting of one term only, as \sqrt{a} and $\sqrt[3]{a}$, are called simple surds; and those consisting of several terms, or numbers, as $\sqrt{a^2 - b^2}$ and $\sqrt[3]{a^2 - b^2 + bc}$, are denominated compound surds. Another commodious method of expressing radical quantities is that which denotes the root by a vulgar fraction, placed at the end of a line drawn over the quantity given. In this notation, the square root is expressed by $\frac{1}{2}$, the cube root by $\frac{1}{3}$, the biquadratic root by $\frac{1}{4}$, &c. Thus $\overline{a}^{\frac{1}{2}}$ expresses the same quantity with \sqrt{a} i. e. the square root of a , and $\overline{a^2 + ab}^{\frac{1}{3}}$ the same as $\sqrt[3]{a^2 + ab}$, i. e. the cube root of $a^2 + ab$; and $\overline{a}^{\frac{2}{3}}$ denotes the cube root of the square of a or the square of the cube root of a ; and $\overline{a + z}^{\frac{7}{2}}$ the seventh power of the biquadratic root of $a + z$; and so of others; $\overline{a}^{\frac{1}{2}}$ is a , $\overline{a}^{\frac{3}{2}}$ is a^3 , &c. When the root of a quantity represented by a simple letter is to be expressed, the line over it may be omitted; so that $a^{\frac{1}{2}}$ signifies the same as $\overline{a}^{\frac{1}{2}}$, and $b^{\frac{1}{3}}$ the same as $\overline{b}^{\frac{1}{3}}$ or $\sqrt[3]{b}$. Quantities that have no radical sign ($\sqrt{\quad}$) or index annexed to them, are called rational quantities.

The sign $=$, called the sign of equality, signifies that

the quantities between which it occurs are equal. Thus $2 + 3 = 5$, shews that 2 more 3 is equal to 5; and $x = a - b$ shews that x is equal to the difference of a and b .

The mark $::$ signifies that the quantities between which it stands are proportional. As $a:b::c:d$ denotes that a is in the same proportion to b , as c is to d ; or that if a be twice, three or four times, &c. as great as b , c will be twice, thrice, or four times, &c. as great as d .

When any quantity is to be taken more than once, the number which shews how many times it is to be taken must be prefixed; thus $5a$ denotes that the quantity is to be taken 5 times, and $3bc$ represents three times bc , and $7\sqrt{a^2 + b^2}$ denotes that $\sqrt{a^2 + b^2}$ is to be taken 7 times, &c. The numbers thus prefixed are called co-efficient; and if a quantity have no co-efficient, unit is understood, and it is to be taken only once.

Similar or like quantities are those that are expressed by the same letters under the same powers, or which differ only in their co-efficient; thus, $3bc$, $5bc$, and $8bc$, are like quantities, and so are the radicals $2\sqrt{\frac{b+c}{a}}$ and $7\sqrt{\frac{b+c}{a}}$.

But unlike quantities are those which are expressed by different letters, or by the same letters with different powers, as $2ab$, $5ab^2$, and $3a^2b$.

When a quantity is expressed by a single letter, or by several single letters multiplied together, without any intervening sign, as a , or $2ab$, it is called a simple quantity. But the quantity which consists of two or more such simple quantities, connected by the signs $+$ or $-$, is called a compound quantity; thus, $a - 2ab + 5abc$ is a compound quantity; and the simple quantities a , $2ab$, $5abc$, are called its terms or members. If a compound quantity consist of two terms, it is called a binomial; of 3 terms a trinomial, of 4 terms, a quadrinomial, &c. of many terms, a multinomial. If one of the terms of a binomial be negative, the quantity is called a residual quantity. The reciprocal of any quantity is that quantity inverted, or unity divided by it; thus $\frac{a}{b}$ is the reciprocal of $\frac{b}{a}$, and $\frac{1}{a}$ is the reciprocal of a .

The letters by which any simple quantity is expressed may be ranged at pleasure, and yet retain the same signification; thus ab and ba are the same quantity, the product of a and b being the same with that of b by a . The several terms of which any compound quantity consists may be disposed in any order at pleasure, provided they retain their proper signs. Thus, $a - 2ab + 5a^2b$ may be written $a + 5a^2b - 2ab$, or $-2ab + a + 5a^2b$, for all these represent the same thing, or the quantity which remains, when from the sum of a and $5a^2b$ the quantity $2ab$ is deducted.

For the method of performing the several operations in algebra, see ADDITION, SUBTRACTION, MULTIPLICATION, DIVISION, FRACTION, INVOLUTION, EVOLUTION, EQUATION, SERIES and SURD. See also APPLICATION of Algebra to Geometry, BINOMIAL Theorem, CONSTRUCTION of Equations, and REDUCTION of Equations.

Algebra has been also applied to the consideration and calculus of infinites; and from this application of it a new and extensive branch of science has arisen, called the doctrine of FLUXIONS, or ANALYSIS of Infinites, or the CALCULUS Differentialis. For an account of the rise and progress of Algebra, as well as other branches of mathematics, see the last and most improved edition of Montucla's Hist. des Mathem. 2 vols. 4to., Paris, 1794.

ALGEBRAICAL, something that relates to algebra.

Thus we say, algebraical characters, or symbols, curves, solutions, &c. An algebraical curve, is a curve, wherein the relation of the abscisses to the semiordinates may be de-

finied by an algebraical equation. These are also called geometrical lines, or curves, in contradistinction to mechanical or transcendental ones. See CURVE.

ALGEBRAIST, a person skilled in algebra.

ALGEDO, in Surgery, from $\alpha\lambda\gamma\epsilon\delta\omicron$, a suppressed gonorrhoea, attended with pain in the genital and urinary organs. This name seldom occurs, except in old authors. See GONORRHOEA.

ALGEDYM ZANO, in Geography, is the name of a considerable chain of mountains in Independent Tartary, which stretches from the river Yaik or Ural, towards the Altaian range.

ALGEMISI, or ALGEMEZEN, a small town of Valencia, in Spain, not far from the river Xucar, near which grow quantities of Pita, as it is called, or American aloes, AGAVE, of which the people make cordage, and the Catalans spin it of a sufficient fineness for making lace; it is six leagues south of Valencia, and five north-north-west of Gandia.

ALGENEB, or ALGENIB, in Astronomy, a fixed star of the second magnitude, on the right side of PERSEUS.

ALGEO, or CARBON, in Geography, a river of European Turkey, which runs into the sea, eight miles west-south-west of Olympia, a town in the Morea.

ALGERANCA island, one of the Canaries, in the North Atlantic Ocean. N. lat. $29^{\circ} 23'$. W. long. $15^{\circ} 58'$.

ALGERI, or ALGER, a small peopled city of Sardinia, situated near a bay on the Western coast. It is a bishop's see, and has a coral-fishery. It is 79 miles north-west of Cagliari. The bay of Algeri is spacious and affords good anchorage; it is formed by the south point of Cape della Caccia on the north, and by a point of land on the south. N. lat. $40^{\circ} 31'$. E. long. $3^{\circ} 30'$.

ALGEZIRA, or ALGERIZA, a sea-port town of Spain, in the province of Andalusia, on the Straits of Gibraltar, and 5 miles west from it. The Moors entered Spain by this town in 713, and were dispossessed of it in 1344. It is said to have been the first town in which cannon were used. The word Algezira in Arabic signifies an island, and as the harbour is formed by two islands, it has been called in the plural number Algeziras. It was also called Old Gibraltar. The harbour is now decayed, and the town lies in ruins. N. lat. $36^{\circ} 5'$. W. long. $5^{\circ} 20'$.

ALGEZIRA, or ALZORA, is also a town of Spain, in the province of Valencia, situate on a small island on the river Xucar, 20 miles south of Valencia. Though the town is small, its silken trade has been extensive.

ALGEZUR, a small town of Portugal, in the province of Algarve, at the mouth of a small river near the Atlantic Ocean, 17 miles north-west of Lagos. It contains about 800 inhabitants.

ALGHEMI, a country of Africa, on the Slave coast.

ALGHISI, THOMAS, in Biography. The father of this writer, who was a surgeon of eminence, at Florence, took care to imbue his mind early with the principles of his art. His instructor in anatomy was the celebrated Laurentius Bellinus. At a proper age he was made surgeon to the hospital at Florence, where applying himself particularly to the operation of lithotomy, which he performed with singular facility and success, he acquired considerable reputation. In 1703, he was made doctor in medicine at Padua. In 1707, he published a treatise on lithotomy, in 4to., written in Italian, which contains, Haller says, Bib. Chir. vol. i. p. 580., several original observations, the fruits of his own experience. Exstat etiam, he adds, hujus Authoris, De Mumia Ægyptia involuta perpulchra epitola ad Valisnerium. He died September 1713, being only 44 years of age, in consequence of the amputation of his left hand, which had been wounded by the bursting of a fusil.

ALGIABARII, a Mahometan sect of predestinarians, who attribute all the actions of men, good or evil, to the agency or influence of God.

The Algiiabarii stand opposed to the **ALKADARII**.

ALGIARROTA, or **ALJUBARROTA**, in *Geography*, a small town of Portugal, in Estremadura, containing two parishes and 1600 inhabitants. King John I. obtained in this place a victory over the Castilians in 1385.

ALGIDUM, in *Ancient Geography*, a town of Latium or Italy, between Preneste to the north-east, and Alba to the south-west, near the mountains. It belonged to the *Æqui*, according to Dionysius Hal. (lib. xi. tom. i. p. 672. ed. Oxon.), and Livy, (lib. iii. c. 38. tom. i. p. 693. ed. Borman.) and had a temple of Diana on the top of a high mountain, called by the same name. This temple was in Greek denominated *Artemisia*, and hence the mountain was called by the same name. It has been supposed that Algidum or Algidus was derived from *gelidus*, cold or freezing, on account of the quality of its air. Horace refers to this mountain, (lib. i. od. 21.) "*Quæcunque aut gelido prominet Alcido*,"—and (lib. iii. od. 23.) "*— Quæ nivali pascitur Alcido*," &c.

ALGIERS, in *Geography*, a kingdom of Africa, comprehends part of the ancient **MAURITANIA**, particularly that which was called *Mauritania Cæsariensis*, and the ancient *Numidia*, and forms one of the most considerable districts of that part of Africa which lies on the northern coast, and which in later ages has been denominated **BARBARY**. The country derives its name from its metropolis, called by the Turks *Algezair*, *Al Jezair*, or *Al Jezirah*, in Arabic, signifying the *island*, because there was an island before the city, to which it hath been since joined by a mole. The extent of this kingdom has been variously assigned by different writers. Saufon, who marks its boundaries by the rivers *Mullooiah* or *Malva*, and the *Zaine*, gives it a length from east to west of 900 miles, *De La Croix*, 720, *Luyts*, reckoning 48½ miles for one degree of longitude, 630; but if with *Dr. Shaw*, we make the boundary of Algiers to the west the *Trara* mountains, which separate it from the dominions of the emperor of Morocco, or *Twunt*, which lies 40 miles to the eastward of the *Mullooiah*, and that to the east the river *Zaine*, formerly called *Tufca*, it will be found to extend 460 miles, or from 0° 16' W. long. to 9° 16' E. longitude. The breadth of Algiers is very unequal in different parts; for near *Tlemfan* it is not more than 40 miles, from the *Sahara* to the sea-coast; near the sources of the rivers *Sigg* and *Sheliff*, it is about 60 miles, and this, in the western part, may be taken at a medium for the extent of what the Arabs call *Tell*, or land proper for tillage. But to the east of Algiers, its breadth is much more considerable; particularly in the meridians of *Boujeiah* or *Bugia*, and *Bona*, where it extends above 100 miles, especially under that of *Jigeri* or *Gigeri*, in lat. 36° 55' to *Luolajah*, situate among the mountains of *Atlas*, in lat. 44° 50'. The Algerine dominions beyond the *Tell*, or more advanced parts of *Atlas*, are very precarious and not easily defined, so that the northern skirts of the *Sahara*, or *Desert*, seem to be the proper boundaries on that side. Accordingly, Algiers may be considered, in general, as bounded on the north by the *Mediterranean*, on the east by the river *Zaine*, which divides it from *Tunis*, on the west by the *Mullooiah*, or by *Twunt*, and the mountains of *Trara*, which separate it from *Morocco*, and on the south by the *Sahara*, or *Numidian desert*. If we take the medium difference of latitude to be 2° 30', and the difference of longitude to be 9° 30', the superficial extent of the whole kingdom would amount to about 4218,

or according to a more accurate astronomical calculation of *M. Von Zach*, 4262 geographical square miles.

This kingdom has been divided by geographers into many provinces, according to the several royalties into which it was cantoned, at different periods, before and after the time of the Turkish conquests. At present it contains, according to *Shaw*, three principal divisions, *viz.* the province of **TLEMSEN** to the west, called by others *Tremecen*, and **MASCARA**; that of **TITERI** or *Titterie* to the south; and that of **CONSTANTINA** to the east; to which some have added, as a distinct province, the territory of the city of *Algiers*. The western province comprehends the towns of **ORAN**, **MUSTYGANNIM**, **TLEMSEN** or *Tremecen*, **MASCARA**, **SHERSHELL**, **TENNIS**, besides several other more inconsiderable places. In this province, coasting from the **TRARA** mountains, we meet with *Twunt*, *Cape Hone*, *Tackumbrect*, at the mouth of the river *Tafna*, the island of **ACRA** or *Harshgoone*, &c. The principal rivers are the *Malva*, *Salt-river*, *Tafna*, *Sigg*, *Hcbrah*, *Massafra*, and *Sheliff*. The mountains are *Atlas* and *Trara*. See **MASCARA**. The southern province has no towns along the coast; but in the interior of the country the two chief towns are **BELIDA** and **MEDEA**; the mountains are branches of the *Atlas*, the *Boojerah*, the *Anwall* mountains on the river *Yisser*, and those of *Jurjura* and *Felizia*; and the rivers are the *Haratch*, *Hamaefe*, *Regya*, *Budwowe*, *Corfoe*, *Merdafs*, and the *Yisser*, of which the last is the most considerable. See **TITERI**.

The eastern province, called the *Levantine government*, is the largest and richest. See **CONSTANTINA**.

The territory of Algiers is principally distinguished by its capital, the metropolis of the kingdom. Within about half a mile to the north-east of the city commences the plain of *Metijiah*, called by *Abulfeda* *Bledeah Kiberah*, *i. e.* a *vast country*, which stretches 50 English miles in length and 20 in breadth, as far as the branch of mount *Atlas*, at the foot of which lies the town of *Belida*. This plain is better cultivated than the other districts of the kingdom. It is watered by several springs and rivulets; particularly by the *Massafra*, which at its entrance into the sea is a very considerable river, and little inferior to the *Sheliff*, the *Shiffa*, and the *Haratch*. The country feeds and *Maltharcas*, as they call the farms of the principal inhabitants of Algiers, are found in these plains; and it is chiefly from them that the metropolis is supplied with provisions. Flax, alliena, roots, potherbs, rice, fruit, and grain of all kinds, are produced here to such perfection, that the *Metijiah* may be justly reckoned the garden of the whole kingdom. For the nature of the soil, productions, inhabitants, population, government, commerce, &c. of the kingdom in general, we refer to the sequel of this article.

After the expulsion of the Greeks from Africa by the *Saracens*, towards the close of the seventh century, (see **AFRICA**), the country was divided into a number of small kingdoms and states, under chiefs of their own nation and choice. This government continued till the year 1051, when they were expelled by *Abubeker ben Omar*, or as the Spaniards call him, *Abul Texchen*, an Arab of the *Zinhagian* tribe, with the assistance of some powerful *Marabouts*; the conqueror assumed the title of *Amir al Miminin*, or chief of the faithful, and his subjects were denominated *Morabites*, and corruptly *Almoravides*. *Texchen*, having succeeded in driving the Arab tyrants out of *Numidia* and *Libya*, and all the western parts, reduced under his dominion the whole province of *Tingitania*. He was succeeded by his son *Joseph*, who laid the foundation of the city of *Morocco*, which he intended for the capital of his empire; but whilst he was

building this city, he deputed an embassy to the Zeneti who inhabited Tremecen, under a pretence of reclaiming them to the true faith; but the Zeneti assembled in hostile array at Amal or Amfa, their capital, and invaded the dominions of Joseph with an army of 50,000 men. The Zeneti, resisted by the inhabitants of Fez, whose succour they expected, were overpowered by Joseph, so that about a million of persons are reckoned to have lost their lives in this contest, and their country was depopulated; but afterwards re-peopled by a colony from Fez, who settled there under the protection of their reigning kings. Joseph directed his next attack against the inhabitants of Fez, whom he subdued and made tributaries, and extended his conquests along the Mediterranean. He also pursued some Arabian cheyks, who had not submitted to him, into their retreats, in the deserts of Libya, and totally subdued them. The empire of the Morabitanes, which was thus established, and which promised permanence, was nevertheless of no long duration. This race was again expelled in the 12th century by Mohavedin, or Al Mohedi, a Marabout, who dethroned Ibrahim Ali, the last emperor of the Zinhagian dynasty. This usurper and his successor, denominated themselves Mohavedins, and they were afterwards called Mohavades, Mohrdes; and ALMOHEDES. However, they were extirpated by Abdulae, governor of Fez; and he was again stripped of his new conquests by the sheriffs of Hascen, the descendants of the Arabian princes of the 10th century. With a view of securing his new dominions, he divided Barbary into several small kingdoms or provinces, assigning to each a separate chief. On this occasion Algiers was divided between four of their native princes; one of whom had Tremecen, and the other three had Tenez, Algiers proper, and Bujeya, and thus these four cities became the capitals of four distinct kingdoms. For some centuries these monarchs continued in mutual peace and amity; but disputes arose among them; and Abu'l-fariz, prince of Tenez, declared war against the king of Tremecen. In a little while he became master of both Tremecen and Bujeya. At his death he divided his kingdom between his three sons; one of whom had Tenez, another Jigeri, and the third, whose name was Abdalaniz, had Bujeyah. This last attacked the king of Tremecen, and having succeeded against him, the Algerines, who had been his tributaries, transferred their subjection and tribute to the conqueror, by which means he became so powerful, that if the Spaniards had not interfered, he would have made himself master of the whole of Barbary. Their interposition, however, checked his progress, and produced a signal change in the aspect of his affairs. In 1505 cardinal Ximenes, prime minister of Ferdinand V., king of Aragon, sent thither the count of Navarre with a powerful army and fleet, principally with a view of restraining the depredations of the Moors, who had been banished from Spain about 12 years before; and such was his success that he soon became master of Oran, Bujeyah, and other considerable places. The Algerines were alarmed; and sought the succour of Selim Eutemi, a warlike Arabian prince, who possessed the fertile territory of Mettjiah. He marched to their assistance; but his co-operation was ineffectual; and the Spaniards, having landed a considerable number of forces near Algiers, reduced this capital to subjection, and compelled it to become tributary to Spain. They also erected a strong fort on the small island opposite to the city, and thus prevented the Algerine Corsairs from sailing into or out of that harbour. On the death of Ferdinand in 1516, the Algerines made an effort for recovering their liberty; and they invited Barbarossa, who was then on a

expedition with a squadron of galleys, to assist them in throwing off the Spanish yoke, promising him a gratuity corresponding to a service so important. The bold and adventurous Corsair gladly accepted the invitation; and leaving his brother Hayradin with the fleet, and having dispatched 18 galleys and 13 barks to the assistance of the Algerines, he hastened his march to them by land. At the head of 800 Turks, 3000 Jigelites, and 2000 Moorish volunteers, he directed his course, not to Algiers, which needed his immediate protection and assistance, but to Sherfhal, where Hassan, another Corsair, had settled. Having obliged him to surrender under a perfidious promise of friendship, he caused his head to be cut off, seized on his ships, and compelled the Turks who had been his adherents, to follow him in his new expedition. Thus reinforced he approached Algiers; and was conducted into the city by prince Eutemi and the people with acclamation and triumph. Lodged in one of the noblest apartments of the prince's palace, and treated with every possible token of respect by the deluded inhabitants, Barbarossa conceived the design of assuming the sovereignty; but dreading opposition on the part of the people, who were irritated by the unrestrained licentiousness and insolence of his troops, he determined to facilitate his advancement to the throne by the murder of the prince, and then to be proclaimed king of Algiers by his own soldiers. The measure was no sooner projected than it was accomplished. As he was a guest in the palace of Eutemi, he easily found an opportunity of strangling him, and of thus removing the chief obstacle to his attainment of the sovereignty. The people suspected him, but they dared neither to punish him nor even to complain of his conduct. Many of them, apprehending measures of further violence and slaughter, abandoned the city and country; and those who remained endeavoured to secure themselves in their houses, so that the pirate and his followers were left complete masters. At their request he ascended the throne, and was proclaimed with great pomp. The Turks and Moors, who attended the procession, exclaimed as he paraded the streets on horseback; "Long live Aruch Barbarossa, the invincible king of Algiers, the chosen of God to deliver the people from the oppression of the Christians, and pour destruction on all that shall oppose or refuse to obey him as their lawful sovereign." The Algerines soon experienced the evils they had apprehended. Barbarossa exercised his sovereignty in the most despotic and cruel manner; and his Turkish soldiers conducted themselves with a degree of insolence and licentiousness, which rendered it dangerous for women and children of either sex to appear in the streets. The people were speedily drained and impoverished by the taxes that were levied upon them, and yet none could venture to remonstrate or even to complain of the wretched condition to which they were reduced. The Algerine chiefs perceiving the exasperated temper of the people, and observing that Barbarossa had alienated the affections of the warlike Arabs by his rapacious exactions, and that he had disbanded the greatest part of his Moorish troops, availed themselves of these circumstances to make a bold attempt for regaining their liberty. A plot was formed; and a day was appointed for assassinating Barbarossa and his Turks. But the suspicious and watchful tyrant discovered the whole design, and caused the heads of 20 of the principal leaders of the conspiracy to be cut off at the door of the mosque into which they had entered at the hour of prayer, and their bodies to be thrown out on the dung-hills. He also confiscated their estates, and laid a heavy fine on others of their accomplices. This dreadful execution so terrified the Algerines, that they never engaged

ged in any similar attempt against him or his successors.

The young Arabian prince, the son of Eutemi, was at this time under the protection of the Marquis de Gomarez at Oran. Eager to revenge the wrongs which his family had suffered, he proposed to the Marquis a very practicable plan for putting the city of Algiers into the possession of the Spanish monarch, and this scheme was laid before Cardinal Ximenes. The Cardinal approved it, and sent a fleet, with 10,000 forces, to drive Barbarossa and the Turks out of Algiers, and to restore young Selim Eutemi. But the fleet was dispersed by a storm; many of the Spaniards were drowned; and those who escaped to shore, were either killed by the Turks or made slaves. The Algerines, in concurrence with the Arabians and Moors, made their next application to Hamidel Abdes, king of Tenez, and requested his aid against Barbarossa and his adherents. This prince consented, on condition that the kingdom of Algiers should be settled upon him and his descendants. When he entered the Algerine dominions at the head of 10,000 Moors, he was joined by the Arabians of the whole country. Barbarossa, however, with 1000 Turkish musqueteers and 500 Granada Moors, defeated this numerous army; pursued Hamidel to the gates of his capital, took the place, and obliged the inhabitants to acknowledge him for their sovereign. Barbarossa, having taken possession of Tenez, received an embassy from the inhabitants of Tremecen; who, dissatisfied with the reigning prince, because he had dethroned his nephew, requested his assistance to dispossess the usurper, and offered him the sovereignty. The invitation was readily accepted. Barbarossa obliged the king of Tremecen, after a severe engagement, to retire to his capital, where he was instantly beheaded by his subjects, and the conqueror received a fresh invitation to take possession of the kingdom. When Barbarossa, thus invested with new power, began to tyrannize over his subjects, the Tremecenians were exasperated; and repenting of their having invited such a tyrant to their assistance, they deliberated on the best means for expelling him, and restoring their lawful prince. Their design, however, was discovered, and many of the conspirators were cruelly massacred. The prince had fortunately made his escape to Oran, and put himself under the protection of the Marquis of Gomarez, who sent immediate advice of his situation to Charles V., lately arrived in Spain with a powerful fleet and army. This politic monarch foreseeing the advantage that was likely to redound to him from placing the prince of Tremecen on the throne, ordered for him a succour of 10,000 men, under the command of Gomarez or Comares, the governor of Oran. This army, in its march, was joined by prince Selim, and a great number of Arabs and Moors from the adjacent countries. Their first enterprize was the attack of Calau, an important fortress situated between Tremecen and Algiers. This place, after a vigorous defence, was compelled to surrender, and after a severe plunder, delivered into the hands of the king of Tremecen. Barbarossa, fearing a revolt on the part of his own subjects, and disappointed in his expectations of assistance from the king of Fez, kept close in his capital. But upon the approach of the enemy he marched out of Tremecen, and determined to force his way through the hostile army which was preparing to lay siege to the city, to the field. He was advised, however, by his council to return and to fortify himself in the city; but the inhabitants refused him entrance, and he was therefore under a necessity of retiring into the citadel, and of there waiting for an opportunity to escape. Here he defended himself valiantly, and

made several successful sallies during a long siege; but apprehensive of famine from the failure of his provisions, he took the advantage of a subterraneous passage, through which he privately conveyed himself and his treasure. His flight was discovered and he was pursued; but ordering a considerable quantity of his money, jewels, and plate to be scattered in the way, he hoped by this stratagem to divert the attention of his pursuers. The artifice failed; for the Spanish general obliged the army to march on, till at length they overtook the fugitive on the banks of the river Haexda, about eight leagues from Tremecen. A bloody engagement ensued; but the Turks were overpowered by numbers; they were all massacred by the Spaniards, and Barbarossa, among the rest, in the 44th year of his age. This defeat occasioned great consternation at Algiers. The Turks to whom the defence of the city was committed were much alarmed; and they soon agreed, as the best measure for preventing a revolt, to cause Hayradin, the brother of Barbarossa, to be proclaimed king of Algiers, and high admiral of the sea. In order to secure himself from an insurrection, which his tyrannical and oppressive conduct had given him reason to apprehend, he dispatched an ambassador with magnificent presents to Selim I. then emperor of Constantinople, to notify the death of his brother, and to make him an offer of submitting the kingdom to his protection, and to pay him an annual tribute in return for his assistance. The Sultan was pleased with this proposal; received Hayradin, called also Barbarossa, under his protection, and appointed him his bashaw or viceroy over the kingdom of Algiers. Thus powerfully protected and aided with troops, he prepared for executing two grand projects which he had for some time in contemplation. The first was the destruction of the Spanish fort, which was a great nuisance to his metropolis; and the other was to render Algiers a commodious harbour by building a mole from thence to the island, in order to shelter them from the weather and the north sea, as well as from the guns of the Spanish fort, to avoid which the ships were obliged to lie about a mile west of the town, where the anchorage was unsafe. Having succeeded in taking the Spanish fort, he employed no less than 30,000 Christian slaves in the accomplishment of his second project, so that his strong mole for the accommodation and security of his ships was completed in less than three years. The execution of these two important projects added so much strength and wealth not only to the city but to the kingdom, that Hayradin became an object of terror, not only to the Moors and Arabians, but to the maritime Christian powers, and more particularly to the Spaniards. The Sultan, either grateful for the services performed by Hayradin, or jealous of his power, advanced him to the dignity of captain bashaw of the empire, and appointed Hassan, or Hassan Aga, a Sardinian renegado, to succeed him as bashaw of Algiers. The depredations of Hassan on the coasts of Italy and of Spain roused the resentment of pope Paul III. and of the emperor Charles V. The pope published a bull, with a plenary absolution of all sins, and the promise of the crown of martyrdom, to all who should fall in battle against the infidels of Barbary; and the emperor equipped a powerful fleet, which he determined to command in person, in order to subdue them. Accordingly Charles, with a fleet of 120 ships and 20 galleys, and 30,000 chosen troops, accompanied by a great number of noblemen and gentlemen, who served at their own expence as volunteers, from motives of religion and glory, set sail towards the end of Summer in 1541, and after a tedious and perilous voyage from Majorca to Africa, appeared on the coast of Algiers. The fleet anchored at

cape Metafuz; about two small leagues to the east of Algiers, and the army landed without opposition. Hassan's force, which garrisoned the city, amounted only to about 800 Turks and five or 6000 Moors, without fire arms, poorly disciplined and accoutred. As Charles's army drew near the city, the inhabitants were much alarmed; but when Hassan was summoned to surrender, he returned, as some say, an ambiguous, and according to others, a fierce and haughty answer. On the second day, however, after the emperor's landing, the clouds began to gather, and the heavens presented a very threatening aspect. In the evening the rain fell, and the storm raged with violence through the whole night, so that the soldiers who had neither tents nor shelter, were much incommoded. The ground also became so wet, and the camp was so much overflowed with water, that they could neither lie down, nor stand without sinking to the ankles in the mud. Their matches also were extinguished, and their powder so moistened, that their muskets were useless. Hassan perceived their distress, and availing himself of it, sallied out with his soldiers to attack them. In this situation the whole army, with the emperor himself in person, was obliged to advance to support the dispirited and retreating troops, who were first engaged, before the enemy could be repulsed; and they at length, after spreading general consternation, and killing a great number of men, retired in good order. The hurricane, however, which still continued, produced a more dreadful disaster. The emperor's ships, on which depended the safety and subsistence of his whole army, were driven from their anchors; some of them dashed against each other, some were beat to pieces upon the rocks, many were forced ashore, and not a few were sunk in the waves. In less than an hour, 15 ships of war and 140 transports with 8000 men perished; and such of the unhappy crews as escaped the fury of the sea, were murdered without mercy by the Arabs, as soon as they reached the land. The emperor stood in silent anguish and astonishment, beholding this fatal event, which at once blasted all his hopes of success, and buried in the deep the vast stores which he had provided, both for annoying the enemy and for subsisting his own troops. At last the storm abated, and afforded some hopes that the ships, which had escaped, might save the army from perishing by famine, and transport them back to Europe. The approach of evening, however, disappointed these expectations; the sea was covered with darkness; and it was impossible for the officers aboard the ships that had outlived the storm to send any intelligence to their companions who were ashore; thus they remained during the night in all the anguish of suspense and uncertainty. Next day, a boat dispatched by Doria, the admiral, against whose advice this expedition had been undertaken, reached land, with information, that having weathered out the storm, to which, during 50 years' knowledge of the sea, he had never seen any equal in fierceness and horror, he had found it necessary to bear away with his shattered ships to cape Metafuz. He advised the emperor, as the face of the sky was still lowering and tempestuous, to march with all speed to that place, where the troops could reembark with greater ease. Metafuz was three days' march from the emperor's camp; his provisions were consumed; and his followers, exhausted with fatigue, and dispirited with a succession of hardships, were in no condition to encounter new toils. But no alternative remained; they were ordered instantly to march; some of them could scarcely sustain the weight of their arms; others, spent with the toil of forcing their way through deep and almost impassable roads, sunk down and died; many perished by famine, as the whole army subsisted chiefly on roots and

berries, or the flesh of horses, killed by the emperor's order and distributed among the several battalions; many were drowned in brooks, swollen by the excessive rain, which, in passing them, they were obliged to wade up to the chin; and not a few were killed by the enemy, who, during the greatest part of their retreat, alarmed, harassed and annoyed them night and day. At last they arrived at Metafuz; and here they were supplied with plenty of provision, and cheered with the prospect of safety. When the forces were embarked, a new storm arose, which by its fury scattered the fleet, and obliged them, separately, to make towards such ports in Spain or Italy as they could first reach. The emperor himself, after escaping great danger, and being forced into the port of Bugia, in Africa, where he was obliged by contrary winds to remain several weeks, arrived at last in Spain in a very distressed condition.

Hassan, the bashaw of Algiers, after this signal deliverance, undertook an expedition against Muley Hammed, king of Tremecen, who had submitted to Charles V., in order to be restored to his kingdom; but this prince purchased peace for a large sum of money, and became his tributary. Soon after this expedition Hassan died in the 66th year of his age, and was succeeded by Haji, who was compelled to surrender his dignity, much respected as he was by the Algerines, to Hassan, the son of Hayradin, the brother of Barbarossa, whom Sultan Solyman had been prevailed upon to appoint bashaw of Algiers. Hassan was engaged in various enterprises against Tremecen, which was at length taken and plundered by the Algerines; and the head of Abdallah, the youngest son of the Sheriff, who had been killed in a previous engagement, was put into an iron cage, and placed on the principal gate of the city, called Bab Azoun, where it continued till the year 1573. During an interval of peace, Hassan erected some public edifices at Algiers, and performed other useful acts both at Algiers and in his alcaidship of Tenez, which rendered his government popular, and his death an occasion of regret. His successor was Salha Rais, the fifth bashaw of Algiers, and the first of Arabian extract, that ever governed the Algerines. Of this bashaw, who was much respected, and who died in the 70th year of his age, it is said, that he was steady in all his resolutions and successful in all his enterprises. From Metafuz, where he died, his body was removed to Algiers and buried among the bashaws, his predecessors, in a sepulchre near the sea-side, over which his unfortunate successor, Hassan Corso, caused a handsome dome to be erected. Corso, who was advanced to the dignity of bashaw by the interest of the Janizaries, was displaced in four months by Tekelli, a principal Turk of the grand Signior's court. He was at first opposed by the Algerines, but at last they were under a necessity of submitting to him. One of the first acts of his government was to condemn Corso, who welcomed him on his arrival, and peaceably surrendered his dignity, to the chin-hun, or hook; a dreadful punishment, on which he hung by the ribs three whole days, and expired in the most exquisite torture. Alifardo, governor of Bugia, who was reckoned immensely rich, also fell a sacrifice to the inexorable Tekelli, who, after inflicting the cruel tortures of bastinadoing, burning and scarifying him, in order to obtain a discovery of his wealth, ordered him to be impaled alive. This act of cruelty and the ignominious punishment of Corso, raised a general resentment among the Janizaries. Yusuf, governor of Tremecen, determined likewise to revenge his death; and at a time when the plague raged furiously at Algiers, and Tekelli had removed to an old demolished town near the sea, about five miles westward, he secretly and speedily

speedily marched to the place of his retirement, before Tekelli had any apprehension of his design. Tekelli fled, and was closely pursued by Yusef, who at length overtook him and pierced him several times with his javelin, till he expired. This action was highly applauded by all the Janizaries; and upon Yusef's entering into Algiers, he was received with universal acclamation, as their deliverer from the tyranny of Tekelli, who fell a just sacrifice to his avarice and cruelty, in the 50th year of his age and third month of his viceroyship. Yusef was unanimously chosen bashaw of Algiers, but soon died, to the great grief of the Algerines, by whom he was buried in the same grave with the unfortunate Hassan Corfo. The new viceroy appointed by the Porte was Hassan, the son of Hayradin, who had been displaced by Selha Rais, at the instigation of Raftan, and who had now the good fortune to be restored to his Algerine government. His first enterprise was directed against Tremecen, in which he was defeated with great loss. The next year proved more glorious to the Algerines, who encountered the Spaniards in their expedition against Mollagan, under the command of the brave count d'Alcandela. The cause of this defeat was the count's excess of valour, or rather his precipitance, in engaging the enemy before he received the supply of troops that were destined to this service; and the consequence was the loss of his own life, the total rout of his army, and the captivity of above 12,000 Spaniards, among whom was the son of the count, and many other noblemen and gentlemen.

Hassan, after this victory, returned to Algiers, laden with laurels and spoils. His next expedition was directed against Abdalazis, prince of the Beni Abbas, who inhabited the mountains, and who had discontinued to pay the usual tribute to the Algerine state. Having for this purpose collected a large army, he commenced the war, which was soon terminated by the death of Abdalazis, in consequence of a musket-ball, which penetrated his breast. About this time the Marilian merchants began, with the permission of Hassan, to build a fort on these coasts, at a small distance from Calle, where the French have since settled; but the fort was in a few years demolished by the Algerine forces, under pretence that the French had bought all the corn, and caused a famine in their kingdom.

Hassan, having married the king of Cuco's daughter, permitted the subjects of this prince to purchase ammunition at Algiers; and this traffic gave such offence, that the Janizaries made an insurrection, seized on the bashaw and some other officers, and sent them in irons to Constantinople, accusing Hassan to the Porte of having a design to make himself king of Algiers. Upon their arrival, they vindicated their conduct to the satisfaction of the Porte, and were set at liberty; but a new viceroy was sent to Algiers. The name of this bashaw was Ahamed, or Achmet; he was a favourite of the Sultan, and insatiably avaricious; and had bought his dignity with a view to the emoluments that were likely to accrue from it. He enjoyed it, however, only four months; and Hassan was restored. Such was the joy of the Algerines on his return, that even the women appeared on the terraces and balconies to welcome him. Having collected a very numerous and powerful army and fleet, he set out on his expedition against Marfa al Quibbir; intending, after the reduction of this place, to attempt that of Auran or Oran. This city was commanded by the count d'Alcandela, who succeeded his father; and the former by his brother Don Martin de Cordova, who had obtained his liberty at an immense sum, and now made a most gallant defence against the Turks. Hassan, after having made several

vigorous attacks both by sea and land, and suffering several repulses, very fatal to his troops, was obliged to retire precipitately from the siege by the approach of the Genoese admiral Doria, who was advancing with a powerful succour from Genoa, Naples and Sicily. This Christian armada having missed its aim of intercepting the Algerine galleys, bore away for Pennon de Velez, hoping to drive them out of that harbour, but it was shamefully repulsed by a few Turks that were then in garrison and compelled to sail away with no small loss and ignominy. The loss of this place in the course of the next year was much regretted by the Algerines and their bashaw, and also by Sultan Solymau. Hassan was displaced by Mahamed bashaw, the son of Selha Rais; and departed for Constantinople, where, three years after, *viz.* in 1570, he died in the 50th year of his age. Mahamed, upon his first arrival, performed several public-spirited acts, which attached to him the love of all the Algerines. Whilst he was consulting how to advance the Algerine power and wealth, a Spanish adventurer, named Gascon, was meditating a design against him. This was nothing less than to surprise the whole piratical navy in the bay, and to set all the ships on fire in the dead of the night. For this purpose he obtained the permission of king Philip II. and a supply of all necessary vessels and materials. Having advanced to the Mole-gate, and dispersed his men with their fire-works, the garrison, during the delay of the execution of his plot, was alarmed, and Gascon was under a necessity of securing himself by flight; but being pursued and overtaken, he was brought back to Algiers; and the bashaw ordered a gibbet of considerable height to be erected on the spot where he landed, on which he was hoisted, and hung by the feet, that he might die in the most exquisite torture; and as an insult on his master, the king's commission was fastened to his toes. Soon after he was suspended, a strong representation was made in his favour, and in a little while the bashaw ordered him to be taken down. This lenity of the bashaw occasioned great murmurs among the people; and the unhappy Gascon was ordered to be hoisted up by a pulley to the top of the execution wall and let down again upon the chin-hum or hook, which occasioned his instant death; and his body was hung up in *terrorem*. This unsuccessful project of Gascon has procured for him a place among the Spanish martyrs. Mahamed, after enjoying his government for about 14 months, was removed in order to make way for the accession of the Corsair Hali Fartaz, or Scald-head, commonly known by the name of Ochali, who was appointed his successor by the Ottoman court. Ochali arrived at Algiers in 1586, when the war against the revolted Morescoes in Granada was at its height. Being solicited to assist them against the Spaniards, he consented that some few persons should go to this service as volunteers, but he declined taking any ostensible and active part in it. In the first year of his government, he laid the foundation of the fortress called Bebal-weyd Castle. Next year he totally reduced the kingdom of Tunis, which was then under the protection of Spain, to the obedience of the Ottoman empire. Having continued a whole year at Tunis, he left the place, and assigned the office of his viceroy to a Sardinian renegade, named Ramadan Sardo, who became afterwards bashaw of Algiers. This person raised himself from the condition of a slave to this dignity, by his superior understanding and good conduct. He became master of the Arabic and Turkish language; read and wrote well; and having followed traffic for some time, he was adopted, on account of his good qualities, by Hali bashaw, who appointed him his deputy governor in the city of Fez; and in consequence of the ap-

plication of the Algerines in his favour to the Sultan, he was appointed bashaw of Algiers. In 1577, after governing Algiers little more than three years, he was forced to resign his office to Hassan Venedic bashaw, a Venetian renegado. During the whole government of Ramadan, it was conducted with so much justice and equity, that a single complaint was not uttered against it. The conduct of his successor was very different; his administration was so oppressive, that complaints being preferred against him to the Porte, he was recalled, after being in office three years and a quarter; and a new bashaw, Jaffer Aga, an Hungarian renegado, appointed in his room, A. D. 1580. At the commencement of his government, Algiers was reduced to the greatest misery by a famine, so that 8000 Arabians and Moors are said to have died in the streets for want in six weeks, chiefly through the avarice of Jaffer's predecessor, who quitted his administration with immense wealth amidst the execrations of the people. Jaffer was of a generous disposition, and did every thing in his power to relieve and mitigate the distresses of the country; he also exercised strict justice against those who abused the power with which they were entrusted. A plot, however, was formed against him; but the execution of it was prevented by some of the principal officers of the Janizaries to whom it was proposed; who declared, that they would prefer being cut in pieces to the ignominy of proving traitors to the Sultan, and his worthy Jaffer Aga. By the inconsistency of the Ottoman court Jaffer was displaced, and the infamous Hassan restored to the dignity of bashaw. He closed his life at Constantinople by poison, administered to him by the renegado Cigala, who succeeded him in the post of captain bashaw. The new bashaw of Algiers was Memmi Arnaud, an Albanian. This officer exhibited signal proofs of his great capacity and strict justice; and gave much satisfaction, not only to the Algerines, but to those Christian merchants who traded with them. During his administration, A. D. 1585, Morat Rais ventured to sail through the Straits of Gibraltar into the Atlantic, and thence to the Canaries, and he was the first of the Barbary Corsairs who engaged in an expedition of this kind. After a government of two years, Memmi was succeeded in 1586 by the rapacious Achmed, who purchased the viceroyship of Algiers for a large sum, and exercised his government by violent extortions. His successor Hidir gained the office by the same means, and conducted it in a manner so haughty and tyrannical, that the Algerines were made very happy by his recall in 1592; but such was his interest with the Porte, that after a short interval he was nominated bashaw a second time, to the great concern and mortification of the Algerines. Mustapha succeeded in displacing this arbitrary and rapacious tyrant, and secured the affectionate attachment of the people by his courtesyness and generosity; though nothing remarkable happened, during his administration, excepting that he repaired the mole, fortifications, and other public buildings.

At the beginning of the 17th century the Algerines complained to the Porte in very strong terms of remonstrance of the oppressive conduct of the Turkish viceroys, and in consequence of this remonstrance obtained leave to chuse their own Deys. They engaged, that the usual tribute should be faithfully transmitted to the Porte; to acknowledge the grand Signior for their sovereign; to be ready on all occasions to assist him with their forces and shipping; to pay a due respect to his bashaws, and to maintain them in a manner suitable to their dignity; provided that the government of Algiers should be wholly committed to the direction of the Dey and his douwan. The great douwan proceeded to the election of a Dey from their own body, and to enact a variety of laws and regulations

for the better maintenance of this new form of government. This century, however, opened with a fresh attempt of the Spaniards on the capital of this kingdom, under the conduct of the famous John Andrew Doria, but the event of it, in consequence of adverse winds, was unsuccessful. The Algerines, in order to counteract these renewed attempts, determined to direct their attention to the improvement of their navy; and in 1616 they had so far succeeded, that it consisted of 40 sail of ships, of between 200 and 400 tons, divided into two squadrons; one of 18 sail lay before the port of Malaga, and the other, without the Straits, at the cape of Santa Maria, between Lisbon and Seville, where they attacked all Christian ships, without distinction, that came in their way, and rendered themselves formidable to all the maritime states of Christendom. The French were the first who dared to resent this contemptuous breach of treaty; and M. Beaulieu was sent with a fleet of 50 sail of men of war and galleys against the Algerines; but upon his departure, they returned to their accustomed depredations on the Spanish coasts, which, being best known by the expelled Moriscoes, were exposed to all the barbarity and resentment of these exasperated infidels. In 1620, in consequence of the earnest solicitations of the Spanish court, by means of Gondemar, an English squadron was sent into the Mediterranean, under the conduct of Admiral Sir Robert Mansel. He directed his course to the bay of Algiers, and attempted to set fire to the shipping in the harbour, but returned without doing much damage. As soon as he retired, the Algerine Corsairs put to sea, and made prize of about 40 good ships belonging to the subjects of the English sovereign. With all the European powers, except the Dutch, the Algerines were at open defiance: but to them they sent a proposal, A. D. 1625, addressed to the prince of Orange, that if they would fit out 20 sail of ships to be employed in the next year against the Spaniards, they would join them with 60 sail; but the proposal was not accepted. In the next year the Collogies, or Coulolies, *i. e.* the children of such Turks as had been permitted to marry at Algiers, formed a conspiracy, and seized on the citadel of Algiers, and had very nearly made themselves masters of that state. The plot was discovered, and the insurgents were defeated with great slaughter. About two years after this conspiracy, the Algerine state underwent a memorable change, by which they became soon after able to shake off the Ottoman yoke, and to become an independent state under their own Deys.

The occasion of this revolution was a truce for 25 years, which Amurath IV. had concluded with the emperor Ferdinand II. This truce was universally disapproved by the Barbary Corsairs; and by none more than the Algerines, who were become haughty and opulent in consequence of their gainful depredations on the Christians for the last three years. They and their neighbours unanimously resolved, to set up for three independent states, and to consider themselves as wholly unconcerned in any treaties which were made by the Porte with any Christian power. Having adopted this resolution, the Algerines began to make prizes of several ships belonging to powers at peace with the Ottoman Porte, and even pursued some of them to the port of Rhodes and carried them off. They did the same at Salamis, in the isle of Cyprus, and at Alexandretta, they not only seized a Dutch ship and a polacre, but ventured on shore, plundered the magazines and warehouses, and then set them on fire. They also drove the French away from a new fort, called the bastion of France, which Louis XIII. depending on his league with the Turks, had erected on their coasts, instead of that which had been formerly constructed by the Marsilians. The Porte considered these depredations as open instances

instances of defiance to his authority; but as he was much occupied by the Persian war and other disturbances in the East, his grand vizir and courtiers were allowed to compound with these pirates, by sharing their spoils. Having, for form sake, reprimanded and threatened them, they returned an insolent reply, declaring that they were the only bulwark against the Spaniards, who were the sworn enemies of the Moslem name, and that if they paid a punctilious regard to every circumstance that could procure peace or liberty to trade with the Ottoman empire, they must set fire to all their shipping, and become mere camel-drivers in order to obtain a subsistence. Accordingly the Algerines pursued their piratical excursions at sea for many years with impunity. Amongst other enterprises in which they engaged, they surpris'd the bastion of France upon their own coast, containing about 600 inhabitants, whom, with all their effects and ships, they carried off to Algiers. In the course of the following year they fitted out a fleet, with which they ranged the seas and seized all the Christian shipping that fell in their way; and they even meditated an attack upon Loretto, which would have proved a great prize. But in this object they were prevented from succeeding by contrary winds; however they made a descent on Puglia, in the kingdom of Naples, where they made captives of both sexes, and steering towards Dalmatia, they scoured the Adriatic, and loading themselves with immense plunder, left those coasts in the utmost consternation. The Venetians, alarmed at their depredations, equipped a powerful fleet of 28 sail, under the command of Admiral Capello, who had orders to burn, sink, and take all the Barbary corsairs, wherever he found them. The Algerine admiral was overtaken by this fleet; and an obstinate conflict ensued, which terminated in the defeat of the Algerines; but Capello was recalled, and the republic were under a necessity of purchasing peace with the Porte, at the expence of 500,000 ducats. The news of this defeat and loss, which were owing to the avarice of the Algerine admiral, filled Algiers with inexpressible grief and confusion, and the whole city was preparing for a general insurrection; but it was prevented by a proclamation of the bashaw and douwan, who expressly prohibited all complaints under the severest penalties. Application was made to the Porte for an order, that the Venetians, settled in the Levant, should indemnify them for the loss they had sustained. Their request was rejected, and they were under a necessity of repairing their losses at their own charge. One of their corsairs soon landed with a fresh supply of 600 slaves of both sexes, which he had brought from the coast of Iceland. In two years after this disaster, the Algerines appeared at sea with a stronger and more numerous fleet than they had ever equipped before. This fleet, consisting of 65 sail, besides other galleys and inferior vessels, performed many exploits in different parts of the Mediterranean, which our limits will not allow us to recount. It is sufficient to observe, that the Algerines became quickly more powerful and more formidable than ever to the European powers, and plundered the subjects of England, France and Holland. As for Spain, Portugal and Italy, they determined never to make any peace with them, as they were sworn enemies to the Mahometan religion. In this height of power and grandeur, which the Algerine state had attained, the English, French and Dutch were glad to secure peace with it at any rate. About the latter end of the reign of Charles II. the British nation obtained from the Algerines that lasting alliance, which, with some renewals, additions, and alterations, hath subsisted to this day. The outrages committed by them on the coasts of Provence and Languedoc, induced Louis XIV. to equip a

considerable fleet, and the command of it was assigned to the marquis Du Quefne, vice-admiral of France. Sailing to their capital, he bombard'd and cannonaded it with such fury, that in a little time the whole town was in flames, and the terrified inhabitants were preparing to leave the place; but the wind suddenly changing, he was obliged to return for Toulon. When the storm subsided, the douwan assembled and ordered a fleet of galleys and galliots to sail immediately for the coasts of Provence, where they committed dreadful ravages. The French apprised of this outrage, fitted out a new armament at Toulon and Marseilles; and the Algerines repaired their walls and fortified the town, in order to be ready for their expected attack. In May 1683, the French Squadron sail anchor before Algiers, as it was determined to bombard the town, and the execution of their purpose was attended with dreadful havoc. Upon this the whole government of the town sued for peace; but some delay having taken place with regard to the surrender of captives, hostilities were renewed; and the greatest part of the city was reduced to ashes, and the fire burnt with such vehemence, that the sea was enlightened by it to the distance of above two leagues. The Algerine commander, in the midst of this scene, caused all the French who were in the town to be cruelly butchered, and ordered their consul to be fastened alive to the mouth of a mortar, and shot against their navy instead of a bomb. The French admiral, exasperated by this unheard of instance of inhumanity, did not leave Algiers, till he had utterly destroyed all their shipping, fortifications, buildings, and, indeed, almost all the lower part, and above two-thirds of the upper part of the city. After his departure the Algerines seriously thought of procuring a peace with France; and for this purpose they deputed an ambassador to supplicate pardon for the murder of the consul, which they attributed to the populace, and to sue for peace. The speech of their envoy on this occasion was a masterly address. The result of their submission was a ratification of the peace at Paris in the course of the following year: upon which the Dey and douwan proceeded to repair the dreadful dilapidations which the metropolis had suffered. In 1686, the Algerines concluded a treaty of peace with England, which was renewed in the second year of James II. and in the second year of King William's reign, and again in the reign of George II. when all former treaties with the Algerine Republic were ratified. The only remedy to which recourse has been had for the occasional violations of this treaty has been that of making reprisals, instances of which have frequently occurred. But it was not till after the capture of Gibraltar and Port Mahon, by Sir George Rooke, that Great Britain could have a sufficient check upon them to oblige them to the observation of treaties; and since this period they have been accustomed to pay a greater deference to the English than to any other European power. In the year 1708 the Algerines retook from the Spaniards the city of Oran, and were at great pains to strengthen it with new fortifications; but notwithstanding these precautions, it was retaken in 1737. The year 1710 was signally propitious to Algiers, upon several accounts; as, first, the assassination of their worthless Dey Ibrahim, surnamed the Madman; 2dly, the election of the brave Hali to the throne; and, 3dly, the expulsion of the Turkish bashaw, the abolishment of that dignity by the courage and address of the new Dey, and the union of that office with that of the Dey. This introduced that form of government which still subsists in Algiers. *Mod. Un. Hist.* vol. xv. p. 1—93. *Robertson's Hist. of Ch.* V. p. 98—100. p. 239—248.

The Government of the Algerines consists of the Dey, who may be compared to the former Dutch Stadtholders, and of a *douwan*, or Common Council. The Dey is chosen out of the army; each order, even the most inferior, having an equal right and title to that dignity with the highest. Every bold and aspiring soldier, however obscure his origin, may be considered as the heir apparent to the throne; nor does he wait for his accession till sickness or old age shall have removed the present ruler, provided that he can protect himself by the same *seymetar* which he plunges into the breast of his predecessor. Accordingly the succession at Algiers has been usually very rapid; and Dr. Shaw observes, that scarcely one in ten has had the good fortune to die in his bed; and those who have enjoyed their power for a longer period, have secured it, not so much by the attachment and good will of the people, as by their own sagacity in perceiving the first tendency of an insurrection; and by their ability to check it by the death of the conspirators before they have had an opportunity for accomplishing their designs. This factious and discontented humour has, however, in some degree subsided, and the power of the Dey is more permanent than it used to be, though he is still liable to be deprived of it by unforeseen rebellion, arising from trivial circumstances, and unavoidable assassination. The whole body of the militia is concerned in the election of a new Dey, and every person, however low his rank, claims a right of voting. Every election is of course generally attended with tumult, and sometimes with serious contests and bloodshed. When the choice is determined, the person elected is saluted with words which signify, "God bless, or prosper you;" and he is then invested with the *kaftan*, or insignia of sovereignty, whilst the Cadi, or Chief Judge, addresses him with a congratulatory speech, and an exhortation to govern with equity, and to maintain the liberty, and promote the welfare of his subjects. The *douwan*, or *divan*, at first consisted of about 800 military officers, without whose counsel and consent the Dey could not act; and on extraordinary occasions, all the officers that resided at Algiers, amounting to above 1500, were summoned to assist. But since the Deys have become more powerful and independent, the *douwan* is principally composed of thirty *yah*-*bashaws*, with the *musti* and *cadi*, upon some emergencies; and upon the election of a new Dey, the whole soldiery, as we have observed, are allowed to give their votes. Of late the *douwan* is little regarded; it is, indeed, formally convened, for the purpose of sanctioning measures previously concerted betwixt the Dey and his favourites; so that, in effect, the whole power is lodged in one person. The next officer in dignity and power to the Dey is the *Aga*, a general of the Janizaries, who is one of the oldest officers of the army, and enjoys his post for two months, and is succeeded by the *chiah*, or next senior officer, or eldest *yah*-*bashaw*. During these two months, the keys of the metropolis are in his custody; all military orders are issued in his name, and the sentence of the Dey upon any soldier that has offended, is executed in the court of his palace. When he is displaced, he is considered as *mazoul*, or superannuated, and receives his pay, and is occasionally summoned to assist with his advice, but not with his vote, at the grand council. The next officer to the *aga* is the secretary of state, who registers all public acts; and next to him are 24 or 30 *chia*-*bashaws*, or chief colonels, from whom are commonly chosen ambassadors to foreign courts, or messengers, to inculcate the orders of the Dey through the realm. Next to these are the *bolluk*-*bashaws*, or eldest captains; after them the *oldah*-*bashaws*, or lieutenants, 400 in number; and other military officers are *vakelards*, or purveyors of the army, *peys* and *soulaks*. The officers now enumerated, compose the *dou-*

wan. The strength of this kingdom consists of its land and sea forces. Its strong cities are few, and it has fewer garrisons, which are weakly fortified and guarded. Dr. Shaw, in 1732, computed the whole force of Algiers to be 6,500 military Turks and *Coloulics*, 2,000 of whom were excused from duty, 1,000 employed in relieving garrisons, and the rest assigned to their cruising vessels, or forming the three flying camps which, every summer, attend the provincial viceroys. To the Turkish troops may be added about 2,000 *zwowah*, as the Moorish horse and foot are called. The deficiency of their army is supplied by recruits collected by their cruising vessels once in five or six years, in the Levant; and these are commonly shepherds, outlaws, and persons of the lowest condition. Besides these, the Dey, on occasions of emergency, enrolls the *cologlics*, or *coloulics*, who are the sons of such soldiers as have been permitted to marry at Algiers; but these are dangerous persons, and are not much encouraged, and when they are admitted into the army, they are excluded from the honour of being Dey, *aga* of the Janizaries, and other considerable offices and employments. The officers of the Algerine army are the *aga* or general, 30 *chia*-*bashaws* or colonels, 800 *bolluk*-*bashas* or captains, and about 400 *oldah*-*bashaws* or lieutenants: and these several posts are attained, not by money or interest, but by seniority. The pay of the army is very small, the youngest soldier receiving only 406 *aspers* every two months, and the oldest, or those in full pay, no more than 5,800, of which 696 make a dollar. The whole army, therefore, with regard to its demands upon the government, may be reduced to about 3,500, so that a sum, less than 200,000 dollars, or betwixt 30 and 40,000*l.* of our money, will defray its expence. Besides the pay, those *chiah* and *bolluk*-*bashaws*, that are unmarried, have each eight loaves of bread a day, and the *oda*-*bashaws* and private soldiers, of the same condition, have four; each loaf being about five ounces in weight, and three *aspers* in value. In their battles or engagements, the *spahics* or cavalry, are of little service; their principal dependance is on the infantry. Their fighting is always at a distance; small parties, or platoons, continually advancing in full career from the main body; and after they have discharged their fire-arms, or their javelins, they as speedily retreat, and make way for others: and hence it happens, that if a few persons are killed, the battle is called bloody.

The naval force of Algiers is more formidable than its army. It commonly consists of 20 ships; one of which belongs to the government, and is assigned to the admiral; but all the rest belong to private persons. The Corsairs, though they are not allowed any concern in the affairs of state, nor in the election of the Dey, are held in great esteem, on account of the prizes they continually bring in, which are one main source of the public revenue, and the means of procuring them respect from the Christian powers for the security of their trade. The government claims an eighth part of all the prizes, slaves, cargo and vessel; the rest being divided amongst the proprietors and ship's company. Passengers are entitled to a share in their prizes. All the officers of the ships must be either *Turks* or *Coloulics*; the Moors not being allowed to come upon the quarter-deck, or into the gun-room, unless they are sent for: but Christian slaves are permitted to act as seamen or inferior officers, and allowed a share according to their abilities and behaviour. The Dey of Algiers pays no other revenue to the Porte than a certain number of fine boys, or youths, and some other annual presents. His own income is variously computed: some estimating it at 40,000 ducats, whilst others raise it to 400,000, and others to 600,000. Dr. Shaw computes the yearly taxes of the whole kingdom at 300,000 dollars;

dollars; but he supposes that the eighth part of the prizes, the effects of persons who die without children, contributions from the districts, together with presents from foreigners, fines and oppressions, may produce as much more.

The commerce of Algiers is principally carried on by their corsairs or pirates, and with this view it is certainly the interest of the Algerines to be at war with those nations that trade in the Mediterranean; because they have always found that the balance of the captures made by them was greatly on their side, both with regard to number and value; and without such a constant supply, their state could not support itself, or prevent the most dangerous insurrections. On the other hand, all the maritime powers in Europe wish to be at peace with the Algerines. Nevertheless, free Christians, Jews, native or foreign, Arabians and Moors, are permitted to exercise a free commerce both by sea and land, together with other trades and manufactures in silk, cotton, wool, leather, and other commodities. These, however, are mostly carried on by the Spaniards, that are settled in this kingdom, and especially near the metropolis. Carpets also constitute a manufacture of this country, though inferior to those of Turkey. There are also at Algiers looms for velvet, taffaties, and other wrought silks, and a coarse kind of linen is also made in most parts of the kingdom. Few of their commodities or products are sent into foreign markets; their oil, wax, hides, pulse and corn, being barely sufficient to supply the country: although whilst grain was in possession of the Algerines, the English merchants shipped from thence seven or eight thousand ton of wheat and barley every year. Their other exports consist chiefly of ostrich feathers, wax, hides, wool, copper, rags, silk fishes, embroidered handkerchiefs, dates, and Christian slaves. Their imports consist chiefly of gold and silver stuffs, damasks, cloths, spices, tin, iron, plated brass, lead, quicksilver, cordage, sail-cloths, bullets, linen, cochineal, tartar, alum, rice, sugar, soap, cotton, raw or spun, coppers, aloes, brazil and logwood, vermilion, arsenic, gum, tar, sulphur, opium, anise and cummin seed, mastic, sarsaparilla, aspic, frankincense, galls, honey, paper, combs, cards, dried fruits, and a variety of woollen stuffs. But of these a small quantity is imported by the merchants, though there is a constant demand for them, on account of heavy duties, frequent exactions, precarious payments, and uncertain returns. They are also furnished by the English consul with powder, balls, bombs, fire-arms, cordage, and other naval stores; as the country furnishes no materials for ship-building.

The coin of Algiers is mostly foreign; their own being only of three kinds, viz. the barba of copper, bearing the arms of the country on both sides, six of which were formerly worth an asper, but now only half that value; the asper, or square piece of silver, with Arabic characters on each side, 15 of which make a Spanish rial, and 24 a dupta, worth about a crown; and gold coin of three sorts, coined only at Tremecen, viz. the rupee, worth 35 aspers, the median, 50, and the zian or dian, 100. Besides these, the Turkish sultanians of gold, worth about a ducat, the moticales of Fez, worth about 22 pence, the Spanish rials, French crowns, Hungarian ducats, and other European money, are current among them; but without any fixed standard. The established species here is the patacachica, or pataca of aspers, an ideal sum like the English pound, worth always 232 aspers, the third part of a pataca gorda, commonly of the weight of two and a-half pistoles, which weight is raised or lowered at the pleasure of the Dey, or according to the exigence of the government. The silver mint at Algiers is under the superintendance of the Jews, for which they pay a yearly sum to the Dey.

The religion of the Algerines differs from that of the Turks only in their adopting a greater variety of superstitions. They acknowledge the Koran as the rule of their faith and practice, but are remiss in the observance of it. They have three principal officers, who preside in religious matters, viz. the Mufti, or High Priest; the Cadi, or Chief Judge in ecclesiastical, and some other concerns, civil and military, that are referred to him, and the grand Marabout. These three officers have their seats in the great douwan next under the Dey, and on his right hand. The cadi is obliged to attend at the court of justice once or twice a day, to hear and determine complaints. But affairs of moment are submitted to the Dey, or, in his absence, to the treasurer, master of the horse, or other principal officers of the regency, who sit in the gate of the palace, according to a custom recognized in Scripture (Deut. xxii. 15. xxv. 7. II. xxix. 21. Amos v. 10. Dan. ii. 49.) for that purpose. The cause is thus quickly decided, and sentence executed in less than an hour. In cases of debt, the debtor is usually detained in prison till the bailiff seize his effects and sell them; after sale, if there be an overplus, it is returned to the prisoner; if the amount falls short, he is released, and no further demands are made upon him. The bastinado, which is inflicted with small sticks about the size of the finger, which are brought in bundles to the place of punishment, is the punishment of small offenders, and it is applied to the belly, back, or soles of the feet, according to the nature of the crime, or the pleasure of the judge, who likewise appoints the number of strokes to be given. For clipping or debasing the public coin, the old Egyptian punishment of cutting off the hands of the transgressor is inflicted. When a Jew or Christian slave, or subject, is guilty of murder, or any other capital crime, he is carried without the gates of the city, and burnt alive; but the Moors and Arabs are either impaled for the same crime, or else they are hung up by the neck over the battlements of the city walls, or else thrown upon the *ching-bun*, or hooks, that are fixed over the walls below, where sometimes they break from one hook to another, and hang in the most exquisite torments, 30 or 40 hours. The Turks are not publicly punished, but sent to the house of the Aga, where, according to the quality of the offence, they are bastinadoed or strangled. When the women offend, they are sent to some private house of correction; and if the crime be capital, as when they are taken in adultery, &c. they are tied up in a sack, carried out to sea, and drowned. The western Moors use the barbarous punishment of sawing the body of the criminal in two. See Matth. xxiv. 51. Luke xii. 46. Heb. xi. 37. For this purpose they prepare two boards, of a proper length and breadth, and having tied the criminal between them, they proceed to the execution by beginning at the head. A person of the first rank in that country, who had been ambassador at the British Court, was put to death in this manner.

As to the population of Algiers, it is not easily ascertained; but we may observe in general, that it is much less than in other countries of the same extent, where arts, sciences and industry are not so much restrained. Tracts of country are here uninhabited and uncultivated; not to add, that despotism, want of commercial intercourse in the inland provinces, and the frequent ravages of the plague, contribute to the diminution of the inhabitants. The soil of this country is generally fertile, and more especially towards the sea-coast and in the vallies. There are few forests, but tracts of thickets and brushwood are more common. The most woody part of the country, and that which supplies the greatest quantity of timber, is the district about Bugia. Upon the whole, the face of the country is mountainous, and in the

chains of its mountains there are various minerals, particularly lead and copper. The fertility of the soil decreases in approaching Sahara or the Desert, although in its borders, and even in the Desert itself, there are some districts which are capable of cultivation, and which produce corn, figs and dates. These regions are inhabited by Nomadical tribes, who, valuing themselves on their independence, endure with fortitude and resignation, the inconveniences attending their condition, and scarce regret the want of these advantages and comforts that pertain to a civilized state of society. The cultivated parts of this country enjoy a wholesome and temperate air; and the climate is distinguished by the equality of its temperature; the barometer indicating all the changes of the weather from 29, 1 to 30, 4, or within the space of 1, 3 inch. The winds generally blow from the sea, or from the west by the north to the east: those from the east are common at Algiers from May to September, and then the westerly winds become the most frequent. The southerly winds, which blow from the Sahara, are usually hot and violent, but not frequent. When they blow for five or six days together in July and August, they are very suffocating, and the inhabitants sprinkle the floors of their rooms with water or vinegar. The quantity of rain that annually falls in Algiers is, at a medium, 27 or 28 inches; but in this climate little or no rain falls in the summer season, and in most parts of the Sahara they have no rain at all. The first rains fall in September, and sometimes a month later; after which, or about the middle of October, wheat is sown and beans are planted. Barley is sown about the end of November. If the latter rains fall, as usual, in the middle of April, the crop is deemed secure; and the harvest comes on in the end of May or beginning of June. The inhabitants cultivate, not only wheat and barley, but rice, Indian corn, and a kind of millet, called *drah*, which they prefer to barley in fattening their cattle, and which they are obliged to guard from the depredation of birds, by a screaming noise continued through the whole day. Here they tread out their corn after the primitive customs of the East, by spreading the sheaves open, and driving mules or horses round about the neadders or threshing-floors. When the grain is trodden out, they winnow it by throwing it up against the wind with a shovel; they then lodge it in the *mattamores*, or subterraneous magazines. Of the pulse kind, beans, lentils, kidney beans, and the chick pea, are the most abundant; and of the roots, herbs and fruits of the kitchen garden, they have a very considerable variety. For the zoology, ornithology, &c. of Algiers, see *BARBARY*.

The inhabitants of the Algerine state are partly Turks, partly Moors, and partly Christians and Jews. The Turks have been established since the middle of the sixteenth century; they form the highest rank in the country, and possess all the offices and employments. According to the constitution of Algiers, no native can be a Turk; he alone is regarded as a genuine Turk, and entitled to the privileges of this class, who is descended from Mahometan parents, or born of a Mahometan mother, in the dominions of the Grand Seigneur. The number of Turks at Algiers was formerly computed to be from 14 to 16,000, but they are now reduced to 9 or 10,000; and they are reckoned, with regard to their disposition and character, ignorant, proud, indolent, voluptuous, jealous and revengeful; but at the same time faithful, sincere, courageous and tolerant. With ideas of superiority, brought with them from their own country, and enlarged by the privileges which are granted to them at Algiers, the meanest Turk considers himself far superior to the Moors, Christians and Jews. Their principal enjoyment consists in ease and inactivity. Besides the qualities we have already

mentioned, the Turks are noted for their avarice. It is therefore proverbial, "Give a Turk money with one hand, and he will permit his eyes to be plucked out by the other." Nevertheless, he is faithful to his engagements, and a stranger to dissimulation. With regard to those who do not profess their religion, they are generally compassionate and tolerant; and instances have occurred, in which Turks have exhorted their Christian slaves to the observance of the external rites of Christian worship: but they despise and abhor apostates and renegadoes. As to their privileges, they pay no poll-tax, and they have an exclusive title to all the chief offices of the state: they cannot be punished except by the express order of the Dey; when condemned to die, they are strangled; they purchase the necessaries of life at a lower price than others; and from gardens and vineyards that are not enclosed by high walls, they may take as much fruit as they can eat; and their testimony, other circumstances being equal, is always held in higher estimation than that of the Moors, Jews and Christians.

The class of persons next in rank and dignity to the Turks, consists of the *Cololies* or *Coloris*, who are the children of Turks by women that are natives of Algiers. The number of these, in the vicinity of the capital, is considerable, and they compose some of the richest and most respectable families in the country. They form a middle class between the Turks and Moors, and resemble the former in courage, pride, jealousy, and voluptuousness, but are more laborious and diligent; and they partake of the perfidy and dissimulation of the Moors, and also of their propensity to superstition. In corporeal strength and form they are not inferior to the Turks; and they belong to the most intelligent and cultivated part of the inhabitants of Algiers, so that the most expert artists and artificers are of this class.

Under the general name of Moors, who constitute another division of Algerines, are comprehended the Moors, properly so called, the *Cabyles* or *Kabyles*, mixed with Berbers or *Brebers*, and several Arabian tribes. The Moors are very distinct from the Negroes, as their natural colour, unchanged by the burning rays of the sun, is as white and beautiful as that of the natives of the South of France, of Spain and Italy. With respect to their moral character, they are inferior to the Turks. They are malicious, false, cowardly, revengeful, fanatical, ignorant, superstitious, fraudulent, avaricious, and among the lower classes, thievish and rapacious. But they are more active than the Turks, and they have an inclination for commerce and the mechanic arts. Those of them who live in cities and engage in commerce, are more polished and less odious in their disposition and manners; some of them are rich, and look down with contempt on the Turks, though they soothe them and secure their patronage by dissimulation and flattery. Of these some are addicted to study, but their knowledge extends little beyond the Koran and History. The less wealthy Moors are artificers, and some of them mariners. In the lowest class of Moors, inhabiting the cities, are found the most abandoned and profligate persons, who cannot be restrained from crimes of every kind, except by a degree of severity approaching to cruelty. The *Biscaris*, however, form a small exception. Of the Moors, who inhabit the country, few are wealthy; they are ignorant and rude, and strangers to the benefits and pleasures of social life. They retain the ancient custom of distinguishing themselves by families and tribes, which is lost among those who live in towns. Some of them lead a wandering life, and others gain a subsistence by cultivating the land for the richer among themselves, or for the Turks, or for the *Cololies*. Among the Moorish tribes in the country polygamy prevails, but this practice does not prevail in towns.

The Moors are not admitted into the infantry of the Algerine state, which is the most honourable and useful corps, but they compose the cavalry of the Dey, which is not much esteemed. The Moorish mountaineers are denominated *CABYLES*. The Arabian tribes, who inhabit the Algerine dominions, are those who, without blending with the Moors, or most ancient possessors of the country, have uniformly maintained their separation from others, partly in a state of independence, and partly as tributaries to the Dey. They are distinguished from the rest by their language, their rude manners, and a peculiar mode of living; and also by a degree of pride which leads them to look upon themselves as better and more noble than others. They are also distinguished by their love of liberty. They live either in the desert, or in inaccessible ridges of mountains, divided into families and clans, under the patriarchal government of a sheik, who may be considered as the judge, instructor and leader of his tribe. Their wealth consists in their flocks and herds. Whenever they think themselves secure, they descend from the mountains into the plain country. The number of these marauders decreases every year. The Arab tribes that are the subjects of the Algerine state, pay a small tribute, and are treated with great lenity, that they may not be provoked to unite with the Cabyles and the independent Arabs. The number of Jews in Algiers is not considerable: they are despised and oppressed, distinguished by a dress of dark colour, restrained from acquiring landed property, and forbidden to ride through the gates or in the city. If a Jew be attacked, he would incur danger by defending himself against the abuse of the Turks and Moors, and therefore they purchase the protection either of powerful Turks, or European consuls. The Algerine Jews are, in general, very superstitious and fanatical, and also cowardly, perfidious, avaricious, and addicted to cheating and fraud. In their own concerns they are amenable to their own tribunal, and have an elder amongst them, known by the appellation of "King of the Jews."

The number of negroes annually imported as slaves into Algiers, amounts to from 150 to 180; and their price varies from 50 to 150 sequins. The females are often kept as concubines by the wealthy Turks and Moors. Most of these slaves obtain their freedom, either gratuitously or by purchase; and during their slavery, they are treated with lenity, and severe usage is noticed and even punished by the government. Both negro and Christian slaves are employed at Algiers in the same offices with our domestic servants. But Jews and Christians are forbidden from keeping negro slaves who profess the Mahometan religion. An emancipated slave becomes entitled to the same privileges with the Moors.

The Christians of Algiers are transitory residents, and can hardly be reckoned in any class of inhabitants. They are seldom found in the open country. On the western coast the Spaniards occupy Oran and Mafalquivir; but the greater part of the citizens who reside there consist of fugitives from their native land, and derive a scanty subsistence from the garrison; and destitute of trade, agriculture and manufactures, pass their time in indolence and wretchedness. The Christians in other cities are, generally speaking, all slaves. Some of them are such as have been captured by the Algerine corsairs; of whom some are selected by the Dey, and the rest are sold in the market-place to the highest bidder. The other Christian slaves are such as enter of their own accord into a state of slavery; and these are for the most part deserters from the Spanish garrison at Oran and Mafalquivir; so that Oran is the nursery of this class of slaves, amounting annually to about 100. As to the treatment of these Christian slaves, those that are deserters from Oran, and those that are captured by the cruisers, are treated without discrimina-

tion: they are generally well kept, but overwhelmed with labour or cruel usage. Those who attend upon the Dey live sumptuously, and are richly clad, but they must seclude themselves from society, and are seldom allowed to leave the palace. The youngest and most beautiful are exposed to the seduction of licentious courtiers. Others, who are the property of the state, are employed in dock-yards and magazines, and are under the command of Turkish task-masters. They labour from sun-rise to sun-set, and their fare is coarse; and their accommodations at night, amidst the filth and vermin and corrupt air of the bagnios, are more intolerable than the fatigues of the day. The condition of slaves, purchased by private persons, is, upon the whole, preferable to that of those who belong to the state. In the cities, they are employed as menial servants; in the country, they cultivate the vineyards and gardens. Those who have an opportunity to acquire property, take taverns in the city, and gradually become rich. Those slaves who had been captured by the corsairs, often regain their liberty by being ransomed; but the Oranite slaves have seldom any hopes of deliverance. Sometimes the government of a country ransoms all its slaves without exception, which was the case with the French in 1784. Their number, however, is not commonly very great. In 1785, the year after the French ransom, it amounted to about 2000. In 1786 and 1787, 500 Spaniards and Neapolitans were liberated, and about 700 died of the plague; so that there remained about 800, most of whom were deserters from Oran.

As to those called *renegadoes*, there are few of them in this country. They are either Jews or Christians. The former, of whom there are commonly more women than men, renounce the faith of their ancestors, and embrace the predominant religion of the country, for the purpose of being revenged of their relations, or with a view to escape from merited and apprehended punishment, or from motives of ambition or interest. If such persons possess talents and render service to the government, they are esteemed equal to the Cololies, and have a chance of being advanced to honourable and lucrative employments. The admiral of the Algerine fleet was a renegado, and formerly a Jew. Of Christian renegadoes the number is not so great. The zeal to gain proselytes from Christianity is abated: such conversions are not now encouraged, and in many instances not permitted, as the proprietors of the slaves would be losers, and be deprived of the expected ransom. Renegadoes are despised and distrusted, and not without reason, for most of them are in judgment and affection attached neither to one religion nor to the other. Shaw's Travels. Passim. Pitts's Account of the Religion and Manners of the Mahometans. ed. iv. 1738. Passim. Mod. Un. Hist. vol. xiv. p. 435—456. 8vo.

ALGIERS, the capital of the country above described, was formerly called *Mesgana*, from an African family of that name, and derives its present name *Algiers*, or *Al-Jezeire*, *the island*, from its being in the vicinity of the eastern mound of the harbour, which, before the time of the Turkish conquest, was severed from the continent. Some have supposed that this was the ancient *Icosium*; but Dr. Shaw is of opinion that the ruins of a Roman city on the banks of the river Haratch, the ancient *Savus*, four miles to the south-east of Algiers, bids fairer than Algiers to be the ancient *Icosium*. The city is situated on the declivity of a hill, and is built in the form of an amphitheatre. The houses rise gradually above one another, and their roofs or terraces are flat and white, so that at sea it appears, says Pitts, like the top-sail of a ship, or like a whitener's ground covered with linen. It is, says Dr. Shaw, about a mile and a half in circuit, and is computed to contain about 2000 Christian

slaves, 15,000 Jews, and 100,000 Mahometans. But since his time the number has been much reduced; and the number of inhabitants is now estimated at about 80,000, in which number are included several thousand Jewish families. It is surrounded by high walls, 12 feet thick, flanked with square towers, but so decayed as to afford very little defence. A ditch, 20 feet wide and seven deep, formerly encompassed the whole city, but is now almost filled with mud. It has five gates, which are open from sun-rise to sun-set; and without the walls seven castles or forts, of which the greatest is that on the mole, all which are supplied with cannon. Its best defence is towards the sea. The mole, the work of Hayradin, the son of Barbarossa, is built on the small island that faces the town, in form of a large semicircle, with a handsome opening into the haven, which is 130 fathoms long, and 80 broad, and where the largest vessels may ride so as to be secure from the violence of the waves. The mole is defended by a castle, which stands upon the solid rock, and which also serves as a light-house. It has three batteries of cannon. At the fourth end of the island is another fort, consisting of three batteries, to defend the entrance of the harbour. There are also other forts along the coast. In the town there is but one handsome street, which reaches from the east to the west end, and in which are the best shops, the houses of the principal merchants, and the market for corn and all provisions. All the other streets are so narrow that two persons cannot walk abreast, and the middle being much lower than the sides for the reception of water and filth, the passage of camels, horses, mules and asses, renders it still more inconvenient and disagreeable for foot passengers. It is still more dangerous to meet with a Turkish soldier, to whom the wealthiest Christian must give way, or be likely to feel the effects of his brutal resentment. The houses are supposed to be placed thus near to each other, either to shelter them from the sun, or for the convenience of mutual support, by means of props, when earthquakes occur. They are built of brick or stone, mostly square, with a paved court in the middle, somewhat like our old inns; round this court there are galleries supported by columns, and over these a second range, and upon this upper gallery are the terraces, which serve for walking or drying linen. Their chimnies rise in the form of a cupola on the four corners of the terrace, and their houses are whitewashed every year. As the houses are contiguous, a person may walk from one end of the town to the other along the terraces, and in this way they keep up an intercourse with each other. The houses of private people are within meanly fitted up and furnished, but those of the rich are incrustated with marble, supported on columns, and have their ceilings finely carved, painted and gilt. The most magnificent building is the palace of the Dey, in the midst of the city, which has two spacious halls, in one of which the douwan meets thrice a week. The barracks for the Turkish soldiery are likewise grand edifices, and each of them contains about 600; their mosques are numerous, of which the larger are seven, and the baths are many and spacious, but they are of different kinds, for the accommodation of persons of every rank and condition. Besides the public baths and those appropriated to women, there are others called basins, which are loathsome prisons, and in which their slaves sleep every night. There are some handsome edifices without the walls of the town, and a great number of tombs, some of which are adorned with chapels and oratories, to which the men and women resort every Friday. The city of Algiers, which had formerly neither wells nor fountains, is now supplied with excellent water by two aqueducts, which convey it from the adjacent mountains to a number of fountains at convenient distances from one ano-

ther. The territory about Algiers is very fertile; the hills and vallies are every where ornamented with gardens, groves, and country-seats, whither the richer forts retire during the summer season. Their villas are little white houses, shaded with a variety of fruit-trees and ever-greens, which, besides the shade and retirement, afford a beautiful prospect towards the sea. The gardens are stocked with plenty of fruit-trees, melons, and pot-herbs, and well watered by a multitude of fountains and rivulets. Algiers, although it has many forts, and though in former times it has counteracted the assaults of some of the greatest powers of Christendom, is but weakly defended, and incapable of sustaining a regular siege. The Spaniards, however, attacked it in 1775, both by land and sea, with a force consisting of about 20,000 foot, and 2000 horse, 47 king's ships of different rates, and 346 transports, and were repulsed with great loss. In 1783 and 1784 their attacks were renewed, but without success. N. lat. $36^{\circ} 49' 30''$. E. long. $2^{\circ} 12' 45''$. The bay of Algiers lies to the east of the city, and the mole that forms the harbour is 500 paces long, and here is anchorage in 18 to 25 fathoms water. Cape Matifou lies to the north-east extremity of the bay, and Cape Caxines to the north-west of the city, and the western limit of the bay.

ALGOA BAY, or *Zwartkops*, a bay of South Africa, situate in S. lat. $35^{\circ} 56'$. E. long. $26^{\circ} 53'$, and distant from the Cape of Good Hope 500 miles. Mr. Barrow, a late traveller, suggests, that from the vicinity of this place to the salt-pans, from the ease of procuring bullocks in good condition, and from the abundance of excellent fish on the coast, great benefits would accrue to the East India company, if an establishment was formed for the preparation of salted beef and fish. The river *Zwartkops* flows through a valley, in which our traveller found a species of antelope, called the *riet-bok*, or red-goat, hitherto undescribed by naturalists.

ALGODONALES ISLANDS lie on the coast of Peru, in S. lat. $21^{\circ} 56'$, and W. long. $72^{\circ} 50'$, eight leagues north from the harbour of Cobijah, and afford fresh water.

ALGODRES, a district of Beira, in Portugal, containing eight parishes and 450 inhabitants.

ALGOIDES, in *Botany*, a name given by Vaillant to a genus of plants, called by Micheli and Linnæus ZANNICHELLIA.

ALGOL, or *Medusa's Head*, in *Astronomy*, a star of the second magnitude, in the constellation Perseus. This star has been subject to singular variations, appearing at different times of different magnitudes, from the fourth to the second, which is its usual appearance. These variations were noticed at the close of the last century by Montanari and Maraldi; also by Flamsteed, 1696 and 1711; but they have been more accurately observed by Mr. Goodricke, at York, in 1783, who has, by comparing a great variety of observations, determined the period of their return to be 2^d , 20^h , 48^m , $56''$. As to the cause of this variation, Mr. Goodricke conjectures, that it may be owing either to the interposition of a large body revolving round Algol, or to some motion of its own, in consequence of which, part of its body, covered with spots or such like matter, is periodically turned towards the earth. M. de la Lande, comparing his own observations with those of Mr. Goodricke, and M. Wurms, of Nuringen, determines the period of variation to be 2^d , 20^h , 49^m , $2''$. Mem. Acad. Sc. Paris, 1788. See Phil. Trans. vol. lxxiii. p. 474. Vol. lxxiv. p. 287.

ALGOMEIZA, a name given to the star Procyon.

ALGONQUINS, in *Geography*, an Indian nation of North America, which formerly possessed considerable tracts of land along the north-west shores of the river St. Lawrence, in Canada. As hunters and warriors they had no rivals, and were

were long in alliance with the Iroquois; whom they agreed to protect from all invaders, whilst the Iroquois stipulated to pay them a tribute out of the produce of the earth, and to perform for them all the menial duties, such as flaying the game, curing the flesh, and dressing the skins. At length the Iroquois associated with the Algonquins in their hunting matches and military expeditions; but by degrees the Algonquins became jealous of their associates and allies, and murdered several of their number. The Iroquois for some time stifled their resentment, but determining upon revenge, they applied to the study of the art of war, as it was practised among the savage nations; and having acquired a competent knowledge, which they improved by experience, they attacked the Algonquins with such fury, that, unless they had been preserved by the interposition of the French, their whole race would have been exterminated. They are daily decreasing in number, subsist principally on fishing and hunting, and have scarcely any notion of agriculture. The Algonquins are now dispersed along the river Atawar, and occupy different parts of Upper Canada, above the lakes Huron, Ontario, and Superior. The lake of the Two Mountains, which may be deemed the commencement of the Utawar river, and which is about 20 miles long, and three wide, and surrounded by cultivated fields, is nominally in possession of the two tribes of Iroquois and Algonquins, whose village is situated in a delightful point of land under the hills, which, under the denomination of mountains, give a name to the lake. Near the extremity of the point their church is built, which divides the village into two parts, forming a regular angle along the water-side. On the east is the situation of the Algonquins, and on the west one of the Iroquois, consisting in all of about 500 warriors. Each party has its missionary, and divine worship is performed, according to the rites of the Romish church, in their respective languages, in the same church: and so assiduous, it is said, have their pastors been, that these people have been instructed in reading and writing in their own language, and are better taught than the Canadians of the country of the lower ranks: but notwithstanding these advantages, and though the establishment is nearly coeval with the colonization of the country, they do not advance towards a state of civilization, but retain their ancient habits, language and customs, and are becoming every day more depraved, indigent, and insignificant. The country round them, though capable of cultivation, presents only a few miserable patches of ground, sown by the women with maize and vegetables. During the winter season they leave their habitations and their pastors to follow the chase, according to the custom of their forefathers. A tribe of the Algonquin nation occupies the parts adjacent to the lake NEPESINGUI. Some few families inhabit the island of St. Joseph, near the lake HURON; also a village, near the fall of ST. MARY, about 50 miles farther towards the north-west, who are starving for one-half of the year, and in a state of intoxication for the other half, and the coasts of lake SUPERIOR, where they live chiefly on fish. The residence of the first chief, or Sachem, of all the Algonquin tribes inhabiting different parts of the country, is at the trading establishment, situate on a high bank on the north side of the river LA PLUIE, in N. lat. 48° 37'. This chief is by way of distinction called Nectam, implying personal pre-eminence. In this place the elders meet in council to treat of peace or war. Of this tribe some few are found near the ASSINIBOIN river, who are in almost constant hostility with the NADOWASIS. Those of them who occupy the country near lake WINNIC and its source, are employed in fur-hunting, so that they thus acquire the additional articles of cloth, blankets, &c. but their passion for rum puts it out of their power to supply themselves with real necessaries. The Al-

gonquins and KNISTENEUX are supposed by a late intelligent traveller to have been originally the same people, and to have inhabited the Atlantic coast, the banks of the river St. Lawrence, and adjacent countries. Their progress has been westerly, and they are even found west and north as far as Athabasca. The language of the Algonquins is one of the three principal languages, or of those which have been called radical, or mother tongues, amongst the Indians of Canada. The other two are the STOUX and the HURON. By means of an acquaintance with the Algonquin and Huron languages, a person may travel 1500 leagues in this country without an interpreter. The Algonquin language is said to excel that of the Hurons in smoothness and elegance. See KNISTENEUX. The Baron la Hontan has given a small dictionary on the Algonquin language; Reland has also given a gloss on several words of the same. The first is entitled, Mem. de l'Americ. Septentr. Hag. 1703: the last is in his Diss. Misc. p. 3. Diss. 2. Mod. Un. Hist. vol. xxxv. p. 379. Mackenzie's Voyages, &c. through the Continent of North America, &c. p. 25, 63, &c.

ALGOR is used by some *Medicinal Writers*, to denote a preternatural coldness or chillness in a part. Muys speaks, in this sense, of an algor of the arm, attended with an atrophy.

ALGORAB, in *Astronomy*, a fixed star of the third magnitude, in the right wing of the constellation CORVUS.

ALGORITHM, or ALGORISM, an Arabic term, which some authors, and especially the Spaniards, make use of to signify the practical operation of several parts of *specious arithmetic* or *algebra*. Sometimes it is also used for the practice of common arithmetic, by ten numeral figures.

Algorithm is properly the art of numbering truly and readily; and comprehends the six common rules of arithmetic. It is sometimes called *logistica numeralis*. We say the algorithm of integers, the algorithm of fractions, the algorithm of surds, &c.

ALGOSAREL, in *Botany*, a name used by Avicenna, and some other authors, for the common wild carrot, or DAUCUS *sylvestris*.

ALGOW, or ALGAU, in *Geography*, a canton of Germany, in the circle of Swabia, bounded on the north by the Danube, on the east by the Leck, on the west by the Hegow and the lake of Constance, and on the south by the county of Tyrol. It includes the marquisate of Burgaw, the counties of Bregents and Montfort, the territory of the bishop of Augsburg, the abbey of Kempten, of the counts of Fugger, Waldburg, Konigseck and Mindleheim; with the cities of Augsburg, Kempten, Memmingen, Isny, Lindaw, Biberac and Wangen.

ALGOZO, a small place of Traz-oz-Montes, in Portugal, situate on the river Maças, containing 20 parishes, and about 400 inhabitants.

ALGUAZIL, in the Spanish *Policy*, a serjeant or official of a judge, or magistrate, appointed to see his decrees executed.

ALGUEL, in *Geography*, a town of Africa, in the empire of Morocco and province of Hea.

ALHABOR, among the Arabian *Astronomers*, is that star commonly called SIRIUS.

ALHAGI, in *Botany*, a species of HEDYSARUM. The inhabitants of Mesopotamia and the eastern countries gather from this shrub a kind of manna, by means of the juice which transudes from its leaves, in the form of drops of various sizes, which is indurated by the heat of the sun. Tournefort has particularly described this tree, and made a distinct genus of it, under the name of *Alhagi*. The shrub grows plentifully about Tauris; it has been also found in Tinos, and in many plains of Armenia and Georgia; and the manna is known in the Levant by the name of Terenjabia.

bin. The leaves are said to be of a hot drying nature, and the natives use the flowers as a purgative, one handful of which, boiled in water, suffices for a dose. Lemery.

ALHAMA, in *Geography*, a pleasant town of Spain, in the province of Granada, situate in a narrow valley betwixt high and very steep mountains; and having warm baths and medicinal waters that are much frequented. It was taken by the Moors, after a gallant defence, in 1481, and surrendered to the pillage of the Christian soldiers, who, besides pillaging an immense quantity of gold and jewels, made slaves of 3000 of the inhabitants. It is about 25 miles south-west of Granada, and 28 north-east of Malaga. N. lat. 36° 50'. W. long. 3° 26'.

ALHAMA, is also a town of Spain, in Cordova, near the Sierra Morena, nine leagues west of Cordova.

ALHAMA is also a small town or village of Spain, in Aragon, celebrated for its medicinal waters.

ALHAMA, a river of Spain, which runs into the Ebro, near Alfaro.

ALHAMA la Seta, a town of Spain, in Granada, situate on the river Almeria, ten miles north-north-west of Almeria.

ALHAMBRA, a town of Spain, in Aragon, seven miles north of Teruel.

ALHAMBRA is also a river of Spain, which joins the Guadalquivir at Teruel.

ALHAMBRA, one of the four wards of the ancient city of Granada, so called by the Moors from the red colour of its materials, Alhambra signifying a red house; and by the Spaniards la Sierra del Sol, because, by its elevation on a high mountain, it is exposed to the rising sun. The inhabitants consist of the descendants of the ancient Moors. In this district are two palaces, one built by the Moors, the other by Charles V. and Philip II. The first, which is very large, is environed with walls, towers, and bastions; and both command, by their eminence, an extensive and delightful prospect. Above the old Moorish palace is the magnificent and beautiful house of Xeneralife, which was also built by a Moorish prince; and on the top of the mountain stands a church dedicated to St. Helena. The Moorish palace, according to the description given of it by Swinburne in his Travels, appears to have been a most magnificent and astonishing edifice. The court to which you are first admitted, called the *Communa*, or *del Mesfucar*, i. e. the common baths, is an oblong square, with a deep basin of clear water in the middle, into which is a descent by two flights of marble steps, and having on each side a parterre of flowers and a row of orange trees. A peristyle, paved with marble, runs round the court, and the arches are supported by pillars, in a style different from all the regular orders of architecture; and the ceiling and walls are incrusted with stucco fret-work. In every division are Arabian sentences of different lengths, denoting "there is no conqueror but God;" and "obedience and honour to our Lord Abouabdoulah." The ceilings are gilt or painted, and the colours still retain their freshness; the lower part of the walls is Mosaic, disposed in fantastic knots and festoons. The porches resemble grotto-work; and that on the right-hand opens into an octagon vault under the emperor's palace, which forms a whispering-gallery, communicating between the offices of both houses. Opposite to the door by which you enter into the *Communa*, is another leading into the *quarto de los leones*, or apartment of the lions; which is an oblong court, 100 feet long, and 50 broad, encompassed by a colonnade, seven feet broad on the sides, and ten at the end. Two porticoes or cabinets, about 15 feet square, project into the court at the two extremities. The square is paved with coloured tiles, and the colonnade with

white marble. The walls are covered to the height of five feet from the ground with blue and yellow tiles, placed checkerwise. Above and below is a border of small escutcheons, enamelled blue and gold, with an Arabian motto on a bend, signifying, "No Conqueror but God." The columns that support the roof and gallery are of white marble, very slender, fantastically adorned, and irregularly disposed. The ceiling of the portico is much more highly finished than that of the *Communa*. The capitals are of various designs. Amidst the varieties of foliage, grotesques, and strange ornaments, there does not occur the slightest representation of animal life. About each arch is a large square of arabesques, surrounded with a rim of characters that are generally quotations from the Koran. Over the pillar is another square of beautiful filligree work; and higher up is a kind of wooden cornice, enriched with carving as much as the stucco below. Over this projects a roof of red tiles, which disfigure this beautiful square, and which has been lately added when the Alhambra was repaired. In Moorish times the buildings were covered with large painted and glazed tiles, some of which still remain. In the centre of the court are twelve ill-formed lions muzzled, bearing upon their backs an enormous basin, out of which rises another of smaller size. When the pipes were kept in order, a volume of water was thrown up, which, falling into the basin, passed through these lions, and was discharged out of their mouths into a larger reservoir, communicating by channels with the jets d'eau in the apartments. This fountain is of white marble, adorned with festoons and Arabic distichs, to this purpose. "Seest thou not how the water flows copiously like the Nile?" "This resembles a sea washing over its shores, threatening shipwreck to the mariner." "This water runs abundantly to give drink to the lions." "Terrible as the lion is working in the day of battle." "The Nile gives glory to the King, and the lofty mountains proclaim it." "This garden is fertile in delight; God takes care that no noxious animal shall approach it." "The fair princess that walks in this garden, covered with pearls, ornaments its beauty so much, that thou mayest doubt whether it be a fountain that flows, or the tears of her admirers." Beyond the colonnade, and on its south side, is a circular room used by the men as a place for drinking coffee, &c. And it was refreshed in summer by a fountain. The form of this hall, the elegance of its cupola, the cheerful distribution of light from above, and the exquisite manner in which the stucco is designed, painted, and finished, exceed all powers of description. In this delightful scene, it is said, Abouabdoulah assembled the Abencarrages, and caused their heads to be struck off into the fountain. At the head of a court are two rooms, which are supposed to have been tribunals, or audience chambers. Opposite to the *Salu de los Abencarrages* is the entrance into the *Torre de las dos Hermanas*, or the tower of the two sisters, so denominated from two very beautiful pieces of marble laid as flags in the pavement. This gate exceeds all the rest in profusion of ornaments, and in beauty of prospect, which it affords through a range of apartments, where a multitude of arches terminate in a large window open into the country. In a gleam of sunshine, the variety of tints and lights thrown upon this ensilage are uncommonly rich. The first hall is the concert-room where the women sat; the musicians played above in four balconies. In the middle is a jet d'eau. The marble pavement is much admired for both the size of the flags and evenness of the colour. The two sisters, which give name to the room, are slabs measuring 15 feet by 7½, without flaw or stain. The walls, to a certain height, are mosaic, and, above, are divided into neat compartments of stucco. The ceiling is a fretted cove. For preserving this vaulted roof,

and some other of the principal cupolas, the outward walls of the towers are raised 10 feet above the top of the dome, and support another roof over all, so that no injury can be occasioned by wet weather, or excessive heat and cold. From this hall you pass round the little myrtle garden of Lindaraxa into an additional building constructed at the east end by Charles V. His admired motto, "plus outré," appears on every beam. This leads to a little tower, called, *El tocador*, or the dressing-room of the Sultana; in one corner of which is a large marble flag, penetrated with holes, through which the smoke of perfumes ascended from furnaces below; and here, it is supposed, the Moorish queen fumigated and sweetened her person. The emperor caused this room to be painted with representations of his wars, and a variety of grotesques, which appear to be copies or imitations of those in the loggia of the Vatican. From hence you go through a long passage to the hall of ambassadors, which is magnificently decorated with innumerable varieties of mosaics, and the mottoes of all the kings of Granada. This antichamber opens on the left hand into the Communa, and on the right into the great audience hall in the tower of Comares, which is a noble apartment, 36 feet square, 36 high to the cornice, and 18 from thence to the centre of the cupola. The lower range of windows is 13 feet high; the walls on three sides are 15 feet thick, and on the other 9. The whole wall is inlaid with mosaic of many colours, disposed in intricate knots, stars, and other figures. In every part various Arabic sentences are repeated.

The lower floor of the palace consisted of bed-chambers and summer-rooms; the most remarkable of which is the king's bed-chamber, which, by means of a gallery, communicated with the upper story. The beds were placed in two alcoves upon a raised pavement of blue and white tiles; but it has been repaired, and probably altered by Philip V. In the middle a fountain played for refreshing the apartment in hot weather. Behind the alcoves are small doors that lead to the royal baths. These consist of one small closet, with marble cisterns, for washing children, two rooms for grown-up persons, and vaults for furnaces and boilers that supplied the baths with water and the stoves with vapour. The troughs are formed of large slabs of white marble; the walls are ornamented with party-coloured earthen-ware, and light is admitted by holes in the covered ceiling. At a small distance is a whispering-gallery, and a kind of labyrinth, said to have been designed for the amusement of women and children. One of the passages is fenced off with a strong iron grate, and called the *Prison of the Sultana*; but it was more probably intended for preventing intruders from climbing into the women's quarter. Under the council-room is a long slip, called the *King's Study*; and adjoining to it are several vaults, said to be the burial-place of the royal family. In the retrospective view of this sumptuous palace, we need not wonder that the Moors thought of Granada with regret; and that they should still offer up prayers every Friday for the recovery of this city, which they regard as a terrestrial paradise.

ALHANDAL, a term in the Arabian *Pharmacy*, signifying *colocynth*. The *TROCHES* of *albandal*, *trochisci albandal*, are a kind of troches, composed of *colocynth*, *billettium*, and *gum tragacanth*. The word is formed of the Arabic *bandal*, or *bandhal*, a name for *colocynth*. They are esteemed good purgatives, and are used on divers occasions.

ALHANDRA, in *Geography*, a town of Portugal, in Estremadura, containing two parishes, and about 1350 inhabitants.

ALHANGA, a small town of Spain, in Estremadura, belonging to the order of St. Jago, seated on an eminence, and defended by a strong castle standing on a rock.

ALHAUR, a river of Asia, which runs into the Sakkaria, eight miles south of Aperia.

ALHAUS, a town of Prussia, four miles south of Culm.

ALHAZEN, in *Biography*, a learned Arabian, lived in Spain about the close of the 11th, or beginning of the 12th century; though Montucla says, that it is not known what was the precise period in which he lived. He wrote a treatise on astrology; and another on optics, which was printed in Latin in the *Theaurus Opticæ* of Risner, in 1572. In this optical treatise he gives a tolerable description of the eye, and discourses largely concerning the nature of vision; maintaining that the crystalline humour is the most important organ for this purpose, without considering it as a lens, and asserting that vision is not completed till the ideas of external objects are conveyed by the optic nerves to the brain. He accounts for simple vision with two eyes, by supposing, that when two corresponding parts of the retina are affected, the mind perceives but one image; and he treats very diffusely of optical deceptions, both in direct vision, and also in vision by reflected and refracted light. Alhazen pursued his enquiries into the nature of refraction much further, and with greater success, than the more ancient writers. He deduces from experimental and general reasoning several properties of atmospherical refraction, observing, that it increases the altitudes of all celestial objects; and he was the first who advanced the notion, that the stars are sometimes seen above the horizon by means of refraction, when they are really below it. He also observed, that refraction contracts the diameters and distances of the heavenly bodies, and that it is the cause of the twinkling of the stars.

Alhazen supposed, that the refraction of the atmosphere did not depend upon its vapours, but upon its different transparency, that is, as Montucla understands his meaning, the density of the gross air contiguous to the earth, and the æther or subtle air that lies beyond it. In examining the effects of refraction, he endeavours to prove that it is so far from being the cause of the heavenly bodies appearing larger near the horizon, that it would make them appear less; two stars, he says, appearing nearer together in the horizon than near the meridian. This phenomenon he ranks among optical deceptions. We judge, says he, of distance, by comparing the angle under which objects appear with their supposed distance; so that if these angles be nearly equal, and the distance of one object be conceived to be greater than that of the other, it will be imagined to be the larger: And he adds, that the sky near the horizon is always imagined to be farther from us than any other part of the concave surface. In the writings of Alhazen, we find the first distinct account of the magnifying power of glasses, and he probably suggested the hints which led to the useful invention of spectacles; for, he says, that if an object be applied close to the base of a larger segment of glass, it will appear magnified; he also treats of the appearance of an object through a globe, and says, that he was the first that found out the refraction of rays into the eye. Alhazen's optics were much illustrated by Vitellio in a treatise published in 1270. Smith's *Optics*, Remarks, § 89. p. 15. Priestley's *Hist. of Vision*, &c. 1772. p. 17—20. Montucla's *Hist. des Mathem.* tom. i. p. 367.

ALHEN, in *Botany*, a name by which Dr. Shaw and others have called a genus of plants, since named by Linnaeus *LAWSONIA*. See *ALCANA*.

ALHIDADE, or *ALIDADE*, the index or label of an astronomical or geometrical instrument, for taking of heights, or distances. The word is Arabic, and it signifies the same thing. In Greek and Latin it is called *διωπτρα*, *dioptra*, and *linea fiducie*, *fiducial line*. The *albidade* is a kind of ruler, moveable

moveable on the centre of the instrument, and carrying two sights, which are erected perpendicularly at the two extremities of it.

ALHIRTO, in *Astronomy*, a fixed star of the third magnitude, in the constellation CAPRICORN. This is otherwise called *rostrum galline*. Near this star, in the year 1600, appeared a new star, which lasted twenty-one years, and then disappeared again.

ALHUYS Point, in *Geography*, is situated upon a river falling into the Baltic, in a bay which bears nearly N. N. W. a little westerly from the island of Bornholm. If a ship is a league east of this point, the course will be due north to the bottom of the bay, having the land all the way on the larboard, but the depth of the water is uncertain. It is in N. lat. $55^{\circ} 35'$. E. long. $14^{\circ} 30'$. Malham's Naval Gaz.

ALI, in *Biography*, the son of Abu Taleb, who was uncle of Mahomet, and was eminently distinguished among the Mahometans, both during the life and after the death of their prophet. Ali was an early convert to the divine mission of his cousin, and contributed, in no small degree, by his zeal and activity, to the success of his cause. Having been taken in his infancy under the protection of Abubeker, the father-in-law of Mahomet, and the ardent promoter of his interest, he was directed by his patron to summon the kindred of the prophet, to receive from him a solemn declaration of his prophetic office. Mahomet, after announcing his commission to his assembled relatives, asked them who would become his vizir or vicegerent? Whilst they were hesitating, Ali started up and exclaimed, with the enthusiasm that marked his character, "I, O prophet of God, will be thy vizir; I myself will beat out the teeth, pull out the eyes, rip open the bellies, and cut off the legs of all who shall dare to oppose thee." Upon this Mahomet embraced Ali with great affection, and enjoined all who were present to regard him as his deputy. To him he afterwards committed the promulgation of the ninth chapter of the Koran; which commission he executed at Mecca, by reading 20 or 30 verses of this chapter to those who were assembled, and then announcing to them four particulars which were strictly to be observed, viz. "that no idolater is to come near the temple of Mecca after this year;" "that no man is to presume to compass the Caaba naked for the future;" "that none but true believers shall enter paradise;" and "that public faith is to be kept." Ali was equally celebrated for his eloquence and his valour; his surname of "the Lion of God, always victorious," sufficiently evinces his military renown; and as he succeeded his father in being chief of the illustrious family of Hashem, and hereditary guardian of the city and temple of Mecca, and had married Fatimah, the daughter of Mahomet, his talents and his rank, as well as his near relation to the prophet, and the personal favour by which he had been distinguished, established claims of pre-eminence, which naturally directed his views to the honour of succeeding Mahomet in the regal office. To this honour he also aspired; but he wisely declined contending for it during the three caliphates of Abubeker, Omar, and Othman. Upon the assassination of the last of these, Ali was unanimously elected caliph. When he was urged by some of the chief Moslems to accept the office, he said to them, "If you intend to recognize my authority as the successor of Mahomet, swear to be faithful to me, or else permit me to take the oath of allegiance to one of you." As soon as he was elected, he hastened to the mosque at Medina, at the time of prayer, in a thin cotton gown, tied about him with a girdle, with a coarse turban upon his head, carrying his slippers in one hand, and in the other a bow, which he used as a walking stick, and was there publicly inaugurated, in the 35th year of the He-

gira, A. D. 655. As soon as Ayeshah, the daughter of Abubeker, and the widow of Mahomet, heard of Ali's election, she expressed her disapprobation; having conceived an invincible prejudice against him, because, as it is said, he had discovered her infidelity to the prophet; and Telha and Zobeir, two persons of great influence, who had concurred in the choice, fled to Bassorah, and there raised the standard of rebellion. Ali had also roused the resentment of a strong party, by displacing those governors of the provinces, who had been appointed by his predecessor Othman. Ayeshah appeared at the head of the malcontents at Bassorah, and there Ali met them with an inferior force with regard to number, but formed of veteran troops. Ayeshah was mounted on a great camel, in a pavilion resembling a sort of cage, from which circumstance the day of battle was called the *day of the camel*. Ali gained a complete victory. Telha was slain in the engagement; Zobeir was afterwards assassinated; and Ayeshah was taken prisoner; and, after some submission, treated courteously, and sent back to Medina. The next enterprise of Ali was directed against Moawyah, a former governor of Syria, who had been proclaimed caliph, and was supported by the house of Onmijah, and by Amru, the conqueror of Egypt. The armies met at the plain of Seffein, on the western banks of the Euphrates. After several skirmishes, and an ineffectual challenge of Moawyah to single combat, the hostile forces engaged, and the contest was continued all night, to the great disadvantage of the Syrians; and this night was denominated by the Arab historians, "the valiant night." As victory was likely soon to be decided in favour of Ali, Moawyah, in concert with Amru, contrived an artifice that might induce the caliph's men to desert. With this view they ordered some of their men to carry lances, bearing upon their points copies of the Koran, at the head of the troops, and to cry out as they advanced, "This is the book that ought to decide all differences between us; this is the book of God between us and you, which absolutely prohibits the effusion of human blood." Ali was thus compelled by some of his troops, who threw down their arms, to sound a retreat, and thus to give up the contest in the moment of victory, and after having lost, as it is said, 25,000 men, and killed 45,000 of the enemy. The dispute was submitted to arbitration, and the two persons, by whose award it was to be determined, concurred in deposing Ali. Sentence was pronounced on a tribunal erected between the two armies. Abu Musa, one of the arbitrators, first pronounced his award: "I depose from the caliphate both Ali and Moawyah, in the same manner as I take this ring off my finger." Amru, the other arbitrator, immediately ascended the tribunal, and said, "I concur with Abu Musa in deposing Ali, and confer the caliphate upon Moawyah; I therefore invest that prince with the supreme authority in the same manner as I put this ring on my finger. And this I am the more disposed to do, as he has justice on his side; having been declared by Othman his successor, and being the most worthy of the Moslems to occupy the high station to which I now advance him." Thus commenced that schism among the Mahometans, which has produced animosity and mutual excommunication, and which is visible to this day in the rooted antipathy that subsists between the Turks and Persians. Ali and his adherents were disgusted and irritated; but they were under the necessity of acquiescing and retiring to Cufa, where Ali was soon deserted by the *Kharejites*, i. e. as the name imports, rebels or revolters. These were called *Mohakkemites*, or judicarians, because the reason they gave for their revolt was, that Ali had referred a matter concerning the religion of God to the judgment of men; whereas, in such case, the judgment belonged solely to God. The Kharejites

Kharejites, not convinced by Ali's reasoning, associated in arms, and fixed upon Naharwan, about four miles to the east of the Tigris, for their place of rendezvous. Ali marched out against them, and having reclaimed most of them to their former attachment by persuasion, he destroyed the rest in battle, and gained again the possession of Arabia. But his rival Moawiyah established himself in Syria and Persia, and Amru seized upon Egypt in his name. The Syrians also made an incursion into Ali's territories, exercised great cruelty, and committed many depredations. At this time three of the Kharejites happening to meet at Mecca, concurred in lamenting the miseries of the civil war which the people were enduring, and resolved to terminate them by assassinating the principal authors of them, *viz.* Ali, Moawiyah, and Amru. One of them hastened to Damascus, and wounded Moawiyah, but the wound, though dangerous, was not mortal. Another went to Egypt, and entering a mosque, where he expected to find Amru, mistook another person for him, and dispatched him, whilst Amru survived unhurt. The third conspirator, whose name was Abdalrahman, was more successful than either of his two prosfligate companions. Having arrived at Cufa, he engaged two associates, who joined in assaulting Ali at the door of the mosque, when Abdalrahman gave him the fatal blow. The expiring caliph left in charge with his son Hassan, in case of his death, to execute the assassin at his stroke, thus humanely guarding against the lingering torments which usually accompanied the death of offenders. Ali, pierced as it is said, by a poisoned sword, expired on the fifth day after his wound, in the 63d, 57th, or 58th year of his age, for such are the different accounts that are given of his age, in the 40th year of the Hegira, A. D. 660. His sepulchre at Cufa was concealed till the expiration of the caliphate of the Omniades; but in the year of the Hegira 367, A. D. 977, Addad ed Dowlat erected a superb monument over it, which has been decorated by the Persian kings, called, "the dome of the distributor of lights and graces," and regarded as a great object of the devotion of his votaries. A city, called Meshed Ali, has also been built to his honour, not far from the ruins of Cufa. Some of his most zealous devotees suppose that he is still alive, and expect his advent in the clouds of heaven to fill the earth with justice. Ali, after the death of Fatima, by whom he had three sons, Hassan, Housfain, and Mohaffan, the first of whom succeeded him, had eight other wives. The Moslem writers, particularly those of his sect, speak highly of his corporeal, mental, and moral endowments. They extol his valour, munificence, and benignity of temper. Among them he also ranks high as to his learning. There are still extant his "Centiloquium," or collection of a hundred maxims or sentences, which has been translated from the Arabic into the Persian and Turkish, part of which has been published in English by Mr. Ockley; and also his "Divan," or collection of verses. But his most celebrated relic is a parchment, written in mysterious characters, intermixed with figures, prophetic of all the events that are to happen in the world. This was a deposit in the hands of his family. Many of Ali's sayings and apophthegms are recorded by authors; one of the most instructive is the following: "He who would be rich without wealth, powerful without subjects, and a subject without master, has only to forsake sin and serve God."

The appellations by which Ali was honoured by the Arabs are very distinguishing and honourable. On account of his superior bravery, they called him "Al Haidar," the lion, and "the victorious Lion of God." They also denominated him "Wasi," *i. e.* legatee or heir of Mahomet, and "Mortadi," *q. d.* beloved by, and acceptable to God.

He was also called by his followers, "the distributor of lights and graces;" and "the king of men."

Ali has given denomination to a sect or party among the Mahometans, who adhere to the right of succession of Ali, the fourth caliph, or successor of Mahomet, and the reform of Mussulmanism introduced by him. The sectaries of Ali are more particularly called *Sunnites*, and stand opposed to the *Sonnites*, or sect of Omar, who adhere to the law as left by Mahomet, Abubeker and Omar. The followers of Ali have possessed various states in Asia and Africa; and at present the Persians, part of the Ussée Tartars, and some Mahometan sovereigns of India are of the sect of Ali; whilst the Turks are of the sect of Omar, and hold Ali in execration. The distinguishing badge of Ali's followers is a red turban, which is worn by the Persians, who are hence called, in derision by the Turks, "Kissbachi," *i. e.* red heads. *Mod. Un. Hist. c. ii. vol. i. Gen. Dict. Sale's Prel. Disc. to the Koran.*

ALI BEY, an eastern adventurer, whose history and exploits have interested much attention, was probably born among the Abazans, a people inhabiting Mount Caucasus, and brought by the slave-merchants to one of the annual sales at Cairo, where he was purchased by the brothers, Isaac and Yousef, Jews, employed in the custom-house, and by them presented to Ibrahim, a kiaya, or veteran colonel of janizaries, who was then one of the most considerable men in Egypt. At this time he is supposed to have been 12 or 14 years of age. By the favour of his patron, to whom he rendered the usual services of the Mamlouks, he was taught to read and write, and to perform the customary exercises of a military kind, in which he displayed a fire and activity that obtained for him the appellation of *djendali*, or madman. At the age of 18 or 20 his beard was allowed to grow, or he was made free; and his patron gave him a wife and revenues; promoted him to the rank of kachef, or governor of a district; and at length procured him to be elected one of the 24 beys. Thus favoured and advanced, his ambition was excited; and the death of Ibrahim, in 1757, opened a free course for the execution of his projects. After an absence of a few years, during which he had been engaged in a variety of intrigues, for raising and displacing several chiefs, and two years of which he had passed in a state of exile in Said, or Upper Egypt, devising and maturing his plans of future dominion, he returned to Cairo in 1766; and in one night killed four beys, who were his enemies, banished four others, and thus became from that time the chief of the most numerous party. Not contented with the trivial title and dependent office of bey, he aspired to the title and honour of Sultan of Egypt; and with these views he determined to throw off the supremacy of the Porte; and accordingly he expelled the pacha, refused the customary tribute, and in 1768, he proceeded to coin money in his own name. The attention of the Porte was so much occupied by other concerns that he was under a necessity of temporising; and Ali, well apprised of his situation, pushed forward his enterprises with success. He began with dispossessing Hammam, an Arab sheik, of a part of the Said, which he had occupied, and where he had formed a power capable of giving disturbance; and towards the end of this year, 1769, he fitted out some vessels at Suez, which were ordered to seize on Djedda, the port of Mecca, whilst a body of cavalry marched by land to take possession of Mecca itself, which was given up to plunder. The project which he had formed, in consequence of the suggestion of a Venetian merchant, was to make Europe abandon the passage to the East Indies by the Cape of Good Hope, by substituting the ancient route of the Me-

the Mediterranean and the Red Sea. Flashed with success in the petty enterprises he had already accomplished, and flattered by his servile courtiers, his ambition suggested to him more extensive conquests. Syria was the first object of his contemplation; and the war with the Russians, which broke out in 1769, and which occupied all the Turkish forces in the north, favoured his design. Besides, sheik Daher, in actual rebellion against the Porte, would be a powerful and faithful ally; and the extortions of the pacha of Damascus disposed those he had oppressed for revolt, and made way for his obtaining the title of the deliverer of nations. Ali having laid his plan, detached in 1770 a corps of Mamlouks to take possession of Gaza, and thus to secure an entrance into Palestine: and soon after he sent a larger army, to form a junction with Daher at Acre, and to proceed from thence to Damascus. Osman, pacha of Damascus, was diligent in his preparations, and collected an army equally numerous and ill regulated. On the 6th of June 1771, the two armies met, and a decisive action took place, in which Mohammed, the friend of Ali, and Daher his ally, proved victorious. They immediately took possession of Damascus; but the cattle resisted. At the moment when the signal of surrender was expected, Mohammed suddenly commanded a retreat, and all his cavalry turned towards Egypt. This singular revolution was at first attributed to a pretended report of the death of Ali Bey; but it was really owing to a conference which had passed the preceding night between a crafty agent of Osman and Mohammed Bey, Ali's commander. Ali, though disappointed and chagrined, did not renounce his projects: he prepared, in conjunction with Daher, a second army for the campaign of 1772; but the event was unpropitious. The escape of Mohammed roused his jealousy and his fears; he beheld in him a dangerous rival, and resolved on his ruin. Having ordered the gates of Cairo to be shut, and no Mamlouk to be allowed to pass, he sentenced Mohammed into immediate exile in the Said. Mohammed, however, contrived to make his escape; and from this moment all was lost. The Mamlouks, wearied with the insolence of Ali Bey, repaired in crowds to his rival, and in about six weeks he left the Said, with a strong force, and marched towards Cairo. Ali prepared to meet him; and in the month of April 1772, the two armies had a rencontre in the plains of El-Mafateh, at the gates of Cairo; the issue of which was, that Mohammed and his party entered the city, sabre in hand; and Ali Bey had barely time to escape with 800 of his Mamlouks. With this inconsiderable force he repaired to Gaza, and attempted to join his ally, Daher, at Acre, who, after some danger from which he was rescued, conducted him to Acre. Both Ali and Daher marched to the succour of Said, (Sidon) which was then besieged by the troops of Osman, in conjunction with the Druzes. At their approach the Turks raised the siege, and retired to a place about a league north of the city, on the river Aoula. There, in July 1772, an engagement took place; and the Turkish army, three times more numerous than that of the two allies, was entirely defeated. The seven pachas, who commanded it, fled; and Said remained in the possession of Daher. Ali Bey and Daher, on their return to Acre, proceeded to chastise the inhabitants of Yafa or Jassa, who had revolted; and after a siege of eight months the town capitulated in February 1773. Ali now determined to return to Cairo; and he was encouraged in his purpose by the promised succours of Daher, and of the Russians. This assistance was delayed, and Ali became impatient. In April 1773, quickened in the execution of his purpose, by fabricated letters, which he received from Cairo, he began his march at the

head of his Mamlouks, and some troops furnished by Daher; but when he advanced into the Desert, which separates Gaza from Egypt, he fell into an ambush of 1000 Mamlouks, who were waiting his arrival. This corps was commanded by Mourad, a young bey, who, being enamoured of the wife of Ali Bey, had obtained a promise of her from Mohammed, in case he should bring him the head of Ali. The attack was impetuous; Mourad met with Ali in the crowd, wounded him in the forehead, made him prisoner, and conducted him to Mohammed. By his former master, Ali was received with perfidious respect; but on the third day, this parade of civility and politeness terminated by the death of Ali Bey, who, according to some, died of his wounds; or, as others report, by poison.

Ali Bey was certainly a character of original vigour and capacity; and was superior in his views to what could have been expected from one who was bred in a school of barbarism and ignorance. He governed Egypt with a steady hand, and was particularly favourable to the Franks; but he undertook more than he had power or talents to perform, and exhausted his revenues in fruitless enterprises. He is also blamed for too soon resigning active labours to his lieutenants, and for placing unlimited confidence in his favourites, and winking at the exactions of his officers. His morals were those of his class and country, where perfidy and murder are allowable means in pursuing the objects of ambition; yet he was not devoid of generosity and a sense of justice. During his administration, several nests of robbers in Egypt were annihilated, villages which had been inhabited by the pirates of the Nile were razed; the communication between different parts of the country was free; the roads were no longer infested with robbers, nor was navigation interrupted by that spirit of pillage, which, since his death, has resumed its fatal activity. It was his wish, "that every man might be able to carry his purse in his hand, and leave his door open, even during the night, without running any risk."

Volney has pointed out the errors of Savary's account of this singular person and the source whence they were derived. Volney's Travels in Egypt and Syria, vol. i. c. 8. p. 114—142. Sonnini's Travels in Egypt, p. 391, 410. Gen. Biog.

ALI, in *Geography*, a town of Asia, in the country of Georgia, 50 miles west of Teflis.

ALI, a town of Asia, in the country of Georgia, in the province of Satabago; 22 miles south-west of Akalzika.

ALIA, *Αλία*, in *Grecian Antiquity*, solemn games celebrated at Rhodes on the 24th day of the month Gorpizea, corresponding to the Athenian Bædromion, in honour of the sun, *Ἡλιος*, or *Αλιος*, who is said to have been born there; the inhabitants of which were hence called *Ἡλιαδῆς*, Heliads. The victors were crowned with poplar. Strabo, tom. ii. p. 966.

ALIABAD, in *Geography*, a town of Persia, in the province of Tabristan, 10 leagues south south-east of Ferabad.

ALIACMON, or HALIACMON, in *Ancient Geography*, a river of Macedon, separating it from Thessaly, rises in the Peneſtæ mountains, and running south-east, enters the bay of Thessalonica, between the cities of Pydna, and Dium.

ALJAKI, in *Geography*, a town of Poland in the palatinate of Kiof, 20 miles south-east of Czerkafy.

ALJAMEIA is a name which the Moreſcoes in Spain give to the language of the Spaniards.

Among other articles agreed on by the junto, which was appointed

appointed by the emperor Charles V. in 1526, in favour of the Moriscoes, this was one, that the Moriscoes should no longer speak Algavareia, *i. e.* Moorish, or Arabic, but should all speak Aljameia, *i. e.* Spanish, as it was called by the Moors, and all their writings and contracts should be in that language. Geddes's Misc. Tracts, tom. i. p. 23.

ALIANA, in *Geography*, a bishoprick of Phrygia, subject to the metropolis of Laodicea.

ALIANNELO, a town of Italy in the kingdom of Naples, and province of Basilicata, 27 miles east of Potenza.

ALIANO, a town of Naples, in the province of Basilicata, 23 miles south-east of Potenza.

ALIANO is also a town of Naples, in the country of Lavora, two miles west of Gaeta.

ALIANSKOI, a fort of Russian Siberia, in the government of Kolivan, 120 miles south-west of Kolivan. N. lat. $52^{\circ} 50'$. E. long. $79^{\circ} 34'$.

ALIARBUCHA, in *Natural History*, the Arabian name for a large kind of rat, the Jerboa of other writers, common in that country, and good to eat, according to Bochart, who thinks it the same as the *saphan*, mentioned in Leviticus, and there declared unclean. Levit. xi. 5.

Dr. Shaw thinks the saphan to be the DAMAN *Israel*, or a species of rabbit.

ALIARDII, in *Ancient Geography*, a people of Africa, according to Ptolemy.

ALIARIA, a town of Comagena, placed by Antonin, in the route from Nicopolis to Edeffa.

ALIARTUS. See HALIARTUS.

ALIAS, in *Law*, a second or farther writ issued from the courts of Westminster, after *cohas*, &c. sued out without effect.

ALIBACA, in *Ancient Geography*, a town placed by Ptolemy, in the Pentapolis.

ALIBANI, or ALIBINALI, in *Geography*, a town of Arabia, 140 miles south-east of Amanzirifdin.

ALIBAG *Revi*, a town of European Turkey in Bulgaria, eight leagues east of Silistria.

ALIBI, in *Law*, denotes the absence of the accused from the place where he is charged with having committed a crime: or his being *elsewhere*, as the word imports, at the time specified.

ALICA, in the *Ancient Physic and Diet*, a kind of food; but the various accounts given of it by authors, make it uncertain what it was; some representing it as a sort of grain, and others as an aliment made of grain.

The Greek word for *alica* was *χορδος*, which term, and *πρισσαν*, seem to have been general names for all split or hulled grain, beaten or ground into a pulp.

Ray, in his history, says the *alica* differs from the *χορδος*, as the *genus* from the *species*.

ALICA, in *Geography*, a town of Italy in the duchy of Tuscany, 29 miles west south-west of Florence.

ALICANDRA, or ALIDRACA, in *Ancient Geography*, a town placed by Ptolemy in Media.

ALICANE, in *Geography*, a river towards the south-west part of the island of Ceylon, nearly east from Barberine island, and south from Caliture.

ALICANT, a small, but well-built, rich, populous, and fortified sea-port town of Spain, in the kingdom of Valencia. It is situated on the Mediterranean, between a mountain, on which the castle stands, and the sea; and it is well defended by strong bastions. This mountain is white, and being visible at a great distance, seems as a guide to pilots. The bay in which it stands is sheltered on the east by Cape

de la Huerta, and to the west by Cape St. Paul, and the island of Tabarea. Vessels anchor about a mile from the mole, which is large and commodious, in water from six to 10 fathoms, and may enter and go out with any wind. This bay is said to have been the famous gulf of Ilici, so called from a Roman colony, now Elelie; but the declining state of that port, and the improvements of Alicant, gave it the name which it now bears: it begins at Cape St. Martin, and terminates at Cape Palos. The coast is guarded by watch-towers against the incursions of the Corsairs. Alicant was taken from the Moors in 1264. The castle was taken by the English in 1706, and retaken in 1708, by the Spaniards. The adjacent territory is fertile, and produces white and red wines that are much valued. The export trade, which is considerable, consists of barilla, antimony, alum, aniseed, cummin-seed, dried fruit, wool, and wine. As the duties of entry are lower than those at Valencia and Carthagen, this circumstance has contributed to the increase of its commerce and riches. Linen, from France, Switzerland, and Silesia, and camblots and woollens from France, are the chief imports. The English, French, Dutch, and some Italian States have usually had a consul at Alicant. N. lat. $38^{\circ} 34'$. W. long. $0^{\circ} 7'$.

ALICARIE, in *Ancient History*, a term synonymous with prostitutes.

ALICANUM, or HALICANUM, in *Ancient Geography*, a town of Pannonia.

ALICASTRUM, in *Botany*. See BROSIMUM.

ALICATA, in *Geography*, a small town of Sicily in the valley of Noto, built partly upon a slope, and partly on the beach, at the end of a long chain of hills; 19 miles east south-east of Girgenti, and 60 south-west of Catania. This is a place of little strength, the castle of St. Angelo on the brow of the hill being ruinous, the town walls much decayed, and the fortrefs on the peninsula wanting repairs. It forms two small bays for the barges that carry out the corn to ships that lie in the offing. It has great connections with Malta in the corn trade. The town contains 10,000 inhabitants. The populace pay great respect to the sacerdotal character; the women and children falling on their knees in the streets before a clergyman, touching his garments with a finger and then kissing their hands with great veneration. Alicata is said to possess some ancient Greek manuscripts relating to the ancient city of Gela: the most remarkable is a psephisma, or decree of the senate, for crowning Heraclides director of the public academy. This town was plundered by the Turks in 1543. N. lat. $37^{\circ} 11'$. E. long. $13^{\circ} 51'$. Swinburne's Travels into Sicily, vol. iv. p. 39.

ALICATA is also a mountain of Sicily not far from this town, in which, as it is thought, was situated Dædalion, where Phalaris kept his brazen bull.

ALICHORDA, or ALICODRA, a town, placed by Ptolemy in Bactriana.

ALICE, a river of Sicily, was the ancient boundary of the Locrian state. Immense quantities of anchovies frequent the mouth of this stream and the adjacent coast: it is therefore probable that either the fish derived its Latin name Halic from the river, or the river was called after the fish.

ALICONDA, in *Botany*, an African tree, growing naturally in the kingdom of Congo, of such bulk that 10 men cannot fathom it round. The natives called it bonda, and as the wood easily rots, they do not build their huts near it, lest its fall should crush them to death, or its fruit, which is of the size of a large gourd, and easily broken from

the tree, should knock them down. The bark of this tree, well beaten and macerated, yields a coarse thread, of which they make their ropes, and which macerated and dried, and beaten with bars of iron or wood, becomes like a large piece of cloth, with which the natives cover their middle from the girdle to the knees. The shell or rind of the fruit, which is hard like that of a gourd or calabash, being freed from its pulp, which in time of scarcity may be made into a nourishing pap, serves for vessels of various kinds, and gives to water, preserved in it, a pleasant aromatic taste. The small leaves are eaten in time of scarcity, and the large ones serve to cover houses, or being burned, to make good soap. *Mod. Un. Hist.* vol. xiii. p. 23. 8vo.

ALICONEA, in *Entomology*, the name given by Cramer to the *PAPILIO JULIA*.

ALICUDA, or ALICUR, one of the Lipari islands, near the coast of Sicily. N. lat. $38^{\circ} 31'$. E. long. $14^{\circ} 32'$. This island is about six miles in circuit; its population is not so great as that of FELICUDA, which contains about 650 inhabitants, and the houses are built at the south and south-east end of the island, on the declivities of the mountains about halfway up their ascent, in order to be guarded against the nightly surprize and attack of the Tunisian Corsairs. Besides Indian figs, and some olive-trees, these two islands contain many vines, from the grape of which a good wine is made, though it be not malmsey, nor the grape the passola or passolina. The corn grown here is barley and wheat, which, together with the grapes, amount in value of produce to about 3000 Neapoltan crowns. The industry and patience of the people of Alicuda are incredible; they do not lose an inch of the ground they cultivate. Their soil is almost wholly interrupted by points of rocks, masses of lava, clefts and crags; and yet they render tracts of this kind productive, by turning and breaking them with pointed spades: so that the Liparese humorously say of them, that the people of Alicuda till their lands with the point of a knife. In all the Æolian isles there is not better bread than that of Alicuda. Three or four fishing boats belong to this island, which are mostly the property of the parish priest, and are employed for the augmentation of their ecclesiastical revenues, amounting to little more than 12 sequins. There is not a single spring of fresh water either in Alicuda or Felicuda; and therefore when it does not rain for several months, the distress of the inhabitants is extreme. They have no serpents in these islands, as they furnish no food necessary for their subsistence. The people are exempted, on account of their poverty, from every kind of taxation, the tythes which they pay to the bishop excepted. These islanders, notwithstanding their extreme poverty, and inhabiting huts, formed of pieces of lava, scarcely admitting a ray of light, and appearing like the nests of birds hung to the cliffs, are singularly contented and happy. Their fare consists of black barley bread, and wild fruits, and sometimes, by way of dainty, salt fish, and their drink of pure water; and yet such is the temperature of the climate, and the salubrious quality of the air, that they enjoy, with little interruption, health of body and cheerfulness of mind. The vestiges of fire are discernible in every part of this island, but the actual existence of volcanic eruptions and conflagration precedes the records of history. The volcanic materials, now found in it, and particularly examined by the accurate and industrious Spallanzani in his visit to this island, are pumices, tufas, and glasses, and great quantities of lava, in detached globules and continued currents, which have petrosilex for their base. Dolomieu was of opinion, that Felicuda and Alicuda had once formed a single

conical mountain, which had been opened and separated on one side; but Spallanzani alledges several circumstances that evince the improbability of this opinion. Although these two islands exhibit numerous and indubitable characters of fire, no signs of it in a state of activity are now to be seen. The ancient name of Alicuda was *Ericusa*; and the author of the epitome of Stephanus says, that it was so named from the *erica* or heath which grows there plentifully. Strabo likewise (lib. vi.) informs us, that these two islands derived their names from plants. But in the time of Aristotle and Strabo, and other ancient writers, the conflagrations in these two islands, as they are unnoticed by them, must have been entirely extinguished. Spallanzani's Travels in the two Sicilies, vol. iii. c. 18.—vol. iv. c. 24.

ALICULA, in *Antiquity*, a kind of puerile habit worn by the Roman children. This was a sort of *chlamys*; some explained it by *tunica manicata*.

ALICYRNA, in *Ancient Geography*, a place of Greece, situate, according to Steph. Byz. in Acarnania, and according to the periplus of Scylax in Ætolia. It is probably the *lycirna* of other authors, to the south of Calydon on the borders of the sea.

ALIDES, in the *Mahometan History*, the descendants of Ali, otherwise called *Fatimites*. See ALI.

ALIEIS, in *Ancient Geography*, a sea-port town of Peloponnesus, in Laconia, inhabited by fishermen, whence its Greek name.

ALIE-KRUYK, in *Natural History*, a Dutch name given to a kind of sea-snail, the history of which is given by Swammerdam. *Bib. Nat.* tom. i. p. 180.

ALJEMBUT, or, as some write it, *gembut*, in *Botany*, a name given by the Arabians, Avicenna, and others, to a species of ACACIA, which they also call the Nabathæan pod, and ceration, or filiqua, and which some have supposed to be the same with the common carob; but they expressly distinguish it, by saying that it is an astringent, whereas the other is gently purgative; and that the fruit of it was given in hæmorrhages. Nay, Isidore goes so far as to say, that the acacia juice of the shops was made of its fruit, while unripe.

ALIEN, in *Law*, a stranger or person born out of the king's allegiance; or under the jurisdiction of some other sovereign; and not naturalized, or made a denizen.

Of these there are two kinds; viz. *alien friends*, who are of those countries which are at peace and league with us; and *alien enemies*, who are of countries at war with us; to which some add a third, viz. *alien infidels*.

A man born out of the land, but within the limits of the king's obedience beyond the seas; or of English parents out of the king's obedience, provided the parents at the time of the birth be of such obedience, is no alien, but a subject of the king, (lat. 2. 25 Edw. III. commonly called the statute *De natis ultra mare*.)

By several more modern statutes, (7 Ann. c. 5. 10 Ann. c. 5. 4 Geo. II. c. 21, and 13 Geo. III. c. 21.) these restrictions are further taken off; so that all children born out of the king's liegeance whose fathers, or grandfathers by the father's side, were natural born subjects, though their mothers were aliens, are now deemed to be natural born subjects themselves to all intents and purposes, unless their said ancestor were attainted, or banished beyond sea for high treason; or were at the birth of such children in the service of a prince at enmity with Great Britain. But the grandchildren of such ancestors shall not be privileged in respect of the aliens duty, except they be protestants, and actually reside within

within the realm; nor shall be enabled to claim any estate or interest, unless the claim be made within five years after the same shall accrue. The children of aliens born in England are, generally speaking, natural born subjects, and entitled to all the privileges of such. 1 Comm. 373.

By the stat. 11 and 12 W. III. cap. 6. all persons being the king's natural born subjects, may inherit as heirs to their ancestors, though their ancestors were aliens. Children of an ambassador in a foreign country by a wife who is an English woman, are natural born subjects by the common law. 7 Rep. 11. And if an English merchant living beyond sea, marries a wife there, and hath a child by her and dies, this child is born a denizen, and shall be heir to him, notwithstanding the wife be an alien. Cro. Car. 605. Persons born in English plantations are natural born subjects.

An alien can hold no land by descent or purchase, or be tenant by courtesy, or in dower; and if he purchase, the king shall have it; but he may purchase a house for years for habitation, during his residence, as necessary for trade. If an alien merchant leaves the kingdom, the king shall have the lease; if he be no merchant, the king shall have his lease for years, though it were for his habitation; and by the stat. 32 Hen. VIII. there is a penalty for letting houses to aliens. 5 Rep. 502.—7 Rep. 18.—1 Inst. 2. 129.—2. Inst. 741.

By 13 Geo. III. c. 14. aliens are enabled to lend money on the security of mortgages of estates in the West India colonies, and may have every remedy to recover the money lent, except foreclosing the mortgage and obtaining possession of the land.

A devise of lands to an alien is void; and if a man be bound to an alien enemy in a bond, it is void to him, but the king shall have it.

Aliens, however, may obtain goods and personal estate by trade, &c. and may bring actions for the same; and make a will and dispose of their personal estate; but an alien enemy cannot maintain any action whatever, nor obtain any thing lawfully within the realm. 1 Bult. 124. Terms de Ley. 36.

Aliens are not to be returned on any jury; but where an alien is party in a cause, the jury are to be half denizens and half aliens, except in cases of high treason. 2 Inst. 17. By stat. 27 Ed. III. c. 8. if both parties are aliens, the inquest shall be all aliens. By the stat. 12 W. III. cap. 2. aliens are incapable of being members of parliament, or of enjoying offices; neither have they any vote for the election of members. Hob. 271. Aliens likewise are by several acts of parliament put under several other restrictions, with regard to exercising trades, taking apprentices, and are likewise disabled from being factors in the plantations, &c. See DENIZEN and NATURALIZATION.

A very great influx of Frenchmen into England having been occasioned in the years 1792 and 1793, by the troubles in France, and there being cause to suspect that some of them were sent here for dangerous and unjustifiable purposes, an act was passed, stat. 33 Geo. III. c. 4. commonly called the *Alien-bill*, compelling the masters of ships arriving from foreign parts, under certain penalties, to give an account at every port of the number and names of every foreigner on board to the custom-house officers; appointing justices and others to grant passports to such aliens; and giving the king power to restrain and to send them out of the kingdom on pain of transportation, and on their return, of death. The same act also directs an account to be delivered of the arms of aliens, which, if required, are to be delivered up, and aliens were not to go from one place to

another in the kingdom without passports. This act was continued by several subsequent acts; by 38 Geo. III. c. 50. to Aug. 1, 1800, and from thence to the end of the then next session of parliament, and by 41 Geo. III. c. 24. till six months after the conclusion of a general peace.

ALIENS duty, an impost laid on all goods imported into England, by aliens, or denizens, and even on certain goods imported by natural subjects, if they be brought on foreign bottoms, over and above what is paid for the same goods imported by British, and in British shipping. 12 Stat. Car. II.

Aliens duty is otherwise called *petty customs*, and *navigation duty*. This was first granted in 31 Ed. I.

Fish, dried or salted, and cod-fish, or herring, not caught in British vessels, and cured by British, pay a double *aliens duty*.

Aliens duty outwards, is taken off by the following acts. 12 Car. II. cap. 4.—25 Car. II. cap. 6.—5 Ann, cap. 27.—6 Ann, cap. 10.—7 Ann, cap. 7.—9 Ann, cap. 6.—8 Geo. I. cap. 15.—11 Geo. I. cap. 59.

Seavage, package, and balliage, payable to the city of London, are properly alien duties. On what footing aliens are permitted to import foreign commodities into Great-Britain. See DUTY.

ALIEN is sometimes used, in *Middle Age Writers*, for *exempt*. Du-Cange.

ALIEN-amy, or *alien friend*. See ALIEN.

ALIEN priories, a subordinate kind of monasteries in England, belonging to, and independent on, other monasteries in foreign countries. In the reign of Henry V. the alien priories, or abbies for foreign monks were suppressed, and their lands given to the crown. Vide Dugd. Monast. Abr. p. 44.

ALIENATION, ALIENATIO, in *Law*, the act of making a thing another man's; or the altering or transferring the property, and possession of lands, tenements, or other things from one man to another.

To *alienate*, or alien in MORTMAIN, is to make over lands or tenements to a religious community, or other body politic.

To *alienate* in FEE, is to sell the fee-simple of any land, or other incorporeal right.

All persons who have a right to lands may generally alien them to others; but some alienations are prohibited: such as alienations by tenant for life, &c. whereby they incur a forfeiture of their estate. 1 Inst. 118.

By the statute of Edward I. a bar was put to alienations by what we call *entails*, which is an expedient for procuring *perpetuities* in families; but counter-expedients were devised to defeat this intent, and a practice was introduced of cutting off entails by *finer*, and of barring remainders and reversions by *recoveries*.

Estates in tail, for life or years, where the whole interest is not parted with, may be made with condition not to alien to others, for the preservation of the lands granted in the hands of the first granter.

The statute for alienations in Henry the Seventh's time, had a great effect on the constitution of this kingdom: as among other regulations of that reign, it tended to throw the balance of power more into the hands of the people. By the stat. 12 Car. II. cap. 24. fines for alienations are taken away; except fines due by particular customs of manors.

Crown lands are only alienable under a faculty of perpetual redemption.

The council of Lateran, held in 1123, forbids any clerk to alienate his benefice, prebend, or the like.

By the laws of the ancient Jews, lands could only be alienated.

alienated for the space of fifty years. At each return of the jubilee, all returned again to the primitive owners, or their descendants, to whom the lands were originally allotted, at the first distribution of Canaan.

ALIENATIO a familia. See *ABDICATIO*.

ALIENATION office, is an office to which all writs of covenants and entry, upon which fines are levied, and recoveries suffered, are carried, to have fines for alienation set and paid thereon.

ALIEU, or *ALIOEU*, in *Ancient Geography*, islands placed by Pliny in the Adulic gulf, near Ethiopia.

ALIFI, in *Geography*, a town of Italy, in the kingdom of Naples, and country of Lavora; five miles north of Capua. This town, placed by M. d'Anville to the south-west of Bovianum and north-west of Beneventum, was formerly a Roman colony, and possessed by the Samnites.

ALIFORMES musculi, in *Anatomy*, are thus called from *ala*, wings, and *forma*, shape, as resembling wings. See *PTERYGOIDEUS externus et internus*.

ALIFORMES processus, are processes of the *sphenoid* bone, under which article they will be described.

ALII multi, *ALI de regno*, are phrases which often occur in our ancient records and historians. Their meaning has occasioned much dispute. Dr. Brady will have them to signify only tenants *in capite*; which Mr. Tyrrel endeavours to refute, and shew that they denote the whole commons of the kingdom. Hist. of Eng. tom. i. Appen.

ALILÆI, in *Ancient Geography*, a people who inhabited the western part of Arabia Felix; among whom gold, it is said, was so abundant, that it was held in lower estimation than copper and iron, which were probably very scarce.

ALINA, among *Mineralists*, a kind of sand found in gold mines, out of which lead is extracted.

ALIMALA, in *Ancient Geography*, a country of Asia Minor in Lycia. Steph. Byz.

ALIMEA, or *HALIMUSIA*, a district of Attica, belonging to the Leontid tribe, situate near the Phalereum, and in the vicinity of Athens. In this district was a temple consecrated to Ceres Thesmophoria, or the legisatrix, and to Proserpine, according to Pausanias, in Attic. lib. i. c. 31. p. 76.

ALIMENA, in *Entomology*, a species of *PAPILIO Nymphalis*, with dentated black wings, an interrupted carulean fascia, and seven white marginal points, found in South America and India.

ALIMENT, *ALIMENTUM*, formed of *alere*, to nourish, in a physical sense, is whatever may be dissolved and turned into chyle, so as to be afterwards converted into blood, for augmenting the body, or repairing its continual waste. The subject of aliments has been very diffusely and comprehensively discussed by Dr. Cullen, in his *Mat. Med.* vol. i. p. 217—408. See *CHYLIFICATION*, *DIGESTION*, *DRINK*, *FOOD*, and *NUTRITION*.

ALIMENT of plants. See *PLANTS*.

ALIMENTARY, *ALIMENTAL*, something that relates to aliment, or food.

ALIMENTARY duct, or *canal*, is a denomination that has been given to the whole of those passages which the food permeates from the mouth to the anus. It is divided into the gula, which is subdivided into the pharynx and œsophagus, the stomach, and the intestines. For an account of its structure and functions, the reader is referred to these divisions.

This duct is said to be the true characteristic of an animal, or *proprium quarto modo*; there being no animal without it, and whatever has it, being properly enough ranged under

the class of animals. Plants receive their nourishment by the numerous fibres of their roots, but have no common receptacle for digesting the food received, or for carrying off the excrements. But in all, even the lowest degree of animal life, we may observe a stomach and intestines, even where we cannot perceive the least formation of any organs of the senses, unless that common one of feeling, as in oysters. Phil. Trans. N^o 269. p. 776, seq.

Dr. Wallis deduces an argument from the structure of the alimentary tube in man, to prove that he is not naturally carnivorous. To the cogency of which, Dr. Tyson makes some objections. Phil. Trans. N^o 269. p. 777.

ALIMENTARY duct, is sometimes also understood of the thoracic duct.

ALIMENTARY law, *lex alimentaria*, was an old law among the Romans, whereby children were obliged to find sustenance for their parents.

ALIMENTARY boys, *Alimentarii pueri*, &c. were certain children maintained and educated by the munificence of the emperors, in a sort of public places, not unlike our hospitals.

Trajan was the first that brought up any of these alimentary boys. He was imitated by Adrian. Antoninus Pius did the same for a number of maids, at the solicitation of Faustina; and hence, in some medals of that empress, we read *PELLAE FAVSTINIANAE*.—Alexander Severus did the like, at the request of Mammæa: and the maids thus educated are called *Mammæane*.

ALIMENTATION is used by some naturalists, for what we more ordinarily call *NUTRITION*.

ALIMENTUS, *CINCIVS*, in *Biography*, a Roman historian, was a prætor in the consulship of Claudius Marcellus and Marcus Valerius, in the year 152, B. C. Livy represents him as a diligent collector of historical facts; and as an eminent writer, giving him the appellation of “*maximus auctor*.” Livy, lib. vii. lib. xxx. He wrote the history of Hannibal, in whose hands he was a prisoner; and the history of Gorgias of Leontium, probably from materials which he collected during his prætorship in Sicily. He was also the author of a treatise on the military art, mentioned by Aulus Gellius, (lib. xxvi. c. 4.) and Arnobius, (lib. iii.) mentions him in his account of the foreign divinities, called *Novensiles*.

ALIMNE, in *Ancient Geography*, a town of Asia, in Phrygia, supposed to be the same with that called also *Alinum*.

ALIMONY, *ALIMONIA*, properly signifies nourishment, or maintenance: but in a modern sense, in *law*, it denotes that portion, or allowance, which a married woman sues for, upon any occasional separation from her husband, wherein she is not charged with elopement or adultery.

This was anciently called *rationabile esoverium*, *reasonable maintenance*, and was recoverable only in the spiritual court; but now it is recoverable also in chancery.

Where a woman is divorced *a mensa & thoro*, she may sue her husband in her own name for alimony, or maintenance, out of her husband's estate, during the separation, either in the chancery, or in the spiritual court; and it will be allowed, except in the cases of elopement and adultery, as aforesaid. 1 Inst. 235.

ALIMOS, in *Botany*, the name given by some of the Greek writers to the common liquorice. It has been thus called, from its quality of palliating the appetite, and making it insensible either of hunger or thirst.

ALINA, in *Ancient Geography*, one of the three small islands

islands Cryæon, situate on the north-west part of the gulf of Glaucus, towards lat. $36^{\circ} 35'$.

ALINA, or ATINA, a district of Italy, in that part of Magna Græcia, called Lucania, north of Cæsariana, and west of Abellinum Mariscum.

ALINDA, a town placed by Ptolemy in Caria, between Stratouice and Badessus. This is erroneously called *Alina* by Steph. Byz.

ALINDESIS, in the *Ancient Gymnastic Medicine*, a kind of exercise, wherein persons being besmeared with oil, rolled themselves naked in the dust.

The word is sometimes also written $\alpha\lambda\iota\nu\delta\omicron\varsigma$.

ALINDOCA, in *Ancient Geography*, a town placed by Steph. Byz. in Macedonia.

ALINGO, *Alingonis portus*, *Lingon*, is assigned by M. d'Anville to the Vassati, and placed between Sirio to the north-west and Uffubium to the south-east. Sidonius Apollinaris speaks of it as being situated on the Garumna.

ALINGSAHS, in *Geography*, a town of Sweden, in West Gothland, situate on the river Sewelanga. It was built by the inhabitants of Ny-Lodese, after the destruction of their town by the enemy. A silk and woollen manufacture is established in this town; tobacco is also spun, and tobacco pipes are made here. This is the 811st voting town in the Diet.

ALINZA, a town placed by Ptolemy in Media, and called also *Orofa*. Another town of the same name was situated more to the north. *Alinza* was also a town of Susiana.

ALIONE, or ALONE, a name given in the Notitia to LANCASTER.

ALIOS baton, in *Ichthyology*, a name given by Aristotle to the strange fish called by Artedi, $\lambda\omicron\rho\eta\iota\upsilon\varsigma$, and by others *RANA piscatrix*.

ALIPÆNOS, in the *Ancient Physic*, an appellation given to dry topical medicines, or such as have no fat mixed with them.

The word is sometimes also written *alipantos*. It is purely Greek, $\alpha\lambda\iota\pi\alpha\omega\varsigma$, compounded of the primitive α , and $\lambda\iota\pi\alpha\omega\iota\varsigma$, *pinguescere*, to fatten. In which sense *alipæna* stands opposed to *lipara*, or plasters, which have fat in their composition; called also by Celsus, *lenia*.

Galen gives the name $\alpha\lambda\iota\pi\eta$ to the remedies applied to fresh wounds, to check the inflammation, and hasten their healing.

ALIPHERA, in *Ancient Geography*, a town of Arcadia, seated in the western part of it, and south of Heræa, by which the river Alpheus passed, on the top of a high and steep hill, which was defended by a strong fortress. Some say that it took its name from Alipherus, the son of Lycaon. It was abandoned by the greatest number of its inhabitants, when Megalopolis was founded; and at the time of the Achæan league it was joined to Triphylia. This city was reduced by Philip of Macedon, when he brought the whole country of the Triphalians under subjection. We learn from Polybius, (lib. ii. p. 343.) that there was to be seen in this fortress a brazen statue of Minerva, famous for its size and workmanship. But he adds, that the inhabitants could give no satisfactory account why it was placed there, and at whose charge. It was the work of Hecabodorus and Softratus, and generally esteemed the most beautiful and finished piece which they ever executed. Minerva and Hercules had both temples in this place; and the tradition of the country reports, that Minerva was born and educated here.

ALIPILARIUS, or ALIPILUS, in *Antiquity*, an officer belonging to the baths, who, by means of wax, and waxen plasters, took off the hairs from the *alæ*, or arm pits. The

women who performed this office were called *picatrices*, and *pariltricæ*.

The *alipilus* answered to what the Greeks called $\delta\mu\pi\tau\alpha\iota\omega\varsigma$.

The ancient Romans made it a point of cleanliness to keep the arm-pits clear and smooth. In after-times, they went farther, and took off the hair from their arms, legs, and other parts, with pitch and rosin, and by the *vossella*, an instrument for that purpose.

ALIPOW MONTIS CETI, in the *Materia Medica*, a kind of white *turbith*, which is a strong purgative. It is to be found in several places of Languedoc, particularly near Cete, whence the modern botanists have given it its name. It is sometimes used instead of *senæ*; which, however, may be dangerous, since it is a much stronger purgative.

ALIPTA, from $\alpha\lambda\iota\pi\tau\alpha$, *I anoint*, in the *Ancient Gymnastics*, an officer appointed to anoint the *athletæ*.

In which sense the *aliptæ* amount to the same with what are otherwise called *unctores*, and *jalraliptæ*.

ALIPTA is sometimes also used, in a less proper sense, for the director, or superintendant of the exercises of the *athletæ*.

In which sense *alipta* is synonymous with *gymnastes*, and *pedotriba*.

ALIPTERIUM, $\alpha\lambda\iota\pi\tau\eta\rho\iota\omicron\upsilon\mu$, in *Antiquity*, a place in the ancient *palestræ*, where the *athletæ* were anointed before their exercises.

The *alipterium*, or *alipterion*, was otherwise called $\epsilon\lambda\epsilon\theta\tau\eta\sigma\iota\omicron\upsilon\mu$, and *unctuarium*; sometimes also *ceroma*.

ALIPTES, the name of a fountain near Ephesus.

ALIQVANT part, in *Arithmetic*, is that which will not measure or divide any number exactly. Or an aliquant part is that which being taken any number of times, is always greater or less than the whole.

Thus five is an aliquant part of 12; for being taken twice, it falls short; and when taken three times, it exceeds 12.

The aliquant parts of a pound, or 20s. are,

3s. an aliquant part composed of a tenth and 20th.

6s. of a 5th and a 10th.

7s. of a 4th and a tenth.

8s. of two 5ths.

9s. of a 4th and a 5th.

11s. of a half and a 20th.

12s. of a half and a 10th.

13s. of a half, a 10th, and a 20th.

14s. of a half and a 5th.

15s. of a half and a 4th.

16s. of a half, a fifth, and a 10th.

17s. of a half, a 4th, and a 10th.

18s. of a half and two 5ths.

19s. of a half, a 4th, and 5th. See MULTIPLICATION.

ALIQVOT part, is such part of any number or quantity, as will exactly measure it, without any remainder.— Or, it is a part, which being taken a certain number of times, becomes equal to the whole, or integer.

The word is formed of *aliquoties*, any number of times. Thus 3 is an aliquot part of 12; because, being taken four times, it will just measure it.

All the aliquot parts of any number may be thus found. Divide the given number by its least divisor, and divide the quotient also by its least divisor, and so on always dividing the least quotient by its last divisor, till the quotient 1 is obtained; and all the divisors, thus taken, are the prime aliquot parts of the given number. Then multiply continually together these prime divisors, *viz.* every two, every three, every four of them, &c.; and the products will be the other or compound aliquot parts of the given number. E.G. Let the aliquot parts of 60 be required; first divide it by 2,

and

and the quotient is 30; then 30 divided by 2 gives the quotient 15; and 15 divided by 3 gives 5, and 5 divided by 5 gives 1; and therefore, all the prime divisors or aliquot parts are 1, 2, 3, 5. Then the compound ones obtained by multiplying every two, are 2, 4, 6, 10, 15; and by multiplying every three, 6, 10, 12, 15, 20, 30; and all the aliquot parts of 60 are 1, 2, 3, 4, 5, 6, 10, 12, 15, 20, 30.

The aliquot parts of 208 are,

108. half of 208.	28. 6d. an eighth.
52. a fourth.	16. 8d. a twelfth.
41. a fifth.	15. 4d. a fifteenth.
26. a tenth.	15. 3d. a sixteenth.
17. a twentieth.	10d. a twenty-fourth.
68. 8d. a third.	5d. a forty-eighth.
35. 4d. a sixth.	

To multiply by the help of aliquot parts, see MULTIPLICATION.

We must not confound an aliquot part with that of a *commensurable*; for every aliquot part is a *commensurable*, but not *vice versa*. Thus four is *commensurable* with six, but is not an aliquot part of it. Phil. Trans. N^o 41.

ALISÆI, in *Ancient Geography*, a name given by Josephus to the inhabitants of Eolis.

ALISANDERS, in *Botany*. See SMYRNIUM.

ALISANUS. See RHENIA.

ALISARNA, or HALISARNA, in *Ancient Geography*, a city of the Troas, in Asia Minor.

ALISCA, a town of Lower Pannonia. In the Notitia Imp. it is called *Alesca*, and placed in Valeria, near the Danube.

ALISDACA, a town of Media, according to Ptolemy.

ALISE, or ALISIA STE. REINE, in *Geography*, a town of France, in the department of the Cote d'Or, eight miles north-east of Semur-en-Auxois. This town was the ancient ALESIA. The celebrity of this place in the time of the Romans is discernible in the vestiges of the Roman ways, which lead to and from it. After the fall of the Western empire, Alise was the chief place of an extended country, called *Pagus-Alesiensis* or *Alsienfis*, whence was formed the Fr. *Aulfois* and *Auxois*. The ravages of the Normans occasioned the removal of the relics of Ste. Reine, the martyress, to Flavigni in the year 864. After the ancient Alise was ruined, the name continued to be appropriated to some dwellings that remained on the declivity of the adjoining mountain. The site of the ancient city is now cultivated ground; "Nunc feget ubi Troja fuit." The commerce of this place consisted of chaplets, shrines, flowers, &c. for the accommodation of the pilgrims, who resorted hither from all parts of France, to celebrate the feast of Ste. Reine, which was kept twice a year. The fountain of Ste. Reine is a reservoir of clear and fresh water, about two feet square; and its water was formerly held in high estimation. But the place has long since lost its reputation.

ALISINCUM, ANIZI, a town of Gaul, belonging to the Edui, between Angustodunum to the east, and Decetia to the south-west.

ALISIO, in *Geography*, a town of Corsica, in the district of Capo Corfo.

ALISIUM, a town of Elis, situate on a high mountain, between Elis and Olympia; the *Alesion* of Steph. Byz. It had a river of the same name, according to Strabo.

ALISIUM or ALESIIUS, a mountain of Arcadia, separating it from the Argolide.

ALISMA, from *ἀλωπεξ*, anxiety, or rather from *αλς*, the sea, *Water Plantain*, in *Botany*, a genus of the

hexandria polygynia class and order, of the natural order of *tripetaloides* and *junci* of Jussieu: its characters are, that the *perianthium* is three-leaved, leaflets ovate, concave and permanent; the *corolla* three-petalled, petals roundish, large, flat and very spreading; the *stamina* have awl-shaped filaments, shorter than the corolla, anthers roundish; the *pisillum* has germs more than five, styles simple, stigmas obtuse, the capsules of the *pericarpium* are compressed, (many and aggregate, Smith,) and the seeds solitary and small.

There are nine species, viz. 1. *A. plantago*, great or broad water plantain, or greater thrumwort, with leaves ovate, acute, capsules obtusely triangular. This species is easily known by its smooth entire leaves on very long petioles; and by its purplish flowers growing in a kind of umbel, at the end of a long scape. The flowers are fully expanded about four in the afternoon. It grows in watery places, on the banks of pools, lakes and rivers, is perennial, and flowers in July. This plant possesses the poisonous quality of the ranunculi, to which order it is naturally allied. Dr. Smith mentions two varieties, viz. *A. lanceolata* of Withering, or narrow water plantain, and *plantago aquatica leptomacrophyllos* of Dill. in Ray Synop., or greater water plantain. 2. *A. flavum*, damafonium flavum of Miller, with leaves ovate, acute, peduncles umbellate, capsules globose. This grows in Jamaica, Barbadoes, and several other places in the warm parts of America, in stagnant waters and swampy places; but being of no great beauty, and not easily preserved in England, it is not worth cultivating. 3. *A. damafonium*, damafonium A. of Miller, star-headed water plantain, with leaves cordate-oblong, flowers six-pointalied, capsules awl-shaped, the flowers are white; styles six, and capsules six, divaricated, with a stellated appearance, of a hard texture, and so closely united at the base, as to appear like a single fruit. Stokes. This is a native of France, Siberia and England; is found, more rarely than the former, in ditches and stagnant waters, about London in several places, on Hounslow Heath, Winkfield plain, near Windsor, &c.; is perennial, and flowers in June and July. 4. *A. cordifolium*, with leaves heart-shaped, obtuse, flowers twelve-flamed, capsules hook-pointed. This species connects the genus *alisma* with that of *sagittaria*; and is found in North and South America. 5. *A. natans*, creeping or floating water plantain, with leaves ovate or elliptic, obtuse, peduncles solitary, and capsules striated. The leaves which swim on the surface are ovate, and those under water linear. It is found in ditches, in France, Sweden, Germany, and Siberia: in the lakes of Bala and Lanberis, in North Wales; is perennial, and flowers in July and August. 6. *A. ranunculoides*, small water plantain, with leaves linear-lanceolate, capsules pentagonous, incurved, globose-aggregate. The corolla is bluish-white, and opens about noon. It is a native of Sweden, Holland, France, Germany, Italy, and England, in marshes and moors; is perennial, and flowers in August. 7. *A. subulatum*, with leaves awl-shaped; a Virginian plant, the dwarf *sagitta* of Clayton, with a very tender white corolla, and subulate leaves. 8. *A. parnassifolium*, with leaves heart-shaped, acute, petioles jointed; a native of Italy, in the marshes under the Apennines. 9. *A. repens*, with stems creeping, leaves lanceolate, petioled, acute, a native of Spain, on the sandy banks of the river Manzanares; flowering in August; and seeming to be the same, though much smaller, with the *alisma*, which Abbè Poirer found on the Northern coast of Africa, described by Lamarck. Willdenow adds a 10th species, *A. sagittifolia*, with leaves sagittated, and capsule obovate, obtuse; found in Guinea. Martyn. Miller. Smith's Flor. Brit. vol. i. p. 400.

ALISMA. See ARNICA, PRIMULA and SENECIO.

ALISO, ALME, in *Ancient Geography*, a small river of Germany, mentioned by Dion Cassius. This was also the name of a castle built by Drusus in Germany for the confinement of the Sicambri.

ALISONTIA, ALSETZ, a river of Germany, which passing by Luxembourg, discharges itself into the Moselle.

ALISTA, a town placed by Ptolemy, in the southern part of the island of Corsica.

ALISTRES, a sort of Epirus, rebuilt by Justinian.

ALISUS, a town placed by Ptolemy in the northern part of Germany.

ALITAMBI, a people of Africa, placed by Ptolemy between Libya and mount Thala.

ALITES, formed from *ala*, a wing, in *Antiquity*, a name given to those birds which afforded auguries by their wings and flight. In this sense alites stand opposed to OSCINES, or birds, which gave auguries by their mouths, by singing, or croaking, &c. To the class of alites belong the buzzard, osprey, &c. To that of OSCINES, the crane, raven, owl, &c.

ALITROPE, in *Ancient Geography*, a town placed by Scylax in a part of Greece, assigned by him to the Achæans, which was the district of Phthiotis, usually comprised in Thessaly.

ALJUBARROTA, in *Geography*. See ALGIBARROTA.

ALJUCEN, a small river of Spain, which runs into the Guadiana, not far from Montachet in Leon.

ALJUSTREL, a town of Portugal, in Alentejo, 16 miles W. S. W. of Beja, containing one parish, and about 1500 inhabitants.

ALIXEN, a town of France, in the department of the Ardeche, two leagues E. N. E. of Valence.

ALKADARII, formed from the Arabic, *alkadar*, which signifies *decree*, a sect among the Mahometans, who deny any eternal, fixed, divine decrees; and are assertors of *free will*. The *Alkadarii* are a branch of MOATAZALITES. They stand opposite to the ALGIABARII.

ALKÆNDA, in *Botany*, see MYRTUS.

ALKAHEST, or ALCAHEST, in *Chemistry*. This word, so famous in the last ages of alchemy, occurs, for the first time in the treatise of Paracelsus, *De Viribus Membrorum*, where it is mentioned as a sovereign remedy against dropsy and all diseases of the liver. Notwithstanding that its particular use is here expressly stated, without any hint of its other qualities, or the method of preparation; notwithstanding also that the term is not to be met with in any other of his writings, yet Van Helmont, giving his master credit for the knowledge of more mysteries than ever he himself has pretended to; has raised the alkahest from a mere medicine in the disorders of a particular organ to the lofty character of an universal solvent, and the most active of all the alchemical menstrua.

The origin of the word is variously derived from *saltz-geist*, spirit of salt; *al-geist*, all spirit, *i. e.* a perfectly pure spirit; or *alk-ess*, *i. e.* alkali est, according to a custom common with Paracelsus and other alchemists, of concealing the name of a substance by abbreviation or transposition, of which a similar example occurs in the same author of the word aroph, for aroma-philosophorum.

The properties of the alkahest, according to Van Helmont, are the following. It is a fluid of perfect simplicity and purity, is never found native, but always prepared by art; is capable of dissolving all substances into a liquor, which rises wholly in distillation, leaving no feces behind; at the same time that the alkahest itself spontaneously separates from the body on which it has produced such a remarkable change. The substances thus acted upon retain, however,

their essential properties, but by further digestion with the alkahest, are all resolved to the same indolent, scentless, insipid elementary water. A menstruum of such surprising powers was immediately supposed to be of the utmost consequence in the higher alchemical processes; and the solemn asseveration of Helmont, that he was really in possession of such an agent, gained early credit even among many from whom a sober scepticism of such mysterious and unheard of qualities might have been expected. As Helmont never divulged the secret method of preparing the alkahest, most of the succeeding alchemists of any eminence had each their particular theory on the subject; Becker imagined it to be contained in sea salt; and Glauber, in his very ingenious tract, "De Mercurio Philosophorum," endeavours to prove it to be nitre; and indeed by taking the liberty, as this author does, of applying the nitre in solution or fusion, or separated into its acid and alkaline elements, there are few substances that are not capable of being thus brought into a fluid state.

In modern chemistry nothing is acknowledged as true till it has stood the test of repeated and accurate experiment; and we now hear no more of the alkahest than of the elixir of metals, and the universal medicine. Boerhaave's *Chemistry*. Glauber's Opera, vol. i.

ALKAHEST is also used in a more extensive sense, so as to comprehend all fixed salts volatilized, and reduced into a quintessence.

ALKAHESTIC is used by some to denote the quality of bodies which are powerfully solvent.

In which sense, alkahestic amounts to much the same with the menstruous; except that the former imports a greater degree of the solutive power than the latter. See MENSTRUUM.

ALKAISAR, in *Geography*, a fortress of Asia, in the Arabian Irak, 106 miles west of Bagdad.

ALKALESCENT, denotes a substance slightly *alkaline*, or in which an alkali is beginning to be formed and to predominate. As the volatile alkali, or ammonia, is the only one which is usually observed to be produced by spontaneous change, the term *alkalescent* generally refers to the generation of this alkali, in certain vegetable and animal substances by the process of *putrefaction* or any similar decomposition. Some species of vegetables, especially the tetradynamious plants, have received the name of alkalescent, because, when placed in circumstances favourable to fermentation, they have a peculiar tendency to form ammonia, which may be separated in a very sensible quantity, by the process of distillation.

ALKALI is the generic term for an order of salts of the highest importance, and the most familiar use in chemistry.

Alkali is a word of Arabian origin, and it was employed by the Arabian chemists and physicians, to express the salt which was procured from the ashes left after the combustion of several vegetables, particularly the salt *kali* of the desert, and several plants growing on the sea shore. The same salt is also found native in immense quantities, mixed with sea salt, in the waters and on the shores of several lakes of Lower Egypt, and has been known, from time immemorial, by the name of *natron*, or the *nitre* of the ancients. The Greeks and Romans were equally familiar with the alkaline salt contained in vegetable ashes, which was termed *lixiviarium* (*lixivius cinis*, Plin.), whence the name of *alkaline ley*, *lixivium*, or *lixiviarium salt*, which is still retained. The use of the word alkali was at first confined to the salt which was yielded by the *fixed* or incombustible ashes of vegetables; but the *volatile* salt, which rises in distillation of vegetable, and especially of animal matter, having been found to possess similar chemical properties with the fixed lixiviarium salt, in the most es-

sential particulars, the respective applications of *fixed* and *volatile alkali* have long been adopted by chemists. For the account of the process of procuring these salts as an article of commerce, for their natural history, and other particulars, we shall refer the reader to the words POTASH, SODA, and AMMONIA.

The properties common to all alkalis are the following: they have a highly acrid taste, which acts with so much energy upon the tongue as to produce the sensation of burning, and unless they are much diluted, they very soon corrode the thin skin which covers it, and produce a small eschar or dead part, which, for a time, leaves a slight sore on that sensible organ. They have an unctuous feel to the finger, not from any oily nature in the alkalis, but because they directly dissolve the surface of the skin, and produce a kind of soap. They effect a remarkable change on several vegetable colours. The red of roses, and the blue of violets, are turned by them to a dull green; the red of archill or litmus, to a blue; the yellow of turmeric, the light brown of jalap root, liquorice root, and of many other roots and woods, are all rendered much deeper in colour, approaching to a brick-red. They unite with sulphur, forming compounds which have the property of absorbing the oxygen from atmospheric air, and, when moistened, of giving out a peculiar fetid gas. These compounds have been denominated *alkaline hepars*, or *livers*, and in the modern nomenclature, *sulphurets*. They have a very powerful action on almost all vegetable and animal matters, producing speedy disorganization, and dissolving them into a thick pulp. With oils they form the well-known compound, *soap*. They are largely soluble in water, giving out heat on union with this liquid. They unite with every acid, and produce *neutral salts* of various degrees of solubility; in which, when the contents are mutually saturated, the distinguishing properties of both acid and alkali are neutralized, and no longer to be perceived. Owing to the very strong affinity which they bear for acids, they decompose the acid solutions of all metals and most earths. These are the most characteristic properties common to *all* alkalis; but there are others which are confined to one or other of the two species. These we shall enumerate, referring the reader for more particular information, to the individual articles.

The VOLATILE ALKALI (*Ammonia*) is distinguished, (as its name implies) by its volatility. The purest form in which it is known to us is that of a gas, which is permanent at any degree of cold that has ever been applied to it, and unites readily with water in large quantity, from which, however, it may be again expelled by a heat much below boiling. It has never been procured in a solid form, unless combined with some other substance; nor as a liquid, except by its union with water. It differs remarkably from the fixed alkalis in having a very pungent smell, which highly stimulates the nostrils, and excites coughing and tears. Owing to the ease with which it assumes a gaseous form, it is incapable of uniting with many substances which the fixed alkalis will dissolve, when assisted by fusion in a strong heat. The volatile alkali is weaker in all its affinities than the fixed. It is also the only one which is decidedly proved to be a compound substance; the nature of its constituent parts (which are hydrogen and azote) having been ascertained by numerous experiments both of synthesis and analysis. See AMMONIA.

The FIXED ALKALIES, (*Alkali fuerbestandiges, Laugensalz*, Germ-*Alkali* fillo Ital.) are the proper *lixiviary* alkalis, or those that are procured by lixiviation of the ashes of burnt vegetables. They may be obtained in a very pure solid form, either crystallized, or as a simple concrete. Besides the properties which have been mentioned as common to all

alkalis, these possess considerable fixity in fire, and at a red heat they run into thin fusion. A higher heat, however, volatilizes them, and they fly off in sensible vapour. The fixed alkalis, when in fusion, will readily dissolve siliceous earth into the perfectly homogeneous transparent compound, GLASS. They also will dissolve by heat all the metallic oxys, and thereby receive various tints. They assist in the fusion of all earthy and metallic admixtures, and their degree of fixity in the fire enables them to combine more intimately than the volatile alkali, with sulphur, phosphorus and charcoal. When pure and solid, they are remarkably deliquescent, absorbing water from every surrounding medium; and hence they have been used by chemists to render the air of any vessel in which they are confined, perfectly dry. The fixed alkalis are two in number, POTASH and SODA, the former being procured from the ashes of all vegetables except marine plants, and a few that grow near the sea shore, which yield the latter alkali. The former is also termed the *vegetable* alkali, and the latter, (owing to its being sometimes found native in the earth), is called the *mineral* alkali. The general properties of these two alkalis were long known, and they were long employed in various arts, before the circumstances by which they are distinguished were well ascertained, and their separate existence established. The close resemblance which they bear to each other when pure, and the similarity in all their most remarkable chemical properties, prevented a proper distinction between them; and it was chiefly by the researches of Pott, Duhamel and Margraaff, that the nature of the two alkalis was fully explained. The two neutral salts with which the older chemists were the most familiar, nitre and sea-salt, have for their bases, the former the vegetable, and the latter the mineral alkali; and it was principally by enquiries into the properties and decomposition of these neutral salts that the distinct nature of their alkaline bases was decided.

Potash and soda differ from each other in the strength of their affinity with acids, which is greater in the former; in some slight variation in their action on oils and animal fats; but chiefly in the neutral salts which they form with the acids, which in all cases differ in form of crystallization, in solubility, often in taste, and in several other particulars.

The intimate nature of the fixed alkalis is still unknown to us. From the very strong analogy with the volatile alkali, the component parts of which are fully established, it must be considered as highly probable that the fixed alkalis are compounds, though their decomposition has not yet been effected by any experiments which can be allowed to be unexceptionable. Fixed alkalis have been supposed to be generated by the process of combustion of vegetables; since no plants, even those whose ashes yield the most of this salt, contain before combustion any sensible quantity of uncombined alkali. The accurate analyses of several of the modern chemists have however detected, in the native juices of plants, several neutral salts, whose alkaline bases are united to an acid which is easily destructible by fire. But for this, and other speculations on the nature of the fixed alkalis, we shall refer the reader to the article POTASH.

ALKALI (*Causlic* or *Pure*). The alkaline salt procured from vegetable ashes, besides being mixed with other salts, and with earth, is always saturated more or less completely with fixed air, or *carbonic acid*; so that the fixed alkali which was the subject of the experiments of all the chemists, till within a few years, was a salt compounded of carbonic acid and the alkaline basis. The beautiful experiments of Dr. Black fully illustrated this point, and shewed, that the reason of the greatly increased causticity of alkalis, when mixed with quick-lime, was the loss of the carbonic acid, which had passed from the alkali to the earth. *Causlic* alkalis, therefore,

fore, are alkalies deprived of carbonic acid by quick-lime or any other method; and this is the only state in which, properly speaking, alkalies can be considered as *pure*; though even when they contain much of this volatile acid, the peculiar qualities of the alkaline part predominate so considerably as to enable them to exhibit (though in a weaker degree) all the chemical properties by which alkalies are characterized.

ALKALI (*Effervescent or Mild*), is opposed to the state of causticity, and expresses that degree of saturation with carbonic acid, which, as has just been mentioned, diminishes, but does not suppress, the characteristic properties of the alkali. Owing to the alkali obtained from vegetable ashes being always left after combustion in union with carbonic acid, *effervescence with acids* was considered by the older chemists as an essential character of alkalies in general, who thus ascribed to a property inherent in this genus of salts, an appearance which is now known to depend upon the expulsion of the gaseous acid. The terms *caustic or pure*, and *effervescent or mild*, are applied to the volatile as well as to the fixed alkalies.

ALKALI (*Extemporaneous*), is a mild vegetable alkali, prepared by deflagrating nitre with tartar. See CARBONAT of POTASH.

ALKALI (*Fluor*), is a solution of pure AMMONIA in water.

ALKALI (*Phlogistic*), is prepared by calcining carbonated potash with bullocks' blood or other animal matter, in which process it unites with the PRUSSIC acid, formed during the calcination.

ALKALI (*of Tartar*), or *Salt of Tartar*, is properly a mild vegetable fixed alkali, prepared by the combustion of tartar, which yields it in great purity. The name is used more extensively for any pure carbonated potash, and it is the term by which this salt is more generally known in common language and in medicine.

ALKALINE EARTHS. It is by no means easy to draw the line accurately between alkalies and earths. The original idea of an EARTH, entertained by the ancient chemists, was that of a substance of considerable density, insoluble in water, without taste, smell, or any perceptible action on the organs of sense, entirely unfusible, and fixed in the most intense fire; and, in short, with properties as opposite as possible to those of a SALT. This opinion principally attached to earth, considered as one of the four elements of which the material world was supposed to be constituted. The progress of chemical investigation having, however, discovered several species of earths, which could not by any means be proved to be compounds, in which the simple or universal earth was so disguised as to lose some of its essential characters, it became necessary to alter and modify the original definition of an earth, and to allow to it more of a saline nature.

Some of the modern chemists, therefore, have adopted the term *salifiable*, and others *alkaline* earths, in order to allow of more accuracy in systematical arrangement. By *alkaline* earth has been meant an earth which agrees with alkali in the property of solubility in water to a certain extent, and thereby rendering it rapid, of changing to green certain blue and red vegetable colours; of absorbing carbonic acid with eagerness, and of possessing, when pure, those *caustic or acrid* qualities that so much distinguish the alkalies. *Magnesia, lime, barytes* and *strontian*, are the earths which may be termed alkaline, but the former is very imperfectly so, being scarcely more soluble in water than flint; and though its habitudes with carbonic acid are partly similar to those of the alkalies, it does not acquire any taste, or any degree of causticity, by the loss of this gaseous acid. Barytes and strontian, on the other hand, approach nearer to an alkaline

nature than lime, in being very largely soluble in water, and readily crystallizable from its solution in a determinate form. They have therefore been actually enumerated as alkalies by Foureroy, who reckons the following; *potash, soda, ammonia, barytes*, and *strontian*. The two latter even stand before the three ancient alkalies in their order of affinity with moist acids, but, till the intimate nature of the fixed alkalies be fully cleared up, it will perhaps be proper to restrict the term *alkali* to the three above-mentioned, and to retain in the class of *alkaline earths* magnesia, lime, barytes, and strontian, all of which, however they may be alkalies in many respects, differ from them in being unfusible *per se* in very intense fire, and being entirely incapable of being volatilized by the utmost heat that has ever been applied to them.

ALKALI, in *Botany*. See SALICORNIA.

ALKALINE, in a general sense, something that has the properties of an ALKALI.

In this sense we say, alkaline salts, alkaline spirits, alkaline substances, &c.

Alkaline salts, considered in their reference to the *Materia Medica*, are known to possess antiseptic powers. Experiments upon them, out of the body, sufficiently indicate and attest these powers; but Dr. Cullen observes, that it is at the same time equally well known, that they are constantly imbued with such an acrimony, that they cannot by themselves be introduced into the body without acting more by their stimulant than by their antiseptic powers. The volatile alkali may sometimes be an useful remedy in putrid fevers; but it cannot, as some have imagined, be given more freely on account of its antiseptic powers, as it can never be given copiously enough to have any effect by these qualities. The volatile alkaline salts shew their stimulant power in every dose, wherever the energy of the brain is weakened, and consequently the action of the heart is languid, or requires to be accelerated. In such cases this stimulus is among the safest, as it is always transitory; and when their acrimony can be covered, so as to pass the mouth and fauces without irritation there, they may be given in large doses from 10 to 20 grains. These are prepared in two different ways; one of which is from sal ammoniac, which gives the ammonia of the London Dispensatory, or the sal ammoniacus volatilis, and spiritus salis ammoniaci of the Edinburgh. These are the purest forms of the volatile alkali, the most free from any adhering animal substances; but whilst the process of preparing a volatile alkali from the bones or other solid parts of animals continues, there will come into the shops a salt and spirit that can hardly ever be so pure, from some empyreumatic animal substance adhering to it; and such an adherence may probably give some peculiar quality to the salt and spirit, and render it more antispasmodic. It cannot be very considerable in any doses of the salt or spirits given to adults, but it may produce more sensible effect in the spasmodic affections of infants. The liquid volatile alkali is commonly employed in its mild state; but by a distillation of the sal ammoniac with quick-lime, the alkali may be obtained in its caustic state. In this state it may be readily joined with spirit of wine, and gives the spiritus salis ammoniaci of the Edinburgh Dispensatory, or the spiritus salis ammoniaci vinosus of that of London. The combination affords an excellent menstruum for dissolving the several fetid substances employed as antispasmodics, and renders them more suddenly diffusible, and perhaps gives them a greater effect in all spasmodic affections. The caustic volatile alkali is seldom administered alone; but if its acrimony be covered while it passes the mouth and fauces, it may be very safely employed. Its chief use is external, and when smelled at the nose, it gives a more powerful stimulus than the mild alkali can do. Its acrimony is so considerable, that when applied to the skin, it readily

readily irritates, and even inflames it, and may be so managed, as to prove an useful stimulant and rubefacient in many cases. But this requires its being blended with a mild, expressed oil, so as to prevent its inflaming too much. See *Volatile Oil*. The fixed alkaline salts have been commonly administered as diuretics. Dr. Cullen has chiefly employed the vegetable fixed alkali, and has sometimes obtained its effects in a remarkable degree; but he has been often disappointed, which he ascribes to the neutralization of the alkali in the stomach, and in that state they could have no other effect than other neutrals, which is commonly inconsiderable, either as laxatives or diuretics. Alkalines do, however, occasionally manifest their diuretic power; and upon the supposition of their neutral state in the stomach, their considerable operation as diuretics cannot be easily accounted for. Of this fact Dr. Cullen offers two explanations. One is, that the quantity of alkali thrown into the stomach may be more than the acid can there neutralize, and therefore some portion of it may reach the kidneys in its alkaline state, and prove a more powerful stimulant than any neutral salt would be; and on this ground a large quantity of alkali is always necessary to produce diuretic effects. Another explanation of the fact is as follows. As the acid of the stomach may be presumed to be of the nature of the fermented acid of vegetables, so an alkali joined with it must form a regenerated tartar, a sal diureticus, or kali acetatum; and if this be less purgative, and more diuretic than other neutrals, while it is also conveyed to the blood-vessels in larger quantity, we can understand why, from these circumstances, the fixed alkali may often appear diuretic. With respect to its operation as a diuretic, another conjecture may be offered. When it is given with bitters, after the manner of Sir John Pringle, it commonly proves diuretic; and Dr. Cullen imagined, that as the bitters are absorbents of acid, they might absorb so much of that present in the stomach, as to prevent its being so fully applied to the alkali. As alkalines may be often prevented, by purging, from reaching the kidneys, so their diuretic effect may be often more certainly secured by giving an opiate at the same time; and for the utility of this practice, see Dr. Mead on the subject of Dropsy. Besides the laxative and diuretic powers of the fixed alkali, another is ascribed to it, which is that of dissolving the fluids, or the concretions which may happen to be formed in them, expressed by French writers under the denomination of *fondant*. Dr. Cullen does not allow it to possess this power to any great degree, or to produce the effects in this way that have been ascribed to it. Cullen's *Mat. Med.* vol. i. p. 568. Vol. ii. p. 382. 512.

ALKALINE acrimony, in *Medicine*, signifies a morbid quality in the blood, which is indicated by a desire of and thirst after four things, loss of appetite, and aversion to alkalescent food, nidorous eructations, putrid ulcers on the lips, tongue, and other parts in the mouth, sickness in the stomach, a frequent *diarrhœa*, a sense of heat, lassitude, and general uneasiness, a dissolution of the texture of the blood, the urine high-coloured and red. It produces a putrescency in the blood, &c. and is to be remedied by the same means as the scurvy and other putrid disorders.

ALKALIZATION, **ALKALIZATIO**, in *Chemistry*, the act of impregnating a liquor with an *alkaline* salt.

This is done either to make it a better dissolvent, for some particular purposes; or to load the phlegm, so as it may not rise in distillation, whereby the spirituous parts may go over more pure.

ALKALIZATION, is a name applied to operations, by which alkaline properties are communicated to bodies; or to those by which alkali is extracted from bodies which contain it, or in which it may be formed; e. g. *spirit of wine* is

said to be alkalized, when it has been digested upon alkali; a part of which it dissolves, and thence acquires alkaline properties. On the other hand, when a neutral salt is decomposed, in order to obtain its *alkaline* basis, this salt is to be alkalized. Vegetable substances when reduced to ashes, may also be said to be alkalized, because the ashes contain fixed alkali.

ALKAMARE, in *Geography*, a town of Persia, in the province of Irak-Agemi, 28 leagues east of Bagdad.

ALKANET, in *Botany*. See **ANCHUSA**.

ALKANSAS, or **ARKANSAS**, an Indian nation of Louisiana, on the west side of the Mississippi river, near the river of the same name, in N. lat. 34°. See **ARKANSAS river**.

ALKENNA. See **ALCANA** and **LAWSONIA**.

ALKEKENGI, in *Botany*. See **ATROPA** and **PHYSALIS**.

ALKEKENGI, a medicinal fruit or berry, produced by the **PHYSALIS Alkekengi**, popularly also called *winter-cherry*; formerly used and much commended as an abstergent, dissolvent, and diuretic.

These berries were well known to the ancients, and are characteristically described by Dioscorides, under the denomination *εργυρον αλκακαθρον*. They have an acidulous and not unpleasant taste, followed by a slight bitterness, which they are said to derive in a considerable degree from the investing calyx, if not gathered with great care. Although these berries are esteemed to be detergent and aperient, they have been chiefly recommended as a diuretic, operating without heat or irritation, in suppressions of urine, and for removing obstructions occasioned by gravel or mucus. With this intention the number of 6 to 12 cherries in substance, or an ounce of the expressed juice has been the usual dose: but there seems to be no danger from a much larger quantity; for, we are told, that in some parts of Germany the country people eat them by handfuls with much benefit; and in Spain and Switzerland they often supply the place of other eatable fruits. Ray informs us, that a gouty person prevented the returns of the disorder by taking eight of these cherries at each change of the moon; and instances are recorded of their good effects in dropical and calculous complaints, but at present they are wholly disregarded.

The cherries may be dried so as to be pulverable, or the depurated juice inspissated with a gentle heat to the consistence of a rob or extract, which Dioscorides commends, and in this state preserved for use. They have been sometimes mixed with opium. Dr. Cullen (*Mat. Med.* vol. ii. p. 553.) observes, that as it is allowed the berries take a taint from the leaves, it will always require some caution in employing any part of a plant which is taken from an order of a very poisonous kind. Lewis, *Mat. Med.* Woodville, *Med. Bot.* vol. iv. p. 34. Murray's *Mat. Med.* vol. i. p. 679.

ALKENDI, or **ALKINDI**, **JACOB EBN ISAAC**, in *Biography*, a celebrated Arabian philosopher and writer, was the son of the prefect of Cufa, under Muhamed Modi and Rashid, and flourished in the caliphate of Al-Mamon, or at the beginning of the ninth century. He acquired such eminence in literature and philosophy in the school of Bassora, that he was called, by way of distinction, "The Philosopher." Although he yielded implicit obedience, in common with his contemporaries, to the authority of Aristotle, and principally devoted himself to the office of interpreting and illustrating his writings, he directed his attention to other more important and useful studies. His name is mentioned among the mathematicians and astronomers of his age; and his medical writings, that are still extant, prove that he sustained a very honourable rank among the Arabian physicians. Herbelot represents Alkendi as a Jew, who was persecuted on account of his religion; but the account of his

his genealogy in the manuscript History of Philosophers, referred to by Dr. Russell, contradicts this statement; for his father's great grandfather is said to have been one of the companions of the prophet. This manuscript contains a catalogue of his writings; but the medical tract usually ascribed to him, and translated into Latin, under the title of "De Medicinarum Compositarum gradibus investigandis," is not included. Abulfaragius mentions an anecdote concerning him, which furnishes a very amiable trait of the moderation and liberality of his temper towards a malicious adversary. Whilst he was visiting the schools of Bagdad, to which the learned and studious usually resorted in his days, he gave great offence, by promoting the study of philosophy, and endeavouring to reconcile the doctrines of Islamism with the principles of reason, to one Albumasar, one of the interpreters of the Koran, who was alarmed lest increasing knowledge should undermine vulgar superstitions. Accordingly this zealot accused him of heresy and impiety. Alkendi, instead of resenting this conduct, and counteracting, by his interest with the caliph, the design which Albumasar had formed against his life, endeavoured to subdue his adversary by lessons and admonitions of philosophy. Fully apprized of the influence of wisdom as a means of meliorating the disposition, he engaged a preceptor to instruct his adversary in mathematics and philosophy. Albumasar was thus led to perceive the folly and baseness of his past conduct, and to offer himself as a pupil to the philosopher whom he had persecuted. Alkendi received him with condescension and kindness, and Albumasar became an ornament to his school. Brucker's Hist. Phil. by Enfield, vol. ii. p. 237. Russell's Aleppo, vol. ii. Appendix, p. 9.

ALKERMES, in *Medicine*, &c. a term borrowed from the Arabs, denoting a celebrated remedy, of the form and consistence of a confection, whereof the *kermes* are the basis.

The other ingredients are rose-water, sugar, ambergrise, musk, cinnamon, aloes wood, pearls, and leaf gold, &c. but the sweets are usually omitted.

The *confectio alkermes* was chiefly made at Montpellier, which place supplies most of Europe with it. It is said to be better made there than it can be elsewhere; the reason of which doubtless is, that the drug, which gives it the denomination, is no where found so plentifully as there. The manner of preparing the grain for making the confection is described in the Phil. Trans. N^o 20.

It has been much used as a cordial; especially, says Dr. Quincy, among female prescribers, and in complaisance to them; but that author decries its value in that intention, and thinks it ought only to be regarded as a sweetener.

Count Marfigli, in an inquiry into the composition of this medicine, shews, that many of the ingredients with which the ancients so plentifully loaded it, and which are still retained in it by the moderns, are not only useless, but hurtful; more particularly the *lapis lazuli*, by many mistakenly held cordial, on account of the appearance of veins of gold in it; whereas, in reality, it is only a marcasite of sulphur and vitriol, and contains a great quantity of acid, directly repugnant to the alkaline nature of the *KERMES*, and highly prejudicial in diseases where the blood tends to coagulation.

ALKES, in *Astronomy*, a star in the constellation CRATER.

ALKETH, in *Geography*, one of the Pelew islands, in the North Pacific Ocean.

ALKMAAR. See ALCMAAR.

ALKMAAR, HENRY OF, in *Biography*, a native of Alkmaar in Holland, and the reputed author of the celebrated fable of "Reynard the Fox;" a poem written in Low

Dutch in the 15th century, which, under the allegory of a Society of Animals, satirizes the different vices of mankind. This poem has been very popular, and translated into all the languages of Europe. A German edition of it, by Gottsched, is adorned with figures, and enriched with learned dissertations. It now appears that this poem was actually written by Nicholas Baumann, an East-Frislander, and that he assumed the name of Henry Von Alkmaar, in order to secure himself from the inquiries of the ducal court of Juliers. Baumann was a member of the council of duke Magnus of Juliers, who died in 1503; but being driven from court by means of a cabal, he composed this allegorical poem, for the purpose of satirizing his enemies, and painting the intrigues carried on there. Nouv. Dict. Hist.

ALKMAR, in *Geography*, a small island near that of Java, within sight of Batavia.

ALKOHOL. See ALCOHOL.

ALKORAN. See ALCORAN.

ALKUSSA, in *Ichthyology*, a name given by the Swedes to a fish, which they also called *lake*. It is a species of the *SILURUS*, and is distinguished by Arctedi by the name of the *silurus*, with only one *cirrus*, or beard, under the chin. The common *silurus*, which is the *glanus* of the ancients, has four *cirri*.

ALKY of lead, among *Alchemists*, denotes a sweet substance procured from lead.

ALL in the *Wind*, a sea-phrase, which expresses the state of a ship's sails when they are parallel to the direction of the wind, so as to shake or shiver.

ALL Hands hoay! the call by which the ship's company are summoned upon deck.

ALL Saints, in the *Calendar*, denotes a festival celebrated on the first of November, in commemoration of all the saints in general, which is otherwise called *All-hallows*.

The number of saints being so excessively multiplied, it was found too burthenome to dedicate a feast-day to each. In reality there were not days enough, scarce hours enough, in the year for this purpose. Hence an expedient was had recourse to, by commemorating such in combination who had no peculiar days of their own. Boniface IV. in the ninth century, introduced the feast of *All Saints* into Italy, which was soon after adopted into the other churches.

ALL Saints, in *Geography*, islands near Guadaloupe island, in the West Indies.

ALL Saints, a parish in the district of George-town, South Carolina, containing 2225 inhabitants, of whom 429 are whites, and 1795 slaves. It sends a member to each house of the state-legislature.

ALL Saints Bay, a spacious harbour near St. Salvador in Brazil, in South America, on the Atlantic Ocean. S. lat. 13° 5'. W. long. 38° 45'. This bay is 2½ leagues wide, is interspersed with a number of small but pleasant islands, and is of great benefit to the whole country. This is also the name of a Captainship in the middle division of Brazil, so called from the bay; bounded north by the Ria real, on the south by that of Los Ilheos, on the east by the ocean, and on the west by three unconquered nations of Indians. It is reckoned one of the richest and most fertile Captainships in Brazil, producing great quantities of cotton and sugar. It has several cities and towns, particularly St. Salvador, which is its capital.

ALL *Sfugita*, in *Italian Music*, is said of discords, which we call passing notes, that appear in the melody, but are unnoticed in the harmony. These discords, *Alla Sfugita*, require no preparation or resolution like notes in ligature.

ALL Souls, in the *Calendar*, denotes a feast-day held on
the

the second of November, in commemoration of all the faithful deceased.

The feast of *All Souls* was first introduced in the 11th century, by Odilon, abbot of Cluny, who enjoined it on his own order; but it was not long before it became adopted by the neighbouring churches. Others say that it was established A. D. 998. See Joxtin's *Ren. on Eccl. Hist.* vol. v. p. 11. p. 34.

ALLA, in *Geography*, a small town of Italy, in the valley of Trent, upon a small river which falls into the Adige. N. lat. $45^{\circ} 45'$. E. long. $13^{\circ} 42'$.

ALLA, or ALLF, a river of Poland, in Ducal Prussia, which runs into the Pregel, about five leagues above Königsberg.

ALLA, Ital. joined to, or rather following, a substantive, has the force of the word *like* in English; as *alla Française*, like the French, or in the French style or manner; *alla Veneziana*, in the Venetian manner. Thus, in music, *alla breve* implies a quick time, though the notes look slow, as when breves are played or sung like or as quick as semibreves, semibreves like minims, and minims like crotchets. This measure is seldom found in secular music composed by authors subsequent to Corelli, Geminiani, and Handel. A bar in *alla breve* time contains two semibreves, performed as quick as minims; and as few black notes appear in such movements, which are generally *fugato*, or in fugue; musicians, in sport, term them *white fugues*. *Alla Scorzese*, in the Scots style; *alla Polacca*, Polish; *alla zoppa*, limping, as in movements full of binding or driving notes or ligatures; *all' ottava*, in the octave; *all' ottava più alto*, an octave higher; *più basso*, lower. In passages for the additional keys to piano-fortes, *all' 8va.* implies that all the notes from this indication, included under the line drawn over them, till the words *in loco* (the usual pitch) occur, are to be played an octave higher. This precludes the trouble and fatigue to the eye of leger lines, as ascending to C in altissimo would require five additional lines and spaces to be piled on the usual staff of five lines. Choral music is said to be *alla Palestrina*, when the style of composition resembles that of this venerable father of ecclesiastical harmony.

ALLABA, or ALLAVA, in *Ancient Geography*, a town of Sicily, on the southern side of it, near the mouth of a river of the same name, and not far from Heraclea Minoa.

ALLAH, or ALLA, an Arabic word, and the name which all who profess Mahometanism give to God, and make frequent repetitions of in their prayers.

ALLAHABAD, in *Geography*, a soubah or province of Hindostan, about 160 miles in length and 120 in breadth, bounded on the east by the province of Bahar, on the north by Oude, on the south by Berar, and on the west by Malwa and Agra. It contains, according to the distribution of Akbar, recorded in the Ayeen-Akbery, 10 circars or counties, divided into 177 pergunnahs, or hundreds. Its revenue, according to the statement of Maurice, in his *Indian Antiquities*, is 3,310,695 sicca rupees. It furnishes 11,375 cavalry, 237,870 infantry, and 323 elephants. The greater part of it is in the possession of Azuph Dowlah, a tributary ally of the British power. The principal cities are Allahabad, Benares, and Iconpour.

ALLAHABAD, a city of Hindostan, situate at the confluence of the two great rivers Jumna and Ganges. It is composed of two towns—the old, which is near the Ganges, and the new, about a mile long and half a mile wide, near the Jumna. It was called Allahabad by the emperor Akbar, who erected a strong fortress of stone in it, which occupies a large space of ground, and of which we have an elegant delineation by Mr. Hodges, in No. IV. of his *Select Views in India*. The tomb of Sultan Khufu is also an

excellent specimen of Mahometan architecture; and a pillar 40 feet high, of one stone, covered with illegible inscriptions, is ascribed by tradition to Bima, one of the heroes of the Mahabarata. Allahabad is a seat of devotion so noted that it is denominated “the king of worshipped places.” We also learn from the Ayeen-Akbery, that the territory round it, to the extent of 40 miles, is deemed holy ground. The Hindoos believe, that when a man dies in this place, whatever he wishes for he will obtain in his next regeneration. Although they teach that suicide in general will be punished with torments hereafter, yet they consider it as meritorious for a man to kill himself at Allahabad. There are various objects of veneration in and about this city, which are still visited with great devotion by an immense number of pilgrims. Dr. Robertson is of opinion, that the ancient Pabothra is the modern city of Allahabad; but major Rennell has placed PALIBOTHTHA on the same site with PATNA. Robertson's *India*, p. 39. p. 356. N. lat. $25^{\circ} 27'$. E. long. $82^{\circ} 5'$.

ALLAKNANDARA, a river of Thibet, which runs into the Ganges, about 20 miles south of Sirinagur.

ALLAM, ANDREW, in *Biography*, a writer of the 17th century, was born of mean parentage at Garlington near Oxford, in 1655; and after previous education at a private grammar school, was entered at St. Edmund's Hall Oxford, in 1671; where he became tutor, moderator, lecturer in the chapel, and at length vice-principal. In 1680, he took orders, and in 1683 was made one of the masters of the schools. He died of the small-pox in 1685. He wrote epistles prefixed to the publications of other writers and additions to a book, entitled, “*Anglicæ notitia*,” and to “*Helvicus's Historical and Chronological Theatre*;” and he also translated the “*Life of Iphicrates*,” laid the foundation of a “*Notitia Ecclesiæ Anglicanæ*,” which was left unfinished, and assisted Mr. Anthony Wood in compiling the “*Athenæ Oxonienses*,” by whom he is mentioned with great commendation and respect. *Biog. Brit.*

ALLAMANDA, so called from Mr. F. Allamand, a Dutch surgeon, who visited Guiana about 1769, and Russia about 1776, and sent descriptions, figures, and specimens of plants to Linnæus, in *Botany*, a genus of the *pentandria monogynia* class and order, of the natural order of *contortæ*, and *apocinæ* of Jussieu; the characters of which are, that the *calyx* is a perianthium one-leaved, five-parted, parts ovate and acute; the *corolla* one-petalled, funnel-shaped, tube cylindric, border semiquinquefid, swelling, divisions spreading, obtuse; the *filamina*, with scarcely any filaments, anthers five, sagittate, converging, in the throat of the tube; the *psillum* has a germ oval, surrounded with a ring, style filiform, of the length of the tube, stigma headed, contracted in the middle; *pericarpium*, an orbicular, lens-shaped, echinate, one-celled, two-valved capsule; the *seeds* very many, imbricate, orbiculate, flat, edged with a membranous wing. There is one species, *viz.* *A. cathartica*, galarips of Allamand, orelia grandiflora of Aublet, a milky shrub, with stem twining and climbing on trees, which grows wild at Cayenne, in Guiana, &c. by the sea-side. The leaves are cathartic, and an infusion of them is used at Surinam, in the colic: introduced in 1785 by Baron Hake. Martyn.

ALLAMP, in *Geography*, a town of France, in the department of the Meurte, and district of Toul, three leagues south of Toul.

ALLAN, a river of Scotland, which runs into the Frith of Forth near Stirling. Allan Water is also a river of the same country, which runs into the Tweed, about a mile north-west of Melros.

ALLANCHE, a town of France, in the department of Cantal,

Cantal, and district of Murat, situate in a valley, and having a considerable commerce of cattle; four leagues and a half north north-west of St. Flour. N. lat. $45^{\circ} 12'$. E. long. $2^{\circ} 54'$.

ALLANTA, in *Ancient Geography*, a town of Arcadia. Steph. Byz.

ALLANTA, or ALLANTIUM, a town of Macedonia, supposed to be inhabited by the Allantienfes of Pliny.

ALLANTOIS, ALLANTOIDES, called also *Farcinialis*, in *Comparative Anatomy*, is a thin transparent sac or bag, found amongst the membranes, investing the *fetus* of quadrupeds; it is connected with the urinary bladder of the young animal, by means of the urachus, and is supposed to serve the purpose of a reservoir for the urine.

Malpighi, Haller, and others have attributed this membrane to the chick during the period of incubation.

The word is derived from *αλλας*, *farcimen*, a gut: and *ειδος*, *forma*, *shape*; because, in many brutes, it has somewhat the appearance of an inflated intestine.—For a further account, see MAMMALIA, in *Comparative Anatomy*.

ALLARD, GUY, in *Biography*, was born at Dauphinè, about the middle of the 17th century, and acquired reputation by several works relating to the history of that province. His “*Nobiliaire du Dauphinè avec les Armoiries*,” 12mo. Grenoble, 1714, and “*Histoire des Maisons Dauphinoises*,” are his principal and most esteemed works.

ALLAT, in *Mythology*, derived from Alla, *God*, is the name of an idol among the Arabians and idolatrous Jews.

ALLATA, in *Ancient Geography*, a town of Arabia Deserta, according to Ptolemy.

ALLATA, a town of Dalmatia, in the itinerary of Antonin.

ALLATIUS, or ALLACCI, LEO, in *Biography*, a voluminous writer of the 17th century, was born in the island of Chios, and at the age of nine years, after having been educated in the Greek church, removed to Calabria, where he enjoyed the patronage of the noble family of Spinelli, and embraced the Catholic religion. At Rome he was admitted into the Greek college, where he acquired reputation by the study of polite learning, philosophy, and divinity. From Rome he went to Naples, and was made great vicar to the bishop of Anglona; and having settled for some time in his native country, he returned again to Rome, studied physic, and took his degree of doctor in that science. But the belles lettres best suited his taste and engaged his principal attention; and, instead of pursuing the practice of physic, he taught the Greek language in the college of his own nation. About the year 1622 he was employed by Gregory XV. in removing to Rome the library of Heidelberg, which the elector of Bavaria had presented to this pontiff; he was afterwards librarian to Cardinal Barberini; and at length pope Alexander VII. appointed him librarian of the Vatican. His publications, which consisted of editions of old MSS, translations from Greek authors, and original compositions, are very numerous. Some of the principal of the latter class are the following: “*De Ecclesiæ Occidentalis et Orientalis perpetua confessione*,” 4to. Cologne 1648; “*On purgatory*,” 8vo. Rome, 1655; “*De patria Homeris*,” 8vo. Lyons, 1640; “*De Septem orbis Spectaculis*,” 8vo. Rome, 1640; “*Confutatio Fabulæ de Joanna papissa*,” “*De Pfellis*,” “*De Georgiis*,” “*De Simeonibus*.” His retentive memory and application qualified him for compiling catalogues; accordingly he published a work of this kind under the title, “*Apes Urbanæ*,” in allusion to the bees borne in the arms of pope Urban VIII. which contained a history of the learned

men of Rome for the years 1630, 1631, and 1632, with a catalogue of their works: and another tract of a similar kind, entitled, “*Dramaturgia*,” giving an account of dramatic authors and their works, printed at Rome in 1636, and reprinted at Venice in 1755. Allatius also wrote several Greek poems, one upon the birth of Lewis XIV. in which he introduced Greece speaking. Allatius was a diligent and rapid writer; and he is said to have written Greek 40 years with the same pen, the loss of which he lamented with tears. His erudition and industry are more commended than his judgment; and he is generally reproached for want of liberality and candour. His criticisms were harsh and ill-natured; his reflections on those who differed from him were coarse and vulgar, as well as severe; and his animosity and intolerance, in his conduct towards those who were not comprehended within the pale of the Romish church, to which he was a profelyte, and for which he was an ardent advocate, were such as led him to denounce against them the most cruel penalties. The Roman pontiff, as he maintained, was independent; judged the world without being accountable to any; his unjust commands were to be obeyed; and he had an absolute authority as legislator and judge, and was incapable of illusion and error. As for heretics and schismatics Allatius was of opinion, that they ought to be proscribed and exterminated, and if they persisted in their heresy, put to death and consumed in the flames. In his zeal for uniting the Greek church to the Latin, and with this view for insinuating himself into the favour and confidence of pope Urban VIII., he is charged by F. Simon with insincerity and misrepresentation. The gentlemen of Port Royal have attempted a vindication of Allatius, particularly against the attacks of Mr. Claude.

Allatius was neither married nor took orders; and in accounting for this part of his indecisive conduct, when he was asked by pope Alexander VII. “*why do you not enter into orders*?” he replied, “*Because I would be free to marry*.” “*Why then*,” said the pope, “*do you not marry*?” “*Because*,” replied Allatius again, “*I would be at liberty to take orders*.” He died at Rome in the year 1669, at the age of 83 years.

ALLAY. See ALLOY.

ALLAZONIUM, in *Ancient Geography*, a town of Asia in Mysia, north east of Scepsis.

ALLBURG, in *Geography*, a township of America, in Franklin county, Vermont, situate on Missisque Bay, and containing 446 inhabitants.

ALLCHURCH, a village of Warwickshire, said to have been formerly seven miles in circumference, and having the Roman Icknild street passing through it. It was once a borough, with a market and several streets. The bishop of Worcester had a palace in it, and the church, parts of which are of Saxon architecture, contains many ancient monuments. It is situated five miles from Bromsgrove, in the road to Leicester.

ALLECTUS, in *Ancient Biography and History*, the confidential friend and prime minister of Carausius, emperor of Britain, apprehending punishment for several crimes with which he was chargeable, murdered his master, A.D. 294, and usurped the imperial dignity, which he maintained for three years. During this period Constantius was preparing for the recovery of Britain; and at length the principal squadron, destined for this enterprise, and assembled in the mouth of the Seine, was intrusted to the command of the præfect Asclepiodotus. The weather proved favourable, and under the cover of a thick fog, the invaders escaped

the fleet of Allectus, which had been stationed off the Isle of Wight to receive them, landed in safety on the western coast; and convinced the Britons, says Gibbon, "that a superiority of naval strength will not always protect their country from a foreign invasion." As soon as the troops were landed, the intrepid commander set fire to the ships, and marched forward to meet the enemy. The usurper had posted himself near London in expectation of an attack from Constantius, who commanded the fleet of Boulogne; but upon hearing of the descent of Asclepiodotus, he made forced marches to oppose his progress. With a small body of harassed and disheartened followers, Allectus encountered the Imperial troops, and the engagement soon terminated in his total defeat and death: so that a single battle decided the fate of this great island. When Constantius landed on the shores of Kent, he was welcomed by the loud and unanimous acclamations of obedient subjects; and Britain, after a separation of 10 years, was thus restored, A. D. 297, to the body of the Roman empire. Crevier's Rom. Emp. vol. ix. p. 311. Gibbon's Hist. vol. ii. p. 127.

ALLEGHANY, or ALLEGHANY County, in *Geography*, a district of Pennsylvania in America, extends from the junction of the river of that name with the Ohio, where its chief town Pittsburg is situated, to the New York line. It contains 10,309 inhabitants, including 159 slaves. Morse.

ALLEGHANY is also the most western county in Maryland, and has Pennsylvania on the north. The windings of the Patowmac river separate it from Virginia on the south, and Sideling-hill Creek divides it from Washington county on the east. It contains 4809 inhabitants, including 258 slaves. Its chief town is Cumberland. Morse.

ALLEGHANY Mountains of America, situate between the Atlantic Ocean, the Mississippi river, and the lakes, are a long and broad range of mountains, formed of a great number of ridges, extending to the north-east and south-west, and nearly parallel to the sea-coast, about 900 miles in length, and 60 to 150 and 200 miles in breadth. The different ridges, which compose this immense range of mountains, bear appropriate names in the several states; *viz.* the Blue Ridge, the North Mountain or North Ridge, or Devil's Back-bone, Laurel Ridge, Jackson's Mountains, and Kittatinny Mountains. All these ridges, except the Alleghany, are broken through by rivers, which appear to have forced their way through solid rocks; and between the several ridges numerous tracts of fine arable and grazing land intervene. In those districts, however, which lie in the back parts of Pennsylvania, Mr. Evans, who travelled over them, observes, that scarcely one acre in 10 is capable of culture. The principal ridge is more appropriately called Alleghany, and distinguished by the appellation of the Back-bone of the United States. From the several ridges proceed innumerable branches or spurs. The general name of the whole range, taken collectively, seems not yet to have been determined. Mr. Evans calls them "the endless mountains;" others have called them "the Apalachian mountains," from a tribe of Indians, who live on a river which proceeds from this mountain, called the Apalachicola; but the most common name is the "Alleghany mountains" so called, probably from the principal ridge of the range. These mountains are not confusedly scattered, rising here and there into high peaks, overtopping each other; but they run along in uniform ridges, scarcely half a mile high. They spread towards the south, and some of them terminate in high perpendicular bluffs; others gradually subside into a level country, giving rise to the rivers which run to the southward into the Gulf of Mexico. Morse.

ALLEGHANY River, an American river of Pennsylvania, rises on the western side of the Alleghany mountains, and after running about 200 miles in a south-west direction, unites with Monongahela at Pittsburg; and both together form the Ohio. The lands on each side of this river, for 150 miles above Pittsburg, consist of white oak and chestnut ridges, and in many places of poor pitch pines, interspersed with tracts of good land and low meadows. This river, and the Ohio likewise, from its head waters until it enters Mississippi, are known and called by the name of Alleghany river, by the Seneca and other tribes of the six nations, who once inhabited it. Morse.

ALLEGATA, in *Antiquity*, a word anciently subscribed at the bottom of rescripts and constitutions of the emperors, as *signata*, or *testata*, was under other instruments. In this sense allegata imports as much as verified, *verificata*. Allegata was a kind of subscription, somewhat less usual than *data*, *propositum*, *accepta*, *subdita*, *supposita*, or *subscripta*.

ALLEGATION, is used for the producing of acts, or instruments, to authorize a thing. In the ecclesiastical courts, articles are drawn out in a formal allegation, or by libel, to set forth the complainant's ground of complaint against the injuring party, brought before the court by citation. To this succeeds the defendant's answer upon oath, when, if he denies or extenuates the charge, they proceed to proofs by witnesses examined, and their depositions taken down in writing, by an officer of the court. If the defendant has any circumstances to offer in his defence, he must also propound them in what is called his defensive allegation, to which he is entitled, in his turn, to the plaintiff's answer upon oath, and may from thence proceed to proofs as well as his antagonist.

Allegation, in a literary sense, denotes the act of citing or quoting an author, or passage of some book.

ALLEGEAS, or ALLEGIAS, in *Commerce*, a stuff manufactured in the East Indies. There are two sorts of them; some are of cotton, and others of several kinds of herbs, which are spun like flax and hemp. Their length and breadth are of eight ells, by five, six, or seven-eighths; and of twelve ells by three fourths, or five-eighths.

ALLEGIANCE, in *Law*, the legal faith and obedience, which every subject owes to his prince: or, it is the tie or ligamen, which binds the subject to the king; in return for that protection which the king affords the subject.

This was anciently called *ligeantia*, or *ligeance*; from the Latin *ligare*, and *aligare*, to bind; q. d. *ligamen fidei*.

The thing itself, in the substance of it, is founded in reason and the nature of government; the name and the form are derived to us from our Gothic ancestors. Under the feudal system, every owner of lands held them in subjection to some superior or lord, from whom or from whose ancestors the tenant or vassal had received them; and there was a mutual trust or confidence subsisting between the lord and vassal, that the lord should protect the vassal in the enjoyment of the territory he had granted him; and, on the other hand, that the vassal should be faithful to the lord, and defend him against all his enemies. This obligation on the part of the vassal was called his *fidelitas*, or fealty; and an oath of fealty was required, by the feudal law, to be taken by all tenants to their lord; which is couched in almost the same terms with our ancient oath of allegiance; except that in the usual oath of fealty there was frequently a saving or exception of the faith due to a superior lord by name, under whom the landlord himself was perhaps only a tenant

tenant or vassal. But when the acknowledgment was made to the superior lord himself, who was vassal to no man, it was no longer called the oath of fealty, but the oath of allegiance; and therein the tenant swore to bear faith to his sovereign lord, in opposition to all men, without any saving or exception; "contra omnes homines fidelitatem fecit." Land held by this exalted species of fealty was called "Feudum ligium," a liege fee, the vassals "homines ligei," or liege men; and the sovereign their "dominus ligius," or liege lord. And when sovereign princes did homage to each other for lands held under their respective sovereignties, a distinction was always made between *simple* homage, which was only an acknowledgment of tenure, and *liege* homage, which included the fealty before mentioned, and the services consequent upon it. Thus, when our Edward III. in 1329, did homage to Philip VI. of France, for his ducal dominions on that continent, it was warmly disputed of what species the homage was to be, whether *liege* or *simple* homage. But with us in England, it becoming a settled principle of tenure, that all lands in the kingdom are holden of the king as their sovereign or lord paramount, no oath but that of fealty could be taken to inferior lords, and the oath of allegiance was necessarily confined to the person of the king alone. By an easy analogy the term of allegiance was soon brought to signify all other engagements, which are due from subjects to their prince, as well as those duties which were simply and merely territorial. And the oath of allegiance, as administered for upwards of 600 years, contained a promise "to be true and faithful to the king and his heirs, and truth and faith to bear of life and limb, and terrene honour, and not to know or hear of any ill or damage intended him, without defending him therefrom." At the revolution, the terms of this oath being thought to favour too much the notion of non-resistance, the present form was introduced by the convention parliament, which is more general and indeterminate than the former; the subject only promising "that he will be faithful and bear true allegiance to the king," without mentioning "his heirs," or specifying in the least wherein that allegiance consists. Accordingly, the convention of estates having offered the crown to the prince and princess of Orange, who accepted it, the old oaths of allegiance imposed by the stat. 1 Eliz. and 3 James I. were abrogated; and a new oath was drawn up to be taken by all the subjects of England, on penalty of being deprived of all employments, civil, military, and ecclesiastical. The form of the oath of allegiance by 1 Geo. stat. ii. c. 13. is "I, A. B. do sincerely promise and swear, that I will be faithful, and bear true allegiance to his majesty king George. So help me God." This oath may be tendered to all persons above the age of 12 years, whether natives, denizens, or aliens, either in the court-leet of the manor, or in the sheriff's tourn, which is the court-leet of the county. See PRÆMUNIRE. The quakers are exempted from taking the oath of allegiance; and, in lieu thereof, are only enjoined a declaration of fidelity, 8 Geo. c. vi. The oath of allegiance, taken by the people to the king, is only the counterpart to the coronation oath, taken by the king to the people; and, as such, partakes of the nature of a covenant: that is, is conditional, and ceases on a violation of the contract by the prince: at least this is the doctrine of some of the chief advocates for the revolution. The anti-revolutioners, on the contrary, held the oath of allegiance to be absolute and unconditional. Archdeacon Paley, in his illustration of this oath, observes, that it excludes all intention to support the claims or pretensions of any other person or persons to the crown and government, than the reigning sovereign;

and also all design, at the time, of attempting to depose the reigning prince, for any reason whatever; and that it forbids the taking up of arms against the reigning prince, with views of private advancement, or from motives of personal resentment or dislike. On the other hand, this oath permits resistance to the king, when his ill-behaviour or imbecility is such, as to make resistance beneficial to the community; nor does it require obedience to such commands of the king as are unauthorized by the law, or that we should continue our allegiance to the king, after he is actually and absolutely deposed, driven into exile, carried away captive, or otherwise rendered incapable of exercising the regal office, whether by his fault or without it.

Besides this express engagement, the law also holds, that there is an implied, original and virtual allegiance, owing from every subject to his sovereign, antecedently to any express promise; and although the subject never swore any faith or allegiance in form. For as the king, by the very descent of the crown, is fully invested with all the right, and bound to all the duties of sovereignty, before his coronation; so the subject is bound to his prince by an intrinsic allegiance, before the superinduction of those outward bonds of oath, homage and fealty, which were only instituted to remind the subject of his previous duty, and for the better securing its performance. The formal profession, therefore, or oath of subjection, is nothing more than a declaration in words of what was before implied in law.

Allegiance, both express and implied, is however distinguished by the law into natural and local; the former being also perpetual, and the latter temporary. Natural allegiance is such as is due from all men born within the king's dominions immediately upon their birth; for immediately upon their birth, they are under the king's protection; at a time too, when (during their infancy) they are incapable of protecting themselves. Natural allegiance, therefore, is a debt of gratitude, which cannot be forfeited, cancelled or altered, by any change of time, place or circumstance, nor by any thing but the united concurrence of the legislature. An Englishman who removes to France, or to China, owes the same allegiance to the king of England there as at home, and 20 years hence as well as now. For it is a principle of universal law, that the natural born subject of one prince cannot by any act of his own, nor by swearing allegiance to another, put off or discharge his natural allegiance to the former: for this natural allegiance was intrinsic and primitive, and antecedent to the other, and cannot be divested without the concurrent act of that prince to whom it was first due.

Local allegiance is such as is due from an alien, or stranger born, for so long time as he continues within the king's dominion and protection; and it ceases the instant such stranger transfers himself from this kingdom to another. Natural allegiance is, therefore, perpetual, and local, temporary only; and that for this reason, evidently founded upon the nature of government, that allegiance is a debt due from the subject, upon an implied contract with the prince, that so long as the one affords protection, so long the other will demean himself faithfully. As therefore the prince is always under a constant tie to protect his natural born subjects at all times, and in all countries, for this reason their allegiance due to him is equally universal and permanent. But, on the other hand, as the prince affords his protection to an alien, only during his residence in this realm, the allegiance of an alien is confined, in point of time, to the duration of such his residence; and, in point of locality, to the dominions of the British empire. Blackstone's Com. book i. ch. 10. vol. i. p. 366—371. Svo. Paley's Principles of Moral and Political Philosophy, book iii. ch. 18. vol. i. p. 203—207. Svo.

ALLEGINI, GUISEPPE, in *Biography*, an Italian engraver, who flourished in 1746, and published the following plates, *viz.* a Virgin Mary, the Circumcision, the stoning of St. Stephen, a small print of Rinaldo and Armida, and a large architectural Opera scene. Strutt.

ALLEGORICAL, something containing an *allegory*.

The divines find divers senses in scripture; as a *literal*, a *mystical*, and an *allegorical* sense. See PROPHECY, and TYPE.

ALLEGORY, ALLEGORIA, a figure in *Rhetoric*, whereby we make use of terms which, in their proper signification, mean something else than what they are brought to denote; or it is a figure whereby we say one thing, expecting it shall be understood of another, to which it alludes; or which, under the literal sense of the words, conceals a foreign or distant meaning.

An allegory is, properly, a continued metaphor, or a series of several metaphors in one or more sentences. Such is that beautiful allegory, in Horace, lib. i. Od. 14.

“O navis, referunt in mare te novi
Fluctus, &c.”

Where the ship is usually held to stand for the republic; waves, for civil war; port, for peace and concord; oars, for soldiers; and mariners for magistrates. Thus also, in Prior's Henry and Emma, Emma describes her constancy to Henry in the following allegorical manner:

“Did I but purpose to embark with thee
On the smooth surface of a summer's sea,
While gentle zephyrs play with prosperous gales,
And fortune's favour fills the swelling sails;
But would forsake the ship, and make the shore,
When the winds whistle, and the tempests roar?”

Cicero likewise speaking of himself (in Pison, c. 9. tom. vi. p. 187.) uses this allegorical language: “Nor was I so timorous, that after I had steered the ship of the state through the greatest storms and waves, and brought her safe into port, I should fear the cloud of your forehead, or your colleague's pestilent breath. I saw other winds, I perceived other storms, I did not withdraw from other impending tempests; but I exposed myself singly to them for the common safety.” Here the state is compared to a ship, and all the things that are said of it under that image, are expressed in metaphors made use of to denote the dangers with which it had been threatened. We have also a very fine example of an allegory in the 80th Psalm; in which the people of Israel are represented under the image of a vine, and the figure is supported throughout with great correctness and beauty. Whereas, if instead of describing the vine as wasted by the boar from the wood, and devoured by the wild beasts of the field, the Psalmist had said, it was afflicted by heathens or overcome by enemies, which is the real meaning, the figurative and the literal meaning would have been blended, and the allegory ruined. The learned Bishop Lowth (*De Sacra Poesi Hebræorum*, Præl. 10. 11. p. 120—140.) has specified three forms of allegory that occur in sacred poetry. The 1st is that which rhetoricians call a continued metaphor. When several metaphors succeed each other, says Cicero (*Orator*, c. 27. tom. i. p. 520.) they alter the form of the composition; and this succession has very properly, in reference to the etymology of the word, been denominated by the Greeks *αλληγορία*, an allegory; although Aristotle, instead of considering it as a new species of figure, has referred it to the class of metaphors. The principle of allegory in this sense of the term, and of the simple metaphor, is the same; nor is it an easy matter to restrict each to its proper limit, and to mark the precise termination of the one, and the commencement of the other. For examples of this kind,

we refer to METAPHOR. This eminently judicious critic observes, that when the Hebrew poets use the congenial figures of metaphor, allegory, and comparison, particularly in the prophetic poetry, they adopt a peculiar mode of doing it, and seldom regulate the imagery which they introduce by any fixed principle or standard. Not satisfied with a simple metaphor, they often run it into an allegory, or blend with it a direct comparison. The allegory sometimes follows, and sometimes precedes the simile: to this is added a frequent change of imagery, as well as of persons and senses; and thus are displayed an energy and boldness, both of expression and meaning, which are unconfined by any stated rules, and which mark the discriminating genius of the Hebrew poetry. Thus, in Gen. xlix. 9. “Judah is a lion's whelp;” this metaphor is immediately drawn out into an allegory, with a change of person: “From the prey, my son, thou art gone up,” that is, to the mountains, which is understood; and in the succeeding sentences the person is again changed, the image is gradually advanced, and the metaphor is joined with a comparison that is repeated.

“He stoopeth down, he coucheth as a lion:
And as a lioness; who shall rouse him?”

A similar instance occurs in the prophecy, recorded in Psalm cx. 3, which explicitly foretells the abundant increase of the gospel on its first promulgation. This kind of allegory, however, sometimes assumes a more regular and perfect form, and then occupies the whole subject and compass of the discourse. An example of this kind occurs in Solomon's well-known allegory, Eccles. xii. 2—6. in which old age is so admirably depicted. There is also in Isaiah, xxviii. 24—29, an allegory, which, with no less elegance of imagery, is more simple and regular, as well as more just and complete, both in the form and the method of treating it. Another kind of allegory is that, which in the proper and more restricted sense, may be called a parable; and consists of a continued narration of some fictitious event, accommodated by way of similitude to the illustration of some important truth. The Greeks call these allegories *αιμοι* or apologues, and the Latins *fabule*, or fables. See PARABLE. The third species of allegory, which often occurs in the prophetic poetry, is that in which a double meaning is couched under the same words, or when the same discourse, differently interpreted, designates different events, dissimilar in their nature and remote as to time. These different relations are denominated the literal and mystical senses. This kind of allegory, which the learned prelate calls mystical, seems to derive its origin from the principles of the Jewish religion; and it differs from the two former species in a variety of respects. In these allegories the writer may adopt any imagery that is most suitable to his fancy or inclination; but the only proper materials for this allegory must be supplied from the sacred rites of the Hebrews themselves, and it can only be introduced in relation to such things as are immediately connected with the Jewish religion, or their immediate opposites.

The former kinds partake of the common privileges of poetry; but the mystical allegory has its foundation in the nature of the Jewish economy, and is adapted solely to the poetry of the Hebrews. Besides, in the other forms of allegory, the exterior or ostensible imagery is mere fiction, and the truth lies altogether in the interior or remote sense; but in this allegory each idea is equally agreeable to truth. The exterior or ostensible image is itself a reality; and although it sustains another character, it does not wholly lay aside its own. There is also a great variety in the use and conduct of the mystical allegory; in the modes in which the corresponding images are arranged, and in which they are ob-

veared or eclipsed by one another. Sometimes the obvious or literal sense is so prominent and conspicuous, both in the words and sentiments, that the remote or figurative sense is scarcely permitted to glimmer through it. On the other hand, the figurative sense is more frequently found to beam forth with so much perspicuity and lustre, that the literal sense is quite cast into a shade, or becomes indiscernible. Sometimes the principal or figurative idea is exhibited to the attentive eye with a constant and equal light; and sometimes it unexpectedly glares upon us, and breaks forth with sudden and astonishing coruscations, like a flash of lightning bursting from the clouds. But the mode or form of this figure, which possesses the chief beauty and elegance, is, when the two images, equally conspicuous, run, as it were, parallel through the whole poem, mutually illustrating and correspondent to each other. The learned author has illustrated these observations by instances selected from the 2d and 72d Psalms. He adds, that the mystical allegory is, on account of the obscurity resulting from the nature of the figure, and the style of the composition, so agreeable to the nature of the prophecy, that it is the form which it generally, and indeed lawfully assumes, as best adapted to the prediction of future events. It describes events in a manner exactly conformable to the intention of prophecy; that is, in a dark, disguised and intricate manner, sketching out in a general way their form and outline; and seldom descending to a minuteness of description and exactness of detail. On this subject in its immediate connection with the double sense of prophecy, which some eminent critics and commentators have not only disputed, but absolutely rejected as groundless and fanciful, and leading to great uncertainty of interpretation; see PROPHECY.

Allegories were a favourite method of delivering instructions in ancient times; for what we call fables or parables, are no other than allegories; where, by words and actions attributed to beasts or inanimate objects, the dispositions of men are figured; and what we call the moral, is the unfigured sense or meaning of the allegory. An *œnigma* or riddle is also a species of allegory; one thing represented or imaged by another; but purposely wrapt up under so many circumstances as to be rendered obscure. Where a riddle is not intended, it is always a fault in allegory to be too dark. The meaning should be easily seen through the figure employed to shadow it. However, the proper mixture of light or shade, in such compositions, the exact adjustment of all the figurative circumstances with the literal sense, so as neither to lay the meaning too bare and open, nor to cover and wrap it up too much, has ever been found an affair of great nicety; and there are few species of composition in which it is more difficult to write, so as to please and command attention than in allegories. In some of the visions of the Spectator, we have examples of allegories very happily executed. In the right management of allegories, care should be taken that the same kind of trope be carried through the whole, so as to compose one uniform and consistent set of ideas; otherwise they dress up a chimera, a thing that has no existence, and of which the mind can form no conception. Quintilian very justly observes (*Inst. Orat. l. viii. c. 6.*) that "to begin with a tempest and end with a fire, would be very ridiculous and unnatural." It is likewise very necessary that the allusions be all plain and evident, especially where the name of the thing alluded to is not expressed. These are called *pure allegories*. But where the reference is not evident, it becomes a riddle, which is nothing else but an *obscure allegory*. To avoid this the best writers use what are generally called *mixed allegories*, or such as express the proper

name of the thing which the whole similitude respects. Of this kind is that in the speech of Philip, king of Macedon, given by Justin (*l. xxix. c. 3.*), where he says, "I perceive that cloud of a dreadful and bloody war arising in Italy, and a thunder-storm from the west, which will fill all places with a large shower of blood, wherever the tempest of victory shall carry it." The proper words "war," "blood," and "victory," being joined to the tropes "cloud," "shower," and "tempest," in this sentence, render the several parts of the similitude plain and evident. Quintilian thinks these allegories most beautiful, where the whole similitude is expressed, and those words, which in their proper sense relate to one of the two things, between which the comparison is made, are allegorically applied to the other: as when Cornelius Nepos says of Atticus (*cap. x.*), "If that pilot gains the greatest reputation, who preserves his ship in a boisterous and rocky sea; ought not he to be thought a man of singular prudence, who arrived in safety through so many and so great civil tempests?" These are the allegories with which orators are chiefly concerned. See Ward's Oratory, vol. ii. p. 27—31. Blair's Lectures, vol. i. p. 396—399.

The Old Testament is supposed, by many, to be a perpetual allegory, or typical representation of the mysteries of the New. Mr. Collins, in his "Grounds and Reasons of the Christian Religion," pretends, that the Old Testament, literally understood, no where serves the purposes of Christianity; but if it be of any use, it must be understood allegorically. He first recommends allegory, as the only mode of reasoning proper for bringing men to the faith of Christ; and then ridicules this allegorical interpretation as absurd. p. 87, 90, 94, 160. In effect, allegories have entered into most religions.—The Jews, we know, abound with them. Philo Judæus has three books, of the allegories in the history of the six days. Nor are the heathens without allegories in their religion: it may be even said, that the use of them is of a much earlier standing in the Gentile than in the Jewish world.—Some of their philosophers, undertaking to give a *raisonné* of their faith, and to shew the reason and scope of their fables, and the ancient histories of their gods, found it necessary to put another construction on them; and maintain, that they signified something very different from what they seemed to express. And hence came the word allegory, or a discourse that, in its natural sense, *ἄλλο ὁρῶμεν*, signifies something other than what seems intended by it. This shift they had recourse to, in order to prevent people from being shocked with those absurdities which the poets had introduced into their religion; and to convince the world, that the gods of Greece had not been those vile persons which their histories represented them to be. By this means the history, as well as religion, of Greece, was at once converted into allegory; and the world left to seek for them both in a heap of fables, few of which have been satisfactorily solved, either by ancient or modern writers. The Jews, finding the advantages of this way of explaining religion, made use of it to interpret the sacred writings, so as to render them more palatable to the Pagans. The same method was adopted by the primitive writers of Christianity. The practice of allegorical interpretation, which the Jews had learned from the Egyptians, and which, before the time of Christ, was common among them, the early converts to Christianity brought out of the Jewish into the Christian church. Some traces of this method we find in the New Testament, particularly in St. Paul's argument against the Jewish advocates for the perpetual and universal obligation of the Mosaic ritual, drawn from the history of Abraham, in the epistle to the Galatians, ch. iv. 22; and in the typical

application of the ceremonial appointment of Moses to the Christian institution, in the epistle to the Hebrews. But a less sober and judicious use was made of this kind of language by the Christian fathers. This was more especially the case with those Gentile converts who had been educated in the Alexandrian school, where, by the help of allegory, the several systems of philosophy were mixed and confounded; and with those Jewish Christians, who, by the same means, had been instructed in the Cabbalistic doctrines, which, before this time, had sprung up in Egypt, and passed thence into Judæa. Several of those sects of Christians, who were called heretics, particularly the Valentian Gnostics, made use of allegorical language to disguise the unnatural alliance which they had introduced between the fanciful dogmas of the oriental philosophy and the simple doctrine of Christ. The orthodox fathers of the church, too, defended themselves with the same armour, both against heretics and infidels, applying, with more ingenuity than judgment, the symbolical method of interpretation to the sacred scriptures. In the same manner in which Philo and other Alexandrian Jews had corrupted the Jewish church, Clemens Alexandrinus, Origen, and other disciples of the Alexandrian school, in the second century, introduced error and corruption into the church of Christ. Whitty on the interpretation of Scripture, Lond. 1744. Brucker's Hist. Philos. by Enfield, vol. ii. p. 272.

Allegories are distinguished into divers kinds: as *verbal, real, simple, allusive, physical, moral, political, theological, &c.*

ALLEGORY, *simple*, according to some writers, is that which is taken from any kind of natural things.

ALLEGORY, *allusive*, is that which relates to other words, or things.

ALLEGORY, *verbal*, is a thread, or series of metaphors; or a continuation of the same trope, chiefly metaphor, through many words. Such is that in Virgil:

“Claudite jam rivos pueri, fat prata biberunt.”

Where the metaphor of watering the ground is carried on to the shutting of the sluices, &c.

ALLEGORY, *perpetual*, or *continued*, is that where the allegorical thread is pursued through all the parts of a considerable discourse. Such are the books of Jonah, of Canticles, of Job, not to say the whole Old Testament, according to the hypothesis of some divines.

ALLEGORIES, *physical*, those wherein some point of natural philosophy is represented: such in Homer, are Juno, who represents the air; Jupiter, the æther, &c.

ALLEGORIES, *medical*, those wherein some secret of physic is revealed: such is Solomon's description of old age, Ecclef. xii. 1, &c. wherein, according to certain authors, the circulation of the blood is indicated: such also, according to a modern writer, is the story of the labours of Hercules. For an illustration of Solomon's allegorical description of old age, see Mead's *Medica Sacra*, chap. vi.

ALLEGORIES, *chemical*, those relating to chemistry: such, according to Suidas, and many moderns, is the story of the Argonautic expedition, wherein the process of making gold is exactly described: such also, according to Tollius, is the name and title of Basil, Valentine, Benedictine, Monk: under which are concealed the secrets of the philosophical mercury.

ALLEGORIES, *moral*, those whereby some useful moral instruction is held forth: such, in Homer, is the victory of Diomedes over Venus, or fleshly lust: such also are the Pythagorean metempsychosis, and the story of the judgment of Hercules, related by Prodicus. To which may be added, the fables of avarice and luxury; of the grotto of grief, and

and others in the Spectators and Tatlers. Spectat. N^o 55. Tatl. N^o 97.

ALLEGORIES, *poetical*, those wherein some maxim of good government is artfully wrapped up; such is that celebrated one of Menenius Agrippa, whereby he prevailed on the Roman people, who had withdrawn in discontent at the magistrates, to return into the city; to which purpose he related to them the parable of a war raised by the several parts of the human body against the stomach.

ALLEGORIES, *theological*, these wherein some truth relating to the nature and attributes of God is couched.

ALLEGORY is also used for the drawing of some words, plainly and literally intended at first, from their natural and proper meaning, to a foreign sense; for the better instructing of our minds in some point of faith or manners. This coincides with what is otherwise called ACCOMMODATION.

ALLEGORY, in *Painting*, is used as in poetry, and sometimes too licentious, by painters, who, while they enrich their pictures by allegories, offend the spectator, especially in representations of modern history. Rubens, whose works are full of great and noble ideas, cannot be justified in the licentious treatment of allegory in his famous pictures representing the history of Mary of Medicis, and in several others of that great master's works which could be mentioned. In the Luxemburg gallery Rubens has so united the Christian ceremonies with heathen mythology as greatly to offend the eye of the intelligent spectator, notwithstanding the grandeur of the composition and richness of the colouring, which are produced by this very means. A great general has been represented crossing a river with his troops by an armed warrior striding over a stream of water flowing from an urn held by a river god; which would, it is apprehended, have been expressed with greater propriety by the general holding his truncheon, while the troops, at a distance, were represented as fording a river. Allegory seems better employed in poetical subjects than in historical representations. See more upon this subject under the article PAINTING.

ALLEGRI, GREGORIO, in *Biography*, an eminent musical composer of the 17th century, was a native of Rome, and by profession an ecclesiastic. He was a disciple of Nanini, who was contemporary with Palestrina, and his intimate friend. His abilities as a singer were inconsiderable, and yet he was accounted an admirable master of harmony; and so much was he esteemed by all the musical professors of his time, that the pope, in order to appropriate him to his service, appointed him to be one of the singers of his chapel in 1629. To his extraordinary merit as a composer of church music he joined a devout and benevolent disposition, and an excellent moral character; for he not only assisted the poor, by whom his door was usually crowded, to the utmost of his power, but daily visited the prisons of Rome, in order to bestow his alms on the most deserving and distressed objects he could find in them. He set many parts of the church service with such divine simplicity and purity of harmony, that the loss of him was much felt and sincerely lamented by the whole college of singers in the papal service. He died Feb. 18th, 1652; and was buried in the Chiesa Nuova, before the chapel of S. Filippo Neri, near the altar of annunciation, where is a vault for the reception of deceased singers belonging to the pope's chapel.

Among his works preserved, that are still in use, is the famous *Miserere*, which, for upwards of 170 years, has been annually performed at the pope's chapel in Rome on Wednesday and Good Friday in Passion week, and which in appearance is so simple as to make those who have only seen it

on paper wonder whence its beauty and effect could arise, and which owes its reputation more to the manner in which it is performed than to the composition: the same music is many times repeated to different words, and the fingers have, by tradition, certain customs, expressions, and graces of convention (*certe espressioni e Gruppi*), which produce great effects, such as swelling and diminishing the sounds altogether, accelerating or retarding the measure at some particular words, and singing some entire verses quicker than others. This information was furnished to the author by signor Santarelli, the pope's maestro di capella. And Andrea Adami asserts, in his *Observazioni per ben reg. il coro della Cap. Pont.* 1711, p. 36, "that after several vain attempts by preceding composers, for more than a hundred years, to set the same words to the satisfaction of the heads of the church, Gregorio Allegri succeeded so well as to merit eternal praise; for with few notes, well modulated and well understood, he composed such a *Miserere* as will continue to be sung on the same days, every year, for ages yet to come; and one that is conceived in such just proportions as will astonish future times, and ravish, as at present, the soul of every hearer.

However, some of the great effects produced by this piece may, perhaps, be justly attributed to the time, place, and solemnity of the ceremonials used during the performance: the pope and conclave are all prostrated on the ground; the candles of the chapel and the torches of the balustrade are extinguished one by one; and the last verse of this psalm is terminated by two choirs; the maestro di capella beating time slower and slower, and the fingers diminishing or rather extinguishing the harmony, by little and little, to a perfect point.

It is likewise performed by select voices, who have frequent rehearsals, particularly on the Monday in Passion week, which is wholly spent in repeating and polishing the performance.

This composition used to be held so sacred, that it was imagined excommunication would be the consequence of an attempt to transcribe it.

Padri Martini said that there were never more than three copies of it made by authority, "one of which was for the emperor Leopold, one for the late king of Portugal, and the other for himself." Of this last he favoured the author with a transcript at Bologna, and signor Santarelli indulged him with another from the archives of the pope's chapel. Upon collating these two copies, they were found to differ very little from each other.—Present state of Music in France and Italy.

Before we quit a subject so interesting to the lovers of church music, we shall add the following anecdote, with which we were likewise favoured by signor Santarelli.

"The emperor Leopold the first, not only a lover and patron of music, but a good composer himself, ordered his ambassador at Rome to entreat the pope to permit him to have a copy of the celebrated *Miserere* of Allegri, for the use of the Imperial chapel at Vienna; which being granted, a copy was made by the signor maestro of the pope's chapel, and sent to the emperor, who had then in his service some of the first singers of the age; but, notwithstanding the abilities of the performers, this composition was so far from answering the expectations of the emperor and his court in the execution, that he concluded the pope's maestro di capella, in order to keep it a mystery, had put a trick upon him, and sent him another composition. Upon which, in great wrath, he sent an express to his holiness, with a complaint against the maestro di capella, which occasioned his immediate disgrace, and dismissal from the service of the papal chapel; and in so great a degree was the pope offended, at the supposed imposition of his com-

poser, that, for a long time, he would neither see him nor hear his defence. However, at length, the poor man got one of the cardinals to plead his cause, and to acquaint his holiness that the style of singing in his chapel, particularly in performing the *Miserere*, was such as could not be expressed by notes, nor taught nor transmitted to any other place, but by example, for which reason the piece in question, though faithfully transcribed, must fail in its effect when performed elsewhere. His holiness did not understand music, and could hardly comprehend how the same notes should sound so differently in different places; however, he ordered his maestro di capella to write down his defence, in order to be sent to Vienna, which was done; and the emperor, seeing no other way of gratifying his wishes with respect to this composition, begged of the pope that some of the musicians in the service of his holiness might be sent to Vienna, to instruct those in the service of his chapel how to perform the *Miserere* of Allegri, in the same expressive manner as in the Sistine chapel at Rome, which was granted. But, before they arrived, a war broke out with the Turks, which called the emperor from Vienna; and the *Miserere* has never yet, perhaps, been truly performed but in the pope's chapel.

With respect to the intrinsic worth of this renowned *Miserere*, as a musical phenomenon, we know that more sublime compositions have been produced, since Allegri's time, by musicians of superior genius; but the words were thought by the heads of the Romish church to be set with so much more propriety, reverence, and effect, than by any former ecclesiastical composer whose productions had been allowed admission into the service of the papal chapel during the holy week, that, besides the manner in which it was performed, its merit was perhaps somewhat exaggerated in imagination by the mystery with which it was sedulously preserved from profane examination.

ALLEGRI, ANTONIO. See CORREGIO.

ALLEGRINI, FRANCESCO, an engraver, who lived at Florence, and flourished in 1760. By him we have many portraits, from different masters. The image of St. Francis d'Assise is held in high estimation at Sienna, in the church named l'Alberino. Strutt.

ALLEGRO, *Ital. Musc.* denotes gay, cheerful, quick. The force of this term is augmented by the words *piu, affai*, and the superlative degree of comparison, as *piu allegro*, more quick; *allegro affai*, and *allegriissimo*, very quick. It has likewise its diminutives, as *poco allegro*, and *allegretto*, a little gay, cheerful, or quick. *Allegro* is the degree of time between *Andante* and *Presto*, which see.

ALLEIN, RICHARD, in *Biography*, a nonconformist divine, was born at Ditchet, in Somersetshire, in 1611, educated by his father, who was rector of the parish, and entered a commoner at St. Alban's Hall, Oxford, in 1627. Having taken the degrees of bachelor and master of arts in the University, he became first, assistant preacher to his father, and afterwards, *viz.* in 1641, rector of Batecomb, in Somersetshire, where he faithfully discharged his duty. Having received from his father a bias towards the sentiments of the Puritans, he attached himself to that party, and zealously supported the solemn league and covenant, though he disapproved the enthusiastic spirit of some of its adherents; as appears by a paper printed in 1648, and entitled, "The testimony of the ministry of Somersetshire to the truth of Jesus Christ, and to the solemn league and covenant." In 1654 he was employed as assistant to the commissioners appointed by parliament for ejecting scandalous ministers; at the restoration he manifested an inclination to yield his assent to the government; but unable conscientiously to comply

with the terms of conformity, he preferred the alternative, imposed by the act of uniformity, of quitting his living after having retained it for 20 years, and of ranking with about 2000 other sufferers, who were distinguished by the denomination of ejected ministers. Under the restraints and penalties of this act, he exercised his ministry in the house of Mr. More, who had been formerly a member of parliament, and who lived in his neighbourhood; and though he was reprimanded by the magistrates and imprisoned, his reputation for piety, learning, and exemplary conduct, procured a mitigation of the rigorous treatment with which he encountered. In consequence of "The Five-mile Act," he was under a necessity of removing from Batcomb to Frome-Selwood, where he continued in the discharge of his professional duties, notwithstanding the dangers to which he was exposed. In this situation he remained, till death terminated his trials and labours in 1681. He was distinguished by his plain, practical and pathetic manner of preaching, and by his assiduity in the duties of his pastoral office, such as catechising, visiting the sick and instructing the ignorant. Although he was an avowed non-conformist, and strictly attached to his principles, the moderation of his temper, as well as his general character, recommended him to the clergy and laity of sentiments different from his own, and he lived amongst them on terms of friendship and intercourse. Mr. Jenkins, vicar of Frome-Selwood, preached his funeral sermon, and bore testimony to his piety, meekness, and moderation. His works, which were all of the devotional kind, were much esteemed, and frequently reprinted. The principal of these was his "Vindiciæ Pietatis," or, "A Vindication of Godliness, in the greatest strictness and spirituality of it, from the imputations of folly and fancy," which was published in 1665, without a printer's name, because it was not licensed; but the copies of it were seized and sent to the king's kitchen for waste-paper. They were afterwards bought by the king's bookseller, who had caused them to be seized, at a cheap rate, and sold; for which artifice he was brought on his knees to the council table, and the books were again sent to the king's kitchen and bisk'd, *i. e.* struck over with ink, so as to be illegible. The other works of Allein were "Heaven opened, or a brief and plain discovery of the riches of God's covenant of grace," printed in 1665; "The World Conquered," 1668, 8vo.; "Godly Fear," 1674, 8vo.; "A Rebuke to Backsliders, and a Spur for Loiterers," 1677, and 1684, 8vo.; "A Companion for Prayer," 1680, 12mo.; "Instructions about Heart-work, &c." 1681, 8vo. Calamy's Life of Baxter, vol. ii. Wood's Athen. Oxon. vol. ii. Biog. Brit.

ALLEIN, JOSEPH, a nonconformist divine, was born at Devizes, in Wiltshire, in 1633. Having manifested at a very early age an eminently pious disposition and an inclination for the ministry, he was educated with this view and sent to Oxford at the age of 16 years. At college he was distinguished by diligence in his studies and gravity in his deportment. In 1653 he became a tutor in the college of Corpus Christi, to which he belonged, and where, for the exercise of his gifts in prayer, he had performed the office of chaplain, which he preferred to a fellowship; and in this situation he was so assiduous and so successful, that many of his pupils occupied respectable stations both in the established church and among the nonconformists. In 1655 he left college, and was assistant minister at Taunton Magdalen, in Somersetshire, until the year 1662, when he was deprived for nonconformity. During this connection he was indefatigable in his ministerial services, and his conduct was so

amiable and exemplary, as to secure the affectionate esteem and attachment of his parishioners. After his exclusion from the church, he persevered in his labours, and preached commonly six or seven, and sometimes 14 or 15 times a week; till in 1663 he was committed to Ivelchester jail, where seven ministers and 50 quakers were closely confined and enduring similar hardships. At the assizes Allein was convicted of having preached in the preceding May, and sentenced to pay 100 marks, and to remain in prison till the fine was paid. "I am glad," said he on receiving his sentence, "that it has appeared before my country, that whatever I am charged with, I have been guilty of nothing but doing my duty; and that all which appeared from the evidence was, that I sung a psalm, and instructed my family, others being there, and both in my own house." By an imprisonment of 12 months, Allein's constitution was impaired and the duration of his life shortened. After his release he renewed his labours, and his sufferings were also renewed; his health gradually declined; and in 1668 he finished his course, at the age of 35 years. His biographers, Anthony Wood excepted, bear testimony to his learning and charity. Zealous in his own mode of worshipping God, he was not, as ministers of the established church have testified, in the least bitter towards any Christians who worshipped in another manner. He preserved a great respect for the church, notwithstanding all his sufferings, and was eminently loyal to his prince, notwithstanding the severities of the times. His writings breathe a true spirit of piety, for which they have been always and deservedly esteemed. His works are, "An Explanation of the Assembly's Shorter Catechism," 1656, 8vo.; "A Call to Archippus," exhorting the ejected ministers to continue in their ministry, 1664, 4to; "An Alarm to the Unconverted," 1672, 8vo. and 12mo., of which 20,000 were sold, and after it was printed in 1675 under the title of "A Sure Guide to Heaven," 50,000; "Christian Letters, full of Spiritual Instruction," 1672, 8vo.; "Cases of Conscience," 1672, 8vo.; "Remains, &c." 1672, 8vo. and several other small practical pieces; besides an imperfect body of natural theology in Latin, which has not been printed. An account of his life and death is often annexed to his writings. Calamy's Baxter, vol. ii. p. 577, &c. Neal's Hist. of the Puritans, vol. ii. p. 670, 4to. Biog. Brit.

ALLELENGYON, in *Antiquity*, a kind of tax, or tribute, which the rich paid to the poor, when absent in the armies.

ALLELOPHAGI, from *αλληλος*, one another, and *φάγω*, I eat, in *Natural History*, a term used by Mouffet, and other writers on insects, to express a peculiar genus of flies, which feed on one another. They are thus called in distinction from another class, called the *heterophagi*, from their feeding on different substances, not on one another.

ALLELUJAH. See HALLELUJAH.

ALLEMAENGEL, in *Geography*, a small Moravian settlement on Swetara river, in Pennsylvania.

ALLEMAND, a river of America, which falls into the Mississippi from the south-east, about 43 miles south of the Natches.

ALLEMANDA, in *Music*, an ancient movement in common time, moderately quick; supposed, from its title, to be of German invention. In almost every lesson, or sonata for the harpsichord in Handel's time, there was a prelude, an allemand, a saraband, a courant, and a jig, which see. Rousseau says, the allemand is a dance very common in Switzerland and Germany, as it became in England a few years ago. But the allemand for dancing is very different from those in the works of Corelli, Handel, and Mattheson.

ALLEMANNIC,

ALLEMANNIC, in a general sense, something relating to the ancient Germans. The word is also written *Alamannic*, *Alemannic*, and *Alemanic*. It is formed from *Allemanni*, *Allemanni*, or *Alamanni*; the name whereby the German nation was anciently known. See **ALEMANNI**.

In this sense we meet with Allemannic history, Allemannic language, Allemannic laws, &c. Goldastus, and others, have published collections of writers on Allemannic affairs: *Allemannicarum rerum scriptores*.

Allemannic language was spoken throughout the southern parts of Germany. It is divided into several dialects; the principal of which are the Suevic, and Helvetic. The Allemannic differed from the Francic, which was the language in use through the northern parts of Germany; the chief dialects of this are the Palatine, Franconian, and Saxon.

ALLEMANNIC law, *jus Allemannicum*, is the same with what is otherwise called the Suevic law, being that which obtained in the more southern parts of the country, as the Saxon law did throughout the northern.

Schilter has published the provincial Allemannic law, and also the code of the feudal Allemannic law.

ALLEN, JOHN, in *Biography*, archbishop of Dublin, in the reign of Henry VIII., was educated at Oxford, and took his degree of bachelor of laws at Cambridge. Having been sent to the pope by Warham, archbishop of Canterbury, on some ecclesiastical affairs, he continued at Rome nine years; and after his return, was chaplain to cardinal Wolsey, and commissary or judge of his court as legate à latere; in the execution of which office he was suspected of dishonestly and even of perjury. In return for his services, the cardinal procured for him the living of Dalby, in Leicestershire. In 1525 he was incorporated at Oxford, doctor of laws, which degree he had taken either at Rome or some Italian university; and in 1528 he was consecrated archbishop of Dublin, and made chancellor of Ireland. He was cruelly murdered by command of the eldest son of the earl of Kildare, in a time of rebellion, A. D. 1534, in the 58th year of his age. His works are, "Epistola de Pallii significatione activa et passiva," and "De consuetudinibus ac statutis in tuitoriis causis observandis;" and several other pieces relating to the church. *Biog. Brit.*

ALLEN, or ALLEYN, THOMAS, an eminent mathematician, was born at Uttoxeter, in Staffordshire, in 1542, and admitted scholar of Trinity college, in Oxford, in 1561, fellow in 1565, and in 1567, master of arts. Averse from taking orders, and inclined to retirement, he withdrew from college and took up his residence in 1570 at Gloucester-hall, where he sedulously pursued his studies and became an eminent antiquary, mathematician, and philosopher. His talents and learning attracted the notice of several persons of distinction; he was offered a bishopric by Robert, earl of Leicester, and strongly solicited by Albertus L'Askie, count or prince of Sirade, in Poland, to reside with him in his own country; but he declined every proposal of this kind, and preferred the pleasure of retirement and study to secular advantages that were likely to accrue to him from the patronage of the great. He associated, however, with persons most distinguished for literature and science at the period in which he lived, to whom he had access in the house of Henry, earl of Northumberland, the great friend and patron of the mathematicians. By the ignorant and vulgar he was regarded, on account of his great skill in the mathematics, as a magician and conjurer. Mr. Selden informs us, "that he was a person of the most extensive learning and consummate judgment, the brightest ornament of the university of Oxford;" and Camden extols him as "highly

accomplished in an extensive acquaintance with the most valuable arts and sciences." He was curious and diligent in collecting MSS. relating to various branches of learning. These collections have been cited by several authors; but they are now dispersed and lost. His works are, "The second and third books of Ptolemy, concerning the judgment of the stars, with a commentary," published in Latin; notes on many of Lilly's books, and on Bale's book "De Scriptoribus Maj. Britannia." It is justly to be regretted, that the world has derived so little advantage from the erudition and literary labours of a person, who in his funeral eulogy by Burton, was denominated "not only the Coryphaeus, but the very soul and sun of all the mathematicians of his time. He died Sept. 30th, 1632. Wood's *Athen. Oxon.* vol. i. *Biog. Brit.*

ALLEN, THOMAS, a learned divine, was born in 1573; educated in the king's school at Worcester, and removed to Oxford in 1589, where he made a great progress in philosophy, and became a noted disputant. He took orders, but applied to the abstruse and critical parts of learning more than to preaching. He wrote in Latin "Observations on St. Chryostom's book upon Isaiah," published in Sir H. Savile's edition of Chryostom's works, and assisted him in his annotations on this father's homilies on the Evangelists. Savile represents him "as a very learned man, and no less skilled in the Greek learning than in divinity." He died in 1636, and was buried in the chapel of Eton-college, of which he was a fellow. *Biog. Brit.*

ALLEN, BENJAMIN, M. D. published in the year 1700, at London, "The natural history of the chalybeat and purging waters in England," 8vo. This was republished in the year 1711. He gives the analysis of the several waters, which he classes under the heads of chalybeat, saline, sulphureous, or mixed, and attributes their virtues to a subtle gas or spirit with which he supposes they are imbued. There are no memorials extant of the life of this writer.

ALLEN, JOHN, M. D. F. R. S. published in the year 1719, "Synopsis universæ Medicinæ Practicæ," 8vo. The work is dedicated to the president and fellows of the Royal College of Physicians, London; and comprises brief descriptions, and accounts of all the diseases incident to the human body, with the most approved modes of treating them; taken, as the author every where acknowledges, from the most eminent writers, ancient and modern. Of this work the author speaks very modestly, and particularly admonishes the reader not to content himself with the abstracts he has given, "sed potius aethores ipsos ubicunque consulat: nam in "transferendis," he adds, "eorum sententiis, verisimile est, me "frequenter errasse, aut saltem sensum obscure, aut imper- "fecte tradidisse. *Dulcius ex ipso fonte bibuntur aquæ.*" The work was, however, received with such avidity, not only in England but in all parts of Europe, that in the space of a very few years, it passed through numerous editions, to which, from time to time, the author made such additions, as increased it to nearly double its original bulk. In the year 1734 he gave an English translation, which was published in two volumes, 8vo.: it had been before translated into French. The author appears to have practised medicine in London, but no particulars of his life have been published.

ALLEN, Flopert Van, an engraver, who flourished in 1686. He drew the town of Vienna, in 1686, and engraved the town of Prague, a large, slight print, with many figures. *Strutt.*

ALLEN, Francis, an obscure engraver of Lubeck, who flourished in 1652.

ALLEN, in *Geography*, a small river of Flintshire, in North Wales, which sinks under ground near Mold, and is lost for a short interval.

ALLENBACH, or ELLENBACH, in *Geography*, a prefecture of the principality of Hersfeld, in Germany, lying betwixt the rivers Nahe and Glans.

ALLENBURG, a small town of Prussia, in the government of Papiem, well situated on the river Albe, eight leagues east-south-east of Königsberg.

ALLENDORF, a bailiwick of Lower Hesse, in Germany, situate amidst high and rocky mountains, of which those of Goburg and Hoheberg, on the frontiers of Eichsfeld, are the most remarkable, and producing some wine. The town of Allendorf is situated on the river Werra, or Weser, about fifteen miles east of Cassel, N. lat. $51^{\circ} 18'$. E. long. $9^{\circ} 44'$. This town was destroyed by fire in 1637. Near it are the great salt-works in the Sedan, which are more ancient than the town itself, as they are mentioned in an instrument of the emperor Otho II. bearing date in 973.

ALLENDORF is also a prefecture of Upper Hesse. The town, surnamed An der Lumde, was erected in 1370. It is six miles north-east of Giessen, and eight south of Marburg.

ALLENSTOWN, a town of America, in New Jersey, in Monmouth county, 15 miles north-east of Burlington, and 13 south by east from Princeton.

ALLENSTOWN is also a township in Rockingham county, New Hampshire, containing 254 inhabitants, situate on the east side of Merrimack river, 25 miles north-west of Exeter, and 40 from Portsmouth.

ALLEN-TOWN, in Pennsylvania, Northampton county, on the point of land formed by Jordan's creek, and the little Lehigh, contains about 90 houses and an academy.

ALLENTROP, a town of Germany, in the circle of the Lower Rhine and duchy of Westphalia, situate on the river Sorbeck, three leagues south of Arenberg.

ALLER, a river of Germany, rises in the duchy of Magdeburg, passes by Luneburg, Gifhorn, Zell, &c. and joins the Weser, a little below Verden.

ALLER *good*, in our *Ancient Writers*. The word *aller* serves to make the expression of superlative signification. So *aller good*, is the greatest good. Sometimes it is written *alder*.

ALLERIA. See ALERIA.

ALLERION, or ALERION, in *Heraldry*, a sort of eaglet, represented without either beak or feet.

The name is French; and is said to have been introduced for the word *eaglet*: it is added, that the practice of calling eaglets, *allerions*, and of representing them spread, without feet and beaks, is not above a hundred years old, and is of French invention; introduced to represent the Imperialists as subdued. Hence, Menage derives the word from *aquilario*, a diminutive of *aquila*. In Latin they are called *aquila mutile*.

The *allerion*, represented *Tab. Heraldry, fig. 1.* appears much the same with the *martlet*, except that the wings of the latter are close, and it is represented, as it were, *passant*; whereas the *allerion* is spread, and is represented in *pale*. Add, that among our heralds, the *martlet* has a beak, which the *allerion* wants.

ALLERSHEIM, in *Geography*, a town of Germany, in the circle of Swabia, and capital of a bailiwick, in the principality of Oettingen, five miles south of Oettingen.

ALLERSHEIM is also the name of a bailiwick, in the principality of Wolfenbuttel, containing four villages, and anciently called Ellenfen.

ALIERSPERG, a town of Germany, in the circle of Franconia, six leagues south of Nuremberg.

ALLERSTEIN, called in the Polish language *Olsineck*, is a small town with a castle in the province of Ermeland, situate on the river Alle, and built in 1367.

ALLERTSPERG, a town of Germany, in the archduchy of Austria, seven miles north of Bavarian Waidhoven.

ALLESANI, a town of Corsica, 13 miles east-north-east of Corte.

ALLESTRY, RICHARD, in *Biography*, an English episcopalian divine, was born at Uppington, near the Wreken, in Shropshire, in the year 1619, and after receiving part of his education at Coventry, under Philemon Holland, the translator, was entered a commoner in Christ-church, Oxford, under the tuition of Richard Busby, afterwards Dr. Busby, the famous master of Westminster school. From a course of study and improvement, in which after he had taken the degree of bachelor of arts, he was chosen moderator in philosophy, the distraction of the times suddenly called him forth to military service. In this new occupation, he and the other Oxford scholars, manifested their loyalty; but having been protected and supported by Sir John Biron, with a party of horse, Allestry and his associates returned to their studies. It was not long before their safety was again endangered by a republican party, who entered Oxford for the purpose of plundering the colleges. Allestry contrived secretly to remove the booty which they had collected; and as soon as it was known that he was the cause of their disappointment, they seized him, and would probably have treated him with severity, if they had not been suddenly called away by the earl of Essex. On a subsequent occasion he was taken prisoner by a party of horse, but when the parliament garrison at Broughton-house, whither he was conveyed, surrendered to the king's forces, he was released. Allestry resuming his studies, took his degree of master of arts. As soon, however, as he recovered from a disorder which threatened his life, and which had prevailed in the garrison at Oxford, he entered again into the king's service, and encountered the fatigues and hazards of a military life, in the humble station of a common soldier. In this service, blending the watchings of a soldier with the lucubrations of a scholar, he continued till the end of the war; and when the republican party became triumphant, he retired to his college. Here he was employed in the office of censor, and as private tutor to several students; and though he had no prospect of ecclesiastical preferment, he entered into holy orders. Still zealously attached to the royal party, he signed the decree passed in the university of Oxford, against the solemn league and covenant. In consequence of this act, he and other members of the university, with whom he concurred, were proscribed and banished from Oxford by the parliamentary visitors. To him, however, a short respite was granted for settling his affairs, "because," as one of their number asserted, "he was an eminent man." During the depression of the royalists he found an asylum, first in the house of Francis Newport, Esq. in Shropshire, where he officiated as chaplain, and afterwards in that of Sir Anthony Cope, in Oxfordshire. His talents and fidelity rendered him an useful and active instrument in preparing the way for the restoration of Charles II. In one of his expeditions for this purpose he was seized at Dover by a party of soldiers, and committed to the jail of the king's friends at Lambeth house. Upon his release from confinement, he proposed to visit his friend Dr. Hammond, at Westwood, near Worcester; but when he approached his house, he met

his funeral procession. Of his esteem, however, he received a valuable testimony in the legacy of his library, which was bequeathed him for this reason; because the testator "well knew that the books in his hands would be useful weapons for the defence of the cause which he had during life so vigorously supported."

Soon after the Restoration, Allestry returned to Oxford, and took the degree of doctor in divinity. In recompence of his past services he was soon made a canon of Christ church, one of the king's chaplains in ordinary, and regius-professor of divinity. In 1665 the king conferred upon Dr. Allestry the provostship of Eton college, which he held till his death. To this college he was a munificent benefactor, by retrenching his own dues in order to pay off its debts, and by erecting at his own expence the west side of the outward court of the college; nor was he less liberal in other respects, as he settled pensions on indigent persons and families, and distributed his income in occasional charities. At the instance of Dr. Allestry, and in compliance with the petition of the provost and fellows of King's college, Cambridge, the king passed a grant under the broad seal, that, whereas formerly the fellowships of Eton were generally disposed of to persons of foreign education, for the future five of the seven fellows should be such as had been educated at Eton school, and were fellows of King's college. In 1679, Dr. Allestry, finding his health, and particularly his sight, much impaired, resigned his professorship of divinity; and in 1681 a dropsy terminated his life, and he was buried in Eton chapel, under a monument of white marble, on which is inscribed a Latin epitaph, distinguished by its terseness and elegance. A biographer in an account of his life prefixed to his sermons represents Dr. Allestry as a man of uncommon talents and singular merit. "Memory, fancy, judgment, elocution, great modesty, and no less assurance; a comprehension of things, and a fluency of words; an aptness for the pleasant, and sufficiency for the rugged parts of knowledge; a courage to encounter, and an industry to master all things, make up the character of his happy genius. There was not in the world a man of clearer honesty and courage; no temptation could bribe him to do a base thing, or terror affright him from the doing a good one. This made his friendships as lasting and inviolable as his life, without the dirty considerations of profit, or sly reserves of craft; not the pageantry of ceremonious address, or cold civility, much less the servile falseness of obsequious flattery." Whatever may be thought of his political principles, no doubt can be entertained of his consistency; and of the benevolence of his disposition, his numerous acts of liberality afford sufficient evidence. Of his literary talents posterity can only judge by a volume of 40 sermons, printed in folio at Oxford, in 1684; and excepting one singular instance of credulity which they furnish, they do no discredit to the memory of the author. His lectures, which gave satisfaction to those who heard them, he would never be prevailed upon to publish. His valuable library he left to his college. *Biog. Brit.*

ALLESTRY, JACOB, a poet of the 17th century, was the son of a bookseller, in London, and entered Christ church, in Oxford, in 1671, at the age of 18 years. He took the degrees of bachelor and master of arts, and was music-reader in 1679, and *teræ-filius* in 1682, both which offices he executed with great applause, as he was esteemed a good philologist and poet. He died in 1686, in consequence, as it is said, of the vices of his youth, and was buried in the church of St. Thomas, at Oxford. The pieces of poetry, written by him, were printed in a book, entitled, "Examen Poeticum." *Biog. Brit.*

ALLEU, or ALLODE, in *Antiquity*. See ALLODIUM.

ALLEVARD, in *Geography*, a town of France, in the

department of Isere, and district of Grenoble, six leagues north-north-east of Grenoble.

ALLEVEURE, the smallest copper coin that is struck in Sweden; it is not worth quite two *deniers Tournois* of France, or about $\frac{1}{3}$ of English money.

ALLEVIARE, in *Old Records*, to LEVY or pay an accustomed fine or composition.

ALLEVIATION, denotes the art of making a thing lighter, and easier to bear or endure.

The word is originally Latin, compounded of *ad, to*; and *levas, light*.

In which sense, alleviation is synonymous with lightening, and stands opposed to aggravation.

ALLEX, in *Geography*, a town of France, in the department of the Drome, and district of Crest, on the north side of the Drome, 10 miles south of Valence.

ALLEY, WILLIAM, in *Biography*, bishop of Exeter, in the reign of Queen Elizabeth, was born at Great Wycomb, in Buckinghamshire, educated at Eton School, and removed to King's college, in Cambridge, in 1528. Here he took the degree of bachelor of arts, and afterwards pursued his studies at Oxford. He was a zealous reformer; and upon Queen Mary's accession he quitted his benefice, and travelled in the northern parts of England, where he was not known, gaining a decent subsistence by the practice of physick and the instruction of youth. When Queen Elizabeth ascended the throne, he came to London, and acquired such reputation in preaching the divinity lecture at St. Paul's, that he was consecrated to the see of Exeter in 1560; and in 1561 he was created doctor of divinity at Oxford. He died in 1570, as some say, according to others in 1571, and, as Fuller says, in 1576, and was buried at Exeter, in the middle of the choir. Over his tomb is a Latin inscription, representing him as "A zealous advocate for the truths of the Gospel, eminent for his virtues, and remarkably skilled in all the useful parts of learning." He wrote "The Poor Man's Library," a miscellany, in two volumes, containing lectures upon the Epistle of St. Peter, and "An Hebrew Grammar." When the version of the Bible was undertaken by command of Queen Elizabeth, this bishop translated the Pentateuch. "His Judgment concerning the Doctrine and Discipline of the Church," has been published by Strype in his *Annals of Queen Elizabeth*. *Biog. Brit.*

ALLEY, derived from *aller, to go*, in *Gardening*, signifies a narrow or confined path between beds, borders, or other compartments of a garden, and is chiefly formed for the convenience of going between them, in order to perform the necessary business, such as hoeing and weeding the plants, and also to cut, pick, and collect the plants or fruits. Alleys are made of different breadths, according to the sizes of the beds or compartments; but in general a breadth from one to two feet is sufficient. In extensive kitchen-gardens, where borders are carried round next the walks, and immediately adjoining the main quarters of the ground, they should be divided from them by two-foot alleys, for the convenience of carrying in dung, water, &c. and the large compartments should likewise be divided by one or two cross alleys, with the same intention. Alleys between asparagus beds should constantly be two feet wide; those between strawberries, a foot and a half; but between beds of aromatic herbs, fifteen inches may be fully sufficient; and between beds of onions, leeks, carrots, parsnips, lettuce, endive, and all other small crops, the width of ten or twelve inches is as much as is requisite in general; and the same distance between beds of seedling and pricked-out cabbages, favours, celery, &c. for the convenience of going in to weed, water, and draw the young plants for transplantation, will be the most convenient. Alleys are frequently intended both for

use and ornament in flower-gardens; therefore, between beds of tulips, hyacinths, ranunculuses, anemones, and other similar garden-flowers that are bedded, they should in general be eighteen inches or two feet wide; and in order to have them ornamental, the beds should be edged with box, and the alleys filled with the best coloured fine gravel; or where that cannot be readily procured, with sand, shells, or other porous substances. See GRAVEL WALKS.

ALLEY, in *Drill Husbandry*, implies the vacant space between the outermost row of corn on one bed, and the nearest row to it on the next parallel bed. In the practice of drilling it was at first supposed that narrow alleys would not answer the end for which they were intended; while, on the other hand, the making them very wide would be a loss of ground; about four feet, exclusive of the spaces or partitions, between the rows of corn in the beds, was therefore considered as the most suitable and convenient distance. But as it is obvious, that it is not necessary to make the alleys so wide in good soils as in those of inferior quality, and that some sorts of crops require much larger spaces than others; the intelligent husbandman should always decide what breadth is the most proper in different cases, and for different purposes; one circumstance must, however, be duly attended to, which is, that wide alleys are more easily and much better stirred between than those that are narrower; for, when an alley is wide, the large furrow in the middle of it may be cut deep, there being then sufficient room to turn the earth over towards the rows, while, on the contrary, the earth where alleys are narrow cannot be stirred deep enough, nor can room be found for what is turned over out of the furrows, without danger of burying some part of the rows of corn or other crops that may be cultivated. In hoeing these spaces the whole of them is not to be stirred, either with the plough or cultivator, when the crop appears; neither of these instruments should go too near the rows of corn or other crop, for fear of rooting up the rows of corn or young plants; but a slip of earth, about six inches wide, is directed to be left untouched on the outside of each bed, by which means the part of the alley that is to be stirred will be reduced to the breadth of three feet; and even that space is lessened in the first ploughing before winter by a deep furrow, which is then cut close to, and all along those six-inch slips, and the earth taken out of each furrow is thrown into the great furrow in the middle of the alley, which it fills and arches up. These two side-furrows make together a breadth of about eighteen inches, and consequently leave, in the middle of the alley, a space of about eighteen inches more, on which is heaped up the earth thrown out of the two furrows; and thus the alleys are to remain during winter. By the first hoeing in the spring, the earth heaped up in the middle of the alleys is to be turned back towards the rows of corn. The two furrows that were opened before winter are then filled up, and a new one is cut in the middle of the alley. This business may be very easily performed with the common plough; two turns of that instrument being frequently sufficient for the purpose, one on each side of the alley, as near as possible to the beds. But when these two turns are not sufficient to form the furrows perfectly, or where too much earth remains between it and the bed, a third turn becomes necessary, and sometimes a fourth, in order to hollow the middle furrow as it ought to be.—When this work is performed with the cultivator with two mould-boards, the instrument must be placed in the middle of the alley, and the horses in one of the two furrows; the share readily entering a great depth into the earth, which was laid there by the last hoeing before winter, the horses advancing, the ridge of the earth is divided into two parts, and fills up the furrows that were made before winter, on each

side of the alley, close to the beds. Thus, the high furrow in the middle of the alley may be opened, and the whole operation performed by a single turn of the cultivator; by which so much time and labour is saved, that the farmer may afford one or two stirrings more in the summer, which will be of great utility in many cases. See CULTIVATOR, HORSE-HOEING, and DRILL-HUSBANDRY.

ALLEY, in *Perspective*, is that which is larger at the entrance than at the exit; to give it the greater appearance of length.

ALLEYN, EDWARD, in *Biography*, a celebrated comedian, was born in London in 1566, and trained at an early period to the stage, for which he was naturally qualified by a stately port and aspect, corporal agility, flexible genius, lively temper, retentive memory, and fluent elocution. Before the year 1592 he seems to have acquired a very considerable degree of popularity in his profession; he was one of the original actors in the plays of Shakspeare, and a principal performer in some of those of Jonson; but it does not now appear what were the characters which he personated. They were probably the most dignified and majestic, for to these the portly and graceful figure of his person was well adapted. At length he became master of a company of players, and the proprietor of a play-house, called the Fortune, which he erected, at his own expence, near Whitecross-street; and he was also joint proprietor and master of the Royal Bear-Garden, on the Bank-side, in Southwark. By the profits accruing from these occupations, added to his paternal inheritance, and to the dowries of his two wives, by whom he had no children, he amassed a considerable property, which he bestowed in a manner that has redounded more to his honour than his professional merit. The wealth thus acquired enabled him to lay the foundation of a college, for the maintenance of aged people, and the education of children, at Dulwich, in Surry, which institution, called, "The College of God's Gift," subsists at this time in an improved and prosperous state. The liberal founder, before he was 48 years of age, began this building after the design, and under the direction, of Inigo Jones: and it is presumed that he expended eight or ten thousand pounds upon the college, chapel, &c. before the buildings and gardens were finished, which was about the year 1617. It is hardly necessary to mention a fabulous tradition concerning the origin of this college, recorded by Mr. Aubrey. The idle tradition, which deserves no credit, and needs no confutation, reports, that Mr. Alleyn, "playing a dæmon, with six others, in one of Shakspeare's plays, was in the midst of the play surpris'd by the apparition of the devil, which so worked on his fancy, that he made a vow, which he performed at this place." After the founder had built this college, he met with difficulties in obtaining a charter for settling his lands in mortmain, that he might endow it, as he proposed, with 800*l. per annum*, for the support and maintenance of one master, one warden, and four fellows, three of whom were to be ecclesiastics, and the other a skilful organist; also six poor men, as many women, and twelve poor boys, who were to be maintained and educated till the age of 14 or 16 years, and then put out to honest trades and callings. The master and warden were to be unmarried, and always to be of the name of Allen or Alleyn. At length the opposition of the Lord Chancellor Bacon was overcome, and Alleyn's beneficence obtained the royal licence, and he had full power granted him to establish his foundation, by his Majesty's letters patent, under the great seal, bearing date June 21, 1619. When the college was finished, the founder and his wife resided in it, and conformed in every respect to the regulations established for the government of his almoners. Having, by his will, liberally provided for his widow, and for founding 20 alms-houses, 10 in the parish of St. Botolph, with-

out Bishopsgate, in which he was born, and ten in St. Saviour's parish, Southwark, and bequeathed several small legacies to his relations and friends, he appropriated the residue of his property to the use of the college. He died in 1626, in the 61st year of his age, and was buried in the chapel of his own college. The chapel, master's apartments, &c. are in the front of this building, and the lodgings of the other inhabitants, &c. in the two wings, of which that on the east side was handsomely new built, in 1739, at the expence of the college. They have a small library of books, and a gallery of pictures, with that of the founder at full length. The inscription over the door concludes with these words: "Abi tu, et fac similiter;" i. e. Go thou, and do likewise. Biog. Brit.

ALL-GOOD, in *Botany*. See CHENOPODIUM.

ALL-HEAL. See HIERACLEUM and STACHYS.

ALLIA, or SEMIRUS, in *Ancient Geography*, a river of Bruttium, in Italy.

ALLIA, a small river of Italy, in the territory of the Sabines, to which Virgil (lib. vii. v. 717.) annexes the epithet of "infaustum nomen," in allusion to the defeat of the Roman army by the Gauls on the banks of this river, when, in the year of Rome 363, 40,000 Romans were either killed or put to flight. Hence, "Allienis dies," is in their almanacks marked as an unlucky day, i. e. the 18th of July, which was the anniversary of this battle. Livy (lib. v. c. 37. tom. ii. p. 165.) represents this river as running down a very steep channel from the mountains of Crustumium, at the 11th mile-stone, and mixing with the Tiber. Our ancestors, says Cicero (ad Attic. lib. ix. 5. tom. viii. p. 355.) deemed the day of the battle of Allia, more fatal than that of the capture of the city.

ALLIANCE, in the *Civil and Canon Law*, the union or connection of two persons, or two families, by means of marriage; otherwise called AFFINITY.

The word seems formed of the Latin *adligatio*, q. d. a *tying together*.

The law of the *Twelve Tables* forbids all alliance between persons of unequal rank and condition. And in Portugal, we are told, the daughters of the nobility are prohibited to ally with such as have never been in the wars.

ALLIANCE is also extended to the leagues or treaties concluded between sovereign princes and states, for their mutual safety and defence; in which sense they are the same with what we otherwise call *confederacy*, *league*, &c. Alliances make a species of treaties, which are usually divided into treaties of peace, of commerce, and of alliance, properly so called. These are sometimes particularly denominated foreign alliances.

Alliances are variously distinguished, according to their object, the parties in them, &c. Hence we read of equal, unequal, triple, quadruple, grand, offensive, defensive, &c. alliances. Unequal alliances, *foedera inaequalia*, are those wherein one of the contracting powers promises patronage or protection, and the other fidelity and observance; by which they stand contradistinguished from alliances, wherein the several powers treat on a par. Offensive alliance, is that whereby the parties oblige themselves jointly to attack some other power. This stands contradistinguished from defensive alliances.

Alliances, offensive and defensive, are those in which the contracting parties agree to regard as a common enemy any power that attacks either of them, as well as mutually to defend each other. Such was that between the Emperor and the States-General against France, concluded at Vienna the 12th of May, 1689, and which was the commencement of that which was called the general or grand alliance. To this treaty Spain was to be invited by the emperor, and

England by the States, and it was stipulated that all the allies of either party were to be admitted, if they thought proper to accede. The triple alliance between England, Holland, and Sweden, in 1668, concluded by the negotiation of De Wit and Temple, was an event of importance in the history of Europe. England thus recovered her influence and credit in Europe. Temple was applauded for it. The French monarch and the court of Spain were greatly displeased; but they were obliged to acquiesce, as the whole of Europe seemed to repose with security under the wings of that powerful confederacy, which had been so happily formed for her protection. Another alliance of this kind was formed in 1701 between the kings of Great Britain and Denmark, and the States-General; and another between the Emperor, England, and Holland was concluded in the same year. A triple alliance was formed in 1710 between Great Britain, France, and the States-General. The intrigues of Cardinal Alberoni, prime-minister to Philip V. of Spain, produced various negotiations in 1718, from which at length sprung the treaty, called at first the triple alliance between Great Britain, France, and Holland; and, after the accession of the emperor, styled the quadruple alliance. The object of this alliance was to settle all disputed pretensions between Spain, Germany, and some of the Italian princes. The king of Sicily was admitted into this treaty; and at length the king of Spain himself was forced to accede to it; and ALBERONI was banished by Philip V. But as some points were still controverted between the emperor and king of Spain, these were referred to be amicably determined in the congress opened at Cambray in 1721, under the mediation of his Britannic Majesty and the most Christian king. Puffendorf, Grotius, and other writers upon the laws of nature and nations, have distinguished alliances into personal and real. The former are those which are made with a king considered personally, so that they terminate with his life, and real are such as exist between states and nations, and which subsist and retain their obligation after the death of the king or ruling magistrates. It has been argued by others, that the admission of personal alliances is inconsistent with the foundation of political society, and that they tend to separate the sovereign from his subjects.

Though the title of allies, *foedera*, of the Romans, was a sort of servitude, it was much coveted. Ariarathes, we are told by Polybius, offered a sacrifice to the gods by way of thanksgiving for having obtained this alliance. The reason was, that thenceforwards people were sure not to receive any injuries except from them. Cæsar informs us that a great number of kings had this honour. There were divers sorts of allies: some only united to them, by a participation of the privileges of the Romans, as the Latini and Hernici; others by their very foundation, as the colonies; others by the benefactions they received from them as Massinissa, Eumenes, and Attalus, who owed their kingdoms to Rome; others by free treaties, which last, by a long alliance, became subjects, as the kings of Bithynia, Cappadocia, Egypt, and most of the cities of Greece: lastly, others by compulsive treaties, and the law of subjection, as Philip and Antiochus. For they never granted peace to an enemy, without making an alliance with him; that is, they never subdued any people without using it as a means of subduing others.

The allies of Italy, *Socii Italici*, were distinguished from other foreign allies. Of these there were two kinds; those distinguished by the name of *praefectura*, who were governed by Roman magistrates and laws, and those who retained the privilege of being governed by their own ancient laws, and were denominated *autonomi*. The Latin allies, *foedera latini*, were those who enjoyed the *jus Latii*, and who held the first

rank in the order of allies; of these there were three distinctions, *viz.* those who inhabited Latium, the Latin colonies, and those on whom were conferred the privileges of the Latin colonies, on account of some service which had been rendered by them to the Roman state, or by the peculiar favour of the Roman people and the emperors. There was a great difference between the allies and the auxiliaries, when they were admitted into the armies of the Roman empire. The allied troops were always taken from the allies of Italy, which had never been reduced into Roman provinces. The auxiliaries were furnished by the foreign allies. The allied troops maintained themselves at their own charge, and were supplied only with corn by the Romans; the latter were kept in pay by them. When the allies joined the Roman army, the consuls chose 12 out of their number to command them, under the name of præfects. They were of the same number, and possessed similar powers with the tribunes of legions. The places which they occupied in the army and camp were assigned them by particular regulations. The allies of the provinces, *socii provinciales*, held the first rank among the foreign allies. The honour of this appellation was conferred on provinces, which submitted to the dominion of the Romans, and were governed by their own magistrates, according to the customs and laws of Rome, and paid an annual tribute to the senate. The *socii immunes* were those who had never been enemies to the Romans, and who were exempt from every kind of imposition. Such were Ptolemy, king of Egypt, and the Jews, who were the first of the eastern nations which solicited the friendship of Rome. Others, after having been enemies of the Romans, laid down their arms and contracted alliances with them.

The forms or ceremonies of alliances have been various in different ages and countries. The Romans conferred it on sovereigns by a deputation of senators, who accompanied it with a sceptre of ivory, the toga picta, and the titles of ally and friend of the Roman people. Among us, signing and swearing, sometimes at the altar, are the chief; anciently eating and drinking together, chiefly offering sacrifices together, were the customary rites of ratifying an alliance. Among the Jews and Chaldeans, heifers or calves; among the Greeks, bulls or goats; and among the Romans, hogs were sacrificed on this occasion. Among the ancient Arabs, alliances were confirmed by drawing blood out of the palms of the hands of the two contracting princes with a sharp stone, dipping herein a piece of their garments, and therewith smearing seven stones, at the same time invoking the gods Vrotal and Alilat, *i. e.* according to Herodotus, Bacchus and Urania. Among the people of Colchis, the confirmation of alliances is said to be effected by one of the princes offering his wife's breasts to the other to suck, which he was obliged to do till blood issued.

It has been disputed, whether the states of the empire have a right of making alliances without the emperor's participation: and whether the king of England be vested with absolute power of making alliances at discretion, without consent of parliament. Dr. Davenant asserts the negative. According to him, the contrary opinion owes its rise to the mere flattery of modern courtiers, having no foundation in the ancient laws and constitution of the kingdom. King John and Richard II. were, according to this author, the first that attempted any thing like it. It is certain there occur numerous instances in history, where the king has asked, or the parliament have offered, their advice, concerning the alliances to be made; but there are many others, at least of later times, wherein no footsteps of any such consultation appear. There are instances likewise where the parliament have declined giving any advice concerning such arduous matters.

ALLIANCE, in a figurative sense, is applied to any kind of union or connection; and in this sense the late bishop Warburton has used the term in his treatise, entitled, "The Alliance between Church and State," published in 1736. Some persons, however, who are advocates for a religious establishment, have objected to this use of the term; alledging, that alliance implies a contract formed by two or more independent powers; whereas the established church, being a part of the state, or one of its members, cannot properly be represented as entering into alliance with it. "The notion," says Lord Bolingbroke (Works, vol. iv. p. 515.) "of a formal alliance between the church and the state, as between two independent distinct powers, is a very groundless and whimsical notion." He informs us, that Dr. Senior, preaching before King Charles II. at Newmarket from Exod. iv. 14, 15, 16, established on these texts a supposed alliance between the church and the state, or rather between the church and the king. "Warburton," he says, "took his hint possibly from it;" but of this we have no evidence besides his lordship's assertion. Others have objected to the sentiment implied in the expression. "Every other idea" of a church establishment, besides that of a scheme of instruction, and "every other end" that has been blended with that of the preservation and communication of religious knowledge, "as the making of the church an engine, or even an ally of the state; converting it into the means of strengthening or of diffusing influence; or regarding it as a support of regal in opposition to popular forms of government, have served only to debase the institution, and to introduce into it numerous corruptions and abuses." Paley's Principles of Moral and Political Philosophy, vol. ii. p. 305, ed. 6th. See RELIGIOUS ESTABLISHMENT.

ALLIANCE ISLAND, in *Geography*, an island in N. lat. 8° and E. long. 100°, discovered by a ship so called from Philadelphia in 1787.

ALLIARIA, in *Botany*, a species of ERYSIMUM.

ALLICA, in *Entomology*, a species of PAPILO *Nymphalis*, with wings dentated and of a dark yellow colour; with numerous black points intermixed with white; found, of a small size, in Siam.

ALLIENI FORUM, in *Ancient Geography*, a city of Italy, now generally thought to be Ferrara.

ALLIER, in *Geography*, a river of France, which gives name to one of the departments. It rises near Chateau Neuf de Randon, in the department of Lozere, and joins the Loire three miles west of Nevers.

ALLIER, *department of*, is formed of the ancient province, Bourbonnois. It is bounded on the north, by the departments of Saone and Loire, Nièvre and Cher; on the east, by those of Saone and Loire, and the Loire; on the south, by those of the Loire, Puy de Dome, and Creuse; and on the west, by those of Creuse and Cher. Its superficies is about 1,454,341 square acres, or 742,272 hectares; its population about 266,105 individuals; it is divided into four communal districts; and its chief town is Moulins.

ALLIGATI, in *Antiquity*, the basest and worst kinds of slaves, whom they kept locked up, or with fetters on.

The Romans had three degrees, or orders, of slaves or servants; the first employed in the management of their estates, the second in menial or lower functions of the family, the third called *alligati*, above mentioned.

ALLIGATION, in *Arithmetic*, a rule or operation by which questions are resolved, relating to the mixture of diverse commodities or ingredients together, with the value, effect, &c. thereof in composition.

The word is formed of *alligare*, to tie together, by reason, perhaps, of a sort of vincula, or circular ligatures, ordinarily used to connect the several numbers together.

Alligation is of two kinds, *medial* and *alternate*; to which some add a third, called *partial*.

ALLIGATION medial, teaches how to find the mean rate of a mixture, when the particular quantities that are mixed or compounded, and their respective mean rates, are given.

The several cases will come under the following rules.

I. The quantity of the ingredients, and the prices of each, being given; to find the price or value of some part of the mixture.

Rule. As the sum of the quantities given,
Is to the sum of the products of each ingredient
by its price,
So is any quantity of the mixture,
To its value.

Example 1. A refiner, or goldsmith, hath 12 $\frac{3}{4}$ of gold at 4*l.* per $\frac{3}{4}$, 8 $\frac{3}{4}$ at 4*l.* 5*s.* 3 $\frac{3}{4}$ at 4*l.* 6*s.* 8*d.* and 9 $\frac{3}{4}$ at 4*l.* 13*s.* 4*d.* per $\frac{3}{4}$; what is an ounce worth of all these melted together?

$\frac{3}{4}$ of gold	<i>l.</i>	<i>s.</i>	<i>d.</i>	<i>l.</i>
12 \times by	4	0	0	the product is 48
8 by	4	5	0	34
3 by	4	6	8	13
9 by	4	13	4	42
<hr/> 32 total				<hr/> 137 sum.

Then as 32 $\frac{3}{4}$: 137*l.* :: 1 $\frac{3}{4}$: 4*l.* $\frac{9}{32}$, or to 4*l.* 5*s.* 7 $\frac{1}{2}$ *d.*
By the same rule the value of any other quantity of that composition is to be found: as supposing 7 $\frac{3}{4}$.

For as 32 : 137 :: 7 : 29 $\frac{1}{2}$.

Example 2. Suppose it were required to mix 6 gallons of wine at 5*s.* a gallon, 8 at 6*s.* and 4 at 8*s.* what would be the value of the mixture per gallon?

6 \times 5 =	30
8 \times 6 =	48
4 \times 8 =	32

Whole compound, 18 110 sum of products.

Then 18) 110 (6 $\frac{2}{9}$ or 6 $\frac{5}{9}$. is the value sought.

II. The prices of the several ingredients, and the sum paid or received for the mixture being given; to find what quantity of each was bought or sold. Divide the sum paid or received, by the sum of the particular prices; the quotient is the answer.

III. The ingredients of a mixture being given, to augment or diminish the mixture proportionally.

Rule. As the sum of the particular quantities of the compound given,

Is to the whole quantity proposed to be augmented or lessened;

So is each particular quantity in the given compound,
To the due proportion required of that specie, fineness, &c.

Example. The compound in the foregoing instance is required to be augmented to 48 $\frac{3}{4}$: that is, 16 is to be added to 32, how much of each ingredient must be taken?

12	Then as 32 : 16 ::	{	12	: 6 $\frac{3}{4}$
8			8	: 4
3			3	: 1 $\frac{1}{2}$
9			9	: 4 $\frac{1}{2}$
<hr/> 32 sum.			<hr/> 16 sum.	

So that there must be 18 $\frac{3}{4}$ of gold at 4 0 0 per $\frac{3}{4}$.

12	4	0	0
4 $\frac{1}{2}$	4	5	0
13 $\frac{1}{2}$	4	6	8
	4	13	4

Sum = 48 for proof of the operation.

IV. The nature, quality, &c. of the several ingredients of

a mixture being given, to find the temperament or degree of fineness resulting from the whole. Place the several quantities of the mixture in rows; against which place orderly their several qualities or fineness: and multiply each quantity by its own quality or degree of fineness; then, as the sum of the quantities is to the products, so is unity to the quality or fineness of the mixture.

V. The quantities of a mixture being given; to find the particular quantities of any ingredient in any part of the mixture.

Rule. As the total of the composition,
Is to the quantity of any simple in that composition,
So is the total quantity proposed, to be proportionably compounded,

To the quantity of each simple to be in that proposed quantity.

Example. How much of each ingredient (or price of gold mentioned in the first case) is in a pound, or 12 $\frac{3}{4}$ of the 32, being the compound given?

	<i>l.</i>	<i>s.</i>	<i>d.</i>
As 32 : 12 ::	12 $\frac{3}{4}$:	4 $\frac{1}{2}$ at 4 0 0 per $\frac{3}{4}$.
	8	:	3 at 4 5 0
	3	:	1 $\frac{1}{2}$ at 4 6 8
	9	:	3 $\frac{3}{8}$ at 4 13 4
			12 proof.

VI. Given the total of a mixture, with the whole value, and the values of the several ingredients; to find the several quantities mixed, though unequally.

This case admits of two varieties: first, where the mixture is of two simples; and, secondly, when it consists of more than two. For the first, the rule is—Multiply the total of the mixture by the least value, subtract the product from the total value; and the remainder is the first dividend; then take the said least value from the greatest valued ingredient, and the remainder is the first divisor. The quotient of this division shews the quantity of the highest-priced ingredient, and the other is the complement to the whole.

Thus, still referring to the first example, and assuming the two first terms of it:

Gold at 4*l.* per $\frac{3}{4}$.
Ditto at 4*l.* 5*s.*

Total of the composition = 20 $\frac{3}{4}$. Total value 8*z*.
 $\times \frac{4}{80}$ $\frac{-80}{80}$ \div by $\frac{1}{4}$ *l.* 2 (8 the quantity of the highest-priced ingredient.

Secondly, when the quantities are more than two in number.

These kinds of questions, as in those of *alligation alternate*, admit of various answers, all of them true, and are called *INDETERMINATE problems*. They are best done by parcel, two at a time, as in the preceding operation.

ALLIGATION alternate is the method of finding the quantities of ingredients or simples necessary to form a compound of a given rate or quality; and it is the converse of *alligation medial*.

Alligation alternate shews the due proportion of several ingredients; and counterchanges the place of such excesses or differences as arise between the mean price and the extremes; ascribing that to the greater extreme which proceeds from the lesser: and contrarily.

The rules which obtain in *alligation alternate* are as follow: every greater extreme is to be linked with one lesser. If either of the extremes be single, and the other extremes plural, the single extreme is to be linked to all the rest.

If both greater and lesser extremes be not plural, they may be linked so differently that several differences may be taken and a variety of answers may be made to the question, yet all true; but if one of the extremes be single, there can be but one answer.

The numbers being linked, take the difference of each from the mean or common price; and place this difference against the number it is linked to, alternately.

Every number, linked with more than one, must have all the differences of the numbers it is linked to, set against it.

These differences resolve the question, when the price of every one of the ingredients is given without their quantities: and the demand is, to mix them so as to sell a certain quantity at a mean rate.

Example 1. A person would mix wheat at 4s. a bushel with rye at 2s. 8d. so as to sell the mixture at 3s. 6d. a bushel, how much of each must he take?

Thus: $d.$
 $42 \left\{ \begin{array}{l} 48 \\ 32 \end{array} \right\} \begin{array}{l} 10 \text{ bushels of wheat,} \\ 6 \text{ bushels of rye.} \end{array} \right\} \text{Answer.}$

Example 2. A vintner would mix Malaga, at 7s. 6d. a gallon, with Canary at 6s. 9d. and white wine at 4s. 3d. so as to sell the compound at 5s. 2d. a gallon: what quantity of each must he take?

$d.$
 $62 \left\{ \begin{array}{l} 90 \\ 81 \\ 51 \end{array} \right\} \left\{ \begin{array}{l} 11 \\ 11 \\ 19.28 \end{array} \right\} \left\{ \begin{array}{l} 11 \text{ Malaga,} \\ 11 \text{ Canary,} \\ 47 \text{ White wine.} \end{array} \right\} \right\} \text{Answer.}$

N. B. The difference between 62 and 51 is 11, which is set against 81, and also against 90: the difference between 62 and 81 is 19, placed against 51: the difference between 62 and 90 is 28, which is also set against 51. Then 10, added to 28, is 47: and therefore the differences required are 11, 11, 47.

But, in *Alligation partial*, when the quantity of one, with the price of all the ingredients, is given, and the demand is to know the quantities of the other ingredients; then, the rule of three is to be used.

Say, as the difference standing against the price of the given quantity is to the given quantity, so are the several other differences to the respective quantities required.

Example 1. If it be desired to mix 10 bushels of wheat, at 5s. with rye at 3s. 6d. and barley at 2s. 4d. so as to sell the mixture at 4s. per bushel, how much rye and barley must be taken?

$48 \left\{ \begin{array}{l} \text{Wheat, } 60 \\ \text{Rye, } 42 \\ \text{Barley, } 28 \end{array} \right\} \left\{ \begin{array}{l} 6.20 \\ 12 \\ 12 \end{array} \right\} \left\{ \begin{array}{l} 26 \\ 12 \\ 12 \end{array} \right\}$

Then $26 : 10 :: 12 : 4\frac{2}{3}$ bushels of rye and of barley.

Example 2. How much Malaga at 7s. 6d. a gallon, Sherry at 5s. white wine at 4s. 3d. must be mixed with 24 gallons of Canary at 6s. 9d. so that the whole may be sold at 6s. per gallon?

$72 \left\{ \begin{array}{l} \text{Malaga, } 90 \\ \text{Canary, } 81 \\ \text{Sherry, } 60 \\ \text{White wine, } 51 \end{array} \right\} \left\{ \begin{array}{l} 12 \\ 21 \\ 18 \\ 9 \end{array} \right\}$

Or thus:—

$72 \left\{ \begin{array}{l} \text{Malaga, } 90 \\ \text{Canary, } 81 \\ \text{Sherry, } 60 \\ \text{White wine, } 51 \end{array} \right\} \left\{ \begin{array}{l} 21 \\ 12 \\ 9 \\ 18 \end{array} \right\}$

Then, the quantity of Canary being given, say, by the first method $21 : 24 ::$ each difference : its respective quantity: that is,

As $7 : 8 :: \left\{ \begin{array}{l} 12 : 13\frac{1}{2} \text{ gall. Malaga,} \\ 18 : 20\frac{1}{2} \text{ Sherry,} \\ 9 : 10\frac{1}{2} \text{ White wine.} \end{array} \right\} \text{Answer.}$

Or, by the second method:—

As $12 : 24 :: \left\{ \begin{array}{l} 21 : 42 \text{ gall. Malaga,} \\ 9 : 18 \text{ Sherry,} \\ \text{Or } 1 : 2 :: \left\{ \begin{array}{l} 18 : 36 \text{ White wine.} \end{array} \right. \end{array} \right.$

And, in *Alligation total*, when the price of every ingredient is given, without any of their quantities, and the demand is to make up a certain quantity to be sold at a mean rate; then all the differences added together will be the first number in the rule of three; the whole quantity to be mixed, the second number; and each difference apart, the several third numbers; and so many forts as are mixed, so many operations must there be of the rule of three.

Example 1. A goldsmith would mix gold of 24 caracts with some of 21, and with another sort of 19 caracts fine, and with a due quantity of alloy, so that 190 ounces might be of the fineness of 17 caracts; how much of each sort must be taken?

N. B. Alloy is reckoned at 0 caract.

$17 \left\{ \begin{array}{l} 24 \\ 21 \\ 19 \\ 0 \end{array} \right\} \left\{ \begin{array}{l} 17 \\ 17 \\ 17 \\ 2.4.7 \end{array} \right\} \left\{ \begin{array}{l} 17 \\ 17 \\ 17 \\ 13 \end{array} \right\}$
 64

Then $64 : 190 :: \left\{ \begin{array}{l} 17 : 50\frac{1}{2} \text{ of the three sorts of gold.} \\ 13 : 38\frac{1}{2} \text{ of alloy.} \end{array} \right.$

Example 1. A mixture of wine is required to be made of 130 quarts from 5 sorts, whose prices are 7d. 8d. 10d. 14d. and 15d. a quart respectively, and the whole is to be sold at 12d. a quart; how much of each is necessary? As there are five quantities, they will admit of several alternations.

First Method.

$12 \left\{ \begin{array}{l} 15 \\ 14 \\ 10 \\ 8 \\ 7 \end{array} \right\} \left\{ \begin{array}{l} 5 \\ 4.2 \\ 2 \\ 2 \\ 3 \end{array} \right\} \left\{ \begin{array}{l} 5 \\ 6 \\ 2 \\ 2 \\ 3 \end{array} \right\}$

Second Method.

$12 \left\{ \begin{array}{l} 15 \\ 14 \\ 10 \\ 8 \\ 7 \end{array} \right\} \left\{ \begin{array}{l} 4.2 \\ 5 \\ 3 \\ 3 \\ 2 \end{array} \right\} \left\{ \begin{array}{l} 6 \\ 5 \\ 3 \\ 3 \\ 2 \end{array} \right\}$

Third Method.

$12 \left\{ \begin{array}{l} 15 \\ 14 \\ 10 \\ 8 \\ 7 \end{array} \right\} \left\{ \begin{array}{l} 2.4.5 \\ 2.4.5 \\ 3.2 \\ 3.2 \\ 3.2 \end{array} \right\} \left\{ \begin{array}{l} 11 \\ 11 \\ 5 \\ 5 \\ 5 \end{array} \right\}$

The operation by the last method is as follows:

$37 : 130 :: \left\{ \begin{array}{l} 11 : 38\frac{2}{3} \text{ quarts of wine at } 15d. \text{ and } 14d. \\ 5 : 17\frac{2}{3} \text{ at } 10d. \text{ 8d. and } 7d. \end{array} \right.$
 The

The rule for this kind of alligation may be otherwise expressed and applied to all the cases above enumerated, thus: Having coupled the rates as before, then for any pair of differences, take their equimultiples, or multiply them by any number at pleasure; proceed in the same manner with any other pair; and you will thus have a new set of differences with which to work.

Example 1. A grocer would mix 12lb. of sugar at 10d. with two other sorts at 8d. and 5d. so that the mixture may be sold at 7d.; how much must he take?

Common Method.

General Method.

$$7 \left\{ \begin{array}{l} 10 \\ 8 \\ 5 \end{array} \right\} \left| \begin{array}{l} 2 \\ 2 \\ 1.3 \end{array} \right| \left| \begin{array}{l} 2 \\ 2 \\ 4 \end{array} \right|$$

$$7 \left\{ \begin{array}{l} 10 \\ 8 \\ 5 \end{array} \right\} \left| \begin{array}{l} 2 \times 2 \\ 2 \times 3 \\ 1 \times 2.3 \times 3 \end{array} \right| \left| \begin{array}{l} 4 \\ 6 \\ 11 \end{array} \right|$$

The pair of differences against 10 and 5, being 2 and 1, are multiplied by 2, and they become 4 and 2: those against 8 and 5, being 2 and 3, are multiplied by 3, and they become 6 and 9; so that 4, 6, 11, will be the new set of differences.

Then, 4 : 12 $\left\{ \begin{array}{l} 6 : 8lb. \text{ at } 8d. \\ 11 : 33lb. \text{ at } 5d. \end{array} \right.$

Example 2. A farmer would mix wheat at 4s. with rye at 3s. and barley at 2s. and oats at 1s. per bushel, in order to obtain a quantity of 120 bushels, to be sold at 2s. 4d. per bushel; how much of each must be taken?

$$28 \left\{ \begin{array}{l} \text{Wheat, } 48 \\ \text{Rye, } 36 \\ \text{Barley, } 24 \\ \text{Oats, } 12 \end{array} \right\} \left| \begin{array}{l} 16 \times 3 \\ 4 \times 5 \\ 8 \times 5 \\ 20 \times 3 \end{array} \right| \left| \begin{array}{l} 48 \\ 20 \\ 40 \\ 60 \end{array} \right|$$

168

Then 168 : 120 :: $\left\{ \begin{array}{l} 48 : 34\frac{2}{7} \text{ bushels of wheat,} \\ 20 : 14\frac{2}{7} \text{ rye,} \\ 40 : 28\frac{2}{7} \text{ barley,} \\ 60 : 42\frac{2}{7} \text{ oats.} \end{array} \right.$

Or, 7 : 5 :: $\left\{ \begin{array}{l} 48 : 28\frac{2}{7} \\ 60 : 42\frac{2}{7} \end{array} \right.$

But all questions of this kind are most easily and accurately solved by common algebra, which will enable us to determine their limits; as they form a sort of indeterminate problems, and admit of many, or an indefinite number of answers. For a further explanation of this rule and examples, we refer to Ward, Wallis, Malcolm, Emerson, and other writers on arithmetic and algebra.

We shall add an example, wherein both the kinds of alligation have place. Suppose a mixture of wine of 119 quarts, required to be made of wines of the following prices, 7d. 8d. 14d. and 15d. per quart; and so as that the whole may be afforded at 12d. per quart.

Having linked 8 to 14, and 7 to 15, and counterchanged their differences from the common price, 12d. the sum of their difference is found to be 14; by which dividing 119, the quotient is $8\frac{1}{4}$, or $8\frac{1}{2}$, or for convenience in operation $\frac{1}{7}$.

	Quarts.	
8	$\times 2 = 17$	
14	$\times 4 = 34$	
7	$\times 3 = 25\frac{1}{2}$	
15	$\times 5 = 42\frac{1}{2}$	
	119	

ALLIGATOR, in *Zoology*, a name given to the American crocodile, a species of LACERTA, under which article it is described.

ALLIGATOR Pear, in *Botany*. See LAURUS.

ALLIONIA, in *Botany*, so called in honour of Charles Allioni, professor of botany at Turin, a genus of the *te-*

trandria monogynia class and order, of the natural order of *aggregata* and *dispacee* of Jussieu; the characters of which are, that the calyx is a perianthium common to three flowers, simple, oblong, five-parted, the parts ovate, acute, persistent; and the perianthium proper is obsolete, superior; the corolla proper, one-petalled, funnel-shaped, edge quinquefid, and erect; the stamina have setaceous filaments, longer than the corolla, bending to one side, anthers roundish; the pistillum has a germ inferior, oblong, style setaceous, longer than the filament, stigma multifid and linear; no pericarpium; seeds solitary, oblong, five-cornered and naked: the receptacle naked. Martyn enumerates two, and Gmelin three species, viz. 1. *A. violacea*, with leaves heart-shaped and calyces quinquefid, a native of Cumana, in South America. 2. *A. incarnata*, with leaves obliquely ovate, and calyces triphyllous, a native of Peru, in rocks and sandy soils, introduced into the Paris garden from seeds sent by Dombey, flourishing there and perfecting its seeds in the middle of summer. 3. *A. allida* of Gmelin, with leaves lanceolate, opposite and roughish, and calyces pedicellated and solitary.

ALLIOTH, in *Astronomy*, a star in the tail of the Great Bear, whose observation is much used at sea.

It is also written *alliot*, and *alio*, and literally denotes a horse. The Arabs give this name to each of the three stars in the tail of the Great Bear, on account of their appearing like three horses, ranged for the drawing of the wagon, represented by four stars, called Charles's wain.

ALLIOTICUM, from *αλλισω*, to vary, a *Galenical medicine*, which alters and purifies the blood, consisting chiefly of the roots of dandelion, succory, fennel, and raisins; with the herbs endive, common ox-eye, lettuce, sorrel, fumitory, &c. See ALTERNATIVE.

ALLITERATION, in *Rhetoric*, is a figure or decoration of language, chiefly used in poetry, and consisting in the repetition of the same letter or letters at certain intervals, whence its name is derived. This figure has been generally regarded either as trivial in itself, or as an instance of false refinement; but for the use of it we might refer to the best authority, and it unquestionably facilitates the recitation of verse, contributes to both its sweetness and energy, serves to enforce the sentiment which it expresses, and aids the memory in retaining it. Pontanus, one of those ingenious Italians who flourished upon the revival of literature in Europe, has particularly described this figure, and furnished instances of it both from poetical and prose writers. It occurs in the repetition of the same letters, syllables, or words; and when it takes place in the first and last syllables, and even in the middle ones, it is, he says, wonderfully pleasing. The instances which he produces from Virgil are such as follow: "Sæva sedens super arma."—"Tales casus Cassandra canebat."—"Infonem infando indicio."—"Longè sale saxa sonabant."—"Magno misere murmure pontum."—"Quæque lacus latè liquidos."—In the following instance, cited from Lucretius, it is continued from one verse to another:—

— Adverso flabra feruntur
Flumine."—

Cicero (in Brut.) uses this figure:—"Nulla res magis penetrat in animos, eosque fingit, format, scètit:" and also (De Orat.):—"Quodque me sollicitare summe solet." For the use of this figure we may add to that of Virgil the superior authority of Homer. ll. ζ 201.

"Ἦτοι ὁ καππιδίων τὸ Ἀλίων οἶος Ἄλλιο,
Ὅν θεμὸν καίδων, πᾶσιεν Ἀθηναίων Ἀλιώνων.

Hermogenes quotes these lines as an example of the figure now described, which he calls by a Greek name, Παρηγορῆσις, *parechesis*, and defines to be beauty in similar words, which under a different signification found the same. Aristotle called this figure παραμοίωσις, *paromoiosis*; and the Latin rhetoricians called it *Anominatio*. Giraldus Cambrensis informs us, that in the time of Henry II. the English and the Welch were so attached to this verbal ornament in every highly finished composition, that nothing was by them esteemed elegantly delivered, no diction considered but as rude and rustic, if it were not first amply refined with the polishing art of this figure. From this national taste may probably be derived some of our proverbial similes, which, independently of the sound, have no other merit.

Spenser and Shakspeare adopted this practice. Spenser says—

“ For not to have been dipt in *Lethe lake*
 Could save the Son of *Thetis* from to die;
 But that *blind bard* did him immortal make
 With verses, dipt in dew of *Castalie*.”

Thus Shakspeare :—

“ Had my sweet *Harry had* but half their numbers,
 This day might I, hanging on *Hofspur's* neck,
 Have talked.” Hen. IV. part 2. act 2.

Milton also followed them :—

“ For eloquence, the *soul*; song charms the *sense*.”
 P. L. ii. 556.

Again :—

“ *Behemoth*, biggest born of earth, upheav'd
 His vastness.—” P. L. vii. 471.

Dryden employed this figure frequently, and, like Virgil, with singular simplicity and strength. E. G.

“ Better to hunt in fields for *health* unbought,
 Than see the *doctor* for a nauseous draught.
 The wife for cure on exercise depend;
 God never made his work for man to mend.” Fables.

Pope adopted the same figure, as in the following couplet :—

“ Eternal beauties grace the *shining scene*;
 Fields ever fresh, and groves for ever green.”

Gray, who professed to have learnt his versification from Dryden, seems also to have paid particular attention to this ornament, as in the following instances :—

“ *Ruin* seize thee, ruthless king !”
 “ To highborn *Hoel's* harp, or soft *Llewelyn's* lay.”
 “ Weave the warp, and weave the woof.”
 “ Stamp we our vengeance deep, and ratify his doom.”
 “ Regardless of the *sweeping* whirlwind's sway.”
 “ Eyes that glow, and fangs that grin.”
 “ —Thoughts that breathe, and words that burn.”
 “ *Hauberk* crash, and *helmet* ring.” &c. &c.

J. Jov. Pontani *Actius-Dialogus*, tom. ii. p. 104. ed. Venet. apud Ald. 1519. Harris's *Philological Inquiries*, p. 94—102.

ALLIUM, probably from αλεω, to avoid, because some persons avoid the plant on account of its very disagreeable smell, or from αλλεθωαι, *exilire*, from the quickness of its growth, or from ἀγλαθεις, which signifies a head of garlic,

GARLIC, in *Botany*, a genus of the *hexandria monogynia* class and order, of the natural order of *spatibaceæ* and *asphodeli* of Justieu: its characters are, the calyx is a common spathe or sheath, roundish, shrivelling, and many-flowered; the corolla consists of six oblong petals: the stamina have six filaments, subulate, generally of the length of the corolla, the anthers are oblong and upright: the pistillum has a germ, superior, short, bluntly three-cornered, the corners being marked with a grooved line, style simple, stigma acute: the pericarpium is a capsule, very short, broad, three-lobed, three-celled, and three-valved; and the seeds are many and roundish. Professor Martyn enumerates 45, Gmelin and Willdenow 53 species, distributed into several divisions. 1. Those with stem and leaves flat, and umbel capsule-bearing. 1. *A. ampeeloprasum*, great round-headed garlic; has umbel globose, stamens three-cusped, and petals with a rough keel: its stem is a foot or more in height, having leaves at the bottom, glaucous and succulent: the spathe is conical, one-leaved, and deciduous; it flowers in a close ball on peduncles which are about an inch in length: the stamens are somewhat longer than the corolla, which is of a pale purplish colour: this is eaten along with other pot-herbs; it communicates its flavour to the milk and butter of cows that eat it: it grows naturally in the East, in Switzerland, on the Holms island in the mouth of the Severn, &c. is perennial, and flowers with us in July. 2. *A. porrum*, porrum fativum of Ray and Miller, common leek, has umbel globose, stamens three-cusped, petals with a rough keel, root coated: it has a rather high stem, leafy at bottom, spathe shortly conical, deciduous: flowers in close large balls on purple peduncles in April or May: it is very like the former species, and probably only a variety: it has been generally supposed that there are two sorts of leeks; but Martyn has made trial of both, and found that they were the same; the difference being occasioned by saving the seeds from old roots, and not from the seedling leeks, whereby they have degenerated, and become smaller and more narrow-leaved: this species was cultivated by Gerard in 1597, and probably at an earlier period; but its native place is not ascertained: it is highly esteemed in some places for culinary uses. 3. *A. lineare*, linear-leaved G. with umbel globose, stamens three-cusped, twice as long as the corolla, grows naturally in Siberia, and is called by Miller, who cultivated it in 1768, porrum anpeeloprasum. 4. *A. suaveolens*, with umbel capitated, and stamens awl-shaped, twice as long as the corolla; grows in Austria. 5. *A. deflexum*, has three-cusped stamens, of the length of the corolla, leaves narrow and linear, and stalk declined. 6. *A. rotundum*, great round-headed G. with umbel sub-globose, stamens three-cusped, and side-flowers nodding, has the fruit and seeds of the second species or leek, and is a native of the southern parts of Europe. 7. *A. victoriale*, long-rooted G. with umbel rounded, stamens lanceolate, longer than the corolla, and leaves elliptic; grows on the mountains of Switzerland, Italy, Austria, Silesia, and Savoy; cultivated in 1739 by Miller. 8. *A. subhirsutum*, hairy G. or Dioscorides's Moly, with stamens awl-shaped, and lower leaves hirsute, is a native of Italy, Spain, Africa, and the Levant; was cultivated by Gerard in 1596; flowers in May. 9. *A. magicum*, Homer's G. or Moly, with simple stamens and bulb-bearing branches, was cultivated in 1596 by Gerard, and is preserved in gardens for the sake of variety; but it has a very strong scent. 10. *A. obliquum*, oblique-leaved G. with filiform stamens, thrice as long as the flower, and oblique leaves, is a native of Siberia, and cultivated here before 1768 by Miller. 11. *A. ramosum*, branched G. with globose umbel, stamens awl-shaped, longer, leaves linear and sub-convex, grows naturally

in Siberia, whence the seeds of this and the former sort were sent to Petersburg, and from them the botanic garden, in which they are preserved for the sake of variety, was supplied. 12. *A. Tataricum*, Tartarian G. with umbel flat, stamens simple, and leaves semi-cylindrical, is a native of Siberia, and introduced into Kew gardens in 1787 by Mr. Haneman. 13. *A. roseum*, rose G. with umbel flat-topped, petals emarginate, and stamens very simple, grows naturally about Montpellier and in Piedmont, in the fields, olive-grounds, and vineyards, and was cultivated in 1752 by Miller. 14. *A. caeruleum* has a globose umbel, simple stamens, linear leaves, and prickly sheaths. Gmelin.

II. *A.* with stem-leaves flat and umbel bulb-bearing. 15. *A. fativum*, common G. with compound bulb and three-cusped stamens, is said to be found wild in Sicily, and cultivated in 1551, or probably at a much earlier period. 16. *A. Scorodoprasum*, Rocambole, with three-cusped stamens, crenulate leaves, and two-edged sheaths, is found wild in Sweden, Denmark, Germany, and Hungary, and cultivated here by Gerard in 1596: it has compound bulbs, but much smaller than those of garlic: the root is heart-shaped, solid, and generally stands sideways of the stalk: the leaves are rather broad and crenated at the edges: the flowers, which are collected into a sort of globular head, are of a pale purple colour: the stem generally rises from two to three feet in height, and produces many small bulbs at the top, that may be made use of as well as those of the root. 17. *A. arenarium*, *A. scorodoprasum* of Flor. Dan. 290, sand G. with three-cusped stamens, columnar sheaths, awnless spathe, and petals slightly rough in the keel, distinguished from the last species by its round sheaths, and by its growing always in a sandy soil: bulbs, which are numerous, and blossoms, are blue; stamens a little longer than the blossoms; leaves three or four, lower ones quickly withering, broad, edges hairy, or rather finely toothed, teeth not discernible without a glass; leaf-sheaths strongly keeled; stem two to five feet high; flowers few, on short stalks, small, purple, marked with a deeper line: it grows wild in Thuringia, Scania, Denmark, Switzerland, Italy, and in the woody and mountainous parts of the north of England, particularly about Lowther in Westmoreland, Castle Howard in Yorkshire, Thorp-arch, and Hestington-fields near York. It is perennial, and flowers in July. 18. *A. carinatum*, ampeloprasum proliferum of Lob. ic. 156, Moly montanum secundum Clusii, mountain G. with awl-shaped stamens, very long (acute, Smith) spathe; stem, when cultivated, four feet high; leaves a foot long, not half an inch broad, sheath-leaves two, awl-shaped, unequal; umbel has few flowers, but many bulbs; blossom of a dull brown yellow colour, often changing to purple: the plant has but little of the garlic smell: it is found wild in Scania, Germany, Carniola, Italy, and Switzerland, and also in the rocky and mountainous parts of the north of England, near Settle in Yorkshire, in Hestington-fields near York, and about Knareborough, on the rocks about Longstedale in Westmoreland, near Ramsgate in the isle of Thanet, and between Sandwich and Deal: it is perennial, and flowers in July.

III. *A.* with stem-leaves columnar, and capsule-bearing umbel. 19. *A. sphaerocephalon*, Moly montanum with a purple flower of Clusius, small round-headed G. with three-cusped stamens, longer than the corolla, and semi-columnar leaves, is a native of Switzerland, Italy, Germany, and Siberia, and cultivated in 1759 by Miller, and is thought by Haller not to be specifically distinct from *A. descendens*. 20. *A. parviflorum*, small-flowered G. with globose umbel, simple stamens, longer than the corolla, and awl-shaped spathe, is a native of the south of Europe, and introduced into Kew

garden in 1781 by M. Thouin. 21. *A. difformis*, purple-headed G. with three-cusped stamens, and outer peduncles shorter, is a native of Italy and Switzerland, and cultivated in the Oxford garden in 1766: this species has two bulbs at the origin of the stalk, the leaves being filulose and channelled above, the stalk generally two or more feet in height, the sheath quadrifid. 22. *A. moschatum*, musk-smelling G. Moly of Bauhin and Rudbeck, with umbel flat-topped, mostly six-flowered, acute petals, simple stamens, and setaceous leaves, grows wild in Provence, Narbonne, and Spain; brought by Saltzmann, according to Calp. Baulic, from the hills about Montpellier in 1598, and cultivated in his garden. 23. *A. flavum*, sulphur-coloured G. with flowers pendulous, ovate petals, and stamens longer than the corolla; thought by Gerard and Gouan to be a variety of the last species; is a native of the south of France, Italy, and Austria, and cultivated in 1768 by Miller. 24. *A. desertorum*, with awl-shaped stamens, and petals marked by a dark line in the middle. Forsk. Fl. Æg. Arab. p. 72: doubtful whether it be a distinct species. 25. *A. pallens*, pale-flowered G. with flowers pendulous, truncated; stamens simple, equalling the corolla; is a native of Italy, Spain, Montpellier, and Hungary; and introduced into the Kew garden in 1779 by Abbé Poiret. 26. *A. paniculatum*, panicle G. with peduncles capillary, spread out, stamens awl-shaped, and very long spathe, joined by Gerard to the preceding, is a native of Italy, Austria, Switzerland, Carniola, Siberia, and the Levant; and introduced into the Kew garden in 1780 by Sign. Giov. Fabroni. 27. *A. vineale*, *A. sylvestre* of Ray and Gerard, crow G. with three-cusped stamens; bulbs tapering, bowed back, often running into long hair-like points, compacted into a close head; blossom small, violet; filaments with two long bristles, projecting beyond the flower; stem about two feet high; leaves smooth, hollow, slender, and very long; umbel sheath of one leaf, broad at the base, ending in an awl-shaped point about an inch long, scored with green lines; bulbs numerous, white; and blossoms few, small; there is a variety with a double head of bulbs: this species is a native of Switzerland, Germany, Italy, &c. and with us is frequent in dry pastures, communicating its rank taste to the milk and butter, and growing in old walls and among corn, chiefly in calcareous soil, near Worcester (Stokes): it is perennial, and flowers in July. 28. *A. oleraceum*, purple striped, or streaked, field or wild G. with stamens simple, leaves rough, (not rough, Withering.) semi-columnar, furrowed underneath: the root a solid bulb, stem two or three feet high, upright or a little bent towards the top, smooth, not scored, solid; leaves hollow, bulbs numerous, egg-shaped, forming a roundish knob, between which arise several thread-shaped fruit-stalks, each supporting a single flower, which is drooping, cylindrical, but somewhat bell-shaped; blossom whitish green, with three dark purple streaks on each petal, or pale with purple lines; germen prism-shaped, six-angled; style slender, longer than the blossom; stamens shorter than the petals; with minute white dots, hardly visible to the naked eye, scattered over the whole plant: it is a native of Sweden, Germany, Switzerland, Italy, and Ingria; and with us in Westmoreland, near York, near Bristol, at Fincham, Norfolk, and Black Notley, Essex, and Baydale near Darlington, among corn, and about the borders of fields. It is perennial, and flowers in July. 29. *A. Pallasii*, Pallas's G. with umbel difform, stamens simple, equalling the corolla, and style very short; three-cornered capsule; is a native of Siberia.

IV. *A.* with leaves radical and stem naked. 30. *A. nutans*, porrum of Gmelin, flat-stalked G. with scape two-edged,

edged, leaves linear, flat, and three-cusped flaments; is a native of Siberia, and introduced into Kew garden in 1785 by Dr. W. Pitcairn. 31. *A. ascalonicum*, *cepa ascalonica* of Moryson, *cepa sterilis* of Bauhin, shallot and eschallotte, with scape columnar, leaves awl-shaped, umbel globose, and three-cusped flaments: this species has a conglobate root consisting of numerous oblong parts bound together by means of a thin delicate membranaceous covering, each of which sends forth two or three long fistular awl-shaped leaves from a sheath nearly like those of the common onion; the flower-stems issue from membranaceous sheaths, are round, nearly naked, and terminated by globular umbels of flowers, that have erect saucer-shaped petals, of the length of the stamina, and of a purplish colour: the roots are very pungent, have a strong but rather pleasant smell, on which account they are generally preferred to the onion for various purposes of cookery; was found by Hasselquist, native, in Palestine, and cultivated here in 1633. 32. *A. senescens*, Narcissus-leaved onion or G. with scape two-edged, leaves linear, convex beneath, smooth, umbel roundish, and awl-shaped flaments, joined by Haller and Scopoli to the *A. angulosum*, is a native of Siberia, the Alps, Silesia, and the island of Sicily, and cultivated by Gerard in 1596. 33. *A. illyricum*, with a columnar scape, leaves linear-lanceolated, flat, umbel flat-topped, and awl-shaped flaments, grows naturally in the vine and olive yards of Austria. Willdenow. 34. *A. odorum*, sweet-smelling G. with scape nearly columnar, leaves linear, channelled, angular beneath, umbel flat-topped, is a native of the south of Europe, China, Japan, &c. 35. *A. inodorum*, Carolina G. with scape naked, subtriquetrous, leaves linear, flat, keeled beneath, umbel fastigiata floriferous, and simple flaments, is a native of Carolina, introduced in 1776 by the Duchesse dowager of Portland, and flowers in March and April. 36. *A. angulosum*, *cepa* of Gmelin, angular-scaped G. with scape two-edged, leaves linear-channelled, somewhat angular beneath, and flat-topped umbel, is a native of Siberia, Italy, Austria, Switzerland, and Germany, in moist places. 37. *A. striatum*, with a three-cornered scape, linear leaves, striated with furrows beneath, fastigiata umbel, obtuse petals and simple flaments, is a native of the Cape of Good Hope. 38. *A. narcissiflorum*, with a columnar scape, linear awl-shaped leaves, fastigiata umbel, or umbel terminal inclined, pointed petals, or petals lanceolated, and simple flaments, shorter than the corolla, is a native of the mountains in the southern parts of France. 39. *A. pedemontanum*, with a four-cornered scape, linear obtuse leaves, and few-flowered umbel, is a native of the Alps of Piedmont. 40. *A. nigrum*, *A. multibulbosum* of Jacquin and Murray, *A. montepellulanum* of Gouan, both of which are in Gmelin's Linnæus characterised as distinct species, black G. with scape columnar, leaves linear, (lanceolated, Willd.) umbel hemispherical, petals erect, (patent, Willd.) spathe pointed and bifid, (flaments simple, Willd.) is a native of Provence, Italy, Austria, and the neighbourhood of Algiers, and cultivated in 1759 by Miller. 41. *A. Canadense*, Canada tree onion, with scape columnar, leaves linear, and head bulb-bearing, is a native of North America: this species has a perennial root; smooth, flat, straight leaves, six or seven inches in length; stem cylindrical, smooth, nearly naked, hardly longer than the leaves, spathe ovate, sharpish, and pointed, flowers few and whitish, petals oval, the filaments simple, nearly of the length of the corolla, having brownish red anthers. 42. *A. usynum*, *A. sylvestre latifolium* of Ray, broad-leaved G. or Ramsons, with scape three-sided, (semi-cylindric, Smith,) leaves lanceolate, petiolate, and flat-topped umbel, flowers large, numerous, and white; is a native of Sweden, Denmark, Ger-

many, Switzerland, and Italy, in woods and moist shady places, and with us in England it is frequent in such situations. It is perennial, and flowers in May and June: the smell and taste, according to Haller and Scopoli, are very acrid: Dr. Smith says, that the plant has a strong smell of garlic, and that it affords to sheep and cattle a pasture not disagreeable; the milk is of course nauseous and fœtid; and other plants near it do not flourish. 43. *A. Clusianum*, Moly minus of Clusius, with columnar scape; linear, flat, ciliated leaves; few-flowered umbel, and obovate concave petals; a native of the southern parts of Europe. 44. *A. triquetrum*, three-cornered Moly, Moly of Parkinson and Ray, with scape and leaves three-sided, and simple flaments, is a native of Italy, and Spain about Narbonne, and cultivated in 1768 by Miller. 45. *A. cepa*, *cepa* of Miller and Bauhin, common onion, with scape swelling out below, and longer than the columnar leaves, is well known by its fistular leaves and swelling stalks: it differs from the garlic only in having a swelling pipy stalk, that is considerably larger in the middle than at the extremities: the Latin name *cepa*, says Mr. Martyn, is derived from *caput*, a head, on account of the form of its bulb, and for the same reason the Greeks called it *κεφαλον*. Others derive it from *κεφαλον* *αολι* *κεφαλον*, or from *κεφαλον* and *κεφαλον* *αολι* for *κεφαλον*. The English and French name are deduced from the Latin *unio*, because the bulb never throws out any off-sets: the varieties of the common onion are, the Strasburgh, or common oval; the Spanish, silver skinned and red skinned; the Portugal great oval onion; and the Tripoli: all these vary from seeds, and there are several intermediate differences not worth enumerating. 46. *A. Moly*, yellow Moly, with scape sub-cylindric, leaves lanceolate, sessile, and umbel level-topped, is a native of Hungary, on Monte Baldo, about Montpellier, and on the Pyrenees, and cultivated in 1604 by Edward Lord Zouch: it was formerly preferred in gardens for the sake of variety, but most persons have rooted it out on account of its very strong garlic taint. 47. *A. tricoccum*, three-seeded G. with scape naked, semi-columnar, leaves lanceolate-oblong, flat, smooth, umbel globular, and seeds foliaceous, is a native of North America, and introduced in 1770 by Mr. W. Young. 48. *A. fistulosum*, Welch onion, or ciboule, with scape equalling the columnar swelling leaves, is perennial, and does not form bulbs like the common onion: it was cultivated in 1629: the *A. altaicum* of Pallas, a native of Siberia, is of a smaller size, and a variety of this species: in Gmelin's Linnæus it is made a distinct species. 49. *A. scænoprasum*, cives or chives, or G. with scape equalling the columnar awl-filiform leaves, is a native of Italy, Switzerland, Sweden, and Siberia; where a variety of this plant has been found and figured by Gmelin, in which the leaves are reflected, whereas in the common sort they are straight: it has been found with us very rarely in meadows and pastures, near Fast-castle on the borders of Berwickshire, in Argyleshire, in Westmoreland, and near Kirby Moor-side, Yorkshire, and Cartmel Fell, in a small rivulet called Chivey Syke: this is a very small plant when compared with the former, the stems naked and seldom exceeding five or six inches in length, the roots producing little or no bulbs, and the leaves hollow and awl-shaped: it has a very strong smell. 50. *A. Sibiricum*, Siberian G. *A. scænoprasum* β . Linn. spec. 433. Murray, Gotting. Com. 1755, t. 4; *Cepa palustris altissima* of Buxb. and *cepa alpina palustris tenuifolia* of Tournefort; with scape columnar, leaves semi-cylindric, flaments awl-shaped, petals lanceolate acute, is found in Siberia and the mountains of Silesia, and was introduced into the Kew garden in 1777 by Chevalier Murray. 51. *A. fellerianum*, with a columnar scape, semi-cylindric

femi-cylindric leaves, dense umbels, and fubulated ftamens longer than the corolla, is a native of Siberia, near the river Jenifea. 52. *A. capillare*, with columnar feape, capillaceous leaves, few-flowered umbel, and petals lanceolate acute. 53. *A. tenuiffimum*, slender-leaved G. with feape columnar, empty; leaves awl-shaped, filiform; and heads loofe and few-flowered (Gmelin), or columnar feape; leaves linear, awl-shaped; umbel few-flowered; and petals roundish-ovate obtufe (Willdenow); is a native of Siberia: it is much eaten by the field-mice, and they lay up the roots for their winter food: the ftamens in this and the preceding are fhorter than the corolla. 54. *A. Chama-Moly*, ballard G. with feape fcareely any, naked, capsules drooping, leaves flat ciliate, is a native of Italy and Spain, and flowers in January. 55. *A. gracile*, Jamaica G. with feape naked, columnar, very long, leaves linear, channelled, ftamens awl-shaped, connate at the bafe, is a native of Jamaica, was introduced in 1787 by Hinton Eait, Efq. and flowers in February. 56. *A. Neapolitanum*, Naples G. with feape naked ancipital, leaves lanceolate channelled, umbel feathered, is cultivated in the gardens near Naples, begins to grow fpontaneously about the city, and flowers in March. 57. *A. ornithogaloides*, with feape columnar, umbel bearing and few-flowered, and leaves awl-shaped and flat. Walt. Flor. Carol. p. 121. Gmelin's Linnæus. Martyn's Miller. Willdenow's Linnæus. Smith's Flor. Brit. vol. i. p. 355. Withering's Bot. Arr. vol. ii. p. 332.

ALLIUM, in Gardening, is applied to *garlick*, *onion*, and *leek*. Of the firft or garlick kind of plants, though there are a great number of fpecies only few are valuable either for ufe or ornament in the garden. The kinds neceffary to be taken notice of in this view are: 1ft. The *fativum* or *common garlick*; 2d. *Scorodoprufum* or *rocambole*, which are officinal or culinary plants. 3d. *Moly* or *common yellow moly*. 4th. *Subbirfutum* or *hairy white moly*. 5th. *Spherocephalon* or *spherical beaded purple moly*. 6th. *Roseum* or *rose-coloured Montpellier garlick*. 7th. *Flavum* or *ftraw-coloured pendulous moly*. 8th. *Magicum* or *great purple moly*. 9th. *Victoriale* or *elliptical garlick*. 10th. *Descendens* or *oval purple-headed garlick*: which are all of the flowering kind.

Thefe different fpecies are of the bulbous-rooted tribe, fome having large bulbs, others not bigger than peas; they are perennial in root, but annual in leaf and ftalk; they are all hardy plants, prosper in almoft any exposure and foil in the garden, and in general are very productive, but moft of the forts have a ftrong fcet like the common garlick.

The *common garlick* has a large round white bulbous root, of an irregular form, with numerous fibres at the bottom, compofed of many fmaller bulbs denominated cloves, which are included in a common membranous covering; each of which being planted, grows, and in one feafon attains the fize and ftructure of the parent bulb: the leaves are cauline, or form a kind of ftalk, which feldom fpindles, except when the fame roots remain in the ground two or three years, when they run up and bear a flower and fmaller bulbs at the top. It deferves to be cultivated in the garden for the fake of its root, which is in great eftimation for culinary and other domeftic purpofes. Indeed, the roots, as well as all the other parts of the plant, have a very acrid taft, with an highly offensive fmell, which has rendered its cultivation in gardens lefs defirable. It is a hardy plant, capable of growing in moft forts of foils and fituations, and readily propagated either by roots or feeds.

Rocambole has very fmaller compound bulbs, which grow in clufters; the ftalk generally fpindling two or three feet

high, with many bulbs at its fummit, which, as well as the root bulbs, are ufeul for the fame purpofes as garlick, though much inferior.

The latter or the flowery kinds have the flower-ftems rifing immediately from the root, growing erect and attaining different heights, from twelve to thirty inches; in fome the leaves are radical, in others cauline, or elevated with the ftalk, fome are broad like thofe of a tulip, others long and narrow like a daffodil, and fome taper and rufh-like; but in all the forts the ftems are terminated by a fort of fneath, from which is protruded an aggregate of many fmaller flowers forming a kind of umbel. The flowers fingly are compofed each of fix petals, which, though feperately fmaller, from many being collected into large heads, are very confpicuous. The *allium moly*, *subbirfutum*, *spherocephalon*, *roseum*, and *flavum*, generally grow from twelve to fifteen or eighteen inches in height, and their umbels often continue in bloom for the fpace of a month or fix weeks. But the *magicum*, *vicioriale* and *descendens*, rife about a yard in height, producing large highly ornamented umbels. They moftly flower in May, June, and July, ripen plenty of feed, and many fmaller bulbs on the ftalk and umbel in feveral of them.

Method of propagation. In all the forts it may be effected with the utmoft facility by off-fets from the root, and in many of them by feed and the fmaller bulbs contained on the ftalk.

Common garlick is constantly propagated by the fmaller bulbs that conftitute the main root, which may be readily divided into a great number of feperate cloves; thefe are to be planted in the fpring, in beds four feet wide, a little raifed in rows lengthways, at from fix to nine inches diftance from each other, and fix inches afunder in each row, and two or three inches deep. The planting may be performed either by means of a blunt dibble or by drawing drills, and placing the cloves in them, afterwards covering them with the earth. When planted in this way they moftly fhoot up their leaves in a month or fix weeks, only requiring occasional fmaller hoeing afterwards to kill the weeds that may rife.

About the end of July or beginning of Auguft, the bulbs are generally full grown, as is evident from the yellow appearance and withering of the leaves; they muft be then taken up, cleaned and dried in the fun, and afterwards tied or plaited in bunches to be hung up and preferved for ufe.

Rocambole may be propagated either by the off-fets of its roots, or by the cloves produced on the top of the ftalks, which may be planted in Spring or Autumn; but in the Autumn planting, as about October or November, they generally grow confiderably larger than when planted in the Spring feafon. The feeds are to be planted in the manner directed for garlick, and are commonly fit for ufe about July or Auguft, according as they have been put in early or late. But it may be obferved that the roots never acquire any very large fize.

The different flowering kinds propagate very rapidly by off-fets, which may be feperated any time after the decay of the flower, taking only fuch as are large and fine, and planting them at once in the borders where they flower the following Summer.

The propagation by feed is beft accomplifhed in a fhady border in Spring, the plants being fit to tranfplant in fuch cafes in the Autumn.

Of the fecond divifion, or the *onion* kind, the characters, &c. of which are the fame as thofe of garlick; the fpecies are thefe, 1ft. *Cepa*, or common onion, the beft garden varieties of which are the Strafburgh or common round onion, the oval long-keeping common onion, the Spanifh large flat

onion, the Spanish silver-skinned onion, the Spanish red-skinned onion, and the Portugal great roundish oval onion. 2d. *Fijulofum* or the Ciboule or Welsh onion. 3d. *Schenoprosam*, cives or chives. 4. *Ascalenicum*, eschalot or shallot. 5. *Canadense*, or Canada-tree onion. All the *first* species and varieties have large bulbous roots, and the plants are biennial, or being sown in the Spring arrive at perfection in the root the same year, and next year shoot up into stalk, flower, and ripen seed, when the stalks quickly die and the individuals are annihilated. But the *second* and *third* species never form any bulbs at bottom; they are, however, hardy and perennial, and may be continued many years by the roots according to the directions given below for them. And the *fourth* and *fifth* species are bulbous-rooted perennials, multiplying greatly by off-sets, as is evident from their culture.

The method of propagation and culture in the onion kind. Common onion. Among the several varieties of the common onion, the Straßburgh is probably the best for general culture, having a handsome bulb, mostly assuming a roundish oval shape. It is of firm growth, and generally keeps well for winter use. The Spanish onions are large and flat; the first sort is, however, of the mildest flavour; but all the varieties for the most part afford profitable crops, and none excel them for culinary purposes; but they seldom keep so well after Christmas as the Straßburgh or oval sort of onion. The Portugal onion is a very large handsome bulb, of a roundish oval shape, though it rarely attains the size here, as in that climate, as is obvious from those annually imported from that kingdom. If, however, seeds sown in Portugal be sown here, the bulbs will arrive at a much larger size than from such as are sown in this country, especially where preserved two or three years successively, in which cases they are often so far degenerated, that the bulbs become flat, and not larger than the common onions. The mode of transplanting them at an early period, which is adopted in that country, may also have much effect in rendering the bulbs so large. From this sort of onion being very mild, it is much esteemed for sauces and other culinary uses.

All these kinds are propagated by seed sown annually; which for the general crop should always be performed from about the twentieth of February until the latter end of March, though in cold wet stiff soils it may be proper to defer sowing entirely until towards the middle of the latter of these months. But in cases of omission in sowing at the times above recommended, it may be performed with tolerable success in the beginning or any time before the fifteenth of April, but the crops of the February or March sowing always bulb more freely and acquire a much larger growth than those sown at later periods.

The most proper situation for crops of this kind is an open exposure, and where the soil is moderately light and rich in vegetable matter. Thus spots of the best mellow ground in the garden should always be chosen, with the addition, if possible, of a good coat of well rotten dung, dug well in, but not too deep, the surface being kept level, and while it is fresh stirred, well raked, and the seed sown, a point which is of importance to be attended to. The sowing when the surface is so wet or moist as to clog to the feet or rake in preparing it, should not however be performed.

The proper quantity of seed is in general about an ounce to every rod or pole of ground; but where it is not required, to have them thick for cuttings, two ounces for three rods may be sufficient. Great care should be taken to procure fresh seed, as but very little of that which is kept more than one year will vegetate.

The seed may either be sown over the whole of the piece

or plot of ground, or it may first be divided into beds of four or five feet in width, allowing foot-wide alleys between them. In sowing, the seed should be put in with a regular spreading cast, and the surface, when very light, immediately trodden over evenly upon the seed; afterwards, where sown in beds, the alleys may be pared an inch or two deep and the earth cast over them, proceeding directly to rake in the seed regularly with an even hand, trimming off all the stones, roots, &c. See SOWING SEEDS.

The method of sowing them in beds is the most eligible, where it is designed to draw or cull the young onions from time to time for market or family use; as, in such cases, a person can stand in the alleys without treading upon the beds, which not only renders the surface hard, so as to injure the crop, but highly destructive, by trampling upon the plants themselves. It is likewise very convenient to stand in the alleys, in order to weed, thin, or hoe the crop as occasion may require. Although it is a common practice in the general culture of onions to sow them thick, in order to allow for culling or drawing out the superabundant plants, by degrees as they are wanted; it would no doubt be a better mode to sow a piece particularly for general culling, exclusive of the main crop; because by daily thinning out the superfluous plants there is no avoiding treading upon, disturbing and loosening the remaining ones, by which they become stunted in their growth, and by no means so fine. There is also another very common but injudicious practice, which is that of mixing other crops such as leek, lettuce, radish, carrot, &c. with these crops. It is productive of confusion, as well as obstruction to the chief crop, without producing any great advantage; nothing should therefore be admitted, except a very thin sprinkling of cobs lettuce in some cases. In about fifteen or twenty days after the seed is sown the plants generally appear, and in a month or six weeks after that, as in May and the beginning of June, they will be three or four inches high; when they should be well cleaned from weeds, and the main crop thinned to three or four inches distance. The weeding and thinning should be begun in due time, before the weeds branch and spread much, which may either be performed by the hand or small hoeing; the latter is the most expeditious method, as by it one man may do as much as three, and it is also the most beneficial to the plants; as by stirring the ground about them with the hoe, it greatly forwards their growth, as is mostly seen in a few days after the operation. This mode, however, is more particularly eligible for the larger principal crops, for which a good sharp one-hand hoe, about two inches, or not more than two and a half broad, is the best, taking the opportunity of dry weather for performing the business and carefully cutting up all weeds. Where the onions stand too close they should be cut out in a regular thinning order to about three inches distance; or in such crops as are not wanted for occasional cutting, they may be hoed out at once to about four or five inches, having regard to leave the strongest plants, as much as possible, for the continuing crops.

In the course of two or three weeks or something more, it will generally be proper to run over them again in the same manner, in order to cut up all advancing weeds, and any superabundant plants that may have escaped in the first hoeing; after this they seldom require any further culture, than that of pulling out such casual straggling weeds as may rise.

But where the crops are small, or where they are required for thinning or culling by degrees, for use in their young green state and in small bulbs, the weeding and requisite thinning where they are in clusters, may generally be best performed by

by the hand. In the advanced growth of the crop, when the superabundant plants are occasionally thinned out for use, as wanted, they should be drawn somewhat regular, so as to leave a sufficiency of the strongest plants remaining at moderate distances for a full crop to attain their full growth in large bulbs.

It is highly necessary to continue to keep the different crops very clear from hurtful weeds in their advancing growth during the months of May, June, and July, which being their principal growing seasons, if they are not kept free from weeds, and sufficiently thinned to proper distances in due time, they draw one another up, weak and slender, which much retards their bulbing. About the middle or latter end of June the continuing crops begin swelling a little at bottom in their bulbing order, but more fully in July; and in August the bulbs arrive to full growth, and are proper for taking wholly up. Towards the middle of August the crops in general should therefore be examined, and when the necks shrink and fall, and the leaves wither, it may be concluded that the bulbs are arrived at maturity, and have done growing.

They should then be pulled up, cleaned, dried, and housed for use; this being best done in dry weather on a piece of the ground hoed, raked, and cleaned, in order to spread them on as they are pulled up, to dry and harden. They should lie in this way a week or a fortnight, being turned every day or two, when, if the weather proves dry, they will be duly prepared for keeping; the first opportunity should then be taken to house them. The bulbs must be first divested of all adhering earth, loose skins, and the grossest parts of the leaves and neck, rejecting all infectious and bruised ones, and then they may be carried into any dry upper room, out of the damp, spreading them on the floor as thinly as convenient. The closer the room is kept the better, but care must be taken to turn them over once in three weeks, and to clear out such as have any tendency to infection.

As in the culture of onions it frequently happens, that through badness of seed many are disappointed of a crop, by waiting in expectation of the plants rising till it has been too late to sow again; in such cases recourse may be had to transplantation from other gardens, as a neighbouring one, where there are superfluous crops, or a bed or such part of one as is necessary may be purchased from a market gardener. This business should be done in May or early in June, and if possible in moist weather; having a spot of well-dunged ground prepared, take up the plants with good roots, and plant them in rows six inches distant, and four inches asunder in each row, inserting the roots but moderately into the ground, for if planted too deep, they do not bulb well; giving them a good watering as soon as replanted. By repeating the waterings occasionally for a week or fortnight, the plants will generally grow freely, and form tolerably handsome bulbs.

Onions for pickling are in great request in many places: such as are proper for this purpose should not be bigger than common round buttons, therefore in order to procure them in due quantity, some seed should be sown late, in a spot of light poor land; about the middle of April is probably the best time. It should be sown moderately thick, the plants requiring little thinning, except where they rise in very thick clusters. They bulb in June and July, and are generally fit to take up in August. In the Spring many of the keeping onions will unavoidably grow as they lie in the house; these may be planted out in rows, at six inches distance, and will serve to draw by way of scallions.

The Autumn or Michaelmas crop, is generally sown in August, and the plants rise before Michaelmas, stand the Winter, some to be drawn occasionally for use in that season, but principally intended for Spring use, to be drawn up young for sallads, &c. and likewise where the Straßburgh or any other variety of the common onion are sown, they, if permitted to stand, bulb to a tolerable size in June, and supply the kitchen or market as headed onions, till those of the Spring crop are bulbed.

But as the common onion is liable to be cut off in severe winters, it is always necessary to sow at the same time some beds of Welsh onions, which bid defiance to the most rigorous Winter frosts. August is the best season for sowing these crops, for if sown sooner they are not only apt to get too forward in growth before Winter, but to run up for seed earlier in the Spring; and therefore the proper time to sow the main crop is the first or second week of that month, or in the third week for a late standing one, sowing them in beds four feet wide, with twelve inch alleys between; sow and rake in the seed as directed in the Spring crop, only let a much larger quantity be sown in this case. The plants generally appear in a fortnight, and numerous weeds, to which early attention must be had to clear them out by hand before they begin to spread; but the plants of this crop are not now to be thinned. But in November and December if they stand very thick, some of the largest may be occasionally thinned out for various uses.

Saving Seed. February is the proper time to plant onions in this view, though this is often done in October by those that save great quantities for sale. For this purpose, make choice of a due quantity of the largest and handsomest bulbs, rejecting all blemished ones, and such as have already made any effort to grow, and having made choice of a spot of ground well exposed to the sun, which being dug, proceed to plant the onions; strain a line, and with a hoe or spade open three drills, twelve inches asunder, and six deep, place the bulbs therein nine inches distant, and rake the earth over them; measure off two feet for an alley, and plant three more rows as above, and in that manner proceed to the end; the wide space of two feet is by way of alley to go between, to hoe and clear off weeds as well as to flake and support the stalks of the plants when necessary. In June the flower-stalks will be shot to their full height, and the flower heads will be formed at top, to secure which, in erect position, drive some stout stakes in the ground along each row, at two yards distance, and from flake to flake fallen double lines of packthread; and if these are tied together in the interval, between the stems of the plants, it will effectually secure them. About the latter end of August the seed will be ripe, which is known by the capsules opening, and the black colour of the seed; the heads should be cut in a dry day and spread upon cloths in the sun, care being taken to remove them under cover in case of wet and at night; and when perfectly dry, beat or rub out the seed; cleaning it from the rubbish, and putting it up in bags for use.

As it is of the utmost importance to have good fresh seed, some to try its goodness, before they venture their general crop, sow a little in a pot, and place it in a moderate hot-bed or near a fire; a more expeditious method however is to tie about a thimble full of the seed, loosely in a piece of linen rag, and put it into a vessel of hot water, suspended by a thread; in ten to fifteen or twenty minutes, pull it out, and if the seeds are good, they will, in that time, have germinated or sprouted, perhaps to the extent of a quarter of an inch in length.

As leek-seed is similar in its nature it may be tried by the same means.

Ciboule or Welsh onion. This is a perennial plant, which never forms any bulb at bottom; therefore deserves to be cultivated only to be drawn as young green onions for sallads, &c. in Spring; but on account of its strong taste it is greatly inferior to those of the common onion. From the plants being so extremely hardy as to survive the severest Winter, in which though their blades be cut off, the roots remain found and shoot forth with great vigour early in Spring, furnishing seasonable supplies till May, when they generally run to seed; from this singular hardiness they may be cultivated more or less as a winter-standing crop, with advantage, for Spring use.

They are perennial in root which increase by off-sets into great clusters, but not to be propagated thereby for general use, but by seed, the same as the former sorts of onion. The best season for sowing them is August, in the manner of the Autumn onion crops.

The plants mostly appear in twelve or fifteen days after being sown, and towards Michaelmas should be carefully hand-weeded. It is a peculiarity in this species of onion to lose their tops in November or December, and remain divested thereof till towards Candlemas, when the roots shoot forth again; at that period it is proper to dig the alleys, and spread about an inch depth of the earth evenly over the surface of the beds, by which vigour is given to the roots, and the plants are made to rise strong, and at the same time the part within the earth blanched white and rendered more tender and mild for eating as well as more agreeable. Where the sowing of a Michaelmas crop has been omitted, some have sown seed towards the end of January, when the plants will rise in February or March, and being hardy, continue growing, and be fit for drawing in the early Spring. In order to have plenty of seed of this species of onion, it is necessary to retain some plants for stools. In the end of March a parcel of strong young plants may be put out nine inches distant, which produce seed in August. If the roots be let remain in the following years they produce treble the quantity; but as they increase into great bunches, the stools should be removed and separated every second or third year.

Cives or Chives. This is the smallest of all the onion kind, rising but a few inches high; but its roots are perennial, and increase considerably into clusters, from which large tufts of slender awl-shaped leaves issue, which are the principal part used, the roots never forming any bulb, at least not bigger than small peas. This is a hardy plant which merits a place in every garden; its clusters of leaves rise early in Spring, and are useful both in sallads and for culinary purposes, in default of onions. The method of gathering it is to cut the leaves off near the ground, by which a fresh supply is soon produced from the bottom; or occasionally the plants in clusters may be slipped quite to the root in separate little plants, resembling young onions, and used as substitutes for them. It is easily increased by dividing the roots in Spring, and planting eight or ten of them together in holes at six inches distance; in this way by Autumn they will multiply into bunches of a large size.

Escalot, or Shallot. This is a species of onion which is bulbous-rooted, and which increases greatly by off-sets, the largest of which are the proper parts of the plant for use. The bulbs are oblong, irregular, and seldom grow large; as they generally increase into clusters they do not swell like roots that grow singly. From the roots are produced many long, narrow, firm leaves in the Spring, and which wither

in July or August, when the roots are full grown; they are then taken up, made dry and housed, when they keep in good perfection till the following Spring.

In the propagation of this plant the smaller roots or off-sets are the best; these may be planted out in Autumn or early in Spring: the end of October, or beginning of November, for the Autumn planting, and February and March for that of the Spring, but not later than the beginning of April. The Spring is the most general season of planting them, but when planted in Autumn, in a dry light soil, they often grow larger, and sooner attain full growth the following Summer; they are to be planted in beds four feet wide, in rows length-ways, the beds six inches asunder; each off-set inserted singly, either by means of a dibble or placed in drills not more than two or three inches deep; and the distance as above in each row. They shoot up in leaves in March or April, and the roots increase in growth till July or August. The only culture which they require is that of keeping them clean from weeds, by occasional hand weeding or hoeing. Towards the end of July or beginning of August the bulbs will have attained their full growth, as is seen by the withering of the leaves. They should then be taken up in a dry day, and spread in the sun to harden; the largest, cleaned and housed for use, and the smaller off-sets reserved for propagation.

As shallots are sometimes required early in the Summer time for immediate use, in such cases as they will have formed small bulbs towards the latter end of May or in June, a few may occasionally be taken up for present supply; permitting a principal crop to remain in order to attain their full growth.

Canada or Tree Onion. This deserves to be cultivated both as a curiosity in producing the onion at top of the stalk; and for the use of the onions, especially for pickling, in which they are excellent and superior in flavour to the common onion. It is perennial, and propagated by planting the bulbs in Spring or Autumn, either the root bulbs, or those produced on the top of the stalk, being planted in a bed or beds of any good earth, in rows a foot asunder, six inches distance in each row, and two or three inches deep; they shoot up leaves and stalks in the Spring and Summer, and produce the bulbs for use in July or August; and the root-bulb remaining, furnish a production of top bulbs, annually in that season; the root-bulb increasing by off-sets, may be taken up occasionally at the time the stem decays, in Autumn; or once in two or three years, in order to separate the off-sets and replant them when necessary.

The leek is the third division of the genus, the general characters of which are the same as those before described, and the species and varieties are the *Porrum* or common leek; which may be said to be an annual-biennial plant, for although the roots often survive, after perfecting seeds, yet the plants always attain perfection the same year they are sown, and the year afterwards run up to stalk and become unfit for use. The seed-stalk of this plant does not belly like that of the onion.

The best of the varieties of this plant for general culture, is the broad-leaved or London leek, which attains a large growth, the neck acquiring a thick substance, in length from six to nine or ten inches, dividing upwards into many large, long, thick leaves, arranging themselves in somewhat a fan-shape.

The narrow-leaved leek runs up with a long thin neck, and narrow thin straggling leaves, which, as a degenerate variety, does not deserve culture; and the striped-leaved kind

is retained merely for variety, which may be continued by suckers rising from the old roots.

Propagation, Culture, &c. The common leek is raised annually from seed sown in the Spring; the proper time, for the general crop for Autumn and Winter use, is the same as that recommended for the onion, as from the twentieth of February to the end of March; but for later crops to stand for Spring use, any time in April may answer, or for a small crop to stand as late in the following Spring as possible, without running to seed, the beginning of May.

It is a common practice from the notion of making the most of the ground, to sow leeks along with the crops of onions; which should not by any means be recommended, as experience has shewn it to be considerably the best culture to keep them separate. It is often practised by the market gardeners, when intending to cull out the onions from time to time for market; so that by a daily thinning, they are mostly all cleared off by the end of July; and those being gone, the same ground remains occupied by a crop of leeks. This method cannot be practised to equal advantage in the main crops of onions that are to stand to grow to full size for keeping. The best culture, therefore, for the general crops of leeks, is to sow them pretty thick in a spot by themselves to be afterwards transplanted, either wholly or the greater part thinned out regularly and planted; the others being left at good distances for full growth, and the same situation, soil, and method of sowing are to be adopted as directed for the onion. In June, July, and August, the plants will be of a proper size for transplanting; in doing which make choice of an open spot of the best ground; if dunged it will be of much advantage, digging in the dung one spade deep; then drawing a parcel of the largest leeks, and trimming their tops and the extreme parts of their root-fibres, proceed to plant them by line and dibber in rows, which for the early crop should be twelve inches distant, and eight or nine inches apart in each row; and for better crops nine inches between the rows and six the other way, putting them three or four inches in the ground, or nearly to the length of their necks, and watering them immediately. The only culture they require afterwards is to be kept clear from weeds, which may be done either by hand-weeding, or more expeditiously by applying a sharp hoe in a dry season.

The leeks thus cultivated are generally finer than those that remain where sown, their necks, which is the principal esculent part, are much longer, and all the part within the earth is finely whitened and rendered mild and tender, which is a desirable property in this plant. However, when it is intended to raise a crop of leeks in good perfection, to remain where sown till their full growth, the seed should be sown much thinner; and when the plants are somewhat advanced, as in June or July, they should be regularly thinned to about ten or twelve inches distance; those thinned out being planted in another compartment of the garden. The remaining plants will by this means attain a larger and thicker growth below, with large spreading tops of thick fleshy leaves.

This is a valuable family plant from Autumn till Spring, for soups, broth, &c. and for boiling the neck part and top leaves together, to use as greens, in the manner of coleworts, &c. to eat with flesh-meat. It is in perfection from September till May, when it shoots up to stalk for seeding.

In order to save the seed of this plant, a quantity of the finest plants should be transplanted in February into a sheltered sunny bed or under a south wall, paling hedge, or other fence. This is mostly necessary, as the seeds ripen late in

the Autumn, and unless assisted by such situation and shelter, seldom ripen freely in this climate. In this view it would be of particular advantage to plant some in a row close under a south fence, at ten or twelve inches distance, they will then shoot up their stalks considerably in May; and in June attain two or three feet in height, when they should be supported, and continued in an upright growth. In July the flowers protrude from their sheath at the summit of each stalk, and form a large globular head; and in September the seeds begin to ripen. After this is effected, cut the heads with part of the stalk and tie them in small bunches, hanging them across lines in a dry airy apartment, two or three months, when the seed will be hardened, and the capsules readily break by threshing or rubbing, and thus discharge it more readily from the cells in which it is lodged.

ALLIUM, dietetic and medical qualities of several species of. The culinary uses of several species of the allium are well known; and it is needless particularly to describe them. They are referred by Dr. Cullen to a particular head under the title of *Alliaceæ*; and he considers them more as condiments than as aliments. Of this order the leek and onion are most commonly employed with the last intention, and they afford a large proportion of alimentary matter. In their boiled state, when their acrimony is exhaled, they manifest, with some sweetness, a large proportion of mucilaginous matter; and even in their recent state, and especially when young, their acrimony is not so strong as to prevent their being used among the lower classes as a considerable part of their food. But by those of superior rank, it is the onion only that is taken in its young and recent state; but hardly in larger quantity than may be regarded as a condiment. Deprived, however, of their acrimony by boiling or roasting, they are used by persons of every condition more freely. Nevertheless it is so difficult to deprive them entirely of all peculiar taste, that many persons, from a particular idiosyncrasy cannot bear them even in a boiled state. The *garlic*, *rocambole* and *shallot* contain also alimentary matter; and when the garlick in certain warmer climates is produced with less acrimony than it is with us, and of course is much milder both in smell and taste, it is more frequently and more largely employed as a part of diet. As condiments, those of the milder kind, more especially when deprived of their acrimony, are very safe and proper; and even the more acrid, as garlick, which is almost solely employed as a condiment, serves, if the odour and taste can be admitted, to stimulate the stomach very powerfully, and to promote digestion. As promoting perspiration and urine, all these vegetables are properly joined with our animal food, and may also be justly reckoned among the antiscorbutics. In the eastern nations, amongst the Jews, ancient and modern, and also in Russia, Hungary, Spain, and France, the several species above enumerated, have been freely used both as aliments and condiments. In Egypt, onions have been from time immemorial a part of their constant food; they are sweet and soft, and used in their soup, and roasted with their meat, so as to make a dish, called by the Turks *kebab*, of which they are very fond. Onion, and particularly garlick, which is more powerful in its effects, by stimulating the stomach favour digestion; and as this stimulus is more readily and quickly diffused through the whole system than that of almost any other known substance, they may be considered as useful condiments, with the food of phlegmatic people, or those whose circulation is languid, and secretions interrupted; but for those who are subject to inflammatory complaints; or where great irritability prevails, these roots, especially in their acrid state,

may prove very hurtful. Onions, says Dr. Lewis, taken freely in hot bilious dispositions, produce flatulencies, thirst, head-ach, and febrile symptoms. In cold sluggish phlegmatic temperaments, they are of service, by warming the habit, attenuating viscid humours, and promoting the natural exertions, particularly expectoration and urine. They are likewise powerfully antiseptic, and by virtue of this quality, are recommended by some as a salubrious addition to the food in scorbutic cases. The disagreeable scent of onions, as an article of diet, may be remedied by eating a few raw pursley leaves immediately after them, which will not only overcome their strong smell, but make them sit more easily on the stomach.

The medical virtues of several of these species have been long attested and generally allowed. That the juice of alliaceous plants in general has considerable effects upon human calculi, may be inferred from the experiments of Dr. Lobb; and we are warranted in asserting, says Dr. Woodville, that a decoction of the beards of leeks, *A. porrum*, taken liberally and continued for a length of time, has been found remarkably successful in calculous and gravelly complaints. To this purpose he alleges the case of a boy, six or seven years old, who had suffered for a considerable time by a calculus in the urinary bladder, which had been discovered on sounding; but by recurring to this decoction his pain was soon relieved; after which his urine became extremely turbid, and constantly deposited a clay-like sediment for several weeks, when it resumed its natural appearance, and the boy was afterwards freed from complaint. Other similar cases have been also known. Dr. Cullen observes, that although all the species of allium have been by many writers commended as useful in nephritic and calculous cases, they do not seem to act otherwise than as diuretics, the use of which, in such cases, is in general very doubtful.

The onion, or *A. cepa*, contains a very volatile part, which, however, flies off so readily, when the substance is cut and exposed to the air, that it cannot be directed to any medicinal purpose, or employed as an active remedy. Onions are externally employed as cataplasms for suppurating hard tumors; but Dr. Cullen observes, that as they are applied in a heated state, they do not seem to have more power than other mucilaginous poultices. Some have recommended them to be rubbed on bald places for promoting the growth of hair. Frederick Hoffman reports, that suppressions of urine, in children, are speedily relieved by the application of roasted onions to the region of the pubes. Lanzoni mentions a fact, in which they were used, as crude and boiled, and as a decoction, and produced a very considerable discharge of urine in an hydropical case. Murray refers to a case of a woman who had an ascites after abortion, and whose feet were swelled, who was effectually relieved by a copious discharge of urine, and a subsidence of the tumor, in consequence of applying to the abdomen a cataplasm of white onions macerated in spirit of wine. The lithontriptic powers of the juice or decoction of onion have been extolled by some, and disputed by others: but in the cure of deafness, a few drops of the juice put into the ear at bed-time have been found effectual. The root, which is the most acrid part of the plant, is much deprived by drying both of its smell and taste, and loses near seven-eighths of its weight. It gives out its virtue by infusion, both to water and spirit, but to neither readily and completely. In distillation no essential oil could be obtained. The watery decoction, inspissated to the consistence of an extract, is very mucilaginous, but has scarcely any taste, and that of the spirituous extract is very weak.

The medical virtues of *A. sativum* or *garlick*, are very various. The whole of the plant possesses similar qualities; but the root, which has a strong pungent odour and a very acrid taste, is the only part employed in medicine. These qualities depend upon a very volatile part, which is readily dissipated by drying, if the roots be bruised and the interior parts be exposed to the air, or by boiling in water. On drying, says Dr. Lewis, the root loses almost nine parts in 15 of its weight, without losing much of its taste or smell; and hence, he says, six grains dried may be considered as equivalent to 15 grains of the fresh root. Dr. Cullen, however, thinks that the virtue of garlick is diminished by drying, and that it is possible by these means to dissipate it entirely; and he is of opinion, that Dr. Lewis improperly proposes the dried garlick to be used in any proportion as a medicine. The volatile substance of this root is at least in part an essential oil, which exhales along with the steam of boiling water; and therefore the garlick should never be boiled either with vinegar or with watery liquors. This oil, which is of a pale yellowish colour, and of a thick rosy consistence, may be obtained by distillation; and like that of many of the siliquose plants, it sinks in water. The virtues of the root may more readily and more perfectly be extracted by rarefied spirit of wine, digested upon it when dry, than by either water or vinegar; and with this menstruum the active matter of the garlic does not easily exhale; and nearly the whole of its virtue remains in the inspissated extract. Both the fresh and dry root give out their virtue to water by warm infusion. A quart of water poured boiling hot upon a pound of the fresh root, cut in slices, and suffered to stand upon it in a close vessel for 12 hours, forms an infusion, which, with a proper quantity of sugar, was the syrup of garlick of the shops; and the oxymel of garlick was prepared by infusing an ounce and a half of the fresh root in half a pint of vinegar, and dissolving in the strained liquor, by the heat of a water-bath, 10 ounces of clarified honey; and in order to cover the ill-smell of the garlick, caraway and fennel seeds bruised, of each two drams, were boiled in the vinegar before the garlick was put into it. But the syrup and oxymel are now expunged from the British Pharmacopœias. The odour of garlick is extremely penetrating and diffusive; inasmuch that when the root is taken into the stomach, the alliaceous scent impregnates the whole system, and is discoverable in the various excretions, as in the urine, perspiration and milk. According to Bennet the discharge of issues and ulcers becomes imbued with this odour very soon after it is taken; and Haller says, that on being applied to the feet, the alliaceous taste has been perceived in the mouth. Garlick has been long in estimation as an expectorant in pituitous and spasmodic asthma, and other pulmonary affections, unattended with inflammation. Dioscorides mentions its use in moderate coughs. Celsus employed it mixed with honey in these complaints. Rosenlein recommends it to be boiled in milk, and a pint to be taken night and morning. Dr. Cullen allows what has been asserted, that even in its external application to the soles of the feet, it has been useful in these diseases. Its utility as a diuretic in dropsies is attested by unquestionable authorities. Dr. Sydenham found some dropsies cured by garlick alone; and as a warm strengthener it has been serviceable not only in the beginning of dropsies, but for preventing a new accumulation of water after evacuation. Dr. Cullen says, there can be no doubt of the *A. sativum* being a remedy for the scurvy. Dr. Lind also commends it both as a preservative and a cure for this complaint. Its febrifuge power has been experienced in preventing the paroxysms of intermittents;

Bergius says, that he has seen even quansans cured by it in many instances. He recommends to begin with a single small bulb morning and evening, and one bulb to be added, till the patient takes four or five at a time. If the fever subside, the dose is to be diminished; and it will be sufficient as the preventive of a return, to take one or two bulbs, morning and evening, for several weeks. Some have held it in great esteem as an antidote to the contagion of peltential and other putrid disorders, whence it received the name of "Theriaea rusticorum;" and with a view of subduing the plague, it is to be administered in such a quantity as to excite a copious diaphoresis. The virtues ascribed to it of obviating and resisting contagion appear to Dr. Cullen very doubtful; though he allows the probability that, in the plague, which is commonly attended with a low fever, it may have been useful. Another virtue ascribed to garlic is that of an anthelmintic; for this purpose the common people boil it in milk; and Hoffman considers it as one of the capital medicines of that class. In calculous disorders it is also said to have been found very beneficial, not only as a diuretic, but as possessing a lithontriptic power. The penetrating and diffusible acrimony of garlic renders its external application useful in many disorders, as a rubefacient, and more especially as applied to the soles of the feet, to cause a revulsion from the head and breast; and thus it was successfully practised and recommended by Sydenham, especially in the confluent small-pox about the eighth day. When it occasions pain, as it sometimes does, this, he says, may be relieved by a cataplasin of bread and milk. Dr. Cullen remarks, that though when bruised and applied to the skin it produces inflammation, and frequently viciates the part, its effects are not so permanent nor so slow in healing as those of mustard and the other siliquose; and that it is more capable of absorption, and of extending its action to remote parts. It has, therefore, been variously employed externally in cases of tumors and cutaneous diseases: and in some instances of deafness, particularly of the rheumatic kind, a clove or small bulb of this root, wrapt in gauze or muslin, and introduced into the meatus auditorius, has been found an efficacious remedy. Bergius recommends for this purpose the juice of garlic dropped in cotton. Garlic may be administered in various forms; swallowing the clove entire, after being dipped in oil, is recommended as the most effectual: or, where this cannot be done, it may be cut into pieces without bruising it, and this may be found equally beneficial, without producing any uneasiness in the fauces. On being beaten up, and formed into pills, the active parts of this medicine soon evaporate.

Several other species of allium, as the *A. porrum*, *A. ascalonicum*, *A. fistulosum*, and *A. schenoprasum*, are employed in diet, but hardly in medicine, as their qualities are in a less considerable degree than those that have been already mentioned. In Kantschatka the wild garlic is useful both in medicine and food. It is gathered by the Russians and natives, for Winter supply, and formed into a ragout with other ingredients, and is their principal remedy for the scurvy. Pennant in his *Tour* 1772, p. 175, says, that an infusion of *A. ursinum* in brandy is esteemed a good remedy for the gravel. The young shoots of *A. vineale* are eaten in sallads, or boiled as pot-herbs. Lewis, *Mat. Med.* p. 32. 214. Cullen's *Mat. Med.* vol. i. p. 272.—429. vol. ii. p. 172.—178. Bergius, *Mat. Med.* vol. i. p. 264.—271. Murray's *Appar. Medic.* vol. v. p. 122.—139. Woodville, *Med. Bot.* vol. iii. p. 460.

ALLIUM. See HYACINTHUS, HYPOXIS, and TRADE-SCANTIA.

ALLIX, PETER, in *Biography*, a learned divine of the church of England, and an eminent writer, was born in the year 1641, at Alençon in France; and after receiving a liberal education, became minister of the reformed church at Rouen. In this situation he acquired great reputation by his excellent writings on the subject of the Eucharist. From hence he removed to Clarenton, which was the resort of the most distinguished protestants in France, and where he had the charge of the principal church belonging to the reformed in that country. Having now an opportunity of essentially serving the protestant cause, he preached several sermons in its defence, which were designed to counteract the attempts of the bishop of Meaux, who was one of its most able opponents. Twelve of these sermons were printed at Rotterdam in 1685, which were highly commended by Bayle, and contributed to increase the reputation of the author. Upon the revocation of the edict of Nantes in 1685, Mr. Allix was obliged to quit France, and to seek an asylum in England. His first object was to acquire a competent knowledge of our language; and in this he succeeded to such a degree, that in 1688, he published a defence of the Christian religion, in a work, entitled, "Reflections upon the Books of the Holy Scripture, to establish the Truth of the Christian Religion," to which he prefixed a dedication to king James II. acknowledging, in very respectful terms, his personal obligations to that prince, and expressing his sympathy and concern for the distressed refugees in general. "I could wish, Sir," says he, towards the close of this dedication, "that this work, which I now present to your Majesty, might be so happy as to pass to posterity with this character of our acknowledgment; and that it might stand as a faithful record for ever, to perpetuate the memory of that lively sense of your bounty, which is imprinted on all our hearts." The author was so well received in this country, that he was soon complimented with the degree of doctor of divinity, to which his character and writings gave him a just claim; and in 1690, he was made treasurer of the church of Salisbury. The time and talents of Dr. Allix were diligently employed in writing several valuable treatises in defence of the reformed religion, which he vindicated both from reason and authority, from the practice of early ages, and also from the precepts of the Gospel; alledging against the church of Rome, that whilst she treated others with the opprobrious name of heretics, she had herself invented new articles of faith. From the defence of religion in general, and of the protestant cause, he proceeded to that of the doctrine of the trinity against the Unitarians, who maintained that the notion of the divinity of Christ had originated with Justin Martyr. This work exhibits a great display of Greek and Hebrew literature; and it was intended, not merely to refute the assertions of the Unitarians, but to prove, that the Trinitarian doctrine was held by the ancient Jewish church. At a time when the distinguished reputation of our author was universally acknowledged, he incurred some raillery and censure, particularly on the part of Mr. Bayle, who had before expressed sentiments of the highest respect for his abilities and erudition, by a publication, in which he hazarded a conjecture concerning the second advent of Christ, the period of which, deduced from an erroneous explication of Scripture prophecies, he fixed to the year 1720, or, at the latest, to 1736. His character, however, for eminent talents, indefatigable assiduity, extensive literature,

ture, and various services which he had rendered to religion and the reformation, was not depreciated in the estimation of the best judges. Having protracted his useful life, and enjoyed an uncommon share of health and spirits to the 76th year of his age, he died at London, Feb. 21st, 1717; "leaving behind him the reputation of a man equally assiduous in the right discharge of all the offices of public and private life, and every way as amiable for his virtues and social qualities, as venerable for his uprightness and integrity, and famous for his various and profound learning."

Mr. Bayle highly commends the learning, candour, and abilities of Dr. Allix; and in speaking of his sermons he says, "that they contain a thousand beautiful passages, equally strong in sentiment, and delicate in their turn and expression." His works were numerous, and they were written in Latin, French, and English. Those of the first class were "A Dissertation on the first rise of the Trisagium or Doxology," 8vo, Rouen, 1674; "On the Blood of our Lord Jesus Christ," 8vo.; "On the Life and Writings of Tertullian," 12mo. Amsterdam, 1701; "On the authority of certain Councils," 8vo. 1680; "Anatolius's twelfth Book of Contemplations on the Six Days Work of the Creation, &c. from the Version and with the Notes of Andrew Dacier, with an expository Preface, &c." 4to. London, 1682; "An historical Preface, as to the Doctrine of Transubstantiation, to the Determination of Brother John Paris, Jacobin, as to the mode of our Lord's Body existing in the Sacrament of the Altar, &c." 8vo. London, 1686; "Of the two Advents of the Messiah, in as many Dissertations against the Jews," 12mo. London 1701; "Nectarius's Confutation of the Pope's Authority in the Church," a translation from the Greek original, printed in 1672 in Moldavia, 8vo. London, 1702; "A Preface to Augustus Herman Francke's Introduction to the Reading of the Holy Scriptures," 8vo. London, 1706; "A Dissertation on the Year and Month of the Nativity of our Lord Jesus Christ," 8vo. London, 1707, and 1710. In French, Dr. Allix published, "An Answer to a Dissertation of Anselm on Bertram and John Scot," printed at the close of Claude's answer to Arnaud, Quevilly, 8vo. 1670; "Ratramn, or Bertram, the Priest, on the Body and Blood of our Lord," in Latin and French, 12mo. Rouen, 1672; "Twelve Sermons on several Texts," 12mo. Rotterdam, 1683; "The Maxims of a good Christian," Amsterdam, 1687; "St. Paul's Farewell to the Ephesians," 12mo. Amst. 1688; "Preparations for the Lord's Supper," 8vo. often printed at Geneva. In English we have by Dr. Allix, "Reflections upon the Books of the Holy Scripture, to prove the Truth of the Christian Religion," 2 vols. 8vo. London, 1688; "Some Remarks upon the Ecclesiastical History of the Ancient Churches of Piedmont," 4to. London, 1690; in answer to the "History of the Variations of the Protestants in Matters of Faith," by the bishop of Meaux, which was penned to facilitate the design of Lewis XIV. to oblige all his subjects to be, or seem to be, of one faith; "Researches upon the Ecclesiastical History of the Ancient Churches of the Albigenes," 4to. London, 1692; "The Judgment of the Ancient Jewish Church, against the Unitarians in the Controversy upon the Holy Trinity, and the divinity of our Blessed Saviour," 8vo. London, 1689; "Preface and Arguments on the Palms," in which the author disapproves of the notion of a double completion of the prophecies contained in them; "The Prophecies which Mr. Whiston

applies to the times immediately following the appearance of the Messiah, considered and examined," 8vo. London, 1707; "Remarks upon some Places of Mr. Whiston's Books, either printed or in MS." 8vo. London, 1711. Biog. Brit.

ALLOA, or ALLOWAY, in *Geography*, a sea-port town of Scotland, situated in the Frith of Forth, about 10 miles above Leith, and five miles east of Stirling. The town is populous, has two market days in the week, and is remarkable for its fine castle, the seat of the Earl of Mar, and for its adjacent coal-mines. The harbour is commodious, having a good depth of water for ships of burden, and vessels are expeditiously loaded with coals, conveyed from the pits by a waggon-way in carriages of such easy draught, that one horse may draw three waggons, each containing one ton and an half. A dry dock has lately been erected, and there is a glass-house in the town, from which any quantity of bottles may be supplied at the shortest notice.

The Frith at this town first becomes a copious and navigable river. N. lat. 56° 10'. W. long. 3° 45'. The tower and lands of Alloa were exchanged by David king of Scots in 1355, with Thomas Lord Erskine, for the lands and estate of Strathgarney, in Perthshire, and since that time the castle has been the residence of the family of Mar. The situation is beautiful, and the gardens, containing about 40 acres, were laid out under the direction of Le Nature, and the plantation was begun in 1706. The tower of Alloa is 89 feet high, its walls are 12 feet thick, and it was built towards the close of the 13th century. The last heir of the Scots monarchy, who was nurtured here, was Henry prince of Wales; of whom some youthful relics are preserved, as is also the private signet of the unfortunate Mary, after she was obliged, by the treaty of Edinburgh, to desist from wearing the arms of England in the first quarter, the chair of James VI. her son, and the festive chair of Thomas Lord Erskine, the second earl of Mar of that name, with an inscription;

"Soli deo honor et gloria."

ALLOBROGES, in *Ancient Geography*, the inhabitants of that part of Gallia Narbonensis, which was situated between the rivers Isara to the south, and Rhodanus to the north, and the lacus Lemanus, comprehending a great part of the countries since known by the names of Savoy, Dauphinè, and Piedmont. Polybius, Plutarch, Dion, and Appian write their name, *Allobriges*, and Ptolemy and Stephan. Byz. *Allobryges*; but the true orthography, established by two inscriptions, is *Allobroges*. Their metropolis was Vienna. The Allobroges were inferior, neither in strength nor riches, to any of the inhabitants of Gaul. When Hannibal passed the Rhine into their country, he found two brothers contending for the crown, and took part with the eldest. This people, whose country bordered on that of the Salyes, and with whom they were in amity, were disposed to succour them against C. Sextius Calvinus, who had overcome Teutomalus, their king. But after Domitius had, during his consulship, settled the country of the Salyes in peace, a work which had been happily begun by Sextius, three years before, the Allobroges, being uneasy at the settlement of the Romans in their neighbourhood, prepared to make an attack upon the Roman colony at Aquæ Sextiæ. Domitius, in order to prevent the Arverni, a powerful people, from joining the Allobroges, formed an alliance with the Ædui, one of the most considerable nations in Transalpine Gaul. In consequence of this connexion the Arverni commenced hostilities against the Ædui; and

and the Roman general took occasion, from this circumstance, to force a passage into the country of the Arverni, whose king sent a deputation to the general, attended by a number of large dogs, and a bard or priest, who chaunted the praises of his king, the people, and the ambassador. The envoy, after being received with respect by Domitius, assuming an imperious air, commanded him, in the name of his master, to forbear molesting the Allobroges, and immediately to retire from Gaul. Domitius, unintimidated by this address, gave orders for his troops to march into the fruitful plains of the Cavari, in the neighbourhood of the present Avignon. Whilst he was encamped near a village, called Vindalia, he was attacked by the Allobroges; but they were easily routed by his regular and well disciplined troops. We are told that 20,000 Gauls were killed on the spot, and 3,000 made prisoners of war. The Allobroges, after this defeat, and another victory gained by Fabius Maximus over the Arverni, submitted; and so important was this event deemed at Rome, that Fabius took from this occasion the surname of Allobrox. At length the Romans made themselves masters of their whole country. Cicero, (Catilin. iii.) commends the Allobroges for their fidelity; but Horace (Epod. xvi.) reproaches them, on account of their fondness for novelty:

“ Novifque rebus infidelis Allobrox.”

ALLOCATION, *ALLOCATIO*, the admitting or allowing of an article in an account; and passing it as such.

ALLOCATION is also an allowance made upon an account; used in the exchequer. Hence,

ALLOCATIONE facienda, a writ directed to the lord-treasurer and barons of the exchequer, upon the complaint of some accountant; commanding him to allow him such sums as he hath in execution of his office lawfully expended. Reg. Orig. p. 206.

ALLOCATO comitatu, is a new writ of exigent allowed, before any other county-court holden, when the former has not been fully served, or complied with, &c. Fitz. Exig. 14.

ALLOCATION. See **ADLOCATION**.

ALLODIAL, in *Ancient Customs*. See **ALLODIUM**.

ALLODIAL tenure of lands, in *Agriculture*, a sort of free tenure still existing in some parts of Scotland, under which the tenant is not required either to pay any quit-rent, or acknowledge a superior.

ALLODIARIUS, the owner or proprietor of an *alodium*, or *allodial lands*; also used to denote a lord paramount of a manor.

This is otherwise written *alodiarius*, *alodarius*, *alovarius*, *aloeer*, *aloeerius*, and *aleutier*.

ALLODIUM, or **ALLEUD**, land held of a man's own right, without acknowledgment of service, or payment of any new rent to another; and this is property in the highest degree; but *feudum* or *feodum*, is such land as is held of another for which service is done, or rent is paid, as an acknowledgment thereof. When the barbarous nations overrun Europe, and settled in the countries which they had subdued, in the fifth and sixth centuries, the victorious troops divided the conquered lands. The portion which fell to every soldier was seized by him as a recompence due to his valour, as a settlement acquired by his own sword. He took possession of it as a freeman in full property. He enjoyed it during his own life, and could dispose of it at pleasure, or transmit it as an inheritance to his children. Thus property in land became fixed. It was

at the same time *allodial*; i. e. the possessor had the entire right of property and dominion; he held of no sovereign or superior lord, to whom he was bound to do homage, and perform service. How it afterwards was converted into feudal possession, will appear under the articles **BENEFICIUM**, **FEOD**, and **FEUDAL SYSTEM**.

In several parts of Europe this change had taken place, or allodial property had become almost entirely feudal, before the beginning of the 10th century. The former species of property seems to be so much better and more desirable than the latter, that such a change seems surprising, especially when we consider that the allodial property was frequently converted into feudal, by a voluntary deed of the possessor. The motives which led to a choice so repugnant to modern ideas concerning property have been investigated and explained, with his usual discernment and accuracy, by Montesquieu in his *Spirit of Laws*, lib. xxxi. c. 8. vol. ii. Those who were seized of fiefs, says this writer, (p. 431.) enjoyed very great advantages. The composition for the injuries done them was greater than that of freemen. It was a privilege belonging to the king's vassal, established by the Salic law, and by that of the Ripuarians, that whoever killed him should pay a composition of 600 sous; whereas they gave but 200 for the murder of a person freeborn, if he was a Frank or Barbarian living under the Salic law, and only 100 for a Roman. Besides, when a man was summoned in court, and did not make his appearance, nor obey the judge's orders, he was appealed before the king; and if he persisted in his contumacy, he was excluded from the king's protection, and no one was allowed to entertain him, or even to give him a morsel of bread. If he was a person of an ordinary condition, his goods were confiscated; but if he was the king's vassal, they were not. The first by his contumacy was deemed sufficiently convicted of the crime, the second was not: the former for the smallest crimes was obliged to undergo the trial by boiling water; the latter was condemned to this trial only in the case of murder. Moreover, the king's vassals could not be compelled to swear in court against another vassal. These privileges augmented daily, and the capitulary of Charlemagne does this honour to the king's vassals, that they shall not be obliged to swear in person, but only by the mouth of their own vassals. When a person who had these honours did not repair to the army, his punishment was to abstain from flesh-meat and wine, as long as he had been absent from the service; but a freeman who neglected to follow his count, paid a composition of 60 sous, and was reduced to slavery till he paid it. When these several circumstances are considered, it is natural to think that those Franks who were not the king's vassals, and much more the Romans, became fond of entering into the state of vassalage; and that they might not be deprived of their domains, they devised the usage of giving their allodium to the king, and of receiving it from him afterwards as a fief, and of nominating to him their heirs. This usage was always continued, and took place especially during the disorders of the second race, when every body stood in need of a protector, and wanted to incorporate himself with the other lords, and to enter, as it were, into the feudal monarchy, because the political no longer existed. This continued under the third race, as we find by several charters; whether they gave their allodium and resumed it by the same act; or whether it was declared an allodium, and afterwards acknowledged as a fief. These fiefs were called *fiefs of resumption*.

In those times of anarchy and disorder, which became general in Europe after the death of Charlemagne, it became necessary for every man to have a powerful protector, under whose banner he might range himself, and obtain security against enemies whom he could not singly oppose. For this reason he relinquished his allodial independence, and subjected himself to the feudal services, that he might find safety under the patronage of some respectable superior. In some parts of Europe this change from allodial to feudal property became so general, that he who possessed land had no longer any liberty of choice left. He was obliged to recognize some liege lord, and to hold of him. Upon this principle was formed the maxim, which, at length, became general in the law of France, "Nulle terre sans seigneur." During the 9th, 10th, and great part of the 11th century, the property in the province of Languedoc seems to have been entirely allodial; and during these centuries, the state of property seems to have been alike in Catalonia and the country of Roussillon. In the Low Countries allodial property continued to a later period; for during the 11th, 12th, and 13th centuries, this species of property appears to have been of considerable extent. Some vestiges of it appear there as late as the 14th century. It appears also by several facts, that allodial property subsisted in different parts of Europe long after the introduction of feudal tenures. Whilst some persons were fond of relinquishing this kind of property, in order to hold it by feudal tenure, others were solicitous to convert their fiefs into allodial property; of which instances occur in a charter of Louis le Debonnaire, again in 1299, and so late as the year 1337.

In Italy, allodial property continued longer in estimation than in France. Many of the charters granted by the emperors in the 9th century, conveyed an allodial right to land. But in the 11th century, there are found examples of persons who resigned their allodial property, and received it back as a feudal tenure. In Germany, the imperial vassals did not aspire so early to independence as in France, nor did they so soon obtain the privilege of obtaining their benefices by hereditary right. Conrad II. or the Salic, who began his reign A. D. 1024, is said to have been the first emperor who rendered fiefs hereditary. In Germany, as well as in France and Italy, a considerable part of the lands continued to be allodial long after the feudal mode of tenure was introduced. Robertson's Charles V. vol. i. p. 255.—Hume's Hist. vol. ii. p. 106. 8vo.

All the lands in England, except the crown-lands in the king's own hands, in right of his crown, are of the nature of FEUDUM, or FEE; for although many have lands by descent from their ancestors, and others have bought land, it cannot come to any either by descent or purchase, but with the burden that was laid upon him who had *novel-fee*, or first of all received it from his lord; so that there is no person hath *directum dominium*, i. e. the very property or demesne in any lands, but the king in right of his crown.

The origin of the word is controverted. Casseneuve says, it is almost as obscure as the head of the Nile. There are few of the European languages, from which one etymologist or other has not derived it; yet some, not improbably, take it for a primitive French word without etymon.

Wachter (*Glossar*. Germanic voc. *Allodium*) makes it a compound of the German particle *an* and *lot*, i. e. land obtained by lot; and it appears from the authorities cited by him, and

by Du Cange (voc. *fors*) that the northern nations divided the lands which they conquered in this manner.

Bollandus explains *allodium*, to be *prædium, seu quævis possessio libera, jurisque proprii, & non in feudum clientelari onere accepta*.

After the conquest of the Gauls, the lands were divided in two ways; viz. into benefices, *beneficia*; and *allodia*.—Benefices consisted in lands given by the king to his officers and soldiers; either for life, or for a time fixed. See BENEFICIUM.

Allodium, or *alleuds*, were such lands as were left in property to the ancient possessors; so that land possessed in *property*, which is mentioned in the law of Charlemagne, was, according to the stile of that age, allodial land; *alodes* and *proprietas*, *alodium* and *proprium* being terms perfectly synonymous. The clearest proof of the distinction between allodial and beneficiary possession is contained in two charters, published by Muratori, by which it appears that a person might possess one part of his estate as allodial, which he could dispose of at pleasure, the other as a benefice, of which he had only the usufruct, the property returning to the superior lord on his demise. Antiq. Ital. mediæ ævi. vol. i. p. 559. 565. The same distinction is pointed out in a capitulare of Charlemagne, A. D. 812. Edit. Baluz. vol. i. p. 491. In the curious testament of Count Everard, who married a daughter of Louis le Debonnaire, by which he disposed of his estate among his children, he distinguishes between what he possessed *proprietate*, and what he held *beneficio*, and it appears that the greater part was allodial. A. D. 837. Aub. Miræi Opera Diplomatica, Lovan. 1723. p. 19. See Robertson's Hist. Charles V. vol. i. p. 258.

The sixty-second title of the Salic law, is *de allodiis*: where the word signifies hereditary lands, or those derived from a man's ancestors. Whence *allodium* and *patrimonium* are frequently used indifferently.

In the ancient capitulars of Charlemagne, and his successors, we find *allodium* constantly opposed to *fee*; but, toward the period of the second race of kings, it lost the prerogative; the feudal lords obliged the proprietors of allodial lands to hold of them for the future. The same change also happened in Germany, &c.

In the customary laws of France, we find mention made of two kinds of allodiums, viz.

ALLODIUM nobile, aleu noble, that to which *justitia* or jurisdiction was annexed; and which was also free from all homage and service.

ALLODIUM villanum, aleu raturier, that to which no jurisdiction was annexed.

ALLOGIA, in *Antiquity*, denote winter-quarters appointed for the soldiery.

Some will have the word of French origin, from *logement*; others, with more probability, from the Italian *alloggio*, formed of *locus, place*.

ALLOISI, BALDASSARE, called *GALANINO*, in *Biography*, an eminent painter, was born at Bologna, in 1578, and educated in the celebrated school of the Caracci, whose style he retained in all his compositions. Being of a melancholy disposition and fond of retirement, he devoted himself to the study of his art; but by his attachment to solitude, he became so indigent as to be under a necessity of procuring a subsistence by painting portraits. In this department of his profession he excelled to such a degree, as to gain very high esteem, not only for striking resemblance, and the beauty of his colouring, but for a new and unusual boldness

boldness of manner, by which his portraits seemed absolutely to breathe. He was allowed to be superior to all his contemporaries; and the Italian writers place him in the same rank of merit with Vandyck. As an engraver, Mr. Strutt mentions one print done by him, which is a copy of Guido's beautiful etching from Annib. Caracci, where, "St. Rock is giving charity to the poor;" but the copy, he says, is far inferior to the original. He died in 1638. Pilkington and Strutt.

ALLOM. See ALUM.

ALLONGE, in *Fencing*, a thrust, or PASS at the enemy. The word is French, formed of the verb, *allonger*, to lengthen out a thing.

ALLOPHYLI, denoting *Strangers*, in *Ancient Geography*, a name given by Sulpicius Severus, and also in the Septuagint, to the Philistines.

ALLOPHYLUS, in *Botany*, a genus of the *œlandria monogynia* class and order, and of the natural order of *guttifera*, Juss.; the characters of which are, that the *calyx* is a four-leaved perianthium, leaflets orbiculate, exterior, opposite, lesser by half; the *corolla* has four petals, less than the calyx, orbiculate, equal, claws broad, of the length of the two smaller leaves of the calyx; the *stamens* consist of filaments filiform, of the length of the corolla, anthers roundish; the *pistillum* has a germ superior, roundish, twin, style filiform, longer than the stamens, stigma bifid, with the divisions rolled back, quadrid (Linn. Syst.). N. B. The flowers of *Rhus Cominia* and *Cobbe* agree with the character of this genus; and *Aporetica* of Forster should be referred to it. Swartz. Martyn enumerates five, and Gmelin in his system of Linnæus three species. 1. *A. zeylanicus*, with leaves oval acuminate quite entire, racemes axillary, very short. This is a tree having the appearance of *Persea*, and a native of Ceylon: its fruit is yet unknown. 2. *A. rigidus*, with leaves simple, denticulated and spiny, and flowers in racemes. 3. *A. racemosus*, with leaves ternate, flowers in racemes. This and the last species are natives of Hispaniola. 4. *A. cominia*, *Rhus cominia* of Linnæus, &c. *cominia* of Brown, and *toxicodendron arboreum* of Tournefort, has leaves ternate, and flowers in panicles, rises 30 feet in height, with a stem of the thickness of a man's thigh, and smooth ash-coloured bark, with numerous whitish yellow flowers, to which succeed small, orange-coloured, smooth berries, about the size of a pin's head, with a brittle shell and large kernel, and grows plentifully in Jamaica. It was introduced into Kew Garden in 1778, by Dr. Clark. 5. *A. ternatus*, with leaves ternate serrate, and racemes long terminating, is a shrub five feet high with spreading branches, and small white flowers with hairy petals, and a nectary of four glands, and bifid style. It is a native of Cochinchina, by the banks of rivers; and the inhabitants use the leaves as a cataplasm in contusions.

ALLORI, ALESSANDRO, called BRONZINO, in *Biography*, a painter of history and portrait, was born at Florence in 1535, and was the disciple of Agnolo Bronzino, who, by his affectionate attention, supplied the place of his father, whom he lost when he was five years old. He was assiduous in his application, and imitated the manner not only of his master, but the different manners of other most eminent masters. His first work was a crucifixion, intended for an altar-piece, consisting of a variety of figures well-grouped, beautifully coloured, and distinguished by good expression. In painting portraits he was much encouraged, and devoted much of his time to this branch of his profession. His picture of the "Last Judgment," after the manner of Michael Angelo Buonaroti, whose works he studied

with peculiar attention and pleasure, is still preserved at Rome, and will perpetuate his honour. He died in 1607. Pilkington.

ALLORI, CHRISTOFARO, called BRONZINO, the son and disciple of the former, was born at Florence in 1577; and having studied design from the works of Santi di Titi, and colouring from the lively and elegant tints of Cigoli, he acquired a manner very different from that of his father, which he first followed. He executed several designs for altars; but he excelled in small pictures, into which he introduced a number of minute figures, so correctly drawn, so round and relieved by the colouring, and so delicately touched, that it was surprising how the hand or eye could execute them. His portraits, as large as life, were highly valued for the expression and the attitude. Pilkington.

ALLORIA, in *Ancient Geography*, a town of Crete. Steph. Byz.

ALLOS, in *Geography*, a town of France, in the department of the Lower Alps, and district of Barcelonette, four miles north of Colmar and nine south of Barcelonette.

ALLOSYGNE, in *Ancient Geography*, a sea-port town of India, on this side the Ganges.

ALLOTRIGÆ, or ALLTRIGÆ, a people placed by Strabo in the northern part of Spain, and probably the same with the *Altrigone* of Ptolemy, and *Antrigones* of Pliny.

ALLOTTING, or ALLOTMENT of goods, in matters of *Commerce*, is when a ship's cargo is divided into several parts, bought by divers persons, whose names are written on as many pieces of paper, which are applied by an indifferent person to the several lots or parcels; by which means the goods are divided without partiality; every man having the parcel to which the lot with his name upon it is appropriated. See INCH of Candle.

ALLOTMENTS of Lands, in *Agriculture*, are such portions of ground as are allotted to claimants on the division and inclosure of commons or other waste lands, and which are generally proportionate to the extent of the right which they enjoy upon them, from the possession of lands, tenements, &c. in the same parish in which they are placed.

ALLOUE', in *Geography*, a town of France in the department of the Charente, and district of Confolent, on the Charente, two leagues west of Confolent.

ALLOVIA, in *Botany*, a species of MARANTA.

ALLOW, a river of England in Northumberland, which runs into the Tyne, between Hexham and Newcastle.

ALLOWANCE of *Frauds*, in *Law*. See FRAUDCHISE.

ALLOWANCE of Pardon. See PARDON.

ALLOWANCE of *Writs of Error*. See ERROR and JUDGMENT.

ALLOWANCE to Bankrupts. See BANKRUPT.

ALLOWAY Creek, in *Geography*, a creek of America, in the county of Salem, and State of New Jersey, which empties itself into the Delaware. It is navigable 16 miles, with the interruption of draw-bridges.

ALLOY or ALLAY, — *Alliage*, Fr. — *Legiren Metallverfischung*, Germ. — *Legga*, Ital.

The true origin of this word is probably derived through the medium of the French, from the Latin *ad-ligatio*, signifying the act of tying, or binding, or connecting together; since, however, the term was formerly almost wholly confined, in England, to the goldsmiths and the mint, where it was

was appropriated to the *lowering* the purity of gold or silver by mixture with copper, previously to its being coined or manufactured, it seems gradually to have assumed the orthography and meaning of the English verb to alloy, *i. e.* to abate, to lower. All the other known combinations of metals with each other were simply called *mixed metals*. But as increased attention has been paid to the accuracy of chemical Nomenclature, the term alloy has at length comprehended all the binary and more complicated metallic compounds; those of which mercury makes a part, being indeed more generally known by the name AMALGAM.

An alloy, therefore, may be defined, a combination of any two or more metals, into one homogeneous mass; to the express exclusion of mere mechanical mixtures, which, however, in some cases, are not easily distinguished from genuine alloys. The most valuable and useful of these have acquired peculiar names, such as brass, type-metal, tutenag, bronze, speculum-metal, &c. all of which will be described in their proper places hereafter; the object in this article being confined to the statement of such general facts and inferences as are deducible from a comparison with each other of those experiments on the combinations of metals that have been made with sufficient accuracy, the number of which is unfortunately very small.

As no metal, except mercury, is fluid at the common atmospheric temperature, and as without the fluidity of one at least of the ingredients, no metallic combinations can take place, it is necessary to expose the materials in a crucible, or other proper vessel, to a heat somewhat greater than is required for the liquefaction of their most fusible part; but as this diminution of cohesion is equally favourable to intimate mixture as to chemical combination, and since all tendency to separation ceases, the very moment of the congelation of the mass, it no doubt often happens that these two circumstances are confounded together, and thus cause many of the anomalies and peculiar difficulties with which the subject is encumbered.

The method that is given in most chemical books for ascertaining whether a mass of metal is a real alloy, or only a mechanical mixture, consists in fusing it with as little heat as possible, and keeping it in this state till its component parts separate from each other, like oil from water, according to their respective specific gravities; and perhaps there is upon the whole no other way equally simple and practicable of effecting this; at the same time that it is liable to a number of errors. In the first place, when experimenting at high temperatures, it is very difficult and indeed impossible to preserve an equal degree of heat through the process, and it is highly probable that a metallic combination may take place at a mere melting heat, which is decomposed by a higher one, or *vice versa*. If this may happen in alloys that consist of only two materials, it is still more likely to do so when three or a still greater number of metals are united into one mass. Thus, if an alloy made of one part zinc and two of mercury be mixed with another of one part bismuth and one mercury, the whole may be fused together by a heat just sufficient to make them flow, may be kept in fusion for a considerable time, and then poured into a melting cone without any separation of the constituent parts; but when the alloy is heated so as to make the mercury boil, the greater part of the zinc immediately rises to the surface and separates, owing to the destruction of the equilibrium between the antagonistic affinities, by the presence of a certain quantity of caloric.

Again, supposing no change in the affinities to take place, if the mixed metals are nearly of the same fusibility and

specific gravity, a spontaneous separation by fusion is scarcely to be expected: so also, if they differ in these two particulars, and the metal of easiest fusion is of the greatest specific gravity, as in an alloy of copper and lead, where the two parts are in equal proportions, the first effect of the heat will be the separation of part of the lead before the mass enters into fusion, this will occupy the bottom of the crucible, and the fusibility of the alloy decreasing by the gradual separation of the lead, a temperature nearly equal to the melting heat of copper will be required to bring the whole to a fluid state; when this is effected, the lead receiving the first impression of the heat as it enters the crucible from below, being also covered with melted copper, will be made to boil, and in consequence will be continually thrown up into the copper notwithstanding its superior specific gravity.

The only way, therefore, of determining with certainty the difference between an alloy and a mere mixture, is by a comparison of the properties of the compound with those of its elements, which if they are not intermediate, nor caused by mere mechanical action on each other, may be received as adequate evidence of a proper chemical union. Here, however, a number of difficulties and doubts, as yet wholly uninvestigated and incapable of being resolved by common cases of affinity, require examination.

If two metals being fused together produce a mass, whose specific gravity is either greater or less than the mean specific gravity of its elements, the result is said to be an alloy, or proper chemical combination. How few however, if even any experiments for the purpose of ascertaining this have been made with sufficient care? It is not enough that the specific gravity of each of the simple metals should be taken and compared with that of the alloy; but they ought to have been previously melted by themselves, and cooled in the same circumstances to which the alloy was afterwards to be exposed. For example, suppose an alloy to be made of copper and gold, equal parts; the copper to have been cut off from a piece of hard wire, and the gold to have been laminated, the specific gravity of the first will be nearly 8.87 and of the latter 19.36; the two metals being thoroughly mixed by fusion, and either left to cool in the crucible or poured into a melting cone, are then weighed in the hydrostatic balance, and the difference or agreement between the specific gravity of the alloy and the mean gravity of the materials, is considered as a fair ground of inference for the reality of chemical combination, or the contrary. But the specific gravity of copper cooled slowly and not wire-drawn is only 7.78, and that of gold in the same circumstances is 19.25; now the alloy is precisely in this state, having been merely melted and cooled gradually; if therefore no chemical combination whatever had taken place, yet the specific gravity of the alloy, instead of being = 14.11, as deduced by calculation from that of the materials, would be = 13.51, merely from the circumstance of slow cooling without compression. By cooling a malleable metal suddenly, as by pouring it into cold water, it becomes hard, and in some degree brittle, resembling in this respect a piece of the same metal that has been laminated without subsequent annealing; the specific gravity of the laminated metal is increased, and probably the same effect is produced by the sudden cooling: thus a great seeming change in specific gravity may exist where there is none in fact. Besides, it is possible that a real alteration of specific gravity may appear in a mixture of two metals, which, instead of being an evidence of chemical combination shall be merely the effect of the hardness and tenacity of one of them. It is well known that all metals expand by heat, and alter their dimensions when passing from

the fluid to the solid state. Let A B then be a binary mixture of three parts A, and one B; A is the least fusible of the two and contracts least in cooling; it will necessarily happen therefore, upon the supposition that no chemical affinity subsists between them, that when they are well mixed by fusion and then allowed to cool, A will harden first, and by its excess in quantity will entirely envelope all the melted particles of B with a crust impenetrable to the air, and capable of supporting the whole atmospheric pressure; afterwards B will become solid and contract, leaving part of the cell which it occupied while fluid, a perfect vacuum, at the same time that these pores may easily be invisible even to common magnifiers; hence the result will be a mixture of less than the mean specific gravity.

The change that takes place in the ductility of metals when mixed together is generally brought forwards as one of the most striking proofs of chemical combination; even here, however, difficulties occur that have not yet been explained. Macquer lays it down as a constant fact that alloys are less ductile than the metals of which they are composed, and Gellert in his *Chimie Metallurgique* infers, that the mixture of gold with silver is not a true alloy on account of its perfect ductility; from the want of accurate experiments it is perhaps impossible at present to determine the question; but, so far from the position of Macquer and Gellert being universally true, the general result of the facts which have been hitherto ascertained, if rightly understood, seems to render the direct reverse highly probable; and that the brittleness of alloys from ductile materials is in all cases a proof of supersaturation, or of mere mechanical mixture. When to any quantity of pure copper one third of zinc is added, the alloy called brass is produced; and that this is a chemical combination between the two metals may be inferred from the remarkable change of colour and fusibility of the mass; the ductility however of brass is fully equal to that of copper. But if the proportion of zinc is increased to an equality with the copper, the colour of the alloy, instead of being yellow like gold, will be nearly a medium between that of brass and of zinc, and its ductility will be destroyed; thus shewing, that the point of mutual saturation of these metals is between one third and a half of zinc to two thirds and a half of copper, and also that brass has little or no affinity with zinc. The ductility of any metal depends on the strong cohesive attraction of its particles, which slide upon each other when impressed by any external force instead of separating; now it may readily be conceived that two ductile metals being intimately mixed so as that every particle of the one is in contact with a particle of the other, provided no very powerful affinity subsists between them, may be broken by a blow which would only have slightly altered the relative position of homogeneous cohering particles; and therefore, that a brittle mixture of two ductile metals does not necessarily infer a chemical combination between them.

Change of colour, in the few cases in which it occurs, provided it is not intermediate between those of the elements of any alloy, may be considered as a very probable evidence of chemical union; of this kind is the golden colour of brass, and the silvery white of arsenicated copper. But the general similarity of colour between all the white metals and their alloys, confines the application of this external character to a very few instances.

One of the most striking proofs of actual combination between the parts of an alloy, or at least what is the most

difficult of explanation upon the theory of mere mechanical mixture, is a remarkable increase of fusibility; this, in almost all cases, is much greater than could be inferred from the mean fusibility of its component parts; thus equal parts of tin and iron will melt at the same temperature as is required for equal parts of tin and copper, or bronze, notwithstanding the great difference between the fusing heat of copper and iron, when they are each of them pure. So also an alloy of tin, bismuth and lead, will melt in boiling water, which is a less heat than is necessary for the liquefaction even of bismuth, the most fusible of the three.

The oxydability of an alloy is generally either greater or less than that of the simple metals. Tin and lead for instance being mixed together and exposed to a low red heat take fire and oxydate almost instantaneously.

Elective affinity takes place in the combinations of metals, as in those of all other substances; thus an alloy of copper and silver is decomposable by lead. Again certain metals resist supersaturation, while others may be mixed in almost all proportions, as cobalt may be combined with a certain proportion of lead, but cannot even be mixed with a larger quantity. These enquiries, however, though highly interesting and intimately connected with many of the useful arts, have been almost wholly neglected during the last fifty years; and the experiments of Gellert, Kraaft and Lewis, still continue to be our only authorities. Many peculiar difficulties attend the investigation of the general principles, according to which metals act on each other, and the general phenomena necessarily attending such action; it is a subject that may demand the abilities, and will recompence the attention, of the greatest and most accurate philosopher, and which unfortunately has hitherto received less notice than any other branch of chemical enquiry.

ALLOY of coinage. See ASSAY.

ALL-SAINTS, in *Geography*. See ALL-Saints.

ALL-SEED, in *Botany*. See LINUM and CHENOPodium.

ALL-SPICE. See MYRTUS.

ALLSTADT, or ALLSTETT, in *Geography*, a very ancient town of Germany, in the circle of Upper Saxony, and principality of Eisenach; 26 miles north of Weimar, and five south-south-east of Sangerhausen. The emperor Otho had a palace in this town, and held a diet here in 974. It belongs to a bailiwick of the same name, lying between that of Sangerhausen in the electorate of Saxony, the principality of Querfurt, and the bailiwick of Bockstedt, in the county of Mansfeld.

ALLUDSJE, a town of Arabia, 14 miles east-north-east of Beitel Fakili.

ALLUM. See ALUM.

ALLUMBADDY, in *Geography*, a town of Hindostan, in the country of the Mysore, 63 miles east of Seringapatam, and 50 south of Bangalore.

ALLUM Bay, lies round the NEEDLES point, or north east from the rocks so called, at the west end of the Isle of Wight, on the coast of Hampshire. It has good anchorage, and a sufficient depth of water, not far from the bottom of the bay, and out of the strong run of the tide, which is frequently very rapid, and accelerates or retards the motion of a vessel, as a ship sails with or against its direction, to an astonishing degree.

ALLUMÉ'E, FR., in *Heraldry*, a term applied to the eyes of a bear, or other beast, when they are drawn sparkling and red.

ALLUMETÆ, in *Ancient Geography*, the name of an ancient people of Arabia Felix.

ALLUMINOR, from the French *allumer*, to lighten, is used for one who coloureth or painteth upon paper or parchment; and the reason is, because he gives light and ornament by his colours to the letters, or other figures. Such ornaments are dyed illuminations. The word is used in flat. 1 Rich. III. cap. 9. But now such a person is called a *linner*.

ALLUMINOUS, any thing that contains *allum*, or partakes of the nature and qualities of that **SALT**.

Crew describes some extraordinary kinds of *alluminous* earths in the repository of the Royal Society.

ALLUMINOUS Clay, Earth, and Schist, in *Agriculture*. See **CLAY, EARTH, and SCHIST**.

ALUMINOUS waters, are those impregnated with the particles of that salt.

Aluminous waters make a species of those called mineral or medicinal waters.

We have also factitious waters, under the denomination of *alluminous*; such as that called in the shops *aqua alluminosa magisterialis*.

Its preparation is thus: take of rock-allum, and white sublimate, ana ℥ii. boil them in rose and plantain water, ana ℔i. till half is consumed; filter the remainder, and keep it for use.

This is prescribed against deformities of the skin, and often for the itch; but it is an uncertain remedy, and not to be used without caution.

ALLUSH, or ALLUSH, in *Scripture Geography*, a city of Idumea, which was one of the stations of the Israelites, between Dophkah and Rephidim, in their migration from the wilderness of Sin to that of Sinai. Numbers, xxxiii. 13, 14. Eusebius and St. Jerom fix Allush near Gabala, *i. e.* Petra, the capital of Arabia Petræa. In the accounts of the empire, it is situated in the third Palestine, and by Ptolemy among the cities of Idumea. It is also called Eluza or Chaluza. The Jerusalem Targum, in Gen. xxv. 18. and in Exod. xvi. 22. translates the desert of Seir by Allush. Calmet.

ALLUSION, ALLUSIO, formed of *ad*, and *ludere*, to play, in *Rhetoric*, a figure whereby something is applied to, or understood of another, by reason of some similitude of name, or sound.

Camden defines allusion a dalliance, or playing with words alike in sound, but unlike in sense; by changing, adding, or subtracting a letter, or two; whence words resembling one another become applicable to different subjects. Thus the Almighty, if we may use sacred authority, changed Abram, *i. e.* high father, into Abraham, *i. e.* father of many.—Thus the Romans played on their tippling emperor Tiberius Nero, by calling him Biberius Mero: and thus in Quintilian the four fellow Placidus is called Acidus.

Allusion is a species of **COMPARISON**, not extending to a **SIMILE**, and consisting chiefly in comparing one fact with another. The most fanciful and poetical is, when two facts, bearing a remote resemblance in a few circumstances, are compared; of which we have a beautiful example in one of Dr. Ogden's sermons. "If it be the obscure, the minute, the ceremonial parts of religion for which we are contending, though the triumph be empty, the dispute is dangerous; like the men of Ai we pursue, perhaps, some little party that flies before us, and are anxious that not a straggler should escape, but when we look behind us we behold our city in flames." Lowth's Lectures by Gregory, vol. i. p. 251.

Allusions are nearly allied to what we popularly call puns.

ALLUVIAL LIMESTONE, in *Agriculture*, a sort of soft limestone found in many districts, supposed to have been formed in the early ages of the world by the disposition of calcareous matters held in the state of solution in water. This kind of limestone is supposed by Dr. Darwin, in his Philosophy of Agriculture, to contain magnesia, which it probably may have acquired from the sea-water in which it was originally dissolved. Such limestone as contains magnesia has been found, by the experiments of Mr. Tennant, to be much less useful when burnt into lime, for the purposes of agriculture, than such as is purely of the calcareous kind.

ALLUVION, ALLUVIO, formed of *adluo*, I wash to, compounded of *ad* and *luvo*, in the *Civil Law*, a gradual addition or accretion made along the sea-shore, or the banks of large rivers.

The civil law places alluvion among the lawful means of acquisition; and defines it to be a latent, imperceptible accretion.—Hence, where any considerable portion of ground is torn away at once, by an inundation, and joined to some neighbouring estate, this is not acquired by right of alluvion, but may be claimed again by the former owner.

Bracton says, that if an island arise in the middle of a river, it belongs in common to those who have lands on each side of it; but if it be nearer to one bank than the other, it belongs only to him who is proprietor of the nearest shore; which is agreeable to the civil law. However, if the whole soil of the river is the freehold of any one man, as it usually is when a several fishery is claimed, in this case it seems just, and such is the constant practice, that the eyotts or little islands, arising in any part of the river, shall be the property of him who owneth the piscary and the soil. But if a new island rise in the sea, though the civil law gives it to the first occupant, yet ours gives it to the king. And as to lands gained from the sea, either by *alluvion*, by the washing up of sand and earth, so as in time to make terra firma, or by *dereliction*, as when the sea shrinks back below the usual water-mark; in these cases the law is held to be, that if this gain be by little and little, by small and imperceptible degrees, it shall go to the owner of the land adjoining; for *de minimis non curat lex*: and, besides, these owners being often losers by the breaking in of the sea, or at charges to keep it out, this possible gain is therefore a reciprocal consideration for such possible charge or loss. But if the alluvion or dereliction be sudden and considerable, in this case it belongs to the king; for, as the king is lord of the sea, and so owner of the soil while it is covered with water, it is but reasonable he should have the soil when the water has left it dry; so that the quantity of ground gained, and the time during which it is gaining, are the circumstances that make it either the king's, or the subject's property. In the same manner, if a river, running between two lordships, by degrees gains upon the one, and thereby leaves the other dry; the owner who loses his ground thus imperceptibly, has no remedy; but if the course of the river be changed by a sudden and violent flood, or other hasty means, and thereby a man loses his ground, it is said that he shall have what the river has left in any other place, as a recompence for this sudden loss. And this law of alluvions and derelictions, with regard to rivers, is nearly the same in the Imperial law; from whence our determinations seem to have been declared and adopted; but we ourselves, as islanders, have applied them to marine increases; and

have given our sovereign the prerogative he enjoys, that whatever hath no other owner is vested by law in the king. Blackst. Com. vol. ii. p. 262, 8vo.

Great alterations are made in the face and limits of countries, by alluvions of the sea, rivers, &c. Whole plains are sometimes formed by alluvions. It is controverted whether alluvions should be considered as fruits, and as such accruing to *usufructuaries*.

ALLUVION of the sea, in *Agriculture*, signifies such kinds of soil as are formed by the deposition of various sorts of matters, held in solution either by the sea, or larger rivers, from their overflowing their banks. The depth of soils formed in this way are various according to particular circumstances. It is observed by Mr. Young, in his agricultural survey of Lincolnshire, that the marsh land in the vicinity of Winterringham, is a tract of *alluvion of the Humber*, deposited to the depth of six feet, apparently as good at the bottom as the top. Soils of this mixture are mostly productive, whether grain or grass be cultivated upon them.

ALLY, in matters of *Polity*, a sovereign prince or state, that has entered into alliance with others. See **ALLIANCE**.

ALMA, in *Geography*, a river of Russia, that takes its rise from the mountains of Taurida.

ALMA, in *Ancient Geography*, a river of Italy, in Etruria.

ALMA, or **ALMUS**, a mountain of Illyria, in the vicinity of Serinium. The emperor Probus planted vines on it, which he conveyed from Italy.

ALMACANTARS, **ALMACANTARAS**, or **ALMICANTHARATH**, in *Astronomy*. See **ALMUCANTARS**.

ALMACANTARS staff. See **ALMUCANTARS staff**.

ALMACARON, or **ALMAZERON**, in *Geography*, a fortified sea-port town of Spain, in the province of Murcia, at the mouth of the river Guadalantin, on the Mediterranean, which has mines of alum in its neighbourhood, is situated 20 miles west of Carthagea. On the west side is a castle, and on the east a rock with a watch-tower upon it. N. lat. 37° 28'. W. long. 0° 56'.

ALMADA, a small market town of Portugal, on the gulf formed by the Tagus, over against Lisbon. It has a church on the summit of a hill, and the English hospital at the foot of it.

ALMADE, in *Sea-language*, a small vessel used by the negroes of Africa, about four fathoms long; and made usually of the bark of a tree.

The same name is also given to the vessels of Calicut in India, which are eighty feet long, and six or seven broad, and square sterned. These are otherwise denominated *caithuri*. They go with great swiftness. Witsen says, that they are twelve or thirteen paces long, sharp at head and stern, and that they are moved both by sails and oars.

ALMADEN, in *Geography*, a small town of Spain in the kingdom of Seville, and province of La Mancha, near which are mines of quicksilver; 13 leagues south-west of Ciudad-Real.

ALMADIA, a fortress of Asia, in the province of Curdesian, 50 miles south-west of Betlis.

ALMADRONES, a town or village of Africa, in the kingdom of Fez, near Cape Spartel. The bay faces the Atlantic Ocean, and lies under the lee of Cape Spartel on the south. The road is safe, and has good anchorage, and is well sheltered from north and east winds, but exposed to the south and west. When the wind shifts to the west, and south-west of this point, ships should be prepared for putting to sea, and take shelter round the point in Tangier bay.

ALMENA. See **ALMANA**.

ALMAGEST, the name of a celebrated work, composed by Ptolemy, and consisting of 13 books; being a collection of many of the observations and problems of the ancients, relating both to geometry and astronomy. It contains a catalogue of the fixed stars with their places, besides numerous records of eclipses, the motions of the planets, &c. being the first work of the kind that has been transmitted to us, it is valuable to astronomers.

In the original Greek it was called *συναξίς μαθηματικῆς*, *greatest construction*, or *collection*: which last word *magest*, joined to the particle *al*, gave occasion to its being called *almagest* by the Arabians, who found it at Alexandria, in Egypt, on their capture of that kingdom, and translated it into their tongue about the year 827, by order of the caliph Almamun.—The Arabic word is *almaghysti*. It was first translated into Latin about the year 1230, by favour of the emperor Frederic II. But the Greek text was not known in Europe till about the beginning of the 15th century, when it was brought from Constantinople, then taken by the Turks, by George, a monk of Trebizond, who translated it into Latin; and this translation has been frequently published.

Ricciolus also published, in 1651, a body of Astronomy, which he entitles, after Ptolemy, the new *Almagest*: being a collection of ancient and modern observations and discoveries in that science.

We have also a botanical *Almagest*, composed by Plukenet, being a kind of *pindex*, or general index of plants, containing the proper and descriptive names of upwards of six thousand. To which, in a supplement, since published by the same author, have been added above one thousand others. *Almagestum Botanicum*, five *Phytographiæ Pluencianæ Onomasticon*, &c. Lond. 1696. fol.

ALMAGRA, in *Natural History*, a name given in later ages to an earth of the *ochre* kind, called *sil atticum* by the ancients. It is an ochre of a fine and deep red, with some admixture of purple, very heavy, and of a dense yet friable structure, and rough dusky surface. It adheres very firmly to the tongue, and melts freely and easily in the mouth, and is of an astringe and strongly astringent taste; it stains the skin in touching it, and ferments very violently with acid menstruums; by which single quality, it is sufficiently distinguished from the *sil sylvicum*, to which it has in many respects a great affinity. It is found in immense quantities, in many parts of Spain; and in Andalusia there are in a manner whole mountains of it. It is used in painting, and in medicine, being a very valuable astringent.

ALMAGRO, **DIEGO DE**, in *Biography and History*, one of the colleagues and rivals of Francisco Pizarro, and Ferdinando de Luque in the conquest of Peru, was probably a foundling of obscure birth and unknown parentage, and derived his name from the village in which he was born, about the year 1463. Although he was un instructed in reading and writing, he advanced himself by military service; and having acquired wealth and influence in Panama, he formed an association with the persons above-mentioned in 1524, for discovery and conquest on the coast of Peru. Each engaged to devote his talents and his whole fortune to the adventure, and their confederacy for this purpose was authorized by Pedrarias, the governor of Panama. The province assigned to Almagro was that of conducting the supplies of provisions and reinforcements of troops, as Pizarro might need them in the prosecution of their enterprise. This office he performed with persevering assiduity, though their first attempts in 1525 and 1526 were attended with difficulties, which would have deterred adventurers less ardent than themselves from renew-

ing their efforts. At length, however, they discovered the coast of Peru, and landed at Tumbez, a place of some note, about three degrees south of the line, distinguished for its sandy temple, and a palace of the Incas, or sovereigns of the country. Having in 1528 settled some preliminaries, and adjusted among themselves that Pizarro should claim the station of governor, Almagro that of lieutenant governor, and Luque the dignity of bishop in the country which they determined to conquer, Pizarro was deputed as their agent to Spain, in order to negotiate and to obtain further powers and supplies. In this negotiation Pizarro, principally concerned about his own interest, neglected his associates; and though he obtained for Luque the ecclesiastical dignity to which he aspired, because it did not interfere with his own pretensions, he claimed for Almagro only the command of the fortress which should be erected at Tumbez. On his return from Spain and arrival at Panama in 1530, he found Almagro so much exasperated at the manner in which he had conducted the negotiation, that he refused to act with such a perfidious companion, and determined to form a new association. Pizarro, however, temporized for the present; and by offering voluntarily to relinquish the office of Adelantado, and promising to concur in soliciting that title, with an independent government for Almagro, he gradually mitigated the rage of an open-hearted soldier, which had been violent, but was not implacable. The confederacy was again renewed on its original terms; and it was agreed, that the enterprise should be carried on at the common expence of the associates, and that the profits accruing from it should be equally divided between them. With an armament of three small vessels, and 180 soldiers, Pizarro sailed for Peru in February 1531, leaving Almagro at Panama with instructions to follow him with such reinforcement as he should be able to muster. Having succeeded in the province of Coaque, and obtained from a principal settlement of the natives rich spoil, he instantly dispatched one of his ships to Panama, with a large remittance to Almagro, by which means he was enabled to complete his reinforcement, which almost doubled the number of Pizarro's followers, and to land with them at St. Michael towards the close of the year 1532. The Inca Ahatualpa was now in the hands of the Spaniards, and when they had received the sum which had been paid for his ransom, Almagro and his followers demanded an equal share of it; and in order to secure this object, they eagerly insisted on putting the Inca to death. Accordingly he was tried and executed. Ferdinand Pizarro was deputed to sail for Spain with an account of the success of the adventurers, and with remittances of great value; in consequence of which his brother's authority was confirmed and enlarged, and Almagro received the honour which he had so long desired. The title of Adelantado, or governor, was conferred upon him, with jurisdiction over 200 leagues of country, stretching beyond the limits of the province allotted to Pizarro. As soon as Almagro was informed, that he had obtained the royal grant of an independent government, he attempted to make himself master of Cuzco, the imperial residence of the Incas, under a pretence that it lay within the boundaries of his territory. This produced new dissensions between him and Pizarro; but a new reconciliation took place, to which was annexed a condition, that Almagro should attempt the conquest of Chili, and that if this province did not afford an establishment which he thought adequate to his merit and expectation, Pizarro engaged to yield up to him a part of Peru. Almagro in 1535 began his march towards Chili, at the head of 570 men, and here he suffered by pursuing a wrong route very

great hardships and losses. Whilst he was contending with a more vigorous resistance than the Spaniards had experienced in other countries, and pursuing his conquests, he was recalled to Peru by the intelligence that Cuzco, as well as Lima, were invested by the natives, who had assembled in great numbers to rescue themselves from their oppressors. In order to hasten his return he pursued a new route; and in marching through the sandy plains on the coast, he suffered from heat and drought calamities, though of a different kind, little inferior to those in which he had been involved by cold and famine on the summits of the Andes. He arrived at Cuzco in a critical moment, and resolved to occupy the place both against the Indians and his Spanish rivals, who were preparing to supplant him. Having gained a decisive victory over the Peruvians, he proceeded to the gates of Cuzco without further interruption; but the Pizarros attempted to obstruct his entry. Almagro, however, whose open, affable, generous temper, had gained an accession of many adherents of the Pizarros, who were disgusted with their harsh domineering manners, advanced towards the city by night, surprized the sentinels, and surrounded the house where the two brothers resided, and compelled them, after an obstinate defence, to surrender at discretion. Almagro's claim of jurisdiction over Cuzco was universally acknowledged, and a form of administration established in his name. This event was the commencement of a civil war; and it was soon followed by more bloody scenes. In the first attack of a body of soldiers, deputed by Francis Pizarro for the relief of his brothers, and which were commanded by Alonso de Alvarado, whose fidelity Almagro in vain endeavoured to corrupt, Almagro succeeded, and took the commander and his principal officers prisoners; but neglecting to improve the advantages he had gained, he marched back from this victory to Cuzco, and there waited the approach of Pizarro. Pizarro practised his usual artifice, and Almagro was weak enough to suffer himself to be amused with a prospect of terminating their differences by amicable accommodation. The negotiation between them was protracted, and whilst every day was precious to Almagro, several months elapsed before they came to any final agreement. In the mean while one of the Pizarros and Alvarado found means to bribe the soldiers to whose custody they were committed, and not only secured their own escape, but persuaded 60 of the men who had guarded them to accompany them in their flight. The other Pizarro was also released by the governor. Whilst Almagro was thus deluded by a pretended treaty, Pizarro was preparing for open hostility, and he determined to settle the dominion of Peru, not by negotiation, but by arms. In 1538 an army of 500 men was ready to march for Cuzco; and Almagro, instead of obstructing their progress in the difficult passes of the mountains through which they marched, waited their arrival in the plains of Cuzco. When the two armies met, Almagro, worn out with the fatigues of service and declining with age, was unable to exert his usual activity; and obliged to commit the conduct of his troops to Orgognez, who, though an officer of great merit, did not possess the same ascendant either over the spirit or affections of the soldiers, as the chief whom they had been long accustomed to follow and revere. The conflict was fierce, and maintained by each party with equal courage. Orgognez was wounded, and the rout of Almagro's troops became general. This officer and several others were massacred in cold blood, and above 140 soldiers fell in the field. Almagro anxiously observed from an eminence, to which he was conveyed on a litter, the progress of the battle, and when he witnessed the total defeat of his own troops, he felt

the passionate indignation of a veteran leader, long accustomed to victory. Although he endeavoured to save himself by flight, he was taken prisoner; and after remaining for several months in custody under all the anguish of suspense, he was impeached of treason, formally tried and condemned to die. Humbled and dispirited in the approach of an ignominious death, he earnestly supplicated life; but all his entreaties, which were abject in a degree unworthy of his former fame, and all the arguments by which they were enforced, proved ineffectual. The Pizzaros were inflexible. As soon, however, as Almagro knew his fate to be inevitable, he met it with the dignity and fortitude of a veteran. He was strangled in prison and afterwards beheaded. He suffered in his 75th year, A. D. 1538, and left one son by an Indian woman of Panama, whom, though at that time a prisoner in Lima, he named as successor to his government, in pursuance of a power which the emperor had granted him. Almagro blended with the qualities of intrepid valour, indefatigable activity and insurmountable constancy, an openness, generosity and candour, that are natural to men whose profession is arms; he was, therefore, beloved by his followers, his misfortunes excited their sympathy and pity, and his death was sincerely regretted not only by them, but by the Indians in general, who regarded him as their protector against the rigour of the obdurate Pizarro. After his death the attachment of his friends was transferred to his son, who was now advanced to the maturity of manhood, and who possessed all the qualities which captivate the affections of soldiers. Of a graceful appearance, dextrous at all martial exercises, bold, open, and generous, he seemed to be formed for command; and as his father, conscious of his own inferiority from the total want of education, had been very attentive to his instruction; and the accomplishments which he had acquired heightened the respect of his followers, who were illiterate adventurers; urged likewise by the feelings of distress, as well as by sentiments of affection, they ranged under his standard, and sought deliverance by his skill and valour from the oppressions of Pizarro. Their consultations, whilst Pizarro confided in his own security, were directed by Juan de Herrada, an officer of great abilities, who had the charge of Almagro's education, with a zeal and authority which contributed to their prosperous issue. A conspiracy was formed against Pizarro, the accomplishment of which, notwithstanding his vigorous resistance, terminated in his death. The assassins, triumphing in their success and waving their bloody swords, proclaimed the death of the tyrant, and compelled the magistrates and principal citizens of Lima to acknowledge Almagro as lawful successor to his father in the government. His triumph, however, was of no long duration. In 1541 Vaca de Castro arrived at Quito, and produced the royal commission, appointing him governor of Peru, with the privileges and authority of the deceased Pizarro. His talents and influence overpowered the interest of Almagro; who perceiving the rapid progress of disaffection to his cause, and wishing to check it before the arrival of Vaca de Castro, set out at the head of his troops for Cuzco, where the most considerable body of opponents had erected the royal standard, under the command of Pedro Alvarez Holguin. During his march, Herrada, the guide of his counsels, died; and from that time his measures were conspicuous for their violence, but concerted with little sagacity, and executed with no address. At length Almagro and Vaca de Castro met at Chupas, about 200 miles from Cuzco, on Sept. 16, A. D. 1542; and victory, after long remaining doubtful, declared at last for the new governor. Almagro conducted the military operations of the

day with a gallant spirit, worthy of a better cause and deserving another fate; and his followers distinguished themselves by their valour. The carnage was great in proportion to the number of combatants; of 1,400 men, the total amount of combatants on both sides, 500 lay dead on the field, and the number of the wounded was still greater. Almagro escaped, but being betrayed by some of his own officers, was publicly beheaded in Cuzco; and in him the name of Almagro, and the spirit of the party, were extinct. *Med. Un. Hist.* vol. xxxiv. p. 387—480. *Robertson's Hist. of America*, vol. iii. p. 4—114, 8vo.

ALMAGRO, in *Geography*, a town of New Castile, in Spain, and capital of the district of La Mancha, called Campo de Calatrava, and situate three leagues east-south-east of Ciudad Real. It was built by the archbishop Roderic, of Toledo, who garrisoned it in 1214, in order to restrain the incursions of the Moors. Its environs are level and fertile, and near it are medicinal springs.

ALMAGUER, a town of South America, in the country of Popayan.

ALMAIN, JAMES, in *Biography*, a scholastic divine, was born at Sens, and became professor of divinity at the college of Navarre, in Paris, in the year 1508. He was a subtle logician and metaphysician, and a strenuous advocate for the principles of Scotus and Occam. In 1512 he was employed in explaining the book of Sentences, and also in writing on behalf of Lewis XII. against pope Julius II., and in vindicating the authority of councils against a book published by cardinal Cajetan. He died at an early age, in 1515. His philosophical works were, "A Treatise on Physics," printed in 1505; "Four Treatises of Ethics," printed in 1510; several treatises on school divinity, and others concerning the power of the church. Lugdunens collected and published them at Paris in 1516. His subtlety, it is said, was equal to his learning; and his application so indefatigable, that he never spent so much as one hour of a whole day without reading, writing or teaching. *Dupin*. 16th cent. vol. vi. p. 254. *Cave Hist. Lit.* vol. ii. p. 242. *Gen. Dist.*

ALMAJORIFASGO, in *Commerce*, a term in the Spanish American customs, denoting a duty paid in America on goods imported and exported, and amounting on an average to 15 per cent.

ALMALECI, in *Medical History*, a celebrated work, containing a system of the ancient Arabian physic.

The word imports as much as the *royal work*.

Concerning the history, contents, &c. of the *almaleci*, see *Freind's Hist. of Phys.* p. ii. p. 36.

ALMAMON, ALMANUS, or MAMON, called also ABDALLAH, in *Biography*, caliph of Bagdad, and an eminent philosopher and astronomer, was the son of the caliph Harun Al Rashid, and great grandson of Almanfor. He was born on the day when his father succeeded to the caliphate, A. D. 786. At the time of his father's death, A. D. 809, he was governor of Khorasan; and he was appointed, by an express declaration of Harun, rendered public and solemn by being hung up in the Caaba, to be the successor of his brother Al Amin, who was now caliph. Al Amin, however, conceiving a prejudice against him, formed a design to exclude him from the succession, and ordered the forces in Khorasan to march immediately to Bagdad. Almamon, notwithstanding this unprovoked insult, was faithful to his brother, and obliged the people of Khorasan to take the oath of allegiance to Al Amin upon his accession. The new caliph addicted himself to drunkenness and gaming, and entrusted the concerns of government to his prime visier. *Misled*

by this minister, Al Amin proceeded to avow his enmity against his brother by acts of open hostility, and at length invaded Khorasana with an army of 60,000 men. As he was advancing to the frontiers of the province, Almamon prepared to receive him, and appointed Thaber ben Hofein, one of the greatest generals of the age, to the command of his army. The caliph's invading army was soon dispersed. Almamon assumed the title of caliph, and determined to maintain it. Thaber pursued the war with vigour and success; and such was the rapidity of his conquests, that the provinces of Egypt, Syria, Hejaz and Yemen, abandoned the interest of Al Amin, whose character was generally detested; and Almamon was proclaimed caliph in his room. The desertion of these provinces was soon followed by a complete revolution. Al Amin was formally deposed at Bagdad, and afterwards assassinated; and his brother succeeded to the caliphate without any farther opposition, A. D. 813. The commencement of his reign, however, was attended with commotions; and as he favoured the sect of Ali, his enemies multiplied, and it was with difficulty that the dissension, which began to manifest itself, was prevented from breaking out into a civil war. Whilst the agitation continued, Thaber, the caliph's general, availed himself of the opportunity of Almamon's absence to acquire the sovereignty of Khorasan, where he formed a dynasty, which subsisted for 60 years. As soon as tranquillity was restored, Almamon presented the plans he had formed for introducing literature and science into his dominions, and for thus laying the foundation of that distinguished honour with which his name has descended to posterity. Whilst he resided in Khorasan he had assembled a number of learned men from various countries, and formed them into a society or college, over which he appointed, as president, Mesue of Damascus, a famous Christian physician. When his father remonstrated against this appointment, because Mesue was a Christian, he replied, that he had chosen him, not as a teacher of religion, but for the instruction of his subjects in science and useful arts, and that his father well knew, that the most learned men and skilful artists in his dominions were Jews and Christians. Upon his accession to the caliphate, he made Bagdad the seat of learning, by forming in it an academy, and inviting thither eminent men from all quarters. He likewise caused translations to be made into Arabic from many valuable books in the Greek, Persian, Chaldean and Coptic languages, among which were the works of Aristotle and Galen. He visited the schools which he had established, treated the professors with respect, and thus encouraged by his example and patronage, every species of mental cultivation. In various parts of knowledge, and particularly in mathematics, astronomy and philosophy, he himself was a considerable proficient. He caused Ptolemy's *Almagest* to be translated in 827, either by Isaac ben Honain, according to Herbelot, or according to others, by Alhazen ben Joseph and Sergius. He also employed the most skilful astronomers to compose a body of astronomical science, which still subsists amongst oriental manuscripts, entitled, "Astronomia elaborata à compluribus, D. D. jussu regis Maimon." History records two observations of the obliquity of the ecliptic, which were made either by Almamon himself, or under his immediate auspices, one at Bagdad, and the other at Damas. In the former, conducted by Jahia ben Abilmansor, Sened ben Alis, and Abbas ben Saïd, the greatest declination of the ecliptic was found to be $23^{\circ} 33'$, according to the report of Iba Jounis; but according to Alfragan, $23^{\circ} 35'$. The other observation was made in the year 233 of the Hegira, at Damas, by Chalid ben Abdolmelic, Abultib, Sened ben Alis, and Alis ben Isa, and the result of it was $23^{\circ} 33' 52''$.

This caliph also employed able mathematicians to measure a degree of the meridian, upon an extensive plain in Mesopotamia, called Singiar or Sandjjar; and they found it to contain $56\frac{2}{3}$ miles, each mile being 4000 coudees or cubits. But of the precise length of the cubit there have been different opinions. Abulfeda says that this cubit contained 27 inches, each inch being determined by six grains of barley placed sideways; but Thevenot says, that 144 grains of barley placed in this manner, would give a length equal to $1\frac{1}{2}$ Paris foot, and therefore four cubits would be equal to one toise and 9 inches, and therefore 4000 cubits, *i. e.* $56\frac{2}{3}$ miles, would give 63,750 toises. But if the ordinary or royal cubit of 24 inches was the measure to which this calculation is to be referred, the degree in this estimate of it would contain 56,666 toises. But according to Massoudi's valuation of a cubit, this measure would consist of 53,123 French toises.

In consequence of the encouragement afforded to science by Almamon, the Saracens began to acquire a degree of civilization and refinement, which distinguished them at a period of very general ignorance and barbarity. But the Mahometan zealots were alarmed; and the scientific Almamon has been reproached by the Sunnites, or orthodox Mussulmen, as little better than an infidel. It must be acknowledged that he manifested an undisguised inclination towards the party of the Moatazalites, who denied the eternity of the Koran, and maintained the doctrine of the free-will of man. Some have said, that in order to quiet the murmurs which prevailed against him on this account, he once determined to evince his zeal for religion by establishing a kind of inquisition, which should compel all his subjects to profess islamism; but if this were the case, his compulsive plan did not comprehend his Christian subjects, and the issue of his experiment was the introduction of universal toleration.

In the progress of his reign he assisted Thomas, a Greek, who, in 822, made war against Michael the Stammerer, emperor of Constantinople, and besieged his capital; but the expedition was on his part unjust, and terminated in the imprisonment and death of Thomas. In his war against the Greeks, in 829 and 830, he was more successful, took several places, and widely ravaged their territories. In 831 he made an expedition into Egypt, and there suppressed a rebellion. Here he discovered a great treasure which had been buried under two columns by Merwan, the last caliph of the house of Ommijah. He displayed his love of science by erecting a new mikias or nilometer, for measuring the increase of the Nile, and repairing one that was decayed. In his return from Egypt, in 833, he penetrated into the territories of the Greek emperor, as far as Tarsus in Cilicia; and in his way towards Bagdad, he encamped on the banks of a river Badandun, and quenched his thirst by drinking freely of its cool waters; and he also partook plentifully of some dates, to which he had access. This repast brought on a fever which endangered his life. In the prospect of dissolution, he wrote letters to the provinces, declaring his brother Motassem his successor, and then waited the event which he apprehended. After a long struggle, he exclaimed, "O thou who never diest, have mercy on me, a dying man!" and then expired at the age of 48 or 49 years, after a reign of twenty years and some months. His body was buried at Tarsus, and this circumstance some zealots interpreted as a token of reprobation.

Science humanized the temper of this Saracen caliph; and in contemplating his character, we cannot do less than admire his liberality and beneficence. As an instance of his clemency and magnanimity, his conduct towards his uncle and rival, Ibrahim, deserves to be recorded. When he was discovered, after having been concealed for some years, and brought

brought to the caliph, under an unanimous sentence of condemnation by the council: "Your counsellors (said Ibrahim), judged according to the customary rules of political government: if you pardon me, you will not, indeed, judge according to precedent, but you will have no equal among sovereigns." The caliph then tenderly embracing him, replied, with great emotion, "Uncle, be of good cheer; I will not do you the least injury:" and he not only pardoned him, but granted him a rank and fortune suitable to his birth. Upon being complimented by his courtiers for this generous act, he exclaimed, in the fulness of his heart, "Oh! did men but know the pleasure I feel in pardoning, all who have offended me would come and confess their faults!" Modern Un. Hist. vol. ii. p. 176—202. Montucla Hill. des Mathematiques, tom. i. p. 356—359.

ALMANA, in *Ancient Geography*, a town of Macedonia, mentioned by Livy, situate on the river Axios, and probably not far from Byzazora.

ALMANAC, a calendar or table, in which are set down the days and feasts of the year, the rising and setting of the sun, the course and phases of the moon, the eclipses of both luminaries, &c. for each month of the year.

The original of the word is much controverted among grammarians.—Some derive it from the Arabic participle *al* and *manach*, to count; whence is naturally enough derived *al manach*, the *diary*. Others, and among them Scaliger, rather derive it from *al*, and *μαναχος*, the course of the months: which is contradicted by Golius, who advances another opinion. He says, that, throughout the East, it is the custom for subjects, at the beginning of the year, to make presents to their princes; and, among the rest, the astrologers present them with their ephemerides for the year ensuing; whence those ephemerides came to be called *almanba*, i. e. hand-fels, or new-year's gifts.—To say no more, Verstegan writes the name *almon-at*; and makes it of Saxon original. Our ancestors, he observes, used to carve the courses of the moon, of the whole year, upon a square stick, or block of wood, which they called *al-monaght*, q. d. *all-moonbeed*.

The use of almanacs or diaries, containing a great variety of astrological and agricultural records, and of others sanctioned by a prevalent superstition, was very common among the Arabians; and it is natural to imagine, that from them, by means of the Saracens, it was introduced into European nations. The present form and method of almanacs have been ascribed to Regiomontanus, who is said to have first published, in 1474, an almanac, resembling that of the moderns, and containing the characters of each year and month, predictions of eclipses and other celestial phases, calculations of the motions of the planets, &c.

The modern almanac answers to the FASTI of the ancient Romans.

For the construction of an almanac: 1st. Compute the sun's and moon's place for each day of the year; or take them from ephemerides. 2d. Find the dominical letter, and, by means of it, distribute the calendar into weeks. 3d. Compute the time of Easter, and thence fix the other moveable feasts. 4th. Add the immoveable feasts, with the names of the martyrs. 5th. To every day add the sun's and moon's place, with the rising and setting of each luminary; the length of day and night; the twilight, and the aspects of the planets. 6th. Add, in the proper places, the chief phases of the moon, and the sun's entrance into the cardinal points, i. e. the solstices and equinoxes; together with the rising and the setting, especially heliacal, of the planets, and chief fixed stars; means for each of which will be found under the proper heads. The duration of the twilights, or the end of the evening and beginning of the morning twilight; to-

gether with the sun's rising and setting, and the length of days, may be transferred from the almanac of one year into that of another; the differences in the several years being too small to be of any consideration in civil life.

Hence it appears, that the construction of an almanac is neither mysterious nor difficult; if access be had to the tables of the heavenly motions.

Some divide almanacs into public and private, perfect and imperfect, heathen and christian, book-almanacs and sheet-almanacs. Public almanacs are those of a larger size, such as sheet almanacs, usually hung up for common or family use; private are those of a smaller form, of which there is a great variety, to be carried about either in the hand, inscribed on a staff, or in the pocket: perfect almanacs are those which have the dominical letters, as well as primes and feasts inscribed on them; imperfect are those which have only the primes and immoveable feasts. Till about the fourth century, almanacs bear the marks of heathenism; from that age to the seventh, they are generally divided between heathenism and christianity: and from that time they have been altogether christian.

Almanacs vary in their contents and the mode of their composition; some containing more points, others fewer. The essential part is the calendar of months and days, with the risings and settings of the sun, age of the moon, &c. To these are added various parerga, astronomical, astrological, meteorological, chronological, and even political, rural, medical, &c.; as calculations and accounts of eclipses, solar ingresses, aspects and configurations of the heavenly bodies, lunations, heliocentric and geocentric motions of the planets, prognostics of the weather, and predictions of other events, tables of the planetary motions, the tides, tenns, interest, twilight, equation, kings, &c.

Henry III. of France very prudently decreed, by an ordinance of 1579, that 'no almanac-maker should presume to give predictions relating to civil affairs, either of states, or private persons, in terms either express or covert.

The almanac, annexed to the book of Common Prayer, is part of the law of England, of which the courts must take notice in the returns of writs, &c. For ascertaining many circumstances relative to a particular day past, the court hath determined by an inspection of the almanac. Upon a writ of error from an inferior court, the error assigned was, that the judgment was given on a Sunday, the day being 26 Feb. 26 Eliz.; and it appearing, by inspection of the almanacs of that year, that the 26th of February actually fell upon a Sunday, this was held to be a sufficient trial, and that a trial by jury was not necessary, although it was an error in fact; and so the judgment was reversed. But in all these cases, the judges, if they conceive a doubt, may order it to be tried by jury. Blackst. Com. vol. iii. p. 333. For every almanac or calendar for one year or less, the following stamp duties shall be paid, viz.

1d	9 Ann. c. 23. §. 23.
1	30 Geo. II. c. 19. §. i.
2	21 Geo. III. c. 56. §. 1.
4	37 Geo. III. c. 90. §. 1.

In the whole amount the stamp duty is 8d. And for every almanac serving more than a year, the same duty shall be paid for each year: but perpetual almanacs pay for three years only. 9 Ann. c. 23. 30 Geo. II. c. 19. and by 10 Ann. c. 19. all books and pamphlets serving chiefly to the purpose of almanacs, shall be charged as such. If an almanac contains more than one sheet, one sheet only need be stamped; and every almanac shall be so printed that some part of the print shall be upon the stamp. 9 Ann. c. 23. §. 26. 21 Geo. III. c. 56. §. 3. Selling almanacs unstamped incurs a penalty,

naity, upon conviction before one justice on the oath of one witness, of commitment to the house of correction for a term not exceeding three months; and the person apprehending such an offender, shall receive a reward of 20 shillings. 16 Geo. II. c. 26. §. 5. 30 Geo. II. c. 19. §. 26.

In the *Philosoph. Collect.* we have a perpetual almanac, described by Mr. R. Wood.

Many forms of a head-almanac have been proposed in some of our periodical publications; but the following distich will very well answer the purpose:

“At Dover Dwells George Brown Esquire;
Good Christopher Finch, And David Frier.”

The twelve words answer to the twelve months; the first letter of each word stands in the calendar against the first day of the corresponding month; and if the dominical letter is known, it is easy to find on what day of the week any day of the month will fall throughout the year. In 1802, C being the dominical letter, Dec. 25 is Saturday, because the first day denoted by F is Wednesday.

ALMANAC, among *Antiquaries*. See *Runic Staffs*.

ALMANAC, *nautical*, and *astronomical ephemeris*, is a kind of national almanac, published annually, by anticipation, under direction of the commissioners of longitude. Beside every thing essential to general use that is to be found in any almanac hitherto published, it contains many new and interesting particulars; more especially, the distances of the moon from the sun and fixed stars for every three hours of apparent time, adapted to the meridian of Greenwich, by comparing which with the distances carefully observed at sea, the mariner may readily, and with little danger of mistake, infer his longitude to a degree of exactness, that may be thought sufficient for most nautical purposes. And the publication of it is chiefly designed to facilitate the use of Mayer's lunar tables, by superseding the necessity of intricate calculations, in determining the LONGITUDE at sea. It began with the year 1767, has been continued ever since, and greatly contributes to the improvement of astronomy, geography and navigation. In this almanac the sun's longitude, and every thing relating to it, have been always inserted, as computed from Mayer's tables, printed under the inspection of Dr. Maskelyne, the astronomer royal, and published in 1770; and both the sun's place and the moon's place are inserted in the almanacs from the year 1791, as computed from Mayer's tables, and Mr. Mason's tables of 1780, duly corrected. In the ephemeris of 1803, the latitudes as well as longitudes of the stars are proposed to be thoroughly corrected; and the moon's distances from them computed by the late Mr. Taylor's accurate tables of logarithmic sines and tangents to every second of the quadrant. The calculations of the planets' places have been made for every ephemeris, beginning with that of 1780, from M. De la Lande's tables, contained in the second edition of his astronomy; and those of the eclipses of Jupiter's satellites were made from Mr. Wargentin's tables, annexed to those of De la Lande, those of the second satellite excepted, which are inserted from new tables of Mr. Wargentin annexed to the nautical almanac of 1779. To the nautical almanacs from 1795 to 1804, both inclusive, are added the eclipses of Jupiter's satellites, computed to mean time, from M. De Lambre's new tables, annexed to the third edition of M. De la Lande's astronomy. To the almanacs of several years, since the commencement of this useful publication, many valuable papers have been added, which are more directly or indirectly connected with its general contents and principal object. The articles of the ephemeris are enumerated and explained, together with those of the

“Requisite Tables,” connected with them, but separately published, and examples of their use are adduced in the appendix annexed to them. See LONGITUDE.

ALMANAR, in the Arabian *Astronomy*, denotes the pre-eminence, or prevalence of one planet over another.

ALMANDIN, or ALABANDIS, a precious stone of the RUBY kind, something softer than the oriental ruby; and, as to colour, partaking more of that of the granite than the ruby.

It is ranked among the richest of stones, and takes its name from Alabanda, a city of Caria, whence Pliny says it was brought.

ALMANSOR, ALMANSUR, or ALMANZOR, the *Vicerious*, in *Biography and History*, the surname of Abu Jaafar, second caliph of the house of Al Abbas, or the Abassides, succeeded his brother Abul Abbas Al Saffah, A. D. 753, in the year of the Hegira 136, and was inaugurated at Al Hashe-miyah in the following year. His right of accession, though Al Saffah had declared him presumptive heir of the crown, and he had been proclaimed caliph in the imperial city of Anbar, then the capital of the Moslem empire, was, immediately upon his inauguration, disputed by his uncle Abdallah ben Ali, who caused himself to be recognized as caliph at Damascus. In order to support his pretensions, he collected a numerous army in Arabia, Syria and Mesopotamia, and marched to the banks of the Taurus, near Nisibis, where he encamped. Here he was harassed for five months by Abu Moslem, who had the command of Almanzor's forces, assembled in Persia, Khorasan and Irak; and at length, A. D. 754, totally defeated. After this victory, and notwithstanding the services which Abu Moslem had rendered to the family of Al Abbas, he became an object of jealousy, and was assassinated by order of Almanzor in his own presence. See ABU MOSLEM. The death of Abu Moslem was succeeded by the rebellion of Sinon, a magian, who having seized on the treasures of the deceased governor of Khorasan, excited the people of that country to a revolt; but this insurrection was soon quelled by Jamhur ben Morad, the general of Almanzor. The spoil obtained by this victory was avariciously seized by the caliph, and the outrage so incensed Jamhur, that he immediately turned his arms against his master; but he was soon defeated by the caliph's forces. About this time Theodorus, patriarch of Antioch, having been detected in an illicit correspondence with the Grecian emperor, was banished into an obscure part of Palestine, and the Christians in the dominions of the caliph were prohibited from building or repairing any churches, and laid under several other restraints.

In 757 Almanzor sent a large army into Cappadocia, fortified the city of Malatia or Melitene, garrisoned it with 4000 men, and deposited in it a great part of his treasures. But in this year he was attacked by the Rawandians, a sect of believers in the Metempsychosis, so called from their head or founder Al Rawand. The followers of this chief assembled at Al Hashe-miyah, where the caliph resided, and by the ceremony of going in procession round his palace, as the religious Moslems go round the Caaba, intimated their purpose of invoking him as a deity, and paying him divine honours. The caliph provoked, as it is said, by their impiety, ordered several of these sectaries to be imprisoned; upon which their resentment was roused, and they formed a design of assassinating him. Their intention, however, was defeated by the generous interposition of Maan ben Zaidet, an Ommiyah chief, who had been under a necessity of concealing himself from the caliph's resentment. Notwithstanding his rescue, the insult he had received in his capital induced him to build a new city on the banks of the Tigris, and there to

to fix his residence. This circumstance gave occasion to his building the city of Bagdad, A. D. 762. In the preceding year he received information that a design had been formed to dethrone him; but the plot being discovered, all who were directly or indirectly concerned in it were severely punished; and most of them were by cruel treatment put to death. His uncle Abdallah shared the fate of other rebels; for having been allured to his court by assurances of pardon and protection, he placed him in a building, which was so constructed, that it fell and crushed him in its ruins. Soon after Almanzor had fixed his residence at Bagdad, A. D. 768, he was cured of a dangerous disorder by the advice of a famous Christian physician, whose name was George ebn Bahtishua Al Jondifaburi. The caliph, as a recompence, presented him with three beautiful Greek girls, and a considerable sum of money; but the girls were sent back, with a declaration on the part of George, who was married to a wife old and infirm, of which Almanzor was previously apprised, that it was not lawful for a Christian to have more than one wife at a time. The physician's conduct on this occasion, whilst it surprised the caliph, raised him in his esteem, and was followed by a profusion of favours. Almanzor in his succeeding military transactions was generally victorious. Towards his Christian subjects he exercised much severity. In the year 744 he set out on a pilgrimage to Mecca; and being seized on his journey with a disease which threatened danger, he sent for his son and intended successor, Al Mohdi, and gave him salutary advice. "I command you," said he, "to treat publicly your relations with the greatest marks of distinction, since this conduct will reflect no small degree of honour and glory upon yourself. Increase the number of your freedmen, and treat them all with kindness, as they will be of great service to you in your adversity: but neither this, nor the other injunction will you fulfil. Enlarge not that part of your capital erected on the eastern bank of the Tigris, as you will never be able to finish it; but this work I know you will attempt. Never permit any of your women to intermeddle in affairs of state, nor to have too much influence over your counsels; but this advice I know you will not take. These are my last commands; or, if you please, my dying advice; and to God I now recommend you." They then parted, and were both in tears. He pursued his journey to Bir-Maimun, *i. e.* the well of Maimun, where he expired, in the 63d year of his age and 20th of his reign. His remains were interred at Mecca. The character of Almanzor seems to have been formed of very heterogeneous and even contradictory qualities. In private his temper was mild, and conciliated affection and attachment; but in public, his aspect and demeanour inspired terror. He was prudent and brave, engaging in discourse, conversant in all the acts of government, and addicted to study and literature, and particularly to philosophy and astronomy; but he was extremely covetous, perfidious, cruel and implacable. *Mod. Un. Hist.* vol. ii. p. 100—135.

ALMANZOR, in *Geography*, a town of Africa, in the kingdom of Fez, situated on the river Guir.

ALMANSPACH, a small town of the circle of Suabia, between the lake of Zell and that of Constance.

ALMANZA, a small town of Spain, in New Castile, on the frontiers of Valencia, situate in N. lat. 38° 54'. W. long. 1° 21'. In the plain adjoining to this town marshal Berwick defeated the allies in 1707, under the marquis de los Minas and the earl of Galway.

ALMARAZ, a town of Spain, in the province of Estremadura, situate in a fine plain, on the north side of the Tagus, eight leagues east-south-east of Coria.

ALMARIA, or ARMARIA, in our *Ancient Records*, denote the archives of a church, or library.

ALMARIA, in *Geography*. See VILLA RICA.

ALMAS, or ALMASCH, a small town of Hungary, in Transylvania, with a district dependent on Claufenbourg. The district lies between Burgles and Claufenbourg, and consists of mountains, in which are found many caverns. Almas is a small place, giving name to the adjacent country in the bannate of Temesvar, and also a river upon which is situated the fortress of Sigeth.

ALMAZAN, a small town or village of Spain, in Old Castile, at the foot of the frontier mountains of the province of Aragon, where is shewn a relic, which is the object of devotion, as the head of the proto-martyr Stephen, and near which was settled the treaty of peace between Henry, king of Castile, and Peter IV., king of Aragon, in 1375. N. lat. 41° 30'. W. long. 2° 16'.

ALME, a river of Germany, which runs into the Lippe, near Elfen, in the bishopric of Paderborn.

ALMÈ, in *Modern History*, singing or dancing girls in Egypt, who, like the *Improvisatori* of Italy, can occasionally chant unprepared verse. They are thus called, because they have received a better education than other women, and they form a celebrated society in this country. The qualifications for admission are a good voice, a knowledge of the language and of the rules of poetry, and an ability to compose and sing couplets on the spot, adapted to the circumstances. The almè know by heart all the new songs, and their memory is furnished with the most beautiful *mets*, *i. e.* elegiac hymns, bewailing the death of a hero or the misfortunes incident to love, and the prettiest tales. They attend every festival, and, placed in a rostrum, sing during the repast; and then descending into the saloon, dance a kind of pantomime ballets, that represent the ordinary occurrences of life, and the mysteries of love. Their bodies are surprisingly supple, and their features so flexible, that they can exhibit at pleasure the different characters they assume. The indecency of their attitudes and of their dress is often carried to excess; their steps are regulated by the sound of the flute, of castanets, the tambour de basque and cymbals, which accelerates or retards the measure; and they are also animated by words adapted to the scenes. They appear in a state of intoxication, and are the bacchants in a delirium. These almè are sent for into all the harems, where they teach the women the new airs, amuse them with amorous tales, and recite poems, rendered interesting by furnishing a lively picture of their manners. By these they are initiated into the mysteries of their art, and taught lascivious dances. As their understandings are cultivated, their conversation is agreeable. They also speak the language with purity; and habituated to poetry, the softest and most generous expressions are familiar to them. They repeat with much grace, follow nature in singing, and excel in the pathetic. Even the Turks pass whole nights in hearing them. When two sing together, it is always with the same voice; and in the orchestra, all the instruments playing in unison execute the same part. These almè assist at the marriage ceremonies, and march before the bride playing on instruments; and they attend funerals, accompanying the procession and singing sorrowful airs. They are paid at a high rate, and seldom appear except among the grandees and rich men. However, the common people have also their almè, who are girls of an inferior class, and strive to imitate the former, without their knowledge, elegance and graces. The public places and walks about Grand Cairo abound with them: nor will decency

ency allow an account of their licentious gestures and attitudes Savary's Letters, vol. i. p. 176—184.

ALMEDINA, in *Geography*, a town of Africa, in the empire of Morocco, between Azamer and Safie, on the edge of Mount Atlas. It was once rich and populous, but now lies in ruins.

ALMEDESSOS, in *Ancient Geography*, a city of Thrace. Pliuy, iv. 18.

ALMEHRAB, among *Mahometans*, denotes a niche in their mosques, which directs to the kebla, that is, to the temple of Mecca, to which they are obliged to bow their faces in praying.

ALMEIDA, or ALMEDA, in *Geography*, a fortified town of Portugal, in the province of Beira, on the river Coa, on the frontiers of the kingdom of Leon. It is seven leagues from Ciudad Rodrigo, and four south-east of Pírsnel. N. lat. $40^{\circ} 5'$. W. long. $6^{\circ} 24'$.

ALMEISAR, a celebrated game among the ancient Arabs, performed by a kind of casting of lots, with arrows, strictly forbidden by the law of Mahomet, on account of the frequent quarrels occasioned by it.

The manner of the game was thus: a young camel being brought and killed was divided into a number of parts. The adventurers, to the number of seven, being met, eleven arrows were provided without heads or feathers; seven of which were marked, the first with one notch, the second with two, the third with three, &c. the other four had no marks. These arrows were put promiscuously into a bag, and thus drawn by an indifferent person. Those to whom the marked arrows fell, won shares in proportion to their lot; the rest to whom the blanks fell were entitled to no part of the camel, but obliged to pay the whole price of it. Even the winners tasted not of the flesh themselves, more than the losers; but the whole was distributed to the poor.

ALMELILETU is used, by Avicenna, for a preternatural kind of heat, a degree more remiss than that of a fever, and which sometimes remains after a fever is gone.

ALMELOO, in *Geography*, a town of the United Netherlands, in the country of Overyffel, situate on the Vecht, not far from the Regge, eight leagues east-north-east of Deventer. N. lat. $52^{\circ} 25'$. E. long. $6^{\circ} 22'$.

ALMELOVEEN, THEODORE JANSEN, in *Biography*, born in the year 1657 in the province of Utrecht, was originally intended for the church; but disgusted, we are told, at the disputes among the clergy, which at that time ran very high, he applied himself to the study of medicine, in which he was made doctor in the year 1681, and in 1697 professor of the Greek language, of history, and of physic, at Harderwiek. He became more known, however, from some excellent works he published, as editor or author, than from his practice of medicine, which does not appear to have been ever extensive. The principal of his works are, "De vitis Stephanorum," first printed at Amsterdam in 1683, 12mo. "Onomasticon rerum inventarium," Catalogue of Inventions in 1694, 12mo. "Bibliotheca promissa et latens," The promised and concealed Library, in 1692, 12mo. "Amœnitates theologico-philologicæ," in 1694, 8vo. "Fasti Consulares," Amst. 1740, 8vo. "Plagiarorum Syllabus," List of Plagiarists. He also published editions of the Aphorisms of Hippocrates, of the works of Celsus, and of Cælius Aurelianus, which are held in very high estimation. He died in the year 1712, not 1742, as stated by mistake in the Biographical Dictionary, and in the General Biography now publishing, as may be seen by referring to a later edition of Celsus, published by Vulpinus, at Padua, in the year 1722, founded on that edited by Almelooven. As he had no children, he left his collection of the different editions of Quinctilian to

the University at Utrecht. His library, which was extensive, was sold the following year at Amsterdam. See Haller's Bib. Med. et Anat. Eloy Dict. Histor.

ALMEN, in *Geography*, a town of the United Netherlands, in the country of Zutphen, situate on the Berckel, two leagues east of Zutphen.

ALMENAR, JOHN, M. D. in *Biography*, a Spaniard, published in 1512, "Libellum de Morbo Gallico, septem capitibus absolutum," which has since passed through several editions, and is included in the collection of treatises on the subject by Luifinus. He is the first Spanish author who wrote on the disease, in which he appears to have had considerable experience. He depended, for the cure, on warm bathing and mercurial frictions, interposing, on the days the frictions were not used, an alterative syrup. The disease might be occasioned, he says, either by the influence of a contaminated and corrupted atmosphere, to which cause we ought to attribute it, when it affected persons dedicated to the church, (Aphrodis. Luifin, p. 361,) or by contact; in either case, however, the same process is recommended in the cure. When salivation arises from the use of the mercurial frictions, he directs it to be checked and moderated by the exhibition of glysters and purgatives. *Vide* Aphrodis. five de Morbo Gallico, Luifino, p. 360. Astruc de Morbis Gallicis, p. 614. Haller, Bib. Med. &c.

ALMENARA, in *Geography*, a small town of Spain, in the province of Valencia, near the river Polencia, and not far from the sea. N. lat. $39^{\circ} 41'$. W. long. $0^{\circ} 16'$.

ALMENDRA, a small place of Portugal, in Beira, containing about 750 inhabitants.

ALMENDRO, a town of Spain, in Seville, six leagues north-north-east of Ayamonte.

ALMENDROLEJO, a town of Spain, in the province of Estremadura, four leagues south of Merida.

ALMENE, a name given, by some of the Arabian writers, to the prickly *lotus* of Africa, called by some of the ancients *lotus acanthos*, and by Virgil *acanthus* only.

ALMENE, in *Commerce*, a weight of two pounds, used for weighing saffron in several parts of the continent of the East Indies.

ALMENHAUSEN, in *Geography*, a town of Prussia, in the province of Natangen, five leagues south-south-east of Königsberg.

ALMERIA, a sea-port town of Spain, in the province of Granada, agreeably situated on a spacious bay, sometimes called Helena Bay, at the mouth of the river Almeria, in the Mediterranean, the see of a bishop, suffragan of Granada. N. lat. $36^{\circ} 51'$. W. long. $2^{\circ} 15'$. The country about it is fertile, particularly in fruits and oil, and near it the land projects eastward into the sea, forming a cape called by the ancients Charidame, and by the moderns Cabo de Gates. Almeria is supposed to have risen upon the ruins of the ancient ABDERA, and was formerly a place of great importance. It was taken from the Moors by the emperor Don Alonso, in 1147, with the assistance of the French, Genoese, and Pisans. At that time it was the strongest place belonging to the Moors in Spain; and its privateers, which were numerous, not only troubled the coasts inhabited by their Christian neighbours, but gave equal disturbance to the maritime provinces of France, Italy, and the adjacent islands. When the place, which was strongly fortified and garrisoned, was taken by storm, the best part of the plunder was distributed among the allies, and all the inhabitants, who were found in arms, were put to the sword. The Genoese particularly acquired here that emerald vessel which still remains in their treasury, and is deemed invaluable. After its reduction by the Christians, Almeria became a bishopric; and though frequent

frequent mention of it occurs in the history of Spain, it gradually sunk in consequence, and retains few traces of its ancient greatness. Its situation and climate, and the various vegetable and mineral productions of its environs, have been highly extolled by ancient and modern travellers.

ALMERICANS, in *Ecclesiastical History*, were the followers of Almeric, or Amauri, in the thirteenth century. They maintained that every Christian was obliged to believe himself a member of Jesus Christ, and attached some extravagant and fanatical ideas to this opinion; and also that the power of the Father continued no longer than the Mosaic dispensation; that the empire of the Son extended only to the thirteenth century; and that then the reign of the Holy Ghost commenced, when all sacraments and external worship were to be abolished, and the salvation of Christians was to be accomplished merely by internal acts of illuminating grace. Their morals were as infamous as their doctrine was absurd; and under the name of charity they comprehended and committed the most criminal acts of impurity and licentiousness. Their tenets were reprobated by a public decree of the council of Paris, in the year 1209, when many persons of this sect were condemned, and afterwards burnt by the order of king Philip. Dupin 13th Cent. vol. v. p. 144. Mosh. Eccl. Hist. vol. iii. p. 157.

ALMERY. See **AMBRY**.

ALMEYDA, **DON FRANCIS**, in *Biography and History*, Count d'Abrantes, having served king Ferdinand of Castile with great reputation, was nominated by king Emanuel of Portugal, first viceroy and governor-general of the newly conquered countries in the East Indies; and had assigned him guards for his person, a number of chaplains, and every other appendage to his office, which was thought necessary to give it dignity and influence. He set sail with a fleet from Lisbon in March 1505-6, touched at the Cape Verd islands, doubled the Cape at a considerable distance to the south, and arrived safely at Guiloa. From thence he proceeded to Mombaza, a small, well fortified city in an island, which he reduced; he proceeded to the Angedive islands, not far from Goa, where he built a fort; he also erected and garrisoned another fort at Cannanor; and, arriving at Cochin, secured it in the interest of Portugal. At this time the island of Madagascar was discovered; and, during his government, his son Don Lorenzo Almeyda surveyed the Maldive islands, and discovered the great island of Ceylon, the chief monarch of which he compelled to submit to the protection of Portugal. This young warrior, after returning from this expedition, was employed in the fleet destined against Calicut, but lost his life in a naval engagement against the Samorin, on which occasion the viceroy behaved with great heroism, acquiescing in the distressing event with this reflection; "All men must die, and Lorenzo could not die better than in the service of his country." Almeyda, however, manifested an unbecoming jealousy on the arrival of Alphonso Albuquerque, who was appointed as his successor, and confined him in the citadel of Cannanor, under pretence of misconduct. Before he surrendered his command he engaged the whole power of the Mahometans at sea, and gained a complete victory, by which he contributed in a great measure to break that formidable league, from which the Samorin was in hopes of compelling the Portuguese to abandon their Indian conquests, and to facilitate the enterprises of **ALBUQUERQUE**, his successor. In his return home with the wealth he had acquired, he touched at Saldanha point, on the coast of Africa, in order to procure some fresh provisions; and some of his sailors, quarrelling with the natives, occasioned a fray, in which Almeyda was induced imprudently to interfere. When his officers urged him to go ashore on this hazardous

enterprise, "Whither do you carry my 60 years?" said Almeyda, on stepping into his boat. The natives assembled in a very numerous body, and Almeyda, with 57 of the 150 men who accompanied him, fell victims to this rash and unjudicious attempt. Mod. Un. Hist. vol. viii. p. 40-43.

ALMEYRIM, or **ALMERIN**, in *Geography*, a town of Portugal, in the province of Estremadura, one league south-east of Santaren.

ALMIA, in *Ancient Geography*, a town placed by Ptolemy in Asiatic Sarmatia.

ALMIGGIM, or **ALMUCCIM wood**, a word used in the Scriptures to signify a beautiful and light sort of wood. It has been conjectured to be several sorts of woods now in use; others think it has been lost long since. Meibomius infers, from the accounts of Josephus, that it was the wood of the Indian pine-tree, or fir-tree. But it has been alledged, that as this tree was common in Judea, it could not have been searched for as far as Ophir. The Vulgate renders it *lignum thuyinum*; and, according to Theophrastus, the thyon-tree grows in Africa near the temple of Jupiter Ammon, and resembles the cypress. It was much esteemed among the Heathens for doors and images, because it would not rot. Dr. Shaw (Travels, p. 422.) supposes that the almuq was the cypress, and he observes, that the wood of this tree is still used in Italy, and in other places, for violins, harpichords, and other stringed instruments. Hiller, in his Hierophyton, considers almuq as a general name for the wood of the gum-bearing trees, and for the trees themselves. But as the cedar and fir-trees are joined with the almuq-trees, it is more probable that some particular species, rather than the whole genus, was here intended. This wood was excellent for its whiteness, as well as remarkably light, and therefore was used in musical instruments.

ALMINA, in *Ancient Geography*, a country of Epirus, according to Ptolemy, between Thesprotia to the west, and Dolopia to the north.

ALMINIA, **AMISSA**, the same with Peguntium. See **ALMISSA**.

ALMIRA, a town of Phœnicia of Libanus.

ALMIRÆ, or **ALMYRÆ**, a district of Africa, in the Mærotis, according to Ptolemy.

ALMIRANTE islands, in *Geography*, are a groupe of small islands in the South Indian ocean, off the coast of Zanguebar in Africa, extending from west-south-west to east-north-east, from S. lat. 5° 45' to 5° 30', and from E. long. 51° 40' to 52° 50'.

ALMIRON, a town of European Turkey, in the isle of Candy, six miles north-west of Retimo.

ALMISSA, **ALMINIUM**, the ancient *Peguntium*, an episcopal city of Dalmatia, is situated in the duchy of Chulm, on a rock betwixt two high mountains, at the mouth of the Tettina, and was formerly notorious for its piracy. It has been reduced by the Venetians. It is 20 miles east of Spalatro, and called by the Turks Omise. E. long. 18° 14'. N. lat. 43° 50'.

ALMO, or **ALMON**, in *Ancient Geography*, a river of Latium, which rising near Bovillæ, took a northern direction, and discharged itself into the Tiber, to the south-west of Rome. The Latin poets, personifying this river, gave it a daughter named Lar, who, divulging the amours of Jupiter with the naiad Juturna, was condemned to eternal silence, and dismissed to the infernal regions. In her way thither she attached the affection of Mercury, and became the mother of two children, under the appellation of the *Diæ Lares*, and the mother was called the goddess *Muetta*, or *Mua*. This river is now Dachia and Il rio d'Appio, as it runs from the Appian way into the Tiber, or from a corrup-

tion of Aquataccio, or Aqua d'Acio. On the place where this river crossed the Appian way, the priests of Cybele performed the annual ceremony of washing the statue of the goddess, and their implements of sacrifice. Ovid describes this ceremony; *Faisti* iv. 337.

“*Est locus, in Tiberin quæ lubricus influit Almon,*
Et nomen magno perdit in ænæ minor,
Illic purpurea canus cum veste sacerdos
Almonus dominam, sacraque lavit aquis.”

ALMOBARIN, a small town of Spain, in New Castile, north-north-east of Merida, and south-east of Alcantara. N. lat. 39° 10'. W. long. 14° 46'.

ALMODAVAR, or ALMUDEVAR, a small town of Spain, in Aragon, three leagues south-west from Huesca. The adjacent country abounds with grain, wine, and saffron.

ALMODAVAR *del Campo*, a town of Spain, in New Castile, situate in a pleasant valley at the foot of Mount Morena, and defended by a castle, six leagues south of Ciudad Real.

ALMODAVAR, a town of Portugal, in Alentejo, containing within its district five parishes.

ALMOENA, in *Ancient Geography*, a town of Africa, placed by Ptolemy in Bizacium, ten leagues to the east-south-east of Tichusa. Almoena is now Tlemcen, and Tichusa, Tegewse. *Shaw's Travels*, p. 126.

ALMOGIZA, among *Arabian Writers*, denotes the limb or circumference of the ASTROLABE.

ALMOHARRAM, in *Ancient Chronology*, was the first month of the Arab year. On some occasions the observance of this month was put off to the following month Safar.

ALMOHEDES, in *History*, the name of an African dynasty which succeeded that of the ALMORAVIDES in Barbary, in the commencement of the 12th century. It took its rise in the 25th year of the reign of Al Abraham, or Brahem, who succeeded his father Ali, A. D. 1115; and derived its name from an obscure founder, called Al Mohedi, or Al Mohedes. This person was a Berber, of the tribe of Muzamada, named Abdallah, and was a famous preacher among those of his tribe, who were seated along Mount Atlas. In order to secure success to the design he had conceived, he assumed the title of Mohdi, or Mohedi, and set up for the head or leader of the Orthodox, or Unitarians, who were now become so numerous by his preaching, that he presumed to bid defiance even to his sovereign. Brahem was too much immersed in pleasure to regard the revolt, and too confident of his own security to apprehend any danger from the insurrection of a party composed of persons whom he looked upon with contempt. But their unexpected increase alarmed him, and he prepared for subduing them. His force, however, was insufficient for the purpose, and in his first engagement he was totally defeated. Abdallah was wary, and secured the capital; so that Brahem, pursued as a fugitive by Abdolmumen, one of the party, was obliged to seek refuge in the city of Fez. But the gates of the city were not only shut against him, but opened to receive his pursuers. The next place to which he repaired was Auran, or Oran, but the city was soon invested by Abdolmumen, and threatened with fire and sword. The magistrates, unable to defend themselves, and dreading the consequences of an hostile attack, urged him to leave the town. Under the shelter of a dark night he, with his favourite wife on horseback behind him, set out from Oran, but they were discovered and pursued; and fearing to fall into the hands of their enemies, he spurred his horse in a fit of despair, and leaped down a precipice, where he and his wife were dashed to pieces. Such was the

fatal end of this prince, whose death put a final period to the empire of the Almoravides. As soon as Abdolmumen, vulgarly called Abdulman, was apprized of Brahem's death, he traversed the kingdom of Tremecen in his way to Morocco, where, Abdallah being dead, he was declared his successor by the chiefs of the party, and proclaimed king of the Almohedes, under the title of Al Emir Al Mumin Abdallah Mohammed Abdal Mumen Ebn Abdallah Ibn Ali, *i. e.* chief or emperor of the true believers of the house of Mohammed Abdal Mumen, the son of Abdal Mumen, the son of Abdallah of the lineage of Ali. Abdallah's reign was long enough to allow his enacting some prudential regulations for the establishment of his sect and his new kingdom, which he left behind in his will. He appointed a council of 40 disciples of his sect, all of whom were preachers; some of these were commissioned to regulate all public affairs, and at proper seasons to be itinerant preachers in the country, for the diffusion of their doctrine; and others of them, to the number of 16, were to act as secretaries. From the former of these two classes the successors to the regal and pontifical throne were to be elected, for both these dignities and titles were to be united in the same person. The disciples of this sect were denominated Mohameddin, or Al Mohaddin; but by the Arabian writers they are styled only preachers, and by the Spanish, Al Mohedes; and the descendants and successors of that tribe continued to retain the appellation of Emir Al Mumenin, or chiefs of the faithful or true believers, as long as their dynasty lasted; and they became very powerful both in Africa and Spain. As to their religious tenets, if we except their specious pretence to orthodoxy, and strict adherence to the doctrine of the unity of God, which they zealously inculcated, they had little or nothing peculiar to themselves; but they were loud in their reproaches against the tyranny of the Almoravides, and in their clamours for liberty; and thus they allured the greatest part of the kingdom to revolt, and to embrace their sect and doctrine.

The new sovereign, on his accession to power, extinguished the Almoravidic line by strangling Isaac, the son of Brahem, and extirpated all the unhappy remains and adherents of this race. During the progress of this revolution, several of the Almoravidic governors, availing themselves of the distraction and tumult that prevailed, erected their governments into independent principalities and petty kingdoms; and those who inhabited the mountainous parts established a variety of lordships under their own cheyks. The Nubians and Libyans took the lead, and others followed their example; particularly the states of Barbary, Tripoli, Kairwan, Tunis, Algiers, Tremecen and Bugeia, each of which had its own sovereign. Abdolmumen, however, pursued his conquests with success, and in a few years reduced the Numidians and Galatians in the west, and the kingdoms of Tunis, Tremecen, and the greatest part of Mauritania and Tingitana, under his subjection. He likewise dispossessed the Christians of Mohedia, the chief city of Africa, and some others on the same coast, and made other conquests both in Spain and Portugal. He died in the seventh year of his reign, and was succeeded, A. D. 1156, by his son Yusef, or Joseph. Yusef was a valiant and martial prince; and having established the kings of Tunis and Bugeia in their respective kingdoms as his tributaries and vassals, he prepared to embark for Spain to assist the Moorish princes, who solicited his protection and succour. Yusef was succeeded by Yakub, or Jacob, surnamed Al Mansur, or the conqueror, who, after securing himself against both the revolted and the plundering Arabs, pursued his conquests with such speed and success, that in a little time he became master of the whole country lying

lying between Numidia inclusive, and the entire length of the Barbary coasts from Tripoli to the kingdom of Morocco, comprehending also those of Fez, Tremecen, Tunis, and Tripoli, and extending above 1200 leagues in length, and in depth from the Mediterranean to the sandy deserts of Libya, above 480, exclusively of his Spanish dominions, where he was acknowledged as sovereign by most of the Arabian Moorish princes. The close of this prince's history is wrapped up in obscurity; for about the year 1206, having quelled a revolt in Morocco, and violated his faith with the governor of the capital which he reduced, and his adherents, in the most perfidious and cruel manner, he disappeared; and, as it is said, touched with remorse in the recollection of his conduct, wandered about obscure and unknown, and at last died a poor despised baker at Alexandria. He was succeeded in the kingdom by his son Mohammed, surnamed Al Naker, who, on his accession to the crown, passed over into Spain with a very large army, consisting of more than 120,000 horse, and 300,000 foot, and engaged the whole force of the Christians on the plains of Tholosa, where he was totally defeated with the loss of above 150,000 foot, 30,000 horse, and 50,000 prisoners. This famous battle was fought, according to some Arabic writers, in the year of the Hegira 609, A. D. 1212; but, according to the Spanish and other historians, in 617, A. D. 1220. After this defeat he returned to Africa, where he was received with coldness and disgust, and soon died of vexation, having appointed his grandson Zeyed Arrax to succeed him. Al Zeyed was soon assassinated by order of Gamarazan Ebn Zeyen, of the tribe of the Zeneti, a descendant of the Abdolwates, ancient monarchs of the kingdom, but at this time vassals to the Almohedes; and with him terminated the dynasty or government of the Almohedes, after having held it for about 170 years; which was succeeded by that of the Benimerini, another branch of the Zeneti. These last, having held the government during the space of 117 years, enlarged their conquests, and enriched themselves by frequent incursions not only into all the neighbouring kingdoms; but even Nubia, Libya, and Numidia were at length swallowed up by the general inundation of Mohammedism. Mod. Un. Hist. vol. xiv. p. 301—316.

ALMOI, in *Geography*, a town of Prussia, in the province of Natangen, eight leagues south-west of Rastenburg.

ALMOIN, in *Law*. See *FRANK Almoïn*.

ALMON, in *Ancient Geography*, a town of Judæa, in the tribe of Benjamin, assigned by Joshua to the Levites of this tribe who were of the family of Aaron.

ALMON, a town of Greece, in Bœotia; and also a town or district of Thessaly.

ALMONACID, in *Geography*, a town of Spain, in Old Castile, three leagues south-east of Toledo.

ALMOND, *African*, in *Botany*. See *BRABEÏUM*.

ALMOND, *Dwarf and Tree*. See *AMYGDALUS*.

ALMOND, in the *Materia Medica*, is a kind of fruit which is the produce of the almond-tree, or *Amygdalus Communis*. There are two principal varieties of this tree, distinguished by the quality of the fruit; and hence we obtain two kinds of almonds, *viz.* the sweet and the bitter. Neither the kernels themselves, nor the trees that produce them, allowing for some difference in the size of the flowers and fruit, are distinguishable by the eye; and it is said that the same trees, which in a wild state bore bitter almonds, have, when cultivated, afforded the sweet kind; and that the sweet, for want of culture, have degenerated into bitter. The almonds which we receive from Barbary, where the tree is indigenous,

are bitter; and those of Europe and of other parts, where it is cultivated, are in general sweet. In the choice of these kernels, particularly those of the sweet sort, care should be taken, as they are very apt, on account of the oil with which they abound, to become rancid in keeping, and to be preyed upon by an insect, which eats out the internal part, and leaves the almond apparently entire.

Sweet almonds are, for most purposes of medicine and diet, blanched, or freed from the outer, thin, acrid skin, by steeping them in hot water till it is sufficiently softened to be peeled off. Sweet almonds are more used as food than as medicine, and like others of the *nucis oleose*, or oily nuts, they are considerably nutritious; but they are said to be of difficult digestion, unless they are extremely well comminuted. Dr. Cullen suggests, that this inconvenience, noticed by Dr. Lewis, may be in a great measure obviated by a very diligent triture, uniting very intimately the farinaceous and the oily part. As medicines, they contribute, by their soft unctuous quality, to blunt acrimonious humours in the first passages, and thus sometimes give present relief in heart-burns and similar complaints. Their medicinal qualities depend upon the oil which is blended with the farinaceous matter, and which they yield, on expression, nearly in the proportion of half their weight. Murray says, that 5½ pounds of unpeeled almonds have yielded, by cold expression, one pound six ounces of oil; and afterwards, on heating the almonds, three quarters of a pound. This oil is more agreeable to the palate than most other expressed oils, and is therefore preferred for internal use, in order to obtund acrid juices, and to soften and relax the solids, in tickling coughs, hoarseness, costiveness, nephritic pains, &c. and externally in tension and rigidity of particular parts. The milky solution of almonds in watery liquors, usually called emulsions, possess in a degree the emollient qualities of the oil, and are prescribed with the same intention, particularly in heat of urine and stranguries; and they are also given as diluents in acute diseases, and for supplying the place of animal milk, to which they bear a great analogy. These emulsions are formed of a due consistence, with the proportion of an ounce of almonds to a quart of water, which should be gradually poured in after the almonds have been first thoroughly pounded; and the London College directs the addition of gum arabic, which renders it a still more useful demulcent in catarrhal affections, stranguries, &c. But if the water is heated for hastening the solution of the gum, it should stand to grow cold before it is poured on the almonds, otherwise the emulsion will be imperfect. Sugar, or some other grateful material, is commonly added, in order to make the liquor more palatable. The oil, after being exposed for a few days in a heat equal to that of the human body, becomes rancid and acrimonious. Emulsions, on standing for some hours, throw up a white cream on the surface, and the whey-like liquor underneath grows not rancid but sour. The latter are therefore preferred in inflammatory distempers, because they are not subject to become acrid and irritating by the heat of the body, but tend rather to a state in which they may serve to abate inflammation. Acids, mixed with emulsions, separate the oily and serous parts, and produce a thick curd, much after the same manner as they do in milk. A more permanent emulsion may be formed by triturating the pure oil with a thick mucilage of gum-arabic, from which the oil will not separate on standing for some days, nor on the addition of acids, though it may be speedily disengaged by alkalies, both fixed and volatile. One part of gum, made into a mucilage with an equal quantity of water, is sufficient for four parts of the oil. The

white or yolk of an egg, and a mixture of syrup, with a small quantity of volatile spirit, will render the oil in some degree soluble in water. Several substances, not miscible of themselves with water, may, by trituration with almonds in the proportion of about six times their quantity, be mixed with it, and thus fitted for medicinal use, as camphor, and various resins, and unctuous substances. Some reckon two kinds of sweet almonds. 1. Jordan, which are the larger, longer, and dearer kind, chiefly sold to be eat with raisins. 2. Valencian and Barbary almonds, or those from which the oil is produced. Houghton Collect. N^o 474. tom. ii.

Bitter almonds yield a large quantity of oil similar to that of sweet almonds, and they are alike miscible with water into an emulsion. The oil has no bitterness, and that of either sort is used indifferently for medicinal purposes; but the matter remaining, after the expression of the oil, is more powerfully bitter than the almond itself. Great part of this bitter matter dissolves by the assistance of heat, both in water and in rectified spirit, and a part also arises with both menstrua in distillation. These almonds, and emulsions of them, have been recommended as aperients, resolvents, diuretics, and anthelmintics; but though they may in these respects be of some use, they are remedies of too dangerous a kind for common practice. When taken freely in substance, they occasion sickness and vomiting; and they have been long known to be poisonous to various brute animals, as wolves, foxes, dogs, cats, and several sorts of birds; and from the sudden effects which this poison produces, and the convulsions and spasms that follow the exhibition of it, there can be no doubt of its acting directly on the nervous energy. Some authors have alledged, that they are also deleterious to the human species. However this be, as their noxious quality seems to reside in that matter from which they derive their bitterness and flavour, it is probable that when this is separated from the farinaceous substance by distillation, and taken in a sufficiently concentrated state, it may prove a poison to man, as is the case with the common laurel, to which it appears very analogous. One small drop of this essential oil convulsed, and in two minutes killed a sparrow. These almonds were formerly eaten to prevent the intoxicating effects of wine; and Plutarch (Sympol. lib. i. apud op. tom. ii. p. 624.) relates, that the physician of Drusus, the son of Tiberius, took five or six bitter almonds for this purpose. John Bauhin, from experiments made on purpose, denies their having this power; and from twelve of them, we are told, that Lorry (De Venenis, p. 17.) experienced the sense of inebriation. They are highly commended by Thebesius (Nov. Act. Nat. Cur. tom. i. p. 181.) for the cure of hydrophobia from the bite of a mad animal, who found them effectual in 12 cases, in which some were eaten every morning for one or two weeks. Bergius says, (Mat. Med. p. 433.) that bitter almonds, in the form of emulsion, cured obstinate intermittents, after the bark had failed. Having dissolved two drams of soluble tartar, and an ounce and a half of honey in a pound of water, he made an emulsion with this water, and one ounce of bitter almonds. Of this emulsion he gave, during the intermission, a pound or two every day, and says, that by this remedy, the recurrence of the fits was prevented. In cases where this failed, and in which he had recourse to the bark, he mixed with the decoction of the bark the bitter emulsion; and he adds, that he had seen intermittent fevers frequently recurring, and which had entirely resisted the bark, at length totally cured by the bitter emulsion alone. This is a remedy, however, which should be used with great caution. Lewis, Cullen, Murray, and Woodville.

The kernels of bitter almonds give much the same relish in

distillation as the kernel of the cherry; on which account some have used them in making a counterfeit cherry brandy. They are also frequently used instead of apricot kernels in ratafia.

Almonds give the denomination to a great number of preparations in confectionary, cookery, &c. of which they are the basis; as almond-cakes, almond-cream, crisped-almonds, almond-milk, almond-paste and powder, almond-snow, &c. Almond-milk is an emulsion or mixture made of one and a half ounce of sweet almonds, half an ounce of double refined sugar, and two pints of distilled water. The almonds are beaten with the sugar, then rubbing them well together, add the water by degrees, and strain the liquor. There is a preparation also called almond-butter, made of cream and whites of eggs boiled, to which are afterwards added blanched almonds, and the whole is set over a slow fire till it becomes thick.

ALMOND, in *Geography*, a river of Scotland which runs into the Frith of Forth, five miles west from Leith.

ALMOND, in *Commerce*, a measure by which oil is sold in Portugal, 26 almonds making a butt or pipe.

ALMOND is also a fruit which serves instead of small money, in several parts of the East Indies; particularly where the *corories*, those small shells which come from the Maldives, are not current.

ALMONDS, *amygdalæ*, in *Anatomy*, denote two mucous glands, in size, shape, and inequality of surface, not unlike a small almond. They are situated in the posterior aperture of the fauces, or the opening by which the cavity of the mouth communicates with the bag of the pharynx. They are more commonly called tonsils, to which title we refer for further information.

ALMOND, or ALMAN-furnace, *fourneau d'Allemagne*, the common melting furnace of the German refiners. See FURNACE.

ALMONDS, *amandes*. Thus the French lapidaries and looking-glass makers call those pieces of rock crystal, or cast crystal, which they cut with a wheel, giving them a figure something like that fruit. They are used to adorn branch-candlesticks, and other furniture made of glass or crystal.

ALMONDBURY, in *Geography*, a village of the West Riding of Yorkshire, 10 miles from Halifax, and 185 from London.

ALMONDSBURY, a village in Gloucestershire, where Alemond, father of Egbert, the first sole monarch of England, is said to have been buried. It has a Saxon fortification, with a double ditch, which commands an extensive view of the Severn. It is eight miles from Bristol.

ALMONER, anciently also written AMNER, an officer in a king's, prince's, or prelate's household, whose business is to distribute alms to the poor.

The *lord almoner*, or *lord high almoner*, of England, is an ecclesiastical officer, usually a bishop; who is to visit and relieve the sick, poor widows, prisoners, and others in necessity, for which purpose he has the forfeiture of all deadlands, and the goods of *sebo de se*, which he is to dispose of to the poor.

He has likewise, by an ancient custom, a privilege to give the first dish from the royal table, to whatsoever poor person he pleases; or, instead thereof, an alms in money.

He also distributes to twenty-four poor men, nominated by the parishioners of the parish adjacent to the king's palace of residence, to each four pence a day in money, and an alms of bread and small beer; each person first repeating the Creed, and the Lord's prayer, in presence of one of the king's

king's chaplains, deputed by the lord almoner to be his sub-almoner, who is also to scatter new-coined two-pences in the towns and places through which the king passes in his progress. See *MAUNDY Thursday*.

He has also the charge of several poor pensioners to the crown below stairs; consisting of such as have spent their youth, and become superannuated, in the king's service; or the widows of such household servants as died poor, and were not able to provide for their wives and children, whom he duly pays. Chamberlayne's State of Great Britain, p. 98.

Under the lord almoner, besides the sub-almoner, there is a yeoman, and two grooms of the almonry, chosen by his lordship.

The French kings used to have their great almoners, first almoners, ordinary or quarterly almoners, &c.

Great almoner, *grand almonier*, was the highest ecclesiastical dignity in that kingdom. To him belonged the superintendency of all hospitals, and houses of lepers. The king received the sacrament from his hand. He said mass before the king, in all grand ceremonies and solemnities.

ALMONER is also applied, in *Ecclesiastical Writers*, to the DEACONS of churches.

ALMONER is also used, in *Historians of the Middle Age*, for him appointed by a person to distribute his alms to the poor. In this sense, almoner amounts to much the same with what has been since denominated executor.

ALMONER is also sometimes used for a person who left alms to the poor, by his last will.

ALMONER is also sometimes used for a legatee.

In this sense, it is the rule, that the same person could not both be almoner and heir.

ALMONER is also a more fashionable title given, by some writers, to chaplains. In this sense we meet with almoner of a ship, almoner of a regiment.

ALMONRY, or AUMBRY, the office or lodgings of the almoner; also the place where the alms are given. See AMBRY.

ALMONTE, a neat town of Spain, in the country of Seville, environed with a forest of olives; 13 miles south-east of Moguer.

ALMONTE, a river of Spain, which runs into the Tagus, not far from Truxillo.

ALMOPHA, in *Ancient Geography*, a country of Macedonia, inhabited by the Almopians, in which stood the cities of Europus, Albanopolis, and Apsalus. Thucydides mentions Almopia, and Pliny the Almopii; and it is said to have derived its name from Almops, son of Neptune and Hellè, the daughter of Athamas.

ALMORA, in *Geography*, a country of Asia, between the mountains of Thibet and Hindostan, north of the province of Rohileund. The principal towns are Rampour and Cossipour.

ALMORAVIDES, in *History*, a name given by the Spanish historians to an Arab tribe, which took possession of a district of Africa in order to live at their ease, and in a state of retirement, as they pretended to follow the dictates of the Koran more closely than others of their sect, from whence they took the name of Morabites, which the Spaniards changed into that of Almoravides. The first prince or chief of this nation was Abuteker Ben Omar, who is commonly called by Spanish authors Abu Texien or Texifian. This prince founded the dynasty of the Almoravides in Barbary, A. D. 1051, by the aid of a powerful army of malecontents in the provinces of Numidia and Libya, assembled by the influence of the Marabouts or Morabites, whence

the appellation was derived. Texefian, as we have shewn in the history of ALGIERS, was succeeded by his son Yusef, or Joseph, who, after having extended his conquests in Africa, and reduced the kingdoms of Tremecen, Fez, and Tunis, to a state of tributary vassalage, took advantage of the intestine wars in Spain, and passed over, with a view of enlarging his conquests, into that country. Here he repulsed the Christians with great vigour; and though the Moorish princes did not afford him the assistance which he expected, he reduced the greatest parts of the kingdoms of Murcia, Granada, Cordova, Juen, and some few places in Valencia; and then returned into Africa, leaving his conquered dominions under the government of his nephew Mohammed, with a considerable part of his army. As soon as he arrived in Africa, he published a general gazie, or religious war, and with a fresh and numerous army embarked at Ceuta for his Spanish conquests, and soon rejoined his nephew in Andalusia, which they ravaged with fire and sword. In 1107, five years after their assault, he made another descent, penetrated into Portugal, and reduced the city of Lisbon, with a great part of the kingdom, but lost the cities of Algazir and Gibraltar, which he had taken before. Having been defeated at sea in his way to Barbary, he proposed a truce, which was agreed to on condition that he should submit to become the tributary of the Spanish monarch. Yusef, the Almoravide prince, was so exasperated that he vowed never to desist until he had utterly extirpated Christianity in Spain. Accordingly he prepared for a fresh descent; and landing at Malaga, led his army into the enemy's country with great fury and little prudence. The consequence of this hasty measure was a battle, famous in history, called the Battle of the Seven Counts, in which, though after great slaughter he gained a victory, he lost so great a number of his own men, that he was obliged to return to Africa, where he died soon after, at his capital of Morocco, leaving the sovereignty to his son Ali, A. D. 1110. This prince, less warlike than his father, employed his thoughts in erecting sumptuous buildings, and in particular the great mosque of Morocco, whilst he neglected his Spanish conquests. Alphonso, king of Aragon, was daily recovering some considerable cities from him; and he was at last reduced to the necessity of passing over to Spain, for the succour of the Moorish princes. But he was unsuccessful in several expeditions; and in his last enterprise, though he had the vigorous concurrence of the Moorish chiefs, he was defeated and slain by king Alphonso, with the loss of 30,000 men, in the sixth year of his reign. He was succeeded by his son Al Abraham, or Brahem, who pursued his pleasures, and oppressed his subjects with taxes, which occasioned dissatisfaction and complaint, and soon terminated in a revolution, by which the government was transferred from the tribe of the Almoravides to the ALMOHEDES, in the 25th year of his reign. Mod. Un. Hist. vol. xiv. p. 296—301.

ALMOUT, in *Geography*, a town of Persia, in the province of Taberistan, 32 leagues south-west of Ferhad.

ALMS, *elemosyna*, something given out of charity or pity to the poor.

The ecclesiastics anciently subsisted wholly on alms.—The alms of the primitive Christians were divided into three parts; one whereof belonged to the bishops, another to the priests, and a third to the deacons and sub-deacons.—Sometimes they divided them into four; the last of which went to the poor, and to the repairing of churches.

The Romanists extend the term alms to that which is given to the church, or to other pious uses.—Hence, what the church holds on this footing is called *tenure in alms*.

Alms are of divers kinds.

ALMS, paschal, eleemosyna paschales, were those distributed at the solemnity of Easter, attended, in some places, with other acts of humility, as washing of feet, &c.

ALMS, reasonable, eleemosyna rationalis, a certain portion of the effects of persons dying intestate, set apart for the use of the church and the poor.

ALMS of plough-lands, eleemosyna carucarum, or eleemosyna pro aratris, was a tax anciently paid for the benefit of the poor, at the rate of a penny for each plough-land.

ALMS of the king, denote what was otherwise called *Peter-pence*.

These were sometimes also called alms of St. Peter.

ALMS are divided by *MAHOMETANS* into *voluntary* and *legal*.

ALMS, voluntary, are those left to every man's discretion, to give more or less, as he sees fit.

The voluntary alms are properly denominated by the Arabs *sadakāt*, because they are a proof of a man's *sincerity* in the worship of God.

No religious system is more frequent or warm in its exhortations to alms-giving than the Mahometan. The Koran represents alms as a necessary means to make prayer be heard; for which reason the Caliph Omar Ebn Abd'alaziz used to say, "that prayer carries us half way to God, fasting brings us to the door of his palace, and alms procure for us admission." The Mahometans esteem alms-deeds to be highly meritorious, and many of them have been illustrious examples of it. Hasan, the son of Ali, and grandson of Mahomet, in particular, is related to have thrice in his life divided his substance equally between himself and the poor, and twice to have given away all he had; and the generality are so addicted to the doing of good, that they extend their charity even to brutes. Alms, according to the prescription of the Mahometan law, are to be given of five things, *viz.* cattle, *i. e.* camels, kine, and sheep; money; corn; fruits, *i. e.* dates and raisins; and wares fold. Of each of these a certain portion is to be given in alms; and that portion was usually one part in 40, or $2\frac{1}{2}$ per cent. of the value. But no alms are due for them, unless they amount to a certain quantity or number, nor till they have been in possession 11 months; nor are alms due for cattle employed in tilling the ground, or in carrying of burthens. However, at the end of the feast of Ramadan, every Moslem is obliged to give in alms, for himself and every one of his family, a measure of wheat, barley, dates, raisins, rice, or other provisions commonly eaten.

ALMS, legal, are those of indispensable obligation, as being commanded by the law, which directs and determines both the portion to be given, and the kind of things of which it is to be given.

The *legal alms* are properly called by the Mahometans *zaca*t, either on account of their increasing a man's store, or of their purifying the remaining part of his substance.

Some writers have given these the denomination of tithes, but improperly; since, in some cases, they fall short, and in others exceed the proportion of a tenth. These legal alms were first collected by Mahomet himself, and employed, as he thought fit, in relieving his poor relations and followers, but chiefly in maintaining those who served in his wars, and fought, as he termed it, in the way of God. His successors continued to do the same, till, in process of time, other taxes and tributes being imposed for the support of the government, they seem to have been weary of acting as almoners to their subjects, and to have left the payment of them to their own consciences. In the Mahometan rules and practice with regard to alms, we may discover obvious traces of

the resemblance of their system to that of the Jews. Sale's Koran, preface, p. 110.

ALMS, charter of, charta eleemosynaria, that whereby a thing is given to the church.

ALMS, aumone, among the French, is also used for a compulsory payment, imposed by way of punishment, to be converted to pious or charitable uses.

In all adjudications to the king's right, there is an *alms* reserved. This amounts to what among us is usually called *forfeiture to the poor*.

ALMS-box, or chest, a small chest, or coffer, wherein anciently the alms were collected, both at church and at private houses. This is also in common use in several places.

The alms-chest, in churches, is a strong box, with a hole in the upper part, having three keys, one to be kept by the parson, or curate, the other two by the church-wardens.

The erecting of such alms-chest in every church was introduced by an act in 27 Hen. VIII.; and it is enjoined by the Book of Canons, as also the manner of distributing what is thus collected among the poor of the parish.

ALMSFEOH, or ALMESFEOH, among our Saxon ancestors, *alms-money*; that is, *PETER-PENCE*, anciently paid in England on the first of August; called also *romeschoe, romescot, and hearth-pening*.

ALMSHADEN, in *Geography*, a town of Arabia, 80 miles north-east of Hagiāz.

ALMS-HOUSE, a petty hospital; or an edifice built by a person in a private capacity, and endowed with a revenue, for the maintenance of a certain number of poor, aged, or disabled people.

ALMSTAD, in *Geography*, a town of Sweden, in the province of Smaland, three miles from the Baltic, and four east from Christianstad.

ALMUCANTARS, or ALMICANTARS, formed of the Arabic *almucantarat*, in *Astronomy*, are circles parallel to the horizon, imagined to pass through all the degrees of the meridian.

As the meridians pass through the several degrees of the equator, the almucantars pass through those of the meridian of any place, and they are the same with regard to the azimuths and horizon, that the parallels are with regard to the meridians and horizon.

They serve to shew the height of the sun and stars; and are described on many quadrants, &c. being also called *PARALLELS of altitude*.

ALMUCANTARS staff, an instrument usually made of pear-tree or box, having an arch of fifteen degrees; formerly used to take observations of the sun, about the time of its rising and setting, in order to find the amplitude, and consequently the variation of the compass.

ALMUCIUM, or ALMUTIUM, in *Middle-Age Writers*, denotes a kind of cover of the head, part of it pendant over the neck and shoulders, worn chiefly by the ancient canons and monks.

The word is also written *almucia, aumucia, almucella, armucia, and amecia*.

The almucium appears to have been much the same with what is otherwise denominated *caputium*. The almucium, though proper only to religious, was sometimes also assumed by laymen, princes, and even women of quality.

The part which covered the head was of a square form, making, as it were, four horns, as may be seen from the ancient pictures of canons. Hence appears the origin of the square caps, bonnets, &c. still retained in cathedrals and universities, which are no other than the upper part of the almucium, without the lower.

ALMUCIA is also used, in some *Ancient Writers*, for the furs

furs or skins worn by the canons, on their left arms, in the manner of muffs.

ALMUDHEBIS, in the Arabian *Astrology*, a kind of dignity, or pre-eminence, accruing to a planet in some place, either from its disposition or benign aspect.

ALMUG-tree, a kind of wood mentioned in Scripture, imported by Solomon from Ophir, and used in the making of rails, or pillars of the temple. 1 Kings, ch. x. ver. 11, 12. 2 Chron. ch. ii. ver. 8. See ALMIGGIM.

ALMUGEA, in *Astrology*, denotes a certain configuration of the planets, in respect to the sun and moon, correspondent to that which is between the hours of those planets, and the sun's and moon's hours.

Thus Saturn would be in the *almugea* of the sun, when distant from him the space of five signs in succession, or in the *almugea* of the moon, when he is at the same distance, only contrary to the succession of the signs.

ALMUGNA, in *Geography*, a large handsome village of Aragon, in Spain, situate at the junction of the Grio with the Xalon.

ALMUGNECAR, a sea-port town of Spain, in the province of Granada, situate on the Mediterranean, with a good harbour and strong citadel, eight leagues south of Alhama, and 18 east of Malaga. N. lat. $36^{\circ} 50'$. W. long. $3^{\circ} 45'$.

ALMIUM, in *Ancient Geography*, a district of Mæsia, upon the Danube.

ALMUS. See ALMA.

ALMUTAZAPHUS, a magistrate of Aragon, whose office is to search houses for stolen goods, weigh the bread, measure the wine, &c.

ALMUTHEN, in the Arabian *Astrology*, the planet which has the disposal of a place, that is, surpasses the rest in the number and efficacy of dignities, regard being had to the essential points, viz. *exaltation, terms, trigons, and phases*. This is otherwise called *almusteli*.

ALNABATI, in the *Materia Medica*, a name given, by Avicenna and Serapion, to the *SILVIA dulcis*, or carob-tree. They called both this and the ACACIA by the common name *charnub*, or *charub*; but they sufficiently distinguish this, not only by this appellation, but by telling us it was a gentle purge, whereas the other was astrigent.

ALNAGE, or AULNAGE, French, formed of *aune*, or *alne*, an ell, q. d. ell-measure; the measuring of woollen manufactures with an ell, and the other functions of the ALNAGER.

All the attempts which our forefathers made for regulating manufactures, when left to the execution of any particular officer, in a short time resolved into a tax on the commodity without respect to the goodness thereof.—As is most notorious in the case of aulnage, which was intended for a proof of the goodness of the commodity; and to that purpose a seal was invented, as a signal that the commodity was made according to their statute; which seals, it is said, may now be bought by thousands, and put on what the buyers please. Sir Jos. Child's Disc. on Trade.

It is probable that the abuses here mentioned by Sir Josiah Child did, among other reasons, give occasion to the clause 11 and 12 Will. III. cap. 20. by which aulnage duties are wholly taken away.

ALNAGER, ALNEGER, or AULNEGER, q. d. *measurer by the ell*, signifies a sworn public officer, who, by himself or deputy, is to look to the assize of woollen cloth made throughout the land, i. e. the length, width, and work thereof; and to the seals for that purpose ordained. The office of king's aulnager seems to have been derived from the

statute of Richard I. A. D. 1197, which ordained, that there should be only one weight, and one measure, throughout the kingdom; and that the custom of the assize, or standard of weights and measures, should be committed to certain persons in every city and borough. This office is first mentioned in the statute-book, A. D. 1328; but it appears to have existed under this appellation, and to have been ordained by letters patent as far back as the 15th year of king Edw. II. A. D. 1322. His business was, for a certain fee, to measure all cloths made for sale, till the office was abolished by the statute 11 and 12 Will. III. cap. 20. In more modern times, instead of the aulnager, they have in every clothing town and parish proper persons called *searchers*, appointed by the clothiers themselves, who examine the qualities and dimensions of the several kinds of cloth, agreeably to the statute of the 5th and 6th year of king Edward V. cap. 6. Anderson's Com. vol. i. p. 181. fol.

ALNAPEST, in *Geography*, a mountain of Ireland, in the county of Donegal, 19 miles north-north-east of Ballyshannon.

ALNASI, in the *Mahometan Law*, the transferring the observation of a sacred month to a profane month.

ALNE, in *Geography*, a river of England, which runs into the Stour in Warwickshire, on the borders of Worcester-shire, four miles north-east of Evesham.

ALNE is also a river which runs into the north sea at Alnmouth.

ALNEMOUTH, or ALEMOUTH, a sea-port town of England, for small vessels, in the county of Northumberland, which carries on a considerable trade with Holland, four miles south-east of Alnwick, and 15 north of Morpeth. N. lat. $55^{\circ} 25'$. W. long. $10^{\circ} 35'$.

ALNEY, an English island, in the river Severn and county of Gloucester, near the city of Gloucester, remarkable for an interview between Canute the Dane and Edmund Ironside.

ALNIDENA, in *Ancient Geography*, a town of Caria, mentioned in the council of Chalcedon.

ALNI EFFIGIE, in *Botany*. See CRATÆGUS and MESPILUS.

ALNIFOLIA. See CLETHRA.

ALNI FRUCTU. See CONOCARPUS and THEOBROMA.

ALNUS, the *alder*. See BETULA and CONOCARPUS.

ALNUS nigra et baccifera. See RHAMNUS.

ALNUS also denotes a part in the ancient theatres, at the greatest distance from the stage.

ALNWICK, in *Geography*, a market town of England and county town of Northumberland, situate on the side of a hill near the river Alne. The town is populous, and in general well built: it has a large town-house, where the quarter-sessions and county-courts are held, and members of parliament are elected. Its principal ornament is an old Gothic castle, belonging to the Percy family. It stands on the brow of a hill above the river Alne, fronting the north, and having the town immediately behind it. The late Duke of Northumberland, after his marriage with the heiress of this noble family, rescued this castle from its decay, and restored it to more than its former splendour. He repaired the surrounding towers, and supplied those that were wanting in all the several courts that encircle the mansion. He rebuilt the citadel in its original form, and converted it into a very superb palace, observing the Gothic exterior in every compartment, and uniting it with all the magnificence of the modern. The approach is extremely grand, through three gateways and two spacious courts, environed by the out-works, into a third court, which appears immured within
the

the citadel. A light and elegant staircase, spreading in the form of a fan, introduces to the grand range of apartments, which are admirably contrived. The dining-room, drawing-room, saloon, and library, are very noble rooms; and they are fitted up in a style which admirably corresponds with the structure. The richly ornamented chapel forms a splendid appendage to the castle. The ground in front of this building is well disposed, on each side of the Alne, which is crossed in sight by two handsome bridges, and the neighbouring hills are clothed with woods of the Duke's creation. On one of the highest eminences he has erected Brisley tower, commanding an extensive prospect over a bleak country towards the Cheviot hills on one side, and the coast on the other. Hulne Abbey hangs beautifully over the river, and several neat apartments are intermixed, with judgment and taste, among the ruins. This town has been noted for a singular custom, which those who take up their freedom are said to be under a necessity of observing, which is that of jumping into a muddy well, called Freeman's Well; and this ceremony is conducted in a manner as singular. The freemen, on their return from this whimsical excursion, are received into the town by a procession of women dressed in ribbons, with bells and garlands, singing and dancing. This ceremony is said to be established by king John, who was mired in this well, as a punishment for their not keeping the roads in good order, and made a part of their charter. In this town Malcolm, king of Scotland, in his incursion into Northumberland, was killed, together with Edward his son, when his army was defeated by Robert Mowbray, earl of this county, A. D. 1092, and William, king of Scotland, when he invaded England in 1174 with an army of 80,000 men, was routed in this place, and made prisoner. The weekly market is on Saturday. The distance of Alnwick from London is 308 miles, from Morpeth 19, and from Berwick 30 miles. N. lat. 55° 24', E. long. 1° 10'.

ALOE, a place situate, according to Ptolemy, in the Marmarica.

ALOA, in *Antiquity*, a Grecian feast, celebrated in the month Posidæon by the Athenian husbandmen, in honour of Ceres, as inventress and protectress of corn and tillage, or in honour of Ceres and Bacchus, by whose blessing the husbandmen received the recompence of their labour. Their oblation was the fruits of the earth. Some say it was in commemoration of the primitive Greeks, who lived *εἰς τὰς ἀρχαίας*, in their corn fields and vineyards. Harwood's *Grecian Ant.* p. 217.

The word is *ἀλωα*, and formed of *ἀλωε*, *grange*, or *barn*; it being in these places that much of the solemnity passed.

Authors are not agreed as to the time or occasion of the celebration of the aloa. Some suppose it to have been before the beginning of harvest; others will have it to have been a rejoicing after harvest, not unlike our *HARVEST-LANE*.

ALOCIVÆ INSULÆ, in *Geography*, islands placed by Ptolemy to the north of the Cimbric Chersonesus, or Jutland.

ALOE, a town of India on this side of the Ganges.

ALOE, in *Botany*, a genus of the *hexandria monogynia* class and order, of the natural order of *Lilia* or *Liliaceæ*, *Coronarie* of Linn. and *Asphodeli* of Jussieu. Its characters are, that it has no *calyx*; the *corolla* is one-petalled, erect, flexid and oblong, tube gibbous, border spreading and small, nectareous at the bottom; the *stamina* have awl-shaped filaments, as long as the corolla or longer, inserted into the receptacle, the anthers oblong and incumbent; the *pisillum* is an ovate germ, the style simple, of the length of the stamina, the stigma obtuse and trifid; the *pericarpium* is an oblong capsule, three-furrowed, three-

celled, and three-valved; the *seeds* are several and angular. Martyn enumerates 14 species with several varieties, Gmelin 16, and Willdenow 17. They are as follow, *viz.* 1. *A. dichotoma*, smooth-stem'd tree aloe, with branches dichotomous, and leaves sword-shaped, and serrate, paniculated flowers, and stamina longer than the ovated corolla. The trunk is round, upright, very stiff, ash-coloured and smooth, two fathoms in height, and of the thickness of a man's thigh. This is a native of the Cape of Good Hope on the mountain called Bockland, and was introduced into Kew Garden in 1780, by Mr. William Forsyth. 2. *A. perfoliata*, perfoliate A. with stem-leaves toothed, embracing, sheathing, flowers in corymbs, drooping, peduncled, and subcylindric: of this species there are the following varieties; *viz.* α. *A. arborescens* of Miller, with leaves embracing, reflex, toothed, flowers cylindrical and stem shrubby. This grows to the height of 10 or 12 feet, with a strong naked stem, embraced by the leaves which grow at the top, and are of a sea-green colour, and very succulent. The flowers are in pyramidal spikes, of a bright red colour, and are in beauty in November and December. β. *A. Africana* of Miller, broad-leaved sword A. with leaves broader, embracing, thorny on the edge and back, flowers in spikes, and stem shrubby. γ. *A. Barbadenfis*, Barbadoes A. with leaves toothed, upright, succulent, and subulate, flowers yellow, hanging down in a thyrsus. The leaves are about four inches broad at their base, and near two inches thick, of a sea green colour, and when young, spotted with white. The flower stem rises near three feet in height, and the flowers form a slender loose spike, and are of a bright yellow colour. This, though generally known in the shops by the name of Barbadoes aloe, is very common in the other islands of America, where the plants are propagated on the poorest land for obtaining the Hepatic aloes. δ. *A. succotrina*, *A. vera* of Miller, with leaves very long and narrow, thorny at the edge, and flowers in spikes. This is the true succotrine aloe, which yields the best sort of aloes used in medicine. It grows in India, and particularly in the island of Socotora, in the Straits of Babelmandel. Its leaves are long, narrow, and succulent, and form large heads, about eighteen inches long, and an inch and a half at their base; the stalks rise to the height of three or four feet, and have two, three, and sometimes four of these heads branching out from them; the flowers grow in long spikes upon stalks about two feet high; they are of a bright red colour, tipped with green, and generally appear in the winter season. ε. *A. purpurascens*, white spined glaucous A. with leaves purplish beneath, with small roundish spots, at bottom. ζ. *A. glauca* of Miller, red-spined glaucous A. with stem short, leaves embracing, standing two ways, spines on the edges erect, and flowers growing in a head. η. *A. lineata*, red-spined striped A. θ. *A. ferox*, great hedge-hog A. with leaves embracing, very dark green, beset with spines on every side. La Marek makes this a distinct species. It rises to the height of eight or ten feet, with a strong stem; the leaves grow on the top, and closely embrace the stalk; four inches broad at the base, and diminishing gradually till they terminate in a spine; they are of a dark green colour, and beset with spines, which are red or purple. This plant grows naturally in Africa, but has not flowered in England, and as it does not put out suckers, it does not admit easily of increase. ι. *A. japonaria*, great soap A. seldom rises above two feet high; the leaves are broad at their base, closely embracing the stalk, and gradually decreasing to a point; their edges are beset with spines; the under leaves are horizontal, of a dark green colour, spotted on the side, resembling

resembling the colour of soft soap; the flowers are of a beautiful red colour, and appear in August and September. *x. A. obscura*, common soap A. with leaves, broader, spotted, thorny at the edge, and flowers in spikes. This has broader leaves of a lighter green, with the edges and spines copper-coloured, &c. *λ. A. ferrulata*, hollow-leaved perfoliate A. with leaves spotted, finely serrated at the edge and the tip of the keel. *μ. A. subereita*, upright perfoliate A. with leaves flat almost upright, thorny at the edge, and on the lower surface. *ν. A. depressa*, short-leaved perfoliate A. with leaves embracing, thorny on both sides, and flowers in spikes. This seldom rises more than a foot high, and the leaves grow near the ground; they are of a sea-green colour, with some white spots; their edges are beset with sharp spines: and the flowers grow in loose spikes, the tubulous part being red, and the brim of a light green colour. *ξ. A. humilis*, dwarf hedge-hog A. with leaves upright, subulate, radicate, with weak spines all round. This plant is low, and never rises into stem; the leaves terminate triangularly, and are beset on their edges and surfaces with soft spines, whence the name of hedge-hog aloe. The flowers are seldom a foot high, below of a fine red colour, and of a pale green above. Willdenow makes a distinct species of this; stemless, with leaves trigonous, subulate, and aculeate, and flowers racemous, reflex and cylindrical; and he makes two varieties. *ο. A. mitraformis*, great mitre A. grows to the height of five or six feet; the leaves converge towards the top in the form of a mitre, are succulent, of a dark green colour, and have spines on their edges, with a few on the upper surface: the flower stem rises about three feet high, and the flowers form a globular spike at the top, which becomes cylindrical: they have long peduncles, and the flowers hang downwards; they are cut to the bottom into six unequal segments; three of the stamens are as long as the tube of the corolla, the other three are shorter: the tube is of a fine red colour, and the brim of a pale green. *π. A. brevifolia*, small mitre A.

3. *A. arachnoides*, cobweb A. stemless, leaves three-cornered, cusped, ciliate, flowers in a sort of spike, upright, cylindrical. The varieties are; *α. A. arachn. communis*, *A. pumila*, *δ.* of Linn. sp. pl. 460, common cobweb A. with leaves short, plane, fleshy, triangular at the end, and borders set with soft spines. This never rises from the ground, but the leaves spread flat on the surface; the flower stem rises about a foot high, and has three or four small distant herbaceous flowers. *β. A. arachn. pumila*, *A. herbacea* of Miller, *A. pumila*, *ε.* of Linn. 460, with leaves ovate-lanceolate, fleshy, triangular at the end, with numerous soft spines. This plant grows near the ground, the leaves are almost cylindrical at their base, and angular near their ends, of a darker green colour than those of the former; and produces many suckers on every side. From the seed of this Mr. Martyn has raised a variety, which has shorter, whiter, and smoother leaves.

4. *A. margaritifera*, A. pearl, *A. pumila*, *α*, *β*, *γ*, of Linn. 460, stemless, with leaves three-cornered cusped papillose, and flowers in racemes drooping and cylindrical. The varieties are, *α. A. marg. major*, great pearl A. *β. marg. minor*, and *γ. A. marg. minima*, least pearl A. The pearl aloe is of humble growth; the leaves come out near the ground, and they are closely studded with white protuberances, whence the name. These plants flower in several seasons of the year. 5. *A. verrucosa*, *A. disticha*, *β* of Linn. 159, warted or pearl-tongue A. stemless, with leaves sword-shaped, acute, papillose and distich, and flowers in racemes reflex or club-shaped. This species has long narrow tongue-shaped leaves, hollowed above, and keel-shaped

below, closely studded with white protuberances; the flowers form loose spikes, and are of a beautiful red colour, tipped with green. It flowers at different seasons, and produces plenty of off-sets. 6. *A. carinata*, *A. disticha γ* of Linn. 459, stemless, with leaves acinaciform, papillose, and flowers in racemes, drooping, curved. The leaves are broader and thicker, not so concave, and with less protuberances than the last; the flowers are of a paler colour, and the leaves shorter. 7. *A. maculata*, spotted A. almost stemless, with leaves acinaciform, smooth, painted, and flowers in racemes drooping, curved. There are two varieties. *α. A. mac. pulchra*, narrow-leaved, spotted A., with leaves sharp, and *β. A. mac. obliqua*, broad-leaved spotted A. with leaves blunt with a point. This species varies, with large, oblong, white confluent spots, and with small ones. It is a native of the Cape of Good Hope, and flowers in August. 8. *A. lingua*, or *linguaformis*, tongue A. almost stemless, with leaves tongue-shaped, tooth-letted, smooth, distich, and flowers in racemes, upright and cylindrical. There are two varieties: *α. A. lingua angustifolia*, A. disticha, *α* Linn. 459, common tongue A. with leaves narrower longer; and *β. A. lingua crassifolia*, thick-leaved tongue A. This grows with its leaves, which are about six inches in length, near the ground. The flowers are red below, and green above. It is a native of the Cape of Good Hope. There is a variety, with leaves much more spotted. 9. *A. plicatilis*, *A. disticha*, *ε. plicatilis* of Linn. 459, *Kumara disticha* Medic. Theod. fan A. almost stemless, with leaves tongue-shaped, even, distich, and flowers in racemes, pendulous and cylindrical. It grows to the height of six or seven feet, with a strong stem, on the upper part of which are produced, two, three, or four heads composed of long, compressed, pliable leaves of a sea green colour, which are placed in a double row: the flowers are red, and appear at different times of the year. 10. *A. variegata*, partridge-breast A. almost stemless, with leaves in three ranks, painted, channelled, angles cartilaginous, and flowers in racemes, cylindrical. This is a low plant, seldom rising above eight inches in height: the leaves are triangular and reflex at their extremity, fleshy, with their edges slightly serrated, curiously veined and spotted, like the breast of the partridge, whence the name. The flowers which grow on stalks about one foot high, are of a fine red colour, tipped with green. A variety of this was raised by Martyn, from seeds received from the Cape of Good Hope, with broader leaves, and not so beautifully spotted, with the flower stalks much taller. It is found in the clayey grounds of Ethiopia. 11. *A. viscosa*, upright triangular A. sub-caulescent, with leaves imbricate, in three ranks, ovate, and flowers in racemes, drooping, and cylindrical. It grows near a foot high, with triangular leaves from the ground upward, of a dark green colour, and the flowers are of an herbaceous colour, with their upper part reflex. It is a native of the fields of the Cape of Good Hope. 12. *A. spiralis*, spiral A. sub-caulescent, with leaves imbricate, in eight ranks, ovate, and flowers in racemes curved back. There are two varieties; *α. A. spir. imbricata*, imbricated spiral A. and *β. A. spir. pentagona*, five-sided spiral A. This grows like the 11th, with rounder leaves, ending in sharp points, and the flowers grow upon taller stems; a variety of this has been raised from seeds, much larger, with thicker leaves and taller stem. It is a native of the fields of Africa. 13. *A. retusa*, cushion A. stemless, with leaves in five ranks deltoid. These are short, thick and succulent, and compressed above like a cushion, whence the name. It grows close to the ground, and puts out suckers on every side; the flowers are of an herbaceous colour, and much resemble those of

the fourth species. It grows in the clayey soil of Africa. 14. *A. spicata*, spiked *A.* with flowers in spikes horizontal, bell-shaped, and stem-leaves, flat, embracing, and toothed. This much resembles the second species, but is very different in the spike and figure of the flowers. The flower is full of a purple honey juice. The best and purest hepatic aloes is obtained from this species. It is found in the interior regions of the Cape of Good Hope. 15. *A. picta*, painted *A.* caulescent, with leaves sword-shaped, toothed, painted and patent, and flowers in racemes, reflex, and cylindrical. There are two varieties; α . *A. major*, *A. perfoliata*, β and λ Linn. 458. β . *A. minor*, *A. perfoliata* μ , Linn. 458, *A. perfoliata*, Japonaria Aiton, Kew. 1. 467. It is a native of the Cape of Good Hope. 16. *A. sinuata*, caulescent, with leaves sword-shaped, sinuate-ferrated and reflex, and flowers in racemes, erect and cylindrical. This is the *A. perfoliata* ξ of Linn. 458, and it is suggested by Willdenow that it is the *A. perfoliata* γ . *barbadensis* of Aiton, Kew. 1. p. 466, and the narrow-leaved spinose, *A. succotrina* of Commel. Hort. i. p. 91, and the *A. Americana*, with the reddish flowers of anana, of Plukenet. It is a native of Barbadoes and the Cape of Good Hope. Martyn's Miller, Gmelin's Linnæus, Willdenow.

La Marck enumerates 31 species, viz. *A. purpurea*, or *A.* of Bourbon, originally brought from that island: when the leaves are cut, they yield a juice of a fetid smell. 2. *A. succotrina*. 3. *A. vulgari*, Kadanaku or Catevala of Rheed, growing in the sandy stony soil of Malabar, and many parts of India, and also in several provinces of America, as Mexico, New Spain, Brasil and Barbadoes; and yielding, by its purified juice, hepatic aloes, and from its dregs a less pure extract, called Cabaline aloes. 4. *A. vera*, growing in India, of which the *A. vaillans* of Forsk. Egypt. 74, n° 34, is a variety. 5. *A. Alysiaica*, brought from Africa by Bruce, and larger and more resinous than the preceding species. 6. *A. fruticosus*, or arborefcens of Miller. 7. *A. ferax*. 8. *A. mitraformis*, of which there is a variety, *A. mitraformis angustior*. 9. *A. maculosa*, or the *A. picta* above mentioned. 10. *A. tenuifolia*. 11. *A. perfoliata*, of which are reckoned two varieties, one commonly called *A.* with red spines, and the other artichoke *A.* 12. *A. humilis*, or *A.* with soft spines. 13. *A. arachnoidea*, with a variety commonly called the least aloes, growing in the fields and uncultivated parts of Ethiopia. 14. *A. margaritifera*. 15. *A. retusa*. 16. *A. venosa*. 17. *A. marginata*. These are the *A. africana*, *humilis*, &c. of Comm. Præl. The former yields an aqueous insipid juice. They are natives of Africa. 18. *A. triangularis*, or *A. viscosa* of Linnæus, a native of Ethiopia. 20. *A. variegata* of Linn; the most beautiful of the genus, a native of Ethiopia. 21. *A. acuminata*, or *A. verrucosa* above-mentioned. 22. *A. carinata*. 23. *A. linguiformis*, or *A. Eugua*. 24. *A. plicatilis*. 25. *A. longifolia*, or *ALETRIS avaria* of Linnæus, which La Marck thinks is erroneously referred to that genus, of which it has no character. 26. *A. spicata*. 27. *A. racemosa*, which is a shrub five or six feet high, observed at the Cape of Good Hope, by Thunberg, and which, as La Marck suggests, may be the same with the 24th species. 28. *A. dichotoma*. 29. *A. Arabica*, or *A. variegata*, called in Arabia Beshil or Beshil. 30. *A. dependens*, found by Forsk. in Arabia. Gmelin queries whether this be a distinct species. 31. *A. inermis*, found by Forsk. in Arabia, but akin to the 17th species. Encycl. Method. Bot. tom. i.

All the aloes are natives of hot climates; and the place of growth of most of them is the Cape of Good Hope. The Hottentots hollow out the trunk of the first species, or

A. dichotoma, to make quivers for their arrows; and several of them are used for hedges. Among the Mahometans, and particularly in Egypt, the aloes is a kind of symbolic plant, and dedicated to the offices of religion: for pilgrims, on their return from Mecca, suspend it over their doors as an evidence of their having performed that holy journey. The superstitious Egyptians imagine, that it has the virtue of keeping off apparitions and evil spirits from their houses, and it is hung over the doors of Christians and Jews in Cairo for this purpose. They also distil from it a water, which is sold in the shops, and recommended in coughs, asthma, and hysterics. Hasselquist mentions a person who was cured of the jaundice in four days by taking four tea-cupfuls of it. The Arabians call it *sabbara*. The negroes, as we are informed by Adanson, in his voyage to Senegal, make very good ropes of the leaves of the Guinea aloes, which are not apt to rot in water. M. Fabroni, as we learn from the Annales de Chimie (vol. xxv.) procured from the leaves of the *aloe succotrina angustifolia* a violet dye, which resists the action of oxygen, acids, and alkalis. This juice, he says, produces a superb transparent colour, which is highly proper for works in miniature, and which, when dissolved in water, may serve either cold or warm, for dyeing silk from the lightest to the darkest shade: and he reckons it one of the most durable colours known in nature. Aloes was used among the ancients, in embalming, to preserve bodies from putrefaction. Of this aloes, interpreters understand that to have been which Nicodemus brought to embalm the body of Christ. John, xix. 3.

Aloes, whose resinous part is not soluble in water, has been used as a preservative to ships' bottoms against the worms, to which those that trade to the East and West Indies are particularly subject. One ounce of aloes is sufficient for two superficial feet of plank; about 12 lb. for a vessel of 50 tons burthen, and 300 lb. for a first rate man of war. It may be incorporated with six pounds of pitch, one of Spanish brown, or whiting, and a quart of oil; or with the same proportion of turpentine, Spanish brown, and tallow. Such a coat, it has been said, will preserve a ship's bottom eight months, and the expence for a first rate ship, will be about 18*l*. The same composition may be used in hot countries for preserving rafters, &c. from the wood-ant. The efficacy of aloes, as a defence against worms, has been controverted. See *ALOES, infra*.

Propagation and Culture.—The soil in which these plants thrive best, is one half fresh, light earth, from a common; and if the turf is taken with it, and rotted, it is much better; the rest should be white sea-sand, and sifted lime-rubbish, each of these two, a fourth part; mix these together six or eight months at least before it is used, observing to turn it over often in this time. The middle of July is a very proper season to shift the plants; at which time you may take them out of the pots, and with your fingers open the roots, and shake out as much of the earth as possible, taking off all dead or mouldy roots, without wounding the young fresh ones: then fill the pot about three parts full of the above mentioned earth, putting a few stones at the bottom of the pot to drain off the moisture; and after disposing the roots in such a manner as to prevent their interfering too much with each other, put in as much of the same earth, as to fill the pot almost to the brim, shaking the plant so as to let the earth in between the roots, and settling it close to the roots with your hand to place it steady in the pot; then water them gently, and set them abroad in a shady place, where they may remain for three weeks, giving them gentle waterings, if the weather be hot and dry.

Toward the latter end of September, in a dry day, remove them into the house again, observing to give them as much free open air as possible, while the weather continues warm: but if the nights are cool, you must shut up the glasses, and give them air only in the day; and as the cold increases, you must discontinue opening the glasses, only giving them gentle waterings till the middle of October, when you must abate them according to the heat of the house in which they are kept. For those plants which are placed in a stove will require to be watered at least once a week, most part of the Winter, whereas those which are kept in a green-house, without artificial heat, should not be watered in the Winter oftener than once in a month, and in Summer they should not receive too much moisture.

The tender sorts, as the viscosa, ferox, and cobweb aloes, should constantly remain in the stove, or be removed in the Summer to an airy glass-case, where they may have free air in warm weather, but be protected from the rain and cold. With this management the plants will thrive and increase; and such of them as usually bear flowers, may be expected to produce them in beauty at their seasons.

Most of these aloes are increased by off-sets, taken from the parent plant when they are shifted, and planted in small spots filled with the earth prepared for the old plants; and these suckers should be quite dry when they are planted, otherwise they will rot. After remaining in the shade for a fortnight, the tender kinds should be removed to a very moderate hot-bed, shading the glasses in the day, and giving them much air. Towards the middle of August, the young plants may be hardened by taking off the glasses in good weather, and admitting the air; and they should be removed into the house towards the end of September, and managed like the old plants. The African aloes generally afford plenty of suckers for increase: most of the others may be propagated by taking off some of the under leaves, laying them to dry for ten days or a fortnight, and then planting them in the soil already mentioned, by putting that part of the leaf which adhered to the old plant, about an inch or an inch and a half, into the earth, and settling the earth about them with a little water: the pot should then be plunged into a moderate hot-bed, preserved from the sun, and refreshed with water once a week. The best season for this operation is June. The method of cultivating the aloe in the island of Barbadoes, described in the Medical Journal, (vol. viii. art. 8. p. 422.) is as follows. The stony and shallow soil, which is in the vicinity of the sea, and subject to drought, and in which the sugar canes will not thrive, best suits the aloe plant. When the stones have been picked up, and laid around the field as a fence, or piled in heaps upon the most barren spots; the land is lightly ploughed and cleared from weeds; then lined in rows at the distance of a foot from one another, and the young plants are set like cabbages, about five or six inches apart from each other. By being thus set, they are easily kept free from weeds, which would obstruct the produce. They may be planted even in the driest season; as they need little or no rain; but the usual time is from April to June.

ALOE, *African*. See CRASSULA.

ALOE, *American*. See AGAVE.

ALOE, *Bastard*. See ALETRIS.

ALOE, *Purpurea*. See DRACENA.

ALOE, *Uvaria*. See ALETRIS.

ALOE, *Water*. See STRATIOTES.

ALOE, *Yucca foliis*. See YUCCA.

ALOES, in *Medicine* and *Pharmacy*, the inspissated juice of various species of the ALOE above described. Of this there have been usually reckoned three kinds, *viz.* the *socotorine*, *hepatic*, and *caballine*. 1. *Socotorine aloes*, so called from the island Socotora, from which it was first brought, though it was probably imported from the Cape by the Dutch East India Company, is obtained from a variety of the *A. perfoliata* of Linnæus. This sort is the purest and most transparent: it comes to us wrapt in skins, and is of a bright surface, and in some degree pellucid; in the lump of a yellowish red colour, with a purplish cast; when reduced into powder of a golden colour. It is hard and friable in the Winter, somewhat pliable in the Summer, and softens between the fingers. Its bitter taste is accompanied with an aromatic flavour, but not sufficient to prevent its being disagreeable; the smell is not very unpleasant, and somewhat resembles that of myrrh.

2. *Hepatic, Barbadoes, or common aloes*, is obtained from another variety of the same species, *viz.* *A. vera, vulgaris, foliis spinosis confertis dentatis vaginantibus planis maculatis*, called by Rheed *kadanaku* or *calwala*, and reckoned by La Marek a distinct species, and is usually brought to us from Barbadoes; that of the best sort in large, gourd shells, an inferior kind in pots, and a still worse in casks. It is of a darker colour than the former, and not so clear or bright; generally drier and more compact; of a stronger and more disagreeable smell, and of an intensely bitter taste, with little or nothing of the aromatic flavour of the other. A tract of mountains about 50 miles from the Cape of Good Hope is wholly covered with the aloes plants, which renders it unnecessary to plant them there; but they are now cultivated in Jamaica and Barbadoes, having been first brought to the former of these islands from Bermuda. They require two or three years standing before they yield their juice in perfection: and it is procured, says Dr. Browne, (Jamaic. p. 198.) in the following manner. The labourers go into the field with tubs and knives, and cut off the largest and most succulent leaves close to the stalk: these they put into the tubs in an upright position, that the loose liquor may be drained from the wound. When this is almost wholly discharged, the leaves are taken out singly, and cleared of any juice that may adhere to them; and the liquor is put into shallow flat-bottomed vessels, and dried gradually in the sun, till it acquires a proper consistence. What is obtained in this manner is called *socotorine aloes*, and is the clearest and most transparent, as well as the highest in esteem and value. In the island of Barbadoes, according to the account of Mr. Millington (Med. Journ. vol. viii. p. 422.) after a sufficient quantity is drained from the leaves to make it an object for the boiling-house, and the juice with this view may be preserved for some weeks, without injury, three boilers of iron or copper are placed by one fire, though some have two and others only one; these are filled with juice, and as it is gradually inspissated by a regular fire, it is laded from boiler to boiler, and fresh juice is added to that which is farthest from the fire, till the juice in that which is nearest to the fire, the smallest of the three, and called tatch, becomes of a proper consistence to be shipped or laded out into gourds, or other small vessels, placed for receiving it. The proper time for lading it out of the tatch is when it is arrived at a resin height, as it is termed, or when it cuts freely, or in thin flakes from the edges of a small wooden slice, that is dipped from time to time into the tatch for that purpose. A little lime-water is used by some aloe-boilers during the process, when the ebullition is too great. This author adds, as to the sun-dried

dried aloes, which is most approved for medicinal purposes, very little is made in Barbadoes. The process, however, is very simple, though very tedious. The raw juice is either put into bladders, left quite open at top, and suspended in the sun, or in broad shallow trays of wood, pewter, or tin, exposed also to the sun every dry day, until all the fluid parts are exhales, and a perfect resin formed, which is then packed up for use, or for exportation.

Dr. Wright (Med. Journ. vol. viii. p. 219.) gives the following account, somewhat different from the former, of the method of preparing *hepatic aloes* in Jamaica. The plant is pulled up by the roots, and carefully cleansed from earth or other impurities. It is then sliced and cut in pieces into small hand-baskets or nets. These nets or baskets are put into large iron boilers with water, and boiled for ten minutes, when they are taken out, and fresh parcels supplied till the liquor is strong and black. At this period the liquor is thrown through a strainer into a deep vat, narrow at the bottom, to cool, and to deposit its feculent parts. Next day the clear liquor is drawn off by a cock, and again committed to the large iron vessels. At first it is boiled briskly, but towards the end the evaporation is slow, and requires constant stirring to prevent its burning. When it becomes of the consistence of honey, it is poured into gourds or calabashes for sale. The *focotorine aloes*, he says, may be prepared in the same manner.

3. *Caballine*, or *horse aloes*, obtained, as some say, from the faces of the hepatic aloes, and according to others from a distinct variety of the *aloe perfoliata*, denominated *A. guineensis caballina vulgari similis sed tota maculata*, is easily distinguished from the two former by its strong rank smell. In other respects it agrees pretty much with the hepatic, and is not unfrequently sold for it. Sometimes it is prepared so pure and bright as scarcely to be distinguishable by the eye, even from the focotorine, but its offensive smell soon betrays it; and if even this should be dissipated by art, its wanting the aromatic flavour of the finer aloes will be a sufficient criterion. Some say, that its colour is also much darker, indicating a mixture of fordes and sand, and that it is of course much more compact and heavy. This aloes is not admitted into the *Materia Medica*, and is employed chiefly by Farriers. From the observations of Professor Murray it appears probable, that different species as well as varieties of aloes would furnish the various kinds of this drug, and that Linnæus by referring these sorts to those plants, the recent juice of which seemed to correspond respectively the nearest to them in taste, might easily be misled; for Murray, upon tasting the fresh juice of many different species of aloes, sometimes found it bitter, and at other times totally devoid of bitterness. This author found the bitterest species to be the following, *viz.* 1. *Aloe elongata*, floribus spicatis tubuloso-triquetris subingentibus oblique dependentibus, foliis aggregatis dentato-spinosis; and he queries whether this is not the variety π of the *A. perfoliata* of Linn. Spec. p. 458, and the aloes mentioned by Hughes and Browne. 2. *A. Spicata*, which is said to afford the best hepatic aloes. 3. *A. linguaformis*, which in the interior parts of the Cape is selected by some as producing the best and purest aloes. M. Jussieu, who saw the three varieties of aloes prepared at Morviedro, in Spain, assures us (says Chaptal, Elem. Chern. vol. iii. p. 86), that they are all obtained from the aloes vulgaris. The first variety, or focotorine aloes, is obtained by making incisions in the leaves. Time is allowed for its impurities to subside perfectly. The fluid is then decanted from the dregs, and left to become thick; after which it is put into leathern sacks for sale, under the name of focotorine

aloes. A juice of the same nature is obtained by expression from the same leaves, which, when clarified in the same manner, forms the hepatic aloes; and the caballine aloes is obtained by a stronger pressure.

Aloes is mentioned neither by Hippocrates nor Theophrastus; Dioscorides mentions two kinds, and Avicenna tells us, that of the different kinds, without naming them, the focotorine is the best. Celsus, who frequently mentions aloes, and recommends it to be mixed with all cathartics, does not distinguish it by any epithets. If, indeed, the account of J. Bauhin (Hist. Plants, tom. iii. p. 697.) be true, that the juice of the leaves forms itself spontaneously into three strata, the upper being the focotorine, the middle the hepatic, and the lowest or faces the caballine; there may be some reason for the distinction of the three names, that have been uniformly appropriated to them.

All the kinds of aloes agree in this, that they consist of a resinous matter, and a large proportion of a substance called gum; and that they dissolve in pure spirit, proof spirit, and proof spirit diluted with half its weight of water, the impurities only being left; and in boiling water they also dissolve, but when the liquor becomes cold, the resinous parts subside. The quantity of resin in hepatic aloes appeared in experiments of Dr. Lewis to be $\frac{1}{3}$ d, in focotorine aloes $\frac{1}{4}$ th, and in the caballine $\frac{1}{6}$ th. According to Boulduc, the focotorine aloes contains no more than $\frac{1}{4}$ th of resin, and the hepatic aloes contains half its weight; and therefore the hepatic aloes contains more resin and less gum than the focotorine, and this than the caballine. The resins of all the sorts, purified by solution in spirit of wine, have little smell; that of the focotorine has scarcely any perceptible taste; that of the hepatic a slight bitterish relish; and that of the caballine a little more of the aloetic flavour. The gummy extracts are less disagreeable than the crude aloes; that of the focotorine aloes has very little smell, and its taste is scarcely unpleasant; the smell of the extract of the hepatic is somewhat stronger, but its taste more agreeable than that of the focotorine; the gum of the caballine retains a considerable share of the rank smell of this sort of aloes, but its taste is not more unpleasant than that of the extracts of the other kinds.

Aloes is a well known purgative; and it acts not only when taken internally, but when externally applied; and its cathartic quality resides chiefly in the gummy part, for the pure resin has little or no purgative virtue. Boerhaave declares it to be an effectual and safe cathartic; nevertheless in large doses it produces much heat and irritation, particularly about the rectum, from which it sometimes occasions a bloody discharge. To those, therefore, who are subject to piles, or of an hæmorrhagic diathesis, the plethoric and bilious, or even in a state of pregnancy, the exhibition of it has done much harm; but it is particularly adapted, by its stimulating quality, to persons of a phlegmatic temperament and sedentary life, to cachectic indisposition, and oppressions of the stomach by viscid crudities contracted from irregularity. Although in purging doses, of half a dram or two scruples, it produces irritation about the anus and sometimes a discharge of blood, yet in smaller doses of 10 or 12 grains, repeated once or twice a day, it not only unloads the first passages, but attenuates and dissolves viscid humours in the remoter parts, warms the habit, quickens the circulation, and promotes the menstrual and hæmorrhoidal fluxes; and its continued use renders the blood sensibly more fluid. This, says Dr. Cullen, (*ubi infra*), appears to me improbable. We have frequently seen the blood drawn from persons using a good deal of aloes, and never could discover any change of its

its consistence; and if the experiments of Schwenke may be trusted, aloes added to the blood drawn out of the veins seems to coagulate rather than to dissolve it: besides the quantity of aloes taken in can hardly have any sensible effect upon the whole mass of blood. It has been urged, however, that by its dissolving power it proves an emmenagogue, and is hurtful in all morbid hæmorrhages. Dr. Cullen observes, that he has seldom found the emmenagogue powers of this substance. If ever there be any appearance of such a power, it is probably to be ascribed, in his opinion, rather to its operation on the rectum, communicating a stimulus to the vessels of the uterus, than to its action on the mass of blood. When aloes is not designed to act as a purgative, it has an action upon the stomach; and it has frequently been found an antispasmodic, in relieving pains of this organ. It is also useful in habitual costiveness, when taken in small doses. With respect to its ordinary operation, Dr. Lewis alleges, that its effects are more permanent than those of any other purgative; this Dr. Cullen (*Mat. Med.* vol. ii. p. 525.) does not admit; for we commonly find, he says, that notwithstanding the use of aloes, the state of costiveness will return at its usual period, and that it is often necessary to anticipate this by the use of the aloetic. This bitter juice has been accounted destructive to worms, or to the matter which favours their production, either taken internally or applied in plasters to the umbilical region; and from its imagined efficacy in this respect, it has been used to preserve ships against the attacks of worms. But its anthelmintic virtue has been disputed by Murray, who says that worms have lived for 20 hours in the bitterest solution of fœcotorine aloes, and for many days afterwards in earth mixed with powder of aloes. In another experiment four worms were not destroyed on the fourth day. It is powerfully antiseptic; and commonly makes an ingredient in tinctures and balsams for cleaning and healing wounds or putrid sores. As to the choice of the different kinds of aloes, it may be observed, that the fœcotorine, which contains more gummy matter than the hepatic, purges with more certainty and greater irritation, and is therefore most proper where a stimulus is required, or for promoting the uterine discharge; but the hepatic is better calculated for the purpose of a common purgative; and as it contains more resin, answers better as a vulnerary, for external application. Aloes is seldom given alone. Aloes, says Dr. Cullen, acts as readily in substance as in any solution; and therefore this is never to be practised but for the sake of more convenient exhibition; and it has been found to operate in substance in a smaller dose than in the vinum aloeticum. Aloes hardly receives improvement by any addition; and the vulgar find as much effect from the aloes alone as from the pilulæ aloeticæ. Some benefit, however, is obtained by some division of the aloes before it is taken into the body, and the extract of gentian is properly enough employed; but Dr. Cullen is persuaded, that the Edinburgh college have not done right in withdrawing the whole of the sal polychrestum from the aloetic pill. In the pilulæ rufi the myrrh may be useful in dividing the aloes; but the addition of the saffron is insignificant. Rhubarb added to aloes can answer no good purpose. In the pilulæ stomachicæ Ph. Ed. and in the elixir sacrum, the rhubarb, says Dr. Cullen, is an useless addition. The aloes, continues this author, is never properly joined with the drastic purgatives, as in the pilulæ colocynthidis cum aloes, and in the extractum colocynthidis compositum; for if such a medicine is intended to produce a liquid evacuation the aloes is superfluous; and if it is intended only to open the belly, the drastics are unnecessary. In the elixir

proprietatis, the saffron is an insignificant ingredient: and on account of the menstruum employed by the Edinburgh college, Dr. Cullen says, he has never employed it as an evacuant, but he often used it with success in curing spasmodic pains of the stomach; and for suiting it better to this purpose, the Edinburgh college have improved it much, by the menstruum they have employed in their elixir aloes vitriolicum. Several preparations of it are directed in the pharmacopœias, for which see ELIXIR, EXTRACT, HIFRAPICRA, PILLS, POWDER, TINCTURE, and WINE. Lewis. Murray. Woodville.

ALOE rosata, is a preparation of the fœcotorine aloes, made by dissolving it in juice of damask roses, and evaporating it to the consistence of a paste. Then more juice is added, and the evaporation repeated, again and again.—This has been held a gentler and safer cathartic than the aloes alone. If this be dissolved in a good quantity of the fresh juices of roses, violets, borage, and bugloss, mixed in equal proportions, and afterwards reduced by evaporation to its former consistence, the extract, thus prepared, is called *aloe infuccata*, and with the addition of one third its weight of cream of tartar, *aloe infuccata tartarizata*.

ALOE violata, is prepared by means of the expressed juice of violet flowers; and mixed with half its weight of cream of tartar, it is called *aloe violata tartarea*. But preparations of this kind are obsolete.

ALOE is applied by some writers, to a kind of mineral juice produced in Judea.

This is called fossil, mineral, or metalline aloes.—Some dispute the existence of any such aloes. Others suppose it to be no other than the ASPHALTUS.

ALOES, lignum. This wood, by the Indians and Portuguese, is called *calamba*, or *calambar*, being the same with what is otherwise called by medical writers *xyloaloes*, and *agallochum*.

This wood is referred by Loureiro, as we have observed under the article AGALLOCHUM to a distinct genus called *aloesylum*, belonging to the order of decandria; but it approaches so nearly to that of the EXCOECARIA *agalloba* of Linnæus, that the latter has been sold for it. The tree grows in Cochinchina, the Molucca islands, and several other parts of the East Indies; and was formerly held in very high estimation, on account of its fragrant odour, as a perfume, for which purpose it was applied to cloaths and apartments, and as a cordial medicine in fainting fits, and in cases of paralytic affection. It is said also to be effectual in destroying the tinea and ascarides in children. By the Chinese and Heathen Moors it was used as incense in their sacrifices; and employed for setting the most precious jewels that are wrought in the East Indies. It was formerly deemed in that part of the world of greater value than gold itself; and various fables have been invented as to the origin of the tree that yields it. Some have feigned, that it grew in Paradise, and that it was conveyed from thence by the rivers, which overflowed their banks and swept off the trees in their way. Others pretend, that it grows on inaccessible mountains, where it is guarded by wild beasts, &c. The Siamese ambassadors brought a present of this wood from their emperor to the court of France in 1686; and thus it became known. Bauhin and many others reckon three sorts of it; viz. two kinds of CALAMBAC and the aloes-wood, the agallochum of the shops, the tehnhiang of the Chinese, thimbio of Camelli, pao de aguila of the Portuguese, and frequently called eagle-wood. This is oily, resinous, compact, heavy, of a brown reddish colour, marked with grey veins, and often pierced with small holes, as if it were worm eaten.

eaten. This wood is not so dear as the *calambac*, and is more commonly found in the shops. It is brought from Cochinchina, and appears to be the production of the same tree. This tree bears a great resemblance to the *agallochum secundarium* of Rumphius, the *funkoo* of Kämpfer, and the eagle-wood of Sonnerat; and is denominated *aquilaria malaccensis* and *guro* of Malaca. The wood of the branches of this tree is white, inclining to yellow; and the bark is of a grey-reddish colour, and its surface is roughish and hairy. The leaves are alternate, ovate-lanceolated, entire, much acuminate, about $3\frac{1}{2}$ inches long and two wide, with a smooth and green surface, and appearing like satin; each of them is supported by a petiole about two French lines long, and have their borders garnished by short hair; the young leaves are hairy and almost white before they are unfolded. The flowers, according to Sonnerat, are small and have no calyx; the corolla consists of one piece, and half-divided into five oval parts, pointed and star-like; and at the interior base of each division of the corolla are two small scales, which are there inserted, and form at the commencement of the flower a crown, composed of 10 nectaria, as Sonnerat describes them. The stamina are 10, short and attached to the corolla between the sections of the nectaria. The pistil is formed by a superior ovary, which is oval, without a style, and crowned by a simple, very small stigma. This ovary changes into a pyriform capsule, about an inch long, and opening naturally into two partitions, and within it has two cells, each containing a black, oval, pointed, small seed, one of which is almost always abortive. At the bottom of each seed is found a spongy substance, which seems to occupy the place of another abortive seed. Whether this tree be of the same genus with the *calambac* or *agallochum* of the ancients, it is not easy positively to ascertain; but it agrees with the description given of it by Kämpfer and by Cunningham, in Geoffroy's *Materia Medica*. If this be the case, it must be of a different genus and family from the *agallochum* of Amboina, which belongs to the *euphorbia*. *Encycl. Method. tom. i. p. 49.* See *AGALLOCHUM*, *CALAMBAC*, and *EXCORCARIA*.

Grew describes a piece of *lignum aloes*, with its own gum growing on it in the repository of the Royal Society. See Grew, *Mus. Reg. Soc. p. ii. c. i. p. 179.*

ALOEDARY, *alcedarium*, *αλοειδαριου*, denotes a purging medicine, wherein *aloes* is an ingredient.

This amounts to the same with what we otherwise call an *ALOETIC*.

ALOEDARY is also used for a history of the class of plants, under the denomination of *ALOES*.

ALOEPHANGINA, in the *Materia Medica*, denote medicines formed by a combination of *aloes* and aromatics.

ALOETICS, medicines wherein *aloes* is the chief, or fundamental ingredient.

Aloetics open the orifices of the vessels, and are on this account found hurtful in cases of hæmorrhages, particularly at the nose; also in the *tensinus*, *hemicanthum*, &c. The immoderate use of *aloe* tends to produce hæmorrhoids, hypochondriac pains, and inflations.

ALOEUUS, in *Entomology*, a species of scarabæus, or beetle, with a three-horned thorax, the intermediate longer and simple, the head submuticous, and the elytræ uniltriated; found in America.

ALOFT, a sea-term, synonymous with up in the tops, at the mast-heads, or any where about the higher rigging.

ALOGIANS, *ALOGI*, or *ALOGIANI*, compounded of the privative *α*, and *λογος*, *q. d.* without *Logos*, or *Word*, in

Ecclésiastical History, a sect who denied that Jesus Christ was the *Logos*, or eternal Word; and on this ground also rejected the Gospel of St. John as spurious, and also the Revelation.

Some ascribe the origin of the name, as well as of the sect of *Alogians*, to Theodore of Byzantium, by trade a currier; who, having apostatized under the persecution of the emperor Severus, to defend himself against those who reproached him therewith, said, that it was not God he denied, but only man. Whence his followers were called in Greek *αλογοι*, because they rejected the Word. But others, with more probability, suppose the name to have been first given them by Epiphanius in the way of reproach. They made their appearance towards the close of the second century.

Philaster has also mentioned a heresy that rejected John's gospel and revelation, and ascribed both to Cerinthus. Dr. Lardner is of opinion that this is a fictitious heresy; and that there never were any Christians who rejected John's gospel and first epistle, and yet received the other gospels, and the other books of the New Testament. No notice is taken of such by Irenæus, Eusebius, or any other ancient writer, before Philaster and Epiphanius; nor has Theodoret given any account of this heresy. This heresy, says this indefatigable inquirer and impartial reporter, was, as he conceives, invented upon the occasion of the controversy of Caius and Dionysius, and others, with the Millenarians in the third century; some of whom disputed or denied the genuineness of the book of Revelation, and ascribed it to Cerinthus. Hence some said that those enemies of the Millennium might as well reject also St. John's Gospel, and others said, that they actually did so, though they did not. In Philaster's catalogue this heresy follows next after the Millenarians, or Chilonetites, as he calls them, and the order in Epiphanius leads us to the same time. Lardner's Works, vol. ix. p. 515.

ALOGONIA, in *Ancient Geography*, a town of Messenia, south-east of Gerenia: north-east of which were a temple of Bacchus and another of Minerva.

ALOGOTROPHIA, among *Physicians*, an irregular nutrition of some part, attended with a vicious figure or conformation thereof, as in the rickets.

If the bones of the vertebræ of the back receive too much nutriment on one side, as sometimes happens in children, an incurvation necessarily ensues, which, as Charleton expresses it, is produced by an *alogotrophia*.

ALOIDES, in *Botany*, a name used by some for the *aloe palustris*, or fresh water *ALOE*, called in some parts of England, *water-soldier*; and by Linnæus, *stratiotes*.

ALOIUM, in *Ancient Geography*, a town of Thessaly, near the valley of Tempè, and founded, says Steph. Byz. by the *Aloades*.

ALOMAYO, in *Geography*, a town of South America, in the country of Peru, and jurisdiction of Guamalies.

ALON, in *Biography*, a celebrated personage whose memory is preserved in the Triads of the Welsh Bards; and who flourished among the first colonies of this island, if not among the Cymry before their arrival here. This Alon, with Pleunydz and Goron, are recorded as the three who combined the institutes and privileges of the bards, druids, and ovates, into a regular system, under the sanction of a national law. This event is said to have taken place in the time of Prydain, who is mentioned in the same Triads, as the first who digested a national constitution for the Cymry or Britons. Be this as it may, there is great reason to conclude,

clude, that Alon is the same person who is called Olen, Olenus, Ailinus, or Linus, among the different people of Greece and the adjoining countries, and even in Egypt; for it is remarkable that similar attributes are ascribed to him by those ancient nations, as in our Triads: according to Pausanias, Olen the hyperborean is said to have been the first prophet of Delphi: Bero the female microphant is made to sing of Olen, as the inventor of verse, and the most ancient priest of Phœbus; and, indeed, all Greece chaunted the song of Olen; and this more particularly occurred in celebrating the completion of the vintage; for thus it is said by Homer, (Il. lib. xviii. v. 570, &c.) in the description of the shield of Achilles:—

“In the procession of the vintagers were groupes of young damsels and youths, carrying baskets curiously entwined, filled with presents of the most delicious fruits. In the midst of these was seen a young man striking from his lyre harmonious sounds; he sang the song of Linus, with a voice most sweet; and the company joined with chaunts and shouts of joy, beating the earth in cadence with lively steps.”

ALON, in *Ancient Geography*, a river of Cilicia, near Sebaste or Eleusa, a small island.

ALONA, or ALONE, a town on the eastern side of Spain, south of the mouth of the Tuder.

ALONE, or HALONE, one of the Æolian islands.

ALONE, or HALONE, a small island of the Propontis, south of the island of Proconessus, and north-west of Cyzicum. The name was given to it, says Steph. Byz. because its inhabitants had found out the art of making salt. This author says, that it was also called Neuris and Procona; but Pliny distinguishes the last of these two islands.

ALONE, a town placed by some writers in Paphlagonia.

ALONG-SIDE, in *Sea-language*, expresses side-by-side, or joined to a ship, wharf, &c.

ALONG-SHORE, a nautical phrase expressing along the coast, or a course which is in sight of the shore, and nearly parallel to it.

ALONG, *Lying*, denotes the state of a ship that is pressed down sideways by the weight of sail.

ALONI, in *Ancient Geography*, a town of Assyria, situate on the eastern banks of the river Zabus, near its entrance into the Tigris.

ALONI, a people joined by Pliny to the Gordians, and placed near the Tigris.

ALONIS, a town and island of Gaul, which Martin imagines to have been the town and island of Magdelona, formed by the retrenchment of the first Celtic syllable *Mag*.

ALONIUM, a place of the island Crete, in the territory of Gortyna.

ALONSO, in *Biography and History*. See ALPHONSO.

ALONTA, a river placed by Ptolemy in Asiatic Sarmatia.

ALONTIGICELLI, a people of Bœtica, near the river Menabas.

ALONTIUM, ALUNTIVM, or HALUNTIVM, a town of Sicily.

ALÖÖF, in *Sea-Language*, denotes at a distance. See LUFF.

ALOPE, in *Entomology*, a species of the SPHINX, with dentated brown wings, the posterior being yellow and black at the apex, black abdomen, and interrupted pale-coloured bands, found in India.

ALOPE, or ALOPA, in *Ancient Geography*, a name given to several towns. *Alope* was a town of Thessaly. Homer mentions a town of this name, supposed to be the same place, as he names it after *Alos*, a town of Phthiotis: it is supposed to have been so called after *Alopa*, the daughter

of Cercyon, or of Ætor. *Alope* was also a town of Attica, and also of Pontus, between Mysia, Caria, and Lyeia; another in Phœcis, and another among the Loerians.

ALOPECE, an island near the coast of Asia Minor, not far from Smyrna.

ALOPECE, or ALOPECÆ, was also a district of Attica, near Cynosarges, and distant about 11 or 12 stadia from Athens. The Lacedæmonian general Anchimolius, who, by the suggestion of the oracle of Delphos, had been sent to drive the Pisistratides from Athens, died and was buried in this place; and Herodotus (lib. v. § 3.) says, that his tomb was near the temple of Hercules. This was also the birth-place of Aristides and of Socrates. *Alopecia* was also an island placed by Strabo in the Palus-Mæotis, and by M. d'Anville, near the mouth of the Tanais.

ALOPECIA, in *Surgery*, baldness in any part of the body, arising from disease, or from a natural defect of growth in the hair. This deficiency is sometimes produced by excessive venery, and has been known to be remedied by a person becoming chaste in his habits; but more frequently it is not connected with any evident external cause, and only indicates a faulty state of the fluids at the roots of the hair, or a want of due nourishment and moisture. *Alopecia* was formerly a common symptom of the *lues venerea*, but is now very rarely observed to occur in such cases.

Oily and gently stimulating applications to the head, with repeated shaving, are proper against the defect in question.

ALOPECIA is also used by Galen for the change of the hair to another colour.

ALOPECIAS, in *Ichthyology*, a name of the *vulpes marina*, or sea-fox.

ALOPECONESUS, in *Ancient Geography*, a town of the Thracian Chersonesus, north of and near the gulf of Melanos. It was peopled by the Æolians, and taken by Philip, king of Macedon.

ALOPECOPITHECOS, in *Zoology*, a name derived from the Greek, and given by Aldrovand and others to the OPOSSUM.

ALOPECOS, in *Ancient Geography*, a hill of Bœotia, in Greece, called also Orchalis.

ALOPECURO-VERONICA, in *Botany*. See MENTHA.

ALOPECUROS. See BETONICA.

ALOPECURUS, *ἄλωπεκος ουρα*, *fox-tail*, a genus of the *triandria digynia* class and order, and of the natural order of *gramina*, or grasses: its characters are, that the *calyx* is a glume one-flowered, two valved; the valves ovate-lanceolate, concave, compressed, equal, connate at the base; the *corolla* one-valved, valve ovate, lanceolate, concave, with the edges united at the base, a little shorter than the calyx, awn twice as long, with a bent joint, inserted into the back of the valve near the base, no nectary; the *stamina* have three filaments, capillary, flattish at the base, longer than the calyx, anthers forked at each end; the *pyssillum* is a roundish germ, the styles are two, capillary, united at the base, longer than the calyx, and stigmatic villous; no *pericarpium*, the corolla invelling the seed; the *seed* ovate and covered. Martyn and Willdenow enumerate eight, and Gmelin 12 species. 1. *A. indicus*, panicum indicum of Miller, panicum alopecuroideum of Linnæus, Spec. pl. 82. Indian fox-tail grass, with cylindrical spikes, involucre setaceous, fasciculate, two-flowered, and villous peduncles, a native of the East Indies. 2. *A. bulbosus*, *A. geniculatus* β. Hudson, gramin-myosuroides nodosum of Dillenius, bulbous fox-tail g. with culm erect, spike cylindrical, (very simple, attenuated, imbric, glumes of the calyx distinct and villous, Smith) and root bulbous. The bulbous esopitose root emits fibres from its lower part, and has a brown, striated, tunicated membrane. The culm is foliary,

litary, scarcely a foot long, very simple, erect, a little decumbent at the base, foliose, binodial, striated, and smooth; the leaves smooth; the radical few and short; the cauline almost linear, patent, and of the length of the sheaths; the stipula short and striated; the spike sesquiuncial, somewhat erect, very simple, slender, acute, and many-flowered; the glumes of the calyx a little unequal, acute, awnless, altogether separate at the base, villous in the nerves, and undilated carina; the glume of the corolla emarginated and awned at the base. This species is very different from the *A. geniculatus*, and has florets, says Dr. Stokes, longer, narrower, and much less hairy; and Dr. Smith observes, that in its spike, and the structure of the flowers, it is more nearly allied to the *A. agrestis*. It is found rarely in salt marshes; in those near Yarmouth, in the marshes of Cardiff in Glamorganshire, and near the Ault passage, and in the vicinity of Northfleet, in Kent. It is perennial, and flowers in July. 3. *A. pratensis*, meadow fox-tail g. with the culm erect and smooth, spike sublobated, and the glumes of the calyx villous and connate at the base. The root is fibrous; the culm two feet high, erect, foliose, smooth; the leaves somewhat smooth and glaucous, with a short, subpubescent stipula; the spike somewhat simple, scarcely paniculated, dense, erect, about two inches long, soft, and many-flowered; all the glumes are equal, lanceolate, compressed, white, marked on both sides with two green longitudinal lines; those of the calyx, especially near the keel, silky-villous and awnless; the glume of the corolla smooth, except toward the apex of the keel, awned at the base, the awn geniculated, twice longer than the flower, and naked. This is a native of most parts of Europe, from Italy through France, Germany, Holland, Great Britain, to Denmark, Norway, Sweden, and Russia; and also in Siberia. It is found with us very common in pastures and meadows. It is perennial, and flowers in May. This is the best grass to be sown in low meadow grounds, or in boggy places which have been drained. Sheep, horses, and goats eat it. Cows and swine are not fond of it; but Dr. Pulteney says, this is the most grateful of all the grasses to cattle. It possesses, says Professor Martyn, the three great requisites of quantity, quality, and earliness, in a degree superior to any other, and is therefore highly deserving of cultivation in lands that are proper for it. The seed may be easily collected, as it does not quit the chaff, and the spikes are very prolific. But the larvæ of a species of muscæ, which are themselves the prey of the cimex campestris, devour the seed so much, that in many spikes you will scarcely find one perfect. Lewis Majendie, Esq. at Hedingham, has cultivated it on a considerable scale, and found it to be an excellent grass. 4. *A. Agrestis*, field or slender fox-tail g. with culm erect, roughish, spike very simple and attenuated, glumes naked, connate at the base, and dilated at the keel. The root is fibrous and small; the culm half a foot long, erect, foliose, naked at the apex, and roughish; the leaves rough above, the stipula lanceolate and pubescent; the spike almost three inches long, erect, slender, acute, many-flowered, and of a purplish colour; the glumes subequal, larger than the preceding, and less pubescent, varied with white and green, and nerves prominent; those of the calyx villous at the base, connate, with a dilated subpubescent keel, and awnless, the glume of the corolla smooth, awned at the base; the awn geniculated, twice longer than the flower, rough and recurved in drying. This grass is a troublesome weed in cultivated ground; and among wheat it is execrated by the farmers, under the name of *black bent*; it is also common by way-sides as well as in corn-fields, and in pastures in the Isle of Wight. It has acquired the name of mouse-tail grass in English, and *Myosuroides* in Latin, from the great length and slenderness of the

spike, which resembles the tail of a mouse. It is annual, flowers in July, continues flowering till Autumn, and comes into bloom very soon after being sown. There is a variety, with a shorter spike, and recurved awns. It is small and brown, on account of its barren and sunny situation. 5. *A. geniculatus*, gramin fluviatile spicatum of Gerard, g. aquaticum spicatum of Parkinson, and g. alopec. flav. genicul. procumbens of Morison, floating fox-tail g. with culm ascending and geniculated or knee-jointed, spike sublobate and cylindrical, and glumes blunted and hairy. The root consists of very long and simple fibres; the culms natant, very long, geniculated, radiating in the inferior geniculi, assurgent in the apex, foliose, ramous, and smooth, the leaves smoothish, the stipula whitish and very slender, the spike cylindrical, short, somewhat obtuse, divisible in lobes, many-flowered, purplish, and in the variety β whitish; the glumes twice less than the preceding, subequal, and very obtuse, those of the calyx longer, hairy; those of the corolla crenated, smooth, awned toward the base, the awn geniculated, and of various length; the root in dry places is bulbous, with a culm somewhat erect; and this variety Hudson has confounded with the *A. bulbosus*. Dr. Smith mentions two varieties, viz. β . g. fluviatile album of Dillenius, and γ . with a bulbous root of Hudson and Withering. This species is easily known in its common state, by pools and in wet meadows, by the frequent joints of the culm or stem changing their direction, and appearing broken. It often puts out roots under water from the joints, and thus spreads itself; the leaves floating on the surface. From the deep colour of the spikes, it is called in some places *black-grass*. It sometimes occurs in dry pastures, and then, according to Mr. Curtis, grows more upright; the spike is much more slender, and the base of the stalk swells out into a kind of bulb. It is perennial, and flowers in July. Cattle eat it, but it is not esteemed a profitable grass. The variety γ is found in walls and a dry sterile soil. Dr. Withering mentions four varieties; one of which, with awns, very fine and soft, not longer than the calyx, fruit little, stalks branched, a fibrous root, and found in a marshy place near the Stews, in Edgborough park, he suspects to be a distinct species. 6. *A. Hordeiformis*, barley-like fox-tail g. with simple raceme, and flowers intrenched with awns. This is an Indian grass, and resembles hordeum murinum, or barley-grass. 7. *A. Mouspelienfis*, *A. Aristatus* of Hudson, &c. phleum crinatum of Schreber, bearded fox-tail g. with panicle subspiked, rugged calyces, and awned corollas. This resembles *A. panicus*, but is three times as large; the calyx has a tubercle at the bottom; the corolla, which has two valves, is shorter than the awn, the culm and leaves are stiff, the glumes rough, but smooth at the edge, both valves are awned, and the awns of the corolla are much shorter than those of the calyx. It grows wild in marshes and wet pastures, at Purfleet in Essex, and at Drayton, about two miles from Portsmouth, is annual, and flowers in June and July. See AGROSTIS. 8. *A. panicus*, hairy fox-tail g. with panicle subspiked, villous glumes, and awned corollas, very much resembles the last species, but the whole plant is soft, and only five or six inches high; the glumes downy, woolly at the edges; the awns of the corolla shorter than those of the calyx; the corolla has two valves, as short again as the calyx, hollow and smooth; the outer three times as broad as the other, roundish-ovate, blunt, with four teeth, with awn longer than the valve issuing from below the point; inner valve ovate-lanceolate, pointed, with two teeth; the calyx ending at the base in a hard tubercle. This species grows on dry soils, is annual, and flowers in July. See AGROSTIS.

Gmelin refers to this genus the following species, besides those above enumerated, viz. *A. ciliatus*, with a culm spiked

spiked and erect, and ciliated glumes. *A. carolinianus*, with radiating culm, subsplined panicle, smooth glumes, and awned corolla. *A. typhoides*, with simple raceme, and awnless flosculi. *A. caudatus*, with spiked caudated panicle, and flosculi intrinched with awns. *A. Ovatus*, with panicle ovated, contracted, resembling a spike, and exterior petal awned before the apex. Willdenow, besides the *A. indicus*, *A. bulbosus*, *A. pratensis*, *A. agrestis*, and *A. geniculatus*, describes the following species, viz. *A. capensis*, with cylindrical spike, and smooth awnless glumes, a native of the Cape of Good Hope. *A. antarcticus*, with erect culm, ovated spike, hairy glumes and awned corolla, the awns being longer than the calyx; brought from the Straits of Magellan. *A. echinatus*, with spiked, ovated panicle, punctated, ciliated glumes, and geniculated culm, a native of the Cape of Good Hope. For the propagation and culture of this genus, see GRASS. Martyn's Miller, Gmelin's Linnæus, Withering, Arrang. vol. ii. p. 419. Smith's Flor. Brit. vol. i. 72. Willdenow's Linn. tom. i. p. 356.

ALOPES, in *Ancient Geography*, one of the ancient names of Ephesus.

ALOPEX, in *Entomology*, a species of the *SCARABÆUS Melolontha*, with yellow hair, the clypeus reflex and emarginated, and the elytræ smooth and black; found at the Cape of Good Hope.

ALOPEX, in *Zoology*, a species of the *CANIS*, with a tail strait and black at the tip. This is less than the common fox, and has a thicker and duskier fur, though it is sometimes brighter and redder than that of the fox. A Pennsylvanian brant-fox, described by Mr. Pennant, was scarcely half the size of the common fox; with the nose black and sharper, the space round the eyes ferruginous, the forehead and upper parts of the body black, mixed with red, ash-colour, and black, and by the predominance of the ash-colour, appearing hoary, the belly yellowish, the tail black above, red beneath, and on the sides ash-coloured. The British variety of the fox with a black tip on the tail, says Mr. Pennant, is unknown in America; and therefore his brant-fox must be either a variety of the other, or a distinct species. This species is found in Europe, Asia, and America. The *alopex europæus*, or coal-fox, the charbonnier of Buffon, is reckoned another variety. It inhabits Burgundy, is of a silver-grey colour, and the tail tipped with white like the common fox; but from the remarkable blackness of its feet and legs, seeming to have been produced by charcoal-dust, it is called charbonnier, or coal-fox.

ALOR, in *Ancient Geography*, a river of Macedonia.

ALORITÆ, a people of Macedonia.

ALORUS, a town of Macedonia, north-west of the Thermaic gulf, placed by Ptolemy in Pæonia, and by M. d'Anville in Pieria.

ALOS, or **ALUS**, a town of the Phthiotis in Thessaly, east of the Pelasgic gulf, at the foot of Mount Othrys, upon the little river Amphryssus. It was built by Athamas, and so called in honour of one of his female domestics.

ALOS was also a town of Peloponnesus, in the Argolid.

ALOSA, in *Ichthyology*, a species of the *CLUPEA*, having the sides spotted with black, and the upper jaw bifid. It is the thrissa of Aristotle, Rondeletius, and Aldrovand, the alaupa of Gesner, the clupea of Willughby and Ray, and our SHAD.

ALOSANGA, in *Ancient Geography*, a town of India, beyond the Ganges, according to Ptolemy.

ALOST, in *Geography*, a town of Flanders, situate on the river Dender, ten leagues south of Antwerp. This town contains a collegiate church, and several convents, in one of which, viz. that of Guillemins, is the tomb of Theodore

Martin, who brought the art of printing out of Germany into the Low Countries. He was a friend of Erasmus, who wrote his epitaph.

This town, which is the capital of a county, was taken and disinanted by M. Turenne, in 1667; and abandoned to the allies in 1706, after the battle of Ramillies. N. lat. 49° 55'. E. long. 3° 56'.

ALOUATE, in *Zoology*, a name given by Buffon to the *SIMIA Seniculus*, or long-tailed, bearded, red monkey, with prehensile tail, of the Linnæan System; the *arabata* of Gummilla, Oronoko, tom. ii. p. 8. and the royal monkey of Pennant. Some have considered this as a variety of the *SIMIA Beelzebul*, from which it differs by its very bright bay colour; but Dr. Shaw (*Zool.* vol. i. p. 71.) is of opinion, that it is a distinct species. From young animals in the Leverian Museum, he describes it as being about the size of a squirrel, and entirely of a very bright, ferruginous, or reddish chestnut colour, with the face naked and black, surrounded on the lower parts by a straggling beard of black hairs, and the tail strongly prehensile. This species is said to be rare in Brasil, but very common in Cayenne. Its voice and manners are the same with those of the *Simia Beelzebul*, which is common in Brasil, but not found in Guiana. By an account of a person who kept these animals at Cayenne, it appears that the alouates, or howlers, as they are called, inhabit the moist forests in the neighbourhood of waters or marshes. They are commonly found in the woody islets of large flooded savannahs, and never on the mountains of the interior of Guiana. They go in small numbers, often in pairs, and sometimes singly. Their cry or horrible scream may well inspire terror, for it seems as if the forests contained the united howlings of all its savage inhabitants together. This clamour is usually made in the morning and evening; but it is repeated in the course of the day, and sometimes in the night. The sound is so strong and varied, that one would imagine it to be produced by several animals at once, though it is emitted by only two or three, and sometimes one. In a state of captivity the animal loses its voice, or does not exert it in the same manner as he does when wild, and in this state he seldom lives long. The male is larger than the female, and the latter always carries her young on her back. In order to kill these animals it is necessary to fire several times; while any life remains, and after they are dead, they will remain clinging to the branches by the hands and tail. Their flesh, after all the trouble of possessing them, is not good; it is always tough, and never admitted to any tables but to those of indigent inhabitants and travellers, to supply the want of other food. This animal is said to be as large as a calf, and to live on the fruit of the banana-tree.

ALOUCHI, a kind of sweet-scented gum which runs from the tree that produces white cinnamon.

ALOUETTE de Mer, in *Ornithology*, a name given by Buffon to the *TRINGA Hypoleucos*, or common SANDPIPER.

ALOUETTE, is also the name of the *ALAUDA Arvensis*.

ALOUS, in *Ancient Geography*, a town mentioned by Steph. Byz. and which belonged to Illyria.

ALP, in *Ornithology*, an English name used by some for the BULL-FINCH.

ALPAGE, *alpagium*, in *Ancient Writers*, denotes the privilege of feeding cattle on the ALPS or high mountains, or a sum paid for the purchase of such a right.

This is otherwise called *Alpaticum*.

ALPAGNA, in *Zoology*, the *CAMELUS Paco* of the Linnæan System, and the PACOS of Pennant.

ALPAM, in *Botany*. See APAMA.

ALP ARSLAN, in *Biography and History*, second

sultan of the dynasty of Seljuks, in Iran or Persia, the son of David or Jassâr Beg, and great grandson of Seljuk, who founded this dynasty, was born in the year of the Hegira 421, A. D. 1030. He succeeded his uncle Togrul Beg, A. D. 1063, and united in his person the two kingdoms of Khorasan and Irak, with their dependencies; so that, at the commencement of his reign, he was sole monarch of all the countries lying between the rivers Jihun, or Amu, and the Djilat or Tigris; that is, of all Iran, or Persia, in the conquest of which he bore a considerable share. Before he embraced Mahometanism he was called Hrael, and afterwards he assumed the name of Mohammed, or Abu Shejah Mohammed; and his surname was Alp Arslan, which signifies in Turkish, "the valiant lion." He was also distinguished, on account of his power and merit, by the appellation of Azzaddin, or Adhadoddin, denoting, "the protector of the religion." He began his reign by subduing several rebellions among his subjects; and he derived great assistance from his vizir Naham al Molk, or Nezam el Mule, who was reputed to be the greatest man of his time, and who administered the affairs of the kingdom, in the reign of this prince and his successor, with the greatest integrity. Having succeeded in his enterprises for the security of his own dominions, and in an assembly of the states declared his son Malek Shah his heir and successor, causing him to sit on a throne of gold prepared for the purpose, and exacting from all the officers of the empire an oath of fidelity to him, Alp Arslan crossed the Euphrates at the head of the Turkish cavalry, and entered Cæsarea, the metropolis of Cappadocia, to which he had been attracted by the wealth and fame of the temple of St. Basil. After plundering this city, he proceeded to the final conquest of Armenia and Georgia, A. D. 1065. In Armenia the title of a kingdom and the spirit of a nation were annihilated; and the artificial fortifications were yielded by the mercenaries of Constantinople; "by strangers without faith, veterans without pay or arms, and recruits without experience or discipline." But the woods and vallies of Mount Caucasus were more strenuously defended by the native Georgians, or Iberians, who were at length compelled to submit by the indefatigable exertions of the sultan and his son Malek; and who were punished for their obstinate resistance, by being obliged to wear at their ears iron horse-shoes as a badge of their slavery; many of whom, in order to avoid this ignominy, assumed the external profession of Mahometanism.

In 1068 Alp Arslan directed his arms against the Constantinopolitan empire, which was then governed by Eudocia. His progress alarmed the empress, and induced her to give her hand and her sceptre to Romanus Diogenes, a brave soldier, who was accordingly invested with the imperial purple. Although in the palace Diogenes was no more than the husband of Eudocia, yet in the camp he was the emperor of the Romans, and he sustained that character with feeble resources and invincible courage. By his spirit and success the soldiers were taught to act, the subjects to hope, and the enemies to fear. In three laborious campaigns the Turks were driven beyond the Euphrates; and in the fourth and last Romanus undertook the deliverance of Armenia. With an army of 100,000 men he marched to the siege of Malazkerd, an important fortress in the midway between the modern cities of Arzeroum and Van. Alp Arslan flew to the scene of action at the head of 40,000 horse, according to the statement of Elmacin, but reduced by Abulpharagius to 15,000, and by d'Herbelot to 12,000. The Greeks, though much superior in number, were distressed and dismayed by his rapid and skilful evolutions; nevertheless, their principal general Basilacius was defeated, Malazkerd was

reduced, and their forces were separated; in this moment of advantage he proposed peace to the emperor. The answer of Romanus was dictated in the tone of insult and defiance: "If the barbarian wishes for peace, let him evacuate the ground which he occupies for the encampment of the Romans, and surrender his city and palace of Rei as a pledge of his sincerity." Alp Arslan smiled at the vanity of the demand, but he wept in anticipating the death of so many faithful Moslems; and, after a devout prayer, proclaimed a free permission to all who were desirous of retiring from the field. With his own hands he tied up his horse's tail, exchanged his bow and arrow for a mace and scymitar, clothed himself in a white garment, perfumed his body with musk, and declared that if he was vanquished, that spot should be the place of his burial. In the decisive and bloody battle that ensued, the Greeks were totally routed, great numbers of them were killed; and Romanus, after valiantly maintaining his station, when he had been deserted by the body of his army, was at length recognized by a slave, taken prisoner, and presented to Alp Arslan. The successor of Constantine, in a plebeian habit, was led into the Turkish divan, and commanded to kiss the ground before the lord of Asia. He reluctantly obeyed; Alp Arslan, starting from his throne, is said to have planted his foot on the neck of the Roman emperor. This fact, however, is doubtful. He instantly raised the royal captive from the ground; and then clasping his hand with tender sympathy, assured him that his life and dignity should be inviolate in the hands of a prince who had learned to respect the majesty of his equals, and the vicissitudes of fortune. Romanus was treated with attention and respect; and in the familiar intercourse of eight days, not a word nor a look of insult escaped from the conqueror. During the negotiation he was asked by Alp Arslan what treatment he expected to receive? To which question Romanus, with calm indifference, replied: "If you are cruel, you will take my life; if you listen to pride, you will drag me at your chariot wheels; if you consult your interest, you will accept a ransom, and restore me to my country." But what," continued the sultan, "would have been your own behaviour had fortune smiled upon your arms?" "Had I vanquished," he fiercely said, "I would have inflicted on thy body many a stripe." The Turkish conqueror smiled at the insolence of his captive; and observed, that the Christian law inculcated the love of enemies and forgiveness of injuries; and nobly declared that he would not imitate an example which he condemned. After mature deliberation, Alp Arslan dictated the terms of liberty and peace, a ransom of a million, an annual tribute of three thousand pieces of gold, the marriage of the royal children, and the deliverance of all the Moslems who were in the power of the Greeks. The treaty was subscribed by Romanus, and the sultan, after a courteous embrace, dismissed him with rich presents and a military guard; but his subjects having revolted, he was unable to collect and remit the stipulated price of his ransom. The generosity, or perhaps the ambition of the sultan, disposed him to espouse the cause of his ally; but the accomplishment of his design was prevented by the defeat, imprisonment, and death of Romanus Diogenes. After this treaty, A. D. 1071, Alp Arslan beheld the fairest part of Asia subject to his laws; 1200 princes, or the sons of princes, stood before his throne; and 200,000 soldiers marched under his banners. He disdained to pursue the fugitive Greeks; but he meditated the more glorious conquest of Turkestan, the original seat of the house of Seljuk. His progress on this expedition, A. D. 1072, was impeded by Joseph Cöthual, a Karasmanian, or Carizmanian, the governor of Berzêm, or Barzâm, who, after vigorously defending his fortress, was taken prisoner;

prisoner; and being reproached by the sultan for his obstinate folly, by his insolent replies provoked a cruel sentence, that he should be fastened by his hands and feet to four stakes, and left to expire in that painful situation. The desperate Joseph, drawing a dagger, rushed towards the throne; the guards raised their battle-axes; but Alp Arslan, the most skilful archer of his age, checked their zeal, and drew his bow; however his foot slipped, and the arrow missed Joseph, who planted his dagger in the breast of the sultan, and was himself instantly cut in pieces. The wound was mortal, and the sultan expired, A. D. 1072, pronouncing an useful admonition to the pride of kings. "In my youth," said Alp Arslan, "I was advised by a sage to humble myself before God; to distrust my own strength; and never to despise the most contemptible foes. I have neglected these lessons, and my neglect has been deservedly punished. Yesterday, as from an eminence, I beheld the numbers, the discipline, and the spirit of my armies; the earth seemed to tremble under my feet; and I said in my heart, 'Surely thou art the king of the world, the greatest and most invincible of warriors.' Those armies are no longer mine; and, in the confidence of my personal strength, I now fall by the hand of an assassin." This prince reigned nine years and six months, and lived 44 years and three months; and his remains were deposited in the tomb of the Seljukian dynasty, at Maru, one of the four cities of Khorasan, with this inscription: "O ye who have seen the glory of Alp Arslan exalted to the heavens, repair to Maru, and you will behold it buried in the dust." The annihilation of the inscription, and of the tomb itself, says a popular historian, more forcibly proclaims the instability of human greatness. Alp Arslan commanded the respect of all who approached him by his stature, aspect and voice; his long whiskers shaded his face, and he wore a large turban in the form of a crown. His valour and liberality were equally renowned; and he was extolled for his piety and his attachment to the Mahometan faith and practice. He was succeeded by his son Malek Shah, who had been acknowledged during his life as the future sultan of the Turks; and who, by a triple victory over his uncle, cousin, and brother, each of whom disputed the inheritance, established his own reputation, and the right of primogeniture. Mod. Un. Hist. vol. iii. p. 394—401. Gibbon's Hist. vol. x. p. 352—363.

ALPEDRINHA, in *Geography*, a small place of Beira, in Portugal, containing about 950 inhabitants, and one church.

ALPEDRIZ, a small place of Estremadura, in Portugal, containing about 600 inhabitants.

ALPEN, a town of Germany, in the circle of the Lower Rhine, and electorate of Cologne; eight miles south-west of Wesel, and fifty north north-west of Cologne.

ALPENE, or ALPENUS, in *Ancient Geography*, the capital of the Locrians, on the south coast of Phœnix, east of Trachia, and above Thermopylæ and Anthela.

ALPESA, a town of Bætica, according to Pliny.

ALPHA, a river in the vicinity of Aquileia, near which Constantine was killed, and into which his body was thrown.

ALPHA BUCCELIS, a town ascribed by Ptolemy to the Marsh; probably the same with ALBA Fucensis.

ALPHA, the name of the first letter in the Greek alphabet; corresponding to our A.

The word is originally Hebrew, formed from *aleph*, the name of the first letter of the Hebrew alphabet.

Alpha, according to Plutarch, was placed at the head of all the letters, because, in the Phœnician language, it de-

notes an ox: which, with regard to use and service, is the first among beasts.

ALPHA, in *Composition*, denotes, sometimes, *privation*, in the same sense with *αρις*, *without*; sometimes augmentation, as *αρος*, *much*; and sometimes union, as *αμα*, *together*. See A.

ALPHA is also used as a letter of order, to denote the *first*; and of a number, to signify *one*; but when it was a numerical letter, a little stroke, or an acute accent, was drawn above it thus, Α', to distinguish it from the mere A, which was a letter of order.

ALPHA and Omega, in the *Divine Writings*, signify the beginning and the end, or the first and the last, (*viz.* before and after all things); and therefore the hieroglyphic of God is formed of these two letters Α and Ω.

These two letters were made the symbol of Christianity, and were accordingly engraved on the tombs of the ancient Christians, to distinguish them from those of idolaters.

ALPHA is particularly used among *Ancient Writers*, to denote the chief, or first man of his class or rank.

In this sense, the word stands contradistinguished from *beta*, which denotes the *second* person.

Plato was called the *alpha* of the wits; Eratosthenes, keeper of the Alexandrian library, whom some called a second Plato, is frequently named *beta*.

Thus Martial, in imitation of the Greeks, who distinguished the rank of persons by letters, says;—

"Quod *alpha* dixi, Codre, penulatorum,
Te nuper, aliqua, cum joculari in charta:
Si forte bilem movit hic tibi versus,
Dicat licebit *beta* me togatorum."

Epig. l. 5. ep. 26.

ALPHA is also a title given by some ancient writers to the Jewish legislator Moses. The reason of the application is much controverted.

ALPHABET, the several letters of a language disposed in their natural or accustomed order.

The word is formed from the names of the two first letters of the Greek alphabet, *alpha*, *beta*: which were borrowed from those of the Hebrew, *aleph*, *beth*.

In the English alphabet we reckon 26 letters, *viz.* *a b c d e f g h i j k l m n o p q r s t u v w x y z*. See each under its proper article, A, B, C, &c.

But as there is a much greater number of different sounds in our language, it is not without reason that some grammarians maintain, that there ought to be a greater number of letters: as also, that the double letters, *x*, *y*, and *z*, and the superfluous ones, *k* and *g*, should be retrenched.

The French alphabet contains only 23 letters. Pasquier indeed maintains it to consist of 25, because he adds the two double letters *Et* for *et* and *Us* for *us*; but these are only abbreviations. The Abbé d'Angeau, on better grounds, reckons 34 different sounds in the French tongue; and urges that the alphabet ought of consequence to consist of 34 different characters, setting aside the double letters *x* and *y*, and the superfluous one *q*.

The difference between languages with respect to the number of letters in their alphabet is very considerable: the Hebrew, Chaldee, Syriac, and Samaritan alphabets, have each 22; the Arabic 28; the Persian 31; the Turkish 33; the Georgian 36; the Coptic 32; the Muscovite, or Russian, 41, of which some are only notes of accent in pronunciation; the Greek 24; the Latin 22; the Slavonic 27;

the Dutch 26; the Spanish 27; the Italian 20; the Indians of Bengal 21; the Bramas 19.

The Ethiopic has no less than 202 letters in its alphabet, there being seven vowels, which they combine with each of their 26 consonants; to which they add 20 other aspirated syllables. The like is said of the Tartarian; each of their letters is a syllable, having one of their vowels joined to its consonant; as *la, le, li, &c.*

The Chinese have no alphabet, properly speaking; except we call their whole language their alphabet; their letters are words, or rather hieroglyphics, and are in number about 80,000. See Phil. Trans. vol. lix. an. 1769, N^o 66.

In effect, alphabets were not contrived with design, according to the just rules of reason and analogy; but have been successively framed, altered, &c. as occasion offered. And hence have arisen many grievous complaints as to their deficiencies; and divers attempts to establish new and more adequate ones in their places. Bishop Wilkins charges all the alphabets extant with great irregularities, with respect to the order, number, power, figure, &c. As to the order, it appears inartificial, precarious, and confused; because the vowels and consonants are not reduced into classes, with such order of precedence and subsequence as their natures will bear. Even the Hebrew order is not free from this imperfection. As to number, they are both redundant and deficient; redundant, either by allotting several letters to the same power and sound; as in the Hebrew *ד* and *ז*, and the ordinary Latin *c* and *k*, *f* and *ph*; or by reckoning double letters among the simple elements of speech; as in the Hebrew *י*, the Greek *ξ* and *ψ*, the Latin *q*, *cu*, *x*, *cs*, and the *j* consonant, or jod—Deficient in divers respects, especially in regard of vowels, of which there are seven or eight kinds commonly used, though the Latin alphabet only takes notice of five; whereof two, *viz.* *i* and *u*, according to our English pronunciation, are not properly vowels, but diphthongs.

Add, that the difference among vowels, in respect of long and short, is not sufficiently provided for: the ancients, we know, used to express a long vowel by doubling its character; as *amaabam, naata, ree, feedes, sanctissimiiis*; though the vowel *i*, instead of being doubled, was frequently prolonged, as *ÆDILIS, PLISO, VIUVUS*. The ways used in English for lengthening and abbreviating vowels, *viz.* by adding *e* quiescent to the end of a word, for prolonging a syllable; and doubling the following consonants, for the shortening of a vowel, as *wane wann, ware warr, &c.* or else by inserting some other vowel, for the lengthening of it, as *meet met, read red, &c.* are all improper, because the sign ought ever to be where the sound is.

As to their powers, again, those are not always fixed to the same signification: the vowels, for instance, are generally acknowledged to have each of them several sounds: *vocales omnes plurifonæ*, says Lipsius; and Vossius assures us, the ancients used their vowels in very different ways, *aliquando tenuius exiliusque, nunc crassius, nunc intermedio sono*. Thus the power of the vowel *i* is expressed in writing no less than in six several ways, *viz.* by *e*; as in *he, me, she, ye*; by *ce*, in *three, free, we*; by *ie*, in *field, yield, shield, chief*; by *ea*, in *near, dear, bear*; by *eo* in *people*; by *i* in *privilege*. So is the power of the vowel *a*, as in *all, aul, aw, fault, caught*; which are only various ways of writing the same long vowel; besides the other distinct ways of expressing the same vowel when used short: again, the power of the vowel *o* is written five ways: *o*, as in *to, who, move*; *oe*, as in *doe*; *oo*, in *soon, moon, noon*; *ou*, in *could, would*; *wo*, in *two*; and so of the rest.—Nor are the consonants of more

determinate powers; witness the different pronunciation of the same letter *c* in the same word *circo*, and *g* in *negligence*.—To say no more, the letters *c, f, t*, are used alike, to denote the same power, and the letter *f* is commonly used for *z*; and, which is yet worse, some letters of the same name and shape are used at one time for vowels, and at another for consonants; as *j, v, w, y*; which yet differ from one another, says Bishop Wilkins, *sicut corpus & anima*.

From this confusion in the power of letters, there arise divers irregularities; as, that some words are distinguished in writing, which are the same in pronunciation, *e. gr.* *cessio* and *sessio, &c.* and others are distinguished in pronunciation, which are the same in writing; as *get, acquirere, and get, gagates, &c.* Hence also the Latin *male* is a disyllable, and the English *male* is a monosyllable.

The names also, in most alphabets, are very improperly expressed by words of divers syllables; *alpha, beta, &c.* in which respect, the Roman and our English alphabets, which only name the letters by their powers, have a great advantage over the rest.

Lastly, their figures are not well concerted; there being nothing in the characters of the vowels answerable to the different degrees of aperture; nor in the consonants, analagous to the agreements or disagreements thereof. Wilkin's Eff. towards a real character, &c. b. i. c. 4.

All these imperfections are obviated in the *universal alphabets*, or characters, of M. Lodwick, Bishop Wilkins, &c. See *UNIVERSAL CHARACTERS*.

In the French king's library is an Arabic work, entitled *Sepbat Alachann*, containing divers sorts of imaginary alphabets, which the author distributes into *prophetic, mystical, philosophical, magical, talismanical, &c.*

Monsieur Leibnitz had in view to compose an *Alphabet of Human Thoughts*. Mem. de l'Acad. Roy. an. 1716.

It is no wonder that the number of letters in most languages should be so small, and that of the words so great, since, from a calculation made by Mr. Prestet, it appears, that, allowing only twenty-four letters to an alphabet, the different words or combinations that may be made out of these twenty-four letters, taking them first one by one, then two by two, three by three, &c. would amount to the following number, 1391,724288,887252,999425,128493,402200. See COMBINATION.

It may be here observed, that every combination may make a word, even though that combination have not any vowel in it; because the *e* mute, or quiescent, insinuates itself imperceptibly between the consonants, or after the consonants, where they are but two, the latter of which would not be heard without it.—The use of this silent *e* is very remarkable in the Armenian, Welsh, and Dutch languages; wherein the generality of words have several consonants together.

Nor must it be omitted, that every single letter may make a word; which is very apparent, where the letter is a vowel; words of that kind being found in most languages. Thus, *a* and *o* make words in the Greek; *a, o*, in the Latin; *a, i, o*, in English; *a, o, y*, in French; *a, e, i, o*, in Italian; *a, y*, in Spanish; *a, o*, in the Portuguese; *o*, in most languages, and even in the Dutch and Swedish. Any consonant also becomes a word, by adding an *e* mute to it in pronunciation.

In fine, though a considerable number of the possible combinations of twenty-four letters were retrenched, yet the number remaining would still be immense, and vastly superior to that of the words in any language known.

Of all known languages, the Greek is looked upon as

one of the most copious, the radices only of which are esteemed about 3244, but then it abounds exceedingly in compounds and derivatives. Bishop Wilkins thinks these may be moderately computed at about ten thousand. Hermanus Hugo, indeed, asserts, that no language has so few as 100,000 words; and Varro is frequently quoted by learned men, as if he affirmed that there are in the Latin no less than 5,000,000; but upon inquiring into the scope of the passage, Bishop Wilkins observes, that this number is not intended by him to express the full number of words in the Latin, but the great variety made thereof by the inflection and composition of verbs.—To this purpose he lays it down, that there are above one thousand radical verbs in the Latin, and that each verb admits of five hundred several varieties. He farther supposes, that each of these may be compounded with nine prepositions; as, *cessit, recessit, accessit, decessit, processit, successit, &c.* which amounts to five millions. See WORD.

Concerning the origin and progress and various kinds of alphabetical writing, see LETTERS and WRITING.

ALPHABET, in matters of Polygraphy, is a duplicate of the key or cypher, which each of the parties corresponding are to keep by them.

It is properly an alphabet of the usual letters disposed in their order; opposite, or underneath which, are the secret characters corresponding thereto, with the blank or useless letters, and the other signs or symbols serving to obscure and render it difficult to decipher. See DECIPHERING.

ALPHABET, among Merchants and Traders, is a kind of index, with the twenty-four letters in their natural order, in which are set down the names and surnames of those with whom open accounts are kept; and which refers to the folios of the ledger, where those accounts are written, in the form of debtor and creditor; serving to find easily, and without any trouble, such accounts as are necessary to be turned to.

ALPHABET, among the French, signifies also those punches or iron tools, which engravers upon metal use to engrave the several letters, or characters, which belong to their works, either for legends, or for other inscriptions. The book-binders have also small brass tools, which they call alphabets, and with which they put the titles, and the number of the volume, on the back of books.

ALPHABETICAL verses. See ABCEDARY.

ALPHÆA, in Entomology, a species of the PHALÆNA Bombyx, with ferruginous wings, a white point in the middle, and a punctated brown streak, found in New Holland.

ALPHÆNIX, white barley-sugar, to which is given an extraordinary name, to render it more valuable. This sugar, which is thought good for colds, is made of common sugar, which is boiled until it becomes easy to crack, when they pour it upon a marble table, greased with oil of sweet almonds, and mould it into various figures with a brass crotchet. It is easily falsified with starch.

ALPHARABIUS. See ALFARABIUS.

ALPHARD. See COR hydra.

ALPHERATZ, in Astronomy, a fixed star of the third magnitude in AQUARIUS. This is otherwise called *alpheratz*. Some also give the denomination *enif alpheratz*, and *mar-chab alpheratz*, to two other stars in the right shoulder of PEGASUS.

ALPHERY, MIKEPHER, in Biography, an English divine of the 17th century, was born in Russia, of the imperial line, and on account of the commotions in Russia, which happened towards the close of the 16th century, was sent to England with his two brothers. They were confined to the

care of Mr. Joseph Bidell, a Russia merchant, and by him entered at Oxford, where two of them died of the small-pox. The survivor took orders in the English church, and was presented in 1618 to the rectory of Wooley, in Huntingdonshire. During his residence in this situation, he was invited to return to his native country by some zealous friends, who promised to exert their utmost efforts in restoring him to the throne of his ancestors; but he declined the proposal, and preferred continuing in the humble, but perhaps no less honourable and useful, station of a parish priest. At the time of the civil wars, he endured great hardships from the republican party, and was ejected from his living. After suffering much insult and oppression by the misguided zealots of that distracted period, he made a small purchase in the vicinity of his living, built a house, and resided in it for some years. The presbyterian minister by whom he was succeeded encouraged and protected him; paid him the fifth part of the annual income of his living; the allowance made by parliament to ejected ministers; treated him with kindness, and did him all the services in his power. After the Restoration, he was replaced in his rectory; but his advanced age of 80 years, and attendant infirmities, obliged him to transfer the duty to a curate, and to retire to the house of his eldest son at Hammersmith, where he died, much respected, and affording a singular example of the vicissitude of the world. Biog. Brit.

ALPHESERA, in Botany, a name by which the Arabian, and some other authors, express the white BRYONY.

ALPHESE, ISAAC, in Biography, a learned rabbi, who flourished in Spain in the 11th century, and who came over from the kingdom of Fez, in Africa, with the Morabites, or Almoravides. His epitaph, written in hexameters, was to this purport:—"Let it be engraved on the stone, that the light of this world is gone out, and that the foundation of wisdom is deposited within this tomb. Daughters of Sion, come and weep! the world is buried, and stricken with blindness. Weep and sigh, for the ark and tables of the law are broken in pieces with this doctor."

ALPHESTIS, in Ichthyology, the name of a fish called by others CINÆDUS, the LABRUS CYNÆDUS of Gmelin's Linnæus.

ALPHETA, in Astronomy, a fixed star in the northern crown; otherwise called *lucida corona*.

ALPHEUS, in Ancient Geography, one of the names of PISA in Etruria, supposed to have been founded by the Etruscans, who arrived thither from the banks of the Alpheus, in the territory of Elis.

ALPHEUS, a river of Elis, no less celebrated in mythology than recognized by geographers. The source of Alpheus was in the interior part of Peloponnesus, in the south-east of Arcadia. Its course was first to the north-west; and then turning to the east, it entered Elis, and passing by Pisa and Olympia, discharged itself into the sea. The mythologists, who are fond of animating all fountains and rivers, pretend that Alpheus, falling in love with Arethusa, pursued her to the sea, into which she plunged herself, and following the same course under the water, rejoined her at Syracuse, in the small island of Ortygia. Virgil. *Æn.* lib. iii. v. 694. Accordingly it is reported that this river passes under the sea, without mixing with the salt water, so as to pass quite into Sicily, where it mixes itself with the fountain Arethusa, near the city of Syracuse, inasmuch that any thing which is thrown into the river on the side of Elis is said to come out at this fountain. The geographical relation and the poetic fiction are so blended, that it is not easy to decide which of them gave occasion to the

the other; but they are both founded on a notion which prevailed among the ancients, that rivers passed under ground for a considerable distance from one place to another. The Olympic games were celebrated on the banks of this river; and Orpheus was worshipped as a god at Olympia. Thus Pindar:—

“Alpheus, thy immortal flood,
On his lord's triumphant brows
The Olympic wreath bestow'd.”

Od. i. WEST'S Pindar, vol. i. p. 7.

Paufanias (in Elid. c. 6.) informs us, that the Eleans had a law, which condemned to death any woman that should either appear at the Olympic games, or even cross this river, during that solemnity; and the Eleans add, that the only woman who transgressed it had disguised herself in the habit of a mafter or keeper of those games, and conducted her son thither; but when she saw him return victorious, her joy made her forget her disguise, so that her sex was discovered. She was, however, spared, on account of her father, husband, and son, who had gained the Olympic prize; but from that time an order was made that the keepers should appear there naked.

ALPHION *lake* was said to be at the source of the river Alpheus, and that it derived its name from the property which the waters had of curing the leprosy, *αλφιος* denoting a leper.

ALPHITIDON, in *Surgery*, a species of fracture, wherein the bone is broke into a great number of small parts, or particles. The word is formed of *αλφίτιον*, *farina*, *flour*; q. d. a bone ground to flour or powder.

ALPHITOMANTIA, in *Antiquity*. See ALBUROMANCY.

ALPHIUS, AVITUS, in *Biography*, a Roman biographer, who probably lived about the time of Alexander Severus, in the beginning of the third century. He wrote the History of the Carthaginian war. Voss. Hist. Lat. c. iii.

ALPHIUS *mons*, in *Ancient Geography*, a mountain of Asia, mentioned by Plutarch in his treatise of rivers, where he is speaking of Lycornas, a river of Ætolia.

ALPHONSIN is the name of a *surgical instrument* which was formerly used for the purpose of extracting foreign bodies, especially bullets, from wounds. The alphoncin derived its appellation from its inventor, *Alphonfus Ferrarius*, a Neapolitan physician in the 16th century, and consists of three branches, which, by their elasticity, are separated from each other, but may be closely held together by means of a ring pushed forwards upon the branches. It is to be introduced to the bottom of the wound in its closed state; the ring is then drawn back, that the instrument may open and lay hold of the bullet; after which the operator replaces the ring, and withdraws the forceps, holding fast upon the extraneous body. See WOUNDS.

ALPHONSINE *Tables*. See ALPHONSO and TABLES.

ALPHONSO I. or DON ALONZO ENRIQUEZ, in *Biography and History*, the first king of Portugal, was the son of Henry of Burgundy, Count of Portugal, and grandson of Don Alonso, king of Leon and Castile, who granted to Henry part of Portugal, as the dowry of his wife Theresa. He was entrusted by his father to the care of Egas Munitz, who gave him an excellent education. But as his father died when he was entering into the third year of his age, A. D. 1112, his dominions were governed by his mother Theresa. As reports prevailed of his mother's familiarity with Don Ferdinand Perez, Count of Trastemara, and her intention to marry him, some of the Portuguese nobility, jealous

of his growing honour and power, advised Don Alonzo, at the age of 18, to assume the sovereign authority. The queen and her party resisted; but though they had recourse to arms, they were speedily defeated, and Theresa was lodged in prison, where she was confined during the remainder of her life. After several conflicts with the Moorish princes, who possessed part of Spain and Portugal, in which he was generally successful, his conquests were restrained by Don Alonso, King of Leon and Castile, who assumed the title of the Emperor of the Spains, by whose numerous army his country was laid waste. Having, however, given him a temporary check, he proposed a treaty of peace, to which the emperor acceded, A. D. 1137; and as the Pope's legate interfered by his interest and influence to effect this accommodation, the Count Don Alonso, under the impulse of gratitude and piety, declared himself tributary for all his dominions to the holy see, and promised to pay an annual sum of four ounces of gold. In 1139 the Moorish princes were reinforced by a powerful army from Barbary. The Count, though he had an opportunity of retiring, and was advised by his generals to adopt this measure of safety, determined to meet them in the plains of Ourique; and after an obstinate and bloody dispute, the Moors were totally routed. This glorious victory was gained on the 25th of July, and the anniversary of it has ever since been celebrated for preserving the memory of so signal a favour vouchsafed by Providence to the Christian arms. Immediately after this victory Don Alonso was proclaimed king on the plains of Ourique; but the form and constitution of the monarchy were not settled till the state, consisting of prelates, nobility, and commons, were assembled at Lamago, in the year 1145. This event was preceded by the conquest of Santaren; and it was sanctioned by the unanimous and cordial concurrence of the states. The king was crowned by the Archbishop of Braga, and it was declared that the regal dignity should descend to his heirs male. Eighteen statutes were framed with the advice of the prelates and nobility for the government of the kingdom, and they were assented to by the people. When the question was proposed, whether it was their pleasure that the king should go to Leon, do homage, and pay tribute to that prince, or to any other, every man, drawing his sword, loudly exclaimed, “We are free, and our king is free, and we owe our liberty to our courage; and if he shall at any time submit to such an act, he deserves death, and shall not reign either over us, or among us.” The king's coronation was next year followed by his marriage with Matilda, daughter of Arnadeus, count of Maurienne and Savoy, and in 1147 by the recovery of Lisbon out of the hands of the Moors. In this conquest he was assisted by a number of adventurers, who were assembled from different countries at the mouth of the Tagus, in their progress to the Holy Land. The capture of Lisbon was followed by the accession of several other places to his dominions. By means of these acquisitions, Don Alonso became master of four of the six provinces that compose the kingdom of Portugal, and the reputation of his arms was raised to a very high degree. He was no less provident in peopling and improving than enterprising in the acquisition of territories; and in all his great and good designs he was seconded by Matilda, a princess equally celebrated for her exquisite beauty, distinguished capacity and singular piety. By her he had a numerous offspring, which enabled him to strengthen his interests by great alliances. The marriage of his second daughter did not prevent his having disputes with his son-in-law, Don Ferdinand, king of Leon; who once made him prisoner, but restored him to liberty on the humiliating condition of coming in person to Leon to do

homage

homage for his dominions. His son, Don Sancho, inherited his father's military disposition, took the lead on several occasions during the latter part of his reign, and in 1180 gained a glorious victory over Joseph, king of Morocco and emperor of the Almohedes, who had advanced with a very large army as far as Santaren. The consternation of the infidels, in consequence of this defeat, was so great, that they left the Portuguese at liberty to improve the interior part of the country, and to fortify their frontiers during the whole of next year. Alphonso needed repose and had retired to Coimbra, where, worn out with cares and fatigue, he departed this life on the sixth of December, 1185, after a reign of 57 years, in the 76th year of his age. His remains were deposited with great funeral solemnity in the church of the holy cross at Coimbra. His gigantic size and strength, as he was no less than seven feet high, and his martial ardour, have given occasion to many absurd and incredible stories concerning his military exploits, so that in the annals of chivalry, as well as in the record of martial achievements, he sustains a very conspicuous rank. He instituted two orders of knighthood, that of the Wings and that of Avis, which still flourishes in that kingdom with honour. He was succeeded by his son, Don Sancho, in the 31st year of his age. Mod. Un. Hist. vol. xviii. p. 175—190.

ALPHONSO, or ALONSO II. DON, surnamed the *Fat*, the third king of Portugal, succeeded his father Don Sancho I., at the age of 27, A.D. 1212. He began his reign with two very popular acts; he sent a body of infantry to the assistance of the king of Castile, who behaved with great reputation in the famous battle of Navas de Tolosa, and he gave the castle of Avis to the knights of that order; nevertheless the lustre of his reign was eclipsed in its dawn. His quarrels with his own family entailed upon him a variety of troubles, and subjected him to the interference, as well as the displeasure, of pope Innocent III. The pope, however, prevailed in producing a reconciliation with his sisters; but this calm was disturbed by the incursions of the Moors. However, an army of Germans and Flemings, destined for the holy land, seasonably arrived in the harbour of Lisbon, and enabled the king to take Alcaçar-do-Sal, where the Moors had a fortress on a rock that was deemed impregnable, A.D. 1217, and also to defeat the Moorish army. Towards the close of his reign he quarrelled with his clergy, who refused a contribution of troops and money for defending the kingdom against the infidels; upon which, in 1221, the pope excommunicated him, and put his dominions under an interdict. Whilst he was negotiating with his subjects on occasion of the confusion produced by the pope's sentence, he died on the 12th of March 1223, in the 12th year of his reign, and was buried with little ceremony, under a plain tomb, in the conventual church of Alcobaca. He was very brave and uncommonly strong; and is said to have been a great promoter of justice. Mod. Un. Hist. vol. xviii. p. 193.

ALPHONSO, or ALONSO III, DON, king of Portugal, succeeded his brother Don Sancho II, A.D. 1248, in the 38th year of his age. Soon after his accession to the throne, he entered into a war with the Moors, and took Faro in the province of Algarve, which was deemed the capital of the Moorish territories, and also Loula, which was carried by storm; and he thus added a considerable district to the dominions of Portugal. His domestic administration was conducted with great prudence, so that his power and popularity were much increased, and he maintained a friendly intercourse with pope Innocent IV. In consequence of his marriage with Donna Beatrix, the natural daughter of Don

Alonso the Wise, king of Castile and Leon, whilst his first wife was living, he incurred the displeasure of pope Alexander IV., who put his kingdom under an interdict. But upon the death of his first queen, A.D. 1262, pope Urban granted a dispensation, legitimated the children of Donna Beatrix, and removed the interdict. In order to prevent all future disputes with the crown of Castile, the two kings defined the boundaries between their respective dominions by means of commissioners, and recognized this settlement by a solemn act. The king, encouraged by the prosperous state of the country and by the happy issue of his enterprises, extended the authority of the crown, and obliged the clergy to contribute to the welfare of the state; but this measure revived old disputes, and the kingdom was again, A.D. 1268, put under an interdict. Such was his policy, that he contrived to obtain from Castile an exemption of all claims upon the crown of Portugal, and to procure a declaration that its monarchs were free from every kind of homage. Before his death, he made a full submission to the church, and was reconciled to the pope and clergy; and having received absolution, he died February 16th, 1279, in the 31st year of his reign, and 69th of his life; leaving the kingdom of Portugal complete to his successors. This prince was of tall stature and engaging aspect and manners; magnificent in times of peace, and frugal when his affairs required economy; the friend of the poor, for he pawned his crown to provide them with bread in a time of scarcity, respected by the nobles, and obeyed by the clergy. Mod. Un. Hist. vol. xviii. p. 204.

ALPHONSO, or ALONSO IV, king of Portugal, surnamed the *Brave*, was the son of king Denis, and succeeded his father in 1324. When he ascended the throne, hunting was his favourite diversion; and whilst he was giving a detail to his council of a month's sports, one of his courtiers had the resolution to remonstrate, and to threaten, that if the grievances of his subjects were not redressed, they must look out for another and a better king. Alonso was at first highly displeased; but upon reflection, "I perceive," said he, "the truth of what you say; he cannot long have subjects who will not be a king. Remember, that from this day you have nothing more to do with Alonso the sportsman, but with Alonso, king of Portugal." To this resolution he adhered; and he exercised the authority of a sovereign in a manner that awed his subjects, without conciliating their esteem. To his father's memory he shewed respect, and promoted those who had opposed himself with the greatest vehemence, regarding them, though enemies to him, as the true friends of the crown. He shewed much duty to his mother, and great affection for his consort queen Beatrix; and commenced his reign with forming designs for the establishment of his family and the security of his dominions. He proceeded, however, against his brother, Alonso Sanchez, as a proscribed traitor, and thus drove him into rebellion; but he was afterwards reconciled, and received him into favour. He engaged in a war with Alonso XI., king of Castile, which terminated in an alliance and in essential assistance against the Moors. But no part of his conduct was more artful and cruel, and reflected greater disgrace on his character, than that which concerned Donna Agnes de Castro, the mistress and concealed wife of his son, Don Pedro. Instigated by his courtiers, who were jealous of the influence of this favourite, he issued orders for the murder of this princess, and afterwards avowed and approved this horrid deed. The son by this act was driven into a civil war, but it was soon concluded by his submission, and by tokens of peculiar favour on the part of the father. As the

the termination of Alonfo's reign and life approached, he endeavoured to compensate his past errors and misconduct by acts of piety and charity, by redressing grievances, establishing laws for the suppression and restraint of vice and immorality, debating salutary maxims for ruling the state, and effecting from the memory of his son the insult and injury which he had received; at the same time he took measures for removing those out of the way, who were likely to become the objects of resentment after his death. Having concerted measures of this kind he died in May 1357, in the 32d year of his reign and the 67th year of his age, with the character of an undutiful son, unnatural brother, and cruel father; but in many respects, of a great man and great king, brave and fortunate in war, but artful and indirect in his political measures, attached to his subjects, strict in the administration of justice, attentive to the public welfare and assiduous in encouraging industry and enriching his people. After all, he was rather revered for a right use of power, than relied on as a public parent; and though feared and even esteemed, he was not much honoured nor beloved. His device was an eagle on the wing, with this motto, "Altiore pcto," *i. e.* my hopes fly high.

ALPHONSO, or ALONSO V., DON, king of Portugal, surnamed the *African*, on account of his heroic exploits, was born in 1432, and succeeded his father, king Edward, at the age of six years. During his minority his uncle Don Pedro was regent, and though he conducted the administration with reputation, and married his daughter to the young king, he was created as a traitor at the expiration of his regency; and both he and several of his adherents were put to death. The king, who on this occasion was overpowered by the enemies of the regent, afterwards did justice to his memory. And he manifested his attachment to his queen, who died in 1455, not without strong suspicions of poison administered by her father's enemies, by renouncing all connections with the sex. Military glory was the chosen object of his pursuit. With this view he turned his arms against the Moors in Barbary, and in 1458 he passed over to Africa with a fleet of 200 sail, and an army of 20,000 men. He began his career with the capture of Alcaçer, which he strongly garrisoned; and prosecuted it, with various success, till the year 1470, when, after reducing Arzila and Tangier, he returned with great honour to his own country, and acquired the distinguishing appellation of *African*. He likewise added to those titles which had descended to him from his ancestors, that of lord of the coasts on both seas, and for perpetuating the memory of his exploits caused them to be elegantly wrought in tapestry. The war of Africa gave occasion to the establishment of the order called *KNIGHTS of the Sword*. Alonfo was engaged in another contest of less fortunate issue against Ferdinand and Isabella, of Castile, in support of the claim of his niece Donna Joanna to that crown. His failure of success induced him to take a journey into France, in order to obtain the assistance of Lewis XI.; but duped by this faithless monarch, he was so mortified that he formed a purpose of resigning his crown and making a pilgrimage to Jerusalem. During his absence, Portugal was governed, with great ability, by the prince Don Juan; and upon the king's return, he was received by his son with respect and joy, and reinstated on the throne. Alonfo, however, oppressed with melancholy, determined to withdraw into a monastery; but in his way thither, he was seized at Cintra with the plague, and died there on the 28th of August 1481, in the 49th year of his age, and the 43d of his reign. Alonfo was much honoured and beloved by his subjects, on account of his private character and public

conduct; his temper was condescending and affable, and he was so much distinguished by his benignity, bounty, and charity, which he particularly displayed in the ransom of prisoners, that he acquired the popular title of the *Redeemer of Captives*. He was eminently chaste and temperate, fond of letters, and a patron of learning, and the first Portuguese king who formed a library in his palace. Guinea was discovered in his reign, under the auspices of his uncle, the celebrated Don Henry; and a very lucrative trade was established by the Portuguese to that country, which Alonfo vindicated against the claims and hostile attempts of the Spaniards. *Mod. Un. Hist.* vol. xviii. p. 283—307.

ALPHONSO, or ALONSO DON, VI. king of Portugal, succeeded his father John IV. in 1656; and having been struck with the palsy whilst an infant, and neglected in his education, became of a fierce and untractable temper, so that he was deposed and succeeded by Don Pedro. He died suddenly in 1683, in the castle of Cintra, after having borne the title of king almost 27 years, living 40, and being a prisoner 15 years. *Mod. Un. Hist.* vol. xviii. p. 441, &c. vol. xix. p. 14.

ALPHONSO, or ALONSO III., surnamed the *Great*, king of Asturias, Leon, and Oviedo, was born in 849, and succeeded his father Don Ordogno in 865. The rebellion of Don Froila compelled him to retire from the kingdom, but upon the death of this usurper he returned with universal applause. He was an able and warlike prince, and in successive combats with the Moors he reduced several places. His attention to the lower classes of his subjects disgusted some of the haughty nobility, and occasioned disturbances which he repressed. In an interval of tranquillity A. D. 900, he held a general council of the clergy and state, which enacted some useful regulations, and he directed his attention to other objects, that contributed to the honour of his kingdom and the happiness of his subjects. Whilst he was employed in building and fortifying some of the towns, which he had taken from the Moors, he was interrupted by them, and reduced to the necessity of defending himself with a considerable army; which he did with such effect, that they were defeated with great loss. About the same time he was distressed by the rebellion of his son Don Garcias, who had formed the design of deposing his father and seating himself upon the throne; but this rebellion was soon suppressed. It was followed, however, by increasing discontent, occasioned by the confinement of Garcias and the oppression of taxes; in consequence of which Alonfo, A. D. 910, assembled the states and also the grandees of the country, and abdicating the crown, resigned it to Don Garcias, who was declared king; and to his other son Don Ordogno he assigned the province of Galicia. Soon after his resignation of the kingdom, his son assembled a numerous army in order to march against the Moors; and having gained considerable advantage in 911, he was preparing for another campaign. Alonfo aided him by his counsel, and took pains to convince him, that incursions and conquests were of little avail, if they were conducted with no other view beside that of enriching the soldiers and of gaining applause. His advice was regarded, and Alonfo himself offered to take the command of the army that was raised for new operations; and having made a glorious campaign in 912, he returned with his army, laden with spoil to Zamora. Here he was soon seized with a disorder, which terminated in his death, December 20th, in 912, two years after his abdication, 49 years from the time of his being associated with his father in the government, and when he was about 63, or as some say 65 years of age. He was deemed a prince

prince of great learning, and the patron of literature; and much respected for piety and virtue, and all princely qualities. It is said, that he composed a Chronicle of the Spanish affairs from the death of king Recevinto to that of his own father Don Ordogno. This chronicle has been incorrectly published by Sandoval, and the later editions have been imperfect. This work was published to the world under the name of Sebastian, bishop of Orensa, at whose request it was composed. Mod. Un. Hist. vol. xvi. p. 130, 141.

ALPHONSO, or ALONSO X., surnamed the *Wise*, king of Leon and Castile, succeeded his father, May 30th, in the year 1252, with the general approbation of the people, who regarded him as a prince of great qualities and remarkable generosity; though the appellation with which he was honoured was more the result of his love and encouragement of science than of his regal talents and exploits. The prosperity of his reign was interrupted by the ill-concerted projects of his ambition. His first attempt was directed against Gascony, to which he pretended a better right than Henry III. of England; but instead of succeeding in enforcing his claims, he consented to renounce them, on condition that Henry's son, afterwards king Edward I., should marry his sister Eleonora. He also prepared for an expedition against the Moors, in Barbary, at an expence which drained his treasures and obliged him to debase his coin; but he was diverted from prosecuting it by supporting claims, derived to him from his mother, to the duchy of Swabia. He was thus led into connection with the German princes, and became a competitor with Richard, earl of Cornwall, for the imperial crown, a titular honour which cost both these rivals immense sums of money. The conspiracies of several princes of the blood, as they were supported by the Moors, demanded his serious attention; and he was successful in restraining and defeating them. In 1268 he formed a romantic design of visiting Italy, against which the states remonstrated, and which, in deference to their opposition, he was under a necessity of relinquishing. This produced a formidable conspiracy among his subjects, and the number of male-contentants became so considerable and so powerful, that a compromise and reconciliation were not effected without great reluctance on their part and condescension on that of the king. After the death of Richard, earl of Cornwall, and even when Rodolph of Hapsburg was actually elected emperor of Germany, Alphonso aspired to this honour; and, for the purpose of preventing the pope from confirming his election, he took a journey to Baucuire, in order to have an interview with him; although in the mean while the Moors, availing themselves of his absence, were ravaging his dominions. This journey, whilst it was attended with great expence, and productive of much confusion in his kingdom, proved ineffectual; the pope was not to be convinced of the justice of his claims; and he returned disappointed and mortified. In this interval his eldest son died; and the second, Don Sancho, claimed the crown against the children of his elder brother. An assembly of the states was convened at Segovia, and Sancho's claim was allowed; but the cause of the children was maintained by their uncle, Philip the Hardy, king of France; Alphonso was thus engaged in a war; and his own queen, Donna Violante, resented the indignity offered to her grandchildren, and retired to the court of her father, the king of Aragon. In addition to these domestic dissensions, Alphonso, engaged in a war with France, was compelled by the pope to renew the war with the Moors, which proved disastrous; and having concluded a truce with them, he was engaged in a contest with the

king of Grenada. By these various measures his finances were ruined, taxes were multiplied, and the affairs of the kingdom were reduced to such disorder, that an assembly of the states was held at Seville in 1281, in which the king proposed, and the states acquiesced, to give a currency to copper money. Another assembly of the states was held at Valladolid, in consequence of the intrigues of Don Sancho, A.D. 1282, which deprived Alphonso of the regal dignity, and appointed Sancho regent. The king, reduced to almost insuperable difficulties, sought the assistance of the king of Morocco; solemnly cursed and disinherited his son; and by his last will in 1283 confirmed the act of exclusion, and appointed, for the succession, the infants de la Cerda, and upon the failure of their heirs, the kings of France. At the commencement of the next year, when Alphonso received information from Salamanca, that Sancho was dangerously ill, and professed the most sincere sorrow for his undutiful conduct to his father, he relented, pardoned his son, revoked his curses, and then died on the 4th of April 1284, in the 81st year of his age. He was buried in the cathedral of Seville, and left behind him the character of a learned man and a weak king. As a proficient in science and a patron of literature, he sustains a high and honourable rank. As a politician and legislator, he completed the code of laws which his father, Don Ferdinand, had begun, known by the title of "Las Partidas;" and he redressed the confusion in law proceedings, occasioned by intermixing Latin with the vulgar tongue, by obliging his subjects to use their own language. He also corrected many errors in the statutes of the university of Salamanca; and caused a general history of Spain to be composed in the Castilian language, which he took pains in polishing. But his favourite object was astronomy; and to the improvement of this science his attention and labour were particularly directed. With this view he assembled at Toledo, during his father's life, a number of the most celebrated astronomers of his time, Christians, Jews, and Arabians, from all parts of Europe, for the purpose of examining the astronomical tables of Ptolemy and correcting their errors. They were employed in this business for four years, and in 1252, the first year of Alphonso's reign, they completed those tables which have been denominated *Alphonso's tables*, from the name of this prince, who encouraged the construction of them by his liberality. The sum, expended upon them, is immense; if we may believe the report of those who state it at 400,000 ducats, or even that of others who reduce it to 40,000. Some have ascribed the principal conduct of this work to the Jewish Rabbi Isaac Aben-Said, whilst others, professing to derive information from the MSS. of Alphonso, refer it to Alcabitus and Aben-Ragel. The other astronomers who were employed on this occasion were Aben-Mufa, Mohammed, Joseph Ben-Ali, and Jacob Abuena, Arabians; Samuel and Jehuda El-Conefo, Jews; but the names of the Christians, if any such were actually engaged, are not known. The epoch of these tables was fixed to the 30th of May, 1252, which was the day of his accession to the throne. They were first printed at Venice in 1483; and there are other editions in 1492, 1521, 1545, &c. He is also said to have written a book, entitled, "The Treasure," containing treatises of rational philosophy, physics, and ethics; and to have been well acquainted with astrology and chemistry, in which last science, as report says, there are two volumes, compiled by him, still remaining in his Catholic Majesty's library, in cipher. But considering the state of this science at that period, they must be more curious than useful. Alphonso has been charged with irreligion and impiety,

piety, chiefly on account of a saying of his, that is very well known, and that has been often repeated to his dishonour; viz. that "if he had been of God's privy-council, when he created the world, he could have advised him better." If we admit the fact, that he used this expression, of which there is some reason for doubt, as it has been variously stated by different writers, it unquestionably indicates a degree of presumption and arrogance not very suitable to the character of a true philosopher. Candidly interpreted, it is to be considered as a kind of *jeu d'esprit*, or pleasant sarcasm on that perplexing variety of eccentric cycles and epicycles, with which the system of Ptolemy was embarrassed; but the reflexion might have been dictated in terms more decorous, and more consistent with that reverence of the Creator, which an enlarged contemplation of his works has a tendency to produce. "An devout astronomer is mad." Young. *Modern Un. Hist.* vol. xvi. p. 343—365.

ALPHONSO, or ALONSO V., deservedly called the *Magnanimous*, king of Aragon and Naples, succeeded his father, Ferdinand the *Just*, as sovereign of Aragon, in the year 1416. The tranquillity of his reign was disturbed, soon after his accession, by the insolence of pope Benedict XIII, and by a conspiracy of several nobles among his own subjects against his life. The discovery of this treason was made just before its execution, and the king had an opportunity of exhibiting a signal display of magnanimity by tearing a paper in which the names of the conspirators were inscribed without reading it; declaring at the same time, "that he would at least force them to acknowledge that he had a greater regard for their lives than they had for his."

Having composed a disturbance in Sardinia, he was preparing to advance to Sicily, when Joan of Naples offered to adopt him for her son and heir, if he would assist her against the pope, the duke of Anjou, and the constable Sforza, who had formed a confederacy to depose her. The king accepted the proposal, raised the siege of Naples by his army, and was immediately installed, by proxy, heir apparent of her kingdom and duke of Calabria. The queen afterwards proving false to her engagement, she was expelled from Naples, which was taken possession of by Alphonso; but when the duke of Anjou made himself master of the greatest part of the kingdom, the queen renewed her application to the king of Aragon, and he prepared for a new expedition. In 1434 he again renewed his attempt for the conquest of Naples, and besieging Gaeta, he involved himself in a quarrel with the duke of Milan and republic of Genoa. In an engagement with the Genoese fleet, which was sent to relieve the place, Alphonso lost all his ships, and was himself taken prisoner. At Milan, whither he was conducted, he so far ingratiated himself with the duke, that he became his friend and ally; and whilst his own hereditary states were liberal in their supplies, his power was greater than ever. In 1443 he made himself complete master of Naples, and in an assemply of the states held first at Beneventum and transferred to Naples, his sovereignty was acknowledged, his son Don Ferdinand, whom he had created duke of Calabria, was recognized as successor to the crown, and he was esteemed the great arbiter of peace and war through all Italy. Alphonso continued in Naples till the close of his life and reign; but his declining years were disquieted by political intrigues and dissensions. Restless and uneasy, he was removed from one castle in Naples to another, and at length expired on the 22d of June, 1468; leaving to his natural son Ferdinand the kingdom of Naples, which he had acquired by arms, and to his brother Don Juan, king of Navarre, the crowns of Aragon, Valencia, Majorca, Sardinia,

and Sicily, and the principality of Catalonia, with all their dependencies. Alphonso was, without doubt, the greatest prince that ever sat on the throne of Aragon, and he was accounted the ablest statesman and the most renowned military commander of the age in which he lived. He was in an eminent degree the patron of learning, and afforded an asylum to the Greek literati when they were expelled from Constantinople; his device was a book opened, and it was his common saying, "that an unlettered prince was but a crowned ass." The perusal of Quintus Curtius cured him of a disorder with which he was attacked at Capua; he was brave and liberal, and in all his negotiations he disdained the mean artifices of intrigue and dissimulation. He lived in familiar intercourse with his subjects, whom he loved. "A father," he said, when walking unarmed and unaccompanied about his capital, "has nothing to fear in the midst of his children." When he was besieging Gaeta, he relieved and dismissed without injury the women and children that were turned out of the town, alledging, "that he had rather lose any city in his dominions than the reputation of humanity." When one of his galleys, with its whole crew and a number of soldiers, was ready to perish, he leaped into a shallop for its relief, saying, "I had rather share than witness their calamity." Upon hearing an officer, who saw his treasurer bringing him 10,000 ducats, exclaiming, "I should only wish that sum to make me happy:" "you shall be so," said Alphonso; and caused the money to be given to him. He expressed an extraordinary dislike of dancing, which he considered as a kind of insanity. His greatest failing was an attachment to women; and it was productive of several improprieties of conduct and pernicious consequences. Lucretia Alana was one of his mistresses, and his fondness for her in an advanced period of life very much sullied his reputation; and connections of this kind led him to neglect his wife, who was faithful and affectionate, and very zealous and active in his interests. *Mod. Un. Hist.* vol. xvii. p. 240—254.

ALPHONSO'S *Island*, in *Geography*, an island of the Indian Ocean, nearly south of the Almirante islands, lying in a tract of the sea, little traversed by European vessels. S. lat. 7° 30'. E. long. 52° 40'.

ST. ALPHONSO'S *Island*, is an island on the coast of Terra del Fuego, in the South Pacific Ocean. S. lat. 55° 51'. W. long. 69° 33'.

ALPHONSUS, PETRUS, in *Biography*, a Spanish Jew, was converted to Christianity, A.D. 1106, baptized at Huesca, and had Alphonso, king of Portugal, for his godfather. He composed a treatise by way of "Dialogue between a Jew and a Christian," concerning the truth of the Christian religion, in which the arguments of the author against the Jews are arranged methodically and urged with clearness and solidity of reasoning. This work was published at Cologne in 1536. Dupin, 12th century, vol. iv. p. 170.

ALPHONSUS TOSTATUS, a learned Spaniard and voluminous writer, flourished in the middle of the 15th century. He finished his studies in the university of Salamanca at the age of 22 years, and made great proficiency in those branches of knowledge that were in principal estimation at that period. He attended the council of Basil, became bishop of Avila, and was advanced to the chief offices in the kingdom of Spain. He died at the age of 40 years, A.D. 1454, and was interred in the church of Avila, with this epitaph:

"Hic stupor est mundi qui scibile discuit omne."

His works, written during his comparatively short life, amount

amount to 27 volumes in folio, of which 24 are commentaries on some of the books of scripture; the rest are chiefly theological; they were printed by the order of Cardinal Ximenes, at Venice, in 1530, at the same place in 1596, and at Cologn in 1612. His "Commentary upon the Chronicon of Eusebius," was printed separately at Salamaica in 1506; as were also several other books in literature and science, and ecclesiastical history. Dupin, 15th cent. p. 83.

ALPHOS, in *Medicine*, a distemper described by Celsus, under the name of *vittiligo*; wherein the skin is rough, and becomes sprinkled as it were with drops of white; and thence denominated *leuce*. Where the spots are black, it is also called *nigra*; and *melane*. It bears the same relation to the *leuce*, as the *scabies* to the *lepra*; the first is superficial and cutaneous, the second sinks deeper into the flesh. The *alphos*, *melas*, and *leuce*, are but one and the same disorder, only differing in its degree of inveteracy.

ALPIEU. See BASSET.

ALPIGNAN, in *Geography*, a town of Italy, in the principality of Piedmont, on the Dora, five miles west of Turin.

ALPINE. See CISALPINE.

ALPINI, in *Ancient Geography*, a people of Spain, mentioned by Aulus Gellius and Varro, in whose country were excellent mines of iron and silver. They were situated near the Ebro.

ALPINIA, in *Botany*, so called after PROSPER ALPINUS, a genus of the *monandria monogynia* class and order, of the natural order of *scitamineæ* and *cannæ* of Jussieu; the characters of which are, that the *calyx* is a perianthium one-leaved, tubulose, three-toothed, the leaflets equal, erect and acute; the *corolla* monopetalous, tubulose, tube cylindrical and short, border three-parted, and parts nearly equal and oblong; the nectary connate with the tube of the corolla, two-parted, the lower part forming the lower lip is larger and longer than the parts of the corolla, broadish, spreading and often divided; the *stamina* have no proper filament, but along the upper division of the nectary, forming the upper lip, which is flattish and of the length of the corolla, grows a large anther, either deeply bifid or entire; the *stipillum* has an inferior, oblong germ, style filiform, often inserted into the fissure of the anther, stigma incrassate and obtuse; the *pericarpium* is an oval capsule, three-celled, crowned with the permanent calyx; the *seeds* are ovate, angular, and covered with a sort of berried aril. This genus differs from the *amomum* and *costus* only in the habit and the inflorescence, which is racemed. Martyn reckons two, Willdenow four, and Gmelin five species. They are as follow: 1. *A. racemosa*, with raceme terminating, spiked, flowers alternate, lip of the nectary trifid, and leaves oblong and acuminate. This is the *A. jamaicensis* of Gærtner, the *amomum pyramidale* of La Marek, the *amomum alpinia* of Rottboel, and the *zingiber sylvestre minus*, &c. of Sloane. It is a native of the West Indies. With us it must be preserved in a stove, and the pot plunged into a tub of water; the leaves decay every Winter, and are pushed out from the roots every Spring. It may be increased by parting the roots, when the leaves decay. Gmelin mentions two varieties, *A. sessilis* of Koenig, and *A. multicaulis* of Aublet. 2. *A. occidentalis*, with raceme radical, compound, erect, nectary emarginate at the apex, three-celled capsules, and leaves lanceolate-ovate and very smooth. This is the *amomum minus*, with clothed stalk and spiked flowers of Brown, Jamaica. It is a native of the woods of Jamaica and St. Domingo. 3. *A. spicata* of Gmelin, who queries whether it be of this genus. See *COSTUS*. 4. *A. langaus* of Gmelin,

with paniculated terminal flowers. He mentions two varieties, viz. *Languas chinensis* and *L. aquaticum* of Koenig. 5. *A. jamaicensis*, made by Ginclin a distinct species. 6. *A. galanga* of Willdenow, having a terminal lax raceme, with alternate flowers, the lip of the nectary emarginate and lanceolate leaves. This is the *maranta galanga*, with a simple culm of other writers, the *amomum galanga*, &c. of Loureiro, the *galanga* of Rumphius, and the *galanga* of the shops. It is a native of the East Indies. 7. *A. carnosa* of W. with a terminal tufted spike, bractes longer than the flower and coloured, and oblong-ovate pubescent leaves. The calyx is red; the corolla yellow; and the nectary yellow, truncated and quinque-dentated. It is found in Caraccas, in South America.

ALPINUS, PROSPER, or PROSPERO ALPINI, in *Biography*, born at Marostica, in the states of Venice, in the year 1553, became celebrated for his skill in medicine and botany, which he cultivated with singular success. Having quitted the army, to which he was at first attached, he went to Padua, where he studied physic, and in 1578 was received doctor in medicine, and through the interest of his father, who was also a physician, was appointed in 1580 to attend the Venetian consul to Egypt. He remained there three years, during which time he applied himself with great industry to acquire a knowledge of the most remarkable plants, indigenous to that country, and of the practice of physic, or the methods used by the natives in curing diseases. These became the subjects of several learned and ingenious works, which he published on his return from Egypt. In 1586, he was appointed physician to Andrew Doria, at Genoa, whence, the reputation of his abilities increasing, he was called home by the states of Venice, and appointed professor of botany and curator of the physic garden at Padua, which office he retained to the time of his death, which happened in November 1616. He was succeeded in the professor's chair, by one of his sons, who had probably been his assistant, as he is said to have been very infirm, and to have laboured under a difficulty of hearing, during some of the latter years of his life. The principal of his works, which have passed through numerous editions, and are in many hands, are, "De Medicina Ægyptiorum," lib. iv. first published at Venice, in 1611, full of ingenious information as to the diseases, medicine, surgery, and modes of life of the modern Egyptians; "De plantis Ægypti, liber;" "De Balsamo, dialogus," a treatise on the famous balm of Gilead. "De præfagienda vita et morte Ægrotantium," published in 1601, and consisting chiefly of a collection and arrangement of the prefaces of Hippocrates; "De medicina methodica," being an attempt to elucidate and restore the ancient doctrine of the Methodistic sect in medicine, published in 1611; "De Rhapsodico disputatio inauguralis;" "De plantis exoticis;" all in quarto. He is also said to have left other works in manuscript, that have not been published. Ample accounts of these several works, and of the editions they have passed through, may be found in Haller's *Bib. Med. Pract.* and his *Bib. Botanica*.

ALPISTE, or ALPIA, a sort of seed used to feed birds with, especially when they are to be nourished for breeding. The alpite seed is of an oval figure, of a pale yellow, inclining to an isabel colour, bright and glossy. It is an article of the corn chandlers and seedsmen's trade. See PHALARIS.

ALPS, ALPES, in *Geography*, was a name given to a chain of mountains, which extended from the sea of Liguria to Istria, and forming a kind of crescent, separated the northern part of Italy from Gaul and Germany. The name is Celtic, and denotes *highly elevated*; or, as the author of a German book, entitled, "Rheinischer Antiquarius,"

suggests, it signifies *mountains abounding in pasture*. Festus is of opinion that the appellation was borrowed from *albus*, pronounced by the Sabines *alpus*, and signifying *white*, because these mountains were always covered with snow. Others, recurring to a fabulous relation, derive it from a person of the name of Albion, the son of Neptune, who is said to have been killed by Hercules, in disputing his passage over these mountains. But the first etymology, adopted by Isidore, (Orig. lib. iii.) and Servius, (in Virgil, *Æn.* lib. iii.) is the most probable. The word *alp* signified, among the ancient Scythians and Scandinavians, both a mountain and a mountain spirit; it being a persuasion among them, that mountains and rocks were inhabited by Demons. Accordingly the Edda of Iceland, (Myth. 15.) mentions good and evil Alps.

This chain of mountains, commencing in the Vada Sabatia or Savona, and terminating near the Sinus Flanaticus or Flanonicus, now the Golfo di Canaro or Carnero, in the bay of Venice, and the springs of the river Colapis or Kulpe, or reaching from the river Varus to the river Arsia, in Istria, has many irregular windings, so that its extent has not been accurately and uniformly ascertained; some of the ancient writers making it 800, and others no more than 250 miles. Its whole range may be more justly computed at about 550 British miles; and may be considered as extending in a kind of semicircular form, from the gulf of Genoa, through Swisserland, which contains its central and more lofty parts, and terminating in the Carnic Alps, on the north of the Adriatic sea. It has been divided, both by ancient and modern geographers, into different portions, and these have been distinguished by different appellations.

The *Maritime Alps*, *Alpes Maritimæ* or *Littorææ* of Ptolemy, arise from the gulf of Genoa, and reach from Vada or Vado, in Nice, to the springs of the Var, or to those of the Po. Some reckon their commencement at Monaco, on the Mediterranean, and trace them in their progress from south to north, between ancient Gaul to the west, and Genoa to the east, through the eastern part of the country of Nice, and between that and the marquisate of Saluzzo to their termination at Mount Viso between Dauphiné and Piedmont. Upon the summit of this ridge trophies were erected in honour of Augustus, at a place called Tropæa, since called Turbia. The ancient capital of the Maritime Alps was Embrun, and the inhabitants of this district obtained from Nero, A.D. 63, the rights of Latium, that is, the rights and privileges which the Latins enjoyed when they were only allies and not citizens of Rome. The highest chain of these Alps, through which is the remarkable passage, called the Colde Tende, forms the exterior boundary of the country of Nice.

The next high ridge, called *Alpes Cotticæ* or *Cottana*, now Mont Genevre, in which is the spring of the river Duranee, extends from the springs of the Var to the city of Suza, or from Mount Viso to Mount Cenis, and separates Dauphiné from Piedmont; having the *Alpes Maritimæ* to the south, and the *Alpes Graiæ* to the north or northwest. In the time of the Romans a petty prince called Cultra possessed an independent territory in this part of the Alps; and in order to maintain his independence paid court to Augustus, and engaged his protection. With this view he traversed these mountains, and formed commodious passes for the Roman troops. The territory of Cottius, a prince who resided at Suza, and whose name was given to this ridge, consisted, according to Pliny, of two independent cantons. Hence the passage of the Alps, which led from Briançon to Suza, was particularly denominated in the Theodosian table *Cottia*. M. d'Anville, Holstenius, and others, are of opinion, that it

was by this part of the Alps Hannibal entered Italy. Some have thought that one part of his army passed over the Cottian, and another over the Graian Alps. It has been said that he cut a passage through the solid rock; and if Livy may be credited, he heated the rock by a fierce fire, and then poured a great quantity of vinegar upon it, which penetrating into the fissures, produced by the intense heat of the fire, calcined and softened it. But this relation, although Pliny (lib. xxiii. c. 1.) takes notice of this quality of vinegar, is rejected by many authors as fictitious. Polybius does not mention it. The capital of the Cottian Alps was Suza; and this territory was added by Nero, about the year of Christ 63, to the demesnes of the Roman empire.

To the north of the *Alpes Cotticæ* were the *Alpes Graiæ* of the ancients, so called by Pliny and Nepos, as it has been said, from the passage of Hercules in his return from Spain; which is rejected by Livy (lib. v. c. 33.) as fabulous: these are now denominated the Little St. Bernard, and commencing at Mount Cenis, where the Cotticæ end, and running between Savoy and the Tarentese to the west, and Piedmont and the duchy of Aosta to the east, terminate in Great St. Bernard.

The *Alpes Penninæ* lay to the north-east of the Graiæ, between the Velagri to the north, and the Salassi to the south. Some have sought the etymology of the epithet in the name *Poeni*, Carthaginians, pretending that Hannibal passed into Italy by this mountain. But both the etymology and the fact are equally erroneous. The appellation *Penninæ* formed from *pen*, head or high, signifies the height of these mountains; and the passage of Hannibal was probably over that part of the Alps, denominated Cottian. The *Alpes Penninæ* consisted of the present Great St. Bernard, Mont Blanc, and the grand chain that extends on the south of the Rhone to the north of the modern Piedmont, and reached from west to east from St. Bernard to Adula or St. Gothard, separating between the Velese to the north, and the Milanesè to the south: and the eastern part of this ridge was denominated the Lepontine Alps, from the appellation of a people who inhabit the country where the rivers Rhone and Tesino originate. From the *Alpes Penninæ* proceed the *Alpes Rhaivicæ*, which extend through the Grisons and the Tyrol, to the springs of the river Piave, of which a part called *Alpes Tridentinæ* are situated to the north of Trent. With the Rhaivicæ are connected the *Alpes Noricæ*, to the east of the former, situate about the source of the river Tajaumento; and joining to the *Alpes Carnicæ* or *Carnianæ*, extending to the springs of the Save; and moreover, these terminate in the *Alpes Julicæ*, which reach to the source of the Kulpe. These last derive their name from Julius Cæsar, who formed a design, executed after his death by Augustus, of opening a road over this mountain into Illyria, which is separated by it from Venice. This part of the Alps is also called *Alpes Venetæ*, and *Alpes Pannonicæ*. Some authors have extended the Alps to the north of Dalmatia, and even through Macedonia into Romania, and as far as the coast of the Black Sea.

The principal passages of the Alps, of which the Romans availed themselves, when they were sole masters of Italy, as they are recounted by Martiniere, are the following: The first was through the maritime Alps along the sea coast; the second by the Grecian Alps, by which, according to Pliny, Hercules entered into Italy, and which, as Cælius Antipater, cited by Livy, says, was the track of Hannibal: the third by the Cottian Alps, by Embrun, Briançon and Suza, which, some say, was Hannibal's course: the fourth, more generally pursued by modern travellers, through the valley of Maurienne, by Suza and Turin: the fifth by the Pen-

nine Alps, which, according to Polybius and Pliny, was that of the Carthaginians, though Livy is of a different opinion; this route is divided into that of the valley of Pœna, which is the broadest, and that of the vallies of Aosta and Bardo, which is the longest: the sixth, through the Pennine Alps by Adula, or Mount St. Gothard, and Bellifona: the seventh, over the Rætian Alps, by the Lake Verbanus or Cosmo, which was the route of Drusus and Tiberius, when they carried on the war in Rætia, and also of Stilicho: the eighth, by which the Cimbri entered into Italy: the ninth, by the Carnic Alps: and the tenth, by the Julian Alps, which was the usual track of the Roman troops into Pannonia and Illyria.

The central part of this chain of mountains, the most extensive and elevated of any in Europe, may be considered as composed of two ridges, which run almost parallel from the south-west to the north-east. The first ridge is that of the Helvetian Alps; and its most conspicuous summits are the Guemmi, or Twins, the Schelen horn, the Blumlis, the Geishorn, the Jungfrau or Virginhorn, the Eiger, the Schreckhorn, the Grimsel, the Furca, the Badur, the Glaciers to the north of the Rhine, and St. GOTHARD.

The highest mountain of the northern chain of the Alps seems to be Jungfrau; and the next in height are the Eiger, and the Schreckhorn, and the Finsteraar Horn. According to Mr. Kirwan (*Geo. Ess.* 213, 217.) the height of these mountains does not exceed 10,000 feet; and he observes, that they consist of granular, or primitive limestone. Saussure (*vol. vii. p. 193.*) says, that the Schreckhorn, and Finsteraar are about 13,218 feet high. Bourrit informs us (*vol. iii. p. 194.*) that the Schreckhorn is the highest of the Swiss Alps. The summits consist of granite; and on the sides appear red slate and calcareous masses. To the south are large deserts and glaciers, and on the north is the romantic lake of Kandel Steig, "whence (as we learn from a modern geographer) there is said to have been a passage to Lautebrun amidst singular glaciers, sometimes resembling magical towns of ice, with pilasters, pyramids, columns, and obelisks, reflecting to the sun the most brilliant hues of the finest gems." The southern chain of the central Alps extends from Mont BLANC, and other eminences to the west, and bearing to the north-east comprehends the Great St. Bernard, Mount Maudit, Combin, Cervin, and Mount ROSA. It traverses northward the vicinity of the lakes Locarno and Como, under the various denominations of Vogelberg, St. Bernardine, Spluger, Albalà, Beraini, &c. and stretching into the Tyrol, terminates in the Brunner, or Rætian Alps, on the south of the Inn, extending even to Salzburg; and the first chain to the north of that river separates Bavaria from Tyrol. This chain of the Italian Alps, proceeding from Mount Rosa, through the country of the Grisons to the Glaciers of Tyrol, and terminating in the Salzian Alps, should form the boundary between Germany and Italy, as they pass through the centre of Tyrol, and as the Italian Alps to the north of the former Milanese and Venetian territories, are of comparatively small elevation. The highest of the Italian Alps belong to the country of Piedmont.

"It was reserved," says the modern geographer already cited (*p. 583.*), "for this age of enterprise to disclose the secret wonders of the Alps. The enormous ridges clothed with a depth of perpetual snow, often crowned with sharp obelisks of granite, stiled by the Swiss horns or needles; the dreadful chafms of some thousand feet in perpendicular height, over which the dauntless traveller sometimes stands on a shelf of frozen snow; the glaciers, or seas of ice, some-

times extending 30 or 40 miles in length; the sacred silence of the scenes before unvisited, except by the chamois and goats of the rocks; the clouds, and sometimes the thunder storm, passing, at a great distance below; the extensive prospects, which reduce kingdoms, as it were, to a map; the pure elasticity of the air, exciting a kind of incorporeal sensation; are all novelties in the history of human adventure."

From Saussure we learn, that the highest summits of these mountains consist of "a large grained granite; the mixture being white opaque felspar, greyish, or white semi-transparent quartz, and mica, in small brilliant scales, forming what is called the white granite. The colours vary; and sometimes hornblende, schorl, garnets, or pyrites are interspersed. The construction seems to consist of flat pyramids of granite, standing vertically, disposed like the fruit of the artichoke; those of the centre being most upright, while the others bend towards them. These flat pyramids commonly stand, like the grand chains of the Alps, in a north-east and south-west direction. Beneath, and incumbent on the granite, especially towards the north, appear large masses of slate, which are followed by exterior chains of high calcareous mountains." For a further account of the Alps, see Cox's Switzerland, Saussure, Bourrit, and the articles BLANC, GOTHARD, ROSA, &c. in this Dictionary.

ALPS, in *Geography*, beside its proper signification, by which it denotes a certain chain of mountains, which separate Italy from France and Germany, is sometimes used as an appellative to denote any mountains of extraordinary height. In this sense, Aufonius and others called the Pyrenean mountains, *Alps*; and Gellius, the Spanish *Alps*, *Alpini Hispani*. Sidonius gives the same appellation of *Alps* to Mount Athos. Other authors speak of Norman *Alps*, *Alpes Arvenne*, *Alpes Astoricenses*, *Alpes Dostrina*, *Alpes Romania*, *Alpes Bosternica*. The Apennines are also called by Johannes Villereuf, *Alpi D'Apennini*. Thus also the British Alps denote the highest mountains in Britain; such are the GRAMPIAN hills, BEN NEVIS, and other mountains of the Highlands in Scotland; such are Snowden, &c. in Wales, *Wharnside*, *Skiddaw*, and *Croftfell*, in England. To the Asiatic Alps we may refer the ALTAI and WERTERIAN mountains; and to the American the ALLEGHANY and APALACHIAN of North America, and the ANDES of the South.

ALPS is also used to denote pastures on the mountains, whereon cattle are fed in the Summer time; or rather in the vallies, and spaces between the mountain tops. Some will have this to be the primary signification of the word *Alps*, which is supposed by these authors literally to denote the freights or apertures between hills.

ALPS, *Lower, Department of*, is one of the four composed out of the Ci-devant Provence, in France. It is bounded on the north by the department of the Upper Alps, on the east by Piedmont and the department of the Maritime Alps, on the south by the department of the Var, and the north-east extremity of that of the mouths of the Rhine, and on the west by the departments of Vaucluse and the Drome. Its chief town is Digne. Its superficies is about 1,459,699 square acres, or 745,007 hectares; its population comprehends 144,436 individuals; and it is divided into five communal districts.

ALPS, *Upper, Department of*, makes a part of Dauphine, which contains three. It is bounded on the north by the departments of Mont Blanc and Here, on the east by Piedmont, on the south by the department of the Lower Alps, on the west by that of the Drome and part of that of Here.

Its chief town is Gap. Its superficies is about 1,084,614 square acres, or 553,569 hectares; its population comprehends 116,754 persons; and it is divided into three communal districts.

ALPS, *Mariime, department of*, is formed of the county of Nice. It is bounded on the north by the Apennines and the department of the Lower Alps, on the east by the republic of Genoa, on the south by the Mediterranean, and on the west by the department of the Var and Lower Alps. Its chief town is Nice. Its superficies is about 632,619 square acres, or 322,674 hectares; its population amounts to 93,366 persons; and it is divided into three communal districts.

ALPSEE, a lake of Switzerland, being a continuation of the lake of Lucern.

ALP-STEIN, the denomination of a chain of mountains in Switzerland, which separate the canton of Appenzel from Toggenbourg, the barony of Saxe and the Rhinthal. It was formerly the limit between the country of the Rhætiens or Grisons, and the landgravate of Turgovia.

ALPUERTE, a town and castle of Spain, in the kingdom of Valencia, to the west of Segorbia and the north-east of the river Guadalquivir. It is agreeably situated, and the territory is fertile. N. lat. 39° 50'. W. long. 1° 6'.

ALPUXARRAS, LAS, are high mountains of Spain, in the kingdom of Granada, on the coast of the Mediterranean; their summits are visible not only from Gibraltar, but from the coast of Africa, between Ceuta and Tangier, and they extend from Velez to Almeria, and are about 17 leagues in length from east to west, and 11 leagues in breadth from north to south. This canton is one of the most populous and best cultivated in Spain; it is interspersed with villages, and covered with vines and other trees. It produces corn, wine, fruits, and good pasture, and also silk. The air and weather in this district are temperate and healthy. The inhabitants were originally Moors, and they are distinguished from the other Spaniards by the simplicity of their manners, the rudeness of their language, and their diligence in labour.

ALQUIER, which is also called *cantar*, a liquid measure for oil, used in Portugal. It contains six *cavadas*, or *canadors*. Two *Alquiers* make an *almeede*, or *almonde*.

ALQUIER is also a measure for grain, at Lisbon, containing a peck, three quarts, and a pint English.

ALQUIFOU, or ARQUIFOU, as the merchants spell it, is a sort of mineral *lead*, very heavy, easily reduced into powder, and hard to melt. When it is broken it parts into shining scales, much like the colour of needles of antimony. The potters use it to give their works a green varnish. In England it is commonly called *potter's ore*. It is found in Cornwall; the potters mix manganese with it, and then the varnish, or glazing, on their wares becomes of a blackish colour.

ALQUIVITE, or QUEVETO *Coast*, in *Geography*, a part of the coast of South America, which is washed by the Pacific Ocean, extends from the Morro del Bonifacio, at the entrance of Baldivia on the south distant 15 leagues to the river Imperial, on the north distant ten leagues. That on the south is the lowest and flattest land on the coast of Chili; but that to the north is higher, and in most places bold, with the exception of the shoals that run west south-west from the island Mocha, north-west by west from the river Imperial. Alquivite is in S. lat. 38° 40'. W. long. 76°.

ALRAMECH, or ARAMECH, in *Astronomy*, the Arabic name of a star of the first magnitude, otherwise called ARCTURUS.

ALRAUPE, in *Ichthyology*, a name given by the Germans, to the *mustela fluviatilis*, or celpout, a species of the GADUS.

ALRED, ALFRED, or ALURED, in *Biography*, an ancient English historian, was born at Beverley, in Yorkshire, and educated in the university of Cambridge. Having acquired a considerable knowledge of divinity, philosophy, and history, he returned to his native country; became a secular priest, and was appointed a canon and treasurer of the church dedicated to St. John of Beverley. His "Annals," containing the history of the Britons, Saxons, and Normans, were continued to the 29th year of Henry I. and he probably died in the year 1128 or 1129. From the preface to his work it appears that he was rather poor than rich, and much devoted to his studies. His abridgment of our history, from Brutus to Henry I. is one of the most valuable pieces that has escaped the rage of time, and the indiscretion of our first reformers. It is written in a concise, elegant, Latin style, with great perspicuity, and an uncommon attention to dates and authorities: so that he may be justly regarded as our English Florus. Leland has omitted Alred, in his collection of British writers, because he considered his work as merely an abridgment of Jeffrey of Monmouth's British History; whereas, it is not only doubtful whether Alured ever saw Jeffrey's history, but probable, from a variety of circumstances, that this history was published after Alred's Annals.

This work was published by Mr. Hearne, at Oxford, in 1716, from a MS. which belonged to the famous Thomas Rawlinson, Esq. under the title of "The Annals of Alured of Beverley;" and in a preface to it, Mr. Hearne has vindicated the author from the charge of plagiarism, which has injured the reputation of this valuable compendium of British history. Although Huntingdon, Hoveden, Maimesbury, and other writers have prefixed summaries of ancient history to the accounts they have left us of their own times, yet none of them, says a very competent judge, are to be compared, in point of accuracy or elegance, with this history, which deserves to be translated and to be continued, with the same spirit, to later times. Besides this work, which has been mentioned under different titles, Alured wrote no other, except "The History of St. John of Beverley," a collection of records, which has never been printed, but is preserved in the Cotton Library, under the title of "Libertates Ecclesie, S. Johannis de Beverlik, &c. Biog. Brit.

ALRESFORD, in *Geography*, a town of Hampshire, situate in the road from London to Winchester on a small stream, which, by means of a large pond as a reservoir, with locks and aqueducts, was formerly navigable by barges and lighters to Southampton; but the navigation has for several centuries reached no farther than Winchester. It consists of about 200 houses, one church, and two principal streets, and has a small manufacture of linens. Its market is on Thursday. It is distant from London somewhat more than 57 miles.

ALROE, a small island of Denmark, in the bay of Hordens and prefecture of Aakiar, belonging to the diocese or general government of Aarhus.

ALRUKAK, in the *Materia Medica*, a word used by Avicenna, and others of his nation, for what was called by the Greeks *leptos libanotis*, and *manna thuris*. This was the fragments of frankincense, which were broken off from the larger pieces in the collecting or packing up, and were most esteemed in medicine, as being the driest and purest kind.

ALRUM, in the *Botanical Writings of the Ancients*, a name given to the tree which produces the *bdellium*. This gum was originally known to be the exudation of a tree growing in Arabia and the East Indies, and well known to Avicenna, and others, and by all of them called by that name.

ALRUNES, a name given by the ancient Germans to small figures of wood, of which they made their **LAKES**.

ALSA, now **ANSA**, in *Ancient Geography*, a small river of Italy, which passing by Aquileia discharged itself into the Adriatic. Near this river Constantine, the son of Constantine the Great, fighting against his brother Constans, lost his life.

ALSACE, was before the revolution a province of France; bounded on the east by the Rhine which separated it from Swabia, on the south by Switzerland, and part of Franche Comté, on the west by Lorraine, from which it is separated by the chain of mountains called Wasgau or Les Vosges, and on the north by the Palatinate of the Rhine; and comprehended between $47^{\circ} 32'$, and $49^{\circ} 8'$ N. lat. and $6^{\circ} 44'$ and $7^{\circ} 24'$ E. long. This has been reckoned one of the most fertile and plentiful provinces in Europe, abounding in corn, wine, oil, flax, tobacco, fruits, and pulse, of various sorts, wood and excellent pasture. The part of this province that lies betwixt the rivers Ill, Haardt and the Rhine, is of narrow extent, and less fertile than the other parts; but the district that borders upon Switzerland and Mount Saverne, and the levels about Strasburg to the Rhine, are very fruitful and agreeable, and produce abundance of grain, tobacco, culinary vegetables, saffron and hemp. The mountains towards Lorraine are high and covered with fir, beech, oak, and horn-beam. The forests of this province are numerous, and furnish great quantities of wood both for fuel and building; as well as plenty of deer and game of all kinds, and it is in general diversified with hills and vales, which render it fertile and productive. Alsace has mines of silver, copper, iron, and lead; and it has also various mineral waters and baths. Its rivers are numerous, of which the principal is the Rhine, and it has also several lakes. The number of inhabitants, who are mostly Lutherans and Roman Catholics, was formerly computed at about half a million; their common language is the German, though the French is generally understood and principally spoken by people of superior rank, and in the towns. This province was divided into Upper and Lower Alsace; the former contained 32 large and small towns, and the latter 39; and in both there are upwards of 1000 market towns and villages. By the late division of France, this province forms two departments, *viz.* those of the Upper and Lower Rhine, the capital of the former being Colmar, and that of the latter Strasburg.

This province was anciently inhabited by the Rauraci, Sequani and Mediomatrici. Its name first occurs in the history of France under the Merovingian kings; and it is most probably derived from the river Ell or Ill, the inhabitants on the borders of which were called Elaffen, from whom the country itself was afterwards denominated Elsas, in Latin Elifatia, Alifatia, and Alfatia. From the Celts it fell under the dominion of the Romans; from them it passed to the Germans, and after the battle of Tolbiac, or Zulpich, gained by Clovis in 496, it was possessed by the Franks. It was afterwards incorporated with the kingdom of Austrasia, and in 752 it was subject, like the rest of the monarchy, to the laws of Pepin and his successors. At the decease of Lewis Debonnaire in 840, his eldest son Lotharius obtained it, and he joined it to that part of the

empire of the Franks which fell to him, and which was called the kingdom of Lotharingia or Lorraine. Lotharius II., his youngest son, inherited it; and after him in 869, it became a province of Germany, and was governed by dukes. About a century before the extinction of dukes, the provincial counts, who governed under them in Alsace, assumed the title of Landgraves, and the countries over which they presided were called Landgravates, one superior and the other inferior. In 1357 the best part of the inferior Landgravate was conveyed to the bill of of Strasburg, who styled himself Landgrave of Alsace. The government of Alsace was afterwards conferred by the emperors on several houses, till Ferdinand I. gave it to the German line of his own house; and accordingly it continued in the house of Austria. At the peace of Munster, in 1648, the emperor ceded for ever to the crown of France all right to the town of Brisac, landgravate of Upper and Lower Alsace, Sundgau, and the district of the ten united imperial cities in Alsace, with the whole sovereignty belonging to them. By the peace of Ryswick, in 1697, the emperor and the empire ceded to France the perpetual sovereignty of the city of Strasburg, and of all its dependencies, on the left side of the Rhine.

ALSADAF, in the *Materia Medica*, a name given by Avicenna and Serapio, to the *unguis odoratus*, and also to the *murex*, or purple fish, of the shell of which it was supposed to be a part.

ALSAHARATICA, a name used in *Botany*, by some, to signify the *parthenium*, or **FEVERFEW**.

ALSCHARCUR, in the *Materia Medica*, a name given by Rhases, and some others of the old writers, to the *skink*, a small animal of the lizard kind, formerly used in medicine as a cordial, and as a provocative to venery.

ALSCHAUSEN, or **ALSHAUSEN**, in *Geography*, a free imperial village of Germany in the circle of Swabia, in a commandery of the same name belonging to the Teutonic order, within the bailiwick of Alsace and Burgundy. It has a castle which is the residence of the country commandery of this bailiwick, and it lies betwixt the district of Altorf and the countries of Konigseck, and Scheer. The title of this place to jurisdiction in ecclesiastical and civil matters has been frequently contested by the Teutonic order.

ALSCHWANGEN, a town with a castle of Poland, in the duchy of Courland, and parish of Alschwang.

ALSCNEFU, in *Botany*, a name used by some authors, for **WORMWOOD**.

AL SEGNO, in *Music*. These Italian words are used when a return is made to a former part of a movement, where this mark or character appears: ♪. as who should say, return to this sign ♪. This is an expedient to save the trouble of writing, or expence of printing certain portions of a movement that are to be repeated. Thus *da capo*, implies that a whole strain is to be repeated from the beginning.

ALSEN, in *Geography*, an island of Denmark, situate in the lesser Belt, or entrance into the Baltic Sea, near the coast of Sleswick, to which it belongs; and separated from the main land by a narrow channel called *Åven-fund*. Its extent is about six leagues in length, and two in breadth; the soil is fertile, and produces plenty of fruit, and, wheat excepted, all kinds of grain, together with large crops of aniseeds, used by the Danes as a curmative for seasoning their food, and mixing with their bread. The island is sheltered by fine woods, which abound with game; and several of its lakes are well stocked with fish. It is divided

into south and north Harde, called Sonderburg and Norburg prefectures. It is about 100 miles west of Copenhagen.

ALSSENS, a river of Germany, which runs into the Ill near Pludentz.

ALSSENS, a town of Germany, in the circle of the Upper Rhine, and duchy of Deux-Ponts; 28 miles west of Worms.

ALSENZ, a town of Germany, in the circle of the Upper Rhine, and principality of Nassau-Weiburg, seven miles south of Creutznach, and 40 north-west of Mannheim.

ALSFELD, a very ancient town of Germany in the circle of the Upper Rhine, in Upper Hesse, in a prefecture of the same name. It lies near the river Schwalm, has an old castle and two churches; and it is the first town in Hesse which received the confession of Augsburg, being formerly more wealthy and populous than it is at present. N. lat. 50° 40'. E. long. 9° 9'.

ALSHASH, a beautiful city in Buckharia, supposed to be that which is now called TASHKUNT, or *Thajekland*.

ALSHEDA, a parish of Smaland in Sweden, where a gold mine was discovered in 1738.

ALSHEIM, a town of Germany, in the circle of the Lower Rhine, 10 miles north of Worms.

ALSIMBEL, in the *Materia Medica*, a name given, by Avicenna and others, to the spikenard of India. It is thus called from its having the appearance of a spike, or ear, and also *simbalath*, a word which signifies its being a congeries of many spikes, or ears; and such is much of the *nardus Indica*, or Indian *spikenard*, that we receive at this day.

ALSINA, in *Botany*. See THELIGONUM.

ALSINANTHEMUM. See ARENARIA.

ALSINASTRUM. See COSTUS and ELATINE.

ALSINE, formed of *ἄλσος*, a *grove*, *chickweed*, Eng. *morgelins*, Fr. in *Botany*, a genus of the *pentandria trigynia* class and order, and of the natural order of *caryophyllei*: its characters are, that the *calyx* is a five-leaved perianthium, leaflets concave, oblong and acuminate; the *corolla* has five equal petals, longer than the calyx; the *stamina* consist of capillary filaments, the anthers roundish; the *pistillum* has a subovate germ, styles filiform, and stigmas obtuse; the *pericarpium* is an ovate, one-celled, three-valved capsule, covered with the calyx; the *seeds* are very many and roundish. Martyn reckons three, and Gmelin five species. 1. *A. media*, holosteum Alfine of Swartz, common chickweed, with petals bipartite, and leaves ovate-cordate. The number of stamens in the flower of the common chickweed is uncertain, from three to ten. This species in different soils and situations assumes different appearances; but it is distinguished from the *cerastium*, which it most resembles, by the number of pistils, and by having the petals shorter than the leaves of the calyx, and from all the plants related to it, and particularly the *stellaria nemorum*, by having the stalk alternately hairy on one side only. Dr. Withering refers it to the *STELLARIA*, with which genus it agrees in various respects, and especially in the capsules opening with six valves. He observes, that it grows almost in all situations from damp and almost boggy woods, to the driest gravel walks in gardens; but in these various states its appearances are very different, so that those who have only taken notice of it as garden chicken-weed would hardly know it in woods, where it sometimes exceeds half a yard in height, and has leaves near two inches long, and more than one inch broad. In its truly wild state, he says, in

damp woods, and hedge bottoms with a northern aspect, it has almost always ten stamens; but in drier soils and more sunny exposures, the stamens are usually five or three. Dr. Smith (*Flor. Brit. vol. ii. p. 473.*) also refers it to the genus *stellaria*, and characterizes it under the species of *STELLARIA media*, with ovated leaves and procumbent stalks, having the lateral line alternately hairy. When the flowers first open, the peduncles are upright; as the flowers go off, they hang down; and when the seeds ripen, they again become upright. Dr. Withering observes, that the flowers are upright, and open from nine in the morning till noon; but if it rains, they do not open. After rain they become pendent; but, in the course of a few days, rise again. In gardens or dunghills chickweed sheds abundance of seeds, which are round, compressed, yellow and rough, with little tubercles; and thus becomes a troublesome weed; but if it be not suffered to seed, it may be destroyed, as it is annual, without much trouble. This species is a remarkable instance of the sleep of plants; for every night the leaves approach in pairs, including within their upper surfaces the tender rudiments of the new shoots; and the uppermost pair but one, at the end of the stalk, is furnished with longer leaf-stalks than the others, so that they can close upon the terminating pair, and protect the end of the branch. The young shoots and leaves, when boiled, can scarcely be distinguished from Spring spinach, and are equally wholesome. Swine are very fond of it; cows and horses eat it; sheep are indifferent to it; and goats refuse it. It is a grateful food to small birds and young chickens. For medical purposes this herb was formerly employed in cataplasms against inflammations; and its expressed juice, or decoction, given also internally, as an aperient, antiscorbutic, antiphlogistic; and as a restorative, probably for abating hectic heats, in atrophies and consumptions. The virtues ascribed to it, says Dr. Lewis, do not appear to be wholly without foundation; though its active matter is so far divided and diluted in the herb, as scarcely to manifest itself till separated from the grosser parts. This plant is found wild in most parts of the world. It is annual, and flowers almost through the whole year. 2. *A. fegetalis*, with entire petals, and awl-shaped leaves. This, according to La Chenal in Hall. helv. is the same with the *ARENARIA tenuifolia*. It is annual, and grows about Paris and in Piedmont. 3. *A. mucronata*, with entire, short petals, fetaceous leaves and awned calyces. This is a native of France and Switzerland, and introduced into Kew Garden, in 1777, by Dr. Gouan. 4. *A. prostrata*, with oblong leaves, and dichotomous prostrate stalk. Forsk. fl. Æg. arab. p. 207. 5. *A. graminifolia*, with lanceolate, rigid, hairy leaves, and erect three-flowered stalk. Arduin sp. ii. tom. x. See *ARENARIA*, *CALLITRICHE*, *CAMPANULA*, *CENTUNCULUS*, *CERASTIUM*, *CORRIGIOLA*, *CUCUBALUS*, *DRABA*, *FRANKENIA*, *GLAUX*, *GLINUS*, *GYPHOPHILA*, *HOLOSTEUM*, *ISNARDIA*, *LINUM*, *LIMOSELLA*, *LYCHNIS*, *MOEHRINGIA*, *MOLLUGO*, *NAMA*, *OLDENLANDIA*, *PEPLIS*, *PHARNACEUM*, *SAMOLUS*, *SIBTHORPIA*, *SILENE*, *SPERGULA*, *STELLARIA*, *TRIENTALIS* and *VERONICA*.

ALSINE, *Affinis*. See ANDROSACE.

ALSINES *Facie*. See THELIGONUM.

ALSINEFORMIS. See MONTIA.

ALSINELLA. See SAGINA.

ALSINOIDES. See BUFONIA and MONTIA.

ALSIRAT, in the Mahometan *Theology*, a bridge laid over the middle of hell, finer than a hair, and sharper than the

the edge of a sword, over which the people are to pass, after their trial on the day of judgment.

To add to the difficulty of the passage, Mahomet asserts, that the alirat, narrow as it is, is beset with briars and thorns; none of which, however, will be any impediment to the good, who shall fly over it like the wind; Mahomet and his Mussulmen lead the way; whereas the wicked, by the narrowness of the path, the entangling of the thorns, and extinction of the light, which directed the former to paradise, will soon miss their footing, and tumble headlong into hell, which is gaping beneath to receive them. See Sale's Prelim. Disc. to Koran, sec. iv. p. 90. See MAHOMETANS.

ALSITZ, in *Geography*, a river of the Netherlands, which passes by the city of Luxemburg, and runs into the Sour near Dierich.

ALSIUM, in *Ancient Geography*, a city of Italy in Etruria, occupying, according to Cluverius, the spot where Palo now stands. If it was built by the Aborigines long before the Tyrsenians invaded Italy, as we are informed by Dionysius Halicarn. it must have been founded not long after the dispersion in the days of Peleg. Silius Italicus (lib. viii. v. 475.) refers its origin to the Trojan times, and says, that it was built by Alesius, the friend of Agamemnon; but some have conjectured, that Alesus or Alisa, its founder, was Elisha, the son of Java, mentioned in Scripture. Velleius Paterculus (lib. i. c. 14.) relates, that it became a Roman colony, towards the end of the first Punic war. It was situated 18 miles from Portus Augusti, and south-east of Cære.

ALSLEBEN, in *Geography*, a town of Germany, in the circle of Upper Saxony and the principality of Anhalt-Desfau, and in the bailiwick of Great Alseben, which has a princely palace built in 1666; nine miles south south-west of Bernburg. N. lat. 51° 38'. W. long. 11° 29'.

ALSLEBEN is also a small town of Germany, in the circle of Lower Saxony and principality of Magdeburg, and in the bailiwick of Alseben, situate on the Saale, and consisting of 108 houses. The revenues of the collegiate church have been transferred to the cathedral of Magdeburg. The old village of Alseben lies so near the town walls as to seem to be a suburb of it. It is 22 miles south of Magdeburg.

ALSO-SAJO, a town of Hungary, in the Gespannschaft of Gomor, situate on the banks of the Sajo. A quantity of cinnabar is dug in its neighbourhood.

ALSO-DANY, a small town of Hungary, in the district of Ofzlan and Rewischtye jurisdiction, to which belongs a mineral water.

ALSOP, ANTHONY, in *Biography*, an English poet and divine, was educated at Westminster school, and from thence elected to Christ-church college, Oxford. He was soon after his admission to the university distinguished by Dean Aldrich, and published "Fabularum Æsopiearum delectus," Oxon. 1698, 8vo. with a preface, in which he took part with Mr. Boyle in the dispute between him and Dr. Bentley. He passed through the gradation of offices to that of censor at the college with reputation, and had the care of several of the principal noblemen and gentlemen of the society; and in this situation he continued, till Sir Jonathan Trelawny, bishop of Winchester, appointed him his chaplain; and soon after gave him a prebend in his own cathedral, together with the rectory of Brightwell in Berks, from which no solicitations to a higher station could induce him to remove. In 1717 he was cast in an action for the breach of a contract of marriage, with 2000*l.* damages; and on this occasion he left the kingdom. The

duration of his exile is not ascertained; but his death, which happened, June 10, 1726, was occasioned by his falling into a ditch near his garden door. A 4to. volume of his was published in 1752 by Sir Francis Bernard, under the title of "Antonii Æliopi, ædis Christi olim alumni, Odarum libri duo." Four English poems, by Æliop, are in Dodsley's collection, one in Pearch's, several in the early volumes of the Gentleman's Magazine, and some in the Student. He was a pleasant and facetious companion, and not rigidly restrained by the forms of his profession. Mr. Æliop is respectfully mentioned by the facetious Dr. King of the Commons, (vol. i. p. 236.) as having enriched the commonwealth of learning by "Translations of Fables from Greek, Hebrew, and Arabic," and no less contemptuously by Dr. Bentley, under the name of "Tony Æliop, a late editor of the Æsopian Fables." Biog. Diët.

ALSOP, VINCENT, an English nonconformist divine, was born in Northamptonshire, and educated at St. John's college, Cambridge, where he took the degree of master of arts. Having taken deacon's orders, he settled at Oakham in Rutlandshire, as assistant in the free-school. Having imbibed the principles of nonconformity, he was ordained among the presbyterians, and exercised his ministry at Wilbec, in Northamptonshire, whence he was ejected in 1662. After this event he preached occasionally, and was imprisoned six months for praying with a sick person. Being known to the world by a book which he wrote in an humorous style against Dr. Sherlock, he was invited to settle with a congregation of presbyterians in Westminster; and in this situation he fortunately escaped fines and imprisonment, because his christian name, which he studiously concealed, was not known to the informers. At the commencement of the reign of James II. Mr. Æliop's son engaged in treasonable practices, and obtained the king's pardon; and this act of clemency seems to have attached the father to the royal interest. In the address which was presented to the king for his general indulgence, and which is supposed to have been written by Mr. Æliop, he intreats his Majesty to believe, "that loyalty is not entailed to a party," and he professes for himself and his brethren, their gratitude and good wishes; to which address the king replied, that he was happy in observing two good effects of his declaration, the easing and pleasing of his subjects, and restoring to God the empire over conscience; adding, "it has been my judgment a long time, that none has, or ought to have any power over the conscience but God;" and expressing his hope, "to live to see the day, when you shall as well have Magna Charta for the liberty of conscience, as you have had for your properties:" closing with this admonition: "and now, gentlemen, do you so preach to your hearers, as they may be good Christians, and then I do not question but they will be good subjects." After the revolution, Mr. Æliop, though he retained a grateful respect for the memory of king James, became zealously attached to the government and interest of king William. He lived to an advanced age, and died on the 8th of May 1703. It is said, that though on grave subjects he wrote with a becoming seriousness, yet when wit might be properly shewn, he displayed it to great advantage. To this purpose we are referred to his "Antifozzo," in vindication of some great truths opposed by Dr. William Sherlock," 8vo. 1675. He also wrote, "Melius Inquirendum," in answer to Dr. "Goodman's Compassionate Inquiry," 8vo. 1679; "The Mischief of Impositions," in answer to Dr. Stillingfleet's Mischief of Separation, 1680, with several single sermons. Biog. Brit.

ALSTADT, in *Geography*, a town of Prussia, in the Oberland, near Preutchmarck.

ALSTEDIUS, JOHN HENRY, in *Biography*, a German protestant divine, and one of the most voluminous writers of the 17th century. He was born about the year 1588, and was for some time professor of theology and philosophy at Herborn, in the county of Nassau, and afterwards at Alba Julia, in Transylvania, where he died in 1638. He was one of the divines that attended at the synod of Dort. He was an industrious compiler of systems of sciences. His principal work is his "Encyclopædia," printed at Lyons in two volumes, folio, in 1649. Vossius speaks with commendation of that part which comprehends arithmetic. His "Thesaurus Chronologicus," has passed through several editions. His "Triumphus Biblicus," was written with a view of shewing, that all arts and sciences may be deduced from the Bible. His "Theologia Polemica," was answered by Himmelius, divinity professor at Iena. His other works are "Philosophia restituta," "Elementa Mathematica;" "Methodus formandorum Studiorum," printed at Strasburg in 4to. in 1610; "Templum Musicum, or Musical Synopsis," which is so formal as to resemble a logical rather than a musical treatise; and a treatise, "De Mille Annis," published in 1627, in which he maintains the Millenarian doctrine, or that of Christ's reign on earth for 1000 years, and fixes the commencement of this reign in 1604. The character of this writer has been well comprized in a single anagrammatic word, "Sedulitas." Gen. Dist.

ALSTER, in *Geography*, a river of Germany, which runs into the Elbe near Hamburg. It passes through the city, and forms a lake nearly half an English mile in circumference, which in summer evenings is covered with all sorts of pleasure-boats, affording to the spectators a very amusing spectacle.

ALSTON, CHARLES, (M. D.) in *Biography*, a botanical and medical writer, was born in the western parts of Scotland in the year 1683. He early applied himself to the study of botany, and opposed, with considerable ingenuity, the sexual system of Linnæus. When 33 years of age, he went to Leyden, and studied three years under Boerhaave. Returning thence with his friend Alexander Monro, he was materially instrumental in establishing a school of medicine in the College at Edinburgh, of which he was appointed professor of botany and the materia medica. In this post he continued to the time of his death, Nov. 1760.

In the fifth volume of the Edinb. Med. Essays, we have a short paper by Alston on the efficacy of the powder of tin in destroying or expelling worms from the bowels. He obtained the prescription, he says, of an empiric, who was famed for his skill in curing persons afflicted with those noxious insects. One ounce of tin, reduced to powder, and mixed with treacle, was given the first morning, and half an ounce each of the two following mornings; the patients were then purged with the infusion of fena and manna. He speaks highly of the efficacy of this medicine, which has certainly considerable powers in these cases, and may be given to the most delicate subjects with perfect safety. His dissertation on the sexes of plants, in which he combats the doctrine of Linnæus, was published in the year 1753, in the first volume of the Edinburgh Physical and Literary Essays. But the work principally calculated to secure his fame with posterity, is his Lectures on the Materia Medica, which was published in the year 1770, in two vols. 4to. by his friend and successor in the professor's chair, Dr. John Hope. Although considerable additions and improvements have been since made in this branch of science, yet this work will be always

held in esteem for the number of curious and useful facts it contains. Haller Bibliotheca Botan.

ALSTON-MOOR, or ALDSTONE, in *Geography*, a town of Cumberland, situate on a hill near the river Tyne, on the borders of Northumberland. The parish is small; but on account of the lead-mines in its neighbourhood very populous. The lands are part of the forfeited estates of the earl of Derwentwater, and are held on lease, granted for a thousand years, under the governors of Greenwich hospital. The market is plentiful, and held on Saturday. The distance from London by Bernard castle is 271, and by Penrith 302 miles. N. lat. 54° 45'. W. long. 2° 4'.

ALSTONIA, so named from Dr. Alston, in *Botany*, a genus of the *polyandria monogynia* class and order: its characters are, that the *calyx* is an inferior, imbricate perianthium, scales ovate, very obtuse and concave, the inner ones gradually larger, forming, as it were, a quadripartite or quinque-partite calyx; the *corolla* is one-petalled, shorter than the calyx, tube short, border spreading, divided into eight or ten parts, divisions equal, in a double row, alternately interior and exterior, obovate, obtuse, quite entire; the *filamina* have very many filaments, inserted into the tube, very short, imbricate, very smooth, the outer ones longer, linear, attenuated at the tip, anthers orbiculate and furrowed; the *pisillum* has a superior germ, ovate and small, style simple, of the length of the corolla, filiform and erect, the stigma capitate-obovate. The fruit is unknown, and the genus is imperfectly determined; it is nearly allied to *Symplocos*, and perhaps only a species of it. Swartz. There is one species, *viz.* *A. theaeformis*, joined by M. l'Heritier with *Hopea* and *Ciponima*, under the same genus *Symplocos*. This shrub was found by Mutis in South America. It is very smooth, and resembles the bohea tea in the leaves, the imbricate calyces, the situation of the flowers, &c. The dried leaves chewed give a green colour to the saliva, and have the taste of Chinese tea. The leaves are alternate on short petioles, elliptical in their form, and from the middle to the tip obtusely serrate, stiff and veined. The flowers are axillary, three or four together, and sessile; the calyx is very smooth, the scales rounded and green, with a membranaceous edge; the corollas are white and spreading. Martyn's Miller. Trans. Linn. Soc. vol. i. p. 170.

ALSTROEMERIA, so named from Baron Alstroemer, of Sweden, who, in his travels through Europe, sent many plants to Linnæus, in *Botany*, a genus of the *hexandria monogynia* class and order, of the natural order of *Lilia* or *Liliaceæ*, *Sarmentaceæ* of Linn. and *Narcissi* of Jussl.; its characters are, that it has no calyx; the *corolla* is six-petalled and sub-bilabiate, the three outer petals wedge-shaped, retuse, mucronate, the inner, which are alternate with the others, lanceolate, the two lower ones tubulous at the base; the *filamina* have awl-shaped filaments, bending down and unequal, anthers oblong; the *pisillum* has a germ inferior, hexangular, truncate, style bending down, filiform, of the length of the flamen, stigmas three, oblong and bifid; the *pericarpium* is a roundish, six-ribbed, mucronate capsule, three-celled, and three-valved, valves concave, and contrary to the dissepiment; the *seeds* very many, globose, covered with raised points, subumbilicate at the tip. Gmelin enumerates five; Martyn and Willdenow six species. 1. *A. pelegrina*, called pelegrina by the Spaniards in Peru, to express a superb flower, spotted-flowered *A.*, has an erect stem, corollas bell-shaped, straight, leaves linear-lanceolate, sessile; or, according to Willdenow, has an erect stem, patent corollas, the three exterior petals wedge-shaped, three-toothed, the rest mucronate, the leaves linear-lanceolate and sessile. This species is found in Peru and Lima; the flowers are whitish,

beautifully stained and veined with purple and red; it flowers from June to October; and was introduced into Kew garden, in 1753, by Messrs. Kennedy and Lee. 2. *A. pulchella*, with erect stem, reflex-spreading and acute corollas, sessile leaves, and pedicels shorter than the involucre. This plant resembles the former in its structure and habit, but the leaves are narrower, and the stem terminated by an irregular involucre of larger petiolate leaves; the peduncles naked and one-flowered, flowers four or six rather nodding; the petals alternately less, whitish, red at the tip, streaked, or dotted with red at the base, filaments yellow, pistil red, and stigma trifid. This species is a native of South America. 3. *A. Light*, striped-flowered *A.* with erect stem, spatulate-oblong leaves, peduncles of the umbel longer than the involucre, and two-lipped corolla. The barren stems are clothed with awl-shaped leaves, and terminated with spatulate-oblong leaves, placed in a kind of rose; the floriferous stem clothed with awl-shaped leaves, the peduncles few and naked; the three upper petals of the corolla larger, white, dotted at the base, and spotted at the tip with red, the three lower ones shorter and red; the filaments longer than the lower petals, rugged, the anthers twin and yellow; the pistil red. This plant, which is a native of Lima, is remarkable for the largeness of its flowers, and for their fragrantcy, scarcely inferior to niguonette; it flowers in February and March, and was introduced here about 1776 by John Brown, Esq. 4. *A. Salsilla*, with twining stem, petiolate, lanceolate, acuminate leaves, branching umbel, peduncles longer than the involucre, bracted and loose. The leaves are nervose, petioles naked, the involucre many-leaved, awl-shaped and reflex, the peduncles few, elongated, sustaining one or two flowers, the outer petals red, and the inner greenish. This is a native of Lima. 5. *A. multiflora*, with twining stem, petiolate, lanceolate, and acuminate leaves, simple umbel, peduncles shorter than the bractes, and petals alternate and truncate. This species resembles the last in habit and structure; but the petioles are wrinkled at the edge, and the umbel is not peduncled, the manyflowered involucre consists of broader leaves, and the peduncles are simple and naked; the three outer petals are shorter, narrower, and entire, the inner truncate or emarginate, with a point; the colour is unknown. It is a native of South America. 6. *A. ovata*, with twining stem, lanceolate leaves, lanuginose on the upper surface, lucid on the lower, and corollas tubular; or, according to Willdenow, with twining stem, petiolate, elliptic, acuminate leaves, above villose, ramose umbel, bracteate loose peduncles, longer than the involucre, and bell-shaped corolla. The stem, twining contrary to the sun, is slender, and three feet high, the leaves are alternate and sessile, the flowers terminate in umbels, the petals approximate into a tube, ovate-oblong, the three outer scarlet, green at the tip, the three inner green, flatted towards the top, and variegated with black dots; the stamens are fixed to the germ near the base of the petals, anthers ovate and brown; germ green without, marked with six longitudinal grooves, and terminated with six small notches, style subulate, stigmas sharp, capsule globular, an inch in diameter, six-grooved, six-notched at the edge. This species differs from the former in its woolly leaves, and tubulose flowers. It is a native of Peru.

All these are stove-plants, and may be propagated by parting the roots in Autumn. The first is more hardy than the third, and may be treated as a green-house plant, but it will flower and ripen its seeds better under the glass of a hot-bed frame, freely admitting air: it is more usually raised from seeds sown in the Spring in a pot of light earth, on a

gentle hot-bed, either of dung or tan. Curtis Mag. Martyn's Miller.

ALSUNGEN, in *Geography*, a lake of Sweden, in the province of Halland, from which the river FALKENBERG issues, and by which river it communicates with the sea.

ALSWANGEN, a town of Poland, in the duchy of Courland, four leagues west of Goldingen.

ALSWEDE, a district of the prefecture of Reinberg, in the principality of Minden, in Westphalia, containing of five parishes, the inhabitants of which are employed in agriculture and the breeding of cattle.

ALSZA, a small place of Turkey in Europe, belonging to a tribe of Tartars, betwixt the Nieper and Black Sea.

ALT, a river of England, which runs into the Irish sea, 7 miles west of Ormskirk, in the county of Lancaster.

ALT, formed of *altus*, high, in *Music*, a term applied to the high notes in the *SCALE*. See also *PIGRAM*.

ALT-BUNZLAU, *Boleslawia vetus*, in *Geography*, a town of Bohemia, in the circle of Bamzlau, or Bolelawiko, founded by Wratislaw in 915, and improved by his son Boleslaw the Cruel in 937, but reduced by the troubles in the 15th and 16th centuries to an inconsiderable place. The collegiate church of St. Cosmus and Damian is very ancient.

ALT-CLOSTER, a town of Germany, in the circle of Lower Saxony and duchy of Bremen, 12 miles south-east of Stade.

ALT-RANSFADT, or *Old-Ransfad*, a town or parochial village of Germany, in the circle of Leipsic, two leagues from Leipsic, famous for a treaty concluded in 1706 between Charles XII. of Sweden, and Augustus II. king of Poland; and for the stipulation with the Imperial plenipotentiary, Count Wratislaw, in 1707, on account of the religious freedom of the Protestant inhabitants of the duchy of Silesia.

ALTA, a town of Sweden, in Helsingland, on the frontiers of Gellricia.

ALTEBA, in *Ancient Geography*, a place of Africa, in Numidia.

ALTAI, or *ALTAY mountains*, in *Geography*, are a chain of mountains in the northern part of Asia, ranking among the most extensive on the globe, and vying in length even with the Andes of South America, which extends from about the 70th to the 140th degree of longitude east from London, or about 5000 miles. The several ridges and branches of this immense chain of mountains are distinguished by different appellations, under which they will be noticed in the course of this work. The Altay mountains are called by the Chinese Altai-alin, and Chin-shan, which signifies the Gold Mount. They are divided into the Great and the Lesser Altay. The former separates the Mongolian Tartary from the empire of the Soongorian Kalmaes, and a small part of Bukharia toward the west. This range proceeds in various windings toward the north-north-east, throwing out several considerable ridges, between which are the main sources of the Yenisei, Oby, and Irtysh, through Soongoria to the north-north-west, where they enter in conjunction with the Lesser Altay. The Lesser Altay separates Soongoria from the government of Kolyvan, through which the abovementioned streams pursue their course over a great extent of country. The great chain of the Altay mountains commences with BOGDO, one of its highest points, passes over the sources of the Irtysh, north-westward between that and the lake Teletzkoi-Ozero, unites beyond the Yenisei with the SAYANE mountains and those of BAIKAL, and in Daouria with the Argulian or NERTSHINSKOI mountains, fixing the limits between Si-

beria and the Chinese empire from the Irtysh to the Amur, and runs on, with divergent branches, to the mountains of OKHOFSK, and to those of KANTSCHATKA, and of the KURILE and ALUTAN islands, terminating in the promontories and rocky shores of Cape Tschutski, the boundary of Asia; unless we suppose the mountainous and rocky island of Kurile and Japan connected with the mountains which reach from Tibet to China. The portion of the Altay mountains that properly belongs to Russia, may be distributed into two parts; one of which comprehends the entire space between the Irtysh and the Oby, and the other the space between the Oby and the Yenisei. The former may be denominated the Kolhyvan, and the latter the Kufnetzkoï mountains. Both include the greater part of the government of Kolhyvan; and the former half might, on account of its mineral wealth, be called, by way of eminence, the Altaian Ore-mountains.

That part of the Altaian chain, which separates the government of Kolhyvan from the Chinese Soongoria, is divided into two great branches; one from the Irtysh to the lake Teletzkoi and the head of the river Abakan, is properly the Lesser Altay, or Khrebet Khalta, and the other, from the Abakan to the Yenisei, is called Sabinskoy Khrebet. In the former are the greatest elevations of the Kolhyvanian, and in the latter those of the Kufnetzkoï mountains; and these form the basis of all the ribs or ridges that shoot out to the north-west and to the north, which at last lose themselves towards the Icy or Frozen Ocean in extensive plains; while toward the south they still continue to soar to an uncommon height over a long and broad extent of territory. In the midst of these lofty mountains, says Dr. Pallas, and on the frontier line between the Soongorian and Mongolian deserts, Bogdo-Dola, or Bogdo-Alim, *q. d.* the Almighty Mount, so eminently famous among all these nations, lifts its pointed heads; which, if not one of the highest, is yet, by its craggy, steep, and irregular form, with the appearance of having been thrown up by some violent agitation of the earth, the most striking of the elevated mountains of this region. North-west from it the principal mountain as far as Altain-Kul, or Teletzkoi-Ozero, is called the Golden Mountain. Eastward towards Mongoley, more to the south, runs a large mountain Changay, and southwards a snow mountain Muffart, which connects either with the Tibetan, or with the northerly mountains in India. To the west the chief mountain throws out an arm, mostly bare of forests, and studded, as it were, with rocks, called Allakoola, *i. e.* the chequered mountain, by the Tartars Ala-Tau, which joins with the Kirghizian Alginskoi-Sirt. The Great Altay mountains are properly connected, as we have already observed, with the mountains of Tibet by the Muffart, or by other chains; for all the deserts between Siberia and India, and the eastern Bukharia, are merely alternate hills and plains, and very rocky. Besides, it is evident that the Altay mountains must make an uninterrupted partition between the Western Steppes and the eastern regions, because the Steppe animals, particularly the antelopes or Steppe-goats, shun the mountains, and even in Asia go no further than to the western range of the Altays, and are come from it northwards to the woody regions of the Oby. The snow-mountain, which appears northwards on the Siberian frontiers from the Irtyshtau between the Buktarma and the Katunia, and quite into the angle formed by the rivers Ina and Belaia, which flow into the Tsharish, is, as it were, a branch or nook of the Great Altays, and is by some usually called the Little Altay, and darts its stupendous pinnacles above the clouds. This mountain is bold and

steep, and appears, especially in the vale where the Ina unites with the Tegerek, like a towering wall, behind which the mountains rise higher by irregular gradations, and at last strike up in separate points. The same steep vale parts the Schistose mountain from the Chalkstone mountain, which spreads from hence northwards between the Ina and the Loktefka quite to the Tsharish. Over the Schistose mountain the snowy summits rise conically out of a granite mixed with schorl and mica. The same granite shews itself again in chalky promontories, with the schistus lying upon it, and forms the Revnovaïo Sopka, as it is called, at the same time, in the bosom of the chalky mountains, the still more elevated Sinaïa Sopka. Granite appears likewise throughout in low, rocky, craggy mounts and single cliffs, between the rivers Ubo and Alay, where the mountain has already fallen deep towards the plain, and likewise about the lake Kolhyvan. The rich ore-mountain of Kolhyvan places itself immediately between and about this granite-block, and thence arises an apparent confusion in the strata through the whole of the ore-mountain.

The principal part of the Altay mountains that belongs to Russia is the range of Kolhyvan, or the proper ore-mountains of Altay; and these may be arranged into the KOLHYVANO-VOJKRESENKOÏ, the KORBOLIKINSKOÏ, the ALAISKIAN, the OUBINSKOÏ, the BUKTARMINSKOÏ, the TELETSKOÏ, and the TSHARISKOÏ mountains. The second range of the Altaian mountains belonging to Russia, or the Kufnetzkoï mountain, is still almost unknown and inaccessible. Its two subdivisions are the Kufnetzkoï proper and the Krasnoyarskoï mountains, which together fill the whole large space between the Oby and the Yenisei. The summits of these mountains, between the sources of the Tom and the Yus, and on the Mrafs, are covered with perpetual snow. Their inward constitution is not accurately ascertained; but various sorts of granite, porphyry, jasper, breccia, saline chalkstone, marble with sea-shells, horn-stone, slate, serpentine, mountain-crystal, chalcedony, and cornelians are brought from hence. On the Kondoma are productive iron-mines; about the source of the Tshumish the Salahirskoï silver-mines continue to be worked with sanguine expectations; and at Krasnoyarsk several copper-mines were formerly wrought, but are now abandoned. In the last-mentioned circle is also an establishment for smelting iron ore. The highest mountains to the south are about the source of the Abakan, where the famous mount Sabin, or Shabina Dabahu raises his snowy head to a stupendous height, and the Ittem on the borders of the brook Shantigyr.

The greater part of the Altay mountains is more bald than woody. The largest forests are in the low country about the Alay, the Oby, and the Yenisei. The species of wood are the pinus sylvestris, the birch, the aspen, the pinus peica, the pinus abies, the alder, the willow, noble larch-trees, (pinus larix) and cedars. The principal rivers of these mountains are the Irtysh, and its collateral streams the Buktarma, the Ulba, and the Uba; the Oby, with its main rivers, the Alay, the Tsharish, the Tshulym, the Tom, the Katunia, the Yus, and the Abakan, which falls into the Yenisei. The upper regions of these mountains are uncommonly exuberant in waters.

The Altayan mountains contain rich gold and silver shafts, and also veins of lead, copper, and iron, impregnated with gold and silver. The most important silver mines in these mountains are those of KOLHYVAN. The copper-mine is also considerable; besides which the cupriferous silver ore yields a quantity of copper, the whole amounting to about 15,000 pood a year. In 1782 there were coined here

18,793 pood of copper. We have before mentioned the iron smelting-house of this mountain. In the Altay there are neither markets for provisions, nor any tradesmen and mechanics; and therefore the miner must provide himself with all necessaries, which he is enabled to do by means of the numerous court and church holidays, on which he is released from public labour. With this view the first object of his attention is to have a small house, with a garden and a cow-yard. When new shafts are opened, he makes a shift at first with a hovel constructed with a few stakes, and covered with fods, or he digs an habitation and a baking oven in the earth; when he has the prospect of being stationary, he erects a regular house to which he brings his cattle and his little property. Hence it often happens, that within forests apparently the most inaccessible, or in wild and dreary steppes, whole streets and villages spring up in a few years. The miners of the Altay are generally very ingenious and industrious; and they are excellent hunters, expert horsemen, and in case of necessity, the best soldiers. Tooke's View of Russia, vol. i. p. 118, &c. Vol. iii. § 10.

ALTALA, a small district in the south-west part of Corsica.

ALTAMIRA, a village of Spain in Galicia, on the river Tamara, which gives title to an earl and grandee of Spain, five leagues west of St. Jago de Compostella.

ALTAMONT, or ALTOMONTE, a town of Italy, in the kingdom of Naples, and province of Calabria Citra, near which are gold and silver mines, 10 miles south-west from Cassano.

ALTAMURA, a town of Naples, in the province of Bari, at the foot of the Apennines, six miles north-east from Gravina.

ALTANUM, in *Ancient Geography*, a town of Italy, in the part of Magna Græcia, called Brutium, situate on the eastern side, south of the gulf of Scylæcum, and north of Locri.

ALTAO, a town of Africa in Mauritania Cæsariensis, according to Ptolemy.

ALTAR, ALTARE, ARA, a place or pile whereon to offer sacrifice to some deity.

Altars are, without doubt, as ancient as sacrifices; and consequently their origin is not much later than that of the world. Gen. c. iv. Some attribute their origin to the Egyptians; others to the Jews; others to the patriarchs before the flood. Some remove them as far back as Adam, whose altar is much spoken of by Jewish and even Christian writers. Others are contented to make the patriarch Enoch the first who consecrated a public altar. Be this as it will, the earliest altars, of which we find any express testimony, are those of Noah, (Gen. viii. 20.) and of Abraham, (Gen. xii. 7.) In the patriarchal times altars were formed of rude materials, and they were of almost instantaneous construction, and temporary, appropriated to the purpose for which they were designed. The altar which Jacob set up at Bethel was merely the stone on which he rested, Gen. xx. 8. Such was also the altar of Gideon, Judges vi.; and the first altar which Moses erected by the command of God was made of earth. Exod. xx. 24.

The principal altars of the Jews were the altar of incense, the altar of burnt-offerings, and the altar or table of shew-bread.

The altar of incense described, Exodus xxx. 1—10. was made of shittim wood, and overlaid with gold. It was one cubit square, and two cubits high, with an ornament of gold like a carved moulding round the top of it. It was carried about by two bars of the same wood, covered with gold, and passing through four golden rings. Its use was for

burning incense every morning and evening; and it was also to be sprinkled with the blood of the sacrifices that were offered for the sins of ignorance, committed either by particular persons, or by the people in general. See MISCELLANY, Plate 1.

The altar of burnt-offering, described Exodus xxvii. and xxviii. was placed towards the east end of the court, fronting the entrance of the tabernacle, and at such a convenient distance from it, that the smoke of the fire which was constantly burning on the altar might not fully the furniture within the tabernacle. Its dimensions were five cubits, or about 19 feet square, and three cubits, or about five and a half feet high. It was made of shittim wood plated over with brass, and it had four brass rings, through which were put two bars, by which it was carried on the shoulders of the priests. It had four horns at the four corners; but critics have been divided as to the form and use of these appendages to this altar as well as to the former. Some have supposed that they were mere ornaments resembling the rays of the sun; the term translated *horn* signifying also a ray of light. Others imagine that the corners of the altars were in shape like the horns of an ox or ram, &c. that they served for the altar of incense to move and carry it about with the greater ease and steadiness; and with respect to this larger altar, for tying the victims to them, according to the allusion of the Psalmist, Psalm cxviii. 27. Michaelis understood by the horns merely the corners, but this interpretation is incompatible with the context. They were evidently projections from the corners; the text, however, does not inform us whether they were upright, oblique or curved. Spencer, Le Clerc, Witius, and others, think that they were really horn-shaped, like those of the *ara pacis* of the Romans. Josephus says so expressly of the altars in his time: *παραγὰς διδρῖου, κερατοειδῆς προσηχῶν γωνίας*. De Bell. Jud. lib. iv. c. 5. n. 6. p. 324. ed. Haverc. The fire of this altar was kept upon a square grate, suspended by rings at the corners, and possibly by chains in the cavity of the altar. The dimensions of this grate might be about five feet square; and six inches being allowed for the thickness of the sides, there would be a space of about 1½ foot betwixt the grate and the altar on every side, which would be sufficient to prevent the wooden sides from being damaged by the fire. The fire on this altar was considered as sacred, having first descended upon it from heaven. Lev. ix. 44. It was therefore to be kept constantly burning, and never to go out. Lev. vi. 13. From hence probably the Chaldeans and Persians borrowed their notion of their sacred fire, which they preserved with religious care and attention; a custom which afterwards passed from them to the Greeks and Romans. This altar was beaten down and destroyed by the Babylonians at the burning of the temple, but it was replaced on the return of the Jews from captivity. Ezra iii. 3. It was now a large pile built of unhewn stone, 32 cubits (*i. e.* 48 feet) square at the bottom, and gradually decreasing to the top or hearth, which was a square of 24 cubits, and one cubit high, made of solid brass, and hence called the brazen altar; for it is not to be imagined that it was all made of solid brass. The ascent up to the altar was by a gentle rising on the south side, called the Kibbesh, 32 cubits in length, and 16 in breadth, and landed upon the upper benching in next the hearth or the top of the altar. Prideaux's Conn. vol. i. p. 199. See MISCELLANY, Plate 1.

The altar or table of shew-bread, described, Exod. xxv. 23—30. was made of the same sort of wood with the altar of incense, and, like that, overlaid and ornamented with gold. Its dimensions were two cubits long, one broad, and one and a half high. It had a golden border, crown, or rim round it;

it; and upon it were placed two rows or piles of leaves, or cakes of bread, six in a row or pile, which were changed for new ones every Sabbath. This table was also furnished with golden dishes, spoons, and bowls.

The Jews also gave the name "altar" to a kind of tables occasionally raised in the country or field, on which sacrifices were offered to God. Thus we often read, that in such and such a place an altar was built to the Lord.

The altars of the Heathens were at first made of turf; they were afterwards made of stone, marble, wood, and even of horn, as that of Apollo in Delos. Before temples were in use altars were erected in groves, in the highways, and on the tops of mountains; and it was customary to engrave upon them the name or attribute of the deity to whom they were consecrated. Altars were also of different kinds with regard to their qualities, the uses to which they were applied, and the objects to which they were appropriated. Accordingly we read of altars sacred to gods, heroes, virtues, vices, diseases, &c. and of inner and outer, stationary and portable, public and private altars. They differed also in their figure, which was round, square, or triangular. All of them were turned towards the east, and generally adorned with sculpture, basso-relievos, and inscriptions, expressing the gods to whom they were appropriated, or representing their distinguishing symbols. For a specimen of Pagan altars, see MISCELLANY. Plate I. N^o 1, represents an altar dedicated to Neptune, a trident, and two dolphins, the attributes of this deity being exhibited on its sides. N^o 2, is a four-square altar, dedicated to the nymphs, as the inscription informs us. N^o 3, exhibits a Bacchanal with a thyrsus in his hand, which shews that the altar was erected to Bacchus; with two other sides it appeared triangular. Each side of N^o 4, which was triangular, exhibited a genius, one of whom is seen carrying an oar upon his neck, which seems to indicate that it belonged to Neptune. N^o 5, with the inscription "Ara Neptuni," is of a round figure; the god is represented wholly naked, preserving the pallium on his shoulder, and holding in his left hand a trident, and in his right a dolphin.

Altars differed also in their height as well as in their figure and the materials of which they were formed.

According to Servius, (in Virg. Ecl. v. 66. Æn. ii. 515.) those altars set apart for the honour of the celestial gods, and gods of the higher class, were placed on some pretty tall pile of building, as the altar of Olympian Jupiter, which was nearly 22 feet high; and for that reason were called *altario*, from the word *alta* and *ara*, a high elevated altar. Those appointed for the terrestrial gods were laid on the surface of the earth, and called *are*—and, on the contrary, they dug into the earth, and opened a pit for those of the infernal gods, which they called *φοβηρι* and *λακκισ*, *ferobiculi*. But this distinction is not every where observed: the best authors frequently use *ara* as a general word, under which are included the altars of the celestial and infernal, as well as those of the terrestrial gods. Witness Virgil, Ecl. v.

"—En quatuor aras."

Where *are* plainly includes *altarum*; for whatever we make of Daphnis, Phœbus was certainly a celestial god. So Cicero, pro Quint. "Aras delubraque Hecates in Græcia vidimus." In the great temples of ancient Rome there were commonly three altars. The first was placed in the sanctuary at the foot of the statue of the divinity, upon which incense was burned, and libations offered; the second was before the gate of the temple, and upon it they sacrificed the victims; and the third was a portable altar, upon which were placed the offering and the sacred vessels.

The Greeks also distinguish two sorts of altars; that

whereon they sacrificed to the gods, was called *βωμης*, and was a real altar, different from the other, whereon they sacrificed to the heroes, which was smaller, and called *εσχαριον*. Pollux makes this distinction of *altars* in his Onomasticon: he adds, however, that some poets used the word *εσχαριον*, for the altar whereon sacrifice was offered to the gods. The Septuagint version does sometimes also use the word *εσχαριον*, for a sort of little low altar, which may be expressed in Latin by *craticula*; being a hearth rather than an altar. The nymphs, instead of altars, had *ωτιον*, caves, in which adoration was paid to them.

Altars and temples afforded an asylum or place of refuge for malefactors, and criminals of all descriptions among the Jews, Greeks, and Romans; chiefly to slaves, from the cruelty of their masters, to insolvent debtors and criminals, where it was reckoned impious to touch them, and whence it was unlawful to drag them; but they sometimes kindled fire round the place, or shut up the temple and unroofed it. Hence "*ara*" is put for "*refugium*." Ovid, Trist. iv. 5. 2. The altars of the ancient Heathens, as well as those of the Jews, were adorned with horns, to which the victims were fastened, and criminals who fled for refuge to the altar laid hold of the horns. The ancients also, on solemn occasions, as in making alliances, and confirming treaties of peace, swore upon and by them. For classical authorities to these several facts, see Adam's Rom. Ant. p. 327. Harwood's Grecian Ant. p. 140, &c.

The altar, bearing an inscription, "To the unknown God," found, by the Apostle Paul, at Athens, and mentioned, Acts xvii. 23, has occasioned some difficulty to biblical critics. Jerom supposes, that the inscription on this altar was not, as St. Paul quotes it, "To the unknown God," but, "To the gods of Asia, and Europe and Africa, unknown and strange gods;" and that the apostle has not quoted the inscription exactly, but dexterously applied it to his own purpose. Theophylact and Oecumenius are also of opinion that the inscription was "to gods," &c. in the plural number. On the other hand, Chrysoſtom and Isidore of Pelusium assert, that the inscription was in the singular number, as St. Paul quotes it. Learned moderns, as well as ancient Christian writers, have entertained different opinions on this subject. Le Clerc says, that though the inscription was in the plural number, St. Paul was in the right to alledge it in the singular number. The occasion on which this altar was erected, is thus related by Diogenes Laertius (in Epimen. lib. i. segm. 110. p. 70, 71.) About 600 years before Christ, "the fame of Epimenides was very great among all the Greeks, and he was supposed to be in great favour with the gods. The Athenians being afflicted with a pestilence, they were directed by the Pythian oracle to get their city purified by expiation. They therefore sent Nicias, son of Niceratus, in a ship to Crete, inviting Epimenides to come to them. He came accordingly in the 46th Olympiad, purified their city, and delivered them from the pestilence in this manner. Taking several sheep, some black, others white, he had them up to the areopagus, and then let them go where they would; and gave orders to those who followed them, wherever any one of them should lie down, to sacrifice it to the god to whom it belonged, and so the plague ceased. Hence it comes to pass, that to this present time may be found in the boroughs of the Athenians anonymous altars, a memorial of the expiation then made." By the God to whom it belonged some have understood, "the god next the place; others have translated the passage, "to the proper god to whom that office belonged; to him, whoever he was, who should remove the inflicted pestilence." Dr. Doddridge, (in loc.)

(in loc.) understands the direction to be, "when the sheep lay down, to sacrifice them to the god near whose temple or altar they then were." Dr. Lardner has given a more satisfactory interpretation of this passage. "Epimenides," says this judicious writer, "took with him up to the areopagus several sheep, some black and some white; and when he let them go, he directed that each one, when it lay down, should be sacrificed to the god to which it appertained or belonged." Black sacrifices were offered to some gods, white to others. Epimenides knew not by what god the pestilence had been inflicted upon the Athenians. When he was desired to purify the city, in order to its deliverance, he chose out sacrifices of different kinds, black sheep, and white sheep, and led them up to the areopagus: and from that place, the citadel or the seat of the senate, and of the court of judicature, he sent out the sheep, as in the name of the whole city or commonwealth to be sacrificed, in order to appease the offended deity, whoever he was. A sheep, with a black fleece, when it lay down, was to be offered to a deity who delighted in such sacrifices; a sheep with a white fleece was to be offered to a deity, to whom white sacrifices were acceptable. By this means he hoped to ingratiate the offended deity, whoever he was." From Laertius's relation Dr. Lardner infers, that there were several anonymous altars at Athens, and in the adjoining country; and that all these altars were in the singular number; for each sheep, when it lay down, was to be sacrificed to the god to whom it appertained. It appears from the testimonies of heathen authors, who lived whilst these altars with their inscriptions subsisted, such as Diogenes Laertius, Pausanias, Philostratus, and the author of Philopatriis, which Dr. Lardner has cited, that the inscription upon the altar at Athens was in the singular number: nor does it appear that there were any in the plural, "to unknown gods:" and this inscription seems to have been peculiar to the Athenians. To the same purpose it is observed, by the ingenious Mr. Hallett, that the Athenian altars were erected, not to the honour of Jupiter, Mars, Apollo, by name, but to that particular god, whoever he was, who had wrought out their deliverance. Nevertheless they thought, that this god, though unknown, was one of the idols of the heathen world. The truth, however, was, though they did not know it, that he, who delivered them by his providence from that distress, was the one infinite supreme God. And therefore St. Paul justly says, that the Athenians worshipped him; for they worshipped him who removed the plague, whoever he was; but the true God removed the plague; therefore they worshipped the true God. And yet, as the apostle observes, they worshipped him ignorantly, that is, they were ignorant of his majesty and power, and regarded him as no greater than one of their own idols. Lardner's Works, vol. viii. p. 111—119. Hallett's Notes and Discourses on Texts of Scripture, vol. i. p. 307—309.

ALTAR of Adam, in Antiquity, is pretended by some rabbins and others to have been erected by the first man soon after the fall; when, being overwhelmed with sorrow, a promise was made him by the ministry of the angel Haziel, that a Redeemer should be sent. In gratitude for this news, and for a perpetual remembrance thereof, Adam is said to have built an altar, and sacrificed on it a heifer.

The reliques of this altar have been mentioned by several writers of later ages.

ALTAR is sometimes also used among Christians for a square table, placed on the eastern side of the church, raised a little above the floor, and set apart for the celebration of the eucharist.

Its form is not borrowed either from that of the Heathen altars, or even from that of the Jews in the temple: but as the eucharist was instituted by Jesus Christ, at supper, and upon a table, the modern altar is made in form of a table; whence it is more usually, and even more significantly denominated *Communion Table*.

In effect the denomination altar is founded on this supposition, that the eucharist is a proper sacrifice; which, though the standing doctrine of the church of Rome, is utterly denied by most of the reformed. Accordingly, Bishop Ridley, in the reign of Edw. VI. A. D. 1550, issued injunctions for taking down all altars, and requiring the church-wardens of every parish to provide a table decently covered, and to place it in such a part of the choir or chancel as should be most meet, so that the ministers and communicants should be separated from the rest of the people. The reasons alledged for this alteration were these: because our Saviour instituted the Sacrament at a table, and not at an altar: because Christ is not to be sacrificed over again, but his body and blood to be spiritually eaten and drank at the holy supper, for which a table is more proper than an altar: because the Holy Ghost, speaking of the Lord's Supper, calls it the Lord's Table; 1 Cor. x. 21. but no where an "altar." The canons of the council of Nice, as well as the fathers St. Chrysostom and St. Augustine, call it the Lord's Table; and though they sometimes call it an altar, it is to be understood figuratively. An altar has relation to a sacrifice, so that if we retain the one we must admit the other, which would give great countenance to mass-priests: there are many passages in ancient writers that shew that communion tables were of wood, that they were made like tables, and that those who fled into churches for sanctuary did hide themselves under them: and the most learned foreign divines have declared against them, as Bucer, Oecolampadius, Zuinglius, Bullinger, Calvin, P. Martyr, Joannes Alaseo, Hedio, Capito, &c. and have removed them out of their several churches, and the Lutheran churches only retain them. Ridley, Cranmer, Latimer, and the rest of the English reformers were unanimously of opinion, that the retaining of altars would serve only to nourish in the minds of people the superstitious opinions of a propitiatory mass, and would minister an occasion of offence and division among the godly. Some of the bishops, however, refused to comply with the order of council, and suffered themselves to be deprived of their bishoprics for contumacy, October 1551. The practice of consecrating altars with their furniture was introduced and vindicated by Archbishop Laud in the reign of Charles I. but objected to by Prynne, as having no higher original than the Roman missal and pontifical, in both which there are particular chapters and set forms of prayer for this purpose; and it was alledged that the practice, as well as the arguments on which it was founded, have no foundation in reason or Scripture, and are contrary to the usage of the church of England, and the opinion of our first reformers. To the antiquity of altars it was replied, that though the name is often mentioned in Scripture, yet it is never applied to the Lord's table; but altars and priests are put in opposition to the Lord's table, and ministers of the New Testament, 1 Cor. ix. 13, 14. It was added, that it cannot be pretended by any law or canon of the church of England, that it is called an altar more than once, Stat. 1 Edw. VI. c. i. which statute was repealed within three years, and another made, in which the word altar is changed into table. It was said, that from the unanimous suffrage of most of the fathers that lived within 300 years after Christ, and of our most learned reformers, it appears, that for
above

above 250 years after Christ there were no altars in churches, but only tables; and that they were first introduced by Pope Sixtus II. and that the canons of the popish council of Aix, in 1583, are the only ones that can be produced for railing them in. The practice of bowing to the altar, charged on the archbishop as another innovation, was objected to as popish, superstitious, and idolatrous, being prescribed only by popish canons, and introduced to support the doctrine of transubstantiation, and having no foundation in antiquity, nor approved by any Protestant writers. Burnet's Hist. Reform. vol. ii. p. 150—159. Strype's Annals, vol. i. p. 160—162. Neal's Hist. Puritans, vol. i. p. 44, &c. vol. ii. p. 136—145, 4to.

In the primitive church the altars were only of wood, as being frequently to be removed from place to place. But the council of Paris, in 509, decreed, that no altar should be built but of stone.

At first there was but one altar in each church; but the number soon increased; and from the writings of Gregory the Great, who lived in the sixth century, we learn, that there were sometimes in the same church twelve or thirteen. In the cathedral of Magdeburg there are no less than 49 altars.

The altar is sometimes sustained on a single column, as in the subterraneous chapels of St. Cæcilia, at Rome, &c. and sometimes by four columns, as the altar of St. Sebastian of Crypta Arenaria; but the customary form is, to be a mass of stone-work sustaining the altar-table.

These altars bear a resemblance to tombs: to this purpose, we read in church-history, that the primitive Christians chiefly held their meetings at the tombs of the martyrs, and celebrated the mysteries of religion upon them. For which reason it is a standing rule to this day in the church of Rome, never to build an altar without inclosing the relics of some saint in it.

In lieu of proper altars the Greeks in process of time made use of ANTIMENSIA.

ALTAR of *Prothesis*, is a name given by the modern Greeks to a smaller, preparatory kind of altar, wherein they bless the bread, before it be carried to the large altar where the solemn liturgy is performed.

F. Goar maintains, that the table of *prothesis* was anciently in the sacristy or vestry; which he makes appear from some Greek copies, where sacristy is made use of in lieu of *prothesis*.

ALTAR is also used, in *Church History*, for the oblations or contingent incomes of the church.

In ancient days they distinguished between the church and the altar. The tithes, and other settled revenues, were called the church, *ecclesia*; and the other incidental incomes, the altar.

ALTAR, in *Astronomy*. See ARA.

ALTAR-tbane, in our *Ancient Law Books*, denotes a priest, or parson of a parish. In this sense the word is synonymous with *church-tbane*.

ALTARAGE, includes not only the offerings made upon the altar, but also the profit that arises to the priest on account of the altar.

ALTARIST, *altarista*, properly denotes the vicar of a church who serves the altar, and to whom the altarage or produce of the altar is assigned for his maintenance. Du Cange.

The *altarist* is sometimes also called *altarius*, sometimes *altar priest*.

ALTARIST is also used for *chaplain*.

ALTASRIF, in *Literary History*, the title of a medi-

cal book written in Arabic, describing the method of practice in use among the Arabs.

It was written by Alfabaravius, an author in the fifteenth century, and translated into Latin by P. Riccius in 1519. Concerning the history and contents of the *Al Tasrif*, see Freund, Hist. Phys. p. ii. p. 124, seq.

ALTAVELLA, in *Ichthyology*, the name of a flat cartilaginous fish, which, in the Linnean system, by Gmelin, is a variety of the Raja *Pastinaca*; with its wings, as they are called, that is, its thin and flat sides, broad and obtuse towards their lower part. The fishermen, from the resemblance these flat sides have to wings, have an opinion that this fish can fly. The tail is very short, scarce being of half the length of the body. Its flesh is solid and well tasted, and it always sells well in the markets. It is caught in the Mediterranean, and is frequently brought to market at Rome. Fab. Columna.

ALTAVELLA, in *Geography*, a town of Italy, in the kingdom of Naples, and province of Principato Ultra, seven miles south of Benevento.

ALTAVILLA, a town of Naples, in the province of Principato Citra, eighteen miles south-east of Salerno.

AL-TAYEF, a town of Hejaz, a district of Arabia Felix, situate above 60 miles east of Mecca, behind Mount Gazwan, where the air is very wholesome, but the cold more intense than in any other part of the district. Its territory abounds in fountains, and produces excellent raisins. The town is small, but surrounded with a wall.

ALTCHIRCK, or ALTKIRCH, a town of France, in the department of the Upper Rhine, situate on an eminence near the river Ill, five leagues west of Bale, and nine south of Colmar. N. lat. 47° 8'. E. long. 7° 8'.

ALTDORF, or ALTORFF, a large and handsome town of Swisserland, and capital of the canton of Uri, situate in the valley of the Reufs, and almost surrounded by steep mountains covered with trees, which throw a gloomy shade over the town. It has two convents, four churches, and several chapels, one of which was erected on the spot where was born William Tell, who is said to have shot the apple from his son's head in this town. Gesler, a tyrannical governor, placed over the free inhabitants of Uri by ALBERT I. among other oppressive and irritating measures, set a hat on a pole at Altdorf, and required the same respect to be paid to it as to his own person; but William Tell refusing to submit to this ignominious requisition, provoked the indignation of the governor, and was obliged to secure himself by flight. This circumstance, as some have reported, laid the foundation of the liberties of Swisserland, and occasioned an union of Uri, Schwitz, and Underwald, in 1308 for throwing off the Austrian yoke; and in 1315 these three cantons formed a perpetual alliance. This town is 20 miles south-east of Lucerne, and 33 south of Zurich. N. lat. 46° 55'. E. long. 8° 24'.

ALTE & *bafse*, in *Middle Age Writers*, denotes sovereignty, or a thing done with the supreme power. Du Cange.

ALTEA, in *Geography*, a sea-port town of Spain, in the Mediterranean, on the south-east coast of Valencia, eight leagues north-east of Alicante, and 17 south of Valencia. It trades in wine, flax, silk and honey. It was taken in 1705, in favour of the Archduke Charles, but lost after the battle of Almanza. N. lat. 38° 40'. W. long. 0° 16'.

ALTEN, or ALTENBOTTEN, a gulf of Norway, on the coast of Finnmark, in the government of Wardhus.

ALTENA, or ALTONA, a sea-port town of Germany, in Holstein, on the Elbe, in a situation favourable for commerce. It was burned by the Swedes in 1712, and afterwards

wards rebuilt and furrounded with walls. It is the port of the Danish East-India Company; half a league west of Hamburg. North lat. 54° . West long. $9^{\circ} 39'$.

ALTENA, a town of Flanders, five leagues north-east of Dendermond.

ALTENAU, a small mine-town of Germany, in the principality of Grubenhagen, situate in the Hartz forest, near the source of the Ocker, and furrounded by rugged mountains and rocks, eight miles south of Goslar. In this town there is a house for smelting silver.

ALTENBECKEN, or ALTEN BEIKEN, a town of Germany, in the circle of Westphalia, and bishopric of Paderborn, three miles east of Lipspring.

ALTENBERG, a town of Germany, in the duchy of Stiria, eight miles south of Weitsburg.

ALTENBERG, a town of Germany, in the circle of Erzgebirg, and prefecture of Altenberg. It is a mine-town, and the tin supplied by it is reckoned the best next to that of the English and Bohemian. The tin mine was discovered in 1458. Great quantities of lace are wove here. It has repeatedly suffered much from fire.

ALTENBURG, O-VAR, a small well-built town of Hungary, with a castle standing on a small branch of the Danube and Leitha, and secured by deep and wide moats. It has an annual fair, which lasts a week. It is 17 miles south of Presburg, and 40 south-east of Vienna. North lat. $47^{\circ} 56'$. East long. $23^{\circ} 15'$.

ALTENBURG, a town of Germany, in the duchy of Stiria, on the Sann, eight miles south-south-west of Windisch Gratz.

ALTENBURG, or OLDENBURG, a town of Germany, in the duchy of Holstein, on a river which runs into the Baltic, about three leagues to the east, 19 leagues north-east of Hamburg. North lat. $54^{\circ} 18'$. East long. $11^{\circ} 4'$.

ALTENBURG, a town of Germany, in the circle of Upper Saxony, anciently called *Plisue*, the capital of a principality of the same name. It is large and populous, and has a castle seated on a rock, which was the residence of the former electors and dukes. It was anciently an imperial city, and the capital of the country of Pleissen. In this town are a place of education for young ladies of decayed families, a house belonging to the Teutonic order, a gynnasium illustre founded in 1703, with a good museum and library, an orphan house, and a house of correction. It is 20 miles south of Leipzig, and 52 west of Dresden. North lat. $50^{\circ} 59'$. East long. $12^{\circ} 52'$. The principality of Altenburg is a part of the ancient Osterlands; and the soil is very fertile in corn, and affords good pasture. It has large breeds of horses, and plenty of wood; and its mines yield copper and cobalt, and other minerals. The states of this principality are divided into those of the Altenburg, Saalfeld and Eifenberg circles, and consist of the nobility and towns of these three districts. Their provincial meetings are held at Altenburg. The religion of the country is Lutheranism.

ALTENBURG, a town in the circle of the Upper Rhine, and bishopric of Spire, two miles north-west of Bruchsal, and nine south-south-east of Spire.

ALTENBURG, a town in the circle of the Upper Rhine, two miles north-west of Wetzlar, and two north-east of Braunfels.

ALTENBURG, a town in the county of Tyrol, nine miles north-east of Glurns.

ALTENBURG, a small village of Swisserland above Bruck, in the canton of Bern, situate on the river Aar, and known by its Roman antiquities, and the ruins of *Castrum Vindonifense*.

ALTENBURG, a town in the archduchy of Austria, two miles south-west of Horn.

ALTENBURG, TEUTSCH, a town in the archduchy of Austria, near Hamburg.

ALTENHAFEN, a town of Germany, in Carinthia, with a citadel on the Gurck, four miles north from S. Veit.

ALTENHOVEN, a town of the archduchy of Austria, on the Danube, four leagues east of Lintz.

ALTENKIRCHEN, a town of the circle of Westphalia, and county of Sayn, in the prefecture of the same name; both which are fiets of the elector of Cologne. It is 15 miles north-north-east of Coblentz. North lat. $50^{\circ} 38'$. East long. $7^{\circ} 27'$.

ALTENKIRCHEN, is also a town of the circle of Upper Saxony, in the island of Rugen, 16 miles north of Bergen.

ALTENMARKT, a town of Germany, in the duchy of Stiria, 14 miles north-east of Rottenmann.—Also, a town of the archduchy of Austria, four miles south-west of Baden. Also, a town of the same archduchy, 24 miles east of Steyregg, and 58 west of Vienna.—Also, a town of the circle of Upper Bavaria, on the river Alza, and near Rastadt.

ALTENRIFF, a town of Swisserland, in the canton of Friburg, six miles south of Gruyeres.

ALTENSOLEN *island*, lies eastward of the south point of Maggeroe island, on the coast of Norway, has a good road and shelter for all winds, and affords a passage for ships to sea northward, without going round the cape. It is about 3° east from Surroy island. North lat. 71° . East long. 26° .

ALTENSPACH, a town of Germany in Swabia, between the lakes of Conitance and of Zell.

ALTENSTADT, a market town in a prefecture of the same name, of Ulm in Germany, seated on the Fils, and anciently belonging to the counts of Spitzenberg.

ALTENSTEIG, a town of Germany, in the duchy of Wurtemberg, situate on the Schwarzwalde, 24 miles south-west of Stuttgart, and 32 east of Straßburg. North lat. $48^{\circ} 31'$. East long. $8^{\circ} 29'$.

ALTENWIED, a town in the circle of the Lower Rhine, in the archbishopric of Cologne, 15 miles north of Coblentz, 5 east of Lintz, and 26 south-east of Cologne.

ALTERANT, or ALTERATIVE, in *Medicine*, a property or power, in certain remedies, whereby they induce an alteration in the body, and dispose it for health and recovery, by correcting some indisposition, without occasioning any sensible operation.

Alteratives, therefore, must generally be either such remedies as destroy some prevailing acrimony in the *prima via*, or virus lurking in the fluids; or, as many believe, correct various acrimonies dispersed through the mass of the blood; or else such as resolve indurations, or calculous concretions, and prepare them when thus resolved, to pass out of the body, by the common emunctories, without the *patient's* being conscious of any important evacuation.

Alteratives may be classed under three heads, viz.

1. Such as subdue *virus*, or, as many call it, *morbid matter*, in the whole system or a part of it. When the venereal *virus* or action is subdued or removed by mercury, or when serofulous or cancerous acrimonies, as they are called, are corrected by internal remedies, they furnish instances of this class. To the same head might, perhaps, be referred the cure of all animal poisons; the vegetable and mineral ones commonly require *evacuants* also.

2. Such as change the quality or texture of the blood itself, and often some of the secretions from it. These remedies are generally to be sought for in diet and regimen, together with those medicines called *Tonics*; such as bark and steel. Some physiologists however believe that the blood

can only be changed by first changing the action of the solids, and this opinion is at present gaining ground.

In the third class may be placed such as act on the nervous system, often called ANODYNES, EMOLLIENTS, &c.

If we employ the term *alterative* in a more extended sense, to denote any means by which an alteration for the better can be produced, we should be obliged to refer all diet and medicines to this head; and even with the limitation, of "without a sensible operation," we find it no easy task to decide in all cases what remedies should be included under alteratives.

We think a warm or cold climate may act as an alterant; so may issues or setons; others go so far as to say that evacuates are the best alteratives; others, on the contrary, ascribe even the salutary effects of evacuants to their alterative nature. This has been alledged of mercury in the cure of the venereal disease; and of it and ipecacuanha in the cure of dysenteries; but it must be observed that these articles succeed best when administered in *alterant doses*.

The arrangement of the MATERIA MEDICA, as well as the modus operandi of remedies, will furnish much diversity of opinion for several centuries: it is, fortunately, a ground of dispute that never has, nor ever will materially injure the *practice* of either medicine or surgery.

ALTERATA, in *Music*, a term used by the French as well as the Italians, for temperament, in speaking of intervals, and likewise of extreme consonance and dissonance: as an extreme sharp 6th, a redundant 5th, an extreme flat 7th, &c.

ALTERATE. See SESQUIALTERATE.

ALTERATION, ALTERATIO, in *Physics*, the act of changing the circumstances and manner of a thing: its general nature and appearance remaining the same.—Or, it is an accidental, and partial change in a body: without proceeding so far as to make the subject quite unknown, or to take a new denomination thereupon. Or, it may be defined, the acquisition or loss of such qualities as are not essential to the form of the body. Thus a piece of iron, which before was cold, is said to be *altered*, when it is made hot; since it may still be perceived to be iron, is called by that name, and has all the properties thereof. By this, *alteration* is distinguished from *generation* and *corruption*; those terms expressing an acquisition or loss of the essential qualities of a thing.

The modern philosophers, after the ancient chemists and corpuscularians, hold all alteration to be effected by means of local motion. According to them, it always consists either of the emission, accession, union, separation, or transposition of the component particles.

Aristotle makes a peculiar kind of motion, which he calls the *motion of alteration*.

ALTERATION is used, in *Medicine*, to denote a change in the state and qualities of an animal body, in respect of temperature or constitution, health or sickness.

In this sense, alteration includes both *evacuation* and *accretion*.

ALTERATION is more strictly taken for a change in the quality of the body, contradistinguished from *evacuation* and *apposition*.

In which sense, alteration is the effect of medicines called ALTRANTS.

Alteration is chiefly applied in respect of the fluids or humours of the body. When applied to the solids, it is chiefly to affect the humours, or the motions of them.

ALTERATION is sometimes also applied in respect of the vital motions of the body.

Thus specifics are applied to alter and rectify convulsive and other disorderly motions. The alteration of the humours is either extrinsic, or intrinsic. The former is a change produced in the sensible appearances, as colour, thicknets,

and the like: and the latter is a change in the primitive crasis, or constitution of a fluid.

ALTERATION in a sense still more strict, denotes that conversion which the food undergoes, to render it nourishment. In this sense alteration both includes the digestion performed in the stomach, and the assimilation in the habit of the body.

It is disputed among physiologists what the alteration is which the food undergoes.—Some reduce it to a mere comminution or trituration.—Others assert a total transubstantiation. See DIGESTION.

ALTERATION of quantities, among *Algebraists*, denotes what we otherwise call variation, or permutation.

ALTERATIVE, in *Medicine*, the same with ALTERANT.

ALTERCATION, a debate or contest between two friends, or acquaintance. The word comes from *altercari*; which anciently signified to converse, or hold discourse together. Thus, we say, they never come to an open quarrel; but there is continually some little altercation or other.

ALTER DO CHAO, in *Geography*, a small town of Portugal, in the province of Alentejo, 12 miles west of Pontalegre, and 84 east-north-east of Lisbon. North lat. 39° 8'. West long. 6° 38'.

ALTERE, a town of Flanders four leagues west of Ghent.

ALTERIO, a town of Naples, in the province of Calabria Citra, 17 miles east-north-east of Cosenza.

ALTERN, a town and castle of Germany, in the circle of Upper Saxony, in the county of Mansfeld.

ALTERN, *base*, a term in *Trigonometry*, contradistinguished from *true base*, thus—In an oblique triangle, the true base is either the sum of the sides; in which case, the difference of the sides is called the *altern base*; or the true base is the difference of the sides; in which case, the sum of the sides is called the *altern base*.

ALTERNANTHERA, in *Botany*, a genus of the *triandria monogynia* class and order; the characters of which are, that the *calyx* has five leaves; no *corolla*; six filaments, alternately barren; the stigma bifid; and the *seeds* solitary. There is one species, *viz.* *A. repens*. Forsk. Fl. Æg. Arab. p. 28.

ALTERNATE, or ALTERNATIVE, is understood of several things which succeed, or are disposed after each other by turns.

We say, an *alternate*, or *alternative* office, or trust, which is that discharged by turns; so, two general officers, who command each his day, are said to have the command *alternately*.

In *Botany*, the term *alternate* is applied to branches, leaves and flowers, when, instead of being opposite, they spring out regularly one above another: such are the leaves of borragé, or chequered daffodil. See LEAF.

ALTERNATE, in *Arithmetic*. See ALLIGATION.

ALTERNATE angles, in *Geometry*, are the internal angles made by a line cutting two parallels, and lying on the opposite side of the cutting line; the one below the first parallel, and the other above the second.

Thus *x* and *u*, and *z* and *y* (*Plate I. fig. 1. Geometry*.) are alternate angles, and these angles are equal to another.

There are also two external angles, *alternately* opposite to the internal ones. See PARALLEL.

ALTERNATE ratio or proportion, is that which the antecedents and consequents bear respectively to each other in any proportion, which has the quantities of the same kind.

Thus, if $A : B :: C : D$; then, *alternately*, $A : C :: B : D$.

ALTERNATE, in *Heraldry*, is used in respect of the situations of the QUARTERS.

Thus in quarterly *cartels*, the first and fourth quarters are

are *alternate*; and are usually of the same nature. And the like holds of the second and third.

ALTERNATION, in its primary sense, denotes a succession by turns.

ALTERNATION is more particularly used among *Civilians*, for disjunction, as in saying this or that.

ALTERNATIONS, in *Arithmetic*, a term sometimes used to express the divers changes, or alterations of order, in any number of things proposed. This is also called *permutation*, &c. and is easily found by a continual multiplication of all the numbers, beginning at unity.

If there be two quantities *a* and *b*, they admit only of 1×2 , or 2 changes, as *ab, ba*. If a third quantity *c* be added, this will admit of 3 changes with each of the two former; that is, it may be first, second or third in each of them; and therefore in this case the number of changes will be $1 \times 2 \times 3 = 6$. A fourth quantity will admit of 4 changes with each of the preceding quantities; that is, it may be first, second, third or fourth, or the whole number will be $1 \times 2 \times 3 \times 4 = 24$. If the number be *n*, multiply the series of natural numbers 1, 2, 3, 4, &c. continually to *n*, and the last product will be the number of alternations required.

Thus, if it be required to know how many changes or *alternations* can be rung on six bells, multiply the numbers 1, 2, 3, 4, 5, 6, continually one into another; and the last product gives the number of changes. See **CHANGES** and **COMBINATION**.

ALTERNATIVE, is particularly used for the choice of two things proposed.—In this sense we say, to take the *alternative* of two propositions.

ALTERNIA, in *Ancient Geography*, a town of Spain, belonging to the Carpetani.

ALTERS, or **ALTARS**, in *Nautical Geography, are a stony shelf, westward of Languard Fort, about a cable's length and a half, on which there are no more than five or six feet of water at low water, so that ships should keep near the fort till they have passed it, and then edge off a point or two to the west, till they come athwart of the north point of Harwich. Malham's Naval Gazetteer.*

ALTES, in *Ancient Geography*, a town of Peloponnesus, situate on the Caldaïis, which fell into the river Alpheus.

ALTESSAN, in *Geography*, a town of Italy, in the principality of Piedmont, three miles north of Turin.

ALTEZEY, or **ALTZHEIM**, a town and castle of Germany, in the Lower Palatinate, capital of a territory of the same name, situate on a small brook which runs into the Saltz, 15 miles south-west of Mentz, and 14 north-west of Worms. North lat. $49^{\circ} 40'$. East long. $8^{\circ} 12'$.

ALTHA, in *Ancient Geography*, a town of Babylonia, upon the Tigris, and in dependence upon Apamea, according to Ptolemy.

ALTHÆA, *Αλθαία* of Dioscorides, from *αλθεο*; a remedy, or *αλθισμω* to heal, or as Dioscorides says *διὰ τὸ πολυαλθεῖς; αἰνῆς*, from its many excellent qualities, in *Botany*, a genus of the *monadelphia polyandria* class and order, or the natural order of *columniferae*, and *malvaceæ* of Jussieu: its characters are, that the *calyx* is a double perianthium, outer smaller, one-leaved, unequally novem-fid or nine-cleft, (6—12) divisions very narrow, inner semiquinquefid, divisions broader and sharper; the *corolla* is five-petalled, united at the base, obcordate, præmorse and flat; and the *stamina* have many filaments inserted into the corolla, anthers subreniform: the *pistillum* has an orbiculate germ, style cylindrical and short, stigmas many (20), setaceous, of the length of the style; the *pericarpium* consists of arils not jointed, forming a flat ring about a columnar receptacle; they are deciduous and open on the inside; the *seal* is one, flat-kidney-shaped in each aril.

There are seven species, *viz.* 1. *A. officinalis*, common marsh-mallow, with leaves simple and downy, (subquinquelobed, Smith.) or with leaves undivided, angular and cotteny (Withering): the root salsiform or spall-shaped; the stalks erect, almost three feet high, simple, cylindrical, slender like a twig, foliose; the leaves alternate, petiolate, cordate, acute, subquinquelobed, 5-angled and serrated; the pedicels axillary, dense, many-flowered, shorter than the pedicels; the external calyx often ten-cleft, also twelve-cleft, the inner five-cleft; the corolla and stamina are purple flesh-coloured; the stigmas are numerous; the capsules compressed; the whole herb very softly pubescent or clothed with a very soft wool or velvet, with bellated interwoven hairs. It is perennial and flowers from July to September. It grows plentifully in salt marshes, and on the banks of rivers and ditches in Cambridgeshire, Norfolk, and Suffolk, and the sea-shores of Cornwall, in Holland, France, Italy, Siberia, &c. There is a variety of this, with the leaves rounder and not ending in a point, called by Ray *A. vulgaris similis, folio retuso brevi*, and found in the isle of Ely; it varies also with lacinated leaves.

2. *A. cannalina*, hen-p-leaved marsh-mallow, with the lower leaves palmate, (dentated, Gmelin,) upper digitate, (hastate, the middle lacinia the longest, Gmelin.) This has a woody stem, four or five feet high, which push out many side branches; the leaves are alternate; the flowers axillary, less than those of the former species, but of a deeper red colour, and the calyx much larger. This seldom flowers the first year, except in a warm summer. It grows naturally in Hungary, Istria, Austria, Carniola, Italy, the south of France, &c. by the sides of wood; and was cultivated here by Gerard, in 1597. 3. *A. hirsuta*, hairy marsh-mallow, with leaves trifid, hairy-hispid, smooth above; peduncles solitary and one-flowered. This is a low plant, its branches trailing on the ground, the flowers axillary, smaller than those of the common sort, and have purplish bottoms; the stalks are woody, and seldom last more than two years; the outer calyx is eight-leaved, the inner as long as the corolla, and acuminate; the corolla cremulate. This species grows wild in Spain and Portugal, Italy, Austria, Carniola, Germany, Switzerland, and France; and was cultivated in Kew garden in 1683, by Mr. J. Sutherland. 4. *A. Ludwigi*, Ludwig's marsh-mallow, alcea of Ray's hist. with leaves lobed, naked on both sides, and peduncles collected and one-flowered. This resembles *malva alcea*; the peduncles are axillary from two to five, the outer calyx eight-leaved, and leaflets lanceolate, the inner shorter, quinquefid, very rough, with white villous hairs. 5. *A. Narbonensis*, Narbonne marsh-mallow, with leaves tomentose on both sides; the lower five-lobed, the upper three-lobed, peduncles solitary, one-flowered. The root is perennial, stems are annual, from four to six feet in height, round, and of the thickness of a finger, hoary with whitish stellate hairs; stipules subulate, acute and ciliate; leaves alternate, petioled, serrate; bractes subulate and small; the segments of the outer perianthium are six or seven, deeply cut, lanceolate, and acute; corolla purple-rose-coloured, twice as long as the calyx; anthers dark-purple; stigmas white; and arils smooth; first discovered by Abbé Pourret near Narbonne, found also in Spain, flowers in August and September, and introduced into Kew garden, in 1780, by M. Thouin. 6. *A. corymbosa*, with leaves simple, cordate or angular, and smooth, peduncles and calyxes hairy, and flowers in corymbs; a native of Jamaica. 7. *A. racemosa*, *Pavonia spicata* of Cavan. and Gmelin, with leaves simple, cordate, ovate, serrate, scabrous on the upper surface, and raceme terminating and erect. The stems are thick, stiff, five feet high, with many branches, leaves

leaves alternate on long petioles; stipules lanceolate and acuminate; outer calyx deeply eight-cleft, inner somewhat tubulose, with five notches; corolla yellow, double the length of the calyx; the petals oblong, almost entire, marked with deeper-coloured streaks; the fruit composed of five bivalve capsules; a native of Jamaica. Instead of this species Gmelin inserts *A. grandiflora*, with cordated, angulated, tomentose, patulous leaves, and subtriflorous peduncles. Martyn. Withering. Smith. Gmelin's Linn.

Culture. The first species may be propagated either by seeds, sown in the Spring, or by parting the roots in Autumn, which is the best season for the purpose. It will thrive in any soil or situation, but grows larger in moist places than on dry land; the plants, whose roots spread wide, should not be nearer than two feet. The second species is propagated by seeds sown in the Spring, in a dry soil and sheltered situation; this sort seldom continues longer than two years in England, but as the seeds ripen here, the plants may be had in plenty. If the seeds of the third species be sown in April, the plants will flower in July, and seeds ripen in September; and they should be sown where they are to remain.

ALTHÆA, in the *Materia Medica*. The *Althæa officinalis* seems to have been known to the ancients, called by Dioscorides *Αλθαία* or *Ιβισκος*, by Galen *Εβισκος*, and by Pliny *Hibiscum*. It is probably the *Hibiscus* of Virgil, *Ecl. x.v. 30*, and *v. 71*.

“Hædorumque gregem viridi compellere hibisco.”

It has been much used by medical practitioners in every country where medicine has been regularly cultivated. All its parts abound with a glutinous juice, with scarcely any smell or peculiar taste. The dry roots, boiled in water, give out half their weight of gummy matter, which is thought to be nearly allied to gum arabic, tragacanth, starch, &c. and dissolves myrrh, and some other resinous substances more readily than gum; and on evaporating the aqueous fluid, forms a flavourless, yellowish mucilage. The leaves afford scarcely one-fourth of their weight, and the flowers and seeds still less. The mucilaginous matter is the medicinal part of the plant, and it is commonly employed for its emollient and demulcent qualities. It is recommended for obtunding and increasing acrimonious thin fluids, in tickling coughs from desfluxions on the fauces and lungs, in hoarseness, erosions of the stomach and intestines, difficulty and heat of urine, the dysentery, costiveness, and gonorrhœa; and for lubricating and relaxing the passages in nephritic and calculous complaints. It has been given in powder, from a scruple to a dram or two, either by itself, or in conjunction with other substances of a similar nature; it is seldom administered in this form: but it is taken to better advantage in that of an infusion or decoction. Dr. Cullen observes, (*Mat. Med. vol. ii. p. 411.*) that demulcents of this kind can have no effect as such in the mass of blood, or in passing by various excretions. The *Althæa* has been often applied in various external affections. The root boiled in honey and chewed by infants has mitigated difficult dentition; and milk, in which this root, figs and a small quantity of saffron have been boiled, has relieved the gums. The decoction is said to be useful in ophthalmiæ; and a gargarism made of the decoction of this root and figs has been serviceable in sore throats. The root, cut and boiled in water or milk, has formed a convenient and useful cataplasm for softening and ripening tumors; and it has been often added to glysters. The root was formerly used as an ingredient in several compounds of the pharmacopœias; but it is now directed only

in the form of a syrup. This is prepared by boiling a pound of the fresh roots bruised in a gallon of distilled water to one half, and pressing out the liquor when cold; and when it has settled for 24 hours, so that the feculencies may subside, the liquor is poured off, and four pounds of double-refined sugar being added to it, the liquor is boiled down to six pounds weight. This syrup is employed occasionally in some disorders of the breast, and for sweetening mollient decoctions in nephritic cases. Lewis. Murray. Woodville.

ALTHÆA. See *HERMANNIA*, *HIBISCUS*, *LAVATERA*, *MALVA*, *MELOCHIA*, *NAPÆA*, *SIDA*, and *WALTHERIA*.

ALTHÆA Frutex. See *HIBISCUS*.

ALTHÆA, *Althæa Olcadum*, *Orgaz*, in *Ancient Geography*, a town of Spain, belonging to the Olcades; mentioned by Polybius under this name, but called Carthæia by Livy, in speaking of the exploits of Hannibal.

ALTHAMERUS, *ANDREW*, in *Biography*, a Lutheran minister at Nuremberg, lived in the 16th century, and attended the conferences at Berne, in 1528, which prepared the way for the reformation in that canton. He was so zealous an advocate for justification by grace, in opposition to the merit of good works, that he inveighed in a very indecent and outrageous manner against the apostle James, and gave him, almost, the lie direct. Grotius cites a passage from his “Annotations on James,” printed at Strasburg, in 1527, in which he charges the apostle with running counter to Scripture, and opposing his single authority against that of the Holy Ghost, the law, the prophets, Christ, and his apostles. Besides some works in divinity, he compiled a dictionary of the proper names in the Bible, “*Sylva Biblicorum nominum, &c.*” printed at Basil in 1535; “*Conciliationes locorum Scripturæ*,” published at Nuremberg in 1535, and at Wittemburg in 1582; and notes upon Tacitus, “*De Situ, moribus et populis Germaniæ*,” printed at Nuremberg in 1529 and 1536, and at Amberg in 1609, 8vo. *Gen. Dict.*

ALTHÆNUS, in *Ancient Geography*, a stream of Daunia, in Italy, the waters of which were said to cure all sorts of wounds.

ALTHEË, in *Geography*, a town of France, in the department of the Mayenne, and chief place of a canton, in the district of Craon, four leagues south-south-west of Laval.

ALTHEA, in *Entomology*, a species of *PAPILIO*, in the class of *Nymphales*, with dentated brown wings, and also a fascia and striga angular-dentated and white, found in Guinea.

ALTHEIM, in *Geography*, a market town of Upper Bavaria, in the district of Maurkirchen, eight miles east of Braunau.

ALTHEPIA, in *Ancient Geography*, a small country, placed by Pausanias, in the Argolide, near Trezena, which had borne the appellation of Orvea.

ALTHUSIUS, *JOHN*, in *Biography*, a German civilian, towards the latter end of the 16th century, advanced free principles on political subjects, which gave great offence to some of his contemporaries. He was a Protestant; and from being a professor of law, at Herborn, he was raised to the dignity of syndic, at Bremen. The fundamental principles of his “*Politics methodically digested*,” printed at Herborn, in 1603, are these; “that kings are mere magistrates; that the chief power of every commonwealth is in the people only; that it is lawful to depose a tyrant, to turn him out of the administration, and even to put him to death, if no other remedy can be found, and to chuse another in his room. He also composed a treatise “*De jurisprudentia Romana;*”

Romana;" another "De Civili Conversatione;" and other tracts. Gen. Dict.

ALTICA, in *Entomology*, a species of the CANTHARIS, with a red thorax, and violet unspotted elytra, found at the Cape of Good Hope.

ALTICÆ, a class of the genus CHRYSOMELA, distinguished as saltatory, and having their posterior thighs incrassated.

ALTIDIUM, in *Ancient Geography*, a place of Italy, in Umbria, north-east of Noceria.

ALTIKEN, in *Geography*, a prefecture of Zurich, in Switzerland, in which is a parochial village of the same name, not far from the Thur.

ALTILIA, a town of the kingdom of Naples, and province of Calabria Citra; 11 miles south of Cosenza.

ALTILIO, GABRIEL, in *Biography*, was born in the kingdom of Naples, and flourished about the end of the 15th century. He died about the age of 60, in 1501. He was preceptor to prince Ferdinand; and afterwards employed in state affairs, as he accompanied Jovianus Pontanus to Rome, in order to negotiate a peace between king Ferdinand and pope Innocent VIII. His reputation as a Latin poet attracted notice, and contributed to his promotion to the bishopric of Policastro. The distinguished excellence of his Latin verses led his contemporaries to regard him as a person who was intimately conversant with polite literature, and who had studied the ancients with great improvement. In the delicacy of his elegies and the sublimity of his heroics, he is said to have so much excelled, that in the opinion of Pontanus and Actius, he was equal to the ancient poets. Most of his poetical performances are lost; but some of them are preserved in the "Deliciæ Poetarum Ital." Gen. Dict.

ALTIMETRY, ALTIMETRIA, compounded of *alus*, high, and *μετρεω*, metior, to measure, the art of taking or measuring ALTITUDES or heights, whether accessible or inaccessible.

Altimetria makes the first part of geometry; including the doctrine and practice of measuring both perpendicular and oblique lines; whether in respect of height or depth.

ALTIN, in *Commerce*, a money of account in Muscovy; worth three copecks, one hundred of which make a ruble, worth about four shillings and six pence sterling.

They have had occasionally altin coins, both of copper and silver. Those of the silver altins under Peter I. had on one side the eagle, and on the other, with the date of the year, the word ALTINIK. But for a long time no more altins have been struck; and those of silver are now seldom to be seen.

ALTIN, or ALTYN-NOOR, LAKE, in *Geography*, a lake of Siberia, in the government of Kolhyvan, is situated on a very considerable elevation of the ALTAIAN mountains, by which it is also entirely surrounded. N. lat. 49°. E. long. 105°. It is also called by the Russians Teletzkoe-ozero and Altain-kul. Its length is computed at 126, and its greatest breadth at 84 versts. From it proceeds the river By, which at its confluence with the Katunia assumes the name of Oby. The bottom of this lake is rocky, and the northern part of it is sometimes frozen so hard as to be passable on foot; but it is said, that the southern part is never covered with ice. The water on this lake and the adjacent rivers rises only in the middle of Summer, when the snow on the mountains is dissolved by the heat of the sun.

ALTIN, a town of Naples, in the province of Abruzzo Citra; nine miles south of Langiano.

ALTINCAR, among *Minerals*, a species of factitious salt used in the fusion and purification of metals.

The altinear is a sort of flux powder. Divers ways of preparing it are given by Libavius.

ALTING, HENRY, in *Biography*, was born at Embden, in 1583, and, having devoted himself to the profession of a divine, he was sent in 1602 to the university of Herborn, where he became a professor. In 1608 he was appointed preceptor to the electoral prince palatine, and in 1612 accompanied him to England, where he was introduced to the acquaintance, among others, of archbishop Abbot. In 1613 he returned to Heidelberg, where he took his degree of doctor of divinity, and was appointed director of the college of Wisdom. At the synod of Dort, to which he was deputed in 1618, he distinguished himself by his prudence and eloquence. After his return to Heidelberg, he very narrowly escaped falling a sacrifice, when the city was taken in 1622, by count Tilly; for, as he was entering the house of the chancellor, one of the guards met him, and ignorant of his person, threatened his life; "with this battle-axe I have this day killed 10 men; Alting, if I knew where to find him, should be the 11th." Alting replied, with a resolution and constancy of mind, and at the same time with an allowable evasion, which saved his life: "I am a teacher in the college of Wisdom." When the Jesuits took possession of the house, he concealed himself in a garret, and was secretly supplied with food, till he had an opportunity of making his escape, and of following his family to Heilbron. After the desolation of the palatinate by count Tilly's forces, he retired to Schorndorf; but here, although situated among Protestants, he encountered new trials. The Lutheran ministers of Schorndorf, who were at variance with the professors of Heidelberg, were dissatisfied with the permission which the duke of Wirtemberg had given to one of these professors to reside among them; and by reason of their jealousy and intolerance, Alting was obliged to remove to Embden in 1623, from whence he followed his late pupil, who was king of Bohemia, to the Hague. Under the patronage of this prince, and in the office of tutor to his eldest son, he remained till the year 1627, when he obtained his permission to remove to Groningen, where he was appointed to the professorship of divinity, which he retained till his death. Such were his talents and character and public services, that he was held in very general estimation; but the confusion and troubles of that period prevented his taking possession of the office of divinity-professor at Heidelberg, to which he was appointed by prince Lewis Philip, administrator of the palatinate. Domestic affliction, occasioned by the loss of his eldest daughter and his wife, brought upon him a settled melancholy, which, after a few months, put a period to his life, in the year 1644. Alting, though he was no friend to the innovations introduced at this period by the Socinians, was of a moderate and peaceable temper, and indisposed to dispute and quarrel about trifles. "Adhering," as he judged, "to the plain doctrine of scripture, he was equally desirous to avoid sophistical subtlety and fanatical scrupulosity." His works were, "Note in Dilem Problematum; Johannis Behm;" Heidelb. 1618; "Locis Communes;" "Problemata;" "Explicatio Catechesos Palatine;" Amstelod. 1646; "Exegesis Augustanae Confessionis;" Sc. Amst. 1647; "Methodus Theologicæ Didacticæ et Catechetice;" "Medulla Historiæ Profanz;" published under the name of PARÆUS. Gen. Dict.

ALTING, JAMES, son of Henry Alting, was born at Heidelberg, in 1618, and after finishing his studies at Groningen, became professor in that university. Attached to

the study of the oriental languages, he put himself, in 1638, under the tuition of a Jewish Rabbi, at Embden. Upon his visit to England, in 1640, he was admitted to clerical orders by Dr. Prideaux, bishop of Worcester; but he altered his purpose of continued residence in this country, as soon as he received an invitation to the Hebrew professorship, at Groningen. He returned to Germany in 1643, and obtained considerable distinctions of honour in the university. In this situation a rivalry commenced between him and his colleague, in the professorship of divinity, Des Marets. The latter was addicted to the scholastic philosophy and plan of instruction; whereas the former devoted himself to the study of the Scriptures and Rabbinical learning, and acquired a degree of popularity, as a lecturer, which excited the jealousy and opposition of Des Marets and his adherents. A dispute between these coadjutors, who were now become competitors and rivals, had for some time prevailed; and at length the decision of it was referred to the divines of Leyden. These umpires pronounced Alting innocent of heresy, but fond of innovation, and Des Marets deficient in modesty and candour. The civil power was at last obliged to interfere, and the penalty of deprivation was decreed against those divines, who should in any ecclesiastical assembly revive the Maretsio-Altingian controversy. The magistrates proceeded by an usurpation of authority which did not belong to them, to prohibit even writing for or against the judgment of the divines of Leyden. This breach between the two professors was never thoroughly compromised; though, by the interposition of friends, a kind of formal reconciliation was effected, while Des Marets lay on his death-bed. Alting did not long survive him, but was taken off by a fever, in 1679. He was reproached, in consequence of his attachment to Rabbinical learning, with an inclination to become a Jew. His works were collected some years after his death, and published in five volumes folio, under the care of Bekker, minister at Amsterdam, by his cousin Menſſ Alting, burgo-master of Groningen, who wrote a good description of the Low Countries, entitled, "Notitia Germaniæ Inferioris." It is said that he preached well in three languages, German, Dutch, and English. Gen. Dict.

ALTITUDE, in *Geometry*, the third dimension of body, considered with regard to its elevation above the ground—called also *height* or *depth*.

ALTITUDE of a figure, is the distance of its vertex from its base, or the length of a perpendicular let fall from the vertex to the base.

Thus, *KL* (*Plate I. Geometry, fig. 2.*) being taken for the base of the right angled-triangle, *KLM*: the perpendicular *KM* will be the altitude of the triangle.

Triangles of equal bases and altitudes are equal; and parallelograms, whose bases and altitudes are equal to those of triangles, are just the double thereof.

ALTITUDE, in *Optics*, is usually considered as the angle subtended between a line drawn through the eye, parallel to the horizon, and a visual ray emitted from an object to the eye.

For the laws of the vision of altitudes. See **VISION**.

If through the two extremes of an object, *S* and *T* (*Plate I. Optics, fig. 13.*) two parallels, *TV* and *SQ* be drawn; the angle *TVS*, intercepted between a ray passing through the vertex *S*, and terminating the shadow thereof in *V*, makes, with the right line *TV*, what is called, by some writers, the *Altitude of the Luminary*.

ALTITUDE, in *Cosmography*, is the perpendicular height of an object, above the plane of the horizon.

Altitudes are divided into *accessible* and *inaccessible*.

ALTITUDE, accessible, of an object, is that whose base you can have access to, so as to measure the nearest distance between your station, and the foot of the object on the ground.

ALTITUDE, inaccessible, of an object, is that whose base cannot be approached, by reason of some impediment; such as water, or the like.

There are three ways of measuring altitudes, *viz.* *geometrically, trigonometrically, and optically*.—The first is somewhat indirect and unartful; the second is performed by means of instruments for the purpose; and the third by shadows.

The instruments chiefly used in measuring of altitudes, are the quadrant, theodolite, geometric quadrat, or line of shadows, &c. the descriptions, applications, &c. whereof, see under their respective articles **QUADRANT**, **THEODOLITE**, and **QUADRAT**.

ALTITUDES, to take accessible. To measure an accessible altitude *geometrically*.—Suppose it required to find the altitude *AB* (*Plate I. Geometry, fig. 3.*) plant a staff, *DE*, perpendicularly in the ground, of such height as may be equal to the height of the eye. Then, lying prostrate on the ground, with your feet to the staff; if *E* and *B* prove in the same right line with the eye *C*, the length *CA* is equal to the altitude *AB*. If some other lower point, as *F*, prove in the line with *E*, and the eye, you must remove the staff, &c. nearer to the object: on the contrary, if the line continued from the eye over *E*, mark out some point above the altitude required; the staff, &c. are to be removed farther off, till the line *CE* raise the very point required.—Thus, measuring the distance of the eye *C* from the foot of the object *A*, the altitude is had; since $CA = AB$.

Or thus: at the distance of thirty, forty, or more feet, plant a staff *DE* (*fig. 4.*) and at a distance from this, in *C*, plant another shorter one, so as that the eye being in *F*, *E* and *B* may be in the same right line therewith. Measure the distance between the two staves, *GF*; and between the shortest staff and the object, *HF*; as also, the difference of the heights of the staves, *GE*.—To *GF*, *GE*, and *HF*, find a fourth proportional *BH*.—To this add the altitude of the shorter staff, *FC*. The sum is the altitude required, *AB*.

To measure an accessible altitude, *trigonometrically*.—Suppose it required to find the altitude *AB* (*fig. 5.*) choose a station in *E*; and with a quadrant, theodolite, or other graduated instrument duly placed, find the quantity of the angle of altitude *ADC*. Measure the shortest distance of the station from the object, *viz.* *DC*, and this of consequence is perpendicular to *AC*.

Now, *C* being a right angle, it is easy to find the side *AC*; since, in the triangle *ACD*, we have two angles, *viz.* *D* and *A* its complement, and a side opposite to one of them, *CD*, the side opposite to the other may be easily found by this canon. As the sine of the angle *A* is to the given side opposite to it *DC*, so is the sine of the other angle *D* to the side required *CA*. To this side, thus found, adding *BC*, the sum is the perpendicular altitude required.

Or say, as radius is to the distance *DC*, so is the tangent of the angle *ADC* to *AC*, the height of the object; and adding the altitude of the instrument above the ground, the whole height of the object is found. The operation is best performed by logarithms. *E. G.* Suppose the angle $ADC = 51^{\circ} 52'$, and the distance $DC = 64$ feet. Then it will be,

Radius	10.000000
Log. of DC, or 64 feet	1.806180
Tang. of 51° 52'	10.105108
AC or 81½ feet	1.911280

To which add four feet, the height of the eye, and the altitude required, or AB, is 85½ feet.

This may also be resolved by projection, thus: draw DC, on which set 64 feet from any scale from D to C; erect the perpendicular CA; then make the angle CDA = 51° 52', and draw DA, intersecting the perpendicular in A, the top of the object. Then CA, measured on the same scale, will give 81½.

If there happen an error in taking the quantity of the angle A, (fig. 6.) the true altitude BD will be to the false one BC, as the tangent of the true angle DAB, to the tangent of the erroneous angle CAB.

Hence, such error will be greater in a greater altitude than in a less; and hence also, the error is greater, if the angle be lesser, than if it be greater. To avoid the inconveniences of both which, the station is to be pitched on at a moderate distance; so that the angle of altitude DAB, may be nearly half right.

Again, if the instrument were not horizontally placed, but inclined, e. gr. to the horizon in any angle, the true altitude will be to the erroneous one, as the tangent of the true angle to that of the erroneous one.

If the plane interposed between the observer, and the object be inclined, as in fig. 7; two stations C and D must be selected, and their distances from the base of the object, viz. CA and DA must be measured. Then as the external angle ACB is equal to CDB + DBC, the angle DBC = ACB - CDB, or DCB is equal to the supplement of ACB; in either way the angles of the triangle BCD are known, and one side DC is given; then say, the sine of DBC : DC :: sine of BDC : BC, which will be known: and in the triangle ABC, the two sides CA and CB being given together with the included angle, we shall

have $CB + CA : CB - CA :: \text{tangent of } \frac{B + A}{2} : \text{tangent of } \frac{A - B}{2}$, whence the angles will become known; and it will be easy to find AB the altitude of the object as before. Otherwise, measure the distance AC, and the angles A and C; and as in the triangle ACB, all the angles and one side AC are given, the other side AB will be easily found.

To measure an accessible altitude optically, by the shadow of the body, see SHADOW.

To measure the altitude of any object by optical reflection, place a plane mirror, or a vessel of clear water, horizontally at C, (fig. 8.), and retreat from it to such a distance at D, that the eye E may just perceive the image of the top of the object, in the reflecting surface at C; then, as these triangles, having two equal right angles, and the angle ACB = ECD, because the angle of incidence is equal to the angle of reflection, are similar, we shall have CD : DE :: CA : AB, the altitude required.

To measure an accessible altitude by the geometrical quadrat or square. Suppose it required to find the altitude AB (fig. 9.) choosing a station at pleasure in D, and measuring the distance thereof from the object DB; turn the quadrat this and that way, till the top of the tower A appear through the sights.

If then, the thread cut the right shadows, say, as the

part of the right shadow cut off, is to the side of the quadrat, so is the distance of the station DB, to the part of the altitude AF. If the thread cut the vertical shadow, say, as the side of the quadrat is to the part of the vertical shadow cut off, so is the distance of the station DB, to the part of the altitude AL.

AE, therefore, being found in either case, by the rule of three, and the part of the altitude BE added to it, the sum is the altitude required. See QUADRAT.

ALTITUDE, to measure an inaccessible, geometrically. Suppose AB (fig. 4.) an inaccessible altitude, so that you cannot measure to the foot of it. Find the distance CA, or FH, as taught under the article DISTANCE; then proceed with the rest as in the article for accessible distances. See STAFF.

To measure an inaccessible altitude, trigonometrically.— Choose two stations G and E (fig. 10.) in the same right line with the required altitude AB, and at such distance from each other, DE, as that neither the angle FAD be too small, nor the other station G too near the object AB. With a proper instrument take the quantity of the angles ADC, AFC, and CFB; and also measure the interval FD.

Then, in the triangle AFD, we have the angle D, given by observation; and the angle AFD, by subtracting the observed altitude AFC, from two right angles; and consequently the third angle DAF, by subtracting the other two from two right ones; and also the side FD; from whence the side AF is found by the canon above laid down, in the problem of accessible altitudes. And again, in the triangle AFC, having a right angle C, and observed angle F, and a side AF, the side AC, and the other CF, are found by the same canon. Lastly, in the triangle FCB, having a right angle C, observed angle CFB, and a side CF; the other side CB, is found by the same canon.

Adding, therefore, AC, and CB, the sum is the altitude required, AB.

E. G. Suppose AFC to be 58° and ADC 38°, and the distance of the stations FD to be 26 yards. Subtract ADC or 38° from AFC or 58°, and there remains FAD or 20°. Then, in the triangle DAF, the angles and one side being known, we shall have sine of DAF . sine of ADF :: FD : FA i. e. S. 20° : S. 38° :: 26 : a fourth, or by logarithms, 9.5340517 : 9.7893420 :: 1.414973 : 9.7893420 + 1.414973 - 9.5340517 = 1.6702633 the log. of 46.8. Again, in the triangle AFC, radius : sine of AFC :: AF : AC, i. e. rad. : S. 58° :: 46.8 : a fourth, and by logarithms, 10.0000000 : 9.9284205 :: 1.6702633 : 9.9284205 + 1.414973 - 10.0000000 = 1.5986838 the log. of 39.69 or 39 yards two feet, to which add the height of the instrument above the ground, and we have the altitude required.

By projection; draw a line DC, and at the extremity D make the angle ADC = 38°, and draw the line DA. Then set off the distance of the stations 26 from D to F, and at F make the angle AFC = 58°, and draw FA to intersect DA in A : then the distance of A from the horizontal line DC, applied to the scale, will give the height.

If two stations be taken at F and D, so that the angle AFC may be = 2 ADC, DF will be = AF; and radius will be to the distance of the stations DF or AF :: S. AFC : the altitude AC.

If the station at F be such, that the angle AFC may be 45°, and the angle ADC = 26° 34', the altitude AC will be equal to DF the distance of the two stations. For when AFC is 45°, AC = CF = FD, and DC = 2 AC, as radius : natural tangent of 26° 34' :: 2 : 1, i. e. :: DC (or 2 AC) : AC.

We may hence deduce a method of finding the height of one object, as AC, situate upon another HC. Find, first, the whole altitude AC, and then the altitude of HC, as above, and their difference will be the altitude of AH, as e. g. of a spire above the tower of a steeple. If the height of the tower HC be known, any distance DF in the horizontal line DC may be measured from H. This is the reverse of the preceding problem.

To measure the altitude of a balloon, cloud, or other moveable object, C; (*fig. 11.*) let two observers at A and B, in the same horizontal plane, take, at the same time, the angles CAD and CBD, and measure the distance AB between the stations; and then the altitude may be calculated as before. The height of a cloud may be found by its shadow in the following manner. Observe the cloud C, (*fig. 12.*) in its direct access to or recess from you; and marking the instant in which the middle of the shadow is at some remarkable point upon the ground as at A, at that moment take the altitude ABC of the middle of the cloud. Then, take the sun's altitude at your station B, and that will be equal to the angle BAC, and measure the distance between your station and the place of the shadow. In the triangle ABC, as all the angles and one side are known, it may be easily projected, and the height of C above BA may be determined: or it may be resolved trigonometrically thus:

fine of C : AB :: fine of B : AC = $\frac{S. B}{S. C} \times AB$; and
 rad. : AC $\left(= \frac{S. B}{S. C} \times AB \right)$:: S. A : the perpendicular;
 or rad. \times S. C : AB :: S. A \times S. B : the height.
 If the cloud be directly over your head at the time of observation, CBA will be a right angle; and rad. : AB :: tangent of the sun's altitude CAB : the height CB.

N. B. The cloud should be small, because the observation must be at a point. If the cloud be large, its edge as well as the edge of the shadow must be observed; and the stations must be upon a large plain or open ground.

To find an inaccessible altitude by the shadow, or the geometrical quadrat.—Choose two stations in D and H (*fig. 9.*) and find the distance DH, or CG; observe what part of either the right or versed shadow is cut by the thread.

If the right shadow be cut in both stations, say, as the difference of the right shadow in the two stations, is to the side of the square; so is the distance of the stations GC to the altitude EA.—If the thread cut the versed shadow at both stations, say, as the difference of the versed shadow marked at the two stations, is to the lesser versed shadow; so is the distance of the stations GC, to the interval AE.—Which being had, the altitude EB is also found by means of the versed shadow in G; as in the problem for accessible altitudes. Lastly, if the thread in the first station G, cut the right shadow, and in the later, the versed shadow; say, as the difference of the product of the right shadow into the versed, subtracted from the square of the side of the quadrat, is to the product of the side of the quadrat into the versed shadow; so is the distance of the stations GC, to the altitude required AE.

The utmost distance at which an object may be seen in the horizon, being given, to find its altitude.

Suppose the top H of a tower FH (*fig. 13.*) just visible at E, the distance EF being 25 miles; and suppose the circumference of the earth to be 25000 miles, or the radius 3979 miles, or 21009120 feet. Then 25000 : 25 :: 360° : 21' 36" = the angle EGH; and radius : secant of the

angle G :: EG : GH = 21009536 feet; and 21009536 - 21009120 = 416 feet or FH the height of the tower.

Otherwise.—In the right-angled triangle GEH, GH^2 or $GF^2 + 2 GF \times FH + FH^2 = GE^2 + EH^2$. But GE being = GF, $2 GF \times FH + FH^2 = EH^2$, or, FH being comparatively very small, $2 GF \times FH = EH^2 = EF^2$, and $FH = \frac{EF^2}{2GF}$, but 2 GF, or the earth's diameter, is

7958 miles, therefore $\frac{EF^2}{7958} = FH$ in miles, and $\frac{EF^2 \times 1760}{7958} = FH$ in yards.

Or, the altitude FH may more easily be found thus. The horizon dips nearly eight inches or $\frac{2}{3}$ of a foot, at the distance of one mile, and according to the square of the distance for other intervals; therefore, as 1² or 1 : 25² or 625 :: $\frac{2}{3}$: $\frac{2}{3}$ of 625 or 416 feet.

The method of taking considerable terrestrial altitudes, of which those of mountains are the greatest, by means of the barometer, is very easy and expeditious. This is done by observing on the top of the mountain how many inches, &c. the mercury is fallen below what it was at the foot of the mountain. When this is done, you will have its altitude by the help of a table calculated for that purpose. A very accurate table of this kind may be found in the Hist. de l'Acad. Roy. des Scien. 1703, and 1705, calculated by M. Cassini; and also in the Phil. Trans. Eames's and Martyn's Abr. vol. vi. p. 34. See BAROMETER.

ALTITUDE of the eye, in Perspective, is a right line let fall from the eye, perpendicular to the geometrical plane. See PERSPECTIVE.

ALTITUDE, in Astronomy, is an arc of a vertical circle, intercepted between the sun, moon, star, or other celestial object, and the horizon.

This altitude may be either true or apparent. If it be taken from the rational, or real horizon, the altitude is said to be true, or real; if from the apparent or sensible horizon, the altitude is apparent. Or rather, the apparent altitude is such as results from observations made at any place on the surface of the earth, and the true is that which has been corrected, on account of the refraction and parallax.

The true altitudes of the sun and fixed stars differ but very little from their apparent altitudes; because of their great distance from the centre of the earth, and the smallness of the earth's semidiameter, when compared with it. The quantity of refraction is different at different altitudes, and the parallax is different according to the distance of celestial objects; in the fixed stars it is too small to be observed; that of the sun is about 8 $\frac{1}{2}$ seconds, and that of the moon about 52 minutes. The altitudes of the heavenly bodies are observed by a quadrant or sextant, or by the shadow of a gnomon, and by various other ways may be found without a quadrant, or any the like instrument, by erecting a pin or wire perpendicularly as in the point C (*Astronomy, Plate I. fig. 5.*) from which point you have described the quadrantal arc AF. Make CE equal to the height of the pin or wire, and through E draw ED parallel to CA, and make it equal to CG, the length of the shadow; then will a ruler, laid from C to D, intersect the quadrant in B; and BA is the arc of the sun's altitude, when measured on the line of chords.

The sun's altitude may be computed by the following rule, proposed by Mr. Lyons for nautical purposes. By the rules in the Nautical Almanac, for 1771, find the logarithm ratio; subtract it from the rising found answering to the given distance of time from noon, in the tables of the same Almanac; the remainder is the logarithm of a number,

which

which subtracted from the natural sine of the sun's meridian altitude, leaves the natural sine of the altitude at the required time. For, finding the altitude of the moon or a star, he gives the following rule. From the tables above mentioned, take out the rising, corresponding to the horary angle in the distance of time from the star's passing the meridian; add to it the logarithmic cosine of the star's declination, and the logarithmic cosine of the latitude of the place; the sum, abating twenty from the index, is the logarithm of a number, which subtracted from the natural sine of the star's meridian altitude, leaves the natural sine of the altitude at the given time. These rules are of great importance in determining the longitude at sea. See Naut. Alm. for 1778.

In taking of altitudes from the visible horizon, where great exactness is required, an allowance is to be made for refraction, and the height of the observer's eye above the surface of the sea. To find the altitude of the stars, &c. by the globe, see **GLOBE**.

An irregularity has been observed in the apparent altitudes of the stars near the **MERIDIAN**. On some occasions, when they are mounting towards the meridian, they appear to fall, and after passing the meridian, to rise. Hist. Acad. Scienc. 1719. p. 75.

M. Parent suggests a new method of taking altitudes at sea, by a common watch. It is obvious, that in an oblique sphere, the difference between the rising and setting of two stars, in the same meridian, is greater, as they are farther distant from one another.

Now the astronomical table furnishing us with tables of the right ascensions and declinations for the fixed stars, it is easy, after observing the difference of time between the rising of two stars, to distinguish that part of the difference which accrues from their different position from that which arises from the obliquity of the sphere.—But such difference is the precise height of the pole of the place of observation.

Indeed, the ship not being immoveable, but changing place between the two observations, seems to lay the method under some difficulty; but to this M. Parent answered, that a small alteration either of the ship's longitude or latitude, will make no sensible error; and that if she have gone a large distance between the two observations, it is easy reckoning how much it is, and accordingly allowing for it. See **SAILING**.

ALTITUDE, meridian. The meridian being a vertical circle, a meridian altitude, that is, the altitude of a point in the meridian, is an arch of the meridian intercepted between it and the horizon.

If *HO* (*Astronomy, Plate I. fig. 6.*) be the horizon, and *HZO* the meridian, then the arc *HE*, or the angle *HCE* will be the meridian altitude of an object in the meridian at the point *E*.

To observe the meridian altitude of the sun, of a star, or other phenomenon, by means of the quadrant, see **MERIDIAN ALTITUDE**.

To observe a meridian altitude by means of a gnomon, see **GNOMON**.

ALTITUDE, or elevation of the pole, is an arc of the meridian *OP* (*fig. 6.*) intercepted between the pole *P* and the horizon: or the angle *OCP*.

The altitude of the pole coincides with the latitude of the place; and may be found by observing the meridian altitude of the pole star, when it is both above and below the pole, and taking half the sum, after it has been corrected on account of refraction. Or the same may be found

by means of the declination and meridian altitude of the sun.

ALTITUDE, or elevation of the equator, is the complement of the altitude of the pole to a quadrant of a circle. Or, it is the angle *HCL* (*fig. 6.*) or arc *HL* of the meridian between the horizon and the equator at *E*, and equal to *ZP*, the co-latitude of the place.

ALTITUDE of the tropics amounts to the same with what is otherwise called the solstitial altitude of the sun, or his meridian altitude when in the solstitial points.

ALTITUDE of the horizon, or of stars seen in it, is variable by the refraction, according to the quantity of which the horizon is, more or less, either elevated or depressed.

ALTITUDE of the nonagesimal, is the altitude of the 90th degree of the ecliptic, counted upon it from the point where it intersects the horizon, or of the middle or highest point of it which is above the horizon, at any time; and it is equal to the angle made by the ecliptic and horizon where they intersect at that time. See **NONAGESIMAL**.

ALTITUDE, refraction of, is an arc of the vertical circle, as *Ss* (*Astronomy, Plate I. fig. 7.*) whereby the altitude *SE*, of a star or other celestial body, is increased by means of the refraction. This is different at different altitudes, being nothing at the zenith, and greatest at the horizon, where it is about 33'. See **REFRACTION**.

ALTITUDE, parallax of, is the difference *CB* (*fig. 8.*) between the true and apparent place of a star; or the difference *BC*, between the true distance of a star *AB*, and the observed distance *AC*, from the zenith *A*. The parallax diminishes the altitude of a star, or increases its distance from the zenith. This arc, or the angle measured by it, is evidently less, as the celestial body is farther distant from the earth, and also less, for the same body, as it is higher above the horizon, being greatest there and nothing at the zenith. To find the parallax of altitude, &c. see **PARALLAX**.

ALTITUDE of the cone of the earth's or moon's shadow denotes the height of the shadow of one or the other in an eclipse, and is measured from the centre of the body. It is found by this proposition: as the tangent of the angle of the sun's apparent semidiameter is to radius, so is one to a fourth proportional, which will be the height of the shadow in semidiameters of the body. The greatest height of the earth's shadow is 217.8 semidiameters of the earth, when the sun is at his greatest distance, or his semidiameter subtends an angle of about 15' 47"; and the height of the same is 210.7 semidiameters of the earth, when the sun is nearest the earth, or when his semidiameter is about 16' 19": and between those limits it is proportional to the intermediate distances or apparent semidiameters of the sun. The altitudes of the shadow of the earth and moon are nearly as 11 to 3, the proportion of their diameters.

ALTITUDE, or exaltation, in Astrology, denotes the second of the five essential dignities, which the planets acquire by virtue of the signs in which they are found.

ALTITUDE of motion, in Mechanics, is a term used by Dr. Wallis, for the measure of any motion, estimated according to the line or direction of the moving force.

ALTITUDE, determinative, is sometimes used for the height, whence a falling body acquires, by acceleration, a certain velocity. Herman. Phoron. lib. i.

ALTITUDE, in speaking of fluids, is more frequently expressed by the term depth.

The ingenious Dr. Hales, in his vegetable Statics, proposed a method of measuring unfathomable depths of the sea; on the principles by which Dr. Desaguliers contrived an instrument called a **SEA-GAGE**, which was tried before

the Royal Society; and is described in the Phil. Trans. N^o 405. A more particular description of this instrument by Dr. Hales himself is as follows.

Suppose *AB* (*Miscellany, Plate I. fig. 1.*) to be an iron tube, or musket-barrel, of any length, as fifty inches, having its upper end *A* well closed; if this tube be let down in this position about thirty-three feet into the sea, a column of water of that height is nearly equal to the mean weight of our atmosphere, and, consequently, from a known property of the air's elasticity, it will be compressed into half the space it took up before, so that the water will ascend half way up the tube; and if the tube be let down thirty-three feet deeper, the air will be compressed into $\frac{1}{3}$ of its first dimensions, and so on $\frac{1}{4}$, $\frac{1}{5}$, $\frac{1}{6}$, &c. the air being constantly compressible in proportion to the incumbent weight; whence by knowing to what height the water has ascended in the tube, we may readily know to what depth the tube has descended into the sea.

Now to measure the depth of one of these columns of sea-water: first, by a line let the iron tube, with a weight at its bottom, sink about thirty-three feet, which depth in salt water will nearly answer to the weight of the air at a mean height of the barometer; then draw up the tube, and observe how far the water rose. If thirty-three feet of water be equal to one atmosphere, then will the water rise so high as to fill exactly one half of the tube. But if the water rise higher or lower than half-way, then, by the rule of three, say, as the number to which the water rises is to one, so is thirty-three to the number of feet, measuring the depth of the column required. For example, suppose the water rises, when the tube is let down thirty-three feet, only $\frac{2}{3}$ of half-way, then say, 9 : 10 :: 33 : 36 $\frac{1}{2}$ feet the depth of each column, which being once known, the number of columns of water is to be multiplied by this number of feet, whereby the depth of the sea in feet will be known.

But since, when the instrument has descended to the depth of 99 columns, or 99 times 33 feet, the air will be compressed into the $\frac{1}{100}$ part of 50 inches, that is, into half an inch, the divisions both for some space below and also above that will be so very small, that the difference in depth of several columns of water will not be sensible. So that an instrument of no greater length than this would scarcely give an accurate estimate of half a mile's depth, that is 2640 feet, or 80 columns depth of water. The lengthening of this instrument to 4, 5, or 10 times this length would obviate this defect, and make the difference of the degrees of descent much more sensible. But since it is impracticable to make a metalline tube of so great a length, and if it were made, it would be so unwieldy as to be easily broken, the difficulty may be obviated in the following manner.

Let there be a globose metalline body of iron or copper, nearly of this form (*fig. 2.*) *K, L, M, N, Q*, whose capacity within may be equal to nine times the capacity of the metalline tube, *Z, K, L*; let this globose body be firmly screwed to the metalline tube, at *K, L*, with a leathern collar, well soaked in some unctuous matter at the shoulder, or joining, thereby to secure that joint in the most effectual manner. Let there be a small hole at *X* for the sea-water to enter freely in, and let some coloured oil be poured into the globose body, to fill it up to the hole *X*. Let there be also provided a slender rod *db*, screwed, or fastened into the metalline tube *ss*, which must also be made to screw in and out, thereby to take out the rod at pleasure; the rod must also have a small button *d* fastened to its upper end, which

will prevent its being daubed by falling against the sides of the tube.

The capacity of the tube must be estimated by pouring water in, when the rod and metalline tube are fixed in their places.

Now since the lower vessel is supposed to contain nine times as much air as the tube *ZL*, which is the same thing as if the tube were nine times as long, therefore the air in the globose vessel will not all be forced within the capacity of the tube, till the vessel has descended to the depth of nine columns, or nine times 33 feet; for then the air will be compressed within one tenth of the space it first took up. Supposing, therefore, the instrument to have descended to the depth of 99 columns of water, or 99 times 33 feet = 3267: then the air will be compressed within $\frac{1}{100}$ part of 500 inches (the capacity of the whole vessel being supposed equal to the tube of that length), that is, within five inches of the top of the tube; and, consequently, the rod *db* will be found tinged with the oil, within five inches of its top.

Suppose again the instrument to have descended to the depth of 199 columns, of 33 feet each, then the air will be compressed within $\frac{1}{200}$ part of the whole, that is, nearly within 2 $\frac{1}{2}$ inches of the top of the tube. In this case, the instrument will have descended 6567 feet; that is, one mile and a quarter, and 132 feet.

Suppose again the instrument to have descended to the depth of 399 columns, then the air will be compressed into $\frac{1}{400}$ part of the whole, that is, nearly within one inch and a quarter of the top of the tube. In this case the instrument will have descended two miles and a half, wanting 53 feet, which may probably be the greatest depth of the sea.

The larger the capacity of the vessel *K, L, M, N, Q*, the deeper will the gage be enabled to sink, the instrument being made stronger, and its joints being secured in proportion.

The instrument being thus prepared, a large buoy, *i*, must be fixed to it, which ought to be a solid piece of light wood, well tarred to prevent the water's being pressed into the sap-vessels; and as it may rise at a considerable distance from the ship, it may be advisable to fix on the top of the buoy broad fans of tin, properly painted, so as to be easily seen.

In order to sink the instrument, a weight must be fixed to it in the following manner. See the diagram. *W* is a weight of ballast, hanging by its sheet shank *T*, in the socket *ff*, which socket is screwed fast to *NQ*. The shank is retained in its place by the ketch *k* of the spring *O*, while the machine is descending; but as soon as *W* touches the ground at the bottom of the sea, the ketch *O* sinking by the descending force, a little below the upper part of the hole *k*, is therefore at liberty to fly back, and so lets go the weight; then the buoy rises up to the surface of the water with the machine. Springs might also be fixed on the inside of the socket *ff*, so as to fly back in the same manner, when the weight touches the ground. It might be advisable to keep an exact account of the stay of the machine under water, which might be done by a watch, or by a pendulum vibrating seconds. Dr. Hook found upon trial, that a leaden ball which weighed two pounds, fixed to a wooden ball of the same weight, and both let down in fourteen fathom water, reached the bottom in seventeen seconds, and the detached wooden ball ascended to the surface in seventeen more. See Phil. Trans. Lowthorp's Abr. vol. i. p. 258. Consequently if this machine descended and ascended greater depths with

with the same velocity, it would reach to the depth of a mile in seventeen minutes, and reascend in the like time. This, however, might be a vague estimate, until experience has furnished a rule.

This machine was tried in various depths in the Thames, and answered very well, always returning, and leaving the ballast behind. It was afterwards tried near the Bermudas, when several ships were in company; but though a good look-out was kept for three or four hours, it was not seen to return. Hales's Statics, vol. ii. p. 328.

ALTITUDE of the sea's surface is not every where the same, as appears from the drift of CURRENTS setting strong out of one SEA into another.

ALTITUDE of the mercury, in the BAROMETER, is marked by degrees placed on the face of that instrument, the variations of which are the chief object of *barometrical* observations.

The mean altitude of the mercury at London for every day in several years is about 29.87 inches, and its variations are computed between 31 and 28 inches. Some suggestions have been made, as if the altitude of the mercury were regularly greater in the morning than in the evening; at least something of this kind was observed to hold for a considerable time at Berlin. Hist. Crit. Rep. Lett. tom. xiv. p. 239.

ALTITUDE of the pyramids in Egypt, was measured so long ago as the time of Thales, by means of their shadow, which makes one of the first geometrical observations we have an exact account of. Plutarch has given an account of the manner of this operation, which, according to this author, was done by erecting a staff perpendicular upon the end of the shadow of the pyramid; and by two triangles made by the beams of the sun, he demonstrated that there was the same proportion between the shadows as between the pyramid and the staff. Stanl. Hist. Phil. p. i. p. 9. See PYRAMID.

ALTITUDE, circles, parallels, and quadrant of. See the respective articles.

ALTITUDE instrument, equal, is that used to observe a celestial object, when it has the same altitude on the east and west sides of the meridian, or in the morning and afternoon. This instrument consists of a telescope about 30 inches long (with two vertical, and three or five horizontal wires in its focus), supported on the end of an iron bar or axis, 30 inches long, and about an inch in diameter; the axis being sustained in a vertical position by passing through a hole in one end of a brass box, whose other or lower end sustains the lower joint of the axis. The box, which is about 21 inches long, with ends about four inches square, has only two sides, which are fixed at right angles. From one of these sides project four flat arms, with a hole in each, whereby the box is, by screws, fixed in a vertical position to an upright post. On the lower end of the box lies a brass plate, which slides in grooves, and can, by means of a screw, be gently moved forwards or backwards; in this plate is a fine punched hole, to receive the smooth conical point, into which the lower end of the axis is formed. On the upper end of the box are two plates, which slide also in grooves; and, by the means of screws, can be gently moved sideways, till their angular notches embrace the axis, which, in this part, is made perfectly cylindrical and very smooth. To the upper part of the axis is fixed, by its radius, a brass sextant (or arch of 63°, to a radius of seven or eight inches) with the arch downwards, so that the centre is just above the top of the axis: also a spirit-level is fixed at right angles across the axis, just under the arch, so as to be clear of the upper end of the box. To the under part of the telescope is fixed a brass se-

micircle, of the same radius with the sextant, both arches having a common centre-pin. In the semicircle is a groove cut through the plate, parallel to its limb, to receive two screw-pins, which go into the sextantal arch, near its ends: by these screw-pins the two arches may be pressed close, and the telescope fixed in any desired elevation, which might be nearly ascertained by graduating the semicircle, and putting a Vernier's scale on the sextant.

When this instrument is used, the box is fixed to the post, and the axis put into the box, letting the conical point drop into the punched hole; the level is screwed on, and the telescope is annexed, observing to insert the centre and arch-pins; then, by the help of the screw-plates at the bottom and top ends of the box, the vertical position of the axis is corrected, so that the same end of the air-bubble in the level may stand at the same point through the whole revolution of the axis, which will thereby be known to be then truly vertical, so that the telescope will describe a parallel of altitude. The tube, thus adjusted, is to be directed to the sun or star, and fixed at the desired elevation, by pressing the two arches together with the two screw-pins. This instrument is very useful in adjusting clocks, &c. and comparing *equal and apparent* time.

ALTMANSTEIN, in *Geography*, a market town of Upper Bavaria, belonging to the family of Abensperg, 12 miles north-east of Ingolstadt.

ALTMORE, a town of Ireland, in the county of Tyrone and province of Ulster. N. lat. 54° 34'. W. long. 7° 2'.

ALTMUHL, a river of Upper Bavaria, which joins the Danube near Kelheim.

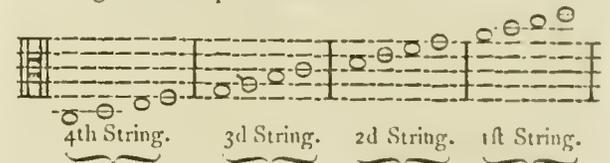

ALTMUHLMUNSTER, a commandery of the order of St. John, in Upper Bavaria, in the district of Rildenburg.

ALTOBASCO, in *Geography*, the name given to the ancient city of Colophon, in Ionia.

ALTMUNSTER, a market town of Upper Bavaria, which has an abbey of nuns of the order of St. Bridget.

ALTO & BASSO, or in **ALTO & in BASSO,** in *Law*, signifies the absolute reference of all differences, small and great, high and low, to some arbitrator, or indifferent person. *Patet universis per presentes, quod Willielmus Tylar de Yetten, & Thomas Gorwer de Almijre, posuerunt se in Alto & in Basso, in arbitrio quatuor hominum; viz. de quadam querela pendente inter eos in curia—Nos terram nostram altè & basse ipsius domini Regis supposuimus voluntati.*

ALTO, high. As *alto viola*, the tenor violin, in opposition to the bass viol. to which instrument or violoncello, the tenor strings are tuned octaves: as C. G. D. A. The following is the complete scale on the tenor:

This instrument has been rendered much more important of late years by quartets, and pieces made expressly for it than it used to be in the old overtures and concertos, in which it seldom had any melody assigned it. To fill up the harmony, by the refuse of other parts, was its only employment. But in the quartets of Stamitz, Boccherini, Giardini, and, above all, those of Haydn, it has been brought fully into action, and enjoyed *equality*.

ALTO Relievo, in *Sculpture*, a representation of figures and other objects against a flat surface or back-ground; differs

from basso rilievo only in the work being much more relieved and brought forward.

To any representation half-relieved or more, if it be not entirely detached from the ground behind, sculptors apply the appellation of Alto Relievo.

ALTON, in *Geography*, a town of England, in Hampshire, situate on the riv. r Wye. Its manufacture consists of plain and figured baragons, ribbed druggets and ferges; and round the town is a plantation of hops. Its market is on Saturday, and it is distant from London 47 miles.

ALTON is a village near Uttoxeter, in Staffordshire, in which are the ruins of a castle, supposed by Dr. Plott to have been erected by Theobald de Verdun in the beginning of the reign of Edward II. but by others apprehended to be prior to the Norman conquest.

ALTON, a tract of land in Strafford county, New Hampshire, in America, north-east from Barnstead.

ALTONA. See ALTENA.

ALTONA, in *Ancient Geography*, a river of Britain, mentioned by Tacitus, and supposed to be the same with the Avona or Avon; but as there are many rivers of this name, it is conjectured that the Altona of Tacitus flowed by Northampton and Peterborough eastwards.

ALTORF, in *Geography*. See ALTDORF.

ALTORF, or ALTDORF, a town of Germany, in the circle of Franconia, now small, but of great antiquity. It has an university with a valuable library, an anatomical theatre, chemical laboratory, and botanical-garden. It has undergone many revolutions from the year 912, when it is mentioned in some ancient records. It is subject to the house of Brandenburg, and is situated 12 miles east-south-east of Nuremberg. N. lat. 49° 25'. E. long. 11° 7'.

ALTRINGHAM, a town of England, in Cheshire, near the canal that passes to Warrington from Manchester, and about 8 miles from the latter town. The market is on Tuesday, and it is 179½ miles from London. N. lat 53° 25'. W. long. 1° 30'.

ALTSOHL, a district and town of Hungary, six miles south-south-west of Neufohl.

ALTSTADT. See ALSTADT.

ALTSTATT, a town of Germany, in the circle of Upper Saxony, and margraviate of Meissen, near Stolpen.

ALTSTED, a town of the circle of Westphalia and bishopric of Munster, five miles north-west of Ahus.

ALTSTETTEN, or ALSTETTEN, a town of Switzerland, in the Upper Rhinthal, seven miles east of Appenzel.

ALTUN-SOU, a river of Asia, which runs into the Tigris, 10 miles above Teerit, in the province of Kurdistan.

ALTUN-TASH, a town of Asiatic Turkey, in the province of Natolia, 20 miles north-west of Kutaja.

ALTUR, or ALTOR, a sea-port town of Asia, in Arabia Petraea, situate to the west of Mount Sinai, and towards the extremity of the western part of the Red Sea. The Greeks called it Raitho; the houses are built of white coral, which is found in great abundance on the coasts of the Arabian gulf. The inhabitants are partly Arabs and partly Christian Greeks. The monks of Mount Sinai have a convent in this place. Its port, like that of Suez, can admit no large vessels. N. lat. 28° 20'. E. long. 34° 19'.

ALTZENAU, a town of Germany, in the circle of the Lower Rhine, five miles south-east of Hanau.

ALTZEY, ALZEY, or ALTZHEIM, anciently *Alecia*, a town of the Lower Rhine, in the Lower Palatinate, with a citadel, on the river Selz, and the capital of a prefecture of the same name, three miles south-west of Odernheim, and 14 north-west of Worms. N. lat. 49° 44'. E. long. 7° 25'.

ALVA DE ALISTA, a town of Spain, in Old Castile, not far from Zamora.

ALVA DE TORMES, a town of Spain, with a castle, in the country of Leon, and province of Salamanca, on the frontiers of Estremadura, situate on the banks of the Tormes, eight leagues east south-east of Salamanca.

ALVA, DON FERDINANDO ALVARES DE TOLEDO, *Duke of*, in *Biography and History*, was born of an illustrious family in Spain in 1508; and having received military instruction under his grandfather, Frederic of Toledo, he was appointed a general, in 1538, by Charles V.; and, in 1542, defended Perpignan against the besieging army of the Dauphin of France. When Charles V. determined to commence hostilities against the German Protestants, in 1546, the duke of Alva was appointed general-in-chief of the Imperial army; and in the following year, when the Elector of Saxony was defeated in the battle of Mulhausen, and taken prisoner, he was chosen to preside at the court-martial, which sentenced this unfortunate prince to suffer death by being beheaded. At the siege of Metz, in 1552, the chief command, under the emperor, was entrusted to the Duke of Alva; but neither the obdurate perseverance of Charles, nor the concurring assistance of Albert of Brandenburg, could avail against the vigorous defence of the Duke of Guise. The emperor, after varying the mode of his operation, and repeatedly renewing the attack, was at length constrained to yield to the solicitations of his generals, who conjured him to save the remains of his army by a timely retreat. "Fortune," says he, "I now perceive, resembles other females, and chuses to confer her favours on young men, while she forsakes those who are advanced in years." In this siege, which lasted 56 days, he lost upwards of 30,000 men, who either died of disease, or were killed by the enemy. In 1555, the emperor found it necessary to check the progress of the French forces in Piedmont by some vigorous measures; and with this view to employ a general of such reputation and abilities, as might counterbalance the great military talents of the Marechal Brissac, who was at the head of the French army. The Duke of Alva was pitched upon for that purpose, and he was invested with the dignity of the emperor's vicar-general in Italy, as well as with the supreme command in all the Imperial and Spanish territories in that country. But though his authority was unlimited, the success of his operations was inconsiderable; and after having boasted, with his usual arrogance, that he would drive the French out of Piedmont in a few weeks, he was obliged to retire into winter quarters, with the ignominy of being unable to preserve entire that part of the country of which the emperor had hitherto kept possession. At the commencement of the ensuing year, Charles resigned to his son Philip the crowns of Spain, with all the territories depending upon them, both in the Old and New World; and though the Duke of Alva had advanced in the course of this year into the pope's territories, and reduced the whole of Campagna Romana, yet it was with reluctance that he pursued hostilities against the head of the church, which were no less repugnant to his own principles than to those of his new master. Having therefore made a truce, he afterwards negotiated a peace with the pope; and, notwithstanding his haughty spirit, submitted to the humiliating condition of asking forgiveness of the pontiff whom he had conquered. After a general peace was established in Europe in 1559, the Duke of Alva was sent to Paris, at the head of a splendid embassy, to espouse, in the name of his master, Elizabeth, the daughter of Henry, king of France. The tyrannical conduct of Philip, and the persecuting measures which he had adopted with a view of restraining the progress

progress of the Reformation, had excited a very general dissatisfaction among his subjects in the Low Countries; and therefore, in 1567, he determined to send the Duke of Alva with an army to compel the discontented to submit to his will, and to punish them for their disobedience. No person could be a fitter instrument for the execution of his purpose. The duke not only approved, but advised and recommended, hostile measures. Notwithstanding the remonstrances of the regent, the Dukes of Parma, Philip persisted in his purpose; and the Duke of Alva, with a considerable army, directed his march to the Netherlands, and, after garrisoning the frontier towns, proceeded to Brussels, where he arrived in the month of August, A. D. 1567. His arrival spread great consternation and astonishment over all the provinces. Many thousand persons had before this time left the country, among whom was the Prince of Orange, who would gladly have prevailed upon Count Egmont to accompany him. But he did not perceive the danger that awaited him. The prince took a sorrowful leave of him with these memorable words, which a disastrous event must soon have brought to his recollection: "You are the bridge, Count Egmont, by which the Duke of Alva will pass into the Netherlands, and he will no sooner pass it than he will break it down. You will repent of despising the warning which I have given you, but I dread that your repentance will be too late." One of the duke's first acts, after his arrival, was to cast both Count Egmont and Count Horn into prison; and their imprisonment was soon followed by their trial, condemnation and death. The Dukes of Parma, after repeated solicitations, obtained permission to quit the country, and she left Brussels in the beginning of the year 1568, much regretted by all, and particularly by the Protestants, to whom her administration appeared mild and gentle, compared with that which they had reason to expect under the present government. As soon as she was removed, the Duke of Alva fully disclosed his commission, and his powers appeared to be much greater than those of any former governor, and such as were subversive of all the rights and privileges which Philip, as sovereign of the Low Countries, had at his inauguration solemnly sworn to maintain. But the pope had previously granted him a dispensation from his oath, so that his mind was quieted in every measure of despotism and cruelty, which he dictated or sanctioned. Alva's commission, besides the absolute command of the army, comprehended the presidency of the three councils of state, of justice, and of the finances, with ample powers to punish or to pardon crimes of every sort at his own pleasure. Allowing to the Reformers a month for leaving the country, he issued secret orders to the Inquisition to proceed immediately in the most rigorous execution of their edicts. For their assistance and encouragement he instituted a council of 12 persons, most of whom were Spaniards, and of which the duke was the president, called the Council of Tumults; but by the Flemings, justly denominated "the Council of Blood." Thus fortified and aided, the duke proceeded to build citadels at Antwerp, and in several other cities, and to spread his troops over the country in such formidable bodies, that the people, who could not endure their oppression and rapacity, either forsook their habitations, or abandoned themselves to despair. Above 20,000 persons escaped at this time into France, England, and the Protestant provinces of Germany. Some were seized in their flight, and innocent persons were overwhelmed with horror at the sight of the dreadful punishments inflicted on those who were charged with guilt; and all concurred in lamenting that a country, once eminently flourishing and distinguished by the mildness of its government and the happiness of the people, should now present to view no other object besides confiscations,

imprisonment, and blood. In the space of a few months more than 1800 persons suffered by the hand of the executioner; and yet Alva's thirst of blood was not satisfied.

Like a host of prey, this savage tyrant searched every secret recess; and his soldiers, accompanied by the executioners, were let loose among the Protestants, who were seized in the middle of the night in their beds, and from thence dragged to prison and dungeons. Those who had been only once present in Protestant assemblies, although they declared their faith in the Catholic religion to be firm and unshaken, were hanged or drowned; and those who professed themselves Protestants, or who refused to abjure their religion, were put to the rack, in order to make them discover their associates; they were then dragged by hooks to the place of execution, and their bodies being committed to the flames, their sufferings were prolonged with ingenious cruelty. To prevent them from bearing testimony in the midst of their torments to the truth of their profession, their tongues were first scorched with a glowing iron, and then screwed into a machine, contrived on purpose to produce the most excruciating pain. It is, indeed, shocking to recount the numberless instances of inhuman cruelty perpetrated by Alva and his associates; especially when we consider that the unhappy victims were generally persons of the most respectable character, who, having imbibed the principles of the Reformation, were too honest to disguise their sentiments; or, to say the worst of them, who had been betrayed into a disservice by their zeal for propagating truths, which they believed to be of the highest importance to the glory of God, and the happiness of mankind. The hearts of even some men members of the "bloody council" revolted against the repeated acts of cruelty to which their sanction was required; some of them sought a dismissal, others absented themselves, and of the 12 that composed the council, there were seldom more than three or four present. At this time the magistrates of Antwerp, whose behaviour had been uniformly obsequious during the whole of Alva's administration, presented an humble petition on behalf of some citizens whom the inquisitors had imprisoned. To this petition Alva returned a haughty reply, reproaching them for folly and presumption in applying on behalf of heretics; threatening them with tokens of his displeasure; and even assuring them, that if they persisted in such measures, he would hang them all, for an example, to deter others from similar presumption. Some of the catholic nobility also remonstrated to the king against the governor's barbarity, and the pope exhorted him to greater moderation. But the inquisitors enforced the council of Vargas, who recommended perseverance, and Philip turned a deaf ear to the remonstrance which had been made to him; and the persecutions were continued with the same unrelenting fury. The people were reduced to circumstances of extreme distress, and they had no resource left but in the wisdom, public spirit, and extensive influence of the prince of Orange. Alva, soon after his arrival in the Netherlands, cited prince William to appear before him, but he was too sagacious to be deluded by promises of lenity, and refused to obey the citation, assigning, at the same time, a variety of reasons for his conduct. Several other noblemen were cited to answer for their conduct; and, upon their refusal, Alva pronounced sentence against them, and confiscated their effects. The Prince of Orange at length had recourse to arms; but whilst he was employed in making levies, his brother Count Lewis arrived with an army in the Netherlands, and resolved to make his first attempt on Groningen. The Spanish army under Count AreMBERG was sent to oppose him, but Lewis was victorious. However, Alva soon marched against him with a superior army, and totally defeated him. The Prince of Orange prepared

for action by publishing a manifesto, in which he declared that his religious sentiments were changed, and that he was now convinced that the opinions of the Protestants were more conformable to the Scriptures, the rule and standard of Christian faith, than those of the Romish church. William was a formidable enemy; and it required all the caution and valour of Alva, and of his son Frederic of Toledo, to prevent him from breaking in upon the Netherlands. Alva succeeded; and the prince, disappointed in his expectation of supplies, was under a necessity of disbanding his army. After this event Alva marched in triumph to Brussels, and commanded a solemn thanksgiving for his success to be observed through all the provinces. He ordered a statue of himself to be formed of brass, and medals to be struck. On one of these medals he was represented riding in a triumphal chariot, with a Victory behind him, putting a crown upon his head. In his right hand he held a sword, to signify that he had conquered Lewis by open force; and in the left an Ægis, to express that wisdom of which he had availed himself against the prince of Orange; and as a farther emblem of his wisdom, the chariot was drawn by owls, which, in the ancient Heathen superstition, were sacred to Minerva. His statue, which was placed in the citadel of Antwerp, was the workmanship of Jockeling, a German artist, the most celebrated sculptor of the age, and afforded a still more striking display of his vanity and arrogance. He was represented trampling under his feet the figure of a monster, having certain emblematical signs in different parts, which denoted the petition which had been presented to the Dukes of Parma, the compromise, and the insurrection and tumults which ensued. The base of the figure was a square pillar of marble, with the name of the artist on one side, and with encomiums on the Duke of Alva on the three other sides, who is said to have extinguished heresy and rebellion, to have saved the church from destruction, and restored justice and tranquillity to the Netherlands.

We learn from Grotius, that about this time the duke enacted several useful regulations with regard to trade, the coin, and the liberty of the press: but they failed in promoting the purposes for which they were intended, and the memory of them was soon effaced by the violence of the measures which he afterwards pursued. He devoted the interval of leisure which he now enjoyed to various acts of tyranny; and to the accomplishment of his schemes for reducing all the provinces to total slavery, and extirpating the reformed religion; and the executioner was fully employed in removing all those friends of freedom whom the sword had spared. The emigrations from the Low Countries were, in consequence of Alva's violent and cruel measures, very numerous; and of those persons who were exiles many came over to England, where they were all received by queen Elizabeth. In this country they enjoyed the free exercise of their religion; and amply recompensed the English for the protection that was afforded them by introducing various branches of manufacture, with which they had been before unacquainted. Alva's vanity was flattered about this time by an embassy which was deputed by the pope, to present him with a consecrated hat and sword; and he was thus confirmed and encouraged in the prosecution of those sanguinary measures, which had procured him this distinguished honour. But such were the absurdity and folly, as well as the oppression and tyranny, into which his arrogance betrayed him, that he adopted a measure which may be regarded as the chief cause of all the difficulties which he afterwards encountered, and of all those astonishing exertions which the people made

to emancipate themselves from the Spanish yoke. Heedless of the rights and privileges of the people, who had been accustomed to be taxed by their own princes, he resolved, by his own authority, to establish numerous and burdensome taxes, sufficient not only for supplying his present exigencies, but to serve as a perpetual fund for defraying all the expences of his government. These taxes, by their number, and by the mode of their imposition and enforcement, excited universal discontent. The states assembled and remonstrated; but Alva was not only deaf to remonstrance, but determined, after some temporising measures, to employ force for rendering effectual his arbitrary requisitions. The states of Utrecht were resolute and firm in their opposition, and though they incurred a confiscation of their territory and revenues, their conduct was attended with the most important consequences, and produced a more general resistance to the taxes which the governor imposed. In the mean while the prince of Orange was not an unconcerned spectator of these transactions. Having returned from France, in 1569, to his country of Nassau in Germany, he commenced preparations for trying his fortune once more against the Spaniards. The exiles also, who had left the country on account of the persecution of Alva, united, and fitted out a great number of armed vessels with which they seized all the Spanish ships which they could meet with on the Flemish or English coast. Alva persevered in issuing edicts for the payment of exorbitant taxes; and, in order to intimidate the people into compliance, he formed the barbarous resolution of putting to death, before their own houses, 17 of the principal inhabitants of Brussels. But before the time fixed for their execution, a messenger arrived with information that the exiles had made a descent on the island of Vorn, and got possession of the Brille. This intelligence alarmed Alva, and induced him to revoke his bloody orders, and to suspend, for a time, the levying of taxes. An order had been issued by queen Elizabeth, in compliance with the request of Alva, that all ships, belonging to such of the inhabitants of the Low Countries, as had withdrawn their allegiance from the king of Spain, should leave her harbours. This order was an occasion of triumph to Alva, but, in the issue it contributed to the vigorous exertions of the exiles, to the capture of the Brille, and to that union under the prince of Orange, which laid the foundation of the independence of the United Provinces. The spirit of resistance and revolt which was spreading through the country was much encouraged by the defeat of the Spanish fleet under Medina-Cæli, in 1572, and by the supply of money and military stores which the exiles found on board the ships that were taken. The revolt in North Holland became general; Mons, the capital of Hainault, and one of the most populous and flourishing cities in the Low Countries, was taken by Count Lewis; the Spanish army was employed in endeavouring to recover it; the people of Holland and Zealand were industriously securing themselves, by every precaution and preparation in their power, from being again reduced under the Spanish yoke. In contempt of the order issued by Alva, for an assembly of the States at the Hague, a meeting was held at Dort, and it was determined to acknowledge the prince of Orange as the only lawful governor or Stadtholder of the provinces, and commander in chief of all their forces both by sea and land: and every possible exertion was made to furnish him with necessary supplies. Whilst the prince and the States were employed in providing for the security of Holland, Frederic de Toledo was making rapid progress in reducing the towns which had revolted in the other provinces;

but his progress was marked by various acts of oppression and of cruelty, of so horrible a nature as to be scarcely credible, if they were not well authenticated by the most unexceptionable testimony. But the perfidious cruelty of Alva and his son, after the siege and capture of Haerlem, exceeded, if possible, in atrocity every other measure of this savage administration. By the lowest computation, 900 brave men were executed, with every circumstance of ignominy and barbarity, like the vilest malefactors, who, trusting to Toledo's promise, had surrendered their arms to throw themselves upon his mercy. The consequence, however, of the length of this siege and of the loss of men sustained by it, was a mutiny among the Spanish troops; and it was with difficulty, and after much negotiation, that they were induced to march against Alkmaar. Here they met with a repulse, attended with great loss, and Frederic was obliged reluctantly to retire. Alva's fleet was, about the same time, defeated by the Zealanders, and the town of Gertruydenburg surprised by the prince of Orange. Alva, dispirited by these events, and declining in his health, by the anxiety and fatigue he had undergone, solicited a recall, and obtained Philip's leave to quit the Netherlands, and to return home. Philip, dissident of the success of the cruel measures that had hitherto been pursued, and determined to try the effect of a milder administration, complied the more readily with Alva's request. Accordingly, in December 1573, the duke and his son set out, by the way of Germany and Italy, for Spain; after having resigned the regency to his successor Requesens, who commenced his administration with demolishing Alva's statue at Antwerp, and with repressing the insolence of certain garrisons, at whose enormities his predecessors had connived.

In the review of Alva's administration we may observe, that both the catholics and protestants regarded him as the chief source of all the calamities in which the Netherlands had been involved. He had received his government from the dukes of Parma, in a state of perfect tranquillity. By his tyranny he had thrown it into the most terrible combustion, and kindled the flames of a destructive war, which he was conscious of being unable to extinguish, and he had, therefore, applied for liberty to retire. He is said to have boasted to Count Koningstein, uncle to the Prince of Orange, at whose house he lodged on his way to Italy, that, during his government of five years and an half, he had consigned more than 18,000 heretics to the public executioner; besides a much greater number whom he had put to the sword, in the towns which he took, and in the field of battle. During Alva's administration, the situation of the Low Countries was truly deplorable. His oppression was not confined to protestants, but many catholics were put to death, and their effects forfeited, under a pretence of their having entertained heretics, or having held a correspondence with them in their exile. Wives were punished with the utmost severity for affording shelter to their husbands, whom the council of tumults had condemned; children for performing the like offices to their parents; and in Utrecht, a father was executed for allowing his son, who had returned from banishment, to lodge under his roof for one night. By forcing so many thousands of the most industrious inhabitants to leave the country, and by neglecting to provide a naval force to oppose the exiles at sea, commerce was almost entirely ruined; notwithstanding which, he imposed upon the people more oppressive taxes, than they could have borne, if they had been in the most flourishing condition. In levying these taxes, the utmost rigour was employed. The people were often wantonly

provoked, and tumults purposely excited, from which occasion was taken to punish them with confiscation of their goods, and sometimes with both death and confiscation. From the confiscations and taxes large sums were raised: yet, by maintaining so numerous an army, and by building citadels to keep the principal towns in awe, as he received little assistance from the king, who was engaged in other expensive enterprises, he fell behind in the payment of his troops; and in order to keep them in good humour, he permitted them to live at free quarters upon the inhabitants, against whom they exercised, on many occasions, the most cruel and oppressive rapacity.

Alva, after his return to Spain, enjoyed for some time the favour and confidence of his master; but his son Don Garcia de Toledo, having debauched one of the maids of honour, under a promise of marriage, was put under arrest, and assisted by his father in making his escape. Alva, in order effectually to prevent the fulfilment of his obligations, enforced by the king's order, concluded a marriage between him and his cousin, a daughter of the Marquis of Villena. Upon this Alva was banished from court, and confined to the castle of Uzeda. Here, notwithstanding many intercessions in his favour by the pope, and some foreign princes, he remained for two years. But when Don Antonio assumed the crown of Portugal, Philip made preparations for opposing him; and devolved on Alva the supreme command in Portugal, without forgiving his offence or admitting him into his presence. Alva, notwithstanding his age and infirmities, accepted the command; repaired to the army in 1580, defeated Antonio, and reduced the whole kingdom of Portugal to Philip's authority. When Lisbon was taken, the suburbs, which were at that time no less considerable than the town itself, were delivered up to be ransacked and plundered by the soldiers, without any distinction between the friends and the enemies of the king. When Alva was required to give an account of the treasure which he had acquired on this occasion, he is said to have replied; "If the king asks me for an account, I will state to him kingdoms preserved or conquered, signal victories, successful sieges, and 60 years' service." Philip made no further inquiries; but Alva did not live to enjoy the honours and emoluments resulting from this last exploit. He died in 1582, at the age of 74 years. Robertson's Hist. of Charles V. vol. iii. and iv. Watson's History of Philip II. of Spain, vol. i. and ii.

ALVACA, in *Ancient Geography*, a town of Media, according to Ptolemy.

ALVAH, the wood wherewith Moses sweetened the waters of Marah. Exod. ch. xv. ver. 25.

The name of this wood is not found in Scripture, but the Mahometans give it that of *alvah*, and pretend to trace its history from the patriarchs before the flood. Josephus, on the contrary, says, that Moses used the wood which he found next lying before him.

ALVALADE, in *Geography*, a small town of Portugal, in Alentejo, situate between two rivers, and containing about 1200 inhabitants.

ALVANIS, in *Ancient Geography*, a town of Mesopotamia, according to Ptolemy.

ALVANNA, in *Geography*, a town of Spain, in the province of Guipuscoa, three leagues east of Trevigno.

ALVAR, a town of Hindostan, in the country of Mewat, 60 miles south south-west of Delhi.

ALVARA *Martens Bay*, is situated on the coast of Loango, in Africa, in S. lat. 3°. and E. long. 11°. This bay

bay has a fine sandy strand, and good anchorage ground. On the south side of it are two villages.

ALVARADO, a town of America, in the province of GUAXACA, situate at the mouth of a river of the same name, 30 miles south-east of Vera Cruz. N. lat. $18^{\circ} 40'$. W. long. $96^{\circ} 36'$.

ALVARADO, a river of New Spain, rises in the mountains of the Zapotecas, and making a circuit through the province of Mazatlan, and receiving several smaller rivers and streams, runs into the Gulf of Mexico, about the distance of 30 miles from Vera Cruz. The mouth of the river is about a mile wide; but for more than two miles from the shore it is almost choaked up with sand.

ALVARE, a town of Arabia Felix, according to Ptolemy.

ALVARES, a town of Portugal, in Estremadura, containing about 1200 inhabitants.

ALVAREZ, FRANCIS, in *Biography*, a Portuguese priest, was chaplain to Emanuel, king of Portugal, and sent by him as ambassador to David, king of Ethiopia and Abyssinia. Having continued six years in this country, he returned with letters to king John, the successor of Emanuel, and to pope Clement VII. and gave an account of his embassy at Bologna in 1533, in the presence of Charles V. He died in 1540; and the account of his embassy, with a description of the customs and manners of the Ethiopians, was printed at Lisbon, in folio, in the same year, and translated into Latin by Goetz, under the title "De fide, regione et moribus Æthiopum," and at Antwerp in 1558, in French, 8vo. He was the first writer who gave any certain information concerning Ethiopia; but his account, though represented by some as true and accurate, is not entitled to implicit credit. Gen. Dict.

ALVAREZ, EMANUEL, a learned Jesuit, was born in the island of Madeira in 1546. He became successively rector of the colleges of Coimbra, Lisbon, and Evora, at which place he died in 1582. His Latin Grammar, "De Institutione Grammatica," is much esteemed, and is still used by the Portuguese Jesuits in their colleges. It was published in 4to. in 1599, and has passed through several editions. Gen. Dict.

ALVAREZ DE PAZ, JAMES, an eminent Jesuit of the 17th century, and author of several devotional treatises, was born at Toledo in Spain, and educated in the schools of the Jesuits, among whom he entered himself at 17 years of age. Having finished his course of theological studies at Alcalá de Henares, he removed to the kingdom of Peru, in South America, and read lectures in divinity and philosophy at Lima, which were much applauded. He was likewise rector of the colleges of Quito, Cuzco, and Lima, and governed the whole province for six years, connecting his public offices with the regular discharge of his private duties. At Potosi, where he was much revered, he was seized with a disease, which proved fatal, A. D. 1620, in the 60th year of his age. Gen. Dict.

ALVARID, among the Spanish Moors, denoted a judge. The word is also written *alvarilus*: in this sense *alvarilus* amounts to much the same with what is otherwise called ALCAID.

ALVARISTS, in *Church History*, a sect or branch of modern Thomists, denominated from Alvares, whose method and principles they follow.

The *Alvarists* differ from the ancient Thomists, in that the former are assertors of sufficient grace, the latter of efficacious grace. The former come near to the Jesuits, the latter to the Janfenists.

ALVAROTTO, JAMES, in *Biography*, an eminent civi-

lian, was born at Padua, and became professor of law in that city, in the 15th century. Besides other treatises, he wrote "Commentaria in Libros Feudorum," printed at Frankfort in folio in 1587, a work much esteemed, and often cited by the Italian lawyers.

ALVAYAZERA, in *Geography*, a small town of Portugal in the province of Beira, containing one parish, and near 1000 inhabitants.

ALUCITÆ, in *Entomology*, a subdivision of insects, with digitated wings, belonging to the genus of PHALÆNA, and of the *lepidoptera* order in the Linnæan system: comprehending 12 species.

ALUCO, *sacred owl*, in *Ornithology*, a species of the owl, or STRIX, with rusty head, black irides, and the primary wing-quills ferrated at the edges. This species, the *La Hulotte* of Buffon, the *Ulula* of Briss. Gessn. and Aldr. the black owl of Albin, and the brown owl of Pennant and Lewin, is 15 inches long; its head is large and round, without tufts, and face sunk, as it were, within the plumage; the beak of a yellow or greenish white; the upper part of the body of a deep iron grey, mottled with black and whitish spots, the under part white, with longitudinal and transverse black spots or bars; and the legs white, sprinkled with black points. It flies lightly, and not rustling with its wings. The outmost feather of the wing is two or three inches shorter than the second, and this shorter than the third; and the longest of all are the fourth and fifth. Its cry is a kind of howl, resembling that of wolves, whence its name *ulula*, and the German *bubu*, or *boo-boo*. It inhabits Europe and Tartary, and is said to be considered as sacred by the Calmucks, for having contributed to preserve the life of their great monarch, Jenghis Khan, though Mr. Pennant attributes this to another species. In Summer it lodges in the hollows of decayed trees in the woods, and in Winter approaches human habitations. Its most usual prey is field-mice, which it swallows whole. It generally lays four eggs, of a dirty grey colour, in the nests of other birds, such as buzzards, bustards, crows, and magpies. Gmelin's Linn. Buffon's Birds, vol. i. p. 291.

ALUCO, in *Entomology*, a species of PHALÆNA *Bombyx*, with brown wings, cinereous at the apex, found at the Cape of Good Hope.

ALUCO is also the name of a species of the PHALÆNA *Noctua*, with dentated wings, brownish, undulated with black and three marginal spots, found in China.

ALUCO is also the name of a species of MUREX, in the class of VERMES *testacea*, with tuberculated spiral windings, the middle stria spinose, the columella uniplicate, and the tail ascending. There are several varieties of this shell. It is found in the Southern Indian Ocean, Red Sea, and Atlantic, about four inches long, whitish, sprinkled with cærulean or brownish dots, the windings transversely striated, the lip roundish, and the aperture oval.

ALUDDA, or ALYDDA, in *Ancient Geography*, a town of Asia Minor, in Phrygia Major, upon the confines of Lydia.

ALUDEL, *Aludel*, Fr.—*Sublimirtopfe*, Germ.—*Aludelle*, Ital.—*Capitella sublimatoria*, Lat. The aludel of the chemists is a kind of pot or cucurbit, generally made of earthen ware, but sometimes of glass, open at both ends for the purpose of collecting the products of dry sublimations. The matrix or cucurbit, containing the substance to be sublimed being fixed in a sand bath, is covered with an aludel, so disposed as that the neck of the cucurbit may be received into the body of the aludel, this again is covered in like manner with another aludel, and so on increasing the series according to the volatility of the substance operated

on, the neck of the upper aludel being either stopped with a cork or covered with an imperforated capital. See Chemistry, Plate iii. fig. 14. A, the cucurbit, B, a series of aludels, C, the capital. It was in an apparatus of this kind, that those crystalline sublimes formerly called *flowers*, as flowers of sulphur, of arsenic, of Benzoe, &c. used to be prepared, when each chemist and druggist manufactured these articles for his own use: but since the shops have been supplied for the most part from large wholesale laboratories, the aludel, together with various other vessels, has been discarded, and its place supplied by apparatus of more simplicity and greater expedition.

ALVEARE, in *Conchology*, a species of **TROCHUS**, with a plicated nodulose shell, striated transversely, and adorned with bands of concatenated points, funnel-shaped umbilicus, and crenulated columella. It is found in India; the shell is coloured with a mixture of green and white, within pearly, and finely annulated.

ALVEARIUM, in *Anatomy*, the bottom of the *concha*, or hollow of the auricle, or outer EAR.

The *alvearium auriculæ* is a cavity, terminating at the *meatus auditorius*, wherein that bitter yellowish excrement is collected called *cerumen*, or ear-wax.

ALVEARIUM also signifies a bee-hive.

The word is formed of *alveus*, a channel, or cavity; in allusion to the *alveoli*, or cells, in bee-hives.

Some of the ancients use also the word *alvearium* for a bee-house, more usually called among us **APIARY**.

ALVEARIUM is sometimes also used figuratively, to denote a collection.

In which sense, *alvearium* amounts to much the same with what we otherwise call *thesaurus*, *cornucopia*, or the like. **Vinc. Boreas** has published an *alvearium* of law.

ALVEHEZUT, among *Arabian Writers*, denotes what we ordinarily call *falling-stars*, or **STAR-SHOT**.

ALVENSLEBEN, in *Geography*, a bailiwick of Magdeburg, in Germany.

ALVEOLATE, in *Botany*, a term used in the same sense with *favosum*, or honey-combed, to express a part that is furrowed by oblong depressions.

ALVEOLI, in *Anatomy*, those little sockets in the jaws wherein the teeth are set.

The *alveoli* are lined with a membrane of exquisite sense, which seems to be nervous, and is wrapt about the roots of each tooth; from whence, and from the nerve, proceeds that pain called *odontalgia*, or tooth-ach. Of these *alveoli* there are usually 16 in each jaw.

ALVEOLI is more especially used, among *Naturalists*, for those waxen cells in the combs of bees, wherein their honey is deposited.

ALVEOLUS, **NAUTILUS** *Orthocera* of the **Linnæan** system, in *Natural History*, the name of a marine body, found frequently fossile, sometimes lodged in the cavity at the end of the *belemnite*, and sometimes loose; and in this last case, often so large, that we cannot suppose any *belemnite* ever to have existed so large as to have been able to contain it. We do not meet with these at this day in their recent state, but what we find of them fossile are ever large at one end, and tapering to a point at the other, and are composed of several hemispheric cells, like so many bee-hives jointed into one another, and having a *siphunculus*, or pipe of communication, like that in the thick *nautilus*. These are sometimes found perfect and whole, but much more frequently truncated, or wanting a part of their smaller end. **Klein**.

ALVERD, in *Geography*, a town of Persia, in the province of Taberistan, 20 leagues south-south-west of Ferabad.

ALVERNO, a mountain of Italy, in the duchy of Tuscany, 10 miles north of Borgo San Sepulchro.

ALVEROA, a small town of Portugal in Estremadura, containing, within a district of one parish, about 400 houses, two leagues from Lisbon.

ALVESEN, in *Botany*, a name used by some for the *pu. alundum*, or **AL-TENSIL**.

ALVEUS properly denotes a channel.

ALVEUS is applied, by some *Antoniists*, to the tumid lacteal branches arising from the *receptaculum chyli* under the *diaphragma*.

ALVEUS is also used in *Antiquity*, to denote a small vessel, or boat, made out of the trunk of a single tree, by boring or cutting it hollow.

Such was that wherein Romulus and Remus are said to have been exposed.

ALVIDONA, in *Geography*, a small place of Naples, in Calabria Citra, nine miles north-east of Cassano.

ALVIDUCA, compounded of *alvus* and *duco*, *I do*, opens of the belly, in the *Materna Medica*, a term used by some writers for **LAXATIVE** or purgative medicines.

ALVIGNANO, in *Geography*, a town of Naples, in the country of Lavora, 10½ miles east of Capua.

ALVITTO, a town of Naples, in the country of Lavora, six miles east of Sora.

ALVIRO is also a small town of Portugal, in the province of Alentejo, containing about 2000 inhabitants, and a barony.

ALULA *notha seu spuria*, ballard or spurious wing, in *Ornithology*, is a kind of appendage to the true and principal wing, placed near its outer extremity, at the base of the primary quill-feathers, and consists of from three to five small feathers of the quill kind.

ALUM, ores of, in *Mineralogy*. Under this head we include all those minerals which either contain alum ready formed, or are capable of yielding this salt by the process of manufacture. They may be conveniently divided into three families. 1. The saline, all the species of which are almost wholly soluble in water; 2. The earthy-saline, in which the soluble particles are diffused through a large proportion of earth; 3. The earthy, which containing no alum but only the materials of it, are insoluble and destitute of that sweetish astringent taste, which is characteristic of the two former.

I. Family—**SALINE**. Taste aluminous, almost wholly soluble in water.

Species 1. Capillary alum.—*Vitriolum halotrichum*, Werner.—*Haarfaltz*, Germ.—*Termes timfo*, Hung.

The colour of capillary alum is either pure or yellowish white, passing into isabella yellow and grey, upon exposure to the air. It occurs in long very tender capillary crystals accumulated on an earthy base, or amorphous or tooth-shaped. Its external lustre is glassy and generally glimmering, advancing sometimes to the little-shining, in the pure white varieties approaching more or less to the mother of pearl lustre; internally it is shining or little-shining with a glassy lustre. The amorphous has a fine, straight or curved fibrous fracture. It flies, when broken, into indeterminate not particularly sharp fragments. It appears sometimes to contain slender columnar distinct concretions: is transparent, soft, and very brittle; though each separate crystal has a slight elasticity: sp. grav. according to Scopoli 1.835: has a sweetish astringent taste.

By the analysis of Scopoli, it is soluble in three times its weight of water, and consists of alum and sulphated iron. It is met with at Cremnitz and Chemnitz in Hungary, also in the quick-silver mines of Ydria, where it has generally been mistaken for white vitriol.

Species 2. Plume alum.—*Alumen raticum* f. *plumefum*, Werner.—*Natürlicher* f. *feder aluun*, Germ. *Fjärdar alun*, Sweed.—*Fiaeragtig aluun*, Dan. *Alun de plume*, Fr.

The colour of this substance is yellowish or greyish white. Its external lustre is dull, but sometimes glimmering, or even little-shining. It consists of slender irregular hair-shaped fibres, either single or accumulated, and slightly adherent to each other; is seldom stalaetic or amorphous. It is usually opaque, but sometimes also transparent or semitransparent. It excites the same taste on the tongue as the preceding species.

It is found efflorescing on bituminous schistus at Göttwig in Aultria, on grey argillite in Carinthia, in clefts and caverns on Stromboli, the Solfatara, the grotto of St. Germano, Miseno, and other places in Italy.

In Klapproth's Essays is an analysis of the native alum of Miseno, from which it appears, that 100 parts yield by simple solution and crystallization 47 of perfect alum, and 29 more by the addition of the necessary quantity of potash, the remainder being sand with a little selenite, and a small trace of oxydated iron.

Species 3. Mountain butter.—*Vitriolum alumen butyraceum*, Werner.—*Bergbutter*, Germ.

Its colour is of a more or less dun isabella yellow, or yellowish brown. It occurs amorphous commonly overlaying the surface of aluminous schistus in lumps or clots. Internally it is shining, with a waxy lustre. At first it is very soft, but by exposure to the air it becomes of a middle consistence, between crumbly and compacted, and is then of a strait shivery fracture. Its fragments are indeterminate, blunt. Its distinct concretions are small and fine granular. It is transparent on the edges, and slightly elastic; feels somewhat unctuous, and leaves on the tongue an acerbly sweetish astringent taste.

It occurs in many places where the aluminous schistus is plentiful, and exposed to the air, as at Muskaw in the Oberlausitz: is also found in Siberia.

It has not yet been analysed, but probably differs from the preceding, in containing a larger proportion of clay and iron ochre.

II. Family. EARTHY-SALINE. Taste aluminous, very little soluble in water. All the ores that belong to the third family are occasionally found to have undergone a natural change, similar to what is produced in them by art at the alum manufactories; in consequence of which they often yield, by lixiviation, a variable proportion of alum, and exhibit the sweetish astringent taste peculiar to this salt. 1. Upon the purely sulphureous ores or alum-stone with its varieties, this alteration seems to take place by the action of subterranean fire: alum is also probably formed in mere earthy compounds of silic and alumine, that contain no sulphur when they overlie heated sulphureous strata, by which they are first cracked and then penetrated with sulphureous acid vapours. Examples of both these occur in Italy at La Tolfa, not far from Civita Vecchia, and the Solfatara in the Neapolitan dominions; from 100 parts of which Bergman obtained by mere lixiviation eight parts of perfect alum. 2. The well known property of pyritous and pyrito-bituminous matters to heat, and afford vitriolic salts by the combined action of air and moisture, may also be traced, though in a slighter degree, in the aluminous ores of this description; hence it is that the upper strata of the softer aluminous schistus, of the alum earth, and the sulphureous peats are occasionally impregnated with alum. The marshy black soil of Arragon, that yields pure alum by lixiviation (Bowles's Spain, p. 388.), appears to be of this kind; also the aluminous turf of Helsingborg in Scania

(Bergm. Ess. vol. i. 353.); and a vein of black earth in the Shetland islands, containing alum and sulphated iron. Alum is also extracted from fossil wood in Hesse, (Vogel. p. 322.) Springs in the neighbourhood of these strata sometimes hold a little alum in solution, as those near Halle (Chym. Ann. 1788. p. 224.)

Family III. EARTHY—no aluminous taste—not soluble in water.

Species 4. Alum-stone. *Argilla aluminaris Tolfensis*, Werner. *Alumen lapid. calcar. mineralizat.* Wall.—*Alaunstein, alaunkalchstein*, Germ.—*Alunsten*, Sweed. *Alunrig steuler*, Dan.—*Pierre alumineuse de la Tolfa. Pierre calcaire alumineuse*, Fr.—*Pietra calcinosa aluminosa*, Ital.

Alum-stone is greyish or yellowish white, isabella yellow, or light smook grey; amorphous. Its internal lustre is dull, seldom glimmering. Its fracture uneven, splintery. Fragments indeminately sharp-cornered. It has distinct conchoidal concretions, which might be mistaken for a fine schistose texture. Is slightly transparent at the edges. Is half-hard passing into hard. Brittle, insipid, feels meagre; and adheres slightly to the tongue.

Its sp. grav. according to Kirwan, is 2.424. It has an earthy smell, and when projected on a red hot iron it hisses and gives out a black' smook, a slight sulphureous smell, and the residue acquires a reddish colour. According to Monnet's analysis, it consists of sulphur and clay, in nearly equal proportions, together with a little iron and potash. Bergman found it to contain about 43 sulphur and inflammable matter, 35 alumine, and 22 silic.

It is found in masses and veins running through argillaceous rocks at La Tolfa, in the states of the church, and in the ore from which the Roman alum is prepared. A volcanic origin has been generally attributed to it, but apparently without reason, as the veins of La Tolfa have been traced into the Apennines. It was formerly supposed to be mostly calcareous, as is evident from the synonyms quoted above. La Metheric (Theorie de la Terre, vol. ii. p. 215.) has hazarded an opinion that it is principally alum superaturated with alumine, and therefore earthy and insoluble. This is a notion which derives high probability from the recent analysis of this ore, by Vauquelin (An. de Chem. vol. xxii. p. 275.) who obtained from it

Alumine	- -	43.92
Sulphuric acid		25.
Potash	- -	3.08
Water	- -	4.
Silic	- -	24.
		100.00

A similar kind of ore has been discovered in rocks near Poliniere in Brittany.

Species 5. Alum-slate. *Aluminous schistus, alaunschiefer*, Germ.—*Alun skifer*, Sweed.—*Ardoise alumineuse*, Fr.—*Lavagna aluminosa*, Ital.—*Timsó pala*, Hung. *Kwaffzowoi schifer*, Russ.

Of this there are two varieties.

Var. 1. Common alum-slate. *Gemeiner alaunschiefer*, Germ.—*Argilla aluminaris schistosa vulgaris*, Werner.

Its colour is bluish black, sometimes greyish black. Amorphous, or in concentric balls imbedded in the strata. Its internal lustre is glimmering, or dull. Fracture strait or curved slaty. It flies when broken into broad shivers, or trapezoidal fragments. Gives a grey streak; feels rather smooth but meagre. Is soft, brittle, and but little elastic.

Var. 2. Shining alum-slate.—*Glanzender alaunschiefer*, Germ.—*Argilla aluminaris schistosa nitida*, Werner.

It is of a bluish black colour, generally passing into the iron black—occurs amorphous, in large strata. The lustre of its parallel fracture is shining or even brightly shining, with a lustre between common and semi-metallic: that of its cross fracture is dull, or at most glimmering. Fracture thick and curved flaty, seldom thin flaty. Its fragments therefore are sometimes thick and sometimes thin shiverv. It feels smooth; is half hard; brittle; and but little elastic.

Both varieties are found in Norway, at Whitby in England, in Sweden, in Saxony, and various other provinces in Germany. The alum of Great Britain and the north of Europe is almost entirely made of it, for which use the second variety is said to be the best adapted. It commonly occurs in the neighbourhood of coal, and seems to differ in no respect from the bituminous shale impregnated with pyrites.

Species 6. Alum-earth — *Pyritaceous clay, alun erde* Germ.—*Argilla aluminaris bituminosa*, Werner. *Alunjard*, Sweed.—*Terre alumineuse*, Fr.—*Tinjsös föld*, Hung.

It has a light or dark blackish brown, brownish black, or blackish grey colour. Occurs in large strata of earthy or irregularly flaty masses. It is generally dull, but when containing scattered particles of mica, becomes occasionally glimmering. Its fracture is between compact earthy and imperfectly flaty. Its fragments are partly flaky and partly irregularly blunt cornered. Its streak has a feeble lustre. It is very soft, and may be rubbed to powder between the fingers; is brittle, and of very little elasticity.

When placed among burning coals, it generally blazes a little; and when moistened and exposed to the air in large quantities, it heats and not unfrequently inflames. From 100 parts of it, after torrefaction, Klapproth obtained 10 alum, 7.25 sulphated iron, 2.25 sulphated lime, and 1 sulphated magnesia.

It is found in alluvial and secondary strata, and is intimately connected with bituminous wood, alum slate, and coal shale. Is used in the manufacture of alum in Germany.

Lenz, Versuch der Mineralien.—Widenman, handbuch der Mineralogie.—Lametherie, Theorie de la terre.—Bergman's Essays.—Klapproth's analytical Essays.—Kirwan's Mineralogy.

ALUM, *Manufacture of.*

In order to appreciate rightly the peculiar advantages or disadvantages of the several methods of manufacturing this salt, it will be necessary to enter into a previous enquiry concerning the nature and proportions of its elements, and the different chemical varieties of alum, which have hitherto been confounded under the same name.

§ 1. *Analysis and Composition of Alum.*

The identity of the earthy base of alum with pure clay, was first ascertained by Geoffroy and Hellot, and the successive experiments of Pott, Margraaf, and Macquer, upon the same subject, put an end to the controversy concerning the nature of aluminous earth, which has ever since been universally received as the same with pure clay or alumine, according to the reformed nomenclature. The acid in alum has always been considered as the sulphuric, and the only question among chemists on this head is whether the acid is necessarily in excess. A solution of alum reddens litmus paper, and exhibits other properties of an uncombined acid; but on the other hand it is contended by Morveau, that crystallization and edulcoration would effectually

separate any such excess, and therefore that the change of vegetable colours is not an unequivocal proof of superabundant acid. Reserving the consideration of this and similar cases till we come to treat of the article SATURATION, it is sufficient to observe here, as indeed Bergman has clearly shown, that the acid exists in alum with two very different degrees of affinity. By the action of iron filings on a solution of alum, all the signs of uncombined or loosely adhering acid are destroyed, sulphated iron is produced, and a white earthy precipitate takes place, consisting of the alum deprived of a small portion of its acid, but still retaining the greater part, as may be proved by the further decomposition of it by a caustic alkali; and to this superabundant or slightly combined acid, is entirely owing the taste, the solubility, and most of the other external characters of the salt.

The component parts of alum, according to Bergman, are 38 sulphuric acid, 18 alumine, and 44 water of crystallization. Observing, however, that those solutions, which contained a great excess of sulphuric acid could not be brought to crystallization by the addition of lime, soda or barytes; but only by means of potash or ammonia; finding also sulphat of potash in many species of alum, he appears often induced to believe that the alum of commerce is a triple salt consisting of sulphuric acid, alumine and potash. The subject remained in this state of uncertainty till it came under the notice of the most eminent analyst of modern times, the accurate and indefatigable Vauquelin, to whose admirable Memoir on the combinations of alumine with sulphuric acid, we are indebted for the final illustration of a question of equal importance to the chemist and manufacturer.

In order to ascertain the component parts of alum, and to determine the necessity and peculiar agency of alkalis in its preparation, he dissolved in pure sulphuric acid some alumine equally pure; the solution was evaporated several times to dryness to drive off the excess of acid, and the dry and pulverulent residue being then re-dissolved in water, was brought by evaporation to various states of specific gravity for the purpose of crystallization; but, notwithstanding every precaution, a soft magma, consisting of crystalline flakes, was all that could be procured. The solution, which had thus constantly refused of itself to afford crystallized alum, began to deposit some immediately on the addition of a few drops of potash, and by gradually adding the alkali, drop by drop as the deposition of alum ceased, the whole was converted into pure alum, without the smallest mixture of sulphated potash.

Another portion of the same pure aluminous sulphat was mixed with carbonated soda, but without obtaining any crystals. Nor were lime or barytes more efficacious.

Hence it appears plainly that the use of potash is not merely to engage the excess of acid, otherwise soda, barytes and lime, ought to have produced the same effect. Again, if potash and ammonia unite only to the superabundant acid, the sulphats of potash and ammonia should occasion no change in the pure aluminous sulphat; but, on the contrary, if they form an essential constituent part of alum, then they should produce the same effects when combined with sulphuric acid, as when pure. To ascertain this, a solution of sulphated alumine was mixed with a few drops of sulphat of potash, the immediate effect of which was the production of octahedral crystals of alum. Sulphat of ammonia produced the same result.

It might still, perhaps, be objected that the action of these salts, as they are remarkably greedy of sulphuric acid, determined the crystallization of the alum, by the simple absorption

tion of superfluous acid. In order to determine this, some uncrystallizable aluminous sulphat was mixed with acidulous sulphat of potash, and afforded us great an abundance of alum as when the neutral sulphat of potash was made use of. Hence, no doubt can remain concerning the influence and particular mode of action exercised by potash and ammonia in the manufacture of alum.

The experiments of Bergman and of several other chemists ascertained, that when a solution of common alum is boiled with a quantity of pure alumine, this last combines with it, and forms a peculiar salt insoluble in water, known by the name of neutral aluminous sulphat, or alum saturated with its own earth. To this fact was added another of equal importance, by Vauquelin, namely, that the earthy salt thus precipitated retains its potash or ammonia, for, by digestion in dilute sulphuric acid, it is dissolved, and affords octahedral crystals of alum; it even appears from the memoir of this philosopher quoted above, that the presence of one of the two alkalies is necessary to the formation of this neutralized alum. To an uncrystallizable solution of sulphated alumine perfectly free from alkali, he added some pure alumine, and found that a part of it was dissolved to the complete saturation of the acid, but that no precipitation took place; having then added a few drops of sulphat of potash, a precipitate was deposited shortly after, possessing all the properties of the foregoing saturated alum. Hence is established the necessity of sulphated potash or ammonia, to enable alum, by combining with a larger proportion of its base, to pass to the earthy state.

The alum of commerce always contains sulphat of potash either alone or mixed with sulphated ammonia, and as it is often of consequence to the manufacturer to know the absolute and relative proportions of these salts, the following method of analysis may be had recourse to. First, let a small piece of the alum be reduced to powder, and mingled with a solution of caustic potash in sufficient quantity to decompose it entirely: if then, upon gently heating, it gives out an ammoniacal odour, as is generally the case, this indicates the presence of sulphated ammonia. Having obtained this indication, let two or three hundred grains of the alum be dissolved in distilled water and put into a tubulated retort, and then add quick-lime, equal in weight to the salt: by making this mixture boil for about twenty minutes, the whole of the ammonia will be expelled, and may be condensed by cold water in the receiver, or a Woulfe's apparatus: this ammoniacal liquor, being then carefully saturated with sulphuric acid and crystallized, will shew the quantity of sulphated ammonia. The residue in the retort being mixed with warm water and filtered, a clear liquor will be obtained, containing the sulphat of potash, with some selenite; this latter will be precipitated by boiling and evaporation, and the remaining fluid will then deposit the sulphat of potash in a crystalline form. When the previous assay does not indicate the presence of ammonia, the alum is to be decomposed by caustic ammonia, the precipitate is to be well washed, and the liquors being added together, are to be gently evaporated to dryness; the salt thus obtained is to be heated in a crucible till it ceases to exhale white vapours of ammoniacal sulphat, and the residue is sulphat of potash.

§ 2. *Manufacture of Alum from the saline-earthly ores.*

The only place where this kind of ore is found in sufficient abundance to be worth working, is at the Solfatara, a few miles from Naples. The Solfatara, called by the ancients *Forum Vulcani, Campi Leucogei*, is a small plain, at the top of a hill, covered with a white soil, and exhaling sulphureous

vapours which, during the night, emit a pale blue lambent light: the ground, even at the surface, is considerably warm, proceeding, no doubt, from subterranean fire. It has continued in nearly the same state from the age of Pliny to the present time, and is celebrated by this author in his *Natural History* (lib. xxxv. ch. 50.) for its sulphur, but not for its alum, as the Abbé Mazeas affirms. On the contrary, by his omission of the *Campi Leucogei*, when mentioning the various places from which alum was then procured, it is plain that the establishment of the alum works of the Solfatara is of more recent origin. The white clayey soil of this plain, being constantly penetrated by sulphureous vapours, and the exhalations during the night being for the most part mixed with the dew, and thus returned upon the surface, cause it to be covered with a light saline efflorescence. This, together with the earth to which it adheres, is daily collected and distributed into leaden cauldrons, so as to fill about two-thirds of their capacity; water is then added, till it stands about three or four inches above the surface of the clay, and this, in a few hours, by the assistance of the natural heat of the ground in which the cauldrons are set almost up to the brim, extracts the alum dissolved through the clay, and deposits it in rough crystals on its surface. These crystals being taken out and washed in the mother liquor, are put with fresh water into other boilers, and again dissolved as before, by the natural heat of the ground; the solution is then run through a filter into large wooden coolers, and in a day or two affords a large quantity of pure colourless crystals. Hence it appears that the alum exists ready formed in the earth of the Solfatara, and the whole of the manufacturing part is reduced merely to lixiviation and purification. The proportion of salt must necessarily be very variable, those parts that are exposed to the rain, and that lie above the general level, will contain the least. A specimen that was analyzed by Bergman yielded eight per cent. of alum. The Abbé Mazeas, from six pounds of the earth, procured, by lixiviation, two pounds and a half of crystals, or about 41 per cent. The alum itself has not yet been analyzed; it seems probable, however, that its alkaline part is entirely potash.

§ 3. *Manufacture of Alum from alum-stone.*

It is at La Tolfa, not far from Civita Vecchia, in the Roman state, that the manufacture of alum from this species of ore is principally carried on. All the alum known in commerce by the name of Roman alum is thus prepared, as well as the Levant or Smyrna alum.

The ore of La Tolfa forms veins of considerable hardness, which are separated by means of blasting from the rest of the rock; the pieces thus obtained are brought to the calcining oven, which is merely a hole dug in a rising ground, four or five feet in diameter, and from five to six in depth, with a lateral gallery, communicating with the open air, and the bottom of the furnace. The bottom being covered with faggots of brush-wood, the pieces of ore are skilfully laid over them, so as to form a kind of hollow vault, between the interstices of which is an ample passage for the smoke. As soon as the fire is kindled and the flame begins to appear between the stones, a workman is at hand to regulate the combustion, that it may be neither too great nor too feeble; in the course of from three to five hours the smoke begins to decrease, and the fire burns brightly; this is allowed to go on till the smell of burning sulphur begins to be prevalent, which is a sign that the ore is sufficiently roasted. The fire is now raked out, and the stones are left to cool. The sign of this first process being well conducted, is, that the

the ore has now acquired the sweetish astringent taste of alum.

The second process begins by piling the calcined stones in long beds, on a sloping floor, the lower side of which is terminated by a ditch of water, extending along its whole length; from this ditch the beds are frequently sprinkled, and the water draining from them returns again into the reservoir. In about a fortnight the stones begin to crack and break down, and are at length, in forty days, more or less, overspread with a reddish efflorescence, and reduced into a kind of paste. A leaden boiler is now half filled with water, and when hot, fresh portions of the prepared ore are continually stirred in till a solution of sufficient strength is procured; the liquor as yet turbid is drawn off into another boiler, where it is subjected to a very gentle evaporation, at the same time that it becomes clear by the deposition of its earth. Having arrived at the point of crystallization, it is transferred by means of a pipe into a square wooden vessel, eight feet high by five wide, so constructed as to be readily taken to pieces; after remaining here for a few days, the mother water is poured out, to be boiled again with fresh alum ore in the first cauldron, and the crystals, when dried, are ready for sale.

From this account of the process, by an eye-witness (the Abbé Mazeas), it would appear that no potash or ammonia is added to the lixivium; it follows, therefore, that one or both these alkalies must be found in the ore, and this is actually the case, according to the analysis, by Vauquelin, already quoted in the preceding article.

The nature of this ore has been long misunderstood, as well as the rationale of its manufacture, and the analyses of it undertaken by Bergman and Monnet have only served to perpetuate the error. Both these chemists found a large proportion of sulphur in it, while Vauquelin finds only sulphuric acid; this apparent contradiction, however, may easily be reconciled, by considering that the ore contains carbonaceous matter enough to blacken it, and to give out a light flame when powdered and spread on a hot iron; hence, if the analysis of Bergman and Monnet was begun by distillation in a close retort, as it probably was, the decomposition of the acid and production of sulphur is readily accounted for. Admitting then the proportions of this ore, as ascertained by Vauquelin, to be sufficiently correct, *viz.* alumine 43.92; sulphuric acid 25.; potash 3.08; water 4.; silice 24.; it ought to be considered as a native saturated alum, with excess of earth and deficiency of alkali, intimately mixed with silice and inflammable matter. The action of the fire in the roasting is to drive off the inflammable matter, and from the sweet aluminous taste which is thus communicated to the ore, notwithstanding the loss by volatilization of part of its sulphuric acid, it seems also to effect a separation between the alum and the excess of earth. The subsequent cracking and breaking down upon exposure to the air and moisture, is probably caused by the absorption of water of crystallization.

But though a considerable proportion of alum is thus obtained, without the addition of potash, it may be worth while to enquire whether a larger quantity might not be procured by a trifling additional expence. The alum of La Tolfa contains by Vauquelin's analysis

49. sulphat of alumine
7. sulphat of potash
44. water

100

And according to Kirwan, (on the proportion of real acid,

See. 1792,) 100 parts sulphat of potash are composed of 54.8 potash and 45.2 sulphuric acid; and 100 parts alum of 63.75 alumine and 36.25 sulphuric acid. Therefore, the 25 parts sulphuric acid in the ore require 37.4 alumine and 4.5 potash. But the ore only contains at most 3.08 potash, so that no more than 16 parts of sulphuric acid will be converted into alum; the remaining 9. will be left in combination with alumine in the mother water; and this agrees with the observation of Mazeas, who speaks of an unctuous acid, efflorescent salt being left in the residue of the lixiviated etc. The 9 parts of acid that are thus left, may, however, be converted into alum, by the addition of 1.42 potash, or about 3. sulphat of potash.

From these data the ore of La Tolfa ought to yield by the present method of working it 78.5 per cent. of crystallized alum; or by the addition of 3 per cent. sulphat of potash, 125 per cent. of crystallized alum. In this calculation, however, no allowance has been made for the sulphuric acid volatilized in the roasting, and that portion of the salt which cannot be extracted by lixiviation in the large way from the prepared ore; both these circumstances will, no doubt, diminish considerably the produce of alum, but the proportions must vary much according to the skill and attention of the manufacturer.

§ 4. *Manufacture of Alum from the Pyritous ores.*

All the European alum, except what is manufactured at Solfatara and La Tolfa, as described in the preceding sections, is prepared from the alum slate or alum earth, and these containing only the remote principles of this salt, a much more complicated process is required than where the alum exists ready formed in the ore.

The only necessary ingredients in the pyrito-aluminous ores are clay, and pyrites, or sulphuret of iron. Besides these, however, there is generally a variable proportion of bitumen, lime, and magnesia. The best alum is procured from the black micaceous species in which the pyrites is thoroughly disseminated through the mass in such small particles as to be indistinguishable from the rest. Such, however, as contains even large nodules of pyrites, is very capable of being manufactured, much of the Swedish ore being of this kind.

The first thing to be done is to dispose the pyrites to decompose into sulphat of iron, (green vitriol), and this at the manufacture of Flone, in the department of Ourte, in France, is brought about by simple exposure of the ore to the action of air and moisture; this ore, however, is of the very best kind, moderately soft, free from bitumen, and with the ingredients well mixed, and even with these advantages, the process requires three years. The more stony and bituminous kinds, such as those of England and Sweden, are subjected to a previous roasting. For this purpose a layer of billet wood or coals is placed on a floor of rammed clay, and set fire to; upon this are thrown by degrees moderately small pieces of unburnt ore, till a stratum is formed, about half a foot in thickness; these presently take fire, by their own bitumen, and are then covered with a stratum of nearly the same thickness of ore that has been already roasted and lixiviated; to this succeeds a layer of unburnt ore, and thus alternate layers, eight or nine in number, are gradually added, till the pile is completed. Care is taken by protecting it from heavy rains, and covering those parts exposed to the wind, to keep up the heat of a moderate equable degree till the bitumen being consumed, the fire goes out of itself. If the ore is now examined it will be found to be of a reddish colour, containing a small quantity of sulphated iron and alumine,

alumine, and in some of the Swedish manufactories is accordingly lixiviated without any further preparation. In the English and German alum-works, however, the roasted ore is watered lightly, and exposed for a greater or less time to the action of the air, by which the sulphur of the pyrites is more completely oxygenated, and in consequence a larger proportion of alum is obtained. In the manufactory of Flone, already mentioned, the singularly judicious practice is observed, of lightly roasting the ore *after* spontaneous efflorescence.

The acid being thus developed, and in part united to the alumine, the process of lixiviation takes place. For this purpose the ore is thrown into large reservoirs of stone or wood, furnished with a false bottom, to serve the purpose of a filter; water is then poured on, and remains for twenty-four hours or more, in which time it dissolves the greater part of the salts; this being let out by means of a cock fixed nearly level with the bottom of the reservoir, a fresh quantity of water is added, in order to exhaust the ore of all soluble matter. The second lixivium is weaker than the first, but is afterwards concentrated by being used instead of water for the first lixiviation of the next parcel of ore. The water with which the lixiviation is performed is cold, and it might seem at first to be an obvious improvement to make use of boiling water; the experiment has, however, been tried without the desired result, the increased strength of the lixivium not being adequate to the time and expence of fuel. Where the lixivium is kept in large reservoirs, exposed to the weather, much depends on the dryness of the season, a few heavy rains weakening the liquor to such a degree, as to add considerably to the cost of boiling down. In Sweden and the northern countries, various attempts have been made to concentrate the liquor by freezing, but the success has not answered expectation; for a saturated solution of alum congeals at nearly the same temperature with common water.

The process of boiling down succeeds to that of lixiviation, and is always performed in leaden boilers, copper being for the most part too dear a material, and iron being attended with the inconvenience of decomposing alum. The lixivium is mixed in the boiler with the mother-water of a preceding boiling, and this is done either by filling the boiler with a mixture of mother-water and liquor, and supplying the loss by evaporation with fresh liquor, or by filling the boiler at first with liquor, and supplying the waste by the above mixture. The evaporation lasts from twenty-four to forty-eight hours, according to the proportion of mother-water. In Saxony, where the proportion of mother-water is large, and the lixivium is brought to a high degree of concentration, the boiling continues without interruption for eight days. At the end of these respective periods the specific gravity of the liquor is assayed by a leaden hydrometer, or, with greater exactness, by filling a bottle of known size with the liquor, and then, by weighing it, to ascertain the comparative specific gravity between it and water. This being done, an alkaline solution is added, and the first crystallization is brought about. In the Saxon manufactories, where the liquor is uncommonly concentrated, as soon as the evaporation is finished the contents of the boiler are let out into a reservoir, where they are strongly agitated for half an hour, during which time a certain proportion of soap-makers lees and putrefied urine is added; and the liquor being then let into another vat, the crystals of alum begin immediately to be deposited; at the end of a few days the mother-water is laded out, and the crystals are collected and washed. The method followed in the English works differs somewhat from the Saxon practice; in these, when the li-

quor appears by the hydrometer to be sufficiently evaporated, the fire is withdrawn from the boiler, and a stream of impure alkaline lixivium, from kelp and soap-maker's ashes, is let into the liquor already in the boiler; at the same time the cock at the bottom of the boiler is turned, so as to allow the contents of it to flow into a reservoir, by which management the two liquors are speedily and effectually mixed. It remains in this reservoir for three hours, during which it deposits an earthy and ferruginous sediment by the action of the alkali, and becomes of a clearer colour; it is now transferred into another large vat, and has its specific gravity again taken, according to which a greater or less quantity of putrid urine is added to lower it to the proper standard; being then agitated briskly for a quarter of an hour it is left at rest, and in the course of five days the crystals are deposited. In some French and Swedish manufactories the liquor, after being boiled down, is merely agitated for some time without adding any alkali, and then passed into the crystallizing tub. The rough alum being washed in order to separate it from the green vitriol which is deposited along with it, is put into a small pan with a little water, and when dissolved and boiling hot, some bullocks blood, or other similar substance, is usually added for the purpose of clarification: when this is effected, the liquor is run into casks, where the crystals are deposited in large masses; after ten or twelve days the mother-water is poured out, and the salt, being then dried, is ready for sale. By keeping in mind the analysis and experiments in § 1. of this article, it is easy to understand the *raisonne* of the manufacture, as well as the advantages and faults of each process. As soon as the pyrites is converted into sulphat of iron, whether by roasting or by spontaneous efflorescence, it begins to be gradually decomposed by the lime and magnesia that may happen to be in the ore, therefore the less there is of these two earths, the greater *ceteris paribus* will be the produce of alum. Clay is incapable of decomposing sulphat of iron; but by exposure to the air, especially when assisted by the action of heat, the metal becomes highly oxygenated, and is no longer combinable with the acid which then unites with the clay, as being the substance in the ore of next affinity. Hence arises the advantage of the practice at Flone of roasting the ore *after* the formation of the sulphat of iron. We have already seen in § 1. that sulphat of alumine, even with excess of earth, is soluble in water, but that it becomes insoluble on the addition of potash; on this account, therefore, coal, which contains little or no potash, is a far preferable fuel for roasting the ore than wood which yields a great deal, as all the alum, thus rendered incapable of extraction by lixiviation, is lost. The bitumen in the ores, however, diminishes the consumption of wood, and the lixivium consists of the sulphats of iron, of alumine, of lime, and magnesia. By long boiling and evaporation the iron becomes so far oxygenated, that the addition of an alkali will decompose the sulphat of iron, rather than the sulphat of alumine. If the alkali is ever so little in excess, the aluminous sulphat will be the next decomposed; this is therefore to be carefully avoided. Nor is the kind of alkali a matter of indifference, for since only ammonia and potash are capable of forming crystallizable alum, it would appear that the use of soda in the English manufactories might be advantageously superseded by potash; indeed the chief use of the kelp seems to consist in the potash which this impure soda contains. The principal thing to be attended to in the boiling down is to bring the liquor to such a degree of concentration, that the alum shall be deposited with as little as possible of the other salts.

The mother-water, when thrown away, holds in solution sulphats of potash or soda, and sulphat of magnesia, the extraction of which was made the subject of one of Lord Dundonald's

donald's patents, but we believe the profits have not yet answered the expence.

The nature of alum, and consequently the true theory of its manufacture, has only been known since the publication of Vauquelin's excellent memoir on the subject in the *Annales de Chimie*; it is not surprising, therefore, that all the long-established processes should be more or less defective. Perhaps the following method would be found to combine more advantages, and be subject to fewer inconveniences than any which has been hitherto put into practice. The ore should be first slightly roasted with coal to drive off the bitumen, and forward the decomposition of the pyrites, which may be further accelerated by moderate waterings, and exposure of fresh surfaces to the action of the air. When saline efflorescences appear at the top of the heaps of ore, and their interior, upon being dug into, also seems penetrated with white saline particles, let the ore be disposed in alternate strata with coal, and again roasted, so as to decompose as much as possible of the sulphated iron, and combine the acid with the clay; the slower and more gently this process can be carried on, the more completely will its object be answered. The lixivium obtained from this roasted ore will consist chiefly of sulphated alumine, nearly saturated with earth, but, on account of the absence of potash, perfectly soluble. By the subsequent boiling and agitation, part of the sulphat of iron would be decomposed, and this oxydation of the iron might perhaps be still further effected, by pouring the liquor through heaps of faggots, exposed to the wind, as is done in the *houses of graduation* for brine in France and Germany. The ferruginous and selenitic sediments being now allowed to settle, the clear liquor ought to be transferred into another reservoir, and there mixed with a hot solution of acidulous sulphat of potash, such as remains after the distillation of aquafortis from nitre and sulphuric acid; crystals will be immediately deposited of an alum much purer than common; and these, by a further clarification, may be made equal to that of La Tolfa.

§ 5. *Manufacture of Alum by Chaptal's process.*

An attempt had been made, but with little success, at the manufactory of Javelle near Paris, to prepare alum by the direct combination of its constituent principles; but it was not till the admirable and decisive experiments, in the large way, by Chaptal, published by him in the genuine spirit of philosophical liberality, that the practicability of this method could be said to be established. According to the modern way of preparing SULPHURIC ACID, the requisite proportions of sulphur and nitre being mixed together, are brought to combustion in a closed chamber lined with lead; the sulphur is thus acidified and converted into vapour, which by degrees unites with the water that overspreads the floor of the chamber, and forms a liquid, diluted, sulphuric acid. A similar process was instituted by Chaptal, only substituting dried clay for the water; the result of which was so favourable, that a large manufactory on the same plan was set on foot; which, having continued in full activity for several years, and producing alum only inferior to that of La Tolfa, merits a particular description.

The chamber in which the combustion is performed is 91 feet long, 48 feet wide, and 31 feet in height to the pitch of the roof. The walls are of common masonry, lined with a moderately thick coating of white plaster; the floor is a pavement of bricks, set in a mortar, composed of baked and unbaked clay; and this first pavement is covered by a second, in which the bricks are made to overlie the joints of the lower ones, and are themselves firmly connected to each other by a cement, composed of equal parts of pitch, tur-

pentine, and wax, made boiling hot, and poured between the joints instead of mortar. The roof is of wood, and the beams are set at much less distances than common; they are also channelled with deep longitudinal grooves, for the purpose of receiving the planks that fill up the space between the beams; so that the whole of this great area of carpentry does not present a single nail. The chamber thus constructed was covered on the sides and top with a layer of the cement just mentioned, applied as hot as possible so as to penetrate into all the pores of the wood and plaster; three more successive layers were then laid on, and the last was polished so as to present an uniform, even, solid face. In order to prevent the wood-work of the cycling from warping, it was covered on the outside with a thick coating of cement, and a light roof of tiles was laid over the whole. By substituting this cement for a lining of lead, a vast saving was effected in the first expence; and it has been found, by long experience, to require much fewer repairs than even lead itself.

The clay ought to be of the purest kind, such as pipe-clay; that it may contain neither lime nor magnesia, and as little as possible of iron. It is to be tempered with water, and made into balls five or six inches in diameter; these being dried in the sun, are afterwards calcined in a furnace; the first effect of the heat is to blacken them, but soon after they become red hot, the carbonaceous matter which causes the blackness is burnt out. Being thus withdrawn from the fire and cooled, they are broken down into small fragments, and spread on the floor of the chamber. In this state they are exposed to the vapour of sulphuric acid from the combustion of sulphur and nitre; and in a few days the pieces are observed to crack and open, and to be penetrated with slender saline crystals. The earth being at length covered with efflorescences, it is removed from the chamber, and exposed to the air under shelter of a shed, that the acid may obtain its highest degree of oxygenation, and become thoroughly united with the earth. It is now lixiviated, and the liquor contains, in solution, little else than acidulous sulphat of alumine: this being boiled down to the proper consistence, a solution of sulphated potash (being the residue in the pots of combustion from which the sulphuric acid was produced in the chamber, and consisting of the alkaline base of the nitre combined with some of the sulphuric acid) is poured in, and the liquor being then transferred into a large vat, perfect crystals of alum are shortly deposited, which are afterwards refined in the usual manner.

The advantages of this process are numerous. It may be carried on whenever a supply of proper clay can be had. The space taken up by the works is much less extensive than what is required according to the common methods. The whole manufacture is performed in at most one-third of the time usually necessary. A large quantity of fuel is saved. The extraneous salts in the mother-water are fewer; an important use is made of the residual sulphat of potash; and lastly, the alum itself is much purer, and almost equally well adapted to fix the delicate dyes as that of La Tolfa, the commercial price of which is generally about double that of the English alum.

§ 6. *Brunswick Alum.*

The dilute red colour of the roch alum, and the flesh-coloured efflorescences with which its crystals are covered, being its distinguishing character among the merchants, occasioned two brothers of the name of Gravenhorst to manufacture, some years ago, a spurious imitation of it at Brunswick. We know not whether the manufacture is still carried on or not; but if it is, the public will be benefited by the communication of an easy method of detecting the counterfeit, more especially

especially as the roch alum is the kind used in medicine, and the Brunswick imitation of it contains *arsenic*. The external appearance of the two sorts differs but little. The taste of the Brunswick alum is less styptic than that of the roch alum, it is less soluble in water, and when heated to redness, it loses only 37.5 per cent. of its original weight, while the other loses 50 per cent. The roch alum, when exposed to the blow-pipe, becomes opaque, swells, foams, and is converted into a spongy white mass. The Brunswick alum, on the contrary, swells less, scarcely foams at all, but melts, and becomes of a green colour, exhaling at the same time an arsenical vapour. Again, the precipitate from a solution of roch alum by potash or soda, being mixed with borax, fuses before the blow-pipe into a white or yellowish white; whereas the Brunswick, by the same treatment, affords a violet-coloured globule: and in fact it is nothing more than common alum, containing a little cobalt and arsenic.

§ 7. *Comparison of English, Roman, Levant, and French Alum.*

The Roman alum, manufactured at La Tolfa, is the purest and dearest of all; it is in pieces about the size of a walnut, shewing more or less of its crystalline form, and is opaque, on account of a farinaceous efflorescence with which it is covered. The Levant or roch alum appears in fragments of nearly the same size as the former, but in which the crystalline form is more obscure; it is externally of a dirty rose-colour, and internally exhibits the same tinge, but clearer. Smyrna is the place whence it is usually shipped for Europe; but it was anciently made at Roccha, or Edeffa, in Syria, whence its commercial name roch-alum. The French alum, that is, Chaptal's, described in § 5, is in small, clear, colourless crystals. The English is in large, irregular masses, considerably harder than the others. Equal portions of all these kinds, being exposed in a muffle to a red heat, were weighed after the intumescence was over, and the loss by calcination in the Roman alum was 50 per cent.; in the Levant alum 40 per cent.; in the French alum 57 per cent.; and in the English 47 per cent. Of pure water, at 144° Fahr. Roman alum required 14 times its weight for solution; Levant alum required 12 parts; French alum 13 parts; and English 15 parts.

Equal parts of these four kinds of alum being dissolved separately in water, the same quantity of prussiated lime was added to each solution. That of the English alum became slightly blue at the end of a few minutes, as was also that of the French alum, though the tint was rather lighter; after some time the Roman alum became faintly blue; but the solution of Levant alum was only lightly yellow, the natural colour of the prussiated lime. After two days an inappreciable quantity of blue precipitate was deposited from the English alum, rather less from the Roman and French, and only a few atoms from the Levantine; the three first solutions were of a bluish green tint, but the last was a very dilute yellow.

Equal parts of the four sorts were dissolved separately in pure water, and their earthy base was precipitated by an excess of ammonia. The precipitate from the Roman alum was of a pure dead white; that of the Levantine and French was nearly equal to the Roman; but that of the English was of a just perceptible bluish tint. By calcination in a red heat, they all at first became blackish, and ended with being perfectly white.

Hence is apparent the superiority of the Roman alum, and the inferiority of the English, when used as mordants for the most delicate colours: for other colours, and for the various uses besides to which alum is applied, each kind may

be used indifferently. The English possesses less water of crystallization than the Roman or French; and a given weight of it will go further than the same quantity of any of the rest, as 12 per cent. is to be deducted from the Levantine, on account of the reddish insoluble sediment with which it is contaminated.

§ 8. *Historical notice of the introduction of alum-making into Europe.*

The ancients appear to have been acquainted only with the native plume alum, which they procured from Lipari, and the neighbouring volcanic islands. In the 12th, 13th, and 14th centuries it was manufactured at Edeffa (Roccha) in Syria, in the vicinity of Constantinople, and at Phocœa (Foya nova), not far from Smyrna. Bartholomew Perdis, a Genoese merchant, who had often visited Roccha, discovered, about the year 1459, a vein of alum ore in the island Ichia, and there established the first European manufactory of alum; soon after John de Castro discovered the body of ore at La Tolfa. Establishments were then made at Viterbo, Volaterra, and other places in Italy with such success, as induced Pope Pius II. to prohibit the importation of Oriental alum. In the 16th century this art was introduced into Germany and Spain; and a little before its conclusion the English alum-works at Whitby were instituted by Sir Thomas Chaloner, who had the honour of being personally excommunicated by the reigning pope on this very account. The earliest of the Swedish works dates no higher than 1637. Macquer's *Chymisches wörterbuch* von Leonhardi, art. *Alum*. *Annales de Chimie*, v. l. viii. xiv. xxii. xxxi. *Philos. Hist. Nat. lib. xxxv. c. 52.* Bergman's *Essays*, vol. i. *Mémoires de l'Acad. Royale*, vol. v. *Encyclopedie Method.* art. *Alum*.

ALUM, in *Chemistry, Materia Medica, &c.* See SULPHAT of Alumine.

ALUMINE.—PURE EARTH OF ALUM.—PURE CLAYEY OR ARGILLACEOUS EARTH. *Alumine*.—*Terre d'alun*.—*Terre argilleuse*, Fr.—*Thon-erde*, Germ.

The word alumine has been adopted, without alteration, from the modern French nomenclature, by the majority of English chemists, as the technical name of pure argillaceous earth, on account of its being generally procured by the decomposition of alum, when required to be in a state of extreme purity.

Next to silica and lime, alumine appears to be the most commonly occurring earth in those stony or earthy masses, of which the globe, as far as we are acquainted with it, is principally composed. It forms the essential, though seldom the greatest part of all kinds of clays, giving to them the property of ductility or plasticity when mixed with water. When in a state of more intimate combination with silica it loses its quality of plasticity, and gives to the minerals in which it enters, the characters of opacity, of hardness inferior to that required for striking fire with steel, of that odour known by mineralogists under the name of earthy, and of that absence of crystalline form which is called amorphous; such are the immense masses of slate and argillaceous schistus that abound in almost all mountainous tracts, the boles, the coloriferous earths, the toadstones and clay porphyries. Alumine, however, occasionally, though very rarely, enters in large proportion into crystallized minerals, and then in its external characters of hardness, transparency and lustre approaches very nearly to silica: such is the adamantine spar, inferior only in hardness to the diamond, and which contains from 80 to 90 per cent. of alumine: such also is the sapphire, which by the analysis of Klaproth appears to contain no less than 98 per cent. of pure

pure alumine. These, however, which are more properly the mineralogical than chemical characters of alumine, will be treated of more at large in the subsequent mineralogical articles.

Pure alumine, in a state proper for chemical experiment, has hitherto never been found native, and it is only of late that chemists have discovered the method of obtaining this earth sufficiently free from foreign admixture. The method of Bergman and his contemporaries was to decompose a solution of purified crystals of alum by an excess of carbonated potash, or soda, and to wash the earthy precipitate in repeated quantities of distilled water, till it came off perfectly tasteless and pure; a white uniform soft matter was thus obtained, which was supposed to be carbonated alumine, and this by drying in a heat below that of redness, was deprived of its acid and water, and was then esteemed pure alumine. The insufficiency of this method had begun to be suspected for some time, however, particularly from the appearance of sulphurated hydrogen, when alumine thus purified was heated with charcoal, and afterwards moistened with a diluted acid, and the admirable memoir of Vauquelin on alum, (which has already been referred to under that article) not only established the validity of these suspicions, but pointed out the method of avoiding the errors of his predecessors, and thus introduced a very important improvement in the difficult art of chemical analysis. Alum has already been shewn to be a triple compound of alumine, potash and sulphuric acid in excess, and when this excess of acid is taken away, either by the addition of alumine or of an alkali, an insoluble salt is produced differing from alum only in the proportion of its earthy base; now the ease with which a salt is decomposed depends very materially on its solubility, when, therefore, we add gradually to a solution of alum a solution of carbonated alkali, the first effect is to neutralize the excess of acid, and the precipitate consists principally of the insoluble salt just mentioned; a further quantity of alkali, especially if assisted by heat, will effect the decomposition of part of the salt, but in proportion as this takes place the residue becomes mixed with the alumine, and thus is covered from the further action of the alkali. This being the case, it is obvious that no subsequent washings can do more than separate the sulphated potash; and therefore the residue, instead of being pure alumine, contains besides a variable proportion of earthy alum, from which last proceeds the sulphur observable on heating it in a close vessel with charcoal.

The only way by which alum can be made to yield its earth in a state of sufficient purity for delicate chemical experiments, is the following. Take any quantity of Roman alum, and dissolve it in lukewarm distilled water, filter the solution, and set it to crystallize. When by cooling and spontaneous evaporation, a sufficient portion of this purified alum is deposited, take it out and redissolve in cold distilled water; to this solution add liquid caustic ammonia, a white precipitate will be thrown down, and continue the gradual addition of ammonia till no farther precipitation takes place; heat the liquor then nearly to boiling for a few minutes, add more water, and throw the whole on a paper filter; in proportion as the fluid drains off add water, till it passes through quite tasteless. The precipitate, while yet in a pulpy state, is to be removed into a flask, and digested with muriatic acid till it is dissolved. The muriatic solution being then concentrated by very gentle evaporation, will at length deposit crystals of alum, which are to be removed, and this process is to be continued till the liquor ceases to yield any more. Nothing now but pure alumine remains in the solution, the potash and sulphuric acid being got rid of, at the expence of a little of the alu-

mine in the crystals, the liquor is therefore to be diluted with water; and ammonia fully sufficient for the decomposition of the muriated alumine being then added, the process of filtration and edulcoration is to be gone through as before, and the result will be pure alumine. On account of the length of this method, and the possibility that even after all a very minute proportion of sulphated potash may still remain, it has been the practice of late with Vauquelin and Berthollet to procure their pure alumine from such of the natural clays as contain only silica and alumine, by digestion in muriatic acid and decomposition of the solution by ammonia.

Pure alumine, obtained by the above methods, is opaque, of a snow white colour, a smooth somewhat unctuous feel, has no smell, even when breathed upon, or moistened with warm water, nor any proper taste; when placed upon the tongue, however, it absorbs all the moisture with which it finds itself in contact, and thus occasions a peculiar sensation of astringency. It is readily dissoluble, and remains for a long time suspended in water, but appears to be totally insoluble in this fluid. Its specific gravity is variously estimated, according to the degree of deliccation, by Bergman it is reckoned 1.305, while Kirwan allows it as much as 2.0. After being thoroughly dried in a heat just not sufficient to destroy its plasticity, it is capable of absorbing $2\frac{1}{2}$ times its weight of water, without allowing any to drop out, and the water thus mixed is retained more obstinately at the usual atmospheric temperature by alumine than by any other earth; a freezing cold however causes this earth to contract remarkably, and thus squeeze out a large proportion of its water.

Alumine is the only earth that possesses the property of plasticity, or of being kneaded up with water into a soft ductile paste, capable of being formed by the hand or the potter's wheel into any shape that may be required; the plasticity therefore of all the natural clays is owing to their aluminous part; nor is this property destroyed even by a very large admixture of other earths; in the finer kinds of pottery scarcely a fourth of the whole mass is pure alumine, and yet its plasticity is unimpaired. If a piece of tempered clay is dried gently in the air, it retains its form, but becomes quite brittle; its former ductility may, however, be restored by again kneading it with water. If exposed to a red heat it hardens, contracts in all its dimensions, becomes more compact, and of greater specific gravity, and is no longer plastic, nor can this property be restored to it by any other means than by solution and precipitation; hence bricks or pottery ware, after having been baked, if pounded ever so fine, are no more capable of forming a paste with water.

The action of caloric on alumine is accompanied by some interesting phenomena which deserve mentioning. If the purest plastic alumine is exposed to a low red heat, it becomes of a bluish black colour, (especially on the inside, as is manifest by breaking a piece across that has been thus heated; as soon as this colour is perceived the plasticity is destroyed, a fact that renders it probable that this property of alumine depends on something else than mere water. By a further increase of the heat with access of air, the carbonaceous colouring matter is burnt out, and the alumine acquires a resplendent white colour, becoming at the same time harder, denser, and of less bulk: all these changes advance in gradual progression in proportion to the heat; and after it has thus experienced the full effect of our most powerful furnaces, it will be found to be so hard as to give fire with steel, and reduced to nearly one half of its original bulk. Upon this last property is founded the use of *Wedgewood's* PYROMETER, for measuring the higher degrees of heat. The

decrease of bulk is in part occasioned by the expulsion of the last particles of water; but from the augmented specific gravity of the alumine, it is plain that an actual condensation or approximation of molecule takes place, as is observable in various other porous substances previous to fusion. Whether any artificial heat is able to bring this earth into real fusion is as yet dubious; for though Lavoisier, by means of a blow-pipe charged with oxygen gas, reduced a piece of alumine to a pasty semi-fluid state, yet it is probable, as the earth was obtained from alum, that a minute portion of potash might still be contained in it, and thus act as a flux.

Alumine has a strong affinity for metallic oxyds, especially the oxyd of iron; hence arises the difficulty, and indeed almost impossibility, of obtaining alum free from iron in the great way, because all natural clays and aluminous ores contain more or less of this metal. The only way of accurately separating these two substances is by digestion in caustic potash or soda, which will dissolve the earth, but not the oxyd.

These two substances are also capable of acting on each other in the dry way at high temperatures; and some important experiments on this subject are recorded by Achard and Kirwan, from which it appears, that when the proportion of alumine exceeds that of the oxyd of iron, the mixture is in all cases very difficultly fusible; that when the proportions of the ingredients are equal, and especially when the iron predominates, the result, after exposure to a heat of about 160° Wedgewood, is a dark-coloured vitreous slag.

The attraction too that subsists between alumine and vegetable or animal colouring matter, is singularly powerful. Thus, if, to a watery infusion of cochineal or madder, a few drops of a solution of alum are added, a decomposition shortly takes place, and the whole of the tinging particles unite, and are precipitated together with the aluminous base of the earthy salt, leaving the supernatant liquor wholly colourless. Fugitive colours also, by this combination, become of sufficient permanence to resist for a long time the changes to which they are subject: hence is explained the preparation of the *LAKE pigments*, and the theory of *Mordants* in the art of *DYING*.

In the direct way sulphur appears to contract no union with alumine; and the hepatic gas that is separated by an acid from alum, after having been heated with charcoal, is no longer a decisive evidence of sulphuret of alumine, since the discovery of the necessity of potash to the very constitution of common alum.

Upon the gaseous substances alumine has not been observed to produce any change, although Humboldt has published (*Annales de Chimie*, vol. xxix.) a long and plausible memoir, to shew that alumine absorbs the oxygen of the atmosphere, and hence produces an important effect in the economy of vegetation. It is true, indeed, that many natural clays will deoxygenate atmospheric air; but this is solely owing to the carbonaceous matter and oxyd of iron that they contain, it having been proved by accurate experiments, instituted for this purpose by Theod. Saussure and others, that pure alumine has no effect whatever on oxygen gas or atmospheric air.

All the acids are capable, in particular circumstances, of combining with alumine; but these combinations are not accomplished with the same ease as those between the acids and alkaline earths. The stronger mineral acids will take up alumine from clay by digestion at a boiling heat, but the vegetable and other weaker acids will not readily effect a solution, except the alumine is presented to them recently precipitated by an alkali from sulphuric, nitric, or muriatic acid. All the aluminous salts are decomposed with precipitation of the earth by the caustic or carbonated alkalies, or alkaline

earths. For further particulars see the salts under their respective acids.

Ammonia has not yet been observed to exert any action on pure aluminous earth; but both potash and soda, when caustic, will dissolve it without any difficulty. This may be done by evaporating to dryness, and igniting in a silver crucible, a mixture of caustic alkali and alumine, and then lixiviating the mass, or merely by boiling some fresh precipitated alumine in a watery solution of the alkali. This alkalinized alumine has of late been recommended as a preferable mordant to common alum in the fixing of those colours that are injured by the presence of sulphuric acid. To separate alumine from its solution in caustic alkali, it is necessary to add nitric or muriatic acid in sufficient quantity to neutralize the alkali and dissolve the alumine, and then to precipitate the earth by caustic ammonia.

The action of barytes on alumine is analogous to that of the alkalies, yet presents some peculiar characters. When a solution of caustic barytes in water is added to a liquid muriat of alumine, the first effect is the appearance of a precipitate, owing to the decomposition of the salt by the barytes; if this last, however, is added in excess, the alumine is redissolved by it, and the liquor becomes clear.

Again, if equal parts of newly precipitated alumine and caustic barytes are boiled together in a quantity of distilled water sufficient to take up the barytes, about half the mixture will be dissolved, and upon analysis the insoluble residue will be found to consist of alumine, with a small proportion of barytes, while the solution will consist of much barytes and a little alumine. By adding to the liquor some muriatic acid, to engage the excess of barytes, a flocculent precipitate will be deposited, consisting of the two earths, nearly in the proportion of the original insoluble residue. Hence it appears that alumine combines with barytes into a salt which is insoluble in mere water, but is capable of being rendered soluble therein by the assistance of barytes. In the dry way, at about 150° Wedgewood, any mixtures of the two earths in which the alumine preponderates remain pulverulent; but when the barytes is three or four times as much as the alumine, the powder concretes into a hard mass, without, however, shewing any signs of fusion. In order to decompose barytic alumine, dissolve the whole in muriatic acid, and add caustic ammonia; the alumine alone will be precipitated.

Strontian produces the same effect on alumine as barytes, but more feebly; the action of these two substances in the dry way, on each other, has not yet been the subject of experiment.

It appears highly probable that lime has a similar affinity for alumine, as the rest of the alkaline earths possess; the only experiment, however, upon the subject, is one of Morveau's; he mixed equal parts of muriat of alumine and muriat of lime in solution, and immediately a precipitate took place, which was insoluble by an excess of acid; this has been since repeated by Darracq, a pupil of Vauquelin, without effect, the liquor remaining perfectly limpid; hence it is probable that the alumine of Morveau was not quite free from sulphuric acid, and that the insoluble precipitate was merely selenite. In the dry way lime and alumine in any proportions are infusible, except by means of a blow-pipe, charged with oxygen gas.

The action of magnesia on alumine is not yet fully ascertained: it appears, however, from Mr. Chenevix's experiments, that the ammoniaco-magnesian triple salts, are formed with difficulty, when alumine is present, and that magnesia prevents, in a great measure, the solubility of alumine in the caustic fixed alkalies. This combination of the two earths

earths is, however, soluble in muriatic or nitric acids, and may then be decomposed either by hydrofulphuret of soda or of ammonia, which will precipitate the alumine and retain the magnesia in solution, or by an alkaline prussiate, which will also separate the alumine while the prussiated magnesia remains dissolved. In the dry way, according to Kirwan, magnesia and alumine at 150° Wedgwood have no action on each other in any proportions.

A considerable degree of affinity exists between silic and alumine, and the unsuspected formation of this compound in many analytical experiments on minerals has often produced a number of deceitful and embarrassing appearances, which have vitiated the results of many a laborious analysis. Chemistry is, therefore, indebted to Klaproth for shewing, that when to a solution of pure silic in caustic potash is added a solution of alumine equally pure in the same menstruum, the liquor immediately assumes a reddish brown colour, and after standing an hour or more, coagulates into a thick opaque whitish jelly. This jelly, by the addition of a little warm water, is resolved into a fluid, and being then mixed with muriatic acid, to the exact saturation of the alkali, a copious precipitate is deposited, consisting of the two earths, in a state of combination; if now a slight excess of acid is dropped in, the silic as well as the alumine, will be perfectly dissolved. Carbonated potash will again cause the precipitate to appear, and this even when separated by filtration and dried, will be still entirely soluble in dilute sulphuric acid, without the smallest deposition of silic. If the sulphuric solution is now gently evaporated, crystals of alum will be deposited, and the remainder will assume the form of a clear jelly, the surface of which, after a few days, will be covered with crystalline pyramids; and in order to shew that it is really silic mixed with alumine, which has thus repeatedly been dissolved in acids, nothing more is necessary than to mix this jelly with a large quantity of water, and digest it for some while in a moderate heat, stirring it repeatedly at the same time, when the liquor will become turbid and pure silic will be deposited. In the dry way, according to Kirwan, equal parts of alumine and silic at 160° Wedgwood concrete together, but shew no signs of fusion.

Alumine is as yet a pure chemical element, never having been composed or analysed. From its affinity with colouring matter, and its blackening in a low heat, Baron was of opinion that it was of a metallic nature, and even Lavoisier entertained the idea that it might be a metallic oxyd, whose component elements were united together by a very powerful affinity. Beaumè considers the earth of alum as essentially the same with silic, being led into this mistake by fusing rock crystal repeatedly with potash, and always obtaining alumine; this experiment of Beaumè's was repeated by Scheele, who found indeed that it was true whenever an earthenware crucible was made use of, but perceiving the crucibles corroded internally after every process, he suspected that the alumine was furnished by the action of the alkali upon them; in proof of which he repeated the fusion of silic with potash in an iron crucible, and as might be expected, did not procure a particle of alumine.

The uses of pure alumine are wholly confined to the laboratory; it gives, however, their peculiar character to all clays; every thing, therefore, that depends on the cohesiveness and plasticity of these substances when fresh, and their hardness after being baked, may be fairly attributed to the alumine which they contain; hence, it is the basis and material of all the arts of pottery, from the common brick to the finest porcelain, and these include more of the comforts and elegancies of life than are perhaps dependent on any other substance in nature.

Journal de Physique, vol. lii.—Scheele's Essays.—Klaproth's Analytical Essays.—Kirwan's Mineralogy, vol. 1.—Annales de Chimie, vols. xxviii. xxix. xxxi. xl.—Macquer's Chimisches Wörterbuch, vol. vi.—Beaumè's Chymic Experimentale, vol. i.

ALUMTA, in *Botany*, a name given by some of the old Latin writers to the plant, otherwise called *lutum* and *corniola*, and by the Greeks *cynece*. It was the same with our *genifella tinctoria*, or dyers weed, and was used by the dyers, and by the ladies to tinge their hair yellow, the colour that was esteemed most beautiful in those times.

ALUNGU, in *Natural History*, is a word of the Malabar language, and the name given by the Malabarians to an animal resembling a large lizard, except as to head and tail, which are both pointed. It is a German ell and $\frac{1}{2}$ long, and its breadth is half an ell. It is a species of the *MANTIS* of Linnaeus, and belongs to the family of *ANT-eaters*, which have no teeth, but a long round tongue, with which they catch the ants. Phil. Trans. vol. lx. N° 5. an. 1700.

ALUNKAN, or ARROUKAGE, in *Geography*, a town of Persia, in the province of Zabulistan, 100 miles south of Candabar.

ALUNTUM, ALONTIUM, or HALUNTUM, in *Ancient Geography*, a town of Sicily, on a steep eminence, near the mouth of the river Chydas. It is now in ruins; but from these arose the hamlet St. Philadelfo, in the Val di Demora. The inhabitants were called *Halantini*.

ALVOR, in *Geography*, a small place with an earldom in the province of Algarve, between Villa Nova de Portimão and Lagos.

ALVOREDO, an island of South America, on the coast of Paraguay, three leagues south of St. Catharine's island. S. lat. 27° 43'. W. long. 49° 16'.

ALVORNINHA, or ALBURNINHA, a small town of Portugal, in Elremadura, containing about 1500 inhabitants.

ALURNUS, in *Entomology*, a genus of insects of the order of *COLEOPTERA*, with filiform antennæ, six very short palpi or feelers, and horny arched maxilla or jaw. There are three species, viz. 1. *A. griffus*, black, with crimson thorax and yellow clytæ, found in South America and India. 2. *A. femoratus*, of a green reddish colour, with the hinder thighs and legs dentated, the tenebrio femoratus of Drury, and the tenebrio viridis of Salzer, found in India, with the antennæ half the length of the body, and the last joints black. 3. *A. dentipes*, black, with the hinder thighs and legs dentated, found at the Cape of Good Hope.

ALUS, in *Ancient Geography*, a village of Palestine, in the vicinity of Nicopolis. Also an ancient town of Arabia Petrea, where was the 10th encampment of the Israelites.

ALUSMA *Caramanica*, in *Botany*, a term used sometimes to express a plant growing in Caramania, and sometimes a preparation of that plant, or pigment made from it. The word frequently occurs in the writings of Avicenna and Serapion.

ALUTA, in *Ancient Geography*, a river of Dacia, now called *Alt*, or *Olt*, which rises at the foot of the Carpathian mountains, and passes through the east and south regions of Transylvania into Walachia, dividing it into the eastern and western parts. It discharges itself into the Ister.

ALUTA, a small village of Palestine, placed by Jerome near the river Chebron.

ALUTÆ, a people of Illyria.

ALUTRAENCES, a people of the Alps, according to Pliny.

ALVUS, among *Anatomists*, is sometimes used to express the lower belly, or *venter*.

ALVUS is more usually taken among *Physicians* for the

state and condition of the *faces*, or excrements, contained within that cavity.

Thus, when a person is laxative, it is called *alvus liquida*; and when costive, *alvus adstricta*.

They who are of a loose belly in their youth are generally costive in their old age; and they who are bound in youth are often loose when old. A laxer state in youth, and rather bound than loose in old age, is most desirable.

Binders of the belly are labour, sitting in a chair, fullers' clay laid over the body, diminution of food, eating once a day instead of twice, little drinking, and that only after a full meal, rest after meals. On the contrary, things which loosen the belly are, walking and eating more than usual, stirring after meat, intermixing draughts with eating, and it ought to be observed, that a vomit binds a loose belly, and loosens a bound one; and that a vomit taken immediately after meat binds the belly, but, delayed until a considerable time after, loosens the fame. Celsus.

ALWAIDII, a sect of Mahometans, who hold that all great crimes are unpardonable, and the criminals reprobated to eternity. The alwaidii stand in opposition to the MORGII. They attribute less efficacy to the true belief in the salvation of men than the rest of the Mussulmen.

ALWEIL, in *Geography*, a lake of Swisserland, in the canton of Bern, seven miles long, and one and a half wide, seven miles south-east of Arau.

ALWEN, a river of North Wales, which runs into the Dee, seven miles north-north-east of Bala, in Merionethshire.

ALWOS, a large and populous village of Hungary, on the side of the Danube, in the district of Comarro, and famous for an aqueduct made there in 1747.

ALYATTIS *sepulchrum*, in *Antiquity*, the tomb, or rather burial-place of Alyattis, the father of Cræsus, near Sardis, which was six stadia in circumference.

ALYBA, in *Ancient Geography*, a town on the eastern part of Pontus, belonging to the Alybians, who inhabited this coast; supposed to be the same with the Chalybes, whose country furnished metals.—Also, a mountain of Africa, the same with *Alyla*.

ALYCUS, a town of Peloponnesus which was either Asiatic of Megaris, or near it.

ALYMNE, a town of Asia Minor, situate towards the confines of Phrygia, Caria, Lycia and Pisidia.

ALYMOHAU, in *Geography*, a town of Hindostan, in the country of Guzerat, and circar of Champaneer, 100 miles north-east of Surat, and 32 east-south-east of Champaneer.

ALYPIAS, in the *Materia Medica* of the ancients, a species of turbeth, prescribed for the purging of bile. Some write the word *alypon*, and define it by white turbit. Galen used *alyrium*, *αλυριον*, for a minorative, or a medicine that gently purges.

ALYPIUS of *Alexandria*, in *Biography*, a Platonic philosopher, was much celebrated for the acuteness of his genius, and the subtlety with which he lectured upon the abstruse speculations of the Platonic school. Jamblichus, who was his contemporary, and who wrote his life, commends him highly on account of his exemplary virtue, as well as his distinguished talents. His stature was very diminutive, so that he was denominated a dwarf, but his mind was proportionably capacious and superior. He died at Alexandria in an advanced age. Gen. Diç.

ALYPIUS of *Antioch*, a geographer of the fourth century, lived under the reign of Julian the apostate, and was sent into Britain as deputy-governor, where, says Mr. Gibbon, his humanity was tempered by severe justice and manly fortitude, and while he exercised his abilities in the civil administration of the country, he imitated, in his political compo-

sitions, the harmony and softness of the odes of Sappho. To Alypius, Julian entrusted the execution of his plan for rebuilding the temple of Jerusalem. Ammianus Marcellinus informs us, that whilst Alypius, assisted by the governor of Palestine, urged, with vigour and diligence, the accomplishment of the work, horrible balls of fire breaking out near the foundation, with frequent and reiterated attacks, rendered the place, from time to time, inaccessible to the scorched and blasted workmen; and the victorious clement continuing in this manner obstinately and resolutely bent, as it were, to drive them to a distance, the undertaking was abandoned. On this relation Mr. Gibbon, in his usual manner, observes, that "Such authority should satisfy a believing, and must astonish an incredulous mind. Yet a philosopher may still require the original evidence of impartial and intelligent spectators. At this important crisis, any singular accident of nature would assume the appearance, and produce the effects of a real prodigy. This glorious deliverance would be speedily improved and magnified by the pious art of the clergy of Jerusalem, and the active credulity of the Christian world; and, at the distance of 20 years, a Roman historian, careless of theological disputes, might adorn his work with the specious and splendid miracle." The impartial enquirer into the credibility of this event will derive greater satisfaction from the testimonies for and against it, cited by Dr. Lardner, than from the sarcastic reflections of this popular historian, whose scepticism on the subject of religion has sometimes perverted his judgment with regard to historical facts. Julian's attempt for rebuilding the temple, and the defeat of it by divine interposition, are mentioned by three contemporary writers, *viz.* Gregory Nazianzen, Chrysostom and Ambrose, bishop of Milan, all Christians; and also by Ammianus Marcellinus, a learned heathen; and afterwards by Rufinus, Socrates, Sozomen, Theodoret, and Philostorgius, as well as by later writers. Some Jewish writers, as R. David Gansius, and R. Geddalus, have also been alledged as bearing testimony to this event. The truth of the history, thus confirmed, has been maintained by Fabricius, Witius, bishop Warburton, and others of high reputation in the republic of letters. Basnage has made some objections to this history, and Dr. Lardner, with his usual modesty, has suggested several reasons for doubting its authenticity. He first argues, that Julian's own writings lead us to think that he never attempted to rebuild the temple at Jerusalem; it is also unlikely that he should give orders for this purpose, and allot money for it out of the public treasury, when he was setting out in his expedition against the Persians; and though great stress is laid upon the testimony of Ammianus Marcellinus, a heathen, and an impartial historian, yet he had his account from the Christians, which he seems to have taken up without examination, and it sufficiently appears from other circumstances, that he was credulous: besides, the history of this event, as it is related by Christian writers, is loaded with miracles, or pretended miracles, which appear to be incredible: nor was there at that time any occasion for such miraculous interpositions. And, lastly, there are several Christian writers, who have said nothing about this affair, but who were likely to have mentioned it if any thing of this kind had been done; such are Jerome, Prudentius and Orosius.

Whether Alypius was ever employed in rebuilding the temple or not, it appears that towards the latter part of his life, he was accused, with others, of practising magic. Hierocles, his son, was condemned to death, and he himself suffered confiscation and banishment. They were charged with administering poison; but Ammianus represents their suffering as unjust. Alypius was the author of a treatise

in geography, of which Julian speaks favourably; but it is probably lost. Another treatise published by Godfrey, in Greek and Latin, under the title of "A Description of the Old World," in 4to. at Geneva, in 1628, was probably not the work of Alypius, though some have ascribed it to him, because the author speaks of Britain from report, and not from his own observation. This work is thought to have been written in the reigns of the emperors Constantius and Constans. Ammian. Marc. l. xxiii. c. 1. l. xxix. c. 1. Lardner's Works, vol. viii. p. 377—391. Gibbon's Hist. vol. iv. p. 105—109. 8vo.

ALYPIUS of *Tagasta*, a town of Africa, was the intimate friend of Augustine, and baptized with him at Milan, in 388. On his return from Palestine, in 394, he was made bishop of his native place. Whilst Augustus was engaged with the Manichees, Alypius was induced to join them; but he afterwards avowed himself a zealous advocate for the catholic faith. He made successive attempts to convince the Donatists of their errors, and to recover them to an union with the church; particularly at the council of Carthage, in 403, and again in 411: but neither his arguments, nor the penal decrees of the emperor Honorius were sufficient to reclaim them. Alypius was also deputed by the churches of Africa about the year 419, to Honorius, in order to obtain severe decrees against the Pelagians, and in this office of persecuting zeal he so far succeeded as to break up their assemblies and banish their ministers. He died about the year 430, less honoured in remembrance for his Christian charity than his orthodoxy and zeal. Gen. Dict.

ALYPIUS, in *Biography*, one of the seven Greek writers on music, that have been collected and published with a commentary and notes, in 1652, by Meibomius. It is difficult to ascertain the time of his excellence. Cassiodorus (*de musica*) placed him before Euclid and Ptolemy, and has ranged his tract, *Ἐισαγωγή μουσική*, or *Introduction to Music*, between that of Nichomachus and Gaudentius. The contents of this work furnish the most ample nomenclature of all the sounds of the several scales and modes of the ancient Greek music, that has come down to us. The characters for sound used by the Greeks for their several modes in the three genera, amounted to 1620. These notes were formed of the twenty-four letters of the Greek alphabet, entire, mutilated, single, double, or lengthened; sometimes turned to the right, sometimes to the left, or lying horizontally, so that their corners or sides were turned upwards; and lastly, some were barred, and others distinguished by the grave and acute accents, which had likewise a place among these numerous discriminations.

This tract was first published by Mcursius, 1616, from the MS. of Joseph Scaliger, but not very correctly, according to Fabricius. Kircher has given extracts from *Alypius* in his *Musurgia*, 1650; pretending that he had translated the whole into Latin; but the table which he has inserted from him of ancient musical notation, is so inaccurate, that Meibomius, who consulted not only the Greek MS. of Scaliger, but that of Bolejanus, Barocius, Barberitti, and Selden, affirms, that he found in it more than 200 errors.

It is from the indefatigable labour of the learned Meibomius, in his commentaries upon the ancient Greek musicians, particularly *Alypius*, that we are able to decipher those characters; which, before his time, had been so much altered, corrupted, disfigured, and confounded, by the ignorance or inattention of the transcribers of ancient MSS. that they were rendered wholly unintelligible. See GREEK MUSIC, and NOTATION.

ALYPON *Montis Ceti*, or white turbit, in *Botany* and the *Materia Medica*. See CONVOLVULUS.

ALYPUM, in *Botany*. See GLOBULARIA.

ALYSEM, a name given by Tournefort to a species of spurge, the *Polypodium orbiculatum*, or *Polypodium*, of narrow-leaved almond spurge of Tournefort.

ALYSEM is likewise a name given by some writers to a species of dog'sbane, distinguished by Tournefort by the name of *apocynum maritimum lenticulum foliis siliis flore purpureo*, the purple-flowered sea apocynum of Venice, with willow-like leaves.

ALYSSOIDES, in *Botany*. See ALYSSUM.

ALYSSON. See ALYSSUM, CLEPTOLA, DRABA, MARRUBIUM, MYAGRUM and VERONICA.

ALYSSUM, formed from *αλυσσα*, to be mad, madwort, in *Botany*, a genus of the *tetradymia filicifera* class and order, of the natural order of *siliquose* and *crucifera* of Jussieu; its characters are, that the calyx is a four-leaved, oblong perianthium, leaflets ovate-oblong, obtuse, convergent, and deciduous: the corolla four-petalled and cruciform, petals flat, shorter than the calyx, very spreading, claws of the length of the calyx; the stamina have six filaments, of the length of the calyx, two opposite a little shorter, marked with a toothlet, anthers from erect spreading: the pistillum has a subovate germ, style simple, of the length of the stamens, longer than the germ, and stigma obtuse: the pericarpium is a subglobose, emarginate silicle, or broad and short pod, with a style of the length of the silicle, two-celled, the partitions elliptic, valves elliptic and hemispherical: the seeds are fixed to filiform receptacles, issuing forth at the end of the silicle, few and orbicular. Martyn reckons 17, and Girardin 15 species, which are distributed into the divisions of undershrubs, herbaceous, and those with silicles inflated, &c.; to the undershrubs belong, 1. *A. Spinosum*, thorny madwort, with the old racemes thorny and naked. The woody branches are about two feet high, and are armed with small spines: the leaves are hoary and lanceolate; the flowers grow in small clusters at the end of the branches: the petals are white and entire; the filaments toothless. This species grows naturally in Italy, Spain, and the South of France. 2. *A. Halimifolium*, sweet M. *thlaspi* of Lerm. Ludgb. with stems procumbent, perennial, leaves lanceolate linear, acute and quite entire. This spreads on the ground, produces at the extremities of its branches pretty tufts of small white flowers for six or seven months successively; is a native of the southern countries of Europe, and was cultivated in the Chelsea garden in 1722. 3. *A. Saxatile*, yellow M. with stems shrubby, panicled, leaves lanceolate, very soft, repand, and petals entire. This is a low plant, rising about a foot high, and dividing into several smaller branches; the flowers are produced in loose panicles at the end of every branch, and are of a bright yellow colour, appearing at the end of April, or beginning of May, and lasting, in a favourable season, about three weeks; it is very suitable to embellish rock-work, as it is small, showy and hardy; it often flowers a second time in Autumn: it is a native of Candia and Austria, and cultivated here by Miller, in 1721. 4. *A. Alpestre*, Italian M. with stems undershrubby, diffusid, leaves roundish and hoary, calyxes coloured. The leaves are very obtuse; the calyxes deciduous, and petals entire, and both yellow: the stamens have a little membrane at the base: it is perennial, and a native of the mountains of Provence, towards Italy, mount Cenis, &c. It differs from the Alyssums in having an ovate-acute silicle, not inflated. To the herbaceous division belong, 5. *A. Hyperboreum*, Northern M. with leaves hoary toothed, and stamens four-forked; found in North America. 6. *A. Incanum*, hoary, (omitted by Gmelin) with stem erect, leaves lanceolate, hoary, quite entire, flowers in corymbs, and petals bifid. This grows to the height of

two feet, with woody stalks, dividing into several branches; the flowers are produced at the extremity of every shoot in round bunches, small and white; the silicle is oval, and full of brown seeds; it grows naturally in the south of France, Spain and Italy, Germany, Austria, Sweden, &c. chiefly on rocky or gravelly soils, is perennial, and was cultivated here by Parkinson in 1640. 7. *A. Minimum*, least *M.* with stems diffused, leaves linear, downy, and filicles compressed. This is annual, and grows wild in Spain: the petals are yellow and submarginate. 8. *A. Calycinum*, calycine *M.* with stamens all toothed, and permanent calyxes. It is annual, and found wild in Austria, Carniola, France, Germany and Switzerland. The petals are small and yellow, becoming white with age: the silicle has two seeds in each cell, one of which is commonly abortive: it was cultivated by Miller in 1768. 9. *A. Montanum*, mountain *M.* with stems diffused, leaves sublanceolate, dotted and echinate. The branches trail, the leaves hoary, rough and alternate, the flowers produced in small clusters at the ends of the branches, and of a dark yellow colour; it grows naturally upon rocks in Burgundy, and some other parts of France, about Basil, in Germany, Austria, Carniola, &c. is perennial, and cultivated by Miller in 1759. 10. *A. Campesire*, field *M.* (omitted by Gmelin) with stamens guarded by a pair of bristles, and calyxes deciduous; resembles the 8th in stem, leaves and petals, is annual, and a native of France, Germany and Switzerland, and cultivated by Miller in 1768. 11. *A. Clypeatum*, buckler-podded *M.* with stem erect, filicles sessile, oval, compressed-flat, petals pointed and linear. This is a biennial (annual, Linn.) plant, and grows naturally in Spain and Portugal, and it was found by Tournefort, on Mount Libanus; it was cultivated by Gerard in 1596. To the division with *filicles inflated*, or *calyxes oblong and closed*, belong the following species. 12. *A. Sinuatum*, sinuate-leaved *M.* with stem herbaceous, leaves lanceolate-deltoid, and filicles inflated. This is a low spreading plant, which divides into small branches, garnished with hoary leaves through the year; the flowers produced at the ends of the branches are of a bright yellow colour. It is annual, or triennial, and grows wild in Spain by the way-side, and in the islands of the Archipelago, and sufficiently hardy to bear the open air in England, in a dry soil and warm situation; it was cultivated in the Kew garden in 1680. 13. *A. Creticum*, cretan *M.* with stem shrubby, leaves lanceolate, a little toothed, downy, filicles inflated and globular. This species seldom continues longer than two years in England, and in a warm, dry situation, will live in the open air. It is a native of Spain and Candia, and was cultivated by Miller in 1759. 14. *A. Gemonense*, *gemona M.* with stem herbaceous, branches divaricated, root-leaves obovate, rather downy, and filicles inflated. This differs from the last in having divaricated branches, and smaller flowers of a deep yellow colour. The root is perennial; the stem spreads on the ground; the leaves are roughish and ash-coloured, about five inches long, and scarcely an inch broad; the perianthium is spreading, yellow and hirsite; the petals are twice the length of the calyx, obovate and emarginate. This species was discovered by Arduini in 1759, on the mountain Della Fontana, near Gemona, in the district of Forlì in Italy, in the clefts of rocks: it flowers in May and June. 15. *A. Utriculatum*, bottle *M.* with stem herbaceous, erect, leaves smooth, lanceolate, quite entire, and filicles inflated. This has the flower of *lunaria*; and resembles it, except in its inflated filicles; it was found by Tournefort in the Levant, and grows in the vineyards of Savoy: it is a hardy and beautiful perennial, flowering from April to June, when it begins to form its curiously inflated pods: it is well adapted to the decoration of walls or rock-

work; it was cultivated in 1739 by Miller. 16. *A. Vesicaria*, bladder *M.* vesicaria of Tournefort, with leaves linear, toothed, filicles inflated, angular and acute. This species and the next have trailing stalks, and produce their flowers towards the extremities in loose spikes. 17. *A. Deltoideum*, deltoid-leaved *M.* leucoium faxatile, &c. of Bauhin, with stems under-shrubby, prostrate, leaves lanceolate-deltoid, and filicles shaggy. The flowers of this resemble those of the stock-gilliflower, and are of a purple colour; it was cultivated in 1739 by Miller. This and the last were found by Tournefort in the Levant. The *alysum sativum* of Dr. Smith, with an herbaceous stalk, lanceolate and fagittated leaves, and obovate inflated filicles, or gold of pleasure, is a species of MYAGRUM in the Linnæan system.

All the species may be propagated by seed, and most of them by slips and cuttings. The seeds should be sown in a border of light earth in April. Cuttings or slips should be planted in April or May; shaded in the heat of the day, and gently refreshed with water. In rich ground they seldom live through the winter in England; but in a dry, poor, rubbishy soil, or on old walls, they will endure the cold and remain much longer. Martyn.

ALYSSUM. See CARDAMINE, CLYPEOLA, DRABA, MYAGRUM, PELTARIA, STACHYS, SUBULARIA and SISYMBRIUM.

ALYTARCHA, in *Antiquity*, a priest of Antioch in Syria, whose office was to lead up the *massigephor*, or *flagelliphori*, officers with whips in their hands, who attended at the games or combats of the *athleta*, encouraged them to behave stoutly, and, on occasion, served to preserve good order, and keep off the crowd.

The officer who presided at the Olympic games was also sometimes denominated alytarcha.

Some will have the alytarcha to be the same with the *hellenodicus*, of which opinion are Faber and Prideaux.

Van Dale shews them to be different offices; not but that the alytarchi might sometimes be substituted for the *hellenodici*, to perform some part of their function.

The alytarchi were the same with what were called, in some other places, *alyta*.

ALYXIA, in *Botany*. See GYNOPOGON.

ALYZIA, in *Ancient Geography*, a town of Greece in Acanania, about 15 stadia from the sea, and near the port of Hercules.

ALZA, in *Geography*, a river of Germany, which runs into the Inn, six miles east of New Oeting, in the circle of Bavaria.

ALZACHI, in the *Materia Medica*, the name given by the Arabian Physicians, to that kind of gourd called in the shops the *CITRUL*, and by the people of some parts of Italy, the *anguria*. It is an oblong, and usually crooked gourd, and contains in its cavity a considerable quantity of water, which is drank by people of the places where the plant is common, to quench thirst. It contains seeds of an oblong figure, flattened, and covered with a hard skin.

ALZAGIAT, a name given, by the Arabian writers, to all the vitriolic minerals. It is also written *zagi*, or *ZEGI*.

ALZARAC, a name given to a kind of CAMPHOR, which was coarse, and of a brown colour. It seems to have been the same with our rough camphor, as imported from the Indies, before being purified.

ALZATO, in *Geography*, a town of Italy, in the territory of Coma, in the Milanese, four miles south of Coma.

ALZBACH, a town of Germany, in the archduchy of Austria, four miles west of Schwannstatt.

ALZEY. See ALTZEY.

ALZIRA. See ALGEZIRA.

ALZIZ, a name given by Serapio and Avicenna to the roots of the *trafi*. The word *ZIZ* is the name of a river

river in Africa, according to Leo; and the roots probably had this name from their being found in great plenty on the banks of that river, the *trasi* always growing in wet places.

ALZANIA, in *Geography*, a province of Asia, in Great Armenia, towards the river Tigris, comprehending nine very considerable districts, which extend along the river to Karamut or Diarbekir.

ALZON, a town of France, in the department of the Gard, and chief place of a canton, in the district of Vigan, 15 miles north-north east of Lodeve.

ALZON, a river of France, which runs into the Gard, about a league below Uzes.

ALZONNE, a town of France, in the department of the Aude, $2\frac{1}{2}$ leagues west of Carcassonne.

ALZUM, in *Botany*, a name given, by the ancients, to the tree which produces the gum *BELLIUM*. It is also written *alrum* and *aldum*, which last seems the proper way. The gum of this tree was called, by the Arabians, *mokel*, and the same word *mokel* is used as the name of a fruit of a palm-tree.

AM, in *Geography*, a famous city of Armenia, where they formerly reckoned 100,000 houses, and about 1000 mosques. It was taken by the Tartars in 1219, and is now considerably reduced. It is thought to be the present *ASNI*.

AMA, in *Ecclesiastical Writers*, denotes a vessel wherein wine, water, or the like, were held, for the service of the eucharist: in which sense, the word is also written *amula*; sometimes also *hama* and *hamula*.

AMA is sometimes also used for a wine-measure, as a cask, pipe, or the like.

AMA, AME, or rather AMES, *αμνς*, a sort of cake. Aretæus used this word to express the quantity of hellebore which is sufficient for a dose in strong constitutions, when given in a *vertigo*.

AMA, or AMAN, in *Geography*, a town of Syria, once the celebrated city of APAMEA, now reduced to ruins.

AMA, or HAMA, a town of Germany, in the circle of Westphalia, and bishopric of Liege, 8 miles south-west of Liege.

AMAAD, in *Scripture Geography*, a town of Palestine, on the borders of the tribe of Azer.

AMABYR, or AMVABYR, *q. d.* in ancient British, "the price of virginity," in some *Ancient Customs*, a sum of money to be paid the lord upon marrying a maid of his manor.—This custom is said to have anciently obtained in Wales, where amabyr was paid to the prince: also in the honour of Cluï belonging to the earl of Arundel, till earl Henry, in the times of queen Mary, in consideration of sixty pounds, released it to all his tenants by the name of the custom of *amabyr* and *chevage*.

AMACACHES, in *Geography*, a people of South America, in Brasil, inhabiting the vicinity of the territory that extends from St. Sebastian to Rio Janeiro.

AMACASTIS, in *Ancient Geography*, a town of India, on this side the Ganges, according to Ptolemy.

AMACCURA, a town of Africa.

AMACI, a people of Spain, whose capital, according to Ptolemy, was Asturia Augusta.

AMACK, in *Geography*, an island of Denmark, joined to Copenhagen, and consequently to Seeland, by two bridges over the channel that separates them. It is about one and one-half geographical mile in length, and above half a mile in breadth. It is level and without woods; the soil is uncommonly fertile, so that it is considered as the kitchen-garden and store-house of the city; and the inhabitants supply it twice every week with all sorts of esculent vegetables, and also with milk, butter and cheese. The present inhabitants occupied it in 1516, being invited hither by Christian II. from the province of Water-land, in North Holland. The

whole island contains about 800 families, and is divided into two parishes. The dialect of the people is a medley of the low Dutch, German, and Danish languages; their mode of dress, and of living is peculiar to themselves. In the Summer they drive their cattle for pasture to a small neighbouring island, called Saltholm. There are excellent quarries of stone for lime and building on this island.

AMACORE, or AMACURE, a river of South America, which waters the Caribana, and runs into the Northern sea, near the mouth of the Oroonoko.

AMACOSQUE, in *Ornithology*, a name given by Fernandez to a Mexican bird, supposed by Buffon to be a species of CHARADRIUS or Plover. It is a noisy bird, the plumage is mixed with white and black, and it has a double collar. It is seen the whole year on the lake of Mexico, where it lives on aquatic worms.

AMACUSA, in *Geography*, an island and province of Japan, with a town of the same name, that borders upon that of Oyanau, and is south-west of the island of Kiurisi. It is between $31^{\circ} 30'$ and 32° N. lat. and E. long. $129^{\circ} 29'$.

AMADABAD. See AHMEDABAD.

AMADAN, or HAMADAN, a town of Persia, in the province of Irac-Agemi, between Bagdad and Ispahan, about 80 leagues from one and the other. It is seated at the foot of a mountain, whence issue streams that water the country; its extent is large, as it encloses waste and cultivated land, though it has but one tolerable street formed of houses, that are built of brick, hardened in the sun. The adjacent country is fertile, and productive of corn and rice; the air is salubrious, but in Winter the cold is intense. The Armenians have a church in this town, and the Jews have a synagogue, near which is a tomb, where, according to report, Esther and Mordecai were interred. This place is resorted to by several pilgrims from all parts of the Levant; and in its vicinity is a mountain called *Nalhana*, abounding with various herbs, and the sick repair hither to recover their health by imbibing their salutary effluvia. Amadan is an ancient city; and it is said that it was destroyed by Nebuchadnezzar, and rebuilt by Darius. The kings of Persia retired to it on account of its delightful situation, and hence it obtained the name of the "Royal City." It was reduced by the Caliph Othman, and was nearly destroyed by Jenghis Khan in 1220. Its castle and walls are now in ruins; and it is merely distinguished by its gardens and springs. N. lat. $35^{\circ} 15'$. E. long. $47^{\circ} 39'$.

AMADANAGEN, a town in the Hither Peninsula of India, in the province of Decan. It was taken by the Moguls in 1598. N. lat. $18^{\circ} 10'$. E. long. $74^{\circ} 15'$. See AHMEDNAGUR.

AMADEUS V., count of Savoy, in *Biography* and *History*, succeeded to the sovereignty in 1285, and obtained the surname of "The Great," by his wisdom and successes. His possessions were much enlarged by marriage, purchase, and donation. In defending Rhodes, against the Turks, in 1311, he gained distinguished honour; and in memory of this service, he and his successors took for their device, F. E. R. T. the initials of the Latin words "Fortitudo ejus Rhodum tenuit," *i. e.* his valour preserved Rhodes. The grand master of the knights of St. John, to whom Rhodes belonged, granted him a palace at Lyons, as a reward of his effectual succour. He died after a reign of 38 years, in 1323, at Avignon, where he was soliciting pope John XXII. to publish a crusade in favour of Andronicus, emperor of the East, who had married his daughter. He was much loved and honoured by all the sovereigns of Europe, and was generally the mediator in all their differences. Mod. Un. Hist. vol. xxxiv. p. 16.

AMADEUS VIII., count of Savoy, succeeded his father Amadeus VII., in 1391, and acquired the titles of the "Pacific," and "the Solomon of the Age." Savoy was erected by the emperor in 1416, into a duchy; but after this elevation, Amadeus formed the resolution of retiring from his throne and family into a religious house at a place called Ripaille. In this retreat, which he had sought according to the opinion of the world from religious motives, he devoted himself to every kind of pleasure and luxury, so that *faire repailles* became proverbial to signify a life of exquisite gratification and indulgence. Here he instituted the order of St. Maurice, or the Annunciata, consisting of a number of hermits, who excluded women from their community, but in other respects maintained the character of Epicureans and votaries of pleasure. In this retreat Amadeus aspired to the papacy, and employed large sums of money at the council of Basil, to secure the object of his ambition. Accordingly, in 1439, this council, having deposed pope Eugenius IV., conferred the triple crown on Amadeus, under the name of Felix V, though he had never taken holy orders. A schism was the consequence of this extraordinary election; and Eugenius at length excommunicated his rival. On his death Amadeus was persuaded to abdicate, and a new pope was chosen in his room. But his resignation was amply recompensed by the dignities of cardinal, bishop and apostolical legate, and by his being allowed to retain most of the pontifical insignia. He died at the age of 69, in 1451, at Lausanne, which, during the latter part of his life, he had chosen for his residence, and was succeeded by his son Lewis, to whom, in his life-time, A. D. 1433, he had resigned the title, but few or none of the revenues of the dukedom. Mod. Un. Hist. vol. xxxiv. p. 78.

AMADEUS IX., count of Savoy, was famed the "Happy," on account of his virtue and piety, his readiness to forgive those who offended, his love of justice, and his study to promote the welfare of his subjects. He succeeded Lewis in 1464, and though his bodily infirmities prevented his engaging in any great exploits, he acquired and maintained a very exemplary character. He was eminently distinguished by the benevolence of his disposition. Being once asked by a courtier, whether he kept hounds: he pointed to a great number of poor people, who were seated at tables, eating and drinking, and replied: "those are my hounds, with whom I go in chase of heaven." When he was told that his alms would exhaust his revenues: "take the collar of my order," he said, "sell it, and relieve my people." He married Iolande of France, who concurred with him in all his good deeds. His death, in 1472, at the age of 37 years, and after a reign of seven, was universally regretted. Mod. Un. Hist. vol. xxxiv. p. 82.

AMADIA, in *Geography*, a fortified and trading town of Asia, in the province of Kurdistan, situate upon a high mountain. Its environs produce tobacco and gall-nuts, which furnish means of commerce. It is the residence of a bey, who governs the whole country. N. lat. 36° 25'. E. long. 43° 1'.

AMADUCA, in *Ancient Geography*, a town of European Sarmatia, inhabited by the *Amadoci*, and whose habitations were also on mountains of the same name, between the Roxalane and Baiterna.

ALMADIS, in *Natural History*, a species of the *CONUS*, in the *VERMES TESTACEA*, with a shell dilutely brown, broad fascia, and articulated bands above and below; and an acute, crowned spire, finely and transversely striated.

AMADOW, a kind of *black-match*, tinder, or touch wood, which comes from Germany. It is made of a sort of large mushrooms, or spongy excrescences, which com-

monly grow on old trees, especially oaks, ash, and firs. This substance being boiled in common water, and afterwards dried and well beaten, is then put into a strong ley prepared with salt-petre, after which it is again put to dry in an oven. The druggists sell this match wholesale in France, and several hawkers retail it. See *AGARIC*.

Some give to the *amadocu* the name of *pyrotechnical sponge*, because of its aptness to take fire.

AMADOWRY, a kind of cotton which comes from Alexandria, by way of Marseilles.

AMÆA, or **AMMÆA**, in *Ancient Geography*, a town of Lusitania, inhabited by the Ammienfes, between the Elvas and Tagus.

AMÆGETOBRIA, now *Broie*, an ancient town of Gaul, mentioned by Cæsar, placed by M. d'Anville on the Arar, to the south of Segobodium, and to the west of Vefontio.

AMAGOR, in *Geography*, a town of Africa, in the empire of Morocco, and province of Hea.

AMAGUANA, the name of one of the Lucayan or Bahama islands, called also *Mayoguanu*.

AMAIÀ, or **AMAGIA**, formerly *Varegia* and *Natricia*, a town of Spain, belonging to the Cantabri, on the confines of Asturias, about three leagues from Villa-Diego, at the foot of a very high rock.

AMAILLOU, a town of France, in the department of the Two Sevres, and chief place of a canton, in the district of Partenay, three leagues south-east of Bressuire.

ALMAIN, or **AMAYNE**, a *sea term*, used by a man of war, to his enemy; and signifying *yield*.

Hence, *to strike amain*, is, to lower, or let fall, the top-sails. The word is also written *amayne*.—Waving *amain*, is to make a sign to another vessel, by waving a bright sword, or other thing, as a demand for striking its top-sails.—This is commonly done either in the fore-top, or on the poop. *Amain* is also a term used in letting down a thing, by a tackle, into the hold, or elsewhere, in the lowering a yard, or the like, to denote, that the sailors are to let go that part of the rope which they held before, and let down the thing easily, and by degrees. *Amain* is also used to denote at once and instantly; as let go *amain*.

AMAK, called also **ABULNAGIE AL BOKARI**, in *Bio-graphy*, a celebrated Persian poet, was a native of Bokhara, and flourished towards the close of the 11th century, under the sovereigns of the Seljuk race. He was at the head of an academy, consisting of about 100 men of letters, with handsome pensions, established by Khedar Khan, who reigned in the Transoxian provinces, and who was a very magnificent patron of letters, and particularly of poetry. This prince presided in the academy, seated on a throne, at the foot of which were four large basons of gold and silver coin, which were intended for the recompence of those poets who obtained his approbation. Amak was a distinguished favourite, lived by the bounty of his patron in great affluence, and kept a number of slaves, and thirty richly caparisoned and trained horses. Thus favoured, he became the object of envy, and Raschidi, whom he had recommended, endeavoured to supplant him. Amak and Raschidi were appointed to contend for poetical victory in the sultan's presence; and the satirical verses of the latter gained the prize, very much to the mortification of the former. Amak lived nearly a century. His principal work is the "History of the Loves of Joseph and Zoleiskah," a romance, founded on the account of the patriarch Joseph, in the Koran. He was most distinguished for his elegies. When sultan Sangiar was inconsolable for the death of his sister, and disregarded all the elegiac verses of other poets, Amak was sent for to soothe him; and an elegy transmitted by him, when he was too aged

aged and infirm for travelling, obtained a decided preference. D'Herbelot. *Gen. Biog.*

AMAL, AMALIA, in *Geography*, a town of Sweden, in the province of Thalland or Dalland, seated on the Wenerlake, which divides the town and the market place into two parts. The town was founded in 1640; it has a good harbour, and carries on a considerable trade, particularly in timber, deals and tar. It is the 89th town of those that vote in the diet. N. lat. 58° 50'. E. long. 12° 40'.

AMALAEVA, a river of Siberia, which runs into the Frozen Ocean. N. lat. 71° 10'. E. long. 128° 14'.

AMALAGO, in *Botany*. See PIPER.

AMALANCHIOR. See MESFILUS.

AMALARIC, or AMAURY, in *Biography and History*, king of the Visigoths, was the son of Alaric II.; but being an infant of five years, at his father's death, in 506, the throne was usurped by Genfalaic, the natural son of Alaric. Amalaric in the mean while retired into Spain; and the Visigoths were governed by his grandfather, Theodoric, king of the Ostrogoths, who expelled Genfalaic from the throne, till his death in 526, when Amalaric assumed the government. This prince was zealously attached to the Arian doctrine and cause, and as he had married Clotilda, the daughter of Clovis, who inherited the piety and orthodoxy of her mother, he used various means, and as the Catholic historians say, those of violence, to proselyte her to his own opinion and party. In process of time, after patiently enduring the wrongs she suffered, she communicated an account of them to her brothers, and testified the truth of her relation by accompanying it with a handkerchief stained with blood. In consequence of this complaint, her brother Childebert, king of France, marched with a numerous army into the territories of Amalaric, defeated him in an engagement, and forced him to take refuge on board his fleet. But recollecting that his treasures were left in the city of Narbonne, he went on shore again, in order to recover them; but had no sooner entered the city than he was surpris'd by the enemy; and seeking safety in a church belonging to the Catholics, a common soldier run him through with a spear, A.D. 531. Some say, that he retired to Barcelona, and was assassinated by his own subjects; but it is more probable, that the assassin was either a Frank or some person employed for this purpose by Theudis, who succeeded him. *Mod. Un. Hist.* vol. xvi. p. 10.

AMALASONTHA, regent and queen of Italy, was the daughter of Theodoric the Great, king of the Ostrogoths, by Audesleda, the sister of Clovis, and united in her person the two most illustrious families of the Barbarians. She was born about the year 498, and in 515 was married to Eutharic, the last heir of the royal race of the Amali, whom her father had sent from Spain, and designed for his successor; as the sex of his daughter excluded her from the Gothic throne. Eutharic soon died and left an infant son, Athalaric, and Amalasontha assumed the guardianship of her son and of the kingdom of Italy. Her beauty was animated by manly sense, activity, and resolution. Education and experience had cultivated her talents; her philosophical studies were exempt from vanity; and though she expressed herself with great elegance and ease in the Greek, the Latin, and the Gothic tongues, she maintained in her counsels an impenetrable silence. By a faithful imitation of the virtues of Theodoric, she revived the prosperity of his reign; and she also strove, with pious care, to expiate the faults, and to obliterate the less favourable remembrance of his declining age. The children of Boethius and Symmachus were restored to their paternal inheritance; she inflicted neither

corporal nor pecuniary penalties on her Roman subjects, and she despised the clamours of the Goths, who, at the end of 40 years, considered the people of Italy as their slaves or their enemies. The measures of her administration were directed by the wisdom, and also celebrated by the eloquence, of Cassiodorus; she solicited and deserved the friendship of the emperor; and the kingdoms of Europe respected, both in peace and war, the majesty of the Gothic throne. The education of her son engaged her particular attention; and she employed three venerable Goths to instil into his mind the principles of honour and virtue, which he was diligently instructed in all those arts and sciences, which might be either useful or ornamental to a Roman prince. But the queen's solicitude for her son's improvement and good conduct, produced a degree of vigilance and discipline, against which his untractable disposition recoiled, and which his subjects disapproved. At length when the Goths were assembled on a public occasion, in the palace of Ravenna, the youth escaped from his mother's apartment, and complained with tears of pride and anger of the chastisement, which his stubborn temper had induced her to inflict. The indignation of the Barbarians was roused, and they accused the queen regent of conspiring against the life and crown of her son; and proceeded to demand, that he should be rescued from his present tuition, and educated, like a valiant Goth, in the society of his equals. Amalasontha was compelled to submit; and the young prince became dissolute and licentious, despised his mother, and counteracted the salutary measures which she had been pursuing. In these circumstances she entered into a negotiation with the emperor Justinian, and prepared for retiring from a scene of discontent and faction. In the mean while she yielded to the impulse of ambition and revenge; three of the most dangerous malecontents, who had been separately removed to the frontiers of Italy, were assassinated by her private emissaries; and this act increased the popular dissatisfaction and complaint. At this time the death of her son, at the age of 16, in consequence of premature intemperance, left her destitute of any firm support or legal authority. Instead of submitting to the laws of her country, and retiring to a private station, she conceived the design of sharing, with one of her cousins, the regal title, and of reserving in her own hands the substance of supreme power. The eloquent Cassiodorus announced to the senate and to the emperor, that Amalasontha and Theodatus had ascended the throne of Italy. The issue of this scheme of ambition soon proved disastrous and fatal. Instigated by the principal Goths, Theodatus caused the queen to be imprisoned in a small island, in the lake of Bolsena, where, after a short confinement, she was strangled in the bath, (A.D. 535,) by the order, or with the connivance, of the new king. *Gibbon's Hist.* vol. vii. p. 206—210.

AMALEK, in *Scripture History*, was the son of Eliphaz, Esau's eldest son, by his concubine Timna. *Gen.* xxxvi. 12—16. *1 Chron.* i. 36. He succeeded Gatam, who was one of the dukes in the land of Edom; and was the father of the Amalekites, who inhabited that part of Arabia Petræa, which lay east of the Edomites, with Midian on the north, Arabia Petræa on the south, Arabia Deserta on the east, and extended almost as far north as the Dead Sea, and southward to the Red Sea, or between Havilah and Shur, *1 Sam.* xv. 7. These people had no constant dwelling, nor do they seem to have had any cities; but they changed their abode, like the Arabs, and lived in tents or booths, as they migrated from one part of the country to another, and sometimes in subterraneous caverns. It is not, therefore, easy to ascertain the limits of their country. *Mr. Reland*

places them between the deserts of Kadesh and those of Engedi, though somewhat nearer to the Mediterranean. Josephus, in one place, affirms, that they extended from Pelusium to the Red Sea, and in another place he fixes them between Gabolitis and Petra. Antiq. lib. vi. c. 8. Ibid. lib. iii. c. 2.

As soon as the Israelites had crossed the Red Sea, the Amalekites determined to cut them off; and with this view they fell on their rear, as they were marching from Rephidim to Mount Horeb, and slew those who, through weakness or fatigue, were left behind. But this unprovoked assault was very justly and severely avenged upon themselves by Joshua, who defeated them with great slaughter, A. M. 2517, B. C. 1487. Between the Amalekites and the Israelites, there seems to have subsisted an irreconcilable enmity; and it has not been improbably traced to their progenitor's having been deprived of his birth-right and blessing by Jacob. Under the Judges, they joined with the Midianites and Meabites against Israel, who were delivered from the former by Ehud, and from the latter by Gideon. Judges, vi. 3. 11. 13. Saul, soon after he was advanced to the throne of Israel, marched against the Amalekites with a large army; advanced to their capital; slew a great number of them, and laid waste their country; but by reserving to himself the best of the cattle and moveables, in violation of the divine command, he laid the foundation of the calamities that afterwards befell him, B. C. 1093. Some fugitives escaped; and we find that some years after this event a troop of Amalekites pillaged Ziklag, which then belonged to David; but he pursued and dispersed them, and recovered the captives and treasures which they had taken. 1 Sam. xxx. The Amalekites were thus gradually reduced; and at last, in the days of Hezekiah, king of Judah, who began his reign, B. C. 726, they were utterly destroyed and scattered by the sons of Simeon, who took possession of their country. 1 Chron. iv. 40—43. Thus the declaration of Balaam, recorded Numb. xxiv. 20, was literally fulfilled; "Amalek was the first of nations; but his latter end shall be, that he perish for ever." According to the account of the Arabians, Amalek was the son of Ham, and grandson of Noah; he was the father of Ad, and grandfather of Schedad. Calmet inclines to this opinion; for he says, it is not easy to conceive how the Amalekites, if they were merely the posterity of the son of Eliphaz and grandson of Esau, could be so numerous and powerful as these people are represented to be when the Israelites departed out of Egypt. Besides, when we call to mind the previous wars of the Amalekites with Chedorlaomer (Gen. xiv. 7.); when we consider that Balaam calls them the first, or beginning, of nations; when we reflect, that Moses never styles them the brethren of Israel or Edom; that the latter never held any confederacy or friendly correspondence with them in all their wars, but suffered them to be invaded and butchered by Saul, without affording them any assistance; and, lastly, when we find them always mentioned with the Amorites, Philistines, and other Canaanitish nations, and with them involved in the same curse, we can scarcely forbear looking upon them rather as a tribe of those nations, than as the descendants of Esau, who probably formed but a small tribe, and not permanently conspicuous. Of the Amalek, destroyed by Saul, the Arabians give the following account. He was the father of an ancient tribe in Arabia, which contained only the Arabians called *pure*, the remains of whom were mingled with the posterity of Jocktan and Adnan, and so became Mosarabes or Moslaarabes, *i. e.* Arabians blended with foreigners. They believe, that

Goliath, who was overcome by David, was king of the Amalekites, and that the giants who inhabited Palestine in Joshua's time, were of the same race; and that part of them retired into Africa, while Joshua was living, and settled on the coasts of Barbary. The son of Amalek was Ad, a celebrated prince among the Arabians, whom some make the son of Uz, and grandson of Aram, the son of Shem. Calmet. See ADITES.

AMALER, in *Geography*, a mountain in the land of Ephraim, on which the town of Pirathon was situated, where Abdon, son of Hillel, judge of Israel, was buried, A. M. 2848, B. C. 1156. Judges xii. 14, 15.

AMALFI, or AMALPHI, an ancient sea-port town and archiepiscopal city of Italy in the kingdom of Naples, and Principato citra, situate on the west coast of the gulf of Salerno. N. lat. 40° 35'. E. long. 15° 20'. The most generally received opinion of the origin of this city is, that about the middle of the 4th century a considerable number of Roman families, either with views of emolument or by compulsory orders of the emperor, left Rome, and embarked for Constantinople; but meeting with adverse storms, they were cast away on the shore of Salerno; and determined to form a settlement on the present site of Amalfi. This feeble and rising colony was guarded by impervious mountains and inaccessible coasts, from the first fury of the Lombards, who seldom attempted the conquest of a maritime people. In the year 825 this small republic, under the patronage of the eastern emperor, attained a degree of wealth and reputation which invited the attack of Sico, prince of Salerno, who marched a body of troops by night, surprised Amalfi, and carried off the greatest number of its inhabitants to supply the place of those, of whom Salerno had been deprived by an epidemical disorder. The Amalfitans taking advantage of the absence of the chiefs of Salerno, in an expedition against the Beneventans, armed themselves, and, after burning and plundering Salerno, marched back in triumph to their native abodes. Being thus restored to their country, they formed a better constitution and code of laws, and adopted various measures likely to prevent internal discord, and the assault of foreign enemies. Under these new regulations Amalfi rose to the summit of its military and commercial glory. Pope Leo IV. found the Amalfitans an useful ally in his war with the infidels, and conferred upon the commonwealth the distinguishing title of defender of the faith. The Neapolitans sought their friendship, and the musfulmen courted alliance with them. Their situation was favourable for commerce; and their attention to naval affairs induced the emperor of Constantinople to establish a court at Amalfi for the decision of all maritime disputes, and the code and reports of this court obtained authority through this part of Europe. The merchants of this town engrossed the trade of the Levant, and transacted the commercial business of the world in a lucrative and exclusive manner. The importance of Amalfi, in its various maritime and commercial connections, led to the establishment of the order of knighthood, under the patronage of St. John of Jerusalem, the members of which were afterwards called knights of Rhodes, and since of Malta. The charitable traders of this port obtained leave of the musfulmen chief at the caliph's court, in 1020, to erect two small hospitals and a chapel for the use of votaries coming from the western parts of Europe. From Pafitano, says Mr. Swinburne, in the neighbourhood of Amalfi, was derived the first knowledge of the mariner's COMPASS.

The flourishing state of the Amalfitans exposed them to various assaults; but they derived from the holy war temporary

posatory rescue from the cruel attack of their enemies, and thus were in some degree instrumental to their charitable zeal on behalf of the persecuted Christians of Palestine. From the year 1100, when the Saracens took possession of this state, and abolished the laws of its republican constitution, it has been exposed to the pillage of every power at variance with its interests; the pillage of it by the Pisans forms an interesting epoch in its history; for they carried away the Pagan copy of the CODE which was formed by Justinian the first; a merchant had brought it as a curiosity from Greece, but it had obtained no authority at Amali, where the Theodosian code was in force. Amali, after the deduction of its liberty, found that its commerce declined. It was entirely lost to this coast in the reign of Joan the first. The alienation of its lordship to feudal proprietors was without doubt a circumstance that hastened its dissolution. The brother of pope Martin V. (Colonna) had the first grant of Amali; the Sanseverini the next; then the Orsini acquired possession; and lastly, Piccolomini enjoyed it with the title of duke.

Amali is now merely a shadow of what it was in magnitude, connections, and real importance, when it was in its flourishing state: when, from a narrow, though fertile, extent of land, by means of an accessible and open sea, it supplied the western world with the manufactures and productions of the east; when 50,000 citizens were numbered within its walls: when it was more abundantly than any other city provided with gold, silver, and the objects of precious luxury; and when its settlements in Constantinople, Antioch, Jerusalem, and Alexandria, acquired the privileges of independent colonies. Its buildings are not remarkable for elegance and size, and contain at most 4000 inhabitants, who seem to be in a poor condition. It presents few objects that can recall any idea of its ancient prosperity. The cathedral is not an agreeable building; under the choir is the chapel and tomb of the apostle St. Andrew, in whose honour the edifice was dedicated, when cardinal Capuano, in 1208, brought his body from Constantinople. Swinburne's Travels, vol. iii. p. 220—236. Gibbon's Hist. vol. x. p. 280.

AMALGAM, *Amalgame*, Fr.—*Amalgama* or *Quickbrey*, Germ.—*Amalgama*, Ital.

The word amalgam, from *ama* and *γαστρον*, *consubium*, is a metaphorical term invented by the ancient chemists, and retained by the moderns to signify any metallic alloy, of which mercury forms an essential constituent part. Hence, as mercury remains fluid at the usual atmospherical temperature, the theory and general phenomena of amalgamation may be said to be those of the solution of metals in mercury.

All that is peculiar to the several amalgams, such as the method of preparing them, their characteristic physical and chemical properties, and the uses to which they are applicable will be detailed hereafter in the article MERCURY; but besides these there remain to be described a number of general facts and appearances common to all amalgams, which may be treated of with more propriety here than elsewhere.

The knowledge of the solvent power which mercury exercises over various metals, especially gold, was not only known by the ancients, but, as we learn from Pliny, was actually employed by them in the separation of gold from the baser metals and in the gilding of silver. Velaasco and Alonzo Barba, in the 16th century, applied the process of amalgamation in the great way to the extraction of silver from the ores of Peru and Mexico; but of the early che-

mists, Borrichius, Osander, Beecher, and Stahl, are the only ones who have treated of various amalgams, with the view of comparing their resemblance, of noting their peculiarities, and thence deducing a few general axioms for the benefit of science. Rouelle and Fuchel, following the steps of their predecessors, discovered the crystallizability of metals from their solutions in mercury, and Sage has since established this department of chemical philosophy with a vast number of curious, correct, and important observations.

§ 1. Methods of preparing Amalgams.

The precaution required in the preparation of an amalgam depend considerably on the degree of affinity existing between the mercury and the metal intended to be dissolved. Where the affinity is very powerful, as is the case with gold and silver, the fluidity of the mercury without any further condition will effect a combination even at the usual atmospherical temperature. Thus leaf-gold, by simple trituration with mercury will form an amalgam in a few minutes; and pieces of gold, silver, or tin, even of considerable thickness, by being immersed in pure mercury will, in a few days without trituration, be wholly dissolved. Other metals of stronger cohesion or weaker affinity require the assistance of heat to make them amalgamate, such are zinc and antimony; for this purpose the zinc is melted in a crucible, and being then withdrawn from the fire is allowed to cool till it is upon the point of becoming solid, at this instant the mercury, previously heated to boiling, is stirred in, and the mixture is kept fluid by a gentle heat till the combination appears to be perfect: it is of consequence to the safety of the operator, and the success of the experiment, that the mercury should be previously heated, otherwise the difference of temperature between the two metals at the time of mixture will be very apt to produce an explosion. The actual fusion of the zinc or antimony is, however, by no means absolutely necessary: the metal in small pieces being put into a crucible, the proper quantity of mercury is then to be added; the interstices will thus be filled up, and the mass being then exposed to a heat a little less than that required for the volatilization of mercury, the amalgamation will in a short time be completely effected. Those metals, however, that require a full red heat for their fusion, will volatilize with explosion any mercury that is attempted to be mixed with them while in this state, such, for example, is copper. This is, therefore, best amalgamated in the moist way; for which purpose take a boiling hot saturated solution of sulphat of copper, pour it into a glass or Wedgewood ware mortar, and add mercury and iron filings; the iron will decompose the sulphat of copper, and precipitate this latter metal in a finely divided state, which by the heat and moderate trituration will unite with the mercury, and the combination may afterwards be perfected by fusion at a gentle heat in a crucible. Amalgams may be made either solid or fluid, according to the proportion of mercury that enters into their composition; the quantity of this last, however, that is required to give the amalgam a fluid state, is different for each metal, for the more powerful the affinity the less is the quantity of mercury required.

§ 2. Phenomena observable during Amalgamation.

All the appearances that happen during the combination of metals with mercury indicate a real solution of one in the other, owing to the chemical attraction between the bodies so uniting. In proportion to the readiness with which any metal tends to amalgamation is the force with which it ad-

heres to mercury when applied to its surface; and, when a plate of this, suspended to the arm of a balance, is brought in contact with mercury, a greater or less counterpoise will be required to break the adhesion, as the chemical affinity between the two is stronger or weaker. (See ADHESION.) Nor is this adhesion an effect taking place merely at the place of contact, but an actual penetration or absorption of the mercury is produced by the other metal: thus, when a plate of gold is placed in contact with mercury, not only the surface of adhesion is whitened by the mercury, but, after remaining in this state a few hours, the gold will become brittle, and particles of mercury may be observed through its whole substance, having no doubt been drawn up through its minute pores by the force of chemical attraction.

During amalgamation, as is the case in all other instances of simple solution, a considerable quantity of caloric is absorbed, producing the sensation of cold, and lowering the thermometer. This is rendered very sensible to the touch, by rubbing together in the palm of the hand equal parts of an amalgam of bismuth and an amalgam of lead; the two solids will almost immediately become fluid, and a very considerable cold will be produced. The same may be shown by the thermometer: if a quantity of mercury is heated to about 80° Fahr. and the bulb of a thermometer wrapped round with tin-foil is then immersed in it, a speedy solution will take place, and at the same time the mercury in the thermometer will descend a few degrees.

Another remarkable phenomenon of amalgamation is the disposition to oxydate which both metals exhibit while the solution is going on, and even after it is completed: it is impossible to combine bismuth, tin, or lead, with mercury, without observing as the process advances the formation of a quantity of black powder, which rises to the surface of the metals, and is a compound oxyd of mercury and the other metal. Upon this also depends Dr. Priestley's simple and ingenious method of separating from mercury a large proportion of the lead, &c. with which it is usually contaminated; for this purpose nothing more is necessary than agitation of the mercury in a bottle, with a little water, till it ceases to be discoloured, or, in other words, till the amalgam is almost wholly decomposed. Hence too is explained the observation of Isaac Hollandus, that gold and silver may be calcined in a reverberatory furnace, if they have been previously mixed with mercury.

§ 3. General Properties of Amalgams.

The specific gravity of amalgams, as of all other alloys, is different from the mean specific gravity of their component parts: sometimes it is greater, at other times less; and, according to Gellert, the amalgam of silver is of superior specific gravity even to mercury, the weightiest of the two ingredients. This takes place, however, only at a low temperature; for it was found by Sage that the amalgam of silver, when heated, floats on the surface of mercury.

The more decidedly crystalline form of amalgams, owing to their soft or semi-fluid state, at a moderately warm temperature, is a circumstance that remarkably distinguishes them from the pure metals. Any metal, when melted and cooled very slowly, will exhibit in its fracture a crystalline structure, and the crystals of which it is composed may, by particular management, be exhibited in a state of separation from each other; but similar appearances may be produced with much greater ease in amalgams. All amalgams are brittle, and any of them, being broken, will exhibit a granular or laminated texture, which, by the microscope, will be found to be owing to a multitude of minute crystals, applied by their

surfaces to each other, but not adhering with any considerable force. Induced by these appearances, M. Sage, after many trials, succeeded in obtaining regular crystals of most of the amalgams by the following method. Having prepared a very fluid amalgam, by adding four, five, or six times a greater quantity of mercury than of the other metal, he put it into a retort, and proceeded to distillation in a sand-bath, till a fourth, or even a third, of the mercury had been driven off; the residue, being then allowed to cool very gradually, was found regularly crystallized at the bottom of the vessel. He thus obtained silver amalgam in the form of articulated tetrahedrons and aluminiform octahedrons, resembling the native dendritic silver. In the same manner the amalgams of gold, bismuth, tin, and zinc, assumed the form of regular crystals, but those of copper, arsenic, and antimony, refused to crystallize.

Amalgams may be decomposed by heat, but the last portions of mercury are not driven off without a much greater heat than is required for the volatilization of pure mercury. Hence a large proportion of the volatile metals, such as zinc and arsenic, unites with the mercury, and is carried over with it, and even the more fixed ones, as gold and silver, are thus rendered in part volatile.

As each metal has its peculiar affinity for mercury, it is obvious that an amalgam may be decomposed by the addition of a metal that has a stronger attraction to mercury than that of which the amalgam is composed: upon this subject, however, no accurate experiments have as yet been made, which is the more to be regretted, as it would much assist the investigation of the difficult but important subject of metallic alloys. One amalgam may even decompose another in a great measure, as is the case with the amalgams of lead and bismuth: these being made separately, with a quantity of mercury equal to the other ingredient, will be solid and friable, but, upon mixture, will combine into a fluid scarcely to be distinguished by its appearance from pure mercury: by standing some days, however, in a temperature not exceeding 40° Fahr. cubic crystals will be deposited of almost pure bismuth. For other particulars see the several amalgams under the word MERCURY. Encycloped. method. art. Amalgame.

AMALGAMATION, in *Metallurgy*. See SILVER ores, extraction of.

AMALI, in *Ancient Geography*, a people comprehended under the appellation of Geræ.

AMALIA, in *Entomology*, a species of PAPHILIO in the *Nymphales* section, with indented wings: upper side brown, under side yellow with two streaks and spots of blue, the lower ones marked with black dots. Fabr. Ent. Syst. tom. iii. p. 1. p. 129. sp. 398. Obs. In addition to this specific character FABRICIUS says, above the brown colour of the wings inclines to fulvous, and the posterior pair is marked with an obsolete row of fulvous spots. Beneath, the apex of the anterior wings has a black mark, and two blue spots with a black character in the middle of each; the exterior margin, two streaks, and seven spots on the posterior wings are blue, the latter with black dots in the middle. Inhabits Sierra Leon.

AMALLOBRIGA, in *Ancient Geography*, a town of Spain, upon the DARIUS, to the south-east of Pallentia.

AMALRIC, AUGERI, in *Biography*, an ecclesiastical historian of the 14th century, dedicated to pope Urban V. a history of the popes, under the title of "Chronicon Pontificale," brought down to pope John XXII. and said to be collected from more than 200 writers.

AMALTHÆA, in *Mythology*, the Cuman Sibyl, who

is said to have come from a far country to Tarquinus Superbus, and to have offered for sale nine books of Sibylline, or prophetic oracles. Upon Tarquin's refusal to give her the price she asked, she went away and burnt three of them. Returning soon after, she demanded the same price for the remaining six. The king ridiculed her for her folly, upon which she went and burnt other three; and returning asked the same price for the three which remained. A. Gellius (l. 19.) says, that the books were burnt in the presence of the king. Tarquin, surpris'd by this strange conduct, consulted the augurs, who, regretting the loss of the books which had been destroyed, advised the king to give the price, which the woman required. Amalthæa, having surrendered the books, with a desire that they might be carefully kept, disappeared, and was never afterwards seen. Dionys. iv. 62. Lactantius, i. 6. Gell. i. 19. Pliny (xiii. 13. l. 27.) says, that she burnt two books, and only preserved one. See **SIBYLS**.

AMALTHÆA, the daughter of Melissus, king of Crete, and nurse of Jupiter, whom she is said to have fed with goat's milk and honey. According to others, Amalthæa was a goat which nourished Jupiter, and whom, in recompence for her attention, he translated into the heavens, and thus she became the constellation which bears this name. It is added, that one of the horns of this goat was given to the daughter of Melissus, as a reward for their kindness, and that it had the peculiar property of furnishing them with whatever they wished for; and hence the Greeks formed of it their *cornucopia*, or horn of abundance.

AMALTHEO, in *Biography*, the name of a family of the 16th century, celebrated for literature originally from Pordenone in Friuli, and branched out into several places in that province. In this family there were poets, physicians, and professors of belles lettres. The most distinguished were the sons of Francesco Amaltheo, professor of belles lettres in Sacile; viz. *Girolamo*, or Jerom, born in 1507, at Oderzo in the Trevisan, who was solicited by the queen of Poland to be her physician, but declined it. He taught medicine at Padua, and practised as a physician in several towns of Friuli, till 1574, when he died at Oderzo highly honoured by his townsmen. He so much excelled in Latin poetry, that he is placed by Muretus at the head of all the Italians who exercised their talents in this way. The famous epigram of "Acon and Leonilla," is by this author. *Gimbatista*, or *John Baptista*, was born at Oderzo in 1525, educated at Padua, and at the age of 20, called to Venice to instruct the youth of the Lippomana family in polite literature. His own studies comprehended, besides the Greek, Latin, and Italian languages, philosophy, jurisprudence, and theology. In 1554 he accompanied the Venetian ambassador, Michele, to England; he was afterwards secretary to the republic of Ragusa, and accompanied the cardinals deputed to the council of Trent, as first secretary to pope Pius IV. He died at Rome in 1573, much lamented by the learned men of his time, by whom he was highly esteemed for his genius and erudition. His Latin poems, first printed in 1550, gave him a reputation equal to that of his brother; and he likewise wrote poems in his own language that are much valued. The Latin poems of these two writers, and of another brother named *Cornelius*, who was a physician, are contained in the first volume of the "Deliciae Poet. Italar." and were published in a separate volume, at Venice in 1627, and at Amsterdam, in 1689. Gen. Biog.

AMAMA, **SIXTINUS**, an eminent biblical critic of the 17th century, was born in West Friesland, educated under Drusus in the university of Franeker, and obtained a

very considerable acquaintance with the oriental languages. Wood (Athen. Oxon. n. 612.) says, that about the year 1612, he visited Oxford, resided in Exeter college, and taught Hebrew in the university. Upon his return to his native country, he was appointed professor of the Hebrew language in the university of Franeker, where he continued, notwithstanding earnest solicitations for his removal to Leyden, in order to succeed Erpenius, till his death, which happened in December 1620. His first work was a criticism on the Vulgate translation of the Pentateuch, printed in 4to. in 1620, at Franeker, and entitled, "Censura Vulgate Latine Editionis Pentateuchi." This was part of a plan which he had formed with a view to a "General Censure of the Vulgate Version of the Scriptures," which the council of Trent had declared authentic. But his attention was diverted from the completion of his design by a collation of the Dutch version of the Scriptures, with the originals, and the most approved translations. The result of this collation was published in 1603, in the Dutch language, under the title of "Bybelsche Conferentie." Whilst he was thus engaged, he received information that father Mercennus, in vindication of the Vulgate, had written a refutation of his criticism on the first six chapters of Genesis, and he, therefore, resumed his original design; and, in 1627, published a letter to Mercennus, and in 1628 a work, entitled, "Anti-Barbarus Biblicus;" or containing a farther reply, together with a censure of the Vulgate on the historical books of the Old Testament, on Job, the Psalms, and the books of Solomon, to which are added, dissertations on particular subjects. This book was reprinted at Franeker, in 4to. in 1656, with a criticism of the Vulgate upon Isaiah and Jeremiah. Amama also wrote a learned dissertation, "De Nomine Tetragrammati," which was published in 8vo. at Franeker in 1620. So successfully did he expose the defects and errors of the Vulgate, and so earnestly did he recommend the study of the original languages of the Bible, that it was decreed by some synods, that those only should be admitted to the ministry, who understood, at least in some degree, the Hebrew and Greek texts of the Scripture. Amama also evinced his solicitude for the honour of the university at Franeker, by his attempts to reform some irregularities of conduct that prevailed in it. He was so much respected by his countrymen, that, after his death, they testified their regard for his memory by their liberality to his children. Gen. Dict.

AMAMASSIUS, in *Ancient Geography*, a town of the isle of Cyprus, in which they worshipped Apollo Hylnes.

AMAM-SAMA, a town of Judæa, in the tribe of Judah.

AMAN, in *Commerce*, a sort of blue cotton cloth, which comes from the Levant by the way of Aleppo.

AMAN, in *Ancient Geography*, a town of Palestine, in the southern part of the tribe of Judah.

AMAN, in *Geography*, a sea-port town of Africa, on the Atlantic, between Cape Ger and Cape Cantin, in the kingdom of Morocco.

AMAN, a district of Sumatra, about the centre of the island.

AMANA, in *Ancient Geography*, a mountain of Palestine, on the other side of Jordan, in the tribe of Manasseh.

AMANA, a town of Asia, in Media, according to Ptolemy.

AMANCE, in *Geography*, a town of France, in the department of the Meurte, and chief place of a canton in the district of Nancy, three leagues south-west of Chateau-Salins, and 1½ north-east of Nancy.

AMANCE is also a town of France, in the department of

of the Upper Saone, and chief place of a canton in the district of Jussey, two leagues east of Jussey.

AMAND, MARK ANTHONY GERARD, SIEUR DE SAINT, in *Biography*, a French poet of the 17th century, was born at Rouen in Normandy in 1594. His father commanded a squadron of ships in the service of queen Elizabeth for 22 years, and his two brothers were killed in a battle against the Turks. As for himself, his whole life was spent in a succession of travels in Europe, Africa, and America, which, whatever might be the amusement or information he derived from them, were injurious to his fortune. His works were chiefly miscellaneous poems, most of which are of the comic or burlesque, and of the gallant or amorous kind. Three volumes of his poems were published in 4to, at Paris; the first in 1627, the second in 1643, and the third in 1649, under the title of "Les Œuvres de St. Amand;" and they have passed through several editions. His "Stanzas upon the Pregnancy of the Queen of Poland and Sweden" were printed in 1650; his "Moses saved, a heroic Idyllium," Paris, 1653, 4to, and 1660, 12mo: his "Stanzas to Monf. Corneille, upon his Imitation of Jesus Christ," Paris, 1656, 4to; and his "Rome ridicule," printed several times in 4to and 12mo; and when it was printed clandestinely at Paris in 1643, the printer was thrown into prison. The earlier part of Amand's life was licentious and debauched; but towards the close of it he was reformed, in consequence of the penury and distress of his circumstances. M. Broffete, in his notes upon Boileau, says, that he wrote a poem upon "the Moon," in which he complimented Lewis XIV. upon his skill in swimming, in which he was accustomed to exercise himself in the Seine; but the king could not bear to hear this poem read to him; and this circumstance is said to have mortified the author to such a degree that he did not long survive. He died in 1661, at the age of 67 years. He was admitted a member of the French Academy from its first foundation in 1633; and he was excused from making a speech upon his introduction, on condition of his compiling the comic part of the Dictionary which the Academy had undertaken, and collecting the grotesque and burlesque terms. Boileau represents the genius of St. Amand as adapted to works of low humour and satire; but he adds, that he spoils all by the mean and trivial circumstances which he introduces. Gen. Dict.

AMAND, PIERRE, born at Riez in Provence, about the middle of the 17th century, practised midwifery with credit at Paris. In the year 1705 he published "Nouvelles Observations sur la Pratique des Accouchemens," in 8vo. of which a second edition appeared in the year 1715. He relates the cases of several women who had extrauterine fetuses, and gives an account, accompanied with engravings, of a kind of net he had invented for extracting the heads of fetuses, when left in the uterus, separated from the body. The invention is ingenious, but has long been laid aside for the crotchet, by which the extraction is performed with much greater ease and certainty. *Vide* Essais Historiques sur l'Art des Accouchemens, par M. Suc.

AMAND, ST. in *Geography*, a town of France, in the department of Cher, seated on the river Cher, 20 miles south of Bourges. N. lat. 46° 45'. E. long. 2° 30'.

AMAND, ST. is also a town of France, in the department of the North, in which was lately a celebrated abbey. When the combined forces of Prussia and Austria invaded France in 1792, it was taken by them, but evacuated afterwards in their memorable retreat. It was given to France by the treaty of Utrecht. It is seated on the river Scarpe, seven miles north of Valenciennes. N. lat. 50° 27'. E. long. 2° 35'.

AMAND, Sr. a small town of France, in the diocese of Auxerre.—Also a small town in the diocese of Clermont.

AMANDA, in *Ancient Geography*, a country of India, which, according to Pliny, contained various people, under the denominations of Samarabrix, Sambruceni, Bisambriti, Ofii, Antixeni, and Taxilke.

AMANDAVA, in *Ornithology*, a species of FRINGILLA that inhabits Asia, and is concisely described by Linnæus, as being of a brown and reddish colour, spotted with white. It is about the size of a wren, or four inches in length: the upper part of the plumage brown, with a mixture of dull red, the under part of the same colours, but paler, except the middle of the belly, which is darkest. Every feather in the upper wing-coverts, breast, and sides, has a white spot at the tip. The bill is dull red, tail black, and legs pale yellow. The female has a mixture of white on the throat and fore-part of the neck, and the belly is pale yellow.

This species is frequent in Bengal, and has been called the Bengal finch (or Amaduvade). In allusion to this, Brisson names it *Bengalus punctatus*, and Buffon Bengale piqueté.

There is a variety of this species, the AMANDAVA β . of Linnæus, hitherto found only in Bengal, which is said to be entirely brown, and without spots. This is the *Bengalus fuscus* of Brisson, and *Bengale Brun* of Buffon. Pl. enl. 115. f. 2. but it seems this variety is not always immaculate. Some have a small white spot at the tip of each of the wing-covert feathers, and there is in general a little white on the breast also. The female is brown, without white spots: the legs, as in the preceding, yellowish.

AMANDRA, in *Ancient Geography*, a town of Ethiopia, placed by Suidas in the territories of king Cepheus.

AMANGO Cape, in *Geography*, lies on the south-east part of the island of Corfica, and forms the limit of Bonifacio bay. It is easily known by a large castle, and two rocks, which are situated just below the haven.

AMANGUCHI, a town of Japan, the capital of the kingdom of Nagaro, and one of the richest towns of Japan.

AMANIA, in *Ancient Geography*, a name given to Arabia Felix, or to that part of it called Yemen.

AMANIBO, a town of South America, on the coast of Guiana, between Paramaribo and Cayenne.

AMANICÆ, or AMANIDÆ, *porte* or *pyls*, in *Ancient Geography*, denote defiles in the mountain AMANUS.

AMANITA, in *Botany*. See AGARICUS.

AMANNIA. See AMMANNIA and PEPLIS.

AMANOIA, in *Botany*, a genus of the *pentandria monogynia* class and order. Its characters are, that the calyx is quinquepartite; no corolla; the germen is triangular, the stigma trigonous, concave, and sinuated. There is one species, *viz.* *A. guianensis*. Aubl. pl. gui.

AMANOBI, in *Ancient Geography*, a people placed by Ptolemy in Sarmatia, in the vicinity of the Roxolane.

AMANOIDES, a promontory of Cilicia, between the rivers Pyramus and Cidus.

AMANTEA, a sea-port town and bishop's see of the kingdom of Naples, on the west coast of Calabria Citra, near the bay of Euphemia. N. lat. 39° 15'. E. long. 16° 21'.

AMANTHONTE, in *Entomology*, a species of PAPILIO in the section *Danai Candidi*, with rotund wings, white and black at the tips. The margin of the posterior wings on the under side is brown. Inhabits South America.

AMANTIA, in *Ancient Geography*, a town in that part of Epirus called by Ptolemy Orestides, and since denominated

nated New Epirus. It is placed by M. d'Anville in the interior of the country, on the river Celydnus. The inhabitants were denominated Amantes, or Amanini.

AMANUS, the name of a mountain, situate at the eastern extremity of the Mediterranean, near the gulf of Issus, and separating Cilicia from Syria. The defile or pass of this mountain, which forms a communication between these countries, is called *Portus Amanicus*, or *Pylæ Ciliciæ*, the Gates of Cilicia. The Persian army, under Darius, marched through this strait, while that of Alexander was encamped at Issus, after having passed the Strait of Mount Taurus, called also one of the Gates of Cilicia. This defile is also famous for the victory gained by Septimius Severus over Pescennius Niger. This mountain extends between the 37th and 38th degree of latitude, and its direction is from the north-east to the south-west. Some geographers have made it a branch of Mount Taurus. Stephanus Byz. says, that it took its name from the Greek word *μῆναι, maris*, because Orestes was delivered here from the furies which agitated him after the assassination of his mother.

AMANUS, or OMANUS, in *Mythology*, the deity of the ancient Persians, which they believed to be the sun, or the perpetual fire, which they adored as an image or emblem of the sun.

AMANZIRIFDIN, in *Geography*, a town of Arabia, 440 miles east of Mecca, and 584 north-east of Mocha. N. lat. 20° 25'. E. long. 67° 30'.

AMAPALLA, a sea-port town in the province of Guatemala, in North America, situate on a gulf of the same name, 220 miles south-east of the town of Guatemala. The inhabitants of this town and its vicinity carry on a considerable trade in cochineal, cocoa, hides, and indigo, and the other commodities of the province. N. lat. 12° 30'. W. long. 86° 40'.

AMAPALLA Bay, or Gulf, lies on the western coast of Mexico, in North America, south-east from Guatemala, and north-west from Realejo, in the direction of the coast. The entrance into the bay is between two peninsulas, which approach near each other, and defend the bay from the ocean; but within it is very spacious, extending from north-west to south-east. It forms the harbour of the town of Amapalla, sometimes called Fonseca or Pensaca. The coast, within the limits of the gulf, and without the bay, is free from rocks and shoals, and affords good anchorage; on the west side of the bay there is a hill, called the Hill of Amapalla, with a port at the foot of it called Martin Lopes. In the Gulf of Amapalla are two islands: one, called Mangerá, is a high round land, encompassed by rocks, with a small sandy creek on the north-east side; and the other, called Amapalla, and the largest, is about the distance of

two miles. The gulf, though it runs a great way beyond this island, is not deep enough to receive ships of burden. Malham's Gaz.

AMARA, in *Ancient Geography*, a town of Arabia Felix.

AMARA INDICA, in *Botany*. See MOMORDICA.

AMARACUS. See ORIGANUM.

AMARANTE, in *Geography*, a considerable and pleasant town of Portugal, in the province of Entre-Medo, on the river Tamega, 23 miles south-west of Braga, and 30 east-north-east of Oporto. N. lat. 41° 19'. W. long. 6° 52'. It contains about 4000 inhabitants, and is situated in a very delightful country.

AMARANTH, an order of knighthood, instituted in Sweden by Queen Christina in 1653, at the close of an annual feast, celebrated in that country, and called *Höflichskaf*.

This feast was solemnized with entertainment, balls, masquerades, and the like diversions, and held from evening till the next morning. That prince, thinking the name too vulgar, changed it into that of the *fiend of the gods*, because each person here represented some deity according as it fell to his lot. The queen assumed the name of *Amarante*, that is, *undefying*, or *immortal*. The young nobility, dressed in the habit of nymphs and shepherds, served the gods at the table. At the end of the feast, the queen threw off her habit, which was covered with diamonds, leaving it to be pulled in pieces by the masques, and in memory of so gallant a feast, founded a military order, called in Swedish *guld-chaffi*, into which all that had been present at the feast were admitted, including sixteen lords, and as many ladies, besides the queen. Their device was the cypher of *amarante*, composed of two A's, the one direct, the other inverted, and interwoven together on a jewel of gold adorned with diamonds; the whole inclosed by a laurel crown, with this motto, *dolce nella memoria*. The jewel was worn by the knights either in a gold chain, or a crimson or blue ribbon. Bulltrode Whitlock, the English ambassador from Cromwell to the court of Sweden, was made a knight of the order of *amarante*. On which account it seems to be, that we sometimes find him styled Sir Bulltrode Whitlock.

AMARANTH denotes a colour inclining to purple, derived from the flower of this name.

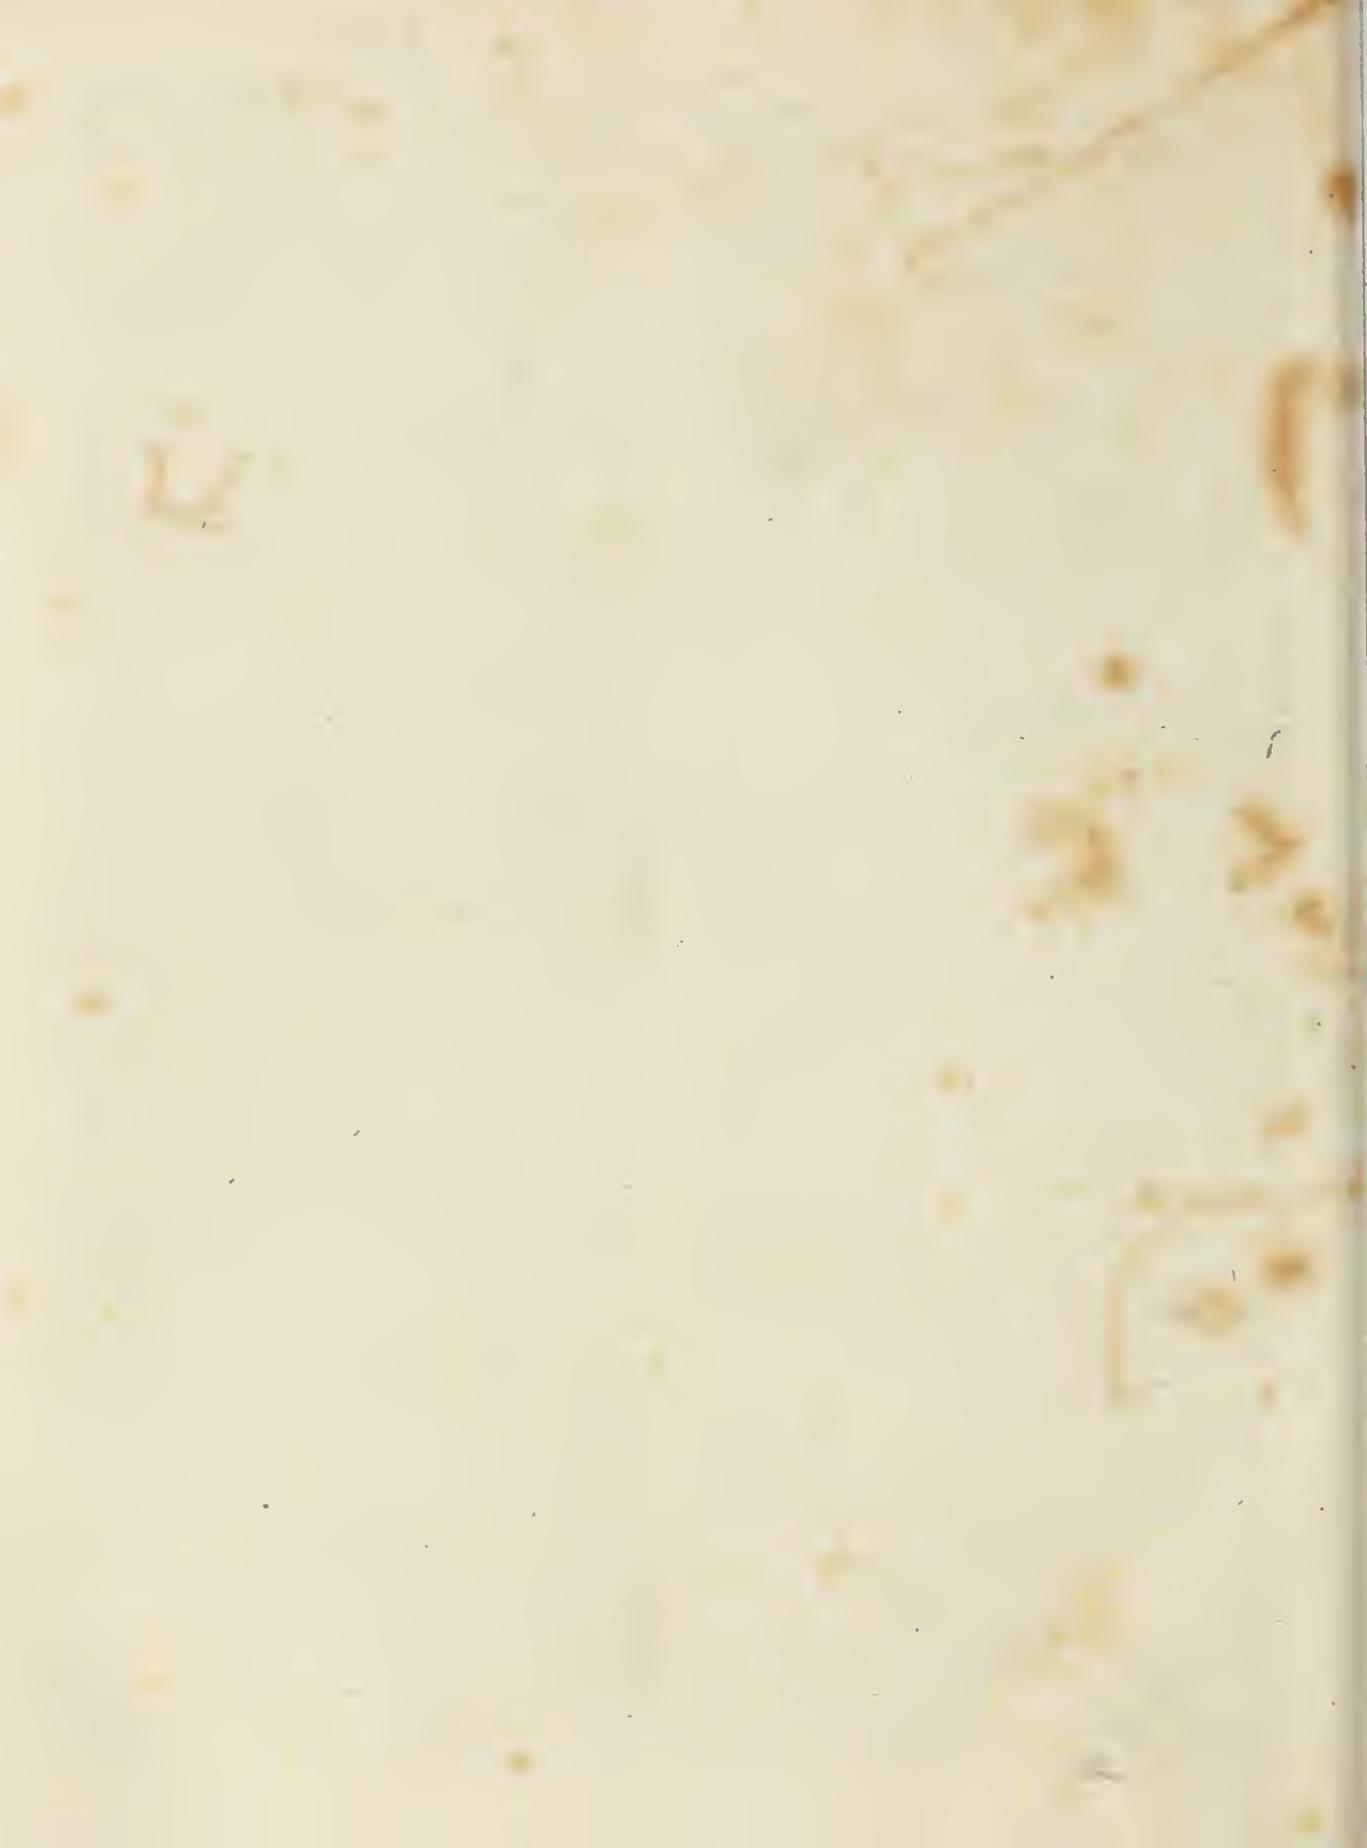

AMARANTH, *Globæ*, in *Botany*. See GOMPHRENA.

AMARANTHI *Spica*. See PHRYNA.

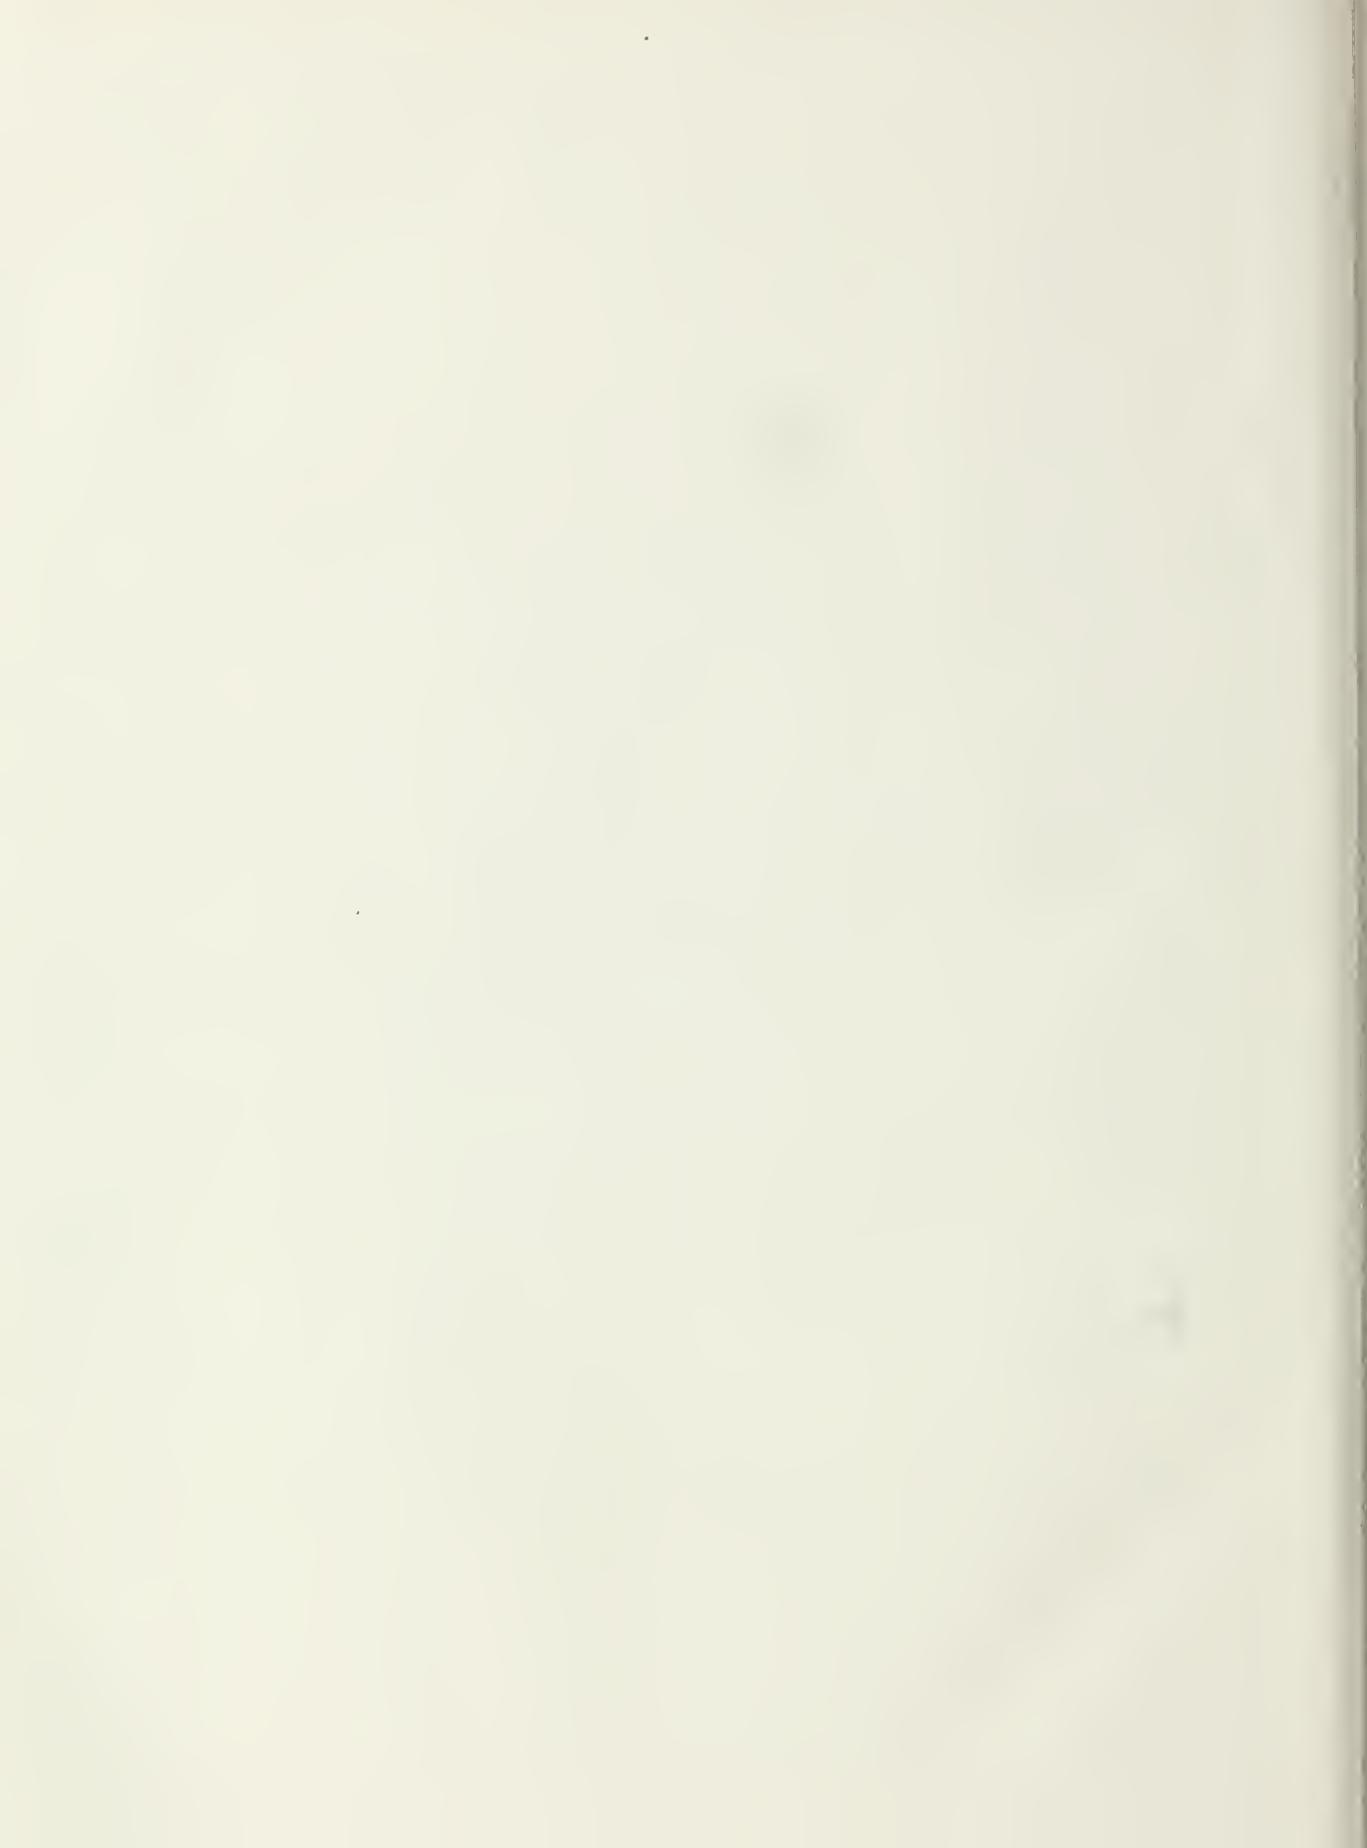

AMARANTHIO *Alyni*. See GOMPHRENA and ILLECEBRUM.

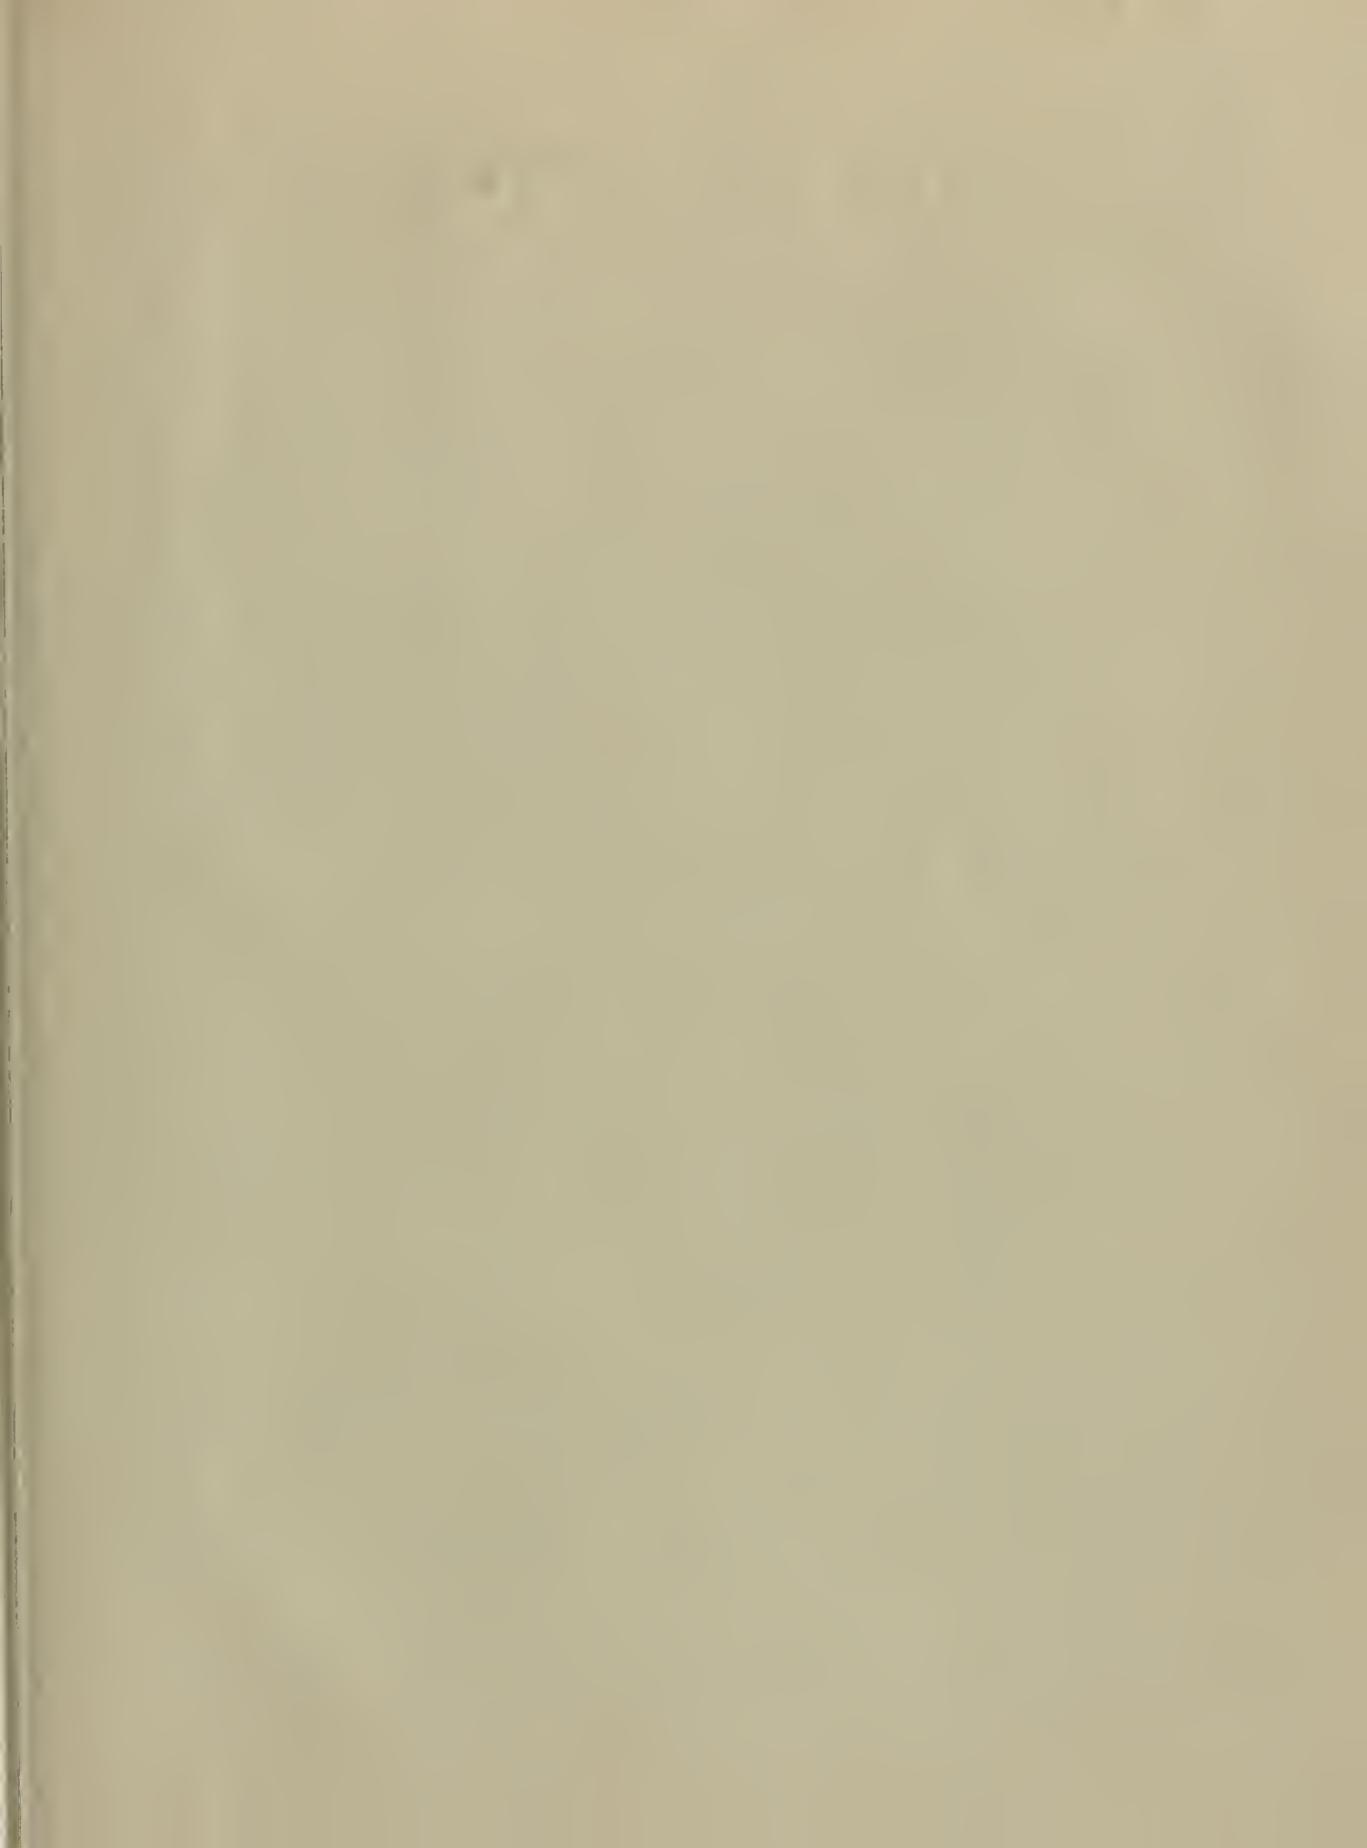

AMARANTHOIDES. See CELOSIA, GOMPHRENA and ILLECEBRUM.
