1819.

PREFACE.

THE CYCLOPÆDIA, which has been the production of the incessant labour of almost twenty years, is now completed, very much to the relief of the Editor's mind, and, as he hopes, to the satisfaction of the Public. To the candid judgment of its numerous readers, the Editor submits the work, assuring them, that, on his part, no pains have been wanting to render it worthy of their approbation. If he had foreseen the time and attention which the compilation and conduct of it required, and the unavoidable anxiety which it has occasioned, he would probably never have undertaken it. But habits of application, and some degree of experience in a work of this nature, disposed him to embark in it, and enabled him to overcome the difficulties that presented themselves to his view in his further progress. He hopes that he may be allowed to say, that an early and long-continued attachment to scientific pursuits, and a desire of serving the cause of Literature and Science, had no inconsiderable influence in directing his views to this object, and encouraging his perseverance in the accomplishment of it. He ought also to acknowledge, that the candour with which his labours, on this as well as on a former similar occasion, were received by the Public, and the expressions of approbation with which they were honoured in the course of sixteen years, afforded a very powerful inducement to unremitting assiduity and exertion. The Proprietors also, who had undertaken this work without any patronage besides that of the Public, and who were advancing large sums towards rendering it worthy of that patronage, were liberal in their co-operation, and in enabling the Editor to procure every kind of assistance, which he might find to be necessary and useful. They employed artists of the first reputation in their respective departments, whose performances have given a peculiar character to this work. The Proprietors and Editor were likewise honoured by connection and acquaintance with persons, eminently distinguished in those branches of science to which they had devoted their talents; and these persons not only consented to be co-adjutors, but to give celebrity to the work by allowing their names to be annexed to it, whilst they were enhancing its importance and value by their contributions. Although the Editor cannot decline availing himself of the reputation which the Cyclopædia must acquire from the established and well-known character of his associates,

SC L-1-44

Samuel J. Torrey - 7.5-43 - Lib. - 45v.

PREFACE.

THE CYCLOPÆDIA, which has been the production of the incessant labour of almost twenty years, is now completed, very much to the relief of the Editor's mind, and, as he hopes, to the satisfaction of the Public. To the candid judgment of its numerous readers, the Editor submits the work, assuring them, that, on his part, no pains have been wanting to render it worthy of their approbation. If he had foreseen the time and attention which the compilation and conduct of it required, and the unavoidable anxiety which it has occasioned, he would probably never have undertaken it. But habits of application, and some degree of experience in a work of this nature, disposed him to embark in it, and enabled him to overcome the difficulties that presented themselves to his view in his further progress. He hopes that he may be allowed to say, that an early and long-continued attachment to scientific pursuits, and a desire of serving the cause of Literature and Science, had no inconsiderable influence in directing his views to this object, and encouraging his perseverance in the accomplishment of it. He ought also to acknowledge, that the candour with which his labours, on this as well as on a former similar occasion, were received by the Public, and the expressions of approbation with which they were honoured in the course of sixteen years, afforded a very powerful inducement to unremitting assiduity and exertion. The Proprietors also, who had undertaken this work without any patronage besides that of the Public, and who were advancing large sums towards rendering it worthy of that patronage, were liberal in their co-operation, and in enabling the Editor to procure every kind of assistance, which he might find to be necessary and useful. They employed artists of the first reputation in their respective departments, whose performances have given a peculiar character to this work. The Proprietors and Editor were likewise honoured by connection and acquaintance with persons, eminently distinguished in those branches of science to which they had devoted their talents; and these persons not only consented to be co-adjutors, but to give celebrity to the work by allowing their names to be annexed to it, whilst they were enhancing its importance and value by their contributions. Although the Editor cannot decline availing himself of the reputation which the Cyclopædia must acquire from the established and well-known character of his associates,

and with this view presenting their names to the Public, he does not wish to rob them of any portion of fame that belongs to them, in order to enrich himself. Notwithstanding all the assistance which he has received, and which he thus gratefully and respectfully acknowledges, his own responsibility furnishes a large demand on the candour of the Public; nor will those who duly consider, that he has devoted almost twenty years of his life, measured not by fragments of time, but by whole days of twelve or fourteen hours, to the completion of his undertaking, and in so doing impaired his health and constitution, be indisposed to exercise that liberality in their estimate of his labours which he solicits. He is not unapprised of defects and imperfections; and if he were to begin the *Cyclopædia de novo*, he could improve it. Science is progressive; and since the commencement of this work, its advances in several departments have not been inconsiderable. The Editor has endeavoured to watch its steps, and to incorporate in his pages every discovery and improvement that has attended its progress. He now presents his work, in its finished state, at the bar of the Public, anxiously but not timidly waiting a favourable decision. He begs leave, however, to suggest, that he does not consider himself as responsible for the opinions advanced by his co-adjutors in the articles which they have furnished, any more than for those which occur in extracts from printed works. Some of these seem to him to be erroneous; and they are actually controverted and contradicted in other parts of the *Cyclopædia*, where the mention of them occurs. As he could not prescribe limits to the articles supplied by his co-adjutors, he could not presume to prohibit a statement of their own sentiments on the subjects of the articles which they contributed. In every case the reader will form his own judgment.

The names of most of his co-adjutors have been already published on the covers of several parts of the work; but after he has again recited them, every reader will be able to assign to each, so well known in the circle of science, the articles of any extent and of principal importance, which he has furnished. Under each head, the arts and sciences being arranged in alphabetical order, will be mentioned the names of those to whom the Editor is indebted for contributions; though in some cases the number is small and the articles are short, whilst in others they are more numerous and more extended. Many of these articles have been considerably enlarged in consequence of the Editor's own researches. His own additions are so incorporated with the communications of his friends, that it would not be easy to distinguish them without a minuteness of detail, which, as he conceives, would be tedious and uninteresting. *Agriculture*, Dr. Dickson. — *Algebra* and *Analysis*, Barlow, Bonnycastle, and Pond. — *Anatomy* and *Physiology*,

Abernethy and Lawrence. — *Comparative Anatomy*, Macartney, Lawrence, and Clarke. — *Annuities*, W. Morgan. — *Antiquities*, H. Ellis and Strutt. — *Architecture*, Porden, E. Aikin, P. Nicholson, Dr. Milner, and Webster. — *Astronomy*, Bonycastle and Pond. — *Astronomical Instruments*, Rev. Dr. Pearson. — *Biography*, Sir J. E. Smith, Dr. Burney, Dr. Malkin, and Dr. T. Rees. — *Botany*, Sir J. E. Smith, Dr. Woodville, Rev. Mr. Wood. — *Canals*, Farey, senior. — *Chemistry*, Aikin, Sylvester, Dalton, Brande, Dr. Marcet, Sir Humphrey Davy, Dr. C. Taylor, and Dr. Davy. — *Conic Sections and Curvilinear Geometry*, Ivory. — *Drawing*, Howard. — *Dynamics*, Cavallo. — *Education*, Dr. Carpenter. — *Electricity*, Cavallo and Cuthbertson. — *Engraving*, Landseer. — *Entomology, Conchology*, and several other articles of *Natural History*, Donovan. — *Exchange, Standard, Coinage, and Weight*, Dr. Kelly. — *Blast and Blowing Furnaces*, Mushett. — *Geology*, Kœnig, Bakewell. — *Geography*, Tooke, Hinckes. — *Geometry*, Barlow, Ivory. — *Grammar*, Dr. Jones. — *Heraldry*, Sir G. Naylor. — *History, English*, S. Turner and Owen Pugh. — *Horology*, Rev. Dr. Pearson. — *Language*, Dr. Carpenter, Dr. Jones. — *Magnetism*, Cavallo. — *Manufactures*, Duncan, J. Thomson, Parkes, and Farey, junior. — *Mechanics and Machinery*, Cavallo, Farey, junior. — *Medicine*, Dr. Bateman and Dr. Henderson. — *Mental Derangement*, Dr. Haslam. — *Meteorology*, L. Howard, Dalton, and Dickson. — *Midwifery*, Dr. Bland. — *Mineralogy*, Kœnig, Bakewell. — *Mining*, Taylor. — *Naval Architecture*, Glover. — *Navigation*, Mackay. — *Music*, Dr. Burney and Farey, senior. — *India Mythology*, Major Moor. — *Mental and Moral Philosophy*, Dr. Carpenter. — *Painting*, Russell, Opie, Ottley, and Phillips. — *Prosody*, H. Parker. — *Sculpture*, Flaxman, P. Hoare, and Bacon. — *Surgery*, Blair, who also furnished the article *Cipher*, and S. Cooper. — *Topography*, Britton. — *Versification*, H. Parker; — and a variety of *Miscellaneous* articles by Joyce, Ellis, Fletcher, Howard, Clarkson, and several other gentlemen, who were occasional contributors, and whose names it is needless to mention. To Mr. S. Bevan and some other literary and scientific friends, the Editor is indebted for the assistance which they have afforded him in suggesting articles that had been omitted, and that have been supplied in the *Addenda*. Dr. Thomas Rees has, towards the close of the work, paid particular attention to the arrangement of the Plates. He has also drawn up a digested catalogue of them, together with an alphabetical index of the subjects which they comprise; and added such explanations, and corrections of references, as appeared to be necessary or desirable, after a minute and careful collation, made in conjunction with the Editor, of every Plate, with the printed letter-press to which it pertained. The Editor and Proprietors of this work are also indebted to

Mr. Donovan, for the General Systematic Arrangement of the Plates of Natural History.

The general plan upon which this work has been conducted, and which was stated in the Advertisement that announced the publication of it, seemed to the Editor, after some experience in this department of literary labour, and after consulting several competent judges, the most suitable to the nature and design of a Scientific Dictionary. Whatever may be the advantage resulting from separate dictionaries appropriate to each particular science, which is the plan of the FRENCH ENCYCLOPEDIA, or from distinct treatises introduced in a dictionary of one alphabet, according to some modern compilations of this kind, the inconvenience and perplexity that attend the multiplication of alphabets, whether they occur in different serieses of volumes, or in the form of an index at the close of each treatise, will furnish an objection against this mode of arrangement, which it will not be easy to obviate. In a work of such magnitude as the French Dictionary, consisting already of between 100 and 200 volumes, and of undetermined extent, the best treatises that have been written, or that may be written, on each subject, may be introduced, and the work itself may be a complete library, and supersede the necessity of recurring to any other. But in a publication of limited compass, such as booksellers may undertake, and the general class of readers purchase, it is hardly possible to combine separate articles, sufficiently instructive, with treatises equally comprehensive and complete. To those who usually consult dictionaries for information, this plan, we are persuaded, is by no means the most eligible. If they wish to extend their knowledge beyond the limits to which a dictionary must necessarily restrict it, they will recur to appropriate treatises for the purpose; and the dictionary should furnish them with the necessary references. A dictionary is intended for communicating knowledge in an easy and expeditious manner; and it is desirable that the several articles should be so full and comprehensive, as to afford sufficient instruction on the subjects to which they relate, without the necessity of recurring to another dictionary, or to an index, for further information. It may be said, indeed, that the sciences are thus mutilated and mangled; and that it is impossible to preserve their unity without discussing each in a separate treatise. We readily allow, that this is an inconvenience, inseparable from the form of a dictionary; but at the same time we think that this may be remedied in a considerable degree by that kind of ramification of the principal subject, which, with suitable references, will lead the reader to subordinate articles, that form, by their mutual connection and dependence, an aggregate or whole, superseding in all common cases the necessity of a distinct treatise. These

references, when judiciously distributed and arranged, will serve, like the index of a book, but much more effectually, to conduct the reader from one subject to another: they will enable him to perceive their relation to each other; and they will direct him how to collect and combine the dispersed parts of any science into one entire and regular system. Each article will afford him, as it were, a distinct lecture; and he may pursue the same course of study by the means now suggested, or vary it as he thinks proper. Upon the whole, the advantage of separate treatises under each head of science, such as the limits of a dictionary will allow, seems to be more imaginary than real; more especially as the want of them may be supplied in the manner that has been mentioned.

In conformity to our proposed plan, it has been our endeavour to give, under each distinct head of science, an historical account of its rise, progress, and present state, concisely and yet as comprehensively as our limits and our sources of information would allow; to refer to those articles in which the discussion of them occurs, and to point out such publications as afford further information. References of this kind are introduced under each separate article, wherever they are thought to be necessary and useful; and thus the reader is able to form his judgment concerning the authorities upon which the compilers of the several articles depend; and if he shall have opportunity or inclination, he may recur to them for himself.

Whilst the Editor and his co-adjutors in this work have availed themselves of the assistance which other similar dictionaries have afforded them, they have not contented themselves with mere transcripts; they have resorted as much as possible to original writers, which they have been enabled to do by the facility of their access to large libraries; and by the citations which they subjoin to the several articles, the Public will judge of the extent of their research, and of the industry and labour which they have bestowed on this compilation. In their account of the arts and manufactures, they have consulted the artisans and manufacturers themselves, and derived from them every kind of information that was likely to conduce to the credit and utility of the work: and this they have not been able to do without incurring a very considerable expence.

Some apology may, perhaps, be thought necessary for the extension of this work beyond the limits first proposed. When it was determined to

introduce biography, as well as geography, topography, and history, upon a larger scale than the Proprietors and Editor had at first intended, principally in compliance with the wishes of intelligent and esteemed subscribers, the enlargement of it became indispensable. To his co-adjutors, whose assistance was highly important, the Editor could not presume to prescribe limits, which would have depreciated the value of the articles which they contributed, and within which, for their own reputation, they would not have consented to be confined, and of course the work would have been deprived of the benefit of their contributions. This circumstance could not fail to occasion an enlargement of the Cyclopædia; but it was proportionably enhanced in value; and the Editor is satisfied, that the purchasers will not ultimately regret the augmentation of expence. The plates likewise have been multiplied far beyond the original intention of the Proprietors, because new and unthought-of subjects were introduced in the progress of the work; but as these plates constitute a character of excellence peculiar to this Cyclopædia, it is thought that the circumstance of their being additional embellishments of the work, besides that of their being indispensable as explanatory of the articles to which they refer, will be a sufficient apology for the increase of their number; more especially when it is considered, that the augmented number of plates, as well as the enlargement of the work, have occasioned a diminution of profit to the Proprietors. It would have been more their interest, as well as more gratifying to the Editor, to have compiled a Cyclopædia in fewer volumes, and to have contented themselves with a smaller number of plates; as in all probability the sale would have been greater, and the sum of money expended upon it would of course have been much less. The Editor must do the booksellers concerned in this Cyclopædia the justice to say, that they have consented to forego part of the possible profit that might have accrued from it for the sake of its reputation and utility.

CYCLOPÆDIA:

OR, A NEW

UNIVERSAL DICTIONARY

OF

ARTS and SCIENCES.

A

A May be considered, I. as a LETTER; II. as a WORD; and III. as an ABBREVIATION.

I. **A**, as a LETTER, or the mark of a vocal sound, is the most simple, and that which the dumb are most easily taught to utter.

To pronounce it clearly, we need only open the mouth wider than for any other sound, and then emit the air from our lungs. It is the first letter of the alphabet in all the known languages of the world, except in that of the Ethiopians; in which, according to Ludolfus, it is the thirteenth.

We must seek the origin of this, and the rest of our letters, in the Oriental languages. See ALPHABET and LETTERS.

In the English language, the character **A** is the mark of three different sounds, which are termed by our grammarians the *broad A*, the *open A*, and the *slender A*.

1. Our *broad A*, resembles the sound marked by the German **A**, and is found in many of our monosyllables, as *all*, *wall*, *malt*, *salt*, where it is pronounced as *au* in *cause* and *fault*, or as *aw*, in *law*. It is probable that this *broad* sound was that which our Saxon ancestors expressed by the character **A**, as it is still, almost uniformly, retained in the rustic pronunciation and northern dialects of our language; as *taulk* for *talk*, *maun* for *man*, *baund* for *band*, &c.

2. The *open A* of the English, is not unlike the **A** of the Italians in *adagio*, and is the sound marked by this letter in *father*, *rather*, &c.

3. The *slender* sound marked by the character **A**, is peculiar to the English language, and resembles the sound of the French *e* masculine, or of their diphthong *ai* in *pais*; perhaps it is a middle sound between them, or between the *a* and *e*. Such we have in the words *place*, *face*, *waste*, and in all those that terminate in *ation*; as *salvation*, *preservation*, &c.

The sounds of which **A** is the character in our language,

are sometimes short; as in the words *glafs*, *grafs*, *brass*, &c. at other times long; as in *glaxe*, *graze*, &c. Their length is commonly denoted by an *i* immediately subjoined to the *a*; as in *plain*, *rain*, &c. or by an *e* added at the end of the word; as in *plane*, *crane*, &c.

Some contend that there are four, others, that there are five distinct sounds, denoted by the character **A** in the English language. There are, perhaps, little variations and distinctions in the sounds marked by the character **A**, as well as by the other vowel letters in our alphabet; but they are so local or arbitrary, or, after all, so nice and subtle, that they entirely escape the notice of foreigners, and are hardly distinguishable by the natives. Those who desire to enter more deeply into the first formation of sounds, and to see the elementary principles of speech treated with philosophical accuracy, will find satisfaction in the ingenious treatises of Wallis and Holder.

In burlesque poetry, the letter **A** is sometimes added after words; it lengthens them a syllable, without altering their sense; as *line-a*, for *line*, in Dryden, &c. It is sometimes redundant, when prefixed to words, as *arise*, *awake*; the same with *rise*, *wake*, &c.

In our Calendar, **A** is the first of the DOMINICAL letters which were introduced in imitation of the eight NUMERAL letters of the Romans, of which the **A** was one.

II. **A** is a WORD. This first simple sound is used in our language to express most of the vehement emotions of the soul. We naturally use it on all sudden occasions of admiration, joy, anguish, apprehension of danger, &c. and where the emotion is very great, the **A** is enforced by adding an aspirate to it, as *ah!*

It is sometimes a noun; for we say great **A** and little *a*; but it is most commonly a definite, or an indefinite article. It is *definite*, and denotes the number *one*, as, *a* man is coming, that is, *no more than one*. It is also used as an in-

definite article; so we say, *a* man may come this way; that is, any man.

A, used as an article, has no plural signification: before a word beginning with a vowel, *y* and *w* excepted, and before a silent *h* preceding a vowel, it is written *an*, of which *a* is the contraction; as *an* harbour, *an* ox, *an* hour, &c. A seems to be a true and genuine preposition, in the three following cases: 1. When it is put before a participle or participial noun, denoting some action not yet accomplished: as I am *a* writing. 2. When it is placed before local surnames: as Thomas *a* Becket. 3. When it is used in composition; e. g. *a*foot, *a*sleep, &c. Dr. Wallis supposes it to be a contraction of *at*: but Dr. Lowth thinks, that it is the preposition *on*, and sometimes *of*. *At*, he says, has relation chiefly to *place*; *on* has a more general relation, and may be applied to *action*, and many other things, as well as *place*.

In some instances, A has a peculiar signification, denoting the proportion of one thing to another; as such income *a* year, so many hours *a* day, so much *a* man, &c.

III. A is also an ABBREVIATION. A put to bills of exchange, is in England an abbreviation for *accepted*, and in France for the word *accepté*. It is likewise usual among merchants to mark their sets of books with the letters A, B, C, instead of the numbers 1, 2, 3, &c.

In the Roman inscriptions, the sense of the A is to be collected chiefly from the connection of the words, and the scope of the inscription. A singly stands for *Aulus*, *Augustus*, *ager*, *aiunt*, *ante*, *are*, *ades*, *edilis*, *edilitas*, *ararium*, *aula*, *anima*, *amicus*, *amica*, *albo*, *alia*, *aia*, &c. and, by a more modern abbreviation, for *arium*. Thus, A. M. stands for *Artium Magister*, *Master of Arts*, and A. B. for *Artium Baccalaureus*, *Bachelor of Arts*, A. A. signifies *Augusti*, and A. A. A. stands for *auro*, *argento*, *are*. A. B. stands for *alia lora*, and A. C. for *aia causâ*, &c. On the Greek and Roman medals, A denotes commonly the name of the place where they were struck, as Athens, Argos, Antioch, Aquileia. On French coins A is the mark of the mint of Paris, and A A signifies their coinage at Metz.

The Romans in their trials used their A to denote absolution; whence Cicero calls it *litera salutaris*, the *saving letter*. Their manner was this: Three ballots were given to each judge, marked one with an A. for *absolvo*, *I absolve*; a second with a C. for *condemno*, *I condemn*; and the third with N. L. which stood for *non liquet*, *it is not clear*. One or other of these each judge, according to his judgment, put into an urn; and the pretor acquitted or condemned the criminal, according to the respective number of these letters. If the suffrages for acquitting and condemning were equal, the accused was always acquitted.

The Romans also made use of the letter A in collecting their suffrages in cases of legislation. When a new law was proposed, or an amendment of an old one was in agitation, each voter had two ballots put into his hand, the one marked A. signifying *antiquo*, q. d. *antiquam volo*, *I like the old way*; and the other marked U. R. for *uti rogas*, *as you desire*; and his suffrage was given, by putting the one, or the other, into the urn. A, in the days of Roman barbarism, was one of the numeral letters, and signified five hundred; when written with a dash over it, thus \bar{A} , it denoted five thousand. The letter A is also used by Chronologers and Historians as an abbreviation for *anno*; so they put A. M. for *anno Mundi*, A. D. for *anno Domini*, &c.

The Romans dated from the building of Rome; and in their writings A. U. C. stands for *anno ab urbe condita*. The Greeks used A, α , prefixed to a word, as a PRIVATIVE particle. With them it was also a numeral letter denoting unit.

Among Logicians, A denotes an universal affirmative proposition; according to the verse,

Afferit A, negat E, verum generaliter ambe. See BARBARA.

In Algebra A or *a*, and the first letters of the alphabet, represent *known* quantities; and the last letters represent quantities that are *unknown*.

In the prescriptions of Physicians, A, or \bar{a} , or $\bar{a}\bar{a}$, denotes equal parts of the ingredients specified, and is a contraction of the preposition *ava*, which is used in the same sense by medicinal writers in the Greek tongue.

Among Chemists, A A A signifies an AMALGAMA, or the operation of amalgamating.

In Heraldry, the letter A is used as a bearing in arms.

AA, *Peter Vander*, in *Biography*, an eminent bookseller at Leyden, who was living in 1729. He published an atlas of 200 charts compiled after the long voyages from 1246 to 1696. They are not deemed very accurate. They are included in the *Galerie Agréable du Monde*, in 66 vols. folio. *Aa* continued Grævius's Thefaurus, or an account of the modern Italian writers, in six other volumes, with the Thefaurus Antiquitatum Siciliæ.

AA, in *Hydrography*, the name of several rivers: one in Westphalia, which rises near Munster and falls into the river Embs; another, that has its source in the department of Somme, in France, becomes navigable by means of sluices near St. Omer, passes on to Gravelines, and discharges itself into the English Channel; a third in Livonia, that falls into the gulf of Riga; and a fourth in Switzerland, that rises in Mount Brunig, and falls into the lake Lucerne.

AACH, in *Geography*, a small town in Germany, in the circle of Suabia and Landgravate of Nellenburg, near the source of the river *Aach*, which falls into the lake of Zell. It belongs to the House of Austria. E. long. 9°. N. lat. 47° 55'.

AAGARD, *Nicholas* and *Christian*, in *Biography*, two brothers born at Wiburg in Denmark in the beginning of the 17th century. The former is known for his philosophical works and other tracts, particularly his disputations upon Tacitus; the latter for his excellent poetry.

AAGGI-DOGII, in *Geography*, a mountain of Amasia in Turkey, on the frontiers of Persia, which is crossed by the Caravans in their way from Constantinople to Ispahan.

AAG-HOLM, a small island on the coast of Norway, near the mouth of the river Lendevand.

AAHUS, or AHAUSZ, i. e. *the house on the Aa*, a small town in the circle of Westphalia, and bishoprick of Munster. It is the capital of the prefecture of *Aahus*, and has a citadel. E. long. 7° 1'. N. lat. 52° 10'.

AAKIAR, a prefecture of the diocese of AARHUUS containing 16 parishes.

AAKIRKE, a town in the island of BORNHOLM, which has the privileges of a city, and in which are held the provincial court and the synod. E. long. 14° 56'. N. lat. 55° 15'.

AALBURG, the capital of a diocese of the same name in North Jutland, in Denmark, and a bishop's see. It derives its name from the number of eels that are taken here. This city is large and populous; and next to Copenhagen, the most opulent and best built in the kingdom. It carries on a considerable trade in herrings and grain, and has different manufactures of muskets, pistols, saddles, and gloves. It has an exchange for merchants; as well as a safe and deep harbour. The population of this diocese amounts to 80,872 persons. E. long. 9° 46'. N. lat. 56° 50'.

AALEN, or AHLEN, a free Imperial town belonging to the bench of Suabia, and so called from the number of eels which are in that part of the river Kocher that

runs through it. This city is Lutheran. It was formerly under the dominion of the kings of Bohemia, and sold to Ebberhard, Count of Wirtemberg. The Emperor Charles IV. recovered it, and restored it to the empire in 1360. This, and similar cities that are almost in a ruined state, preserve their franchises and immunities with care. E. long. 9° 36'. N. lat. 48° 48'.

AALST, or AELST, *Everard*, in *Biography*, a painter, was born at Delft in 1602 and died in 1658. He excelled in fruit pieces, dead game, and armory. His nephew, named William, surpassed his uncle. He was born in 1620 and died in 1679. His pictures are chiefly known in Holland.

AALST, or ALEST, in *Geography*, the capital of a county of the same name in the district of Ghent and circle of Burgundy, and lying between the rivers Schelde and Dender. This city lies on the latter of these rivers. E. long. 3° 54'. N. lat. 50° 58'.

AAM, or HAAM, is a liquid measure generally used by the Dutch; it contains 128 mingles, each mingle weighing about 36 ounces avoirdupois; and consequently the *Aam* is equal to 148 $\frac{2}{3}$ pints of Paris, or to 288 pints of English measure; the Paris pint weighing 31 ounces, and that of England 16 ounces.

AAMA, in *Geography*, a province of Barbary in Africa, about 15 days' journey from Tunis.

AANSIRE, a small island on the coast of Norway, opposite to AAG-HOLM.

AAR, or AREN, in *Hydrography*, a large river of Switzerland, which has its source in Mount Grimsel in the south of the canton of Bern, and pursuing a circuitous course towards the north-west, passes through the lakes of Brienz and Thun to Bern, and afterwards changing its direction towards the north-east, flows to Solothurn and Brugg, and being joined by the Reufs and Limmatt, discharges itself into the Rhine near Waldshut. There is another smaller river of the same name in Westphalia.

AAR, in *Geography*, the name of a small island in the Baltic.

AARASSUS, in *Ancient Geography*, a town of Pisidia in Asia, which some have supposed to be the Anassus of Ptolemy. Strabo, Geog. tom. ii. p. 855.

AARAW, in *Geography*, a town and bailiwick in the canton of Bern in Switzerland. E. long. 7° 10'. N. lat. 40° 2'.

AARDENBORG, a small town in Flanders situated on a canal which communicates with the Zwin. It was once a fortress; but its works were totally razed in 1700. E. long. 3° 14'. N. lat. 51° 17'.

AARHUUS, the capital of a diocese of the same name in North Jutland, extending from that of Wiburg along the Cattegat, about 15 miles in length and 8 or 9 in breadth. This diocese is extremely fertile, and diversified with woods, bays, and lakes abounding with fish. It is watered by several rivers, the chief of which is the Guden. The town lies in a fine plain between the sea and a lake, from which a stream of water passes through it. It is large and populous, has 6 gates, 2 principal churches, 2 market places, an university, a free school, and a well endowed hospital. It carries on a good trade. The number of inhabitants in this diocese is estimated at 117,942. E. long. 10°. N. lat. 56° 6'.

AARON, in *Scripture History*, the son of Amram and Jochebed, and the grandson of Levi, was born A. M. 2430, before the Christian æra 1574. He was three years older than his brother Moses, and appointed to aid him under the character of his advocate and interpreter, as well as prophet, in his intercourse with Pharaoh, and in the rescue of the Israelites from their bondage in Egypt. With this view

they both went together into Egypt; and after many attempts to overcome the opposition of the Egyptians, and the obstinacy of Pharaoh, they accomplished their object A. M. 2513, ante A. D. 1491. After the Exodus of Israel, and during their peregrination in the Wilderness, *Aaron* and his sons exercised the office of priests by a divine appointment; and as soon as the TABERNACLE was built, *Aaron* was consecrated by Moses with the holy oil, and invested with the pontifical ornaments. When Moses went up to the Mount to receive the law, *Aaron*, accompanied by the 70 elders, followed him; but during his continuance for 40 days on the Mount, the people became impatient and tumultuous, and *Aaron*, yielding to their solicitations, melted down their pendants, and the ear-rings of their wives and children, and formed the golden CALF, to which they paid homage. He afterwards humbled himself for this offence, obtained forgiveness, and was continued in the priesthood. In a subsequent period, viz. A. M. 2515, Korah aspired to the priestly office, and Dathan and Abiram claimed a share with Moses in the sovereign authority; for which act of rebellion, as their history informs us, they were signally punished. *Aaron* was afterwards confirmed in the priesthood by the miracle of the almond-rod, which blossomed, and which was deposited in the most holy place, in order to perpetuate his title, and the remembrance of this prodigy. He married Elisheba, the daughter of Aminadab of the tribe of Judah, by whom he had four sons; two of whom were destroyed by fire, and from the other two the race of the high priests of the Jews was continued from *Aaron* in regular succession. When the period of *Aaron's* service was completed, he ascended Mount Hor near the encampment of the Israelites at Mosera, disrobed himself of the pontifical ornaments in the view of the people, and put them upon Eleazar his eldest son, and his successor in the high priesthood. He then died in the arms of Moses and his son, at the age of 123 years, in the 40th year after the Exodus; and they buried him in a cave of this mountain: but the place of his interment was concealed, probably under an apprehension that in future ages he might become an object of superstitious worship. For a farther account of *Aaron* the reader is referred to Exodus, Leviticus, and the book of Numbers to the 24th verse of the xxth chapter; and for an abstract, with remarks on several circumstances pertaining to his station, character, and office, to Calmet's Dictionary of the Bible.

AARON, in *Church History*, a British martyr, who suffered a cruel death, together with Julius, under the persecution of Dioclesian, in the year 303. It does not appear what were the British names of these two martyrs; as the Christian Britons took new names from the Latin, Greek, or Hebrew, at the time of their baptism. They were buried at Caerleon, and each of them had a church dedicated to his memory in that city. In the Roman martyrology their feast was fixed on the *first* of July. Biog. Brit.

AARON, a presbyter and physician of Alexandria, author of 30 books in the Syriac tongue, containing the whole practice of physic, called the Pandects, chiefly collected from the Greek writings, and supposed to be written before 620. They were translated into Arabic by a Syrian Jew physician about A. D. 683. He is the first author that mentions, and that has clearly described, the small-pox and measles, which probably first appeared at Alexandria in Egypt A. D. 640, and were brought thither by the Arabians when they took that city. He directed the vein under the tongue to be opened in the cure of the jaundice, and observed that the fœces in that disease are of a white colour. The above-mentioned work and its translations are lost: and

we have only fragments remaining, collected by Mohammed Rhazis in his *Continens*.

AARON, or HARUN, *Al Rafidid*, in *General Biography*, a celebrated caliph of the Saracen empire. See BAGDAD.

AARON *Aurijebon*, a learned Rabbi and CARAITE in the thirteenth century, who wrote an Hebrew grammar, printed at Constantinople in 1581. He was probably the same with *Aaron*, who wrote a commentary on the Pentateuch, which is in MS. in the French king's library, and translated by DANZ in 1710; and MSS. annotations on the Old Testament. There was another *Aaron*, distinguished from the former by the epithet *Hacharon*, i. e. posterior, who was born at Nicomedia in 1346. His writings are esteemed oracular by the Caraites Jews. The Garden of Eden, containing the doctrines and customs of his nation, is the principal.

AARON, a Levite of Barcelona, was the author of 613 precepts on Moses in Hebrew, printed at Venice in 1523. He died in 1292.

AARON, *Ben chaim*, was chief of the synagogue of Fez and Morocco in the beginning of the seventeenth century. His commentary on the Prophets, intitled the heart of *Aaron*, one on the Syphra, and another on the Law, were printed at Venice in 1609, folio.

AARON, *Ben aser*, was a celebrated Rabbi, who is said to have invented the Hebrew points and accents towards the fifth century. His Hebrew grammar was printed by Bomberg in 1515, folio.

AARON, in *Geography*. See ST. MALOES.

AARONSBURGH, in *Geography*, a town of America, lying at the head of Penn's creek in the county of Northumberland, about 30 miles W. from Louisburgh, and 40 W. by N. from Sunbury.

AARSENS, *Francis*, Lord of Someldyck and Spycck, one of the greatest ministers for negotiation in the United Provinces. He was sent by Barneveldt, who presided over these provinces, as agent into France, and was the first person recognised, in 1609, as Dutch ambassador by the French court. He was the first of three extraordinary ambassadors sent to England in 1620, and the second of those who were deputed in 1641, to negotiate the marriage of Prince William, son to the Prince of Orange. After having been employed in several other important missions, he died in an advanced age, very rich, and left on record memoirs of all the embassies in which he had been engaged.

AARSENS, or AERTSEN, *Peter*, denominated from his stature by the Italians *Pietro Longo*, a celebrated painter, was born at Amsterdam in 1519. He excelled in painting a kitchen with its furniture, and his altar-pieces were particularly admired. A famous piece of this kind was destroyed in the insurrection of 1566; and because he complained of this outrage, he was in danger of being murdered by the populace. He died in 1575.

AARTGEN, or AERTGEN, a painter of eminence, who was born at Leyden in 1498, and pursued his father's trade of a woolcomber to the age of eighteen. He voluntarily lived in meanness and obscurity; and declined offers of advancement, alleging that he found more sweets in his poverty than others did in their riches. He never worked on Monday, chusing to devote that day, with his disciples, to the bottle. It was his practice to stroll about the streets in the night, playing on the German flute; and in one of these frolics he was drowned in 1564.

AASAR, in *Ancient Geography*, a town of Palestine, situated between Azotus and Asecalon, which in the time of Jerome was a hamlet.

AATTER, a district of the northern part of Arabia Felix, on the Red Sea.

AAVORA, in *Natural History*, the fruit of a sort of large palm tree in the West Indies, and in Africa. It is of the size of a hen's egg, and included, with several more, in a large shell. In the middle of the fruit there is a hard nut, about the size of a peach stone, which contains a white almond, very astringent and proper to check a DIARRHOEA.

AB, in the *Hebrew Chronology*, the eleventh month of the civil year, and the fifth of the ecclesiastical year, which begins with *Nisan*. This month answered to the moon of July, comprehending part of July and of August, and contained thirty days.

The first day of this month is observed as a fast by the Jews, in memory of Aaron's death; and the ninth, in commemoration of the destruction of the temple by Nebuchadnezzar, in the year before Christ 587. Josephus observes, that the burning of the temple by Nebuchadnezzar, happened on the same day of the year on which it was afterwards burned by Titus. The same day was remarkable for Adrian's edict, which prohibited the Jews to continue in Judæa, or to look towards Jerusalem and lament its desolation. The eighteenth day is also kept as a fast, because the sacred lamp was extinguished that night, in the reign of Ahaz. On the twenty-first, or according to Scaliger, the 22d day, was a feast, called Xylophoria, from their laying up the necessary wood in the temple: and on the twenty-fourth, a feast in commemoration of the abolishing of a law by the Asmoneans, or Maccabees, which had been introduced by the Sadducees, and which enacted, that both sons and daughters should alike inherit the estates of their parents.

AB, in the *Syriac Calendar*, is the name of the last summer month.

AB, prefixed to the names of places, generally denotes that they belong to some abbey.

ABA, or ABAU, HANIFAH. See HANIFAH.

ABA, ABAS or ABUS, in *Ancient Geography*, a mountain of Greater Armenia, situated between the mountains Niphates and Nibarus. According to Strabo, (Geog. tom. ii. p. 799.) the Euphrates and Araxes flow from this mountain; the one towards the west, and the other to the east. Eustathius and Dionysius Periegetes, call this mountain, which is part of Mount Taurus, Achos.

ABA, or ABÆ, a city of Phocis in Greece, near Helicon, famous for an oracle of Apollo, more ancient than that at Delphi, and also for a rich temple, plundered and burnt by the Persians. Strabo's Geog. tom. i. p. 647, and the authors there cited.

ABACA, in *Botany*, a kind of flax or hemp, gathered in some of the Manillas or Philippine Islands. This plant is sown every year; being gathered, it is steeped in water, and beaten as hemp is. It is of two kinds, the white and the grey. The white *abaca* is used for making very fine linen; but the grey is employed for nothing but cordage.

ABACA, in *Geography*, one of the Philippine Islands in Asia.

ABACÆNA, in *Ancient Geography*, a town of Media, and another of Cana in the Hither Asia.

ABACÆNUM, a town of Sicily, the ruins of which are supposed to be near Trippi, a citadel on a steep mountain near Messina. Its inhabitants were called *Abacenini*. Stephan. de Urbibus, tom. i. p. 2.

ABACAY, in *Natural History*, a name given by the people of the Philippine Islands to a species of parrot, called also CALANGAY.

ABACH, in *Geography*, a market town of Bavaria, situated on the Danube. It has an old castle, in which Henry II. is said to have been born, and is much frequented

machinery, whereby the strings of the polyplectra, or instrument of many strings, were struck, with a plectrum made of quill.

Abacus harmicus is used by Kircher for the structure and disposition of the keys of a musical instrument, whether to be touched with the hands or the feet.

ABACUS, or **ABACISEUS**, in *Architecture*, is the uppermost member of the capital of a column; serving as a kind of crowning, both to the capital and the whole column.

Vitruvius, and others after him, who give the history of the orders, tell us, the *abacus* was originally intended to represent a square tile laid over an urn, or rather over a basket.—An Athenian old woman happening to place a basket thus, covered over the root of an acanthus: that plant shooting up the following spring, encompassed the basket all around, till meeting with the tile, it curled back, in a kind of scroll. Callimachus, an ingenious sculptor, passing by, took the hint, and immediately executed a capital on this plan; representing the tile by the *abacus*, the leaves by the volutes, and the basket by the vase, or body of the capital. There is some difference in the form of the *abacus* in different orders. In the **TUSCAN**, **DORIC**, and ancient **IONIC**, it is a flat, square member, well enough representing its original tile; whence the French call it *tailleur, tron levé*. In the richer orders it loses its native form; its four sides or faces being arched, or cut inwards, with some ornament, as a rose, or other flower, or a fish's tail, in the middle of each arch. See **CORINTHIAN** and **COMPOSITE**. But some architects take other liberties in the *abacus*, in respect of its name, place and office. Thus, in the Tuscan order, where it is the largest and most massive, as taking up one third of the height of the whole capital, it is sometimes called the *dye* of the capital.—In the Doric it is not always the uppermost member of the capital; a *cymatium* being frequently placed over it.—In the Ionic, some make it a perfect ogee, and crown it with a fillet.—The proportion of the *abacus*, as prescribed by Vitruvius, is, that its diagonal (from corner to corner) be twice its height; but the moderns dispense with this proportion.—Scamozzi applies the term *abacus* to a concave moulding in the capital of the Tuscan pedestal, and Palladio calls the plinth above the echinus, or boustin, in the Tuscan and Doric orders, by the same name.—In the *Ancient Architecture*, *Abacus* is used to denote certain compartments in the incrustation or lining of the walls of state-rooms, **MOSAIC** pavements, and the like. There were *abaci* of marble, porphyry, jasper, alabaster, and even glass; shaped variously, square, triangular, and the like.

ABADA, in *Zoology*, a singular kind of wild animal in Benguela, in Africa. It is about the size of a half-grown colt, shy and swift-footed. It has two horns, one in its forehead, and another in the nape of its neck, which are of different length and bulk. The head and tail of this animal resemble those of an ox, and its feet are cloven like those of a stag, but much thicker. The front horn is deemed an antidote in many disorders; and the pulverised bones are made into a poultice, and recommended by the natives as a sovereign remedy against all aches and pains, and as effectual for purifying the blood and humours. Mod. Un. Hist. v. 13, p. 8. See **RHINOCEROS**.

ABADAN, in *Geography*, a town of Asia, on the gulph of Persia, and near the mouth of the river Tigris. It is dependent on Bassora. E. long. 47° 15'. N. lat. 29° 20'.

ABADAVINE, in *Ornithology*. See **SPINUS**.

ABADDON, Heb. corresponding to *Apollyon*, Gr. *i. e.* *Destroyer*, in *Scripture-history*, is represented, Rev. ix. 11. as king of the locusts, and the angel of the bottomless pit, who has been thought by many interpreters to be Satan, or

the devil. Dr. More (*Theol. Works*, p. 130.) interprets this title as referring to the profession which the Mahometans should make of maintaining the doctrine of the unity. Le Clerc and Dr. Hammond understand by the locusts in this passage, the zealots and robbers who infested and desolated Judæa before Jerusalem was taken by the Romans, and by *Abaddon*, John of Gischala, who having treacherously left that town before it was surrendered to Titus, came to Jerusalem and headed those of the zealots who acknowledged him as their king, and involved the Jews in many grievous calamities. The learned Grotius concurs in opinion, that the locusts are designed to represent the sect of the zealots, who appeared among the Jews during the siege, and at the time of the destruction of Jerusalem. Mr. Jos. Mede remarks, that the title *Abaddon* alludes to Obodas, the common name of the antient monarchs of that part of Arabia, from which Mahomet came; and considers the passage as descriptive of the inundation of the Saracens. Mr. Lowman (*Paraphr. on Rev.* p. 118, &c.) adopts and confirms this interpretation. He shews that the rise and progress of the Mahometan religion and empire exhibit a signal accomplishment of this prophecy. All the circumstances here recited correspond to the character of the Arabians, and the history of the period that extended from A. D. 568 to A. D. 675. In conformity to this opinion, *Abaddon* may be understood to denote either Mahomet, who issued from the abyss, or the cave of Hera, to propagate his pretended revelations, or, more generally, the Saracen power. Mr. Bryant supposes *Abaddon* to have been the name of the Ophite deity, the worship of whom prevailed very antiently and very generally. See **SERPENT**.

ABADIR, in the Roman *Theology*, the stone which Saturn swallowed, believing it his new-born son Jupiter, and which at length became deified, and the object of religious worship. The Carthaginians gave this title to gods of the first order.

ABÆ. See **ABA**.

ABAST, in the *Sea Language*, is used in speaking of things placed or done towards the stern, or hinder part of a vessel; called also *ast*, and stands opposite to *fore*.—Thus they say a thing is *abast* the fore-mast, when it is behind it, or near to the stern. The post of the master, captain, and other officers, is *abast* the main-mast.—The stern, strictly speaking, is only the outside; *abast* includes both inside and out.

ABAST the beam, denotes the relative situation of any object with the ship, when the object is placed in any part of that arch of the horizon which is contained between a line at right angles with the keel and that point of the compass which is directly opposite to the ship's course.

ABAGI, the same thing with **ABASSI**, although of different value; it is worth at Teflis, and throughout all Georgia, about 36 sols French money; four chaouris, which are also called *sains*, make one *abagi*.

ABAKA Il Khan, in *Biography*, the 8th emperor of the Moguls, of the race of Zingis, who succeeded his father Hulaku, and commenced his reign, A. D. 1264. He was prudent and learned, and possessed many amiable qualities which endeared him to his subjects, and rendered his government prosperous. He joined the Christians in celebrating Easter-day at Hamadan, whence some have erroneously inferred that he was a Christian. He reigned 17 years. Mod. Un. Hist. v. iv. p. 386.

ABAKANSKOI, in *Geography*, a garrison town of the province of Yenisei, in Siberia. It stands on the river Jenisei, and is so called from the river Abaken, which falls into the Jenisei at no considerable distance from it. E. long. 94° 5'. N. lat. 53° 5'.

ABALAK, a small town in Siberia, about two miles from

from Tobolsk, famous for an image of the Virgin Mary, to which many pilgrims resort, and which is annually carried in procession to Tobolsk. E. long. 68° 20'. N. lat. 58° 11'.

ABALIENATION, from *ab* and *alienare*, to *alienate*, in the Roman *Law*, denotes a species of alienation; whereby those goods called *res mancipi*, such as cattle, slaves, lands, and possessions, within the territory of Italy, were transferred to persons legally capable thereof, either by a formula, called *traditio nexu*, or a surrender in open court.

ABALIENATUS, *alienated from*, a medical term, which, when applied to the body, signifies that the part so spoken of, is in a state that requires amputation: and when applied to the senses, denotes their total destruction.

ABALITES. See **AVALITES**.

ABALLABA, in *Geography*, the ancient name of *Appleby*, a town in Westmoreland, remarkable only for having been a Roman station. W. long. 1° 4'. N. lat. 55° 38'.

ABALUS, an island, as the ancients supposed, in the German ocean, called by Timæus *Basilis*, and by Xenophon Lamplacenus *Bahia*, now the peninsula of Scandinavia. Amber, according to Pliny, (Hist. Nat. tom. ii. p. 770. ed. Hard.) was thrown on the shores of this island by the waves of the sea; and he reports, that some persons thought this substance dropped from the trees in the adjacent mountains.

ABAN la Ville, a town in the bailiwick of Quingey, situate between the town of that name and Lieu Dieu, in Franche Comte. E. long. 6° 15'. N. lat. 47° 10'.

ABANA, a river of Phœnicia, which rising from Mount Hermon, washed the south and west sides of Damascus, and fell into the Phœnician sea to the north of Tripolis. The *Abana* was one branch of the **BARRADY**, called by the Greeks *Chrysorrhœas*. This river is mentioned by Naaman, 2 Kings, v. 12.

ABANGA. See **ADY**.

ABANO, a village near Padua, in Italy, famous for its warm baths. In one of these baths the patients are covered with the warm mud. E. long. 10° 47'. N. lat. 45° 30'.

ABANTES, in *Ancient History*, a warlike people who came originally from Thrace, and settled in Phocis, a country of Greece, where they built a town, called **ABA**, after the name of their leader. Some ancient authors say, that the *Abantes* afterwards settled in the island *Eubœa*, now called *Negropont*: others say these *Abantes* came from Athens. These people are called by Homer (Il. l. ii. v. 542.) *αυθεν κομωστες*, from wearing their long hair behind. They were called *Curetes* from their cutting it short before.

ABANTIA, or **ABANTIS**, in *Ancient Geography*, a name given to the island *Eubœa*, in the Egean Sea; extending along the coast of Greece, from the promontory Sunium of Attica to Thessaly, and separated from Bœotia by a narrow strait called *Euripus*. It derived its name from the **ABANTES**, according to Strabo, tom. ii. p. 682. Others say, that the inhabitants were called *Abantes*, from Abas their leader, who first reigned in the island; and Reineccius supposes that they were Arabians, who followed Cadmus into *Eubœa*, and settled there.

ABAPTISTA, or **ABAPTISTON**, in *Surgery*, derived from the privative *α* and *βάπτω*, to *plunge*; the shoulder of a trepanning instrument. This term is employed by Galen, Fabricius ab Aquapendente, Scultetus, and others, to denote the conical saw with a circular edge (otherwise called **MODIOLUS** or **TEREBRA**), which was formerly used by surgeons to perforate the cranium. Modern practitioners, however, have usually preferred the cylindrical form. Various contrivances are recommended, to avoid the danger that may arise from want of dexterity in the operation of trepanning, and a new instrument has been lately

delineated for this purpose, by Mr. Rodman of Paisley; (Philosophical Magazine for April 1800;) but as no invention can compensate for a defect of skill in the surgeon, these precautions are not in general attended to. For a more particular account of this instrument, see **TREPAN** and **TREPHINE**.

ABARA, in *Geography*, a town in the greater Armenia, under the dominion of the Turks. E. long. 46° 15'. N. lat. 39° 45'.

ABARANER, a town of Turcomania, in Asia, situated on the river Alingena, and twenty miles north of Naksivan. It is said that 300 Roman Catholics reside here. E. long. 46° 30'. N. lat. 39° 50'.

ABARCA, an ancient kind of shoe used in Spain to pass the mountains, made of raw hides, and bound with cords, which secured them against the snow.

ABARIM, in *Scripture Geography*, a ridge of high mountains situate between the rivers Arnon and Jordan, and nearly opposite to Jericho, in the land of Canaan. Nebo and Pisgah, which were supposed to have been the same mountain, formed a part of this extensive range of steep hills. Here the Israelites encamped for the last time but one before they passed over Jordan into the promised land. The name *Abarim* was applied to part of this ridge of mountains in the time of Eusebius and Jerome. Wells's Geog. of the O. Test. vol. ii. p. 152, &c.

ABARIMON, in *Ancient Geography*, a valley of Scythia, at the foot of Mount Imans, the inhabitants of which, according to Pliny, (Hist. Nat. tom. i. p. 370.) were Anthropophagi, little superior in their habits and manners to the wild beasts with which they associated. Their feet were turned backwards, and yet they were very swift.

ABARIS, in *Biography*, the famous Hyperborean Sage, who is said to have been the disciple and friend of Pythagoras, and to have performed a great number of singular exploits. His history is so fabulous, that Herodotus contents himself with relating (lib. iv. cap. xxxvi. p. 296. ed. Wessel.) that he travelled through the world on an arrow, without any sustenance. Harpocration (art. *Αβάρης*) informs us, that he was sent by his countrymen as an ambassador to Athens, in conformity to an order of Apollo, who being consulted at the time of a destructive plague that generally prevailed, replied, that the Athenians should offer up prayers on behalf of all other nations; on this occasion, as we learn from Diodorus Siculus, (lib. ii. c. xlvii. p. 159. ed. Wessel.) he renewed the friendship and intercourse between his countrymen and the people of Delos, which had been interrupted. He also visited Lacedæmon; where some writers say, as we are informed by Pausanias, (lib. iii. cap. xiii. p. 238. ed. Kuhnii,) he built a temple consecrated to Proserpine the Salutory. *Abaris* performed this long voyage with ease and expedition, being transported through the air, over rivers, seas, and mountains, on an enchanted arrow, which, says Jamblichus, (Vit. Pythag. p. 118.) he had received as a present from Apollo. Some have suggested that this arrow denoted his skill in astronomy, by which he directed his course. He is said by Strabo (lib. vii. tom. i. p. 462.) to have gained the esteem of the learned men of Greece by his politeness, eloquence, and wisdom. He particularly excelled, says Jamblichus, (cap. xix. p. 131.) in the arts of magic and divination, of which he exhibited the most illustrious proofs in all the countries through which he travelled. He adds, that he was taught by Pythagoras to find out all truth by the science of arithmetic. Porphyry (Vit. Pythag.) informs us, that he was capable of foretelling earthquakes, driving away plagues, laying storms, &c. *Abaris*, says Bayle, constructed the famous palladium of the bones of Pelops, and sold it to the people

people of Troy. After he had visited many countries, and collected a great quantity of gold, he set out on his return home: and in his way had an interview with Pythagoras at Crotona, in Italy. Suidas enumerates various books which he is said to have written; and Himerius the Sophist, applauds him for speaking pure Greek, which he acquired by means of the intercourse that subsisted between the Greeks and Hyperboreans. In his various peregrinations he imposed upon the vulgar by false pretensions to supernatural powers; delivering oracular predictions, healing diseases by incantation, and practising other arts of imposture. Hence the fabulous stories concerning *Abaris* grew up into an entire history written by Heraclides. Some of the later Platonists, says Eshfield, (*History of Philosophy*, vol. i. p. 103.) in their zeal against christianity, collected these and other fables, and exhibited them, not without large additions from their own fertile imaginations, in opposition to the miracles of Christ. He concludes upon the whole, that *Abaris* has a better title to place among impostors than among philosophers, and that the time in which he flourished may, with some degree of probability, be fixed about the third olympiad, or B. C. 768. The age of Pythagoras is no less uncertain, otherwise it is not likely that they should be contemporaries. Mr. Toland in his *Posthumous works*, (vol. i. p. 161.) premising that the *Hebrides* were the Hyperboreans of Diodorus, infers that *Abaris* was both of that country, and likewise a Druid, having been the priest of Apollo. Suidas, says this writer, who knew not the distinction of Insular Hyperboreans, makes him a Scythian; whereas Diodorus has truly fixed his country in the island, and not on the continent. Notwithstanding the fictions and errors that have been blended with the history of *Abaris*, it is certain, (as he apprehends,) that he travelled over Greece, and from thence into Italy, where he familiarly conversed with Pythagoras, who favoured him beyond all his disciples, by imparting his doctrines to him, (especially his thoughts of nature,) in a more plain and compendious method than to any others. The Hyperborean in return presented the Samian, as if he had equalled Apollo himself in wisdom, with the sacred arrow, on which he had traversed seas and mountains; as the vulgar, particularly in the Hebrides, still believe, that wizards and witches waft themselves whither they please upon broom-sticks. According to the account given by Himerius, and cited by Toland, (p. 180, &c.) *Abaris* the sage, was by nation an Hyperborean, a Grecian in speech, and resembling a Scythian in his habit and appearance. He came to Athens, holding a bow, having a quiver hanging from his shoulder, his body wrapt in a plaid, girt about his loins with a gilded belt, and wearing trowsers reaching from his waist downward. His habit, therefore, was not that of the Scythians, who were always covered with skins; but he appeared at Athens in the native garb of an aboriginal Scot. As for what regards his abilities, Himerius relates, that he was affable and pleasant in conversation, in dispatching great affairs secret and industrious, quicksighted in present exigencies, in preventing future dangers circumspect, a searcher after wisdom, desirous of friendship, trusting indeed little to fortune, and having every thing trusted to him for his prudence. Neither the Academy nor the Lyceum, says Mr. Toland, could furnish out a man with fitter qualities to go so far abroad, and to such wise nations, about affairs no less arduous than important. But if we attentively consider his moderation in eating and drinking, and the use of all those things which our natural appetites incessantly crave, adding the candour and simplicity of his manners, with the solidity and wisdom of his answers, all which we find sufficiently attested; it must be owned, that the world at that time had few to compare with *Abaris*. One of our most industrious

historians has adopted the opinion of Mr. Toland, and taken great pains to prove that *Abaris* was a native of Britain, or of one of the British isles. See Carte's *Gen. Hist. Eng.* vol. i. p. 52, &c. cited by Dr. Henry in his *History of Great Britain*, vol. ii. p. 70, 8vo.

ABARNUS, or ABARNIS, in *Ancient Geography*, a city, country, and promontory of Pariana, near the Hellespont. Milesius, in his description of Asia, says, that it was a promontory of Lampfacus; and it is said to have been so denominated from *Abarnis*, a Phocian, by the Phocians, who built Lampfacus. Some writers have called it *Aparnis*. Stephan. de Urbibus, tom. i. p. 4.

ABARTICULATION, in *Anatomy*. See DIARTHROSIS.

ABAS, a weight used in Persia for weighing pearls; being an eighth part lighter than the European CARAT.

ABAS, in *Mythology*, the son of Hypothoon and Megaira, who entertained Ceres, and offered a sacrifice to that goddess; but *Abas* ridiculing the ceremony, and giving her opprobrious language, she sprinkled over him a certain mixture which she held in her cup, that transformed him into a newt or water-lizard.

ABAS, or ABASIA, in *Entomology*, a species of the *Bombyx* of Fabricius, and of the *Phalena* of Linnaeus, with brown, spreading wings, the hinder wings cinereous, and the ocellus reddish. It is found in Surinam.

ABASA, in *Geography*, a small town of Romania in European Turkey, 12 miles from Adrianople, in the road to Constantinople. N. lat. 42° 8'. E. long. 26° 35'.

ABASED, ABAISSE', in *Heraldry*, is applied to the vol, or wings of eagles, &c. when the tip, or angle, looks downward towards the point of the shield; or when the wings are shut: the natural way of bearing them being spread, with the tip pointing to the chief, or the angles. A chevron, a pale, bend, &c. are also said to be *abased* when their points terminate in, or below the centre of the shield. Again, an ordinary is said to be *abased*, when it is below its due situation.

ABASCIA, or ABCASSIA, in *Geography*, the northern district of the western division of Georgia, in Asia. The inhabitants are poor and treacherous. They trade in furs, the skins of the buck and tyger, linen yarn, box-wood, and bees-wax; but their principal traffic consists in the sale of their own children to the Turks, and to one another. They are christians only in name; but their customs resemble those of the MINGRELIANS. The men are robust and active, and the females fair and beautiful. E. long. from 39° to 43°. N. lat. from 43° to 45°. See ABASSA and АБХКАС.

ABASCUS, a river of Asiatic Sarmatia, which rises in mount Caucasus, and falls into the Euxine, between Pityus to the east and Nosis to the west.

ABASITIS, a tract of Asiatic Mysia, in which was situated the ancient city of Ancyra.

ABASKAJA, a town in Siberia, on the river Ichim. It has a church encompassed by ramparts, and guarded by dragoons. E. long. 69° 5'. N. lat. 50° 10'.

ABASSA, the smaller and the great, two districts in the vicinity of the Caucasian mountains. The former, according to the account lately given by Pallas in his journey to the southern departments of Russia, is inhabited by six tribes, who were formerly Christians, but their nobles now acknowledge the Mahometan religion; their manners, clothing, and way of life, resemble those of the CIRCASSIANS; and there is some similitude in their language. They likewise practise agriculture, though they live more by pasturage. They are celebrated on account of their large and fine breed of horses; and they would be rich (in their own estimation) if they were not incessantly plagued,

plagued by the encroachments of the Circassian princes. The most powerful inhabitants of the great *Abassi* are the NATUSCHAKI. See ABASCIA and ABHKAS.

ABASSI, a silver coin current in Persia, worth two mammoudis, or four chayes; the chaye being estimated at nine sols six deniers of French money, makes the *abassi* worth thirty-eight sols; seventeen sols of Holland, or from one shilling and four pence to about eighteen pence English. It derives its name from Shah Abbas II. king of Persia, under whom it was struck.

ABASSI, in *Geography*. See GOMBROON.

ABASSIA, in *Geography*. See ABYSSINIA and ETHIOPIA.

ABAT-CHAUVÉE, a name given in Poitou, Angoumois, Saintonge, La Marche, and Limosin, in France, to a sort of very ordinary wool; much like that called by the French, *paignons*, and *plures*.

ABATE, *Andrea*, in *Biography*, a Neapolitan master, who excelled in painting inanimate objects. His colouring was bold; he gave a noble relief to the vases and other ornaments, with which he enriched his design; and grouped all his objects with peculiar judgment and care. He died in 1732. Pilkington's Dict.

ABATE, in *Law*, from the French *abbatre*, signifies to break down or destroy; as, to *abate* a nuisance; and to *abate* a castle. It is likewise used to denote the act of one who steps into an estate, void by the death of the last possessor, before the heir can enter; and by that means keeps him out. It also means to defeat or overthrow, on account of some error or exception. See ABATEMENT. It is also used in the neuter sense thus: the writ of the demandant shall *abate*, i. e. be frustrated or overthrown; the appeal *abate*th by covin, i. e. the accusation is defeated by deceit.

ABATE, in the *Manege*. A horse is said to *abate*, or take down his CURVETS, when he puts both his hinder legs to the ground at once, and observes the same exactness in all the times.

ABATELEMENT, in *Commerce*, (from the French *abbatre*), a term used for a prohibition of trade to all French merchants in the ports of the Levant, who will not stand to their bargains, or who refuse to pay their debts. It is a sentence of the French consul, which must be taken off before they can sue any person for the payment of their debts.

ABATEMENT, in *Heraldry*, something added to a coat-armour, to distinguish its proper value and dignity, and note some dishonourable action, or stain, in the character of the person who bears it. These *abatements*, which are nine in number, may be made by reversion or diminution.

Reversion is either turning the whole escutcheon upside-down, for treason; or the adding another escutcheon, inverted, in the former, for despoiling a maid or widow, or flying from the banner of the sovereign.

Diminution is the blemishing any part by adding a stain, or mark of diminution: such are the delf tennè for a person who revokes or recedes from a challenge; a point dexter parted tennè, for a person who boasts of an act of valour which he never performed; a point in point sanguine, for a person guilty of cowardice; a point champaign tennè, for him who kills his prisoner after his having demanded quarter; a plain point sanguine, for one who tells a lie to his sovereign or commander in chief; a gore sinister tennè, for him who behaves in a cowardly manner towards his enemy; and a gusset sanguine, for an adulterer or drunkard, the gusset being on the right side for the former, and on the left for the latter.

It may be added, that these marks must not be of metal,

and always either tennè or sanguine, otherwise instead of diminutions, they become additions of honour.

The last editor of Guillim discards the whole notion of *abatements*, as a chimæra. He alleges that no one instance is to be met with of such bearing; and that it implies a contradiction to suppose it. Arms, being *insignia nobilitatis & honoris*, cannot admit of any mark of infamy, without ceasing to be arms, and becoming badges of disgrace, which all would covet to lay aside. Besides, as no hereditary honour can be actually diminished, so neither can the marks thereof. Both indeed may be forfeited; as in the case of treason, where the escutcheon is totally reversed, to intimate a total suppression of the honour.

Some instances, however, are produced to the contrary by Cumbiere and others. But these, though they may shew some extraordinary resentments of princes for offences committed in their presence, do not amount to a proof of such custom or practice; much less authorise the being of particular badges in the hands of inferior officers, as kings at arms. Menestrier calls them English fancies.

In a word, as arms are rather the titles of the dead than of the living, it would seem, that they can neither suffer diminution nor *abatement*; for thus an equal indignity would be put upon the ancestor and the descendant. Diminution, therefore, and *abatement*, can only affect arms lately granted, and solely when the person who obtained them is yet alive, and has tarnished his former glory by his subsequent misbehaviour. Even in this case, where *abatement* may properly take place, it can only be made by the suppression of some honourable badge, and not by the introduction of any degrading emblem.

ABATEMENT, in *Law*, is the frustrating, or setting aside a suit, on account of some fault, either in the matter, or proceeding thereof. Thus, *Placitum*

ABATEMENT, is some exception alleged, either against the plaintiff's writ, as wanting due form, or against his count or declaration, as being insufficient, or varying from the writ, specialty, or record; or against the matter of either, as insufficient, or being before another court; or against the allegations, as being uncertain, on account of some misnomer, or the death of one of the parties, or the marriage of the plaintiff, being a woman; to which some add disability.—Upon any of these, the defendant prays, that the plaintiff's writ or plaint may *abate*, i. e. that his suit may cease for that time: if it be granted, all writs and processes must begin *de novo*.

The death of a plaintiff did in all cases *abate* the writ before judgment, until the statute 8 and 9 W. III. c. 11. by which neither the death of the plaintiff nor that of the defendant shall *abate* it, if the action might be originally prosecuted by and against the executors or administrators of the parties; and if there are two or more plaintiffs or defendants, and one, or more, die; the writ or action shall not *abate*, if the cause, or action, survives to the surviving plaintiff, against the surviving defendant, &c. See PLEA. *Abatement* also denotes an irregular entry upon lands. See ABATE.

ABATEMENT of *Freehold*. See REMAINDER.

ABATEMENT of *Nuisance*. See NUISANCE.

ABATEMENT, in *Commerce*, is a discretionary allowance made for damage in goods sold, for a defect of weight or measure, on account of bad markets, or to a bankrupt-debtor, &c. See DISCOUNT and REBATE.

ABATEMENT, in the *Customs*, is an allowance made upon the duty of goods, when the quantum damaged is determined by the judgment of two merchants upon oath, and ascertained by a certificate from the surveyor and land-waiter.

ABATIS, or **ANNATIS**, in *Writers of the Barbarous Age*, denotes an officer of the Bibles, who had the care and distribution of the same. The name is derived from *Bann*, which denoted an ancient measure of corn. *D. Gange.*

ABATIS, or **ABATIA**, from the French, *abatre*, to pull down, in the *History of the*, denotes a heap of large trees that have been cut down, and with logs to boughs, and designed to stand upright, to cover the public of an er, to build a bridge, &c. See *LIST.*

ABATON, a structure erected at Rhodes, as a fence to the trophy of Antiochia, Queen of Hircania, Coos, &c. in memory of her victory over the Rhodians, or rather for concealing the disgrace of the Rhodians from the public eye, as the raising, or destroying the trophy is, in their estimation, a point of religion.

ABATOR, in *Law*. See **ABATE**.

ABATOS, in *Ancient Geography*, an island in the lake *MORIS*, famous for its papyrus, and for being the burial-place of Osiris.

ABAVI, **ABAVO**, or **ABAVUM**; a large tree in Ethiopia, which bears a fruit like a gourd. See **ADANSONIA**.

ABAUZIT, *Firmin*, in *Biography*, was born at Ufez, in Languedoc, on the 11th of November, in 1679. As his parents were protestants, he was obliged to leave France by the revocation of the edict of Nantes, and to wander among the mountains of Cevennes, till at length he found an asylum in Geneva. His mother, who had suffered much, expended the wreck of her fortune in his education. His chief attention was directed to the study of mathematics and natural history, whilst he made a considerable progress in every department of literature. In 1698 he visited Holland, and became acquainted with Bayle, Jurieu, and the *Basnages*. He afterwards came to England, and conversed with St. Evremond and Sir Isaac Newton. "You," says Sir Isaac, in an epistolary correspondence, "are a very fit person to judge between Leibnitz and me." King William, to whom he became known, attempted, by a liberal offer, to detain him in England; but he chose to return to Geneva; where, in 1715, he entered into the society formed for translating the New Testament into the French language; and where, in 1723, the university offered him the chair of philosophy, which he refused on account of the weakness of his constitution, and of his talents. In 1727 he was preferred with the freedom of the city, and appointed to the office of its librarian. There are few persons, whose mental endowments, natural and acquired, and whose moral and Christian virtues merit higher estimation than those of *Abauzit*. Of his mathematical and philosophical knowledge he gave ample evidence in his defence of Newton against father Castel, and in his discovery of an error in the *Principia*, which the author corrected in a second edition of that admirable work; a work which at the time of its first publication few were able to understand. He was also an excellent linguist, geographer, and historian, and intimately conversant with medals and ancient MSS. Such were not only the extent and accuracy of his knowledge, but the tenaciousness of his memory, that he could readily avail himself of the knowledge he had acquired. To this purpose it is mentioned, that when Rousseau published his Dictionary of Music, he found that *Abauzit*, who had not directed his attention to the music of the ancients for thirty years, could give him a clear and satisfactory account of the subject which he himself had investigated with so much labour. To this circumstance it was probably owing, that the only panegyric which Rousseau ever wrote upon a living person, and one of the finest of his *eloges*, was addressed to *Abauzit*. Voltaire is also said to have paid him a very high

and delicate compliment. A stranger having told the poet of Lera-y, that he was come to Geneva to see a great man, Voltaire asked him, Whether he had seen *Abauzit*? We may naturally imagine, that the esteem and attachment of these frequent philosopher would not be diminished by the liberality of his theological sentiments. On a subject that has been much controverted, *Abauzit* is said to have adopted and promoted the Arian doctrine. He also employed himself in discovering errors in the various translations of the Bible; and conceiving mathematical demonstration to be necessary in matters of testimony, he was led to divest the Scriptures of several miracles. But whatever may have been his occasional doubts, and the result of his inquiries on particular topics, he was, as a valuable biographer delineates his character, "religious by principle, and a Christian upon conviction." He defended religion to the time of his death, and employed some of his last days in establishing its evidence. Pious without hypocrisy, virtuous without austerity; he loved mankind; he sought to be useful to them; and he never blamed others for thinking differently from himself. His love of simplicity appeared in all his actions; he shunned ceremony, and retired from flattery. His conversation, always heard with eagerness, was delivered without ostentation. Even the exterior of his house, and of his person, discovered an unaffected dislike of parade and luxury. Always himself, he was always the modest, the wife *Abauzit*." This valuable man died, lamented by the republic, and regretted by the learned, on the 20th of March, 1767, at the advanced age of 87 years. He published, in 1730, a much improved edition of Spon's History and State of Geneva. As a citizen, he was active in the dissensions of 1734; and though he was attached to the aristocratic party, he possessed a great degree of republican zeal. The writings he left behind him were chiefly theological. Of these the principal was, "An Essay upon the Apocalypse," written to shew that its canonical authority is doubtful, and to apply the predictions to the destruction of Jerusalem. This work was translated by Dr. Twells, and refused so much to the satisfaction of the author, that he stopped an impression of it, which had been intended. It was, however, afterwards introduced by the Dutch editors into their edition of his works, which also comprehends "Reflections on the Eucharist;" "on Idolatry;" on "the Mysteries of Religion;" "Paraphrases and Explanations of sundry Parts of Scripture;" several critical and antiquarian pieces, and various letters. An edition, without the Essay on the Apocalypse, was printed at Geneva, in 8vo. in 1770. *Gen. Biog.* by Dr. Aikin and Enfield. *Biog. Dict.*

ABAY, in *Geography*, a name given to the *NILE*, in the territory of *Gojam*; which some derive from *Ab*, *father*, under which appellation this river, or perhaps the spirit residing in it, is an object of worship; but Mr. Bruce (*Travels*, vol. iii. p. 655.) says, that *Abay* in the Amharic language signifies, "the river that suddenly swells, or overflows periodically with rain."

ABB, among *Clothiers*, denotes the yarn of a weaver's warp, whence the wool of which it is made is called *Abb-wool*.

ABBA, in *Ancient Geography*, a town of Africa, near Carthage.

ABBA, in the Syriac and Chaldee languages, literally signifies a *father*; and figuratively a superior, reputed as a father in respect of age, dignity, or affection. This appellation was not allowed to be used by slaves, when addressing the head of a family, and this circumstance adds peculiar force to the expression of the apostle, *Rom. viii. 15.* It may also

be observed, that St. Paul and St. Mark used the Syriac *abba*, which was understood in the synagogues and primitive assemblies of Christians, but added to it, when writing to foreigners, by way of interpretation, the term *father*. The Jews assumed this denomination as a title of dignity; in allusion to which, our Saviour forbade his disciples to call any man their father on earth.

It was also anciently used as a title of honour, which some great men, it is said, still retain in the Pyrenean mountains.

ABBA, ABA, or ANBA, is more particularly used in the Syriac, Coptic, and Ethiopic churches, as a title which the people give to their bishops.

The bishops themselves bestow the title *abba*, more eminently, on the patriarch of Alexandria; which occasioned the people to give him that of *baba*, or *papa*, that is, *grandfather*; a title which he bore before the bishop of Rome. It is a Jewish title of honour, given to certain of that class of Rabbins called *Tanaites*; and it is also particularly used by some writers of the middle age, for the superior of a monastery, usually called ABBOT.

ABBADIE, *James*, in *Biography*, an eminent protestant divine, was born at Nay in Berne, in 1654, or 1658. He studied in various places, but received his degree of Doctor of Divinity at Sedan. Discouraged from the exercise of his profession in France, on account of the distressed circumstances of the protestants, he first settled at Berlin under the patronage of the Elector of Brandenburg, about the year 1680 or 1681, where he resided for many years with great reputation. In 1688 the Elector died, and he accompanied Marshal Schomberg, first to Holland, and then to England with the Prince of Orange. Losing his patron, whom he attended to Ireland, in 1690, he returned to England, and became minister of the French church at the Savoy. He afterwards removed to Ireland, and, by the recommendation of King William, he obtained the deanry of Killaloo, with some other preferments. He was strongly attached to the cause of his royal master, as appears by his elaborate defence of the Revolution, and his history of the assassination-plot. In 1726 he removed again to England, and died in the parish of Mary-le-bone, in London, in the following year, at the age, as some say, of 69, and according to others 73. He was a zealous protestant, and one of the most eloquent men of the period in which he lived. But his imagination and memory, which was singularly retentive, as well as his learning and eloquence, seem to have been superior to his judgment. His works were numerous, and much approved at the time of their publication: the chief of them were the following, *viz.* *Traité de la Verité de la Religion Chretienne*, Rotterdam 1684, 2 tomes 8vo; which work has been translated into English and High Dutch, and has passed through several editions. Mr. Bayle commends this book, as one of the most perfect in its kind.—*Traité de la Divinité de notre Seigneur Jesus Christ*, Rotterd. 1689, 8vo.—*L'Art de se connoitre soi-même, ou la Recherche des Sources de la Morale*, Rot. 1692, 12mo.—*Defence de la Nation Britannique*, &c. à Londres, 1692, 8vo.—*Histoire de la Conspiration dernière d'Angleterre*, &c. Londres, 1696, 8vo. This book was written by order of King William III. and the original papers for compiling it were furnished by the Earl of Portland and Sir William Trumball, secretary of state.—*La Vérité de la Religion Reformée*, Rot. 1718, 8vo. 2 tom.—*La Triomphe de la Providence et de la Religion, ou l'Ouverture des sept Sceaux per le fils de Dieu*, &c. Amst. 1723, 4 vols. 12mo. *Biog. Brit.*

ABBA-GUMBA, in *Ornithology*. See ERKOOM.

ABBAISSEUR, in *Anatomy*, a name given by Win-

slow, and other French writers, to one of the muscles of the eye, called by others the *deprimens* and *humilis*; and by Fabricius, the *rectus inferior*: Cowper and Albinus call it the *depressor oculi*: and it is one of the *quatuor recti oculi* of the last author.

ABBAS, in *Biography*, son of Abdalmotaleb, and uncle of Mahomet, was at first hostile to his nephew as an impostor and traitor to his country; but being taken prisoner in the second year of the Hegira, at the battle of Beder, and a large ransom being demanded, he represented to Mahomet that the payment of it would ruin him, and reduce his family to dishonour. Mahomet, however, had heard that he had secreted money, and inquired for the purses of gold which he had left with his mother at Mecca. *Abbas* was thus led to regard him as a prophet, and to embrace his religion. He afterwards saved his life at the battle of Honain, soon after the reduction of Mecca. *Abbas* was not only a great commander, but an eminent doctor of the Mussulman law, and read lectures upon every chapter of the Koran, as Mahomet pretended to receive them from heaven. He died in 653, and his memory is held in veneration among the Mussulmen to this day.

ABBAS ABDALLAH, *Ebn*, was the grandson of Abdalmotaleb, and the most considerable of all the doctors among the Mussulmen. He is said to have acquired from the angel Gabriel a perfect knowledge of the Koran, when he was ten years of age, and was honoured with the title of *Targiuman al Koran*, or interpreter of the Koran. He died in the 68th year of the Hegira, and was very much lamented.

ABBAS I. *Shah*, surnamed the *Great*, was the third son of Khodabandeh, and the 7th king of Persia of the race of the Sosis. He succeeded Ismael III. who had murdered their eldest brother Amir Hamzeh, and who was himself put to death after a short reign of eight months, in the year 1585. These two princes are not commonly reckoned in the number of Persian kings. His first thoughts and actions, after he ascended the throne, if we except the murder of his tutor Murhid, to whom he was indebted for his life and crown, were directed to the recovery of those provinces which the Turks and Tartars had taken from his predecessors. By a series of victories, he defeated Abdallah, khan of the Usbecks, who invaded Khorazan, and the Othman Turks, from whom he took Tauris; subdued the provinces of Shirwan and Ghilan; took possession of the kingdom of Lar, comprising a great part of Persia proper; invaded and secured Georgia, and captured Bagdat, and Ormuz in the Persian gulf. After a prosperous reign of 43 years, during which he consolidated the divided provinces of the Persian empire, and considerably enlarged its extent, he was seized with a dangerous disemper at Ferabad, in the province of Mazanderan, supposed to have been the effect of poison, and closed a life of 70 years in 1628. Having appointed his grandson for his successor, he ordered his death to be concealed till the throne was secured to him; and for this purpose he directed his funeral obsequies to be performed at three different places at once, and that his body should be exposed every day in the hall of justice, seated in a chair of state, with the eyes open, and his back to the hangings, behind which stood a person who contrived to answer any questions that were proposed. By this artifice his death was kept secret for six weeks. The memory of Shah *Abbas* has been held in high veneration by the Persians, and they speak of him as the greatest prince their country has produced for many ages. He was wise and valiant, attentive to the poor, and rigorous in the administration of justice. He adopted all possible measures for promoting the wealth and good government of his dominions; and took great pains to intro-

duce and encourage commerce among his subjects. Having made Ispahan the metropolis of Persia, he built the royal mosque and palace, and caused the mountains at the distance of 3 leagues to be cut through, in order to augment the Zandakah, which runs through the city, by turning into it the stream of another river. He also adorned several of his other cities with magnificent structures. Nevertheless, his cruelty, of which many notorious instances are recorded in his history, enables him to rank with those ferocious eastern tyrants, whom Providence seems to send into the world to harass, aggrive, and destroy the human race. Mod. Un. Hist. vol. v. p. 118, &c.

ABBAS, *Shah*, II. the 9th king of Persia, of the Soffi race, was the great grandson of the former, and succeeded his father in 1642, at the age of thirteen years. His cruel and tyrannical father had ordered him to be deprived of sight; but the eunuch, who was charged with the office, more compassionate than the savage parent, refrained from executing it. The father relented, and rejoicing to find, when he was dying, that his command had been disobeyed, appointed him for his successor. The successful expedition of this prince, when he was 18 years of age, for the recovery of Candahar, which had been surrendered to the Great Mogul in the time of his father, and his defence of it against an army of 300,000 men, seem to have been the principal events of his reign. His character has been very differently represented by those who have professed to give an account of his life. Whilst some have extolled his justice and clemency, and spoken in the highest terms of his talents and military exploits; others have reproached him for his cruelty and debauchery. Upon the whole, he seems to have been more kind and tolerant to strangers than to his own subjects, and especially to the Christians, whom he distinguished by his protection and favour. He was very much addicted to drinking, and governed by passion: and after a reign of about 24 years, fell a sacrifice to his intemperance, and died in 1666. The Jews were very severely persecuted during his reign; because, as it is pretended, the Messiah did not appear, according to the assurances which they are said to have given to Abbas the Great, and which was the stipulated condition of their toleration. See Mod. Univ. Hist. vol. v p. 150. 8vo.

ABBAS III. was succeeded by the famous Kuli Khan.

ABBASSIDES, in *History*, a race of Caliphs, who were thirty-seven in number, and succeeded one another from between A. D. 746 and 750, for about 523 years without interruption. They were so called from *Abul Abbas*, surnamed *Suffah*, with whom this dynasty commenced, according to Dr. Blair, (*Chronology*, pl. 35.) A. D. 749.

ABBASSUS, in *Ancient Geography*, a town of the greater Phrygia, on the borders of the Tolistobojii, a people who inhabited the northern parts of Galatia in Asia.

ABBE', in a *monastic sense*, the same with ABBOT.

ABBE', in a *modern sense*, the denomination of a class of persons, which has been popular in France, but was not known among the Romanists till about a century and a half ago. *Abbes* are persons who have not obtained any fixed settlement either in church or state, but they are expectants of any office that may occur. Their dress is rather that of an academic, or of a professed scholar, than of an ecclesiastic. They are a numerous and useful body. In colleges they are the instructors of youth, and tutors in private families; and many of them obtain a decent subsistence by their writings. They are persons of universal talents and learning, and are held in esteem and respect by people of various descriptions, and particularly by the female sex to whom they are devoted.

ABBEFIORD, in *Geography*, a sea-port town of Norway, about 60 miles south-west of Christiana, situate on a small bay, in which are three islands.

ABBER-LOUGH, a lake of Lorne, in Argyleshire, in Scotland.

ABBESS, the superior of an ABBEY, or convent of NUNS. The *abbess* has the same rights and authority over the nuns, that the ABBOTS regular have over their monks. Her sex, indeed, does not allow her to perform the spiritual functions annexed to the priesthood; but in some instances *abbesses* have the privilege of commissioning a priest to act for them: and they have even a kind of episcopal jurisdiction.

F. Martene, in his treatise on the rights of the church, observes, that some *abbesses* have formerly confessed their nuns. But he adds, that their excessive curiosity carried them such lengths, that there arose a necessity of checking it.

St. Basil, in his rule, allows the *abbess* to be present with the priest at the confession of her nuns.

Before the conquest *abbesses* were summoned to the Witenagemote, and they assisted in the deliberations of ecclesiastical councils.

ABBEVILLE, in *Geography*, the capital of Ponthieu in the late province of Picardy, in France. It lies in a pleasant valley, and is divided into two parts by the river Somme. This town carries on a considerable trade in grain, oil, hemp, flax, cordage, soap, &c. by means of the Somme, in which the tide rises six feet, and by which ships may come to the middle of the town. The woollen manufactory was established here in 1665, and has succeeded so well, that its cloths are deemed little inferior to those of England and Holland. In this respect it has been aided by the clandestine importation of English and Irish wool, and of workmen from this country. It is conveniently situated for a fortification, and as it has never been taken, it is sometimes called the *maiden town*. It has a collegiate church, thirteen parish churches, and other public buildings. It is 52 miles south of Calais, and 80 N. by W. of Paris. E. long. 1° 49' 45". N. lat. 50° 7' 1".

ABBEVILLE is also the name of a county in the district of Ninety-six, in South Carolina, bounded on the N. E. by the Saluda, and on the S. W. by the Savannah; 35 miles in length, and 21 in breadth, containing 9197 inhabitants, of whom 1665 are slaves.

ABBEY, or ABBY, a monastery, or religious house, governed by a superior under the title of ABBOT, or ABBESS.

In our ancient statutes the word is sometimes also written *abbathy*. By 31 H. VIII. c. xiii. *abbathies* are given to the king.

Abbeys differ from PRIORIES, in that the former are under the direction of an abbot, and the latter of a prior; but abbot and prior (we mean a prior conventual) are much the same thing, and differ in little but the name.

One third of the best benefices in England were anciently by the pope's grants, appropriated to *abbeyes*, and other religious houses; which, upon their dissolution under king Henry VIII. became lay-seces. For a farther account and an estimate of the number and value of religious houses abolished and surrendered in this reign, see MONASTERY.

ABBEY-LANDS. See PREMUNIRE and TITHE.

ABBEYBOYLE, in *Geography*, a town of Ireland, in the county of Roicomeon, and province of Connaught, famous for an old abbey. W. long. 8° 32'. N. lat. 56° 54'.

ABBEYHOLM, a town in Cumberland, so called from an abbey built by David king of Scots. It is situated on an arm of the sea, and is 16 miles S. W. of Carlisle. W. long. 3° 29'. N. lat. 54° 53'.

ABBEY-

ABBEYMILTON, or MIDDLETON, an ancient, but mean town in Dorsetshire, which had formerly an abbey and a market, and which is 12 miles N. E. of Dorchester. W. long. 2° 24'. N. lat. 50° 51'.

ABBIANY, a town on the coast of Guinea, in Africa, at the distance of three leagues from Tebbo.

ABBIATI, *Filippo*, in *Biography*, an eminent painter, who was born at Milan in 1630, and died in 1715, at the age of 75 years. He was distinguished by fertility of invention and correctness of design. His hand was free, and his touch light; he executed with expedition, and performed with equal beauty, in fresco and in oil. Pilkington's Dict.

ABBON, in *Biography*, a monk of St. Germain-des-Pres, who composed, in barbarous Latin verses, a relation of the siege of Paris by the Normans towards the close of the 9th century. He was more distinguished as a faithful historian than as a good poet. His poem is published in the second volume of Duchesne's collection, and has since been more correctly printed, with notes, by Duplessis, in 1753. Biog. Dict.

ABBON, *De Fleury*, was born in the territory of Orleans. After devoting himself with ardour to the study of almost every art and science, and obtaining distinguished reputation in the schools of Paris and Rheims, he was elected abbot of the monastery of Fleury, of which he was a monk. He wrote an Apology for his conduct against the accusations of his enemies, which was addressed to the kings Hugh and Robert; to whom he also dedicated a collection of canons on the duties of kings and subjects. The collection of his letters and canons, and his apology, were published in 1687, in folio. He was slain in a quarrel that arose between the French and Gascons at Reole in Gascony, in 1004. Gen. Dict.

ABBOT, or ABBAT, originally derived from the Hebrew *Ab*, father, signifies the superior of a monastery of monks erected into an abbey or prelacy.

Abbots were really distinguished from the clergy, though frequently confounded with them, because they were a degree above laymen. St. Jerome, writing to Heliodorus, says expressly, *alia monachorum est causa, alia clericorum*.

In those early days the *abbots* were subject to the bishops, and the ordinary pastors. Their monasteries being remote from cities, and built in the farthest solitudes, they had no share in ecclesiastical affairs. They went on Sundays to the parish-church with the rest of the people; or, if they were too remote, a priest was sent to them, to administer the sacraments, till, at length, they were allowed to have priests of their own body. The *abbot*, or archimandrite, was usually the priest; but his function extended no farther than to the spiritual assistance of his monastery, and he remained still in obedience to the bishop. In process of time, as many of them were persons of learning, they opposed the heresies that sprung up, which induced the bishops to fix them near, and in the cities.

The *abbots* soon laid aside their former plainness and simplicity, and endeavoured to be independent of the bishops, which occasioned some severe laws to be made against them at the council of Chalcedon: notwithstanding this, in time, many of them carried the point of independency, and got the appellation of *lord*, with other badges of the episcopate, particularly the mitre.

Hence arose new species and distinctions of *abbots*: *mitred*, and *not mitred*; *croziered*, and *not croziered*; *acumenical abbots*, *cardinal abbots*, &c.

ABBOTS, *Mitred*, were those privileged to wear the *mitre*; and also allowed a full episcopal authority within their several precincts.—Among us, these were also called

abbots sovereign, and *abbots general*; and they were lords of parliament. Of these Sir Edward Coke reckons twenty-seven, and Selden twenty-six, in England, beside two *mitred* priors.

The rest, who were *not mitred*, were subject to the DIOCESAN.

ABBOTS, *Croziered*, are those who bear the CROZIER, or pastoral staff.

ABBOTS were likewise distinguished into *abbots deſiſive*, and *abbots preſentative*; but are now chiefly distinguished into *regular* and *commendatory*.

ABBOTS, *Regular*, are real monks, or religious, who have taken the vows, and wear the habit of the ORDER.

ABBOTS in commendam, are seculars; though they have undergone the tonsure, and are obliged, by their bulls, to take orders when they come of age.

Though the term *commendam* insinuates, that they have only the administration of their abbeys for a time; yet do they hold, and reap the fruits of them for ever, as well as the regular *abbots*.

Their BULLS give them a full power *tam in ſpiritualibus quam in temporalibus*; and yet it is true that the commendatory *abbots* do not perform any spiritual offices; nor have they any spiritual jurisdiction over their monks. So that the phrase *in ſpiritualibus*, is rather something of the Roman style than a reality.

The ceremony whereby *abbots* are created, is properly called benediction; or sometimes, though improperly, consecration.

It anciently consisted in clothing them with the habit called *cuculla*, a *coccol*; putting the pastoral staff in their hands, and the shoes called *pedales*, or *pedules*, on their feet. These particulars we learn from the *Ordo Romanus* of Theodore, archbishop of Canterbury.

ABBOT is also a title, which has been given to certain bishops, because their sees had originally been abbeys; and they were even elected by the monks: such are those of Catania and Montreal in Sicily.

ABBOT is also an appellation sometimes given to the superiors or generals of some congregations of regular CANONS; as that of St. Genevieve at Paris.

ABBOT is also a title borne by several magistrates, and other lay-persons.—Among the Genoese, one of their principal magistrates was called the *abbot* of the people.

In France, particularly about the time of Charlemagne, there were several lords and courtiers, who having the superintendency of certain abbeys committed to them, were styled *abbacomites*, or abbey-counts.

ABBOT, *George*, Archbishop of Canterbury, was born Oct. 29, 1562, at Guildford in Surrey. Having passed through the rudiments of literature in his native town, he was removed, in 1578, to Baliol college at Oxford. In 1583, he was elected probationer fellow of his college; and having passed through the usual course of graduation, he took orders and became a celebrated preacher in that university; and in 1597 he was elected Master of University College. In 1600, and again in 1603, he was Vice-chancellor of the university, and discharged the duties of this office with general approbation. In the succeeding year the translation of the Bible, now in use, was undertaken by the direction of king James; and Dr. *Abbot* was the second of eight learned divines in the university of Oxford, to whom the care of translating the whole New Testament (excepting the epistles) was committed. In 1605 he was again Vice-chancellor. After the decease of his patron, the Earl of Dorset, in 1608, he became chaplain to Geo. Hume, Earl of Dunbar, and accompanied him this year to Scotland, to assist in establishing an union between the Scots and English churches; and in conducting this business he acquired

character for prudence and moderation, which laid the foundation of all his future preferments. From this time he was, through the king's favour, that he was consecrated Bishop of the united Bishops of Litchfield and Coventry in 1609, and in the beginning of the next year he was translated to London; and in 1611 he was preferred by his majesty to the archiepiscopal see of Canterbury. Thus, before he had arrived at the age of fifty, he was exalted to the highest dignity in the church, and celebrated by Godwin, (*de Prelul. Angliæ*, p. 275.) one of his contemporaries, for his learning, eloquence, and indefatigable diligence in preaching and writing, notwithstanding the various duties of his high office, of the high commission court, over which he presided, and of his regular attendance on the privy-council. He was at this time in the highest favour both with prince and people, and chiefly concerned in all the great transactions of church and state. His great solicitude for the protestant religion induced him zealously to promote the match between the Elector Palatine and the Princess Elizabeth, which was solemnized on the 14th of February 1613, the archbishop performing the ceremony in the royal chapel. During the agitation of the divorce between the Lady Frances Howard, daughter of the Earl of Suffolk, and Robert Earl of Essex, which has been considered as one of the greatest blemishes of King James's reign, the archbishop added much to the reputation he had acquired for inflexible integrity. He resisted the divorce, though the king was very desirous of its taking place, and he published his reasons for persisting in his opinion, to which the king himself thought fit to reply. Sentence was given in the lady's favour. In 1618 the king's declaration for permitting sports and pastimes on the Lord's day gave the archbishop great uneasiness; and happening to be at Croydon on the day when it was ordered to be read, he had the courage to forbid its being read. This year he did great service to the protestant religion, by employing Mr. N. Brent to procure the MS. of Father Paul's excellent History of the Council of Trent. In 1619, when his health began to decline, he prepared to execute the benevolent design in favour of his native town of Guildford, which he had long meditated; he attended when Sir Nicholas Kempe laid the first stone of his hospital, and afterwards nobly endowed it. Towards the close of this year, when the Elector Palatine accepted the crown of Bohemia, he took part with those who thought, that natural affection for his son and daughter, and a just concern for the protestant interest, ought to have engaged his majesty warmly to support the new election. Being under a necessity of using exercise, he made a tour into Hampshire; and when he was hunting in the park of Lord Zouch at Bramzill, he had the misfortune of killing his lordship's keeper by an arrow from a cross-bow, which he shot at one of the deer. This accident threw him into a deep melancholy. The day on which it happened he kept as a monthly fast ever afterwards, and he settled an annuity of 20l. on the widow. This accident excited prejudices against him in the minds of many persons, though his majesty declared, that "an angel might have miscarried in this sort," and wrote him with his own hand a consolatory letter. A commission of ten persons was appointed to inquire into this matter, and the result of the whole was, that a pardon and dispensation passed the Great Seal, and he was declared capable of all metropolitanical authority, as if this affair had not happened. In the parliament that met on the 19th Feb. 1723-4, the archbishop took an active part in the measures which were then pursued for persuading the king to dissolve his treaties with Spain, relating to the marriage and the palatine state. Though, on account of his increasing infirmities he seldom attended at council, yet in the king's last sickness he constantly attended, and was near him when he expired on the 27th of

March 1625. He performed the duty of his rank in putting the crown on the head of king Charles I.; but he visibly declined in the king's favour, and the Duke of Buckingham watched for an opportunity of testifying the severity of his displeasure against him. An occasion soon presented itself in consequence of his refusing to license a sermon, preached by Dr. Sibthorpe, to justify and promote a loan, which the king had demanded. Accordingly he was suspended from all his functions as primate, and they were exercised by commission appointed by the king. But a parliament being necessary, he was again restored to his authority and jurisdiction. His presence at court, however, was unwelcome; and Laud, who directed the rigorous measures of the church party, which the archbishop disapproved, had the honour, as dean of the chapel, of baptizing the young prince, afterwards Charles II. The archbishop, being worn out with cares and infirmities, died at Croydon on the 4th of August in 1633, at the age of seventy-one. He was buried at Guildford, where a stately monument was erected over his grave, with his effigy in his robes. He was distinguished by his natural talents, and by a considerable portion of acquired literature, as the various works which were written by him testify. He manifested, in many circumstances, a great degree of moderation to all parties; and he was desirous that the clergy should engage the respect of the laity by the sanctity of their manners and the uprightness of their behaviour, rather than claim it as necessarily attached to their function. But his sentiments and conduct have not escaped reflections; nor has even Lord Clarendon done justice to his memory. Dr. Welwood has more truly appreciated his abilities and merit. There was another writer of the same name, who published a Paraphrase on Job, a Vindication of the Sabbath, and a Paraphrase on the Psalms. He died about the year 1650, and had been a member of the parliament that was then sitting. *Biog. Brit.*

ABBOT, *Robert*, was brother to the former, born at Guildford in 1560, and completed his studies at Baliol college in Oxford. He took his degree of Master of Arts in 1582, and became a distinguished preacher, to which his preferment was owing. In 1594 he became no less eminent for his writings. In 1597 he took his degree of Doctor in Divinity; and in the beginning of the reign of king James he was appointed chaplain in ordinary to his majesty, who ordered the doctor's book, *De Antichristo*, to be printed with his own commentary on the Apocalypse. He was elected master of Baliol college in 1609, and in 1612 his majesty appointed him regius professor of divinity at Oxford. The reputation which he acquired by his lectures induced his majesty to name him for the see of Salisbury, and he was consecrated by his brother at Lambeth, Dec. 3, 1615. He found the cathedral falling into decay, and applied the sum of 500l., which he obtained from the prebendaries, towards repairing it. Here he devoted himself with exemplary assiduity to the duties of his function; but his close application to study brought upon him the gravel and stone, which terminated his life on the 2d of March 1617, in the 58th year of his age. He was buried over-against the bishop's seat in the cathedral. Dr. Fuller (in his *Worthies of England*) says, speaking of the two brothers, "that George was the more plausible preacher, Robert the greater scholar; "George the abler statesman, Robert the deeper divine; "gravity did frown in George, and smile in Robert." His writings were numerous, and many of his MSS. were given by Dr. Corbet, who married his grand-daughter, to the Bodleian library.

There was another *Robert Abbot*, a minister, and author of several devout pieces, who was scarcely a writer before the bishop died.

ABBOTS-BROMLEY, in *Geography*, a town of Staffordshire, with a market on Tuesday. W. long. $1^{\circ} 2'$. N. lat. $51^{\circ} 5'$.

ABBOTSBURY, a small town in Dorsetshire, with a market on Thursday. W. long. $1^{\circ} 17'$. N. lat. $50^{\circ} 40'$. The abbey near this town was founded by a Norman lady about the year 1026; and Edward the Confessor and William the Conqueror were benefactors to it.

ABBOTS-CASTLE, or **APEWOOD-CASTLE**, an old fortification, in Staffordshire, seven miles from Wolverhampton, on the north side of the road from Shrewsbury to London, situated on a lofty round promontory, and a steep ridge of hills, which extend a mile in length, and are supposed to have been one continued fortification, and a work of the ancient Britons.

ABBOTS-LANGLEY, a village in Herts, four miles from St. Albans, famous as the birth-place of pope Adrian IV.

ABBREVIATE of **ADJUDICATION**, in *Scots law*, an abstract or abridgment of a decret of adjudication, which is recorded in a register kept for that purpose.

ABBREVIATION, or **ABBREVIATURE**, a contraction of a word, or passage, made by dropping some of the letters, or by substituting certain marks, or characters, in their place.

A late ingenious writer on the subject of grammar distributes the parts of speech into words, necessary for the communication of our thoughts, which are the noun and verb, and *abbreviations*, employed for the sake of dispatch. These latter, he says, are in the strict sense of the term, parts of speech, because they are all useful in language, and each has a different manner of signification. He inclines, however, to allow that rank only to the necessary words; and to include all the others, which are not necessary to speech, but merely substitutes of the first sort, under the title of *abbreviations*. Words, he says, have been called *winged*, whence the title of this work, *viz.* *πτερολογια*; and they well deserve that name, when their *abbreviations* are compared with the progress which speech could make without these inventions; but compared with the rapidity of thought, they have not the smallest claim to that title. *Abbreviations* are employed in language three ways; in terms, in sorts of words, and in construction. Mr. Locke's *Essay* is the best guide to the first; and the authors who have given particular explanations of the last are numberless; the province of this author is confined to the second class of *Abbreviations*. See *ΕΠΕΑ ΠΤΕΡΟΕΝΤΑ*; or, *The Diversions of Purley*, c. 1. p. 39. &c.

Lawyers, physicians, &c. use abundance of *abbreviations*; partly for the sake of expedition, and partly for that of mystery. A list of the principal *abbreviations*, in the several arts and faculties, see under **CHARACTER**.

Of all people, the Rabbins are the most remarkable for this practice; so that their writings are unintelligible, without an explanation of the Hebrew *abbreviations*. The Jewish authors and copyists do not content themselves to *abbreviate* words, like the Greeks and Latins, by retrenching some of the letters, or syllables thereof; but they frequently take away all except the initial letters. Thus, \aleph stands for *rabi*, and \beth for *bi*, $\aleph \beth$, or $\aleph \beth$, according to the place in which it is found.

But still further, they frequently take the initial letters of several succeeding words, join them together, and adding vowels to them, make a barbarous sort of word, representative of all the words thus abridged. Thus, *Rabbi Sehelemb Farchi*, in the jargon of Hebrew *abbreviations*, is called *Rafi*; and *Rabbi Moses ben Meimon*, is *Rambam*. Mercerus, David de Pomis, Schindler, Buxtorf, &c. have given expli-

cations of such *abbreviations*. The most copious collection of Roman *abbreviations*, is that of Sertorius Ursatus: *Sertorii Ursati, equitis, de notis Romanorum commentarius*.

ABBREVIATION of *Fractions*, in *Arithmetic* and *Algebra*, is the reduction of them to lower terms. See **FRACTION**.

ABBREVIATOR, in a general sense, a person who abridges any large book into a more narrow compass.

ABBREVIATOR is more particularly used for an officer in the court of Rome, appointed an assistant to the vice-chancellor, for drawing up the pope's briefs, and reducing petitions, when granted by the pontiff, into proper form, for being converted into bulls.

The *Abbreviators* are supposed by Ciampini, in his two volumes on their institution, office, &c. to be the successors either of the *cancellarii* in the imperial household, or of the seven *notarii*, said to have been placed by pope Clement I. in the seven quarters of Rome, to write down the acts of the martyrs within their several districts.

The *abbreviators* form a college of seventy-two persons, divided into two ranks; one called *abbreviatores de parco majore*, who are twelve in number, all prelates; the other, *abbreviatores de parco minore*, called also *examinatores*, who may be lay-men.

ABBS HEAD (St.), in *Geography*, a promontory of Berwickshire in Scotland, in the southern extremity of the Frith of Forth. N. lat. $55^{\circ} 55'$. W. long. $1^{\circ} 56'$.

ABBT, *Thomas*, in *Biography*, was born in 1738, at Ulm, and died in 1766, at Bückeberg, a privy-counsellor of the Count of Schaumburg-Lippe. Besides his translation of Sallust into German, he also published a volume "concerning Merit," and another "concerning Death for one's country," which are well esteemed. He is one of the earliest German writers, who retain a classical rank, and would have probably excelled as a historian, if his life had been prolonged. Gen. Biog.

ABBTEAU, in *Geography*, a market town in the archbishoprick of Salzburg, about 20 miles S. E. of the city of Salzburg. N. lat. $47^{\circ} 32'$. E. long. $12^{\circ} 56'$.

ABBUTALS. See **ABBUTTALS**.

ABCEDARY, **ABCEDARIAN**, or **ABECEDARIAN**, is sometimes applied to compositions whose parts are disposed in the order of the letters of the alphabet.

In this sense *abecedarian* is synonymous with *alphabetical*. Thus we meet with *abecedarian* psalms, lamentations, prayers, and the like; chiefly among Hebrew writers; which makes it probable they were the inventors of this species of composition.

This is the first and most manifest indication of verse in the Hebrew poetical books. Poems of this kind consist of 22 lines, or systems of lines, or periods, or stanzas, according to the number of the letters in the alphabet; and every line, or stanza, begins with each letter in its order. This artificial contrivance was intended for the assistance of the memory, and was chiefly employed in subjects of common use, as maxims of morality and forms of devotion. There are still extant in the books of the Old Testament twelve of these poems, *viz.* Psalms xxv. xxxiv. xxxvii. cxl. cxii. cxix. cxlv. Prov. xxxi. 10—31. Lament. i. ii. iii. iv. Three of these, *viz.* Ps. cxl. cxii. Lam. iii. are perfectly alphabetical, in which every line is marked by its initial letter; in the other nine every stanza only is so distinguished. With respect to the three former it may be observed, that the whole poem is distributed into stanzas; two of them, *viz.* Ps. cxl. cxii. into ten stanzas each, all of two lines, except the two last stanzas in each, which are of three lines; and the third, *viz.* Lam. iii. consists of twenty-two stanzas, of three lines, the initial letter of every stanza being also the initial letter of every

every line of that stanza. In these three poems, the lines thus determined by the initial letters, in the same poem, are remarkably equal to one another in length, in the number of words nearly, and probably in the number of syllables, and the lines of the same stanza correspond one with another, in the matter and the form, in the sense and the construction. Of the other nine poems, six, *viz.* Pl. xxv. xxxiv. cxix. cxlv. Prov. xxxi. Lam. iv. consist of stanzas of two lines; two, *viz.* Lam. i. ii. of stanzas of three lines; and one, *viz.* Pl. xxxv. of stanzas of four lines; allowing for irregularities, which are probably owing to the mistakes of transcribers. These stanzas likewise naturally divide themselves into their distinct lines, the sense and construction pointing out their limits, and the lines corresponding one with another in matter and form, as in the poems more perfectly alphabetical. In these however, two of them, *viz.* Pl. cxi. cxii. have the lines shorter than those of the third, Lam. iii. by about one-third, or almost half; and of the other nine poems, the stanzas of which are only alphabetical, three, *viz.* Lam. i. ii. iv. consist of the longer lines, and the six others of the shorter.

From these examples it may be inferred, that the poems, perfectly alphabetical, consist of verses properly so called, regulated by some regard to harmony or cadence, measure, numbers, or rhythm. The other poems, which are divided into stanzas by the initial letters, are compositions of the same kind, and equally consist of verses. We may also conclude from these perfectly alphabetical poems, that the Hebrew verse did not consist in rhyme, or similar and correspondent sounds at the ends of the verses, but in some sort of rhythm, probably some sort of metre, the laws of which are altogether unknown and undiscoverable. Nevertheless the peculiar form of composition is so observable, as plainly to discriminate in general the parts of the Hebrew scriptures which are written in verse from those which are written in prose. See Lowth's Preliminary Dissertation to his Isaiah, p. 4, &c.

ABCEDE or **ABSCUDE**, from *abcedo*, to keep *afunder*, a term in *Surgery*, signifying nearly the same thing as to suppurate. An abceded surface, is a part whose texture has been altered, vitiated, or separated by the formation of purulent matter. The mere contiguity of purulent matter to a solid part of the living body, will sometimes effect a dissolution of its natural structure: this may arise either from the acrimonious quality, or the mechanical pressure, of the confined pus. See **ABSCEDENTIA**, **ABCESS**, **PUS**, and **SUPPURATION**.

ABCOURT, in *Geography*, a town near St. Germain's, four leagues from Paris, famous for a brisk chalybeat water, impregnated with fixed air and the fossil alkali, and resembling that of Spa.

ABDALLAH, formed of *abd*, *slave*, and *allah*, *God*, and denoting *the slave of God*, in *Biography*, a younger son of Abdal-Motaleb, and the father of MAHOMET. He was the most beautiful and modest of the Arabian youth, and when he married Amina, of the noble race of the Zahrites, 200 virgins are said to have expired of jealousy and despair. Gibbon's Hist. vol. ix. p. 255.—Several other eminent Arabians bore the same name.

ABDALLAH, *Ebn Salem*, was a Jew, intimate with Mahomet, and an early convert to his religion. He is said to have assisted him in compiling his pretended revelations.

ABDALLAH, *Ebn-Zobeir*, having ingratiated himself with the inhabitants of Mecca and Medina, by his religious zeal and engaging behaviour, was proclaimed Caliph, A. D. 682. Heg. 12. He was recognized in all the provinces of the empire, except Syria and Palestine; and enjoyed his dignity nine years, till the 72d year of his age, and 73d of the

Hegira. At this juncture Mecca was besieged, and the Caliph's spirits were supported by the attention of his mother Asema, grand-daughter to the Caliph Abubeker, who, at the age of 90, administered refreshment to him and his soldiers at the breach with her own hand. At length, however, he took leave of his mother, and sallied out on the enemy. Having killed many with his own hand, he was at last overpowered; and when he found the blood trickling down his face and beard, he is said to have repeated this verse from an Arabian poet; "The blood of our wounds falls not upon our heels, but our feet;" and he soon died. The avarice of this *Abdallah* gave rise to the proverb: "That there was never a brave man who was not liberal, till *Abdallah* the son of Zobeir." He is reported to have been so pious and so intent on his devotions, that a pigeon once alighted on his head, whilst he was thus employed, and sat long there without his perceiving it. Gen. Dict.

ABDALMALEC, the son of Mirwan, and fifth caliph of the race of the Omniades, succeeded his father in the 65th year of the Hegira, A. D. 685, and reigned 21 years. At the commencement of his reign he converted the temple of Jerusalem into a mosque, and directed his subjects to perform their pilgrimage to this place; because Abdallah Ebn Zobeir, who had been elected caliph by the Arabs, retained possession of Mecca. In the progress of his reign he concluded a treaty with the Greek emperor, reduced Persia, or rather Irak, under his dominion, and having failed to engage the submission of Abdallah by amicable conference, laid siege to Mecca, and took it. By this event he acquired possession of the peninsula of the Arabs, and became sole and absolute master of the Moslem empire. In the 76th year of the Hegira, he caused dinars, and dirhems, to be struck, with Arabic inscriptions upon them, which proclaimed the unity of the God of Mahomet. Before his time the former, or gold coins, had Greek, and the latter, a silver money, had Persian characters upon them. On this occasion he established a mint for coinage in his own dominions. *Abdalmalec* was deemed brave, learned, and wise, and was much more powerful than any of his predecessors; having subdued Abdallah Ebn Zobeir, and annexed Arabia to his empire; reduced to his obedience the sectaries of all denominations that appeared in arms against him; conquered India, or at least a considerable part of that vast region in the East; and in the west, penetrated with his victorious troops as far as Spain. He was buried at Damascus; and the government devolved on Al Walid, the eldest of his sixteen sons, who extended the Moslem conquests, and rebuilt the temple of Medina in a style of extraordinary magnificence. Under the reign of this caliph the Greek language and characters were excluded from the accounts of the public revenue. If this change (says Mr. Gibbon, Hist. of the Decline and Fall of the Roman Empire, vol. x. p. 8. 8vo.) was productive of the invention, or familiar use of our present numerals, the ARABIC or Indian cyphers, a regulation of office has promoted the most important discoveries of arithmetic, algebra, and the mathematical sciences. *Abdalmalec* was avaricious to such a degree as to be denominated by some of his subjects, in derision, the *sweat of a stone*; and his breath was so fetid, that the flies which accidentally lighted upon his lips were poisoned by it; from which circumstance he was called the *father of flies*. Mod. Un. Hist. vol. ii. p. 32. 8vo.

ABDALMOTALLEB, or *Abdol Motaleb*, the son of Hashem, the father of ABDALLAH, and grandfather of MAHOMET, was, according to Abulfeda, prince, or chief of the Koreish, during the war of the Elephant. Upon the death of the father of Mahomet, he took charge of his grandson;

grandson; and at his decease committed the care of him to his son Abu Taleb, who was the guide and guardian of his youth. The life of *Abdul Motaleb* is said to have been prolonged to the age of 110 years; and he was the father of six daughters and thirteen sons.

ABDALONYMUS, defended from king Cinyras, and of the royal family of Sidon, lived in obscurity, and subsisted by cultivating a garden, when Strato had possession of the crown of Sidon. Alexander the Great having deposed Strato, wished to restore the race of Cinyras, and having found Abdalonymus, he was convinced of his high descent by the apparent dignity of his person. Interrogating him how he bore his poverty, Abdalonymus replied, "I wish I may bear my new condition as well. These hands have supplied my necessities. I have had nothing, and I have wanted nothing." Alexander was so much pleased with this reply, that, besides bestowing upon him what belonged to Strato, he augmented his dominions, and gave him a large present out of the Persian spoils.

ABDALS, in the Eastern countries, a kind of faints supposed to be inspired to a degree of madness. The word comes, perhaps, from the Arabic *abdallab*, the servant of God. The Persians call them *devanch kboda*, agreeably to the Latin way of speaking of their prophets and sibyls, q. d. *furentes Deo, raging with the God*.

The Abdals are often carried by excess of zeal, especially in the Indies, to run about the streets, and kill all they meet of a different religion. The English sailors call this *running a muk*, from the name of the instrument, a sort of poignard, employed on this occasion. D'Herbel. Bib. Or. p. 5.

ABDELAVI, in *Botany*, an Egyptian plant very like a melon, except that the fruit is more oblong, and acute at the extremities.

ABDELEUR, in *Geography*, an island in Africa, situate in the country of Anian, in the Indian Sea. N. lat. 11° 55'. E. long. 51° 45'.

ABDERA, or ABDARA, in *Ancient Geography*, a town of Bætica in Spain, a Phœnician colony; now *Adra* or *Aladra*, to the west of Alceira in Granada.

ABDERA, a maritime town of Thrace, not far from the mouth of the river Nestus, on the east side. Solinus says, that *Abdera* was founded by the sister of Diomedes, and took her name; but Stephanus (de Urb. tom. 1. p. 5.) ascribes the name to Abderus, one of the companions of Hercules, who was devoured by the fabulous horses of Diomedes. Herodotus (lib. 1. p. 168.) informs us, that Timæsius, the Clazomenian, attempted to lay the foundation of it, but he was prevented by the Thracians from accomplishing his purpose. The Teians afterwards succeeded and settled in this place, in order to avoid the contumely of the Persians, which gave occasion to its being called *Abdera pulchra Tejorum colonia*, signifying, that brave men will live any where rather than suffer oppression and servitude. To this saying some suppose that Cicero alludes in his epistles to Atticus, lib. 4. 7. The horses that fed on the grass in the neighbourhood of this city were seized with madness, according to Pliny (Hist. Nat. tom. 2. p. 374. Ed. Hard.) In the reign of Cassander, king of Macedonia, it was so infested with frogs and rats that the inhabitants were obliged, for a time, to quit it. The *Abderites* were for some months, in the reign of Lyfimaachus, afflicted with a singular disease. It was a kind of burning fever, according to the description of it given by Lucian, (Op. tom. 2. p. 1. Ed. Reitz.) which came to a crisis on the seventh day. During its continuance, the imaginations of those who were seized with it were distracted, and they fancied themselves players; and they continued reciting verses from some tragedy, particu-

larly out of the *Andromeda* of Euripides, till the cold of winter terminated their delirium. Of the cause of this disease Lucian gives the following account. Archelaus performed the tragedy of *Andromeda* before the *Abderites* in a very hot summer; several persons were attacked with the fever on their leaving the theatre; and their imaginations being fully possessed with the dramatic incidents which had been exhibited, they could not forbear imitating Archelaus's action and declamation: and from them the fever was communicated to others by infection.

The *Abderites* were reproached for want of wit and judgment; nevertheless many eminent persons, as Protagoras, Democritus, Anaxarchus, Hecateus the historian, Nicænetus the poet, and several others, were born in this city. It was formerly famous for its gold and silver mines; but it is now reduced to a mean place, on the Archipelago, called *Polytilo*, *Asperosa*, and *Akrizzo*. There was another city of the same name in Iberia, built by the Phœnicians, and now called *Almeria*.

ABDERAHMA, ABDIRACHMAN, or ABDALRAHMAN, a Saracen viceroy in Spain, who revolted and formed an independent principality at Cordova. He had several successors of the same name.

A viceroy and captain-general of this name led the Saracens and their followers into France, ravaging the country wherever they came; but at length he was met at Tours by Charles Martel, who had been reinforced by a body of Germans and Gepidæ; and, after many skirmishes, a general action took place, in which the Saracen army was totally defeated, and *Abderahma* was killed, with 370,000 Moors. This great event, which first broke the Saracen power, and taught the Europeans that they were not invincible, is placed by most writers in the year 732, Heg. 114. Mariana (Hist. Spain, l. 7. c. 2.) dates this battle in the year 734, twenty-one years after the conquest of Spain.

ABDERANA. See *ARIANA*.

ABDEST, among the *Mahometans*, a peculiar manner of washing, before prayer, entering the mosque, or reading the Alcoran; practised with some difference both by Turks and Persians. The word is compounded of the Persian *ab*, *water*, and *dest*, *hand*.

ABDIAS of *Babylon*, in *Biography*, a legend-writer, who had the effrontery to boast, that he had seen Christ, was one of the 70 disciples, had been eye-witness of the actions and prayers of several of the apostles at their death, and had followed St. Simon and St. Jude into Persia, by whom he had been made the first bishop of Babylon. But his forgery is easily detected; as he mentions Hegeffippus and Jul. Africanus, one of whom lived about 130 and the other 221 years after our Lord's ascension. His book, intitled *Historia Certaminis Apostolici*, was published by Wolfgang Lazius at Basil, in 1551, and has passed through several editions in other places. It may be seen, with notes, in Fabr. Codex. Apocr. N. T. part 2. p. 388.

ABDICARIA *propositio*, in *Logic*, is used for a negative proposition.

ABDICATION, ABDICATION, derived from *abdicare*, to renounce, the act whereby a magistrate, or person in office, renounces, and gives up the same, before the legal term of service is expired.

Abdication is frequently confounded with *resignation*; but, strictly speaking, there is a difference: *abdication* being done purely and simply; whereas *resignation* is done in favour of some other person.

In this sense, Dioclesian is said to have *abdicated* the crown; but Philip IV. of Spain *resigned* it. The parliament of England voted that king James II. having endeavoured

voured to subvert the constitution of the kingdom, by breaking the original contract between king and people, and having, by the advice of Jesuit and other wicked persons, violated the fundamental laws, and withdrawn himself out of the kingdom, has *abdicated* the government, and that the commons thereby vacant. This vote was passed by a great majority of the commons; but was opposed in the house of lords. They particularly objected to the word *abdicated*, and it was carried, that *deposed* was more proper. The commons adhered to their vote, and by their perseverance obliged the lords to comply. The Scots convention voted that king James, by his mal-administration and his abuse of power, had *forfeited* (from *foris-facio*) all title to the crown.

ABDICATIO, among Roman Writers, is more particularly used for the act whereby a father discarded or disclaimed his son, and expelled him the family.

In this sense the word is synonymous with the Greek *αποκρησις*, and the Latin *a familia alienatio*, or sometimes *allegatio*, and *negatio*; and stands opposed to *adoption*. It is distinguished from EXHEREDATIO, or disinheriting, in that the former was done in the father's life-time, the latter by will at his death: so that whoever was *abdicated*, was also disinherited, but not *vice versa*.

ABDITÆ Cause, are the secret or remote causes of distempers, which physicians of the dogmatic, or rational sect, affirmed, were necessary to be known, in order to establish a right method of cure.

ABDOMEN, in *Anatomy*, derived from *abdere* to *hide*, the *lower Belly*, or the cavity that is bounded at its upper part by the diaphragm, or midriff, by which it is separated from the thorax; and at its lower part it is distinguished from the pelvis by a circular ridge of bone, which is considered as the brim of the latter cavity. The spine and lumbar muscles form the back part of the abdomen, whilst the sides and front are completed by muscles, named *abdominal*. The abdominal muscles are the *OBLIQUI externi* and *interni*, the *RECTI transversales*, and *PYRAMIDALS*. This great cavity is divided by anatomists into certain regions or districts, that they may be able easily and accurately to describe the situation of the contained viscera. The divisions are in a great degree arbitrary; one imaginary line is drawn across from the greatest convexity of the cartilage of the 7th or last true rib; another from those projecting points of the hip-bones, named the anterior and superior spinous processes. That part of the cavity, which is situated above the upper line, is termed the epigastric region; that below the lower one, the hypogastric. The space included between the lines, is called the umbilical region. These regions are again subdivided: the sides of the epigastric region, which extend beneath the cartilages of the ribs, being named *hypochondria*, and the small depression at the upper part, just over the esiform cartilage, being called *serobiculus cordis* by Latin writers, and the pit of the stomach commonly by the English. The sides of the umbilical region are named the *ilia* or *flanks*, and the back part the *loins*. The sides of the hypogastric region are the *groins*, and the lower part in front, the *pubes*. The boundaries of the abdomen are every where lined by a thin and elastic membrane, named *peritonæum*, which is also spread over the contained viscera. From the smooth glossy surface of this membrane, a small quantity of an aqueous fluid is poured forth, which keeps the bowels separate from each other, and from the sides of the cavity in which they are contained. All the abdominal viscera, except the kidneys, are employed in the digestion of our food, the conversion of it into chyle, and the expulsion of the residue. The viscera more directly em-

ployed in the chylopoietic function, are the stomach, and the small and large intestines. The small intestines are divided into the duodenum, the jejunum, and the ilium; the large into the cæcum, colon, and rectum. The liver, with its gall-bladder, the spleen, and pancreas, are subservient to the functions of the alimentary canal. Behind the peritonæum in the loins, we find the kidneys, which are also abdominal viscera. Several processes of peritonæum present themselves in the cavity of the abdomen, and claim attention, as the great and small omentum, the mesentery, and others of less importance.

The abdominal viscera are pressed upwards towards the hollow cavity of the chest, by the abdominal muscles, in expiration; they are pushed down again by the action of the diaphragm during inspiration. When both the diaphragm and abdominal muscles act at the same time, a pressure is made on all the abdominal viscera, which is occasionally employed to aid particular parts in performing their office; to assist, for instance, in the expulsion of urine and fæces, and in parturition. The effort by which this pressure is made, we call *straining*, and it is often so forcible as to protrude some of the viscera from their natural situation in the cavity of the abdomen. The parts thus protruded form external tumors, and are called *herniæ* or *ruptures*. Coughing, in which the abdominal muscles alone compress the viscera, and tend to diminish the cavity of the abdomen, produces, in a gradual manner, such protrusions.

The principal nutrient arteries of the parietes of the abdomen, are the lower intercostal, the lumbar, and circumflexed arteries of the ilium, at the sides; whilst the epigastric, and internal mammary arteries are distributed in front and communicate by their minute branches with the former vessels. These arteries have corresponding veins. The nerves supplying the parietes of the abdomen arise from the lower dorsal and lumbar nerves, and their branches are distributed in a circular manner round that cavity. For an account of the large arteries, veins, nerves, and absorbents, which are found at the back part of the abdomen, in their progress to supply the contained viscera, and also the pelvis and lower extremities, see *Ramifications of ARTERIES, VEINS, and NERVES, and Distribution of the ABSORBING VESSELS*.

ABDOMEN, in *Medicine*. This part of the body is liable frequently to become the seat of several important and dangerous *Diseases*. Some of these are real affections of this cavity, while others, though commonly referred to it by the patient, more properly belong to the *primæ viæ*, or the organs of generation and urine.

All these diseases, with the manner of treating them, will be found under some of the following heads or terms, *viz.*

1. INFLAMMATIONS of the abdominal viscera, including Inflammation of the Diaphragm, see *DIAPHRAGMITS*; of the Liver, *HEPATITIS*; of the Stomach, *GASTRITIS*; of the Peritonæum, *PERITONITIS*; of the Intestines or Mesentery, *ENTERITIS*; of the Bladder, *CYSTITIS*; of the Kidneys, *NEPHRITIS*; and of the Womb, &c. *HYSTERITIS*.
2. Painful or Spasmodic Affections, referred to the *abdomen* by the patients, and not attended by inflammation or fever, will be found under *CARDIALGIA* or *GASTRODYNIA*; pain in the region of the stomach, under *ENTERODYNIA*, *COLIC*, *JAUNDICE*, *CALCULI*, *SCIRRHUS*, *HYSTERIA*, *GOUT*, and *WORMS*.
3. Other Diseases of the *Primæ Viæ*, or Intestines, will be included under *VOMITING*, *CHOLERA*, *DIARRHOEA*, *LIENTERIA*, and *DYSENTERIA*.
4. *DROPSIES* of the *abdomen* will be treated of under *ASCITES*, *HYDROPS ovarii*, and *TYMPANITES*.

ABDOMEN, *Chirurgical Diseases and Operations of the*. We do not here propose to treat at large of all the local disorders to which the belly is liable, but only to enumerate those of more frequent occurrence, and the operations necessary for their removal. They may be divided into *internal* and *external*. The latter affect the muscles and common integuments chiefly; the former are principally seated among the abdominal viscera. Many diseases, however, are common both to the internal and external parts of the *abdomen*; as **INFLAMMATION**, **SUPPURATION**, **ULCERS**, **HÆMORRHAGES**, **TUMORS**, and **WOUNDS** of various kinds, &c. See each of these articles in their respective places.

The abdomen and its contents are subject to certain diseases, either of a peculiar nature, or requiring peculiar treatment on account of their situation. When the external tegments, from being dilated or ruptured in any part, permit the bowels to force their way through them, an hernia is formed, which must be replaced in their natural position. See **HERNIA**. When an accumulation of fluid happens within the belly, so as to prove inconvenient or dangerous, the operation of tapping, technically named **PARACENTESIS**, is required for its evacuation. See **DROPSY**. Sometimes the intestinal canal is prematurely contracted, forming a **STRICTURE**; or is distended with flatus, which constitutes the **TYMPANITES**; or is reflected within itself, forming the disease called **INTUSSUSCEPTION**. The liver often inflames and suppurates, or becomes indurated and scirrhus. The womb is liable to be ulcerated and cancerous, or may suffer during parturition. See **SCIRRHUS** and **CANCER**. The glands of the mesentery will likewise inflame, suppurate, and enlarge to a great degree. Collections of pus may form upon the muscles of the loins; calculi within the kidneys, or the urinary and gall bladder; varicose swellings and aneurisms in the blood-vessels, &c. &c. See **PSOAS** or **LUMBAR ABSCESS**, **LITHOTOMY**, **VARICOCELE**, and **ANEURISM**. Several chirurgical operations are also peculiar to the *abdomen* and its contents; for example, **GASTRORAPHY**, **GASTROTOMY**, **LITHOTOMY**, and the **CÆSAREAN SECTION**.

All these several disorders and operations are particularly explained in other parts of this work, under their appropriate denominations, to which we therefore refer our readers.

ABDOMEN of Insects. See **INSECTS**.

ABDOMINAL Ring, in *Anatomy*, an aperture through which the spermatic vessels pass in men, and the ligamenta rotunda uteri in women. It is formed by the tendinous fibres of the *musculus obliquus externus abdominis*, which are separated from each other near the os pubis. See **OBLIQUI**, &c.

ABDOMINALES, in the *Linnaean System of Ichthyology*, an order of **FISH**, having the ventral fins placed behind the pectoral in the abdomen, and the branchia ossiculated, and comprehending sixteen genera, and one hundred and ninety-five species.

ABDUCENS laborum, in *Anatomy*, a name given by Spigelius to a muscle, which he also calls the *secundus ad latera trahens*. This is the *levator anguli oris* of Albinus, and the *caninus elevator* or *levator laborum communis* of others.

ABDUCENT, in *Anatomy*. See **ABDUCTOR**.

ABDUCTION, in *Law*. See **FORCIBLE Abduction**, **KIDNAPPING**, and **RAVISHMENT**.

ABDUCTION, in *Logic*, a kind of argumentation, by the Greeks called *apagoge*; wherein the greater extreme is evidently contained in the medium, but the medium not so evidently in the lesser extreme as not to require some farther medium, or proof, to make it appear.

It is called *abduction*; from *ab*, *from*, and *ducere*, *to*

draw; because from the conclusion, it draws us on to prove the proposition assumed.

Thus, in the syllogism, "All whom God absolves are free of sin; but God absolves all who are in Christ: therefore, all who are in Christ are free of sin." The major is evident; but the minor, or assumption, is not so, without some other proposition to prove it; as, "God received satisfaction for sin by the sufferings of Jesus Christ."

ABDUCTION, or **ABRUPTION**, in *Surgery*, denotes a kind of transverse **FRACTURE**, in which the broken extremities of the bone recede from each other. *Galen* calls this species of fracture *κωλυνδον*; but *Cælius Aurelianus*, by the word *Abductio*, means a strain or violent distension of a muscle, and speaks of it as a cause of chronic pains.

ABDUCTOR, or **ABDUCTOR**, compounded of *ab*, *from*, and *ducere*, *to draw*, in *Anatomy*, a name common to several muscles, whose action is the withdrawing, opening, or pulling back, the parts to which they are fixed. Their antagonists are called **ADDUCTORES**.

ABDUCTOR auricularis. See **ABDUCTOR minimi digiti manus**.

ABDUCTOR Auris, or **BICAUDALIS**. See **RETRAHENS Auriculam**.

ABDUCTOR indicis manus, arises from the os trapezium, and from the superior part and inner side of the metacarpal bone of the thumb, and is inserted by a short tendon into the outer and back part of the first bone of the forefinger. Its use is to bring the forefinger towards the thumb. This is the semi-interosseus of Winslow. Cowper calls it *adductor pollicis*; and Douglas says, that with respect to the thumb, it may be called *adductor*, and to the index *abductor*.

ABDUCTOR indicis pedis, arises tendinous and fleshy, by two origins, from the root of the inside of the metatarsal bone of the foretoe, from the outside of the root of the metatarsal bone of the great toe, and from the os cuneiforme internum; and is inserted tendinous into the inside of the root of the first joint of the foretoe. Its use is to pull the foretoe inwards from the rest of the toes.

ABDUCTOR minimi digiti manus, arises fleshy from the os pisiforme, and from the part of the ligamentum carpi annulare that is next to it; and is inserted tendinous into the inner side of the upper end of the first bone of the little finger. Its use is to draw this finger from the rest. This is the *hypothenar minor* of Winslow, the *extensor tertii inter-nodii minimi digiti* of Douglas, and the *auricularis* of others.

ABDUCTOR minimi digiti pedis, arises tendinous and fleshy from the semicircular edge of a cavity in the inferior part of the protuberance of the os calcis, and from the root of the metatarsal bone of the little toe; and is inserted into the root of the first joint of the little toe externally. Its use is to draw the little toe outwards from the rest. This is the *Parathenar major* and *Metatarsæus* of Winslow.

ABDUCTOR oculi, arises from the bony partition between the foramen opticum and lacerum; and is inserted into the globe of the eye opposite to the outer canthus. Its use is to move the globe outwards. It is also called *Indignatorius*.

ABDUCTOR pollicis manus, arises by a broad tendinous and fleshy beginning, from the ligamentum carpi annulare, and from the os trapezium; and is inserted tendinous into the outer part of the root of the first bone of the thumb. Its use is to draw the thumb from the fingers. Albinus names the inner portion of this muscle, *Abductor brevis alter*, and it is called *Abductor* and *Thenar Riolani* by Douglas.

ABDUCTOR longus pollicis. See **INTEROSSEUS Auricularis**.

ABDUCTOR pollicis pedis, arises fleshy from the inside of the root of the protuberance of the os calcis, where it forms

the heel, and tendinous from the same bone, where it joins with the os navicular; and is inserted tendinous into the internal os cuneiform, and root of the first joint of the great toe. Its use is to pull the great toe from the rest. This is the *Tarsus* of Winslow.

Abductor med. dig. m. p. li., arises tendinous and fleshy from the inside of the root of the metatarsal bone of the middle toe; and is inserted tendinous into the inside of the first joint of the middle toe. Its use is to pull the middle toe inward.

Abductor tert. dig. m. p. li., arises tendinous and fleshy from the inside and inferior part of the root of the metatarsal bone of the third toe, and is inserted tendinous into the inside of the root of the first joint of the third toe. Its use is to pull the third toe inward.

The thigh has also strong and remarkable *abductor* muscles, which are interposed between the dorsum of the ilium and the trochanter of the femur; the form and bulk of which are visible in the external lineaments of the body. These muscles will be described under *GLUTEUS medius et minimus*.

ABDUCTORES, or *abducentes nervi*, are names which have been given to the 6th pair of nerves, on account of their being distributed to the *ABDUCTOR* muscles of the eye.

ABEC Flute. See *FLUTE*.

ABECEDARIAN. See *ABECEDARY*.

ABEILLE, *Gaspard*, in *Biography*, was born at Riez, in Provence, in 1648. He was much admired at Paris, in early life, for the brilliancy of his wit. He obtained the confidence of Marshal Luxemburg, who appointed him as his secretary; and he contributed, by his lively and animated conversation, to the amusement of the Prince of Conti and the Duke de Vendome. A very ugly wrinkled countenance, susceptible of a variety of comic expressions, gave a zest to his bon-mots and stories, and enabled him to produce mirth on various occasions. *Abeille* enjoyed a priory, and a place in the French academy. He wrote some odes and epistles, several tragedies, one comedy, and two operas. A certain prince observed of his tragedy of Cato, that if Cato of Utica should return from the grave, he would be no more Cato than that of the Abbé *Abeille*. He was held in low estimation as a poet. He died at Paris, May the 21st, 1718. His brother, Scipio, who died in 1697, was also a poet. He has left a good history of the bones, published in 1685, in 12mo.; and he also published, in 1669, a treatise, in 12mo. suitable to his office as surgeon-major, under the title of the Complete Army Surgeon.

ABEL, in *Scripture History*, the second son of Adam and Eve, born in the second year of the world. His history is comprised in a very narrow compass. He was a shepherd, and offered to God the firstlings of his flock, and his sacrifice was accepted; whilst that of Cain, his brother, was rejected. This distinction exasperated Cain, so that he slew his brother. Although no religious respect is paid to his memory in the Greek churches, which have established feasts for every other patriarch and prophet, and his name does not occur in any one of the Roman martyrologies before the 10th century; he, as well as other saints, is made the object of worship in several Roman litanies, designed for persons at the point of death. Some calendars commemorate him on the 25th of March; others on the 2d of January; and others on the 30th of July. Among the Ethiopians he is honoured on the 28th of December. The poem, intitled "The Death of Abel," written in German by Gesner, and translated into various languages, has been much admired.

ABEL, *Fredrick Gottfried*, M. D. the son of Caspar Abel, the historian, was assessor of the college of physicians, and member of the literary society at Halberstadt.

He was born July 8th, 1714, and after a classical education became a student of theology in 1731, under Mosheim, and afterwards at Halle, under Wolf and Baumgarten, where he often preached with great applause. He declined the theological profession and applied to medicine at Halle, and in 1744 was admitted to the degree of doctor at Konigsberg in Prussia. On his return to Halberstadt he practised as a physician for half a century, and died Nov. 23, 1794. His poetical translation of Juvenal into German, was published in 1788. One of his sons, viz. John Abel, a physician of Duffeldorf, has distinguished himself as a writer. Gen. Biog.

ABEL, *Charles Frederic*, an eminent musical composer and performer, was a native of Germany, and a disciple of Sebastian Bach. He left Dresden in a destitute condition in 1758, and travelled through Germany, supplying his necessities by his talents, till at length he arrived in England in 1759, where he soon gained notice and recompence, both as a public performer and as a private teacher. He had a salary of 200l. a year as chamber musician to her majesty, and his weekly concert, in conjunction with Bach, was liberally supported. He performed on several instruments; but he was chiefly attached to the viol da gamba. Dr. Burney, in the 4th volume of his History of Music, has given the following account of his composition and performance: "His compositions were easy and elegantly simple; for he used to say, 'I do not chuse to be always struggling with difficulties, and playing with all my might. I make my pieces difficult whenever I please, according to my disposition and that of my audience.' Yet, in nothing was he so superior to himself, and to other musicians, as in writing and playing an *adagio*; in which the most pleasing, yet learned modulation, the richest harmony, and the most elegant and polished melody, were all expressed with such feeling, taste, and science, that no musical production or performance, with which I was then acquainted, seemed to approach nearer perfection. The knowledge Abel had acquired in Germany, in every part of musical science, rendered him the umpire in all musical controversies, and caused him to be consulted in all difficult points. His concertos and other pieces were very popular, and frequently played on public occasions. The taste and science of Abel were rather greater than his invention, so that some of his later productions, compared with those of younger composers, appeared somewhat languid and monotonous. Yet he preserved a high reputation in the profession till his death." Abel was irascible in his temper, and apt to be overbearing. He loved his bottle; and by excess of drinking, when he was labouring under a spitting of blood, he put an end to his complaint and to his life. He died in London, June 20, 1787.

ABEL-Keramim, or *of the Vineyards*, in *Geography*, mentioned Judges xi. 33. was, according to Eusebius, six miles from Philadelphia, otherwise Rabbath, the capital of the Ammonites. It was remarkable for its vines, whence the name; and it was probably the same with *Abela*, between Jabez and Gadara, near Pella; and the *Abila*, mentioned by Polybius, (Hist. lib. v. p. 414. ed. Casaub.) among other cities of Galatic. See *ABILENE*.

ABEL-Meholah, the country of Elisha, 1 Kings, xix. 16. about sixteen miles south of Scythopolis according to Eusebius. Near this place Gideon obtained a victory over the Midianites. Judges, vii. 22.

ABEL-Mizraim, the mourning of the Egyptians in allusion to the lamentation for Jacob, called also the threshing floor of Atad, Gen. l. 11. was thought by Jerome, and some others, to be the place afterwards called *Bethagla*, at some distance from Jericho and Jordan westward.

ABEL-Shitim, or *Abel-fatim*, was situated in the plains of

of Moab, opposite to Jericho, not far from Jordan. Here Moses encamped before the Israelites passed the Jordan under Joshua. Here also, seduced by Balak, they worshipped Baal-Peor, and were punished by the instrumentality of the Levites. Numb. xxv. 1. &c. xxxiii. 49.

ABEL-TREE, or ABEL-TREE, in *Botany*, a species of POPLAR, with large leaves. This tree may be propagated by layers or cuttings, and also by suckers. Many advantages might be derived from planting it in boggy soils, where few other trees will thrive. The wood of it is useful for flooring or wainscoting rooms; and it is preferred for turnery-ware to any other, on account of its peculiar whiteness. The quickness of its growth, inasmuch that it will yield shoots of eighteen or twenty feet long in a year, renders it eligible in plantations that are designed for shade or shelter.

ABELA, *John Francis*, in *Biography*, was commander of the order of Malta. His book, intitled *Malta illustrata*, published in 1647, in folio, and containing a description of Malta, and of its principal antiquities, is rare and curious. Biog. Dict.

ABELARD, *Peter*, an eminent scholastic philosopher of the 12th century. He was the son of Berenger, of noble descent, and born at Palais, near Nantes in Brittany, in the year 1079. At the age of 16 he had acquired, under Rosceline, the founder of the sect of the Nominalists, a considerable acquaintance with metaphysics and logic; together with a subtlety of thought and a fluency of expression, which qualified him for the literary contests in which he was afterwards engaged. Ardent in the prosecution of fame, and of that kind of science, which then prevailed, he settled at Paris, in the 20th year of his age, and devoted himself to the study of dialectics under William de Champeaux, called the *venerable doctor*. The master and the pupil were for some time much attached to each other; but when the disciple presumed to contradict his teacher, and to enter into disputations with him, in which, according to the judgment of his fellow students, he was victorious, the vanity of Abelard was inflamed, and the jealousy of Champeaux excited; and a separation became necessary. Thus flattered and encouraged, and possessing superior talents, both by nature and in consequence of sedulous application, Abelard, at the age of 22, determined to open a public school for himself; and the place which he selected was Melun, a town distant from Paris about ten leagues, where the court at that time often resided. Notwithstanding the competition and hostility of Champeaux, the young lecturer's school was thronged with auditors, who were highly gratified by his public performances. Farther emboldened by this success, he approached nearer to Paris, and removed his school to Corbeil, where he had an opportunity of triumphing over his former master, and of compelling him to retire. His application and activity, however, impaired his health, and rendered it necessary for him to withdraw from the public scene of literary contest into his native country. After an absence of two years, he returned to Corbeil; where he renewed his lectures with such reputation, that the scholars of Champeaux deserted him; and where he obtained fresh triumphs over his envy and opposition. In the issue his victory was so complete, that Champeaux, who had assumed the monastic habit among the regular canons in the convent of St. Victor, and who was afterwards preferred to the see of Chalons, was constrained to relinquish the contest and to yield to the acknowledged superiority of his rival. Upon this Abelard quitted the school which he had established at the abbey of St. Genevieve, and directing his views to the study and profession of theology, removed to Laon, and placed himself under the tuition of Anselm. Here again the disciple, by the superiority of his talents and acquirements, excited the jea-

lousy of this celebrated theologian; and after establishing his reputation by the lectures which he delivered, he was compelled to retire from Laon, and to remove to Paris. His lectures in this city, both in theology and philosophy, were attended by a great number of students, who resorted to his school, not only from various parts of France, but from Spain, Italy, Germany, Flanders, and Great Britain. At the age of forty Abelard sacrificed the reputation which he had acquired, as an able disputant and popular preceptor, to the love of pleasure, and disgraced himself by forning and executing a deliberate plan for the seduction of female innocence. During his residence at Paris, where he was acquiring affluence as well as renown, he boarded in the house of Fulbert, a canon of the cathedral church, who had a niece called Heloise, about the age of 18 years, and equally celebrated for her beauty and literary attainments. The avaricious canon, wishing to have his niece instructed without expence, employed Abelard as his preceptor; but instead of improving her in the sciences, he betrayed his trust, taught her to love, and determined to seduce her. From this time Abelard became remiss in the performance of his public functions, and wrote nothing but amorous verses. The canon, deluded by his respect for the preceptor of his niece, remained ignorant of an amour, which became the subject of general conversation. In a little while, however, the pregnancy of Heloise discovered the culpable conduct of her lover, and roused the resentment of the infatuated uncle. She was soon removed to the house of Abelard's sister in Brittany, and there delivered of a son. When the child was born, Abelard made a proposal to Fulbert of privately marrying his niece, to which the canon consented. Heloise, however, hesitated in accepting the offer, partly from a regard to the honour of Abelard, whose profession bound him to celibacy, and partly from a romantic notion, that her passion ought not to submit to ordinary restraints. Abelard at last prevailed, and they were privately married at Paris; though it is said, that she protested to her uncle that she was not married, and that this was one cause of his unkind and severe treatment of her. Abelard made this a plea for removing her from his house to the abbey of Benedictine nuns, in which she had been educated. The uncle meditated revenge, and hired ruffians, who forced their way into his chamber by night, and insisted on his person a disgraceful and cruel mutilation. Abelard resolved that, as Heloise could no longer be his, she should never be another's, and demanded from her a promise to devote herself to religion. She submitted to the selfish and harsh injunction, and professed herself in the abbey of Argenteuil. On this occasion she exclaimed, in the words of *Cornelia*:

——— O maxime conjux!

O thalamis indigne meis, hoc juris habebit
In tantum fortuna caput! cur impia nupsi,
Si miserum factura fui? nunc accipe pœnas,
Sed quas sponte luam.

Lucan Pharsal. l. viii. v. 94, &c. p. 541. Ed. Burman.

“ Ah! my once greatest lord! Ah! cruel hour!
Is thy victorious head in fortune's pow'r?
Since miseries my baneful love pursue,
Why did I wed thee, only to undo!
But see, to death my wiving neck I bow;
Atone the angry gods by one kind blow.” ROWE

Soon after this event Abelard assumed the monastic habit in the abbey of St. Denys. His scholars in Paris, however, intreated him to return to his school; and after some deliberation

beration and delay he resumed his lectures at a small village in the country, and regained his popularity. But his reputation excited envy and exposed him to a variety of persecutions. About this time he published a treatise, intitled, "The Theology of Abelard," which was said to contain some heretical tenets concerning the Trinity. The work was condemned to be burnt, by a decree of the synod at Soissons, held in 1121, and Abelard was ordered to throw it into the flames. He was also required to read, as his own confession of faith, the Athanasian creed, and to be confined in the convent of St. Medard. His persecutors became ashamed of their conduct, which occasioned general dissatisfaction; and Abelard was soon permitted to return to St. Denys. Here again he was pursued by his enemies; and having asserted, that the patron of the convent and of the French nation was not Dionysius the Areopagite, but another St. Dionysius, bishop of Athens, he was accused to the bishop and the king, as a calumniator of the order and an enemy to his country. On this occasion he made his escape, and fled to the convent of St. Ayoul at Provins in Champagne, the prior of which was his intimate friend. Hence he soon retired to a retreat in the forest of Champagne, near Nogent upon the Seine, where, in 1122, he erected a small oratory, which he dedicated to the Trinity, and which was afterwards enlarged and consecrated to the third person, the Comforter or Paraclete. His pupils in this retreat soon amounted to 600; but he was compelled to withdraw from this solitude, and, by the interest of the Duke of Brittany, he was elected superior of the monastery of St. Gildas, in the diocese of Vannes, where he remained for several years. The nuns of the convent of Argenteuil being dispersed about this time, Abelard invited Heloise, with her eight companions, to take possession of the Paraclete. Heloise accepted the invitation; was chosen abbess of the new institution that was established; and in 1127, the donation was confirmed by the king. Whilst Abelard resided at St. Gildas, the interesting correspondence occurred between him and Heloise, which is still extant; and he then wrote the memoirs of his life, which came down to the year 1134. The letters of Heloise in this correspondence abound with proofs of genius, learning, and taste, which might have graced a better age. Upon these letters Mr. Pope has formed his "Epistle from Eloisa to Abelard," a piece that has been highly celebrated for its poetical merit, but which deviates in many particulars from the genuine character and story of Heloise, and culpably violates moral propriety, as Mr. Berrington (*Hist. Abelard*, p. 240, &c.) has shewn in his judicious critique. Abelard was, in this situation, accused to pope Innocent II. of noxious errors and mischievous designs. His accuser, the Abbot of St. Thierry, was challenged by Abelard to make good his accusation in a public assembly; and upon his delivering the heads of his accusation, Abelard, probably apprehending a popular tumult, rose up and exclaimed, "I appeal to Rome." The pope, in consequence of some person's intrigues, anticipated his arrival by pronouncing his opinions heretical, and sentencing him to perpetual silence and confinement. Abelard, in his way to Rome, called at Cluni, a monastery on the confines of Burgundy, where he was kindly received by Peter Maurice, the abbot: and here a reconciliation was effected between him and Bernard, abbot of Clairvaux, who had prejudiced the pope against him. Peter interposed with the pope in his favour, and obtained his pardon; and he was permitted to end his days in the monastery of Cluni. In this monastery, the cloistered philosopher was retired, studious, and devout; and his lectures were renewed and heard with applause. But his health and spirits were too feeble to bear the exertions which this service required. Although he was

removed to the pure air of the priory of St. Marcellus, near Chalons, his debility and decay increased, and terminated his life in his 63d year, on the 21st of April 1142. His body was sent to Heloise to be interred in the convent of the Paraclete. Heloise survived her husband 21 years, a pattern of conjugal affection and monastic virtue. Of the character of Abelard, we shall subjoin the following extract from Enfield's account of him in the General Biography, vol. i. "The amour, which has given Abelard so much celebrity in the annals of gallantry, will certainly not entitle his name to a place in the tablet of moral merit: it will remain an eternal blot upon his memory. In Heloise, the criminality, though not obliterated, was palliated by youthful ardour and inexperience; and extreme sensibility, romantic attachment, noble generosity, and disinterested invincible constancy, united to throw a veil over human frailty. In Abelard, every circumstance, instead of excusing, aggravated the offence. At forty, 'the hey-day of the blood is tame, and waits upon the judgment.' It was not a juvenile indiscretion of which Abelard was guilty, but, according to his own confession, the seduction of innocence, deliberately planned, and resolutely executed. It was accompanied with breach of confidence, violation of duty, and degradation of character. Except in the grant of the Paraclete as an asylum to Heloise and her sisterhood, an uniform selfishness appears in Abelard's conduct, which admits of no apology; unless we transfer the blame from the man to the profession, and reprobate that system of superstition, which, by the unnatural injunction of clerical celibacy, has given birth to innumerable irregularities and enormities. Viewed apart from this disgraceful affair, Abelard appears with more advantage. His writings, indeed, will not give the reader a high idea of his genius or taste: but it cannot be questioned, that the man, who could foil the first masters of the age at the weapons of logic, could draw round him crowded and admiring auditories, and could collect scholars from different provinces and countries, whenever he chose to form a school, must have possessed extraordinary talents. He must be allowed the credit, not only of having made himself master of the philosophy and theology of the age, such as they were, but of having boldly advanced, beyond the time, into the region of new opinions. Had his love of truth been equal to his thirst of fame, and had his courage in adhering to his principles been equal to his ingenuity in defending them, his sufferings and persecutions might have excited more regret, and his title to honourable remembrance would have been better established. Upon the whole, of Abelard it may, perhaps, with truth be said, that he was too vain to be truly great, and too selfish to be eminently good, and that his character is rather adapted to excite admiration than to command respect." His principal works, written in Latin, are, "An Address to the Paraclete on the Study of the Scriptures," "Problems and Solutions," "Sermons on the Festivals," "A Treatise against Heresies," "An Exposition of the Lord's Prayer," "A Commentary on the Romans," "A System of Theology," and his letters to Heloise and to others. These, with some other pieces, were collected and edited from the MSS. of Amboise, in 4to. at Paris, in 1616. Bayle, Moreri, Berrington's *Hist. of the Lives of Abelard and Heloise*. Gen. Biog.

ABELIANS, ABELONIANS, or ABELITES, in *Ecclesiastical History*, a sect in Africa, not far from Hippo, mentioned by St. Austin, (*Oper. tom. vi. p. 14.*) and supposed to have commenced in the reign of Arcadius and terminated in that of Theodosius. Their distinguishing tenet and practice were to marry, and yet live with their wives in a professed abstinence, without having any carnal commerce together.

together. 1 Cor. vii. 29. The learned have taken great pains to ascertain the principle upon which they acted, and the reason of their denomination, to very little purpose. But, in effect, it is more than probable, they took their name from Abel for no other reason, but because, like that patriarch, they had no issue; not that he lived in continence after marriage; but because he was killed before he had married, or died without issue. In order to perpetuate the sect, St. Austin informs us, (ubi supra,) that when a man and woman entered into this society, they adopted a boy and girl, who were to be their heirs, and to marry under the same obligation of continence, and of adopting two children of different sexes.

ABELICEA, in *Botany*, the name of a very tall tree, growing principally in Crete, called also *santalus adulterina*, and *pseudosantalum*.

ABELL, *John*, in *Biography*, an English musician, who belonged to the chapel of Charles II. and continued in it till the revolution, when he was discharged, because he was a papist. After many rambles on the continent, and singular adventures, he returned to England; and, in 1701, published a collection of songs in several languages, which he dedicated to King William. It is said that this artist possessed the secret of preserving the natural tone of his voice to extreme old age. Hawkins's *Hist. Mus.* vol. iv. p. 455.

ABELLA, in *Ancient Geography*, a municipal town of Campania, near the river Clanis, mentioned by Virgil, lib. vii. v. 740. and by Silius (lib. viii. v. 544.) and inhabited, according to Justin, (lib. xx. cap. i.) by a colony of Chalcidians. The *nux Avellana*, or hazle-nut, takes its name, according to Macrobius, from this town. It is now a heap of ruins, near the town and castle of AVELLA. The ancient walls enclose a circuit of near three miles, and in the middle are the fragments of an amphitheatre; the environs are remarkable for the excellent quality of their fruit and honey. Swinburne's *Trav.* vol. i. p. 162.

ABELLI, *Lewis*, in *Biography*, bishop and count of Rhodes, was born in the Vexin François, in 1603. Quitting his bishopric soon after his promotion, he retired to St. Lazare, where he died in 1691, at the age of 88 years. His *Medulla Theologica*, in 2 vols. 12mo. is a book which has been often cited by protestants against Bossuet, because it supplied them with weapons against the catholic zeal of making converts. He wrote other books in Latin and French. Gen. Dict.

ABELLINUM, in *Ancient Geography*, a town of the Hirpini, a people of Apulia, near the river Sabbato, between Beneventum and Salernum. Pliny calls the inhabitants *Abellinates Protopi*, in order to distinguish them from the *Abellinates Marfi*. It is now Avellino. E. long. 15° 20'. N. lat. 21°.

ABELMOLUCH, a species of the *ricinus*, or PALMA *Christi*.

ABELMOSCH, or ABELMUSK, the musk seed; a small odoriferous seed brought from Egypt, chiefly used in perfumes. The best comes from MARTINICO. The plant which produces it is the *HIBISCUS Abelmoschus* of Linnæus.

ABENAS, in *Geography*, a town in France, in Languedoc, and in the Lower Vivarais, situated on the river Ardefeh, at the foot of the Cevennes. E. long. 4° 43'. N. lat. 44° 40'.

ABENDANA, *Jacob*, in *Biography*, a learned Spanish Jew, prebect of a synagogue in London; known as the author of a Spicilegium of explanations on select passages of Scripture in Hebrew. Amst. 1685. fol. He died in 1685.

ABENEL CAUBY, a fixed star of the second or third magnitude, in the south scale of the constellation LIBRA.

ABENEZRA, *Abraham*, in *Biography*, a celebrated

Rabbi, born at Toledo, in Spain, and called by the Jews, the wise, great, and admirable doctor, was a very able interpreter of the Holy Scriptures, and well skilled in grammar, poetry, philosophy, astronomy, and medicine. He was also a perfect master of the Arabic. His principal work is Commentaries on the Old Testament, which are much esteemed, and printed in Bomberg's and Buxtorf's Hebrew Bibles. His style is clear, elegant, concise, and much like that of the Sacred Writings. He generally adheres to the literal sense, and always manifests genius and judgment; though his sentiments are sometimes erroneous. His *Jesud Mora*, which recommends the study of the Talmud, is the most rare of all his writings. His Poem on the game of Chess was translated by Dr. Hyde. Many other theological, grammatical, mathematical, and astronomical works of this author remain in ancient libraries, and have not yet been edited. He died at Rhodes in 1174, or 1190, aged 75. Mafes. Heb. Gram. vol. ii. p. 30.

ABEN-MELEK, a learned Rabbi, whose work, intitled, The Perfection of Beauty, printed at Amsterdam, 1661, fol. in Hebrew, and translated into Latin in 4to. and in 8vo. is a Commentary on the Bible, in which he confines himself to the explanation of the grammatical sense.

ABENOW, in *Geography*, a mountain of Suabia, thirteen miles from Friburg, remarkable as the source of the Danube, and for giving name to a chain of mountains extending from the Rhine to the Neckar, and from the forest-towns to the city of Thorheim.

ABENRAD, a town of Denmark, in Sleswick, in a territory of its own name. It is situated on a spacious bay of the Baltic, surrounded by three high mountains, and has been lately much improved. E. long. 9° 14'. N. lat. 55° 6'.

ABENSBERG, a small town in the circle of Bavaria, on the river Abens, near the Danube. E. long. 11° 55'. N. lat. 48° 46'.

ABER, in *Natural History*, the name given by Adanson to the *Mytilus puniceus* of Linnæus, with a gibbous acuminate shell, 15 furrows, and a dentated margin. It is found on the western shore of Africa.

ABERARTHY. See CARDIGAN Bay.

ABERAVON, a small borough-town in Glamorgan-shire, in Wales, governed by a portreeve. It is now an inconsiderable village, situated at the mouth of the river Avon, whence its name; *Aber*, in the ancient British, denoting such a situation. W. long. 3° 48'. N. lat. 51° 35'.—The copper-works established near this place have given it importance, and increased its population.

At a small distance from this town is the charming seat of Lord Vernon, at Briton ferry, where the Neath river, issuing from the bold hills which enclose its vale, passes between several majestic groves, and precipitates itself into the sea.

ABERBROTHICK, or ARBROATH, one of the Royal Burghs of Scotland, situated in the county of Angus, about forty miles N. N. E. of Edinburgh, at the discharge of the river Brothick into the sea. It is a small well-built town, and is gradually improving. Its manufactures consist of coarse brown linens, sailcloth, and thread. Its export trade consists of these articles, barley, and wheat; and its imports are flax and timber from the Baltic. Coals and lime form its coasting trade. This port is very ancient, and it is famous for the ruins of an abbey, founded by William the Lion, in 1178, and dedicated to Thomas à Becket. The monks were of the Tyronensian order, and the last abbot was Cardinal Beaton. This town has a chalybeate water, containing iron dissolved in fixed air, and used as a diuretic and corroborative. W. long. 2° 29'. N. lat. 56° 36'.

ABERCONWAY. See CONWAY.

ABERCORN, a small town of Georgia, in America, on the Savannah river, about thirteen miles N. W. of Savannah.

ABERCROMBY, *Thomas*, M. D. in *Biography*, was born at Forfar, in the county of Angus, in 1656, and educated at St. Andrews and Leyden, in which latter place he took his degree in 1685. Upon his return he renounced his religion at the request of James II. and was appointed one of the court physicians. After the revolution he applied to the study of antiquities, and wrote the *Martial Antiquities of Scotland*, in 2 vols. fol. His *Treatise on Wit* is not much esteemed. He died at Edinburgh in 1726, aged 70. *Biog. Diet.*

ABERCROMBY, *David*, in *Biography*, a Scotch physician, published, in 1684, a *Treatise on the Venereal Disease*, under the title, *Tracta et efficacia Lasis Venerae, sæpe abique Mercurio, et semper abique Salivatione Mercuriali, curandæ Methodus*, 8vo. This was followed by another book on the same subject, in the year 1687. He also published, *De Pulsus Variatione*, an. 1685; and, in the same year, *Ars explorandæ medicas facultates Plantarum, ex solo sapore*. His works however are of little value.

ABERDARON Bay, in *Geography*, is situated within the S. W. point of Caernarvon county in Wales, and N. E. from Bardley island.

ABERDAVINE, in *Ornithology*, a name sometimes given to a species of FRINGILLA, more generally called SISKIN. See SPINUS.

ABERDEEN, in *Geography*, the name of two cities in Scotland, called the *Old* and *New Town*, situated on the German ocean. This is a place of great antiquity; as it appears, that privileges were conferred upon it in the reign of Gregory, about the year 893; and a bishoprick founded by Malcolm II. in 1004, at a place in Banffshire, was transferred to old *Aberdeen* by David I.; and, in 1163, a new charter was obtained from Malcolm IV. Another charter was granted by Alexander II. in 1217.

Old Aberdeen lies at the mouth of the river Don, over which is a fine Gothic bridge of a single arch, resting upon two opposite rocks, which has been much admired, and which is said to have been built about the year 1290. The principal building in this town is the King's College, which is built round a square, with cloisters on the south side. This college was founded in 1494, and from the circumstance of King James IV. claiming the patronage of it, it derives its present name. This and the Marischal College in the new town form one university, called the *University of King Charles*. The library is large, but has not many curiosities. The first principal was Hector Boethius, who was sent hither from Paris on an annual salary of 40 Scots marks, at thirteen pence each.

The *New Town* is the capital of the shire of *Aberdeen*, and exceeds in extent, trade, and appearance, any town in the north of Scotland. It is situated about one mile from the old town, on a rising ground, in a small bay formed by the river Dee, deep enough for a ship of 200 tons, and about two miles in circumference. There is an elegant bridge over the river, consisting of seven arches, which is said to have been built by Dunbar, who was bishop about the year 1500. The chief public building in this town is the Marischal College, founded by George Keith, Earl Marischal, in 1594, and augmented since by many additional buildings. In this college there are about 150 students, who are instructed, as well as those of the king's college, by able professors. Besides two parish-churches, and the college kirk, there is an elegant episcopal chapel, with several meeting-houses. The other public buildings are a handsome town-house, a grammar school, Gordon's hospital, and an

infirmary. The harbour is defended by a strong stone pier, lately erected under the direction of Mr. Smcaton. The trade of Aberdeen is now considerable, and capable of improvement by an attention to the white fisheries. Its imports are from the Baltic, and a few merchants trade to the West Indies and North America. Its exports are stockings, thread, salmon, oatmeal, and pickled pork. The two first articles are very important branches of manufacture in this town and neighbourhood. The salmon fisheries on the Dee and Don, and particularly those of the Dee, are very productive; and Mr. Knox observes, that if the merchants would, in addition to the fish supplied by these, export the cargoes of 50 or 60 vessels, constantly employed in the herring and white fisheries, the port of Aberdeen would in a few years become the most celebrated mart of fish now existing. The number of inhabitants in *Old* and *New Aberdeen* is estimated at 25,000. There are two springs near this town, one of pure water, and another of a quality resembling the German Spa. Aberdeen, with Aberbrothick, Brechin, Montrose, and Inverberie, returns one member to parliament. Aberdeen is 84 miles N. E. of Edinburgh. W. long. 2° 8'. N. lat. 57° 9'.

ABERDEENSHIRE, a county of Scotland, which comprehends the districts of Mar, Garioch, Strathbogie, and the greater part of Buchan. It is washed on the east and north by the German ocean, and abounds in sea-ports, which are convenient for commerce. The rivers are numerous, and the banks exhibit many natural woods and extensive plantations. In the high parts there is much excellent pasture, and in the level tract, called Strathbogie, there are many well cultivated fields. This county sends one member to parliament.

ABERDOVEY, a small sea-port in Merionethshire, at the discharge of the river Dovey into the bay of Cardigan. Its export trade, which is not considerable, consists of flannels, Welch webs, oak bark, and other productions of the vale of Dovey.

ABERDOUR, a small town of Fifeshire, in Scotland, on the Frith of Forth, about ten miles N. W. of Edinburgh.

ABEREMURDER, ABERMURDRUM, in *Ancient Law Books*, denotes murder that has been proved, or made manifest by a judiciary process.

The word is Anglo-Saxon, compounded of *ebere*, *proved* or *clear*, and *morth*, *killing* or *homicide*.

In this sense, *aberemurder*, called also *eberemurder*, amounts to the same with *probatum murdrum*, or *murder which needed proof*; and stands opposed to open murder, which was murder sufficiently known by the notoriety of the fact.

Lambard explains *aberemurder* by *manifestum murdrum*; and Spelman, by *causæ manifesta*: others, by *apertum murdrum*.

Aberemurdrum was one of those crimes which could not be expiated by money, as most others might be.

ABERFORD, in *Geography*, a market-town in the west riding of Yorkshire, 184 miles N. N. W. of London. W. long. 1° 21'. N. lat. 53° 50'.

ABERFRAW, a village in the isle of Anglesey, where the princes of North Wales had formerly a palace. W. long. 4° 36'. N. lat. 33° 53'.

ABERGAVENTNY, an irregularly built town of Monmouthshire, beautifully situated in the midst of a range of meadows, at the confluence of the rivers Usk and Gavenny, and surrounded by several projecting hills. It contains about 500 houses. Its public buildings consist chiefly of a long Gothic bridge, the imperfect fragments of a castle, and an ancient church adjoining to the priory. It is a place of resort in summer for goats' whey, and is a great thoroughfare to the western parts of South Wales. It is about 143 miles W. by N. of London. W. long. 3° 5'. N. lat. 51° 50'.

Abergavenny seems to have been the *Gibbanium* of Antoninus, and *Usx* his *Burrium*. At the distance of a few miles from this town are the ruins of Llantony Abbey, situate in one of the deepest recesses of the black mountains, founded on the site of a chapel, supposed to be the residence of St. David, the tutelary saint of Wales. It was rebuilt, and the monastery formed for Augustine monks by Sir William de Lacy, in 1108.

ABERNETHY, a town in Strathern, a district of Perthshire, in Scotland. It is situated on the river Tay, and said to have been the residence of the Pictish kings, and the see of an archbishop, since transferred to St. Andrews. It is now much decayed.

ABERNETHY, *John*, in *Biography*, an eminent presbyterian divine, was born at Coleraine, in Londonderry, on the 19th of October 1680. His father was a dissenting minister in that town. After continuing under the care of his parents for nine years, he was separated from them by a concurrence of circumstances, which in the event proved favourable. His father had business in London, and his mother removed to Derry. Their son accompanied a relation to Scotland, who removed thither to avoid the troubles occasioned by the insurrection in Ireland; and he thus escaped the danger attending the siege of Derry, in which Mrs. Abernethy lost all her other children. At the early age of thirteen he was sent to the college at Glasgow, where he remained till he had taken the degree of Master of Arts. In conformity to the advice of his friends, he declined the profession of physic, to which his views were at first directed, and devoted himself to the study of divinity under Professor Campbell at Edinburgh. Such was his success in the prosecution of this object, that he was licensed to preach by the Presbytery of Route before he was twenty-one years of age. In 1703, after having been for some years at Dublin with a view to farther improvement, he was ordained at Antrim; where his public performances were much admired, and where his general conduct and distinguished attainments recommended him to the esteem of all who knew him. He was much respected not only by his brethren in the ministry, but by many of the laity, who were pleased with the vivacity of his disposition, and the urbanity of his manners. His talents and virtues gave him a considerable ascendancy in the Synod, so that he had a large share in the management of public affairs. As a speaker, he was considered as their chief ornament; and he maintained his character in these respects, and his interest in their esteem, to the last, even when a change of his religious sentiments had excited the opposition of many violent antagonists. In 1716 he attempted to remove the prejudices of the native Irish in the neighbourhood of Antrim, who were of the popish persuasion, and to engage them to embrace the protestant religion. His labours in this laudable design were not without success. Several of them were induced to renounce popery, and continued firm in their attachment to protestant principles; though others, to his great discouragement, reverted to their former persuasion. In the following year he received two invitations, one from Dublin, and another from Belfast; and the Synod, whose authority was very great, advised his removal to Dublin. Such, however, was his attachment to his congregation at Antrim, that he determined to continue there, at the risk of incurring the displeasure of the Synod. The interference of this assembly was repugnant to those sentiments of religious freedom which Mr. Abernethy had been led to entertain, by the exercise of his own vigorous faculties, and by an attention to the BANGORIAN controversy, which prevailed in England about this time. Many other ministers in the north of Ireland formed more enlarged ideas of christ-

tian liberty and charity than they had been accustomed to do, by means of the writings of Dr. Hoadly and his associates. With a view to the improvement of useful knowledge, they instituted a society, whose professed aim was to bring things to the test of reason and scripture. This laudable design was probably suggested by Mr. Abernethy. However he was very active in promoting it. As the gentlemen who concurred in this scheme met at Belfast, the society derived its appellation from the place in which they assembled. In the progress of this business, and in consequence of the debates and dissensions that were occasioned by it, several persons withdrew from the society; and those who adhered to it were distinguished by the title of non-subscribers. Their avowed principles were these:—"First, That our Lord Jesus Christ hath in the New Testament determined and fixed the terms of communion in his church: that all christians who comply with these have a right to communion; and that no man, or set of men, have power to add any other terms to those settled in the gospel. Secondly, That it is not necessary as an evidence of soundness in the faith, that candidates for the ministry should subscribe the Westminster Confession, or any uninspired form of articles, or confession of faith, as the term upon which they shall be admitted; and that no church has a right to impose such a subscription upon them. Thirdly, That to call upon men to make declarations concerning their faith, upon the penalty of cutting them off from communion, if they should refuse it, and this merely upon suspicion and jealousies, while the persons required to purge themselves by such declarations, cannot be fairly convicted upon evidence of any error or heresy, is to exercise an exorbitant and arbitrary power, and is really an inquisition." Mr. Abernethy was justly considered as the head of the non-subscribers, and he became of course a principal object of reproach and persecution. In an early period of this controversy, viz. in 1719, he published a sermon from Romans, xiv. 5. in which he explained the rights of private judgment, and the foundations of christian liberty. He afterwards published a small piece, intitled, "Seasonable Advice to the contending Parties in the North," which was accompanied with a Preface by the Reverend Messrs. Weld, Boyse, and Chappin, of Dublin. The design of this publication was to prove, that there ought to be no breach of communion among the Protestant Dissenters on account of their different sentiments and practices concerning subscription to the Westminster Confession. The Synod, however, determined, in 1726, that the non-subscribers should no longer be of their body, and revived, with additional force, the act of 1705, requiring the candidates for the ministry to subscribe the Westminster Confession. From that time the excluded members formed themselves into a separate Presbytery, and prepared to encounter many difficulties and hardships. Mr. Abernethy found that his justly acquired reputation, which he had uniformly maintained by a most exemplary life, was no security to him against these evils. Some of his congregation deserted him, and under the influence of the Synod formed themselves into a distinct society; and though most of his old friends adhered to him, he thought it most advisable to accept an invitation which he received from the congregation of Woodstreet, in Dublin; and accordingly he removed thither in 1730. At Dublin he prosecuted his studies with renewed diligence; and deviated from a practice which he had pursued in the north, by writing his sermons at full length, and constantly using his notes in the pulpit. The dissenters in Ireland being at this time desirous of emancipating themselves from the incapacities devolved upon them by the Test

A. A. Mr. Abernethy, in 1731, wrote a paper, in subser-
vency to this design, with a view of shewing the unreason-
ableness and injustice of all those laws, which upon account of
merit difference in religious opinions and forms of worship,
excluded men of integrity and ability from serving their
country, and debarred them of those privileges and advan-
tages to which they had a natural and just title as free-born
subjects. He particularly insinuated that, considering the state
of Ireland, it was a great error, in point of policy, to con-
tinue restraints which weakened the protestant interest, and
were prejudicial to the government. In 1733 the Irish dis-
senters made an attempt for obtaining the repeal of the
obnoxious act, and Mr. Abernethy again appeared from the
press in favour of the scheme; but the design miscarried. He
continued his labours in Wood-street for ten years, and en-
joyed great satisfaction in the society and esteem of his
friends. From the strength of his constitution, the vi-
gour of his spirit, and the uniform temperance of his life,
there was reason to hope, that his usefulness would have
been prolonged. But a sudden attack of the gout in the
head, to which disorder he had been subject, frustrated the
expectations of his friends, and he died, December 1740,
in the 60th year of his age. For this event he was fully
prepared, and he met it with great composure and firmness of
mind, with a cheerful acquiescence in the will, and a fixed
trust in the power and goodness of the Almighty. Mr.
Abernethy was twice married; first, soon after his settle-
ment at Antrim, to a lady of excellent character, of whom he was
deprived in 1712; and again, after his removal to Dublin,
to another lady, with whom he lived, in all the tender-
ness of conjugal affection, to his death. The most celebrated
of Mr. Abernethy's writings were his two volumes of Dis-
courses on the Divine Attributes, which were much ad-
mired at the time of their publication, and honourably recom-
mended by the late excellent Archbishop Herring; and are
still held in the highest esteem by those who are disposed to
approve the most liberal or manly sentiments on the great sub-
jects of natural religion. Four volumes of posthumous Ser-
mons were likewise published, the two first in 1748, and
the others in 1757; to which is prefixed the Life of the
Author, written, as is generally understood, by Dr.
Duchal. A volume, intitled, "Scarce and valuable Tracts
and Sermons, &c." was published in 1751. He also left
behind him a Diary of his Life, consisting of six large
volumes in 4to. of which the author of his Life has given
a large account, and from which he has made many valu-
able extracts, which bear ample testimony to the singular
excellence of his disposition and character. Biog. Brit.

ABERRATION, in *Astronomy*, an apparent motion in
the celestial bodies, occasioned by the progressive motion
of light, and the earth's annual motion in its orbit: the theory
of which is explained by Dr. Bradley: for an account of
which, see LIGHT and STAR.

This theory may be illustrated and applied in the follow-
ing manner. If light be supposed to have a progressive mo-
tion, the position of the telescope, through which any celest-
ial object is viewed, must be different from that which it
would have been, if light had been instantaneous; and there-
fore the place measured in the heavens will be different from
the true place. Thus, if S' be a fixed star (*ASTRONOMY*,
plate i. fig. 1.), VF the direction of the earth's motion, $S'F$
the direction of a particle of light, entering the axis ac of a
telescope at a , and moving through aF whilst the earth
moves from c to F , and if the telescope be kept parallel to
itself, the light will descend in the axis. For, let the axis
 nm , continue parallel to ac ; and if each motion be
considered as uniform, that of the spectator, occasioned by

the earth's rotation, being disregarded, because it is so small
as to produce no effect, the spaces described in the same time
will preserve the same proportion; but cF and aF being de-
scribed in the same time, and as we have $cF : aF :: cn : av$,
 cn and av will be described in the same time; and therefore
when the telescope is in the situation nm , the particle of
light will be at v in the telescope; and the case being the
same in every moment of its descent, the place measured by
the telescope at F is s' and the angle $S'F'$ is the *aberration*,
or the difference between the true place of the star, and the
place measured by the instrument. Hence it appears, that
if we take $FS : Ft ::$ the velocity of light : the velocity of
the earth, join $S't$ and complete the parallelogram $F'S't$, the
aberration will be equal to $FS't$, S will be the true place of the
star, and s the place measured by the instrument: and this
latter is the same with the apparent place of the object, as it
would be seen by the naked eye. In order to prove this, let
it be considered, that if a particle of light fall upon the eye
in motion, its relative motion with regard to the eye will be
the same as if equal motions, in the same direction, were im-
pressed upon each at the moment of contact; for it is well
known to be a principle in mechanics, that equal motions in
the same direction, impressed upon two bodies, will not affect
their relative motions, and consequently the effect of one upon
the other will not be altered. Let VF then be a tangent to
the earth's orbit at F , and represent the direction of the
earth's motion at F , and S' a star; join $S'F$, and produce it to
 G , and take $FG : Fn ::$ the velocity of light : the velocity
of the earth in its orbit; complete the parallelogram $FGHn$,
and draw the diagonal FH . Since FG and nF represent the
motions of light and of the earth, if we conceive a motion
 Fn equal and opposite to nF to be impressed upon the eye
at F , and upon the particle of light, then the eye will be at
rest, and the particle of light, by two motions FG and Fn ,
will describe the diagonal FH , which is its relative motion
with respect to the eye itself. Hence it follows, that the
object appears in the direction HF , and consequently that
its apparent place differs from its true place by the angle
 $G'FH = FS't$.

But by trigonometry, sine $FS't : \text{sin. } F'S :: Ft : FS ::$ the
velocity of the earth : the velocity of light, and therefore
the sine of *aberration* = $\text{sin. } F'S \times \frac{\text{vel. of earth}}{\text{vel. of light}}$; and if these
velocities be considered as constant, the sine of *aberration*, or
the *aberration* itself, which never exceeds $20''$, varies as the
sine of $F'S$, and is therefore greatest when $F'S$ is a right
angle. Let s then express the sine of $F'S$, and we shall
have 1 (radius) : $s :: 20'' : s \times 20''$, the *aberration*. Hence
when Ft coincides with FS' , or the earth is moving directly
to or from a star, there is no *aberration*. And since $FS't =$
 $20''$ when $F'S = 90^\circ$, we shall have the velocity of the
earth : the velocity of light :: $\text{sin. } 20'' : \text{radius} :: 1 : 10314$.
It appears that the *aberration* $S's'$ lies from the true place of
a star in a direction parallel to that of the earth's motion,
and towards the same part.

M. de Maupertuis, in his *Elements of Geography*, fami-
liarly illustrates the *aberration* by the direction in which a gun
must be pointed in order to shoot a bird in its flight. In-
stead of pointing straight to the bird, the fowler directs the
gun a little before it in the path of its flight; and so much
the more as the flight of the bird is more rapid with respect
to that of the shot. M. Clairaut too, in the *Mem. of the*
Acad. Scienc. for 1746, explains the *aberration* by suppos-
ing drops of rain to fall quickly and rapidly after each other
from a cloud, under which a person moves with a very nar-
row tube; in which case it is evident that the tube must
have a certain inclination, in order to admit a drop which
enters

enters at the top, to fall freely through the axis of the tube, without touching the sides of it: and this inclination must be greater or less according to the velocity of the drops in respect to that of the tube. In this case the angle made by the direction of the tube, and that of the falling drops, is the *aberration* arising from the combination of these two motions.

To find the *aberration* in latitude and longitude. Let ABCD (ASTRON. pl. i. fig. 2.) be the earth's orbit, supposed to be a circle, with the sun in the centre at *x*, let P be in a line drawn from *x* perpendicular to ABCD, and represent the pole of the ecliptic; let S be the true place of a star, and *apcq* be the circle of *aberration* parallel to the ecliptic, and *abcd* the ellipse into which it is projected; let φT be an arc of the ecliptic, and PSG a secondary to it, which will coincide with the lesser axis *bd*, into which the diameter *pq* is projected; draw GCx, which is parallel to *pq*, and BxD perpendicular to it must be parallel to the greater axis *ac*: then, when the earth is at A, the star is in conjunction, and in opposition when the earth is at C. But as the place of the star in the circle of *aberration* is always 90° before the earth in its orbit, when the earth is at A, B, C, D, the apparent places of the star in the circle will be at *a, p, c, q*, or in the ellipse at *a, b, c, d*: and to find the place of the star in the circle, when the earth is at any point E, take the angle $pSs = ExB$, and *s* will be the corresponding place of the star in the circle; and to find the projected place in the ellipse, draw *sv* perpendicular to *Sc*, and *vt* perpendicular to *Sc* in the plane of the ellipse, and *t* will be the apparent place of the star in the ellipse; join *s* and *t*, and *st* will be perpendicular to *vt*, because the projection of the circle into the ellipse is in lines perpendicular to the ellipse; draw the secondary P*vt*K, which will, as to sense, coincide with *vt*, unless the star be very near to the pole of the ecliptic. Now as *cvS* is parallel to the ecliptic, S and *v* must have the same latitude; hence *vt* is the *aberration in latitude*; and as G is the true, and K the apparent place of the star in the ecliptic, GK is the *aberration in longitude*. To find these, put *m* and *n* for the sine and cosine of the angle *sSc*, or Cx*E* the distance of the earth from syzygies, radius being 1; and as the angle *svt* = the complement of the star's latitude, the angle *vst* = the star's latitude, for the sine and cosine of which put *v* and *w*, and put *r* = Sa, or S*s*: then in the right angled triangle S*sv*, $1 : m :: r : sv = rm$; and therefore in the triangle *vts*, $1 : v :: rm : tv = rvm$, the *aberration in latitude*. Also, in the triangle S*sv*, $1 : n :: r : vS = rn$; hence $w : 1 :: rn : GK = \frac{rn}{w}$, the *aberration in longitude*. When the earth is in syzygies, *m* = 0, therefore there is no *aberration* in latitude; and as *n* is then greatest, there is the greatest *aberration* in longitude. If the earth be at A, or the star in conjunction, the apparent place of the star is at *a*, and reduced to the ecliptic at H; therefore GH is the *aberration*, which diminishes the longitude of the star, the order of the signs being γ GT. In this case the

angle Ax*E* described by the earth from conjunction, or the angle *sSa*, shews the elongation of the star from the sun. But when the earth is at C, or the star in opposition, the apparent place *c* reduced to the ecliptic is at F, and the *aberration* GF increases the longitude: hence the longitude is the greatest when the star is in opposition, and least when in conjunction. When the earth is in quadratures at D or B, then *n* = 0, and *m* is greatest, therefore there is no *aberration* in longitude, but the greatest in latitude; when the earth is at D, the apparent place of the star is at *d*, and the latitude is there increased; but when the earth is at B, the apparent place of the star is at *l*, and the latitude is diminished; hence the latitude is least in the quadratures before opposition, and greatest in quadratures after opposition. From the mean of a great number of observations, Dr. Bradley determined the value of *r* to be $20''$.

From the principles above stated and explained it appears, that the greatest *aberration in latitude* is equal to $20''$ multiplied by the sine of the star's latitude; and that the *aberration in latitude* for any time is equal to $20''$ multiplied by the sine of the star's latitude, and multiplied also by the sine of the elongation found for the same time. The *aberration* is subtractive before the opposition, and additive after it. The greatest *aberration in longitude* is equal to $20''$ divided by the cosine of its latitude; and the *aberration* for any time is equal to $20''$ multiplied by the cosine of the elongation of the star, and divided by the cosine of its latitude. This *aberration* is subtractive in the first and last quadrant of the argument, or of the difference between the longitudes of the sun and star, and additive in the second and third quadrants. The application of these rules will be seen in the following examples:

1. To find the greatest *aberration* of γ *Ursæ minoris*, whose latitude is $75^\circ 13'$. Here *m* = 1, *v* = ,9669 the sin. $75^\circ 13'$; consequently $20'' \times ,9669 = 19'', 34$ the greatest *aberration in latitude*. Also, *n* = 1, *w* = ,2551; and therefore $\frac{20''}{,2551} = 78'', 4$ the greatest *aberration in longitude*.

2. To find the *aberration* of the same star, when the earth is 30° from syzygies. Here *m* = ,5, and therefore $19'', 34 \times ,5 = 9'', 67$ the *aberration in latitude*. If the earth be 30° beyond conjunction or before opposition, the latitude is diminished; but if it be 30° after opposition or before conjunction, the latitude is increased. Also, *n* = ,866; consequently $78'', 4 \times ,866 = 67'', 89$ the *aberration in longitude*. If the earth be 30° from conjunction, the longitude is diminished; but if it be 30° from opposition, it is increased.

3. For the sun, *m* = 0, *n* = 1, and *w* = 1: hence it has no *aberration in latitude*, and the *aberration in longitude* = *r* = $20''$ constantly; and this quantity of *aberration* answers to the sun's mean motion in $8' 7'' 30''$, which is therefore the time which the light takes to move from the sun to us at its mean distance. Hence the sun always appears $20''$ more backward than its true place.—The following table will expedite the calculations:

The Argument for the Longitude is, *Long. Sun—
I. ang. Star*. The Argument for the Latitude is, *Long.
Sun—I. ang. Star—3 Signs*.

	XI. V.	X. IV.	IX. III.				

To find the *aberration in longitude*, multiply the quantities taken from this table by $\left\{ \begin{matrix} \text{secant} \\ \text{fine} \end{matrix} \right\}$ of the star's latitude.

Ex. Let the longitude of the fun be $7^{\circ} 5' 18''$, the long. of a star $5^{\circ} 18' 14''$, and its latitude $31^{\circ} 10'$.

$7^{\circ} 5' 18''$
 $5^{\circ} 18' 14''$

$1 \quad 17 \quad 4 \quad - \quad - \quad -13'', \quad 62$
 $31 \quad 10 \quad \text{Sec.} \quad - \quad - \quad 1, \quad 169$

Aberration in longitude $- -15, \quad 92$ Product.

$1^{\circ} 17' 4'' - 3'' = 1^{\circ} 17' 1'' - 14'', 65$
 $31 \quad 10 \quad \text{Sine} \quad - \quad - \quad 0, 5175$

Aberration in latitude $- 7, 58$ Product.

To find the *Aberration in declination and right ascension*. Dr. Bradley has annexed to his theory the rules or formulæ for this purpose; and these rules have been variously de-

monstrated, and reduced to other practical forms by M. Clairaut, in the Mem. of the Acad. of Sciences for 1737; by Mr. Simpson in his Essays in 1740; by M. Fontaine des Crutes in 1744; by M. Euler, Mem. Acad. Berlin, tom. ii. p. 14. &c.; and by several other persons. The results of them are as follow:—The greatest *aberration in declination* is equal to $20''$, multiplied by the sine of the angle of position A at the star, and divided by the sine of B, the difference of longitude between the sun and star, when the *aberration in declination* is nothing. And the *aberration in declination* at any other time will be equal to the greatest *aberration* multiplied by the sine of the difference between the sun's place at the given time, and his place when the *aberration* is nothing. Also the sine of the latitude of the star is to radius, as the tangent of A is to the tangent of B. The greatest *aberration in right ascension* is equal to $20''$ multiplied by the cosine of A, the angle of position, and divided by the sine of C, the difference in longitude between the sun and star, when the *aberration in right ascension* is nothing. And the *aberration in right ascension* at any other time, is equal to the greatest *aberration* multiplied by the sine of the difference between the sun's place at the given time, and his place when the *aberration* is nothing. Also, the sine of the latitude of the star is to radius as the cotangent of A to the tangent of C. Hutton's Mathem. Dict. Art. ABERRATION.

Mr. Vince has pursued the method given by M. Cagnoli in his Trigonometry, as the most convenient in practice, and subjoined the tables computed by M. de Lambre in this way.

We shall here annex the tables, referring to Mr. Vince's Astronomy, (*ubi infra*), for the processes, whence the expressions for the *aberration in right ascension and declination* on which they are formed have been deduced.

General Tables for the Aberration of the Fixed Stars.

USE OF THE TABLES.

A = the right ascension } of the star.
 D = the declination }
 S = the longitude of the sun.

Enter Table I. with the argument $A-S$, and Table II. with $A+S$, and the sum of the two corresponding numbers multiplied by the secant of D will be the *aberration in Right Ascension*.

Enter Table I. with the argument $A-S+3$ signs, and Table II. with $A+S+3$ signs, and the sum of the two corresponding numbers multiplied by the sine of D will be the first part of the *aberration in declination*.

Enter Table III. with the arguments $S+D$ and $S-D$, and you will have two other parts of the *aberration in declination*; and the sum of these three parts will give the whole *aberration in Declination*.

If the declination of the star be south, add six signs to $S+D$ and $S-D$.

Ex. To find the *aberration of α Aquile*, on May 10, 1795, at 12 o'clock in the evening.

$A=9^{\circ} 25' 12''$
 $S=1. 20. 12$

$A-S=8. 5. 0$	Table I.	-	$+8^{\circ}, 1$
$A+S=11. 15. 24$	Table II.	-	$+0, 8$
			<hr/>
			$+8, 9$
$D=8^{\circ}. 20'$	secant	-	$1, 011$
			<hr/>
<i>Aberration in Right Ascension</i>		-	$+8, 998$ Product.

$A-S+3$ signs $11^{\circ}. 5^{\circ}. 0'$ Table I. $-17^{\circ}, 38$
 $A+S+3$ signs $2. 15. 24$ Table II. $+0, 21$

			<hr/>
			$-17, 17$
$D=0^{\circ}. 8^{\circ}. 20'$	sine	-	$0, 145$
$S=1. 20. 12$			<hr/>
			$-2, 49$ Product.
$S+D=1^{\circ}. 28^{\circ}. 32'$	Table III.	-	$-2, 08$
$S-D=1. 11. 52$	Table III.	-	$-2, 97$
			<hr/>
<i>Aberration in Declination</i>		-	$-7, 54$

If the star's declination had been south, then

$S+D+6$ signs	$=7^{\circ}. 28^{\circ}. 32'$	Table III.	-	$+2^{\circ}, 08$
$S-D+6$ signs	$=7. 11. 52$	Table III.	-	$+2, 97$
First Part			-	$-2, 49$
				<hr/>
<i>Aberration in Declination</i>		-		$+2, 56$

The *aberration of a star* applied to its apparent place gives the true place. On the subject of this article, see Dr. Maskelyne's rules for finding the *aberration of a star*, and Vince's Astron. vol. i. chap. 22. p. 311—330.

ABERRATION of a planet, in Astronomy, is its geocentric motion, or the space through which it appears to move as seen from the earth, during the time of light's passing from the planet to the earth. Let S (ASTRON. pl. i. fig. 4.) be the sun, T the earth, P the corresponding place of the planet; and let the earth be supposed to move in the direction Tt , parallel to which draw PQ , and let it be equal to the space through which the earth has moved, whilst light passes from P to T , and Q will be the apparent place of the planet. If Pp represent the motion of the planet in the same time, Q being the apparent, and p the corresponding true place, the angle QTp will be the *aberration* arising

from the progressive motion of light and the motion of the planet. Since PQ and Pp represent the motions of the earth and planet, Qp will represent their relative motions; and hence the motion of the planet about the earth in the time which light takes to pass from the planet to the earth in the *aberration*. With respect to the sun, the *aberration* in longitude is constantly $20''$, that being the space moved through by the sun, or by the earth in the time of $8' 7\frac{1}{2}''$, which is the time in which light passes from the sun to the earth. In like manner, if we know the distance of any planet from the earth, we shall obtain its *aberration*. For let $ST=1$, $PT=d$, and m = the angle described by the planet about the earth, or its geocentric motion, in latitude, longitude, right ascension or declination, in 24 hours: then $1 : d :: 8' 7'' . 5 : 8' 7'' . 5d$, the time in which light moves from P to T ; consequently $24 h : 8' 7'' . 5d :: m : \text{the aberration} = 8' 7'' . 5 dm$

$\frac{8' 7'' . 5 dm}{24 h} = 0,00564 dm$. Thus by taking the geocentric motion from the Nautical Almanac, and estimating the distance, in doing which no great accuracy is required, we shall find the *aberration* of a planet in latitude, longitude, right ascension or declination. When m is = 0, or the planet is stationary, the *aberration* is evidently equal to nothing.

Ex. 1. On May 1, 1791, at noon, What is the *aberration* in longitude of Mars? Here $SP=1,5237$ the mean distance, the longitude of the sun is $1^{\circ} 11'$, and the geocentric longitude of Mars is $0^{\circ} 29' 19''$; and therefore the angle $PTS=11^{\circ} 41'$, and consequently $PT=2,489=d$; and $m=44' 50''=2690''$, taken from the Nautical Almanac; hence $0,00564 dm=37\frac{2}{3}''$ the *aberration* in longitude.

Ex. 2. For the Moon, $d=0,00253$ the mean distance, $m=13^{\circ} 10' 35''=47435''$ the mean diurnal motion: hence $0,00564 dm=0^{\circ}, 67$ the *aberration*, which is so small that it may be neglected.

It is evident that the *aberration* will be greatest in the longitude, and very small in latitude, because the planets deviate very little from the plane of the ecliptic, so that this *aberration* is almost insensible and disregarded: the greatest in Mercury being only about $4\frac{1}{3}''$, and much less in the other planets. As to the *aberrations* in declination and right ascension, they must depend upon the situation of the planet in the zodiac. The *aberration* in longitude being equal to the geocentric motion, will be greater or less according to this motion. It will be greatest in the superior planets Mars, Jupiter, Saturn, &c. when they are in opposition to the sun; but in the inferior planets Venus and Mercury, the *aberration* is greatest at the time of their superior conjunction. These maxima of *aberration* for the several planets, when their distance from the sun is least, are as follow, viz. Georgian or Herschell $25''$, Saturn $27''$, Jupiter $20''$, Mars $36''$, Venus $43'' . 5$, Mercury $59'' . 5$, and the Moon $\frac{3}{4}$. Between these numbers and nothing the *aberrations* in longitude vary according to the situation of the planets. That of the Sun, however, is invariable, being constantly $20''$: and this may alter his declination by a quantity which varies from 0 to near $8''$, being the greatest, or $8''$, about the equinoxes, and vanishing in the solstices. The methods and formulæ of computation are given by M. Clairaut in the Mem. Acad. Scienc. for 1746, and by Mr. Euler in the Berlin Mem. vol. ii. for 1746. M. de la Lande has calculated a table shewing the *aberrations* of the planets at various degrees of elongation from the sun, by means of which the apparent place may be determined from the true place. When the planet is stationary, there is no *aberration*; when the planet's motion is direct, the *aberration* is negative, and when retrograde, positive. This table is published by Mr. Vince. It has been already stated, that the

the aberration is = 0,00564 d/n, if the earth's distance be supposed 1; and if this distance be represented by 10, the aberration will be = 0,00564 d/n, upon which foundation the following table was constructed. If the distance be greater than 10, e. g. 37, find the value for 10, multiply it by 3, and add to the product the value for 7.

A T A B L E

To find the Aberration of a Planet or Comet, in Longitude, Longitude, Right Ascension or Declination.

Suppose the distance of a comet to be 43, and its apparent motion in 24 hours to be 2° 15' in longitude, and it be required to find the aberration in longitude. If we enter the table with the distance 10 and daily motion 2° 15', we thus get 45",68, which multiplied by 4, gives 182",7, and by entering with the distance 3, we obtain 13",7; and therefore the aberration is 196",4.

For reducing the place of the body computed from the table, to the apparent place, add the aberration, if the latitude, longitude, right ascension, or declination of the body decrease, but subtract, if it increase; and the contrary, to reduce the apparent to the true place. See Vince's Astronomy, vol. i. p. 332—338. See remarks on the effects of aberration on the transit of Venus over the sun by Dr. Price in Phil. Transf. vol. lx. art. 47. p. 536.

ABERRATION, in Medicine, signifies a deviation from the ordinary course of nature.

ABERRATION, in Optics, is used to denote that error or deviation of the rays of light, when inflected by a lens or speculum, whereby they are hindered from meeting or uniting in the same point, called the geometrical focus. It is either lateral or longitudinal. The lateral aberration is measured by a perpendicular to the axis of the speculum, pro-

duced from the focus, to meet the reflected or refracted ray: the longitudinal aberration is the distance of the focus from the point in which the same ray intersects the axis. If the focal distance of any lenses be given, their apertures be small, and the incident rays homogeneous and parallel, the longitudinal aberrations will be as the squares, and the lateral aberrations as the cubes of the linear apertures.

There are two species of aberration, distinguished by their different causes: one arising from the figure of the glass or speculum; the other from the unequal refrangibility of the rays of light. The second species of aberration is sometimes called the Newtonian, from its having been discovered by Sir I. Newton. With regard to the former species of aberration we may observe, that if rays proceed from a point at a given distance, they will be reflected into the other focus of an ellipse when the luminous point is in one focus, or directly from the other focus of an hyperbola; and if the luminous point be infinitely distant, so that the rays are parallel, they will be reflected by a parabola into its focus: but in both cases they will be dispersed by lenses of all other figures. Specula of the former kind are made with difficulty; and therefore curved specula are commonly of a spherical figure, which have no accurate geometrical focus. Let BVE (OPTICS Pl. i. fig. 1.) represent a concave spherical speculum, whose centre is C; and let AB, EF be two incident rays parallel to the axis CV. At the angle of reflection is equal to the angle of incidence, if CB and CF be drawn to the points of incidence, and the lines BD and FG be drawn so as to make the angles CBD and CFG respectively equal to CBA and CFE, BD and FG will be the reflected rays, and D and G the points in which they meet the axis. Because the triangles CBD and CFG are isosceles, the angles at the base being equal, the sides CD, DB, and CG, GF, are respectively equal, and therefore the points of coincidence with the axis are equally distant from the point of incidence and the centre. Hence it appears, that if B be indefinitely near the vertex V, D will be in the middle of the radius CV; and the nearer the incident rays are to the axis, so much the nearer will the reflected ray be to the middle of the radius, and vice versa. So that the aberration of any incident ray increases, as it is farther removed from the axis, till the distance VI become 60 degrees; in which case the reflected ray is equal to the radius, its point of intersection coincides with the vertex, and the aberration is equal to the radius. This illustration shows us why specula are made of very small segments of spheres, viz. that all their reflected rays may intersect the axis near the middle point of the radius, and thus suffer the least aberration, and render the image more distinct. The case is the same with regard to rays refracted through lenses.

In different spherical lenses M. Huygens has demonstrated that the aberration from the figure is as follows: 1. In all plano-convex lenses, having their plane surface exposed to parallel rays, the longitudinal aberration of the extreme ray, or that remotest from the axis, is equal to 1/2 of the thickness of the lens.

2. In all plano-convex lenses, having their convex surface exposed to parallel rays, the longitudinal aberration of the extreme ray is equal to 1/6 of the thickness of the lens: the aberration in this case being about 1/4th of that in the former, or in proportion to it, as 7 to 27.

3. In all double convex lenses of equal spheres, the aberration of the extreme rays is equal to 1/3 of the thickness of the lens.

4. In a double convex lens, the radii of whose spheres are as 1 to 6, if the more convex surface be exposed to parallel rays, the aberration from the figure is less than in any other spherical lens, being no more than 1/12 of its thickness.

M. Huygens has also shewn, that the same *aberration* is produced by concave lenses as by similar convex ones.

However this species of *aberration* is altogether inconsiderable, compared with the latter; insomuch that if the object-glass of a telescope be plano-convex, and the plane side be turned towards the object, and the diameter of the sphere to which the convex side of the glass is ground, be 100 feet, the semidiameter of the aperture be two inches, and the ratio of the sine of incidence out of glass into air 1 to that of refraction as 20 to 31; the diameter of the circle

of *aberrations* will in this case be only $\frac{961}{72000000}$ parts of

an inch. But the diameter of the little circle, through which the same rays are scattered by unequal refrangibility, will be about the 55th part of the breadth of the aperture of the object-glass, which is here four inches; and therefore the error arising from the spherical figure of the glass is to the error arising from the different refrangibility of the rays,

as $\frac{961}{72000000}$ to $\frac{4}{55}$, that is, as 1 to 5449. See Newton's

Optics, p. 83. 8vo. (apud oper. tom. iii. 347. tom. iv. p. 56. Ed. Horfl.) or Smith's Optics, book ii. chap. 6. (vol. 1. p. 39.) where this proposition is demonstrated. That objects should appear through telescopes so distinct as they do may seem surprising. Newton accounts for the fact by observing, that the rays are not uniformly dispersed over the whole circular space; in the centre they are more dense, and they become more and more rare towards the circumference, and on this account they are not visible, except those of them that are in or near the centre.

In consequence of the discovery of the unequal refrangibility of light, and the apprehension, that equal refractions must produce equal divergencies in every sort of medium, it was imagined, that all spherical object-glasses of telescopes would be equally affected by the different refrangibility of light, in proportion to their aperture, of whatever materials they might be constructed; and therefore, that the only improvement of which refracting telescopes were capable, was that of increasing their length. On this account Sir Isaac Newton, and others after him, despairing of success in the manufacture and use of refracting lenses, directed their chief attention to the construction of reflecting telescopes. However, about the year 1747, M. Euler applied himself to the subject of refraction, and pursuing a hint suggested by Sir Isaac Newton, formed a scheme of making object-glasses with two lenses of glass, inclosing water between them; hoping, that by constructing them of different materials, the refractions would balance one another, and prevent the usual *aberration*. Mr. J. Dollond, an ingenious optician of London, examined this scheme, and found that M. Euler's principles were unsatisfactory. M. Clairaut likewise concurred in opinion, that his speculations were more ingenious than useful.

This controversy, which promised to be of great importance in the science of optics, engaged the attention of M. Klingenshierna of Sweden, and induced him carefully to examine the eighth experiment in the second part of Newton's Optics, with the conclusions which he draws from it. He found, that the rays of light, in the circumstances there supposed, did not lose their colour, as Sir Isaac imagined. This hint of the Swedish philosopher, led Mr. Dollond to re-examine the same experiment; and it appeared, after accurate trials, that different substances made the light to diverge very differently, in proportion to their general refractive power: therefore, in the year 1757, he procured wedges of different kinds of glass, and applied them together, so that the refractions might be made in contrary directions, in order to discover, whether the refractions and divergency of colours would vanish together. The result of his first trials

encouraged him to persevere; for he discovered a difference far beyond his hopes in the refractive qualities of different kinds of glass, with respect to their divergency of colours. The Venice glass and the English crown glass were found to be nearly allied in this respect; the common English plate glass made the light diverge more, and the English flint glass most of all. Without enquiring into the cause of this difference, he proceeded to adapt wedges of crown glass, and of white flint glass, ground to different angles, to each other, so as to refract in different directions, till the refracted light was entirely free from colours. Having measured the refractions of each wedge, he found that of the white glass to be to that of the crown glass nearly as *two to three*; and he deduced this general conclusion, that any two wedges, made in this proportion, and applied together so as to refract in contrary directions, would refract the light without any *aberration* of the rays. Mr. Dollond's next object was to make similar trials with spherical glasses of different materials; and he found that, in order to obtain a refraction of light in contrary directions, one must be concave, and the other convex; the latter, which was to refract the most, that the rays might converge to a real focus, was made of crown glass, and the former of white flint glass; and, the refractions of spherical glasses being in an inverse ratio of their focal distances, it was necessary that the focal distances of the two glasses should be inversely as the ratios of the refractions of the wedges; for being thus proportioned, every ray of light that passes through this combined glass, at any distance from its axis, will constantly be refracted by the difference between two contrary refractions, in the proportion required; and therefore the different refrangibility of the light will be entirely removed.

But in the applications of this admirable discovery to practice, many difficulties occurred. At length, however, by repeated trials, and resolute perseverance, Mr. Dollond succeeded so far as to construct refracting telescopes much superior to any that had before been used; representing objects with great distinctness, and in their true colours.

M. Clairaut, who interested himself betimes in this discovery, endeavoured to ascertain the principles of Mr. Dollond's theory, and to lay down rules for facilitating the construction of these new telescopes. With this view he made several experiments, in order to determine the refractive powers of different kinds of glass, and the proportion in which they separated the rays of light; and from these experiments he deduced several theorems and problems of general use. M. D'Alembert likewise made a great variety of calculations to the same purpose; and shewed how to correct the errors to which these telescopes are subject, by placing the object-glasses, in some cases, at a small distance from one another, and sometimes by using eye-glasses of different refractive powers. But though foreigners were hereby supplied with the most accurate calculations, they were very defective in practice. The English telescopes, made, as they imagined, without any exact rule, were greatly superior to the best of their construction.

M. Euler, who first gave occasion to this important and useful inquiry, was very reluctant in admitting Mr. Dollond's improvements, because they militated against a preconceived theory of his own. At last, however, convinced of their reality and importance by M. Clairaut, he assented; and soon after received farther satisfaction from the experiments of M. Zeiber, of Peterburgh.

M. Zeiber demonstrated, that it is the *lead*, in the composition of glass, which gives it this remarkable property; so that, while the refraction of the mean rays is nearly the same, that of the extreme rays considerably differs; and by increasing the lead, he produced a kind of glass, which occasioned

caused a much greater separation of the extreme rays than the flint glass which Mr. Dollond had made use of, and at the same time considerably increased the mean refraction. M. Zeiker, in the course of his experiments, made glass of minium and flint, with a mixture of alkaline salts; and found that this mixture greatly diminished the mean refraction, without making hardly any change in the dispersion; and he at length obtained a kind of glass greatly superior to the flint glass of Mr. Dollond for the construction of telescopes; since it occasioned *three* times as great a dispersion of the rays as the common glass, whilst the mean refraction was only as 1.61 to 1.

Other kinds of metallic glass, as well as that of lead, possess the same useful property of dispersion. Some philosophers have, indeed, imagined, that there is a constant relation between the specific gravity of glass and its dispersion; but it ought to be considered, that the dispersion in æther and spirit of wine is stronger than that produced in water, which is a much heavier fluid. The object which opticians have generally proposed by using flint and common glass in the construction of achromatic telescopes, might be attained by means of other transparent substances, both solid and fluid. Dr. Blair of Edinburgh has lately evinced this fact. Flint glass was found to reflect the green light considerably less than crown glass, in proportion to the whole refraction of red and violet light; so that when the divergency of the red and that of the violet light, caused by the refraction of the two mediums, are equal, the divergency of the red and green light is always greater in the crown than in the flint glass, and the divergency of the violet and green is always less in the crown than in the flint glass. After a variety of experiments, Dr. Blair discovered that the muriatic and nitric acids, which are dispersive fluids of considerable strength, instead of refracting the green light less than crown glass, in proportion to the whole refraction of the red and violet light, refracted the green light more than crown glass, in proportion to the whole refraction of red and violet light. He, therefore, mixed these two kinds of dispersive mediums, and thus obtained a medium, which disperses the rays much more than crown glass, and yet causes them all to diverge accurately in the same proportion in which they are made to diverge by the refraction of crown glass; which entirely removes the *aberration* from the unequal refrangibility of light.

In 1758, Mr. Dollond made a farther improvement in telescopes, by introducing *two* object-glasses of crown glass, and one of flint. For various papers on the subject of this article, see Phil. Transf. vols. 35. 48. 50. 51. 52. 55. 60. Hist. Ac. Par. for 1737—46—52—55—56—57—62—64—65—67—70. Swed. Mem. vol. xvi. Ac. Berl. 1746, 1762, and 1766. Com. Nov. Petrop. 1762. Euler's Dioptrics. M. D'Alembert's Opus. Mathem. Edinburgh Transactions, vol. iii. pt. 2. p. 1.—76.

For a farther account of Mr. Dollond's and other new refracting telescopes of the achromatic or aplanatic kind, see TELESCOPE.

ABERRATION, *crown of*, is a luminous circle surrounding the real disk of the sun, and depending on the *aberration* of the solar rays, whereby his apparent diameter is enlarged.

ABERSPERG, in *Geography*, anciently *Abusina* or *Aventinum*, a small town and castle in Upper Bavaria, seated on the river Umbs, and containing a convent of Carmelites. It is famous as the birth-place of Johannes Aventinus.

ABERYSTWITH, in *Geography*, a market town of Cardiganshire in Wales, on the Rhydol, near its confluence with the Yŷwith, where it falls into the sea. It is situate on a bold eminence overhanging the sea, or bay of Cardigan. The streets are steep and ill-paved, and the houses are covered with the black slate of the country. It carries on a

trade in lead, calamine, and fish, particularly herrings, which last branch has lately declined; and a few manufactured goods, such as webs, flannels, and stockings. Of late it is has been improving, and is become a place of resort for sea-bathing. Its walls and castle are in ruins. The castle was built by Gilbert de Strongbow, in the reign of Henry I. and commands the whole coast with the contiguous mouths of the Yŷwith and Rhydol on one side, and a beautiful view of the vale which descends with the river on the other. A mint for the coinage of silver was established in this place by king Charles in 1637, and the coin was to be stamped on both sides with the *Feathers*, in order to shew that it was coined in Wales. It is 203 miles W. N. W. of London. W. long. 4°. N. lat. 52° 5'.

ABERMENAI, a passage at the S. W. end of the Merai straits, separating Carnarvonshire from Anglesea.

ABERVILLE river, a branch of the Mississippi, in New Orleans, communicating with the lakes which fall into St. Louis bay.

ABESTA, or **AVESTA**, the name of one of the sacred books of the Persian Magi; which they attribute to their great founder Zoroaster, or Zerdusht.

The *Abesta* is a commentary or exposition of two other of their religious books, called *Zend* and *Paxend*; the three together include the whole system of the *ignicole*, or worshippers of fire. D'Herbel. Bibl. Orient. p. 11. Hyde de Rel. vet. Pers. c. 2.

According to Du Perron, the *Avesta* signifies the language of the Oriental text of Zoroaster's works. Hist. Ac. Sc. Par. 1762. See SHANSCRIT and SHASTAH.

ABESTON. See ASBESTOS.

ABETHANCOURT, *Jacques*, in *Biography*, a physician at Rouen, published *Nova penitentialis quadragesima, et Purgatorium in Morbum Gallicum, five venerum, una cum Dialogo Aquæ Argenti, ac Ligni Guaiaci collectantium super dicti Morbi Curationis prelatura*. Opus fructiferum, Parisiis, 1527, in 8vo.

He is the first French physician who wrote on the venereal disease. Perhaps, M. Eloy says, because the disease appeared at Rouen before it was communicated to other parts of the kingdom.

ABETTOR, or **ABBETTOR**, in *Law*, one who incites or encourages another to perform something criminal; or by some way assists him in the performance itself. It is the same with *art* and *part* in the Scots law.

Thus those who procure others to sue out false appeals of felony, or murder, against men, to render them infamous, are particularly denominated *abettors*.

So *abettors* in MURDER, are such as advise or procure a murder to be committed, or are accessary thereto.

There are *abettors* in FELONY, but not in TREASON; the law looking on all those concerned in treason as principals.

ABEVACUATION, in *Medicine*, denotes a partial evacuation of the peccant humours, either by nature or art.

ABEX, or **ABESH**, in *Geography*, a country of Ethiopia in Africa, bordering on the Red Sea, which bounds it on the east. It has Nubia on the north, Abyssinia on the west and south. Its principal towns are Suaquem and Arkeko. It has the name of Beglerbeg of Habeleth, and is subject to the Turks. It is a sandy, barren, unhealthy country, about 500 miles in length, and 100 in breadth. Being very mountainous, it abounds with wild beasts; and in its forests there are many ebony-trees. See ANIAN.

ABEYANCE, **ABEIANCE**, or **ABBAYANCE**, in *Law-books*, something that only exists in expectation, or in the intendment, or remembrance of the law.

Abeyance, in our law, amounts to much the same with *hereditas*

reditas jacens, among the Romans, and κληροδοσιον, or διαληπτων, among the Greeks; i. e. *hereditas sperata* or *expectata*, or rather *novum dominium expectans*. As civilians say lands and goods *jacent*: so common lawyers say, that things in like condition are in *abeyance*.

It is a maxim in law, that of every land, either there is a fee simple in somebody, or it is in *abeyance*. If a church become vacant by the death of a parson, the freehold is said to be in *abeyance*, till a new parson be inducted, for the patron has not the fee, but only the right of presenting to it, the freehold itself being in the incumbent thus presented, and therefore till such presentation, in nobody.

ABGARUS, in *Biography*, a name given to several of the kings of Edessa; one of whom is said to have been contemporary with Christ; who, hearing of his miracles, and labouring under a grievous distemper, incurable by human skill, applied to him, by letter, for relief. It is also said, that our Saviour returned him a written answer, promising to send one of his disciples to cure him, and that Thaddeus was commissioned for that purpose. Eusebius (Ecl. Hist. lib. i. cap. 13.) relates this story, and says, that the evidence of it existed in the records of the city of Edessa. *Abgarus's* letter, which was sent to our Saviour at Jerusalem by the courier Ananias, is as follows:

“*Abgarus*, toparch (or prince) of Edessa, to Jesus the good Saviour, who has appeared at Jerusalem, sendeth greeting: I have heard of thee, and of thy cures, performed without herbs or other medicines. For it is reported that thou makest the blind to see, and the lame to walk; that thou cleanest lepers, and castest out unclean spirits and dæmons, and healest those who are tormented with diseases of a long standing, and raisest the dead. Having heard of all these things concerning thee, I concluded in my mind one of these two things:—either that thou art God come down from heaven to do these things, or else thou art the Son of God, and so performest them. Wherefore I now write unto thee, intreating thee to come to me, and to heal my distemper. Moreover, I hear that the Jews murmur against thee, and plot to do thee mischief. I have a city, small indeed, but neat, which may suffice for us both.” The following is our Lord’s answer, returned by the same courier: “*Abgarus*, thou art happy, so far as thou hast believed in me, though thou hast not seen me.” John, xx. 29. “For it is written concerning me, that they who have seen me should not believe in me, that they who have not seen me might believe and live. As for what thou hast written to me, desiring me to come to thee, it is necessary that all those things, for which I am sent, should be fulfilled by me, and that after fulfilling them, I should be received up to him that sent me. When, therefore, I shall be received up, I will send to thee one of my disciples, that he may heal thy distemper, and give life to thee, and to those who are with thee.” To these epistles are subjoined many particulars recited by Eusebius: After the ascension of Christ, Thomas, one of the apostles, he says, moved by a divine impulse, sent Thaddeus, one of Christ’s 70 disciples, to Edessa to be a preacher and an evangelist of Christ’s doctrine, by whom all things promised by our Saviour were fulfilled. This was done, A. D. 43. The authenticity of these letters, and of the history to which they relate, has been allowed by Parker, Cave, Grabe, Wake, Tillemont, Addison, and others; but rejected as false and fabulous by the Basnages, Spanheim, Le Clerc, Fabricius, Dupin, Jones, Lardner, &c. The two last writers have produced reasons to prove the whole story to be fictitious, which are unanswerable. Allowing that the particulars recited by Eusebius, who flourished at the beginning of the 4th century,

or before, were recorded in the archives of Edessa, it does not appear that Eusebius was ever at this city and took the account from the archives himself. Besides, it is remarkable, that this story is not mentioned by any writer before Eusebius; that it is not much taken notice of by succeeding writers; that the whole affair was unknown to Christ’s apostles, and to the christians their contemporaries, as is manifest from the early disputes about the method of receiving Gentile converts into the church; which this story, had it been true, must have entirely decided. As to the letters, no doubt can be made of their spuriousness, since, if Christ had written a letter to *Abgarus*, it would have been a part of sacred scripture, and placed at the head of all the books of the New Testament. Dr. Lardner has also pointed out several passages, both in the epistle to *Abgarus*, and in the history, which are liable to exception. Not to add, that it was the opinion of many of the most learned and ancient christians, that our Lord never wrote any thing. See Jones’s Canon of the New Test. vol. ii. p. 1. and Lardner’s Works, vol. vii. p. 222. 231.

ABGILLUS, *John*, surnamed *Prester John*, was son to a king of the Frisii, and from the austerity of his life obtained the name of *Prester*, or priest. He attended Charlemagne in his expedition to the Holy Land; but instead of returning with that monarch to Europe, it is pretended that he gained mighty conquests, and founded the empire of the Abyssines, called from his name the empire of *Prester John*. He is said to have written the history of Charlemagne’s journey into the Holy Land, and of his own into the Indies; but they are more probably trifling romances, written in the ages of ignorance.

ABHEL, in *Botany*, a name given by some to favin, an ever-green garden-shrub, well known in physic in many intentions.

ABHER, in *Geography*, a town of the Persian Irak, or ancient Parthia, in Asia, delightfully situated, and adorned with fine gardens and elegant public buildings. It is about 26 miles S. E. from Sultania.

ABHORRERS, in *English History*, a denomination given to a party about the year 1680, formed in opposition to those called *Petitioners*. In order to restrain the prevailing practice of petitioning against grievances, the church and court party framed addresses, containing the highest expressions of regard to the king, the most entire acquiescence in his wisdom, the most dutiful submission to his prerogative, and the deepest *abhorrence* of those who endeavoured to encroach upon it by prescribing to him any time for assembling the parliament. Thus the nation came to be distinguished into *petitioners* and *abhorers*. But these appellations were soon forgotten, though, when the parliament assembled, great numbers of the *abhorers*, says Hume, (Hist. vol. viii. p. 130.) from all parts of England, were seized by order of the commons and committed to custody.

ABI, in *Biography*, a learned rabbi of Alexandria, who wrote a treatise on the intelligences which move the heavens, and on the influence of the planets. He flourished in Egypt about the year 1150.

ABIAD, in *Geography*, a town of Africa, on the borders of Abex, situated on a high mountain, and remarkable for its trade in ebony and aromatic plants.

ABIAD, or *white river*, flows into the Nile, and is supposed, by some, to be the NILE itself.

ABIAGRASSO, a small town of Italy, seated on a canal, in the duchy of Milan. E. long. 9° 24'. N. lat. 45° 20'.

ABIANS, in *Ancient History*, a people of Thrace, or, as others say, of Scythia, who derived their name from the negative particle *a*, and βίος, *life*, probably because they had no

fettled habitations and regular means of subsistence. They led a wandering life, and carried all their possessions with them in waggon, which were their houses. Their food was the flesh of their flocks and herds, milk, and cheese, and chiefly mare's milk. They were unacquainted with commerce, and though they possessed lands, did not cultivate them. From others, who possessed this office, they received a tribute sufficient to supply them with the mere necessaries of life. They never took arms but to oblige those to make good a promise that was violated. They paid tribute to none of the neighbouring cities; and depended on their own strength and courage to repel any invasion. They were a people of great integrity. Thus Homer has described them, *Abou* τὸν ἄριστον ἀνδρῶν, Strabo, tom. i. p. 453-5. 460. 478.

ABIATHAR, in *Scripture History*, the son of Ahimelech, and the tenth high-priest of the Jews. When Saul, resenting his father's kindness to David, massacred the priests, he alone escaped. Having attached himself to the interest of David, he became the high-priest, though Saul conferred the office on Zadok. But afterwards, conspiring with Adonijah, Solomon deprived him of his office, and banished him. 1 Kings, ii. 26.

ABIB, in the *Hebrew Chronology*, the name of the first month of the ecclesiastical year. This month was afterwards called Nisan, and answers to part of our March and April.

ABIES, in *Botany*, a Species of the PINUS. See FIR-TREE.

ABIES marina, or *Sea-fir*, in *Natural History*, a name given to the *SERRULARIA alatina*. The *Caprifolius*, a species of *ANTIPATHUS*, is by some writers denominated *Abies reclusa*.

ABIGA herba, the *ground-pine* or *CHAMÆPITYS*.

ABIGEATUS. See *ARACTUS*.

ABIHU, one of the sons of AARON, who, within eight days after the consecration of Aaron and his sons, and the dedication of the tabernacle, was consumed with fire, for offering incense with strange fire. Lev. x. 2.

ABII Scythæ, in *Ancient Geography*, a people, supposed by Strabo (tom. i. p. 454-) to be the European Sarmatii, bordering on the Thracians and Bactaræ; they are sometimes called *Avii*, and are commended by Curtius (de Rebus Gestis Alex. Magn. tom. ii. p. 525. Ed. Snakenb.) for their love of justice. See *ABIANS*.

ABIJAH, in *Scripture History*, the son of Jeroboam, who was the first king of the ten tribes of Israel. *Abijah* predicted, that he would be the only person of his family who should receive funeral honours. 1 Kings, xiv. 13.

ABIJAH was the name of a king of Judah, who succeeded Rehoboam. After a reign of three years, during which he imitated the impiety and bad conduct of his father, he died, A. M. 3049, ante A. D. 955.

ABILA, in *Ancient Geography*. See *ABEL-Kiramim*, and *ABUL-Situm*, and also the next article.

ABILENE, in *Ancient Geography*, a small province in Cælo-Syria, between Libanus and Antilibanus, whereof Lyfania was for some time tetrarch. *Abela* or *Alila*, the capital of this province, was N. of Damascus and of Pameas, and S. of Hierapolis. It is mentioned by Polybius, (Hist. l. xvi.) Pliny, (Hist. l. xv. c. 13.) and others. See Luke. iii. 1. Gibbon (History of the Decline and Fall of the Roman Empire, vol. ix. p. 400. 8vo.) informs us, that the produce and manufactures of the country were annually collected in the fair of *Abyla*, about thirty miles from the city, and that they furnished a rich spoil to the Saracens after the conquest of Damascus, A. D. 634.

ABILITY is used, in *Law*, for a capacity of doing certain things, relating either to the acquisition of property, or the transferring of it.

Ability in this sense coincides with *capacity*, and stands opposed to *disability* or *non-ability*.

Every person is supposed to be *able*, i. e. to have the power of taking and disposing of effects, whom the law does not disable.

The king's issue are of *ability* to inherit in England wherefoever born; and children of subjects born beyond sea, may inherit, if their birth were within the allegiance of the king.

ABIMELECH, in *Scripture History*, the name of two kings of Gath, a country of the Philistines, one of whom was contemporary with Abraham, who took away Sarah and determined to marry her, but being warned of his danger, restored her to her husband. She was Abraham's sister, as well as wife, being of the same father, but by another mother. He afterwards made considerable presents to Abraham; and they entered into a mutual covenant at Beerisheba. Gen. ch. xx. xxi. A. M. 2107, ante A. D. 1897. The other *Abimelech* was, probably, the son and successor of the former. Isaac employed the same artifice which had been practised by his father Abraham, in order to preserve Rebekah from the danger to which she was exposed. But when *Abimelech*, who was captivated by her beauty, discovered that she was his wife, he forbade his subjects, upon pain of death, from doing any injury to Isaac or Rebekah. The subsequent prosperity of Isaac excited the envy of the Philistines, upon which *Abimelech* ordered him to depart from them. However, he afterwards formed a covenant with him. A. M. 2200, ante A. D. 1804.

Abimelech was also the name of the natural son of Gideon, by his concubine. His violent acts and death are recorded in Judges, ch. ix. A. M. 2769, ante A. D. 1235.

ABINEAU, in *Geography*, a port of America, on the north side of the Lake Erie, and about 13 miles W. S. W. from fort Erie.

ABINGDON, a market town of Berks, situated on the Thames. It derives its name from an ancient abbey. The assizes, sessions, and county meetings are often held here. It has a good hall for the assizes, &c. Here are two churches said to have been erected by the abbots of *Abingdon*. The streets are well built, and centre in a spacious corn-market. It sends one member to parliament. Great quantities of malt are made here and sent in barges to London. It is seven miles S. of Oxford, and 56 W. of London. This town is said to have been built by Cissa, king of Suffex, A. D. 517, and supposed by Bishop Gibson to be the place called in the Saxon annals, *Clowisfoot*, where two synods are said to have been held, one in 742, and the other in 822. W. long. 1° 12'. N. lat. 51° 42'.

ABINGDON is also the name of the chief town of Washington county in Virginia, about 260 miles in a direct line from Richmond. N. lat. 36° 30'.

ABINGDON is also a town of Harford county in Maryland, 12 miles S. W. from Havre de Grace, and 20 N. E. from Baltimore. Clesbury college, instituted by the methodists in 1785, is in this town.

AB-INTESTATE, in the *Civil Law*, is applied to a person who inherits from one who died intestate.

ABIOSI, *John*, in *Biography*, an Italian physician and astronomer, who lived towards the end of the 15th century and beginning of the 16th. His Dialogue upon Astrology, 4to, Venice, 1494, has been put into the Index Expurgatorius.

ABIPONIANS, in *History*, a tribe of American Indians, who formerly inhabited the district of Chaks in Paraguay; but who have since been compelled by the hostilities of the Spaniards to remove southward, into the territory lying between Santa Fe and St. Jago. M. Dobrizhoffer lived seven years in their country, and published an account of them in 1785. He says, their number is small, and does not exceed

5000, which he ascribes to the women's destroying their infants, in order to prevent the infidelity of their husbands during the long time of their keeping them at the breast, which is not less than two years. They are naturally white, but acquire a brown colour by exposure to the air and smoke. They are strong and hardy, which, as this writer says, is owing to their not marrying before 30 years of age; and they are much celebrated for their chastity and other virtues, though, according to our author, they have no knowledge of a deity; and yet they admit the existence of an evil spirit, and believe that the soul exists for ever. They consider their diseases as the effects of sorcery and witchcraft; and this superstitious notion gives rise to frequent murders. They are ranged into distinct bodies, under their respective chiefs, and, by means of their wild horses, they make frequent and formidable incursions into the territories of the Spaniards; against whom they have conceived an invincible hatred. Their use of horses commenced in 1641; and they manage them with great agility, without stirrups, saddles, or spurs. The fraud and cruelty practised among them by the Spaniards, have induced the Jesuit missionaries to prohibit any of them from coming, without a formal permission, into any of their colonies. The success of these missionaries, in their endeavours to convert them to the christian faith, has been very inconsiderable. They are still so ignorant and uncivilized, that they can proceed in reckoning no farther than the number three; and the Jesuits have failed in teaching them the simplest use and expression of numbers.

ABIRAM, in *Scripture History*, a seditious Levite, who rebelled against MOSES and AARON, with a view of obtaining a share in the government, and who, with Korah and Dathan, concerned with them, were swallowed up alive by the opening earth. Numb. xvi.

ABISHAI, in *Scripture History*, the son of Zeruiah, and brother of Joab, was one of the most valiant warriors of his time, and principal general in the armies of David. His military exploits are recorded in 2 Sam. xxi. 17. xxiii. 18.; but the time and manner of his death are not known.

ABISHERING, an *ancient law term*, denoting a being free, or exempt from all AMERCIAMENTS for transgressions of any kind.

The word in a charter or grant, is said not only to give the proprietor the forfeitures and amerciaments of all others for transgressions committed within his fee, but also to exempt him from all such controul by any within that compass.

ABITIBBI, in *Geography*, the name of a small lake in Upper Canada, to the S. of which is a settlement called Frederick, in N. lat. 49°. W. long. 79° 40'. It is also the name of a river, which runs N. and joins Moofe river, near its mouth at James's bay.

ABITIBIS, a lake to the N. of Nipissing lake, on the N. E. boundary of Canada in New South Wales, which communicates with James's bay, near Moofe fort. W. long. 78° 5'. N. lat. 59° 3'.

ABIUL, a small town of Beira in Portugal. W. long. 7° 10'. N. lat. 40° 20'.

ABJURATION, compounded of *ab*, from or against, and *jurare*, to swear, in a general sense, the act of denying, or renouncing a thing in a solemn manner, and even with an oath.

Among the Romans, *abjuration* signified the denying a debt, pledge, deposit, or the like trust, by a false oath. In which sense, *abjuration* coincides with *perjuration*; and stands distinguished from *ejuration*, where the oath is supposed just.

ABJURATION, more particularly, is used for a solemn re-

nantiation, or renunciation of some doctrine, or opinion, as false and pernicious. Thus it is used in the phrase, *abjuration of HERESY*.

In our own laws, to *abjure* a person, is to renounce all authority or dominion of such a person. By the *oath of abjuration*, a person binds himself not to own any regal authority in the person called the Pretender, or ever to pay him the obedience of a subject. 1 W. and M. 13 W. III. 1 Geo. I. The refusers of the oath enjoined by these statutes are liable to sundry penalties, forfeitures, &c. The oath of *abjuration* by the 6th G. III. cap. 53. "I A. B. do truly and sincerely acknowledge, profess, testify, and declare in my conscience, before God and the world, that our sovereign lord king George is lawful and rightful king of this realm, and all other his majesty's dominions thereunto belonging. And I do solemnly and sincerely declare, that I do believe in my conscience, that not any of the descendants of the person who pretended to be Prince of Wales during the life of the late king James the Second, and since his decease pretended to be, and took upon himself the style and title of king of England, by the name of James the Third, or of Scotland, by the name of James the Eighth, or the style and title of king of Great Britain, hath any right or title whatsoever, to the crown of this realm, or any other the dominions thereunto belonging. And I do renounce, refuse, and abjure any allegiance or obedience to any of them. And I do swear, that I will bear faith and true allegiance to his majesty king George, and him will defend, to the utmost of my power, against all traitorous conspiracies, and attempts whatsoever, which shall be made against his person, crown, and dignity. And I will do my utmost endeavour to disclose and make known to his majesty, and his successors, all treasons and traitorous conspiracies which I shall know to be against him or any of them. And I do faithfully promise, to the utmost of my power, to support, maintain, and defend the succession of the crown against the descendants of the said James, and against all other persons whatsoever; which succession, by an act, intitled, *An act for the further limitation of the crown, and better securing the rights and liberties of the subjects*, is and stands limited to the princess Sophia, electress and duchess dowager of Hanover, and the heirs of her body, being protestants. And all these things I do plainly and sincerely acknowledge and swear, according to these express words by me spoken, and according to the plain and common sense and understanding of the same words, without any equivocation, mental evasion, or secret reservation whatsoever. And I do make this recognition, acknowledgment, *abjuration*, renunciation, and promise heartily, willingly, and truly, upon the true faith of a Christian. So help me God."

ABJURATION is also used in our *Ancient Customs*, for an oath taken by a person guilty of felony; who, flying to a place of sanctuary, would swear to forsake the realm for ever, in lieu of other punishment. We also find instances of temporary *abjuration*, viz. for three years, for one year and a day, and the like. This, in some case, was admitted from criminals in lieu of death. The devotion for the church was so warm, from the time of Edward the Confessor to the Reformation, that if a man, having committed felony, could recover a church or church-yard before he was apprehended, it was an asylum from which he could not be brought to take his trial at law; but confessing his crime to the justices, or coroner, and *abjuring* the kingdom, he was at liberty.

By stat. 21 Jac. I. all use of sanctuaries, and consequently of *abjuration*, is taken away.

ABKHAS, in *History*, one of the seven nations in the countries

countries comprehended between the Black Sea and the Caspian. Their principal and most ancient establishments are on the southern declivity of the mountains that lie between the river Cuban and the Black Sea. They are tributary to the Turks, and are divided into two governments, the eastern and western; each of which is subject to a bashaw. The capital is Anacopia, formerly Nicopsis. They speak a language peculiar to themselves, but bearing a remote affinity to that of the *Circassians*. Some have supposed that it is a dialect of the Celtic. They have little religion, though they preserve some traces of christianity. See **ABASSA** and **ABASCIA**.

ABLACTATION, the weaning of a child from the breast. The proper time for weaning a child must be determined by the state of health of the child, and of the parent, but particularly of the latter. The helplessness of infants, and the late period at which they get their teeth, seem to indicate that nature intended they should derive the greater part of their food, for the first two years, from the breast. This, doubtless, was universally the case in the early periods of the world; as before the culinary art had obtained some degree of perfection, it must have been difficult to have found a sufficient quantity of such kinds of food as the children could properly masticate or digest, without the assistance of the breast. And even now we know this to be the practice in rude and uncivilized countries. The negroes, Mr. Park says in his Travels in the interior Parts of Africa, suckle their children three years. A similar practice prevails among the poorer part of the inhabitants of this, and, perhaps, of every other country in Europe. These people also, previous to weaning their children, and for some time after, chew for them, such parts of their food as they are incapable of masticating. In families better circumstanced, and who are capable of providing for their children proper nourishment, they are usually weaned when they have attained eight or nine months, although they have then rarely more than the eight first teeth, the incisives, or fore teeth. They are therefore necessarily fed for some months after with bread or biscuit softened with milk, or with broth made of beef, mutton, or veal. Pieces of crust of bread, or of flesh, are also given them to chew, which is supposed not only to accelerate the cutting the remainder of their teeth, but by exciting a flow of saliva, to assist in digesting the new kind of food they are now gradually to be accustomed to take. See **WEANING**.

ABLACTATION, in the *Ancient Agriculture*, is a method of engrafting; wherein the cyon of one tree, being united for some time to the stock of another, is afterwards cut off, and, as it were, weaned from its mother-tree.

Among the modern writers *ablactation* is more usually called **ENARCHING**, or **GRAFTING by approach**.

ABLANCOURT. See **PERROT**.

ABLANIA, in *Botany*. See **TRICHOCARPUS**.

ABLAQUEATION, a name used by the ancient writers of *Agriculture* for an operation in gardening, whereby the earth is dug from about a vine, or other fruit-tree, and its roots are laid bare, to expose them more to the sun, rain, and air, in order to promote its fecundity.—The proper season for *ablaqueation* is autumn, for the benefit of the winter rain, and snow water. Bradley fixes it in January. But experience having shewn the practice to be dangerous, it is now generally laid aside.

ABLATION, formed from *aufero*, to take away, in *Surgery*, the removal of whatever might be injurious or useful to the animal body.

ABLATIVE, in *Grammar*, the sixth case of Latin nouns. The word is formed from *aufero*, to take away.

Priscian also calls it the *comparative case*; as it served among the Latins, for comparing, as well as taking away.

The **ABLATIVE** is opposite to the **DATIVE**; the first expressing the action of taking away, and the latter that of giving.

The ablative hardly answers to the just idea of a case; at least it is more vague than any other. It will be shewn in its place that the English, and other modern tongues, have properly no such thing as cases; unless we except the nominative and genitive or possessive, which are the only cases that admit of different terminations. But even in the ancient languages, from which the notion of cases is borrowed, it is suggested, that the ablative is only a sort of supernumerary, or supplement to the rest. The five proper cases not being found sufficient to express all the relations of things to each other, recourse was had to an expedient: viz. the putting a preposition before some of the other cases; and this made the ablative.

It may be added, that in the plural number the ablative is still more obscure, as being only the **DATIVE** repeated. In English, French, &c. there is no precise mark whereby to distinguish the ablative from other cases; and we only use the term in analogy to the Latin. Thus, in the two phrases, *the magnitude of the city*, and *he spoke much of the city*; we say, that *of the city* in the first is *genitive*, and in the latter *ablative*: because it would be so, if the two phrases were expressed in Latin.

The question concerning the Greek ablative has been the subject of a famous literary war between two great grammarians Frischlin and Crusius; the former of whom maintained, and the latter opposed the reality of it.

The dispute is not yet decided. Sanctius, and the Port-royalists, maintained the affirmative; Perizonius the negative. The chief reason alleged by Sanctius is, that the Roman writers often joined Greek words with the Latin prepositions, which govern ablative cases, as well as with nouns of the same case. To which Perizonius answers, that the Latins anciently had no ablative themselves; but instead thereof, made use, like the Greeks, of the dative case; till at length they formed an ablative, governed by prepositions, which were not put before the dative: that, at first, the two cases had always the same termination, as they still have in many instances: but that this was afterwards changed in certain words. It is no wonder then, that the Latins sometimes join prepositions which govern an ablative case, or nouns in the ablative case, with Greek datives, since they were originally the same; and that the Greek dative has the same effect as the Latin ablative. See **CASES**.

ABLATIVE ABSOLUTE, in *Grammar*, is a word or phrase detached and independent of the rest of the discourse; neither governing, nor being governed of any other thing. This is frequent among the Latins; in imitation of whom the modern languages have likewise adopted it.

ABLAY, in *Geography*, a country in Great Tartary, the inhabitants of which, called *Buchars* or *Bachares*, are subject to Russia, for the sake of obtaining its protection, but their chief is a Calmuck. It lies east of the river Irtyz, and extends 500 leagues along the southern frontiers of Siberia. E. long. from 72° to 83°. N. lat. from 51° to 54°.

ABLE, or **ABEL**, *Thomas*, in *Biography*, chaplain to queen Catharine, consort of king Henry VIII., who distinguished himself by his zeal in opposing the proceedings of the king, and particularly the divorce of his royal mistress. For this purpose he wrote a treatise, intitled, *Tractatus de non dissolvendo Henrici & Catherine Matrimonio*, or, according to Tanner, *Invicta Veritas*; though some suppose these are the titles of different works. He took his degree of A. B. at

Oxford in 1513, and that of A. M. in 1516. In 1534 he was prosecuted for his concern in the affair of Elizabeth Barton, called, *The Holy Maid of Kent*, who was suborned by the monks to use strange gesticulations, to exhibit a variety of fictitious miracles, and to feign the gift of prophecy, by which means she attached many respectable persons to her interest; but she was afterwards attainted of treason in parliament, condemned and executed, together with her chief accomplices, whose names she disclosed. *Able* was also adjudged guilty of misprison of treason, by stat. 25 Henry VIII. He was also one of those who denied the king's supremacy over the church, for which he was apprehended and imprisoned, and afterwards hanged, drawn, and quartered, in Smithfield, on the 30th of July, 1540. Boucher gives him the character of a very learned man, and tells us, that he taught the queen music and the languages. Biog. Brit.

ABLECTI, in *Antiquity*, a choice and select part of the soldiery in the Roman armies, picked out of those called EXTRAORDINARIJ.

ABLEGMINA, in *Antiquity*, those choice parts of the entrails of victims which were offered in sacrifice to the gods.

Some authors make *ablegmina* to denote all those parts of the victims which were offered to the deities; contrary to the authority of Festus, who restrains *ablegmina* to the *exta*, or entrails only.

The *exta* being found good, were to be protected, or parted; i. e. the extremes or prominent parts cut off, as *ablegmina*, to be sprinkled with flour, and burnt by the priests on the altar, pouring wine on them.—Tertullian rallies the heathens for thus serving the gods with scraps and offals.

ABLET, or ALBLEN, in *Ichthyology*, a name given by some to the common BLEAK, a small fresh-water fish, called in Latin ALBURNUS.

ABLOE, in *Geography*, a town of Little Tartary, lying between the river Dnieper and the Black Sea. E. long. 33° 15'. N. lat. 46° 20'.

ABLUMENTS, in *Medicine*, a name which some authors give to a sort of diluting medicines, suited to wash off from the external or internal surfaces of the body, any substances improperly adhering to them; they are either water or other fluids, and they are administered in the form of lotion, gargarism, or injection. They are more commonly known by the names of ABSTERGENTS, DETERGENTS, and DILUENTS.

ABLUTION, from *abluo*, quasi *ab* & *lavo*, I wash away, in *Antiquity*, a religious ceremony in use among the Romans; being a sort of purification, performed by washing the body, before they entered on sacrifice.

Sometimes they washed their hands and feet, sometimes the head, and oftentimes the whole body: for which purpose, at the entrance into their temples, were placed marble vessels filled with water.

Ablutions appear to be as old as any ceremonies, and external worship itself. Moses enjoined them; the heathens adopted them, and Mahomet and his followers have continued them; thus they have been introduced among most nations, and make a considerable part of most established religions.—The Egyptian priests had their diurnal and nocturnal *ablutions*: the Grecians their sprinklings: the Romans, their lustrations and lavations: the Jews their washings of hands and feet, beside their baptisms: the ancient Christians had their *ablutions* before communion, which the Roman church still retain before their mass, sometimes after: the Syrians, Copts, &c. have their solemn washings on Good Friday: the Turks, their greater and lesser *ablutions*; their gaff and wodon; their aman, tabarut, gusul, and abdest, &c.

ABLUTION is particularly used in the Romish church, for a sip of wine and water, which the communicants anciently took after the host, to wash it down, and help to digest.

The same term also signifies the water which serves to wash the hands of the priest who consecrated it.

ABLUTION, in *Pharmacy*, is a preparation which divers remedies undergo, by washing them in water, or some other fluid, proper to cleanse or free them of their impurities, and so to exalt their powers.

The usual way of doing this, is by COHOBATION, or pouring the liquor distilled from the body, upon it again: and repeating this as often as it is necessary. See DEPURATION.

ABLUTION, in *Surgery*, a term, signifying the washing or cleansing a body. This is performed by injecting with a syringe, or by repeated affusions of a proper liquor, or by plunging the part itself into the fluid.

ABNAKIS, in *History*, Indians of North America, between New England and Canada, who are averse from labour, and take no pains in cultivating the ground.

ABNER, in *Scripture History*, the son of Ner, and general of Saul's armies, who adhered to Saul during his reign, set his son Ishbosheth on the throne, and supported him for seven years at Mahanaim, beyond Jordan, against the forces of David, who then reigned at Hebron, in Judah. He afterwards conceived a prejudice against Ishbosheth, and went over to David, with the chiefs of the army and the elders of Israel. David received him with tokens of affection, which offended Joab, by whom he was insidiously killed; avenging himself, by this murder, of the death of his brother Asahel. His funeral was solemnized by David, who composed a mournful song in honour of him. *Abner* died A. M. 2956, ante A. D. 1048.

ABO, in *Geography*, a maritime town in Sweden, and the capital of the province of Swedish Finland, is situated at the point in which the gulfs of Bothnia and Finland unite, and on the river Aurojocki, which runs through this city. This is the most considerable town in the whole country, and has a good harbour. It has many good brick-houses, but they are generally built of wood, painted red. In 1226 it was erected into a bishop's see. In 1628 Gustavus Adolphus founded a gymnasium or seminary, which queen Christina converted into an academy in 1640, and endowed with the same privileges as that of Upsal. In 1779 it contained about 300 students. The only royal high court of judicature in Finland is held at this place; and here the governor of the province usually resides. The export trade consists of linen, corn, deals, flax, and iron. *Abo* is the 8th voting town in the Diet. It is 140 miles N. E. of Stockholm. E. long. 22° 13' 30". N. lat. 60° 27' 10". The result of 12 years observations, viz. from 1750 to 1761, gives the mean annual temperature at this place, 40° of Fahrenheit. Kirwan's Estimate of the Temperature of different Latitudes, p. 60.

ABO-SLOT, or Abo-Castle, is one of the most ancient fortifications in Finland. It stands on a peninsula near the mouth of the river *Auro*. In the 16th century king Erick XIV. was confined in this castle. It has often suffered both by the enemy and by fire. Busching.

ABOARD, in *Sea-language*. See BOARD.

ABOASAR, in *Geography*, a village in Lower Egypt, said to be the ancient BUSIRIS.

ABOCCIS, in *Ancient Geography*, the *Abuncis* of Ptolemy, a town of Æthiopia, situate on the western side of the Nile, not far from the greater Cataract.

ABOCRO, or ABORREL, in *Geography*, a town near

near the river Ankobar or Cobre on the Gold Coast in Africa, which gives name to a republican province.

ABOLA, in *Geography*, one of the divisions of the Agow in Abyssinia. It is a plain, or rather a valley, from half a mile to a mile broad; formed on the east and west side by mountains that are covered with herbage and acacia-trees to the very summit, and that become towards the south more lofty, rugged, and woody. On the top of these mountains there are very delightful plains, abounding with excellent pasture. In this valley there were many villages, which had escaped the havoc of war, and which appeared less poor and wretched than other habitations of the country. A river of the same name flows through this valley, which has two branches issuing from the two adjoining ridges of mountains. Another river, called Iwoira, rising in the east, runs westward into the *Abola*. It also receives several other streams and torrents, as the Gooqneri, Karnachiuli, Caccino, &c. which fall into it in different directions. Mr. Bruce found no fish either in the *Abola* or any of its tributary streams, which he accounts for by their being almost dry in summer and violently rapid in winter, so that the spawn and fish are both destroyed in different seasons by different causes. Bruce's Travels, &c. vol. iii. p. 581.

ABOLITION, ABOLISHING, in a general sense, the act of destroying a thing, or reducing it to nothing. Some derive the word from *abolere*, ex *ab* & *aleo*, and others from the Greek ἀποδομα, *I destroy*.

In our laws the *abolition* of a law, statute, or custom, is the abrogating or repealing it.

The leave given by a prince, or judge, to a criminal accuser, to desist from farther prosecution of the accused, is peculiarly called *abolition*. 25 H. VIII. c. 21.

Abolition is particularly used among civilians, for remitting the punishment of a crime. In this sense *abolition* is a lower species of amnesty, which takes off the punishment but not the infamy: *liberat sed notat*.

Abolition is also particularly used, among Roman lawyers, for the annulling a prosecution, or legal accusation: and in this sense differs from amnesty and oblivion; because in the former, the accusation might be renewed, even by the same prosecutor, which in the latter was extinguished for ever. Within thirty days after a public *abolition*, the same accuser by the prince's licence, was allowed to renew the charge; after a private *abolition*, another accuser might renew it, but the same could not.

This kind of *abolition* is either granted in favour of the accused, or of the accuser; and is either public, granted by the prince or senate, on occasions of public rejoicings, victory, and congratulation; or private, sued for to the president or judge, by one of the parties; frequently by the accuser himself, who after having embarked in the prosecution, by subscribing his name to the charge, could not by the *Turpilian senatus-consultus* otherwise desist, without incurring infamy. On such occasions therefore the accuser would *petere abolitionem*; that is, move for an *abolition*: which was only granted, on his shewing fair and honest motives for withdrawing the charge; viz. inadvertency, youth, warmth, or the like; nor was it granted without the consent of the accused; or if the accusation appeared to have been utterly false, or malicious, &c.

As to the accused, the charge against him was also *abolished* by the death of the accuser, or his being incapacitated from prosecuting by reason of sickness, or the like.—An action of injury was *abolished* by dissimulation; a sentence of condemnation, by indulgence.

Abolition was also used for expunging a person's name out of the public list of the accused, hung up in the treasury.

This was called *abolere nomen*; and, like the former, was either public, as that under Augustus, when all the names, which had long hung up, were expunged at once; or private, done at the motion of one of the parties.

By several laws in the Theodosian code it appears, that an *abolition* of debts was sometimes granted the debtors to the fiscus. We have a medal of the emperor Adrian, wherein that prince is represented standing with a sceptre in his left hand, and a lighted torch in his right; with which he sets fire to several papers in presence of the people, who testify their joy and gratitude by lifting up their hands towards heaven. The legend is, *Reliqua vetera H. S. novam abolita*.

ABOLLA, in *Antiquity*, a warm kind of garment, lined or doubled, used by the Greeks and Romans; chiefly out of the city, in following the camp.

The word is Latin, formed, as some imagine, from *bulle*, on the supposition that this vestment was garnished with those ornaments called *bulle*. Others, denying this circumstance, derive it from the Greek ἀβολη, or ἀνοβολη, *amictus, cloathing*.

Critics and antiquaries are greatly divided as to the form, use, kinds, &c. of this garment. Papias makes it a species of the *toga*, or *gorron*; but Nonius, and the generality, a species of the *pallium*, or *cloak*.

The *abolla* seems rather to have stood opposed to *toga*, which was a garment of peace, as the *abolla* was of war; at least Varro and Martial place them in this opposite light. Some, after Nonius, hold it to have been a military garb alone; others, after Papias, a senatorial; and Salmastius particularly supposes it to have been worn by the presidents in the provinces, and even by the prefects of the city when they administered justice; which Ptitiscus endeavours to refute. Others will also have the *abolla* to have been used by the philosophers, particularly the Stoics, Cynics, &c. Lastly, others reconcile all the variances by making divers kinds of *abolla*, accommodated to different occasions and professions. Even kings appear to have used the *abolla*: Caligula was affronted at king Ptolemy for appearing at the shews in a purple *abolla*, and by the eclat thereof turning the eyes of the spectators from the emperor upon himself.

ABOMASUS, ABOMASUM, or ABOMASIUM, in *Comparative Anatomy*, a name given by old anatomists to one of the stomachs or ventricles of animals of the ruminating kind. See RUMINANT and RUMINATION.

Beasts that chew the cud are found to have four stomachs; viz. the rumen, or *magnus venter*, or *stomach*, properly so called; the *reticulum*, *omasus*, and *abomasus*. The *abomasus*, properly called the *maru*, is the last of the four; being the place where the chyle is formed, and from which the food descends immediately into the intestines.

It is full of a sort of leaves, like the *omasus*; but its leaves have this peculiarity, that, beside the membranes they consist of, they contain a great number of glands, not found in any of the first.

It is in the *abomasus* of calves and lambs that the rennet, or *earring*, is formed, with which milk is curdled.

ABOMINATION, in *Scripture History*, a term used with regard to the Hebrews, who, being shepherds, are said to have been an *abomination* to the Egyptians; because they sacrificed the sacred animals of that people, as oxen, goats, sheep, &c. which the Egyptians esteemed as *abominations*, or things unlawful. The term is also applied in the sacred writings to idolatry and idols, not only because the worship of idols is in itself an abominable thing, but likewise, because the ceremonies of idolaters were almost always attended with licentiousness, and with actions of an infamous and abominable nature. To this purpose, Chryostom (Opera, vol. i.

p. 645. ed. Benedict.) affirms, that every idol and every image of a man was called an *abomination* among the Jews. The *abomination of desolation* foretold by the prophet Daniel, (ch. x. 27. xi. 31.) is supposed by some interpreters to denote the statue of Jupiter Olympius, which Antiochus Epiphanes caused to be erected in the temple of Jerusalem. See 1 Maccab. i. 54. 59. ch. iv. 38. 2 Maccab. vi. 2. The second of the passages above cited may probably refer to this circumstance, as the statue of Jupiter did, in fact, *make desolate*, by banishing the true worship of God, and those who performed it, from the temple. But the former passage, considered in its whole connection, bears more immediate reference to that which the Evangelists have denominated the *abomination of desolation*. Matt. xxiv. 15, 16. Mark, xiii. 14. This, without doubt, signifies the ensigns of the Roman armies under the command of Titus, during the last siege of Jerusalem. The images of their gods and emperors were delineated on these ensigns; and the ensigns themselves, especially the eagle, which was carried at the head of every legion, were objects of worship, and, according to the usual style of Scripture, they were called an *abomination*. These ensigns were placed upon the ruins of the temple after it was taken and demolished; and as Josephus informs us, (De Bell. Jud. l. vi. c. 6. apud Oper. tom. ii. p. 391. Ed. Havercamp.) the Romans sacrificed to them there. The horror with which the Jews regarded them sufficiently appears from the account which Josephus (Antiq. l. xviii. c. 3. § 1. &c. c. 5. § 3. apud Oper. tom. i. p. 884. 875. Ed. Haverc.) gives of Pilate's introducing them into the city, when he sent his army from Cæsarea into winter-quarters at Jerusalem, and of Vitellius's proposing to march through Judæa, after he had received orders from Tiberius to attack Aretas, king of Petra. The people supplicated and remonstrated, and induced Pilate to remove the army, and Vitellius to march his troops another way. The Jews apply the above passage of Daniel to the Romans, as we are informed by Jerome *in loc.* The learned Mr. Mede (See his Works, b. iv. epist. 41. p. 797. and b. iii. p. 667. 672.) concurs in the same opinion. Sir Isaac Newton (Obs. on Daniel, c. ix. and also c. xii. See his Works by Horsley, vol. v. p. 369. 410.) observes, that in the 16th year of the emperor Adrian, A. C. 132. the Romans accomplished the prediction of Daniel by building a temple to Jupiter Capitolinus, where the temple of God in Jerusalem had stood. Upon this occasion the Jews, under the conduct of Barchochab, rose up in arms against the Romans, and in the war had 50 cities demolished, 985 of their best towns destroyed, and 580,000 men slain by the sword; and in the end of the war, A. C. 136, they were banished from Judea upon pain of death; and thenceforth the land remained desolate of its old inhabitants. Others again have applied the prediction of Daniel to the invasion and desolation of Christendom by the Mohammedans, and to their conversion of the churches into mosques. From this interpretation they infer, that the religion of Mohammed will prevail in the east 1260 years, and be succeeded by the restoration of the Jews, the destruction of antichrist, the full conversion of the Gentiles to the church of Christ, and the commencement of the millennium. See Newton on the Prophecies, in his Works, vol. viii. p. 197. 8vo.

ABON, ABONA, or ABONIS, in *Ancient Geography*, a town and river of Albion. According to Camden, the town is ABINGDON, and the river *Abbon* or *Avon*. But by Antonine's Itinerary, the distance is nine miles from the Venta Silurum, or Caer-went; and therefore, others take the town to be Porshut, at the mouth of the river *Avon*, near Bristol. *Abbon* or *Avon*, in the Celtic language, denotes a river.

ABONI, in *Geography*, a town in the interior part of

Africa, near the Slave-coast, which gives name to a province that is rich in gold.

ABONOTICA, or ABONOTICHOS, i. e. Ἀβωνοτική, in *Ancient Geography*, a small fortified town of Paphlagonia, whose situation is determined by Arrian and Ptolemy. This was the habitation of the emperor Alexander, whom Lucian (Pseudomant. ap. Oper. tom. ii. p. 217, &c.) has particularly described. On the coin of Antoninus Pius it is denoted by a double serpent, the attribute of Æsculapius. This town was called *Ionopolis* after the time of Alexander.

ABORAS, called by Xenophon *Araxes*, a river of Mesopotamia, which rose near the Tigris, was increased a few miles below Nisibis by the little stream of the Mygdonius, passed under the walls of Singara, and fell into the Euphrates at Circesium. It was fixed as the boundary between the Roman and Persian empires, in the negotiation between Dioclesian and Narseus, towards the close of the 3d century, A. D. 297.

ABORIGINES, or ABORIGENES, in *History*, a name sometimes given to the primitive inhabitants of a country, or those who had their origin in it; in contradistinction to colonies, or new races of inhabitants, derived from other places.

The term *Aborigines* is famous in antiquity.—Though now an appellative, it was originally a proper name given only to a certain people in Italy; and both the reason and origin of it are greatly disputed among the learned.

Aborigines then primarily denoted a nation in Italy, which inhabited the ancient Latium, or country now called Romania, or Campagna di Roma.

In which sense the *Aborigines* are distinguished from the Janigenæ, who, according to the false Berofus, inhabited the country before them; from the Siculi, whom they expelled; from the Grecians, from whom they descended; from the Latins, whose name they assumed, after their union with Æneas and the Trojans; and lastly, from the Ausonii, Volsci, Oenotrii, &c. neighbouring nations in other parts of the country.

Whence this people came by the appellation is much disputed.

S. Jerome says, they were so called, as being, *absque origine*, the primitive planters of the country after the flood. Dionysius of Halicarnassus, (Antiq. Rom. l. i. c. 10. apud Op. tom. i. p. 8, 9. 11. ed. Oxon.) recites several opinions as to the origin of the appellation. Some, he says, allege that they owe their name to their being original inhabitants of the country, and because they were the founders of the race that occupied it, and that the denomination is similar to the Greek term γενεάρχαι and παροργονοι. Others consider the appellation as synonymous with *Aberrigines*, and others again conceive them to have been originally *Arcadians*, and that their ancestors were the Oenotrii, who migrated from Greece seventeen generations before the Trojan war, and settled in that country above 400 years before the Trojan war; and that they derived their name either from the mountains of Arcadia, *qu. ορεινω γένος*, natives of the mountains, or because they gave origin to the Latins, who being descended from them, called them *Aborigines*: that is, the people from whom they derived their origin; and to this opinion he himself inclines.

Aurelius Victor (de Orig. Roman.) suggests, that they were called *Aborigines*, q. d. *Aberrigines*, from *ab*, *from*, and *errare*, *to wander*; as having been before a wandering people, who, coming from different countries, met accidentally in Italy, and lived there by rapine; to which opinion Festus gives some credit. It is added, that Pelasgians, another name sometimes given them, is of the same import, and denotes vagabonds, like cranes.

Paucitas thinks (Græc. Descript. p. 603. ed. Kuhnii,) that Italy was colonized by Oenotrius, an Arcadian; and hence it may be inferred that, as Arcadia abounded with high mountains, the appellation might have been derived, *are opus, from mountains*; which opinion seems confirmed by Virgil, who, speaking of Saturn, the legislator of this people, says:

*Ipse genus indocile, ac dispersum montibus alis
Composit, legesque dedit.* Æn. l. viii. v. 321.

The *Aborigines* were either the original inhabitants of the country, settled there by Janus, as some imagine, or by Saturn, or Chæn, as others, not long after the dispersion; or even, as some think, before it; or they were a colony sent from some other nation; who, expelling the SICULI, who (according to Dion. Hal. lib. i. Ant. Rom. tom. i. p. 7.) were the original inhabitants, settled in their place; but whether these Siculi were not, in their origin, Arcadians, first brought into Italy by Oenotrius, son of Lycaus, more than 400 years before the Trojan war, is not certain. Some have maintained that this party, a second from Thessaly, a third under Evander, 60 years before the Trojan war, and another under Hercules, and another of Lacedæmonians, who fled from the severe discipline of Lycargus, uniting together, constituted the *Aborigines*; others trace their origin in Scythia; others again in Gaul; and others will have them to be Canaanites expelled by Joshua.

ABORREL. See ABOCRO.

ABORTION, *Abortio, Aborsus*, formed of *ab, from*, and *orior, to be born*, in *Midwifery*, the premature exclusion of a *fœtus*. It has been usual to assign names to abortions, occurring at different periods of utero-gestation. Those happening within the first seven or eight days, before the *fœtus* or membranes have acquired such a consistence as to retain their distinct form when excluded, are called *effluviations*; from that period to about the sixth or seventh month, they are called *abortions*, or *miscarriages*; from the sixth month, to any time before the end of the ninth month, premature labour.

Abortion may be occasioned by too full, or too sparing a diet, or by taking food that is too rich and spirituous; by blows or falls; sudden frights, or any thing violently agitating the mind, whether joy or grief; *frequenti coitu; hinc abortus primis graviditatis mensibus non infrequens recens nuptiis, veneris avidioribus*; by diseases, particularly fever; by profuse evacuations, as from large discharges of blood, whether happening spontaneously, or procured by art, and used in the cure of some acute disease, as pleurisy; or by long continued and violent purging. Vomiting, if occurring spontaneously, though extremely violent, and continuing through the whole course of pregnancy, rarely occasions abortion; but when excited by the exhibition of sharp, acrid, or poisonous drugs, it usually continues until the *fœtus* is excluded.

There are other causes of abortion, depending on the peculiar constitution of the uterus, or of the *fœtus*. Thus some women, who are prone to breeding, are incapable of retaining their offspring longer than the fourth, fifth, sixth, seventh, or eighth month. In these cases, the *fœtus* usually dies three or four weeks before the periods here mentioned; at the end of that time the separation of the blighted ovum from the uterus being completed, it is expelled by the pains, and ordinarily with as little difficulty or danger as a living and healthy *fœtus*. The cause of this peculiarity is not known, neither has any appropriate remedy or means of preventing it been discovered. Sir Richard Manningham supposed it to arise from an incapacity in the

uterus to bear more than a certain degree of distension. *Sæ mulier sæpius abortum facit*, he says, (*Apbor. med.*) *et eodem tempore, ut 3tio, 4to. vel 5to. mense, ob uteri angustia accidit, quæ auferentem fatum amplius continere non potest.* The same effect, however, would follow imperfection in the structure of the *fœtus*, incapacitating it to live or increase beyond a certain time. We know there are children who, owing to a malconformation of some of their organs, never live beyond twelve, fifteen, eighteen, or some definite number of months. Whatever may be the cause, it not unfrequently happens that women who have parted with five or six *fœtuses* prematurely, shall afterwards go to their full time, and bear living and healthy children. Women who have miscarried once or twice will be prone to the same accident, at whatever period it happened; it becomes necessary therefore, when approaching that time, that they should use the utmost caution that nothing may occur to agitate or disturb them.

By some writers, women have been supposed to be more subject to abortions than brute animals, in consequence of the erect position of their bodies. That they more frequently suffer abortion than such animals seems well ascertained; but as this disposition is more incident to women living in large towns, and treating themselves too delicately, to those following sedentary and enervating occupations, or to those who are compelled to labour hard for their living, it seems likely that the accident is occasioned by those circumstances, rather than from any vice in their conformation.

From a very early period, attempts have been made to devise means of procuring abortion, without injuring the constitutions of the women, by the exhibition of certain drugs, as safin, colocynth, &c. but without success. It is remarkable, that although Hippocrates prohibited physicians from assisting in procuring abortion, he relates the case of a young woman whom he had recommended to dance and use other violent exercise for that purpose, in whom it produced the effect, and without materially injuring the woman. The more ordinary consequences, however, to be expected from such efforts, or from taking acrid and drastic medicines, are pain and inflammation of the womb, violent hemorrhage, which, though ultimately terminating in abortion, not unfrequently destroys the life of the woman also. These modes being found to be dangerous to the woman, and not certain in producing the proposed effect, endeavours have been used to destroy the birth by a more direct method, *viz.* by introducing a stilet, or some sharp instrument, into the uterus, which piercing the membranes, and thence giving vent to the *liquor amnii*, uterine contractions, or labour pains were produced, which continued until the *fœtus* with its involucri were ejected. At what time this mode of procuring abortion was discovered is not known; no traces of it appearing in any of our old medical or chirurgical writers. Ovid, it is probable, alludes to it, in the following lines:

— *sine crescere nata.
Est pretium parvæ non leve vita moræ.
Vestra quid effoditis subjectis viscera telis;
Et nondum natis dira venena datis?*

Amor. l. 2. Eleg. 14. apud op. tom. i. p. 444. Ed. Burman.

Tertullian reprobates the practice, and mentions the kind of instrument with which the operation of breaking the membranes and destroying the *fœtus* was performed, which shews it was not uncommon in his time. *Est etiam eneum speculum*, (says this father, De Anima apud oper. p. 328. ed. Rigalt.) *quo jugulatio ipsa dirigitur, cæco latrocinio quæ quædam appellant, utique viventis infantis peremptorium.* Guy Patin says, a midwife was hanged at Paris,

Paris, for occasioning the death of a lady there, by an attempt to procure abortion by this method. On her trial she said she had frequently practised it with success; but, in this case, it seems, the instrument had pierced the body of the uterus, instead of passing through the os internum.

This operation will be again noticed, when treating of those kinds of laborious parturition, where the difficulty is occasioned by the bones of the pelvis being so distorted, and the cavity thence so reduced in size, as to render the passage of a full grown foetus through it totally impracticable. In those cases, it has been lately discovered, the operation may be performed with perfect safety, and with equal advantage both to the child and to the mother. See LABOUR.

A peculiar delicacy, or irritability of habit, distinct from weakness, though perhaps rarely occurring, but in debilitated constitutions, may be also reckoned among the causes of abortion. This habit of body seems in a peculiar manner, and almost exclusively, to belong to persons living in the higher ranks of life, who use late hours, frequent large and crowded assemblies, lie much in bed, and indulge in rich and delicate food. The sudden opening of a door, or appearance of a person not expected, or any thing exciting the least surprise, will often, in such constitutions, be sufficient to produce abortion. That this is not occasioned merely by weakness of constitution is evident, as very weakly, and even consumptive persons, are found to conceive more frequently, to be more tenacious of their offspring, and generally to produce larger and stronger children, than many women of superior general health.

As the causes of abortions, and the constitutions most prone to it, are so various, the modes of preventing it, or of conducting persons through it, must vary likewise. One of the earliest symptoms announcing an approaching abortion, is a sense of fulness, of weight, or heaviness, at the lower part of the abdomen; this is soon followed by pains in the loins and thighs, and if these pass unnoticed, which is not uncommonly the case, a discharge of blood, more or less profuse, according to the constitution of the woman, takes place: this, if accompanied with pains, recurring at intervals similar to those of labour, usually continues until the ovum is excluded. Sometimes the discharge of blood abates, or entirely ceases for six, eight, ten, or more days, and then recurs again, usually with greater violence; and intermissions of this kind sometimes happen three or more times, before the fruit is excluded. On the other hand, it sometimes happens, that after a woman has suffered two, three, or more effusions of blood in this way, they cease; the part of the placenta that had been detached reuniting itself to the uterus, and the woman goes on to her full time. These circumstances only happen in those abortions that occur within the first three, four, or at the latest five months, which are rarely attended with danger. Discharges of blood occurring at a later period, although they also sometimes cease, and recur again at intervals, never completely leave the woman until the foetus and involucre are excluded, which ordinarily does not happen until so much blood has been lost as to destroy the life of the foetus, and to put that of the mother also into extreme danger.

If a pregnant woman of a sanguine temperament, should be seized with pain in the loins, and with discharges of blood from the vagina, six or eight ounces of blood may be advantageously drawn from the arm, which will divert the current of blood from the part. The bowels are next to be opened with some mild purgative; she must be kept quiet, but not confined to the bed; be put upon a cooling regimen,

and take a powder consisting of twenty grains of nitre, and the same quantity of the compound powder of gum tragacanth twice or three times in the day, mixed with barley water. A tea-spoonful may be taken every night, of an electuary consisting of, lenitive electuary, two ounces; cream of tartar, and flowers of sulphur, of each two drams; jalap, one dram; syrup of roses, a sufficient quantity to give it a proper consistence. For women who are easily moved, a scruple, or half a dram of jalap, may be sufficient, or thirty grains of rhubarb may be substituted for the jalap. If the woman should be only three or four months advanced in her pregnancy, and the foetus should not be dead, or the ovum entirely separated from the uterus, the above may be sufficient to preserve it, and prevent the abortion. In the case of women of more relaxed and delicate constitutions, the bleeding must be omitted, but the electuary with the rhubarb must be given every night, and instead of the powder with nitre and gum tragacanth, a decoction of bark, with a few drops of the vitriolic acid may be given; or the following:

℞ Mucilag. gummi arabici ꝑij.
Olei terebinth. gtt. xl.
Syrup. alb. ꝑ℥. aquæ ꝑv.
Spirit. nucis moschatae ꝑ ℥. m. capiat ægra cochlearia tria ter in die.

If nausea prevails, so that the stomach with difficulty retains either food or medicines, or if the bowels are too loose, twelve or fifteen grains of ipecacuanha may be given in a spoonful of water, as an emetic, and the following draught at night:

℞ Pulv. radiceis rhei gr. vj. Confectionis aromaticæ ℥i.
Spt. nucis moschatae ℥i. Tincturæ opij gtt. xij.
Aquæ ꝑij. m.

Under this treatment, if the foetus cannot be preserved, the hemorrhage will be restrained, and the abortion will happen without doing any material injury to the constitution.

Abortions occurring at the times we have mentioned, are rarely attended with danger, and never require manual assistance. Those occurring later, *viz.* after the sixth month, if the hemorrhage should not be restrained by the means here proposed, or should return, which usually happens, often require manual assistance, and must be treated in the same manner as when hemorrhage occurs in women who have attained the full term of gestation. See LABOUR.

Persons administering drugs to pregnant women, with the view of procuring abortion, or even women taking medicines, or using means for that purpose, have in most civilized countries, and from a very early period, been subjected to certain penalties.

The ancient Greek legislators, Solon and Lycurgus, prohibited the practice of producing abortion. Whether or not it was permitted among the Romans, has been much disputed, between two learned modern civilians. It is certain the practice, which was by them called *viferibus vim inferre*, was frequent enough: but whether there was any penalty annexed to it, before the emperors Severus and Antonine, is the question. Nooet maintains the negative; and farther, that those princes only made it criminal in one particular case; *viz.* of a married woman's practising it out of resentment against her husband, in order to defraud him of the comfort of children; this was ordered to be punished by a temporary exile: *siqua pregnantis vim viferibus suis intulerit ne inimico marito filium procrearet, temporali exilio coarctetur*. He adds, that there was no general prohibition of the practice before Gratian and Valens. It is true we find in

Cicero an earlier instance, of a woman punished for this fact; but it was in Miletia, a country not subject to the Roman laws.

Bynkershoek however denies, that a woman was allowed to drink the *poculum abortivum*; and the reason he gives, is, that the womb was the husband's property, who was declared, by the laws, the sole *custos* of it; to prevent his being imposed on in the children he was to bring up. But then this does not affect women who had been impregnated by others, who were not their husbands.

The foundation on which the practice is said to have been allowed, was, that the *fœtus*, while *in utero*, was reputed as a part of the mother, ranked as one of her own viscera, over which she had the same power as over the rest; besides, that it was not reputed as a man, *homo*; nor to be alive, otherwise than as a vegetable: consequently, the crime amounted to little more than that of plucking unripe fruit from the tree. V. Juven. Sat. vi. v. 500, &c. Senec. Consolat. ad Helviam Matrem, c. 16.

This last cited author represents it as a peculiar glory of Helvia, that she had never, like other women, whose chief study is their beauty and shape, destroyed the *fœtus* in her womb. *Nunquam te secunditatis tue quasi exprobraret atque, pulsit: nunquam more alienarum quibus omnis commendatio ex forma petitur, tumescentem uterum abscondisti quasi inleceus onus, nec inter viscera tua conceptas spes liberorum elisisti.* By the decretals of the canon law, (Part ii. Causs. 32. quest. ii. c. 8.) *Non est homicida, que abortum procurat, antequam anima corpori sit infusa.*

The primitive fathers, Athenagoras, Tertullian, Minucius Felix, Augurin, &c. declaimed loudly against the practice, as virtual murder: *Homicidii festinatio est*, [says Tertullian, (Apolog. apud Oper. p. 10.) *prohibere vases; nec refert, ratam quis eripiat animam, an nascentem disturbet.* Several councils have declared against it. That the *fœtus* in the mother's womb is without life, and that it is not animated before it is born; and also that it is lawful for a young woman, her life or character being at stake, to procure an abortion, are propositions which pope Innocent X. in a general council in 1679, condemned as false and scandalous. Yet we are told that the modern Romish ecclesiastical laws allow of dispensations for it. Egane mentions the rates at which a dispensation for it may be had.

Foderi says, (*Traité de Médecine Légale*), in the Introduction, the Emperors Severus and Antonine, decreed, that women procuring abortion, forty days after they had conceived, at which time they imagined the *fœtus* was completely formed, and endued with life, should be put to death; but earlier than that period, and before the *fœtus* was supposed to be living, they should only suffer a temporary banishment. Our law seems to have adopted a principle similar to this, but it extends the punishment to any person (maliciously or intentionally, we suppose,) being instrumental in occasioning a woman to miscarry.

"*Si aliquis mulierem pregnantem percusserit*," says Bracton, lib. iii. c. 21. "*vel ei venenum dederit, per quod fecerit abortivam; si puerperam jam formatum fuerit, et maxime si fuerit animatum, fuerit homicidium.*" "Life," says Blackstone, (Commentaries, book i. chap. 1. vol. 1. p. 129. 8vo.) "is the immediate gift of God, a right inherent by nature in every individual; and it begins, in contemplation of law, as soon as an infant is able to stir in the mother's womb. For if a woman is quick with child, and by a potion, or otherwise, killeth it in her womb; or if any one beat her, whereby the child dieth in her body, and she is delivered of a dead child, this,

though not murder, was by the ancient law homicide, or manslaughter." But, he goes on to observe, "The modern law doth not look upon this offence in quite so atrocious a light, but merely as a heinous misdemeanour." 3 Inst. 50.

ABORTION, among *Gardeners*, signifies such fruits as are produced too early, and never arrive at maturity.

ABORTIVE, something come before its due time, or before it has arrived at its maturity and perfection.

The term is applied by some writers on the materia medica to medicines that occasion an abortion in pregnant women. Medicines of this kind have also been denominated *Amblotica* and *Echolica*; and they have been commonly supposed to possess the power of promoting the natural birth, of forcing off the placenta, and even of expelling a dead *fœtus*. But these powers, ascribed to medicines by the ancients, are now deemed imaginary, and such medicines are now hardly ever employed. Cullen's *Mat. Med.* v. i. p. 162.

ABORTIVE corn, in *Agriculture*, a distemper of corn mentioned by M. Tillet, and suspected to be occasioned by insects. It appears long before harvest, and may be known by a deformity in the stalk, the leaves, the ear, and even the grain.

ABORTIVE flux. See ABORTION.

ABORTIVE vellum, is made of the skin of an abortive calf.

ABOTRITES, or ABOURITES, in *History*, a people bordering upon Bulgaria, in that part of Dacia contiguous to the Danube. Henry I. of Germany, surnamed the Fowler, in his zeal for the propagation of the christian faith, undertook, and actually effected the conversion of the king of these people. The kingdom of the *Abotrites* was a part of the ancient Vandalia, and is now called Mecklenburg.

ABOU HANNES, in *Ornithology*, a bird of Abyssinia, so called, because it appears on St. John's day; the terms signifying, *father John*. This is the season when the fresh water of the tropical rains is first known in Egypt to have mixed with the Nile, and to have rendered it lighter, sweeter, and more exhaleable in dew; and accordingly it is the season when all water-fowl, that are birds of passage, resort in great numbers to Ethiopia. This bird, according to Mr. Bruce, (*Travels, &c.* vol. v. p. 173.) is the *IBIS* of the ancients. Its beak resembles in shape that of a curlew, and the colour of the upper part is green, and of the lower part black; and it is four and a half inches in length. The bone of the leg is round and strong, six inches long, and the length of the thigh-part is five and a half inches. The height of the body, as it stands, from the sole of the foot to the middle of the back is nineteen inches. Its feet and legs are black; it has three toes before, armed with sharp strong claws, and a toe behind. The head and back part of the neck are brown; the throat, breast, back, and thighs are white. The largest feathers of the wings are a deep black for thirteen inches from the tail, and a space of six inches in length from the end of the tail along the back is also of the same colour. The measures and colours correspond to those of the embalmed Ibis. See *Plate I. Birds*.

ABOUALI, in *Hydrography*, a river of Palestine, which rises in mount Libanus, and flows with a rapid current into a romantic valley, where it is concealed by trees.

ABOUILLO. See APOLLONIA.

ABOUKIR, in *Geography*, a small town of Egypt, situate in the desert between Alexandria and Rosetta. It is the ancient *CAIROPUS*, and distant, according to Mr. Savary, (*Letters on Egypt, v. i. p. 49.*) six leagues from Pharos. Pliny, (*N. H. l. v. c. 31. tom. 1. p. 283. ed. Hard.*) who had collected the testimonies of antiquity, says, that it was formerly an island. Its local appearance makes this credible.

dible. The grounds around it are so low, that the sea still covered a part of them in the time of Strabo, (lib. xvii. tom. 2. p. 1311.) The town, built upon a rock, which forms a handsome road for shipping, was out of the reach of inundations. *Aboukir* has been lately (*viz.* in 1798,) rendered famous by the battle between the English and French fleets, in which the British admiral, Nelson, obtained a signal victory, and for which he has been honoured with a peerage. The place itself, though well fortified, and vigorously defended by the Turks, was taken by the French in 1799, and retaken by the English in 1801.

ABOUT, in *sea language*, the situation of a ship immediately after she has tacked, or changed her course by going *about* and standing on the other tack. *About ship* is the order to the ship's crew for tacking.

ABOUTIGE, or ABUTISH, in *Geography*, a town in Upper Egypt, near the Nile, where they make the best opium in the Levant. It was formerly a large, but is now a mean place, though governed by an Emir. It stands on the site of *Abotis*, mentioned by Stephanus Byzantinus; the burgh of Settefé, a little above it, represents the small city of Apollo. N. lat. 26° 50'.

ABRA, a silver coin in Poland, nearly equivalent to the English shilling. It is current in several parts of Germany, and through the dominions of the Grand Seignor, at the value of one fourth of the Holland's dollar or *asluni*. See COINS.

AERABANEL, ABARBANEL, or AVRAVANEL, *Isaac*, in *Biography*, a learned rabbi, said to be descended from king David, and born at Lisbon, A. D. 1437. He was obliged to leave Spain with the other Jews, after having been confessor to Alphonso V. king of Portugal, and to Ferdinand the Catholic. He resided at Naples, Corfu, and several other cities, and died at Venice in 1508, aged 71. Among the Jews he was denominated the sage, the prince, and the great politician. Some writers say, (See Act. Lips. Nov. 1686, p. 530.) that, by negotiating bills of exchange, which was the business he followed at Castile, after he fled from Lisbon, and by practising the several arts and frauds of the Jewish people, he amassed prodigious wealth; that he oppressed the poor; that he aspired after the most illustrious titles, such as the noblest houses in Spain could not attain; and that being a sworn enemy to the christian religion, he was the principal cause of that storm which fell upon him and the rest of his nation in 1492, when they were driven out of the Spanish dominions. His Commentary on the Old Testament, which is scarce, is written in a clear, though diffuse, style; and adheres principally to the literal sense. This book, which consists of detached parts, composed at different times, abounds with so much rancour against the christians in general, and the Roman Catholics in particular, that father Bartolucci was desirous that the Jews should be prohibited the perusal of it; and they were not allowed to read or keep in their houses his commentaries on the latter prophets. Biblioth. Rabbin. tom. iii. p. 876. 879. His other works are, A Treatise on the World against Aristotle, who maintains its eternity; a Treatise on the Explication of the Prophecies relating to the Messiah against the Christians; a Book concerning Articles of Faith; and some others of less note. The various persecutions which he, and other Jews suffered, soured his temper, and produced an implacable hatred against the christians, which he has manifested in his writings; though, in company with them, he behaved with great politeness, and was cheerful in conversation. He was an assiduous student, and a very ready writer.

ABRACADABRA, or ABRASADABRA, a magical word, recommended by Serenus Samonicus, preceptor to the

younger Gordian, as a charm, or amulet, in curing agues, and preventing other diseases, particularly the fever called by the physicians *benitriteus*. See Seren. Samon. de Medio. N. 53. p. 1598. fol. Mattaire.

To have this effect, the word must be written on paper, and repeated, omitting each time the last letter in the former, so that the whole may form a kind of inverted cone, (as in the margin,) in which there is this property, that which way soever the letters be taken, beginning from the apex and ascending from the left to the right, they make the same word, or as some would have it, the same sentiment, as is found in the first whole line. This paper must be suspended about the neck by a linen thread. According to Julius Africanus, another ancient writer, the pronouncing of the word in the same manner, will do as well.

ABRACADABRA is said to have been the name of a god worshipped by the Tyrians, so that wearing his name was a kind of invocation of his aid; a practice not more superstitious than that of some christians, who bear various things about them in expectation of their operating by sympathy.

ABRAHAM, in *Scripture History*, the celebrated patriarch, who was the father and founder of the Jewish nation, though it was never called by his name. He was the son of Terah, and the 10th in lineal succession from Noah by his second son Shem, who lived till Abraham was 150 years old. He was born 352 years after the flood, and A. M. 2008, according to the Hebrew chronology, in Ur of the Chaldees, in the 130th, and not, as some have supposed, in the 70th year of his father's life, and removed with him, at the age of 70, A. M. 2078, into Haran, where Terah died at the age of 205 years. At the age of 75, *i. e.* 427 years after the flood, A. M. 2083, he migrated into Canaan, in consequence of the divine order and promise, recorded in the three first verses of the 12th chapter of Genesis. Shuckford (Conn. vol. i. p. 274.) supposes, that this promise was made to the patriarch before he dwelt in Haran (see Acts vii. 2.), and that it was 430 years before the law. (See Gal. iii. 17.) But the interval from the birth of Isaac to the law was 400 years; and therefore, he concludes, that the promise was made at Ur, thirty years before the birth of Isaac, who was born when Abraham was 100 years old, and that it took place much about the time of his removal to Haran. Others (see Taylor's Scheme of Scripture Divinity, p. 250.) date the promise to Abraham at the time of his removal to Canaan A. M. 2083. A. D. 1921.; and they reckon 430 years from this period to the Exodus. Compare Exod. xii. 41. with Gal. iii. 17. See Blair's Chronology, Pl. 1. This promise, however, was the foundation of that grand scheme for preventing the universal prevalence of idolatry, and for preserving among mankind the knowledge and worship of the only true God, which, under several variations and improvements, was to reach to the end of time. For this purpose Providence selected the family of Abraham, which was afterwards formed into a nation, instructed in religious knowledge by God himself, and favoured with such extraordinary privileges and honours, among all other nations of the earth, as were in their own nature adapted to engage them, by the most rational motives, to adhere to God and his worship. The ground of this noble and extensive scheme, and of God's singular regard to Abraham and his posterity, was the COVENANT of Grace, the promise or grant of favours and blessings to mankind in Jesus Christ our Lord. In the conduct and accomplishment of this scheme, God required the patriarch to cast himself

wholly upon his Providence, by removing at his special command, from his own kindred and country, to an unknown distant land, which he would show him, a bringing him of his posterity and special blessing. Accordingly, soon after his settlement in Canaan, probably within two or three years afterwards, by the renewal of the divine promise, that the land should be given to his posterity, he was forced by a messenger to remove into Egypt. Many chronologists fix the commencement of the 430 years, during which the Israelites remained in this country, at this period. Here Sarah, though she had previously consented, for her own security and that of Abraham, to be called his sister, was forcibly taken away by the king of Egypt; who captivated by her beauty, designed to have made her his wife. But the king was punished in an extraordinary manner for the injustice of his conduct, restored her without violation, and gave orders, that Abraham, and his wife, with all that belonged to them, might safely depart from his dominions. The famine having ceased in Canaan, he returned to the situation near Bethel, which he had left, and where he had erected an altar, and devoutly acknowledged his happy deliverance. Abraham, being under the necessity of separating from Lot, his nephew, on account of the increase of their substance, and the contention of their respective herdsmen, removed to the plain of Mamre, in Hebron. Here he formed an alliance with three of the principal persons of the country, by whose assistance he rescued Lot, who had been taken captive, and restored him, his family, and his whole property, to his former habitation. A. M. 2092. At his return, as he passed near Salem, supposed to be the city afterwards called Jerusalem, he met Melchizedek, who was king of that city, and "priest of the Most High God," and received from him tokens of special favour. Soon after this event the divine promise was again renewed to him, and accompanied with circumstances of peculiar encouragement. It was particularly revealed to him, that his posterity should sojourn, and be afflicted in a strange land 400 years; at the expiration of which, God would interpose for the punishment of their oppressors, and for their rescue. These years are to be reckoned, not from their coming into Egypt, but from the birth of Isaac. For during the whole time of their sojourning in the land of Canaan and elsewhere, they were in a strange land, in which they had not a foot of ground, if we except the cave of Machpelah. The meaning of this prophecy to Abraham, therefore, can only be this, that his seed from Isaac forward should be strangers in a land that was not theirs, for the space of 400 years, during some part of which they should be oppressed, and at length brought under bondage; which term being expired, they should find a happy deliverance. After the renewal of this promise, Abraham married Hagar, who was recommended to him by Sarah, and whose children the designed to adopt and educate as her own, according to the custom which was common in those times. By Hagar he had a son, who was called Ishmael. A. M. 2094. When the patriarch had attained the age of 99 years, A. M. 2107, A. D. 1897. God was pleased to ratify his former covenant with him, by changing his name from *Abram*, formed of אַבְרָם, *father* and רַם, *exalted*, to *Abraham*, derived from אַבְרָם אֱלֹהֵי רַם, *father of a great multitude*, assuring him that he would make him the father of many nations, Gen. xvii. 5. As a token and confirmation of the covenant now made with him, he enjoined him to be circumcised, and to circumcise all the males of his family: and he promised that, within a year, he should have a son by his wife, whose name was now changed from *Sarai*, q. d. *my princess*, to *Sarah*, the *princess*. This son was to be called *Isaac*: to him belonged the covenant and promise; and in his seed all the nations of

the earth were to be blessed. The promise of a son was again renewed by those celestial messengers, who announced to him the destruction of Sodom. His intercession on behalf of this devoted city, though in the issue unavailing, forms a distinguishing circumstance in his history. Soon after this event, Abraham removed to the country of the Philistines, and sojourned in Gerar, where an incident occurred similar to that which had happened in Egypt. See ABIMELECH. Isaac was born at the appointed season, 452 years after the flood, and A. M. 2108. But within 25 years after this joyful event, upon which depended the accomplishment of the divine promise, and of the patriarch's hopes, Isaac was demanded as a burnt-sacrifice, and Abraham was ordered to present the offering on mount Moriah. The event, with all the circumstances that attended it, is well known. The order was countermanded, and the patriarch, in consequence of this signal trial of his faith and obedience, obtained a solemn renewal of all the divine covenants and promises. In the year 488 after the flood, A. M. 2144, Sarah died at Hebron, and was buried in the cave of Machpelah, which Abraham purchased as a burying-place, of the sons of Heth, for 400 pieces of silver, amounting at the rate of 3s. for a shickel, to 60l. of our money. This purchase was made, according to the custom of ancient times, at the GATES of Hebron. Abraham having married his son Isaac to Rebekah, the daughter of Nahor, his brother, at the age of 141 years, took another wife, named Keturah, by whom he had six sons. These he portioned, that they might not interfere with Isaac's inheritance; and they went to the east of Beersheba, and the land of Canaan, and settled in both Arabias, the Petraea and Deferta, where some traces of their names are still to be perceived. This venerable patriarch died in the 175th year of his age, 527 years after the flood, A. M. 2183, A. D. 1821, and was buried by his two sons, Isaac and Ishmael, in the cave of Machpelah, near Sarah, his wife.

To the above abstract of the history of Abraham, recorded in the book of Genesis, it may not be improper to subjoin a few particulars collected from other sources. Terah, the father of Abraham, it is said, (Suidas in voc. Ἀβραάμ and Σαρρα, Lex. tom. i. & ii.) made statues and images for the purposes of that idolatrous worship, which had been transmitted to him from his ancestor Serug, and which he encouraged by example and exhortation. Some Jewish authors relate, (apud Genebrand. in Chron.) that Abraham pursued the same occupation; and Maimonides (More Nevochim, c. 29.) says, that he was educated in the religion of the Sabæans, who acknowledged no deity but the stars, and that he was led by his own reflection to the belief of an intelligent Creator and Governor of the universe; but that he did not renounce paganism till the 50th year of his age. That he was brought up in the religion of the Sabæans is an opinion adopted by Spencer, de Leg. Heb. Ritual. lib. ii. c. 1. § 2. vol. i. 279. See SABBATISM. Suidas (*ubi supra*,) informs us, that at 16 years of age he cautioned his father against seducing men to idolatry for the sake of pernicious gain, and taught him that there is no other God besides him who dwells in heaven, and created the whole world. It is added, that he destroyed the statues and images of his father, and departed with him from Chaldaea. Others relate (Heidegger Hist. Patriarch. tom. iii. p. 36.) that his father deputed Abraham to sell his statues in his absence, and that a man, who pretended to be a purchaser, having ascertained that he was 50 years of age, remonstrated with him for adoring at such an age, a being which is but a day old. Abraham, impressed and confounded by this remonstrance, destroyed them all, excepting the largest,

before his father's return; and he told him, that having presented an oblation of flour to the idols, the stoutest of them, in whose hand he had placed a hatchet, hewed the others to pieces with that weapon. Terah replied, that this was bantering, because the idols had not sense to act in this manner; upon which Abraham retorted these words upon his father against the worship of such gods. But he was delivered up by Terah to Nimrod, the sovereign of the country, and because he refused to worship the fire, according to his order, he was thrown into the midst of the flames, from which he escaped uninjured. Mr. David Levi, in his *Lingua Sacra*, has given an account of this tradition, extracted from *Medrash Bereschith*; and it is related by Jerome, (Trad. Hebraic. in Genesim,) who seems to admit its general credibility. The vulgar translation of 2 Esdras ix. 7. expresses, that he was delivered from the *fire of the Chaldeans*; but the ambiguity of the word *Ur*, which denotes fire, as well as the birth-place of Abraham, seems to have given rise to this opinion. However, if we allow that Abraham, being born and educated in an idolatrous country and family, might have been addicted in very early life to that superstition, it is certain that he renounced it, and that he was providentially removed from a scene of danger, and that he contributed to propagate just sentiments concerning the deity wherever he sojourned. The fame of his wisdom, piety, and virtue, spread far and wide among the nations of the world: this appears from the testimonies of Berofus, Hecateus, Nicholas of Damascus, cited by Josephus, (Antiq. l. i. c. 7. apud Oper. tom. i. p. 28. ed. Haverc.) and also from what is said of him by Alexander Polyhistor, Eupolemus, Artapenus, and others, whose testimonies may be seen in Eusebius's *Præp. Evang. lib. ix. cap. 16, 17, 18, 19.* His name is mentioned with honour all over the East to this day. Josephus (Antiq. l. i. c. 8. tom. i. p. 30.) informs us, that he taught the Egyptians arithmetic and astrology; and we learn from others, (see Eusebius and Suidas, *ubi supra*;) that he also instructed the Phœnicians in astronomy; that he invented the Hebrew characters and language; and that he wrote several books. Traditional truth and fiction seem to have been blended in the accounts that are given of this eminent patriarch by the Jews, Arabians, and Indians. Of the books ascribed to him, the principal seems to have been the treatise called *Jetzirah*, or *the Creation*, of which it gives an account. This is mentioned in the Talmud, and held in high estimation by several learned Rabbis. It was printed at Paris in 1552, and translated into Latin by Postel; and also translated into Latin, with remarks, in 1642, by Rittangel, a converted Jew, and professor at Königsberg. A book, called *Abraham's Revelation*, was dispersed by an ancient sect, under the denomination of *SETHIANS*. Abraham's *Assumption* is mentioned by Athanasius in his *Synopsis*; and Origen takes notice of a treatise, pretended to be written by him, in which two angels are introduced disputing about his salvation. The Jews also represent him as the composer of some prayers, and of the 19th Psalm, and of a Treatise against Idolatry. Fabricius (Bibl. Græc. tom. ii. p. 516.) informs us, that some astrological books of Abraham, which are now lost, are commended by Vettius Valens and Jul. Firmicus; and from Kirchem's Treatise of Libraries, p. 142. we learn, that all the several words, which Abraham composed in the plains of Mamre, are contained in the library of the monastery of the Holy Cross on Mount Amaria, in Ethiopia. The Indians believe this patriarch to have been the same with their great prophet Zoroaster. According to the Arabians, who have given us a history of Abraham, very different from that of the Bible, he was the son of Azar, and grand-

son of Terah; and the eastern heathens have a long tradition concerning Abraham's life, which differs very much from that of Moses. In a book, said to be in the French king's library, No. 792. which was written by Ephrem the Syrian, and translated from the Syriac into Arabic, upon Abraham's journey into Egypt, there is a sermon on his death, preached by St. Athanasius, on the 28th of March; on which day the Coptic and Egyptian christians observe his festival. Among the Mahometans, the memory of Abraham is held in great veneration, and his name frequently occurs in the *KORAN*. See *CAABA*. We are told by Ebn Shebna, (ad. Ann. Hegira 513, cited by D'Herbelot *Bibl. Orient. Art. Abraham*, p. 16.) that in the beginning of the 12th century, the tomb of Abraham having been discovered near Hebron, his body, as well as those of Isaac and Jacob, were found entire and uncorrupted. There were likewise some gold and silver lamps hung up in the cave, which was visited by multitudes. The Moslems have such a reverence for this place, that they make it one of their four pilgrimages, the three others being those of Mecca, Medina, and Jerusalem; and the christians built a church over the cave, which the Turks afterwards converted into a mosque, and prohibited christians from approaching. The emperor Alexander Severus, (Lamprid. in Sever.) who knew Abraham only by the extraordinary circumstances related by Jews and Christians, conceived so high an opinion of him, that he ranked him with Jesus Christ among his gods.

ABRAHAM, Rabbi, in *Biography*, was prince of the Jewish nation, and tutor to Abenezra. He foretold that the Messiah would be born under the same configuration or conjunction of Jupiter and Saturn, with Moses the Jewish lawgiver. According to his calculation, this was to happen 2859 years after the former, i. e. A. D. 1464; and two such conjunctions are said to have actually occurred within the 15th century, viz. in 1444 in Cancer, and 20 years after in Pisces; but instead of deliverance, the Jews experienced only disaster and distress.

ABRAHAM, R. Isaac Ben, a Jewish writer, who lived about the beginning of the 17th century. He was by nation a Polander, but spent most of his time in the courts of Germany. His book, intitled, *Chasuk Emunah*, i. e. *Munimen Fidei*, was a violent attack on the christian religion, in which he examines the whole gospel, and endeavours to explode all the proofs of it, and to confute the objections of Christians against the Jews. This book, which was composed against the disciples of Luther, was published in 1616, from a MS. which was become very scarce. It was translated into Spanish, and very widely dispersed. The African Jews held it in high estimation, and from them it was brought into Germany by Wagenfeil, who inserted a Latin translation of it in his *Tela Ignea Satanae*.

ABRAHAM, Ujque, a Portuguese Jew, supposed by some to be a Christian, who, with Tobias Athias, translated the Bible out of Hebrew into Spanish. It was printed at Ferrara in 1553, and reprinted in Holland in 1630. The first edition of this Bible, which is the most valuable, is marked with stars at certain words, which are designed to shew that these words are difficult to be understood in the Hebrew, and that they may be used in a different sense.

ABRAHAM, or ABRAM, Nicholas, a learned jesuit, was born in the diocese of Toul in Lorraine in 1589. He was made divinity professor in the university of Pont à Mousson, which office he held 17 years, and died Sept. 7, 1655. He wrote notes on Virgil and Nonnus, a Commentary on some of Cicero's Orations, in 2 vols. fol. a collection of theological pieces, intitled, *Pharus Vet. Test.* and some other works.

ABRAHAM, *Israel's Pi-aro*, a Jewish rabbi, who flourished at Amsterdam about the middle of the 17th century. He wrote a book intitled, the Sceptre of Judah, which is an exposition of the prophecy of Jacob, and intended to confute the notion of the Messiah's having actually appeared. Bafnage has given a particular account of this book, which he saw in MS. Hist. des Juifs. l. ix. c. 36. § 14—21.

ABRAHAM, *Ill. of*. See **S. MARY**.

ABRAHAMIANIS, or **ABRAHAMITES**, in *Encyclopædical History*, a sect of heretics, who renewed the error of the PAULICIANIS.

They took their names from that of their leader Abraham, a native of Antioch, by the Arabs called Ibrahim; whence also the name Ibrahimiah, given by them to this sect. The Abrahamians arose about the close of the eighth century, and were suppressed by Cyriacus, patriarch of Antioch.

The same denomination is also applied to a party of monks, who suffered death for the worship of images, under Theophilus.

ABRAHAMSDORF, in *Geography*, a populous large village in Upper Hungary. E. long. 19° 50'. N. lat. 46° 20'.

ABRAM'S Creek, a creek which falls into Hudfon's river in America, near the city of Hudfon.

ABRAMBOE, a town in the kingdom of Fetu on the African coast, in which is held a brilliant assembly of the natives from all parts of the kingdom, to celebrate, by dancing, and other diversions, the birth-day of the king.

ABRAMIS, in *Ichthyology*, a name given by Bellonius and others, to the *cyprinus latus*, or **BREAM**.

ABRANTES, in *Geography*, a town of Estramadura in Portugal, seated on an eminence near the river Tajo, and encompassed with delightful gardens and olive-yards. It contains about 3500 inhabitants, four convents, and an hospital. It was fortified by Peter II., raised to a county by Alphonfus V., and promoted to a marquifate by John V. in 1718. W. long. 7° 18'. N. lat. 39° 13'.

ABRASA, in *Surgery*. See **ABRASION**.

ABRASANAS. See **ABRAXAS**.

ABRASION, composed of the Latin *ab*, and *rado*, to *scrape*, or *scrape off*, a superficial excoriation or ulceration of any part of the body: but the term is generally applied to a surface which has been rubbed off by external violence. The minute portions of abraded skin are not to be hastily taken away; as, by careful re-application, they may often adhere and unite, thus preventing the consequences of a recent wound. See **ADHESION** and **AGGLUTINATION OF WOUNDS**.

Sores attended with excoriation are denominated *abrafæ*. The part rubbed off is technically named *abrafæm*. Vide *Orifafæ de Morb. Curat.* l. iii. c. 18.

ABRAVANNUS, in *Ancient Geography*, the name of a promontory and river of Galloway, in Scotland, so called from *Aber*, which, in Celtic, denotes the mouth of a river, and *avon*, a river. It is probably that small river which falls into the bay of Glenuee, a little to the south of the Mull of Galloway.

ABRAUM, in *Natural History*, a name given by some writers to a species of red clay, used in England by the cabinet-makers, &c. to give a red colour to new mahogany wood; we have it from the Isle of Wight, but it is also found in Germany and Italy.

ABRAXAS, a barbarous word, denoting a power which presides over three hundred and sixty-five others, the number of days in the year.

Abraxas is a word of obscure origin: it is supposed to be technically compounded of the Greek letters, considered

as numeral characters: according to the custom of the Grecians, who expressed their numbers by letters of the alphabet; the values of which in the present word stand thus: A 1, B 2, P 100, A 1, X 60, A 1, S 200; which added together make the number 365.

The word is usually written, among modern authors, *abraxas*, though as some hold, by a corrupt transposition of the letters S and Z, for *abrefax*, as it is found in all the Greek fathers, as well as on ancient stones. Irenæus indeed (lib. i. c. 23. p. 59. ed. Grabe) has *abraxas*, but the reason may be, that the chapter in which the word occurs is only extant in Latin: so that though it be in Greek characters, the orthography is of Latin copyists or translators.—In strictness the word ought to be written in Greek characters, ΑΒΡΑΧΑΣ; since, besides that the inventor of it spoke that language, the word does not contain the number 365, when written in the Latin character. Hence a farther error in most books, which occurs in the smaller or running character, on account of the Greek sigma; this having in ancient inscriptions the same figure with the Latin C, is often rendered by a Roman C instead of S; whence *abraccax* for *abrafax*.

Beaufobre (Hist. de Manich. tom. ii. p. 55, 56.) conjectures, with a very great degree of probability, that *abraxas*, or *abrafax*, is derived from two Greek words, which signify magnificent Saviour. For the epithet *αερος*, the first part of *abrafax*, is particularly applied, in the sense of magnificent or splendid, to Apollo and Bacchus, who, according to Macrobius, (Sat. l. i. c. 18.) are the same deities; and the second word of which *abrafax* is composed is *σωω*, which is used by Homer for *save*, or *σωα*, which denotes *salvation*.

Many learned moderns affirm, that the Basilidians used to call the supreme God *Abraxas*. For this they have the authority of Jerome (Adv. Lucif. p. 304.), and of the author of the additions to Tertullian's Book of Prescriptions, c. 46. But that these writers are mistaken, we may conclude from the better authority of Irenæus (lib. i. c. 23.), who informs us, that their opinion was, that the Father of all was ineffable, or without a name, and that *abraxas* was the first of their 365 heavens, or the prince of the angels that resided in them. It is probable that they applied this term to the arcana of their philosophy, and not to their theology. Accordingly, Jerome assures us, (*ubi supra*), that it is the same with Mythras, or the Sun, which is the deity worshipped by the Persians. Hence we learn, why *abraxas* is said to be the chief of the 365 heavens, or angels who reside in them, and rule over the 365 days of the year; for the sun may, with great propriety, to preside over all the days of the year, and in the hieroglyphical language, be said to contain in himself the parts of which the year is composed, and to rule over it. *Abraxas* is, therefore, a technical term, much in the spirit of the cabalistic or oriental philosophy; which, joined with that hieroglyphical disposition for which the Egyptians were remarkable, will account for the emblematical figures that appear on several of those gems, called by Montfaucon (Palæog. Græc. l. ii. c. 8.) *abraxæi*. But there is no sufficient evidence that these belonged to the Basilidians.

Several have even suspected that they discover some trace of the gospel trinity concealed in this word; which they explain, by supposing it compounded of the initial letters of the Hebrew words *Ab ben rouah*, q. d. father, son, and spirit. Wendelin, canon of Tournay, and father Hardouin, have given more precise explications of the word, according to this system. The former makes it stand for *pater, filius, spiritus sanctus, salus a ligno*: the latter, improving

proving somewhat on the explication, makes it represent as below,

A	A	Pater	A	1
B	Ben	Filius	B	2
P	Rouah-hakadosh	Spir. Sanctus	P	100
A	αἰθεραίως	homines	A	1
C	σαζων	salvans	C	200
A	ερια	per sacrum	A	1
E	ξυλω	lignum	E	60

365

ABRAXAS is also used, among *Antiquaries*, for a species of graven gem, on which the word *abraxas* is usually inscribed; supposed to have been worn by the ancient Gnostics, Basilidians, and Carpocratians, as an amulet or talisman against diseases.

If the above explication of the meaning of the term *abraxas* be just, we can easily account for the introduction of this practice. In the system of ancient mythology, Apollo and the Sun were the same, and Apollo was the god of healing. Hence, in the true spirit of hieroglyphics and mythology, these gems were undoubtedly used by the heathens, and probably by some superstitious christians, who being lately converted, retained a relish for their former absurdities, as amulets, or charms, to drive away agues and other diseases; and this also gave rise to the use of the word *ABRASADABRA* for the same purpose. It is not unlikely that such were found among the orthodox as well as among the Basilidians and other reputed heretics.

Abraxas are of divers figures and sizes: sometimes in that of rings to be worn on the finger; in which form they were supposed of great efficacy for driving away flies.

Abraxas are frequent in the cabinets of the curious: a collection of them, as complete as possible, has been much desired by several. There is a fine one in the abbey of S. Genevieve, which has occasioned much inquiry. They are chiefly of the third century; most of them seem to have come from Egypt, whence they are of considerable use for explaining the antiquities of that country. But they are much too numerous and too costly to have been the production and possession of the christians of the three first centuries, though they had all taken delight in such things.

Macarius, Chifflet, Capello, and Montfaucon, have written expressly on *abraxas*; the latter has given 36 plates of them, well filled, and he has divided them, for the sake of order and perspicuity, into seven different classes.

Abraxas have sometimes no other inscription beside the word; but more usually some symbol annexed to it. Beside which, we sometimes find other marks and words adjoined; as the names of saints, angels, apostles, and the ineffable name Jehovah itself, either at length, or in the abbreviation ΙΑΩ; sometimes the words *αεθαι*, *Αδωνι*, Eloai, or the names of other gods; as Mithras, or Mithraξ; *ΩΩΩ*, Semes, Sol; *Αουε*; *ε*; *Ζει*; *Σερ*, or Serapis, the one Jupiter; and the like. Sometimes we observe Isis sitting on a lotus, or Apis, surrounded with stars; Osiris, Serapis, Harpocrates, Canopus; the cock, the dog, the lion, the ape, and the sphinx, which are well known symbols of heathen deities; sometimes monstrous compositions of animals, obscene images, Phalli, and Ithyphalli; in a word, every kind of thing which the Egyptians placed among their gods. The graving of *abraxas* is not uniform, rarely good; the reverse, on which is the word, is said to be sometimes of a lower and a more modern taste than the face. The characters are usually Greek, sometimes Hebrew, Coptic, or Etrurian; and sometimes of a mongrel kind, forged as it should seem on purpose to make their import impenetrable. It is disputed,

whether or not the Veronica or Montreuil, or the Granite obelisk, mentioned by Gori, be *abraxas*.

Dr. Lardner, who, with an industry and accuracy for which he was distinguished, and by which he has eminently served the cause of christianity, has examined the particular classes of these gems given by Montfaucon, and clearly proved that they are of heathenish origin. Many of the figures and inscriptions on them are exceedingly obscene and idolatrous, and could not be the production of any Christian sect whatever; but they must be pagan, and for the most part Egyptian. To this purpose, Beaufobre (*ubi supra*, cap. 4.) observes, that it is altogether incredible, that a sect, which made profession of christianity, should have adopted the monstres adored by the Egyptians; or that a man who boasted of deriving his doctrine from Matthias, and from an interpreter of St. Peter, and who received the gospels and the epistles of St. Paul, should make images of the deity; at a time when christians had the most excessive aversion to all sorts of images, even the most innocent. This learned writer has also urged a variety of irrefragable arguments against the opinion of those, who maintain that these gems were the invention of the Basilidians. From many of the figures themselves, produced by Chifflet, it appears that they are pagan, and of Egyptian origin, and could not belong to any sect of christians; and as for those gems, which have the names of Abraham, Isaac, or Jacob on them, or the God of these patriarchs, or the words, Sabaoth, Adonai, or Eloai, these, he says, are the inventions of the Cabalists, or of the Egyptian magicians; and he has thus deduced, from his observations on Chifflet's figures, the same conclusion, which Dr. Lardner has drawn from those of Montfaucon. As for the names of angels, which Montfaucon asserts (*Pal. Græc. l. ii. c. 8. p. 177.*) to have been in use among the Basilidians, it is evident, that those which he mentions were derived from the Ophites, as Origen (*Cont. Cels. l. v. p. 295. ed. Cantab. opp. i. p. 653. D. Bened.*) plainly informs us. After an elaborate investigation of this controverted subject, Dr. Lardner concludes in words similar to those of Beaufobre; 1. That *Abraxas* was not the god of the Basilidians. 2. That this name signifies nothing but the sun, which was never worshipped by them. 3. That the figures, both in Chifflet and Montfaucon, are, for the most part, Egyptian. 4. That there is no kind of proof that any of them belonged to the Basilidians. 5. That those which have Iao, Sabaoth, &c. upon them, were the works of magicians, who never made any profession of christianity. 6. That some of these figures derived their origin from the SIMONIANs and OPHITEs, who were not Christians either in belief or profession. See Lardner's Works, vol. ix. p. 290—364.

ABREAST, a *Marine* term, expressing the situation of two or more ships, that lie with their sides parallel to each other, and their heads equally advanced. But if their sides be not parallel, then that ship, which is in a line with the beam of the other, is said to be *abreast* of her. When the line of battle at sea is formed *abreast*, the whole squadron advances uniformly, the ships being equally distant from, and parallel to each other; so that the length of each ship forms a right angle with the extent of the squadron, or line *abreast*. See LINE. *Abreast*, within the ship, denotes on a line with the beam, or by the side of any object aboard.

Abreast of any place, means off or directly opposite to it. ABREIRO, in *Geography*, a small town of Tral-os-Montes in Portugal, in a district, which, according to Busching, consists of one parish. W. long. 7° 10'. N. lat. 41° 20'.

ABRETTENE, in *Ancient Geography*, a district of Mysia in Asia. Hence, according to Strabo (*Geog. tom. ii. p. 861.*),

p. 561.), the epithet *Meteorus*, given to Jupiter, whose priest was Cleon, who, after being the leader of a gang of robbers, received signal favours from Antony, and in the Actian war deserted him and went over to Cæsar. The people were call'd *Meteoræ*, and inhabited the country that lies between Ancyra of Phrygia and the river Rhyndacus. Cæsar's.

ABRIDGING, in *Algebra*, is the reducing a compound quantity, or EQUATION, to its more simple EXPRESSION.

To *abridge* the equation

$$\begin{aligned} x^3 - ax^2 + dx - ab &= 0 \\ -b &+ a; \\ -c &+ b. \end{aligned}$$

All the known quantities $-a-b-c$ of the second term are first reduced equal to one single letter $-n$: all the known quantities $+d+r+bc$ of the third term, equal to another letter $+p$: and all the known quantities $-abc$ of the fourth term, equal to a single letter $-q$. By which means we have $x^3 - nx^2 + px - q = 0$, instead of the equation proposed.

An equation thus abridged, is called a FORMULA.

This is done either to save room, or the trouble of writing a number of symbols, or to simplify the expression for relieving the attention and memory, or rendering the formula more easily and generally.

ABRIDGMENT, in *Literature*, a summary or contraction of a discourse; wherein the less material things being more briefly inserted on, the whole is brought into a lesser compass. The Abbé Guakier has published an elaborate work in 2 vols. 4to. intitled, A Method of making Abridgments.

Abridgments of books are numerous. They are usually said to have had their rise in the times of ignorance; to have been one of the first fruits of that barbarism which ensued on the decline of the Roman empire; and to have been unknown in those happy days, when letters flourished among the Greeks and Romans: yet we have some traces of them in those times. Lord Bolingbroke, speaking of those who are employed in this way, says, that "they do neither honour to themselves, nor good to mankind; for surely the abridger is in a form below the translator; and the book, at least the history, that wants to be abridged, does not deserve to be read. They have done, anciently, a great deal of hurt, by substituting many a bad book instead of a good one; and by giving occasion to men, who contented themselves with extracts and abridgments, to neglect, and, through their neglect, to lose, the invaluable originals." See *ÉPITOME*. Notwithstanding this reflection, abridgments are in many cases necessary and useful; though it is a difficult task, and it requires peculiar talents to perform the office of an abridger well; to preserve the original author's facts, reasoning, manner, and spirit, and to omit nothing that is essential either in argument or illustration, and at the same time to retrench what is redundant, to restrain needless amplification, and to avoid irrelative or useless digressions, are objects of unquestionable importance. When these objects are duly regarded, abridgments cannot fail to make knowledge of various kinds more easy of access and of attainment, and by reducing the expense and labour of acquiring it, to extend its diffusion and prevalence. To readers of various classes and descriptions, compendious epitomes of voluminous works will be acceptable and useful. The practice of abridging books that are read, or the lectures of public professors in the various departments of science, is a method of study, which has been recommended by those who have experienced its utility, and which has contributed in no small degree to assist both the judgment and the memory. Those who have accustomed themselves to this practice have also acquired a facility of composition, of which they have availed themselves on vari-

ous occasions; whatever may have been the employment or profession to which they have been devoted. We shall here subjoin two excellent specimens of that kind of abridgment which we have recommended.

In the Essay on Miracles, Mr. Hume's design is to prove, that miracles which have not been the immediate objects of our senses, cannot reasonably be believed upon the testimony of others. His argument is,

"That experience, which in some things is variable, in others uniform, is our *only* guide in reasoning concerning matters of fact. Variable experience gives rise to probability only; an uniform experience amounts to proof. Our belief of any fact from the testimony of eye-witnesses is derived from no other principle than our experience of the veracity of human testimony. If the fact attested be miraculous, here arises a contest of two opposite experiences, or proof against proof. Now a miracle is a violation of the laws of nature; and as a firm and unalterable experience has established these laws, the proof against a miracle, from the very nature of the fact, is as complete as any argument from experience can possibly be imagined; and if so, it is an undeniable consequence, that it cannot be surmounted by any proof whatever derived from human testimony."

In Dr. Campbell's Dissertation on Miracles, the author's principal aim is to shew the fallacy of Mr. Hume's argument; which he has most successfully done, by another single argument, in the following manner:

"The evidence arising from human testimony is *not solely* derived from experience; on the contrary, testimony hath a natural influence on belief antecedent to experience. The early and unlimited assent given to testimony by children gradually contracts as they advance in life: it is, therefore, more consonant to truth to say, that our *diffidence* in testimony is the result of experience, than that our *faith* in it has this foundation. Besides, the uniformity of experience in favour of any fact, is not a proof against its being reversed in a particular instance. The evidence arising from the single testimony of a man of known veracity, will go farther to establish a belief in its being actually reversed. If his testimony be confirmed by a few others of the same character we cannot withhold our assent to the truth of it. Now, though the operations of nature are governed by uniform laws, and though we have not the testimony of our senses in favour of any *violation* of them; still, if in particular instances we have the testimony of thousands of our fellow-creatures, and those too men of strict integrity, swayed by no motives of ambition or interest, and governed by the principles of common sense, that they were actually witnesses of these violations, the constitution of our nature obliges us to believe them."

These two examples contain the substance of about 400 pages.

For *abridgments* of the common law and the statutes, see *DIGEST, LAW, and STATUTES*.

ABRIDGMENT, in *Law*, is particularly used for the shortening a count or declaration, by subtracting some of the substance of it.

A man is said to *abridge his plaint* in a *chife*, or a woman her demand in an action of dower, when, having put any lands therein which are not in the tenure of the tenant or defendant; and non-tenure, or the like, is pleaded to that land in the abatement of the writ; they are brought to *abridge*, i. e. to desist from and leave that parcel out of the demand; and pray that the tenant may answer to the rest, to which he has not yet pleaded any thing.—Though the demandant has

has *abridged* his plaint, or demand; yet the writ still remains good for the rest. The reason is, that such writs run in general, and do not specify particulars. See 21 H. VIII. c. 3.

ABRINCATARUM *oppidum*, in *Ancient Geography*, the town of the *Abrincate* or *Abrincatui*, now *Avranches*, in France, situated on an eminence in the south-west of Normandy, near the borders of Brittany, on the English Channel. W. long. 1° 10'. N. lat. 48° 40'.

ABRIZAN, or **ABRIZGHIAN**, derived from *Abriz*, which signifies in Persian, *a vessel proper for pouring out water*; the name of a feast observed by the old Persians on the 13th day of the month Tir, which nearly corresponds to our September, with abundance of idolitrous superstitions. This heathenish festival was apparently preparatory to the descent of the rain in those countries, being about the time of the autumnal equinox, and has been partly adopted by the Mahometans. Mr. Harner (*Observations on Scripture*, vol. iii. p. 10.) has availed himself of the practice at this feast, to explain the Jewish ceremony of pouring out water at the feast of tabernacles, alluded to by our Saviour, John, ch. vii. After the return of the Jews from their captivity in Babylon, Zechariah (ch. xiv. xvi. xvii.) connects attending the feast of the tabernacles with obtaining the rains of autumn, which are of such consequence after the drought of a Syrian summer; and therefore (says the ingenious writer) this rite was probably then practised, and the pouring out of water in the temple, with solemnity, as before God, understood to be a religious prognostic of the approach of rain, or a *morally* instrumental and procuring cause of its speedy coming. Might not (he adds) the returning Jews think of adding some memorial of Jehovah's being the giver of rain to that ancient national solemnity that had been enjoined by Moses, to be observed just about the same time of the year with that of the Persian festival, which that people solemnly ascribed to some deity they worshipped, but which the Jews knew was the gift of Jehovah?

ABROCHMENT, or **ABROCHMENT**, **ABROCAMENTUM**, in some ancient *Law-writers*, denotes the act of ingrossing or buying up commodities by wholesale, before they come into the open market, in order to sell them off dear by retail, otherwise called *forestalling*.

ABROGATION, from the Latin *abrogo*, *I repeal*, the act of abolishing a law, by authority of the maker.

In which sense the word is synonymous with abolition, repealing, and revocation.

Abrogation stands opposed to *rogation*: it is distinguished from *derogation*, which implies the taking away only some part of a law; from *subrogation*, which denotes the adding a clause to it; from *obrogation*, which implies the limiting or restraining it; from *dispensation*, which only sets it aside in a particular instance; and from *antiquation*, which is the refusing to pass a law.

ABROHANI, or **MALLEMOLLI**, the name of a kind of muslin, or clear white cotton cloth, brought from the East Indies, particularly from Bengal; being in length sixteen French ells and three quarters, and in breadth five eighths.

ABROJOS, or *Baxos de Babuca*, in *Geography*, a bank formed by several small rocks and isles, east of Turk's island. W. long. 69° 40'. N. lat. 21° 5'. A deep channel of the breadth of three leagues lies between this bank and the island.

ABROKUS, in *Botany*, a name used by some of the Latin writers, for the *bronus*, or *avena sterilis*, the wild oat; and by others for the *orobus*, or bitter vetch. The Greeks originally used the word, and that not only for these two

vegetables, but in a much larger sense, understanding by it any herb resembling the plants cultivated for the use of the table, but not esculent. The Greeks and Romans had a way of expressing the boiling of pulse or herbs, by words signifying the wetting of them: thus the Greeks expressed boiled things by *brocha*, βροχα, and the Romans by *malida*. Virgil uses the word for the pease, and Plautus, for all esculent things that were boiled: hence these bastard pease and oats were called *abrocha*, *non malida*, not fit for boiling or eating.

ABROLHOS, in *Geography*, dangerous shoals about 50 miles from the coast of Brasil, and about the island of St. Barbe. S. lat. 18° 22'. W. long. 33° 45'.

ABROMA, in *Botany*, formed of α and βρομα, q. d. *not fit for food*, is used in opposition to **THEOBROMA**, as a genus of plants belonging to the natural order of *Columniferæ*, the *Malvaceæ* of Jussieu, and the 18th class of *Polyadelphia Dodecandria*. The generic characters are as follow: the *calyx* is a five-leaved perianthium, with lanceolate, acute, spreading, and permanent leaflets; the *corolla* has five petals, larger than the calyx, with obovate, arched, concave, obtuse claws, hairy at the end, erect, and inserted at the base into the nectary; and oval, obtuse, spreading, ciliate borders, contracted at the base into recurved little claws, on which the chief claws are placed; and a small pitcher-shaped nectary, divided into five segments, which are obovate, hairy, erect, recurved, and arched; the *stamina* are five membranaceous, very small filaments, growing on the nectary between the segments, emarginate-trifid, with three anthers on each filament, that are twin and kidney-form; the *pistil* has a subcylindrical germ, with five subulate styles, and acute stigmas; the *pericarpium* is an ovate, membranaceous, five-winged, five-beaked, and five-celled capsule, with folded partitions; and the *seeds* are numerous and subovate, within an oblique membranaceous aril, fixed in a double row to the central edge of the partitions, which is thickened and longitudinally bearded; and without a receptacle. There are two species, viz. the *Maple-leaved abroma*, which is a tree, with a straight trunk, yielding a gum when cut, and filled with a white pith like the elder; it flowers from June to October, and its fruit ripens in September and October; it is a native of New South Wales and the Philippine islands, and was introduced into Kew gardens about 1770, and is a hot-house plant, requiring great heat, and much water:—and *Wheler's Abroma*, so called by Koenig, in compliment to Edward Wheler, Esq. of the Supreme Council in Bengal; this is a shrub with a brown bark, a native of the East Indies, and is not known in Europe. Miller's Dict. by Martyn.

ABRONO, in *Botany*, a name given by Serapion, and others, to the *heart-PEA*; called also *abrygi*.

ABROSTOLA, in *Ancient Geography*, a town in Phrygia, which, according to Ptolemy and the Peutingerian Table, is about 23 miles from *Amurium*. Cellarius, vol. ii. p. 89.

ABROTANOIDES, in *Botany*. See **ARTEMISIA**, **PROTEA**, and **SERIPHIMUM**.

ABROTANOIDES, in *Natural History*, a name given by Bauhin to the *MADREPORA muricata* of Linnæus and others.

ABROTANUM or **ABROTONUM** *maf.* See **ARTEMISIA**, and **SOUTHERNWOOD**. **ABROTANUM** *famina*. See **SANTOLINA**, and **LAVENDER-COTTON**. See also **ERIOCEPHALUS** and **TANACETUM**.

ABROTONUM, in *Ancient Geography*, a town and harbour on the Mediterranean, in the district of Syrtis Parva, in Africa; one of the three cities that formed **TRIPOLY**.

ABRUG-Banya, in *Geography*, a populous town of Transylvania, in the district of Weissenburg, the residence of the Mage office, and the chief of the metal towns. It is situated among mines of gold and silver. L. long. 23° 24'. N. lat. 46 5'.

ABRUPTION, in *Surgery*, a term of the same signification with **ABDUCTION**.

ABRUS, in *Botany*, of ἀβρυσ, *sift* or *delicate*, so called from the extreme tenderness of the leaves, is a genus of the natural order of *Leguminae*, and the 17th class of *Diadelphous Decandri*; its general characters are, that the calyx has a one-lobed, bell-shaped, obscurely four-lobed perianthium, with blunt teeth, the upper one broader than the rest; the corolla papilionaceous, with a roundish banner, flattened at the sides longer than the wings and keel, oblong blunt wings, and oblong sickle-shaped gibbous keel; the *stamina* are nine filaments united in a sheath, cloven above, with oblong erect anthers; the *ovary* is a cylindrical hairy germen, with subulate style, shorter than the *stamina*, and small stigma in form of a head; the *pericarpium* is a legume or pod, like a rhomb, compressed, coriaceous, bivalved, with four or five cells, and a subulate deflex claw; and the *seeds* are solitary and subglobose. There is one species, viz. the *Abrus precatorius*, formerly the *Glycine abrus* of Linnæus, the *Phaselis* of Sloane, and *Orobus Americanus*, &c. of Tournefort. It grows naturally in both Indies, Guinea, and Egypt. It is a perennial plant, rising to the height of eight or ten feet. Its leaflets have the taste of liquorice, whence it is called in the West Indies *Jamaica wild liquorice*, and used for the same purpose. There are two varieties, one with a white, and the other with a yellow seed. The seeds are commonly strung, and worn as ornaments in the countries, where the plant grows wild; and they are frequently brought to Europe from Guinea, and the East and West Indies, and wrought into various forms with other hard seeds and shells. They are also used for weighing precious commodities, and strung as beads for rosaries, whence the epithet *precatorius*. They are frequently thrown, with other West Indian seeds, on the coast of Scotland. This plant was cultivated by Bishop Compton at Fulham before 1680. It is propagated by seeds, sown on a good hot-bed in spring, and previously soaked for 12 or 14 hours in water. When the plants are two inches, each of them should be transplanted into a separate pot of light earth, and plunged into hot-beds of tanners' bark, and shaded from the sun. They will flower the second year, and sometimes ripen their seeds in England. Miller by Martyn.

ABRUS, in the *Materia Medica*, the name of a seed produced by one of the phaseola, or kidney-beans, and commonly called *Ango's seeds*.

ABRUZZO, in *Geography*, a province of Naples, deriving its name from the ancient city of **TERAMO**, which was focalled. This name was applied by the Goths, Lombards, and Normans, to a small domain, denominated the county of *Apruzzo*, or *Aprutinus*. Under the Swabian government it was extended to the whole country that now bears this appellation. It is divided by the river Pescara into two parts, one of which is denominated *Uterior*, or *Ultra*, having *Aquila* for its capital, and the other *Citior* or *Citra*, whose capital is *Chieti*. The tribunals of government in this country were fixed, on the accession of the house of Arragon, at *Aquila* and *Chieti*. But in the last century it was found expedient to divide that of *Aquila* into two jurisdictions: and a third tribunal was established at *Teramo*. In this province there are, besides the Apennine mountains, two others called *Monte Cavallo* and *Monte Maiello*, the top of the last of which is always covered with snow, and many more of

inferior note. Although *Abruzzo* is a cold country, it is fertile in corn, rice, fruit, oil, and wine, which afford not only a sufficient supply for the natives, but articles for exportation. Wool is also a staple commodity, which is furnished by the flocks that pass the summer on the fine pastures of the mountains, and are driven in winter to the plains of *Puglia*, and other parts near the sea coast, where the snow does not lie. Saffron was formerly produced in great abundance in the territory of *Aquila*, but since the culture of it in *Lombardy*, it has been neglected in *Abruzzo*. Liquorice-roots are exported from the maritime districts of this country; and in the province of *Teramo* there is a manufactory of pottery-ware, which is valued in *Germany*, and conveyed thither by the way of *Trieste*; but this is sinking into decay. This country, which is naturally fertile and productive, needs only industry and labour, under the protection and encouragement of a good government, to render it important and prosperous. But destitute of internal improvement and convenient sea-ports, it is, in most parts of it, desolate and wretched. Feudatory estates abound; but the towns are thinly inhabited, and the face of the country exhibits traces of inattention and neglect. The antiquary and naturalist may travel through this province with pleasure and advantage. The most interesting monuments are those of *Monte-Corno* and *Majella*. The inhabitants bear a great resemblance to their northern progenitors, who were first *Lombards*, and afterwards *Normans*, possessing the same goodness of heart with great indolence, and an indisposition to active exertions. Among the mountaineers there are evident traces of the Frank and Teutonic languages. In this province is the lake **CELANO**. Swinburne's Travels, vol. iv. p. 378.

ABSALOM, in *Scripture History*, the son of *David*, by *Maacah*, daughter of *Talmai*, king of *Geshur*, and brother of *Tainar*, who was dishonoured by *Amnon*, *David's* son by another mother. For this injury, *Amnon* was assassinated by *Abfalom* at a feast which he prepared for the royal family. He then took refuge with *Talmai*, in the country of *Geshur*; and soon after he was restored to favour, he engaged the *Israelites* to revolt from his father. Having been proclaimed king at *Hebron*, his father was under a necessity of leaving *Jerusalem*, where *Abfalom* was received by the people. He and his army, however, were soon routed by *David's* forces under the command of *Joab*; and flying into the forest of *Ephraim*, his hair was entangled in the branches of an oak, and in this situation he was killed by *Joab* and his armour-bearer, A. M. 2980, ante A. D. 1024. *David*, who had ordered his life to be preserved, lamented his death with excessive grief. The extraordinary weight of *Abfalom's* hair, which is stated (2 Sam. xiv. 26.) at "200 shekels after the king's weight," has been considered by critics and commentators as a difficulty, which is not easily solved. If we allow with *Dr. Cumberland*, (*Essay on weights*, &c. p. 103.) that the Jewish shekel of silver was equal to half an ounce avoirdupois, 200 shekels would be equal to 6½ pounds. *Josephus* (*Op. t. i. p. 386.*) supposes the 200 shekels to be 5 minæ, and each mina to be 2½ pounds, and consequently the weight of the hair to be 12½ pounds, which is still more incredible. For the solution of this difficulty some have supposed that the shekel in this passage denoted a weight in gold equal to the value of the silver shekel, or half an ounce, and thus reduce the weight of the hair to about 5 ounces. Others suppose, that the 200 shekels signify, not the weight, but the value of the hair. Others, again, are of opinion, that there has been an error in transferring the Hebrew copy; so that the number of shekels being expressed by the letter τ , which denotes 20, was mistaken for γ , or 200, or that γ , which signifies

nifies 4, was substituted for 7, or 200. If the last of these suppositions be admitted, the 4 shekels, by Josephus's estimate, would be equal to a quarter of a pound, and by Cumberland's valuation 2 ounces. The learned Bochart in an elaborate dissertation on this subject, (apud Oper. tom. i. p. 883, &c. ed. Villem.) reduces the weight of Absalom's hair to about 2 pounds, which, considering the various circumstances mentioned by him, is by no means incredible.

ABSCEDENTIA, in *Surgery*, denote morbid parts which are in a state of separation. See **ABCEDE**.

ABSCHARON, in *Geography*, a peninsula adjoining the Caspian Sea, and abounding with numerous and productive sources of naphtha and petroleum, and with salt lakes. On this peninsula is situated the city called **BAKU**.

ABSCESS, in *Surgery*, from *abscedo*, to separate, or *abs* and *cedo*, to retire; a cavity containing pus, or a collection of puriform matter; called *Abcessus* by the Latins, and Ἀΐσσημα by the Greeks. The term **EMPYEMA** is used to designate those **IMPOSTHUMES** which form in parts not contiguous to the integuments of the body, especially large **SUPPURATIONS** within the chest or belly; and it is sometimes applied to collections of pus in the skull, the orbits of the eyes, the maxillary sinusses, the joints, &c. Abscesses likewise obtain other denominations, according to their seat; as **PANARIS**, in the finger; **ANCHYLOS**, in the greater angle of the eye; **HYPOPHYON**, in the anterior chamber of the eye; **VOMICA**, in the parenchymatous substance of the lungs; **BUBO**, in the arm-pit or groin; **PAROTIS**, behind the ear; **PARULIS**, in the gums, &c. &c. These appellations are explained in their respective places. We shall now proceed to the general doctrine and treatment of suppurations; after which, will follow some remarks on abscesses of particular parts, requiring peculiar management.

The proximate cause and formation of ABSCESSSES.

This morbid state is always preceded by an inflammation of the vessels from whence the pus has issued. If the purulent matter be well formed, there has been a previous increase of arterial action, a throbbing in the parts adjacent, an exquisite degree of sensibility, augmented animal heat, distension of the minute blood vessels, elasticity of the muscular fibres, and an effusion of serum, or of coagulable lymph from the arteries immediately affected. These phenomena are followed by a gradual diminution of the pain, heat, redness, tension, and throbbing, with a deposition of puriform fluid into the surrounding cellular membrane.

Actual suppuration having now taken place; if the pus lies near the surface of the body, a cream-like whiteness will soon be perceived in some particular point, near the middle, or towards the inferior side of the abscess: an elevation or prominence next occurs, and a fluctuation may be felt underneath, which becomes more distinct as the matter approaches the surface; the pain also is considerably abated, the brilliant appearance of the skin declines; and, if the collection of matter be large, there is usually an attack of shivering, accompanied with febrile symptoms, &c.

The general Seat of ABSCESSSES.

In general, if not always, the matter of an abscess is primarily deposited in the cellular membrane, which surrounds or lies contiguous to the inflamed vessels; except when the secreting arteries terminate and empty themselves in a natural cavity; for example, in the thorax or abdomen. As the texture of the cellular substance admits of easy distension, the pus gradually diffuses itself, and forms an extensive reservoir, which either ruptures spontaneously, in a

part affording the least resistance, or is evacuated by an artificial opening. When pus is confined by a firm adhesion, or by an aponeurosis, or is situated very deeply among parts that resist its pressure, one or more interstices will be sometimes formed of considerable extent; the aperture of which may be at a distance from the original seat of the disease; and if the matter should exit in a very large quantity, the gravitating force of the fluid will give it a tendency to some depending spot. Thus it happens, that matter formed under the temporal muscle may be discharged into the mouth, or pus accumulating in the loins may descend to the lower part of the thigh. We are, therefore, not to imagine the point where the pus makes its appearance by a protrusion externally, to be always the focus or centre of the abscess; although it is generally the most proper place for its evacuation. Some judicious remarks on this subject, by the late Dr. W. Hunter, are contained in the *Medical Observations and Enquiries*, vol. ii. p. 57, &c.

General Indications in the Treatment of ABSCESSSES.

When a practitioner has ascertained, from the preceding and concomitant symptoms, that an abscess exists. (for this disease has sometimes been confounded with an hernia or aneurism,) he should carefully determine whether or not the confined pus ought to be evacuated, and what intermediate steps should be pursued. It may be a question, in some cases, if the suppuration be complete, or sufficiently advanced for an operation. In other cases it may happen, that the tumor ought not to be opened, though the maturation be perfect. At other times the matter, from its situation, ought to be evacuated speedily, lest it should injure the contiguous parts. Regard must also be had to the general state of the patient's health, especially if the suppuration under which he labours be extensive, and has arisen spontaneously. In cases of this kind, which occur after a fever, it will be indispensably necessary to administer such medicines as are adapted to the nature of the internal complaint, as well as to employ appropriate topical remedies to the abscess. When it has been determined to open the tumor, the surgeon should consider in what manner this may be best accomplished, whether by the scalpel, the caustic, or the seton; whether by a single opening, or several; by discharging the pus at once, or at different times.

The various Methods of opening ABSCESSSES.

1. The ancients, and especially Albucasis, used to open abscesses by the application of an actual **CAUTERY**. But the unnecessary and terrific apparatus of hot-irons being now laid aside, all the advantages of exciting a further degree of inflammation, &c. previously to evacuating the pus, may be obtained by milder remedies. When an abscess is seated in a glandular part, and has been very tardy in advancing to a state of maturation, (as is particularly the case with serofulous and venereal tumors,) it will be often better to open them with a caustic than by any other means. The chief grounds of preference in favour of the caustic are, that it tends to augment the inflammation and suppuration; it diminishes the subjacent glandular swelling; it gives free vent to the confined matter; it promotes healthy granulations; it is much less likely to be followed by troublesome sinusses, or by a sore with loose and callous edges, than when a simple puncture or incision has been had recourse to; and it may be employed with patients who have an insurmountable dread of the knife. An unseemly fear is, however, a not unfrequent consequence of the caustic; and on this account, it is not so eligible in the face or neck, where a cicatrix ought, if possible, to be avoided. The method of preparing and applying caustic substances, in

this and other chiralurgical cafes, is explained under the term CAUSÆ.

2. An incision or a puncture is employed rather than the caustic, where the surgeon proposes to let out only a part of the contents of the abscess at once; where it is necessary to limit the extent of the artificial opening to certain dimensions; where the parts too deep for the precarious operation of an escharotic substance; where an immediate outlet is required, and danger is apprehended from delay; or, where it is requisite to make a wide incision, for the purpose of facilitating the discharge, or applying external medicines to the bottom of the sore. The precise circumstances requiring a variety in the plan of treatment, will be explained in the paragraphs which follow, while we describe the different kinds of abscesses that occur in several parts of the body.

3. Another mode of opening abscesses is by the seton, which consists in passing a skein of soft thread or silk through the parietes of the tumor, by means of a seroton-needle. This practice is very common in the veterinary art, but is not much employed on the human subject. Setons are apt to produce adhesions between the skin and subjacent muscle; the scars which they leave, however, is generally but small, and for this reason they are sometimes advantageously had recourse to in superficial collections of matter about the neck and face, where suppuration is likely to continue a long while. They are also used in certain cases of abscesses near a joint, or other important part, which might be injured by the scalpel or caustic, or which does not admit of a wide orifice being made, so as to expose the abscessed surface to the air.

Treatment of particular ABSCESSSES.

There are certain general principles in the management of abscesses, from which surgeons do not greatly deviate in common cases; such, for example, as the applying of warm and stimulating applications to the part affected, where the intention is to accelerate the suppuration: when the pus is to be evacuated, they not only make an artificial opening, but assist the daily discharge by compresses, or by lightly filling the orifice with easy dressings; and, when there is a tendency in the sore to granulate, they remove all external obstacles, and use such gentle means as are calculated to aid the healing process of nature: at the same time internal remedies are administered, according to the nature of the symptoms, and the state of the patient's constitution. But, we shall proceed to illustrate these general remarks by an example.

Suppose an extensive inflammation of the phlegmonous kind to have taken place in a robust young person, upon a fleshy part of the body. If no effective topical means have been used to allay the pain, heat, and tension; if no general or local bleeding has been employed; if the patient be not abstemious in his diet, nor has had recourse to purgative remedies; under such circumstances it is very probable the inflammation will advance rapidly, and terminate in complete suppuration. In this latter stage of the case, warm emollient poultices and fomentations should be applied three or four times a day; and, if the inflammatory symptoms become excessive, the cooling regimen, with moderate bleeding, and mild saline purgatives may be advantageously employed. These last should, however, be cautiously and sparingly used, lest the suppurating process be too far checked or interrupted. When the pus has forced its way towards the surface of the limb, and is nearly ready to burst from the tumor, (which will be known by a palpable fluctuation of the matter, and by the integument becoming bluish,) prudence suggests that a sufficient opening should

be made for the free and perfect evacuation of the contents of the abscess. But there are circumstances which sometimes forbid our waiting till this critical period: the matter may be confined within a cyst; it may be retained by a thick and firm fascia lying over it; for want of an outlet, it may be actually re-absorbed into the general system, and circulating with the blood, may produce very serious consequences to the patient's health: in order, therefore, to prevent the inconveniences which might ensue from long waiting, a judicious surgeon foreseeing the evil, will evacuate the pus by an early opening. In making his incision, it should be an invariable rule to cut in the direction of the muscular fibres; lest, by a transverse wound, some important part be deprived of its action through life: by neglecting to observe this rule in an imposthume of the forehead, an ignorant operator deprived his patient of the power of opening his eyes, so that he was obliged to paste up his eye-brows with adhesive plasters, in order to enjoy the benefit of vision. It is also necessary, in using the scalpel, to recollect the situation of neighbouring blood-vessels and nerves; taking the precaution to employ a grooved director, whenever there is the smallest danger of cutting these organs. The subsequent dressings, BANDAGES, &c. &c. will be nearly the same as are required in common ULCERS or WOUNDS; for an account of which, to avoid prolixity, we refer the reader to those articles. But it will now be proper to point out the plan of treatment to be adopted in some *peculiar kinds of abscesses*.

ABSCESS of the maxillary sinus. The cavity of the cheek-bone, Antrum Highmorianum, is lined with a delicate vascular membrane, which, when it inflames and suppurates, produces great pain in the upper teeth, nose, and the eye of the side affected; it is also very common for people with this complaint to have a severe pain in the forehead, where the frontal sinusses are placed; but still these symptoms are not sufficient to distinguish the disease. Time must disclose the true cause of the pain, for it will frequently continue longer than that which arises from a diseased tooth, and will become more and more severe; after which, a redness will be observed on the fore-part of the cheek, somewhat higher than the roots of the teeth, and an induration at the same place, which will be considerably circumscribed; this hardness may be felt rather highly situated on the inside of the lip. The method of cure consists in extracting one of the *dentes molares* from the affected side; and then perforating through the socket into the bony cavity. A mild injection may afterwards be employed to cleanse the sinus, and be repeated as occasion requires. Consult Gooch's Cases, Hunter on the Teeth, and Bernstein's Handbuch.

ABSCESS near the Anus. Any of the causes of inflammation, whether internal or external, may produce this disease. It is generally slow and insidious in its progress, involving the rectum, and adjacent cellular membrane in its ravages; for the most part it is painful and tedious, occasioning deep, fistulous, and callous orifices, which demand prompt attention from the surgeon. See FISTULA. The chief indications are, to alleviate the pain by glysters, fomentations, and emollient poultices; to make a free opening as soon as the pus is fairly within reach of the knife; to divide all the sinuosities, if they communicate with each other, so as to effect one general outlet; and, when the intestine has been laid bare or perforated, by the confined matter lying upon it, to rip it up with a curved bistory, guided by the operator's forefinger. Recourse must also be had to internal medicines whenever the patient's health is deranged; and indeed, without such collateral aid, the surgeon's efforts will frequently be in vain. Mr. Pott's observations on this sub-
ject

ject deserve particular attention.—See the article **FISTULOUS ULCER**.

ABSCESS in the Groin and Arm-pit. The inflammation and tumefaction which occur in these situations, generally arise from a disease in the absorbent glands; sometimes they are occasioned by an injury sustained by a distant lymphatic vessel, communicating with the inflamed gland; and not unfrequently such glandular affections are the consequence of a malignant constitutional disorder, such as the **PLAGUE** or **VENEREAL DISEASE**, when they are denominated **BUBOES**. See these terms in their respective places. From whatever cause abscesses arise in the absorbent system, they are mostly tedious and difficult to cure. See **ABSORBENTS**, and their *diseases*. But when they happen in the groin or axilla, it is especially requisite to avoid making deep incisions, on account of the large blood vessels there situated; in other respects they require no peculiar management, except that, being very slow to suppurate, it will often be necessary to apply stimulating plasters or cataplasms; and when they arrive at a state of perfect maturation, it will much accelerate the cure to evacuate the pus by a caustic instead of a puncture or mere incision. A scrofulous habit of body very commonly gives rise to glandular enlargements; in such cases it will, therefore, be proper to employ the appropriate internal means, without which external remedies will often prove useless. See **SCROFULOUS TUMORS** and **ULCERS**.

ABSCESS in the Loins; otherwise called the *Psoas* or *Lumbar Abscess*. The large muscles situated within the loins, and their connecting cellular substance, are very liable to inflame, and form extensive collections of pus. These are so important and serious, even under the most favourable circumstances, that comparatively few persons recover from their effects. This consideration should urge practitioners to adopt decisive means of relief in the earliest period of the complaint, and never to make light of the symptoms which indicate a fixed inflammation in the lumbar region. When pus has actually formed, we ought not absolutely to despair, but the principal hope lies in preventing its formation: it is, therefore, of great consequence to ascertain the exact state of the patient when he first applies to the surgeon. An incipient lumbar abscess may be suspected, if the patient has been lately exposed to any of the exciting causes of inflammation; if a dull and constant pain affects him in the deep seated muscles of the loins; if this pain be aggravated in raising and rotating the thigh; if a sense of tightness or confinement be felt within the belly, or near the groin, accompanied with external tenderness to the touch; if there be much difficulty in standing erect, or in lying at full length; and if, in addition to these symptoms, the patient be of a delicate and scrofulous habit of body. When matter is formed in considerable quantity, a new set of symptoms and a more decided character will be attached to this disease: the sufferer will experience nocturnal exacerbations of fever, with frequent rigors, languor, and loss of appetite, swelling of the body, night sweats, hectic complaints, and an external protuberance in the vicinity of the abscess. The matter, however, does not uniformly fluctuate in any particular spot, but may be felt sometimes about the loins, near the hip, or in the groin, and sometimes at the anus, or towards the bottom of the thigh. This tumor will generally diminish, owing to the retrocession of the pus, on placing the patient in an horizontal position. During the increase of the suppuration, there will often be such a remission of the symptoms, that the patient imagines himself in a state of recovery, until a spontaneous rupture takes place in the swelling, or it requires an artificial opening. Now and then some of the lumbar vertebræ become carious, from the pres-

sure of the contiguous pus, and the lower extremities are paralyzed; the large blood-vessels may be eroded, and thus, a speedy termination is put to the patient's existence.

The early remedies to be employed in this disease, before suppuration has commenced, are free topical bloodletting, by the repeated use of fifteen or twenty Leeches, or by the scarificator and cupping glass; the exhibition of Elixirs purgatives; a mild vegetable diet; perfect tranquillity and rest; with repeated blistering, or a large caustic, over the affected part of the loins. But, as suppuration advances, the diet is to be improved; some animal food and wine must be allowed; tonic and acid medicines are to be employed; with country air, moderate bodily exercise, warm sea-bathing, and cheerful company. When the suppuration is far advanced, if it be judged proper to make an outlet, the best method is to evacuate the pus by a very small oblique aperture, with a broad lancet or trocar. Mr. Abernethy advises us to empty the abscess early and completely; then to bring the lips of the wound in contact, and by means of lint and sticking plaster to keep them together; and over these to apply a suitable bandage. The wound heals, in general, without much difficulty, and requires dressing only once in two days. When the skin again projects, from the pressure of the subjacent matter, another puncture may be made; and thus, the evacuation is to be repeated as often as shall be necessary, avoiding any permanent exposure of the cavity of the abscess. Among the means which have been successfully employed on these occasions, are emetics, injections, opium, cinchona, and electricity: but for a more detailed account of the treatment, we recommend the perusal of Mr. Abernethy's Essays, and Mr. Bell's System of Surgery.

ABSCESS in the Muscles of the Belly. The principal object in this case, is to prevent the matter from burbling internally; since such an event might prove fatal. The surgeon should therefore open the abscess early, and endeavour to use those kinds of bandages, or compresses, which may obviate future collections, and the formation of sinuous ulcers.

ABSCESS of the urinary Bladder. When an accumulation of pus or mucus occurs in the bladder, mild emollient injections may be used by means of a syringe and catheter. This practice has been lately taken notice of as new; but it was recommended by the Arabian physicians, and by some of the oldest European practitioners, who perhaps took the hint from Albucaasis.

ABSCESS under the Cranium, within the cylindrical bones. No other remedy can be here advised, for giving free vent to the confined matter, than perforating the bone with a trephine.

ABSCESS under the Sternum. When pus lies immediately under the chest-bone, within the duplicature of the mediastinum, the surgeon will not hesitate to apply a trephine. An interesting paper on this subject may be seen in the 15th number of the London Medical Review and Magazine. Mr. Blair's Observations on a successful case of this kind, are likewise contained in the 4th volume of that work, page 319.

ABSCESS of the Thorax. See **EMPHYEMA**.

ABSCESS of the Breast. The mammary abscess may be produced by any of the remote causes of inflammation, but is mostly occasioned by a redundancy of milk soon after parturition. In general it might be prevented by an immediate application of the infant to the breasts after delivery, or at least before they are turgid with milk. See **INFLAMMATION of the Breast**. When pus is actually formed, a soft, warm, emollient poultice, composed of bread and milk, or of a decoction of poppies and linseed meal, should be constantly kept upon the part, and renewed every three or four hours;

at the same time carefully suspending the enlarged breast, with an handkerchief spread under it, and tied behind the neck. It is very rarely proper to make any artificial opening in these abscesses: they should be permitted to burst of themselves, and be poulticed as long as the hardness or inflammation continues. During this painful period, the child must be suckled by the healthy breast; for it rarely happens that the milk is pure during a state of inflammation, or that the mother can bear the irritation of her child's attempt to draw the nipple.

It is here necessary to apprise mothers that the true milk-abscess never degenerates into a cancer, as many persons have ignorantly imagined. Those pests of society, called *CANCER-CURERS*, often impose on anxious wives, and persuade them they have cured cancers of the breast, when none ever existed! At other times, they keep up a false alarm, to the great detriment of women's health, and the furtherance of their own base designs. See the articles *CANCER* and *SCIRRHUS*.

During the tedious suppurating process, if the patient be not sanguine and robust, it will sometimes be proper for her to live on strong nourishing broths, with animal food, and porter, and to have daily recourse to tonic medicines. Without these means all external applications may prove fruitless. When the abscess leaves a deep ulcer, it should be dressed very lightly with mild warm digestives; and cold air must be guarded against in the convalescent stage, after all the dressings shall have been discontinued. The hardness within the breast, or around the cicatrix will generally subside of itself; but if it should not, a little oil of sweet almonds, either alone or mixed with palm-oil, should be gently rubbed over the breast twice a-day. In lieu of these, a piece of fresh butter may answer the purpose. Sometimes, however, it is necessary to administer cicuta and calomel to reduce the glandular indurations; now and then superadding the mercurial liniment. But the treatment must vary according to circumstances.

ABSCESS of the Eye. See *HYPOPHYON*.

ABSCESS of the Ear. See *OTALGIA*.

ABSCESS of the Gums. Simple gum-boils require no peculiar management: they may be opened with a lancet when the matter lies superficial; but, if they arise from decayed teeth, or a carious jaw-bone, the tooth affected, or the decayed portion of bone, must be removed before the cure can be effected. The mouth may be frequently rinsed, in order to keep the parts clean, and the breath sweet, with a mixture of warm wine, honey, and diluted vinegar; or with some tincture of myrrh and water. See the article *TEETH*.

ABSCESS in the Hip-joint and its Involucra. Spontaneous diseases of the hip are very insidious and dangerous. The first symptoms of an approaching disorder in this part too often pass unobserved, or slighted, even by the patient himself. Perhaps it begins with a trifling degree of weakness, lameness, and wasting of the limb; which, if it be attentively examined, will be found a little elongated, and likewise depressed on the nates of the affected side. After some time, there will be a pain felt as if it were situated in the knee, especially during the night; but this joint, nevertheless, remains in a state of perfect soundness. The patient soon begins to favour the diseased limb, by bearing chiefly on the other leg, and by elevating the heel of the affected side. As his strength fails, he will be seen to grasp the disordered thigh during the act of walking; and before night he will be complaining of unaccustomed weariness. Though he may be naturally alert and cheerful, he will, as the complaint augments, shew a great aversion to move; and, in

aiming to produce quick exertions, there will be a sudden halting, or even danger of falling. The affected limb will afterwards be kept in a bended position as much as possible, and a tenderness is complained of in the vicinity of the hip-joint. In scrofulous subjects, the inflammation sometimes advances more rapidly, the general health suffers in proportion to its ravages, the appetite fails, debility and emaciation succeed, night sweats, colliquative diarrhoea, and other hectic symptoms supervene; in short, the local complaints become aggravated, suppuration then discovers itself, the exterior part of the thigh enlarges, the concealed pus fluctuates, the limb shortens and is contracted, the carious joint yields a fetid puriform discharge, and the head of the thigh bone becomes displaced, or forms an immoveable *ANCHYLOSIS*.

Now and then the progress of this disease varies from the course we have described: there may be no external outlet for the matter; suppuration may not be distinctly perceptible; the febrile symptoms may not be very urgent; and the patient may be carried through the different stages of his complaint, with but a small share of bodily pain. This disease, however, most frequently goes on to a fatal termination; involving the ligaments, the cartilages, and bones of the joint in one dreadful destruction.

The general curative means to be pursued in these cases, resemble those we advised in the lumbar abscess: but, too commonly, the aid of the surgeon proves ineffectual. If the subject of an hip-disease be scrofulous, it may be proper in its incipient state, to administer the vegetable tonics, with prepared natron, and small doses of calomel; at the same time, prescribing the warm sea-bath, country air, local bleeding, passive motion, abstinence from wine, milk diet; and, if the complaint advances, the use of perpetual blisters, caustics, issues, or setons, are to be especially relied on. See the treatment of *ARTHRITIS* and *WHITE-SWELLING*. M. Petit, De Haen, Pott, and others, have written on this subject; but, the most satisfactory treatise we have seen, is that of Mr. Ford, intitled, "Observations on the Diseases of the Hip-Joint," 8vo. London, 1794.

ABSCESS of the Abdominal Viscera. Any of the contents of the belly may be the seat of an abscess: the most frequent and remarkable are, a suppuration of the Liver, the Kidneys, and the Mesentery. In these cases, the peculiar symptoms will distinguish the part affected, and the general principles before laid down must be attended to. When the pus fluctuates externally, and there is a well grounded hope of its being evacuated by an artificial opening, no time should be lost; as it might prove fatal to suffer the spontaneous rupture of a large abscess into the cavity of the abdomen. If there be any particular constitutional affection, the medicinal treatment adapted for such diseases must be likewise had recourse to. See *HEPATITIS*, *ICTERUS*, *SCROFULA*, *TABES MESENTERICA*, *EMPHYEMA*, *NEPHRITIS*, *GASTRITIS*, *CYSTITIS*, *ENTERITIS*, &c.

ABSCESS of the Thoracic Viscera. As all abscesses are preceded by inflammation, the peculiar nature and order of the symptoms which precede the formation of pus in the thorax, or its contents, will guide the practitioner in his diagnosis. See the articles *CARDITIS*, *PNEUMONIA*, *PLEURITIS*, *VOMICA*, *PHTHISIS*, &c. If matter be seated in the interior substance of the lungs, it will probably find its way into the bronchia, and be coughed up from time to time; but if the pus lies near the surface of that viscus, it is more likely to be discharged into the cavity of the chest, forming an *EMPHYEMA*. As an evacuation into the bronchia is most desirable, we should use all our endeavours to solicit a discharge of the pus in that way. The surgical operation

operation for an EMPYEMA is described in its proper place.

From what has been said in the foregoing paragraphs, it will not be difficult to determine on the plan of treatment in other cases of abscesses. The principal authors to be consulted on this subject are Severinus, Hildanus, Wiseman, Heister, Van Swieten, Sharp, Pott, Bell, and Kirkland. Some curious cases are also related, or referred to, in the Bibliothèque Choisie de Médecine:—the compilations of Mangetus, Bernstejn, and James;—the Memoirs and Transactions of different learned Societies;—and in the works of Bonetus, Forestus, Lufitanus, Tulpius, Hildanus, Morgagni, Horstius, Stalpart Vander Wiel, &c. &c.

ABSCISSA, *Abscissa*, in *Conics*, a part of the diameter or transverse axis, of a conic section, intercepted between the vertex, or some other fixed point, and a semiordinate.

Such are the lines AP, AP, &c. (*Tab. Conics, fig. 20.*) intercepted between the vertex A, and the semiordinates PM, PM, &c. which are called *abscisses*, of the Latin *abscindere*, to cut off; as being parts cut off from the axis. Others call them *sagitta*, q. d. *arrows*.

Abscisse, in a more general sense, is a part or segment of a line, terminated at some certain point, cut off by an ordinate to a curve. As the abscisse may commence either at the vertex of the curve, or at any other fixed point; it may be also taken either upon the axis or diameter of the curve, or upon any other line drawn in a given position. Hence there may be an infinite number of variable abscisses, terminated at the same fixed point at one end, whilst the other end of them is at any point of the given line or diameter. In the parabola, each ordinate has one abscisse; in the ellipse, or circle, it has two, lying on the opposite sides of it, and in the hyperbola also two, both of which lie on the same side of it. It may be observed, in general, that a line of the second order, or a curve of the first kind, may have two abscisses to each ordinate; a line of the third order may have three abscisses to each ordinate; a line of the fourth order may have four; and so on. The use of the abscisse is, in conjunction with the ordinate, to express the nature of the curves, either by some proportion or equation including the abscisse and its ordinate, with some other invariable line or lines; and hence every different curve has its own peculiar equation or proportion by which it is expressed or defined. When the nature and properties of curves, are expressed by algebraic quantities, the abscisse is commonly denoted by the letter *x*.

In the *parabola* the abscisse is a third proportional to the parameter and semiordinate; and the parameter a third proportional to the abscisse and semiordinate.

In the *ellipse*, the square of the semiordinate is equal to the rectangle of the parameter into the abscisse, subtracting another rectangle of the same abscisse, into a fourth proportional to the axis, parameter, and abscisse.

In the *hyperbola*, the squares of the semiordinates are to each other as the rectangles of the abscisse into another line, composed of the abscisse and the transverse axis. See CONIC SECTION, ELLIPSE, HYPERBOLA, and PARABOLA. See ALSO CIRCLE and CURVE.

ABSCISSION, in *Rhetoric*, is a figure of speech, when beginning to say a thing, we break off short, as supposing the matter sufficiently signified, by what has been already said. Cicer. ad Heren. lib. iv. cap. 77.

For an instance: one of her sex, age, and beauty, to be seen alone, at such an hour, with a man of his character—I need say no more.

Abscission is a species of ELLIPSIS, or SUPPRESSION. Scaliger distinguishes it from precision and suspension.

ABSCISSION, in *Surgery*, denotes the act of taking away some morbid or superfluous part by an edged instrument. In this sense abscission amounts to the same with the Greek ἀποκοπή. Cowper speaks of the abscission of a leg; which is more properly called AMPUTATION. The abscission of the prepuce makes what we call CIRCUMCISION. Abscission of the ears is a kind of legal punishment inflicted on perjury. In some countries they also practise abscission of the nose on traitors in an army, as a punishment reputed worse than death.

ABSCISSION is more properly used for the operation of cutting away some soft part of the body, when depraved or grown hurtful. In which sense, abscission differs from amputation, in that the latter is of a solid or bony part, the former of a fleshy or membranous one; yet they are sometimes confounded. We say the abscission of a muscle, lip, cheek, or the like. Mr. Shipton gives an instance of the abscission of a portion of the intestines not being mortal. Phil. Trans. N^o 283.

Chefelden, and some later surgeons, have removed several inches of mortified intestine in cases of strangulated HERNIA.

ABSCISSION is sometimes used by *medical writers* to denote the sudden termination of a disease in death, before it arrives at its decline. Celsus frequently uses the terms *abscissa vox*, to express a loss of voice.

Astrologers also speak of an *abscission* of the light of a planet, by another planet outstripping it, and joining a third before it. Abscission is held a deterioration.

ABSCONSA, a dark lanthorn used by monks at the ceremony of burying their dead.

ABSENCE, in *Sots Law*, is applied to a judgment pronounced, when a person cited before a court does not appear. No person can be tried criminally in *absence*.

ABSENTEE, in *History*, denotes a person, who is absent from his station, employment, or country. The term has been commonly applied to Irishmen, who possess estates in Ireland, and do not reside in the country. A parliament under this denomination was held at Dublin, 8 Hen. VIII.

ABSINTHII *phalena*, a species of PHALÆNA found on the ABSINTHIUM.

ABSINTHITES, ABSINTHIAC, or ABSINTHIATED, something tinged or impregnated with the virtues of *absinthium*, or WORMWOOD.

Bartholin mentions a woman whose milk was become absinthiated, and rendered bitter as gall, by the too liberal use of wormwood. Act. Med. tom. ii.

Vinum absinthites, or *poculum absinthiatum*, wormwood wine, is much spoke of among the ancients, as a wholesome agreeable drink, and even an antidote against drunk mnes; though some have charged it with being offensive to the head, and liable to cause fevers, cephalalgies, vomitings, uterine fluxes, &c. Ray also makes it a preventive of venery. According to the common account, it is made by infusing the leaves of the plant in a quantity of wine. But Fehr shews that it should rather be prepared by fermentation, in order to correct the crudities of the plant, and call forth its volatile salt. Paulli prepares it even without *aque*. Dr. Bowle prefers the *aqua absinthies*, or wormwood-water, taken in a small quantity after meals, to the wine; as being less liable to affect the head, and fill it with vapours.

ABSINTHIUM, in *Botany*, is compounded of the privative particle *a* and *βίσις*, *delectatio*, *pleasure*, alluding to the disagreeable taste of this plant. See ARTEMISIA and WORM-

WOOD, ACHILLIA, ANTHEMIS, PARTHENIUM, SENECIO, and TANAC-TUM.

ABINTHIUM is also a name given to other plants, by different authors; as to dwarf *pharica*, with leaves divided after the manner of wormwood; also to the Alpine *chamomile*, with fourcher wood leaves.

ABSIS. See APsis.

ABSOLUTE, in a general sense, something that stands free or independent.

ABSOLUTE, in *Mathysics*, denotes a being whose whole essence does not consist in a mere habitude or relation to another.

In which sense *absolute* stands opposed to RELATIVE or *relative*.

ABSOLUTE is more particularly understood of a thing which does not proceed from any cause, or does not subsist by virtue of any other being, considered as its cause.

In which sense, God alone is *absolute*.

Absolute, in this sense, is synonymous with *independent*, and stands opposed to *dependent*.

ABSOLUTE also denotes a thing's being free from conditions or limitations.

In this sense, the word is synonymous with *unconditional*. We say, an *absolute* decree, *absolute* promise, *absolute* obedience.

ABSOLUTE government, that wherein the prince is left solely to his own will, being not limited to the observance of any laws, except those of his own discretion.

When the Danes made their king *absolute*, in 1660, they declared him absolved from his coronation oath.

ABSOLUTE number, in *Algebra*, is the known quantity or number which possesses one entire side, or part of an EQUATION; and it is that which Vieta calls *homogeneum comparationis*.

Thus, in the equation $aa + 16a = 36$, the *absolute number* is 36; which is equal to a multiplied by itself, and added to 16 times a .

ABSOLUTE equation, in *Astronomy*, is the sum of the optic and excentric equations.

The apparent inequality of a planet's motion, arising from its not being equally distant from the earth at all times, is called its optic equation; and this would subsist if the planet's real motion were uniform. The excentric inequality is caused by the planet's motion not being uniform. For the illustration of this, conceive the sun to move, or appear to move, in the circumference of a circle, in whose centre the earth is placed. It is manifest, that if the sun move uniformly in this circle, then he must appear to move uniformly to a spectator at the earth; and, in this case, there would be no optic or excentric equation. But suppose the earth to be placed out of the centre of the circle; and then, though the sun's motion should be really uniform, it would not so appear, when seen from the earth; and in this case, there would be an optic equation, but not an excentric one. Imagine farther, the sun's orbit to be, not circular, but elliptical, and the earth to be in its focus, it is evident that the sun cannot appear to have an uniform motion in such ellipse; and therefore, his motion will be subject to two equations, viz. the optic and the excentric EQUATION. See OPTICAL INEQUALITY.

ABSOLUTE Gravity, motion, place, space, time. See the respective substantives.

ABSOLUTE Ablative, in *Grammar*. See ABLATIVE.

ABSOLUTELY, in a general sense, stands opposed to *relatively*. It is also used for *unlimitedly* and *unconditionally*. In which sense, the schoolmen oppose it to *secundum quid*.

Moreover, it is used by *Divines*, in opposition to *declaratively*.

The church of Rome holds, that a priest can forgive sins *absolutely*: the protestants say, only *declaratively*, and ministerially.

ABSOLUTELY, in *Geometry*, is taken for entirely, or completely. Thus we say such a thing is *absolutely* round; in contradistinction from that which is only partly so; as a spheroid, cycloid, &c.

ABSOLUTELY, in *Grammar*; we say, a word is taken *absolutely*, *absolutè sumptus*, when it has no REGIMEN, or government. Thus, in the phrase, We should pray without ceasing. The word *pray* is taken *absolutely*, as it governs nothing.

ABSOLUTION, ABSOLUTIO, in the *Civil Law*, &c. a definitive sentence, whereby a person accused of any crime, is acquitted, and declared innocent.

Among the Romans, the ordinary method of pronouncing judgment was this: after the cause had been pleaded on both sides, the prætor used the word *dixerunt*, q. d. they have said what they had to say; then three ballots were distributed to each judge, marked as mentioned under the article A; and as the majority fell of either mark, the accused was absolved or condemned, &c. If he were absolved, the prætor dismissed him with *videtur non fecisse*, or *jure videtur fecisse*.

ABSOLUTION, in the *Canon Law*, is a juridical act, whereby a priest, as a judge, remits the sins of such as, upon confession, appear to have the conditions requisite for this purpose.

The Romanists hold absolution a part of the sacrament of penance: the council of Trent, sess. xiv. cap. iii. and that of Florence, in the decrees *ad Armenos*, declare the form of the essence of the sacrament to lie in the words of absolution, I absolve thee of thy sins.

The form of absolution used by Tetzel, in Germany, is preserved in Seckend. Comment. lib. i. p. 14. and a translation of it is given by Robertson in his Hist. of Ch. V. v. ii. p. 117. It extended to all ecclesiastical censures, and to all sins, however enormous; it remitted all punishment in purgatory, and restored those who were supposed to have the benefit of it to the holy sacraments of the church, to the unity of the faithful, and to the innocence and purity which they possessed at baptism; so that when they died, the gates of punishment should be shut and those of the paradise of delight opened; and if they did not die immediately, this grace remained in full force when they were at the point of death.

The formula of absolution, in the Romish church, is absolute: in the Greek church, it is deprecatory; and in the churches of the reformed, declarative.

In the church of Rome there are divers other political *absolutions*; as,

ABSOLUTIO à servis, which is necessary where a person has been witness to the execution of sentence of death on a criminal, or has any other way disqualified himself for the holding of a benefice.

ABSOLUTIO ad cautelam, is that granted to a person who has lodged an appeal against a sentence of excommunication, by which the force of the censure is suspended.

It being a maxim, in the papal jurisprudence, that the sentence stands good, notwithstanding any appeal; this sort of absolution is sometimes granted until the issue of his appeal be known: by means hereof, some articles, at least, of his excommunication, are taken off; inasmuch that persons

sons may converse with him without danger: and besides, in case of death, his sentence is supposed to be of some avail to him.

ABSOLUTION is chiefly used among protestants for a sentence, whereby a person, who stands excommunicated, is released or freed from that punishment.

ABSORBENTS, from *absorbeo*, to *drink up*, in a general sense, denote substances which possess the faculty of *absorbing*, or swallowing up others; such are ashes, cloves, plants, &c.; and earths of various kinds. Ashes are absorbent with respect to water, though not in the degree supposed by Aristotle, from whom we derive a vulgar error; that a pot full of ashes will still absorb as much water as it would contain if it were empty. Cloves absorb moisture to such a degree, that we are told, if care be not taken in importing them, to keep water, wine, and other liquids at a distance from them, a certain quantity of cloves will, in two days' time, drain a whole hoghead of wine. See ABSORBENTS in the *Materia Medica*.

ABSORBENTS, or ABSORBING VESSELS, in *Anatomy*, denote a minute kind of vessels found in animal bodies, which attract and imbibe any fluid that is brought near their mouths. These vessels are so minute and transparent as not to be discovered in ordinary dissection; but by great labour, they have at length been detected to abound in every tribe of animals. As these vessels are transparent, their contents are visible, which circumstance occasioned them to receive the different denominations of lacteals and lymphatics. The former were so called, because they imbibed the chyle, a milky fluid from the bowels; whilst the latter, containing much lymph, which they had taken up from all the interstices of the body, were therefore named lymphatics.

The lacteal vessels were first noticed at the Alexandrian school by Erasistratus, who observing that they extended from the region of the liver to the bowels, erroneously concluded that they were a peculiar system of vessels, destined for the nutriment of those organs. They were not again particularly noticed till Aselli, in Italy, in 1622, perceiving that the contents of the intestines, and these vessels were similar, rightly conjectured that they absorbed the fluid which they contained from the bowels.

Pecquet, in France, shortly after the publication of the discoveries of Aselli, on opening the large veins near the heart, discovered the chyle not yet incorporated with the blood, and the vessels by which it was poured into the left subclavian vein, and which proved to be the principal trunk of the lacteal and lymphatic vessels, and was named from its situation, by Bartholine, the Thoracic Duct. A little afterwards, in 1651, Rudbee a Swedish, and Bartholine a Dutch anatomist, discovered vessels resembling the lacteals in structure and office in other parts of the body, and which they named, from their contents, lymphatic vessels.

In Haller's time, although great numbers of lymphatic absorbing vessels had been discovered throughout the body, they did not appear to him completely adequate to perform the function of absorption. They had not then been discovered in birds or fishes, and therefore that great anatomist still retained the idea that the veins performed, in part, the important office of absorption.

The merit of first demonstrating the absorbing vessels in these tribes of animals belongs to Mr. Hewson, who assisted in the labours of the first eminent anatomical school in London, in which anatomy was most ably taught by Dr. Hunter.

Mr. John Hunter undertook, by experiments, to determine whether the veins assisted in any degree in the office of absorption. Having conveyed milk, coloured with indigo or saffron, or scented with milk, into the small intestines of an

als, after a short interval the lacteals were found full of these fluids; but on opening the veins of the intestines at the same time, and suffering the blood to separate into serum and crassamentum, the serum was neither coloured nor scented. When irritating substances are imbibed, the absorbing vessels always become inflamed, whilst the veins suffer no kind of irritation. Of late also the absorbing vessels have been injected in such great abundance, that they appear fully adequate to perform the office for which they seem so admirably adapted. Anatomists at present, therefore, are warranted in believing that they are the only vessels engaged in performing that very important function in the animal economy.

Mr. Cruikshank published a systematic account of these vessels, chiefly taken from the preparations and observations that were made in the school established by Dr. Hunter.

Mascagni, in Italy, by employing a new artifice in injecting these vessels, has been able to exhibit them in a more complete and satisfactory manner than any former anatomist. The extremity of a glass tube, like that of the barometer, being melted, is drawn out to any required degree of tenuity, in which state it still remains pervious, or tubular, and affords an opportunity of conveying quicksilver into the minutest vessel discernible by the eye. If these vessels be the only ones, which perform the office of absorption, they must exist in every part of the body. For there is no spot on the surface of the skin, from which ointment may not be taken up, nor any internal part, from which blood, accidentally effused, is not absorbed; nay, the very matter composing the texture of the body is undergoing continual removal and renovation. These vessels therefore must be supposed to begin by open orifices very generally throughout the body, though their commencement can only be demonstrated upon the inner surface of the intestines. They appear to the unaided eyes, in that situation, fine and pointed tubes; but by the microscope, their mouths are discerned to be patulous, and like a cup, which circumstances have been well described by Leiberkuyn. The beginning absorbents soon join together, and after some time form minute vessels, capable of being injected by anatomists; these again conjoin, and form larger vessels, which are still discoverable with great difficulty.

In structure and arrangement these vessels have great similitude to veins; they have, in consequence, been named by some anatomists the lymphatic veins. Like the veins their sides are thin and transparent, though of considerable strength: like the veins, they frequently communicate with each other, or, as it is technically termed, anastomose. The advantage derived from these communications is obvious; for by these means the dissimilar matters which they take up from various parts, are mixed together, and blended with the lymph, which they imbibe from the interstices of the body, and which serves as a vehicle for such heterogeneous particles: they also prevent accidental pressure made on a few vessels from obstructing the progress of the absorbed fluids, which are in that case conveyed forward by collateral channels. Like the veins also, these vessels, by conjoining, form a tube of smaller area, than the united areas of the vessels before their junction. The effect of this construction is the same as in the veins, that is, an acceleration in the current of the lymph, in proportion as it comes nearer to the trunks of the absorbing vessels. The diameter of the thoracic duct bears but a small proportion to the united diameters of all the minute absorbents in the body, and when this duct has been opened, the lymph has flowed from it with a force and jet like that with which the blood issues from a large vein. Like the veins the absorbents are furnished

furnished with numerous valves, which prevent any retrograde motion of the fluids, and also prevent any portion of the vessel from sustaining the weight of more fluid than it contains by its valve. The absorbents however differ from the veins in one very material circumstance, *viz.* that they have a power of contraction, and are able, of themselves, to propel their contents. Whoever reflects on the process of absorption, can scarcely doubt that the mouths of these vessels have a contractile power, by which they refuse admission to noxious substances, whilst they readily admit of those that are salutary. If these vessels are obliterated in the intestines, when turgid with the absorbed chyle, their contents will disappear in a certain tract of the vessel, and again become visible; a phenomenon that cannot be explained, unless by supposing the vessel to contract at that part, and urge forwards its contents. Haller found that the thoracic duct contracted when stimulated, so that there can be little doubt of these vessels being muscular throughout their whole extent. The absorbents are found in considerable numbers beneath the skin of the extremities, and when they arrive at the groins and armpits, they pass through little hollows about the size of small beans, which are called lymphatic glands. The absorbent vessels, as they approach the gland, generally separate into several branches, which terminate in that body, and again about an equal number of absorbents emerge from the gland, conjoin, and form one or more principal absorbing vessels. The absorbents which enter the gland are usually denominated *vasa inferentia*, and those which go out of it, *vasa efferentia*. If quicksilver be poured into the former vessels, the gland swells, and a great deal of quicksilver appears to be deposited in it; and afterwards, if the power propelling the injection be continued, it is seen coming out of the gland by the *vasa efferentia*. It seems therefore to follow, that the progress of the absorbed fluid is checked a little in these glands, and it is probable that some change is effected in it during its passage through them. This opinion is confirmed by observing that these glands abound with blood-vessels, which probably pour some fresh animal juices into those which are contained in the lymphatic vessels.

The lymphatic glands are found in great numbers in the groins, armpits, and by the side of the neck, apparently serving like barriers to the absorbents of the head and extremities, as they approach to the large veins of the trunk. The absorbents of the intestines, which contain the chyle, a scarcely animalized fluid, sometimes pass through three or four sets of glands before they arrive at the thoracic duct; hence they are called *vasa lactea primi, secundi, tertii, and quarti generis*. The place where the lacteals conjoin, and meet with the lymphatics from the lower parts of the body to form the thoracic duct, appears in animals like a reservoir, and has been named the receptaculum chyli. The vessel thus formed by the junction of the lacteals, with the trunks of absorbents from the lower parts of the body, having passed through the diaphragm, is there named the thoracic duct. In this situation it lies close upon the vertebræ of the back, between the vena azygos and the aorta, receiving in its passage the absorbents of all parts in its vicinity. As it approaches the neck, it leaves the bone to get to the left subclavian vein, in which it terminates just at its commencement. As, however, the absorbents of the right side of the head, and right arm, would have to deviate considerably were they to end in this chief trunk of the absorbing system, they conjoin and form a similar vessel on the right side, which empties itself into the corresponding part of the right subclavian vein. Thus all the old materials of the body, which the absorbents are continually removing, all

the new matter imbibed from the surface, all the redundant lymph taken up from the interstices of the body, and all the chyle occasionally obtained from the bowels, are conveyed into the large veins near the heart. It is, in short, chiefly by this system of vessels that the blood is augmented in quantity or altered in quality; they replenish the body with nutriment, and they also occasionally taint it with infection.

Absorbing Vessels, Distribution of the, throughout the body.—The absorbents of the foot have been injected in considerable numbers from the spaces between the toes; those of the inner side ascend over the inner ankle, and accompany the vena saphena interna. Being joined by others in this course, the trunks thus formed appear like network on the inside of the calf of the leg. These vessels continue in company with the vena saphena interna; and like it, ascend over the inside of the knee and thigh, where their numbers and size increase, and at last they terminate in the inguinal glands. These glands vary considerably in number; the greater part of them is placed above the fascia of the thigh, but some are found beneath it, in the hollow between the iliacus internus, triceps, and sartorius muscles. Those glands which are highest and nearest to the pubes, receive also the absorbents of the genitals. The absorbents of the outside of the foot pass behind the outer ankle, and accompany the vena saphena externa up the back of the leg to the ham, where they terminate in the popliteal glands. They, however, communicate by some branches with the superficial absorbents on the inside of the leg.

The deep-seated absorbents of the leg accompanying the several arteries, which branch off from the popliteal, also arrive at, and end in the glands of the ham, which are small and few in number, seldom exceeding three. The absorbents emerging from these glands are large, and accompany the femoral artery to the groin, to terminate in the inguinal glands. Other deep-seated absorbents of the thigh, however, enter the pelvis at the inferior apertures of that cavity, and communicate with the vessels and glands contained in it. The large *vasa efferentia* of the inguinal glands pass beneath Poupart's ligament, and accompany the external iliac artery to the loins. There is a series of glands placed in the course of the external iliac vessels, which are named the external iliac glands, with which these absorbents are connected. Having arrived at the lumbar vertebræ, and being increased in size by the accessory absorbents, which they are continually receiving, they terminate in the lumbar glands. These are much more numerous than any of the classes of glands hitherto mentioned, and quite cover the aorta and vena cava.

The absorbents of the genitals terminate, as has been said, in the upper and innermost of the inguinal glands. Some have been injected on the sides of the penis, and others on the middle, accompanying the vena dorsalis; by their junction they form two trunks, which diverge, and proceed to either groin. The absorbents of the scrotum accompany the cutaneous veins to the groin, and terminate in the inguinal glands. The testicles abound in absorbents, some of which join with those of the scrotum, and go to the inguinal glands; but the greater part, consisting of large and numerous vessels, pass up the spermatic chord, and along the external iliac vessels to terminate in the lumbar glands. The absorbents of the clitoris, and external parts of the organs of generation in females form two divisions, one of which goes, as in the male, to the inguinal glands, the other vessels either pass with the round ligament of the uterus through the abdominal rings, and along the psoas muscle to the lumbar glands, or entering the pelvis at the inferior aperture, they join the absorbents of the uterus. The absorbents of the hips

hips and nates also pursue a twofold course; some bend round the trochanter, and go to the inguinal glands, whilst the greater number enter the pelvis with the gluteal and sciatic arteries at the sacro-sciatic foramina, and go to the internal iliac plexus of glands. Thus we have traced the absorbents of the lower extremities, and of the parts of generation, and find them either entering the abdomen, and running along the lower part of that cavity to the loins, or ascending through the inferior apertures of the pelvis, and joining the absorbents of that cavity, which we next proceed to describe.

In the pelvis there is a numerous plexus of glands, situated in the course of the internal iliac vessels, and continued toward the obturator foramen; there are also many absorbent glands lying in the hollow of the sacrum. The absorbents of the bladder, after passing through small glands, placed by the side of that viscus, proceed to the internal iliac plexus. The absorbents of the rectum proceeding through the sacral glands pass on to those of the loins. The absorbents of the uterus form two sets, according with the blood-vessels in this respect; those which accompany the uterine vessels pass through glands by the side of the vagina, and proceed to the internal iliac plexus. Those which accompany the spermatic vessels terminate, as in the male, in the lumbar absorbents.

The absorbents of the kidney pursue the same course as the renal blood-vessels, and terminate in the lumbar glands. The absorbents of the intestines, commonly called the lacteals, are extremely numerous on account of the function which they have to perform, and abound more in the jejunum than elsewhere, as the chyle is chiefly absorbed from that intestine. The course of these vessels is through the mesentery, where they communicate with glands, the number of which is stated to be between 100 and 150.

The lacteals have been traced through three or four series of these glands, and have been denominated *vasa lactea primi, secundi, tertii, et quarti generis*.

The lacteals form one or more large trunks as they approach the superior mesenteric artery, which join the thoracic duct. The absorbents of the large intestines pass through glands situated near them, which are very small, and not numerous. Those vessels which arise from the ascending and transverse arch of the colon terminate in the lacteals near the root of the mesentery. Those absorbents which arise from the descending and sigmoid flexure of the colon proceed to the lumbar glands and thoracic duct. Having thus described the principal absorbents that contribute to the formation of the thoracic duct, that vessel may in the next place be attended to. Large trunks of absorbents may be traced in the course of the iliac vessels, converging to form this duct; to these are joined the large trunks of the lacteals, and they unite low down upon the loins. In animals, and particularly in dogs, they terminate in a dilated pyriform cell, which is called *receptaculum chyli*. This appearance, though sometimes observed, is more frequently wanting in the human subject. At the first vertebra of the loins the thoracic duct gets above the diaphragm, and lies between the vena azygos and aorta on the right side of the bodies of the vertebra; it is sometimes double, and then the second branch lies beneath the aorta on the left side; at all times large lymphatics are found also in this situation.

The dimensions of the thoracic duct gradually lessen till it has reached the middle of the back, and then again enlarge. At about the 8th dorsal vertebra it generally divides, and afterwards reunites. Having got above the arch of the aorta, it leaves the spine, ascending and inclining to the left side to reach the subclavian vein, in which it is to

terminate. It passes beyond the vein and again descends, and empties itself into the venous system at the angle made by the junction of the internal jugular and axillary vein, as they unite to form the left subclavian vein. At the termination of the thoracic duct we find valves, which prevent the blood contained in the veins from passing into that vessel.

During this course, the thoracic duct receives the absorbents from various parts of the body, of which we now proceed to give some account. It may be proper first to mention that there is a similar duct on the right side of the body, generally less than half an inch in length, which terminates in the corresponding angle, made by the junction of the right internal jugular and axillary veins. This duct is formed by the concurrence of the absorbents of the right arm, the right side of the head, and those accompanying the right internal mammary vessels.

The absorbents of the omentum pass through very small glands, situated near the great arch of the stomach, and there join with those belonging to that viscus. The absorbents of the stomach accompany its arteries; these conjoin to the left gastric join those of the spleen and pancreas, and terminate in glands, extending themselves along the pancreas and splenic vessels. Those which are found in company with the right gastric artery, pass like it beneath the duodenum, and terminate in the same glands with the deep-seated absorbents of the liver, to which they are conjoined. Those which accompany the coronary artery on the lesser curvature of the stomach, pass through glands situated about that part; they then in general descend to the glands beneath the duodenum, and terminate in the thoracic duct; others, however, may be traced through the cardia to the thoracic duct. The absorbents of the spleen and pancreas, when they arise from those viscera, pass through glands extending along the splenic vessels, and are afterwards continued to the thoracic duct. The absorbents of the liver, which are extremely large and numerous, proceed from its convex surface through the right and left, and suspensory ligaments of that viscus; some of their branches descend upon the diaphragm, and terminate in the thoracic duct near the cœliac artery; others penetrate the diaphragm and go to glands on the outside of the pericardium, from whence they proceed through the anterior mediastinum to the thoracic duct; others accompany the internal mammary vessels on the inside of the sternum, and those of the right side end in the right trunk of the absorbents. Some of the absorbents from the interior part of the liver, emerge from its posterior edge, and join those superficial absorbents. The deep-seated absorbing vessels of the liver ramify in its substance like the vena portæ; they come out where that vessel enters the gland, and being joined by the superficial absorbents of the concave surface of the liver, they pass through numerous glands situated in the capsula Glissoni, and afterwards join the thoracic duct. The absorbents of the diaphragm are numerous, and join with, and augment those large trunks, which arise from the liver and penetrate that muscle. Both these sets of vessels are connected with glands, situated towards the front of the thoracic surface of the diaphragm, on each side of the pericardium. The absorbents of the heart are found in company with its nutrient vessels; the trunk of absorbents belonging to the right coronary artery passes by the side of the aorta to a gland near the origin of the right carotid, and terminates in the right trunk of the absorbing system. The absorbents accompanying the left coronary artery, which are much larger than the former, proceed with the pulmonary artery to glands near the trachea, are there conjoined with the pulmonary absorbents, and empty themselves into the thoracic

thoracic duct near its termination. The absorbents of the heart pass through the cardiac glands, which are situated about the arch of the aorta.

The absorbents of the lungs may be distinguished into the superficial and deeper seated. Those on the surface are distributed in the areolæ, surrounding the small lobules of those organs, and appear like the fibres of network. The deeper seated absorbents which communicate with the others, emerge where the air-vessels enter the lungs, and both classes terminate in the bronchial glands, which are numerous, and surround the bronchix. These glands are also connected with those belonging to the heart, so that both sets of glands frequently participate in the same disease. Three or four large trunks of pulmonary absorbents proceed more immediately, or more remotely, to pour their contents into the thoracic duct; the upper ones do not reach that vessel till it approaches its place of insertion in the venous system.

Numerous absorbents have been seen upon the œsophagus, and there are many glands placed along the course of that tube. The absorbents of the œsophagus conjoin with those of the heart and lungs. Absorbents have been injected in company with the intercostal blood-vessels, which pass through two small glands, situated near the head of each rib, and then enter the thoracic duct. The superficial absorbents of the upper extremity accompany the superficial veins, those from the palm and outside of the hand, near the little finger, run up with the ulnar veins over the internal condyle, and then accompany the basilic vein to the axilla, when they enter numerous glands situated in that part. These absorbents, however, previously are connected with several glands, which are situated in the course of the basilic vein, one of which is found as low as the internal condyle of the os brachii. The absorbents of the thumb, and the outside of the hand in its vicinity accompany the radial veins to the elbow, and then ascend on the outside of the biceps muscle with the cephalic vein. Arriving at the deltoid muscle they bend along its inner edge, and pass between it and the pectoral muscle to glands situated beneath the clavicle. Other cutaneous absorbents have been injected from the palm of the hand, accompanying the median veins in the forearm between these two sets, which afterwards terminate in those, which accompany the vena basilica. The deep-seated absorbents of the arm are found by the sides of the large arteries, and go to the glands of the axilla. The absorbents of the shoulder also terminate in the same glands. The axillary glands, and those beneath the clavicle are connected together, and their vasa efferentia conjoining form a large trunk, which terminates in the thoracic duct on the left side, and is one of the principal vessels forming the corresponding trunk of absorbents on the right side.

Absorbents have been injected on the outside of the head in company with all the principal arteries: for instance, the temporal, occipital, external, and internal maxillary arteries; those from the temple pass through small glands found on the parotid gland as high as the zygoma: those from the face in glands, situated in the cheeks and outside of the jaw: those from the occiput in glands, situated behind the mastoid process. They afterwards converge, and with the deeper-seated absorbents terminate in the most numerous cluster of glands found in any part of the body, excepting only those of the mesentery. They have been named glandule concatenatæ, and extend beneath the jaw, over the side of the neck, where the external jugular veins are found, and all along the internal jugular to its termination. No absorbents can with certainty be said to have been injected

in the brain. The absorbents of each side of the neck having by conjunction formed a common and large trunk, it terminates on the left side in the thoracic duct near its insertion, and on the right it contributes to form the corresponding trunk. The absorbents of the thyroid gland form two vessels of considerable size, which end in these two ducts near their termination. Some of the absorbents of the breast, which are very numerous in females, proceed to the axillary glands, being previously connected with some small glands, situated midway between the breast and axilla; others pass over the pectoral muscle to the glands, beneath the clavicle, and others from the back part of the breast penetrate the intercostal muscles, and join the absorbents and glands, which accompany the internal mammary blood-vessels.

Naturalists, as Malpighi, Leewenhoek, De la Hire, &c. speak of similar absorbents in plants; the fibrous or hairy roots of which are considered as a kind of *vasa absorbentia*, which attract and imbibe the nutritious juices from the earth and air. From the sap-vessels they pass into the whole cellular tissue, composed of vesicles and closely interwoven with the whole vascular part of the plant. Thence they enter the vasa propria and glands, which contain and prepare the fluids and secretions peculiar to the species. See PLANTS and VEGETATION.

ABSORBENTS, *Diseases of the, in Surgery.* When we consider how recently the structure and uses of the absorbent vessels have been explained, it is not surprising that practitioners are too neglectful of this branch of pathology. Until these last six years, we have not met with one publication on the diseases of the absorbent system; and even to the present day we do not possess a single work upon this subject in the English language. A few scattered hints, indeed, are contained in the writings of several authors; but it still remains a desideratum, to point out—What are the peculiar morbid affections of the lymphatic glands and vessels, and what are their appropriate remedies? To solve this enquiry in a satisfactory manner, would occupy an entire volume. We can, therefore, only throw out a few casual hints, and recommend the farther prosecution of the subject among medical men.

I. *Of morbidiferous fluids contained in the absorbent system.*

We know, from the experiments of physiologists, and especially of Mr. Abernethy, that the absorbents which open on the surface of our bodies, imbibe both aqueous and gaseous matters derived from the atmosphere, or from substances lying in contact with the skin. It is desirable to have the precise nature of these matters ascertained in different persons, under the various circumstances of health and disease; and to determine what means are advisable, in order to regulate their quantities or qualities. If our health may be affected by the absorption which goes on upon the external surface of the skin, there is equal reason to believe we are sometimes influenced by the nature of the vapours that must be constantly imbibed from the cavities, reservoirs, or interstices of the body. When the synovia, the milk, the bile, semen, and other secreted fluids become inspissated, this change arises from the more watery parts having been absorbed and carried into the sanguiferous system by the lymphatic vessels. When serum, pus, or blood has been effused among the cellular membrane, its disappearance is entirely owing to the activity of the absorbents. In a dropsy or an emphysema, the same agents are occasionally set to work, and will effect a removal of the disease. Other examples might be adduced to illustrate the different ways in which the absorbent vessels may be irritated and undergo a morbid change from the quality of their contents, not

to mention the noxious vapours applied to them by means of contagious disorders.

II. *Of irregular action in the absorbent vessels.*

The irritability or contractile power of the absorbents may be preternaturally weakened; and in that case, probably, there will be an accumulation of the secreted fluids in one or more of the different natural cavities or interstices of the body; for, unless the action of the absorbents keep pace with that of the exhalent or secreting arteries, the natural equilibrium must inevitably be destroyed. Thus it happens in dropsies: either the arteries deposit a larger quantity of serum than can be carried off by the natural power of the absorbents; or, the latter are defective in their action, and cannot take up their usual proportion of fluid. The different causes and remedies of diminished or increased action in this system of vessels is, therefore, an important object of enquiry.

III. *Scarcely changes in the structure of absorbents.*

Anatomists have taught us to look for various alterations in the structure of absorbent vessels and glands, under particular circumstances of disease. The diameter of these vascular bodies is often entirely obliterated by external compression and other causes. They may be ruptured, wounded, lacerated, or eroded. They may be thickened in their coats, or rendered unfit for use by excessive inflammation and suppuration.

It would be entering into a very wide field of enquiry, to consider what changes the absorbent glands and lymphatics undergo in consequence of the absorption of morbid poisons; for example, in cancer, in syphilis, in the yaws, in the various morbillous, and vaccine diseases, &c. &c. On this subject, we particularly recommend the perusal of professor Soemmerring's Dissertation, *De morbis vasorum absorbentium corporis humani*, 8vo, 1795; Dr. Baillie's *Morbid Anatomy*, 2d edition; Mascagni's splendid work, *De Venis Lymphaticis*; Mr. Cruikshank's book on *the Anatomy of the absorbing vessels*, 2d edition, 4to.; Adams on *Morbid Poisons*; and the concluding part of Dr. Darwin's *Zoonomia*, vol. i. 3d edition, 8vo. Connected with this subject, it may also be worth while to peruse a curious original piece, intitled, an *Essay on external Remedies, wherein it is considered whether all the curable distempers incident to human bodies, may not be cured by outward means*. By P. Kennedy, *Chir. Med.* 8vo. London, 1715. Respecting the latter work, the author says, "there has never, as yet, any thing been attempted of this kind." *Introduct.* p. 5.

ABSORBENTS, or ABSORBENT EARTHS, in *Chemistry*, are those earthy substances which are capable of imbibing by capillary attraction a large proportion of water: such are magnesia, lime, and clay. It is, however, only when these bodies are dry and porous, that they exhibit this property; for certain gems, which are pure argil, and calcareous spar, which, chemically speaking, is the same with chalk, are not in the least degree absorbent. Hence appears the impropriety of this term in chemical nomenclature. Indeed it is at present almost discarded.

ABSORBENTS, in the *Materia Medica*, comprehend those medicinal substances, which, taken inwardly, or applied externally, are adapted to dry up or absorb redundant or acid humours. They are sometimes called driers and sweeteners, and by the Latin writers the word is synonymous with *imbibentia* and *siccantia*. The term has been occasionally confounded with ALKALI, because alkalis have the effect of absorbents with respect to acids. It is now almost restricted to certain earths, which are distinguishable from others by their solubility in acids, and which are suited to imbibe acids, and at the same time to destroy their acid quality. In reference to this property, some have re-

ferred them to the class of ANTACIDS. Of the *absorbents* we may reckon the mineral calcareous earths, as chalk; the animal calcareous earths, as crabs-claws, oyster-shells, egg-shells, pearl, coral, and coralline; and animal earths, not calcareous, as crabs-eyes and burnt hartshorn. The obvious and immediate virtue of these substances is to attract acid humours in the first passages, and thus to relieve the cardiac and other complaints occasioned by them; and they possess different properties, and produce different effects, according to the materials which they absorb, and by which they are refilled. The relief they give is often merely temporary, as they serve to absorb the acid actually generated, without correcting the indisposition which tends to produce it. In some cases they are injurious, for if there be no acid humours in the stomach and intestines, these earthy bodies not being soluble by any other kind of fluid, congregate with the viscous contents of the stomach, and form with them indigestible masses, which may be very hurtful. Hence have proceeded indigestion, loss of appetite, nausea, vomiting, obstructions of the bowels, and other disorders. Sometimes they have formed a kind of crust on the stomach and intestines, which has prevented the separation of the gastric liquor, and obstructed the passage of the chyle through the orifices of the lacteal vessels into the mass of blood. The taking of an inmoderate quantity of crabs-eyes and other absorbents for the heart-burn, has sometimes been attended with fatal consequences. See *Phil. Trans.* No. 459. Sect. 2.

It is observed that absorbents are of more general use in infancy than in adult age. Young children are more subject to acidities than adult persons, because their food is chiefly of the vegetable acescent kind, and produces acidities, which are attended with alarming symptoms, and productive of various disorders. When infants, or persons of mature age, but of a feeble constitution, indicate complaints of this kind by four cruciations, paleness of the face, and in the case of children by the four smell and green colour of the alvine feces, absorbent medicines may be very properly administered. The other cordial, alexipharmic, antifebrile, and similar virtues ascribed to these medicines, seem to be founded on an erroneous theory, which attributes the acute diseases of adults to a morbid acid; diseases which, instead of being produced, are more successfully subdued by acids. The use of absorbents, says Dr. Lewis (*Mat. Med.* p. 643.), in different kinds of fevers, is nevertheless still continued, and sometimes perhaps with advantage; for though the earths of themselves are apparently rather injurious than beneficial, yet as acids are often given freely at the same time, the solution of the earth in the acid may prove a medicine more serviceable in particular cases than the acid unobtunded. Different absorbents have been selected and recommended for particular purposes. If it be the intention to *absorb*, constringe and strengthen at the same time, chalk, coral, oyster or egg shells, are esteemed the most efficacious absorbents; if for restraining a seminal flux, some prefer the cuttle-bone; for provoking urine, crabs-eyes; for promoting perspiration, burnt hartshorn; and for dissolving coagulated blood, crabs-eyes dissolved in vinegar. But all these differences have not yet been sufficiently determined by experience, because the earths have rarely been given in a dissolved or soluble state. It is most probable, says Dr. Lewis, that they all act, when dissolved, as mild cooling retringents; for when they are given in substance, as absorbents, in cases of acidities, they all tend to restrain fluxes of the belly, or to bring on costiveness; an effect which should be regarded in the use of them. It is, therefore, a necessary caution to drink diluting liquors with them; and also

to be used, as well for some time after they are used, and during the use of them. Dr. Cullen (*Mat. Med.* vol. 5. p. 117.) observes that chalk, and the several terreftrials may be usefully used for correcting acidities of the stomach, in a large quantity; and says that if, upon being mixed with the acid of the stomach they become astringent, it is an effect which he has not observed, and which, if it ever happens, must rarely occur. Their utility in diarrhoea is of use, not to their astringent quality, but merely to their correcting acidity, which, by being mixed with the blood, is removed the disease. Barst hartthorn he says is the weakest of all the absorbents; and he thinks it has not any peculiar virtue. Van Swieten, in his Commentaries on Boerhaave's Aphorisms, observes, that these absorbent powders ought not to be ground too fine, but rather left somewhat coarse, as they will be less apt to concret and prove dangerous. The college of Berlin, however, sensible of the advantage of having the earths, when administered in febrile cases, previously dissolved, or reduced to a soluble saline form, directs them to be digested in distilled vinegar with a gentle heat, till the menstruum ceases to act, and the filtered solution to be inspissated to dryness. This preparation, says Dr. Lewis, is greatly preferable to the simple imbibition with vinegar or lemon-juice recommended by some; as by this last management the earth is made soluble only in part, and in an undeterminable proportion. Absorbents are sometimes applied to ulcers; but it is to be observed, that the insipid terreftrious absorbents, such as coral, &c. put into an ulcer, where a bone is carious, can have little effect besides that of imbibing the matter of the ulcer: if they fall into any *cavernule* of the corrupted bone, they may remain so long there, that the matter imbibed by them may become acrid. Lint is an absorbent, which has not this disadvantage. See *Monro in Med. Ess. Edinb.* vol. v. art. 24.

Experiments have been made for determining the comparative strength of different absorbents, or the quantities of acid they are capable of satiating. Langius (*Op. Med. Lips.* 1704, p. 452.) reports, that 10 grains of crabs-claws destroyed the acidity of 40 drops of spirit of salt; that egg-shells, crabs-eyes, and mother-of-pearl, taken in the same quantity, saturated 50 drops each; red coral, white coral, and fixed alkaline salt, 60 drops each; volatile alkaline salt and pearl, 80 drops each; chalk, 100 drops; oyster-shells, 120; and some lime-stones, 160. These experiments cannot be much relied on, as earths have different habitudes to different acids. Accordingly Homberg concludes from his experiments, (*Mem. Acad. Royal. des Sc. de Paris pour l'ann. 1700.*) that oyster-shells require for their solution more of the marine acid than coral does; whereas the case is the reverse with the nitrous acid. But neither of these acids is that which absorbents are designed for satiating in the human stomach. The vegetable acids, and the acid of milk, are most analogous to those which are generated in the animal body; and on trying these with the several substances above enumerated, the differences in their absorbent powers appeared not to be very great. *Lewis Mat. Med.* 645.

ABSORBING, the act of sucking up, or imbibing another body. Sir Isaac Newton shews that black bodies absorb all the rays they receive, and that those rays of light which impinge against the solid particles of bodies are absorbed and lost: but it appears from some later experiments and observations of M. Bouguer, that this effect is to be attributed, not to the impact of light on the solid parts of bodies, but to the action of some power diffused over their surfaces. He found by repeated trials on the reflection of

light, from the surface of water, and of different pieces of crystal, that a considerable quantity of light, when the angles of incidence were small, was actually extinguished. This effect, he observed, was diminished by increasing the incidence; so that at an inclination to crystal of above $47^{\circ} 47'$, a very small part of the rays was absorbed; though some few were lost, when they fell perpendicularly on the reflecting surface. See his *Traite d'Optique.* Paris 1760.

ABSORPTION, in the *Animal Economy*, is the function performed by the *ABSORBENT vessels* above described. The only opportunity which anatomists have hitherto met with of observing the orifices of these vessels, is upon the villous coat of the intestines. The accounts which have been given of them in that situation are so various, and delivered with such little confidence as not to warrant the insertion of any description. The internal coat of the intestine is seen speckled with chyle coagulated in the mouths of these vessels, in persons who have died when the absorption of that fluid was carrying on. The evident reluctance with which the absorbents admit noxious matter has led to the general belief, that their mouths are irritable, and have the power of denying admission to stimulating substances. Various theories have been formed to account for the admission of matter into the orifices of the absorbing vessels; but whichever theory be adopted, it is previously necessary to admit a corresponding aptitude in the vessel to receive, and in the matter to be received. This being granted, some physiologists have imagined that the absorbent attracted matter into its mouth, in the same manner that capillary tubes imbibe fluids. A little reflection is sufficient to shew that the absorbing vessels are not circumstanced like capillary tubes (the sides of which are rigid) immersed in a fluid. Besides, were such attraction the cause of absorption, that process should be carried on with regularity. On the contrary, absorption is occasionally very deficient when an abundance of fluids, as in œdema, is presented to the mouths of the vessels. This fact may indeed be explained by supposing the orifices of the vessels to be in a contracted state, but the contrary problem is more difficult of solution. In the course of one night a pint of pus may be imbibed from the cavity of an abscess, and sometimes absorption is so excessive that the very substance of the body is in parts removed, and chafms in consequence created.

Other physiologists have endeavoured to discover some propelling power which should protrude the matter subject to absorption into the mouths of these vessels. The pressure of the atmosphere on the surface of the body has been considered adequate to this effect, and the deposition of new matter by the fecerning artery has been assigned as the cause of the propulsion of the old particles into the orifice of the absorbent. Were this theory correct, secretion and absorption should more exactly correspond than they are known to do; like the former theory, it appears inadequate to account for the facts above stated.

Mr. John Hunter who contemplated the facts of natural and morbid absorption in animal bodies with the most steady attention, acknowledged that he was unable to account for the effects produced, unless by attributing to the mouths of these vessels powers similar to those which a caterpillar exerts when feeding upon a leaf. This idea, however, has generally been considered as too wild and chimerical.

Doctor Fullarton, in his ingenious Thesis on absorption, published at Glasgow in 1800, attributes to the absorbing orifices a power of suction, which opinion he supports not only by arguments but by analogies. The umbilical tube of the embryos of the sepia and polypi is said, on the authority

thority of Albinus, to absorb by suction. The proboscis of the papilionaceous flies acts in the same manner. And the absorbents of the *echinus marinus* have this power in so great a degree as to enable the animal firmly to attach itself to any substance which it may happen to touch. It may be right to remind the reader that the difficulty in accounting for the function of these vessels exists only at its commencement, for when the imbibed matter has gone beyond the first valve it must proceed, and it will be powerfully carried forward by the contractile force of the vessel, and by every occasional pressure which is applied to it. Some physiologists believe that the absorbents cannot take up any matter that is not fluid. If this opinion were true, the solids of our bodies must be converted into fluids before they could become subjects for absorption. A small addition of phosphoric acid might indeed render the earth of bones soluble, and it is in this state, that it is carried out of the circulating fluids by the urinary secretion. No liquid has been conceived capable of dissolving such solids as compose the muscular fibres, but one that resembles in qualities the gastric juices. Dr. Stringham, in his Thesis on the absorbing vessels published in Edinburgh, and Mr. Smith in London, imagined they had discovered that such a fluid capable of dissolving flesh, could be secreted in various parts of the body. See Duncan's Med. Com. vol. x. p. 354. Subsequent experiments have, however, been followed by contrary consequences. See Dr. Fullarton's Thesis on absorption, published at Glasgow, A. D. 1800. Indeed it is unlike the simplicity observable in other parts of the animal economy, should such a double secretion take place; first, the secretion of solid materials to compose the structure of the body, and then the secretion of a fluid to dissolve them. It seems best in such difficult investigations to note facts rather than to form theories, and whoever contemplates the things done in the animal body will be astonished at the powers of the vessels by whose agency they must be effected. As an instance, the following may be mentioned. A whole bone may perish, it may be encased by a new one; and by the vascular lining of the new bone, the original dead bone may be altogether removed.

ABSORPTION, in Chemistry. It is a well known chemical fact, in most cases of combination of gaseous substances, either with other gases or with liquids or solids, that a very considerable diminution of volume is experienced. This effect is called absorption, to distinguish it from the decrease of bulk occasioned by condensation. The condensation of a gas, whether by mechanical pressure, or by lowering its temperature, merely increases its specific gravity, without destroying that state of elastic fluidity which is essential to its existence as a gas. On the contrary, the absorption of a gas implies such an intimate union with the absorbent as wholly destroys its gaseous state of existence, and reduces it to a liquid or a solid. Thus carbonic acid and ammoniacal gases, if inclosed in separate vessels, may be condensed, by mechanical means, till they are of much greater specific gravity than ordinary, but yet retaining all the physical properties of air: as soon however as these gases are brought into contact with each other, a great absorption takes place, and a solid is produced containing all their gravitating matter, but wholly deprived of the essential character of a gas.

In pneumatic chemistry, or that branch of the science which treats of the aeriform substances, the apparatus for containing the gases consists of jars or other glass vessels inverted in water or quicksilver; now on account of the great difference in specific gravity between these fluids, whenever a jar partly filled with air, and the rest of its capacity with

quicksilver, is transferred from a basin of quicksilver to one of water, the metal descends, and is replaced by a column of water, at the same time that an apparent absorption takes place: this fallacy has no doubt often vitiated the results of experiments, and therefore deserves to be particularly cautioned against. For example, if an inverted jar 14 inches high, contains eight inches of air, and six of mercury, (the barometer standing at 30°,) the pressure of the atmosphere on the confined air is = 30 inches of mercury - 6 inch = 24 inches; but if the jar, with its contents, be removed into a basin of water, the quicksilver sinks down and is replaced by water, in consequence of which the atmospheric pressure on the confined air becomes = 30 inches of mercury - 6 inches of water, or (the specific gravity of mercury to water being 14 : 1) = 29.572 inches. The difference here amounts to full one sixth of the whole atmospheric pressure, and therefore the inclosed air occupies less space than before, although no real absorption has taken place. See *PNEUMATIC Chemistry*.

ABSORPTION of the earth, in Natural History, a term used by Kircher and others, for the sinking in of large tracts of land, by means of subterranean commotions, and many other accidents.

Pliny (Hist. Nat. tom. i. p. 115. Ed. Hard.) tells us, that in his time the mountain Cybotus, with the town of Curites, which stood on its side, were wholly absorbed into the earth, so that not the least trace of either remained: and he records the like fate of the city of Tantalus in Magnesia, and after it of the mountain Syphilus, both thus absorbed by a violent opening of the earth. Galanis and Gamales, towns once famous in Phœnicia, are recorded to have shared the same fate: and the vast promontory, called Phegium, in Æthiopia, after a violent earthquake in the night-time, was not to be seen in the morning, the whole having disappeared, and the earth having closed over it. These and many other histories, attested by authors of greatest credit among the ancients, abundantly prove the fact in the earlier ages; and there have not been wanting too many instances of more modern date. Kircher's Mund. Subter. p. 77.

The mountain Picus, in one of the Molucca isles, was so lofty, that it appeared at great distances as an immense column reared erect in the air, and served as a land-mark to sailors; an earthquake in this island destroyed it; at one instant the whole mountain was absorbed into the bowels of the earth, and no mark of its place remained, but a vast lake of water exactly answering to the shape of the base of the mountain. A like accident, but of a more terrible kind, happened in China, in the year 1556, when a whole province of the mountainous parts of that kingdom was in one moment absorbed into the earth, and all the towns buried, the whole number of the inhabitants sinking with it, and an immense lake of water remaining in its place to this time. Of much later date is the destruction of a city in the confines of Switzerland: but this, though generally said to have been swallowed up into the earth, was not properly an absorption, for the whole city was buried by the fall of a mountain upon it.

The burning mountains, *Vesuvius* and *Stromvolus*, both once very high, have in length of time lost half their height, the upper part having been undermined by the burning, and having fallen into, and been absorbed by the under part and the sea. And in the year 1646, during the terrible earthquake in the kingdom of Chili, several whole mountains in the Andes disappeared, and were one after another wholly absorbed in the earth.

These, and a thousand other accidents of the like kind, prove

prove the truth of absorptions in general; some of them leaving level ground in the place of the things absorbed, some immediate chufons and cracks, and some lakes of fresh or salt water; and it may be that many immense lakes were formed in a part, of which we have no histories, by the like absorptions.

Pliny gives in many accounts of the restoring of places thus absorbed, but later observations do not give an equal credit to those parts of this history.

There are instances, however, of ISLANDS being produced, though we cannot affirm them to have appeared in the place of any which have been absorbed.

In the year 1638, an island was raised near St. Michael's in the Atlantic ocean, by subterranean fires, which threw stones and other subterranean productions, in such quantities that they formed an island of five miles in length. The mountain raised in one night, in the sea near Puzzoli, is another instance of this sudden production of these mountains: this appeared after one night's violent subterranean conflict, and still keeps its place, and is known by the name of Mons Sanctus. See ICELAND.

ABSTEINEN, in *Geography*, a district near the river Memel, in Little Lithuania. It is a mountainous and pleasant country, and on account of its fertility in corn and pasturage, called the larder of Lithuania. It abounds with flocks of sheep, various kinds of grain, and excellent horses.

ABSTEMII, in *Ecclesiastical History*, a name given to persons who could not partake of the cup of the Eucharist, on account of their natural aversion from wine.

ABSTEMIOUS, is properly understood of a person who refrains absolutely from all use of wine.

It is compounded of *abs, from, and timetum, coine.*

The history of Mr. Wood, in the *Medic. Transf.* vol. ii. p. 261. art. 18. is a very remarkable exemplification of the very beneficial alterations which may be effected on the human body, by a strict course of abstemiousness.

The Roman ladies, in the first ages of the republic, were all enjoined to be abstemious; and that it might appear, by their breath, whether or not they kept up to the injunction, it was one of the laws of the Roman civility, that they should kiss their friends and relations whenever they accosted them.

ABSTEMIUS, *Laurentius*, in *Biography*, a native of Macerata, in Italy, who made a very considerable progress in polite literature, to which he devoted himself in early life. He taught the belles lettres at Urbino, where he was librarian to Duke Guido Ubaldo, under the pontificate of Alexander VI. His works are Notes on different passages of ancient authors: Hecatomythium, or a Collection of 100 Fables, which have been often printed with those of Æsop, Phædrus, Gælius, Avienus, &c. and a preface to the edition of Aurelius Victor, published at Venice, in 1505.

ABSTENTUS, among *Civilians*, is understood of an heir with-held by his tutor from taking on him an inheritance. Among *Ecclesiastical Writers*, the word is also used for a person excommunicated.

ABSTERGENTS, or ABSTERSIVE medicines, more usually called among physicians DETERGENTS, are medicines which not only wash off adhering substances, as ABLUENTS, but are supposed to possess a power of resolving and loosening their cohesion. But the terms are too general, and are often erroneously applied upon a false supposition, that they have a power of resolving viscid substances, which water simply, as an abluent, cannot effect.

ABSTINENCE, derived from *abstinere*, formed of *abs, from, and tenere, to hold*, in a general sense, the act or habit of refraining from something to which we have a propensity, or in which we find pleasure.

The Jews were obliged to practise various kinds of abstinence by their law. The Pythagoreans were accustomed, upon being initiated into the fraternity of the select companions and friends of Pythagoras, to abstain from animal food, except the remains of the sacrifices, and to drink nothing but water, unless in the evening, when they were allowed a small portion of wine. Some of the primitive christians also abstained from the use of particular kinds of food, whilst others treated their abstinence with contempt. See Rom. xiv. The council of Jerusalem, which was held by the apostles, enjoined the christian converts to abstain from meats strangled, blood, fornication, and idolatry. Acts xv. 20. The abstinence, called *ritual*, which consisted in abstaining from particular meats at certain seasons, was introduced by the Romish church, prescribed by rules, denominated ROGATIONS, and grossly abused. The church of England also recommends certain days of fasting and abstinence.—*Abstinence from flesh* has been enjoined by statute even since the Reformation, particularly on Fridays and Saturdays, and on Vigils, and all commonly called fish-days, 2 and 3 Ed. VI. c. 19.—The like injunctions were renewed under queen Elizabeth, but at the same time it was declared, that this was done, not out of motives of religion, as if there were any difference in meats, but in favour of the consumption of sea-fish, and to multiply the number of fishermen and mariners, as well as spare the flock of sheep. 5 Eliz. c. 15. The great fast, says St. Augustin, is to abstain from sin. See FAST.

The ancient Athletæ lived in a perpetual abstinence from all kinds of sensible pleasure, to render their bodies more robust and hardy.

ABSTINENCE is more particularly used for a spare DIET, or a slender parsimonious use of FOOD.

The Physicians relate wonders of the effects of abstinence in the cure of many disorders, and in protracting the term of life. The noble Venetian Cornaro, after all imaginable means had proved vain, so that his life was despaired of at forty, recovered, and lived to near a hundred, by mere dint of abstinence, as he himself gives the account.

Many of the christians of the east, who retired from persecution into the deserts of Arabia and Egypt, lived in health and cheerfulness to a very advanced age on very little food. According to Cassian, the common allowance for twenty-four hours was twelve ounces of bread, and water; and yet with this subsistence St. Anthony lived 105 years, James the Hermit 104, Arsenius, tutor of the emperor Arcadius, 120; Epiphanius 115; Simeon the Stylite 112; and Romauld 120. Buchanan informs us, that one Laurence attained to 140, by temperance and labour: and Spotswood mentions one Kentigern, called St. Mongah or Mungo, who lived to 185 by the same means. See LONGEVITY.

Most of the chronical diseases, infirmities of old age, and the short lives of Englishmen, are owing, according to Dr. Cheyne, to repletion; and may be either cured, prevented, or remedied, by abstinence.

Abstinence, however, should be maintained with discretion, and with a due regard to age, sex, climate, exercise, disposition to corpulence in the individual, and various other circumstances; without a reference to which, it may be pursued to a very hurtful extreme. It is certain, that many persons have irreparably injured their constitutions by excessive parsimony; and those who, either by design or accident, have fasted long, seldom enjoy good health afterwards.

Among the brute creation, we see extraordinary instances of long abstinence.—It is the natural course of divers species

to pass four, five, or six months, every year, without either eating or drinking: accordingly the tortoise, dormouse, serpent, &c. are observed regularly to retire, at certain seasons, to their respective cells, and hide themselves; some get into the caverns of rocks, or ruins; others dig holes under ground; others get into the woods, and lay themselves up in the clefts of trees; others bury themselves under water, &c. See SLEEPERS.

The serpent kind bear abstinence to a very great degree. We have seen rattle-snakes that have subsisted many months without any food, yet still retain their vigour and fierceness. Dr. Shaw (*Trav.* p. 411.) speaks of a couple of *cerastes* (a sort of Egyptian serpents), which had been kept five years in a large crystal vessel, without any sort of food, unless a small quantity of sand, wherein they coiled themselves up in the bottom of the vessel, may be reckoned as such; yet, when he saw them, they had just cast their skins, and were as brisk and lively as if just taken.

Indeed, several species of birds, the whole tribe almost of insects, and many among the other tribes, are able to subsist all through the winter, not only without food, but many of them in a state of apparent insensibility and torpor.—This furnishes an admirable instance of the wisdom of the Creator: the proper food of these creatures, especially the insect tribe, being then wanting, there is provision for them to live without it. When the fields are divested of their flowery furniture, and the trees and plants are stripped of their fruits, what would become of such animals as are subsisted only by the produce of the spring and summer, and of others which are incapable of bearing severe cold? To prevent the total destruction and extirpation of many species of animals, the Author of nature has provided, that creatures, bereaved by the season of their food, should be likewise impatient of cold: that they might thus be led to shelter themselves out of the way of danger; and that when arrived in a place of safety, the natural texture and viscosity of their blood should dispose it, by a farther degree of cold, to stagnate in the vessels: so that the circulation stopping, and the animal functions being, in a great measure, suspended, there is no sensible waste or consumption of parts, but they remain in a kind of drowsy neutral state, between life and death, till the warm sun revives both them and their food together, by thawing the congealed juices, both of such animals and vegetables. The fact, however, is questionable; and will be more particularly considered hereafter.

It is more than probable, that all motion of the animal juices is extinct in flies, and other insects, when thus asleep; because, though they are cut in pieces, they do not awake, nor does any fluid ooze out of the wound, unless some extraordinary degree of warmth hath been first applied to unbind the congelation. See *Hedge-Hog*. The sleep of such animals is little else than death, and their waking a resurrection.—For if life does not consist in a circulation of the blood, we do not know in what it consists.

Hence it is no wonder that tortoises, dormice, &c. are found as fat and fleshy, after some months abstinence, as before. Sir G. Ent weighed his tortoise several years successively, at its going to earth in October, and coming out again, in March; and found that of four pounds four ounces, it only used to lose about one ounce. *Phil. Trans.* N^o 194.

We have some instances of men who have passed several weeks, and even months in abstinence without injury. The records of the Tower mention a Scotman, imprisoned for felony, and strictly watched for six weeks; during which time he did not take the least sustenance: on which account he obtained his pardon. There are many cases

of abstinence from morbid causes, that are related in the different periodical Memoirs, Transactions, Ephemerides, &c.

It is to be added, that in most of the instances of long abstinence related by naturalists, there were apparent marks of a texture of blood and humours, much like that of summer bealls and insects; though it is no improbable opinion that the air itself may furnish something for nutrition. It is certain, there are substances of all kinds, animal, vegetable, &c. floating in the atmosphere; which must be continually taken in by respiration: and that an animal body may be nourished thereby, is evident in the instance of vipers; which, if taken when first brought forth, and kept from every thing but air, will yet grow very considerably in a few days. So the eggs of lizards are also observed to increase in bulk, after they are produced, though there be nothing to furnish the increment but air alone; after the like manner as the eggs or spawn of fishes grow, and are nourished with the water. And hence, some say, it is, that cooks, turnspit dogs, &c. though they eat but little, yet are usually fat.

ABSTINENCE is also used sometimes to signify a *suppression*. Thus in Cælius Aurelianus, *abstinentia sudoris*, signifies a suppression of sweat. Sometimes in this author it means a *compression*; as *Spiritus ob abstinentiam clausus*, means the wind shut up in the intestines by compression, thereby causing the *ILIAC passion*.

ABSTINENTES, in *Ecclesiastical History*, a sort of people, who carried abstinence and mortification so far, that they have been put into the catalogue of heretics; though it is not known in what their error consisted.

Some represent them as the same with those otherwise called *Continentes*, and that they particularly enjoined abstinence from the use of marriage: others say, from flesh, and others from wine. Others will have them a branch of the Gnostics. Some make them the same with the Hieracites; others with the Encratites. They are said to have risen in Spain and France towards the close of the third century.

ABSTOTTEN, in *Geography*, a small market town, belonging to the bishop of Passau, in the circle above the forest of Wiener, in Austria.

ABSTRACT, ABSTRACTUM, in a general sense, any thing separated from something else.

ABSTRACT of a fine, in Law. See FINE.

ABSTRACT idea, in *Metaphysics*, is a partial idea of a complex object, limited to one or more of the component parts or properties, laying aside or abstracting from the rest. But among those who adopt the system of Mr. Locke, an *abstract idea* denotes an idea formed in the mind, when we consider a thing simply in itself, without respect to the subject wherein it resides; or it is a simple idea detached and separated from any particular subject or complex idea, for the sake of viewing and considering it more distinctly.

Thus, magnitude and humanity are *abstracts* or *abstract ideas*, when considered in themselves, and without being attached to any particular body, or person; though they cannot have any real subsistence without such subjects, nor the subjects without them.

Whiteness is an abstract, inasmuch as it does not denote any one white object, but that colour, or idea in the general, wherever found.

Abstract ideas are opposed to those which are concrete; the concrete denoting a general or abstract idea's being attached to some particular subject, or considered as combined with some other ideas: as, *great house*, *white seal*. All our simple ideas, says Mr. Locke, have abstract, as well as concrete names: as *whiteness*, *white*; *sweetness*, *sweet*, &c. The

like also holds in our ideas of modes, and relations: as *justice, just: equality, equal, &c.*

But as to our ideas of substance, we have very few abstract names at all. Those few that the schools have forged, as *Animalitas, Huminitas, &c.* bear no proportion to the infinite number of names of substances; and could never get admittance into common use, or obtain the licence of public approbation; which seems to intimate a confession of mankind, that they have no ideas of the real essences of substances; since they have not names for such ideas.

Indeed the reality and existence of all abstract ideas, and of any such faculty in the mind as abstraction, have of late been controverted, and actually denied by persons of very considerable eminence as metaphysicians and philosophers. It will appear in what sense they use the terms *abstract ideas* under the article ABSTRACTION.

ABSTRACT terms, are those made use of to denote abstract ideas. In which sense the words *whiteness, paternity, animality, justice, crookedness, &c.* are abstract or abstract terms.

ABSTRACT mathematics. See MATHEMATICS.

ABSTRACT numbers, are assemblages of units considered in themselves, and not applied to denote any collections of particular sorts of things.

ABSTRACT, in *Literature*, is a compendious view, or EPILOGUE of a larger work, and is supposed to be somewhat shorter, and more superficial than an ABRIDGMENT.

ABSTRACTI, *abstracted*, in *Church History*, is a name given to a sect among the Lutherans, under the lead of Heshusius, a Prussian bishop, who asserted against Beza, "that Christ was to be adored not only in the concrete, as the son of God, but that his flesh in the abstract was an object of adoration." Wigandus prevailed so far against Heshusius as to get him deposed: afterwards the *Abstracti* gained the ascendancy, and Wigandus was silenced. *Micræl. Hist. Eccl. l. iii. f. 2. &c. Budd. Isag. Hist. Theol. l. ii. c. 7.*

ABSTRACTION, in *Chemistry*, properly means the act of drawing off or separating, by means of heat, one part of a compound from the other. If the part abstracted is collected, the operation is synonymous with DISTILLATION. If it is not collected, the term has the same meaning with EVAPORATION. At present, however, it is almost entirely appropriated to the repeated distillation of nitrous acid off any substance; in which case it is said to have been abstracted *with the acid*.

ABSTRACTION, in *Metaphysics*, an operation of the mind, whereby we separate things naturally conjunct, or existing together; and form, and consider, ideas of things thus separated: or, as others define it (see Duncan's Elements of Logic, p. 51.), *abstraction* is that operation of the mind, by which we separate from any of our conceptions all those circumstances that render it particular, or the representative of a single determinate object; so that, instead of standing for an individual, it is made to denote a whole rank or class of things. In this manner we acquire our *general* ideas, that serve as standards by which we may rank and denominate particular objects. Thus, in viewing a square, or circle, we leave out the consideration of every thing that is peculiar to them, except their figure and shape. Whenever, therefore, we meet with a figure answering to that shape and form, which we had laid up in our understandings, it is immediately referred by the mind to this pattern, and called by its name, which by this means becomes proper to the whole species. Thus, a square and circle are universal terms, common to all figures of that particular shape, and alike applicable to them wherever they exist; in

like manner as the ideas themselves are *general*, and representatives of all of the kind.

The faculty of abstracting stands directly opposite to that of compounding. By composition we consider those things together, which in reality are not joined together in one existence. And by abstraction we consider those things separately and apart, which in reality do not exist apart.

Abstraction is chiefly employed in these three ways. First, when the mind considers any one part of a thing in some respect distinct from the whole; as a man's arm, without the consideration of the rest of the body. Secondly, when we consider the MODE of any substance, omitting the substance itself, or when we separately consider several modes which subsist together in one subject. Thus abstraction the *Geometricians* make use of, when they consider the length of a body separately, which they call a LINE; omitting the consideration of its breadth and depth. Thirdly, it is by abstraction that the mind frames general, or universal ideas: omitting the modes and relations of the particular objects whence they are formed. Thus, when we would understand a thinking being in general, we gather from our self-consciousness what it is to think; and omitting the consideration of those things which have a peculiar relation to our mind, or to the human mind, we conceive of a thinking being in general.

Ideas framed thus, which are what we properly call *abstract ideas*, become general representatives of all objects of the same kind; and their names applicable to whatever exists conformable to such ideas. Thus, the colour that we receive from chalk, snow, milk, &c. is a representative of all of that kind; and has a name given it, *whiteness*, which signifies the same quality, wherever found or imagined. It is this last faculty, or power of abstracting, according to Mr. Locke, that makes the great difference between men and brutes; even those latter must be allowed to have some share of reason; that they really reason in some cases, seems almost as evident as that they have sense; but it is only in particular ideas. They are confined to those narrow bounds; and do not seem to have any faculty of enlarging them by abstraction. Essay on Human Understanding, book ii. c. 11. § 9, 10, 11. book iii. c. 3. § 9. Such is the doctrine of abstract ideas, as it has been delivered by that excellent author. From him it became, for a considerable time, a prevailing opinion, that the mind has such a power or faculty of framing abstract ideas or notions of things; and on such ideas a great part of the writings of philosophers is founded. These are supposed in all their systems; and they are more especially reputed the objects of logic, mathematics, and metaphysics, and of every thing that passes under the notion of the most abstracted and sublime learning.

However, an eminent and ingenious author, Dr. Berkeley, has contested the reality of any such ideas; and led the way towards overturning the whole system, and consequently towards setting philosophy on a new foundation. See a Treatise concerning the Principles of Human Knowledge, first printed in 1710.

The qualities or modes of things, it is on all hands agreed, says that learned prelate, do never really exist apart, and separated each from all others, but are constantly mixed and combined together, several in the same object. But, say the philosophers, the mind being able to consider each quality singly, or abstracted from other qualities with which it is united, does by that means frame to itself abstract ideas, of a different nature and kind from the sensible ones.

For example, when the eye perceives an object extended, coloured, and moved, the mind resolves this compound idea into

into its simple constituent parts; and viewing each by itself, exclusive of the rest, frames abstract ideas of extension, colour, and motion. Not that it is possible for such colour and motion to exist without extension; but only that the mind can frame to itself, by abstraction, the idea of colour exclusive of extension; and of motion, exclusive both of colour and extension.

Again, say the same philosophers, the mind having observed that in the particular extensions perceived by sense, there is something common, and alike in all; and some other things peculiar; as, this, or that figure, or magnitude, which distinguish them one from another: it can consider apart, or single out by itself, that which is common; making thereof a general abstract idea of extension, which is neither line, surface, nor solid, nor has any figure or magnitude, but is an idea entirely precluded from them all. So, likewise, by leaving out of the several colours perceived by sense, that which distinguishes them one from another, and only retaining what is common to all, it makes an idea of colour in the abstract, which is neither red, nor blue, nor white, &c.—After the same manner by considering motion abstractedly, both from the body moved, and from the figure it describes, and all particular directions and velocities; an abstract idea of motion is framed, which equally corresponds to all motions whatever.

They add, that as the mind frames abstract ideas of qualities or modes, so does it by the same faculty, obtain abstract ideas of the more compound beings, which include many co-existent qualities. For example: Having observed that Peter, James, John, &c. resemble each other in shape, and other qualities; we can leave out of the complex idea we had of Peter, James, &c. that which is peculiar to each, retaining only what is common to all, and so make an abstract idea, wherein all the particulars equally partake. And thus it is we are supposed to obtain the abstract idea of man, or of humanity, or human nature; wherein there is indeed included colour, because there is no man that has not some colour; but it is neither white, nor black, nor brown; because there is no one particular colour wherein all men partake. So likewise there is included stature, but then it is neither tall nor low, nor yet middle stature, but something abstracted from all these; and so of the rest.

Farther yet, there being a general variety of other creatures, which partake in some parts, but not all, of the complex idea of man; the mind leaving out those parts which are peculiar to men, and retaining only those which are common to all living creatures, frames the idea of animal; which abstracts not only from all particular men, but also from all birds, beasts, fishes, and insects.

The constituent parts of such abstract idea of animal, are body, life, sense, and spontaneous motion. By body is meant, body without any particular shape, or figure; there being no one common to all animals; without covering, either of hair, or feathers, or scales; nor yet naked; hair, feathers, scales, and nakedness, being the distinguishing properties of particular animals, and for that reason left out of the abstract idea. Upon the same account, the spontaneous motion must be neither walking, nor flying, nor creeping; it is nevertheless a motion. But what the motion is, it is not easy to conceive. "I will not affirm," says Dr. Berkeley, "that other people have not this wonderful faculty of abstracting their ideas; but I am confident I have it not myself. I have, indeed, a faculty of imagining, or representing to myself the ideas of things I have perceived, or of variously compounding or dividing them: I can imagine a man with two heads, or the upper parts of a man joined to the body of a horse. I can consider the hand, the

eyes, the nose, each by itself, abstracted or separated from the rest of the body. But then, whatever hand or eye I imagine, it must have some particular shape and colour. So again, the idea of a man I frame to myself, need be either of a white, or a black, or a tall, or a middle-sized, or a crooked, a tall, or a low, or a middle-sized man. "I cannot by any effort of thought, conceive the abstract idea above described; and it is equally impossible for me to form the abstract idea of motion, distinct from the body moving, and which is neither swift nor slow, or circular nor rectilinear. And the like may be said of all other abstract general ideas whatever."

Since all things that exist are only particulars, "Whence," says Mr. Locke, "is it, that we come by general words, expressive of a thousand individuals?" His answer is, terms only become general, by being made the sign of abstract and general ideas; so that the generality of abstract ideas should follow from the reality of general words.—But, according to Dr. Berkeley, a word becomes general, by being made the sign not of an abstract general idea, but of several particular ones, any of which it indifferently suggests to the mind.—For example, when I say, that whatever has extension is divisible; the proposition is to be understood of extension in general; not that I must conceive any abstract general idea of extension, which is neither line, surface, nor solid, neither great nor small, &c. To make this more evident, suppose a geometrician to be demonstrating a method of dividing a line into two equal parts: with this view, he draws, for instance, a black line, an inch long; and this, which in itself is a particular line, is nevertheless, with respect to its signification, general; since it represents all lines whatever; so that what is demonstrated of this one will hold of all others—And as that particular line becomes general by being made a sign, so does the name *line*, and the idea of a line in the imagination, either of which, taken absolutely, is particular, by being signs become general likewise; and as the former owes its generality, not to its being the sign of an abstract or general line, but of any or all particular right lines that may possibly exist; so must the latter, both the name and the idea, derive their generality from the same cause, or the various particular lines which each of them indifferently denotes.

But to this reasoning it has been replied, that the universality consists in the idea; and not merely in the name as used to signify, and recal into the mind, a variety of particular things, resembling that which is the immediate object of reflection; because had we no previous fixed notion what the name signifies, we could not know what particular things to apply it to, or assign any reason for applying it to one thing rather than another. All that can be pictured in the imagination, as well as all that we take notice of by our senses, is indeed particular. And whenever any general notions are present in the mind, the imagination, at the same time, is commonly engaged in representing to itself some of the particulars comprehended under them. But it would be a very strange inference from hence, that we have none but particular ideas. As well almost might we conclude, that we have no other notion of any thing than of its name, because they are so associated in our minds, that we cannot separate them; or of the sun, than as a white bright circle such as we see in the heavens, because this idea or phantasm is apt to accompany all our thoughts of it. See Dr. Price's Review of the principal Questions and Difficulties in Morals, p. 43.

Dr. Cudworth observes, that abstract ideas are implied in the cognitive power of the mind; and he pronounces the opinion, that they are only singular ideas annexed to a com-

mon term: or in other words, names without any meaning, to be so ridiculously false, as to deserve no confutation. See *External and Inamutable Morality*, book iv.

Mr. Locke, (*Ess. b. iv. c. 7. §. 9.*) speaking of the difficulty of forming abstract ideas, says: "does it not require some pains and skill to form the general idea of a triangle, which yet is none of the most abstract and comprehensive; for it must neither be oblique, nor rectangular; neither equilateral, isosceles, nor scalenous; but all, and none of these at once. In effect, it is something imperfect, that cannot exist; an idea, wherein some parts of several different and inconsistent ideas are put together." Now, let any man look into his thoughts, and try whether he has, or can attain to an idea of a triangle correspondent to this description.

Dr. Campbell, in his *Philosophy of Rhetoric*, vol. ii. p. 105. expresses his apprehension, that the bare mention of this hypothesis is equivalent to a confutation of it, since it really confutes itself. He adopts the sentiments of Berkeley on this subject, and will allow to the mind no other power of abstraction, if the term be retained, beside that, by which a particular idea is regarded, as representing a whole order. Mr. Locke, he says, has, on some occasions, evidently inclined to the same opinion: in proof of which he refers to his *Essay*, book iii. chap. 3. §. 11.

In this section Mr. Locke maintains, that not only words but ideas are made signs; and a particular idea is made general, not by any change produced in it (for then it would no longer be the same idea), but by being set up as the representative of many particular things. Universality, he observes, as it belongs not to things, belongs not even to those words and ideas, which are all of them particular in their existence, but general in their signification. Again, the general nature of those ideas is nothing but the capacity they are put into by the understanding of signifying or representing many particulars; and, if possible, still more explicitly, the signification they have is nothing but a relation, (no alteration in their essence,) that by the mind of man is added to them. "If such an extraordinary faculty," as abstraction, says Dr. Campbell, (*ubi supra*, p. 110.) "were possible, I cannot for my part conceive what purpose it would serve. An idea hath been defined by some logicians, the form or resemblance of a thing in the mind, and the whole of its power and use in thinking is supposed to arise from an exact conformity to its archetype. What then is the use or power of that idea, to which there neither is, nor can be, any archetype in nature, which is merely a creature of the brain, a monster that bears not the likeness of any thing in the universe."

The late Lord Bolingbroke likewise controverted the existence of abstract ideas. He apprehends that the disputes about abstraction may after all be considered as verbal, and owing to the want of making a proper distinction between ideas and notions, which have been used, he says, both by Mr. Locke and his antagonist the Bishop of Cloyne, as if they were synonymous. We might avoid the confusion arising from this ambiguity, he presumes, if we conceived the former to be particular in their nature, and general only by their application; and the latter to be general in their nature, and particular only by their application. In another place he observes, that much confusion and error have arisen from the improper use of the word abstraction. There is a very practicable operation of the mind, by which we are said to abstract ideas, and by which we do, in effect, generalize them in a certain manner, and to a certain degree, by substituting one as representative of many. There is another supposed, but impracticable operation of the mind, by which some

philosophers have made themselves and others believe, that they abstract, from a multitude of particular ideas, the idea of one general nature or essence, which is all of them, and none of them; whereas, in truth, though they can define general natures or essences in very clear propositions, they cannot frame an idea of any general nature, which is not a particular idea of that nature. Bolingbroke's *Works* by Mallet, vol. iii. p. 438. and vol. v. p. 17. &c.

The acute Mr. Hume has also attacked the system of abstraction. He asserts, (*Essays*, vol. ii. p. 165.) that it is unintelligible, and even absurd, to conclude, that the ideas of primary qualities are obtained by abstraction. An extension, that is neither tangible nor visible, cannot possibly be conceived: and a tangible or visible extension, which is neither hard nor soft, black nor white, is equally beyond the reach of human conception. Let any man try to conceive a triangle in general, which is neither isosceles, nor scalene, nor has any particular length or proportion of sides, and he will soon perceive the absurdity of all the scholastic notions with regard to abstraction and general ideas. Mr. Hume has pursued Berkeley's reasoning to an extent which he himself never proposed, and represented all his arguments as merely sceptical, "because they admit of no answer, and produce no conviction."—Dr. Reid, in his valuable *Essays on the Intellectual Powers of Man*, (*Ess. v. passim.*) has discussed the subject of abstraction, and examined the various opinions that have been formed concerning it, in a very diffuse and elaborate manner. This ingenious writer apprehends, that we cannot, with propriety, be said to have abstract and general ideas, either in the popular or philosophical sense of that word. In the former sense, an idea is a thought, or an act of the mind in thinking, or in conceiving any object; and this must be an individual act. In the latter sense, an idea is an image in the mind, or in the brain, which in Mr. Locke's system is the immediate object of thought, and in the system of Berkeley and Hume, the only object of thought: and as he believes there are no such ideas, there can be no abstract general ideas. If they existed, they could not be general, because every thing that really exists is an individual. Universals are neither acts of the mind, nor images in the mind. They cannot be the objects of imagination when the word is taken in its strict and proper sense. We cannot imagine a man, without colour, or stature, or shape. But though Dr. Reid denies the reality of *abstract ideas* in the sense above stated, he maintains the same doctrine by merely substituting the term *conception* for *idea*. As general words are necessary in language, there must, he says, be general conceptions, of which these are the signs; and they take this denomination, not from the act of the mind in conceiving, which is an individual act, but from the object or thing conceived, which is general. These general words express either the attributes of things, or the genera and species, into which we divide and subdivide them; and of both these we may have clear and distinct conceptions. As to the operations of the understanding, by which we form these general conceptions, he apprehends that they are the three following, viz. 1. The analysing or resolving a subject into its known attributes, and giving a name to each attribute, signifying that attribute, and no more. 2. The observing one or more such attributes to be common to many subjects. The first act is by philosophers called *abstraction*: the second may be called *generalising*; but both are commonly included under the name of abstraction. We cannot generalise, he says, without some degree of abstraction; but we may abstract without generalising. For what hinders me from attending to the whiteness of the paper before me, without applying that

that colour to any other object. The whiteness of this individual object is an abstract conception; though not a general one, while applied to one individual only. To this reasoning it might be replied, that if whiteness be separated in his conception of it from the paper, it is no longer the whiteness of that object; and he must either conceive it as abstracted from all objects, which is impossible, or as pertaining to some other object: and thus neither the quality of whiteness, nor his conception of it, is abstract and general, but concrete and particular. 3. A third mental operation, by which we form abstract conceptions, is, according to Dr. Reid, the combining into one whole a certain number of those attributes, of which we have formed abstract notions, and giving a name to that combination. It is thus we form abstract notions of the genera and species of things. With regard to abstraction strictly so called, the difficulty of which was acknowledged by Mr. Locke, this author says, "I can perceive nothing in it that is difficult either to be understood or practised." "What can be more easy," as he proceeds, "than to distinguish the different attributes which we know to belong to a subject? In a man, for instance, to distinguish his size, his complexion, his age, his fortune, his birth, his profession, and twenty other things that belong to him." But in this case, it may be alleged, that though we separate one or more of these attributes from the others in our conception of them, we cannot abstract them from the individual person without transferring them to some others; so that our conceptions will be still concrete and particular. Dr. Reid adds farther, that attributes which are in their nature absolutely inseparable from their subject, and from one another, may be disjoined in our conception. In a body we can distinguish its solidity from its extension, and its weight from both: and in extension we can distinguish length, breadth, and thickness; and yet none of these can be separated from the body, or from one another. But can we conceive solidity, as separated from all extension and weight? Can we conceive solidity or extension, separated from all bodies? Those who cannot do this will still contend that there is no abstraction strictly so called. Without pursuing this ingenious writer's reasoning any farther, or giving in detail his answers to the various objections of Berkeley and Hume, we shall close our abstract of what he says on this subject with the following general conclusions, which he has deduced from his account of abstract and general conceptions. 1. It is by abstraction, he says, that the mind is furnished with all its most simple and most distinct notions. Abstraction analyses the simplest objects of sense, as well as those of memory, and of consciousness. 2. Our most distinct complex notions are formed by compounding the simple notions got by abstraction. 3. Without the powers of abstracting and generalising, it would be impossible to reduce things into any order and method, by dividing them into genera and species. 4. Without these powers there could be no definition, which can only be applied to universals, as no individual can be defined. 5. Without abstract and general notions, there can be neither reasoning nor language. 6. As brute animals shew no signs of being able to distinguish the various attributes of the same subject; of being able to class things into genera and species; to define, to reason, or to communicate their thoughts by artificial signs, as men do; "I must think," says this author, "with Mr. Locke, that they have not the powers of abstracting and generalising; and that, in this particular, nature has made a specific difference between them and the human species."

The notion of abstract ideas, which, according to Dr. Berkeley, has contributed to render speculation intricate and perplexed, and to occasion innumerable errors and dif-

iculties in almost all parts of knowledge, led men, in his opinion, first to suppose, that bodies have an existence of their own, exclusively and independently of the mind which perceives them.—Can there be a greater strain of abstraction, says he, than to distinguish the existence of sensible objects from their being perceived, so as to conceive them existing unperceived?—If there were external bodies, he says, it is impossible we should ever come to know it; and if there were not, we might have the very same reasons to think there were that we have now. His principal argument may be reduced to the following syllogism; whatever is immediately perceived by sense, is an idea; sensible things are immediately perceived by sense; for the proof of which he appeals to experience; therefore sensible things are ideas: and consequently exist only in the mind. See his Dialogues between Hylas and Philonous.

Mr. Hume concurs with Dr. Berkeley in denying the existence of matter; and advances a step farther, maintaining that the soul is merely a bundle of perceptions, and that there is nothing in the universe but impressions, and ideas.

Some late Scots writers, Doctors Reid, Beattie, and Oswald, with a view of obviating those sceptical inferences, which had been deduced from the principles of Mr. Locke, have, in opposition to these, offered a new system respecting the nature and origin of our ideas, the outlines of which, with remarks, will be inserted under their proper heads, in the course of this work. See IDEAS, INTUITION, and COMMON SENSE.

We shall only add, that abstracting, on the common system, is no more than generalising: it is making one thing stand for a hundred, by omitting the consideration of the differences between them: it is taking several different, *i. e.* different combinations, setting aside the peculiarities in each, and considering only what is found alike in all.—Thus it is that I say, I love my friend, love my mistress, love myself, my bottle, my book, my ease, &c.—Not that it is possible, I should have the same perception with respect to so many different sorts of things, things that stand in such different relations to me; but only that there appearing something in them all that bears a resemblance to the rest, in some circumstance or other, I chuse to express all by one name, *love*. For if I consider the tendency and effects of them all, I shall find they lead me very different ways, to very different actions; all the analogy there is between them, is a sort of pleasure or satisfaction, arising upon the application of the particular object to its proper organ, or sense.—The abstract idea of love, then, will terminate in the idea of pleasure: but it is certain, there can be no idea of pleasure without a thing pleasant to excite it. Any other abstract idea of pleasure will amount to no more than a view or perception of the circumstances wherewith our pleasures have been attended; but these are mere externals foreign to the pleasurable sensation itself; which nothing but an object applied in such and such a manner can excite.—To suppose an idea of pleasure produced indirectly, by any other than by the proper cause, is as absurd as to suppose an idea of sound, produced without a sonorous object. The mind has no power of making any ideas, call them what you will, whether *abstract* or *concrete*, or *general*, or *particular*: its activity goes no farther than to the perceiving of such as are presented to it; so that its action is really no other than a degree of passion.

ABSTRACTITIOUS, or ABSTRACTIVE, is applied by some modern *Chemists* to a spirit drawn from vegetables without fermentation.

ABSTRUSE, *abstrusus*, formed of *abs*, from, and *trude*, I thrust, denotes something deep, hidden, or far removed from

from the common apprehensions, and more intelligible ways of conceiving; in opposition to what is obvious and palpable.

In this sense *Metaphysics* is an *abstruse* science; and many speculations of *Mathematics* are likewise *abstruse*.

ABSURD, ABSURDUM, a term applied to any action or sentiment that thwarts, or goes contrary to some evident truth.

Thus, a proposition would be absurd, that should affirm that two and two make five; or that should deny them to make four.

The *Logicians* and *Mathematicians* have a way of proving the truth of a proposition in this indirect manner, by shewing that the contrary is absurd.

This they call

Rebutio ad ABSURDUM, or *arguing ex absurdo*.

Absurd, when applied to actions, is synonymous with *ridiculous*.

ABSURDITY, a kind of error or offence against some evident or generally allowed truth or principle.

The greatest of all absurdities is CONTRADICTION.

The schoolmen make two species of absurdities—The one *absolute*, *απλως*; which is repugnant to the common sense of mankind; the other *relative*, *τινι*, which contradicts some one, or more philosophers, or persons of great weight and authority.

In this sense the doctrine of a *vacuum* is an absurdity; as being contrary to Aristotle: and that of a *plenum*, as being contrary to Sir Isaac Newton. In effect, there is scarce one truth of any moment, that is not an absurdity in this sense; as being repugnant to the system of some sect, or party.

As reason consists in the due use of names and words, absurdity consists in the abuse of them. Hobbes assigns absurdity as a privilege peculiar to man, and which no other creature is capable of: he adds, that of all men, those called philosophers are most exposed to it. Whence the saying of Cicero, there is nothing so absurd but has been said by a philosopher, *nihil tam absurde dici potest, quod non dicatur a philosopho*. The reason seems to be, that of all men they reason, and discourse most. Yet a nearer and more apposite cause may be assigned, viz. their neglect at setting out, to define the terms they make use of, i. e. to assign the precise idea each is made to represent: which is much like a man's undertaking to number, without knowing the value of the numeral figures; reasoning, according to the author first cited, being no other than computing. Divers absurdities also arose from the wrong connecting of names into propositions; as first, when the names of bodies are applied to accidents; or the names of accidents to bodies: as in that proposition, "faith is infused or inspired:" since nothing is either fusible, or inspirable, but body: and the same absurdity the Cartesians fall into, when they make extension to constitute body, &c. Secondly, when the names of accidents inherent in external bodies are attributed to accidents of our own bodies: as when it is said, that colour is in the object, sound in the air, &c. Thirdly, when the names of bodies are attributed to words, or conceptions: as is done by those who assert that there are universal things, that animal is a genus, &c. Fourthly, when the names of accidents are given to words, and propositions; as when it is said, that the definition is the nature of the thing, or a person's command is his will. Fifthly, when in lieu of proper words, metaphors and tropes are made use of: as, the way leads to such a place, the proverb says this or that; which though allowable on ordinary occasions, yet is of mischievous consequence in reasoning and

searching after truth. Lastly, when names are taken at random, and used without meaning, as transubstantiation, consubstantiation, *entelechia*, &c.

He that can avoid these rocks will not easily fall into an absurdity, except in a very long chain of reasoning, when he may be apt to forget some proposition before laid down. Hobb. Lev. P. i. c. 5. p. 22.

ABSUS, the Egyptian LOTUS of Ray. See CASSIA.

ABSINTHIUM. See ABSINTHIUM.

ABSYRTIDES, or APSYRTIDES, in *Ancient Geography*, islands in the Adriatic, on the coast of Illyricum, mentioned by Strabo, Pliny, Mela, and Ptolemy, to which pertain *Apsyrtis* or *Absyrtium*, and *Abforus* or *Apsforus*; so called according to Strabo (tom. i. p. 484.), and Pliny, (tom. i. p. 181.) from *Absyrtus*, Medea's brother, who was slain there. They are separated by a channel, and are now called *Cherso* and *Osero*.

ABSYRTUS, in *Mythology*, the son of Cæta and Hypæa, and brother of Medea. When Medea ran away with Jason, whom she assisted in carrying off the golden fleece, she was pursued by her father; but in order to retard his progress, she tore Absyrtus in pieces, and threw his limbs in the way.

ABTHANES, in *History*, a title of honour anciently used in Scotland, denoting the high order of *thanes*, or king's ministers, in contradistinction to the lower, called *underthanes*.

ABUBEKER, or ABU BECR, i. e. the father of the girl or virgin, viz. Ayesha, who was of this description when Mahomet married her, the first caliph, and successor of Mahomet. His original name was *Abdulcaaba*, the servant of the *Caaba*, denoting his piety; which name was changed by Mahomet on his conversion, into *Abdallab*, the servant of God; and on the prophet's marriage with his daughter, he assumed the appellation of *Abubeker*. He was eminently useful to this impostor at the commencement of his undertaking, as he vouched for his veracity in every thing he related concerning his revelations, and his nocturnal journey to heaven; and very much exerted himself in augmenting the number of his followers. On this account the prophet gave him the surname of Al Seddik, which denotes the faithful witness, and the appellation Atik, or preserved, i. e. saved from hell-fire, thus intimating that he was one of the elect. At the time of Mahomet's death, two powerful parties, called the Mohajerin and the Ansars, claimed the right of nominating his successor. The former founded their pretensions on their having attended the prophet in his flight to Medina, and declared themselves in his favour before any of the other Arabs joined him; whilst the latter pleaded, that they supported him when he was expelled his native city, and enabled him to surmount opposition, when he and his followers were in a state of persecution. At length, however, by the interposition of Omar, they concurred in the election of Abu Becr, A. D. 632. As many of the Arabs had renounced their new religion, and returned to paganism, judaism, or christianity, towards the close of Mahomet's life, and after his death, they were unwilling to pay the customary tribute which he exacted of his followers, and made attempts for throwing off the yoke which he had imposed upon them. Abu Becr's first attention was engaged in reducing these rebels, whom he defeated, and whose children he made slaves. This service was conducted by Khaled, or Caled, an excellent general; who afterwards by his conduct and bravery conquered Syria, and greatly contributed to the establishment of the Mahometan religion and policy. On the day, however, of the reduction of Damascus, Abu Becr died, in the 13th year of the Hegira, hav-

ing attained the age of 63, and reigned only two years and three months. A little time before he expired he made his will, and appointed Omar for his successor. He dictated it to his secretary in the following terms: "In the name of the most merciful God. This is the testament of Abdallah Ebn Abu Kohafa, when he was in the last hour of this world, and the first of the next; an hour in which the infidel shall believe, the wicked person be assured of the reality of those things that he denied, and the liar speak the truth. I appoint Omar Ebn Al Khattab my successor; therefore hearken to him and obey him. If he acts right he will answer the opinion I have always entertained of him; if otherwise, he must be accountable for his own conduct. My intention herein is good, but I cannot foresee future events. However, those who do ill shall hereafter be made fully sensible of the consequences of their behaviour. Fare ye well, and may ye always be attended by the divine mercy and benediction." Before he expired, he prayed God to bless the choice he had made; to inspire the Moslems with sentiments of concord and unanimity; to render their affairs prosperous and flourishing; and to enable them to propagate the doctrines of the Koran in the most effectual manner, as by the prophet Mahomet, in his last moments, they had been most strictly enjoined. Among other sayings of Abu Beer that are recorded, the following are worthy of notice: "Good actions are a guard against the blows of adversity;" and "Death is the easiest of all things after it, and the hardest of all things before it." Such was the liberality of his disposition, that on the Friday of each week, he distributed the residue of his own and the public money, after appropriating a very small sum to his own maintenance; first, to the most worthy, and then to the most indigent, of the Moslems. Gibbon's Hist. vol. ix. 358. 8vo.

ABUCARAS, *Theodore*, was bishop of Charra, or Haran in Mesopotamia, and lived in the eighth century. At first he adhered to the party of Photius, and in connection with Zachary, bishop of Chalcedon, undertook an embassy to the emperor Lewis II. for the purpose of presenting Photius's book against pope Nicholas, and inducing him to throw off the papal yoke. He afterwards abandoned the interest of Photius, and was restored, after humiliating submission, to his place in the council of Constantinople, from which he had been excluded. Several treatises bearing the name of Abucaras, written against Jews, Mahometans, and Heretics, have been collected by Gretzer, and published in 4to. at Ingolstadt, in 1606. Another treatise by Abucaras, intitled, *De Unione & Incarnatione*, was found by Mr. Arnold in the Bodleian library, and published at Paris in 1685, in 8vo. Some have doubted whether Abucaras, the friend of Photius, and the author of these treatises, be the same person. Bayle.

ABUCATUIA, in *Ithyology*, the name given by Marcgrave to the *ZEUS gallus* of Linnæus.

ABUCCO, *Abocco*, or *Abocchi*, a weight used in the kingdom of Pegu. One abucco is twelve teccalis and a half; two abuccos make an agira, which is also called giro; two giri make half a biza; and a biza weighs a hundred teccalis; that is, two pounds and five ounces the heavy weight, or three pounds nine ounces light weight of Venice.

ABUDHAHER, or *ABU THAHER*, succeeded his brother Abufaid, in the 311th year of the Hegira, at the age of eighteen, as chief of the sect of the KARMATHIANS; and proceeded with a large army to Bassora, which he took and pillaged. The next year he intercepted and plundered a caravan returning from Mecca to Bagdad; and having been

refused the sovereignty of Bassora, he pillaged Cufa in the following year, and put many of its inhabitants to the sword. He afterwards threatened Bagdad, but was obliged to retreat. However, in the 316th year of the Hegira, he seized the towns of Rahaba and Karkisia in Mesopotamia. In the 317th year, he laid waste Mecca, plundered the pilgrims and the inhabitants, killed 30,000, of whom 1700 were murdered within the walls of the Caaba; and having profaned this holy place, he carried off the black stone, which remained in the custody of the Karmathians for twenty-two years; but finding that the temple was still venerated and resorted to by pilgrims, they restored it. Abudhaber ridiculed the Mahometan religion, and insulted its votaries; reproaching them with the folly of calling the edifice at Mecca God's house, which he was allowed to profane, without being destroyed by the thunder of the Almighty. Six years after these outrages he made a treaty with the Caliph Al Radi, who granted him an annual tribute of 120,000 dinars, on condition of his permitting the pilgrims to pass to Mecca without molestation. This chief resided at Hajar in Yemama, where he built a palace, and lived till the year of Christ 953, in the peaceable possession of a large territory. Bayle-Mod. Un. Hist. vol. ii. p. 311, &c.

ABU JAAFAR AL TABARI, an Imam of great piety, as well as of very extensive reading and erudition, was born at Amu, or Amol, the capital of Tabrestan, whence his name, in the year of the Hegira 224; and though he was a strenuous defender of the koran, he was censured at Bagdad as a heretic or Shiite. His work, intitled, *Al Tarikh Al Tabari*, is held in high esteem, and considered as the basis of all the other histories of the Moslems. What we now have is only an abridgment of a much larger work. It began with the creation of the world, and continued, according to Abulfeda, to the year of the Hegira 302; or, as others say, to the time of the author's death, in the year 310. The Tarikh was translated into Persian and Turkish, and continued by different writers to the year of the Hegira 521. Mr. Ockley says, that an imperfect MS. copy of it, in Arabic, is preserved in the Bodleian library at Oxford. Mod. Un. Hist. vol. ii. p. 309.

ABUKESB. See *ASLANI*.

ABULFARAGIUS, or *ABUL FARAI*, or *ABULPHARAGIUS*, *Gregory*, in *Biography*, son to Aaron, a christian physician, was born in 1226, in the city of Malatia, near the source of the Euphrates, in Armenia. He practised physic with success, but was more distinguished by his study of the Greek, Syriac, and Arabic languages, as well as philosophy and divinity. The commendations of his contemporaries are dictated in the style of the highest panegyric; and he is intitled, the king of the learned, the most excellent of those who excel, the example of his times, the phoenix of his age, the glory of the wife, and the crown of the virtuous. He wrote a history in Arabic, divided into ten dynasties, which is an epitome of universal history, from the creation of the world to his own time, and which does honour to his memory. The parts relating to the Saracens, Tartar Moguls, and the conquests of Jenghis Khan, are the most valuable. It was published with a Latin translation, in two small quartos, at Oxford, in 1663, by Dr. Pococke, who annexed to it a brief continuation relating to the history of the eastern princes. He had, in 1650, published an extract from this work, intitled, "Specimen Hist. Arabum," &c. Abulfaragius was ordained bishop of Guba at twenty years of age, by Ignatius, the patriarch of the Jacobites; and, about the year 1266, he was elected their primate in the east; which dignity he possessed till his death, in 1286, which happened at the time when he is said to have predicted,

predicted, and expected it. Considering the age in which he lived, it is not wonderful that miracles were ascribed to him; but it is needless to record them in this place. Abulfaragius wrote about 30 tracts, besides the history above mentioned, which are recited by Asemunus. The learned Pocock: vindicates him from the charge of having renounced christianity. There was another Abulfaragius, surnamed Abdalla Ebu Attiba, who died A. D. 1043. He was a Nestorian monk, a learned man, and a philosopher. He wrote a commentary on the Old and New Testament, in Arabic; he also explained the works of Aristotle, and reproved the Nestorian patriarchs for their neglect of ecclesiastical learning.

ABULFAZL, *i. e.* the *fat'er* of excellence, the title which was given to the secretary and vizier of the Mogul emperor Akbar. He was deemed the most learned and best writer in the East. He was murdered by order of Sultan Selim, on suspicion of his having occasioned a misunderstanding between him and the emperor his father. His death was much lamented by Akbar, and many others, who had any regard for literature. He wrote a history of the Mogul emperors, which he continued to the 38th year of Akbar's reign, A. D. 1594. His official correspondence formed three volumes, and was much esteemed. Frazer's Kuli Khan, p. 11.

ABULFEDA, *Ismael*, prince of Hamah, a city of Syria, was born in the year of the Hegira 672, A. D. 1273, and was the sixth in lineal descent from Ayub or Job, the father of the famous Saladine. He was a lover of study, and particularly of geography, which may be inferred from a work, intitled, *Chorasmiæ & Mawarahnahræ, h. e. Regionum extra fluvium Oxum desertio, ex tabulis Abulfedæ Imaelis, Principis Hamah.* It was printed in London in 1650, by our learned countryman John Greuvius, who has added to the Arabic original a Latin translation, with a preface, informing us that he consulted five MSS. At the conclusion of this work it is said to have been finished in the 721st year of the Hegira, or A. D. 1321. The tables are given in the order of the climates, with the degrees of longitude and latitude. Abulfeda is said to have discovered the true longitude of the Caspian sea, concerning which Ptolemy was mistaken. A new edition of this work was published at Oxford in 1712, by M. Gagnier, in the third volume of Hudson's *Geographia veteris Scriptores Græci minores*: and another at London, in 1732, fol. Abulfeda wrote other works, which manifested his general literature; for he is said to have been acquainted with jurisprudence, physic, philosophy, astrology, history, and poetry, as well as geography. His "General History," from the beginning of the world to his own time, was continued to the year 730, or A. D. 1329. He also wrote "A short system of the Mohammedan civil law;" "A Treatise of Physic;" and some poems. He is also supposed to be the author of the "Astronomical Tables," of which there is a copy in the Bodleian library. His "Life of Mahomet," was published in Arabic and Latin, at Oxford in 1723; and his treatise of the "Life and Actions of Saladine," was printed, with a Latin translation, at Leyden, in 1732, fol.

Abulfeda was no less a military man, than a student. He served under his father in several expeditions, and he was present at the storming of Tripoli, A. D. 1289; and at the capture of Acca or Ptolemais, A. D. 1291, as well as on other occasions, when he distinguished himself, by his skill and valor. He died about the 730th year of the Hegira, A. D. 1322. We are cautioned by the editors of the General Dictionary from confounding Abulfeda with Ismael, surnamed Shakhisshah, the compiler also of a General History, which

is mostly transcribed verbatim from the work of that prince. Gen. Dict.

ABULGHAZI, *Bayatur*, khan of the Tartars, was born in the city of Urgens, capital of the country of Karazm, in the year of the Hegira 1014, A. D. 1605. He was descended both by his father's and mother's side, in a direct line from Zingis Khan, or Jenghizkan. After experiencing many misfortunes in early life, he became sovereign of Karazm, in the year of the Hegira 1054, and having reigned twenty years, and by his courage and conduct rendered himself formidable to his neighbours, he resigned the throne to his son some time before his death, in order to devote the remainder of his life to the service of God. In his retreat he wrote the famous genealogical history of the Turks, but being prevented by his death, in the year 1074 of the Hegira, from finishing it, he left it in charge with his son and successor to complete it, which was done in two years afterwards. It is written in the Mogul, or Turkish language, and divided into nine parts: the two first treat of the khans and tribes descended from Turk, the son of Japhet, to the time of Jenghizkan; the third relates the life and actions of that conqueror; the five next those of his sons and successors in the several parts of Tartary; and the ninth treats of the khans of Karazm to the death of the author. This history was procured by Strahlenberg, while prisoner in Siberia, and has been translated into Russian, German, French, and English. As this book is one of the chief funds which afford materials for the history of the Turks and Tartars, it will not be improper to mention the authority on which it is founded. The grandson of Jenghizkan, being desirous of preserving the memory of the Mogul tribes, and the signal exploits of his ancestors, sent a nobleman, skilled in the Mogul language, into Tartary, in order to collect materials for this purpose. At his return his memoirs were digested, under his own inspection and assistance, into a work, which consisted of three folio volumes, and was finished in the year of the Hegira 702. The first volume is in the Library at Paris, and was translated by De la Croix, the son, but not published. It was chiefly from this history that Abulghazi extracted his work, excepting that part which relates to the Ufbeks of Great Bukharia and Karazm. A French translation appeared at Leyden in 1726, 12mo. Mod. Un. Hist. v. iii. p. 334.

ABUL OLA AHMED, one of the most celebrated of all the Arabian poets, was born at Maara, a town of Syria, A. D. 973. He lost his sight by the small-pox, at three years of age; at forty-five he left off the use of animal food, in conformity to the tenets of the Bramins, and also that of eggs and milk, and lived only on vegetables. He died in 1057. He was not esteemed by the orthodox, as a sound Mussulman, for one of his sayings was, "The christians wander here and there in their paths, and the mahometans are entirely out of the way." Another of his apothegms is, "The world is divided between two sorts of pertons, of whom some have sense without religion, others religion without sense." The inscription which he ordered for his tomb confirmed the suspicions of his orthodoxy: "This crime did my father commit against me, but I have not committed the same against any." Gen. Dict.

ABU MOSLEM, a governor of Khorasan in the second century of the Hegira, who, A. D. 747, caused the dignity of caliph to pass from the race of the Omniades to the family of Abbas; and who, in accomplishing and maintaining this revolution, is said to have killed 600,000 persons. Notwithstanding the services which he had rendered to Aimanfor, this caliph, A. D. 759, ordered him to be private-ly

ly assassinated, &c. some say; or, as others report, to be thrown into the Tigris. His character has been variously represented by different writers. Some say, that he was a fierce brutal foldier; and by others, he is described as discreet and merciful. Some extol his acquaintance with the poets of the country, and with the moral precepts of his religion; and others degrade his character as a glutton and sensualist. Bayle says, that he was addicted to magic, and of a sect similar to that of Spinoza. Of his wives he was so jealous, that he confined them in a castle, to which none besides himself had access, and where they were supplied with provisions through the windows. Bayle. Mod. Un. Hist. vol. ii. p. 104, &c.

ABUNA, among the *Christian Arabs*, is the title or appellation of a religious character.

The word, which is Arabic, is sometimes also written *abouna*, sometimes *abanna*, and by some *abuna*, or *abunna*; it literally denotes—our *father*, and is more particularly used for the archbishop or metropolitan of the Abyssinian church. Fabr. Lux Evang. c. 45. Ludolf. Hist. Æthiop. lib. iii. c. 7.

ABUNDANCE. See ABUNDANTIA.

ABUNDANT Numbers, are those whose aliquot parts added together, exceed the NUMBER itself whereof they are parts.

Thus the number 12 is *abundant*, its aliquot parts, 1, 2, 3, 4, and 6, amounting to 16—In opposition to *abundant* numbers stand DEFICIENT ones.

ABUNDANT Notion, in *Logic*, is that which includes more marks and characteristics than are necessary to distinguish it from others.

Thus, we may be said to give an abundant notion of a rectilinear triangle, when we describe it as a space terminated by three right lines, and containing three angles. Inasmuch as the number of its angles is determined by that of its sides; so that the bare mention of its three sides was sufficient to have defined it.

ABUNDANTIA, in *Mythology*, a heathen divinity, represented on ancient monuments under the figure of a woman with a pleasing aspect, crowned with garlands of flowers, pouring all sorts of fruit out of a horn which she holds in her right hand, and scattering grain with her left, taken promiscuously from a sheaf of corn. On a medal of Trajan, she is represented with two cornucopiz.

ABUNOWAS, in *Biography*, a celebrated Arabian poet, who was born in the city of Basra, in 762, left several works collected by different persons, and died A. D. 810.

ABU OBEIDAH, one of the companions of Mahomet, who was appointed by Abubeker to the supreme command in Syria, and afterwards superseded by Caled, under whom he served at the famous siege of Damascus. He restrained the violence of Caled on this occasion, and obtained leave for the citizens to capitulate, and for the christians to depart with their effects. Omar, on his accession, restored Abu Obeidah to the chief command, and Caled submitted to serve under him. He took Baalbec, Emessa, and Jerusalem: and assuming the government of northern Syria, he took Aleppo and Antioch. Whilst he was pursuing his conquests in Palestine, a grievous pestilence proved fatal to many of the Mahometan officers, and also to Abu Obeidah, who died A. D. 639, Hegira 18; which year was called the *year of destruction*. The civil and moral virtues of this commander are more distinguished than his military talents; but he succeeded in consequence of the impression made upon the minds of his enemies by his clemency and good faith. Mod. Un. Hist. vol. i. p. 215, &c.

ABUS, in *Ancient Geography*, a river of Britain, formed

by the confluence of the Ure, the Derwent, Trent, &c. falling into the German sea between Yorkshire and Lincolnshire, and forming the mouth of the Humber. See also AUSA.

ABU SAID, in *History*, sultan of the Moguls, succeeded his father Aljatu, at the age of twelve, A. D. 1317. He died in 1336, at Sultania, where he was crowned, and which was the place of his usual residence. His valour was so distinguished, that he was called *Bahadur*, or *brave*. Having fallen in love with the daughter of Emir Juban, who was married to the Emir Hassan, and who was deemed the greatest beauty in Asia; and the father refusing to consent to her divorce from her husband, Abu Said conceived a prejudice against him, which terminated in his death. Hassan, however, acquiesced in a divorce, and sent her to the sultan, over whom she obtained a great ascendancy. Abu Said was the last monarch of the race of Jenghizkhan; and after his death, that happened in the year in which Tamerlane was born, the empire was dismembered, and became a scene of blood and desolation. Gen. Dict.

ABUSE, compounded of *ab*, *from*, and *usus*, *use*, an irregular use of a thing, or the introducing of something contrary to the true intention thereof.

In *Grammar*, to apply a word *abusively*, or in an *abusive* sense, is to misapply, or pervert its meaning.

A permutation of benefices, without the consent of the bishop, is deemed abusive, and consequently null.

ABUSINA. See ABERSPERG.

ABU TEMAM, in *Biography*, sprung from an Arabian tribe, surnamed Tay, and considered as the prince of the Arabian poets, was born in the 190th year of the Hegira, A. D. 805, or as others say, in 188, or 192 Heg. i. e. A. D. 803, or 807; or in 172 Heg. i. e. A. D. 788, at Jafem, a little town situated between Damascus and Tiberias. He was educated in Egypt, and died at Mawfel, near the spot where ancient Niniveh stood, in the 231st year of the Hegira, A. D. 845, or in 228 or 232 Heg. i. e. A. D. 842, or 846. His poetical compositions were collected with those of others, into a volume, and intitled *All Hamafab*. Having written an elegy on the death of another, the following eulogium was given Abu Temam:

The man whose virtues thus ascend the sky,
Prais'd (mighty Bard) by thee, can never die. Gen. Dict.

ABUTILON, in *Botany*, the trivial name of several species of the SIDA. See also HIBISCUS, MELOCHIA, MALVA and NAPÆA.

ABUTTALS, among *Law-writers*, denote the buttings or boundings of a piece of land; expressing on what other lands, highways, or the like, the several extremes thereof do abut, or terminate. In this sense the word is sometimes also written corruptly *abbuttals* or *abutals*.—In o'd surveys, we often find them called *headlands*. Abuttals amount to the same with what Latin writers call *capita*; Marcellus, *frontes*; the French, *boutes*. In Coke, the plaintiff is said to fail in his abuttals, that is, in setting forth how the land is bounded.

ABUTUA, in *Geography*, a kingdom in the south of Africa, to the north of the country of the Hottentots, and adjoining to the province of Ohila, which is said to be rich in gold mines.

ABYDENUS, in *Biography*, a celebrated historian, author of the history of the Chaldeans and Assyrians, of which only some fragments have been transmitted to us by Eusebius in his *Præparatio Evangelica*, Cyrillus, and Syncellus; which have been illustrated with several notes by Scaliger in his book *De Emendatione Temporum*.

ABYDON. See **AMYDON.**

ABYDOS, in *Ancient Geography*, a town built by the Milesians, in Asia, on the **HELLESPOINT**, where, according to Le Brun, (*Voyage au Levant*.) the strait is only half a mile, others say two miles wide, opposite to Sestos, on the European side; both of which, according to some geographers, are now called the **DARDANELLES**; but others say, that Sestos was much nearer the Propontis than Abydos; and Strabo, (l. xiii. p. 460.) reckons 3750 paces from the port of Abydos to that of Sestos. Abydos was situated midway between Lampacus and Niun, and was famous for Xerxes's bridge, mentioned by Herodotus, l. vii. c. 34.; and by Lucan, *Phars. lib. ii. v. 672.*; also for the loves of Leander and Hero, recorded by Musæus and others, and celebrated for its oysters by Virgil and Ennius. The inhabitants were effeminate, and also addicted, according to Stephanus, (*de Urbibus*, vol. i. p. 9.) to calumny; whence the proverb, *Ne tenere Abydon calcare*, when we would caution against danger. This city was formerly very important, as it commanded the straits, and made those who were possessed of it masters of the communication between the Euxine sea and the Archipelago. It was defended by its inhabitants with great courage and obstinacy against the attack of Philip of Macedon, but at length surrendered amidst the horrors of almost universal slaughter, A. M. 3803. Ant. J. C. 201. Fifty of the citizens were compelled to take an oath, in the presence of all the inhabitants, that when they saw the enemy master of the inward wall, they would kill the women and children, set fire to the galleys laden with their effects, and throw into the sea all their gold and silver; and then, in the presence of the priests, they took another oath, either to conquer or die sword in hand. After the surrender of the city, this dreadful resolution was executed to such an extent, that the individuals of every family killed one another, and none escaped but those who by violent restraint were prevented from destroying themselves. Abydos was taken by the Turks, through the treachery of the governor's daughter, in the year 1330.

ABYDUS, an inland town of Thebais in Upper Egypt, between Ptolemais and Diospolis Parva, towards Syene, famous for the palace of Memnon and the magnificent temple of Osiris built by Ismandes, into which no singers or dancers were allowed to enter. Here the Egyptians revered the oracle of the God Besa, which was one of the most ancient oracles of Egypt, and famous even in the time of the emperor Constantius. Strabo, vol. ii. p. 1167—1169. Pliny, l. v. c. 9. Stephanus (*Urb.* vol. i. p. 9.) say, that it was a colony of Milesians. The city, reduced to a village, under the empire of Augustus, presents in our time nothing but a heap of ruins without inhabitants. About three miles west of the Nile, in the place, as Poccoke (*Descript. East.* p. 83.) conjectures, where the present village El-Berbi is situated, but to the west of these ruins is still found the celebrated monument of Ismandes. The entrance is under a portico, 60 feet high, and supported by two rows of massy columns. This leads into a temple 300 feet long, and 145 wide. There are several other spacious apartments, which communicate with one another, both by passages and stair-cases. The solidity of the edifice, the huge masses of marble which compose it, and the hieroglyphics that cover the walls, evidently testify that it is a work of the ancient Egyptians. In the multitude of human figures, which are intermixed with those of other animals, there may be discovered women suckling their children, and men presenting offerings to Venus. Here are also the divinities of India, such as they are represented in the temples of Indostan. Six lions' heads, placed on the two sides of the

temple, serve as spouts to carry off the water. The stair-case is formed of stones incrusting in the wall, and projecting six feet from it, so that being supported only at one end, they appear to be suspended in the air. The walls, roof, and columns of this stupendous edifice, have suffered nothing from the injuries of time; and its solidity will resist the natural decay of many ages. Except the colossal figures, whose heads serve as an ornament to the capitals of the columns, and which are sculptured *in relief*, the other hieroglyphics, which cover the inside, are carved in stone. To the left of the great building, there is another much smaller, with an altar at the bottom of it, which was probably the sanctuary of the temple of Osiris. Savary has minutely described this structure in his *Letters on Egypt*, vol. ii. p. 5, &c.

ABYLA, one of Hercules's pillars, on the African side, called by the Spaniards *Sierra de las Monas*, over against Calpe, in Spain, the other pillar. These were supposed to have been formerly joined, but separated by Hercules, in order to make an entrance into the sea, now called the Mediterranean. This, according to Pliny, (*Procem. l. 3.*) was the limit of the labours of Hercules. The Hebrew עַב *ab*, denotes a thick cloud, and also a column, and might therefore be applied to a high mountain, or to the pillar of Hercules. See Bochart. *Oper. tom. i. p. 731—733.* Edit. Villem. See the other authors Strabo, Mela, and Ptolemy, cited by Cellarius, tom. ii. p. 136.

ABYLA. See **ABILA.**

ABYO, or **ABUYO**, in *Geography*, one of the **PHILIPPINE** islands, in the East Indies, between Mindanao and Luzon, where the Spaniards have a fort. E. long. $122^{\circ} 15'$. N. lat. $10^{\circ} 0'$.

ABYSS, in a general sense, denotes something profound, and, as it were, bottomless.

The word is originally Greek, $\alpha\beta\upsilon\sigma\sigma\omicron\varsigma$; compounded of the privative α , and $\beta\upsilon\sigma\sigma\omicron\varsigma$, *bottom*; q. d. *without a bottom*.

ABYSS, in a more particular sense, denotes a deep mass, or fund of waters.

In this sense the word is particularly used, in the Septuagint, for the water which God created at the beginning with the earth, which encompassed it round, and which our translators render by the *deep*. Thus it is that darkness is said to have been on the face of the abyss.

ABYSS is also used for an immense cavern in the earth, where God collected all those waters on the third day; which, in our version is rendered the *deep*, and elsewhere, the *great deep*.

Dr. Woodward has made several observations and conjectures with reference to this great abyss, in his *Natural History of the Earth*. He asserts, that there is a vast collection of waters enclosed in the bowels of the earth; constituting a huge orb in the interior or central parts of it; and over the surface of this water he supposes the terrestrial strata to be expanded. This, according to him, is what Moses calls the *great deep*, and what most authors render the *great abyss*.

The water of this vast abyss, he alleges, communicates with that of the ocean, by means of certain hiatuses, or chasms passing betwixt it and the bottom of the ocean: and this and the abyss he supposes to have one common centre, around which the water of both is placed; but so that the ordinary surface of the abyss is not level with that of the ocean, nor at so great a distance from the centre, as the other, it being, for the most part, restrained and depressed by the strata of earth lying upon it; but wherever those strata are broken, or are so lax and porous, that water can

can pervade them, there the water of the abyfs ascends, fills up all the clefts and fissures into which it can get admittance; and saturates all the interstices and pores of the earth, stone, or other matter, all round the globe, quite up to the level of the ocean.

The existence of an abyfs, or receptacle of subterraneous waters, is controverted by Camerarius, (Diff. Taur. Act. Erud. Sup. tom. vi. p. 24.) and defended by Dr. Woodward, chiefly by two arguments; the first, drawn from the vast quantity of water, which covered the earth in the time of the deluge; the second, from the consideration of earthquakes, which he endeavours to shew are occasioned by the violence of the waters in this abyfs. A great part of the terrestrial globe has been frequently shaken at the same moment; which argues, that the waters, which were the occasion thereof, were co-extended with that part of the globe. There are even instances of universal earthquakes; which shew that the whole abyfs must have been agitated: for so general an effect must have been produced by as general a cause; and that cause can be nothing but the subterraneous abyfs.

This abyfs is no useless thing; when once established, it serves to solve several difficult phenomena; as the origin of springs and rivers; the level maintained in the surface of different seas, and their not overflowing their banks. To the effluvia emitted from this abyfs some even attribute all the diversities of weather, and changes in our atmosphere; and, what is more, the origin of every thing in the earth, or in its surface. Dr. Woodward has an epistle on the œconomy of the great abyfs hid in the bowels of the earth, and the perpetual communication between it and the atmosphere. Ray, (Physico-Theological Discourses, p. 76. ed. 4.) and other authors, ancient as well as modern, suppose a communication between the Caspian sea and the ocean, by means of a subterranean abyfs: and to this they attribute it, that the Caspian does not overflow, notwithstanding the great number of large rivers it receives; of which Kempfer reckons above fifty, in the compass of sixty miles. But the daily evaporation may be sufficient for this purpose. See EVAPORATION, SEA, and SPRING.—The different arguments concerning this subject, are collected by Cockburn in his Inquiry into the truth and certainty of the Mosaic deluge, p. 271. See DELUGE, EARTH, and VOLCANO.

ABYSS is also used to denote the cavernous belly of a hollow MOUNTAIN.

In which sense Mr. Tournefort describes the abyfs of mount Ararat. This, and similar gulphs, or precipices in mountains, M. Buffon, and others, suppose to be the craters of extinguished volcanoes.

ABYSS is also used to denote HELL. In which sense the word is synonymous with what is otherwise called Barathrum, Erebus, and Tartarus: in the English Bible, the *bottomless pit*.

ABYSS is more particularly used, in *Antiquity*, to denote the temple of Proserpine.

It was thus called, on account of the immense fund of gold and riches deposited there; some say hid under ground.

ABYSS is also used in *Heraldry*, to denote the centre of an *Escutcheon*.

In which sense, a thing is said to be borne in *abyfs*, or *abyssine*, when placed in the middle of the shield, clear from any other bearing: he bears azure, fleur de lys, in abyfs. Colombiere.

ABYSS is also used *metaphorically*, for a thing not to be

known or comprehended, on account of its immense extent, or profundity.

In which sense it coincides with secret, inscrutable, incomprehensible, &c.—The judgments of God are called a great abyfs.

ABYSS, in *Hydrography*, is synonymous with GULPH.

ABYSSINIA, or, as it is sometimes called ABASSIA, HABESSINIA, and UPPER ÆTHIOPIA, in *Geography* and *History*, an empire of Africa, situated in the Torrid Zone, and mostly comprehended between 8° and 16' N. lat. and 34° and 40° E. long. As to the etymology of this name, some have sought for it in the fruitful spots amongst rugged deserts with which the country abounds, and which the Egyptians call *abysses*; and others have traced it to *Abaxa*, the capital of the kingdom of Adel, whose monarchs were once masters of Abyssinia; but Ludolfus, and many who have adopted his opinion, ascribe the origin of the appellation to the Arabic *Habish*, which has the same meaning with the Latin *Convener*, and signifies a number of distinct people meeting together accidentally in one place. This etymology, it is alleged, corresponds to the manner in which this country was originally inhabited. For the appellation of Prester or Prebyter John's empire, which the Portuguese gave to this country, there is no sufficient foundation, as there was no person of this denomination that was ever known in Abyssinia. See PRESTER JOHN.—The imaginary limits of this country have been erroneously extended by ancient geographers far beyond the equinoctial line, and its real boundaries have been in later times very much reduced by the invasion of a barbarous people, denominated GALLAS, of whom we shall give an account under that article. It is at present bounded on the N. by the kingdom of Sennaar, on the E. and N. E. by the Red Sea, on the S. by the Gallas, and a vast chain of mountains extending with little interruption from 34° to 44° E. long. and between 8° and 9° N. lat.; and on the S. E. by the kingdom of Adel, and on the W. by the Nile, and some adjacent provinces. But its boundaries have suffered so many irruptions and encroachments, that they are not easily ascertained. At the time of Lobo's mission, in 1624, it extended from the Red Sea to the kingdom of Congo, and from Egypt to the Indian Sea, containing forty provinces. At Masuah, i. e. on the coast of the Red Sea, says Mr. Bruce, begins an imaginary division of Abyssinia, into two parts; the first is called Tigré, between the Red Sea and the river Tacazzé; the second is Amhara, between that river and the Nile, westward, where it bounds the Galla. But this division respects language, rather than territory; and it is, in neither view of it, sufficiently precise and determinate. The provinces now comprehended under the empire of Abyssinia are the following; viz. MASUAH; TIGRE; SIRE; SAMEN; WALDUBBA; BEGEMDER, bordering upon Angot, which is almost wholly conquered by the Gallas; AMHARA; and between the rivers Gessen and Samba, a low, unhealthy, but fertile province, called Walaka; and to the S. of this the *Upper SHOA*; GOJAM; DAMOT; MAITSHA; the province of the AGOWS; DEMBEA on the south of Gondar, and Woggora a small province on the east, which are altogether sown with wheat, and are the granaries of Abyssinia; and to the south of Dembea, KUARA. There are many other small provinces which are occasionally annexed, and sometimes separated, such as Guesgué to the east of Kuara; Waldubba, between the rivers Guangue and Angrab; Tzegadé and Walkayt on the west of Waldubba; Abergalé and Selawa, near Begemder; Temben, Dobas, Giannamora, Bur, and Engana, in the neighbourhood of Tigré, &c. Such was the state of the country at the time when Mr. Bruce visited it. These

provinces form one empire, subject to a monarchy, hereditary in one family, but elective in that line, and despotic; of which the capital was formerly *AXUM*, but is now *GONDAR*.

The surface of this country is generally rugged and mountainous; it abounds with forests and morasses; and it is also interspersed with many fertile valleys and plains, that are adapted both to pasture and to tillage. The rivers of Abyssinia, which are numerous and large, contribute very much to its fertility. Besides the *NILE*, which has its source in Geesh, an elevated district of this country, there are also the *TACAZZÉ*, the *KIBBEE*, or as the Portuguese call it, *ZENNÉ*, which lies indeed beyond the extent of Abyssinia, as it has been above assigned, the *MAREB*, the *HIOAX* or *HAWASH*, the *COROR*, which rises in Angot, and empties itself into the *Tacazzé*, the *Angueah* and *Lidda*, which form branches of the *Mareb*, the *Andona*, which rises near the source of the *Tacazzé*, is continued under the name of the *Hanazo*, through the kingdom of *Dawaro*, and discharges itself near the bay of *Zeyla*, the *Bashilo*, *Loha*, *Geihen*, *Samba*, *Jema*, *Roma*, *Belo*, *Rahad*, and *Dender*, which rising in provinces bordering on the Nile, empty themselves into that river; the *Angrab*, *Tukoor*, and *Guangue*, which flow into the *Tacazzé*, &c. The principal collection of water in this country, is the lake of *TZANA*, or, as it is generally called, the lake or sea of *Demba*. The climate of Abyssinia, though, like other parts of the torrid zone, it was formerly thought to be uninhabitable, is not only tolerable, but in general temperate and healthy. In this respect, however, the uneven surface of the country exposes different situations to the effects of heat and cold, of dryness and moisture, and of a free circulation or a stagnation of the atmosphere in very various degrees. On the mountains, and in the higher parts of the country, the sky is clear and serene, the air is cool and refreshing, and the people are healthy and sprightly; whilst those who live in some of the vallies, in the vicinity of marshes, and in sandy deserts, cannot but experience the pernicious influence of excessive heat, and of a moist, stagnant, and suffocating air: so that the climate depends upon soil and situation as much almost as upon the latitude; and therefore no description of it will equally suit the several provinces. Mr. Bruce (*Travels*, vol. iii. p. 662.) observes, that on the highest mountain of the ridge called *Lamalmon*, the thermometer stood at 32° in the depth of winter, the wind being N. W. clear and cold, but attended only with hoar frost. This, he adds, vanished into dew after a quarter of an hour's sun; nor did he ever see any sign of congelation upon the water upon the top of that, or any other hill. The barometer stood at 29° 9' at noon of the same day, and the therm. was at 78°. He observed had to lie for three hours in the forenoon on the mountains of *Amid Amid*. From an examination of Mr. Bruce's register of the barometer and thermometer, &c. kept at *Gondar*, from February 19, 1770, to May 31, 1771, it appears, that the greatest height of the barometer was 22° 11' 9", on April 29, at 6½ N. the therm. being 69°, and wind S. The least height was 20° 11' 5", March 29, at 2¼ N. therm. 75°, wind E. The greatest height of the thermometer was 91°, April 19, at 12 N.—Wind W. N. W. The least height was 54½°, July 7, at 12 N. barom. 21° 6' 7", wind W. The rainy season commences in April or the beginning of May, when the sun becomes vertical, and ends in September. The rains generally cease about the 8th of September; a sickly season follows till they begin again, about the 20th of October; they then continue constant, but moderate, till the 8th of November. All epidemic diseases cease with the end

of these rains. In order to avoid the inconveniences that attend the overflowing of their rivers during this season, as well as on account of the greater salubrity of elevated situations, the Abyssinians have built many of their towns and villages on the mountains. Their houses are generally very mean, consisting only of one story, and constructed with straw and laths, earth and lime, though there are some of stone, and better materials. It is a mistaken notion, however, that they live in tents, and not in houses. In a climate like that of Abyssinia, subject to scorching weather for six months, and to deluges of rain, storms of wind, thunder and lightning, and hurricanes, such as are unknown in Europe, for the other six, it is not probable that they should chuse to live in tents, after having known how to build such cities as *Axum*. In many of the towns and villages, the houses are separated by hedges, which being always green and intermixed with flowers and fruit-trees, at certain distances, afford an agreeable prospect, and contribute also to their salubrity. Notwithstanding every caution, the Abyssinian climate, more especially in particular situations, exposes the inhabitants to a variety of diseases. They are subject to violent fevers, which commonly prove fatal on the third day. Those who survive to the fifth day often recover, merely by drinking cold water, and by repeatedly throwing cold water upon them in their beds. The bark is the most effectual remedy; which in critical cases, (says Mr. Bruce, vol. iii. p. 34.) should be frequently repeated in small doses, and perfect abstinence observed, unless from copious draughts of cold water. Another common disease in Abyssinia, is the tertian fever, which is in no respect different from our tertian, and is successfully treated in the same manner. All fevers terminate in intermittents, and if they continue long, in dysenteries, which are always tedious, and very frequently mortal. Bark and ipecacuanha, in small quantities, water, and fruit not over-ripe, have been found the most effectual remedies. The dysentery, commencing with a constant diarrhoea, is seldom cured, if it begins with the rainy season; otherwise small doses of ipecacuanha either remove it, or change it into an intermittent fever, which yields to the bark. Another endemic disease is called *hanzeer*, the hogs or the swine, and is a swelling of the glands of the throat, and under the arms, which by ineffectual attempts for producing suppuration, and opening the tumors, becomes a running sore, and resembles the evil. In connection with this disorder, we may mention those swellings, to which the whole body is subject, and particularly incident to the arms, thighs, and legs, sometimes accompanied with ulcers in the nose and mouth, which deface the smoothness of the skin, and which on this account are much dreaded by the Abyssinians. The two last diseases sometimes yielded to mercurials; but the last is speedily and completely cured by antimonials. Another complaint afflicts those who are in the habit of drinking stagnant water. It is called *Parentit*, or the worm of Pharaoh, and appears in all parts of the body, but most frequently in the legs and arms. It is a worm with a small black head and a hooked beak, of a whitish colour, and a white body of a silky texture, resembling a small tendon. The natives seize it by the head and wind it gently round a piece of silk, or a bird's feather, and thus by degrees they extract it without any inconvenience or permanent scar. Mr. Bruce suffered much from this complaint, and the breaking of the worm in the operation of extracting it. The most terrible of all the diseases of this climate is the *ELEPHANTIASIS*. The cicuta, mercury, and tar-water, were unsuccessfully tried in this complaint: the greatest benefit was derived from whey made

made of cow's milk. To the alternation of scorching heat and chilling cold, thin cloathing, the use of stagnant putrid water for four months, and other such causes, these diseases may be partly, if not wholly, ascribed. The small-pox was introduced into Abyssinia at the time of the siege of Mecca, about the year 356, and the Abyssinian army was the first victim to it. The diseases and other inconveniences to which the Abyssinians are subject from the nature of their climate, are in some degree counterbalanced by substantial advantages, if they would avail themselves of them by their industry and activity. Their soil, though in many places thinly spread, is rendered fertile and productive by their rains and rivers. Wherever it can be tilled and well watered, it yields very large crops of wheat, barley, millet, and other grain. The inhabitants have two and often three harvests in the year; and where they have a supply of water, they may sow in all seasons; many of their trees and plants retain their verdure, and yield fruit or flowers throughout the year; the west side of a tree blossoms first, and bears fruit, then the south side, next the north side, and last of all the east side goes through the same process towards the beginning of the rainy season. Their rivers abound with various kinds of fish; and their pastures are covered with flocks and herds; and yet for want of application and exertion, notwithstanding the almost spontaneous productions of nature which their country affords them, they are in general poor and wretched. Though they have plenty of wheat, and some of excellent quality, the chief grain they use is that called *TEFF*. They have grafs in abundance, but they neglect to make hay of it; and therefore they are obliged to supply this defect by feeding their cattle with barley, or some other grain. Notwithstanding the plenty, and frequent return of their crops, they are sometimes reduced almost to famine, either by the devastations of the locusts or grasshoppers, which infest the country, or by the more destructive ravages of their own armies, and those of their enemies. They cultivate the vine, peach, pomegranate, sugar-cane, almonds, citrons, and oranges; and they have many roots and herbs, which grow spontaneously; and their soil, if properly managed, would produce many more. However, they make little wine; but content themselves with the liquor which they draw from the sugar-cane, and their honey, which is excellent and abundant. They have also the coffee-tree, and a plant called *ENSETE*, which produces an eatable nourishing fruit. The country also produces many other plants and fruits, that are adapted both for domestic and medicinal uses: such as the *KOLQUALL*, *PAPYRUS*, *WANZEY*, *BALFSSAN*, *WOOCINOOS*, *CUSSO*, *SUESA*, *ERGETT*, *SENA*, *CARDAMOM*, and *GINGER*. Here is also plenty of cotton, which grows on shrubs, like the Indian. Flowers in a rich variety adorn the banks of their rivers, and encircle their houses; some of which are common with us, and others unknown in Europe. Their forests likewise abound with trees of various descriptions, particularly the *RACK*, *BAOBAB*, *CEDAR*, *SYCAMORE*, &c. This country produces a great number of animals, both domestic and wild. Amongst the former we may enumerate horses, some of which are of a very fine breed, mules, asses, camels, dromedaries, oxen, cows, sheep, and goats; and these constitute the principal wealth of the inhabitants. Amongst the wild animals we may reckon the antelope, the buffalo, the wild boar, the jackall, the elephant, the rhinoceros, the lion, the leopard, the hyæna, the lynx, apes and baboons, which are very destructive to the fields of millet, as well as the common rats; the zecora or wild mule, and the wild ass; the jerboa, the fennec, ashkoko, hare, &c. The hare, as

well as the wild boar, is deemed unclean, and not used as food. To the amphibious kind we may refer the crocodile and hippopotamus, and the water-lizard, called *ANGOLE* by the natives, and by the Italians *caudiverbera*. Of the vast variety of fish with which their lakes and rivers teem, we shall only mention the *TORPIDO* and the *BISNY*. Amongst the birds, we might enumerate the eagle, hawk, and many of the vulture kind; the ostrich, the stork, the *WAALLA*, and many other species of pigeons which are birds of passage, the *ERKOOM*, the *ABOU-HANNES*, the *MOROC*, or honey bird, &c. The swallows that are known in Europe, appear in passage there when they take their flight from hence. In the island of Masuah, they lighted, and tarried two days, and then proceeded with moon-light nights to the south-west. Mr. Bruce saw no sparrows, magpies, nor bats; nor many water-fowl, nor any geese, except the golden goose or goose of the Nile, which is common in every part of Africa; but there are snipes in the marshes. The *LOCUSTS* of this country are very destructive; they have also a species of *ANTS*, that are injurious: but from their *BEES* they derive a rich supply. Of their vipers and serpents we shall take notice under the articles *CERASTES* and *BOA*. For a peculiar fly, see *TSALTSALYA*.

The inhabitants of Abyssinia are Christians, Jews, Mahometans, and Pagans. The Christians are those of the Abyssinian church, of whom we shall give some account in the next article.—The Jews have been settled in this country from time immemorial. Of these some have been voluntary profelytes to christianity; others have been compelled to embrace the profession of it, in order to avoid persecution, and to enjoy the benefits of manufacture and commerce; and those that remain Jews have been, for the most part, forced to reside in the inaccessible and mountainous parts of the country; and even here they retain the ancient distinction of Caraites and Talmudists, with invincible pertinacity. Besides these two sects, there is a third sort of them, (says Ludolf, l. i. c. 14. p. 73.) who inhabit the Abyssinian frontiers, between them and the Caffres, who dwell along the Nile. These are supposed to be descended either from those whom the kings of Assyria and Babylon carried away captive, or from those who were dispersed over the world, or were sold by Titus Vespasian, after the destruction of Jerusalem. They were never incorporated with the original Jews that came thither, as tradition says, with Menelck, the son of Solomon, but were looked upon as aliens, being called *Salaxa*, i. e. strangers or exiles. They retain their Hebrew bible in the corrupt Talmudic dialect, and their synagogue-worship.—The Mahometans are reckoned to amount to about one third part of the inhabitants of Abyssinia, and are every where intermixed with the Christians. Some of them apply to agriculture; but the richest and most prosperous are the factors, who, since the Abyssinians have been deprived of their sea-ports on the Red Sea by the Turks, have, by favour of the Mussulmans, engrossed that trade very much to themselves.—The Pagans are chiefly the *GALLAS*; besides some others who are dispersed through several of the provinces of the Abyssinian empire. Amidst this variety of nations, there must be supposed a corresponding variety of language, disposition, customs, and government. The Jews speak a kind of corrupt Hebrew. The Moors use their own Arabic in an impure state. The dialect of the court is that of *AMBARA*; that of *TIGRE*, however, approaches nearest to the old *ETHIOPIA*, which is called *Leshone Geez*, or the learned language, and is still used, not only in all their literary and religious books, but also in the king's letters patent, and all their records. See specimens in Bruce's Travels, vol. i.

p. 424, &c. With regard to arts and sciences, and general literature, the Abyssinians are commonly very uninformed and likely to continue so, not only from the form of their government and natural indolence, but as long as they are in a great degree secluded from intercourse with nations that are better instructed than themselves.

As to their persons, the Abyssinians are, in general, tall and well made; their features are duly proportioned, their eyes large, and of a sparkling black colour, their noses rather high than flat, their lips small, and their teeth extremely white and handsome. With respect to their natural temper, they are said to be good-humoured, mild, and placable; unless we except those of Tigré, who, according to the accounts of the Jesuits, not indeed always to be credited, are of a sickle, cruel, treacherous, and vindictive disposition. In their common conduct, they are sober and temperate. They have both a capacity, and an inclination for acquiring knowledge, but have hitherto wanted the necessary means. To religion, or rather to superstition and ceremonial observances, they are much inclined, and deference to their priests is considered by them as one of their first duties. But inured as they are to war and scenes of blood, and to feeding on raw, and even living flesh, they cannot avoid contracting an obduracy of temper, and remaining in a state of barbarity.

The dress of persons of quality, is a long fine vest either of silk or cotton, tied about the middle with a rich scarf. The common people have only a pair of cotton drawers, and a kind of scarf, or piece of the same linen with which they cover the rest of their body. In some parts of the country, more especially near the coast, and in the adjacent provinces, men and women have no kind of covering. Indeed, their dress is suited to the climate, so that the cloth which covers their bodies, and their drawers, are made so wide and long, as to admit as much air as possible. The habit of the women, particularly of the superior class, is formed of the richest silks, garnished, according to their rank, with trinkets and jewels, images, and relics of various kinds. They are allowed to appear in public, and to converse freely with the men, without any of those restrictions to which the Turkish women are commonly subject. The women of superior condition are not very guarded in their conduct, but those of inferior rank are more faithful to their husbands; and they also submit to the meaner and more laborious offices of domestic life. It is their business to grind corn for the family, which they perform daily by means of hand-mills. Every kind of intercourse (says Mr. Bruce, vol. iii. p. 304.) is permitted with absolute freedom. In this particular they resemble the Cynics of old, of whom it was said: "*Omnia que ad Bacchum et Venerem pertinuerint in publico facere.*" They bear children, and are delivered with little pain and inconvenience. Although we read from the Jesuits, continues this author, a great deal about marriage and polygamy, yet there is nothing which may be averred more truly, than that there is no such thing as marriage in Abyssinia, unless it be that which is contracted by mutual consent, without other form, subsisting only till dissolved by dissent of one or other, and to be renewed or repeated as often as it is agreeable to both parties; who, when they please, cohabit together as man and wife, after having been divorced, and had children by others, or whether they have been married, or had children by others or not. Upon separation they divide the children. The eldest son falls to the mother's first choice, and the eldest daughter to the father. If, after the first election, the remaining number be unequal, the rest are divided by lot. There is no such distinction as legitimate and illegitimate children from the king to the beggar. The king in his marriage uses no other ceremony than this: he sends an

Azage, or officer, to the house where the lady lives, who announces to her, that it is the king's pleasure she should instantly remove to the palace. She then dresses herself in the best manner, and obeys. From this time an apartment is assigned her in the palace, and a house is given to her wherever else she chuses. When he makes her Iteghé, the form seems to be the nearest resemblance to marriage: for, whether it be in the court, or in the camp, he orders one of his judges to pronounce in his presence, that he, the king, has chosen his hand-maid, naming her, for his queen; upon which the crown is put upon her head; but she is not anointed. Whatever be the forms of marriage in this country, and such are entered into at a very early period, when the males are ten, and the females younger; polygamy is allowed, divorces frequently occur, and adultery is compensated by an easy fine. Their funerals are attended with many superstitious ceremonies. The relations, friends, and a number of hired mourners, bewail the dead for many days together, with shrieks and lamentations, clapping of hands, smiting their faces and breasts, and uttering a variety of affecting expressions in the most doleful tone. They express their concern at hearing of the death of a relation or friend, not only by violent exclamations, but by throwing themselves on the ground with such force as to do themselves great injury. Whenever a near relation dies, every woman in Abyssinia, with the nail of her little finger, which she leaves long on purpose, cuts the skin of both her temples, about the size of a sixpence; and, therefore, you see a wound, or scar, on every fair face in the country; and in the dry season, when the camp is out, from the loss of friends, they are seldom allowed to heal till peace and the army return with the rains.

The food of the Abyssinians is plain and coarse. Their bread, which is indifferently prepared, of wheat, pease, millet, teff, or any other grain, is made into flat cakes or apas, which serve for dishes, plates, and spoons, and even for napkins and table-cloths. They wash their hands before they sit down to their meals, and this is the more necessary, as they touch every thing they eat. The rich have their victuals cut for them, and conveyed to their mouths by pages, who attend them. All their sauces are rich, greasy, and highly seasoned. They never drink till they have finished their meals, alleging an old rule, that you must plant first and then water. When the tables are cleared, they indulge themselves freely in circulating the glass. The common liquor is hydromel, made of five or six parts of water to one of honey, with a handful or two of parched barley meal, which causes it to ferment; to which they add some chips of a wood, called fardo, in order to take off the luscious taste of the honey, and to make it palatable and wholesome. At a feast, which Mr. Bruce attended, there was excellent red wine, brought from Karoota, which is the wine country, good new brandy, hydromel, and a kind of beer, called bouza; both the last of which were fermented with herbs or leaves of trees, and thus made very heady and intoxicating. The Abyssinians neither eat nor drink with strangers; and they break, or purify, every vessel which has been used by them. This custom they seem to have derived from the Egyptians. The Abyssinians eat their flesh raw; and they have a method of obtaining it, which at the first report seems to be hardly credible; but, upon farther enquiry, is an undoubted fact. In the neighbourhood of Axum, Mr. Bruce met with some travellers, who were driving a cow before them. He afterwards found that they cut fleas from the higher part of the buttock; they then closed the wound by drawing the skin over it, and applied to it a cataplasm of clay. They then drove the animal before them, in order to supply them and their companions

panions with another meal. At their feasts they have a bull or cow, one or more, according to the number of guests, which are tied at the door of the house in which they are assembled. After letting out a few drops of blood from the dew-lap under the throat, they cut through the skin on each side of the spine, and stripping off the hide of the animal half way down the ribs, and as far as the buttock, they cut out the solid flesh from the buttocks in square pieces, and the roaring of the animal, during this savage operation, is a signal for the guests to seat themselves at table. These pieces are served up on round cakes of unleavened bread made of teff. Three or four of these cakes of a whiter sort are placed uppermost, and designed for food; and four or five of a blacker kind are under the others, and serve the master to wipe his fingers upon, and afterwards the servant eats them as bread at his dinner. As no person of any fashion feeds himself, or touches his own meat, the women take the steak, whilst the motion of the fibres is distinctly seen, cut it into small pieces, well pepper them, and wrap them up in the teff bread, like so many cartridges. In this form they are put into the mouths of the guests, who, like birds fed by their dam, are opening their mouths to receive the morsels that are ready as fast as they can be prepared for them. The females, after having thus supplied the male guests, eat till they are satisfied, and then all drink together. The victim is still bleeding, writhing, and roaring at the door. When the animal has bled to death, the cannibals tear the remaining flesh from the thighs with their teeth like dogs. Such, in brief, is the description of an Abyssinian feast. For a fuller account, see Bruce's Travels, vol. iii. p. 302, &c.

The offering of meat and drink in Abyssinia, is an assurance that your life is not in danger; and it is also the constant practice to wash the feet of those that come from Cairo, and who are understood to have been pilgrims at Jerusalem. Many of the customs in Abyssinia resemble those of the ancient Persians and Egyptians. For particular instances, we refer to Bruce's Travels, vol. iii. p. 268—294.

The capital punishments in Abyssinia are the cross, hanging, slaying alive, stoning to death, and plucking out of the eyes. The dead bodies of criminals slain for treason, murder, and violence on the highway at certain times, are seldom buried. The streets of Gondar are strewed with pieces of their dead carcases, which bring the wild beasts, and particularly the hyenas, in multitudes into the city as soon as it becomes dark, so that it is hardly possible to walk about with safety in the night; and the dogs bring pieces of human bodies into the houses and yards that they may devour them in greater security.

The Abyssinians have few manufactures, though their country produces, or is capable of producing, ample materials for them. Before the discovery of the Cape of Good Hope, and before the Turks took possession of the ports of the Red Sea, there was a considerable intercourse of a commercial kind between Abyssinia with its adjacent provinces and various parts of Arabia and of India. Mafuah was then a harbour of great resort, and had a large quantity of exports brought to it from an extensive tract of mountainous country behind it, in all ages very inhospitable, and almost inaccessible to strangers. Gold and ivory, elephants, and buffaloes' hides; and, above all, slaves, of much greater value, made the principal articles of exportation from this port. There is still a considerable trade carried on from this place; but the hand of power restrains and discourages every exertion, and the interference of it renders every kind of property insecure. The goods imported from the Arabian side are

blue cotton, Surat cloths, and cochineal ditto, fine cloth from different markets in India, cotton unspun in bales, Venetian beads, crystal, drinking and looking glasses, and crude antimony. Old copper is also a gainful article, and imported in large quantities. To the westward of Gondar they wear bracelets of it; and near the country of Gongas and Guba it has been sold, weight for weight with gold. The Banians were once the principal merchants of this port; but their number is now reduced to six, and they scarcely gain a subsistence, as silversmiths, by making earrings, and other ornaments for the women on the continent, and assaying of gold. The same coin is current here as on the Arabian side, and it is valued by the Venetian sequin. But glass-heads, called Contaria, of all kinds and colours, perfect and broken, pass for small money, and are called, in their language, Borjooke. The Venetian sequin is = 2½ pataka; the pataka, or imperial dollar = 28 harf or dahab; the harf = 4 diwani, or 120 grains of beads; the diwani = 10 kibeer; and the kibeer = 3 borjooke, or grains. They have no gold in Abyssinia; and in lieu of small money, they frequently make use of rock salt as white as snow, and as hard as stone. This salt is also applied to the same purposes as common salt. With this mineral salt they purchase pepper, spices, and silk stuffs, which are brought to them by the Indians in their ports on the Red Sea. Cardamoms, ginger, aloes, myrrh, cassia, civet, ebony-wood, ivory, wax, honey, cotton, and linen of various sorts and colours, may be procured from Abyssinia; to which may be added, sugar, hemp, flax, and excellent wines, if they had the art and industry to prepare them. The merchandises above specified are more for foreign than for inland trade. The emeralds of this country have been estimated at a high value. Their domestic commerce consists chiefly in salt, honey, buckwheat, grey-pease, citrons, oranges, lemons, and other provisions, with fruits and herbage necessary for the support of life. Antimony, large needles, goat skins, coarse scissars, razors, and steels for striking fire, as well as hugges and beads, are articles of barter in several of the provinces. Those places which the Abyssinian merchants mostly frequent are Arabia Felix and the Indies, particularly Gon, Cambaye, Bengal, and Sumatra. With regard to their ports on the Red Sea, to which foreign merchants commonly resort, the most considerable are those of SUAKEM, JIDDA, MOCHA, LOHEIA, MASUAH, SUEZ, AZAB, and METE. The trade of the Abyssinians by land is inconsiderable. There are, however, bands of them who arrive yearly in Egypt, particularly at Cairo, laden with gold-dust, which they bring to barter for the merchandises of that country, or of Europe. These caravans, or caravans, formed of a few persons who associate for their mutual safety, are commonly three or four months in their route, traversing forests and mountains, in order to exchange their gold for necessaries for their families, and return immediately with the greatest part of their merchandise on their backs. One of the principal branches of the Abyssinian commerce is that of their slaves, who are highly esteemed in India and Arabia; and who, entrusted by the merchants, as their factors, and found worthy of confidence, obtain their liberty and a suitable recompence.

The government of Abyssinia has been always monarchical and despotic, and it has exercised an absolute dominion over the lives, liberties, and fortunes of its subjects, and uncontrollable authority in all matters ecclesiastical as well as civil. This empire has ever been destitute of written laws to restrain the royal power, or to secure the property and privileges of the subject; so that the will of the sovereign is the universal law. The princes of Abyssinia claim descent from Menelik, the son of Solomon, by the queen

of Sheba. Accordingly it is maintained by many learned men, and in conformity to the Abyssinian records, of which Mr. Bruce has availed himself, that Sheba, or rather Saba, Azab, or Azaba, signifying *South*, was the same country with Abyssinia, whatever might have been its extent; and that it was the kingdom of queen Candace, whose eunuch or prime minister, came to worship at Jerusalem; and who, on his return homewards, was baptised by Philip the deacon, and from whom the Abyssinians acknowledge they afterwards received the gospel. See Acts viii. 27—38. This country, say Pliny (l. vi. c. 29.), and Strabo, (l. xvi. xvii. t. 2. p. 1116. 1175.) was commonly governed by queens; and, it is said, that Candace was a name common to them all, as Pharaoh was to the kings of Egypt; the term Candace importing their sovereign authority. The queen of Sheba or Saba, having heard of Solomon's fame, determined to pay him a visit at Jerusalem. She was there converted, as the Abyssinians say, from heathenism to the Jewish religion, and had a son by Solomon, who was named Menilek. With this son she returned to her own country, and after some time sent him back to Jerusalem to be instructed by his father. Having been anointed and crowned king of Ethiopia in the temple of Jerusalem; and having also, at his inauguration, assumed the name of David, he returned to Azab with a colony of Jews, among whom were many learned doctors of the law, and particularly one of each tribe, from whom the present Umhars, or supreme judges, three of whom always attend the king, are thought to be descended. Azarias, the son of Zadok, the priest, was one of the number, and he brought with him a Hebrew copy of the law, which was committed to his custody as high priest, and which was burnt with the church of Axum in the Moorish war of Adel. By the last act of the queen of Saba's reign, the settled mode of succession in her country for the future; enacting, 1st, That the crown should be hereditary in the family of Solomon for ever: 2dly, That, after her, no woman should be capable of wearing that crown, or being queen, but that it should descend to the heir-male, however distant; and that these two articles should be considered as fundamental and immutable laws of the kingdom: and 3dly, That the heirs-male of the royal house should always be sent prisoners to a high mountain, where they were to continue till their death, or till the succession should open to them. The custom, however, of having women for sovereigns prevailed among the neighbouring kingdoms till the last century, and may possibly prevail in some of them to this day. It obtained in Nubia, and the kingdom of Meroë, till the time of Augustus, when Petronius, his lieutenant, subdued the country, and took and destroyed Napata, the residence of queen Candace; and this queen; Mr. Bruce (v. i. p. 477.) supposes, was succeeded by the Candace above mentioned. Whatever was the origin of the last regulation, it seems to have been necessary in order to prevent the confusion that must have arisen from various claimants, in a country where polygamy was allowed, and where the heirs to it must have been numerous; as the crown was to be hereditary in one family, but elective as to the person. Whilst they are confined in a good climate, on a high mountain, they are taught merely to read and write, and the state allows to the amount of 30,000 dollars for their maintenance. However, they are often severely treated, and in times of tumult, put to death upon the slightest misinformation. It is another rule of the society in Abyssinia, that no person that is maimed shall inherit the crown. The queen of Saba having established the laws above recited, and reigned forty years, died in the year 986 before Christ; and was succeeded by her son Menilek, or Menilech, i. e. *Another self*; whose posterity,

according to the annals of Abyssinia, have ever since reigned. The device of these kings is a lion passant, proper upon a field gules, and their motto, "*Mo Anbasa am Nizilet Solomon am Negade Jude*:" i. e. "The lion of the race of Solomon and tribe of Judah hath overcome." Instead of the lion passant, the Portuguese missionaries introduced a lion rampant, in order, as it is supposed, to put a cross into the paw of this Jewish lion; but the lion passant is restored. In virtue of this noble descent, the Abyssinian monarchs assume the title of Nagush, and are always addressed either by that of Nagusha Nagasht, king of kings, or by that of Natzeghe, equivalent to the French Sire. They are approached with adoration; when seated in council, they are concealed; they are attended by a splendid retinue; their camp is extensive and magnificent, and they wear a very rich and costly crown. The imperial revenue chiefly arises from the four following sources: the tribute paid by those provinces which have gold mines, or which trade with the Caffres and other neighbouring nations, which amounts to about 5 or 6000 ounces *per annum*; the second source of revenue is, the sale of all the great places in the empire, the annual tax on holding them and their appendages, the amount of which from two provinces, one the largest, and the other the richest, is about 75,000 French livres: the third source is, a tenth, levied every third year, upon all the cattle in the empire: the 4th source is, a duty laid upon every loom of cotton cloth, which, if it belongs to a Christian, pays one piece of cloth, and if to a Mahometan, a piece of eight *per annum*. This revenue, the whole amount of which is not easily estimated, falls far short of what might be expected from an empire of which the sovereign is the sole proprietor and disposer.

The military force of Abyssinia has been greatly exaggerated. Mr. Bruce does not imagine that any king of this country ever commanded 40,000 effective men at any time, or upon any cause whatever, exclusively of his household troops, which are about 8000 infantry; 2000 of these last carry firelocks, and supply the place of archers; bows having been laid aside for near a hundred years, and being now used only by the Waito Shangalla, and some other inconsiderable barbarous nations. As they are in a state of almost continual war, either among themselves, or with their neighbours, the face of the country is strewn with dead bodies; and as they bury neither their friends nor enemies, and their beasts of burthen are perpetually dying under the load of baggage which they carry, the army is followed by an immense number of birds and beasts of prey, who devour the putrefying carcases when scattered over the ground; and the surrounding trees are covered with them; and they form a kind of dark canopy over the marching army.

The Abyssinians in computing time, have continued the use of the solar year. Thirty days constitute their month, to which they add five days and a quarter, and thus they complete their year. The five days are added to the month of August, and to every fourth year they add a sixth day. They begin their year with the 29th or 30th of August, i. e. the kalends of September: the 29th of August being the first of their month Mascaram. The common epoch which the Abyssinians use is from the creation of the world, and they reckon 5500 years from the creation to the birth of Christ, rejecting the odd eight years of the Greeks, who make this period 5508 years. They have also many other epochs, such as from the council of Nice and Ephesus. In their ecclesiastical computations they make use of the golden number and epoch. The first use of epochs amongst them was not earlier, according to Scaliger, than the time of Dioclesian; but Mr. Bruce observes, (vol. iii. p. 352.) that this

this is contrary to the positive evidence of Abyssinian history, which says expressly, that the *epact* was invented by Demetrius of Alexandria. This Demetrius was the 12th patriarch of Alexandria, and elected about the 190th year of Christ, or in the reign of Severus, and consequently long before the time of Dioclesian. The Abyssinians have another mode of computing time, that is peculiar to themselves. They read the whole of the evangelists, in order, every year in their churches; and when they speak of an event, they write or say, it happened in the days of Matthew; that is, in the first quarter of the year, whilst they were reading the gospel of St. Matthew in their churches. They compute the time of the day in a very arbitrary manner. The twilight being very short, is selected for the beginning of their day; this they call *Naggé*, which comprehends the duration of twilight. *Méset* expresses the moment when the evening twilight begins. Mid-day is called *Kater*, which signifies culmination. All the other parts of time they describe, in conversation, by pointing at the place in the heavens where the sun was, when the event, which they are describing, happened. After all, nothing can be more inaccurate than the Abyssinian calculations. This is a circumstance which renders the historical records of Abyssinia very confused and indeterminate. Besides, the earlier part of their history is, on account of its remoteness, involved in a considerable degree of obscurity and uncertainty; and in later ages, the access into this country was difficult, and the intercourse with it very rare and limited. For that kind of knowledge of this country, in modern times, which is attended with any degree of certainty, we are first indebted to the discoveries of the Portuguese. But the zeal of their missionaries to convert the Abyssinians to the Catholic faith, involved them in difficulties and persecution, and barred the access of other Europeans, for a considerable time, into this country. The first history of Abyssinia was written by Alvarez, who accompanied an ambassador sent thither by Emanuel king of Portugal; and it was printed at Lisbon in 1540. It is preserved in Purchas's collection. Father Bermudes, who also visited the country, has given some account of it, intermixed with much fable. His relation was printed in 1565. Father Pais, who resided there for a considerable time, and died there in 1622, wrote an account, which extends from 1556 to his death. Father Almeyda, who travelled through the inland provinces; Father Mendez, who resided there ten years; and Father Jerome Lobo, who arrived in Abyssinia in 1624, resided there nine years, and travelled above 38,000 miles in this empire, and whose history was published by M. le Grand at Paris 1738, have given distinct details of the provinces, produce, customs, and inhabitants of Abyssinia. From these several sources, and the letters of the Abyssinian missionaries to the college of Jesuits at Lisbon, Father Balthazar Tellez derived materials for his general history, which was published in the Portuguese language in 1660. Poncet, a physician, who was sent by the French consul at Cairo into Abyssinia, to cure the emperor of an obstinate disease, in 1698, published an account of the religion, laws, and customs of the Abyssinians; but his personal observation was very restricted, and of course he must have depended very much upon the report of those with whom he conversed. The Jesuit writers have concurred to degrade and vilify him without sufficient reason; but his account is in general just and credible, and is held in good estimation. The history of Ludolph, in folio, is the most comprehensive of any that had been written at his time. It is chiefly compiled from the Portuguese authors above mentioned; though he relies too implicitly in many instances on the authority of the Abbot Gregory, whose learning, capa-

city, and integrity, did not warrant the confidence reposed in him. Ludolph's history was decried by the J. suits. M. Mailet, in his description of Egypt, hath given some account of this country, but it is more incidental than direct and circumstantial. But the most comprehensive account of Abyssinia is that published by James Bruce, Esq. F. R. S. in 5 vols. 4to. in 1790, after a residence of several years in the country. His work is intitled, "Travels to discover the Source of the Nile, in the years 1768, 1769, 1770, 1771, 1772, and 1773." Of this work we have freely availed ourselves in the compilation of this article.

The chronicle of Axum, which is the most ancient repository of the antiquities of the country, and which, according to Mr. Bruce, is a book esteemed the first in authority after the sacred Scriptures, says, that Abyssinia had never been inhabited till 1808 years before Christ; and 200 years after that, or in the year 1600 before Christ, it was laid waste by a flood, and the face of the country was much changed and deformed, so that it was denominated at that time *Oure Midre*, or the country laid waste; or, as it is called in Scripture itself, a land which the waters and floods had spoiled.

It is the concurrent opinion of many authors, ancient and modern, that Abyssinia, called also Ethiopia, was first peopled by the early descendants of Cush, the eldest son of Ham: and it is a tradition among the Abyssinians, which they pretend to have had from time immemorial, that almost immediately after the flood, Cush, grandson of Noah, with his family, passing through Atbara from the low country of Egypt, then without inhabitants, came to the ridge of mountains, which still separates the flat country of Atbara from the more mountainous high land of Abyssinia. Their tradition says, that, terrified by the late dreadful event, the flood still recent in their memories, and apprehending a similar calamity, they chose for their habitation caves in the sides of these mountains, rather than trust themselves again on the plain. This apprehension would be naturally increased by the tropical rains of this climate. In these mountains, therefore, the Cushites first resided; and as they became more populous, they extended their borders to those other mountains that were near them, spreading the industry and arts which they cultivated, as well towards the eastern as the western ocean, but never venturing to quit their stated residence on the mountains, and to settle at a distance from them in the plains and vallies. The Abyssinian tradition adds, that they built the city of Axum at an early period, in the days of Abraham. Soon afterwards, without utterly forsaking their first habitations in the mountains, they pushed their colony to Atbara, and built another city called Meroë. This they did, says Mr. Bruce, partly to avoid a fly, named *Zimb*, which was very troublesome both to them and to their cattle. From thence they advanced to *Tubes*; and, by degrees, as they proceeded, they acquired a greater degree of courage, and of confidence in their own security. Whilst they were thus establishing themselves in the central and northern territory of the country, their brethren to the south were not idle. Having extended themselves along the mountains that run parallel to the Arabian gulph towards Saba, or Azabo, signifying *south*, which was an appropriate appellation, because it was on the south coast of the Arabian gulph, and the first land to the southward that bounded the African continent, they enjoyed the perfumes and aromatics of the east, myrrh, frankincense, and cassia. The Cushites, in travelling southward towards the mountains of Sofala, supposed by Mr. Bruce to be the *Ophir* of Scripture, found mines of gold and silver, which became gradually ample sources of commerce and wealth. But being

ing fully occupied, in consequence of the discoveries they had made, they acted carriers to disperse their commodities to other provinces of the continent. There they found in a nation that dwelt in their neighbourhood; and they have been distinguished by the appellation of SHEPHERDS. In this employment they gradually advanced to great wealth and power. Their numbers increased, and the extent of their territory was enlarged. Whilst they extended themselves along the Indian ocean, and afterwards along the Red Sea, for the convenience of trade; the principal seat of their residence and power was the level part of Africa, between the northern tropic and the mountains of Abyssinia, a country now called *Bein*. This country reaches from Masuah along the coast to Suakem; then turning westward, continues in that direction, having the Nile on the south, the tropic of Cancer on the north, with the deserts of Selima and Libya on the west. The next district belonging to these people was MEROE, now called ATBARA. A third district, now called *Dirkin*, is a small plain lying between the river March on the east, and Atbara on the west. But the most noble and warlike of the Shepherds were those who possessed the mountains of Habab, reaching from the vicinity of Masuah to Suakem, which district they still inhabit. The building of Carriage increased their employment as carriers in the intercourses of commerce, and of course their power. The enmity of the Shepherds to the Egyptians originated principally in religious differences; for the latter worshipped the animals which the former used as food; and the Shepherds worshipped the heavenly bodies, whilst the Egyptians practised the grossest kind of idolatry.

Besides these Cushites and Shepherds, who were the first settlers in Abyssinia, the above cited Chronicle of Axum mentions, among other particulars, that about the year 1400 before Christ, it was taken possession of by a variety of people, speaking different languages, who, as they were in friendship with the Agaazi, or Shepherds, possessing the high country of Tigré, came and sat down beside them in a peaceable manner, each occupying the lands that were before him. This settlement the chronicle calls *Angaba*, the entry and establishment of these nations, which finished the peopling of Abyssinia. Tradition farther says, that they came from Palestine. Many approved writers are of opinion, that some of the early descendants of Cush, first settled in the land bordering on the eastern side of the Red Sea, moving gradually from thence to the southern extremity of Arabia; and afterwards, by means of the easy passage over the straits of Babelmandeb, transplanted themselves into Ethiopia. This migration, according to Eusebius, happened whilst the Israelites were in Egypt; but Syncellus places it in the time of the Judges. These Arabian Cushites were called Abafeni, and formed a great part of the Sabæans or Homerites; and the Ethiopians were distinguished by the same name, agreed in many particulars with the others, and were believed by most of the Asiatic nations in Josephus's time, to have had the same origin. Of these new settlers, Mr. Bruce (vol. i. p. 399.) gives a somewhat different account. When Joshua had passed the Jordan, and destroyed Jericho, a panic seized the whole people of Syria and Palestine. These petty states, many in number, and diversified by language, sought for safety from the conqueror by flight or emigration. Having already carried on a commercial intercourse with the Shepherds of Abyssinia and Atbara, they directed their views to them for protection, and obtained settlements among, or near them. The curse of Canaan, (Gen. ix. 25, 26, 27.) says Mr. Bruce, seems to have followed them, as they have obtained no principality, but served the kings of the Agaazi, or Shepherds, and so

they still continue. The first and most considerable of these nations settled in AMHARA; the second were the AGOWS of Damot, one of the southern provinces of Abyssinia; and the third are the AGOWS of Laita, with a separate language, living in caves, and paying nearly the same worship to the Siris or TAZAZZÉ, that those of Damot pay to the Nile; the fourth is a nation near Damot, called GAFAT; the situation of the fifth is not precisely ascertained, unless it be intermixed with the GALLA and FALASHA. From this recital, we may perceive the propriety of the appellation *Habysb* or *Consenz*, denoting separate nations settled together, as affording the most satisfactory etymology of Abyssinia. The inhabitants who possessed Abyssinia from its southern boundary to the tropic of Cancer, or frontiers of Egypt, were the Cushites, a polished people, living in towns, being first Troglodytes, and having their habitations in caves. The next were the Shepherds. After these were the nations who, according to Mr. Bruce, came from Palestine. If the account we have now given of the origin of the Abyssinians be just, they might very well vie with the Egyptians, and even be deemed superior to them with respect to antiquity, since Cush, their great ancestor, was the eldest son of Ham. They might likewise have been esteemed of equal antiquity with the Arabians, as from the kingdom of Midian the Cushites penetrated both into the southern parts of the peninsula of the Arabs and Ethiopia. The communication between Egypt and Ethiopia, as well as the proximity of blood of Cush and Mizraim, introduced that similitude of laws and manners that is observable among their respective inhabitants. The Ethiopians, or Abyssinians, account for this mutual resemblance, by asserting, that Egypt, when recovered from the Nile, and made habitable, was first peopled by colonies that migrated out of their country, and they again were civilized by the Egyptians. Mr. Bruce endeavours to prove, that the Abyssinians in ancient times were not only the most learned people in the world, but that they spoke the original language, and were the inventors of writing. How they, as well as the Egyptians, came to lose this character, and to sink into their present state of degeneracy and barbarity, it is not easy to explain. But the nature of their respective governments will serve in some measure to resolve the difficulty. According to some authors, Moses resisted the progress of the Ethiopians from Thebais into the Lower Egypt, and drove them back into their capital Meroë, which, being surrounded by three rivers, the Nile, Atapus, and Ataboras, was deemed impregnable. This city, however, was betrayed by a young woman, who fell in love with Moses, and delivered it up to him on condition of his marrying her. He then ravaged the country, and having reduced the inhabitants to such a state, that they were incapable of any farther hostile attempts for a long time, he returned in triumph to Egypt, after an absence of ten years. Without attempting to fill up the chasm that occurs in the history of Abyssinia from this period to the time of Solomon, and without recurring again to the story of the queen of Sheba, and her son Menilek, from whom the kings of Abyssinia derive their descent, we shall proceed to observe, that the Ethiopians, or Abyssinians, after the accession of Menilek, were invaded by Sefac, or Sefostris, who plundered their rich temple at Saba, and probably occasioned the removal of the imperial seat to Tigré. Ethiopia, or at least a considerable part of it, became subject to this monarch. The Ethiopians, according to Sir Isaac Newton, drowned the successor of Sefac in the Nile, and seized upon Egypt, and obtained Libya in connection with it. However, they were defeated by Asa king of Judah. Upon this the people of the Lower Egypt revolted, and obliged

obliged Memnon, supposed to be the same with Menes and Amenophis, to retire first to Memphis, and then into Ethiopia. In about thirteen years he returned, with his son Rameses, at the head of a large army, and compelled the Cananithish forces to abandon the Lower Egypt; and this event is denominated by the Egyptian writers the *second expulsion of the Shepherds*. Sir Isaac Newton supposes, that the Memnon just mentioned built, or at least fortified Memphis, in order to prevent the Egyptians from penetrating into Ethiopia, and that he died at a very advanced age, about 90 years after the decease of Solomon. In his time the Argonautic expedition is said to have happened. He was succeeded by Rameses; and his successor Moeris adorned Memphis, and made it the capital of his empire, about two generations after the Trojan war. Cheops, Caphrenus, Mycerinus, and his sister Nitocris, succeeded one another; and in the reign of Apychis, the successor of Nitocris, Ethiopia and Assyria revolted from Egypt, which being partitioned into several small kingdoms, was soon subdued by Sabacon or So, the emperor of Ethiopia. This monarch, forming an alliance with Hofhea, king of Israel, occasioned his revolt from the Assyrians; in consequence of which, an end was put to the kingdom of Israel by Shalmanaser king of Assyria, in the 24th year of the era of Nabonassar, and the 720th before the commencement of the Christian era. Sabacon was succeeded by Sethon, who marched with a powerful army against Sennacherib king of Assyria, and defeated him. In the 78th year of the era of Nabonassar, Ethiopia was subdued by Esar-Haddon king of Assyria, who over-run both these countries for three years, when the Ethiopians asserted their independence, which they preserved till the time of Cyrus, whose dominion, according to Xenophon, extended to Ethiopia. After his death the Ethiopians revolted; and their empire was so powerful, that Cambyfes found it impracticable to penetrate into the country; though Sir Isaac Newton suggests that he subdued them about the year 223, or 224, of Nabonassar. But others are of a different opinion. Herodotus asserts, that they reduced some of the provinces contiguous to Egypt; and it appears, that the Persians proceeded as far as Cyrene; but it is not probable that they brought under subjection the whole Ethiopia Propria of the ancients, which comprehended Sennaar, Abassia, and other countries. We have no account of any expedition undertaken by Alexander the Great against Ethiopia, though he was very desirous of exploring the source of the Nile. With this view Ptolemy Evergetes advanced into the country; but if he made any conquests, he does not seem to have long retained them, for nothing of importance relating to Ethiopia occurs till the days of Augustus. About this time, *i. e.* the year of Rome 725, Candace, queen of Ethiopia, or rather of the kingdom of Meroë, made an irruption into the province of Thebais, and being repulsed by Petronius, was obliged to sue for peace, which, as we have already mentioned, was granted to her by Augustus. From this time the Romans considered themselves as masters of Ethiopia. Menilek, according to the Abyssinian records, succeeded to the throne in the 986th year before Christ, and they reckon twenty-two kings from Menilek to Bazen, the eighth year of whose reign coincides with the era of the birth of Christ. But this account must be very erroneous, because each reign will amount to more than forty-four years, which is impossible. In the reign of Meliogabalus, about the year of Christ 220, there seems to have been an intercourse between the Roman empire and the Ethiopians; and we learn from Procopius, (*De Bell. Pers. l. i. c. 19.*) that before the reign of Dioclesian, the frontiers of the Roman empire extended so far into Ethiopia,

that they were not above twenty-three days journey distant from the capital. Nothing remarkable occurs in the history of the Ethiopians from the time of this emperor to the period of their conversion to Christianity, which event took place under Abreha and Atzchela, or as they are also called Abra and Asba, who are considered by Mr. Bruce as one prince, and by others as joint sovereigns, about 523 years after Christ. Frumentius was consecrated bishop of Axum by St. Athanasius, and deputed by him to propagate the Christian religion in Ethiopia. Of this Frumentius it is said, that whilst he was young, he accompanied Nicomachus, a philosopher of Tyre, who, in a voyage on the Red Sea to India, was cast away on the coast of Abyssinia. Nicomachus was slain by the natives, but Frumentius, who had been liberally educated, was conducted to Axum, where he continued to reside. Here he was entrusted by the queen with the education of the young prince; and having instructed him in various parts of learning, and impressed his mind with a veneration for the Christian religion, he soon was disposed to embrace Christianity on his return from Alexandria in discharge of the commission entrusted with him by Athanasius. The greatest part of Abyssinia followed the example of this prince, and the church of Ethiopia continued in unity with this bishop to the time of his death. When Constantine the emperor embraced Arianism, an attempt was made to depose Frumentius, because he refused to sanction it with his rank and authority. About this time an expedition into Arabia Felix produced, what the Arabian writers, and Mahomet in the koran, have called the War of the Elephant. The occasion was this: the temple of Mecca had been held in high veneration for 1,400 years, because, as the Arabs say, Adam, when expelled from Paradise, pitched his tent upon this spot; and they also shew a black stone, where Jacob reposed when he saw the vision, mentioned *Genesis xxviii. 12.* But Mr. Bruce thinks it to be much more probable, that this temple was built by Sesostris, and that he was worshipped here under the title of Osiris. This temple, venerated by neighbouring nations, was made the emporium of the trade between India and Africa, but Abreha wishing to render it more convenient for his dominions, built a very large church or temple in the country of the Homerites, and nearer the Indian ocean, and extended to it all the privileges belonging to the pagan temple of Mecca. A tribe of Arabs, called Beni Koreish, who had the care of the Carava at Mecca, alarmed by the prospect of having their temple deserted, entered Abreha's temple, burned every part of it that could be consumed, and polluted the rest by besmearing it with human excrements. This insult exasperated Abreha, who, mounted upon a white elephant at the head of a large army, resolved to destroy the temple of Mecca. The temple, however, was miraculously preserved, according to the Arabian writers; but the more probable account is, that the Abyssinian army fell a sacrifice to the small-pox and measles, with which they were infected at this siege. This happened about the year 526. Abreha's church, near the Indian ocean, was finally destroyed in the Khalifat of Omar. In the year 522, Justin, the Greek emperor, sent an embassy to Caleb, or Elbaas, king of Abyssinia, intreating his interference in favour of the Christians in Arabia, who were severely persecuted by Phineas, a Jewish prince, and others of the same profession, then in possession of the country. Phineas was defeated by Arctas, an Arabian prince, before Abreha, Caleb's general, arrived; but the Jewish kingdom was not wholly overturned, as some of them continued till after the Hegira. To this period, or the reign of Elbaas, the Arabian historians refer the War of the Elephant, and the miraculous discomfiture of the Ethiopian army. The con-

sion of names will account for the difference between the Arabian and Abyssinian records; for if this Abreha was the prince who had intercourse with Abou Thaleb, Mahomet's grandfather, to whom the custody of the Caaba was committed, and who was defeated before Mecca, the small-pox was introduced among the Abyssinians about the year 522, or 100 years before the Hegira; and thus the Arabian and Abyssinian accounts may be made to correspond. Some historians have said, that the Ethiopian monarchs embraced the doctrines of Mahomet, soon after the appearance of this impostor; but this account has been considered as improbable. It is more certain, however, that Najashi, who was the Ethiopian governor of Yeuuen, and who was related to the royal family of Abyssinia, was profolytized to the Mahometan faith. On this occasion the Abyssinians lost their territories in Arabia, and were forced to seek refuge on the side of Africa, where they established several kingdoms, such as Adel, Mara, Hadea, Aussa, Wypo, Tarhith, and other states, which acquired permanent power and importance. The Jews being at this time oppressed by the caliphs, sought an asylum in Abyssinia; and they contributed to augment and strengthen an independent sovereignty, which had been preserved in one family of Jews on the mountain of Samen, the royal residence having been fixed upon a high-pointed rock, called the Jews' rock. Judith, a very beautiful and intriguing queen of the Jews, had made so strong a party, that she resolved to attempt the subversion of Christianity, and also the succession in the line of Solomon. Having massacred the royal family, she took possession of the throne, in defiance of the law of the queen of Saba; but the infant king, the only remaining prince of his race, fortunately escaped into the province of Shoa, and thus the royal family was preserved to be again restored. Judith and her descendants maintained their usurpation for more than 300 years; but no part of their history is recorded in the Abyssinian annals, except that of Lalibala, who lived at the close of the 12th, or beginning of the 13th century, and was reputed to be a saint. This appellation he probably acquired from the protection which he afforded to the christians, who, persecuted by the Saracens in Egypt, fled for refuge to Abyssinia. Lalibala employed them in forming various works in the solid rocks, some traces of which remain to this day; and in unsuccessful attempts to divert the Nile out of its course, so that it might no longer be the cause of the fertility of Egypt, which was then in possession of the enemies of his religion. The race of Solomon, which had been restricted to the sovereignty of Shoa, was unexpectedly restored in the person of Icon Amlac, to whom Naacueto Laab, grandson of Lalibala, by the mediation of Tecla Haimanout, a monk and native of Abyssinia, who had been ordained Abuna, and who was highly esteemed for his sanctity and patriotism, resigned the kingdom of Abyssinia. Amongst other articles of the treaty between them, one was, that no native Abyssinian should for the future be chosen Abuna; and this article between Icon Amlac and the house of Zagué was observed for near 500 years. Icon Amlac continued to reside at Tegulat in Shoa, from his accession in 1268, and his reign lasted fifteen years. After a rapid succession of princes, Amda Sion ascended the throne in 1312. This sovereign professed Christianity, but disgraced it by his conduct. During a reign of thirty years, this prince was almost incessantly engaged in various wars with the Moors, who inhabited different provinces of Abyssinia and its vicinity; but at last, weary with conquest and carnage, he returned in triumph to his capital, and having never suffered defeat in any battle, he ended his days, and transmitted the crown to his son, Saif Araad. The only transaction that distinguishes

this reign, is the relief afforded to the Coptic patriarch, whom the sultan of Egypt had thrown into prison, with a view of extorting money from him. Of Zara Jacob, whose reign commenced in 1434, and continued thirty-four years, Mr. Bruce observes, that he was regarded in Abyssinia as another Solomon, and a model of what the best of sovereigns should be, though he was not justly entitled to this high encomium. This prince sent an embassy to the council of Florence, which formed a subject for a picture in the Vatican, and he obtained from the pope a convent at Rome for the use of the Abyssinians. From this period a party was formed in favour of the church of Rome; and this best of sovereigns was the first who introduced religious persecution into his dominions. Although the established religion in Abyssinia was that of the Greek church, many different superstitions prevailed in every part of the country. An accusation having been brought against some families for worshipping the cow and the serpent, they were seized by order of the king, capitally convicted, and executed. This severity was followed by a proclamation, declaring, that any person who did not, upon his right hand, carry an amulet, with these words, *I renounce the devil for Christ our Lord*, should forfeit his personal estate, and be liable to corporal punishment. Before the close of his reign persecution was suppressed, and he employed himself in repairing the churches which had fallen into decay, or which had been destroyed in various parts of the country in the wars with the Mahometans. In the next reign, which commenced in 1468, the old law for confining the royal children, which had been discontinued from the reign of Judith, in the tenth century, was revived; and they were sent to the high mountain of Geshen, on the confines of Amhara and Begemder, which continued to be the state-prison till a slaughter occasioned the desertion of Geshen. Bæda Mariam, having ingratiated himself with his people, by clemency towards those who had been banished for various offences in the former reign, commenced a war with the Dobas, who made inroads into his country; and he also turned his arms against the kingdom of Adel; but being seized with a pain in his bowels, which occasioned his death, all his plans and enterprises terminated. About this time Henry of Portugal, a scientific and adventurous prince, formed the project of discovering a passage to India, by doubling the cape of Africa, and thus of sharing with the Venetians, and others, the profits of the commerce that was carried on with that country. A plan was also concerted for penetrating into India through the interior parts of Africa. The practicability of this latter scheme was rendered probable, by the report of some monks who resorted to Jerusalem and to Alexandria, and who were the subjects of a christian prince, said to be a priest, whose dominions were said to extend through the African continent from the east to the west sea. This report had been confirmed at the court of Bemoy, the sovereign of the Jaloffes, on the west coast of Africa, and also at Benin, another negro country; though it was somewhat confused and precarious, in consequence of the account given by Marco Paulo, a Venetian traveller, who said that, in his travels into Tartary, he met with a christian prince, who was a priest, and who was called Presbyter, or Prester John. The king of Portugal, however, resolved to send Peter Covillan and Alphonso de Paiva, as ambassadors to this unknown prince. The object of their mission was to explore the sources of the Indian trade, the principal markets for spice and pepper, and the channels of their conveyance to Europe; and to ascertain the country whence gold and silver were obtained, and the possibility of arriving at the East Indies by sailing around the southern promontory of Africa.

Africa. Having proceeded on their journey together from Alexandria to Cairo, thence to Suez, and afterwards to Aden, a rich trading town, without the straits of Babelmandeb, they separated from one another. De Paiva soon lost his life; but Covillan set sail for India, and having visited Calicut and Goa, and crossed the Indian ocean to inspect the mines of Sofala, returned to Aden, and then to Cairo, where he heard of the death of his companion. Here he found two Jews with letters from the king of Abyssinia, which induced him to return to Aden; whence he crossed to the dominions of that prince, whose name was Alexander, and whom he accompanied to Shoa, where the court resided. Covillan settled in the country, became rich and powerful, and no more returned to Europe. But the intelligence he transmitted from time to time to the court of Portugal was important and useful. He described the Indian ports which he had seen, the situation and riches of the mines of Sofala, the disposition of the princes, and the wealth and populousness of the country where he dwelt; and he exhorted the king to prosecute the discovery of the passage round Africa, affirming, that the cape itself was well known in India, and accompanying his communication with a chart, which he had obtained from a Moor in India, and which exhibited the exact situation of the Cape, and the cities round the coast. Covillan came into Abyssinia in the year 1490, and the reigning prince, Alexander, or Iscaander, to whom he was introduced, died by violence, in 1495. He was succeeded by an infant son, who reigned seven months; after which his younger brother, Naod, was elected king by the unanimous voice of the people; and having, by his courage and prudence, delivered himself from the fear of a foreign war, he applied with diligence to reform internal abuses, and to cultivate the arts of peace. After a reign of thirteen years, he died in 1508, and was succeeded by his son David III. an infant of eleven years of age, who was settled on the throne by the interell of Helena, widow of Bæda Mariam. At the commencement of this reign, the Turks, with a view of sharing the profits of the trade of the country, took possession of Zeyla, a small island in the Red Sea, opposite to the coast of Adel; but their desire of possessing India diverted their views from Adel and Abyssinia. It was thought desirable, in the present situation of the country, to form an alliance with the Portuguese, and for this purpose Matthew, an Armenian merchant, was deputed as an ambassador. The principal object of the embassy was to obtain a force sufficient to destroy the Turkish power; and, it is said, that a third part of Abyssinia was offered as an acknowledgment. During the progress of this embassy, the Turks renewed their depredations on the Abyssinian territories. David prepared to resist them; and, at length, succeeded in completely defeating and routing them. On the day in July 1516, when he obtained a decisive victory over the Moors, the island of Zeyla was taken, and the town burnt by the Portuguese fleet under Lopez Suarez de Alberguiera, who had brought back Matthew, and with him an ambassador, from Portugal. The two ambassadors, accompanied by fifteen Portuguese, set out on a very difficult and perilous journey for the emperor's court. Matthew died of an epidemic fever in the course of the journey; but the Portuguese ambassador arrived in 1520, within three miles of the Abyssinian camp. His reception was not favourable; and it was not till after a delay of five years, that the business of the embassy was completed, and he was allowed to depart for Portugal. This long intercourse between two distant nations, alarmed the Mahometan powers; and the Adeliens, assisted by the Turks, defeated the emperor in several successive battles, and over-ran the empire, plundering

and burning the towns and villages, and carrying away the people for slaves. This destructive war continued till the year 1537. In the next year the affairs of Abyssinia seemed to revive, and a new embassy to Portugal was projected. John Bernudes, one of the attendants of Rodrigo, the Portuguese ambassador, was deputed, who was invited with the ecclesiastical authority of Abuna. Being a bigot to the popish religion, he declined accepting the office, unless his ordination should be approved by the pope, which was indirectly submitting the church of Abyssinia to that of Rome; and this submission on the part of David gave the pope inexpressible pleasure, at a time when so many kingdoms in the west were revolting from his supremacy. Having in his way through Italy obtained the pope's sanction, he proceeded to Lisbon, and was acknowledged by the king as patriarch of Alexandria, Abyssinia, and of the sea; and he succeeded in obtaining the succours which he requested. When these succours arrived, they took the town of Arkeeko, killed the governor, and massacred all the people in the town whom they could find. The delay, however, had reduced the Abyssinians to great distress. A Mahometan chief had made an attack upon the rock Geshen, where the royal family had been kept, and massacred them; and David, sinking under a complication of disasters, died in the year 1540, and was succeeded by his son Claudius. On his accession, the Moors formed a league against him, but were defeated. Aided by the Portuguese forces, which had joined those of the empire, Claudius freed himself from all apprehension of foreign enemies; and he then directed his attention to the internal state of the country. John Bernudes, insolent in his disposition, and invell with ample ecclesiastical powers, attempted the conversion of Claudius, and insisted that he should establish the popish religion through his dominions, as his father David had promised to do; but Claudius was invincible, and the alteration terminated in the expulsion of the catholics, and the discontinuance of all intercourse with the Europeans; and Bernudes himself was obliged to leave Abyssinia, and return to Portugal. In 1558, the pope sent a new deputation of priests; but, though they were civilly received by Claudius, they seemed to have had little success with respect to the principal object of their mission. The thoughts of Claudius were now employed about a successor; and as he had no son, it was proposed to ransom his youngest brother, the prince Menas, who had been taken prisoner by the Moors in the time of David. This business having been settled, Claudius's premature and violent death made way for the advancement of Menas to the throne in 1559. After a short reign, embroiled by internal rebellion, and the seditious practices of the popish missionaries, he closed his life in 1563, and was succeeded by his son Sertza Denghal, who, after various conflicts with the Moors, and with the Galla and Falasha, two neighbouring nations, in which he was generally victorious, died in consequence of eating fish of a poisonous nature, in 1595. Before his death he nominated Za Denghal, his nephew, for his successor. The affections of his people were alienated from this prince on account of his attachment to the church of Rome, whose interest in Abyssinia had much declined, in consequence of the death of Oviedo, and the other missionaries, and through want of a fresh supply of catholic preachers. In the year 1600, Peter Paetz, or Paiz, was sent on this mission. He was learned, diligent, and active. The emperor was engaged by his manners and discourses to embrace the catholic religion; he issued orders for prohibiting the observance of the Jewish Sabbath, and sent letters to pope Clement VIII. and Philip III. of Spain, requesting a supply of mechanics to instruct his people in the useful arts,

and of J. S. to teach their religion. This imprudent conduct on the part of the emperor, excited a rebellion among his subjects; he was excommunicated by the Abuna; and having been deserted by his troops, he was overpowered and slain. The succession was for some time disputed. At length S. S. called also S. S. and M. Seguel, was fully established on the throne; and being declared to Paez his favourite of embracing the Romish religion, he addressed his letters, one to the pope, and the other to the king of Portugal, supplicating assistance against the invasions of the Galla. In the mean while he defeated these people, and also a body of rebels assembled to support the claims of an impostor, who pretended to be the late emperor Jacob, that had contended with him for the crown. Whilst he was meditating the establishment of religion in the empire, a new rebellion demanded his attention, and his thoughts were wholly employed in various military expeditions. In 1616, he issued a very severe order against the Jews, whom he determined totally to exterminate. His conduct towards them was in the highest degree cruel and unjust. The consequence of his measures was the almost entire extinction of the Jewish religion, the professors of which were commanded to renounce their religion, and be baptised, under pain of death. Paez was at the same time assiduous and successful, in his endeavours to proselyte the Abyssinians to the Catholic faith, and Socinios having received letters from the pope and the king of Spain, with assurances of such support as each of them, in his respective province, could afford him, resolved to make a formal submission to the pope, and to renounce for ever his connexion with the Greek church. Ambassadors were appointed to go to Europe, to communicate this intelligence, and to finish the negotiation between the pope and the Abyssinians; but these ambassadors were obliged to return; and this unprosperous occurrence prevented the establishment of popery in Abyssinia. The attempts of Socinios to change the religion of the country, occasioned a variety of seditious and rebellious associations against his government; but the obstinate emperor persevered. Though the Abyssinian ambassadors had been constrained to return, many favourable accounts of the state of religion in Abyssinia had been transmitted to Europe; and new missionaries were sent under the direction of Alphonso Mendez, who arrived at Gorgora, the royal residence, in the beginning of the year 1626. Socinios, after the first audience, takes an oath of submission to the pope, and the ceremony was attended with circumstances of peculiar solemnity. It was followed by a proclamation, that all priests should embrace the catholic faith on pain of death, that Lent and Easter, and the other moveable feasts, should be observed according to the rules of the Romish church, and that the clergy should be re-ordained, the churches consecrated anew, the people re-baptised, and circumcision, polygamy, and divorce abrogated. The emperor, however, soon perceived the injurious effects of these measures, and found it necessary to relax the severity of his proceedings. He proceeded to grant an universal toleration; and having restored the Alexandrian faith, ceremonies, and worship, he resigned the crown and empire to his son Facilidas, or as he is sometimes called Basilides; and soon after his proclamation for this purpose, he died, in 1632, and with him all the hopes of the Jesuits were extinguished. Facilidas was an inveterate enemy to the catholic faith, and he adopted every method in his power to suppress and eradicate it. He first banished and then executed his uncle Sela Christos, who had been active in promoting it, expelled the European missionaries, and resisted the attempts of the Jesuits for introducing others. The spirit of rebellion in Abyssinia, and the neighbouring provinces,

was still active; nor could the efforts of Facilidas totally subdue it. However, he left the empire at his death, in 1665, in a much more peaceful and prosperous state, than that in which it was devolved upon him by his father. He was succeeded by his son Hannes I., who had the address to prefer peace during his whole reign, if we except some feeble expeditions against Lalta and the Shangalla; and, in 1680, his son Yafous I. ascended the throne with the approbation of the whole kingdom. This prince is said to have possessed all those abilities and dispositions which form the character of a great and good monarch. In this reign attempts were made to revive European missions. They were occasioned by a report that, on the expulsion of the Jesuits from Abyssinia, many catholic christians had fled into the adjacent countries of Nubia and Sennaar, where they were grievously oppressed by the Mahometans. The cause of these christians was espoused at Rome, and the pope dispatched a mission for their relief, under the title of the *Ethiopic mission*. The missionaries were instructed to penetrate as far as possible into Abyssinia, and to maintain the catholic faith as far as they were able, till an opportunity offered of converting the whole empire; and for their protection and encouragement, a convent was established at Achmim, in Upper Egypt. At the same time, Louis XIV. of France appointed six Jesuits to the same mission, and furnished them with suitable presents for the emperor and the principal nobility. The admission of these missionaries was facilitated by a dangerous scorbutic disorder, which had attacked Yafous and his son, and for which they wished to have the advice of an European physician. Maillet, the French consul at Cairo, wishing the Jesuits to have the honour of the mission, disappointed the views of Friars Paschal and Anthony, two Franciscans, who were first thought of, and recommended Charles Poncet, a Frenchman, who had been bred a chemist and apothecary, and Father Brevedent as his servant, to Hagi Ali, a Mahometan factor at Cairo, for the desired purpose. The Franciscans attempted the destruction of Poncet and his attendants; but Poncet arrived safe at Gondar on the 21st of July, 1699, and having perfectly cured his royal patient, set out on the 2d of May, 1700, on his return for Europe, and arrived in safety at Mafuah. Brevedent died at Gondar soon after their arrival. An embassy on the part of the Abyssinian monarch was defeated by the interference of Maillet; but the Jesuits concerted another mission from France, and the person appointed as ambassador was M. de Roule, vice-consul at Damietta. This mission was very injudiciously conducted; the merchants at Cairo resisted it; the Franciscans obstructed it, and it terminated in the murder of the ambassador in the province of Sennaar. Yafous, the emperor, had been previously assassinated, in 1704, by a conspiracy of his wife and son, Teela Hainanout, who was himself assassinated in 1706, and succeeded by his uncle Tifilis, or Theophilus. After the death of this monarch, in 1709, the line of Solomon, by the queen of Sheba, was set aside, by the influence of the conspirators who had contributed to the murder of Yafous and Teela, and a stranger, called Oufkas, was seated on the Abyssinian throne. Oufkas was soon deposed; and David, son of Yafous, was proclaimed king of Abyssinia, and crowned at Gondar on the 30th of January, 1714. The dissensions among the Abyssinian clergy, that occurred in this reign, produced a dreadful massacre, and ended in the death of the king, who died, by poison, in 1719. He was succeeded by his brother, Bacuffa; and Bacuffa, in 1729, by his son Yafous II. His reign was disturbed by frequent seditious and rebellions; in one of which Gondar, the capital, was set on fire, and almost entirely ruined. He died in 1753,

not without the suspicion of having been poisoned, and was succeeded by his son Joas. The whole empire, in this reign, was divided into two powerful factions, the causes and effects of which are particularly recited by Mr. Bruce, who was witness of the confusion and tumult which they produced. In the process of this contention, Joas was assassinated; and, at his death, in 1769, Hannes, brother to the late king Bacuffa, was appointed emperor. Hannes, however, being maimed by the loss of his hand, was deemed incapable of assuming the sovereignty: he was removed by poison, and his son Tecla Haimanout II. was advanced to the throne. From, and even before the accession of Joas, Michael Ras, who had been appointed Rus or Governor of Tigré, and other provinces, and who was become master of almost one half of Abyssinia, had the principal direction and influence in the government of the country. His marriage with Ozoro Esther, a very beautiful and accomplished princess, and the widow of Mariam Barea, the most distinguished nobleman of the country, had very much augmented both his dignity and power. Hannes was established on the throne by his authority, and when he found that he was not likely to answer his purpose, he is supposed to have made way, by poison, for his successor Tecla Haimanout. This prince treated him, from the moment of his accession, with the affection and respect of a son; and this influence of Michael was very considerable in preserving the attachment and submission of his subjects, as well as in conducting the military operations of his reign. Of these Mr. Bruce has given a very minute detail, for which we must refer the reader to the 4th volume of his elaborate and comprehensive work.

ABYSSINIAN, in *Eccl. History*, is used as the name of a sect in the christian church, established in the empire of Abyssinia.

The Abyssinians are a branch of the Cophts, or Jacobites; with whom they agree in admitting only one nature in Jesus Christ, and rejecting the council of Chalcedon: whence they are also called MONOPHYTES, and EUTYCHIANS.

Some learned men are of opinion, that the Abyssinians, or Ethiopians, embraced the sentiments of the Monophysites in the ninth century, in consequence of the exhortations addressed to them by the doctors of that sect who resided in Egypt. But Mosheim (*Eccl. Hist.* v. ii. p. 363, 8vo.) says, it is certain that the Abyssinians, who were accustomed to receive their spiritual guide from the bishop of Alexandria, commenced Monophysites in the seventh century, if not sooner. For in that period the Arabians made themselves masters of Egypt, oppressed the Greeks, and granted to the Monophysites such a powerful protection, as enabled them to reduce under their jurisdiction almost all the churches that had been established in Egypt. The Abyssinians are, strictly speaking, a distinct body from the Cophts, who comprehend those Christians who dwell in Egypt, Nubia, and the adjacent countries, and whose condition is truly deplorable. They surpass the latter considerably in numbers, power, and opulence; nor is this surprising, when it is considered that they live under the dominion of a Christian emperor.

The Abyssinian church is governed by a bishop, or metropolitan, styled ABUNA, and sometimes, though improperly, patriarch, sent them by the Cophtic patriarch of Alexandria residing at Cairo, who is the only person that ordains priests. The first person who possessed the episcopal dignity was Frumentius, who converted the Abyssinians to Christianity in the beginning of the fourth century. Some, indeed, have supposed, that they were converted by the apostles; others have asserted, that the Eunuch, baptized

by Philip, upon his return to Candace, became the apostle of Abyssinia. But, if the Abyssinians were converted at so early a period, it is not likely that they should have continued without bishops, and without any kind of church-government for 300 years, and that they should have had no intercourse with neighbouring churches during this long period. Bold as we know, in fact, that the Christian religion had not penetrated into the court of Candace, who was much nearer to Egypt, in the time of Philip, and it therefore could not reach into the more distant mountainous country of Abyssinia. The Eunuch, when Candace departed, could not have been the same with Abyssinia; because, if this were the case, the whole story of the queen of Saba must be rejected as fabulous, as there must have been a woman sitting upon the throne of that country for 500 years, after she had been excluded by a fundamental law of the land. But we are assured by credible writers, that this Candace reigned upon the Nile, in Abura, much nearer to Egypt. Her capital was taken in the time of Augustus, as we have already mentioned under the article ABYSSINIA, and her successors and kingdom existed in the reign of the Abyssinian kings, long after the Mahometan conquest, and they exist there to this day. To which we may add, that the Abyssinians are known to have continued Jews and Heathens above 300 years after the time of the apostles. The ground upon which some ecclesiastical writers have attributed the conversion of the Abyssinians to the apostles, is a canon of a council, said to be that of Nice, found, or pretended to have been found, in Alexandria. This canon is written in Arabic, and is so unintelligible, says Mr. Bruce, who had seen it, that it scarce conveys any sense at all. But this canon regulated the precedency of the Abuna of Ethiopia in all succeeding councils, and places him immediately after the prelate of Seleucia. The Jews have availed themselves of this canon, in order to vindicate the honourable antiquity of the church of Ethiopia. The Abyssinian history informs us, that a queen reigned in Abyssinia, when Frumentius came into this country. Mr. Bruce observes, that though women are excluded from the Abyssinian throne, there exists a law, or custom, that the queen upon whose head the king shall have put the crown during his life, is regent of the kingdom, and guardian of every minor king, as long as she shall live. If such a queen should have a son, she would have the care of the kingdom, and of the king, during his minority: and if her son should die, and a minor, who was no relation to her, should succeed, she would still be regent, nor would her office cease till he came of age. This regent, for life, is called *Iteghé*. Such was probably the case at the time of Frumentius's settlement in Abyssinia. The history of the Abunas is very imperfectly known for many years after their appointment. The first of them, who is particularly mentioned, is Abuna Tecla Haimanout, who distinguished himself by the restoration of the royal family, and by the regulations made by him both in church and state. He established the law, that the Abyssinians should not have it in their power to chase any of their own countrymen as Abuna. The Arabic canon, above mentioned, may probably be attributed to this Abuna; and is a forgery in, or very soon after, his time. Tecla Haimanout was a native of Abyssinia, and therefore the prohibition had not taken place before his time; but as no Abyssinian was afterwards chosen to this office, the canon must be a work of his time; for it is impossible a canon should have been made by the council of Nice, settling the rank of a bishop in a nation which, for above 200 years after that general council, were not Christians. As the Abuna seldom understands the language of the country, he has no share of the government.

It is much sunk in general estimation from what he was formerly, chiefly by his intrigues, ignorance, avarice, and want of firmness. His principal employment is in the ordination of priests, deacons, and monks. Some of these Abunas have been merely lay-monks, without so much as priestly orders. Their revenue arises from the sale of dispensations, and of ordination, and from certain lands in the kingdoms of Tigré, Gojam, and Dembea, of which they are the sole farmers; to which we may add, a kind of public collection of salt and cloth annually made for them through the empire, which amounts to a considerable value.

The order next, if not in rank and dignity, yet in general estimation, to the Abuna, is that of the Debtaras, who are neither priests nor deacons, but a kind of Jewish Levites or chanters, who assist at all public offices of the church, and particularly in the conduct of all their musical performances. Besides these, every parochial church has a president, subordinate to the Abuna, called Komos, or Hegumenos, or Archi-presbyter, who has all the inferior priests and deacons, and all the secular affairs of the parish, under his inspection and government. The deacons occupy the lowest rank of the priesthood; they assist at divine service, and have their respective duties and vestments when they officiate. All these orders are allowed to marry; but the monks, who are very numerous, vow celibacy; and, it is said, with a reservation. Le Grand says, they make a promise aloud, before their superior, to keep chastity, but add in a low voice, *as you keep it*.

The monks are divided into two classes; those of Debra Libanos, and those of St. Eustathius. The head of the latter, who are grossly ignorant, is the superior of the convent of Mahebar Selassé, in the north-west corner of Abyssinia, near Kuara, and the Shangalla, towards Sennaar and the river Kender. The chief of the former is the Itchegué, who is ordained by two chief priests, holding a white cloth, or veil, over him, while another says a prayer; and they then lay all their hands on his head, and join in psalms together. This Itchegué is, in troublesome times, of much greater consequence than the Abuna. The monks do not live in convents, but in separate houses round their church, and each cultivates a part of the property they have in land. The churches in Abyssinia are very numerous. Every great man that dies thinks he has atoned for all his wickedness, if he leaves a fund to build a church, or has built one during his life. The king builds many. The situation of a church is chosen near running water, for the convenience of their purifications and ablutions, in which they strictly observe the Levitical law. The churches are placed on an eminence, and surrounded by rows of Virginia cedar, which form very pleasing objects along the face of the country. All the churches are round buildings, with conical summits, and thatched roofs, and on the outside encompassed with pillars of cedar, to which the roof projects about eight feet beyond the wall, so as to form an agreeable walk in hot weather, or in rain. The inside of the church is partitioned in the manner prescribed by the Mosaic law. In the first and outer circular apartment the congregation sit and pray. Within this is a square, divided by a veil or curtain, in which is another small division answering to the holy of holies, and so narrow, that none but the priests can enter it. Persons of both sexes, under Jewish disqualifications, are prohibited from going within the outer circumference of the church, and must perform their devotion at an awful distance among the cedars; and those who enter the church must put off their shoes, and take care they are not stolen by the priests and monks before they return; kiss the threshold and two door-posts, say any prayer which they think proper, and

thus their duty is finished. As for the doctrinal religion of the Abyssinians, it is that of the Greek church, which they received on their conversion to Christianity by Frumentius, about the year 335; and every rite or ceremony in the Abyssinian church may be traced to its origin in the Greek church whilst both of them were orthodox. Frumentius preserved it untainted with heresy whilst he lived. Afterwards Arianism, and a number of other heresies, as they are called, were brought by the monks from Egypt, and infected the church of Abyssinia. Many of these were owing at first to the various use of the two words, nature and person, than which no words were ever more equivocal in every language in which they have been translated. For some time the Abyssinians had free access to Cairo and Jerusalem, where their books were revised and corrected, and many of the principal orthodox opinions inculcated. But since the conquest of Arabia and Egypt by Sultan Selim, in 1516, their intercourse with those countries has been interrupted; and they are now, says Mr. Bruce, with regard to doctrine, as great heretics, and with respect to morals, as corrupt as the Jesuits have represented them. But though he concurs with the Jesuits in condemning their sentiments and practice, he disapproves of their mode of reforming them. The eucharist is received by the Abyssinians in both kinds: for this purpose they use unleavened bread, and the grape bruised with the husk, and forming a kind of marmalade, is substituted for wine, though an excellent strong wine is made at Dreedda, about thirty miles south-west of Gondar. The communicant after receiving, drinks a large draught of water, and turning his face to the wall of the church, repeats some prayer in private with apparent decency and attention. Whether the Abyssinians believe the doctrine of transubstantiation or not, is not absolutely certain. Ludolph (l. iii. c. 5.) thinks, that the words of consecration prove their disbelief of this doctrine. Mr. Bruce maintains the contrary opinion; though he tells us, that a priest declared to him, with great earnestness, that he never did believe that the elements in the eucharist were converted, by consecration, into the real body and blood of Christ. This, he said, was the Roman Catholic faith, but it never was his, and he conceived the bread to be bread, and the wine to be wine, even after consecration. With respect to the state of souls before the resurrection of the body, the opinion generally prevailing is, that there is no third state, but that the souls of good men enjoy the beatific vision immediately upon their separation from the body. However, their practice and their books contradict this opinion; for when any person dies, alms are given, and prayers are offered for the souls of those departed.

Upon the whole, we may observe, that the religion of the Abyssinians, in the present state of it, is unworthily dignified with the name of Christianity, since it consists in a motley collection of traditions and tenets, which have not any influence on practice. This people, of all ranks, of either sex, and of every age, are habitually liars, drunkards, gluttons, implacable in their resentment, faithless in their dealings, and cruel in their vengeance. The king has unlimited power; and a minister, in the king's name, exercises that power with the most licentious cruelty. The Abyssinians are totally illiterate; the arts cultivated among them remain in a state of great imperfection; and, which is a defect peculiar to themselves, they have not even an idea of music. Their bloody feasts, and their promiscuous amours, are too disgusting for description. Every thing in their country wears an air of wretchedness and meanness. Such are the reflections of an anonymous writer in the Monthly Review, vol. ii. p. 423. New Series.

The Abyssinians have divers times expressed an inclination to be reconciled to the see of Rome; but rather out of interest of state than any other motive. See *ABYSSINIA*.

Several missionaries accuse the Abyssinians of Judaism, in regard to the many Jewish observances still in use among them: some have even doubted, whether they are more Christians, or Jews. Lobo says expressly, they are more Christians in name: they practise circumcision on females as well as males. But different opinions are held in different provinces with regard to the origin and obligation of this rite, as well as the time and mode of performing it. The Abyssinians of Tigré profess to have derived it from Ishmael's family and his descendants, with whom they were connected at an early period in their trading voyages: and they say, that the queen of Sheba, and all the women of that coast, had suffered excision at the usual time of life, before puberty, and before her journey to Jerusalem. The Falasha declare, that their circumcision was that commonly practised at Jerusalem in the time of Solomon, and in use among them when they left Palestine, and came into Abyssinia. They perform it on the 8th day, as a religious rite, according to the first institution by God to Abraham. The Abyssinians pretend theirs is not of this kind, and that they practise it because Christ and the apostles were circumcised, though they do not hold it necessary to salvation. But none of them pretend that circumcision arises from any kind of necessity, or from any impediment to procreation, or that it is necessary for cleanliness, or from the heat of the climate; and therefore it is probable, that it was originally derived from a divine command, and as such, transmitted to them. See *CIRCUMCISION*. The Abyssinians eat no meats prohibited by the law of Moses. Women are obliged to the legal purifications. Brothers marry their brothers' wives, &c. They abstain from hog's flesh, blood, meats strangled, &c., and observe both Saturday and Sunday sabbath, according to the custom of the primitive church: all of them marks of Judaism; though by some resolved into mere human institution, and usage. They celebrate the Epiphany with peculiar festivity, in memory of Christ's baptism; when they plunge and sport in ponds and rivers, which has occasioned some to affirm that they were baptised a-new every year. This is positively asserted by Alvarez, but as positively contradicted by Mr. Bruce, (vol. iii. p. 324, &c.) who has given a very ample account of this ceremony, which is an old observance of the eastern church, formerly performed publicly in Egypt, as it is now in Ethiopia. Many falsehoods have been propagated with regard to the mode of baptism in Abyssinia, in order to impugn the validity of it, and to excuse the rash conduct of the Jesuits in rebaptising all the Abyssinians, as if they had been a Jewish and Pagan people that had never been baptised at all. Among the saints-days, which are very numerous, is one consecrated to Pilate and his wife; because Pilate washed his hands before he pronounced sentence on Christ; and his wife desired him to have nothing to do with the blood of that just person. They have four Lents: the great one commences ten days earlier than ours, and is observed with much severity, many abstaining therein even from fish, because St. Paul says there is one kind of flesh of men, and another of fishes. They allow of divorce, which is easily granted among them, and by the civil judge: nor do their civil laws prohibit polygamy. They have at least as many miracles, and legends of saints, as the Romish church; which proved no small embarrassment to the Jesuit missionaries, to whom they produced so many miracles, wrought by their saints, in proof of their religion, and those so well circumstantiated and attested, that the Jesuits were obliged to deny miracles to be

any sufficient proof of a true religion; and to allege the same arguments against the Abyssinians, which protestants in Europe allege against the papists. They pray for the dead, and invoke saints and angels; and have so great a veneration for the Virgin, that they charged the Jesuits with not rendering her honour enough. Images in painting they venerate, and pictures have been used in the churches from the earliest age of Christianity, but they abhor all those that are embossed and in relief; nor do they use a cross on the top of the ball of the Seneck or standard, because it casts a shade. They hold that the soul of man is not created, because, say they, God finished all his works on the sixth day. They have the same books of scripture with us; though few are able to purchase entire copies either of the Old or New Testament. The Revelation of St. John is a favourite book with them. The Song of Solomon is also much esteemed by the old priests, but the reading of it is prohibited to the young ones, the deacons, laymen, and women. The Abyssinians believe that this song was made by Solomon in praise of Pharaoh's daughter; but they do not think, with some of our divines, that it contains any mystery or allegory respecting Christ and the church. They also admit the apocryphal books, and the canons of the apostles, as well as the apostolical constitutions, for genuine. Their liturgy is given by Alvarez, and in English by Pagit; their calendar by Ludolf; the answers to abbé Gregory to certain questions, proposed by the author last cited, are published by Fabricius, under the title of *Theologia Æthiopica*.

ACA, *Acco*, and *ACON*, in *Ancient Geography*, a town of Phœnicia, on the Mediterranean; afterwards called *Ptolemais*, now *ACRE*. See *ACHA*.

ACABA, a ridge of mountains near *GERRI*, in Abyssinia.

ACABENE, one of the districts or provinces into which Ptolemy divided Egypt. It was situated near the river Tigris.

ACABIS, a small town in Cyrenaica, mentioned by Ptolemy.

ACACALIS, in the *Materia Medica*, the name given by some authors to the *siliqua sylvæstris*, or wild *carob*. Dale.

ACACALOTL, or *ACALOT*, in *Ornithology*, the name of an American bird, which is the *TANTALUS Mexicanus* of Gmelin, and called by some *CORVUS aquaticus*, or the water raven.

ACACESIUM, a city of Arcadia, so called from Acacus the son of Lycaon. It is mentioned by Pausanias, l. 8.

ACACIA, or *AKARIA*, *Martin*, in *Biography*, was born at Chalons sur Marne, about the year 1520. He studied at Paris under the celebrated Monf. Brissot, and was made Professor of Medicine and Surgery there, and acquired considerable reputation as a teacher in those sciences.

He published commentaries on several of the works of Galen, in the years 1548, and 1555, and two books de Morbis Muliebribus, inserted in the *Gynæcia* by Spachicus. He died in the year 1588.

ACACIA, in *Botany*. See *GUILANDINA*, *GUAJACUM*, *MIMOSA*, *POINCIANA*, and *SPARTIUM*.

The flowers of a species of the acacia are used by the Chinese in making that yellow, which, we see, bears washing in their silks and stuffs; and appears with so much elegance in their painting on paper. The method is this:

They gather the flowers before they are fully open; these they put into a clean earthen vessel over a gentle heat, and stir them continually about, as they do the tea-leaves, till they become dryish and of a yellowish colour; then to half a pound of the flowers they add three spoonfuls of fair

water, and after that a little more, till there is just enough to hold the flowers incorporated together: they boil this for some time, and the juice of the flowers mixing with the water, it becomes thick and yellow; then they take it from the fire and strain it through a piece of coarse silk. To the liquor they add half an ounce of common alum, and an ounce of calcined oyster-shells reduced to a fine powder. All is then well mixed together; and this is the fine lasting yellow they have so long used.

The dyers of large pieces use the flowers and seeds of the acacia for dyeing three different sorts of yellow. They roast the flowers, as before observed; and then mix the seeds with them, which must be gathered for this purpose when full ripe: by different admixture of these they give the different shades of colours; only for the deepest of all, they give a small mixture of Brasil wood.

M. Geoffroy attributes the origin of bezoar to the seeds of this plant; which being broued by certain animals, and vellicating the stomach by their great sourness and astringency, cause a condensation of the juices, till at length they become coated over with a stony matter, which we call BEZOAR, or BEZOARD.

ACACIA, *bastard or false*, in Botany. See ROBINIA.

ACACIA *Indiana*, signifies TAMARIND.

ACACIA, *three-thorned*. See GLEDITSIA.

ACACIA *Zeylanica*, signifies LOGWOOD.

ACACIA, in the *Materia Medica*, is a subastringent gummy substance, prepared by inspissating to a due consistence, the juice expressed from the unripe pods of the *Acacia foliis scorpioidis leguminose* of Bauhine, or the *MIMOSA Nilotica* of Linnæus. For an account of the pods, and manner of preparing the juice, see Murray's Apparatus Med. vol. ii. p. 412. This substance is brought from Egypt, in roundish masses, wrapt up in thin bladders from four to eight ounces in weight. It is outwardly of a blackish brown colour, and inwardly of a reddish or yellowish brown. This juice totally dissolves in water; but rectified spirit produces little or no effect upon it; it is therefore truly of the gummy kind. It has no smell, and applied to the tongue it soon softens, and manifests first a moderately rough and then a sweetish taste.

This mild gummy astringent may be given to advantage in disorders arising from laxity and acrimony, as habitual diarrhœas, uterine fluors, and catarrhal coughs. By the Egyptians it is used against spitting of blood, in doses of a dram; and also in collyria for strengthening the eyes, in gargarisms for quinseys, and glysters for diarrhœas. Among us it is seldom otherwise used than as an ingredient in mithridate or theriaca. The above substance has been called *Acacia vera*, by way of distinction from the *German Acacia*, which is a counterfeit of the other, and often sold for it in the shops. This is the inspissated juice of unripe sloes, formed by boiling the juice to the consistence of a solid extract. It is distinguished from the *true Acacia* chiefly by its colour, which is as black as that of Spanish liquorice, and also by being harder and heavier, and of a sharper taste, and by giving out its astringency to rectified spirit. This is administered in fluxes, that indicate the want of styptic medicines, in doses from a scruple to a dram. Lewis, Mat. Med.

ACACIA, among *Antiquaries*, denotes something resembling a kind of roll or bag, seen on medals in the hands of several of the consuls and emperors from the time of Anastasius.

According to Du-Cange, the *ακακία*, properly so called, was a purple bag filled with earth, or sand, and born by the prince in his left hand, to remind him of his frailty and

mortality; and thus to prevent his being too much elated with his station.

But authors are not agreed, either about the use of this roll, or about the substance whercof it consists; some taking it for a handkerchief rolled up, which the person who presided at the games threw out as a signal for their beginning; whilst others rather imagine it intended to represent a roll of memoirs, or petitions.

ACACIANS, in *Church History*, the followers of Acacius, bishop of Cæsarea, who flourished about the middle of the fourth century. He succeeded his preceptor, the famous Eusebius, in 340, wrote his life, and several other works, viz. 17 books upon Ecclesiastes, six books of Miscellaneous Questions, and a book against Marcellus, and died about the year 356. He was surnamed Lufcus, or Monophthalmus, because he could see only with one eye. He is generally reckoned a man of unsteady principles, but he was sensible and eloquent, and a skilful disputant. Some of the Acacians maintained, that the Son was not of the same, but of a similar substance with the Father: others held that he was of a different substance from the Father. This was likewise the denomination of another sect, derived from the name of their leader, a patriarch of Constantinople, in the fifth century, who favoured the opinion of Eutyches. See EUTYCHIANS, and MONOPHYTES.

It was by the advice of this *Acacius*, who succeeded Genadius in 471, and died in 489, that the HENOTICON was published, by the emperor Zeno in 482. In this connection we cannot forbear introducing a circumstance, that redounds much to the honour of another Acacius, bishop of Amida, in 420, whose name, says Gibbon, (*Hist. Decl. and Fall of the Rom. Emp.* vol. v. p. 427, 8vo.) might have dignified the faintly calendar. Boldly declaring that cups of gold and silver are useless to a god, who neither eats nor drinks, this generous prelate sold the plate of the church of Amida; employed the price in the redemption of 7000 Persian captives; supplied their wants with affectionate liberality; and dismissed them to their native country, to inform the king of the true spirit of the religion which he persecuted. The king, it is said, was so affected with this act of benevolence, that he wished to see the bishop; and the interview produced a peace between this prince, Veranius, and Theodosius I.

ACACIUS, a name given to several bishops, and other eminent persons besides those mentioned under the preceding article; particularly a martyr under the emperor Decius; a patriarch of Antioch, who succeeded Basil in 458, and died in 459; a bishop of Miletum in the 5th century; another bishop of Beroea in Syria, who was present at the council held at Constantinople in 381, the friend of Epiphanius Flavianus, and the enemy of John Chrysostom, bishop of Constantinople, whom he caused to be deposed, and who, at the age of 110 years, advised Theodosius the younger, to confirm the sentence pronounced against Nestorius, and also against Cyril, bishop of Alexandria: he was eminent for wisdom and sanctity, says Theodoret, and died in 436:—and a famous rhetorician in the reign of the emperor Julian.

ACADA, see PORTO BELLO.

ACADEMICS, a sect of philosophers who followed the doctrine of SOCRATES and PLATO, as to the uncertainty of knowledge, and the incomprehensibility of truth.

Academic, in this sense, amounts to much the same with Platonist; the difference between them being only in point of time. They who embraced the system of Plato, among the ancients, were called *Academici*; whereas those who did the same, since the restoration of learning, have assumed the denomination of PLATONISTS.

We usually reckon three sects of Academics; though some make five. The ancient *Academy* was that which was founded by Plato; and consisted of those followers of this eminent philosopher, who taught the doctrine of their master without mixture or corruption. The first of these was SPEUSIPPUS; he was succeeded by XENOCRATES. After his death the direction of the academy devolved upon POLEMO, and then upon CRATES, and terminated with CRANTOR. After the death of Crates, a new tribe of philosophers arose, who on account of certain innovations in their manner of philosophising, which in some measure receded from the Platonic system, without entirely deserting it, have been distinguished by the appellation of the *Second* or *Middle Academy*. The first preceptor, who appears in this class, and who, in consequence of the innovations which he introduced into the Platonic school, has been commonly considered as the founder of this Academy, is ARCESILAUS.

In order to conceive justly concerning the nature and causes of this revolution, it will be proper to advert to the state of opinions in the preceding period. It had been very generally maintained by both the Greek and Barbaric philosophers, that there can be no certain knowledge of things so variable and fluctuating as those material objects which fall under the notice of the senses. But they did not imagine, that human reason is wholly incapable of arriving at truth; nor was the doctrine of universal scepticism introduced in the infancy of philosophy. In excluding material objects from the department of science, the first philosophers discovered an inclination to inquire with modesty concerning the nature of things, to divest themselves of prejudice, and to satisfy themselves with a sober assent to those truths which lay within the reach of the human understanding. Besides, the Barbaric philosophers, and after them the Greeks, held two kinds of doctrine, the popular for the amusement of the vulgar, and the concealed, which was communicated in the confidence of mere private instruction to their professed disciples. Such was the state of philosophy, when Socrates appeared, and exerted himself in regulating the conduct of the human mind. In opposition to the Sophists, who boasted that they knew every thing, he confessed that he knew nothing; by which acknowledgment he did not mean to assert the universal uncertainty of human knowledge, but merely to convince his followers of the futility of those speculations, which do not rest upon the firm foundation of experience, and to teach them modesty in their inquiries, and diffidence in their assertions. Among the sects who sprung out of the school of Socrates, the greater number deviated into the mazes of disputation, and resumed the Sophistic mode of arguing on either side of every question, that was proposed. Plato inclined to a stricter method of philosophising; and in his public disputations after the Socratic manner, whilst he refuted the opinions of others, and left his hearers undecided concerning his own, he fully explained the principles of his philosophy to those pupils who were indulged with his private and confidential instruction. His doctrine was, that no certain knowledge can be obtained concerning the varying forms of natural bodies, and that ideas are the only objects of science. This doctrine was universally taught in the *Old Academy*; but before the time of Arcesilaus, it was never denied, that useful opinions may be deduced from the senses. Cic. Acad. l. i. c. 8. tom. ii. Ed. Olivet. Two sects arose about this time, which threatened the destruction of the Platonic system; one was founded by PYRRHO, which held the doctrine of universal scepticism, and the other by ZENO, which maintained the certainty of human knowledge, and taught with great confidence, a doctrine essentially different from that of Plato. In this

situation, Arcesilaus thought it necessary to exercise a cautious reserve with regard to the doctrine of his master, and to conceal his opinions from the vulgar, under the appearance of doubt and uncertainty. Professing to derive his doctrine concerning the uncertainty of knowledge from Socrates, Plato, and other philosophers, he maintained, that though there is a real certainty in the nature of things, every thing is uncertain to the human understanding, and consequently that all confident assertions are unreasonable. He thought it disgraceful to assent to any proposition, the truth of which is not fully established, and maintained that, in all questions, opposite opinions may be supported by arguments of equal weight. He disputed against the testimony of the senses, and the authority of reason; acknowledging at the same time, that they furnish probable opinions sufficient for the conduct of life. However, his secret design seems to have been to establish the doctrine of Plato, that the knowledge derived from sensible objects is uncertain, and that the only true science is that which is employed upon the immutable objects of intelligence, or ideas.

After the death of Arcesilaus, the Platonic school was successively under the care of LACYDES, who is said to have founded a new school, merely because he changed the place of instruction, and held it in the garden of Attalus, within the limits of the Academic grove, and of Evander and Egesinus. Arcesilaus, however, had opposed the Stoics and other dogmatical philosophers, with such violence, and extended his doctrine of uncertainty so far, as to alarm not only the general body of philosophers, who treated him as a common enemy to philosophy, but even the governors of the state, who apprehended that his opinions would dissolve all the bonds of social virtue and of religion. His successors, therefore, found it difficult to support the credit of the academy; and CARNEADES, one of the disciples of this school, relinquished, at least in words, some of the more obnoxious tenets of Arcesilaus.

From this period the Platonic school assumed the appellation of the *New Academy*, which may be reckoned the *third* in order from its first establishment. It was the doctrine of this Academy, that the senses, the understanding, and the imagination, frequently deceive us, and therefore cannot be infallible judges of truth; but that, from the impressions produced on the mind, by means of the senses, called by Carneades phantasies, or images, we infer appearances of truth, or probabilities. These images do not always correspond to the real nature of things, and there is no infallible method of determining when they are true or false; and consequently they afford no certain criterion of truth. But, with respect to the conduct of life and the pursuit of happiness, probable appearances are a sufficient guide, because it is unreasonable not to allow some degree of credit to those witnesses who commonly give a true report. See PROBABILITY. According to the doctrine of the *New Academy*, the judgments arising from the operation of the mind in estimating the different degrees of probability, are not science, but opinion, which is all the knowledge that the human mind is capable of attaining. The chief point of difference between the *Middle* and the *New Academy*, seems to have been, that the latter taught the doctrine of uncertainty in less exceptional terms than the former. Dr. Warburton, however, offers several reasons to shew that both these Academies were in reality the same, and that they were as real sceptics, as the sect which was so denominated. See Div. Leg. of Moses, vol. ii. p. 117, 118, 4th ed. Arcesilaus, in his zeal for overturning all other sects, furnished his opponents with a pretext for charging

him with attempts to undermine the whole foundation of morals. Carneades, availing himself of probability, afforded sufficient scope for practical principles of conduct. Arcesilaus was chiefly employed in opposing the tenets of other philosophers in logic and physics, and paid little attention to ethics. Carneades, whilst he inculcated the necessity of suspense in speculative researches, prescribed rules for the direction of life and manners. The immediate successor of Carneades, in the *New Academy*, was CLITOMACHUS. He was succeeded by PHILO of Larissa, who is considered by some writers as the founder of a *fourth Academy*; and a *fifth* is said to have been established by ANTIQCHUS of Ascalon, who was the last preceptor of the Platonic school, and who attempted to reconcile the tenets of the different sects, and maintained that the doctrines of the STOIICS were to be found in the writings of Plato. After his time the professors of the Academic philosophy were dispersed by the tumults of war, and the school itself was transferred to Rome. Here the philosophy of the *Old Academy*, revived and corrected by Antiochus, found many advocates. Amongst the most eminent of these we may reckon LUCULLUS, MARCUS BRUTUS, M. Terentius VARRO, and M. PISO. The *Middle Academy* had likewise its patrons in this city: as it was founded upon a conviction of the imbecility of human reason, without running, with the Pyrrhonists, into the extravagance of an entire suspension of opinion, it became a favourite sect among the Romans. CICERO, to whose profession, as a public pleader, whose business it was to collect arguments from all quarters on opposite sides of every doubtful question, it was peculiarly adapted, addicted himself to this sect; and having himself been instructed by Philo, he would not find it difficult to induce others to follow his example. Cicero De Off. l. 2. c. 2. Oper. tom. iii. p. 328. Tusc. l. 2. c. 2. tom. ii. p. 353.—l. 4. c. 4. tom. ii. p. 419. Acad. Qu. passim. tom. ii. p. 5—99. De Fin. l. 2. c. 1. tom. ii. p. 129—l. 5. c. 3—5. tom. ii. p. 248—251. De Orat. l. 3. c. 16—18. tom. i. p. 328. De Nat. Deorum, l. 1. c. 5—7. tom. ii. p. 504. Philos. Fragm. tom. iii. p. 585. Ed. Olivet. Genev.—Diog. Laert. l. 3—4—6. tom. i. Ed. Amst.—Sext. Emp. l. 1. c. 33. p. 56. Contra Logic. l. 7. p. 401, &c. Ed. Fabr. Lips. Enf. Hist. of Philos. b. 2. c. 8. vol. i. p. 238, &c. b. 3. c. 1. vol. ii. p. 9—11. See ECTHETICS, PLATONISTS, and SCEPTICS. For the difference between the Academics and Sceptics; See SCEPTICS.

ACADEMICS, ACADEMICIANS, or ACADEMISTS, is also used among us for the members of the modern academies, or instituted societies of learned persons.

ACADEMY, ACADEMIA, in *Antiquity*, a public grove, or villa, situate in one of the suburbs of Athens, about six stadia, or $\frac{2}{3}$ of a mile from the city; where Plato, and the wise men who followed him, held assemblies for dispute and philosophical conference; and which gave the denomination to the sect of ACADEMICS.

It took its name *academy*, from one Academicus, or Ecademus, a citizen of Athens, to whom it originally belonged; and who appropriated it to gymnastic sports or exercises.—He lived in the time of Thales.

Some, erroneously, derive its name and origin from Cadmus the Phœnician, as being the first who introduced learning, and the use of letters, among the Greeks.

The academy was farther improved and adorned by Cimon, with fountains, trees, shady walks, &c. for the convenience of the philosophers and men of learning who here met to confer, dispute, &c.—Hipparchus, the son of Pisistratus, built a wall round it: and, in order to defray the charges, laid so heavy a tax on the people, that ever

after 'Ἰππάρχῳ ταχόν, was used proverbially for any expensive business. It was also the burying-place of illustrious persons, who had deserved well of the republic. Of this retreat, so well adapted to philosophy and the muses, Horace speaks, Epill. 11. 45.

“Atque inter sylvas Academi quærere verum.”
“Midst academic groves to search for truth.”

Within this inclosure Plato possessed, as a part of his humble patrimony, purchased at the price of three thousand drachmas, or about 116l. 10s. 6d. sterling, a small garden, in which he opened a school for the reception of those who might be disposed to attend his instructions.

Here he taught his philosophy: and from this circumstance all public places, destined for the assemblies of the learned and ingenious, have been since called ACADEMIES.

Sylla sacrificed the delicious groves and walks of the academy, planted by Cimon, to the laws of war; and employed those very trees to make machines with which to batter the city. Cicero also had a villa, or country retirement near Puzzuoli, which he called by the same name, *academia*; where he used to entertain his philosophical friends.—It was here he composed his *Academical Questions*, and his book *De Natura Deorum*.

ACADEMY is more frequently used among the moderns, for a regular SOCIETY, or company of learned persons; instituted generally under the protection of a prince, for the cultivation and improvement of arts or sciences.

Ptolemy Soter, in order to encourage and improve the liberal arts in his dominions, founded an academy at Alexandria, or a society of learned men, who devoted themselves to the study of philosophy, and all other sciences; and he provided them with a collection of books, which became by degrees the finest library in the world, and has been known under the name of the ALEXANDRIAN library.

Theodosius the younger, founded an academy at Constantinople, which he furnished with able professors of every science, intending it as a rival institution to that at Rome, which, with other literary seminaries, had been destroyed by Alaric and the Goths, towards the close of the fourth, and beginning of the fifth centuries.

Some authors confound academy with university; but though much the same in Latin, they are very different things in English.—An university is, properly, a body composed of graduates in the several faculties; of professors, who teach in the public schools; of regents or tutors, and students who learn under them, and aspire likewise to degrees. Whereas, an academy is not intended to teach or profess any art, such as it is, but to improve it: it is not for novices to be instructed in, but for those that are more knowing; for persons of distinguished abilities to confer in, and communicate their lights and discoveries to each other, for their mutual benefit and improvement.

The first academy we read of, was established by Charlemagne at the motion of ALCUIN: it was composed of the chief wits of the court, the emperor himself being a member.—In their academical conferences, every person was to give an account of what ancient authors he had read; and each of them assumed the name of some ancient author who pleased him most, or some celebrated person of antiquity. Alcuin, from whose letters we learn these particulars, took that of Placcus, the surname of Horace; a young lord named Augilbert, took that of Homer; Adelard, bishop of Corbie, was called Augultin; Riculf, bishop of Mentz, was Dametas; and the king himself, David.

Most nations have now their academies; but Italy has the greatest number.

Of these useful institutions we shall give an account in the following order.

ACADEMIES of *Antiquities*; as

The *Academy* at Cortona, established for the study of the *Hetrurian antiquities*; which are numerous and extensive. Their head is called *Lucumon*, a name taken from the ancient governors of *Hetruria*. One of their laws is to give audience to poets only one day in the year: another is, to fix their sessions, and impose a tax of a dissertation on each member in his turn.

The *Academy of Antiquities* at Upsal, owes its rise to queen *Christina*, but its establishment chiefly to *Charles Gustavus* her successor. Its design is for illustrating the northern languages, and the antiquities of the country, as stones, coins, and the like monuments; in which notable discoveries have been made by it. The more eminent of its members have been *Verelius*, *Loecenius*, *Schiesier*, *Rudbecks*, *Keder*, *Salin*, *Perischiold*, &c.

ACADEMY, of *Architecture*, was established at Paris by *M. Colbert*, in 1671, consisting of a company of skilful artists, under the direction of the Superintendent of the buildings.

ACADEMY, *Royal, of Arts*, was instituted in London for the encouragement of *Designing, Painting, Sculpture, &c.* &c. in the year 1768. This academy is under the immediate patronage of the king, and under the direction of forty artists of the first rank in their several professions. It furnishes, in winter, living models of different characters, to draw after; and in summer, models of the same kind to paint after. Nine of the ablest academicians, are annually elected out of the forty, whose business is to attend by rotation, to set the figures, to examine the performances of the students, and to give them necessary instructions. There are likewise four professors of *Painting, of Architecture, of Anatomy, and of Perspective*, who annually read public lectures on the subjects of their several departments; beside a president, a council, and other officers.

The admission to this academy is free to all students, properly qualified to reap advantage from the studies cultivated in it; and there is an annual exhibition of paintings, sculptures, and designs, open to all artists of distinguished merit.

The *Academy of Arts*, at Petersburg, was established by the empress *Elizabeth*, at the suggestion of count *Shuvalof*, and annexed to the *Academy of Sciences*. The late empress *Catharine* has formed it into a separate institution, enlarged the annual revenue from 4000l. to 12,000l., and augmented the number of scholars from 40 to 300. She has also constructed, for the accommodation of the members, a large circular building, which fronts the *Neva*. The scholars are admitted at the age of six, and continue to 18; and they are lodged, clothed, fed, and taught, at the expence of the crown. All of them are instructed in reading and writing, arithmetic, the French and German languages, and drawing. At the age of 14, they may chuse any of the following arts, which are distributed into four classes: 1. *Painting* in all its branches of history, portrait, battle, and landscape; architecture; mosaic; enamelling, &c. 2. *Engraving* on copper-plates, seal-cutting, &c. 3. *Carving* in wood, ivory, and amber. 4. *Watch-making, turnery, instrument-making, casting statues in bronze and other metals, imitating gems and medals in paste and other compositions, gilding, and varnishing.* Prizes are annually distributed among those who excel in any particular art; and from those who have obtained four prizes 12 are selected, who are sent abroad at the public charge. Their travelling expences are defrayed; and when they settle in any town, they receive an annual salary of 60l. for four years. There

is an assortment of paintings and models for the use of the scholars.

ACADEMIES, of *Painting, Sculpture, and Architecture*: as these celebrated ones anciently at Florence and Milan, called also *school*; and that other at Bologna, incorporated into the new institute; to which may be added the academy of painting and sculpture at Paris and Vienna; another of designing at Rome.

ACADEMY of *Painting and Sculpture* at Paris, was first projected by *Le Brun, Sarazin, Cornille, &c.* for which they obtained an arret of council in 1648, and established in 1654 and 1655, under the Cardinal *Mazarine*, first protector thereof; and the chancellor *Sequier* vice-protector. In 1663, a pension of 4000 livres was granted to the academy by the interposition of *M. Colbert*. It consists, besides, of a director, a chancellor, four rectors, a treasurer, and four professors, one of anatomy, and another of geometry; adjuncts to the rectors and professors; counsellors; a secretary; an historiographer, and two ushers.

Persons are here admitted either in quality of painters or sculptors, who model from a naked person.—The painters are admitted according to their respective talents; there being a distinction made between those who work in history, and those who only paint portraits, or landscapes, or beasts, or fruits, or flowers, or paint in miniature; or only design, or engrave, or carve, &c. In the Academy of painting there are 12 professors, each of whom attends a month in the year, and their place is supplied by 12 adjuncts. The professor upon duty places the naked man as he thinks proper, and sets him in two different attitudes every week. This they call *setting the model*. In one week of this month he sets two models together, which is called *setting the group*. The paintings and models made after this model are denominated *academics, or academy-figures*. They have likewise a woman who stands for a model in the public school. Three prizes for design are distributed every three months among the elites or scholars; two others for painting, and two for sculpture every year. An account of this academy has been published by *Guerin*, under the following title, *Descript. De l'Acad. Roy. de Peinture & Sculpt.*

There is also a French academy of painting, sculpture, &c. at Rome, established by *Lewis XIV.*, wherein those who have won the annual prizes in the like academy at Paris, are received and entertained for three years with a view to farther improvement.

An *Academy* of drawing and sculpture was established at *Manheim*, by *Charles Theodore*, elector Palatine, in 1775, with a view of encouraging and promoting the fine arts.

The *Academy* of painting and sculpture, at *Stockholm*, has nine professors, and commonly about 400 scholars. This academy annually distributes three large and three small medals; and the students who most distinguish themselves, are permitted to travel into France and Italy, at the expence of the institution.

ACADEMIES of *Belles Lettres*, those wherein eloquence and poetry are chiefly cultivated. Italy abounds with these; and in France there are not a few; such are

The *Academy* of *Umidi* at Florence, called afterwards *La Fiorentina*, in honour of the grand-duke *Cosmo I.* who declared himself its protector in 1549, is illustrious both for the works it has produced, and its members; which for these two last ages have included most of the eminent men, not only in *Tuscany*, but in all Italy. Their chief attention is to the Italian poetry.

ACADEMY of *Humorists, Umaristi*, had its origin at Rome, from the marriage of *Lorenzo Mancini*, a Roman gentleman, at which several persons of rank were guests; and

and it being carnival time, to give the ladies some diversion, they took themselves to the reciting of verses, sonnets, speeches, and comedies, first, *ex tempore*, and afterwards premeditatedly; which gave them the denomination of *Belli Humori*. After some experience, coming more and more into the taste of these exercises, they resolved to form an *academy of Belles Lettres*: and changed the title of *Belli Humori* for that of *Humoristi*; choosing for their device a cloud, which, after being formed of the saline exhalations of the sea, returns in a gentle sweet shower, with the motto from Lucretius, *redit aequino dulci*.

ACADEMY of *Arcadi* was established at Rome in 1690, for reviving the study of poetry, and the *belles lettres*; and comprehends most of the polite wits in Italy, of both sexes; many princes, cardinals, and other ecclesiastics: to avoid all disputes among whom, about pre-eminence, it is wisely provided, that all appear masked, after the manner of shepherds of *Arcadia*. Within ten years from its first establishment, the number of *Academists* amounted to 600. They hold assemblies seven times a year, in a mead or grove; or in the gardens of some nobleman of distinction. Six of these meetings are employed in the recitation of poems, and verses of the *Arcadi* residing at Rome, who read their own compositions: except ladies and cardinals, who are allowed to make use of other shepherds for this office. The seventh meeting is set apart for the compositions of foreign, or absent members; in which there is more entertainment than in all the rest; because the pieces produced here are written in all the different styles and dialects of Italy. The government of this academy is wholly democratical, allowing of no prince or protector, but only a *custos*, who represents the whole society, chosen each olympiad, that is, every four years; with a power of electing twelve others yearly, to assist him in the administration. Under these are two *subcustodes*, one vicar or *procurator*, and four deputies or superintendants, annually chosen. There are five ways of electing members; the first called *acclamation*, used when sovereign princes, cardinals, and ambassadors of kings, desire to be admitted; in which case the votes are given *viva voce*; the second, *annumeration*, introduced in favour of ladies and academical colonies; where the votes are taken privately: the third, *representation*, established in favour of colleges and universities, where the young gentry are bred; who have each a privilege of recommending one, or two members, privately to be balloted for: the fourth, *surrogation*, whereby new shepherds are substituted in the room of those dead, or expelled: the last, *designation*, whereby, when there is no vacancy of members, persons of poetical merit have the title *Arcadi* conferred on them, till such time as a vacancy shall happen. All the members of this body at their admission, assume new pastoral names, in imitation of those of the ancient *Arcadians*. The academy has divers colonies of *Arcadi* established in other cities in Italy, all regulated after the same manner.

ACADEMY, *Royal* at Caën, was established by letters patent in 1705; it had its rise fifty years earlier in private conferences, held first in the house of M. de Brioux. M. de Segrais retiring to this city, to spend the rest of his days, restored and gave new lustre to their meetings. In 1707, M. Foucault, intendant of the generality of Caën, procured the king's letters patent for erecting them into a perpetual academy, of which M. Foucault was to be protector for the time, and the choice afterwards left to the members, the number of whom was fixed to thirty, and the choice of them, for this time, left to M. Foucault. Before the thirty, leave is given to add some supernumerary members, not exceeding six, from the ecclesiastical communities in that city.

An assembly of men of letters was formed at Lyons, which merely wanted letters patent to constitute a royal academy, inferior to few in France. It consisted of twenty academists, with a director at their head, and a secretary who is perpetual. F. Lombard, a Jesuit, one of the members here read a learned dissertation on infinity.

There is an *Academy* of Belles Lettres, History, and Antiquities at Stockholm, the Memoirs of which are published in the Swedish language.

ACADEMIES, *Chirurgical*; as that first instituted at Paris in 1731, and finally established by letters patent from the king in 1748; the members of which are not only to publish their own and correspondents' observations and improvements, but to give an account of all that is published in surgery, and to compose a complete history of this art, by their extracts from all the authors, ancient and modern, who have wrote on it. A question in surgery is to be proposed by the academy yearly; and a prize of a gold medal of five hundred livres value to be given to him who furnishes the most satisfactory answer.

ACADEMY of *Surgery* was instituted some years ago at Vienna by the emperor, under the direction of the celebrated Brambilla. It had at first only two professors, who had the charge of instructing 130 young men, of whom thirty had been surgeons in the army. But the number both of teachers and pupils has been much increased. They are provided with a large edifice in Vienna, which affords habitation for the teachers and students, and also for pregnant women, and patients for clinical lectures, and new arts. They have also a medical library, a complete set of surgical instruments, an apparatus for experiments in natural philosophy, a collection of specimens in natural history, a number of anatomical and pathological preparations, and a variety of other useful articles. Adjoining to the building, there is also a good botanical garden. Three prize-medals, of the value of forty florins each, are annually bestowed on the students who return the best answers to the questions proposed in the preceding year.

ACADEMIES, *Cosmographical*; as that of the Argonauts at Venice, instituted at the solicitation of F. Coronelli, for the improvement of *Geography*. The design of the *academia cosmographica* is to procure exact maps, geographical, topographical, hydrographical, and ichnographical, of the celestial as well as terrestrial globe, and the several regions and parts thereof, together with geographical, historical, and astronomical descriptions: in order to which, the several members oblige themselves, by their subscription, to take one or more copies of each piece, published under the direction of the academy; and to advance the money or part of it, in order to defray the charge of publication. To this end, three societies were settled at Venice, Paris, and Rome: the first under F. Moro, provincial of the Minorites of Hungary; the second under the abbot Laurence au Rue Payenne au Marais; the third, under F. Ant. Baldigiani, Jesuit, professor of Mathematics in the Roman college; to whom those address themselves, who are willing to engage in this design. The number of members in the several countries of Europe has been considerable; their device is the terraqueous globe, with the motto, *plus ultra*. At the expence of this academy, all the globes, maps, and geographical writings of F. Coronelli have been published.

ACADEMY of *Dancing*. One of this kind was instituted by Louis XIV. with extraordinary privileges.

ACADEMIES, *Ecclesiastical*; as that at Bologna, instituted in 1687, and employed in the examination of the doctrine, discipline, and history of each age of the church.

ACADEMIES, *Historical*; as the *Royal Academy of Portuguese*

queste History at Lisbon, which was instituted by king John V. in 1720, as appears by a medal struck by the academy, on the front whereof is that prince's effigy, with the inscription *Johannes V. Lusitanorum Rex*; and on the reverse, the same prince standing is represented supporting and raising History, almost prostrate before him, with the legend *Historia Resurgens*: underneath are the following words in abbreviation, REGIA ACADEMIA HISTORICÆ LUSITANÆ INSTITUTA VI. Idus Decembris MDCCXX.

This academy consists of a director, four censors, a secretary, and fifty members; to each of whom is assigned some part either of the ecclesiastical, or civil history of the nation; which he is to treat either in Latin, or Portuguese.

ACADEMY of *Swabian History*, at Tubingen, was established by some learned men, for publishing the best historical writings, the lives of the chief historians, and compiling new memoirs, on the several points and periods thereof.

ACADEMIES of *Language*, are called by some, *Grammatical Academies*: as the *Academy della Crusca*, *Academia fursuratorium*, or the *Bran Academy*, alluding probably to the end of their institution, which is to sift out and reject as husks or bran, all Italian words that are not good Tuscan, is famous for its vocabulary of the Italian tongue, and was formed at Florence, in 1582, but scarce heard of before the year 1584, when it became noted for a dispute between Tasso and several of its members. Many authors of note confound this with the Florentine academy. The famous Torricelli delivered many of his philosophical discourses in this academy. This academy is now united with two others, viz. the *Fiorentina*, and the *Apatisti*, under the name of *Reale Accademia Fiorentina*.

ACADEMY of *Frustriferi* had its rise in 1617, at an assembly of several princes and nobility of the country, who met with a design to refine and perfect the German tongue. It flourished long under the direction of princes of the empire, who were always chosen presidents. In 1668, the number of members arose to upwards of nine hundred. The history of this academy is written in the German tongue by George Neumarek.

ACADEMY, *French*, had its rise in a private meeting of men of letters in the house of M. Conrart, in the year 1628. Cardinal Richelieu, in 1635, at the instance of M. Chapelain, erected it into an academy for refining and ascertaining the French language and style. The number of the members was limited to forty, out of whom a director, a chancellor, and secretary, are to be chosen; the two former hold their post for two months, the secretary is perpetual. Several privileges and immunities were conferred on the new academy, particularly the *droit de committimus*, or a privilege of not appearing to answer before any court, but that of the king's household. Their first assemblies were held in the cardinal's apartment; after his death, in that of the chancellor Seguier. At last an apartment was given them in the Louvre, now called *l'Academie Française*. They meet three times a week in the Louvre; at breaking up, forty silver medals are distributed among them, having on one side the king of France's head, and on the reverse, *protecteur de l'Academie*, with a laurel and this motto, *a Pimmortalité*. By this distribution, the attention of the academists is secured: those who are present receiving the surplus, otherwise intended for the absent.

As to the employments of the academy: its design being not only to give rules but examples of good writing; they began with making speeches on subjects taken at pleasure, each member in his turn; twenty of these have been printed. Their next work was a critique of the *Cid* of M. Corneille,

a task enjoined them by the cardinal. They next set about a dictionary of the French tongue, which after about fifty years spent in it, in order to settle the words and phrases to be used in writing, &c. was published in 1694; having in the mean while given occasion to some smart disputes with M. l'Abbé Furetiere, one of their own members.

Their history is written with great elegance to the year 1652, by M. Pellisson; improved and continued to the year 1700, by M. l'Abbé d'Olivet: the same is given rhetorically, by F. le Camus.

A similar *Academy* was founded at Petersburg by the late Empress, upon a plan proposed by the prince's Dalkof, and a fund provided for its establishment and support. It is to consist of 60 members.

The royal *Swedish Academy* was formed on the plan of the French academy by Gustavus III., who attached a pension to some of its members. Its object is the improvement of the Swedish language, poetry, and eloquence.

ACADEMY, *Royal Spanish*, is an academy for cultivating the Castilian tongue, established at Madrid, on the model of the French academy.—The design of this was laid by the duke d'Escalona, and approved of by the king in 1714, who declared himself protector thereof.—It consists of twenty-four academists; including the director and secretary. Its device is a crucible on the fire, with this motto, *limpia, fija, y da esplendor*: i. e. it purifies, fixes, and gives brightness; which some have criticised. Their object, as marked out by the royal declaration, is to cultivate and improve the national language: in order to which, they are to begin with choosing carefully such words and phrases, as have been used by the best Spanish writers: noting the low, barbarous, or obsolete ones, and composing a dictionary, wherein these may be distinguished from the former, &c. by which means, adds that prince, it will clearly appear, that the Castilian tongue is inferior to none of those most esteemed in the world; and may be employed with advantage either in teaching the arts and sciences, or in expressing the most perfect Latin or Greek originals in exact translations. The academy is to have its own printer; yet not to put any thing to press without the permission of the council. For farther encouragement all privileges and immunities enjoyed by the domestic officers, actually in the king's service, and the royal palace, are granted the academists.

ACADEMIES of *Law*: as that famous one at Beryta, and that of the *Sitientes* at Bologna.

ACADEMY of *Medals and Inscriptions* at Paris, was set on foot by M. Colbert in 1663, and distinguished by its present appellation, in 1691, for the study and explanation of ancient monuments, and perpetuating great and memorable events, especially those of the French monarchy, by coins, relievos, inscriptions, &c. The number of members at first was confined to four or five, but in 1701 was increased to forty; whereof ten were to be honoraries, ten pensioners, ten associates, and the same number of novices or elevés, which has been since annexed to the class of elevés. The king nominates their president and vice-president yearly; but their secretary and treasurer are perpetual. The rest are chosen by the members themselves, agreeably to the constitutions given them on that behalf. Their chief work is a kind of medallie history of the reign of Louis XIV. which, after some interruptions, was continued to the advancement of the duke of Anjou to the crown of Spain. Beside which we have several volumes of their essays, under the title of memoirs: and their history, written and continued by their secretaries. Their motto is *velat mori*.

ACADEMIES, *Medical*, as that of the *Naturæ Curiosæ* in Germany: that founded at Palermo, in 1645; another at Venice,

Venice, in 1701, which meets weekly in a hall near the grand hospital; another at Geneva, in 1715, in the house of M. le Clerc. The colleges of physicians at London and Edinburgh, are also by some ranked in the number of medical academies.

Academy of Nature Curiosorum, in Germany, was first founded in 1652, by M. Bausch, a physician, who invited all physicians to communicate their extraordinary cases, and was elected president. Their works were at first published separately; but, in 1670, it was proposed to publish a volume of observations every year. The first volume appeared in 1684, under the title of *Ephemerides*, which was continued with some interruptions, and variations of the title, &c. In 1687, this academy was taken under the protection of the emperor Leopold, who granted the members several privileges, and particularly that their presidents should be counts palatine of the Roman empire. From him it has been sometimes denominated the *Leopoldine academy*.

This academy differs from all others, in that it has no fixed residence, or regular assemblies; instead whereof is a kind of bureau, or office, first established at Breslaw, afterwards removed to Nuremberg, where letters, observations, &c. from members and correspondents are taken in. The academy consists of a president, two adjuncts, or secretaries, and colleagues or members. The colleagues, at their admission, oblige themselves to two things; first, to choose some subject out of the animal, vegetable, or mineral kingdom to handle, provided it had not been treated of by any colleague before; the second, to apply themselves to furnish materials for the annual *Ephemerides*. Each member is to bear a symbol of the academy, *viz.* a gold ring, whereon, instead of a stone, is a book open, and on the face thereof an eye: on the other side the motto of the academy, *nunquam otiosus*, i. e. *never idle*. See the history, laws, &c. of this academy, with the names of its members, and the titles of its pieces, in *Ephem. Germ.* dec. 1. an. 1, & 2, Pref. and the continuation of the same in the prefaces and appendices to the ensuing volumes.

Academy, Musical, consists of the managers and directors of the opera.

An academy of this kind, called the *Academy of Ancient Music*, was established in London in 1710, by several persons of distinction, and other gentlemen, in conjunction with the most eminent masters of the time, with a view to the study and practice of vocal and instrumental harmony. This institution, which had the advantage of a library, consisting of the most celebrated compositions both foreign and domestic, in manuscript and in print, and which was aided by the performances of the gentlemen of the chapel royal, and the choir of St. Paul's, with the boys belonging to each, continued to flourish for many years. In 1731, a charge of plagiarism brought against Bononcini, a member of the academy, for claiming a madrigal of Lotti of Venice as his own, interrupted the harmony, and threatened the existence of the institution. Dr. Greene, who had introduced the madrigal into the academy, took part with Bononcini, and withdrew from the society, taking with him the boys of St. Paul's. In 1734 Mr. Gates, another member of the society, and master of the children of the royal chapel, retired in disgust; and it was thus deprived of the assistance which the boys afforded it in singing the soprano parts. From this time the academy became a seminary for the instruction of youth in the principles of music, and the laws of harmony. Dr. Pepusch, who was one of its founders, was active in accomplishing this measure; and by the expedients of educating boys for their purpose, and admitting auditor members, the subsistence of the academy was continued.

The *royal academy of Music* was formed by the principal nobility and gentry of the kingdom for the performance of operas, composed by Mr. Handel, and conducted by him at the theatre in the Haymarket. The subscription amounted to 50,000*l.* and the king, besides subscribing 1000*l.*, allowed the society to assume the title of *Royal Academy*. It consisted of a governor, deputy governor, and twenty directors. On occasion of a contest between Handel and Senesino, one of the performers, in which the directors took the part of the latter, the academy was dissolved, after having subsisted with reputation for more than nine years.

Academy, Naval; as that of Peterburgh, and those in England. See *Academy*.

Academy, Political, such as that of Paris, composed of six persons, who met on certain days each week at the Louvre, in the chamber where the papers relating to foreign affairs were lodged. Here they perused such papers as were put in their hands, by order of the secretary for foreign affairs, who acquainted the king with the progress they made, and the capacities of each, that his majesty might employ them accordingly.

Academies of Sciences chiefly denote those erected for improving natural and mathematical knowledge, otherwise called philosophical and physical academies: such as the *academy secretorum natura*, formed at Naples in the house of Baptista Porta, about the year 1560, the first academy of the philosophical kind. It was succeeded by the

Academy of Lyncei, founded at Rome by Prince Frederic Cesi, towards the close of the same century; several of whose members rendered it famous by their discoveries: the celebrated Galileo Galilei was of the number.

Several other academies contributed also to the advancement of the sciences; but it was by speculations, rather than by repeated experiments on the phenomena of nature: such were the academy of Bessarion at Rome, and that of Laurence de Medicis at Florence, in the sixteenth century; in the sixteenth, that of Inflammati at Padua, of Vegna Juoli at Rome, of Ortolani at Placentia, and of Umidi at Florence. The first of these studied fire and pyrotechnia; the second, wine and vineyards; the third, gardens and pot-herbs; the fourth, water and hydraulics. Add to these, that of Venice, called La Veneta, founded by Frederic Badoara, a noble Venetian; another in the same city, whereof Campegio, bishop of Feltro, appears to have been the chief; and that of Cosenza, or la Consentina, whereof Bernadin Telesio, Sertorio Quatromanni, Paulus Aquinas, Julio Cavalcanti, and Fabio Cicali, celebrated philosophers, were the chief members.

The compositions of all these academies of the sixteenth century were good in their kind, but none of them comparable to those of the Lyncei.

Academy del Cimento made its appearance at Florence some years after the death of Torricelli, under the protection of Prince Leopold, afterwards cardinal de Medicis. Galileo, Torricelli, Aggiunti, and Viviani, prepared the way for it; and some of its chief members were Paul del Buono; who, in 1657, invented the instrument for evincing the incompressibility of water, which was a thick globular shell of gold; Alphonfus Borelli, Candide del Buono, brother of Paul, Alexander Marfili, Vincent Viviani, Francis Redi, and count Laurence Magalotti, were some of its chief members. The latter was secretary of this academy, and published a volume of curious experiments in 1677, under the title of *Saggi di Naturali Esperienze*: a copy of which being presented to the Royal Society, was translated into English by Mr. Waller, and published at London, in 4to. in 1684.

and putting it on a new and more solemn footing. In virtue of that regulation, the academy was to be composed of four kinds of members, viz. *honorary, pensionary, associates, and elevés*.—The first class to consist of ten persons; and the rest of twenty each.—The honorary academists to be all inhabitants of France; the pensionaries all to reside at Paris; eight of the associates allowed to consist of foreigners; and the elevés all to live at Paris. The officers, to be a president, named every year by the king, out of the class of honorary academists; and a secretary and treasurer, to be perpetual.

Of the pensionaries, or those who receive salaries, three to be geometers, three astronomers, three mechanics, three anatomists, three chemists, three botanists; the remaining two, secretary and treasurer.—Of the twenty associates, two to apply themselves to geometry, two to botany, and two to chemistry.—The elevés to apply themselves to the same kind of science with the pensionaries they are attached to; and not to speak, except when called upon by the president.—No regular or religious to be admitted, except into the class of honorary academists; nor any person to be admitted, either for associate or pensionary, unless known by some considerable printed work, some machine, or other discovery.—Farther, no person to be allowed to make use of his quality of academist, in the title of any of his books, unless such book have been read to, and approved by the academy.

The establishment of this academy, as well as of that of the Belles Lettres, was confirmed by royal patent in 1713.

In the year 1716, the duke of Orleans, then regent, made an alteration in their constitution; augmenting the number of honoraries, and of associates capable of being foreigners, to twelve; admitting regulars among such associates; suppressing the class of elevés, and establishing in lieu thereof, a new class of twelve adjuncts, to the six several kinds of sciences cultivated by the academy; and, lastly, appointing a vice-president, to be chosen yearly by the king, out of the honorary members; and a director, and sub-director, out of the pensionaries.

In the year 1785, the king farther confirmed, by letters patent, the establishment of this academy; added classes of agriculture, natural history, mineralogy, and physics; and incorporated the associates and adjuncts, limiting to six the members of each class, viz. three pensioners, and three associates. The academy, by this regulation, was made to consist of eight classes, viz. geometry, astronomy, mechanics, general physics, anatomy, chemistry and metallurgy, botany and agriculture, and natural history and mineralogy. Each class was to remain irrevocably fixed at six members, viz. three pensionaries, and three associates, besides a perpetual secretary and treasurer; twelve free associates, and eight associate foreigners; and the adjunct geographer was henceforth to be called the associate-geographer. These several classes were filled with persons, whose names have been respectable in the commonwealth of letters. Their meetings, which were formerly held in the king's library, have since 1699 been held in a fine hall in the Old Louvre.

This academy has done great things for the service of learning, by the continuation of the *MÉRINIAN*, by sending persons to different parts of the world for making observations; but especially by the excellent writings they have published, either in a separate, or a joint capacity; particularly their *MÉMOIRS*. These have been regularly published every year, some late years excepted, ever since the re-establishment of the academy in 1699. To each volume is prefixed the history of the academy, or an extract of the memoirs; and, in general, of whatever has been read or said at the academy. At the close of the volume are eulo-

giums on such academists as have died in the course of the year. A general Index to the volumes has been published every ten years. In the volume for 1783, &c. the extracts from the registers are omitted, but the eulogies of distinguished men lately deceased, are continued. M. l'Abbé Rozier has published, in four quarto volumes, an excellent index of the contents of all the volumes, and the writings of all the members, from the commencement of their publications to the year 1770. M. Rouille de Meslay founded two prizes, one of 2500, and the other of 2000 livres, which are alternately distributed every year; the subjects for the first must relate to physical astronomy, and those for the latter, to navigation and commerce. Indeed they have an advantage over most academies, in being defrayed their expenses, and even paid for time and attendance. Their history to the year 1697 was written by M. Du Hamel; and since that time continued from year to year by M. Fontenelle, under the following titles: *Du Hamel Historia Regiæ Academiæ Scientiarum, Paris, 4to. Histoire de l'Académie Royale des Sciences, avec les Mémoires de Mathématique et de Physique tirez des Registres de l'Académie, Paris, 4to. Hist. de l'Acad. Roy. des Sciences depuis son Etablissement en 1666, jusqu'en 1699, en 13 tomes, 4to.*

A new history, from the institution of the academy to the period from whence M. de Fontenelle commences, has been formed; with a series of the works published under the name of this academy, during the first interval.—Their motto is *invenit & perfecit*. This academy was suppressed; and, in 1793, abolished by the Convention of France; the last volume of its memoirs being that for 1790; and other institutions of various kinds have been established; see *INSTITUTE*.

The memoirs of the academy, abolished by the edict of the Convention, because it was a royal institution, and royalty was overthrown, are comprehended in 139 volumes in quarto: 11 from the foundation of the academy in 1666 to its renewal in 1699; 92 from 1699 to 1790; the year 1772 containing two: 11 of memoirs presented to the academy; 9 of prizes; 9 of tables to 1780; and 7 of drawings of machines.

The French have also considerable academies in most of their great cities; as, the academy at Caen, established by letters patent in 1705; the royal society of sciences in 1706, at Montpellier, which, since 1708, formed one body with the royal academy of sciences at Paris; *académie des jeux floraux* at Toulouse, besides the academy of sciences and belles lettres, founded in 1750; and other academies at Bourdeaux, founded in 1703; at Soissons in 1674, at Marseilles in 1726, at Lyons in 1700, at Par in Bearn in 1721, at Montauban in 1744, at Angers in 1685, at Amiens in 1750, at Villefranche in 1679, at Dijon in 1740, at Nîmes in 1682, at Besançon in 1752, at Chalons sur Maine in 1755, at Rochelle in 1734, at Beziers in 1723, at Rouen in 1744, at Metz in 1760, at Arras in 1773, &c. &c.

ACADEMY, Royal, of Sciences, at Berlin, was founded by Frederick I. of Prussia in 1700, on the model of that of England, excepting that, besides natural knowledge, it likewise comprehends the belles lettres. A new form, and a new set of statutes, were given it in 1710; by which it is ordained, that the president shall be one of the counsellors of state, and nominated by the king. The members were divided into four classes; the first, for prosecuting physics, medicine, and chemistry; the second for mathematics, astronomy, and mechanics; the third, for the German language, and the history of the country; the fourth, for Oriental learning, particularly as it may concern the propagation of the Gospel among infidels. Each class to elect a director for themselves, who

who shall hold his post for life. Their meeting to be in the castle called New Marshal; one class to meet every week in their turns. The members of any of the classes to have free admission into the assemblies of any of the rest. The great promoter of this institution was the celebrated M. Leibnitz, who accordingly was made the first director. The academy has published several volumes of its transactions in Latin, under the title of *Miscellanea Berolinensia*. The 1st volume was published in 1710; and, though undistinguished by any peculiar tokens of royal favour, they continued to publish new volumes in 1723, 1727, 1734, 1737, and 1740. At last, however, viz. in 1743, Frederic III. gave new vigour to this academy, by inviting foreigners of literary merit to Berlin, encouraging the culture of science among his subjects, by suitable rewards, and conferring the honour of president of the academy on M. Maupertuis. He also proposed new regulations for the academy, and assumed the title of its protector. The members hold two public assemblies annually; at the latter of which, viz. in May, is given a gold medal, of fifty ducats value, as a prize for a dissertation, the subject of which shall be successively natural philosophy, mathematics, metaphysics, and general literature. Since 1743, this academy has published several volumes of its transactions in French, under the title of *Histoire de l'Academie Royale des Sciences et Belles Lettres, a Berlin*.

Some new arrangements relating to this academy were proposed by his Prussian Majesty, in the year 1798. The economical commission of the academy, which had subsisted to this time, was abolished, and its place supplied by a directory, which should be formed of a president, the four directors of the classes, and two members, to be chosen not from the academy, but men of business, equally distinguished by their literary merit, and capable of preserving the necessary order in the economical state of the academy. The members of the academy were to be either honorary or ordinary. The latter members were divided as before, into four classes: and each class composed of a director and six members, forming an aggregate of 24 academicians, besides the members of the directory. It was proposed that this number should continue invariable, and that no new members should be admitted except in the case of vacancies. The right of electing members is preserved to the academy; whilst the king reserves to himself the right of confirming or rejecting. The large public library at Berlin, as well as the collection of natural curiosities, are united to the academy, and entrusted to its direction. The grand design of the new regulations is to direct the attention of the academy to objects of real utility; to humanise it, as the king expresses himself in his letter to the academy, by giving encouragement to efforts that contribute to the happiness of common life, to the improvement of every thing that concerns its wants, and to its conveniences, by the constant application of the theory of the sciences to things rather than to speculative meditations; to excite the national industry, by furnishing it with the principles suited to that art, which it exercises; to purify the different systems of moral and literary education, from many vague and erroneous principles, which fashion, and the imagination of some enthusiastic pedagogues, have introduced, and which must degrade future generations; and to combat the prejudices and delusions of the people, as well as the licentious and destructive efforts of the false philosophers of the present day.

There are other academical institutions at Berlin, and other parts of the north; several of which have distinguished themselves by their journals, ephemerides, &c. The reader will find some account of them under the article

ACADEMY, Imperial, of Sciences, at Petersburg, was projected by czar, Peter the Great, who, during his travels in 1717, having observed the utility of institutions of this kind, determined to establish a similar one in his own country. Wolf and Leibnitz were consulted as to the regulations which were proper to be adopted. The death of Peter, however, prevented the execution of the plan which he had drawn up and signed in 1724. At the close of 1725, his design was happily executed by the munificence of the czarina, Catherine I., his wife and successor, on the model nearly of the academy of Paris, wherof the czar was a member. The academy held its first public meeting on the 27th of December, 1725, in the presence of the duke of Holstein, and a large appearance of persons of distinction. The empress settled a fund of 4982*l.* *per annum* for its support; and 15 members, eminent for their talents and learning, were admitted and pensioned under the title of Professors, in the various branches of literature and science; among whom were Nicholas and Daniel Bernouilli, the two De Lilles, Bullinger, and Wolf. The academy languished under Peter II., and was again revived by the empress Anne, who added a seminary for the education of youth. At the accession of Elizabeth, the original plan was enlarged and improved by letters patent in 1747; which, besides the academy, established in connection with it an university, having regular professors, who read lectures; and the academy acquired reputation and vigour by the influx of several learned foreigners. The annual income was increased to 10,655*l.*

The late empress took this society under her own immediate protection; corrected many of its abuses, and infused a new spirit into the researches of its members. In order to encourage ingenious professors to visit the various provinces of her dominions, she granted an extraordinary benefaction of 2000*l.*, which she occasionally renewed. These travellers were instructed by the academy, to prosecute their inquiries into the different sorts of soil and water, the best methods of cultivating barren and desert spots, the local disorders incident to men and animals, and the best means of relieving them, the breeding of cattle, and especially of sheep, the rearing of bees and silk-worms, the proper places for fishing and hunting, the various minerals and plants, and the arts and trades. They were also enjoined to rectify the latitude and longitude of the chief towns, to make astronomical, geographical, and meteorological observations, to trace the course of rivers, to take the most exact charts, and to observe the manners and customs of the different people, their dress, language, antiquities, traditions, history, and religion; and, in a word, to obtain every information which might tend to illustrate the real state of the whole Russian empire. These expeditions have produced, in the course of a few years, a great variety of excellent publications on the several objects above enumerated.

The first transactions of this society were published in 1728, and intitled *Commentarii Academicæ Scientiarum Imperialis Petropolitane ad Ann. 1726*. The publication was continued till the year 1747, when its transactions were called *Novi Commentarii Academicæ, &c.* In 1777, the title was again changed into *Nova Acta Academicæ Scientiarum Imperialis Petropolitane*. Of the commentaries 14 volumes were published. The first of the new commentaries appeared in 1750, and the 20th in 1776. About 30 volumes have been published, and two are printed, in the Latin language, every year, all of which abound with important and useful disquisitions upon various parts of science, and natural history. This academy, from the mal-administration of some of its directors, was, for several years, torn by internal dissensions, which retarded the labours of the academicians, and put a

stop to the usual publication of its collections. By an edict of the empress, the government of the academy was new-modelled; and the academy resolved to begin a new series of publications. From this era the history commences, which is prefixed to Vol. I. of the *Nova Acta*; &c. published in 1747. The academy is composed of 15 professors, besides a president and director. Each professor has a house and an annual stipend, from 200*l.* to 600*l.* There are also four adjuncts, who are pensioned, attend the sittings of the society, and succeed to the first vacancies. The ordinary assemblies are held twice a week, and public or solemn ones thrice in the year; wherein an account is given of what has been done in the private ones. The building, apparatus, &c. of this academy, are extraordinary. They have a fine library, consisting of 36,000 books and manuscripts; an extensive museum; an observatory, &c. Their motto is *pau-latio*, and their device, a tree bearing fruit not ripe.

ACADEMY of Sciences, called the *Institute of Bologna*, was founded by count Marigli, in 1712, for the cultivating of physics, mathematics, anatomy, medicine, chemistry, and natural history. Its history was written by M. de Liniers, from memoirs furnished by the founder himself, and published at Amsterdam in 1723. The academy founded not long before by Pope Clement XI. for architecture and painting, was incorporated with this; and for its further encouragement the city purchased and appropriated to its use the palazzo Celesti, that the library, museum, observatory, schools, and the apartments of the professors, might be under the same roof. On the entrance of this edifice is the following inscription: *Bononicense Scientiarum et Artium Institutum, ad publicum totius orbis usum.*

ACADEMY, Imperial and Royal, of Sciences and Belles Lettres, at Brussels, was founded in 1773; and several volumes of their memoirs have been published.

ACADEMY, Royal, of Science, at Stockholm, derived its origin from six persons of distinguished learning, one of whom was the celebrated Linnæus; who, in 1739, formed a private society for reading dissertations on literary subjects. As their number increased, it attracted public notice; and the society was incorporated by the king, in 1741, under the title of the *Royal Swedish Academy*. Though it has no pension from the crown, its fund has been gradually augmented to a large sum by legacies, and private donations. The only persons who receive salaries, are a professor of experimental philosophy and two secretaries. Each member resident at Stockholm becomes president by rotation, and continues in office three months. The members, both native and foreign, are admitted without fees. The dissertations read at each meeting are written in the Swedish language, and are collected and published four times in the year; and the annual publications make a volume in 8vo. The first 40 volumes, which were finished in 1779, are called the *Old Transactions*; for in the next year, the title was changed into that of *New Transactions*. Any person who sends a treatise, which is thought worthy of publication, receives the transactions for one quarter gratis, and a silver medal of the value of three shillings. All papers relating to agriculture are published separately, under the title of *Oeconomica Acta*. Annual premiums in money and gold medals are distributed by the academy, principally for the encouragement of agriculture and inland trade. The meetings of this academy are sometimes attended by the king.

ACADEMY, Royal, of Sciences, at Copenhagen, took its rise from the occasional meetings of six literati, whom Christian VI. in 1742, employed in arranging his cabinet of medals. With these persons others gradually associated; and they formed a society, under the patronage of the count of Holstein, whose immediate object was to make researches into

the antiquities and history of their country, and to explain them. In 1743, his Danish majesty took the society under his protection, gave it its name, endowed it with a fund; and directed the members to extend their pursuits to natural history, physics, and mathematics. The academy has published 15 volumes in the Danish language; some of which have been translated into Latin.

ACADEMY, Royal, of Sciences, at Lisbon, was founded in the year 1779, by the Duke de Lafoens, uncle to the queen. The sovereign is the immediate patron, and the founder is president. Twenty-four effective members, divided into three classes, viz. natural sciences, mathematics, and national literature, form the main body of the society; and the residue is composed of 36 free members; a small number of literary foreigners, and a larger one of great personages of the nation, as honorary members; some veteran members and a considerable proportion of extra correspondents. Government allows them a revenue, by means of which they have established an observatory, a museum, a library, and a printing-office. The academy has hitherto directed its attention to the encouragement of many objects, which do not, in other countries, require the care of an academy of sciences. The 1st volume of its memoirs was published at Lisbon in 1797. The memoirs commence at 1780.

ACADEMY, of Arts and Sciences, American, was established in 1780, by the council and house of representatives of the province of Massachusetts's bay, for promoting and encouraging the knowledge of the antiquities of America, and of the natural history of the country; for determining the uses to which its various natural productions might be applied; for promoting and encouraging medicinal discoveries, mathematical disquisitions, philosophical inquiries, and experiments, astronomical, meteorological, and geographical observations, and improvements in agriculture, manufactures, and commerce; and in short for cultivating every art and science, which might tend to advance the interest, honour, dignity, and happiness of a free, independent, and virtuous people. The members of this academy are never to be more than 200, nor less than 40.

ACADEMY, Royal Irish, sprung out of a society, established at Dublin, about the year 1782, and consisting of an indefinite number of gentlemen, most of whom belonged to the university, who held weekly meetings, and alternately read essays on various subjects. The members of this society, anxious to make their labours redound to the honour and advantage of their country, formed a more extensive plan, and admitting only such names as might add dignity to their new institution, became the founders of the *Royal Irish Academy*, which professes to unite the advancement of science with the history of mankind and polite literature. The first volume of their transactions for 1787 was published in 1788, and the publication has been occasionally continued. We shall here add, that a society was formed in Dublin, similar to the Royal Society in London, as early as the year 1683; but the distracted state of the country was unpropitious to the cultivation of philosophy and literature. The plan was resumed about the beginning of the present century, and the Earl of Pembroke, then Lord Lieutenant, was president of a philosophical Society established in Dublin College. In the year 1740, there was instituted a Physico-historical Society; of which two volumes of minutes are extant; but this society soon declined.

ACADEMY, of Sciences, at Mannheim, was established in 1763 by Charles Theodore, elector Palatine, according to a plan of the learned Schopflin, and divided into two classes, viz. the Historical and Physical. The latter class was subdivided, in 1780, into the Physical, properly so called, and

Meteorological. The papers of the academy have been published in 11 volumes 4to., under the title of *Acta Academiae Theodoro-Palatinae*. The Meteorological observations, from 1781 to 1782, form 12 volumes 4to. with the title of *Ephemerides Societatis Meteorologicae Palatinae*.

For a farther account of similar institutions, see SOCIETY.

ACADEMY, is also used among us as a kind of collegiate school or seminary; where youth are instructed in the liberal arts and sciences in a private way; now indeed it is used for all kinds of schools.

There were two public academies in the Roman empire; one at Rome, founded by Adrian, in which all the sciences were taught; and the other at Berytus in Phœnicia, which was principally destined for the education of youth in the science of law. In consequence of the protection that was given to the sciences in the 13th century, academies were erected in various parts of Europe, peculiar privileges of several kinds were granted to the youth that frequented them; and these learned societies acquired, at length, the form of political bodies; *i. e.* they were invested with a certain jurisdiction, and were governed by their own laws and statutes. In the public schools or academies that were founded at Padua, Modena, Naples, Capua, Thoulouise, Salamanca, Lyons, and Cologne, the application of the youth was restricted to certain branches of learning, and thus the course of academical education remained imperfect. The academy of Paris, which surpassed all the rest, both with respect to the number and abilities of its professors, and the multitude of students by whom it was frequented, was the first learned society which extended the sphere of education, comprehended all the sciences, and appointed masters for every branch of education. Hence it was distinguished, before any other academy, with the title of UNIVERSITY, to denote its embracing the whole circle of science; and in process of time, other schools of learning were ambitious of forming themselves upon the same model, and of being honoured with the same title. In the 16th century, academies were founded by the Lutherans at Jena, Helmstadt, and Altorf; and by the Calvinists at Franeker, Leyden, Geneva, under Calvin and Beza, and many other places.

Frederic I. king of Prussia, established an academy in Berlin in 1703, for the education of the young nobility of the court, suitable to their extraction. The expence of the students was very moderate, the king having undertaken to pay the extraordinaries. This illustrious school, which was then called the *Academy of Princes*, has now lost much of its first splendor.

The Romans had a kind of military academies established in all the cities of Italy, under the name of *Campi Martii*. Here the youth were admitted to be trained for war at the public expence. The Greeks, beside academies of this kind, had military professors called *Tactici*, who taught all the higher offices of war, &c. &c.

We have two royal academies of this kind; one at Portsmouth, for teaching navigation, drawing, &c. which may be styled a naval or maritime academy, founded by George I. in 1722, and under the direction of the board of admiralty, which gives salaries to two masters; and another at Woolwich, where youth are taught fortification, gunnery, and such branches of the mathematics as are necessary to qualify them for engineers. This was established by George II. in 1741, and is under the direction of the major-general and board of ordnance. None are now educated in this academy, but the gentlemen-cadets, to the number of 90 or 100. The masters are now 12; *viz.* a professor of mathematics, and two other mathematical masters, a professor of fortification and an assistant, two drawing masters,

a French master, with masters for fencing, dancing, and chemistry. This institution is important and admits of improvement. It has now the benefit of the valuable services of Dr. Hutton and Mr. Bourycastle, whose names are well known among men of science. The royal academy of marine at Brest, in France, was established in 1752.

The nonconformist ministers, &c. are bred up in private academies, as not approving the common university education. The principal of their academies are those in London, Manchester, Exeter, Wymondley in Herts, Rotherham, Carmarthen, and Wrexham.

ACADEMY is likewise a name given to a riding school, where young gentlemen are taught the great horse, and other suitable exercises, as fencing, &c. See MANEGE.

ACADEMY is also used in speaking of the schools of the Jews; *i. e.* those seminaries where the rabbins, or doctors, instruct the youth of their nation in the Hebrew tongue; explain to them the Talmud; teach them the Cabbala, &c.

Soon after the destruction of Jerusalem, and the dispersion of the Jews, they are said to have erected academies at Japhne, Lydda, Babylon, and Tiberias; which last place in particular became famous for its learned men, such as the compilers of the MISHNA, and the MASORIM. According to Buxtorf, this academy subsisted in Jerem's time. See Stephanus de Urb. vol. i. p. 482. n. 1.

Of the Babylonian schools, the most famous in later times were those which were established in the cities of Sora, Nahardea, and Pumbeditha. Saadians, a celebrated grammarian, was rector of the academy at Sora in 927. But these academies were demolished by the Mahometan kings of Persia, about the year 1040. See Maseles's Gram. Heb. vol. ii. p. 14.

ACADEMY, or **ACADEMY Figure**, in *Painting*, is a drawing, or **DESIGN** made after a model of a naked man or woman, taken after the life; which is usually done on paper, with red or black chalk, and sometimes with pastils or CRAYONS.

ACADIE or **ACADIA**, in *Geography*, a name formerly given to NOVA SCOTIA, or *New Scotland*, in America. The name was first applied to a tract of country between the 40th and 46th degrees of latitude, granted to De Mons in 1603, by Henry IV. of France.

ACÆNA, *αχαινα*, in *Antiquity*, a Grecian decemped, or ten-foot rod, used in measuring of their lands. Beryn. Syntag. de Ponderibus, &c. p. 177. Ricciol. Geo. l. ii. c. 4. Salmast. Ex. in Solin. p. 684.

ACÆNA, in *Botany*, a genus of the *tetrandria monogynia* class and order of plants; the generic characters of which are these: the calyx is a four-leaved perianthium, with ovate, concave, equal, permanent leaflets; there is no corolla, unless the calyx be considered as such: the stamina consist of equal filaments, of middle length, opposite to the calyx, and the anthers are quadrangular, twin, and erect: the pistillum has an obovate, hispid germ, a very small inflected style, and the stigma is a small thickish, coloured membrane, divided into many segments; the pericarpium is a dry, obovate, single-celled berry, with spines that are bent backwards; and the seed is single. There is only one species, which is a Mexican plant. Miller's Dict. by Martyn.

ACAGUNA, in *Geography*, a mountain on the coast of Peru, in the South Sea, about four leagues S. E. from the river Hilo, and as far N. W. from the river Sama. It is a good sea-mark; but a strong surge lies on the coast, so that ships should not keep too near, till they are sure of an entrance into some port.

ACAJOU, and **ACAJUBA**, in *Botany*. See ANACARDIUM.

ACAI-ANDRA. See CALANDRA.

ACALANDRUS, in *Ancient Geography*, a river falling into the bay of Tarentum, not far from the Metapontum. This river is mentioned by Pliny (*Hist. Nat.* l. iii. c. 10. tom. i. p. 165.), and by Strabo, (*Geog.* tom. i. p. 429.) It is now Fiume de Roletto.

ACALEPHE, a nettle. It also signifies a certain fish, the flesh of which is very tender. Likewise a sea-fowl mentioned by Nicander, and a sea-animal, mentioned by Gellius.

ACALOT, an abridgement of ACACALOTL.

ACALYPHA, in *Botany*, a genus of plants belonging to the *monocotyledonous* class, and the natural order of *Tricocco*, called by Boerhaave, and others, *Ricinocarpos* or *Tick-fruit*. It derives its name *Ακαλύφη*, from its not being pleasant to handle, i. e. *παρά τὸ μὴ ἔχειν καλὴν ἀφῶν*. Its characters are these: the male flowers are crowded above the female ones; the calyx is a three or four-leaved perianthium, with roundish, concave, equal leaflets; it has no corolla; the stamina have from eight to sixteen filaments, which are short, crowded, and connected at the base, with roundish antheræ. The female flowers are fewer, and received into a large divided involucre. The calyx is a three-leaved perianthium, with subovate, concave, converging, small, permanent leaflets; there is no corolla; the pistillum has a roundish germen, three styles, branching, usually tripartite, and long, and the stigmas are simple; the pericarpium has a roundish, three-furrowed, three-celled capsule, the valves gaping two ways, and the seeds are solitary, roundish, and very large. There are fourteen species. The first sort, or *A. Virginica*, grows naturally in Virginia, several parts of North America, and also in Ceylon: the second, or *A. virgata*, is a native of the warmest countries, and grows plentifully in Jamaica, and its leaves resemble those of the annual nettle, and sting as much: the third, or *Indian Acalypha*, was discovered in great plenty by Dr. Houttoun at La Vera Cruz, and is also found upon dunghills in the East Indies, and its leaves are like those of Mercury, whence these plants have sometimes been called *three-seeded Mercury*: the fourth, or *Villous Acalypha*, is found in the woods about Carthage: the fifth is a native of South America, whence it has its name: the rest are all natives of the West Indies. These plants have no beauty to recommend them, and are preserved in some botanic gardens merely for the sake of variety. Martyn's Miller. In the last edition of Linnæus's *Syst. Nat.* by Gmelin, the *Acalypha* is made a genus of the *Monadelphica didecandria* class and order, and includes twenty-one species.

ACALZIKE, a town and fortrefs of Asiatic Tartary. N. lat. 41° 30'. E. long. 44° 14'.

ACAM. See ACHAM, and AKAM.

ACAMACU, or ACAMAKY, in *Ornithology*, the Brazilian name of the crested MOUCHEROLLE of Buffon; the crested Brazilian FLYCATCHER of Brisson, and the crested Brazilian TODUS, or variety of the TODUS *Paradisæus* of Gmelin, and of the MUSCICAPA *Paradisæi* of Linnæus. It is found in Africa and Madagascar.

ACAMANTIS, in *Ancient Geography*, the name of the island of Cyprus, taken from its western promontory, called *Acamas* and *Cacamo*, now cape Pifanio, or Epifanio, where there was formerly a town of the same name, now a village, called Crufoco. The wood in this part of the island (says Mr. Bruce, *Travels*, vol. i. p. 4.) remains as thick and impervious as at the first discovery; and in these woods large stags, and wild boars of a monstrous size, shelter themselves in perfect security.

ACAMAS, in *Ancient History*, the son of Theseus, who followed the other Grecian princes to the siege of Troy,

and was deputed with Diomedes to restore Helen. Laodice, Priam's daughter, had a son by him, called Munitus. He was one of the heroes who were concealed in the wooden horse. One of the tribes of Athens was called *Acamantides* from him, by the desire of the oracle; and he founded a city in Phrygia Major, called *Acamantium*. Homer (*Iliad.* l. ii. 823. and l. xiv. 475.) mentions two other heroes of this name; one a Thracian prince, who came to succour Priam; and another, a son of Antenor.

ACAMATOS, among *Physicians*, means that disposition of a limb, which is equally distant from flexion and extension.

ACAMBOU, in *Geography*. See AQUAMBOE.

ACAMEA, in *Ancient Geography*, a town of Assyria, in the province of Sittacene.

ACANACEOUS, see ACANTHACEOUS.

ACANGA, in *Botany*. See BROMELIA.

ACANGIS, i. e. *Ravagers*, or *Adventurers*, a name given by the Turks to their hussars, or light troops, who are generally sent out in detachments to procure intelligence, harass the enemy, or ravage the country.

ACANNY, or AKANNI, see ACHEM.

ACANOR, a particular sort of chemical furnace. See ATHANOR.

ACANOS, in *Botany*. See ONOPORDUM.

ACANTHA, formed from *ακν*, *point*, and *ανθος*, *flower*, in a general sense, a spine or prickle, chiefly of plants of the thorny kind.

ACANTHA, in a more particular sense, denotes a spine, or quill of certain fishes, as the echinus marinus, or sea-hedge-hog. Hence the thorn-back, a species of the raja, is by some called *acanthias*, from the two prickles on its back. Rondelet. de Piscib. lib. xiii. c. 2.

ACANTHA, among some *Anatomists*, is applied to the hind or posterior protuberances of the VERTEBRÆ of the back; forming what we call the SPINA dorsæ.

ACANTHABOLUS, compounded of *ακανθα*, a thorn, and *βαλλω*, to cast away, in *Surgery*, an instrument, wherewith to extract foreign bodies, which by the sharpness of the points have penetrated, and entered any part of the body.

The *acanthabolus* is the same with the instrument which is otherwise called *wolfella*. Its chief use is for extracting fish-bones, or the like, sticking in the œsophagus; as also the fragments of weapons, bones, hair, &c. remaining in wounds. Its figure resembles that of a pair of pincers; sometimes it is also made crooked, for more commodious application to the fauces. Celsus, lib. vii. c. 30.

ACANTHABOLUS is also sometimes used for an instrument, wherewith people pull out the hairs from their eye-brows.

ACANTHACEOUS, among *Botanists*, a term applied to a class of plants, that are armed with prickles; popularly known under the name of the THISTLE kind.

ACANTHALZUCA, the same as *echinopus*, or globe THISTLE.

ACANTHARIS, in *Entomology*, a species of the CIMEX, in the Linnæan system, and of the REDUVIUS, in the arrangement of Fabricius, the characters of which are, that it has a spinous thorax, and a ciliated abdomen, with spines. It is found in Jamaica.

ACANTHE, in the *Materia Medica* of the ancients, a name given to the plant we now call the ARTICHOAK.

ACANTHE *Arabica*, in *Botany*, a name given by some of the Greek writers to a plant called also *leucacantbe*, and by the Arabian physicians *bunkon*. It was a prickly plant, whose roots were somewhat like those of the cyperus, and composed of several knobs or joints, and of a bitter taste. It was brought for medicinal use from the East Indies, and

some

Some parts of Arabia, and was the root of the *amgalla* of Avicenna and others.

ACANTHIA, in *Entomology*, a genus of the class of *Ryn-gota*, in the distribution of Fabricius, and forming a division in the arrangement of the **CIMEX** by Gmelin, in his edition of Linnæus. The *acanthia* of Fabricius have no lip, and Gmelin comprehends under this division the *aperiti* the *co-leoptrati*, and the *membranacei*.

ACANTHIAS, in *Ichthyology*, a name given by some authors to the fish, the skin of which is used by our artificers in polishing, and called by them simply fish-skin. In the Linnæan system it is a species of **SQUALUS**, and the *picked DOG-FISH* of the British *zoology*. A variety of this is mentioned by Gmelin, and described under the name of *Squalus Fernandezus*. Its dorsal fins are spinose like the other, and its body round and ocellated. It is found in all seas, and rarely in the Baltic. Its length is about three and a half feet. *Acanthias* is also a species of **GASTEROSTEUS**, with four small spines before the dorsal fin, and three rays appertaining to the branchiostegous membrane. It is found in the Danish seas. See **GALEUS Acanthias**.

ACANTHICE, *maslich*, among ancient *Naturalists*, a kind of gum, yielded by the herb helxine. Gaza explains it by *spinalis masticha*. Plin. Hist. Nat. l. xxi. c. 16. Hard. Not. tom. ii. p. 250.

ACANTHINE, in *Ancient Geography*, an island mentioned by Ptolemy, in the Arabian gulph on the side of Egypt.

ACANTHINE, *acanthinus*, denotes a thing relating to, or resembling the herb **ACANTHUS**.

In this sense, we read of *acanthina vestimenta*, *acanthine garments*, of which we have two different explications. Some understand by it a kind of embroidery, wrought in imitation of the Egyptian *acanthus* or thorn, whose small sprigs are much interlaced. Others will have it a peculiar kind of filken stuff, made of the lanugo, or down of a plant of the thistle kind, growing in Sicily and the East. Plin. Hist. Nat. l. xxiv. c. 12. Hard. Not. tom. ii. p. 343.

ACANTHINUM lignum is used by some writers for **BRAZIL** wood.

ACANTHION, among *Naturalists*, a plant of the thorn, or rather of the thistle kind; whose down, being cleaned from the prickles, was manufactured into a kind of stuff, not unlike silk. Plin. ubi supra. See **ONOPORDUM**.

ACANTHIS, in *Ornithology*. See **GOLDFINCH**.

ACANTHOCEPHALUS, in *Natural History*, a name given to the **ECHINORHYNCHUS carponis**, a species of worm which is found in the intestines of the carp.

ACANTHOPTERYGII, derived from *ακανθα*, a thorn, or prickle, and *πτερυγιον*, a fin, in *Natural History*, a term used by Ardeti to express one of the general classes or families of fishes; the character of which is, that the rays of the fins are bony, and some of them prickly at the extremities.

ACANTHOS, **ACANTHUS**, or **ACHANTUS**, in *Ancient Geography*, a town of Egypt, near Memphis, now Bifalta; or, according to Savary (v. i. p. 484), corresponding with the present Dachhour, whither the waters of the Nile are conducted by a canal, and near which is the ruin of the temple of Osiris, and to the west of it a great pyramid. (Strabo, tom. ii. 1163.) Also a maritime town of Macedonia, a colony of Andrians; now Erisso: near which was shewn Xerxes's ditch of seven stadia, in order to separate Mount Athos from the continent, and convey his ships, without doubling Athos, into the Singitic bay. Herodotus, l. vii. c. 121, &c. Pliny, Nat. Hist. tom. i. p. 202. *Acantus* is also a town of Epirus.

ACANTHRUS, in *Natural History*, a name given to the **ECHINORHYNCHUS candidus**, which is found in the intestines of many different species of fish.

ACANTHUS, *Bear's Breech* or *Branc-Ursine*, in *Botany*, a genus of the *didynamia angiospermia* class, and belonging to the natural order of *Personate*; of which the generic characters are these: the calyx is a perianthium, with leaflets in three alternate pairs, unequal and permanent; the corolla is single-petalled and unequal, having a short tube closed with a beard, no upper-lip, very large under-lip, which is flat, straight, very broad, three-lobed, obtuse, and of the length of the upper-lip of the calyx; the stamina have four filaments, subulate, shorter than the corolla, the two upper rather longer, recurved, and incurved at the top; the anthers are oblong, compressed, obtuse, the lateral ones parallel, and villous before; the pistillum has a conical germ, filiform style, of the length of the filaments, and two acute lateral stigmas; the pericarpium is a subovate pointed capsule, two-celled and two-valved, with a contrary partition, alternate claws, curved, and fastened to the partition; the seed is ovate, and gibbous, and single; sometimes double. There are ten species: 1. The *smooth acanthus*, with white flowers, proceeding from about the middle to the top of the stalk, is the species used in medicine under the name of *Branca ursina* or *Brankursine*. It is a native of Italy, about Naples, of Sicily, Provence, and the islands of the Archipelago, and is cultivated in our gardens, and flowers in June and July. Turner (in his Herbal in Hort. Kew.) informs us, that it cultivated in Sion gardens so long ago as the year 1551. The leaves, and particularly the roots, abound with a soft, insipid mucilage, which may be readily extracted, either by boiling, or by infusion. Rectified spirit, digested on the leaves, extracts from them a fine deep green tincture, which is more durable than that which is communicated to spirit by other herbs. *Brankursine* is seldom or ever used medicinally in this country. But where it is common, it is employed for the same purposes to which the *Althæa* or *Marsh-mallow*, and other mucilaginous vegetables are applied among us. In foreign countries the cow-parsnep is said to be substituted for it, though it possesses very different properties. The last edition of Linnæus by Gmelin, contains twelve species.

The ancients have not only called the herb bear's breech by this name, but also a thorny tree growing in Egypt.

An accurate examination of the ancient writers will, however, shew very plainly, that they meant two very different vegetables under this name. Virgil has two very different plants under the same name. The *acanthus* with which he adorns the handles of Alcimedon's cups, in the 3d Eclogue, and places in the Corycian's garden, in the 4th Georgic, and the Egyptian *acanthus* of Theophrastus, are two very different plants. Virgil mentions another *acanthus* as being an ever-green plant, and producing berries, or a small round fruit; *Laccas semper frondentis acanthi*, are his words; and Theophrastus tells us, that his Egyptian *acanthus* is a prickly tree, and bears pods like those of beans. The Greek sculptors adorned their works with the figure of the latter; as the Gothic did with that of the former, which they represented not only in their capitals, but also in other ornaments. It is plain, that the *acanthus* of Theophrastus is the acacia, a tree, from some species of which we have the gum arabic now in use: and the *acanthus* of Virgil, mentioned in the places above cited, is a garden herb, described by Dioscorides, under the name of *Ακάνθη*, which is supposed to be the species of *acanthus* already noticed, though Linnæus takes it to be the fourth species. The other *acanthus*, mentioned by Virgil in the fourth Eclogue, and second Georgic, is the *acanthus* of Theophrastus. See Professor J. Martyn's notes on Virgil.

The leaves of this species of *acanthus* accidentally growing round a basket covered with a tile, gave occasion to Cali-

Callimachus to invert the Corinthian capital. See *ANACUS*. For the appearance of the fur of bear's breech in the microscope, see *Plate of Microscopical Objects*. 2. The *thistle-leaved acanthus* was found by Sparman at the Cape of Good Hope, and has many leaves, proceeding immediately from the root, resembling those of the thistle. 3. The *prickly acanthus* grows wild in Italy and Provence, and flowers from July to September. Its leaves are divided into segments, terminated with a sharp spine, which renders this plant troublesome to those who handle it. 4. The *acanthus* of *Dioscorides*, as Linnæus supposes it to be, grows naturally in the East, on Lebanon, &c. 5. The *holly-leaved acanthus* is an evergreen shrub, about four feet high, and separating into many branches, with leaves resembling those of the common holly, and bearing white flowers, similar to those of the common acanthus, but smaller. 6, 7, 8, 9. These species, viz. the *entire-leaved*, *procumbent*, *forked*, and *Cape acanthus*, are natives of the Cape of Good Hope. 10. The *Madras acanthus* is a native of the East Indies.

The *smooth and prickly acanthi* are perennial plants, and may be propagated either by seeds, which should be sown in a light dry soil towards the end of March, and left to grow, about six inches asunder, till autumn, when they should be transplanted where they are to remain; or by roots, which may be planted either in spring or autumn for the third sort; but the others must only be removed in the spring, because if they are transplanted in autumn, they may be in danger of being destroyed by a cold winter. These plants take deep root, and when they are once established in a garden, they cannot be easily eradicated. The 5th and 10th species are too tender to thrive out of a stove in England, and cannot be propagated, except by seeds, which do not ripen in Europe. The other sorts must be treated in the same manner with Cape plants.

ACANTHUS, in *Architecture*, an ornament in the Corinthian and Composite orders: being the representation of the leaves of an acanthaceous plant, in the capitals thereof. See *Tab. Archit.*

ACANTHUS AVICULA, in *Ornithology*, the name given by Gesner to the *FRINGILLA spinus* of Linnæus, or *SISKIN* of others. See *SPINUS*.

ACANTHUS, in *Ancient Geography*. See *CHALCIDICA*.

ACANTHUS, in *Entomology*, a species of *PAPILIO*, in the division of *Plebeii*, with entire brown wings, blue bands underneath, and yellow linb; found in Surinam.

ACAPALA, or *Arapula*, a town in the province of Chiapa, in New Spain. It is situated on the Tabasco river, five leagues north-west from Chiapa.

ACAPAM, or *ACAPARAMI*, a town of Asia, on the Euxine sea.

ACAPATLI, in *Botany*, a name used by some authors for the plant which produces the long pepper, used in medicine. De Lact. Ind. Occ. p. 231.

ACAPNISTON, *ακαπνιστον*, from *α* and *καπνιστος*, *smoke*, a term applied to the excellent honey of *Hymettus*, in Attica, both by Pliny, l. xii. c. 16., and Strabo, tom. i. p. 613, from the mode of its preparation.

ACAPNON, *ακαπνον*, a name of the *SAMPSUCHUS*, or *MARJORAM*; also of dry wood.

ACAPULCO, in *Geography*, a considerable town and harbour in Mexico, situate on a bay of the South Sea, and distant from the city of Mexico about 210 miles, south-east. The haven is large and commodious, and capable of containing several hundred ships; and the entrance is secured by a small island, which runs across it, and forms at each end a deep channel of sufficient breadth for the largest vessels. The only inconvenience is, that ships must enter by

the sea-breeze in the day-time, and go out by the land-breeze in the night, which seldom fail to succeed each other alternately, so that they are frequently blown off to sea, after repeated attempts to make the harbour. Acapulco itself is a mean and ill-built town, and derives its importance and extent from the great trade carried on with the East Indies and Peru, and the number of warehouses and habitations for strangers which this commerce requires. The houses are slightly constructed on account of the frequent earthquakes to which this country is exposed; and good buildings are the less necessary, as the principal inhabitants retire from the sea-coast, when business does not demand their immediate attendance. Besides, the climate is exceedingly unhealthy, and very prejudicial to strangers. Upon the arrival of the galleons, the town is populous and gay, being crowded with the richest merchants of Mexico, Peru, and even of Chili, who provide themselves with tents in the vicinity of the town, and form a kind of large encampment. For the trade of this town, see *Manila GALLEON*. Opposite to the town, on the east side, is a strong castle, said to be provided with forty pieces of cannon, and the platform at the end of the town is also mounted with guns; and ships ride near the bottom of the harbour; so that this place is not so easily accessible as some have imagined. The port is a basin surrounded with very high mountains. Two islands, off the fort, parallel to the port, are to be left on the larboard, and within the harbour is a small island near the shore, on the larboard. Within a league of the east of the town, is a very good harbour, called Port Marquis, where the ships from Peru generally run in contraband goods. W. long. 102° 20'. N. lat. 17° 22'.

ACARA, in *Ichthyology*, the name of a fish caught in the fresh waters in the Brazils, and esteemed a very delicate and well-tasted one. It seldom exceeds three or four inches in length, and has a high back like the *PEARCH*. Its mouth is small, and its jaws rough like a file. It has one long back-fin, which is supported by a great number of rigid and prickly rays, and reaches to the tail. Its scales are large; its back is of a glossy brown; its sides and belly white; its tail is not forked. It has a large black spot on the middle of each side, and another near the tail. Its fins are all brown. Maregrave.

ACARAAYA, the name of a fish caught on the Brazilian shores, and by some called also *garababa*. It grows to three feet in length, and is of the shape of our carp. Its lower jaw is furnished with an even range of sharp teeth, like little needles. Its upper jaw has two very long ones, and beside these, a multitude of other very short ones. Its eyes are large, and their iris red. Its tail is broad, and a little forked. Its scales are of a moderate size, and of a silver hue, with an admixture of purple. Its belly, and the under part of its head, are wholly white; and its fins of a fine pale red, except those under the belly, which are white, with a slight edge of red. It is eaten in Brasil, both fresh and salted. Maregrave.

ACARAI, in *Geography*, a town of Paraguay, in South America, built by the Jesuits in 1624. N. lat. 26°. W. long. 51° 5'

ACARAMUCU of Maregrave and Willughby, in *Ichthyology*, is the *BALISTES Monoceros* in the Linnæan system by Gmelin. See *MONOCEROS*.

ACARAPEBA, the name of an American fish, called also by some *braseme*. It has a somewhat broad and flat body, covered with large scales of a fine silver whiteness. It grows to a foot in length, and to four or five fingers in breadth. It has a large mouth, but without teeth; and its tail is forked. It has one long black fin, the anterior rays, or naves, of which are rigid and prickly, the hind naves soft

and flexile. The fins are all like the rest of the body, of a pure white. This fish seems to be a kind of *SMARIS*. Maregrave.

ACARAPINIMA, the name of a Brazilian fish, of the *CANTHARUS* kind, and seeming to be of the same species with the *cantharis* of the Mediterranean. Ray.

ACARAPITAMBA, the name of a fish caught in the Brazilian seas, of an oblong figure, resembling the *MULLET*, and growing to two feet or more in length. Its mouth and teeth are very small. It has one long fin on the back, running very nearly to the tail, which is supported by rigid and prickly rays. Its tail terminates in two oblique horns. Its scales are large, and of a purplish colour, with a fine admixture of blue; and along the middle of each side there runs, from the gills to the tail, a very broad and beautiful gold-coloured line. Its back, down to this line, is variegated also with small gold-coloured spots; and the sides under the line are very beautifully variegated with small and fine longitudinal, but short gold-coloured lines, of a somewhat paler colour than the broad one. Its belly is white, and its fins yellow. Maregrave and Willughby.

ACARAPUCU, the name of a Brazilian fish, caught in the fresh waters, and growing to eighteen inches in length. It is of a rounded body: and its mouth is small, and not prominent. It has lips, which it can hide, or suffer to appear, at pleasure, and has no teeth. Its tail is long and forked; its scales are all of a silvery hue. On the back it has a fine golden gloss, shining in the whiteness; and on the sides five or six large blue spots. Its back and side fins are of a pale blue, as is also the tail: the belly fins are yellowish. It is a well-tasted fish. Maregrave.

ACARAUNA, of Maregrave, Willughby, Ray, and Jonston, is the *CHÆTODON nigricans* of Linnæus, with a sub-bifid tail, nine spines in the dorsal fin, and a lateral spine on each side of the bifid tail. Its eyes are large, with a silvery iris; the teeth in each mandible are from ten to sixteen, cylindrical, and narrow in the lower part, and above wider, very hard, sub-pellucid, and disposed in a series, the fore-teeth being the longest; the tongue is short and thick; the operculum of the gills is long and narrow; the lateral line proceeds from it in a direction parallel to the back: most of the fins have ramose rays; the pectoral and caudal are cinereous, the ventral black; the dorsal and anal white at their base, and in other parts of a dusky hue, and they have bifurcated radii. This fish is found in the Indian, Brasil, and Red Seas, and grows to the length of two feet; it is covered with small scales, blackish above, and whitish beneath, and brown on the sides. It feeds on young crabs and testaceous fish.

The small black *Acarauna* of Willughby, is the *CHÆTODON arcuatus* of Linnæus, with an entire tail, eight spines in the dorsal fin, and four white arches, and is called by Maregrave and Ray, *GUAPERVA*. The *Acarauna altera major* of Willughby and Ray, is the *CHÆTODON ciliaris* of Linnæus, with an entire tail, fourteen scales in the dorsal fin, spinose opercula, and ciliated scales. This fish is found in India; it is of a cinereous colour, white beneath, the iris of the eyes is reddish; the mouth very small, the lips strong, the mandibles equal, the aperture of the gills large, the operculum furnished with three spines, the lateral line near the back and parallel to it, the anus in the middle of the body, and the fins brown at their edge, with ramose rays, and a black ring before the dorsal fin.

The *Acarauna maculata* is the *CHÆTODON bicolor*. It is allied to the perch, of an oblong shape, thick body, part of which, and the tail, are white, and the other parts brown. It is found in South America and India. Linn. Syst. Nat. by Gmelin, tom. i. pt. 3. p. 1243—1245—1253—1258.

ACARI Port, in *Geography*, lies on the coast of Peru. Vol. I.

S. lat. 15° 50'. W. long. 74° 40'. To the N. W. is the headland of *Morro de Acari*. This port is sometimes called Port Lomo.

ACARNA, in *Botany*, a name by which Theophrastus, and some other writers, express the common *ARTICHOKE*. See *ATRACTYLIS*, *CARDUUS*, *CARLINA*, and *CNICUS*.

ACARNAN, in *Ichthyology*, the name of a small sea-fish very common in the Mediterranean, and brought to market among the rubellios, or erythrin, and called by the fishermen by the name *fravolino*, or *phragelino*. It very much resembles the erythrinus in shape; but as that is of a fine red, this, on the contrary, is of a silvery white. Its mouth is moderately large; its teeth slender and pointed; and its eyes large, having fine yellow irises. Its fins are white, but have each a black spot at their origin. It seems doubtful whether this be really any way different from the erythrinus, except in colour, which alone is not distinction sufficient to make a species. Rondelet.

ACARNANIA, in *Ancient Geography*, the first country of Free Greece, or Greece Proper, bounded by the Sinus Ambracius, and the river Achelous; the latter of which separates it from Ætolia, on the east; and the former from Epirus, on the west. Ptol. Geog. l. iii. c. 15. Strabo l. x. Pliny, l. iv. c. 1. Thucyd. l. ii. Pausan. l. viii. Acarnania was a free state, and governed by a prætor, or general assembly, and other subordinate magistrates, of the same description and authority as those of the Achæans and Ætolians. The inhabitants of this country were called *Acarnanes*, as some say, from *ακάρνηος*, i. e. people *unshorn*, as the Curetes on the other side of the Achelous were so called from *καρμητιον*, i. e. *shorn*. But Pausanias says, that they were thus denominated from Acarnanes, the son of Alcæon. Stephan. de Urb. vol. i. p. 49. Strabo Geog. tom. ii. p. 690—714. According to Lucian (Dial. Meret. apud op. tom. iii. p. 298.) they were noted for effeminacy and incontinence, whence the proverb, *χαρμηλος Ακαρνησος*, *porcellus Acarnanius*. *Ακαρνησος* is likewise proverbial to denote any thing excellent in its kind, because this country was famous for its breed of horses. It is now called *la Carnia* and *il Despotato*.

The Acarnanians are represented by Polybius (l. iv. p. 299. ed. Casaub.) as faithful to their promise, and extremely jealous of their liberty. They derived their origin from different nations, but associated in a general confederacy, and were almost always at war with their neighbours the ÆTOLIANS. They were the only people of any note that did not appear amongst the Grecian forces in their expedition against Troy. They were, more than all the other Greeks, attached to the kings of Macedon, and principally to Philip, the father of Perseus, and valued themselves upon an inviolable fidelity in the observance of treaties. The Romans made many attempts to withdraw them from their allegiance, and to deprive Philip of his only support. After more gentle efforts had failed, Lucius Flaminius resolved to reduce them by force, and laid siege to LEUCAS, their capital. It was at length betrayed by some Italian exiles, who, being acquainted with the place, had introduced many Romans into the city. The Acarnanians were surrounded, and those who refused to submit were put to the sword. The reduction of the capital struck such terror into the whole nation, that they deserted Philip, and submitted to the Romans, under whose protection they lived according to their own laws till the destruction of Corinth, when Acarnania became part of the province of ACHAIA. Liv. l. xxxii. c. 4.

ACARNANIA was also the name of a town in Sicily, famous for a temple of Jupiter.

ACARO, in *Geography*. See *AQUAMBOE*.

ACARON, in *Botany*, the wild *MYRTLE*.

ACARON, in *Geography*. See ACCARON.

ACARON Bay. See BERKLEY'S SOUND.

ACARUS, the TICK or MITE, in *Natural History*, so called, probably from a priv. and *καρπ* to cut, because it is deemed so small that it cannot be cut, is a genus of insects belonging to the order of *aptera*, in the Linnaean system, and to the eighth class called *anulata* in the distribution of Fabricius. The distinguishing characters of this genus are, that the mouth has no proboscis, that the haustellum or sucker is included in a bivalve, cylindrical sheath; that the feelers are two in number, equal, and of the length of the haustellum; that the eyes are two, placed at the side of the head, and that it has eight legs. Fabricius reckons forty, and Gmelin, in the last edition of Linnaeus's system, eighty-two species; of which, some are inhabitants of the earth, others of water; some live on trees and plants, others among stones, and others on the bodies of other animals, and even under their skin. They are as follow; viz. *elephantinus*, with an orbicular, depressed, livid body, and a black ovated spot at the base, found in India: *Aegyptius*, ovated and black, with a white margin, a native of Egypt: *REDUVIUS*: *Indus*, oval and ferruginous, with a black ovated spot at the base, found in South America and India: *Americanus*, obovated and ruddy, with white scutellum and joints of the legs, found on the cattle and horses of America: *SANGUISUGUS*: *RICINUS* or TICK: *crassipes*, with the second pair of legs very thick, nimble, gregarious, and found in the soil of Europe, and frequently in that of gardens: *Vesperilionis*, with an angulated thorax and unguiculated legs longer than the body, called the BAT-LOUSE, and found on the murine bat: *passerinus*, found on various sparrows, and called the sparrow-louse: *motatorius*, of a yellow colour, and with its first legs very long and adapted to swift motion, found on mushrooms: *Aphidioides*, red, with the fore-legs long and fit for running; and the hinder part of the abdomen terminating in two horns; and lodging in the putrescent wood of Europe: *coleoptratus*, black, with acute-angled sides, found under the bark of trees in Europe: *telarius*, of a greenish-yellow colour, with a brown spot on each side of the abdomen, found on plants in Europe that are not much exposed to the wind, or placed in a hot-house, which it penetrates with its sting, and suffocates; and frequent on the leaves of the lime-tree in autumn: *Siro* or MITE: *lactis*, with an ovated, obtuse abdomen, and the hinder part having four declining bristles as long as the body, found in sour cream and unwashed milk-vessels: *typhenteria*, with two bristles to the legs, and four horizontal bristles at the hinder end of the ovated abdomen, of the length of the body, found in beer-casks, &c.: *exulcerans*, with very long setaceous legs, and the two fore-legs short, supposed by some to be the cause of the ITCH, and nesting in the ulcers of this disease, but by others not to be sufficiently distinct from the *A. scabiei*: *geniculatus*, black, with sub-globose joints of the thighs, found on the dead branches of trees: *tinctorius*, with a red hairy abdomen, the hinder part obtuse, and the anterior tibiae of a paler colour, a native of Surinam and Guinea, and lately introduced into the practice of dyeing: *aquaticus*, with a sanguineous depressed abdomen, covered with a velvety down, obtuse behind, found swimming briskly in the fresh waters of Europe: *holosericus*, with an abdomen like that of the former species, and found in dry situations in Europe and America, generally under the surface of the earth, and sometimes among hay: *baccarum*, with a distended red abdomen, and sides of a darker hue, found on berries, and particularly currants and gooseberries: *muscorum*, with a red abdomen, and hinder legs very long and filiform, found on the mosses of Europe: *BATATAS*: *gymnopterorum*, with a red abdomen, and two

crimson-coloured spots on the sides, found on bees, wasps, the libellula, alilus, and other insects: *coeopratorum*, with an ovated red body and whitish anus, frequent on beetles, whence the common black beetle is sometimes called the lousy beetle: *rufesfris*, brown, with a dorsal line of two colours, frequent under the stones of Europe: *longicornis*, red, with bilid antennæ longer than the rostrum, found in the rocks of Europe: *litoralis*, ovated and red, with a subulated extended rostrum, found among the rocks on the shores of Europe: *fungorum*, of a reddish-brown colour, with a subglobose, smooth, unspotted abdomen, gregarious, and moving slowly on different fungi: *tremelle*, subglobose, of a black-blueish colour, found on the *TREMELLA juniperana*: *scaber*, depressed and ash-coloured, and rough sides, found in the earth at the beginning of spring: *salicinus*, red, with a double brown dorsal line, and in the fore-part bifurcated, found swiftly running on the willows: *croceus*, yellow, with a red spot on the sides of the thorax, found on the galls of the WILLOW: *URSELLUS*: *grossus*, ovated, somewhat depressed, of an olive-brown colour, with a blackish scutellum, and the base and apex of a golden copper colour, found on the animals of South America, and supposed to be the same with the *elephantinæ*: *undatus*, orbiculated and black, with waves of white on the sides, and a black spot, found in New Holland: *Lippensis*, ovated and brown, with a thick margin, found at Leipick: *Iguanae*, ovated and spotted with gold, with the margin of the abdomen striated and somewhat jagged, fixing itself to the throat of the *lacerta* IGUANA: *Cayensis*, ovated, and varicied with gray and white, with the hinder margin elevated and striated, a native of Cayenne: *lineatus*, ovated and ferruginous, with two white wavy lines, found in America: *aureolatus*, obovated and brown, with two small lines and a palmed spot on the hinder part, of a green and gold colour, a native of America: *bolivatus*, ovated and ferruginous, with a brown thorax: *pallipe*, ovated and brown, with the antennæ and legs of a pale white: *bispanus*, ovated and black, with ferruginous legs and white joints, found in Barbary: *HIRUDO*: *vibrans*, roundish, testaceous, and without spots, with the fore-legs longer than the others, found in Cayenne: *domesticus*, white, with two brown spots, an ovated body contracted in the middle, very long hairs, and equal legs, found in the houses of Europe, but supposed not to be different from the *siro*: *scabiei*, white, with reddish legs, and the hinder having four very long bristles, and much less than the *siro*, and found in the ulcers of persons infected with the ITCH, exciting irritation, and supposed to be either the cause, or rather a symptom of the disease: *zosteræ*, roundish and whitish, with a red abdomen, found in the fuci of the Norwegian seas: *phalangii*, ovated and red, with an extended rostrum and long legs, frequent on the phalangii and spiders: *phaetonis*, ovated, and behind acuminate, with the legs fasciculated at their apex, found on the phaeton of the Southern Ocean: *fucorum*, pale-coloured, with two winding black lines and the hinder legs very short and bent, found on the fuci of the seas of Norway: *rufipes*, ovated and white, with ferruginous legs, found in Europe: *lichenis*, with the first and fourth pair of legs longer, and the second thick, found on the lower surface of the lichen: *leucurus*, with the second legs very thick, a testaceous body, and a pale-coloured anus, found on carcasses: *locusta*, with four bristles in the hinder part, and as many on the sides: *conferva*, ovated and brown, with the second joint of the legs small, and the third furnished at its apex with a long brittle, found in the filaments of the conferva under water, but dying out of the water: *cadaverum*, with a body formed with two lobes and four long bristles to the hinder part of the body, found on the carcasses of insects: *destructor*, ovated, with many long bristles

bristles to the anus, and one to the legs, found on the exuvie of insects in moist places: *eruditus*, with the first pair of legs very thick, and clawed, and the second having two very long bristles at their apex, found in books that are kept in moist places: *clauda*, with the hinder part of the anus emarginated, found on the *Alauda arvensis*: *graminum*, red, with the legs of the first pair very long, and the hinder part of the abdomen jagged, found on the leaves of grasses: *appendiculatus*, subglobose and crimson-coloured, with long legs of a paler hue, and the hinder legs longer, found under the lichen *pulmonarius*: *vitis*, ovated, fetose and red, with equal legs and several bristles, found swiftly running on the vine: *piger*, red, with paler legs, and the hinder part of the abdomen furnished with small bristles, found upon moss: *denticulatus*, with four teeth to the anterior part of the body, found under garden-pots: *tesudineus*, with a smooth abdomen, lodged in the soil at the commencement of spring: *rubens*, red, ovato-oblong, with subequal legs, found under moss: *pregnans*, red, globose and very smooth, scarce visible to the naked eye, found in the soil in spring: *musci*, corneous, hairy and black, found on moss: *limacum foliorum*, ovated, greenish, and naked, with all the legs equal, found on the leaves of various plants in summer: *putrescentie*, ovated, greenish, and bristly, with unequal legs, found in the earth: *carduelis*, ovated, greenish and blackish, naked, with unequal inflated legs, found on the *fringilla*: *coccineus*, ovated and of a crimson-colour, with a flat body, lodged on various insects: *vegetans*, crustaceous, brown, emarginated and convex, and plain beneath, found on various insects of the coleoptera order: *sambuci*, red, with pale legs and feelers, with long bristles scattered over the body and legs, found slowly moving on the leaves of the black elder: *muscarum*, found on the *musca acarorum*, hemispheric, pale-coloured and smooth, with equal legs, found on the *acarus crassipes*: *cardinalis*, ovated, downy and red, black below between the legs, and furnished with an ovated black scutellum, found on mosses in the grove adjoining to the Hague.—Aristotle, (Hist. Anim. l. v. c. 32. Oper. tom. i. p. 857. Ed. Du Val.) mentions the acarus bred in wax, as the least object of human sight. These insects, which are often very troublesome on plants and in hot-houses, may be effectually destroyed by the mixture recommended for destroying those on the PINE-APPLE. The following mixture will be also equally efficacious: Take two ounces of soft green soap, one ounce of common turpentine, and one ounce of flowers of sulphur; pour upon these ingredients a gallon of boiling water, and work the whole together with a whisk, and let the mixture be used warm. This mixture may also be of use for preventing the mildew on the peach and apricot. However, this method should never be practised on fruit-trees near the time when their fruits are ripening. A strong ley made of wood-ashes will likewise destroy the *Acari*; but plants are greatly injured by this, and other briny and spirituous compositions. The *Acari* may be also destroyed in plants, by brushing them with a common painting brush, by often dusting them with flowers of sulphur, by keeping a hot-house in a moist state, by dipping the tops of plants frequently in clear water in which flowers of sulphur and tobacco have been infused, in the hot summer months, and always keeping the hot-house clean.

ACARUS is the name given by Brown (Jam. 418.) to the PULEX *penetrans* of Linnæus. It is also a species of the TRICHODA, in the order of INFUSORIA, and class of WORMS.

ACASABASTIAN, in Geography, a river in the province of Vera Paz, in Mexico, whose source is not far from

the South Sea, which runs into the Golfo Dolce. There is a town of the same name situated on its banks.

ACASATHULA, a sea-port situated on a point of land, in the province of Guatimala Proper, in Mexico, on a bay of the South Sea, about four leagues from Trinidad. It receives the greatest part of the treasures from Peru and Mexico. There are three volcanos in its vicinity. N. Lat. 12° 50'. W. Long. 93°.

ACASTA, in Entomology, a species of PAPILIO, found in India, with roundish wings, having five transverse spots, and brown apices, and the under part yellow.

ACASTA, in Mythology, one of the nymphs, called OCEANIDIS.

ACASTUS, in Classical History, the son of Pelias king of Thessaly, and one of the most famous hunters in his time. He married Atalanta, according to Suidas, or Altydamea, as his annotator calls her, who, falling in love with Peleus her son-in-law, and not having her wishes gratified by him, accused him to her husband of a rape; upon which he made war against Acastus, and slew his wife. Suidas, tom. i. p. 365.

ACASTUS, in Entomology, a species of PAPILIO, with black wings, the fore-wings having a snowy band, and the hinder green beneath, marked with yellow ridges; found in Surinam. It is also a name given by Cramer to the *Papilio PHIDIAS*.

ACATALECTIC, ACATALECTICUS, formed of the privative α and $\kappa\alpha\lambda\alpha\lambda\alpha\kappa\tau\iota\kappa\omicron\varsigma$, from $\kappa\alpha\lambda\alpha\lambda\eta\eta\varsigma$, to cease or end, in the Ancient Poetry, a term applicable to such VERSES as have all their FEET and syllables, and are in no respect lame or defective at the end. In the following strophe of Horace, the two first verses are *acatalectic*, and the last *catalectic*:

Solvitur acris hyems, grata vice

Veris & Favoni:

Trabantque siccas machinae carinas—

ACATALEPSIA, ACATALEPSY, compounded of the privative α and $\kappa\alpha\tau\alpha\rho\alpha\rho\iota\sigma\tau\alpha\iota$, *deprehendo*, to find out, in Philology, an impossibility of a thing's being conceived or comprehended.

Acatalepsia is synonymous with incomprehensibility.

ACATALUS, in Botany, a JUNIPER berry.

ACATASTATOS, formed of α and $\kappa\alpha\theta\iota\sigma\tau\omega$, *confisso*, inconstant, is a physical term, anciently applied to irregular fevers, whose paroxysms are uncertain, and which are indicated by frequent changes in the urine. It is likewise applied to those shivering fits in fevers, which have no constant return, and to turbid urine, that deposits no regular sediment.

ACATECHILI, or ACATECHICHICTLI, in Ornithology, the FRINGILLA *Mexicana* of Gmelin, and the *Mexican SISKIN* of Latham, is about the size of the siskin, and has the same song, and feeds on the same substances. Its head and the upper part of its body are a greenish brown, and the throat and under part white, shaded with yellow. Its Mexican name *Acatechichictli*, signifies the bird that rubs itself against the reeds, and may allude to some of its habits.

ACATERY, or ACCATRY, in the king's household, a kind of check betwixt the CLERKS of the kitchen and the PURVEYORS.

ACATHARSIA, of α and $\kappa\alpha\theta\alpha\rho\omega$, to cleanse, in Medicine, denotes an impurity of the blood or humours.

ACATHISTUS, $\alpha\kappa\alpha\theta\iota\sigma\tau\omega\varsigma$, in an ecclesiastical sense, a solemn hymn, or vigil, anciently sung in the Greek church on the Saturday of the fifth week in Lent, in honour of the Virgin, for having thrice delivered Constantinople from the invasions of barbarous nations.

It was called $\alpha\kappa\alpha\theta\iota\sigma\tau\omega\varsigma$, i. e. without sitting, because it was celebrated standing: the people stood all night, singing the praises of their deliverers. The same name is also given to

the day whereon it was performed, which is called the feast
 18 2226, 57.

ACATIUM, in the ancient *Navigation*, a kind of boat or pinnace used for military purposes.

The *acatium* was a species of those called *actuarie naves*, i. e. such as were wrought with oars. It was sometimes made use of in battle. Strabo represents it as a kind of privateer, or pirate sloop; and Suidas, as a fishing vessel.

ACAULIS, and ACAULOSE, in *Botany*, a term applied to certain plants, the flowers of which have no stalk or pedicle to support them, but rest immediately on the ground: of this kind are the carline thistle, and some others.

ACBAB, in *Ornithology*, a name given by the people of the Philippine islands to a bird very like our common hen, which is very frequently wild among them. It lives on rice, and other vegetables, and does a great deal of mischief; but is short-winded, and does not fly well, so that it is easily destroyed.

ACBAR, the name of an idol of enormous size, which the Arabians are said formerly to have worshipped. It was with difficulty that Mahomet restrained them from this species of idolatry. Hyde's *Diff.* vol. i. p. 257.

ACBARABAD, in *Geography*. See AGRA.

ACCA (St.) in *Ecclesiastical History*, bishop of Hagustald, or Hexham, in Northumberland, who succeeded Wilfrid in 709. Besides ornamenting the cathedral, he erected a noble library, consisting chiefly of ecclesiastical learning, and a collection of the lives of the saints. He was accounted a very able divine, and famous for his skill in church music. He wrote several books, particularly *Passiones Sanctorum*, and *pro illustribus Scripturis ad Bedam*. He died in 740, under Egbert. Simeon of Durham relates several miracles performed by his relics.

ACCABA, in *Geography*, the name given by the Arabs to a chain of mountains near the Red Sea; and which formed the easternmost range of the *μείλινα ὄρη* of Ptolemy. The castle of *Accaba* is situated below these mountains on the elanitic point of the Red Sea. See HOR.

ACCABAAR, in *Natural History*, the *Isis Ochracea* of Linnæus, the red *Indian coral* of Ellis.

ACCABAAR is also a name given to the *ANTIPATHES pennacea* of Linnæus.

ACCABARIUM, in *Natural History*, a name given by Rumphius to the *MADREPORA Oculata* of Linnæus, or the white coral of the shops; and also to the *Isis Hippuris* of the same author.

ACCAD, ACCHAD, or as the LXX has it ARCHAD, in *Scripture Geography*, a town in the kingdom of Nimrod or Babylonia, to the east of the Tigris. Wells (*Geog. O. T.* vol. i. p. 228) supposes that the city SITTACE or PSITTACE was formerly called by this name, and that ARTACENE, mentioned by Strabo, was formed from *Acad*.

ACCADEMIA, in *Musical Language*, a term used in Italy to denote a private concert.

ACCALIA, in *Antiquity*, solemn feasts, held in honour of Acca Laurentia, wife of the shepherd Faustulus, and nurse or foster-mother of Romulus. She was deified by the Romans, and the flamen of Jupiter once a year offered sacrifices to her on a holiday instituted to her honour.

These were otherwise called *Laurentalia*.—To the same Acca is also attributed the institution of the *FRATRES ARVALES*. Varro, de *Ling. Lat. & Scalig. Conject.* in Varro.

ACCAPITARE, ACCAPTARE, ACAPTARE, in ancient *Law-books* and records, the act of becoming vassal of a lord, or of yielding homage and obedience to him.

The word is compounded of the Latin *ad, to*; and *caput,*

head; because vassals owned their lords for their head. Whence also the lords are sometimes called *domini capitales*: as those who command in an army are called *capitanei, capitains*; and in old French, *cheveteines, chiefstains*, in respect of their soldiers.

ACCAPITUM, a sum of money paid to a vassal, upon his admission to a FEUD.

The word is also written *acapitum, acapitamentum, acapitio, acaptatio, and acaptagium*.

ACCAPITUM, in our ancient *Law-books*, signifies RELIEF due to the chief lord.

ACCARBAAR, in *Natural History*, the *GORGONIA Sappo* of Linnæus; and also the *ALCYONIUM arboreum* of the same author.

ACCARBAARIUM, the *GORGONIA Antipalbes* of Linnæus, or the *black CORAL* of other authors.

ACCARISI, *Francis*, in *Biography*, an ancient civilian in the 16th and 17th centuries, who was born at Ancona, and obtained celebrity as a professor of civil law in the university of Sienna. At first his lectures consisted of illustrations of Justinian's Institutes; they were afterwards extended to the pandects: and at length comprehended civil law in general. After having occupied the chair of law-professor at Sienna with high reputation for twenty years, and resisting many advantageous offers from other Italian universities, he was induced to accept the proposals of the duke of Parma, who, besides pecuniary recompence, tempted him with the title of his counsellor; and he removed to Parma. However, he was soon recalled by the Grand Duke of Tuscany, who assigned him the first professorship in law at Pisa. He died at Sienna in 1622. Gen. Dict.

ACCARON, in *Scripture Geography*, a town of Judea called *Ekron*, 1 Sam. vi. 17. vii. 14. and mentioned in Josephus, Ant. l. vi. c. 1. It was the boundary of Philistia to the north, not far from the sea, and from Bethihemesh, (Joh. xv. 11. 46.) and famous for the idol Baalzebub, who was worshipped here under the same attribute with ACHOR, the god of flies, from which, according to Bryant (*Mythology*, vol. i. p. 83.) this city derived its name. It was about thirty-four miles from Jerusalem. It first fell to the lot of Judah, and was afterwards given to the tribe of Dan. N. lat. 31° 55'. E. long. 34° 57'.

ACCAS *Island*, in *Geography*, lies off the mouth of Ancobar river, on the coast of Guinea, and extends so near the shore on each side as to render the channel very narrow.

ACCEDAS *ad Curiam*, in *Law*, an original writ, which lies for the removing suits in any court baron, except the county court, into the king's court; upon apprehension of partiality, or false judgment in the other.

A like writ lies for him who has received false judgment in the county court; where it is called *de falso judicio*.

An *Accedas ad Curiam* lies also for justice delayed, as well as falsely given; and is a species of the writ RECORDARI.

ACCEDAS *ad Vicecomitem*, is a writ directed to the coroner, commanding him to deliver a writ to the sheriff, who having a PONE delivered to him, suppresses it.

ACCELERANDO, in *Music*, is an Italian term for accelerating the time in the middle of a piece of music, as *raltando* is for retarding it. This last is a fashionable effect lately introduced in the performance of music, and much abused by the excess and too frequent use of it. The gradual change of measure, when practised in the midst of a regular movement, seldom produces any other effect on common hearers than that of breaking time. Perhaps in a very pathetic and expressive passage, even in an allegro, when very delicately done from real feeling, the effect may be approved; but the imitators of the licences and retiments

ments of great masters disgrace the compositions which they mean to embellish, and disgust their hearers. Daring imitators of the bold modulation of Haydn, and of the rapid running up and down the keys in half notes, as Mozart did in his juvenile days, have deformed melody, and corrupted harmony. These great masters knew when to stop; but their apes think they never can season their productions too highly; and, it is to be feared, that the lovers of simplicity will never be indulged again with plain food, even by those who have no means of gratifying them with luxuries.

ACCELERATING Force, in *Mechanics*. See **FORCE**.

ACCELERATION, in *Mechanics*, the increase of velocity in a moving body.

Accelerated motion is that which continually receives fresh accessions of velocity, and is either equally or unequally accelerated. If the accessions of velocity be always equal in equal times, the motion is said to be equally or uniformly accelerated; but if the accessions in equal times either increase or decrease, the motion is unequally or variably accelerated. *Acceleration* stands directly opposed to retardation, which denotes a diminution of velocity.

ACCELERATION is chiefly used in *Physics*, in respect of falling bodies, i. e. of heavy bodies tending towards the centre of the earth by the force of **GRAVITY**.

That natural bodies are accelerated in their descent, is evident from various considerations, both *à priori* and *posteriori*.—Thus, we actually find that the greater height a body descends from, the greater impression it makes, and the more vehemently does it strike the plane or other obstacle on which it falls.

Various are the systems and opinions which philosophers have produced to account for this acceleration. Some attribute to it the pressure of the air: the farther, say they, a body falls, the greater load of atmosphere is consequently incumbent on it: and the pressure of a fluid is in proportion to the perpendicular altitude of the column thereof.—Add, that the whole body of the fluid pressing in innumerable right lines, which all meet in a point, viz. the centre of the earth; that point, by the meeting of those lines, sustains, as it were, the pressure of the whole mass: consequently, the nearer a body approaches to it, the effect or pressure of more united lines must it sustain.

But what overturns this account is, that as the pressure of the air downwards increases; so, by the known laws of statics, does the resistance, or the force wherewith the same fluid tends to repel, or drive the body upwards again. Others insist, that the incumbent air is the grosser and more vaporous, the nearer the earth; and filled with more heterogeneous particles, which are not true elastic air: and hence, say they, a descending body, meeting continually with less resistance from the elasticity of the air, and having the same force of gravity still acting on it, must necessarily be accelerated. Hobbes (*Philos. Probl. cap. i. p. 3.*) attributes acceleration to a new impression of the cause which makes bodies fall; which, on his principles, is also the air. As part of this mounts, part also must descend; for reasons drawn from the motion of the earth, which is compounded of two motions, one circular, the other progressive; consequently, the air descends, and circulates at once. As the body, in its fall, receives a new pressure in every point in its descent, its motion, he says, must needs be accelerated.

But what overturns all accounts where the air or atmosphere is concerned, is, that the acceleration holds *in vacuo*, and even more regularly than in air. See **VACUUM**.

The Peripatetic account is worse than this: the motion of heavy bodies downwards, say they, arises from an intrin-

sic principle, which makes them tend to the centre, as the proper seat, or element, where they would be at rest: hence, add they, the nearer bodies approach to it, the more is their motion accelerated.

The Cassendists, on the other hand, hold that the earth emits a sort of attractive effluvia, innumerable threads whereof continually ascend and descend; which threads, proceeding like radii from a common centre, diverge the more the farther they go: so that the nearer a heavy body is to the centre, the more of these magnetic threads it receives; and hence the more is its motion accelerated. But this is refuted by an easy experiment: for if a ball be let fall out of the lowest window of a high tower, and also out of the highest, notwithstanding the greater vicinity to the centre in the one, than in the other case.

The Cartesians account for acceleration, from the repeated pulses of a subtle ethereal matter, which is continually acting on the falling body, and impelling it downwards.

After all, the immediate cause of acceleration is not mysterious; the principle of **GRAVITATION** being once admitted, will determine the body to descend, and its motion will be accelerated by necessary consequence.

Suppose a body let fall from on high: the primary cause of its beginning to descend, is doubtless the power of gravity; but when once the descent is commenced, that state becomes in some measure natural to the body; so that if left to itself, it would persevere in it for ever, even though the action of the first cause should cease: as we see in a stone cast with the hand, which continues to move after it is left by the cause that gave it motion.

But, beside the propensity to descend, impressed by the first cause, and which of itself were sufficient to continue the same degree of motion once begun, *in infinitum*; there is a constant accession of subsequent efforts of the same principle, gravity, which continues to act on the body already in motion, in the same manner as if it were at rest. Here, then, being two causes of motion; and both acting in the same direction, the motion they jointly produce must necessarily be greater than that of any one of them.—And the velocity thus increased having the same cause of increase still persisting, the descent must of course be continually accelerated.

For, supposing gravity, whatever it be, to act uniformly on all bodies, at equal distances from the earth's centre; and that the time in which a heavy body falls to the earth be divided into equal parts indefinitely small: let this gravity incline the body towards the earth's centre, while it moves in the first indefinitely small part of the time of its descent; if after this, the action of gravity be supposed to cease, the body would proceed uniformly towards the earth's centre, with a velocity equal to that which results from the force of the first impression.

But now, since the action of gravity is here supposed still to continue; in the second moment of time, the body will receive a new impulse downwards, equal to what it received at first; and thus its velocity will be double of what it was in the first moment; in the third moment it will be triple; in the fourth quadruple, and so on continually: for the impression made in one moment, is not at all altered by what is made in another: but the two are, as it were, aggregated or brought into one sum.

Wherefore, since the particles of time are supposed indefinitely small, and all equal to one another; the velocity acquired by the falling body will be every where proportioned to the times from the beginning of the descent; and the velocity will be consequently proportional to the time in which it is acquired.

Thus, if a body, by means of this constant force, acquire a velocity of $32\frac{1}{2}$ feet in one second of time, it will acquire a velocity of $64\frac{1}{2}$ feet in two seconds, of $96\frac{1}{2}$ feet in three seconds: and all bodies, whatever be their quantity of matter, will acquire, by the force of gravity, the same velocity in the same time. For every equal particle of matter being endued with an equal impelling force, viz. its gravity or weight, the sum of all the forces, in any compound mass of matter, will be proportional to the sum of all the weights or quantities of matter to be moved; consequently, the forces and masses moved, being thus constantly increased in the same proportion, the velocities generated will be the same in all bodies, great or small: *i. e.* a double force moves a double mass of matter, with the same velocity that the single force moves the single mass, &c. or, the whole compound mass falls altogether with the same velocity, and in the same manner, as if its particles were not united, but as if each fell by itself, and all were separated from one another; and being put into motion at once, they would fall together, just as if they were united into one mass.

Galileo, who first discovered the above-mentioned law of the descent of falling bodies, illustrated it nearly in the following manner.

The space passed over by a moving body in a given time, and with a given velocity, may be considered as a rectangle made by the time and the velocity.—Suppose A (*Plate 1. Mechanics, fig. 1.*) a heavy body descending, and let AB represent the time of its descent; which line we may suppose to be divided into any number of equal parts, AC, CE, EG, &c. representing the intervals, or moments of the given time.—Let the body descend through the first of those divisions, AC, with a certain equable velocity arising from the proposed degree of gravity: this velocity will be represented by AD; and the space passed over, by the rectangle CAD.

Now, as the action of gravity in the first moment produced the velocity AD, in the body before at rest; in the second moment, the same will produce, in the body so moving, a double velocity, CF; in the third moment, to the velocity CF will be added a farther degree, which together therewith will make the velocity EH, which is triple of the first, and so of the rest. So that in the whole time AB, the body will have acquired a velocity BK.—Again, taking the divisions of the line, *e. g.* AC, CE, &c. for the times, the spaces gone through will be the areas or rectangles CD, EF, &c. So that in the whole time AB, the space described by the moveable body, will be equal to all the rectangles, *i. e.* to the dented figure ABK.

Such would be the case, if the accessions of velocity only happened in certain given points of time, *e. g.* in C, in E, &c. so that the degree of motion should continue the same till the next period of acceleration occurs.—If the divisions or intervals of time were supposed less, *e. g.* by half; then the dentures of the figure would be proportionably smaller; and it would approach so much the nearer to a triangle.—If they were infinitely small, *i. e.* if the accessions of velocity were supposed to be made continually, and in every point of time, as is really the case; the rectangles thus successively produced will make an exact triangle, *e. g.* ABE (*fig. 2.*)—Here, the whole time AB consisting of the little portions of time A 1, 1 2, &c. and the area of the triangle ABE, of the sum of all the little triangular surfaces answering to the divisions of the time; the whole area or triangle expresses the space moved through in the whole time AB; and the little triangles A 1 f, &c. the spaces gone through in the divisions of time A 1, &c.

But these triangles being similar, their areas are to one another, as the squares of their homologous sides AB, A 1, &c. and consequently, the spaces moved are to each other as the squares of the times.

If the velocity were uniform, the space would be equal to the product of the velocity and time; *i. e.* by an obvious notation $S = V \times T$; but, in this case, the velocity increases from 0 till it becomes equal to V, and therefore the space described must be equal to half the above product; *i. e.* $S = \frac{1}{2} V \times T$, and $s = \frac{1}{2} v \times t$, and $S : s :: \frac{1}{2} V \times T : \frac{1}{2} v \times t :: VT : vt$. But $V : v :: T : t$, and $VT : vt :: T \times T : t \times t$; consequently $S : s :: T^2 : t^2$.

Hence we may easily infer the great law of acceleration, viz. “That a descending body uniformly accelerated, describes, in the whole time of its descent, a space which is just half of what it would have described in the same time, with the accelerated velocity it has acquired at the end of its fall.” For, the whole space the falling body has moved through in the time AB, we have already shewn, will be represented by the triangle ABE; and the space the same body would move through in the same time with the velocity BE, will be represented by the rectangle ABEF.—But the triangle is known to be equal to just half the rectangle.—Therefore the space moved is just half of what the body would have moved with the velocity acquired at the end of the fall. Hence we infer, that the space moved with the last acquired velocity BE, in half the time AB, is equal to that really moved by the falling body in the whole time AB.

From the preceding principles and reasoning we deduce the following general laws of uniformly accelerated motions: viz.

1. That the velocities acquired are constantly proportional to the times.
2. That the spaces are proportional to the squares of the times; so that if a falling body describe any given length in a given time, in double that time it will describe four times that length, in thrice the time nine times the length, &c.; and universally, if the times be in arithmetical proportion, 1, 2, 3, 4, &c. the spaces described will be 1, 4, 9, 16, &c. Thus, a body, which falls by gravity through $16\frac{1}{2}$ feet in the first second of time, will fall through four times as much, or $64\frac{1}{2}$ feet in 2 seconds, &c. And since the velocities acquired in falling are as the times, the spaces will be as the squares of the velocities: and both the times and velocities will be in a subduplicate ratio, or as the square roots, of the spaces.

3. The spaces described by a falling body in a series of equal moments or intervals of time, will be as the odd numbers 1, 3, 5, 7, 9, &c. which are the differences of the squares or whole spaces, *i. e.* a body which has fallen through $16\frac{1}{2}$ feet in the first second, will fall in the next second through $48\frac{1}{2}$ feet, and in the third second through $80\frac{1}{2}$ feet, &c.

Retaining the above notation, $S : s :: T^2 : t^2$ or $V^2 : v^2$; and $V : v$ or $T : t :: \sqrt{S} : \sqrt{s}$ *i. e.* $S^{\frac{1}{2}} : s^{\frac{1}{2}}$; and the times will be reciprocally as the velocities, and directly as the spaces; for $S : s :: TV : tv$, and $Stv = sTv$: consequently $T : t :: Sv : sV$; or $T = \frac{S}{V}$. When the accelerating forces are different, but constant, the spaces will be as the products of the forces into the squares of the times; and the times will be in the subduplicate ratio of the spaces directly, and of the forces inversely. For when the force is given, the velocity (V) is as the time (T); when the forces are different, but constant, and the time is given, the velocity (V) will be as the force (F). But when neither the force nor the time is given, the velocity (V) will be partly as the time and partly as the force, or as their product (F x T). Thus, $V : v ::$

$F \times T : f \times t$, consequently $F \times T^2 : f \times t^2 :: VT : vt :: S : s$.
 Therefore, $T^2 : t^2 :: \frac{S}{F} : \frac{s}{f}$, and $T : t :: \sqrt{\frac{S}{F}}$
 $\sqrt{\frac{s}{f}}$

4. If a body fall through any space in any time, it acquires a velocity equal to double that space; *i. e.* in an equal time, with the last acquired velocity, uniformly continued, it would pass through double the space. Thus, if a body fall through $16 \frac{1}{2}$ feet in the first second of time, it will have acquired a velocity of $32 \frac{1}{2}$ in a second: *i. e.* if the body move uniformly for one second, with the velocity acquired, it will pass over $32 \frac{1}{2}$ feet in this second; and if in any time the body fall through 100 feet, then in another equal time, if it move uniformly with the velocity last acquired, it will pass over 200 feet, &c.

To those who disapprove of Galileo's demonstration of the laws of accelerated motion, the following method of illustrating and evincing them, may possibly be more satisfactory. Let the whole time of a body's free descent be divided into any number of parts, each of which is called 1; and let a denote the velocity acquired at the end of the first part of time; then $2a, 3a, 4a$, &c. will represent the velocities at the end of the 2d, 3d, 4th, &c. parts of time, because the velocities are as the times; and for the same reason, $\frac{1}{2}a, \frac{3}{2}a, \frac{5}{2}a$, &c. will be the velocities at the middle point of the 1st, 2d, 3d, &c. parts of time. But as the velocities increase uniformly, the space described in any one of these parts of time may be considered as uniformly described with the velocity in the middle of that part of time; and therefore, multiplying each of those mean velocities by their common time 1, we shall have the same fractions $\frac{1}{2}a, \frac{3}{2}a, \frac{5}{2}a$, &c. for the spaces passed over in the successive parts of the time; *i. e.* the space $\frac{1}{2}a$ in the first time, $\frac{3}{2}a$ in the second, $\frac{5}{2}a$ in the third; and adding these spaces successively to one another, we shall obtain $\frac{1}{2}a, \frac{4}{2}a, \frac{9}{2}a, \frac{16}{2}a$, &c. for the whole spaces described from the beginning of the motion to the end of the first, second, third, fourth, &c. portions of time, *viz.* $\frac{1}{2}a$ in one space of time, $\frac{4}{2}a$ in two spaces, $\frac{9}{2}a$ in three spaces, $\frac{16}{2}a$ in four, &c. and the spaces will be as the numbers 1, 4, 9, 16, &c. which are as the squares of the times.

From this mode of demonstration, all the properties above mentioned will evidently follow; such as, that the whole spaces, $\frac{1}{2}a, \frac{4}{2}a, \frac{9}{2}a$, are as the squares of the times 1, 2, 3, &c. and the separate spaces $\frac{1}{2}a, \frac{3}{2}a, \frac{5}{2}a$, &c. described in the successive times, are as the odd numbers 1, 3, 5, &c. And that the velocity a , acquired in any time 1, is double the space $\frac{1}{2}a$ described in the same time.

From the properties above demonstrated, we obtain the following practical theorems or formulae for use. Let g denote the space passed over in the first second of time by a body urged by any constant force, denoted by 1, and t denote the time or number of seconds in which the body passes over any other space s , and v the velocity acquired at the end of that time: then we shall have $v = 2gt$, and $s = gt^2$; and from these two equations we obtain the following general formulae: *viz.*

$$1. t = \frac{v}{2g} = \frac{2s}{v} = \sqrt{\frac{s}{g}}$$

$$2. v = 2gt = 2\sqrt{gs} = \frac{2s}{t}$$

$$3. s = gt^2 = \frac{v^2}{4g} = \frac{t v}{2}$$

$$4. g = \frac{s}{t^2} = \frac{v}{2t} = \frac{v^2}{4s}$$

Hence it appears, that when the constant force 1 is the natural force of gravity, then the distance g descended in the first second, in the latitude of London, is $16 \frac{1}{2}$ feet: but if it be any other constant force, the value of g will be different in proportion as the force is greater or less. See Hutton's Dict. Art. *Acceleration*, where two propositions are introduced, which were communicated to the author by Mr. Abram Robertson of Christ Church College, Oxford, in which the laws of accelerated motion are demonstrated in a manner somewhat different from that which is above given. See farther on this subject, *Laws of the DESCENT of Bodies, and Laws of MOTION, uniformly accelerated and retarded.*

Having above illustrated the laws of accelerated motion, when the accelerating forces are constant, and deduced the formulae for expressing them in finite determinate quantities, we shall now subjoin those that pertain to the cases of variably accelerated motions. Here the formulae will be fluxionary expressions, the fluents of which, adapted to particular cases, will give the relations of time, space, velocity, &c. Let t denote the time of motion, v the velocity generated by any force, s the space passed over, and $2g$ the variable force at any part of the motion, or the velocity which the force would generate in one second of time, if it should continue invariably like the force of gravity during that one second, and the value of this velocity $2g$ will be in proportion to $32 \frac{1}{2}$ feet, as that variable force is to the force of gravity. Then, because the force may be supposed constant during the indefinitely small time t , and the spaces and velocities, in uniform motions, are proportional to the times, we shall have two fundamental proportions, *viz.* $v : s :: 1'' : t$, or $s = t v$: and $2g : v :: 1'' : t$, or $v = 2gt$: from which are deduced the following formulae, in which the value of each quantity is expressed in terms of the rest

1. $t = \frac{s}{v} = \frac{v}{2g}$
2. $v = 2gt = \frac{2gs}{v}$
3. $s = vt = \frac{v^2}{2g}$
4. $2g = \frac{v}{t} = \frac{v^2}{s}$

These theorems are equally applicable to the destruction of motion and velocity, by means of retarding forces, as to the generation of them by means of accelerating forces. Hutton's Dict. *ubi supra*. Parkinson's System of Mechanics, &c. p. 50.

The motion of a body ascending, or impelled upwards, is diminished or retarded from the same principle of gravity acting in a contrary direction, in the same manner as a falling body is accelerated. See *RETARDATION*.

A body, thus projected upwards, rises till it has lost all its motion; which it does in the same time that a falling body would have acquired a velocity equal to that with which the body was thrown up. Hence, the same body thrown up, will rise to the same height from which, if it fell, it would have acquired the velocity with which it was projected upwards. And hence the heights to which bodies thrown up with different velocities ascend, are to one another as the squares of those velocities.

ACCELERATION of bodies on inclined planes. The same general law obtains in this case, as in bodies falling perpendicularly; *viz.* that the velocities are as the times, and the spaces descended down the planes as the squares of the times or of the velocities. But the velocities are less, according

to the sine of the plane's inclination, and the spaces less according to the square of the sine. See *Inclined Plane*.

ACCELERATION of the Motion of Pendulums. See *PEN-DULUM*.

ACCELERATION of the Motion of Projectiles. See *PRO-JECTILE*.

ACCELERATION of the Motion of Compressed Bodies, in expanding or restoring themselves. See *COMPRESSION, DILATATION, and ELASTICITY*.

ACCELERATION, in Astronomy, is a term applied to the fixed stars. Thus, the diurnal acceleration is the time by which the stars, in one diurnal revolution, anticipate the mean diurnal revolution of the sun, which is $3^m 55^{\frac{9}{10}}s$ of mean time, or nearly 3 minutes 56 seconds; *i. e.* a star rises or sets, or passes the meridian, $3^m 56^s$ sooner each day. This apparent acceleration of the stars is owing to the real retardation of the sun; and this depends upon his apparent motion towards the east, which is at the rate of about $59' 8\frac{1}{2}''$ of a degree every day. In consequence of this, the star which passed the meridian at the same moment with the sun yesterday, is to-day about $59' 8''$ beyond the meridian to the west, when the sun arrives at it; and this distance it will require about $3^m 6^s$ for him to pass over; and therefore the star will anticipate the motion of the sun at this rate every day. The true quantity of this anticipation or acceleration, is found by the following proportion, *viz.* $360^\circ : 59' 8\frac{1}{2}'' :: 24 \text{ hours} : 3^m 55^{\frac{9}{10}}s$, the acceleration required. This diurnal acceleration serves to regulate the lengths and vibrations of pendulums. If the pendulum marks *e. g.* $8^h 10^m$, when a fixed star sets or passes behind any intervening object to-day, and on the next day, the eye being in the same situation, the same appearance occur at $8^h 6^m 4^s$ by the pendulum, it may be inferred that such a pendulum is truly regulated, or justly measures mean time. See *CLOCK*.

ACCELERATION of the moon, is a term used to express the increase of the moon's mean motion from the sun, compared with the diurnal motion of the earth; so that it is now a little swifter than it was formerly. Dr. Halley (*Phil. Transf. No. 218*) was the first who made this discovery; and he was led to it by comparing the ancient eclipses observed at Babylon with those observed by Albatregnius in the ninth century, and some of his own time. He was not able to ascertain the quantity of this acceleration, because the longitudes of Bagdat, Alexandria, and Aleppo, where the observations were made, had not been accurately determined. But since his time, the longitude of Alexandria has been ascertained by Chazelles, and Babylon, according to Ptolemy's account, lies $50'$ east from Alexandria. From these data, Mr. Dunthorne (*Phil. Transf. No. 492. abr. vol. x. p. 84. &c.*) compared several ancient and modern eclipses, with the calculations of them by his own tables, and thus verified Dr. Halley's opinion: for he found, that the same tables represent the moon's place in the ancient eclipses *behind* her true place, and *before* it in later eclipses: and thence justly inferred, that her motion in ancient times was slower, but in later times quicker than the tables give it; and therefore, that it must have been accelerated. But he did not content himself with merely ascertaining the fact. He proceeded to determine the quantity of the acceleration; and by means of the most ancient eclipse of which any authentic account remains, observed at Babylon in the year before Christ 721, he concluded that the observed beginning of this eclipse was not above an hour and three quarters before the beginning by the tables; and therefore the moon's true place could pre-

cede her place by computation but little more than $50'$ of a degree at that time. Admitting the acceleration to be uniform, and the aggregate of it as the square of the time, it will be at the rate of about $10''$ in 100 years. M. de la Lande makes it $9''.886$. In Mayer's tables it is $9''$, beginning from 1700.

Dr. Long (*Astron. vol. ii. p. 436.*) attributes the acceleration above described to one or more of these causes: either, 1. the annual and diurnal motion of the earth continuing the same, the moon is really carried round the earth with a greater velocity than it was formerly: or, 2. the diurnal motion of the earth, and the periodical revolution of the moon continuing the same, the annual motion of the earth round the sun is a little retarded; which makes the sun's apparent motion in the ecliptic a little slower than it formerly was; and, consequently, the moon, in passing from any conjunction with the sun, spends less time before she again overtakes the sun, and forms a subsequent conjunction: in both these cases, the motion of the moon from the sun is really accelerated, and the synodical month actually shortened: or, 3. the annual motion of the earth, and the periodical revolution of the moon continuing the same, the rotation of the earth round its axis is a little retarded: in this case, days, hours, minutes, seconds, &c. by which all periods of time must be measured, are of a longer duration; and, consequently, the synodical month will appear to be shortened, though it really contain the same quantity of absolute time as it always did. If the quantity of matter in the body of the sun be lessened by the particles of light continually streaming from it, the motions of the earth round the sun may become slower; if the earth increases in bulk, the motion of the moon round the earth may be thus quickened. M. de la Place (*Mem. de l'Acad. Roy. des Scienc. for 1786.*) has evinced this acceleration of the moon's motion to arise from the action of the sun upon the moon, combined with the variation of the excentricity of the earth's orbit. By the present diminution of the excentricity, the moon's mean motion is accelerated; but, when the excentricity is arrived at its *minimum*, the acceleration will cease: after which, the excentricity will increase, and the moon's mean motion will be retarded. M. de Lambre found, by comparing the modern observations at about the distance of a century, that the secular mean motion of the moon in the last tables of Mayer was too great by $25''$; and that the place of the moon calculated by these tables ought to be corrected by the quantity $-25'' n + 2''$, $135 n^2 + 0''$, $04398 n^3$, n being the number of centuries from 1700. M. de la Lande, in his tables of the moon, has thus corrected Mayer's tables. Hence it appears, that the present acceleration of the moon is nothing more than an equation, the period of which is very long. It will be accelerated and retarded by the same quantity; and therefore, if the mean motion be taken for the whole time of acceleration or retardation, it will be found never to vary. Vince's *Astron. vol. i. p. 206.*

ACCELERATION, in Music. See *ACCELERANDO*.

ACCELERATORES Urinae, called by Winslow *Bulbo-cavernosi*, and by others *Urinae stimulators* and *ejaculatores seminis*, in *Anatomy*, a pair of muscles whose office it is to expedite the discharge of the urine and of the semen. These muscles may be said to arise from just before the verge of the anus, where the sphincter ani terminates. They are spread over the bulb and a small portion of the corpus spongiosum urethrae; having that appearance, which anatomists have termed a doubly penniform muscle. From the anterior part of the muscle a fascicula of fibres proceeds on each side, by which the body of the penis is encircled

When these muscles act, they generally contract in a sudden and convulsive manner, and by this means expel in jets the last portions of urine, or any other fluid which may be contained in the urethra.

ACCIDENTENTES, or **ACCENSORS**, in *Ecclesiastical writers*, a lower order of ministers in the church of Rome, whose office is to light, snuff, and trim the candles or tapers. **SPELMAN**.

The accidententes are much the same with those otherwise called *acolythi* and *ceroservarii*.

ACCENDONES, or **ACCEDONES**, in *Roman Antiquity*, a kind of **GLADIATORS**, whose office was to excite and animate the combatants, during the engagement.

ACCENSI, in *Antiquity*, an inferior order of officers, appointed to attend the Roman magistrates, somewhat in the manner of ushers, serjeants, or tip-staves, among us. They were thus called from *accire*, to find for; one part of their office being to call assemblies of the people, summon parties to appear before the judges, &c.

ACCENSI also denote a kind of supernumerary soldiers in the Roman armies; whose office was to attend the motions of their principals, and supply the places of those who were killed or disabled by their wounds.

They were thus denominated *quia accensebantur*, or *ad censusum adjiciebantur*: Vegetius calls them *supernumerarii legionum*: Cato calls them *ferentarii*, because they furnished those engaged in battle with weapons, drink, &c. Though Nonnius suggests another reason of that appellation, viz. because they fought with stones, slings, and weapons, *quæ feriuntur*, such as are thrown, not carried in the hand. They were sometimes also called *velites*, and *velati*, because they fought clothed, but not in armour; sometimes *adscriptiitii* and *adscriptivi*; sometimes *rorarii*. The *accensi*, Livy observes, were placed in the rear of the army, because no great matter was expected from them: they were taken out of the fifth class of citizens. Festus in voc. *Ferentarii*. Salmast. de Re Milit. Rom. c. 15.

ACCENSI was also an appellation given to a kind of adjutants, appointed by the tribune to assist each centurion and decurion. In which sense, *accensus* is synonymous with *optio*.—In an ancient inscription, given by a Torre, we meet with **ACCENSUS** **EQUITUM** **ROMANORUM**; an office nowhere else heard of; that author suspects it for a corruption, and instead thereof reads **A CENSIBUS**. Act. Erud. Leipf. 1701. p. 259.

ACCENSION, **ACCENSIO**, in *Physics*, the act of kindling, or setting a body on fire.

The word is formed of the Latin *accendere*, to kindle; a compound of *ad*, to; and *candere*, to glow. Though some grammarians suspect the primitive signification of *accendere*, to have been, to render famous.

Accension, on other occasions, is called **INFLAMMATION**, **IGNITION**, **CONFLAGRATION**, &c.

Accension stands opposed to **EXTINCTION**.

Chemists furnish us with various instances of the *accension* of cold liquors by bare mixture: as of the acid spirits of minerals, and the essential oils of plants.

ACCENT, in its primitive sense, an affection of the voice, which gives each syllable in a word its due pitch, in respect of height or lowness.

The word is originally Latin, *accentus*, a compound of *ad*, to, and *cans*, to sing. In this sense, accent is synonymous with the Greek *ῥοιός*, the Latin *tenor*, or *tonor*, and the Hebrew **גַּזְזִי** *guzzi*, *tafle*.

The accent, properly, only respects high and low, or acute and grave.—Though the modern grammarians use

it also in respect to loud and soft, long and short; but this confounds accent with quantity.

The difference between the two may be conceived from that which we observe between the beat of a drum, and the sound of a trumpet; the former expresses every thing belonging to loud and soft, and long and short; but so long as there is a monotony in the sound, there is nothing like accent.

The ingenious Mr. Harris (*Philological Inquiries*, p. 64.) compares quantity to musical tones differing in long and short, as upon whatever line they stand a semibreve differs from a minim; and accent to musical tones differing in high and low, as D upon the third line differs from G upon the first, whether its length be the same, or it be longer or shorter.

ACCENT is also used in *Grammar* for a character placed over a syllable, to mark the accent, i. e. to show that it is to be pronounced in a higher or a lower tone, and to regulate the inflections of the voice in reading or in speaking. It is distinguished from emphasis, as the former regards the tone of the voice, the latter the strength of it. For other distinctions between accent and emphasis, see **EMPHASIS**.

It has been long disputed among the learned, whether accents were originally musical characters, or marks of **PROSONY**: it is not easy to determine a question concerning which the arguments on both sides are so numerous. But as music, says Dr. Burney, (*Hist. of Music*, vol. i. p. 13.) had characters different from accents so early as the time of Terpander, to whom the invention is ascribed by the Oxford marbles, which place this event about 670 years before Christ; and as accents for prosody are likewise proved to be of high antiquity, there seems to have been no necessity for the antients to use the one for the other. Mr. West (*Pindar*, vol. ii. p. 194, 12mo.) maintains, that accents were originally musical notes, set over words, to direct the several tones and inflexions of the voice requisite to give the whole sentence its proper harmony and cadence. The names of the Greek accents, he says, express their musical origin, and correspond exactly to those terms made use of in our modern music; viz. sharp, flat, and a grave, called the *turn*, and consisting, like the circumflex, of a sharp and a flat note. The Abbé du Bos (*Reflex. Crit. c. iii. p. 85.*) asserts, that as poets originally set their own verses, they placed for this purpose a figure, or accent, over each syllable. The learned author of "The Origin and Progress of Language," has also taken pains to prove that the Greek accents were musical notes, invented and accommodated to raise, depress, and suspend the voice, according to a scale of musical proportions.

We reckon three grammatical accents in ordinary use all borrowed from the Greeks, viz. the *acute*, *grave*, and *circumflex*.

The *acute accent* shows when the tone of the voice is to be raised and sharpened. In modern writings it is a small line, or virgula, placed over the vowel, a little sloping or inclined in its descent from right to left, as (´). It is not ordinarily used either in English or Latin; the French indeed retain it; but it is only to mark the close or masculine é. The *grave accent* is used when the note or tone of the voice is to be depressed and flattened; and is figured thus (̀).

The *circumflex accent* is composed of both the acute and grave; it points out a kind of undulation of the voice, which is first raised and sharpened, and then depressed and flattened; or it is an acute tone dying away into a grave, and consequently lengthening the syllable. It is expressed thus (ˆ) or (˘). Upon a nearer consideration of the sub-

ject says a learned writer, "On the Profodies of the Greek and Latin Languages," it appears, that the acute accent, which is a sharp stroke of the voice upon some one syllable of the word, is in truth the only positive tone. The grave consists merely in a negation of this acuteness, and is not marked except it be upon the last syllable of certain words; but is to be understood upon every syllable of the word, which carries neither the acute nor circumflex: and it seems to amount to no more than this, that what grammarians call the grave tone, consists in a mere negation of acuteness, and of circumflexion, if that be different from acuteness. Accordingly, the general doctrine of accents is, that, with the exception of fourteen monosyllables in the Greek language, which carry no accent, unless it be in particular circumstances, and for that reason are called *ακατακτα*, or *atonic*, some one syllable of every word, and one syllable only, bears an accent, either acute or circumflex.

If it be true, that the whole system of pronunciation depends upon three accents, it is no less true, that each of these three admits of several degrees. The acute accent, for instance, may be either higher or lower; may be simply acute, or very acute: and the like holds of the grave and circumflex. So, that each of the three common accents is, as it were, a genus including various particular species; though the ancient Grammarians have not thought fit to annex particular names and figures to all these differences. Vander Hardt. *Arcan. Accent. Græc.* 1715, 12mo.

Mr. Sheridan, in his Lectures on Elocution, p. 38, observes, that the meaning of the term accent, among the ancients, was very different from what it is with us. They distinguished accents by certain inflexions of the voice like musical notes; but the manner in which they did it must remain for ever a secret to us; for, with the living tongue perished the tones also, which we in vain endeavour to explore in their visible marks. With us, the term accent denotes a peculiar mode of distinguishing one syllable from the rest; and this distinction is made in various ways: either by dwelling longer upon one syllable than upon the rest, or by giving it a smarter percussive of the voice in utterance. Of the first of these we have instances in the words *gl'ory*, *fáther*, *hóly*: of the last in *báttle*, *hábit*, *bórrów*. So that accent, with us, is not referred to tune, but to time; to quantity, not quality; to the mere equable or precipitate motion of the voice, not to the variation of notes or inflexions. He proceeds to observe, that the quantity depends upon the seat of the accent, whether it be on the vowel or consonant: if on the vowel, the syllable is necessarily long, as it makes the vowel long; if on the consonant, it may be either long or short, according to the nature of the consonant, or the time taken up in dwelling upon it. By changing the seat of the accent in the instances above specified, we should change their quantity: if, instead of *gl'ory* we should say *glór'y*, instead of *fáther*, *fat'her*, instead of *hóly*, *hol'y*, the first syllables would become short: and, on the other hand, if we were to dwell on the vowels instead of the consonants in the last instances, they would be changed from short to long, as *báttle* for *bat'tle*, *hábit*, for *habít*, and *bórrów*, for *bor'rów*. This, he says, is one of the chief sources of the difference between the Scotch and English gentlemen in the pronunciation of English: *i. e.* laying the accent on the vowel instead of the consonant, so as to make syllables long that are short with us. He adds, it is an unerring rule, that whenever the accent is on the consonant, the preceding vowel has a short sound; and there is another inflexible rule in our tongue, that no vowel ever has a long sound in an unaccented syllable; and therefore, if the

accent were properly adjusted, it would prove a master-key to the pronunciation of our whole tongue. In another place, (*Art. of Reading*, vol. ii.) Mr. Sheridan says, that when the seat of the accent is on a vowel, the syllable is long: when on a consonant, short: and that all unaccented syllables are short.

But the use of accent in our language is not confined to quantity alone. It is also the chief mark by which words are distinguished from mere syllables. The essence of a word, says this author, consists in accent as well as articulation. The Greeks also distinguished words from mere syllables by a certain tone or note annexed to each word, which made their speech more musical or pleasing to the ear, than that of any other nation in the world. These tones they learned from their infancy, and they used them with such accuracy, that even the vulgar among the Athenians would have hissed an actor or actress from the stage, and an orator from the PULPITUM, on account of a few mistakes in the enunciation of these notes. The wonderful effects of the harangues of the Greek orators on the enraptured minds of their hearers were owing, in a considerable degree, to those artificial musical tones, by which their syllables were so happily diversified. To this purpose consult Dionysius Hal. de Compositione Verborum, apud Oper. tom. ii. p. 17. &c. Ed. Oxon. 1704. This harmony of utterance is not studied by any of the moderns, except the Chinese. Words are also distinguished from syllables by making a perceptible PAUSE at the end of each word. Mr. Sheridan is of opinion, that the most evident and precise as well as the most easy and certain mode of distinction, is that of accent; and that it would contribute most effectually both to utility and to ornament.

As to public speakers, who can pronounce English properly, the only rule necessary to be observed by them is to lay the accent always on the same syllable, and the same letter of the syllable, which they usually do in common discourse, and to take care not to lay any accent or stress upon any other syllables. Such persons should recollect, that, in the English language, every word which consists of more syllables than one, has one accented syllable; and that there is seldom or never more than one such syllable in any English word, however long. See PRONUNCIATION.

In the English language there is a remarkable peculiarity of throwing the accent farther back; that is, nearer the beginning of the word than is done by any other nation. In Greek and Latin no word is accented farther back than the third syllable from the end, or what is called the antepenult. But, in English, we have many words accented on the fourth, some on the fifth, syllable from the end, as *mémorable*, *convéniency*, *ambulatory*, &c. The general effect of this practice of hastening the accent, or placing it so near the beginning of a word, is to give a brisk and spirited, but at the same time a rapid and hurried, and not very musical, tone to the whole pronunciation of a people.

The Hebrews have a grammatical, a rhetorical, and a musical accent: though the first and last seem, in effect, to be the same; both being comprised under the general name of *tonic accents*, because they give the proper tone to syllables: as the rhetorical accents are said to be *euphonic*, inasmuch as they tend to make the pronunciation more sweet and agreeable.

There are four euphonic accents, and twenty five tonic: however, authors are not agreed as to the number of either class. Of these, some are placed above, and others below the syllables: the Hebrew accents serving not only to regulate the risings and fallings of the voice, but also to distinguish

tinguish the sections, periods, and members of periods, in a discourse; and to answer the same purposes with the points in other languages. Their accents are divided into emperors, kings, dukes, &c. each bearing a title answerable to the importance of the distinction it makes.—Their emperor rules over a whole phrase, and terminates the sense completely; answering to our full point.—Their king corresponds to our colon; and the duke to our comma. The king, however, occasionally becomes a duke, and the duke a king, as the phrases are more or less short.—It must be noted, by the way, that the management and combination of these accents differ in Hebrew poetry from what they are in prose.

The use of the tonic or grammatical accents has been much controverted; some holding that they distinguish the sense, while others maintain that they are only intended to regulate the music or singing; alleging, that the Jews sing, rather than read, the scriptures in their synagogues. The truth seems here to lie between the two opinions: for though we incline to think, that the primary intention of these accents was to direct the singing; yet, the singing seems to have been regulated according to the sense; so that the accents might serve not only to guide the singing, but also to point out the distinctions.—Though it must be confessed, that many of these distinctions are too subtle and inconsiderable; nor can the modern writers, nor the editors of old ones, agree in opinion on this subject: some of them making twice as many of these distinctions as others. The Hebrew accents have, indeed, something common with those of the Greeks and Latins; and something peculiar to themselves. What they have in common is, that they mark the tone; showing how the voice is to be raised and sunk, in certain syllables. What they have peculiar is, that they perform the office of the points in other languages. The six following are of this latter kind, viz. SYLLUK, ATHNACH, REBHANG, SEGOLTA, ZAKEPH-KACON, and ZAKEPH-GADHOL. To which we might also add, TIPHTHA and SARKA, on account of their occasional application to the same purpose. It is certain the ancient Hebrews were not acquainted with these accents; so that, at best, they are not *jure divino*.—The opinion which prevails among the learned is, that they were invented by the Jewish doctors of the school of Tiberias, called the MASORITES. The learned Hennin affirms them to be of Arabic invention; and to have been adopted and transferred thence into the Hebrew by the Masorites, especially by the celebrated Rabbi Ben Ascher; and it is said they were introduced on occasion of the emperor Justinian's prohibiting the reading of their traditions in their synagogues, or about the middle of the sixth century. However, the revival of the sacred writings by Rabbi Ascher on the part of the Western Jews, and by Rabbi Neptali on that of the Eastern Jews, was solely employed about the accents and POINTS: and these two Rabbis lived, according to some writers in the 11th century, and according to others about the year 940. See Maselef's Heb. Gram. vol. ii. p. 24. Hennin adds, that they were first brought to their degree of perfection by Rabbi Judah Ben David Chiug, a native of Fez, in the 11th century. It is indeed possible the Jews might borrow their points from the Arabs; but how they should have their accents from them it is not easy to conceive, since the Arabic language has no such thing as accents, either in prose or verse.

The introduction of accents by the Masorites has been the source of great difficulty in learning the Hebrew language, and of equal confusion and error in the interpretation of it. Few of them have now any known use, except that of distinguishing periods. Biblical interpreters are disagreed concerning the position, necessity, and utility of them. The

doctrine of Hebrew accents has occasioned much dispute amongst learned critics. See Buxtorf's Thesaurus, and Everard Vander Hooght's Pref. to the Bibles of Athias, 1705.

As to the Greek accents, now seen both in manuscript and printed books, there has been no less dispute about their antiquity and use, than about the use of those of the Hebrews. On the subject of this dispute we may observe, in general with a learned writer, Bishop Lowth, (Prelim. Diss. to his Isaiah, p. 10.) that there were certain laws of Hebrew metre is very probable, and that the living Greek language was modulated by certain rules of accent is beyond dispute: but a man born deaf may as reasonably pretend to acquire an idea of sound, as the critic of these days to attain to the true modulation of Greek by accent, and of Hebrew by metre. To which we may add, that though the ancient Greeks had no accentual marks, they learned those modifications of voice by practice from their infancy; and in pronunciation they are so observed to this day.

Isaac Vossius, in a treatise "De Accentibus Græcorum," endeavours to prove that they are of modern invention, and that anciently they had nothing of this kind; but only a few notes in their poetry, which were invented by ARISTOPHANES the Grammarian, about the time of Ptolemy Philopater; and that these were of musical, rather than of grammatical use, serving as aids in the singing of their poems; and very different from those which were afterwards introduced. This appears from inscriptions as well as manuscripts, none of which, till 170 years after Christ, have either accent, spirit, apostrophus, or *iota* subscribed. He adds, that Aristarchus, a disciple of Aristophanes, improved on his master's art; but that the whole of what they both did was only designed to assist youth in the more readily making of verses. The same Vossius shows from several ancient Grammarians, that the manner of writing the Greek accents in those days was quite different from such as are now used in our books. It is alleged by others, that accentual marks, which, they say, were invented by Aristophanes, were not in common use till about the seventh century; at which time they were found in MSS. Amongst those who totally reject the accents, on the supposition that they would confound the quantity, as it is determined by the rules of prosody, we may reckon Beza, Scaliger, Spelman, Ger. Jo. Vossius (De Arte Gram. l. ii. p. 174), and Salmasius in Epist. ad Sarrafinum.

Hen. Christ. Hennin thinks, (see his ΕΡΩΤΗΜΑΤΟΣ ορθότητος, seu Dissertatio Paradoxa, Græcam Linguam non esse pronuntiandam secundum Accentus, 1664,) that accents were the invention of the Arabians so late as the eighth century, and that they were only used in poetry; that they were intended to ascertain the pronunciation of the Greek, and to keep out that barbarism, which was then breaking in upon them; that the ancient accents of Aristophanes were perfectly agreeable to the genuine Greek pronunciation, but that the modern ones of the Arabs destroy it. Wetstein, Greek professor at Basil, in a learned Dissertation, endeavours to prove the Greek accents to be of an older standing; and that the Greeks, long before the birth of Christ, regulated their pronunciation by accents, very much like those that are now in use. He owns that they were not always formed in the same manner by the ancients; but thinks that difference owing to the different pronunciation which obtained in the several parts of Greece: and he adds, that accents were not used except in the schools of grammarians, who recurred to them in reading the old poets. He brings several reasons *a priori* for the use of accents, even in the earliest days; as that, then they wrote wholly in capital letters equidistant from each other,

other, without any distinction of words or phrases: so that without accents they could scarcely be intelligible; and that accents were necessary to distinguish ambiguous words, and to point out their proper meaning; and this sentiment he confirms from a dispute on a passage in Homer, mentioned by Aristotle in his Poetics, ch. v. Accordingly he observes, that the Syrians, who have tonic, but no distinctive accents, have yet invented certain points, placed either above or below the words, to shew their mood, tense, person, or sense. See farther, in his *Dissertatio Epitologica de Accentuum Græcorum Antiquitate et Usu*. Basil. 1686.

Montfaucon, (*Pal. Græc.* p. 33) after observing that Aristophanes of Byzantium invented prosody, or accents, adds, that the Greek language was not, before his age, totally destitute of accents and aspirates, because, without these, no language can be pronounced; but, that he directed the regulation of them, invented the marks and forms by which they were to be expressed, and the place in which they were to be introduced. The same sentiments are likewise maintained by Dr. Foster, in his ("Essay on the different Nature of Accent and Quantity. Eton. 1763. ed. 2d.") who explodes the notion that the Greek accent teaches the quantity of pronunciation; and who maintains, with many others, that it is a musical note. Professor Gesner, in a dissertation "De Accentuum genuina Pronuntiatione," printed in 1755, has laboured to remove the principal objections against the antiquity of accents, viz. that they do not coincide with the prosody of the Greeks; and are, therefore, to be considered as a modern corruption of the Greek language. His opinion amounts to this, that the accents do not at all determine which syllable is to be pronounced longest; that the accent e. g. of ἀνθρώπος, being placed on the first syllable, does not oblige us to pronounce the word as a dactyl; that, as the Greeks spoke more musically than we, they pronounced some syllables more distinctly than others; that they raised their tone and dropped it; and that the elevation and fall of the tone were determined by the accents. See Monbodo's *Origin and Progress of Language*, vol. ii. b. 2. passim. Mr. Marsh, the learned translator of Michaelis's *Introduction to the New Testament*, informs us (vol. ii. p. 892) that Eugenius, a Greek priest and archbishop of Cherson, in reading Greek, distinctly marked by his pronunciation both accent and quantity, lengthening the sound without raising the tone of his voice, when he pronounced a long syllable, which had not an acute accent, and raising the tone of his voice without lengthening the sound, when he pronounced a short syllable which had an acute accent; in the same manner as in music, where the highest note in a bar is frequently the shortest. Hence he infers, that the opinion advanced by Prof. Gesner and Dr. Foster, is not merely theoretical, but confirmed by actual experience. An example of this kind, however, is very rare; because the modern Greeks, in general, pronounce according to accent alone. In England the Greek accents are rejected; and quantity alone, as it is generally supposed, is regarded in pronunciation. But Mr. Marsh observes, that we still pronounce Greek according to accent, though according to rules different from those which are followed by the Greeks themselves. In reading Greek we observe the same rules with regard to the position of the tone, as in reading Latin; and here we do not regulate the tone of the voice merely by the length of the syllables. e. g. *Virtūs, prāvūs, salūs, bonūs*, are pronounced in the same manner, though they differ in quantity; and *crīminīs, pātūlis, hōmīnis, lūcidīs*, are pronounced alike, though they vary in quantity. We are therefore directed in placing the accent, or raising the tone of the voice, by some principle

distinct from that of quantity. The rule for placing the accent in Latin words, which has been laid down by Latin grammarians, is the following. In Latin dissyllables the accent is always on the first syllable, whether it be long or short. In polysyllables the accent is on the penultimate, if it be long; but, if it be short, the accent is on the antepenultimate, whether this be long or short. See Diomedes de *Accentibus*, l. ii. p. 426, printed in the *Grammaticæ Latine Auctores Antiqui. Op. et Stud. Helæ Putschii*, Hanov. 1605, 4to. See also *Quintilian Inst.* l. i. c. v. p. 59, Ed. Burman. According to this rule, there is only one case in which accent and quantity must coincide, and that is in polysyllables, which have the penultimate long; but, in polysyllables which have the penultimate short, and in all dissyllables, it is merely accidental, whether accent and quantity coincide or not. This disagreement constitutes the harmony of Latin verse, which would be intolerable if accent and quantity always coincided; as any one will find, who makes an hexameter consisting of six words, of which the first five are dactyls: whereas, those verses are the most harmonious, in which the number of words, where accent and quantity disagree, is equal to the number of those in which they coincide. In the first line of Virgil's *Bucolics*, which is a very harmonious verse, accent and quantity coincide in *Tityre* and *teginine*, but disagree in *recubans* and *patule*.

The Greeks adopted a very different principle from the Latins in determining the syllable which was to be elevated in speaking; for in ἀνθρώπος they raised the antepenultimate, in ἀνθρώπου they shortened the penultimate. Thus Diomedes (ubi supra, l. iii. p. 425.) observes, that the acute accent of the Greeks occupied three places, the ultimate, penultimate, and antepenultimate; but amongst the Latins only two places, viz. the penult and antepenult. Since we then, in order to avoid a method attended with some difficulty, regulate the tone of the voice in Greek as we do in Latin, it follows that we read Greek, neither according to Greek accent, nor Greek quantity; but according to the rules of the Latin accentuation. The whole difficulty of the Greek accents, say Messrs. Port Royal, consists in two points; the first, in knowing the quantity of the penultimate and ultimate, and the second, in knowing on what syllable the words should have their elevation by nature; because, even supposing the same quantity, the elevation may not be the same, which never happens among the Latins. This is a difficult and embarrassing business, for which grammarians have given a number of rules and a greater number of exceptions. See *Port Roy. Gr. Gram.* vol. ii. p. 291, &c.

The best advocates for accents have not contended, that the ancient Greeks used them in common books, much less in letters, but only in their schools; and Michaelis apprehends that they do not occur in any copies of the New Testament still extant, which are antecedent to the 8th century, and but seldom in those which are more modern. He adds, they were not written by the Apostles; but were probably first added by Euthalius in the year 458. See *Wetstein's Prolegomena*, p. 73. His translator, however, has discovered both accents and marks of aspiration in several MSS. which he mentions; particularly the Vatican and the Claremontianæ. The Alexandrian, Cambridge, and four other MSS. are without accents. Marsh's *Transl. of Michaelis's Introd.* vol. ii. p. 894. In a treatise de *Rhythmo Græcorum*, not long since published, and ascribed to a learned Prelate of the English church, the author controverts the opinion, *aliam esse in soluta oratione scanfione rhythmicam, aliam in metris*, in opposition to Faber, Dacier, Pearce, Clarke, and others. Another learned writer, supposed to be Bishop Horsey, in

his "Essay on the Profodies of the Greek and Latin languages," maintains, that the marks of the accents were introduced in the writing of the Greek language some time before the commencement of the Christian æra, and that they exhibit the true speaking tones of the language; such as were used by the Greeks themselves, when it was a living language, spoken in its purity. This writer ably refutes the system of Mr. Primatt, who (in his "Accentus Redivivi," published in 1764,) is an advocate for the antiquity of the accents, and who defends the accented pronunciation of Greek prose; whilst he agrees with the opposers of the Greek accents, that they are not calculated to regulate the recitation of verse. According to Mr. P. verse and prose were pronounced, by the ancient Greeks, by two different rules: the one, by the rule of the Latin accent, which he, as well as most others who disuse the Greek accents, consider as an universal rule of quantity, or metrical recitation: the other, by the proper accents of the Greek language. He is thus reduced to the necessity of adopting the indefensible hypothesis, that it is the nature of the acute accent to lengthen the syllable on which it falls, and yet, with evident inconsistency, he admits, that, in music, length of sound and acuteness of tone are not always united. The learned prelate, just mentioned, condemns the rule, which has been sanctioned by some of the classical scholars of our two universities, that we are to read by accent in prose and quantity in verse; and he observes, that it is not very probable, that any people should have had two pronunciations essentially different, one for prose, and another for verse. He equally condemns the position, that prose as well as verse in Greek must be read by quantity, that is, as he says, by the Latin accent, and thinking that the Greek accentual marks express, as we have already said, the true speaking tones of the language, he proposes rules of recitation, on the supposition that tone was not always laid on connected words, where the accentual marks appear; whose position, however, was not changed, to prevent the confusion which would follow from making the position of the written mark different in connected from what it is in isolated words; and he censures the printing of books unaccented. He also maintains, that, though in placing accent, regard is had to quantity, *euphonia gratia*, and though it may therefore be a symptom of quantity, it is never a cause of it, and never creates it; and he calls the opinion of Mr. Primatt and others, that the acute accent lengthens the tone of the syllable on which it falls, a common prejudice. In order to prevent accent from interfering with quantity, he proposes to transpose it: as in the line, Μῆνιν ἄειδε θεὰ Πηληϊάδεω Ἀχιλῆϊ, the word Ἀχιλῆϊ must be pronounced Ἀχιλῆι.

An ingenious writer, viz. Mr. A. Browne, in his observations upon Greek accents, published in the Irish Transactions, vol. vii. p. 359, &c. professes, that he never could assent to a position so contradictory to the testimony of his ear, as that of the acute accent not lengthening the syllable on which it falls; and that his mind was much impressed by an observation of Mr. Primatt, that it is one of the extraordinary powers of the acute accent, even to change the real quantity, and also with his assertion, that the opinion of Mess. De Port Royal, viz. that the accent only raises the voice without giving any duration in pronouncing, is erroneous. Nevertheless, he is disposed to acquiesce in the sentiment, that the accents denote only tone, or elevation and depression of the voice. This writer, conceiving it of importance to ascertain the pronunciation of the modern Greeks, and their mode of using the accents, made some attempts for this purpose. The importance of this inquiry is obvious, because the Greek is at this day a living lan-

guage; whereas the Latin has in this respect been extinct for 1200 years.

The result of his inquiry, after conversing with some modern Greeks, was, that they have not two pronunciations for prose and verse, and that in both they read by accent. But they make accent the cause of quantity, so as to govern and controul it; and they make the syllable long on which the acute accent falls, and they allow the acute accent to change the real quantity. They pronounced ἀδύσσοι short, and ἀδύσσοι long, with a marked attention to the alteration of the accent with the variety of the case. Instead of καλλιγρά they said καλλιγρα, and for Σοφία they pronounced Σοφίασι. He was assured by them, that verse as well as prose was read by accent, and not by quantity, and they exemplified their mode of reading by reciting several lines of Homer. Our author concludes, upon the whole, that the ancient Greeks as well as the modern read both verse and prose by accent, and that they allowed the accents to controul and alter the quantity. Dacier, Pearce, and Clarke admit, that they read prose by accent, not by quantity: and the learned Prelates, to whose opinion and writings we have referred, contend that they could not have had a different mode of reading prose and verse.

To these two propositions Mr. B. accedes, and the combination of them confirms his opinion. He dissents, however, from the inferences deduced from them by their advocates, viz. that verse is not to be read by accent, as the first mentioned gentlemen maintain, or as the Prelates affirm, that, though it is, its quantity is not thereby affected. Our author adds, that the modern Greeks use for accents the word ὄξεια, thus confirming the opinion, that there is properly no accent but the acute, the grave being the negation of accent; and that the word περιστάσις in the ancient Greek language, is the term used for accents; which word, when translated into Latin, is *accentus* or *adcentus*, implying elevation of voice, or a kind of song, *superadded* or raised in the common tone of the voice, and cannot be applied to the grave, which is the negation of any departure from the usual level. He is of opinion, that the circumstance which has been mentioned as the peculiarity of the English, viz. that we always prolong the sound of the syllable in which the acute accent falls, is true with regard to every nation upon earth. It is true of the modern Italians and modern Greeks. In the English language, quantity is not affected, because quantity and accent always agree. The case is the same, as Sir William Jones has shewn, among the Persians; and he observes, with respect to its position, that the Persians, like the French, usually accent the last syllable of the word. We shall here add a remark, though not immediately connected with the subject of this article, suggested to Mr. B. by his conversation with the modern Greeks, that we are much mistaken in our idea of the supposed lofty sound of πολεμολογία θαλάσσης; as the Borderers on the coast of the Archipelago take their ideas from the gentle laving of the shore by a summer wave, and not from the roaring of a winter ocean; and they accordingly pronounced it *Polyphlyveo Thalasses*.

On the subject of Greek accents we may refer to the Port Royal Gr. Gram. vol. ii. p. 288, &c. Labbei Regule Accentuum, Paris 1693. Lamberti Bos Regule Accentuum 1733. Morell's Thesaurus Græcæ Poeseos, an edition of which was printed at Venice in 1767. Franklin de Tonis. Foster, ubi supra. Primatt, &c. &c.

The use of accents to prevent ambiguities is most remarkably perceived in some eastern languages, particularly the Siamese and Chinese. The Chinese only reckon four accents; for which the missionaries use the following marks

à, á, â, ã, to which they have added a fifth, thus *av*. They make a kind of modulation, so that by prolonging the duration of the sound of the vowel, they vary the tone, raising or falling it by a certain pitch of voice: and their talking is a sort of music or singing. The same sound *ys*, according to the accent affixed to it, signifies *God*, a *swail*, *excellent stupidity* and a *goose*. If they deviate ever so little from the accent, they say quite a contrary thing to what was intended. Thus, meaning to compliment the person with whom you are conversing with the title of Sir, you call him a bear with the same word, by merely a slight variation of the tone. Spizel. de Re. Liter. Sineuf. p. 106. Bulling. Diss. de Litt. Sineuf. p. 308. Le Compte, Nouv. Mem. sur la Chine, tom. i. p. 270.

The Samefe are also observed to sing rather than talk. Their alphabet begins with six characters, all only equivalent to K, but differently accented. For though in the pronunciation the accents are naturally on the vowels, yet they have some to diversify such of their consonants as are in other respects the same. De la Loubiere du Royaume de Siam. tom. ii. § 8.

As minutely as the accents of words have been studied, those of sentences seem to have been utterly overlooked; yet it may be observed, that all mankind lower the voice at the end of a period, and elevate it in interrogations, and the like. See Bacon de Augm. Scien. l. vi. c. 1. Elem. Crit. vol. ii.

ACCENT is applied, not very properly, to the characters which mark the quantities of syllables, or the time during which the voice is to dwell upon them. The spurious accents answer to the characters of time in music, as crotchets, quavers, &c. The genuine accents rather answer to the musical notes, sol, fa, &c. Such are the long accent, which shews that the voice is to stop on the vowel, and is expressed thus, (ˉ): and the short accent, which shews that the time of pronunciation ought to be shorter, and is marked thus (˘). Some even rank the hyphen, diastole and apostrophe, among accents.

ACCENT also denotes a certain inflexion of the voice; or a peculiar tone, and manner of pronunciation, contracted from the country, or province, where a person was bred. In this sense, we say, the Welsh tone or accent, the Northern accent, the Gascoign accent, Norman accent, &c. See PRONUNCIATION.

ACCENT is also a tone or modulation of the voice, frequently used as a mark of the intention of the speaker, and giving a good or evil signification to his words. One may give offence with the softest and most soothing words imaginable, by a proper management of the accent and manner of pronouncing them. The accent frequently gives a contrary sense to that which the words themselves naturally imported.

ACCENT, in *Music*. In the mechanism of melody, or measured musical tones, musicians have long agreed to regard the *first* and *third* notes of a bar, in common time, whether vocal or instrumental, as accented, and the *second* and *fourth* notes as unaccented. In triple time, divided into three portions, the *first* note and *last* are accented, the *second* unaccented. But these accents are variously modified; often to produce some comic effect, as wantonly limping to ridicule lameness. If the *third* note in triple time is accented in serious music, it is always less forcibly marked than the *first*. In the speech or elocution of the natives of every country, and almost in every province of a country, there is a peculiar tone or tune, by which nice observers discover the residence of the speaker. A native of Scotland, *e. g.* however carefully educated, and accurate his

pronunciation, has a cantilena, a tone of voice, by which an Englishman discovers his country. The language that is the most forcibly and frequently accented, is indisputably the best fitted to receive musical tones. When it was said in a conversation with Metastasio on the subject of languages, that the Italian was the best calculated for music of any dialect in Europe, he cried out "*è musica flippa*," it is music itself. Another Italian (Eximeno) observed, that the conversation of a Roman matron, *val un'aria*, is equal to an air. In setting songs, the structure of the verse regulates the musical accents; and instrumental music is but a succedaneum to vocal. It may be said, therefore, that no music, even for instruments, is so generally pleasing as that which can be sung. The genius of instruments, and abilities of performers, require more notes to display their powers, than a human voice can, with propriety, attempt to execute. In very rapid divisions, ascending or descending the scale in notes of equal length, no regard is had to accents; and, though the execution may be neat and articulate, an Italian, fond of simplicity, would say of it, as of a shake misapprehended; *non dice niente*, it says nothing. Without accent there is no more melody in song, than in the humming of a bee; and without the regular arrangement of long and short syllables, there can be no versification. There are as many different accents in music as in speech, or modes of enforcing or enfeebling the meaning of words. There is a *yes* that says *no*, and a *no* that says *yes*. There are accents of spirit and accents of violence, of tenderness and of friendship. The voice of a feeling singer can modulate all these shades, or affect the hearer on the side of intellect as well as of sense. Dionysius Halicarn. regards accent as the source of all music. Accents is a poetical name for verse itself.

"Wings on your wings to heav'n her accents bear

Such words as heav'n alone is fit to hear."

Passions and affections are the food of vocal music. Dryden's Virgil, part. iii.

"Give to the musician (says Rousseau) as many images and sentiments to express as possible; for the passions sing, the understanding only speaks."

"Accent, according to Holder (Elements of Speech), as in the Greek names and usage, seems to have regarded the tune of the voice; the acute accent raising it in some certain syllables to a higher, *i. e.* more acute pitch, or tone, and the grave depressing it lower, and both having some emphasis, *i. e.* more vigorous pronunciation." See ACCENT in *Grammar*.

The variety of instrumental expression produced by the different manner of using the same passage or groupe of notes on the violin and violoncello, on the flute by the *coup de langue*, on the hautboy by the pressure of the lip, is beyond calculation. Articulation, emphasis, pointed bowing, flurring, tonguing, &c. are all technical terms, which will be severally explained, as connected with accent.

ACCENT, in *Poetry*. See REST and VERSIFICATION.

ACCEPTANCE, the act of receiving or admitting.

Acceptance, among *Civilians*, is the concurrence of the will, or choice of the donee, which renders the act complete; and without which the donor may revoke his gift at pleasure.

In beneficiary matters, the canonists hold, that the acceptance should be signed at the same time with the resignation, not *ex intervallo*.

ACCEPTANCE, in *Common Law*, denotes a tacit agreement to a preceding act, which might have been defeated and avoided were it not for such acceptance.—If a man and his wife, seized of land in the right of the wife, make a joint lease, or feoffment by deed, reserving rent; the man dying,

dyng, and the wife receiving the rent; such receipt is deemed an acceptance, and shall make the lease good: so that she shall be barred from bringing the writ, *Cui in vita*.

So if a lessee for the term of twenty years, accept a lease of the same land for ten years: by the lessee's acceptance of the new lease, the term of twenty years is determined in law. 2 Roll. Abr. 469.

ACCEPTANCE, in *Commerce*, is particularly used in respect of bills of exchange.—To accept a *BILL of exchange*, is to sign or subscribe it; and thereby become principal debtor of the sum contained therein: with an obligation to pay or discharge it at the time prefixed.

The acceptance is usually performed by him on whom the *BILL* is drawn; upon its being presented to him by the person on whose behalf it was drawn, or by some others by his order.

A small matter amounts to an acceptance, so that there be a right understanding between both parties; as, "Leave your bill with me, and I will accept it;" or, "call for it to-morrow, and it shall be accepted." This obliges as effectually by the custom of merchants, and according to law, as if the party had actually subscribed, or signed it, which is usually done.

But should a man say, "Leave your bill with me; I will look over my accounts and books between the drawer and me, and call to-morrow, and accordingly the bill shall be accepted." This shall not amount to a complete acceptance; for this mention of his books and accounts was really intended to give him an opportunity of examining if there were effects in his hands to answer; without which perhaps he would not accept the same; and so it was ruled by the Lord Chief Justice Hale, at Guildhall, London.

A bill may be accepted for part; because the party, upon whom the same was drawn, had no more effects in his hands; which being usually done, there must be a protest, if not for the whole sum, yet at least for the residue; however, after payment of such part there must be a protest for the remainder.

Bills payable at sight are not to be accepted; as being to be acquitted at their presenting; or in defect of payment, to be protested.—In bills drawn for a certain number of days after sight, the acceptance must be dated; because the time is to be accounted therefrom.—The form of this acceptance is *accepted such a day*; and then the signature.

Bills drawn, payable on a day named, or at *USANCE*, or double usance, need not be dated; usance being reckoned from the date of the bill itself.—On these it is sufficient to write, *accepted*, and the signature.

If the bearer of a bill be contented with an acceptance to be paid in twenty days after sight, where, in the bill itself, only eight days are expressed, he runs the risque of the twelve additional days: so that if the acceptor fail he has no remedy against the drawer. And if the bearer contents himself to receive a less sum than is expressed, in part, he is to stand the chance of the rest.

ACCEPTATION, in *Grammar*, the SIGNIFICATION of a word; or the sense wherein it is taken and received.

ACCEPTILATION, in the *Civil Law*, an acquittance given without receiving any money, or a declaration of the creditor in favour of the debtor, signifying, that he is satisfied for his debt, and forgives all farther claim, or demand; though in reality no payment has been made.

ACCEPTOR of a bill of exchange, the person who accepts the bill. See **ACCEPTANCE**.

ACCESS, in a general sense, signifies the approach of a thing towards another.

In which sense, access stands opposed to *recess*.

We sometimes say, the access of bodies, the access of the moon, the sun, planets, &c. but more frequently, the approach of bodies, the appulse of the moon, the rising of the sun, &c. Geometicians speak of a line called the curve of equal access, or APPROACH.

ACCESS, in a more particular sense, denotes entrance, or admission.

We say such a person has access to the prince: the access on that side was very difficult, by reason of rocks, &c.

ACCESS, in *Medicine*, denotes a fit, or return of some periodical disease.

We say an access of the gout, but especially of an ague, an intermitting fever, an epilepsy, &c. an access of madness; sometimes also a prophetic access, a cold access, &c. Access is frequently confounded with paroxysm: but they are different things; an access being frequently the beginning or first onset of a disease, a PAROXYSM the height of it.

ACCESSIBLE, something that may be approached, or to which we may have access.

Such a place, a fortress, is accessible from the seaward; *i. e.* the passage to it is practicable. See **FORTIFICATION**.

In surveying, it is such a place as will admit of having a distance measured from it; or such a height or depth as can be measured by a proper instrument: for the means of doing which, see **ALTIMETRY**, **ALTITUDE**, **DISTANCE**, **HEIGHT**, and **LONGIMETRY**.

ACCESSION, in a general sense, is the act of approaching or going to a place, person, or thing. It is more particularly used for the act whereby a thing is joined, or united to something that existed before.

ACCESSION, in *Politics*, is used for the act of engaging and becoming a party, in a treaty before concluded between other powers; on the same conditions as if originally comprehended in the treaty itself: such as the accession of the States General to the treaty of Hanover, of the Czarina to the treaty of Vienna, &c. It likewise signifies a prince's succeeding to the government upon the death of his predecessor.

ACCESSION, in the language of the *Conclave*, is a method of electing a pope, by procuring for some candidate two-thirds of the voices, upon which the rest are enrolled by way of accession.

ACCESSION, in the *Civil Law*, denotes a method of acquiring property in certain things, by virtue of their connection with other things, which already belong to us.

Accession is effected divers ways, whence arise several species of it, simple and mixed, natural and artificial, discrete and concrete accession. See **ALLUVION** and **SPECIFICATION**.

ACCESSION, in *Medicine*. See **ACCESS**.

ACCESSORIUS Flexor digitorum felis, in *Anatomy*, a name given by Dr. Hunter to that portion of muscle which was described by Sylvius, and generally distinguished by the title of *Massa carnea Sylvii*.

ACCESSORII musculi ad sacro-lumbarem. See **SACRO-LUMBARIS**.

ACCESSORY, or **ACCESSARY**, something that accedes, or is added to another more considerable thing: in which sense the word stands opposed to **PRINCIPAL**.

ACCESSORY, in *Grammar*, is used by Mr. Harris to denote such words as are significant by relation in opposition to principal, which is applicable to words that are significant of themselves. See **WORD**.

ACCESSORY, or *Accessory*, in *Common Law*, is chiefly used for a person guilty of a felonious offence, not principally, but by participation; as, by advice, command, or concealment.

There are two kinds of accessories; *before the fact*, and *after it*.—The first is he who commands, or procures another to commit felony, and is not present himself; for if he be present, he is a principal.

The *second* is he who receives, assists, or comforts any man that has done murder, or felony, whereof he has knowledge. A man may also be accessory to an accessory, by aiding, receiving, &c. an accessory in felony.

An accessory in felony shall have judgment of life and member, as well as the principal, who did the felony; but not till the principal be first attained, and convicted, or outlawed thereon.—Where the principal is pardoned without attainder, the accessory cannot be arraigned; it being a maxim in law, *Ubi non est principalis, non potest esse accessorius*. But if the principal be pardoned, or have his clergy after attainder, the accessory shall be arraigned. 4 & 5 W. & M. cap. 4. And by stat. 1 Anne, cap. 9. it is enacted, that where the principal is convicted of felony, or stands mute, or challenges above twenty of the jury, it shall be lawful to proceed against the accessory in the same manner as if the principal had been attained; and notwithstanding such principal shall be admitted to his clergy, pardoned, or delivered before attainder. In some cases also, if the principal cannot be taken, then the accessory may be prosecuted for a misdemeanor, and punished by fine, imprisonment, &c. Stat. *ibid.* See Stat. 5 Anne, cap. 31. In the lowest and highest offences there are no accessories, but all are principals: as in riots, routs, forcible entries, and other trespasses, which are the lowest offences.—So also in the highest offence, which is, according to our law, high treason, there are no accessories. Cok. Littlet. 71.

Accessories, in petty treason, murder, and in felonies of several kinds, are not to have their clergy.—There can be no accessory before the fact in manslaughter; because that is sudden and unpremeditated.

ACCESSORY *by statute*, is such a one as abets, advises, aids, or receives one that commits an offence, which is made felony by statute.

ACCESSORY *nerves*, ACCESSORIUS *Willisii*, or *Par Accessorium*, in *Anatomy*, a pair of nerves, which, arising by several filaments from the medulla spinalis of the neck, and having advanced to the first vertebra, where each of them is fixed to the posterior side of the ganglion of the nervus suboccipitalis, or tenth pair, ascend through the great foramen of the os occipitis into the cranium; and communicating with the 9th and 10th, pass out again close to the 8th pair. Afterwards turning backward, and perforating the musculus sterno-mastoideus, they terminate in the trapezius, having first distributed some branches to the rhomboides. Physiologists have been at a loss to account for the singular origin and course of these nerves. The ancients considered them as branches of the 8th pair. Willis also considered them as appendages to that pair, and called them *accessorii*. They are sometimes called the *spinal* pair, but as this denomination comprehends the nerves of the spine indiscriminately, Willis's name is more appropriate, and therefore it has been generally preferred. See *Origin and Course of the Nerves*.

ACCESSORY, among *Painters*, an epithet given to such parts of a *HISTORY* piece, as serve chiefly for ornament, and might have been wholly left out: such as *vases*, *armor*, &c.

ACCHO, in *Geography*, a port called by the Greeks *PTOLEMAIS*, and now *ACRE*.

ACCI, in *Ancient Geography*, a town in the confines of *Bœtica*, supposed to be *GUADIX*, in the province of *Granada*, in *Spain*. It was also called *Colonia Accitana*, and its

inhabitants were denominated *Genclenses*, and the colony *Genilla*, because it was formed from two legions, *viz.* the third and the sixth.

ACCIACATURA, in *Music*, is a term, as it should seem, by the little success of those who have attempted it, difficult to be defined by words, or to be exemplified in notes. It is putting down with any interval the half note below it, and instantly taking off (as if it were red hot) the finger which has struck the lowest of the two notes, continuing the sound of the other note, till the harmony is changed. An organist never puts down a single slow note on his instrument without touching, at the same time, the semi-tone below, and sometimes keeping it on, or making a beat with the forefinger, while the thumb remains firm on the principal sound. The term acciacatura, though uncommon, is not new; as it occurs in "l'Armonico Pratico al Cembolo," of the eminent opera composer *Francisco Gasparini*, the master of *Dominico Scarlatti*, and of the celebrated singer *la Faustina*: this tract, which is in fact a treatise on accompaniment, was first published at Venice in 1703. The technical term *acciacatura* is derived from *acciacare*, to *bruise*, *crush*, or *jam down*. *Gasparini* compares it to the hasty bite of an insect, that instantly flies away. See pl. i. No. 1. *Music*; some examples from the 5th edition of this excellent little tract, printed in 1764.

ACCIAIOLI, *DONATUS*, in *Biography*, a learned Florentine of the 15th century, was born in 1428, and distinguished by the honourable employments which were assigned him in his native country, and by the probity and disinterestedness of his character. He published commentaries on the ethics and politics of *Aristotle*, which he collected from the lectures of *Argyropolus the Byzantine*, and translations of the lives of *Alcibiades* and *Demetrius* from *Plutarch*, to which were added those of *Hannibal* and *Scipio*, and of *Aretino's* twelve books of the history of Florence, printed at Venice in 1476. He also wrote an Abridgment of the Life of *Charlemagne*, and some other Treatises. Having been sent to France by the Florentines to sue for succour from *Louis XI.* against *Pope Sixtus IV.* he died on his journey at *Milan*, in 1473; but his body was carried to Florence, and buried in the church of the *Carthusians*. His daughters, like those of *Aristides*, were married, and portioned at the public expence, as an acknowledgment of his services. His funeral eulogium was pronounced by *Christopher Landini*, and an elegant epitaph by *Politian*, was inscribed on his monument. *Gen. Dict.*

ACCIAIOLI, *Zenobio*, a learned Dominican, of the same family with the former, continued to enjoy the office of library-keeper to *Pope Leo X.* from the year 1518, to his death in 1520, as some say, in 1537 according to others, at the age of 58. He learned Greek and Hebrew towards the close of his life, translated several of the fathers, and wrote several orations and poems, sermons on the *Epiphany*, and some other pieces. He likewise collected a volume of *Politian's* Greek epigrams, which were published in 1495. *Bayle*.

ACCIAIOLI, *Angelo*, cardinal, legate, and archbishop of Florence, died in 1407. He preserved the Florentines in their obedience to the pontiff *Urban VI.* when attempts were made to seduce them in favour of *Clement VII.* He wrote a work, with a view of healing schism, which then rent the church.

ACCIAIOLI, *Renatus*, descended from a noble family of Florence, achieved the conquest of *Athens*, *Corinth*, and a part of *Bœotia*, at the beginning of the 15th century. Having no male issue by *Eubois*, his wife, he bequeathed

Athens to the Venetians, Corinth to Theodosius Paleologus, who had married his eldest daughter; and he gave Bocotia to Anthony, his natural son, who also made himself master of Athens; but it was taken from his successors in 1455, by Mahomet II.

ACCIDENCE, ACCIDENTIA, a name chiefly used for a little hook, containing the first elements, or rudiments of the Latin tongue.

ACCIDENS, in *Philosophy*. See **ACCIDENT**.

Per ACCIDENS, is frequently used among philosophers to denote what does not follow from the nature of a thing, but from some accidental qualities thereof, in which sense it stands opposed to *per se*, which denotes the nature and essence of a thing.

Thus fire is said to burn *per se*, or considered as fire, and not *per accidens*; but a piece of iron, though red hot, only burns *per accidens*, by a quality accidental to it, and not considered as iron.

ACCIDENT, in the popular sense of the word, signifies a CONTINGENT effect, or something produced casually, and without any foreknowledge or design in the agent that produced it.

ACCIDENT, in *Grammar*, denotes a property attached to a word, without entering into its essential definition. Thus every word, whatever be its signification, will be primitive, derivative, simple or compound, which are the accidents of words. Besides, each particular species of words has its accidents: e. g. those of the noun substantive are gender, declension, and number, and the adjective has another accident, *viz.* comparison.

ACCIDENT, in *Heraldry*, is an additional note or mark in a coat-armour, not necessarily belonging to it; but capable either of being retained, or omitted, without altering the essence of the armour. Such are **ABATEMENTS**, **DIFFERENCES**, and **TINCTURE**. Edmonson observes, that accidents of arms, though frequently mentioned by authors, can have no meaning in blazonry.

ACCIDENT, in *Logic*, something additional, or super-added, to a **SUBSTANCE**; or not essentially belonging to it, but capable, indifferently, either of being or not being in it, without its destruction. The schoolmen distinguish three kinds of accidents, *verbal, predicable, and predicamental*. *Verbal accident* stands opposed to essence; and in this sense the adjuncts to a thing, though substances themselves, are denominated its accidents. Thus a man's cloaths which are not essential, but adventitious or accessory to his person, are accidents. *Predicable accident* is used in opposition to *proper*.—Such is any common quality; as whiteness, heat, or the like. These are called in the schools, *predicable accidents*, because usually laid down and explained in the doctrine of predicables. They may either be taken in the **ABSTRACT**, as whiteness, learning; or in the **CONCRETE**, as white, learned. If taken in the *abstract*, as is done by Porphyry, the accident is defined as above, that which may either be present, or absent, without the destruction of its subject. If it be taken in the *concrete*, accident is usually defined by the schoolmen, to be something capable of being predicated contingently, of many, in respect of quality.—As learning, which may probably be predicated of you, him, &c. *Predicamental accident* is a mode or modification of some creating substance, inhering or depending thereon, so as not to be capable of subsisting without the same. In this sense, accident is opposed to substance.—Whence, as substance is defined a thing that subsists in itself, and the *substratum* of accidents; so an accident is said to be that *cujus esse est inesse*: and therefore Aristotle, who usually calls sub-

stances simply *entia*, entities, beings; commonly calls accidents, *moda*; *moda*, entities of entity; requiring some substance wherein to reside, as their subject of adhesion. So that accident has an immediate and essential dependence on its substance; both as to its production, its continuation, and its effects; it arises or is deduced from its subject, is preserved or subsisted by it; and can only be affected by what alters, or affects, the subject. The old schoolmen, however, will not have accidents to be mere modes of matter, but entities really distinct from it: and, in some cases, separable from all matter.—But the notion of real accidents, and qualities, is now exploded. Aristotle and the Peripatetics make nine kind of classes of *predicamental accidents*: others contract them into a less number. The term *absolute accident* is used in the Romish theology for a predicamental accident, which subsists, or may possibly subsist, at least miraculously, and by some supernatural power, without a subject.

Such, they contend, were the accidents of the bread and wine in the eucharist, e. g. the colour, flavour, figure, &c. thereof, which remain after the substances they belonged to are changed into other substances of flesh.

The Cartesians universally combat the notion of absolute accidents; it being their doctrine, that the essence of matter consists in extension; and that accidents are only modifications thereof, in no wise distinct from it; an accident therefore without a subject must be a contradiction.—And hence Cartesianism is branded as contrary to the Roman catholic faith.

Various expedients have been invented by the Cartesians, to account for transubstantiation, &c. without the hypothesis of absolute accidents.—Some hold that the usual impressions are made on the sense by the immediate agency of God; and without any thing remaining of the former nature. Others ascribe the whole to heterogeneous matter contained in the pores of the bread, &c. which remaining unaltered by the transubstantiation, produces the same sensations as the bread produced.

ACCIDENT, among *Physicians*, is sometimes used for what is more generally called **SYMPTOM**.

ACCIDENTS, in *Astrology*, denote the most extraordinary occurrences in the course of a person's life: such are a remarkable instance of good success, a signal deliverance, a dangerous sickness, &c.

ACCIDENTAL, in a *general sense*, signifies something that partakes of the nature of an accident; or, what is not essential to its subject, but is indifferent. Thus, whiteness is accidental to marble; and sensible heat to iron.

ACCIDENTAL, in *Philosophy*, is applied to that effect, which proceeds from a cause occurring by **ACCIDENT**, without being subject, according to appearance, to general laws or regular returns. In this sense, accidental is opposed to constant and principal. Thus, the sun's less or greater distance from the earth is the constant and chief cause of the heat in summer, and cold in winter; whereas winds, snow or rain are accidental causes, which often alter and modify the action of the principal cause.

ACCIDENTAL colours, so called by M. Buffon, are those which depend upon the affections of the eye, in contradiction to such as belong to the light itself. The impressions made upon the eye by looking steadfastly on objects of a particular colour are various, according to the single colour, or assemblage of colours, in the object; and they continue for some time after the eye is withdrawn, and give a false colouring to other objects which are viewed during their continuance. M. Buffon has endeavoured to trace the connection which these accidental colours have with those

that are natural, in a variety of instances. The subject has likewise been considered by M. de la Hire, and M. Épinus; and M. d'Arcy has contrived a machine for measuring the duration of the above-mentioned impressions on the eye; and he inferred in the result of several trials, that the effect of the action of light on the eye continued about eight thirds of a minute. See *Acta. Par.* 1743, and 1765. *Nov. Com. Petrop.* vol. 10. And for an abstract, Priestley's *Hist. &c. of Discoveries relating to Vision, &c.* p. 631.

ACCIDENTAL Point, in *Perspective*, is a point in the horizontal line, in which, a right line drawn from the eye, parallel to another right line, intersects the picture or perspective plane. This is also the accidental point of all other lines parallel to the original line, since the same line drawn from the eye is parallel to them all; and the representation of all these parallels, when produced, concur in the accidental point. See **PERSPECTIVE**.

ACCIDENTAL Dignities and Debilities, in *Astrology*, are certain casual dispositions and affections of the planets, whereby they are supposed to be either strengthened or weakened, by their being in such a house of the figure.

ACCIDENTAL, in *Music*, is an epithet added to such sharps, flats, and naturals, as occur not at the clef, and which imply some change of key or modulation different from that in which the piece began. In the key of C natural, for instance, an accidental C \sharp , implies the key of D minor; a D \sharp , the key of E; an F \sharp , that of G major; and g \sharp , the key of A minor. In like manner a flat placed before B, implies the key of F major, or D minor, &c.

ACCIPENSER, in *Icthyology*. See **ACIPENSER**.

ACCIPESIUS, a name given by Athenæus and others of the Greek writers to the **STURGEON**, called by others *Onifcos*.

ACCIPITER, a name given by Gallius and some others to the fish, called by others the *milvus* and *lucerna*. It is a species of **TRIGLA** in the systems of Artedi and Linnæus.

ACCIPITRES, or **RAPACIOUS BIRDS**, in the Linnæan system of *Ornithology*, the first order of birds; the characters of which are, that the bill bends downwards, that the upper mandible is dilated a little on both sides towards the point, or armed with a tooth-like process, and that the nostrils are wide; the legs are short and strong; the feet are of the perching kind, having three toes forwards and one backwards; the toes are warty under the joints, with claws hooked and sharp at the points. The body, head and neck are muscular, and the skin very tough. The birds of this order subsist by preying on other animals, and on dead carcases, and they are unfit for food. They live in pairs, and are monogamous; and build their nests in lofty situations. The female is generally larger and stronger than the male, and usually lays four eggs at a time. This order corresponds to that of **FERÆ** and comprehends four genera, viz. **VULTUR**, **FALCO**, **STRIX**, and **LANIUS**. Mr. Latham has removed this last genus to the order of **PICÆ**.

ACCIPITRINA, in *Botany*, a name by which some authors have expressed the hawkweed, and others, the flixweed or *sophia chirurgorum*. See **HIERACIUM** and **SISYMBRIUM**.

ACCISMUS, denotes a feigned refusal of something which a person earnestly desires. The word *ακισμος* is supposed to be formed from *Acco*, the name of a foolish old woman, famous in antiquity for an affectation of this kind.

Accismus is sometimes considered as a virtue, sometimes as a vice, which Augustus and Tiberius practised with great success. Cromwell's refusal of the crown of England may

be brought as an instance of an accismus. In *rhetoric*, the term is used for a species of irony.

ACCIUS, *Lucius*, in *Biography*, a Latin tragic poet, who, according to St. Jerome, was born in the year of Rome, 583, B. C. 170. Several of his tragedies were founded on the most celebrated stories which had been represented on the Athenian stage, as *Andromache*, *Andromeda*, *Atreus*, *Clytemnestra*, *Medea*, *Meleager*, *Philoctetes*, the civil wars of Thebes, &c. He also composed one dramatic piece entirely Roman, called *Brutus*, which related to the expulsion of the Tarquins. Some say that he wrote comedies; and the *Wedding* and the *Merchant* are ascribed to him. See *Vossius de Poet. Latin.* p. 7. Besides his dramatic writings, he left other works, particularly his *Annals*, mentioned by *Macrobius*, *Priscian*, *Festus*, and *Nonius Marcellus*. He was much applauded by *Decimus Brutus*, who was consul in the year of Rome 615, for the verses which he wrote in his praise; and he was so much esteemed by the public, that a comedian was punished for only mentioning his name on the stage. However, he has been censured by some for the harshness of his style, though he was generally allowed to be a very considerable poet. The particular character of Accius seems to have been that of vigour and sublimity. *Horace* styles him *altus*, *elevated*, and *Ovid*, *animosus*, *spirited*: the latter applies the epithet *atrox*, *cruel*, to his works, which is thought to refer to the subjects of them, or the great catastrophes treated of by the Greek Dramatists. *Cicero* (*De Clar. Orat. apud Oper.* tom. i. p. 395, Ed. *Genev.*) speaks with derision of one Accius, who had written history: and some have supposed that, as Accius had written *Annals*, he refers to him; but this is not probable, as *Cicero* himself, *Horace*, *Quintilian*, *Ovid* and *Paterculus* have expressed themselves in terms of distinguished applause of the Accius, that is the subject of this article.

There was also another *Accius*, or *Attius*, called *Pisauriensis* from *Pisaurium*, the place of his nativity, who was esteemed a good orator, against whom *Cicero* defended *Anulus Cluentius*. See *Cicero de Clar. Orat.* § 78, apud *Op.* tom. i. p. 473. *Orat. pro Cluent. apud Op.* tom. v. p. 57, &c. *Valerius Maximus* mentions a poet of this name, who was accustomed not to rise when *Julius Cæsar* entered the assembly of the poets, as he reckoned himself, in that place, his superior. *Gen. Dict.*

ACCIUS, *Zucchus*, an Italian poet of the 16th century, who is said to be the author of Italian sonnets by way of paraphrase on the fables of *Æsop*, on which *Julius Scaliger* bestows great commendation.

ACCLAMATION, a confused noise, or shout of joy, by which the public express their applause, esteem, or approbation of any thing.

Acclamation, in a more proper sense, denotes a certain formula of words, uttered with extraordinary vehemence, and in a peculiar tone, somewhat resembling a song frequent in the ancient assemblies.

Acclamations were usually accompanied with applauses, with which they are sometimes confounded, though they ought to be distinguished; as acclamation was given by the voice, applause by the hands; besides, acclamation was also bestowed on persons absent, applause only on those present. Acclamation was also given by women, whereas applause seems to have been confined to men.

Acclamations are of various kinds; *ecclesiastical*, *military*, *nuptial*, *senatorial*, *synodical*, *scholastic*, *theatrical*, &c.

Bishops, and other ecclesiastical officers, were elected by the acclamations of the people. We meet with loud acclamations, musical and rhythmical acclamations, acclamations

of joy and respect, and even of reproach and contumely. The former, wherein words of happy omen were used, were also called *laudationes & bona vota*, or good wishes: the latter, *execrationes & consilia*. Of this latter kind of acclamation Suetorius has given an instance, (Oper. vol. ii. p. 1056, Ed. Pitisc.) on occasion of the decree for demolishing the statues of Domitian, when the senate rejoiced, and uttered very bitter and contumelious acclamations against the deceased. The formula used for the purpose of acclamation was repeated several times, so that we find in Roman writers, *acclamatum est quinque et vicies*, i. e. five and twenty times; and, on some occasions, much more frequently. The emperor Claudius suppressed those indecent acclamations, which custom had introduced into the senate, as unbecoming the gravity of that respectable body. But that custom, founded on flattery, prevailed again in succeeding times; and historians have given us such instances as fully justify Claudius's contempt of it.

The acclamations of the theatres, which were at first confused and tumultuous shouts, became in process of time a kind of regular concerts. Nero contributed very much to this improvement of them. When this emperor played in the theatre, a signal was given by clapping; upon which 5000 soldiers, called *Augustiani*, began to chant his praise, which the spectators were obliged to repeat. This business was conducted by a music-master, called Mesochorus, or Pausarius. The servile band was divided into chorusses, who practised a kind of measure in their applauses, and modulated their noise in different ways: the chief of each chorus had a salary of 40,000 sesterces.

The honour of acclamations was chiefly appropriated to emperors. On them it was bestowed to the most extravagant excess. The task of applause was not abandoned to the rude and spontaneous voices of the croud. Persons of all factions and parties vied with each other on this occasion; and after conflicts which had shaken the capitol, insensibly sunk into the emulation of servitude. From either side they echoed in responsive melody the praises of the emperor; their poets and musicians directed the choir, and long life and victory were the burthen of every song. The same acclamations were performed at the audience, the banquet, and the church; and they were repeated in all languages by the mercenaries, who sustained the real and fictitious character of the nations in whose respective languages they were pronounced. Constantini Porphyrogenitus has reduced this science of form and flattery into a pompous and trifling volume, which, says Mr. Gibbon, the vanity of succeeding times might enrich with an ample supplement. But this writer very justly observes, that the calmer reflection of a prince would surely suggest, that the same acclamations were applied to every character, and every reign; and if he had risen from a private rank, he might remember that his own voice had been the loudest and most eager in applause, at the very moment when he envied the fortune, or conspired against the life of his predecessor. Decl. and Fall of the Rom. Emp. vol. x. p. 128. 8vo. In proof of this it may be remarked, that the acclamations of the populace were conferred on the stupid Vitellius, and the cruel Nero, as well as on Trajan, who merited the title of *optimus*. In the latter instance, however, they were received with lively feelings of satisfaction and delight, to which the former were utter strangers. His subjects were frequently heard to exclaim in his presence, "Happy citizens! Happy emperor! Long may he lead this great and virtuous life! Long may he hear our ardent wishes for him!" At which tender expressions Trajan blushed, and shed tears of joy; for he was sensible, it was to himself, and not to his fortune, that

they were applied; and the senate, after obtaining the prince's leave with great difficulty, ordered such acclamations to be inscribed on plates of brass, that they might be a permanent monument and motive of emulation for succeeding emperors, and a lesson to teach them to distinguish between flattery and the language of the heart.

The honour of acclamations was not wholly restricted to emperors. It was also conferred on their children and favourites, and on the magistrates who presided at games. We have likewise instances of its being rendered to persons of distinguished merit, as in the case of Cato and Virgil, mentioned by Quintilian. The most usual forms of acclamation were, "*Felicitur, longiora vitas, annis sibi.*" The actors, and those who gained prizes in the games of the circus, were not excluded from this honour.

The Greeks were accustomed to practise acclamation on extraordinary occasions, as well as the Romans. Plautch mentions an acclamation so loud, in consequence of Flavianus's restoring liberty to Greece, that the birds fell from the sky with the shout.

The Turks observe a similar ceremony on the sight of their Emperors and Grand Viziers to this day; and the practice of saluting kings, conquerors, and distinguished persons, with some forms of acclamation, is very general and prevailing.

Authors and poets, who recited their works in public, were always anxious to obtain this honour; and their admirers endeavoured to render it in the most solemn and respectful manner. Sometimes presents enforced the invitations that were designed for convening numerous assemblies for this purpose. The acclamations, like those of the theatre, were attended with music, and they were adapted to the person, and to the subject; so that philosophers, orators, historians, and poets were differently distinguished. One of the most usual forms was *σφοδρως*, *sophros*, repeated three times; but Martial comprehends other customary forms in the following verse:

"*Graviter, citò, nequiter, Euge, Beate.*"

Acclamations made also a part of the ceremony of marriage.

Acclamations, which were at first practised in the theatre, and which passed from hence into the senate, and other departments of civil society, were, in process of time, received into the acts of councils, and the ordinary assemblies of the church. Chryostom reproved, and checked acclamations of this kind; but Augustine received them very willingly. Sermons were applauded with the hands and feet, by leaping up and down, and exclaiming "orthodox;" and by shaking the loose garments, moving plumes, and waving handkerchiefs. See Lardner's works, vol. iii. p. 81. But their principal use has always been at the solemn entries of princes and heroes; where they are usually attended with good wishes, prayers, vows, &c. Antiquity has transmitted to us several forms of acclamation, some of which we have already recited. The Hebrews used to cry, "Hosanna;" the Greeks, "*Αγαθη ευχη*, good luck." The Romans addressed their princes, generals, &c. with such expressions as these; "*Di te nobis servent; vestra salus, nostra salus*; i. e. "May the gods preserve you for us; your safety, our safety." The acclamations of the army were generally, "*Io triumphe*," or "*Salve Imperator*." Schlemon. de Acclam. Veter. Gen. 4to. 1665. Pitisc. lex Ant. tom. i. p. 12. Ferrar. de Acclam. et Plaus. lib. i. cap. 8. Suicer. Thef. verb. *χαρως*. Aquinas Lex. Milit. tom. i. p. 6. Bingham Orig. Eccles. lib. xiv. cap. 4. §. 27.

ACCLAMATION is also applied among the antiquaries to certain medals, on which the people are represented expressing their joy for some considerable favour. In this sense acclamation is also used to denote the vow; represented on

medals, for the prosperity of the emperor and commonwealth.

ACCLAMATION also denotes a method of election, practised in the ACADEMY of *Arcaidi*.

ACCLAMATION, in *Rhetoric*, is a figure of speech, thus called by the Latins, and by the Greeks EPIPHONEMA.

ACCLIVIS, in *Anatomy*, a muscle, otherwise called OBLIQUUS *ascendens*.

ACCLIVITY, the steepness, or slope, of a line or plane inclined to the horizon, taken upwards. The ascent of a hill is an acclivity: the descent of the same a declivity. Some writers of fortification use the term acclivity for TALUS.

ACCO, in *Geography*. See ACRE.

ACCOLA, compounded of *ad*, *to*, and *colere*, to dwell, in a general sense, denotes an inhabitant near any certain place, in contradistinction to *incola*, who dwelt in it; according to the verse,

“*Accola non propriam, propriam colit incola terram.*”

ACCOLADE, a ceremony anciently used in the conferring of knight-hood.

The word literally denotes an embrace, being formed of *ad*, *to*; and *col*, or *collum*, neck.

Antiquaries are not agreed, wherein the *accolade* properly consisted. The generality suppose it to be the embrace, or kiss, which princes anciently gave the new knight, as a token of their affection.—Whence the word *accolade*, q. d. a clasping, or taking round the neck. A very ingenious author will rather have it to be a blow on the chine of the neck, given on the same occasion. Fauchet seems to reconcile the two opinions: he supposes it to be the kiss; but withal, imagines the kiss to be intended as a stroke on the cheek, *En leur baisant sur la joue*—The ceremony being only an imitation of that practised among the Romans, in the manumission of their slaves, where it is known a blow was given. Skinner. *Cafeneuve*. Orig. Franc. Colomb. *Theat. d'Honneur*.

As for the *accolée*, or blow, John of Salisbury assures us, it was in use among the ancient Normans: by this it was that William the Conqueror conferred the honour of knight-hood on his son Henry.

At first, it was given with the naked fist; thus Lambertus Ardensis, describing the manner in which Baldric, count de Guines, was created knight by Thomas à Becket, says, *eidem comiti in signum militiæ gladium lateri et calcario sui militis pedibus aptavit, & alapam collo ejus infixit*. But this was afterwards changed into a blow with the flat of the sword, on the shoulder of the knight.

Salmonet, and after him the continuators of Moreri, mention an order in England, called knights of the *accolade*; so called from the manner of their creation. The order here meant is that of knights bachelors, or *equites aurati*. But the name, if ever, is now no longer known among us.

ACCOLE'E is sometimes used as synonymous with ACCOLADE.

Accolée is also used in Heraldry, in divers senses, when two things are joined together, as two shields divided at the flanks, they are said to be *accolée*. It moreover is also applied to lions, dogs, and other animals, which have collars, or crowns about their necks; as the lion in the arms of Ogilvy; others use the term *accolée*, when two keys, battoons, maces, swords, &c. are fastierd wife, behind the shield. Nisbet's *Essay on Armor*. English heralds ordinarily say, *collared*, or *gorged* with an open crown, instead of *accolée*.

ACCOLTI, *Benedict*, the Younger, in *Biography*, was grandson of Benedict Accolti, the elder, who flourished about the year 1376; was born at Arezzo, in 1415, and

was distinguished about 1450, when he is said to have succeeded Poggius as secretary to the Republic of Florence. He wrote “Four books concerning the war which the Christians carried on against the Infidels, in order to recover Judæa and the holy sepulchre;” which work was printed at Venice in 1532, 4to. and serves as the ground-plot to Tasso's *Jerusalem delivered*; and also an account “of the excellent personages of his time,” in the form of a dialogue, printed at Parma, in 1692, 8vo. He died in 1466.

ACCOLTI, *Benedict*, was also nephew, or, as some say, grandson to Peter Accolti, and was born at Florence, in 1497. He made a great progress in the study of the law, and became so much a master of the Latin tongue, that he was called the Cicero of the age. He was also distinguished by a very retentive memory. The ecclesiastical honours which he enjoyed were very considerable. Leo X. gave him the bishopric of Cadiz, Adrian VI. that of Cremona, and the archbishopric of Ravenna; and Clement VII. created him a cardinal. At the request of this pontiff, he wrote a treatise in vindication of the right of the pope to the kingdom of Naples. He left several other works, and particularly several pieces of poetry. He died at Florence in 1549. Gen. Dict.

ACCOLTI, *Francis*, the brother of the former, was professor of jurisprudence in several academies, and styled the prince of lawyers. He is said to have possessed a vigorous understanding, comprehensive knowledge, and powerful eloquence. He aspired to the purple under the pontificate of Sixtus IV.; and by a sordid parsimony amassed large treasures. He was born about the year 1418, and died about the year 1470. He left behind him several treatises of law, and translations of some of the works of Chrysoctom. Voss. de Hist. Lat. l. iii. c. 7. Gen. Dict.

ACCOLTI, *Peter*, the son of Benedict the younger, was born at Arezzo about the year 1455, and died at Rome in 1532. He was professor of law, and taught with great applause. He was employed by the popes, and raised successively to several bishoprics, and became a cardinal in 1511. He wrote several historical tracts. His brother, Benedict, duke of Nepi, was celebrated for the extent of his erudition, and the excellency of his poetical talents. Pope Leo X. in 1520, created him prince of the state of Nepi. His *Virginia*, a comedy printed in 1553, 8vo.; and his poems, at Venice, in 1519, and 1553, were much applauded by his contemporaries. Benedict Accolti is said to have taken a lead in a conspiracy against pope Pius IV. and to have been brought to capital punishment in 1562. Gen. Dict.

ACCOMA, in *Geography*, a town of New Mexico, in North America, situated on a high mountain, with a strong castle, which is the capital of the province. It was taken by the Spaniards in 1599. W. long. 104° 15'. N. lat. 35°.

ACCOMACH County, in Virginia, is situated in a peninsula, bounded on the north by Maryland, east by the ocean, and west by the Chesapeake bay, and contains 13,959 inhabitants, of whom 4262 are slaves.

ACCOMMODATION, in *Philosophy*, the application of one thing by analogy to another. To know a thing by accommodation, is to know it by the idea of a similar thing referred to it.

ACCOMMODATION is also used in *Theology*; thus, a prophecy of scripture is said to be fulfilled properly, when a thing foretold comes to pass; and improperly, or by way of accommodation, when an event happens to any place or people, like to that which occurred some time before to another. This method of explaining scripture by accommodation,

tion, serves as a key for solving some of the greatest difficulties relating to the prophecies. This convenient principle of accommodation is applicable to those passages, in which are used the strong expressions, "then was fulfilled" that which was spoken by the prophet," or "this was done that it might be fulfilled which was spoken by the prophet." Wetstein, in his note to Matth. i. 22. (vol. i. p. 237-8.) has produced, in support of this principle, an example from Ephrem Syrus, and similar expressions from other writers. This principle of accommodation has been adopted, not only by Wetstein, but by Grotius, by Nicholls in his "conference with a theist," (vol. i. p. 335.) Michaelis in his "Introduction to the New Testament," (see Marsh's Transl. vol. i. p. 214.) and particularly by Dr. Sykes, who has illustrated, defended, and applied it in the introduction to his "Paraphrase on the Hebrews," §. 3. p. 28, &c. and in his "Truth of the Christian Religion," ch. 13, 14, 15.

Dr. Eckermann, professor of divinity in the university of Kiel, extends the doctrine of accommodation to every quotation in the New Testament without exception, proceeding on the hypothesis, that the Old Testament contains no prophecy, which literally and immediately relates to the person of Jesus Christ. On the contrary, Dr. Owen in his "modes of quotation used by the evangelical writers," §. 5. entirely rejects the principle of accommodation, admitting, as many others have done, a typical meaning, in order to resolve the difficulties that occur in the explication of particular passages. Dr. Sykes observes, that if we were better acquainted with the Jewish phraseology, we should less hesitate in admitting the above mentioned principle. As for the particular term "fulfilled," he says, the Jewish writers often meant no more by it than the happening of a similar event, or an exact agreement in particular circumstances of latter things with former. An ingenious and much admired writer (see Paley's View of the Evidences of Christianity, vol. ii. p. 298.) speaking of those quotations in the Old Testament found in the New, some of which are applied in a sense and to events apparently different from that which they bear, and from those to which they belong in the original, observes, "it is probable to my apprehension, that many of those quotations were intended by the writers of the New Testament as nothing more than accommodations. They quoted passages of their scripture which suited, and fell in with, the occasion before them, without always undertaking to assert, that the occasion was in the view of the author of the words. Such accommodation of passages from old authors, from books especially which are in every body's hands, are common with writers of all countries; but in none, perhaps, were more to be expected than in the writings of the Jews, whose literature was almost entirely confined to their scriptures." This writer adds, "those prophecies which are alleged with more solemnity, and which are accompanied with a precise declaration, that they originally respected the event then related, are, I think, truly alleged. But, were it otherwise, is the judgment of the writers of the New Testament, in interpreting passages of the Old, or sometimes, perhaps, in receiving established interpretations, so connected either with their veracity, or with their means of information concerning what was passing in their own times, as that a critical mistake, even were it clearly made out, should overthrow their historical credit? Does it diminish it? Has it any thing to do with it?"

The question of fact, whether the Jewish Rabbins, in quoting passages from the Old Testament with a formula of this kind; "In this the Scripture was fulfilled," did consider those passages as having themselves reference to the

event to which they applied them, or grounded the quotation on a mere parity of circumstances, has been accurately examined by Surenhusius in his *Ευβλοῖ καὶ ἀλλοιωτικαί*, printed at Amsterdam in 1713. In his third thesis, "De formulis allegandi," he compares the expression "εὐλοῖ καὶ ἀλλοιωτικαί," with Rabbinical Hebrew formulæ of a similar kind; and concludes upon the whole, that the expression is not only allusive, but demonstrative. See QUOTATION.

The primitive church accommodated multitudes of Jewish, and even heathen ceremonies and practices to Christian purposes; but the Jews had before done the same with regard to those of the Gentiles: some will even have circumcision, the tabernacle, brazen serpent, &c. to have been originally of Egyptian use, and only accommodated by Moses to the purposes of Judaism. Saurin's Dissert. Old Test. tom. i. p. 506. Spencer de Leg. Hebr. Disc. i. lib. 3. p. 32. Middleton's Letters from Rome in his Works, vol. iii. p. 63.

This accommodation, in the most extensive sense of the term, is the subject of two prize dissertations in Teyler's Theological society; and the discussion of it by Van Hemert, professor of Philosophy and Literature in the society of Remonstrants in Amsterdam, and De Vos, minister of the Baptist congregation in the same city, may be found in the 12th volume of these Dissertations. The learned Professor had prepared the way for this discussion by an oration which he had delivered upon being appointed to this office. In this discourse he maintains, that Christ, who was the wisest and best of all teachers, adapted both the manner and matter of his instructions to the capacity and habits of his hearers. With regard to the former there can be no dispute; and, as to the latter, he observes, that our Saviour manifested an evidently intended condescension to the ignorance, imbecility, and prejudices of his hearers. Whilst he avoided the discussion of subjects that were superior to the capacity of his disciples, and that philosophical train of reasoning, which would have been unintelligible to them; he made use of arguments, which, coinciding with their popular notions and national prejudices, were likely to make the deepest impression on their minds; without warranting them to conclude, that these notions were in themselves just, or that he approved them as such. That our Saviour never attempted to correct those errors of his countrymen which related to opinions merely philosophical, is abundantly evident; but there were others that might be supposed to have a more intimate connection with religion, which, however, for wise reasons, he did not think it proper to reform; either because he did not deem them of importance, or because, by opposing them, he might have unnecessarily irritated the minds of his hearers, and have rendered them averse from his instructions. In proof of this observation the Professor refers to the conversation of Christ with the woman of Samaria, his discourse with the Sadducees concerning the resurrection, his answer to the mother of Zbedee's children, and his reply to his disciples, when they believed his appearance to be that of a ghost, or spectre. He distinguishes, however, between what is essential to religion itself, and what relates merely to theology, or the mode of teaching it. The strict propriety and absolute necessity of this kind of accommodation he vindicates by a survey of the stupid ignorance and inveterate prejudices of the Jewish nation. As proofs that our Saviour condescended to found his arguments even on the erroneous notions of his countrymen, when they suited his purpose, and did not interfere with the essential doctrines of the Gospel, he refers to Matt. xv. 26, Mark vii. 27; to his distinction of the precepts of the law into greater and less, Matt. v. 19; and to his using the term gehenna, and the judicial style of the Sanhedrim, in Matt. v. 22.

The apostles and evangelists also imitated his example, of which instances occur in 1 Thess. v. 23. Coloss. i. 16. Ephes. i. 21. iii. 10. Rom. viii. 38. 1 Pet. iii. 22. In relating facts, the writers of the New Testament conform to the popular opinion. Of this nature, (says this author) are all those passages which refer to demons and demoniacs, and those which represent the devil as the principle of evil, instigating mankind to sin. These, he adds, were opinions which properly related to philosophy, and did not materially affect religion; as long, at least, as it was believed that these malignant agents were under the control of divine power, and might be vanquished by good men. The Professor is of opinion, that the existence of such a malignant being, exerting an influence over the minds of men, and impelling them to vice and misery, is utterly inconsistent with the perfections of the Deity, with the wisdom of the divine government, and with the free and moral agency of man. The Jews had derived from the Chaldeans a notion, that the air was peopled with demons, and that some of these were confined in dark prisons, in the infernal world; and some commentators have supposed, that what the apostles Peter and Jude have said concerning the punishment of angels, was borrowed from the apocryphal book of Enoch, which might probably have been written by some Hellenistic Jew. Of the acquiescence of the writers of the New Testament in the current, but erroneous notions of their countrymen, this author mentions St. John's account of the wonderful virtues of the pool of Bethesda, and what St. Luke says of the Sadducees in Acts xxii. 8. There are also many cases, in which Christ used, what logicians call, the *argumentum ad hominem*; of which there is a striking example in the answer given to the Pharisees, when they accused him of casting out devils by Beelzebub. Thus also, in the parable of the rich man and Lazarus, Christ founded his description of the future state of reward and punishment on the notions of the Jews concerning their paradise and gehenna, which were nearly the same with those of the Greeks and Romans concerning the Elysian fields and Tartarus. See also Luke xxii. 30. The acquiescence of Christ and his apostles in the prejudices of their countrymen is also evident in the quotations from the books of the Old Testament. These, as their classic authors, the Jews cited on every occasion; but being, like all the orientalists, very fond of allegory, they supposed that, beside the obvious and literal meaning of these writers, which they considered as comparatively of little value, there was a hidden and mysterious sense which referred to the Messiah and his kingdom. With this custom, says the Professor, though in itself injudicious, the writers of the New Testament judiciously complied. Hence, he adds, most of, if not all, the passages of the Old Testament, which are quoted in the New, are adduced in a sense very different from their primitive signification, and form a kind of *argumenta ad hominem*, founded on the principles of those to whom they were addressed. Of the same kind of accommodation to Jewish prejudices the author deems the condescension of St. Paul in adopting the puerile allegories of the rabbies concerning Sarah and Hagar in Gal. iv. 24; and that of the apostles Peter and Jude, in referring to a story, related in some apocryphal book, of a dispute between the archangel Michael and the devil about the body of Moses. Such are the outlines of the Dissertation above cited, in which the author produces other instances of accommodation. The Pharisees believed the metempsychosis or transmigration of souls (see Josephus Bell. Jud. l. ii. c. 8); and M. Hemert. imagines, that they applied this hypothesis to the prophecy in Malachi iv. 5, and that our Lord did not contradict it in

his discourse with his disciples, Matt. xvi. 14. And again, he apprehends, that in Matt. xi. 14, Christ not only forbears to correct this notion of the Jews, but indirectly allows it, as what he did not at that time think proper to oppose; and shews them that, even on this hypothesis, the prophecy of Malachi was fulfilled. The blended accounts that are given of the destruction of Jerusalem, and of the resurrection and last judgment in Matt. xx. 34, &c. are considered by this writer as an acquiescence in the popular notion, with a view of animating the first Christians to constancy and diligence amid the peculiar difficulties which they had to encounter. The Professor having by such modes of reasoning stated the fact, proceeds to inquire how far this hypothesis of accommodation to popular notions may be extended, consistently with the veneration and esteem due to the character of our Saviour and his apostles. Whilst our Lord generally left physical errors uncontradicted, he constantly opposed those prejudices and mistakes that were contrary to the persuasion of God's impartial love to all mankind, or detrimental to the nature and principles of practical piety and virtue. In answer to the objections which may be alledged against his hypothesis, the Professor begins with evincing the absurdities to which those have been reduced, who have endeavoured to vindicate the philosophical accuracy of the Scriptures. In accommodating their instruction to the different capacities of those to whom they were communicated, and adapting them to the peculiar character of their age and nation, as well as to their particular prejudices and habits, Christ and his apostles did no more than what might be expected from wise teachers, endued with a divine commission; and they who on this account object to them, manifest an ignorance of the human heart, as well as of the office of an instructor of mankind. They also misapprehend the design of Christ's mission; which was not to make his hearers philosophers, nor even to instruct them in all those particular truths which may be considered as influencing religious opinions. Mankind in general, and the Jews in particular, were not qualified to receive such instruction. Without this accommodation the design of our Lord's mission would have been counteracted and defeated, if either he or his apostles had encountered every error of the age and nation to which they were sent. To those who alledge that, among the instances cited by the author, of popular errors, in which Christ and his apostles are supposed to have acquiesced, there are some which relate to the essential doctrines of the gospel; he replies, that while he allows that important truths might sometimes be inculcated on the attention of the people, by arguments founded on their own erroneous notions, he absolutely denies that these notions themselves have any necessary connection with the essential truths of the gospel. Perhaps, he adds, it may be asked, whether the existence and power of the devil be not religious tenets?—but by whom, or on what foundation, were these ever made articles of Christianity? Does the belief of such an enemy of mankind at all contribute to promote that integrity, and that sanctity of heart and conduct, which the Saviour came to establish? Or is not this notion rather calculated to fill the weak and superstitious with vain terrors? For this reason, says this professor, the apostles, though they did not contradict the popular notion, took care to obviate its pernicious consequences by always representing the devil as vanquished by Christ. Is the belief of demons that inhabit the air, that haunt the desert, or that insinuate themselves into the bodies of men and afflict them with diseases, an essential doctrine of the gospel? May we not believe the Christian doctrine of a future state of retribution, without acquiescing in the notions of the Jews concerning paradise

and gehenna, and cultivate a firm hope of the resurrection of the dead by Christ, without believing that the archangel will sound a trumpet to awaken us from the sleep of death? Is it necessary to our belief that Jesus is the Christ of God, that we refer to him all those passages which the Jewish doctors, and, after their example, the Jewish converts to Christianity, from their love of allegories and types, explained as relative to him? &c. &c. In a word, if we consider the genuine nature of our religion, as taught by our divine master, we shall see, says the author, that none of the instances, in which it has been here supposed, that Christ and his apostles accommodated their instructions to the prejudices and notions of their countrymen and contemporaries, have any necessary connection with the design of the gospel, or interfere with any of its essential truths. The Professor proceeds to specify some rules by which we may discriminate those passages of scripture that may be considered as instances in which the sacred writers acquiesce in popular prejudices; and he closes with some observations on the utility of this hypothesis of accommodation in explaining the scriptures. M. De Vos traces nearly the same ground of argument; but without extending the hypothesis of accommodation so far or so intrepidly controverting received opinions; opinions which the reader of this article will not incautiously reject, and without the previous hesitation and subsequent examination which they demand.

ACCOMMODATION, in *Law*, is used for an amicable agreement or composition between two contending parties. Thus we say, the process is become so intricate and perplexed that there is no hope of getting out of it but by an accommodation. These accommodations are frequently effected by means of compromise and arbitration.

ACCOMPANIMENT, something attending or added as a circumstance to another; either by way of ornament, or for the sake of symmetry, or the like.

ACCOMPANIMENT, ACCOMPAGNAMENTO, ACCOMPAGNATURA, in *Music*, implies the instruments that *accompany* the voice, solo, or concerto, to sustain the principal part, whether vocal or instrumental, as well as to enrich the harmony.

The *Crusca Dictionary* gives no authority from early writers in Italian, of *accompagnamento*, accompaniment, being used as a technical term. In the fourth and last acceptance of the verb *accompagnare*, it is only said, in general, to be a musical term, signifying "to play on an instrument in harmony with the voice;" and this definition appears in no edition anterior to that of 1746.

Italian musical terms have now been adopted by all Europe; yet we are acquainted with no professed musical dictionary in that language. But the words peculiar to the art being taken from the common language of the country where it was first cultivated, they need no explanation to the natives; yet, in other countries which have derived their knowledge, or at least, their taste, from the Italians, these words are become technical, and need a glossary.

To write, make, or compose, an accompaniment, are synonymous terms with musicians, for setting, or adding parts for violins, flutes, or other instruments, to a melody, vocal or instrumental, in order to be performed with it. In the early operas the accompaniments were very thin. In the first operas, indeed, none appeared, except in the symphonies and chorusses; but, in process of time, as dramatic music advanced towards perfection, it was found that effects could be produced by the orchestra which were picturesque, coloured sentiments, and augmented auricular pleasure. A simple melody, unless performed by a great singer, became insipid. But, though much ingenuity and

science appear in a rich and full accompaniment *on paper*, yet in performance, the composer and the orchestra frequently abuse their power, and tyrannise over the voice, which they should cherish, and disguise the poetry by complication and noise, which they should help to explain and enforce. And it is a general complaint at the opera, when a *cantilena*, or vocal part is good, and performed by a singer of the first class, that the *accompaniments* are too loud—*ti p' cha gè*, say the French, and *troppo caricato*, cry the Italians.

Accompaniment is likewise another word for *thorough-bass*, by giving in chords the whole harmony on which the melody is built. These chords are expressed by figures over the base, which figures supply the place of a treble part for the right hand on keyed-instrument.

The rules for accompaniment are few, with respect to harmony, but their use depends on judgment and good taste. Some, fond of crowded harmony, think it can never be too loud or full; while others, who prefer a simple and beautiful melody to the most artful combination of kindred sounds, almost think harmony a grievance. There are who prefer a meagre and monotonous accompaniment in triplets; and others imagine that the voice is best supported by being accompanied in unison. But Rousseau, in enumerating the qualifications of an *accompanier*, has settled this point: "Whoever undertakes to accompany a song or solo, should be a consummate musician, well skilled in harmony, and the construction of the several parts; should have a nice and cultivated ear, a hand prepared for all difficulties of execution in the base, and modulation into different keys, with a sound judgment and good taste. It is the business of the *accompanier* on the organ, harpsichord, or pianoforte, to give the pitch to the several instruments, and the time to the whole band; to have always under his hand the note which the singer is about to deliver, in order to correct, if false, and enforce, if feeble; and, at the beginning of an air or movement, to mark with energy and precision the several portions of the bar, that the orchestra, if a quick air, may proportion the rapidity to the abilities of the singer; and, whether quick or slow, indicate such a specific motion as suits the genius of the composition, and the design of the composer. But, above all, whoever is *accompanying* another to whom the principal melody is assigned, should remember, that he is a servant, an humble attendant on a temporary superior, and should suppress all ambition of shining at the expense of the voice or instrument which he *accompanies*."

A great player accustomed to be listened to with delight, and applauded with rapture, seldom accompanies well: his fingers itch to be in action, and to call the attention of the audience from the principal performers to himself.

No general rules can be given for accompanying that will be applicable on all occasions. After the harmony is well known, and the hand well exercised, experience, good sense, and propriety must do the rest. *Accompaniment*, though it require little brilliancy of execution, is the last thing which a practical musician acquires. There is nothing which a singer so much dreads as an ignorant or injudicious accompanier. If ignorant himself, the singer wants assistance; if his taste is refined, and his voice good, all his art and natural powers are destroyed by a clumsy *accompaniment*.

Nothing but consummate experience, and a familiar acquaintance with all styles, with the best compositions of great masters, and the being able to grasp at a single glance a whole line of a score, and occasionally select the most important passages in the instrumental parts to play with the right hand, instead of the chords, can completely qualify a performer

performer on a keyed-instrument to accompany a good or a bad singer.

Rousséau, though no deep theorist, had a very good taste in music, and excellent views concerning its refinements and effects; and, in his "Letter on French Music," the best piece of criticism on the art, perhaps, that has ever been written, speaking of *accompaniment* on the harpsichord, he says: "when burletta operas were first performed at Paris, every one was struck at seeing the manager's son, a child of ten years old at most, accompanying the singers, and producing with his little fingers effects so different from those of M. Noblet, the usual performer on the harpsichord, a good harmonist, and exact in giving the full complement to each chord. But what was my surprise in watching the hands of the little man, and observing that he hardly ever gave the whole harmony to the base; but suppressing many of the sounds, and frequently using only two fingers, with one of which he generally played the octave to the base, and with the other the interval most important in the melody! What! says I to myself, has a mutilated harmony more effect than one that is complete? And do our thorough-bass players, by giving the full chords produce only a confused noise, while this child with fewer sounds enforces the melody more, and renders the *accompaniment* more useful and agreeable? This was a problem which I was unable to solve; but I became more sensible of its importance afterwards, by observing that all the Italians accompany good singers in the same manner as this infant did; and upon the same principle as the composers have their scores thin, often making the tenor play only in octaves above the base, and the second violin in octaves below the first. I remembered that I had read somewhere in Rameau, that every concord had a different character, or power of affecting our sensibility, peculiar to itself; that the effect of the 3d was different from that of the 5th, the 4th from the 6th. In the same manner 3ds and 6ths minor must produce different affections from those of 3ds and 6ths major. These facts once established, it evidently follows, that even discords and every kind of interval will be included in the rule: an idea which reason confirms, since, when the relations are different, the impression cannot be the same."

The reasoning of the citizen of Geneva on this principle is very specious and ingenious. "I see clearly," continues he, "that, by adding concord to concord, injudiciously, though agreeable to the doctrine of chords, by augmenting the harmony, we may weaken and counteract the effect of each sound. If the entire and pure effect of a 5th, be necessary for the expression which I want, I risk the weakening this impression by a 3d sound, which, dividing the 5th into two 3ds of different kinds, though when struck together the harmonical effect is good, yet they may mutually diminish the peculiar effect of each other. In like manner, if the simultaneous impression of the 5th and two 3ds were necessary to my design, I should fail in producing the effect I intended by retrenching either of the 3ds from the chord. This reasoning becomes still more intelligible, applied to discords."—"It follows from all this, that, after having well studied the elementary rules of harmony, the musician should not hastily lavish it inconsiderately, nor believe himself a composer because he can crowd the chords with unmeaning notes; but, before he begins to combine sounds, he should apply himself to a much longer and more difficult study: that of the different impressions which the concords, discords, and all the intervals make on the ear of sensibility, and often say to himself, that the great art of a composer consists no less in discerning what sounds occasionally to

suppress, than what to admit. It is in studying and turning over incessantly the master-pieces of Italy, for vocal music, (and of Germany for instrumental, he would now have added) that a composer would learn to make this exquisite choice, if Nature has given him sufficient genius and taste to feel its necessity; for the difficulties of the art are only perceived by those who are able to vanquish them; and such will not treat with contempt the vacant lines in a score; but, seeing with what ease a mere Tiro might fill them up, they will suspect, and seek the reasons for this seeming simplicity; so much the more admirable, as it conceals prodigies under a feigned negligence, and that *l'arte che tutto fa, nulla si senopre*. These seem to me (continues Rousséau) the causes of those surprising effects which the Italian music produces, though much less crowded with harmony than ours, (that is, the old French music) of which the effects are so small and the labour so great. This does not imply that a score should never be full, but that it should be filled with choice and discernment; neither is it to say that to accomplish this, the musician should make all these reflexions; but that he should feel the result. It is his business to have genius and taste to find these effects, and that of the theorist to seek and explain whence they arise."

To *accompany* recitative on a keyed-instrument, where no regular time is observed, and the singer utters in musical tones, a soliloque or dialogue, under no more restraint, as to measure, than if he were declaiming in common speech, the instrumental accompanier must attentively read the words, and strike the chord firmly which is given to the most accented and energetic part of a verse or period, exactly when it is pronounced by the singer, except at a close or termination of a scene or period, when two chords are given without the voice: one to the base of the 5th of a key, with a sharp 3d, and the other usually to the key note, in whatever key the modulation is carried; but this expectation is often disappointed, except at the close which immediately precedes the air.

We shall pursue the subject of ACCOMPANIMENT still further, under the articles HARMONY, CHORDS, THOROUGH-BASE, REGLE DE L'OCTAVE, FIGURING A BASE, and RECITATIVE.

ACCOMPANIMENTS, in *Heraldry*, are all such things as are applied about the shield by way of ornament, as the belt, mantlings, supporters, &c. A thing is also said to be accompanied when there are several bearings or figures about some principal one, as a saltier, band, fess, chevron, or the like.

ACCOMPANIMENTS, in *Painting*, denote such objects as are added by way of aptitude or ornament to the principal figures; as dogs, guns, game, &c. in a hunting-piece.

ACCOMPLICE, compounded of *ad, to, con, together*, and *plicare, to fold*, in *Law*, one that has a concern in a business, or that is privy in the same design or crime with another. See ACCESSORY.

By the law of Scotland, the accomplice can only be prosecuted after the conviction of the principal offender; unless the accession of the accomplice be immediate, *in ipso actu*, so as in effect to render them co-principal. By the general rule, the accomplice suffers the same punishment with the principal offender. Yet if he be remarkably less guilty, justice will not permit equal punishment. The council of Sens, and several other synodical statutes, expressly prohibit the revealing of accomplices. See DISCOVERY of accomplices.

ACCOMPLISHMENT, in a general sense, the entire execution, atchievement, or fulfilling of something proposed, or undertaken.

ACCOMPLISHMENT, in *Theology*, is principally used in speaking of events foretold by the Jewish prophets, in the Old Testament, and fulfilled under the New. In the writings of biblical commentators and critics, we read of a literal, mythical, typical, single and double accomplishment. Prophecy may be accomplished either directly or by way of **ACCOMMODATION**. See **PROPHECY**.

ACCOMPLISHMENT is more particularly used for any personal endowment, mental or corporal.

ACCOMPT. See **ACCOUNT**.

ACCORD, in *Law*, is a verbal agreement between two, at the least, to satisfy an offence which the one hath committed against the other; whether it be a trespass, or the like; for which the one agrees to make, and the other to accept, a certain satisfaction.—This, if executed, becomes a good bar in law to any suit to be brought for the same matter. Accord with satisfaction is a good plea in personal actions, where damages only are to be recovered, and in all actions, which suppose a wrong, *vi et armis*, where a *capias* and *exigent* lay at the common law, in trespass and ejectment, detinue, &c. So in an appeal of *Maibem*. But in real actions, it is not a good plea. 4 Rep. i. 9. 70. 9 Rep. 77. By several late statutes, particularly 11 Geo. II. c. 19. in case of irregularity in the method of distraining, and 24 Geo. II. c. 24. in case of mistakes committed by justices of the peace, even **TENDER** of sufficient amends to the party injured is a bar of all actions, whether he thinks proper to accept such amends or not.

ACCORD, in *Music*, is more usually called **CONCORD**. It is also used by old authors for **CHORD**.

The word is formed, according to some, from the latin *ad, to*, and *cor*, the *heart*; but others, with greater propriety, derive it from the French *corde*, a *string*; on account of the agreeable union between the sounds of two strings struck at the same time. Whence also some of the consonants in music are called *tetrachord*, *hexachord*, &c. which are a fourth and a sixth.

ACCORDARE, *Ital.* } to tune instruments.
ACCORDER, *Fr.* }

ACCORD, in *Painting*, denotes the harmony that prevails among the lights and shades of a picture.

ACCORDS, **STEPHEN TABOUROT**, *Seigneur des*, in *Biography*, an advocate in the parliament of Dijon in France, was born in the year 1549. The lordship of Accords is an imaginary fief or title, derived from the device of his ancestors, which was a drum, with the motto, *à tous accords*; " chiming with all." S. Accords was a man of genius and learning, but too much addicted to trifles, and to a licentious mode of writing. This appears from his piece entitled " *Les Biguarres*," printed at Paris in 1582; and another called " *Les Touches*," published at Paris in 1585, which is a collection of witty poems indelicately written. Bayle.

ACCOSTED, in *Heraldry*, a term not often used, but of the same signification with **COTTISED**.

ACCOUCHEUR, and **ACCOUCHEUSE**, *Fr.* a man or woman practising midwifery.

ACCOUCHMENT, *Fr.* the act of delivery.

ACCOUCHMENT *prematurè*, **AVORTEMENT**, or **FAUSSE COUCHE**, *Fr.* the premature exclusion of a fœtus.

ACCOUNT, or **ACCOMPT**, of *ad, to*, and *computus*, a *computation*, in *Arithmetic*, a calculation, or computation of the number or order of certain things; as the computation of **time**, &c. There are various ways of accounting, as by enumeration, or telling one by one; and by the rules of arithmetic, addition, subtraction, &c.

ACCOUNT, in *Chronology*, is nearly synonymous with

STYLE. We account time by years, months, &c. the Greeks accounted it by olympiads; the Romans by indictions, lustris, &c.

ACCOUNT is also used in respect of a **COMPANY** or **SOCIETY**, when two or more persons have received or disbursed money for each other; or when this has been done by their order or **COMMISSION**.

ACCOUNT, or **ACCOUNTS**, is also used collectively, for the several books or registers which merchants keep of their affairs and negotiations.

There are divers kinds of accounts among merchants, as *personal, real, imaginary, general, particular accounts*, &c.

ACCOUNTS, *personal*, are those which discover what each person, or subject, with whom a man has dealings on credit, owes to, or has owing to him.

ACCOUNTS, *real*, are those whereby a dealer discovers what effects are on hand at any time, and what is gained or lost on each.

Every account is distinguished into two parts, for which two opposite pages are assigned of one folio or opening; the name of the person with whom a man has account being written on the top of each, with the word debtor on the left side, and creditor on the right.

ACCOUNT, *personal*, is to contain on the debtor side what the person owes me, and the payments I make to him; and on the creditor side, all that I owe to him, and the payments he makes of his debts to me.

ACCOUNT, *real*, must contain on the debtor side the quantity and value of what was upon hand at the beginning of the account, and all afterwards received, with the costs and charges thereof; and on the credit side, the quantity and value of what is disposed of or any way taken out of it, with the returns made by it.

ACCOUNTS, *imaginary*, are then brought in to make a balance between credit and debt, and in cases where the real and personal accounts will not in the articles belonging to them make, as they usually do, such balance.

The chief of these is the account of *profit and loss*; on the debtor side of which are entered all losses, and on the creditor side all gains. Such also is the *stock account*, &c.

ACCOUNTS, *sundry*, when one account is balanced by sundry, *i. e.* when one is debtor or creditor for a sum, and sundry accounts creditors or debtors for the parts of the sum; it is entered under the head of *to*, or by, *sundry accounts*.

ACCOUNTS, *general*, are those where all the goods of the same name are put into one account.

ACCOUNTS, *particular*, are those where each species, or subdivision of things under the same name, have their separate account.

ACCOUNT, *open*, is used for an account not liquidated or settled.

ACCOUNT, *in bank*, is a fund of money, which merchants, or others, place in the common cash of a bank, to be in readiness for the payment of bills of exchange, or promissory notes, purchases, and other debts contracted in the course of business.

ACCOUNT, *current*, amounts to the same with an open account.

ACCOUNT, *opening an*, with any one, signifies the placing him, for the first time, in the great book. This is done by writing his name, surname, and place of residence in large characters, and afterwards charging him with articles, either of debtor or creditor, as affairs turn up. When an account is opened with any person in the great book, his name is at the same time to be entered in the index or alphabet book, with the page wherein his account is to be found.

ACCOUNT, *placing a sum to an*, is to enter down in the great

great book the several particulars for which a person becomes either debtor or creditor.

ACCOUNT, examining an, is the reading it exactly over, pointing the several articles, and verifying the computation, in order to find whether there be any error, and whether the sum total, or the balance, be just.

ACCOUNT, casting up, or closing an, is the stating and settling of it, to find the balance: this is called also *balancing* or *settling an account*.

Accounts are *closed* in the great book, on two occasions: the first, when it is required to terminate an affair entirely, either with debtors or creditors, in order to learn what is due. The second, when it is necessary to carry on the account to another page of the same book, or to a new book, for want of room.

ACCOUNT, balance of an, is the sum by which the debt exceeds the credit, or *vice versa*, upon stating or settling of it.

ACCOUNT of sales, is an account given by one merchant to another, or by a factor to his principal, of the disposal, charges, commission, and net proceeds of certain merchandise, sent for the proper, or company, account of him, who consigned the same to such factor or vender.

When the like account is inland or domestic, the same is transmitted in the current money of that country wherein the business is transacted. As from a Blackwell-hall factor to the clothiers in the country, or from the warehousemen in town, who deal by commission for the country manufacturers.

ACCOUNT, money of, is an arbitrary species, contrived for the facilitating, and expediting the taking, and keeping of accounts. Such are pounds sterling in England; livres and sols in France; roupees in India; milrees in Portugal.

ACCOUNTS, books of, of merchants and tradesmen, are considered as a sort of private instruments, and in the civil law, and law of merchants, are allowed to make a half proof. The reason is, that merchants are often under a necessity of dealing on trust without note or writing. Hence the suppletory oath of the merchant, with his book of accounts, is admitted abroad as a full proof against his chapman. But in England this is under some limitation. See stat. 7 Jac. I. cap. 12. which confines this species of proof to such transactions as have happened within one year before the action brought; unless between merchant and merchant, in the usual intercourse of trade.

ACCOUNT, or ACCOUNT, in a legal sense, is a particular detail or enumeration, delivered to a court, a judge, or other proper officer or person, of what a man has received or expended on the behalf of another, whose affairs he had the management of.

In the REMEMBRANCER'S office in the exchequer, are entered the states of all the accounts concerning the king's revenues; for customs, excise, subsidies, &c.

The great accounts, as those of the mint, wardrobe, army, navy, tenths, &c. are called *imprest accounts*.

All accounts which pass the remembrancer's office are brought to the office of the clerk of the PIPE. See TALLY and AUDITOR.

ACCOUNT, in Common Law, denotes a writ or action which lies against a person, who by his office ought to give an account, but refuses.

A writ or action of account properly lies only against bailiffs, receivers, and guardians in socage; though others are also brought in as a secondary intendment.

By 4 and 5 Anne, actions of account may be brought against the executors and administrators of guardians, bailiffs, receivers, &c. and by one joint-tenant, &c. against

the other, his executors and administrators, as bailiff, for receiving more than his share: however, actions of account are now very seldom used; the most ready and effectual way of settling matters of account being by bill in a court of equity.

ACCOUNTS, chamber of, in the former French polity, is a sovereign court of great antiquity, where the accounts relating to the king's revenue were delivered in, and registered. This answers pretty nearly to the court of exchequer in England.

There are presidents of accounts, masters of accounts, correctors of accounts, &c.

ACCOUNTANT, or ACCOMPTANT, in a general sense, denotes a person skilled in accounts. In a more limited sense it is applied to a person, or officer, appointed to keep, or make up the accounts of a company, office, court, or the like.

Thus there are accountants in the custom-house, the excise, bank, South-sea, and East India-house.

ACCOUNTANT-General, an officer in the COURT of CHANCERY, appointed by act of parliament, to receive all monies lodged in court, instead of the masters, and convey the same to the bank of England for security. Counterfeiting the hand of the accountant-general is felony without clergy, by 12 Geo. I. c. 32.

ACCOUNTANTSHIP, the act of keeping and balancing accounts. See BOOK-KEEPING.

ACCOUNTS, Public, Commissioners of, are five persons appointed by letters patent under the act of 25 Geo. III. c. 52. who are invested with the powers formerly entrusted to the AUDITORS of the *imprest*, and who receive salaries paid out of the aggregate fund, not exceeding in the whole 4000*l.* They hold their office *quamdiu se bene gesserint*, except two of them, who are comptrollers of the army accounts, and who continue commissioners so long only as they are comptrollers. The Treasury likewise appoints officers, clerks, &c. to make up and prepare for declaration the public accounts of the kingdom, and all charges are allowed out of the aggregate fund to an amount not exceeding 6000*l. per annum*, which sum precludes all fees and perquisites. The purposes for which these commissioners are appointed are "to examine and state in what manner, and at what times, the receipts, issues, and expenditures of the public monies are now accounted for; and to consider and report, by what means and methods the public accounts may, in future, be passed, and the accountants compelled to pay the balances due from them, in a more expeditious, more effectual, and less expensive manner." The commissioners have already made a great number of reports.

ACCOUTREMENT, an ancient term used for an habiliment; or a part of the apparatus and furniture of a soldier, knight, or even of a gentleman.

The word is formed from the ancient German, *kuster*; whence *coutre*, a name used in some cathedrals in France, *e. g.* at Bayeux, for the sacristan, or officer, who has the care of furnishing, and setting out the altar, in the church: called in German *kuster*, *κωστρος*.

ACCRETION, of *ad, to,* and *crefcere, to grow,* in *Physics*, the growth or increase of an organical body, by the accession of new parts: also a growing together, as of the fingers to one another.

Accretion is of two kinds; the one consisting in an external apposition of new matter. This is what we otherwise call, *juxtaposition*; and it is thus, stones, shells, &c. are supposed to grow.

The other is by some fluid matter received into proper vessels, and gradually brought to adhere, or grow to the sides

sides thereof. This is what we call *introfufception*; and it is thus that plants and animals are nourished.

ACCRETION, in the *Civil Law*, denotes the union or ACCESSION of a thing vague or vacant, to another already occupied or difpofed of.

A legacy given to two persons jointly, *tam re quam verbis*, falls wholly to him that furvives the tellator, by right of accretion. ALLUVION is another fpecies of accretion.

ACCROCHE, in *Heraldry*, denotes a thing being hooked into another. Coats Herald.

ACCROCHING, in old *Law* books, the act of in-croaching or ufurping on another's right; and particularly the attempt to exercife royal power, which was a very vague charge, and led to a multitude of constructive treafons. Thefe are limited and defined by flat. 25 Ed. III. cap. 2. The word is originally French, *accrocher*, which fignifies to falten a thing by a hook.

ACCRUE, or ACCREW, in *Law*, is underflood, of a part that accedes to, or follows the property of, another part or perfon.

ACCRUED, in *Heraldry*, a term applied to a tree full-grown.

ACCUBATION, a pofture of the body, between fitting and lying.

The word is compounded of *ad, to*; and *cubo, I lie down*. *Accubation*, or *accubitus*, was the table pofture of the Greeks and Romans; whence we find the words particularly ufed for the lying, or rather, as we call it, fitting down to meat.

The Greeks introduced this pofture. The Romans, during the frugal ages of the republic, were ftrangers to it. But as luxury got footing, this pofture was adopted, at leaft by the men; for as to women, it was reputed an indecency in them to lie down among the men; though afterwards this too was got over. But children did not lie down, nor fervants, nor foldiers, nor perfons of mean condition; but took their meals fitting, as a pofture lefs indulgent.

The Roman manner of difpofing themfelves at table was this; a low round table was placed in the cœnaculum, or dining-room, and about this ufually three, fometimes only two beds, or couches; according to the number of which, it was called *bichinium*, or *trichinium*. Thefe were covered with a fort of bed-cloaths, richer or plainer, according to the quality of the perfon, and furnifhed with quilts and pillows, that the guefts might lie the more commodiouly. There were ordinarily three perfons on each bed; to crowd more was efteemed fordid. In eating they lay down on their left fides, with their heads refting on their pillows, or rather on their elbows. The firft lay at the head of the bed, with his feet extended behind the back of the fecond: the fecond lay with the back of his head towards the navel of the firft, only feparated by a pillow, his feet behind the back of the third; and fo of the third, or fourth. The middle place was efteemed the moft honourable. Before they came to table they changed their cloaths, putting on what they called *cœnatoria veftis*, the dining garment, and pulled off their fhoes, to prevent foiling the couch. Pitife. Lex. Ant.

ACCUBITOR, an ancient officer of the emperor of Conftantinople; whofe bufinefs was to lie near the emperor. The accubitor was the head of the youths of the bed-chamber, and had the *cubicularius* and *procurator* under him.

ACCUMULATION, compounded of *ad, to*; and *culmus, heap*; the act of heaping, or amaffing feveral things together.

ACCUMULATION, in a *legal* fenfe, denotes a concurrence of feveral titles to the fame thing; as, when a perfon claims lands, a benefice, or the like, in virtue of feveral titles, or pretentions of different kinds; e. g. by death, by refignation, &c. Or it denotes a concurrence of feveral circumftances to the proof of one fact: thus, we read of accumulative treafon; which is, where a fact is not treafon in itfelf, but becomes fo by an accumulation of circumftances.

The earl of Strafford was condemned of accumulative treafon; none of the facts alleged againft him amounting fingly to treafon. But his attainder was reverfed by 13 & 14 Car. II. cap. 29.

ACCUMULATION, in the ancient *Agriculture*, denotes the operation of covering up the roots of trees, by throwing on them the earth that had been before dug from them; in which fenfe, accumulation ftands oppofed to ABLAQUEATION. Pliny Nat. Hift. vol. ii. p. 88. Ed. Hard.

ACCUMULATION of arms, *cumulatio armorum*, in *Heraldry*, is what the moderns call QUARTERING of arms. Nibbet.

ACCUMULATION of Degrees, in an *Univerfity*, is ufed for the taking of feveral DEGREES together, and with fewer exercifes, or nearer to each other, than the ordinary rules allow of.

ACCURSED; fomething that lies under a curfe, or fen-tence of EXCOMMUNICATION.

In the Jewish idiom, *accursed* and crucified were fynonymous. Among them, every one was accounted accursed, who died on a tree.

This ferves to explain the difficult paffage in Rom. ix. 3. where the apoftle Paul wifhes himfelf *accursed after the manner of Chrift*, i. e. crucified, if happily he might by fuch a death fave his countrymen. The prepoftion *ἀπὸ* here made ufe of, is ufed in the fame fenfe, 2 Tim. i. 3. where it obviously fignifies *after the manner of*.

ACCURSIUS, in *Biography*, a professor of law in the 13th century, born in Florence, who, on account of his great authority, was called the idol of the lawyers. Three other lawyers of eminence had the fame name.

ACCURSIUS, *Maxiangelus*, a famous critic of the 16th century, born at Aquilo, in the kingdom of Naples. His *Diatribæ*, printed at Rome in 1524, fol. on Aufonius, Solinus, and Ovid, evince his diftinguifhed erudition. In his edition of Ammianus Marcellinus at Augfburg, in 1533, there are five books more than in any preceding ones, and he fays that he had corrected 5000 errors. Although his predominant paffion was the collecting of old MSS. he neverthelefs made Latin and Italian verfes, was mafter of the French, German, and Spanifh languages, and underftood optics and mufic. Having been charged with plagiarism in his edition of Aufonius, he purged himfelf by oath. Bayle.

ACCURSIUS, or ACCORSO, *Francis*, the elder, an eminent lawyer, was born at Bagnolo, near Florence, in 1182, and became professor of law in the univerfity of Bologna, where he had ftudied. He undertook the great work of forming into one confiftent and harmonious whole, the numerous comments on the Code, the Inftitutes and the Digests. This work, intitled, "A perpetual Commentary," was much valued, and is printed with the "Body of Law," published in fix volumes folio, at Lyons, in 1627. Accorso died very rich, in 1260. His fon, the younger Francis Accorso, fucceeded him in the chair of law; and, in 1273, accompanied Edward I. on his return from the cruftades to England. Gen. Dict.

ACCUSATIO, among *Physicians*, is a word of the fame import as INDICATIO.

ACCUSATION. compounded of *ad, to;* and *causari, to plead,* in the *Civil Law,* the charging any person with a criminal action, either in one's own name, or on behalf of the public.

By the Roman law, there was no public accuser for public crimes; every private person, whether interested in the crime or not, might accuse, and prosecute the accused to punishment, or absolution. Cato, who was esteemed the most innocent person of his age, had been accused forty-two times, and absolved as often. But the accusation of private crimes was never received unless from the mouths of those who were immediately interested in them. Thus, none but the husband could accuse his wife of adultery. Indeed, it was not properly an accusation, except in public crimes; in private ones, it was called simply *actio*, or intending an action, *intendere actionem,* or *litem.* When the accused accuses the accuser, it is called recrimination, which is not admitted till the accused has been first purged.

The ancient Roman lawyers distinguished between *postulatio, delatio* and *accusatio*: for, first, leave was desired to bring a charge against any one, which was called *postulare*; then he, against whom the charge was laid, was brought before the judge, which was called *deferre,* or *dominis delatio*: lastly, the charge was drawn up, and presented, which was properly the *accusatio.* Voss. *Etym. Lat.* The accusation properly commenced, according to Pædianus, when the *reus,* or party charged, being interrogated, denied he was guilty of the crime, and subscribed his name to the *delatio* made by his opponent. Calv. *Lex. Jur.* p. 17.

The accusers, or actors, as they are called, were, by the laws of Pompey, A. U. C. 702, allowed two hours for pleading their cause, and the party charged three hours for a reply. Dion. *Cass. lib. xl. 52. tom. i. p. 255, Ed. Reimari.* They had a recompence assigned them, part of the property of those who were condemned, and they were frequently honoured with the superior offices of the state. *Ib. tom. i. p. 100. 485. 867. 887, &c.*

By the cruel laws of the **INQUISITION,** the accused is forced to accuse himself of the crime objected to him. There are three ways of entering an information in the tribunal of the inquisition. The first, by way of inquisition, when a private person, applying to the inquisitor, declares he will neither be denunciator, nor accuser, but that common fame gives out, that such and such a person is a heretic: the second, by way of accusation, when the informer takes on him the office of accuser, which rarely happens, because in this case, the accuser is obliged to prove, and exposes himself to the *lex talionis,* if his information should prove false. The last, and most usual way, is by denunciation, that is by naming those who know the fact.

It has formerly been the custom in some parts of Europe, where the accusation was very heavy, either to decide it by combat, or at least to make the accused purge himself by oath; which, however, was not admitted, unless a certain number of his neighbours and acquaintance swore together with him.

In the French law, none but the procureur general, or his deputies, can form an accusation, except for high treason, and coining, where accusation is open to every body. In other cases, private persons can only act the part of denouncers, and demand reparation for the offence, with damages.

In Britain, by Magna Charta, no man shall be imprisoned or condemned on any accusation, without trial by his peers, or the law: none shall be vexed with any accusation, but according to the law of the land; and no man may be molested by petition to the king, &c. unless it be by indictment or pre-

sentment of lawful men, or by process at common law. Promoters of suggestions are to find security to pursue them; and if they do not make them good, shall pay damages to the party accused, and also a fine to the king. No person is obliged to answer upon oath to a question whereby he may accuse himself of any crime.

Writers on politics treat of the benefits and inconveniences of public accusers. Various arguments are alleged, both for the encouragement and discouragement of accusations against great men. Nothing, according to Machiavel, tends more to the preservation of a state, than frequent accusations of persons trusted with the administration of public affairs. This, accordingly, was strictly observed by the Romans, in the instance of Camillus, accused of corruption by Manlius Capitolinus, &c. Accusations, however, in the judgment of the same author, are not more beneficial than calumnies are pernicious, which is also confirmed by the practice of the Romans. Manlius, not being able to make good his charge against Camillus, was cast into prison. *Mach. de Repub. l. i. c. 7. p. 35.* Solon facilitated public accusations, because they are more necessary in a democracy than under any other form of government. Without this formidable check, the general liberty would be perpetually endangered by the liberty of each individual. At Athens, if an accuser had not the fifth part of the votes on his side, he was obliged to pay a fine of a thousand drachmas. Æschines, who accused Ctesiphon, was condemned to pay this fine. At Rome, a false accuser was, by the Roman law, branded with infamy, by marking the letter K on his forehead. Guards were also appointed to watch the accuser, in order to prevent his corrupting either the judges or the witnesses. See Monteq. *Spirit of Laws, vol. i. p. 283.*

ACCUSATIVE, in *Grammar,* the fourth case of nouns that are declined. Its use may be conceived from this, that all verbs which express actions that pass from the agent, as, to beat, &c. must have subjects to receive those actions, or imply effects that are produced by them; so that such verbs evidently require after them a noun, or name, to be the object of the action expressed. Hence, in all languages which have cases, the nouns have a termination, which they call accusative; as, "*Achilles vulneravit Hectorem:*" "*Achilles wounded Hector:*" here the accusative denotes the subject. "*Lysippus fecit statuas:*" "*Lysippus made statues:*" here the accusative denotes the effect. In whatever other manner, says Mr. Harris, (*Hermes, p. 283.*) whether figuratively, or with prepositions, this case may have been used, its first destination seems to have been that here mentioned, and hence he forms its character and description. Accordingly, the accusative is that case, which to an efficient nominative and a verb of action, subjoins either the effect or the passive subject. But it has been alleged, that this description does not give us an appropriate and discriminating character of the accusative, and sufficiently distinguish it from the **DATIVE.** E. G. "*Antonius lesit Ciceronem,*" and "*Antonius nocuit Ciceroni,*" are expressions of the same import; and in each the action of hurting is conceived as proceeding from Antony to Cicero. It has, therefore, been reasonably affirmed, that the only thing essential to these two cases is the apposition or junction of one object with another; and they denote this much in the same manner, although from the custom of language they may not be indifferently subjoined to the same verb. See **CASE.**

In English, we have nothing to distinguish this case from the nominative; but as we ordinarily place words in their natural order, it is easily discovered: the nominative constantly preceding, and the accusative following the verb.—

Thus,

Thus, when we say, "the prince loves the princess," and "the princess loves the prince;" the prince is the nominative in the first, and the accusative in the last; and the princess the accusative in the first, and the nominative in the second.

ACE, a card or die, marked only with one point.

ACE, in *Ancient Geography*, a name given by several of the ancient writers to the city afterwards called PROLEMAIS, and now ACRE. Strabo. Geog. vol. ii. p. 1099.

ACELA, a city of Lycia.

ACELDAMA, was a place without the fourth wall of Jerusalem, beyond the river of Siloam, and was called the Potter's field, (Matt. xxvii. 7—10.) because they dug out of it the earth of which they made their pots, and the Fuller's field, because they dried their cloth there; but being afterwards bought with the money by which the high priests and rulers of the Jews purchased the blood of Jesus Christ, it was, by the Providence of God so ordering it, called *Aceldama*, i. e. the field of blood. Acts i. 19.

ACELIUM, or ACETUM, a town of the Venetian territory, now called *Axolo*, or *Afolo*, situate to the west of Trevigi, at the source of the rivulet Musone. E. long. 13°. N. lat. 45°.

ACENTETUM, or ACENTETA, in *Natural History*, a name given by the ancients to the purest and finest kind of rock CRYSTAL. They used the crystal in many ways; sometimes engraving on it, and sometimes forming it into vases and cups, which were held next in value to the *Murrahina vasa* of those times. The crystal they obtained from the mines of Cyprus was much esteemed, but often faulty in particular parts, having hairs, cracks, and foulness, which they called salts, in the middle of the large pieces. Pliny tells us (N. H. vol. ii. p. 769. Ed. Hard.) that when it was used for engraving, the artist could conceal all these blemishes among the strokes of his work; but when it was to be formed into cups and precious vases, they always chose the *acentetum*, i. e. the pure crystal, which had no flaws nor blemishes.

ACEPHALI, or ACEPHALITÆ, a term that frequently occurs in *Ecclesiastical History*, as the denomination of various sects: particularly—1. Of those who in the affair of the council of Ephesus, refused to follow either St. Cyril, or John of Antioch. 2. Of certain Christians of the fifth century, who at first followed Peter Mongus, but afterwards abandoned him, upon his subscribing the council of Chalcedon, and were thus deprived of their chief; being generally of the opinion of Eutyches, that there was only one nature in Christ. This sect was afterwards divided into three others, who were called Anthropomorphites, Barfanophites and Esaiianists; and these again, in the following century occasioned new factions, frequently mentioned by the ancient writers. However, these numerous branches of the Eutychian faction declined gradually in the next century; and the influence of the famous Baradæus chiefly contributed to their extinction by the union which he established among the members of that sect. 3. Of the adherents of Severus of Antioch; and of all in general who refused to admit the council of Chalcedon.

ACEPHALI, in *English History*, a name given to the levellers in the reign of Henry I. who were reckoned so poor, that they had not a tenement by which they might acknowledge a superior lord. In this sense the term is used in our ancient law-books, for persons who held nothing in fee, either of king, bishop, baron, or other feudal lord.

ACEPHALUS, or *Acephalous*, composed of the privative *a*, and *κεφαλη*, head, something that wants a head. Pliny represents the BLEMMEYES as a headless, or acephalous nation. Ctesias and Solinus mention others in India, near the Ganges, without a head, and with their eyes in

their shoulders. Mela, Suidas, Stephanus Byzantinus, Vo-piscus, and other writers, furnish similar relations; and some modern travellers pretend that they have found people of the same description in America. The origin of this fable has been variously explained. Bartholin understands it metaphorically, affirming that the Acephali had less brain, or conducted themselves with less prudence than others. In this opinion Bochart seems to have concurred. See BLEMMEYES. Olearius ascribes it to the dress of such persons; alleging, that the Samogitians being short of stature, and covering their heads with hoods in winter, seemed at a distance as if they were without heads. Lastau says, that the term Acephali was merely a denomination of people whose heads were depressed below their shoulders. He says, in his epitome of Raleigh's voyage to Guiana, speaks of a people discovered by that traveller in the province of Irvipanama, between the lakes of Panama and Cassipa, who had no head or neck: and Hondius, in his map, marked the place, and delineates the figures of these monsters. However, De Laet (*Descr. Americ. l. xvii. c. 22.*) rejects the story, and relates, that those who dwell on the banks of Caora, a river that flows out of the lake of Cassipa, had their heads so far sunk between their shoulders, that many believed they had their eyes in their shoulders, and their mouths in their breasts. But though the existence of a nation of Acephali be ill-warranted, naturalists furnish several instances of individuals born without heads, by some lustus or aberration of nature. Wepfer gives a catalogue of such acephalous births from Schenckius, Licetus, Paræus, Wolfius, Mauriceau, &c. Acephalous worms, or what are deemed such, are frequent. The *lumbricus latus*, or joint worm, was long taken to be acephalous. The first who ascribed a head to it was Tulpus, and after him Fehr; the former even makes it biceps, or two-headed. See ΤΡΕΝΙΑ.

ACEPHALUS, Clerk. See CLERK.

ACEPHALUS is also used in *Poetry*, for a verse which is defective in the beginning. Some also give the name *ακισφαλος* to all verses which begin with a short instead of a long syllable: as

Ἐπειδὴ νῆός τε καὶ Ἑλλήσποντος ἕκαστο. Iliad. l. xxiii. v. 2.

In the beginning of this verse we have an Iambus instead of a Spondee.

ACER, MAPLE, in *Botany*, so called, as some say, from *acris*, denoting the hardness of the wood, or according to others, from *acre ingenium*, because the common maple was much employed by ingenious artificers in fine works, a genus of the *Monocia* order and *polygamia* class of plants, and belonging to the natural order of *Tribilata*. Its generic and essential characters are these: it hath hermaphrodite and male flowers on the same tree; the hermaphrodite calyx is a one-leaved, five-cleft, acute, coloured, flat, and entire at the base, permanent perianthium; the corolla has five petals, ovate, broader outward, obtuse, scarcely larger than the calyx, and spreading; the stamina consist of eight or ten subulate short filaments: the antheræ are simple, and the pollen cruciform; the pistillum has a compressed germ, immersed in a convex, perforated, large receptacle: the style is filiform and daily progressive; the stigmas are two or three, pointed, slender, and reflex; the pericarpium is composed of as many capsules as stigmas, with one seed in each, coalescent at the base, roundish, compressed, and each terminated by a very large membranous wing; the seeds are solitary and roundish: the male flowers are the same with the hermaphrodites, except that they have neither germ nor style, but only a bifid stigma. On the unfolding of the flower the stigma only appears, and a few days after, the style. The hermaphrodite flowers in
the

the same umbel are often of two kinds; the lower ones feminine hermaphrodites, of which the anthers do not burst, but the pistil grows into a fruit; the upper ones masculine hermaphrodites, of which the anthers scatter their dust, and the pistils do not grow, but fall off. Mr. Martyn in his much improved edition of Miller's Dictionary, enumerates and describes twenty species. In the last edition of Linnæus by Gmelin, the *Acer* is a genus of the *Océanaria Monogynia* class and order, including twenty species. For the properties and uses of the several species, and the method of propagating and cultivating them. See MAPLE and SYCAMORE.

ACÉR. See BANISTERIA and TRIOPTERIS.

ACERIS, *Phalena*, in *Natural History*, a species of PHALÆNA, found on the Acer, Æsculus, and Juglans.

ACERATOS, ἀκερατός, from α negative and κερως, or κεραιωμα, to mix, unmixed, uncorrupted, is applied sometimes to the humours of the body by Hippocrates. Paulus Ægineta mentions a plaster under this name. See ACERIDES.

ACERB, a compound taste, consisting of four, with the addition of a degree of roughness, and astringency; such as that of unripe fruit.

ACERIDES, ἀκεριδες, from α neg. and κερως, wax, denote plasters made without wax.

ACERINA, in *Ichthyology*, a name given by Pliny, and others of the old naturalists, to the fish now called the *Cernua* and *Aurata fluviatilis*, and in Eng. and the *Ruff*. The acerina of Gmelin's Linnæan system is a species of PERCA, whose dorsal fin has 31 rays and 17 spines. It approaches to the *Cernua* in many respects, but differs from it in the number of rays and spines of the dorsal fin, and the size of its head, which is longer. It is found in the Euxine sea, and the lake of Mæotis, and the rivers that run into them.

ACERNO, in *Geography*, a small city of Naples, with a bishop's see, about 12 miles N. E. of Salerno. E. long. 15° 6'. N. lat. 40° 45'.

ACERNO is also the name given by the Portuguese, on the first discovery of it in the 15th century, to the island now called the *Ile of FRANCE*.

ACEROSE leaf, in *Botany*. See LEAF.

ACEROSUS, *chaffy*, is an epithet, denoting the brownest and coarsest sort of bread, made of flour not separated from the bran.

ACEROSUS, in *Natural History*, a name given by Vogel in his *Mineralogy* to a species of TALC.

ACERRA, in *Antiquity*, a kind of altar, erected among the Romans near the bed of a person deceased; on which his friends daily burned incense till the time of his burial. The Chinese have a similar custom. They erect an altar to the deceased in a room hung with mourning; and upon it they place an image of the dead person, to which every one that approaches it bows four times, and offers oblations and perfumes. The original intention of the practice was, without doubt, to overcome any offensive smell that might proceed from the corpse.

By the laws of the 12 tables, the erecting of acerræ was prohibited.

The Acerra also signified a little pot, wherein the incense and perfumes were put, to be burnt on the altars of the gods, and before the dead. It appears to have been the same with what was otherwise called *thuribulum* and *pyxis*.

We find mention of acerræ in the ancient church. The Jews also had their acerræ, in our versions rendered censers; and the Romanists still retain them under the name of incense-pots. In Roman writers, we frequently meet with *acerra plena*, a full acerra; for understanding which it is to be observed, that people were obliged to offer incense in proportion to their estate and condition; the rich in larger

quantities, the poor only a few grains: the former poured out acerræ full on the altar; the latter took out two or three bits with their fingers. Pitife. Lex. Aut. Brisson. de Formul. l. i.

ACERRA, in *Geography*, a walled town of Naples in the Terra di Lavoro, situate on the river Agno, seven miles N. E. of Naples. It is the residence of a bishop, and has the title of an earldom. E. long. 14° 30'. N. lat. 40° 55'.

ACERRÆ, in *Ancient Geography*, the name of a town on the Clanius in Campania, now ACERRA. It was a Roman colony, and its inhabitants were reckoned a brave people: "Acerranis plus animi, quam virium erat," says Livy, l. xxiii. c. 17. tom. iii. p. 739, Ed. Drakenb. This was also the name of another town, now called *La Girola*, or *Gberra*, which retains some trace of the original name, in the territory and to the S. E. of Lodi, where the river Serio falls into the Adda, to the W. of Cremona, and N. of Piacentia. It was formerly a place of considerable importance. Its siege by the Romans is particularly described by Polybius, l. ii. p. 121. Ed. Casaub.

ACERRI, a town of Spain, belonging to the Lacetani; probably *Gerri*.

ACESÆ and ACFSAMENÆ, cities of Macedonia.

ACESCENT, a word used to denote any thing which is turning sour or acid, or which is slightly acid. It is only applied properly to denote the first of these two meanings. The second may be better expressed by either of the words acidulous, or subacid.

ACESINES, in *Ancient Geography*, a large and rapid river of India, which Alexander passed in his expedition into that country; and on the bank of which he built a city under the direction of Hephestion. The kingdom of Porus, whom he vanquished, and which, according to Strabo, contained about 300 cities, lay between the Hydaspes and this river, which, after receiving the former and other considerable rivers, emptied itself into the Indus. Its situation is not precisely known. Arrian says, (De Exped. Alex. l. v. p. 222. Ed. Gronov.) that, where Alexander passed it, its breadth was 15 stadia, its course very rapid, and the channel full of large and sharp rocks. It was subject to extraordinary inundations, rising at the summer solstice 40 cubits and overflowing the adjacent plains. Theophrastus (Hist. l. iv. c. 12) speaks of the reeds that grew near this river; and Pliny (H. N. l. xxxvii. c. 12. tom. ii. p. 796) says, that this and the Ganges furnished gems. We read of trees near this river of such magnitude, that 50, some say 400 horsemen might lodge under the spreading branches of one of them; and that they produced long pods of honey, which proved fatal to those who eat it. Strabo, Geog. vol. ii. 1014—1022. Some have supposed that the Acesines of Arrian was the river now called Rauvæ; but major Rennell, in his Memoir, gives good reasons for concluding that the modern Jenaub was the Acesines of the ancients.

ACESINUS, a river of Sarmatia, called by Pliny PANTICAPES.

ACESIUS, in *Biography*, a bishop of Constantinople, in the reign of Constantine, was a disciple of Novatus, who founded a sect whose tenet was, that those who had fallen from the faith in time of persecution, or, who after baptism had committed any mortal sin, were not to be admitted to the communion of the church, even on their exhibiting tokens of sincere repentance. Constantine was so much displeased with the severity of this sect, which discouraged repentance, that, after questioning Acesius concerning it, he said, "then, Acesius, make a ladder for yourself, and go up to heaven alone." This story is related by Socrates (l. i. c. 10.) and Sozomen (l. i. c. 22); but disputed by Valcius,

Valesius, (Annot. p. 9), and defended by Basnage, Ann. 325, No. 33. Bayle. Lardner's Works, vol. iii. p. 224, &c.

ACESTA, of *αἰσθησις*, to cure, signifies curable distempers.

ACESTA, in *Ancient Geography*, a name given by Virgil (*Æn.* 5. v. 718) to a town called SEGESTA.

ACESTIE, in *Entomology*, a species of PAPILIO, found in India, with subdentated wings, the anterior black, with a yellow base and band, the posterior yellow, with brown bands under the body.

ACESTIDES, a name given to the chimneys of furnaces where brass was made; contrived narrow at the top, for receiving and collecting the fumes of the melting metal, that CADMIA might be produced in greater quantities.

ACESTIS, *αἰσθίς*, a factitious sort of CHRYSOCOLLA, made of Cyprian verdigrise, the urine of children, and nitre.

ACESTRIDES, female physicians. Midwives were so called among the Greeks.

ACETABULUM, in *Antiquity*, a little vase or cup, used at table for serving up things proper for sauce, or seasoning; much after the manner of our salts and vinegar cructs. Hence, Agricola, in his Treatise of Roman measures, takes the name to have been formed from *acetum*, vinegar, supposing that it was principally destined to serve vinegar.

ACETABULUM also denotes a Roman measure, used both for liquid and dry things, chiefly in medicine. The acetabulum contained a cyathus and a half, as is proved by Agricola, from two verses of Fannius; who, speaking of the cyathus, says it weighs ten drachms; and the oxybaphus, or acetabulum, fifteen, or about one eighth of a pint.

“Bis quinque hunc faciunt drachmæ, si appendere tentes;
Oxybaphus fiet, si quinque addantur ad illas.”

Du Finet, in his Treatise of weights and measures, prefixed to his translation of Pliny, makes the acetabulum of oil weigh two ounces and two scruples; the acetabulum of wine, two ounces, two drachms, a grain, and a third of a grain; and the acetabulum of honey, three ounces, three drachms, a scruple, and two siliquæ.

ACETABULUM, in *Anatomy*, a name given by Latin writers to that cup-like cavity of bones formed for ARTICULATION, which the Greeks called Cotyle or Cotyledon, from its supposed resemblance to a certain small measure. When the round head of one bone is lodged in a spherical cavity of another, the joint admits of motion in almost every possible direction. This species of articulation is technically termed ENARTHROSIS. See JOINT. See also COTYLEDON.

ACETABULUM is also used by *Anatomists*, in the same sense with COTYLEDON. It signifies also a glandular substance, found in the PLACENTA of some animals.

ACETABULUM, in *Botany*, a species of PEZIZA; so called from its resemblance to a cup. It is sessile and externally angulated, and has ramose veins.

ACETABULUM is also a species of LICHEN; and it is a name given to the COTYLEDON and CRASSULA; and with the epithets *marinum nitus* to the ANDROSACES, *sea NAVAL-WORT*, or UMBILICUS *marinus*. See TUBULARIA.

ACETARIA. See SALLET.

ACETARIUM *scorbaticum*, in the *Materia Medica*, a kind of pickle, in which Dr. Bates advises scorbutic patients to dip their victuals before they eat it. It is thus made. R̄ fol. cochlear. marin. ℥iij. Sacchar. alb. ℥vi sal cochlear. ℥i bene contund. simul et adde succ. aurant. ℥vi. Motherby's Dict. by Wallis.

ACETARY is used for an inner part in the structure of certain fruits, thus called from the sourness of its taste. The actery of a pear is a globular part, lying within the calycary or choak, and surrounding the core. It is of the same substance with the parenchyma, or pulp, only that the bladders of which it consists are smaller, and rounder than those of the PARENCHYMA; from whence, however, it seems to be derived. On this account it is also sometimes called the inner parenchyma. The quince also has an actery, resembling, though less than, that of a pear.

ACETI Spiritus, spirit of vinegar; made by drenching copper- filings with distilled vinegar, then evaporating it till the fumes of the vinegar cannot be smelt; the saturation and evaporation to be again repeated, till the menstruum be fatiated; which being then distilled, the spirit comes over. Its qualities and uses are much the same with those of the distilled vinegar; excepting that it is more powerful.

AC ETIAM, in *Law*, a clause devised by the officers of the King's Bench, and added to the usual complaint of trespass, in order to maintain the jurisdiction of this court over civil injuries without force; of which statute, 2. 13 Car. II. c. 2. had nearly deprived it. The bill of Middlesex having been framed only for actions of trespass, a defendant could not be arrested and held to bail upon it for breaches of civil contracts. To remedy this inconvenience the above clause was adopted: the bill of Middlesex commanding the defendant to be brought in to answer the plaintiff of a plea of trespass, *ac etiam*, and *also*, to a bill of debt; and thus the complaint of trespass gives cognizance to the court, and that of debt authorizes the arrest. In imitation of this Lord Chief Justice North directed, that in the common pleas, besides the usual complaint of breaking the plaintiff's close, a clause of *ac etiam* might be added to the writ of CAPIAS; and this was done in order to save the suitors of his court the trouble and expence of suing out special originals.

ACETIC ACID, in *Chemistry*, Radical vinegar, *Acide Acétique*, *Vinaigre radical*, *Vinaigre de Venus*. If any quantity of crystallized acetite of copper (distilled verdigrise) be distilled in a glass retort, with a regulated heat, till at length the bottom of the vessel is nearly red hot, the equilibrium of the affinity between the component parts of the salt will be destroyed, and several new substances in consequence produced. The proportion of these on 1000 parts of the salt, according to an accurate analysis of Cit. Adet, will be 486 acetic acid, 312 brown oxyd of copper mixed with charcoal, 118 hydrogen and carbonic acid gas, and about 84 of the acetite of copper, will remain undecomposed. In order to be fully aware of what takes place in these changes, it is necessary to observe, that the crystallized acetite of copper contains hydrogen and oxygen forming the water of crystallization, hydrogen, carbon, and oxygen forming acetous acid, and copper, with about 25 per cent. of oxygen. By the process of distillation, the acetous acid appears to be decomposed by the separation of part of its hydrocarbonous base, and at the same time the oxyd of copper is brought to a lower state of oxydation: part of the carbon becomes acidified at the expence of the copper, and, uniting with the hydrogen, forms hydrocarbonous gas; the remainder of the carbon is found in the retort, mixed with the oxyd of copper, and possesses the properties of a pyrophorus. Thus it seems that acetic acid differs from acetous, in a larger proportion of oxygen to the base, which is effected not by an addition of oxygen, but by a diminution of the base. Acetic acid may also be procured by distilling together acetite of lead, of soda, potash, or lime, with sulphuric acid; the product is however, in this case, contaminated by sulphureous acid gas; but this may be in part prevented, by adding

adding to the materials some black oxyd of manganese. M. Badolier proposes to obtain acetic acid, by distilling equal parts of sulphat of copper, and acetite of lead: the acid thus produced costs only a fourth of that which is formed from acetite of copper. In its general properties, acetic acid is very similar to acetous acid, yet differing from it in the following particulars.

The active acid qualities of this fluid bring it to a near resemblance with some of the mineral acids; it is corrosive, and intensely acid to the taste, exhales a pungent almost suffocating odour, and has nothing of the spirituous flavour of distilled vinegar: its specific gravity is 1.0626. With earthy and alkaline bases it unites readily, forming the genus of neutral and earthy acetats, the properties of which have been but very little examined. It dissolves copper, and certain other metals which are not soluble in acetous acid, and it is capable of partly decomposing and uniting with alcohol, forming acetic ETHER.

This acid is of some use in the laboratory, and is employed occasionally in medicine, as a stimulant application to the nostrils in fainting fits; for this purpose some acetite of potash is put into a smelling-bottle, and a little sulphuric acid is poured upon it. *Annales de Chimie.* xxvii. 299. xxviii. 113. Fourcroy, *Syst. des Connaiss. Chim.* viii. Gren's Chem. ii.

ACETITE OF POTASH. *Kali acetatum*, Lond. Pharm. *Lisiva acetata* et *Tartar. regenerat.* Edin. Pharm. *Acétite de Potasse. Terra foliata Tartari. Digestive salt of Silvius.*

This salt occurs native in the sap, and certain other vegetable juices, and also in the urine of some quadrupeds: it is prepared artificially by adding to pearlash, or carbonat of potash, distilled vinegar, till the liquor contains a slight excess of acid; if the salt is wanted in a solid state, evaporation in a glass or silver vessel must be had recourse to; when a pellicle appears on the surface, the process should go on at a very gentle temperature, till all the moisture is exhales; there will remain a white micaceous salt, which must immediately, while warm, be put into a well-closed vial. The salt may also be obtained cheap and pure, by adding sulphat of potash to acetite of lime, evaporating to dryness in a water-bath, and dissolving out the acetite of potash by hot alcohol.

Acetite of potash has a lively penetrating odour, and a sharp taste; but leaving an alkaline impression on the palate: it crystallizes in needles and plates, the form of which has not been ascertained.

This salt has a strong affinity for water, deliquating readily in the air: it requires 1.021 parts of this fluid at 50° Fahren. for its solution, and, while dissolving, absorbs caloric: from its hot saturated solution in alcohol, crystals may be obtained by cooling.

Of the alkalies and alkaline earths, barytes alone is capable of decomposing acetite of potash, setting at liberty the alkali, and forming with the acid acetite of barytes.

The sulphuric, nitric, muriatic, fluoric, phosphoric, oxalic, tartareous, arsenic, succinic and malic acids, are each capable of separating the acetous acid from its alkaline base: all the easily soluble sulphats, and several other neutral salts effect the same by double affinity.

Acetite of potash, subjected to dry distillation, yields hydrocarbonous gas, an ammoniacal liquor mixed with empyreumatic oil, sublimed crystals of carbonat, or acetite of ammonia, and there remains in the retort, charcoal, with potash, partly caustic, and partly carbonated. The appearance of ammonia in this process, is a circumstance well worthy of accurate investigation: it was first observed by Beaumé, and afterwards by Morveau, and seems likely to

throw much light on one of two very important questions, viz. Is azot a compound? Is ammonia one of the elements of potash? Ammonia consists of azot and hydrogen, but acetite of potash furnishes only oxygen, hydrogen, carbon, and potash; hence, it seems reasonable to suppose, either that these four substances contain the bases of azot, or that ammonia is one of the component parts of potash.

The above salt is applied to no use in the laboratory, or in the arts: it is an article of the *Materia Medica*, and possesses considerable diuretic qualities.

Beaumé, *Chim. Experim.* Fourcroy, *Connaiss. Chim. Encycloped. Method. Art. Acète de Potasse.* Gren's Chemistry.

ACETITE OF SODA. *Acétite de Soude. Terra foliata mineralis vel crystallizata.*

To any quantity of carbonated soda add distilled vinegar, leaving the liquor, however, still alkaline; evaporate gently to a pellicle, and by cooling, acetite of soda will be obtained in long striated prismatic crystals similar to those of sulphated soda, permanent in the air, soluble at a gentle temperature in their water of crystallization, and of a pungent bitterish taste.

Acetite of soda is easily soluble in water and alcohol, is decomposable with abstraction of the acid or alkaline base by potash, and the same substances as the preceding salt: when kept long in solution it is converted into carbonat of soda by decomposition of its acid; if subjected to dry distillation it yields hydrocarbonous gas, empyreumatic oil and acid, and there remains in the retort, charcoal and carbonated soda.

This salt is employed a little in France as a medicine—in this country is made no use of.

Beaumé, *Ch. Exp.*—Fourcroy, *Syst. des Conn. Chim.*—*Encyclop. Method. art. Acétite de Soude*—Gren's Chem.

ACETITE OF AMMONIA. *Acétite d'Ammoniaque.*—*Ammonia Acetata* et *Spiritus Mindereri*; Lond. et Edin. Pharm.

This is prepared in the liquid form by adding carbonated ammonia to distilled vinegar till saturation. On account of its great volatility, it is not very easy to obtain it in the crystalline form; the following method was successfully practised by M. Delafosse for this purpose: equal parts of chalk and sal-ammoniac were mixed well together, and put into a retort, upon which was poured half their weight of concentrated acetous acid; by a gentle heat a white vapour arose, which concentered in beautiful crystals in the receiver, and was acetite of ammonia. Another way of preparing this salt is by distilling equal parts of acetated lead (sugar of lead), and muriated ammonia (sal-ammoniac.)

This substance is very deliquescent—has a hot pungent flavour—is decomposed by alkalies, by most acids, and by double affinity in various ways; it is destroyed by fire, and spontaneously when in solution.

It is only employed in medicine, and is considered as a diaphoretic.

Beaumé, *Ch. Exp.*—Fourcroy, *Syst. des Connaiss. Chim.*—*Encyclop. Method. art. Acète d'Ammonia.*—Gren, ut supra.

ACETITE OF LIME. *Acétite de Chaux.*—*Salt of Chalk,*—*Salt of Coral.*

This salt is readily procured, by adding distilled vinegar to chalk, marble, coral, oyster-shells, or any other substance that consists chiefly of calcareous carbonat; the carbonic acid is disengaged with effervescence, and by evaporating the solution to a pellicle, and allowing it to cool gradually, crystals of acetite of lime are deposited.

Calcareous acetite crystallizes in white slender silky filaments, permanent in the air; its taste is bitter, acerb, rather caustic; it is soluble with ease in water, and in small proportion

proportion by alcohol. Barytes, and the fixed alkalis decompose it, by union with its acid; the stronger acids do the same, by combining with its earthy base: most of the carbonats and sulphats decompose it by compound affinity: when in solution, it is destroyed spontaneously by decomposition of the acid, and deposits carbonat of lime: in dry distillation it yields hydrocarbonous gas, empyreumatic acid and oil, charcoal and calcareous carbonat.

It is still admitted into the foreign pharmacopœas as a sudorific and diuretic.

Beaumé, Ch. Exp.—Fourcroy, Syst. des Connais. Chim. Encyclop. Method. art. Acète Calcaire.—Gren, ut supra.

ACETITE OF BARYTES. *Acétite de Baryt.*

This salt is usually prepared by adding carbonat of barytes to distilled vinegar, in which case the acid is always in excess: when reduced by evaporation, to the consistence of a syrup, and allowed to cool gradually, it deposits a white opaque granular salt, and the sides of the vessel are covered with silky filaments of the same: a better way of procuring this substance, is by boiling for a few minutes the sulphuret of barytes in a slight excess of acetous acid, (vide ACETITE of Strontian) filtering the solution, and setting it to evaporate spontaneously; transparent crystals may thus be obtained in long slender prisms. The salt formed by either of these methods is permanent in the air, and decomposable by most of the mineral acids, the carbonated alkalis, and the sulphuric salts. Its only use is as a reagent, for ascertaining the presence of sulphuric acid in those cases where the muriat or nitrat of barytes might affect the results of the analysis.

Encyclop. Method. art. Acète Barotique.

ACETITE OF STRONTIAN. *Acétite de Strontian.*

To any quantity of warm distilled vinegar, add gradually sulphuret of strontian, as long as any effervescence is perceived; then boil the liquor for a few minutes and filter; add afterwards, drop by drop, a solution of acetite of lead, (sugar of lead) as long as any precipitate takes place, then suffer the liquor to stand for a few hours, and finally separate it from the dark sediment by filtration. This salt has not as yet been the subject of experiment; its properties are, in all probability, very similar to those of the Acet. Baryt. It is not made any use of.

ACETITE OF MAGNESIA. *Acétite de Magnésie.*

This salt is prepared by saturating distilled vinegar with carbonated magnesia, then boiling the liquor to separate the remains of carbonic acid, and filtering it, if turbid, to get rid of the excess of carbonated magnesia.

The taste of acetite of magnesia is sweet, with a slight mixture of bitter: by evaporation, it is reduced to a viscous syrupy consistence, incapable of being crystallized; but by further concentration, and subsequent cooling, becomes solid, and deliquescent in the air: it is totally soluble in spirit of wine, and from the ease with which it is decomposed, the affinity between its elements appears to be extremely weak. The alkalis, and the rest of the alkaline earths, most of the mineral, vegetable, and animal acids are capable of decomposing this salt by abstraction of its acid or earthy base. It is not made any use of.

Encyclop. Method. art. Acète Magnésien. Pearson's Tables of Affinity.

ACETITE OF ALUMINE. *Acétite d'Alumine.* Aluminous mordant of the calico-printers.

Of all the acetous salts this is the most important, being absolutely essential to the improved state of the arts of DYEING and CALICO-PRINTING. It is not easy to prepare this salt directly, distilled vinegar, even when concentrated, having no perceptible action on clay; the fresh precipitated and washed earth of alum is indeed soluble by

long digestion in a large excess of acetous acid; but the most economical and effectual way of producing the salt in question, is by means of the double affinities of common alum and sugar of lead. For this purpose, to a blood-warm solution of alum in rain-water, is first of all to be cautiously added a solution of pearlash, or any other sufficiently pure alkali, till the liquor is just upon the point of becoming turbid, in order to saturate the excess of acid in common alum; a cold saturated solution of acetite of lead (sugar of lead) in rain-water is then to be stirred in as long as any precipitation takes place: by standing a few hours, the sulphat of lead entirely subsides, and the supernatant clear liquor, containing acetite of alumine and potash, may be drawn off with a siphon. By washing the sediment with cold water a dilute solution of acetite of alumine is obtained, which may be used instead of water in dissolving alum for the next preparation of aluminous mordant.

Acetite of alumine thus prepared has an acetous strongly styptic taste: by gradual evaporation and cooling, it assumes the form of small needle-shaped crystals, which are exceedingly deliquescent: by a heat inferior to that of boiling water, the acid is almost wholly driven off. It is decomposed by magnesia, and by all the substances that decompose acetite of magnesia. Its use is almost wholly confined to the dyers and calico-printers.

Encyclop. Method. art. Acète Alumineux.

ACETITE OF GLYCINE. *Acétite de Glucine.*

This is an uncrystallizable salt, which by evaporation becomes of a gummy semiductile consistence; its taste is sweet and very astringent, with a flavour of vinegar: its other properties have not been examined into; it is not applied to any use. B. la Grange, ii. 452.

For the *metallic acetites*, see the respective metals.

ACETIFICATION is used by some *Chemists* to denote the action or operation, by which vinegar is made. See ACETOUS FERMENTATION.

ACETOSA, in *Botany*. See RUMEX and SORREL.

ACETOSELLA. See RUMEX, OXALIS, and wood SORREL.

ACETOUS ACID—*Distilled vinegar*—*Acide Acéteux*—*Acetum distillatum*, Lond. et Edin. Pharm. in *Chemistry*, is produced from saccharine mucilage, gum mucilage, fecula and all vinous liquors, through the medium of the acetous FERMENTATION; also in urine and dunghills during their spontaneous decomposition; from the dry distillation of wood, mucilage, and tartar, from the action of sulphuric acid on many vegetable substances; and from the superoxygenation of most of the other vegetable acids. It is prepared for use, however, in the large way, only by the former of these methods, and is called aleger, if made from malt liquor; but if from any other fermentable liquor, it bears the name of VINEGAR.

Common vinegar never contains this acid in a state of purity, but always contaminated by mixture with tartar, mucilage, and carbonaceous matter, which render it very liable to spontaneous decomposition; these substances can only be got rid of by having recourse to distillation, which ought to be performed in glass or tinned-copper vessels; the first product of this operation is an odorless, faintly acid liquor containing alcohol; the next is less odorless and more acid; and what comes over towards the end of the operation is a still stronger acid, but with an empyreumatic flavour, and a slight tinge of colour: hence, in distilling four parts of vinegar, the first may be rejected as too much diluted, and the process may be stopped when three-fourths of the liquor is come over. If distilled vinegar is exposed to frost in a broad shallow vessel, and the ice removed as it forms, till

It tastes nearly as sour as the remaining liquor, a very strong and pure acetic acid will be obtained, in the proportion of about 7 or 8 per cent. to the distilled vinegar.

Acetic acid is a transparent colourless fluid, of the specific gravity of 1.0095, nearly as volatile as water, exhaling a pungent fragrant odour, and of a lively agreeable acid taste.

When concentrated, it unites eagerly with water, either in the solid or liquid state; absorbing heat in the former case, so as to produce a considerable depression of the thermometer, and giving out heat in the latter case.

Upon fat oils it has little or no action, but camphor and most of the essential oils are readily soluble in it, giving their peculiar odours and increasing the inflammability of the liquor. With the empyreumatic oils of wood, tartar, &c. it forms the PYROLIGNEOUS and PYRO-TARTAREOUS acids.

At a temperature above that of boiling water it decomposes atmospheric air, by abstracting its oxygen, and at the same time giving out flame, and producing carbonic acid and water; the same effect is produced more gradually, by exposing to the air a solution of the earthy or alkaline acetites; thus acetite of lime is converted into carbonat of lime. Acetic acid is however capable of uniting to oxygen without experiencing such a total decomposition. If equal parts of acetite of lime, black oxyd of manganese and sulphuric acid are distilled together, a pungent volatile acid called ACETIC acid will be produced together with hydrocarbonous gas: the same results are obtained from the distillation of crystallized verdigrise, and the copper is found in the retort nearly in the metallic state.

Acetic acid unites easily with all the alkalies and alkaline earths, whether pure or carbonated, forming the genus of alkaline acetites, which contains seven species; viz. ACETITE of potash, soda, ammonia, lime, barytes, strontian, and magnesia.

It appears to have no action on silicæ, but combines with the other earths into ACETITES of alumine and glycine.

Excepting iron and zinc, the rest of the metals are difficultly or not at all soluble in acetic acid, their oxyds, however, especially if carbonated, are easily so; hence results the large and important genus of metallic acetites.

On vegetable and animal colouring matter this acid appears to have little effect; it possesses indeed the property of reddening syrup of violets, and certain other vegetable blues, in common with all acids.

The component parts of acetic acid are oxygen, hydrogen, and carbon, but their relative proportions have not yet been ascertained. If acetic acid in vapour is passed through a red-hot glass tube, it is decomposed into water, hydrogen, and carbonic acid.

The affinity of this acid is as follows:

This acid forms an important article in the *Materia Medica*; it is also much used in food both as an agreeable

condiment, and for the preservation of animal and vegetable substances. Fourcroy, *Systeme des Connoissances Chimiques*, vol. viii. *Encyclopedie Methodique*, art. *Acide Acetueux*. Beaumé, *Chimie Experimentale*. Gren's *Chemistry*, vol. ii.

ACETOUS *æther*. See ETHER.

ACETOUS *Fermentation*. See ACETOUS FERMENTATION.

ACETUM, formed of *acere*, to be sharp, the same with vinegar; the properties, uses, and preparations of which, see under the article VINEGAR. There are several medicines in the shops, of which this liquor is the basis: as, ACETUM *alkalizatum*, made of distilled vinegar, with the addition of some alkaline, or volatile salt.

ACETUM *Colchicum*. See COLCHICUM.

ACETUM *distillatum*. See DISTILLED VINEGAR, and ACETOUS Acid.

ACETUM *esuriens*, distilled vinegar rectified by means of verdigrise. It is made by dissolving the common verdigrise in fine distilled vinegar, then evaporating the solution, and recovering the verdigrise again in form of crystals; and from this, by a proper degree of fire, distilling with a retort an acid spirit, which is the richest acid that can by any art be prepared from vinegar. Boerhaave's *Chem.* p. 138.

ACETUM *Lithargyrites*. See ACETITE of LEAD.

ACETUM *Philosophorum*, a four kind of liquor, made by dissolving a little butter of antimony in a great deal of water. See SPIRIT of Venus.

ACETUM *Portabile*. See VINEGAR.

ACETUM *prophylacticum* is a preparation made in the following manner. R flor. lavend. et rorism. fol. rutæ, absinth. salviæ, menth. ã ã. m. j. Aceti vini cong. j. infund. in B. A. per 8 dies. R hujus tinct. ℞j. camph. ℞iij. m. f. This is also called the *vinegar of the four thieves*; for during the plague at Marseilles, four persons by the use of it, attended many of the sick unhurt: under the colour of their services they robbed the sick and the dead; but one of them being apprehended, saved himself from the gallows by discovering this remedy. Motherby's *Dict.* by Wallis.

ACETUM *rosatum*, vinegar of roses, is made of rose buds infused in vinegar forty or fifty days; the roses are then pressed out, and the vinegar preserved. It is chiefly used by way of embrocation on the head and temples in the head-ach. After the like manner are made *acetum sambucinum*, vinegar of elder; *acetum anthosatum*, vinegar of rosemary flowers; *acetum scilliticum*, vinegar of squills. The German dispensatories abound with medicated vinegars, chiefly aimed against pestilential diseases; but they are not used among us.

ACH, or ACHEN, *John Van*, in *Biography*, a painter of history and portrait, was born at Cologne, in 1556, and died, aged 65, in 1621. Having studied and practised portrait-painting for some time in his own country, he travelled to Venice, in order to obtain a more extensive knowledge of colouring; and with a view of perfecting his taste, and improving in correctness of design, he settled for some years at Rome. Here he painted a nativity for the church of the Jesuits, and a portrait of Madona Venusta, a celebrated performer on the lute, which is accounted one of his best performances. The best judges allow his colouring to be extremely good, his design correct, and that the airs of his heads manifest much of the taste of Correggio. His talents, and polite accomplishments, recommended him to several considerable princes of Europe; and under the patronage of the elector of Bavaria, he painted a grand design of the invention of the cross, which is highly commended for the elegance of the composition, the correctness of the design, the graceful airs of the heads, and the attitudes of the figures. For this, and his portraits of the electoral family,

family, he was presented by the elector with a chain and medal of gold, as a peculiar token of his esteem. By the emperor Rodolph he was invited to Prague, where he executed a picture of Venus and Adonis, so much to the emperor's satisfaction, that he was particularly distinguished by him as long as he lived. His character was that of one of the best masters of his time. Pilkington's Dict.

ACHA, or Aca, in *Geography*, a district of Africa, on the confines of Lybia; formerly rich and populous, but now reduced: the chief produce is dates.

ACHABYTUS, in *Ancient Geography*, a high mountain in Rhodes, on the top of which stood a temple of Jupiter.

ACHAC, in *Ornithology*, the name given by the people of the Philippine islands to a bird common there. It is of the size of a common hen; its belly, breast, and neck are of a pale brown, and its back of a dusky reddish colour; its wings are extremely beautiful, being principally of a greenish blue colour; the tail is white, short, and continually in motion; the eyes are black, and the beak is thick and strong, and is of a black colour, and of an obtuse figure; the legs are reddish, and the claws black: when it makes any noise, it seems to utter the word *phi, phi*, very often repeated. It lives principally about the cultivated parts of the islands, and feeds on rice and other vegetables, being properly of the partridge kind.

ACHÆA, in *Ancient Geography*, a well fortified town of the island of Rhodes, in the district of Jalyfus, said to be the first and most ancient of all, and to have been built by the HELIADES, or children of the Sun. Diod. Sicul. l. v. c. 57. tom. 1. p. 376. Ed. Wesseling.

ACHÆA was also a hamlet of Asiatic Sarmatia, on the Euxine. The inhabitants were a colony of Orchomenians, and called *Achai*.

ACHÆANS, *Achai*, in *Ancient History*, the inhabitants of ACHAIA *Propria*, so called from Achæus, the son of Xuthus, who having been banished from Thessaly, settled in Athens, married Creusa, the daughter of Erechtheus, and had by her two sons, *viz.* Achæus and Ion. Achæus, putting himself at the head of a small number of Athenian and Ægealean forces, made an expedition into Thessaly, and recovered his grandfather's kingdom; but having committed the crime of manslaughter, he was soon obliged to fly to Laconia, where he died, and where his posterity remained, under the denomination of Achæans, till they were expelled by the Doræ and Heraclidæ. On this occasion they determined to lay claim to Achaia, and to expel the Ionians. They founded their title on their descent from the eldest son of Xuthus, and enforced it by collecting a number of troops, and arranging themselves under their brave king Tisamenes, the son of Orestes. The Ionians were overpowered, and driven into Attica; and the Achæans took possession of the kingdom, which consisted chiefly of twelve cities. These cities were divided between the four sons of Tisamenes; who, uniting with their cousin, the son of Penthillus, and grandson of Orestes, and jointly reigning over this new Achaian state for some time, agreed to form an alliance with Preagenes, and his son Patrus, the sovereigns of those Achæans, who had been banished out of Lacedæmon, and gave them the sovereignty and territories of a city, which from the last of these was called *Patræ*. The Achæans fortified themselves so well in their new settlement, after having expelled the Ionians, that they were able to defend themselves against the Heraclidæ, and to preserve their laws and liberty, even after all the rest of Peloponnesus had been subdued by them, and under a series of kings from Tisamenes to Ogygus; after which they formed themselves into a kind of republic, or democracy.

As their country was poor, without commerce, and almost without industry, its inhabitants enjoyed the liberty and equality afforded them by a wise legislature. Strangers to the desire of conquest, and having little connection with corrupt nations, they never employed fraud and falsehood even against their enemies; and as all their cities had the same laws, and the same offices of magistracy, they formed only one body, and one state: and the harmony that prevailed among them pervaded every class of citizens. The excellence of their constitution, and the probity of their magistrates were so universally allowed, that the Greek cities of Italy addressed themselves to this people to become their arbitrators, and some of them even formed a similar confederacy. The Lacedæmonians and Thebans, who respectively claimed the victory at Leuctra, referred their dispute, in which their honour was so materially interested, and which demanded the most impartial decision, to the determination of the Achæans. Having long retained their liberty, they ceased not to assemble, when the necessity of public deliberation required it, even when the rest of Greece was threatened with wars and pestilence. Polybius observes, that the Achæans so far gained the esteem and confidence of all the Peloponnesians, that their name became common to that whole country. The arms which these people chiefly used were slings, in the use of which they were trained from their infancy, and acquired such dexterity, that they struck any object at which they aimed with surprising exactness. The Achæan government continued in its democratic form from the expulsion of Ogygus or Gyges, the last king of Achaia, to the time of Alexander the Great; after whose death this little republic was involved in all the calamities that are inseparable from discord, and was constrained to submit to the Macedonian yoke. The Achæans then changed masters as often as Macedon changed sovereigns, and were frequently enslaved by tyrants of their own. Unable to bear this slavish subjection, in the 125th olympiad, *ante* Chr. 280, when Pyrrhus invaded Italy, they revived their ancient union. The first assertors of liberty were the inhabitants of Patræ and Dyma, and they were soon joined by those of Ægium, Bura, and others. The good order that reigned in this little republic, where liberty and equality, with a sincere zeal for justice and the public welfare, were the fundamental principles of their government, induced several neighbouring cities to join them. The Achæan league thus revived, and extending its influence, was first acceded to by the Sicyonians, under the direction of Aratus; they were followed by other states not only of Peloponnesus, but by all Greece, except the Lacedæmonians, who first entered into a war against the Achæans. By the Achæan league, all the cities subject to it, were governed by the great council, or general assembly of the nation. To this assembly each of them had a right to send a certain number of deputies, who were elected in their respective cities by a plurality of voices. As the supreme and legislative power was lodged in this assembly, it was constantly convened, except on extraordinary occasions, twice a-year; on which occasions they enacted laws, disposed of vacant employments, declared war, made peace, and concluded alliances; and the acts of the assembly were binding on all the confederated cities. The chief magistrate of the league, called by the Greeks *strategos*, and by the Latins *prætor*, was chosen by the majority of votes. At first they had two officers of this kind; but they were soon reduced to one, who presided in the diet, and commanded the army. The prætor, and other magistrates, continued in the same office two years successively. The former was responsible to the general assembly. The *demiurgi* were next in power to the prætor, and are therefore denominated

by Polybius and Livy, the supreme magistrates of the Achæans. Their number was ten; they were chosen by the general assembly, and their office was to assist the prætor, who was not allowed to propose any measure to the assembly, which had not been previously approved of by the majority of these demiurgi. In some extraordinary cases they were allowed to summon the general assembly. Such was the fundamental constitution of the Achæans; and they had also several laws, which were religiously observed as long as the republic continued in a flourishing condition. Their peace and prosperity, however, were interrupted by the jealousy of neighbouring states; and particularly by the Lacedæmonians, who, about the year before Christ 227, commenced a war against them, which, from the name of Cleomenes their king, was called the *CLEOMENIC war*. The Achæans, under the command of Aratus, were successively defeated, and reduced to such a state of distress, as to be under a necessity of engaging Antigonus, king of Macedon, to assist them. In a variety of subsequent contests, the Achæans behaved with uncommon bravery, and PHILOPŒMEN distinguished himself above the rest. Cleomenes was defeated; and Antigonus received the thanks of the deputies of each city comprehended under the Achæan league; and, by a decree of the council assembled at Argos, was declared protector of Achaia. The Achæans afterwards took part with the Messenians against the Ætoli-ans; and being overpowered by them, recurred to Philip of Macedon, who promised to assist them with the whole force of his kingdom. A confederacy was formed, and war, called from this circumstance the *confederate war*, was proclaimed against the common enemy. This war having terminated first in a treaty between Philip and the Achæans on one side, and the Ætoli-ans, Lacedæmonians, and Eleans, on the other, and soon after in a peace; the Achæans returned to their ancient manner of life, rebuilt their cities, temples, and altars, restored their worship, and repaired the various damages which they had sustained during the progress of the war. Philip, however, soon changed his conduct towards the Achæans, and disturbed that tranquillity which he had been the instrument of establishing. As they refused to concur with him in his purpose of subjecting the Messenians, who were members of the Achæan body, he ascribed their reluctance to Aratus, whom he contrived to remove by poison, whilst he was prætor of the Achæans for the seventeenth time. When Aratus perceived the danger of his situation, he said to an intimate friend who attended him, "Behold, my dear Cephalion, the effect of friendship with kings." This distinguished magistrate closed his life at Ægium, in the 57th year of his age, and was interred with extraordinary pomp and solemnity at Sicyon, the place of his nativity; and the part of the city in which he was buried, was from that time called Aratium, in honour of his memory. The Achæans also decreed, that divine honours should be paid him, and appointed a priest for that purpose. The conduct of Philip incensed the Achæans, and when a favourable opportunity occurred they testified their displeasure. In the mean while they concurred with him in carrying on the war with the Ætoli-ans, who had formed an alliance with the Romans. Philopœmen gained new honours; and in the year before Christ 210, was appointed, for the first time, commander in chief of the Achæan forces. After a very decisive victory over the Lacedæmonians, the Ætoli-ans sued for peace, and obtained it; and the Romans also concluded a treaty of peace and amity with Philip and his allies. This peace was not of long duration. The Romans declared war against Philip, who was joined by the Achæans and Lacedæmonians. It was not long however before the Achæans formed an alliance with

the Romans, to whom they maintained a steady attachment during the whole course of this war. At the conclusion of it, they were put into possession of Corinth; the Greeks were declared free by the Romans; and the Achæans amongst others, were delivered from every kind of servitude, and allowed to govern themselves by their own laws. Soon after the departure of the Romans, Nabis, who had been left in possession of Lacedæmon, began to raise insurrections in the maritime cities, which were garrisoned by the Achæans; and these hostilities obliged them to have recourse to the Romans, and to declare war against Nabis. The whole management of this war was committed to Philopœmen. After a defeat by sea, and a very fortunate escape, this illustrious general obtained a complete victory over Nabis by land; and was thus enabled to unite the powerful city of Lacedæmon to the Achæan commonwealth in the year before Christ 191: by which means the Achæans eclipsed all the other States of Greece. Philopœmen, with a disinterestedness and patriotism that served to establish his reputation more than all his military exploits, refused to accept a present of 120 talents, the produce of the palace and furniture of Nabis, which the Lacedæmonians offered him as a token of their gratitude. Recommending the application of this money to the purpose of conciliating the discontented, he said to those who urged his acceptance of it, "it is much more advisable to stop an enemy's mouth than a friend's; as for me, I shall always be your friend, and you shall reap the benefit of my friendship without expense." The Achæan republic, by the addition of Lacedæmon, and the protection of Rome, was now become very formidable. But internal disputes about the place of holding their assemblies, which were transferred by Philopœmen from Ægium to Argos, and the more important quarrel with the Lacedæmonians, and their attempt to secede from the Achæan league, produced an interruption of their tranquillity, and exposed them to new dangers. Lacedæmon, indeed, was reduced by the Achæans; and Philopœmen ordered them to demolish their walls, disband their mercenaries, drive out all the slaves whom the tyrants had set at liberty, receive the exiles, and renounce the laws of Lycurgus, and for the future govern themselves only by those of Achaia. At this time the Achæan league was in great repute all over the East, and the friendship of a state so powerful was courted by all the princes of Asia. The ancient alliance with Ptolemy, king of Egypt, and with Seleucus, king of Syria, was renewed. But the Romans became jealous of their increasing power, and interfered with their internal government. The city Messene withdrew from the Achæan league; and Philopœmen, in his endeavour to reclaim the rebels, was defeated, taken prisoner, and put to death. When he held the cup of poison in his hand, he enquired whether Lycortas and the Megalopolitan youth, who had accompanied him as volunteers, had got into a place of safety; and being informed, that they had all made their escape; he replied, "That is enough; I die content." Upon his death the glory of Achaia began to decline; so that Philopœmen was not improperly called the last of the Greeks, as Brutus was afterwards styled the last of the Romans. Messene was afterwards restored to the Achæan league; and the Romans imperiously urging the readmission of the Lacedæmonians, the Achæans were obliged to submit. In the year before Christ 169, when a war broke out between the Romans, and Perseus king of Macedon, the Achæans declared for the Romans, and Polybius was sent to the Roman general with the resolution of the Achæan diet. However, several of the Achæans favoured Perseus; and a thousand of them were summoned to appear before the Roman senate. These persons were

kept close prisoners at Rome; and, notwithstanding repeated remonstrances, their trial was delayed. After a confinement of 17 years, 300 of them, who had survived the hardships which they experienced, were sent home. This treatment alienated the minds of the Achæans from the Romans; and, by degrees, brought on an open war, which ended in the reduction of Achaia, and the dissolution of the Achæan league. Commissioners were sent from Rome, in the year before Christ 147, who announced the orders of the Roman senate and people, that all the cities which were not formerly of the Achæan league, viz. Corinth, Lacedæmon, Argos, Heraclea, and Orchomenos, should be separated from the general alliance, and governed by their own laws, independently of the confederacy. The Achæan deputies, assembled at Corinth, as soon as they heard these words, left the assembly before Aurelius had finished his speech, and when they informed the people of the Roman decree, the whole city was in an uproar; and both the commissioners and Lacedæmonians were treated with the most outrageous insult and violence. The senate was incensed, but sent out new commissioners with proposals of accommodation. But these ambassadors having been treated with disrespect, returned with their complaints to the senate. Four other Romans were deputed by Metellus to negotiate with the Achæans; but their endeavours were ineffectual. The consequence of these unsuccessful efforts was an open rupture, and the declaration of war with Lacedæmon and the Romans. Metellus, without waiting for the orders of the senate, marched towards Achaia; and the Achæans, joined by the cities of Thebes and Chalcis, prepared to receive him. The greater number of them were struck with terror, and sent new deputies to Metellus to treat of peace. But the Achæans, now governed by magistrates, who had no other rule of conduct but their passions, and no other talent for war besides a savage fierceness, and a blind desire of revenge, seemed to be devoted to destruction. On this occasion, after Metellus had in vain endeavoured to settle the affairs of Achaia, Mummius arrived in Greece, and defeated the Achæans; and in the year before Christ 146, plundered CORINTH of its rich spoils, and then reduced it to ashes; and under the ruins of this city the Achæan league seemed to be buried. Ten commissioners were sent from Rome, to regulate the affairs of Greece in general, and of Achaia in particular, in conjunction with the consul. These abolished popular government in all the cities, and established magistrates, who were to govern each city according to their respective laws, under the superintendency of a Roman prætor. Thus the Achæan league was dissolved, and Greece reduced to a Roman province, called the province of Achaia; because, at the taking of Corinth, the Achæans were the most powerful people of Greece. The whole nation paid an annual tribute to Rome; and the prætor who was sent thither every year, was charged with the care of collecting it. From this time Achaia was governed like the other Roman provinces till the reign of Nero, who restored the whole of Greece to the enjoyment of its ancient liberties; but it was afterwards reduced by Vespasian to its former state of subjection. Under Nerva, some shadow of liberty was restored; but it was still governed by a Roman prætor. In this condition the Achæans remained till the time of Constantine the Great, who, in his new partition of the Roman provinces, subjected Achaia to the præfect of Illyricum. Upon the division of the empire, Achaia, with the rest of Greece, fell to the emperors of the East. Under Arcadius and Honorius, all these provinces suffered greatly by the incursions of the Goths, who, under their king Alaric, laid waste the whole country, and reduced the mag-

nificent structures that were then remaining to heaps of ruins. In the reign of the emperor Emanuel, in the 12th century, Peloponnesus was divided into seven principalities, and he bestowed them on his seven sons. In the 13th century, when Constantinople was taken by the western princes, the maritime cities of Peloponnesus, with most of the islands, were allotted to the Venetians. In the 15th century, Constantine Dracofes, despot of Morea, being raised to the imperial throne, divided that province between his two sons, bestowing Sparta on one of them, and Corinth on the other. Mahomet II. taking advantage of their divisions, stripped them both of their dominion. The Mahometans having gained possession of Morea, drove the Venetians from the cities which they possessed on the coast, and made themselves masters of that fruitful province, till they were expelled by the Venetians in 1687. By the treaty of Carlwitz, in 1699, the barbarians yielded it to the republic of Venice; but retook it in 1715; and in their hands it still continues, being governed by a Sangiac, under the beglerbeg of Greece, who resides at Modon. On the subject of this article, see Polybius Hist. and Excerpt. leg. Index. verb. Achæi, Ed. Casaub. Pausanias Græc. Deser. p. 521, &c. 558, &c. Ed. Kuhnii. Strabo Geog. tom. ii. Index verb. Ed. Pittæ. Plin. l. viii. Ep. 24. Herodot. p. 71. Ed. Wessel. Anc. Un. H. vol. vi. p. 44—155. Anacharsis's Travels, &c. vol. iii. p. 401—406. See also an elaborate discourse on the origin, nature, and object, &c. of the Achæan league, compared with the Belgic and Helvetic confederacies, intitled, Discours qui a remporté le Prix de l'Academie Royale des Inscriptions et Belles Lettres, de Paris, in 1782, &c. by M. J. de Meerman, 4to. Hague, 1784.—and an abstract of it in the Monthly Review, vol. lxxi. p. 531, &c.

ACHÆMENES, in *Ancient History*, was grandfather of Cambyfes, and great grandfather of Cyrus the First, king of Persia. According to Herodotus, p. 515:—and according to the same historian, p. 199. 548. there was a son of Darius I. king of Persia, and brother of Xerxes, who was of the same name. This Achæmenes governed Egypt, after Xerxes had restored them to their allegiance, and he commanded the Egyptian fleet in the celebrated expedition which proved so fatal to all Greece. Having been sent into Egypt to suppress a rebellion, which occurred after the death of Xerxes, he was vanquished and slain by Inarus, chief of the rebels. The term *Achæmenius* is a very common Persian epithet: Stephanus Byzantium says, that Achæmenia is a part of Persia, so called from Achæmenes, son of Ægeus. According to Herodotus, p. 63, the Achæmenidæ were certain tribes from which the Persian kings sprung: and Strabo (vol. ii. p. 1059.) reckons the Achæmenidæ as one of the three principal nations of Persia. Horace (l. 2. od. 12.) mentions an Achæmenes who was very rich; and who is supposed, by his commentators, to have been one of the Persian monarchs.

ACHÆMENIA, in *Ancient Geography*, a part of Persia, according to Stephanus Byzantium and Strabo, so called from its first king ACHÆMENES. It is sometimes used to signify Persia in general, particularly by Herodotus, who represents Cambyfes, in an oration, calling his people Achæmenidæ.

ACHÆMENIS, in *Botany*, a species of the TEUCRIUM.

ACHÆORUM portus, in *Ancient Geography*, a harbour of the Chersonesus Tauricæ, on the Euxine; and another mentioned

mentioned by Strabo (Geog. vol. ii. p. 890.); and also by Pliny, (Hist. Nat. vol. i. p. 282.) near Sigæum, into which the river Xanthus, after having been joined by the Simois, falls.

ACHÆUS, the son of Andromachus, whose sister was the wife of Seleucus Ceraunus, was offered the crown of Syria, as successor to Seleucus, but declined in favour of Antiochus, the brother of the deceased king, who was afterwards surnamed the *Great*. All the provinces of Asia Minor were committed to the charge of Achæus. In this station he wrested from Attalus, king of Pergamus, all the countries in Asia which that prince had seized, and annexed them to the crown of Syria; when designs were formed against him, he seized the crown which he had before refused, and was crowned at Laodicea, in Phrygia, assuming ever afterwards the regal title in all letters to the cities of Asia, and obliging them to give it him in all their addresses. Antiochus having succeeded in several enterprises, directed his attention towards carrying on the war in Asia Minor against Achæus; who being shut up in the castle of Sardis, was delivered to Antiochus, after he had taken the city. This prince was moved with compassion towards a person to whom he had once owed his crown; but motives of state prevailing over his natural tenderness, he ordered him to be put to death in the manner related by Polybius, l. viii. p. 528. Ed. Casaub. For an account of *Achæus* the son of Xuthus; see **ACHÆANS**.

ACHAIA, in *Ancient Geography*, was used in three different senses. In the earlier ages it comprehended all the provinces of that great continent, which the geographers, strictly speaking, call **GREECE**. It was afterwards confined to that narrow district of Peloponnesus, which was possessed by the **ACHÆANS** in the more limited sense of the appellation, and which extended westward along the bay of Corinth, that lay to the north, and was bounded on the west by the Ionian sea, on the south by Elis and Arcadia, and on the east by Sicyonia. This was called *Achaia propria*, and it is now denominated *Romania alta*, and forms a part of *Chiarença* or *Clarença* in the **MOREA**. Its metropolis, according to some, was *Patræ*, and according to others **ÆGIUM**. In the Roman times the name of *Achaia* comprised not only all Peloponnesus, but such other cities beyond the isthmus as had entered into the Achæan league; upon the dissolution of which Greece was, by a decree of the Roman senate, divided into two provinces, viz. that of Macedonia, containing also Thessaly, and that of *Achaia* which included all the other states of Greece.

ACHAIE *Presbyteri*, *Presbyters of Achaia*, in *Eccllesiastical History*, those who were present at the martyrdom of St. Andrew the apostle, A. D. 59; and who are said to have written an epistle relating to it. Bellarmine, and other Romish writers allow it to be genuine; but Dupin, (Hist. of Eccl. Writers, vol. i. p. 17) and many others reject it.

ACHAIUS, in *British History*, the son of Ethwin, who was raised to the crown of Scotland, A. D. 788. At the desire of the emperor Charlemagne, an alliance with him against the English, whose pirates infested the seas and interrupted commerce, was concluded in France upon conditions so advantageous to the Scots, that *Achæius*, to perpetuate the memory of it, added to the arms of Scotland a double field sowed with lilies. He died in 819.

ACHALACTLI, or, as Buffon has contracted the name, **ALATLI**, in *Ornithology*, the *ALCEDO torquata* of Linnæus and Gmelin, the *cinereous KING-FISHER* of Latham, and the *Collared-bird* of Nieremberg, is one of the largest king-fishers, being near 16 inches long. Its specific characters are, that it is short-tailed, half-crested, hoary-

bluish, with a white collar, and its wings and tail spotted with white. The upper part of the body is bluish-grey, and this colour is variegated on the wings with white fringes in festoons at the points of the quills, the largest of which are blackish, and intersected within by broad white indentings; those of the tail are marked with broad stripes of white; the under-part of the body is chestnut-rufous, diluted towards the breast, and there scaled or mailed with grey; the throat is white, which colour forms an entire circuit on the neck; the whole head and nape of the neck are of the same bluish grey colour with the back. The beak is sharp, and about three fingers breadth long; it is red, with a mixture of blackish brown at the base; and the feet are red. This bird is migratory; and at a certain time of the year visits the northern provinces of Mexico; and is also found in Martinico and the Antilles. It feeds on fish, whence its name *Achalaali*, i. e. devourer of fish.

ACHAM, in *Geography*, a country in Asia, bounded on the N. by Bontan, on the E. by China, on the S. by Burmah, and on the W. by Hindostan. It is very little known to the Europeans.

ACHAMÆ, in *Ancient Geography*, the name of a people who inhabited that part of Lybia interior, which is near the mountain Arvaltes, and on the confines of the equinoctial line.

ACHAMELLA, in *Botany*. See **ACMELLA**.

ACHAN, in *Scripture History*, the son of Carmi, of the tribe of Judah; who, when Jericho was taken, concealed 200 shekels of silver, a Babylonish garment, and a wedge of gold, in direct violation of a divine prohibition. After the Israelites had been repulsed at Ai, they cast lots in order to discover the offender, who had been accessory to this calamity; and when Achan was found to be the guilty person, he and his children were stoned to death, and afterwards burned. Joshua, chap. vii. Some have supposed, that Achan alone was put to death, and understand the words, "and they stoned them," (v. 25) as it is in the Hebrew, and not *him*, as in our translation, of Achan and his cattle. Grotius in *Loc.* Others suppose, that Achan's children were accomplices in his crime. St. Aulin vindicates the justice of this act, on the ground of God's having a right to resume the life he has given, when and how he pleases. Some have alleged, that the severity of this punishment was necessary to keep the people in awe, and to oblige them to a perfect submission to the divine commands.

ACHANDES, in *Ichthyology*, a name given by some to the **REMORA**.

ACHANE, *Δαχων*, an ancient Persian corn-measure, containing 45 Attic medimni.

ACHANI. See **ACHEM**.

ACHANIA, in *Botany*, from *αχων*, *non liens*, because the corolla does not open; a genus of the *mezadelphia polyandria* class, and the natural order of *columnifera*. The characters are, that the calyx has a double perianthium, the outer having many leaves, and the leaflets being linear, permanent, and slightly coalescing at the base; the corolla is subclavate and convoluted; and the petals are five, obovate-oblong, erect, with a lobe at the base on one side, involving the column of stamens: the stamens are numerous filaments, coalescing into a writhed tube longer than the corolla, free at top, and capillary; the anthers are oblong; the pistillum has a subglobular germen; the style is filiform, of the same length with the tube of the stamens, ten-cleft at top, the segments spreading, the stigmas capitate; the pericarpium is a subglobular, fleshy, five-celled berry; the seeds are solitary, on one side convex, and angular on the other. There are three species, viz. the *A. malvarifcus*, scarlet achania,

or bastard hibiscus, which is a native of Mexico and Jamaica, cultivated here in 1714 by the dutchefs of Beaufort, and flowering through the greatest part of the year; the *Mollis*, or woolly achania, a native of South America and the West India Islands, found in Jamaica by Houftoun, in 1730, and introduced in 1780, by B. Bewick, Esq. and flowering in August and September;—and the *pilofa*, or hairy achania, a native of Jamaica, introduced in 1780 by Mr. G. Alexander, and flowering in November. Achania is generally propagated by cuttings, which are planted in pots of light earth, plunged into a gentle hot-bed, and kept from the air till they take root, when they should be gradually inured to the open air. They must be preserved in winter in a moderate stove; and kept warm in summer, they will flower, and sometimes ripen fruit. The achania, in the Linnæan system by Gmelin, is made a species of *MALVAVISCUS*. Martyn's Mill. Dict.

ACHAOVÁ, in the *Materia Medica* of the ancients, the name of an herb much celebrated in many distempers; which some have supposed to be what is called in Egypt Uchove, an herb nearly resembling chamomile, but lower, and with broader leaves, approaching to those of feverfew, and of a faint, but not disagreeable smell. Avicenna seems, however, to have meant a different plant by this name, and probably the herb which we call *MARUM*. Prosper. Alpin.

ACHARACA, in *Ancient Geography*, a town of Lydia, situate between Tralles and Nyfa; in which were the temple of Pluto and Juno, and the cave Charonium, where patients slept in order to obtain a cure, either by the suggestions of their own minds, or by those of others, who, during their sleep, were directed what effectual remedies to prescribe. Strabo Geog. vol. ii. p. 960—1.

ACHARISTON, from α , *without*, and $\chi\alpha\rho\iota\varsigma$, *value*, a denomination under which Galen describes some compositions of singular efficacy, which cured so quickly, that they were undervalued.

ACHARNA, in *Ancient Geography*, a town of Attica, near Cecropia; the largest of those towns, according to Thucydides, (l. ii. c. 19. p. 111. Ed. Dukeri) which were called $\delta\eta\mu\alpha\iota$, or villages. Pindar (Nem. Od. ii. v. 25, p. 333, Ed. West and Welfsted) says, it had been famous for brave men; and it was particularly celebrated as the birth-place of Themistocles. Corn. Nep. c. i.

ACHARON, in *Entomology*, a species of *SPHINX*, of an azure colour, with brown wings, and red anus; found in New Holland.

ACHASA, in *Ancient Geography*, a country of Scythia beyond the mountain Imaus.

ACHAT, in our *Law French*, signifies a contract, or bargain; especially in the way of purchase. Purveyors were by act of parliament 34 Edw. III. ordained to be thenceforth called *Achators*.

ACHATES, in *Biography*, the companion and faithful friend of Æneas, who is celebrated by Virgil, and so called, says Servius, either in reference to some properties of the achates or agate mentioned by Pliny, or from $\alpha\chi\alpha\varsigma$, the concern he felt on account of Æneas. Virgil, by Mafvic. v. i. p. 336, n. 178.

ACHATES, in *Entomology*, a species of *PAPILIO*, with black wings, red at their base, and the hinder marked with 2 white spot; found in China.

ACHATES, in *Ancient Geography*, a river of Sicily, now the *Drillo*, which runs from N. to S. near, and almost parallel to, the Gela. Silius records it, (l. xiv. v. 229) "Et perlucetum splendenti gurgite Achaten," and Pliny, (H. N. l. xxxvii. c. 10. p. 786, Ed. Hard.) says, that the achates or agate was first found on the banks of this river.

Bochart. (Geog. Sacr. l. i. c. 29. Oper. tom. i. 549, Ed. Villem.) supposes, that the name of the stone and river is derived from the Punic $\gamma\pi\gamma$, *varied* or *spotted*, referring to the varied colours of the stone.

ACHATES, in *Natural History*, the stone called *AGATE*.

ACHATINA, in *Natural History*, a species of *BULLA*, in the class of testaceous worms; with an ovated shell, sanguineous, obovated, aperture, and apex, and a truncated columella. It has varieties; such as the white with yellow apex; the yellow or white with sanguineous columella; and the white with clove bands, and a pale columella. It is found in the American ocean. This is also the name of the *CYPRÆA amethystea* in the Linnæan system, which is found in Madagascar.

ACH BOBBA, in *Ornithology*, a bird mentioned by Dr. Shaw (Travels, v. ii. p. 449), of which numerous flocks appear near the city of Cairo in Egypt, and feed upon the carrion and filth that are thrown out of the city. The name, in the Turkish language, signifies *white father*, and is given to this bird partly from the reverence they have for it, and partly from the colour of its plumage. It is about the size of a large capon. This bird is called by Belon the Egyptian Sacre, and it is a variety of the *Alpine VULTURE*, or *Vultur peregrinifer* of Linnæus. It is of a red tawny ash-colour, with dusky spots, and its feet are naked. Belon conceives that it is the Hierax, or Egyptian hawk of Herodotus, which, like the Ibis, was held in veneration by the ancient Egyptians, because both of them eat and destroy the serpents and other noxious reptiles, which infest Egypt. Buffon suggests that it may be the same with the *Carrion Vulture*.

ACHE, or ACH, a painful ailment in any part of the body. Aches may be either scorbutic, or rheumatic, owing to violent pains, or the like. See *HEADACH*.

ACHE, in old authors, a name given to the plant called *Apium palustre*, or *paludapium*, in English, *SMALLAGE*.

ACHEEN, ACHÉ, or ACHEN, in *Geography*, a kingdom of SUMATRA, lying on the N. W. part of the island. Its capital, of the same name, is situated on a river which empties itself near the N. W. point, or *Acheen-head*, about two miles from the mouth. N. lat. 5° 22'. E. long. 95° 40'. The town lies in a valley, formed like an amphitheatre by two lofty ranges of hills. The river discharges itself into the sea by several channels, and is very shallow at the bar. The houses, of which there are about 800, are built of bamboo and rough timber, and they are raised by means of pillars to some height above the ground, in order to preserve them from inundation and damps in the rainy season. In the centre of the town, which has neither wall nor moat, is the king's palace, which is a large though rude edifice, and encompassed by a deep moat and strong walls. Though this place is no longer the mart of eastern commodities, it carries on a considerable trade with the nations of that part of the coast of Hindostan called *Telinga*; by whom they are supplied with the cotton goods of the country, and who receive in return gold-dust, Japan wood, betel-nut, pepper, sulphur, camphor, and benzoin. The European traders supply the country with Bengal opium, iron, and other articles of merchandize. The inhabitants manufacture a considerable quantity of a thick kind of cotton-cloth, and of stuff for the short drawers worn by the Malays and Acheneſe. They also weave pieces of silk, of a particular form, for the Malayan drefs. Acheen is deemed, comparatively, healthy, being less subject to complaints arising from woods and swamps than other parts of the island; and the soil is light and fertile, producing rice and cotton, and a variety of excellent fruits. The raw silk of the country is of inferior quality.

quality. The mountains near Acheen produce a small quantity of gold-dust; but the greatest part is brought from the southern parts of Nalaboo and Soofoo. The sulphur is collected from a volcano in the neighbourhood, and, besides supplying their own manufacture of gun-powder, admits of a large exportation. The inhabitants are, with respect to their persons, taller, flouter, and of a darker complexion than the other Sumatrans; and they are supposed to be a mixture of Battas, Malays, and Moors from the coast of India. In their dispositions and habits, they are more penetrating and sagacious, more active and indoltrious, and possess a greater stock of knowledge than their neighbours. With regard to religion, they are Mahometans; and their mosques and priests are numerous; and the forms and ceremonies of their worship are strictly observed. They are expert and bold navigators, and employ a considerable number of vessels for different purposes. Being destitute of convenient coins, they commonly make their payments in gold-dust, which they carry with them in pieces of bladder; and they use grain or seeds for weights. The government is an hereditary monarchy, and the king has usually a guard of 100 seapoys about his palace. The grand council of the nation consists of the king, four other officers, eight of a lower degree, who sit on his right hand, and sixteen who sit on his left. The king's pleasure is communicated by means of a woman, who sits at his feet, to an eunuch near her, and by him to an officer, who proclaims it to the whole assembly. Merchants and other strangers introduce themselves by presents to the king and his officers. Whenever an European enters the royal palace, he is obliged to take off his shoes: The royal throne was formerly made of ivory, and tortoise-shell; and, when queens governed, a curtain of gauze was hung before it. After the stranger has been introduced, he is entertained in a separate building with the delicacies of the country, and returns in the evening, attended by a prodigious number of lights. On high days the king goes in great state, mounted on an elephant richly caparisoned, to the great mosque; and he is preceded by officers armed very much after the European manner.

The country under the immediate jurisdiction of Acheen is divided into three districts; each of which is governed by a Pangleemo, and subordinate officers. Crimes are severely punished, and without any commutation by the *Achenese* laws. Petty theft incurs the suspension of the criminal from a tree, with a heavy weight tied to his feet, or the cutting off a finger, hand, or leg, according to the nature of the offence. Highway robbery, and house-breaking are punished by drowning, and exposing the body on a stake for some days. If an imau or priest be robbed, the criminal is burned alive. The adulterer is delivered up to the friends and relations of the injured husband, who form a circle round him; and, if he be not so fortunate as to make his escape, he is presently cut to pieces, and buried without being admitted into any house, or the performance of any funeral rites. Notwithstanding these discouragements to iniquity, the *Achenese* are represented by travellers as one of the most dishonest and flagitious nations of the east.

For other particulars, we must refer to Mr. Marsden's account of SUMATRA. Acheen was visited by the Portuguese in 1509, but they could form no establishment in the country. Captain Lancaster was very differently received in 1602. He made a treaty in behalf of the English East India company, with the king of Acheen, and obtained for the company peculiar privileges. They had for many years a factory at Acheen. See SUMATRA.

ACHEIROPOIETA, formed of *a priv.* *χειρ*, hand, and

ποιεω, to make, and denoting *made without hands*, an epithet given to an image of Christ in the Lateran church at Rome, which is said to have been designed and sketched by Luke, and finished by angels.

ACHELOUS, in *Zoology*, a species of PHALÆNA, with ferruginous wings, and the anterior marked with a white point and fascia: it is large, and found in America.

ACHELOUS, in *Mythology*, is said to have wrestled with Hercules for Deianira, the daughter of king Oeneus, and, assuming the shape of a bull, Hercules is said to have broken off one of his horns, which was restored on condition of his giving the victor the horn of Amalthea, the same with the Cornucopia, or horn of plenty, which Hercules filled with various fruits, and consecrated to Jupiter. For the meaning of the fable, see the next article.

ACHELOUS, in *Hydrography*, a river of Acarnania, which rises in mount Pindus, and, dividing Ætolia from Acarnania, flows from N. to S. into the Sinus Corinthiacus. It was formerly called *Theos* on account of its impetuosity, and by Homer, (*Iliad*, l. xxi. v. 194.) the *king of rivers*. The epithet *Achelous* is used by Virgil, (*l. i. v. 9.*) for *aqueus*, the reason of which, according to Servius (*in loc.*) is, that *Achelous*, on account of the antiquity of this river, was used by the ancients as a denomination of water in general. The ancient poets called rivers *Tauriformes*, either from the bellowing of their waters, or from their ploughing the earth in their course. The fable in the preceding article is explained by some in this manner. *Achelous* being a rapid and winding river, roared like a bull, and often overflowed its banks; but Hercules, by dividing it into two channels, and restraining its inundations by mounds and ditches, broke off one of the bull's horns, and restored plenty to the country. See Strabo (*Geog. l. x. vol. 2. p. 703—4.* Ed. Amst.). There are other rivers of this name in Achaia Propria, Thessaly, and Asia Minor.

ACHEM, in *Geography*, a country of Africa, in that part denominated the *SLAVE-coast*. The extent of this country is unknown: the negroes assert that it reaches to the coast of Barbary. It is divided into great and little Achem, which were formerly united under one monarchy, but are now two separate republics: little *Achem* is denominated *Achani*, or *Akanni*. There is a town of the same name, sometimes called *Acmeny*. N. lat. 8. 30. E. long. 0. 30. Most of the gold exported from this country is brought to the European forts at ACRA. The negroes of both these districts are of an insolent and haughty character, valuing themselves on the superiority they once maintained in respect of their neighbours; but civil dissensions have of late rendered them less formidable.

ACHEMENIS, in *Botany*, an herb mentioned by Pliny (*H. N. l. xxi. c. 4. tom. ii. p. 392.*) supposed by the ancients to have the property of exciting terror in their armies, and putting them to flight. The fable may probably denote, that soldiers could not prosper in war with plants in their hands.

ACHEMON, in *Entomology*, a species of SPHINX, yellow, with glass-coloured wings, black at their apex, and the fore wings yellow at their base; found in Jamaica.

ACHERI, LUKE *d'*, in *Biography*, a learned Benedictine of the congregation of St. Maur, was born at St. Quintin in Picardy, in 1609, and made himself famous by printing several works, that existed in M.S. with prefaces and notes; such as Barnabas's Epistle, the works of Archbishop Lanfranc, the Life and Writings of Guibert Abbot of Nogent, and a collection of curious pieces, begun in 1655, and concluded in 1677, under the title of *Spicilegium, i. e. Gleanings*, in 13 volumes 4to. In 1723, it was reprinted by

M. de la Barré, in three volumes folio. With regard to subjects of ecclesiastical history this may be an useful book of reference. The title of the Acts of the Saints, of the order of St. Benet, also expresses, that they were collected and published by him and Mabillon. He died at Paris April 29th, 1685, in the abbey of St. Germain, where he had been librarian. Gen. Dict.

ACHERNER, or ACHARNER, in *Astronomy*, a star of the first magnitude in the southern extremity of the constellation ERIDANUS, but invisible in our latitude. It is marked α by Bayer. Its longitude for 1761 was $\kappa 11^{\circ} 51' 1''$; and latitude $59^{\circ} 22' 4''$ S.

ACHERON, in *Mythology*, a river of Epirus, which the poets feigned to be the son of Ceres, whom she hid in hell for fear of the Titans, and converted into a river, over which souls departed were ferried in their way to Elysium. The Acheron of the lower regions is derived by Servius and others from *αἰὼν χυρῶς*, without joy.

ACHERON, in *Ancient Geography*, a river of Theoprotia in Epirus, now *Delichi*; which, rising in the country of the Molossi and forming the lake of Acherusia, falls into the sea near the promontory of Chimerium, to the west of the Sinus Ambracius, in a course from N. to S. Such is the account of Ptolemy, Strabo, and Thucydides. Pliny says, that it springs in the above-mentioned lake, and empties itself into the Ambracian gulph.

ACHERON, or ACHEROS, is a river of the Brutii in Italy, now *Savanto*, running from E. to W. In this river Alexander king of Epirus was slain by the Lucani, being deceived by the oracle of Dodona, which bade him beware of Acheron, and of the city of Pandosia. Alexander, not knowing that in this country there were a river and city of the same names with those of Epirus, pursued his military operations without fear of danger. But, being driven by the enemy to the border of a river, which was overflown with rains, he plunged into it on horseback; when one of his attendants, seeing him in danger of being drowned, exclaimed, "curst Acheron! thou art justly called by a fatal name!" At these words Alexander recollected the admonition of the oracle: and, whilst he was hesitating whether he should proceed or not, he was traiterously put to death by one of the Lucani, who were appointed to be his guards. Livy, l. viii. c. 24. vol. ii. p. 760. Ed. Drak.

ACHIERONTA, in *Entomology*, a species of PAPILO, with dentated wings, the anterior being red at their base, and black at the apex, spotted with white. It is found in Brasil.

ACHERONTIA, a small city of Apulia, now *Acerenza*, situate on a hill, and thence called by Horace (Od. 3, 4.) a bird's nest.

ACHERSET, in *English Antiquity*, a measure of corn conjectured to be the same with our quarter or eight bushels. The monks of Peterborough had a weekly allowance of 12 *acherfotes de frumento*, and 8 *acherfotes de brassico*, and 6 *degradi*, and 11 *acherfotes de fabis*, &c. Spein.an.

ACHERUSIA *palus*, in *Ancient Geography*, a lake between Cumæ and the promontory Misenum, now *Il lago della Collaria*, or *del Fusaro*. Some confound it with the *lacus Lucrinus*, and others with the *lacus Averni*; but Strabo (vol. i. p. 374) and Pliny (H.N. l. iii. c. 5. vol. i. p. 154) distinguish them. The former supposes it to be an effusion of the sea; and therefore called by Lycophron, (v. 695) *Αχρυσια χυρῶς*. There is a lake of Épirus of this name, through which the Acheron runs. There is also an Acherusia, which is a peninsula of Bithynia on the Euxine, near Heraclea; and a cave of the same name, through which Hercules is fabled to have descended into hell, to drag forth Cerberus.

ACHATA, in *Entomol.*, a name by which Linnæus has distinguished the third family of the GRYLLO; the characters of which are, that they have two bristles situated above the extremity of the abdomen, and three sternalata; and that the tarsi are composed of three articulations. Twenty-eight species are enumerated in the new edition of the *Systēma Naturæ*. The insects of this family feed upon the roots of plants. See CRICKET.

ACHIA, a kind of cane which grows in the East Indies, and is pickled there while green, with strong vinegar and pepper, together with some other spice and ingredient.

ACHIACHICA, in *Geography*, a town of the province of ANGELOS or TLASCALA in Mexico.

ACHIENUS, or ACHÆINUS, in *Natural History*, a word used by the ancients to express a stag or deer, in the second year's age. In the first it was called nebrus, in the third dicotus, and always after that cerastes.

ACHLAR, is a Malayan word, signifying all sorts of fruits and roots pickled with vinegar and spice. The Dutch import from Batavia all sorts of Achlar. The name is applied to whatever the Achlar is made of, as bamboo achlar, &c.

ACHICOLUM, is used to express the fornix, tholus, or sudatorium of the ancient baths; which was a hot room where they used to sweat. It was also called architholus.

ACHILLEA, *Milfoil*, in *Botany*, so called from Achilles, who is supposed to have acquired some knowledge of botany from his master Chiron; and to have used this plant for the cure of wounds and ulcers; a genus of the *syngenesia polygamia superflua* class of plants, and of the natural order of *compositæ discoidæ*: the characters are, that the common calyx is ovate, and imbricated, with ovate, acute, converging scales; the compound corolla is radiate, the hermaphrodite corollæ are tubular in the disk, and the females ligulate, being from five to ten in the ray; the proper corolla of the hermaphrodites is funnel-shaped, five-cleft, and spreading; the female obcordate, spreading and triid, the middle cleft being less than the others: the stamina in the hermaphrodites consist of five capillary, very short filaments, and the anther is cylindrical and tubular; the pistillum in the hermaphrodites has a small germ, a filiform style of the length of the stamens, and an obtuse, emarginate stigma; in the females, a small germ, filiform style, of the same length as in the others, and two obtuse, reflex stigmas; there is no pericarpium; the calyx is scarcely changed; the receptacle is filiform, elongate as the disk of the seeds, ovate, and twice the length of the calyx: the seeds are solitary, ovate, furnished with hooks, but without down; and the receptaculum is chaffy and elevated; the chaffs being lineolate, of the length of the florets. There are 27 species, viz. 1. the *Santolina* or lavender cotton leaved Milfoil, with large yellow flowers standing singly on long peduncles, whose leaves when rubbed emit a strong oily odour, an inhabitant of the Levant, cultivated by Miller in 1759, and flowering in June and July:—2. the *AGERATUM*, sweet M. or maudlin:—3. the *foliata*, or sickle-leaved M. a native of the east, where it is used in medicine:—4. the *tenatifolia*, or woolly M. which grows naturally in Spain, the South of France, and Italy, bears the open air in England, was cultivated in the Oxford garden in 1658, and bears flowers that retain their beauty for a considerable time:—5. the *pusilliflora*, or downy M. without stalks to the receptacle, a native of the Levant, and cultivated in the Chelsea garden in 1739:—6. the *abrotanifolia*, or southern-wood leaved M. a native of the Levant, which was cultivated by Mr. Miller in 1759, and flowers in June and July:—7. the *lispicata*, a native of the Levant:—8. the *Alphitona*, with fine silvery leaves, which make a good appearance

pearance through the year, a native of the Levant, and cultivated at Chelsea in 1712. All the preceding species have yellow corollas: the corollas of the following are white in the ray:—9. the *macrophylla*, or feverfew-leaved M. whose leaves resemble those of the common sneezewort, and are of the size of those of the tanfy, the scales of the calyx edged with black, the plant, and especially the flowers, smelling like sneezewort; a native of the Alps, hardy, and thriving in any soil, and deserving a place in gardens; flowering in July and August, and cultivated by Mr. Miller in 1759:—10. the *impatius*, with a stem red at bottom, and terminating in a handsome umbel of white flowers, and the florets in the ray elegantly cut, frequent in Siberia:—11. *clavencia*, or silvery-leaved M. the *Absinthium album* of Gerard and Ray, a native of the Alps of Switzerland, Austria, Pannonia, and Carinthia, cultivated in 1683 by Mr. J. Sutherland:—12. *ptarmica*, or sneezewort M. growing wild in all the temperate parts of Europe, found in Britain not uncommonly in meadows, by the sides of ditches, on the balks of corn-fields, in moist woods, and shady places; the shoots are put into fallets, and the roots, being hot and biting, are used for the toothach, whence the plant has been called bastard pellitory; and, on account of the form of the leaf, goose-tongue: the powder of the dried leaves used as snuff provokes sneezing, whence the name; in Siberia a decoction of the whole herb is said to be successfully used in internal hemorrhages: of this plant there is a variety with double flowers called *bachelor's buttons*; it flowers in July and August, and makes a tolerable appearance:—13. *alpina*, or Alpine M. resembling the last, and by some supposed to be a variety of it; a native of Switzerland, Savoy, and Siberia, very hardy, cultivated here by Mr. Miller in 1731:—14. *ferrata*, or notch-leaved M. appearing like *ptarmica*, flowering in August and September, and introduced, with the next species, in 1784, by Mr. J. Graëffer:—15. *criflata*, or slender-branched M. a native of the East, flowering here in July and August:—16. *atrata*, or camomile-leaved or black M. found on the mountains of Switzerland, the Valais, and Austria, and introduced here in 1774 by Drs. Pitcairn and Fothergill:—17. *moschata*, musk M. or Swiss genipi, an excellent fudorific, but injurious in the pleurisy attended with high fever, promising to be serviceable in disorders arising from a debility of the solids, and yielding a grateful food to cattle; it grows wild on the high Alps, in Savoy, Piedmont, and Austria, and was introduced in 1775 by Drs. Pitcairn and Fothergill:—18. *nana*, or dwarf M. found on the high Alps of Switzerland, the Valais, and Savoy, very hardy, thrives in any soil, loves an open exposure, and deserves a place in gardens:—19. *magna*, great M. or YARROW, found in Italy, and cultivated here in 1683 by Mr. J. Sutherland:—20. *millefolium*, common M. or YARROW, abundant in pastures and by the sides of roads, flowering from June to September; mixed instead of hops, by the inhabitants of Dalecharlia, in their ale, in order to give it an exhilarating quality; recommended by Anderson in his *Essays on Agriculture*, for cultivation, though thought to be a noxious weed in pastures: the bruised herb fresh is recommended by Linnæus as an excellent vulnerary and styptic, and by foreign physicians in hemorrhages, and thought by Dr. Hill to be excellent in dysenteries, when administered in the form of a strong decoction; an ointment is made of it for the piles, and for the scab in sheep; and an essential oil is extracted from the flowers; but it is not used in the present practice:—21. *nobilis*, a native of Italy, Germany, Switzerland, Narbonne, and Tartary, and cultivated in 1640 by Mr. J. Parkinson:—22. *odorata*, or scented M. thought by Gerard and Haller to be a variety of

the former, and a native of the same place:—23. *Cretica*, or Cretan M. a native of Crete:—24. *squarrosa*, rough-headed M. introduced in 1775 by M. Thouin:—25. *Herbarota*, esteemed among the peasants of the Alps as a sudorific against worms, flatulencies, and intermittent fevers:—26. *ligustica*, marjoram-scented M. having a strong smell, as well as the last, like maudlin:—27. *tanacetifolia*, tanfy-leaved M. a native of the Grisons, and not uncommon in the pastures and valleys of the Alps. In the last edition of Linnæus, Gmelin enumerates 32 species, omitting the *bifinnate*, and adding the *lobata*, *capitata*, *coronopifolia*, *Halleri*, *micrantha*, and *pilosa*.

All the species of the *Achillea* may be propagated by parting the roots either in spring or autumn. The seeds of many of them may be sown in March or April, and they may be transplanted at Michaelmas. They will flower the following summer. As they are mostly hardy, they will require little care in the cultivation. Miller's Dict. by Martyn.

ACHILLEA *inodora*. See ATHANASIA.

ACHILLEA *montana*. See SENECIO.

ACHILLEA *tanacetifolia* of Miller. See CHRYSANTHEMUM.

ACHILLEA, in the *Materia Medica* of the ancients, a name given to the gum, which we at this time know by that of the Sanguis draconis, or DRAGON'S BLOOD. The ancient Greeks called this cinnabari; and the use of the word for the mineral which we now call cinnabar, was only because it had the same red colour with this gum. Avicenna, treating of the Achillea says, it is otherwise called Sanguis draconis, and describes it as a real gum, universally known in his time.

ACHILLEA, in *Ancient Geography*. See LEUCE.

ACHILLEIS, or ACHILLEID, in *Literary History*, a celebrated poem of Statius, of the epic kind, in which he proposed to deliver the whole life and actions of Achilles. It only comprehends his infancy; the poet being prevented from proceeding by death. It is a point controverted among critics, whether the whole life of a hero, e. g. of Achilles, be a proper subject of an epic poem?

ACHILLEON, in *Ancient Geography*, a town and promontory of the Cimærian Bosphorus, where anciently was the temple of Achilles; now *Capo di Croce*.

ACHILLES, in *Ancient History*, the son of Peleus and Thetis, was one of the most celebrated heroes of Greece. He was born at Phthia in Thessaly. His mother, it is said, dipped him in the river Styx, by which his whole body became invulnerable, except the heel by which she held him. This relation, however, is not universally received; for it appears by Homer's account, (Il. l. xxi. v. 161, &c.) that he was actually wounded in the right arm by the lance of Asteropæus, in a battle near the river Scamander. He was entrusted also by Thetis to the care of the centaur Chiron, who fed him with honey and the marrow of lions and wild boars, in order to fit him for enduring martial toil, and taught him horsemanship and the use of arms. When she attempted, by concealing him among young women at the court of Lycomedes, to prevent his going to the siege of Troy, where, as she had been warned by an oracle, he would be slain; Ulysses, being admonished by an old prediction that, without Achilles, the enterprise against Troy would be unsuccessful, discovered him, and persuaded him to follow the Greeks: his mother having procured for him an armour made by Vulcan, which was impenetrable. During his concealment he is said to have debauched one of the king's daughters, of whom was born Pyrrhus, king of Epirus. Pausanias observes, that Homer has omitted this circumstance as dishonourable to his hero, though it has been

been recorded by all the other poets. At the siege of Troy Achilles distinguished himself by a variety of heroic actions; but being disgusted with Agamemnon for the loss of Briseis, he retired from the camp. When he afterwards returned to avenge the death of his friend Patroclus, he slew Hector, fastened his corpse to his chariot, and dragged him thrice round the walls of Troy. The body was afterwards redeemed by the father with a large sum. At last being wounded in the heel with an arrow by Paris, the brother of Hector, whilst he was in the temple treating about his marriage with Philoxena, daughter to king Priam, the wound proved fatal to him; and he was interred on the promontory of Sigæum. When Troy was taken, the Greeks sacrificed Philoxena on his tomb, in conformity to his request, that he might enjoy her company in the Elysian fields. It is said, that Alexander, when he saw this tomb, honoured it by placing a crown upon it; exclaiming at the same time, that "Achilles was happy in having, during his life, such a friend as Patroclus, and after his death, a poet like Homer." Achilles is supposed to have died 1184 years before the Christian æra. Homer has been blamed for making his hero Achilles of too brutal and unamiable a character. This charge, Dr. Blair apprehends, is unjust to Achilles, and it is founded on an exaggerated representation of his character by Horace, de Arte Poet. p. 55. Ed. Wakefield.

"Impiger, iracundus, inexorabilis, acer,
Jura neget sibi nata, nihil non arroget armis."

The following brief account will serve to vindicate Homer, as well as his hero. "Achilles, says Dr. Blair, (Lect. on Rhet. &c. vol. iii. 240.) is passionate, indeed, to a great degree; but he is far from being a contemner of laws and justice. In the contest with Agamemnon, though he carries it on with too much heat, yet he has reason on his side. He was notoriously wronged, but he submits; and resigns Briseis peaceably when the heralds came to demand her; only, he will fight no longer under the command of a leader who had affronted him. Besides his wonderful bravery and contempt of death, he has several other qualities of a hero. He is open and sincere. He loves his subjects, and reveres the gods. He is distinguished by strong friendships and attachments; he is, throughout, high-spirited, gallant and honourable; and, allowing for a degree of ferocity which belonged to the times, and enters into the characters of most of Homer's heroes, he is, upon the whole, abundantly fitted to raise high admiration, though not pure esteem."

ACHILLES TATIUS. See TATIUS.

ACHILLES, in *Philosophy*, a name which the schools give to the principal argument alleged by each sect of philosophers in behalf of their system. In this sense we say, this is his *Achilles*; that is, his master-proof, alluding to the strength and importance of Achilles among the Greeks. Zeno's argument against MOTION, is peculiarly termed Achilles. That philosopher made a comparison between the swiftness of Achilles and the slowness of a tortoise: arguing, that if the tortoise were one mile before Achilles, and the motion of Achilles 100 times swifter than that of the tortoise, yet he would never overtake it; and thence he concluded, that there was no such thing as motion. But this is a mere sophism; and is easily solved by expressing the whole relative distance ran by the tortoise before Achilles overtook him by the following series, $\frac{1}{100} + \frac{1}{10000} + \frac{1}{1000000} + \frac{1}{100000000}$, &c. the sum of which is $\frac{1}{99}$ of a mile; and the distance ran by Achilles is one mile more; so that, when Achilles had ran $1 \frac{1}{99}$ of a mile, he would have overtaken the tortoise.

ACHILLES, *island of*, in *Geography*. See LEUCE.

ACHILLES, in *Entomology*, a species of PAPHIO, with

wings black on the upper part, a blue band, and brown beneath, and three or five ocelli; found in America.

ACHILLES, *tendon of, chorda Achillis*, in *Anatomy*, is a large tendon, formed by the union of the soleus and gastrocnemius extensor muscles, which are inserted into the os calcis. See TENDO Achillis. It is so called because the fatal wound, by which Achilles is said to have been slain, was given there.

ACHILL HEAD, in *Geography*, is the W. point of the islands of Achil on the W. coast of Ireland. N. lat. 53° 51'. W. lon. 10°. 45'. The coast between this head and Slinc head is much indented by bays and creeks. Archarisker, or Achariston point is eight leagues S. of this head, and from thence to Slinc head, S. by E. eight miles more. Within land there is between these a high hill, called St. Patrick's hill, which may be seen at sea to a great distance. Achill-head is a very high point, and appears at a distance with a hollow in the middle. Within this are two high mountains; and these three appear at sea like three islands.

ACHILLINI, *Alexander*, in *Biography*, a native of Bologna, and distinguished both as a philosopher and a physician. He flourished in the 15th and 16th centuries, and was called, by way of eminence, the great philosopher. His progress in his studies was so rapid, that he was promoted in early life to the honour of being a professor in the university. In the year 1506 he removed to Padua, where he filled the first chair of philosophy, and drew to his lectures a great number of students. When the war, in which the republic of Venice was engaged against the league of Cambray, constrained him to leave Padua, he returned to his native country, and was again appointed professor of philosophy in Bologna. He adopted and maintained the sentiments of Averroës; and was particularly distinguished for his acuteness in the conduct of private and public disputations. To him some have ascribed the discovery of the malleus and incus, two small bones in the organ of hearing. Achillini was a man of singular simplicity, and so unacquainted with the common modes of civility and address, that he was often ridiculed by the young scholars who attended him, though much and deservedly esteemed on account of his learning. He was the rival of Pomponacius, who sometimes acquired a superiority over his arguments by his wit and humour. He died at Bologna in 1512 at the age of 40 years; and was buried with great pomp in the church of St. Martin the great, belonging to the Carmelite friars. The following epitaph, composed by Janus Vitalis, was inscribed on his tomb: viz.

"Hospes, Achillium tumulo qui queris, in isto
Falleris; ille suo junctus Aristoteli
Elysiū colit; et quas rerum hic discere causas
Vix potuit, plenis nunc videt oculis.
Tu modò, per campos dum nobilis umbra beatos
Errat, dic longum perpetuumque Vale."

He wrote several pieces on philosophical subjects, which he published and dedicated to John Bentivogli. His works are, 1. In Mundini Anatomen, Annotationes. Venet. 1522, fol. 2. De Humani Corporis Anatomia, Venet. 1516, 1521, 4to. In 1568, a collection of all his works, philosophical and medical, was published at Venice in folio.

ACHILLINI, JOHN PHILOTHEUS, a brother of the former, was the author of a poem intitled Il Vnidario, in which are found the eulogy of several Italian literati, and various lessons of morality. It was printed at Bologna in 1513. He was born at Bologna in 1466, and died in 1538. He was a man of talents and erudition, and conversant with the Latin and Greek classics, with music, philosophy, theology and antiquities; of which last he has made ample collections.

ACHILLINI, CLAUDIUS, was grand nephew of Alexander. He was eminent as a philosopher, divine, lawyer, orator, mathematician and poet. He read lectures at Vienna, Ferrara and Bologna, the place of his nativity. His hopes of preferment were repeatedly disappointed. At last, however, the duke of Parma appointed him professor of law, with a good salary. He published a volume of Latin letters, and another of Italian poems at Bologna in 1632, which gained him great reputation. He was born in 1574, and died in 1640. Gen. Dict.

ACHILIS D'ISLAND, *Ἀχιλλεύς Δίους*, in *Ancient Geography*, a peninsula not far from LEUCE, or the island of Achilles, and near the mouth of the Borysthenes, in the Euxine sea: so called from its being the place which the Grecian hero appropriated to his own use and that of his companions for various kinds of exercise, and particularly that of running; whence *ἄχος* from *ἄχω*, to run. It is now called FIDONISI.

ACHIMBASSI, the name of an officer, who presides over the practice of medicine at Cairo. His business is to examine persons offering to practise physic in that city, and to license only such as are found to be duly qualified. This is, without doubt, the intention of the appointment: but as the Achimbassi purchases his office of the Bassa, the privilege of practising physic there is granted to the persons offering the largest fee, and not to those most distinguished by knowledge in their profession.

ACHINOU PAYS, in *Geography*, lies betwixt the island of Negropont and the main in the Archipelago sea. N. lat. 39° 45'. E. long. 23° 55'.

ACHIOTTE, a red drug from America, used in dying, and in the preparation of chocolate. The word is Brazilian, and properly signifies the tree from which this matter is procured. Ray writes it Achiotte. Achiotte is the same with what the French frequently call *roucou*, and the Dutch *orkane*. It was formerly, and even by Mr. Ray himself, deemed a kind of argilla, or earth; but later observers find it to be a flower, or seed of a tree, which grows chiefly in hot countries, as Yucatan or Campeche, and Guatimala. It is about the size of a plum-tree, only more tufted; its branches being longer than the trunk. The fruit is inclosed in a rind like a chestnut, except that it is of an oval figure. It begins to open crossways from the middle to the top, and subdivides into four parts; having in the middle a beautiful carnation-coloured flower. The tree has no leaves; but instead of these shoots out filaments like those of saffron, only bigger and longer. Between these grow little soft vermilion-coloured grains, about the size of pepper-corns; which the Indians, separating from the filament, bake in cakes of about half a pound each; in which form the drug is brought into Europe. For the uses to which it is applied, and the method of preparing it; see ANNOTTO and ROUCOU. See also *Bixa Orillana*.

ACHIROPOETOS. See *ACHEIROPOIETA*.

ACHIVI, in *Ancient History*, a name given by the Roman poets to the people of Greece, or Achaia. See *ACHÆANS*. Homer (Il. l. iii. v. 8.) uses the term to express all the enemies of the Trojans.

ACHLEITTEN, in *Geography*, a town of Germany, in the circle of Austria, on the Danube, four leagues E. S. E. of Ens.

ACHLET, a town of Great Armenia, situate on the north side of the lake Van, or Acramar. This town, though small, is important to the Turks, because it lies on the frontier of their empire, and is well fortified. N. lat. 39°. E. long. 23° 20'.

ACHLIS, in *Zoology, a name given by Pliny to the *CERYUS ACHIS*, or *ELK*.*

ACHLYS, *αχλυσ*, literally signifying a kind of cloud, in *Surgery*, a darkness or dimness of sight. It also denotes a small scar or mark over the pupil, of a light blue colour, and is synonymous with caligo corneæ, or blindness from opacity of the cornea. It is the leucœma nephelium of Sauvages, and is described to be a speck of the cornea, somewhat pellucid, which occasions objects to appear as if seen through smoke, or a cloud, and therefore obscured. By oblique inspection it is discovered to be different from the opacity of the aqueous humour, accompanying some diseases of the eye. This species often arises from a variolous ophthalmia, or moist one, or whatever can render the cornea opaque. In infants, as they grow up, it often vanishes spontaneously. The juice of pimpemel, either the blue or purple, dropped into the eye twice a-day for a week, and the juice of the common star-thistle and blue-bottle, are useful. Sugar-candy powdered is often sufficient. Emetic wine, which is the least hurtful, may be dropped into the eye with advantage. The vapours of anniseed, or fennel-seed water, are of service. See Walli's *Nosologia Methodica oculorum*.

In a metaphorical sense, achlys also denotes a disorder of the womb, answering to what Latin authors call *justiffo ueri*. **ACHLYS**, in *Mythology*, is applied by some Greek authors to the first Being, who existed before the creation of the world, of chaos, and of the gods.

ACHMET, in *Biography*, an Arabian author, supposed to have lived about the fourth century, wrote a book "On the Interpretation of Dreams, according to the doctrine of the Indians, Persians, and Egyptians. The original is lost, but it has been preserved by curiosity, or superstitious credulity in Greek and Latin. It was published, together with Artemidorus on Dreams and Chiromancy," by M. Rigaud, at Paris, in 1603, 4to. Gen. Dict. and Gen. Biog.

ACHMET I. emperor of the Turks, was third son and successor of Mahomet III. and ascended the throne before he had attained the age of fifteen. His reign was attended with various circumstances, both prosperous and adverse to the Turkish empire. The Asiatic rebels, who took refuge in Persia, involved the two empires in a war, during the progress of which Bagdad was taken from the Turks, and which lasted, with intermissions, for several years. In this reign Transylvania and Hungary were the scenes of warfare between the Turks and Germans; and the former were assisted by Bethlem Gabor and Potkay. The tranquillity of Achmet was disturbed by various disasters and calamities, which occurred both by sea and land, by a pretender to his throne, and by attempts on his life. His time, however, was chiefly devoted to the gratifications of the haram, in which he had 3000 women, and to the sports of the field, for which purpose he kept 40,000 falcons, and nearly as many huntsmen, in different parts of his dominions. He expended large sums in building, and particularly on a mosque which he erected in the Hippodrome. Achmet was less cruel than his predecessors; but he was haughty and ambitious. His constitution was strong, and his life was active; nevertheless he died at the age of 29, in 1617. His three sons successively ascended the throne after him. Mod. Un. Hist. and Gen. Biog.

ACHMET II. emperor of the Turks, son of Sultan Ibrahim, succeeded his brother Solyman, in 1691. This prince, though devout and inoffensive, cheerful and condescending, just and amiable in private life, was destitute of the talents necessary for the exercise of sovereign power. He was fond of poetry and music, in both of which he made some proficiency. He died in 1695, at the age of 50, requesting
his

his successor Mustapha, to spare the life of his son. *Mod. Un. Hist. and Gen. Biog.*

ACHMET II. emperor of the Turks, son of Mahomet IV. was raised to the throne on the deposition of his brother Mustapha II. in 1703. His first object after removing the malecontents, was to amass wealth; and with this view he debased the coin, and laid new taxes. When Charles XII. of Sweden, in 1709, after the battle of Pultawa, took refuge in the Turkish dominions, he was received with great hospitality; and under the influence of the sultana mother, war was declared against Czar Peter, which terminated by the peace of Preth. The king, however, was at length obliged to quit the Turkish dominions. Achmet recovered the Morea from the Venetians; but in his expedition into Hungary, in 1716, his army was defeated by Prince Eugene, at the battle of Peterwaradin. Achmet was led by his ministers and favourites, and their influence frequently occasioned political revolutions. He is said, however, to have resorted in disguise to public places, in order to discover the sentiments of his subjects. At length a sedition amongst the soldiers caused his dethronement in 1730, and the elevation of his nephew Mahomet V. He was confined in the apartment whence his successor had been taken, and continued unmolested till he was removed by an apoplexy in 1736, at the age of 74 years. Achmet was a prince of moderate abilities, and good intentions; but confidence in his vizier obscured the lustre of his reign, and brought it to a speedy termination. *Mod. Un. Hist. Gen. Biog.*

ACHMETSHET, in *Geography*, a town in the peninsula of the Crimea, the residence of the Sultan Galga, the eldest son of the Khan of Tartary. It stands on the largest river in the country. E. long. $52^{\circ} 20'$. N. lat. $45^{\circ} 35'$.

ACHMIM, a large town of Upper Egypt, situated on the eastern bank of the Nile: the Chemmis of Herodotus, and PANOPOLIS of Strabo. On a triumphal arch, situate a few 100 yards south of the convent, and built of marble by the emperor Nero, there is a Greek inscription, says Mr. Bruce, *ἄριστος θεός*. The temple of this place, says Abulfeda, is one of the most celebrated monuments of antiquity; being constructed of stones of a prodigious size, on which are sculptured innumerable figures. There may still be traced four concentric circles in a square; the innermost of which contains the sun; the two next are divided into twelve parts, one containing twelve birds, and the other twelve animals almost effaced, which appear to be the signs of the zodiac; the fourth presents twelve human figures, which Savary supposes to be the twelve gods representing the twelve months of the year, as the Egyptians, according to Herodotus, (l. ii.) first divided the year into twelve months, and the angles of the square, on the sides of which may be distinguished a globe with wings, are occupied by the four seasons. This temple was probably dedicated to the sun; and these various hieroglyphics mark his passage into the signs of the zodiac; whence Savary infers, that the Egyptians possessed the knowledge of astronomy from the remotest antiquity. The serpent Haridi is the wonder of the neighbouring country. Scheilk Haridi, above a century ago, died in this place; and as he was deemed a saint among the Mahometans, they raised a monument in honour of him, and one of their priests persuaded the people, that the soul of Haridi passed into the body of a serpent. This artful priest had contrived to make a serpent obedient to his voice, and he pretended to perform a variety of tricks, and to cure many disorders by means of this serpent, which he confined to the tomb, and made the instrument of great gain to himself. The virtues of this serpent are acknowledged by the Chris-

tians of the country as well as by the Turks; and they maintain, that it is the demon Aímódeus, who slew the seven husbands of Tohit's wife, and that he was brought by the angel Raphael to this place, after metamorphosing him, and that God makes use of him to deceive the infidel. Though Achmim has lost much of its ancient splendour, it is still one of the most beautiful towns of Upper Egypt. It is subject to a well regulated police. The streets are wide and clean, and commerce and agriculture flourish in its vicinity. It has a manufacture of cotton, stuffs, and pottery, which are conveyed over the whole of Egypt. Bruce (*Travels, &c.* vol. i. p. 98.) says, that the air is bad, and the aspect of the inhabitants, of whom he speaks in very degrading terms, yellow and unhealthy. See Savary's *Letters on Egypt*, vol. i. p. 562, &c. There is in this town a convent of religious Franciscans established for the purpose of entertaining the persecuted Christians in Nubia. They are chiefly Catholics, intermixed with Coptits and Moors. The poultry bred here, and sent down to Cairo, is esteemed the best in Egypt. But the great export from Achmim is wheat, the country about it being sown with that grain, and the crops being superior to any in Egypt. They have also abundance of fish, particularly the BISSY. The women seldom marry after sixteen; and several were seen with child who were under eleven years of age.

ACHMOUNAIN, a village in Upper Egypt, about four miles to the north of MELAQUI, which is remarkable for the ruins it contains, and particularly for a superb portico in good preservation. On the frieze there are carved several hieroglyphics, which probably exhibit the history of the time, the place, and the deity in whose honour this monument was raised. It is particularly described by Savary. *Letters*, vol. i. p. 546, &c.

ACHNE, *Αχνη*, has various significations: sometimes it denotes lint, at other times chaff, or froth of the sea. Hippocrates uses it to denote a white mucilage, observable in the eyes of patients who have fevers, and also a white mucus in the fauces, thrown up from the lungs.

ACHNE, in *Geography*, an ancient name given to one of the islands of Rhodes, afterwards called *Cafes*.

ACHNE, in *Medicine*. See *ACRIMONY*.

ACHOLLA, in *Ancient Geography*, a free city of Africa propria, mentioned by Strabo and Stephanus; called by others *Aiclla*. Ptolemy has fixed its situation between Thapsus and Ruspe; and Dr. Shaw (*Trav.* p. 111.) supposes it to be the present Elalia, lying upon the borders of a fertile plain, which extends from Salecto to the vicinity of Sbeah.

ACHOMBONE, in *Geography*, the capital of the canton of AXIM, on the gold coast of Africa. It is defended by a Dutch fort; and the houses are separated by avenues planted with fruit-trees, which form elegant vias. The river Axim runs through the town.

ACHONRY, a small town of Ireland, in the province of Connaught, and county of Sligo, situate on the river Shannon.

ACHOR, in *Scripture Geography*, a valley of Jericho, lying along the river Jordan, not far from Gilgal; so called from *ACHAN*, who was there stoned to death.

ACHOR, in *Mythology*, the god of flies; to whom, according to Pliny, the inhabitants of Cyrene sacrificed, in order to obtain deliverance from these insects, and the disorders occasioned by them.

ACHOR, in *Surgery*, a species of herpes, the crustea lactea of some authors, and in England the scald-head. It is a sort of small running ulcer on the face and head, chiefly of children while they suck, by which the skin is broke into

a number of little holes, out of which issues a viscid humour, like ichor, whence its name. When the disease spreads, this serum dries, and forms a scab. Achor differs from the *FAVUS* and *TINEA* only in the degree of virulence. When the perforations are large, it is called favus, and tinea, when they are like those which are made by moths in cloth. By tinea is generally understood a dry scab on the hairy scalp of children, with thick scales, and an offensive smell; and when the disorder affects the face, it is called *CRUSTA LACTEA*. Mr. Bell, in his treatise of ulcers, says, that both these may be reduced to the same species of *HERPES*, viz. the herpes pustulosus, as they differ only in situation. Dr. Cullen considers this disease as a synonym of *ULCUS*, where he also places the crusta lactea, in the class *locales*, and order *dialyses*. When it happens to children, otherwise healthy, it will be commonly sufficient to keep the belly moderately lax, to preserve cleanliness, and to restrict them to a moderate diet. The hair should be kept short, and the head washed with soap-suds; and an issue may be of service. When the disorder is more violent, attended with much itching, paleness of countenance, and other unpleasant symptoms, the same method of treatment will generally succeed. Small doses of calomel may be administered as an alterative, and the antimonial wine, at proper intervals, as the stomach will bear. The unguentum è pice may be used externally two or three times a week; or cream mixed with chalk in fine powder. When the humour is repelled, warm sudorifics should be used; and though the cold-bath should be avoided, the warm-bath will be beneficial. When the hair is short, the part may be washed with a lotion made of aq. pur. ℥i. and gr. x. of hydrargyrus muriatus. Motherb. Dict. by Wallis. See *ACRIMONY* and *TINEA CAPITIS*.

ACHRADINA, or as Cicero has it, *ACRADINA*, in *Ancient Geography*, one of the cities, or divisions of Syracuse, and the largest, most beautiful, most fertile, and best fortified of the five. The others were the island Nafos, or Ortygia, Tyche, and Neapolis; to which was afterwards added the hill called Epipole. It was adorned, according to Cicero, (l. iv. c. 53, de Syraculis), with a very spacious forum, beautiful porticos, a very elegant prytaneum, a capacious senate-house, and a superb temple of Jupiter Olympius. The rocks of this quarter of Syracuse, which are formed by marine depositions, possess the singular property of dissipating or absorbing the moisture of dead bodies so speedily, that they are preferred in vaults excavated for the purpose, in their proper form and habiliments.

ACHRAS, or *SAPOTA-PLUM*, in *Botany*, a genus of the *Hexandria Monogynia* class, and of the natural order of *Dumose*. The characters are; the calyx is a perianthium, consisting of six ovate, concave, erect leaflets, the outer broader and shorter, and the inner coloured: the corolla is one-petalled, ovate, of the same height with the calyx, with the border cut into six subovate flat divisions, and scales at the jaws of the corolla, equal in length to the divisions, narrower, spreading, and emarginate; the stamina have six short awl-shaped filaments at the jaws of the corolla, alternate with the divisions, bent inwards, and the anthers are sharp: the pistillum has a roundish, flattened germen; the style is awl-shaped, and longer than the corolla; and the stigma is obtuse: the pericarpium is a globose, very succulent pomum, with twelve cells: the seeds are solitary, ovate, shining, scarred on one side, and pointed at the base. There are four species, viz. 1. The *mammosa*, or mammee sapota, otherwise called nipples S. or American marmelade, growing in America to the height of thirty or forty feet, with

leaves a foot long, and three inches broad in the middle, cream-coloured flowers, and large oval fruit, containing a thick luscious pulp, called natural marmelade; this tree is planted for the fruit in Jamaica, Barbadoes, Cuba, and most of the West India islands, and was cultivated here by Mr. Miller in 1739: of this there is a variety, called the bully or nifberry bully-tree, because it is the tallest of all the trees in the woods: it is esteemed one of the best timber-trees in Jamaica. 2. The *sapota*, which grows to the height of sixty or seventy feet, without knots or branches, and bears a round, yellow fruit, bigger than a quince, which smells well, and is of an agreeable taste; it is common at Panama, and some other places in the Spanish West Indies, but not to be found in many of the English settlements; it was cultivated here by Mr. Miller, in 1739. 3. The *difsecta*, or cloven-flowered S. cultivated in Malabar for the fruit, which is of the form and size of an olive, having a pulp of a sweetish acid flavour; its leaves are used for cataplasms to tumors, bruised and boiled with the root of *cureuma* and the leaves of ginger, supposed to be a native of the Philippine islands, and probably growing in China, and found by Forster, flowering in September, in the island of Tongatabu. 4. The *salicifolia*, or willow-leaved S. called in Jamaica white-bully tree, or galimeta wood, which supplies good timber; cultivated here by Mr. Miller, in 1758. The bark of the *sapota* and *mammosa* is very astringent, and is called *CORTEX Jamaicaensis*. This was once supposed to be the true Jesuit's bark, but its effect on the negroes has been pernicious. These trees being natives of very warm climates, cannot be preserved in England, unless they are placed in the warmest stoves, and managed with great care. Miller's Dict. by Martyn.

Gmelin has added the *balata*, with ovated oblong leaves, hoary underneath, and an oblong ovated pomum.

ACHRIDA. See *OCHRIDA*.

ACHROCORDES of *Java*, in *Natural History*, one of the genera of serpents, in the second volume of Count de la Cèpede's natural history. This genus is described by M. Hornstادت, a Swedish naturalist. Its body and tail are covered with little warts or tubercles; its back is black; its belly and sides are whitish; the latter are marked with black spots; the head is flat, and covered with small scales; each jaw of the mouth, which has a small opening, is armed with a double row of teeth, but it has no poisonous fangs: the largest part of the body is near the anus, and the tail is remarkably slender. The specimen from which this description was taken measured eight feet and three inches in length; its tail was eleven inches long; and the greater diameter of the body was above three inches. It was a female, and in it were found five young ones, completely formed, and nine inches long.

ACHROMATIC, composed of *α priv.* and *χρῶμα, colour*, and denoting *without colour*, a term, says M. de la Lande, first introduced into his astronomy, to denote telescopes of a new invention, contrived to remedy aberration and colours. See *ABERRATION* and *TELESCOPE*.

ACHRONICAL, in *Astronomy*. See *ACRONYCHAL*.

ACHSTEDE, in *Geography*, a small town of the circle of Lower Saxony, in the duchy of Bremen, two leagues north of Bremen.

ACHSTETTEN, a town of Germany, in the circle of Swabia, two leagues N. W. of Augsburg.

ACHTELING, a measure for liquids used in Germany. Thirty-two achtelings make a heemer; four feiltems or feiltins make an achteling.

ACHTIAR, in *Geography*, a small commodious haven near Inkerman in the Black Sea.

ACHTIRKA, a town of Russia, in the government of Charkov, ten German miles W. S. W. of Charkov.

ACHTUBA, a river of Russia, which rises from the Volga, a little above the town of Tzaritzin, and runs parallel with that river to Krasnojarsk, near which place it joins it, and flows with it into the Caspian Sea.

ACHY, a species of *CASSIA*, that grows in Arabia.

ACHYR, in *Geography*, a strong town and castle of the Ukrain, subject to the Russians since 1667. It stands on the river Uorskolo, near the frontiers of Russia, 127 miles west of Kiow. E. long. 36° 0'. N. lat. 49° 32'.

ACHYRACANTHA, in *Botany*, a name given by Dillenius to the *ACHYRANTHES* of Linnæus.

ACHYRANTHA, a species of *ILLECEBRUM*.

ACHYRANTHES, formed of *αχυρον*, chaff, and *ανθος*, a flower, in *Botany*, a genus of the *pentandria monogynia* class of plants, belonging to the natural order of *miscellanea* Linn. and of *amaranthi* Just. The characters are these: The calyx consists of an outer perianthium, that is three-leaved, lanceolate, acute, permanent; and of an inner one, that is five-leaved and permanent: it has no corolla; the nectarium has five valves, surrounding the germ, bearded at the tip, concave and caducous: the stamina are filiform filaments, of the length of the corolla, and the anthers are ovate and incumbent: the pistillum has a superior turbinate germ; the style is filiform, of the length of the stamens, and the stigma is bifid and villous: the pericarpium is a capsule, roundish, one-celled, not gaping; and the seed is single and oblong. There are eleven species, *viz.* 1. *aspera*, or rough, of which there are two varieties; the Sicilian plant with oblong pointed leaves, growing near three feet high, and the Indian, found in Malabar, Ceylon, Jamaica, and almost every where within the tropics, with broader leaves, and on both sides smooth and green, cultivated here in 1713: 2. *lappacea*, or burry, a lofty plant, a native of Malabar and Ceylon, cultivated by Mr. Miller in 1759: 3. *muricata* or prickly, a native of India, introduced in 1777, by M. Thouin: 4. *patula* or spreading: 5. *alternifolia* or alternate-leaved; both natives of the East Indies: 6. *corymbosa*, formerly belonging to the *Celista* of Linnæus, a native of Ceylon: 7. *dicbotoma*, a native of Virginia: 8. *prostrata*, a native of India: 9. *nivea* or white, a native of the Canary islands, introduced here in 1780, by Mr. Masson, and flowering from May to July: 10. *altissima* or tall, climbing up trees to the height of twenty feet, common about Spanish-town and Kingiton, in Jamaica, and in the woods of Domingo, and called by Browne bastard hoop-withe: 11. *polygonaoides*, found in Arabia and Malabar. Gmelin enumerates sixteen species; adding the *papposa*, *villosa*, or *ILLECEBRUM lanatum*, *paniculata*, *capitata*, and *decumbens*, from Forsk. *fl. eg. Arab.* The several species have little beauty, and are only preserved in botanic gardens.

ACHYRONIA, in *Botany*, a name given by Van Royen to a genus of plants called by Linnæus *ASPALATHUS*.

ACHYROPHORUS, the name given by Vaillant to the *HYPOCHOERIS* of Linnæus.

ACHIZIB, or **ACHAZIB**, in *Scripture Geography*, a town of Galilee, in the tribe of Asher, nine miles from Ptolemais; probably the same with that called by the Greeks *Ecdippa*; also, a town in the more southern parts of the tribe of Judah.

ACIA, formed of the vernacular name *Aciova* in Guiana, in *Botany*, a genus of the *Madelpia dodecandria* class, and natural order of *pomacea*. Its characters are: the calyx

is a one-leaved, turbinate, curved perianthium, with a five-parted border, the parts roundish and spreading, the uppermost and two lowest larger, the two middle ones smaller: the corolla has five, oblong, rounded petals; the three upper longer, ascending; the two lower shorter: the lamina consist of twelve unequal filaments, uniting at bottom in a linear fleshy membrane, inserted into the calyx between the two smaller petals; the anthers are roundish and small: the pistillum has an ovate germen, above the base adhering by the membrane of the lamina to a rib internally prominent from the bottom of the calyx; the style filiform and curved; the stigma acute: the pericarpium is an ovate, fibrous, chinked, large drupe: the seed is an ovate nut, with a brittle shell. There is one species, which is a tree, whose trunk is sixty feet high, and three or four feet in diameter, covered with a smooth grey bark; the fruit is of the size of a walnut, inclosing a large kernel, of an agreeable taste, and eaten by the negroes when brought to market in August at Cayenne; they also extract an oil from it, as sweet as that of almonds; the wood is hard and heavy, and of a yellowish white colour.

ACIA, a term in the Roman *Surgery*, concerning the meaning of which physicians and commentators are much divided. Celsus, speaking of the healing of wounds, either by nature, or by the fibula, says, each is best effected by means of a soft acia, not too much twisted, that it may fit the easier on the body. Boethornius will have the acia to be the acus of the fibula, or that part which is pinched: in which view, acia mollis only imported, that it was not set so as to pinch too much.

ACICOCA, in *Botany*, an herb that grows in Peru, and is sometimes used instead of the herb *PARAGUAY*, of which it is said to have all the properties.

ACICULA, in *Natural History*, a species of *BUCCIUM*, with a smooth, subulated, very thin shell, transversely striated with contiguous spiral windings. It is found in fresh waters. *Acicula* is also a species of *HELIX*, with an oblong acuminate shell, longitudinally ribbed and transversely striated, and an oval aperture; found in Coromandel.

ACICULÆ denote small spikes, or prickles, in form of needles, with which nature has armed several animals and plants.

ACID, in *Chemistry*, is used in common language as a generic name for all those substances which impels the organs of taste with a sharp sour sensation. Since, however, there are certain bodies destitute of this property, which nevertheless are classed by all chemical writers as acids, this popular characteristic must be abandoned as essential, for one which is more comprehensive.

Newton's well known definition of an acid, "that which strongly attracts, and is strongly attracted," would have required notice only in the history of chemical opinions, if it had not been implicitly adopted by one of the ablest chemists of the present age, Cit. Gayton Morveau. (Dict. Method. art. *acide*) "Now if any one should ask me," says he "what is an acid, I reply, it is that which of all palpable substances is the most powerful solvent; that which acts on the greatest number of other bodies; that, as Newton has so well expressed it, which strongly attracts, and is strongly attracted." It is a greater fault for a definition to be too comprehensive than too circumscribed, and that which has been just quoted not only includes alkalies as well as acids, as indeed Morveau allows, but all the active chemical agents, such as water, alcohol, hydrogen, oxygen, &c. for they are all powerful solvents, act on a great num-

ber of other bodies, strongly attract, and are strongly attracted. In fact, there is no one property peculiar to the genus acid, and which belongs to each species, so that it is not possible to give a definition of the term: nevertheless, by combining together the general distinguishing qualities of acids, and noting at the same time the exceptions to these, a description may be produced more illustrative than the most laboured definition.

Previously to the consideration of the general properties of acids, it will be an advantage to give a sketch of the opinions held by the old chemists concerning their origin and mode of action, and to examine more at large the theory of Lavoisier upon the same subject.

When the mechanical system was in vogue, according to which the chemical action of bodies was explained by the supposed figure and size of their respective molecules, acids were supposed to be a genus of salts, composed of extremely small and sharp spicula, which readily penetrated into the minutest pores of the substances subjected to their action, and thus separated from each other their component parts; while, at the same time, the acid became neutralized by its points being sheathed in the pores of the body with which it was mixed. This explanation was, however, ably controverted by Boyle, and by Stahl in his work on salts; and, at length, together with other chemical phenomena, the solvent power of acids was arranged by Macquer and his contemporaries, under the general laws of elective attraction.

After a few of the acids were discovered, it was supposed by Paracelsus, and several chemists of his age, that there existed an universal saline element, or principle of acidity common to all acids, which therefore differed from each other rather in mode than essence. Becher, though he allowed the unity of the cause of acidity, yet affirmed it to be composed of water and variable earth, and therefore not entitled to rank as an element. Stahl, in his valuable researches into the existence of phlogiston, and the composition of salts, was induced to believe that the sulphuric acid, or as it was then called the vitriolic, was the original acid, of which all the rest were only modifications. A similar opinion was held by Sage and Landriani, except that the former supposed the phosphoric acid, and the latter the carbonic acid, to be the primary one. The discovery of dephlogisticated air, (oxygen gas) having been made by Priestley in 1774, a multitude of experiments were soon after instituted by the chemists of Europe on this interesting substance: and, in 1778, a memoir was presented to the royal academy of sciences at Paris, by Lavoisier, on the composition of the acid of sugar. In this, after having described the method of preparing the acid of sugar by means of nitrous acid, he concludes, that the conversion of nitrous acid into nitrous gas, is owing to the abstraction of part of its oxygen by the supe-ior affinity of sugar for this substance, and that the sugar in consequence of its union with oxygen acquires the properties of an acid. Proceeding afterwards to generalize this inference, he maintains that oxygen is the universal acidifying element, and that by combining in certain proportions with combustible bases without decomposing them, it thereby converts them into peculiar acids. This doctrine, simple and elegant, and plausible as it was, did not however at first meet with general concurrence; but, in the course of the controversy, it gradually acquired, and merit d new advocates from the accumulated testimonies of experiment in its confirmation.—The publication of Lavoisier's Elements of Chemistry, in 1789, contributed more than any thing else to settle the opinion of chemists upon

the subject; in this work he demonstrates that phosphorus and charcoal, and sulphur, being separately inflamed in oxygen gas, combine with its base, acquire an additional weight equivalent to that of the air consumed, and are converted into the phosphoric, carbonic, and sulphuric acids.

Besides the synthetical arguments above alluded to, the Lavoisierian theory is supported by an equal number of analytical experiments, in which most of the known acids are decomposed into oxygen, and one or more combustible bases. The most elegant specimen of both kinds of proof is furnished by the nitrous acid: if purified nitre, (nitrat of potash) previously deprived of its water of crystallization, be exposed in a silver retort to a low red heat, a large quantity of gas, consisting of oxygen and azot, in the proportion of about 80 of the former to 20 of the latter, will be given out, and pure potash will remain in the retort, whose weight together with that of the gasses will be equivalent to that of the original nitre; the mixed gasses are wholly destitute of acid properties, but by being forced into union by means of the electric spark, their volume is gradually diminished, and at length the whole is reduced to an acid liquor, possessing all the qualities of nitrous acid; if this and the potash remaining in the first process be mixed together, chemical union immediately ensues, and nitre is reproduced.

Three of the known acids are incapable of being decomposed by any method that we are at present acquainted with; it is therefore only from analogy that they are supposed to contain oxygen for their acidifying principle; this circumstance, however, is no peculiar objection to the theory of Lavoisier, for since all the decomposable acids may be resolved into oxygen and a simple or compound combustible base, it seems consistent with the principles of chemical philosophy to establish that as a general law, to which in the present state of our knowledge, there is not a single exception.

Substances, whose mutual affinity is considerable, may combine with each other in various proportions, and the resulting compounds will vary in their properties accordingly: this is the case with all the known acidifiable bases which in their lowest state of oxydation exhibit no acid properties whatever: nor is the development of an acid an evidence of the complete saturation of its base with oxygen, there being several acids capable of combining with additional quantities of oxygen, and thus acquiring new and more decided acid characters.—It is even supposed that some bases may be oxygenated in three different degrees, preserving in each the essential qualities of acids: hence results an important arrangement of acids according as they are oxygenated in the first, second or third degree. The reformed chemical nomenclature on the principles of Lavoisier and Berthollet, has ingeniously distinguished these states by the terminations *ous* and *ic*, and the prefix *oxy* (for oxygenated); thus sulphur, at the lowest state of oxygenation in which it acquires acid properties, is called *sulphureous acid*; when still further oxygenated it becomes *sulphuric acid*; thus also, muriatic acid, when raised to the third degree of oxygenation, becomes *oxy-muriatic acid*.

The old chemists divided acids into mineral, vegetable, and animal, according to their supposed origin; this, however, is not only an inconvenient, but an incorrect method of arrangement, as many of these bodies are found in all the three natural kingdoms. Upon the whole, perhaps, the best way of arranging them is the following:

States of Oxygenation.

	Bases.	1st.	2d.	3d.
With simple radicals.	Sulphur	Sulphureous	Sulphuric	
	Azot	Nitrous	Nitric	
	Phosphorus	Phosphoreous	Phosphoric	
	Carbon	-	-	Carbonic
	Arsenic	Arsenious	Arsenic	
	Molybdena	-	-	Molybdic
	Chrome	-	-	Chromic
With double radicals.	Carbon and Hydrogen in different proportions.	Acetous	Acetic	
		Tartaric		
		Citric		
		Oxalic		
		Malic		
		Gallie		
		Benzoic		
		Succinic		
		Saccharic		
		Formic		
Sebacic?				
With triple radicals.	Carbon, Hydrogen, and Azot.		Prussic	
			Lithic	
With unknown radicals.			Muriatic	Oxymuriatic
			Fluoric	- riatic
			Boracic	

classes of earthy, neutral, and metallic salts, most of which are susceptible of crystallization.

5. The property of incombustibility has been generally attributed to acids as a characteristic, but certainly very erroneously. The most incombustible of the acids are no more so than the fixed alkalies, the earths, and the perfect metallic oxys; and all the acids with two or three radicals, and those with simple radicals in the first state of oxygenation, are, strictly speaking, combustible, that is, they unite at a certain temperature with oxygen gas, during which combination heat, and in some cases light also are extricated.

The medical effects of acids are considerable, and vary according to their degree of concentration; the most active, when pure, or nearly so, are used externally as caustics and escharotics, and as powerful stimulants in some cases of palsy: if largely diluted with water, they may be safely employed internally in fevers, inflammations, and hemorrhages, as refrigerants and allringents.

For the particular acids, see them under their specific names.

Encycloped. Method. art. Acide.—Lavoisier's Elements of Chemistry.—Priestley on Air. vol. ii.—Fourcroy, Systeme des Connoiss. Chimiq. vol. ii.—Macquer's Chem. Dict. art. Acid. Cullen Mat. Med. vol. ii.

ACIDALIUS, VALENS, in *Biography*, an eminent grammarian and critic, was born at Witloch, in Brandenburg, and after visiting several academies on the continent, fixed his residence at Breslaw. Being disappointed of employment, he became a Roman catholic, and was chosen rector of a school at Niesla. Thuanus informs us, that he was a very close student, and that his nocturnal studies, which were unseasonably prolonged, whilst he was composing his conjectures on Plautus, occasioned a distemper that terminated in his death, on the 25th of May 1595, when he was just turned of 28. He wrote a Commentary on Quintus Curtius; Notes on Tacitus; on the twelve Panegyrics; besides speeches, letters, and poems. A small piece, printed in 1595, and intitled, *Mulieres non esse homines*, or that "women were not of the human species," was falsely ascribed to him. He only accidentally found the MS. and printed it. It is said, that in order to appease the wrath of some ladies, who reproached him as the author, he declared his opinion, that the author was a judicious person, the ladies being certainly more of the species of angels than of men. M. Baillet, who admits him among his *Enfans celebres*, says, that his comment on Plautus was written when he was not more than seventeen or eighteen years of age, and that he composed several Latin poems about the same period.

ACIDALUS, the name of a fountain in Orchomenos, a city of Bœotia, in which the Graces, who are sacred to Venus, bathed: hence the epithet *Acidalia*, given to Venus. See Virgil *Æn.* l. i. v. 724.

ACIDAVA, in *Ancient Geography*, a town of Dacia, towards the country of the Jazygii.

ACIDIFIABLE base, ACIDIFICATION, in *Chemistry*. The general theory of the formation of ACIDS has already been explained under that term. An acidifiable base or RADICAL is any substance, whether simple or compound, that is capable of uniting without decomposition, with such a quantity of oxygen as thereby to become possessed of acid properties. All acids agree with each other in containing oxygen, but differ from each other in their radicals; hence it is the acidifiable base that determines the species of acid. This term was unknown in chemistry previously to the discoveries of Lavoisier on the composition of acids, because those bodies that are now proved to be convertible

The chemists of the last century seem to have been acquainted only with the three mineral acids, as they are called, viz. the sulphuric, nitric, and muriatic, and with the acetous acid or vinegar: the accuracy and industry of the moderns have increased the number of species to twenty-nine; how many more may be hereafter added to the list it is impossible to ascertain. Without adverting to the possibility of discovering new acidifiable bases, it is by no means improbable, however, that many of the simple combustible bodies as the metals, or the compound ones as phosphorated hydrogen, sulphurated hydrogen, the metallic phosphurets, &c. may be so far saturated with oxygen, as to become peculiar acids.

The characteristic properties of acids, *i. e.* the peculiar laws and effects of their action on other chemical substances, yet remain to be mentioned.

1. When taken into the mouth they occasion a sour taste.

The oxymuriatic acid alone is destitute of this property; the rest possess it in a greater or less degree according to their liquid or solid form, and the energy with which they act on the animal fibre, from the corrosive and intensely sour sulphuric acid, to the boracic, whose taste can scarcely be perceived.

2. They change native vegetable blues to red.

Indigo is not turned red by any acid, nor does turnsole paper yield to some of the weakest ones, but both these pigments are artificial: the sulphureous and oxymuriatic acid discharge entirely the native vegetable blues, not however before having changed them to red.

3. They have a stronger affinity for alkalies than there have for any other substance. Therefore, all the soluble combinations of alkalies with metallic oxys, with earths, with sulphur, &c. are decomposed by any acid.

4. They combine with earths, with alkalies, and with metallic oxys, forming the numerous and very important

into acids by combination with oxygen, were supposed by Stahl and his followers to be already acids united to PHLOGISTON: thus sulphur, which according to the present theory is a chemical element, and capable, by combination with oxygen, of being converted into SULPHURIC ACID, was, by the Stahlians, considered as a compound of sulphuric acid and phlogiston.

The object of the reformed chemical NOMENCLATURE is to denote, as much as possible, the composition of bodies in the names appropriated to them; thus sulphuric, carbonic, and phosphoric acids express the perfect saturation of their respective bases, sulphur, carbon and phosphorus, with oxygen. This rule, however, has by no means been uniformly adhered to, and the young student in chemistry, reading of the BENZOIC, SUCCINIC or SEBACIC acids would on this account be led into an error if he supposed that benzoe, amber, or fat were the acidifiable bases of the acids that bear their names. Almost all substances are capable of combining with oxygen, but it does not therefore follow that they are acidifiable bases; that the process of *acidification* may take place a large proportion of oxygen seems essentially necessary, otherwise the result is only an oxyd. Hence oxydable substances may be divided into those which are capable only of a low state of oxydation, or *proper oxydable bases*; and into those capable of a further combination with oxygen by which they acquire acid properties, or *acidifiable bases*. Acidification may be performed in various ways according to the temperature and the affinity of the base for oxygen. The two great reservoirs from which nature procures her oxygen for the composition of acids are WATER and atmospheric AIR, the former consisting of oxygen and hydrogen, and the other of oxygen and azot. The chemist employs principally oxygen gas and atmospheric air at a high temperature, as in the formation of carbonic and phosphoric acids by combustion of charcoal and phosphorus, or the nitric acid as in the formation of the SULPHURIC and OXALIC acids. The acidifying processes of art are generally more rapid than those of nature.

ACIDITY, the quality which constitutes or denominates a body acid, or that sensation of sharpness and sourness which acids excite upon the organ of taste.

ACIDON, a river of Peloponnesus, called also *Acidas*, which united with Jardanus, near Anigrus.

ACIDOTON, in *Botany*, a genus of the *monoecia polyandria* class and order; the characters of which are, that it has male and female flowers on the same, or a different tree; the calyx of the male is a five-leaved perianthium, and the leaflets are ovate-lanceolate, and reflex; it has no corolla: the stamens are numerous filaments from 35 to 40, placed on a globular receptacle, the outer shorter, the inner longer and upright: the anthers are cordate-ovate, upright and small: the calyx of the female is a six-leaved perianthium; the leaflets linear-lanceolate and spreading; no corolla: the pistillum is a three-cornered germen: the style short, acute, thick and trifid at the top; the stigmas are tomentose and reflex: the pericarpium is a three-grained, hirsute, three-celled capsule; and the seeds are solitary and ovate. There is one species, *viz. A. urens*, a native of Jamaica, described by Sloane, though he never saw the flower and fruit, which grows to the height of eight or nine feet. Miller's Dict. by Martyn. This, in Gmelin's edition of Linnæus, is a genus of the *polyandria monogynia* class and order.

ACIDOTON is also a species of ADELIA.

ACIDULA, in *Ancient Geography*, a fountain of Italy, near Linternum, to the waters of which, probably impregnated with fixed air, or carbonic acid, Pliny ascribes a salutary effect, as an antidote to stone and gravel.

ACIDULÆ, *Eaux acidules*, Fr. a species of mineral waters, distinguished by their sparkling appearance when poured from one vessel into another, and by their brisk acidulous taste; they contain a considerable quantity of free carbonic acid to which these properties are owing.

ACIDULATED, a term denoting any thing blended with acid juices, in order to give it a coolness and briskness.

ACIDULOUS denotes a thing that is slightly acid: it is synonymous with the word *sub-acid*.

ACIDULUM, *Acidul.*, Fr. a term used in the new chemical nomenclature, to express a genus of native compound salts, in which the alkaline bases superaturated with acid, and which therefore are employed in various chemical processes, and for economical purposes as acids. We are at present acquainted with two species, the tartareous acidulum, or *acidulous TARTRITE of potash*, and the oxalic acidulum, or *acidulous OXALAT of potash*.

ACIDUM PINGUE,—*Cauticum—Acide gras*. Fr. *Fett-saure* Germ.

In the year 1764, when the abilities of Macquer, Bergman, Black, and Scheele, had already discovered many important chemical facts, which were with difficulty explicable on the Stahlian theory, and when the rigorous method of demonstration so honourable to the present age had not as yet been universally assented to, there appeared in German a volume of Essays on the subject of Lime, by Fred. Meyer an apothecary of Olnaburg, announcing the discovery of a new chemical agent, the *acidum pingue*, with an extensive theory dependent upon it, and, in many respects, essentially contrary to the conclusions of Dr. Black, from his admirable experiments on the same subject. Several of Meyer's countrymen became the zealous advocates of his system, and it was soon taught publicly in many of the German schools. At length, in 1769, Jacquin published an able vindication of Black, intitled *Examèn chemicum doctrinæ Meyerianæ de acido pingui, et Blackianæ de aere fixo respectu calcis. Vindobonæ*. This work brought out in the course of the following year a reply by Crautz, and another by Fourchy, both of them strenuously defending the doctrine of Meyer. It does not appear that any thing more was expressly written on either side, but by the accumulation of the splendid discoveries of Lavoisier, Priestley, &c. the theory of Meyer was silently overwhelmed, and the conclusions of Black unequivocally established. Nearly the same hypothesis was afterwards revived by Sage in the effects attributed by him to an imaginary principle, the *igneous acid*, (*acide igné*) but which has not been since recognized by any chemical writer.

The facts upon which Meyer's doctrine is founded are the following. Mild calcareous earth being kept at a full red heat for a certain length of time is converted into quicklime; this change, which at present is accounted for by the volatilization of its water and carbonic acid, was by Meyer supposed to be owing to the combination of the acidum pingue with the calcareous base, and the consequent disengagement of its water; hence originated a caustic earthy salt soluble in water; if to this lime water, a mild alkali, be added, a decomposition takes place, the acidum pingue unites by preference with the alkali, making it caustic, while the calcareous earth combines with a portion of water, becomes insoluble, and is precipitated in the state of mild calx. So far the theory of Meyer was supported by facts which, however equivocal and imperfect, had at least some plausibility. But, in his attempt to raise this *causticum* to the rank of an acid, and of a prime agent in chemical phenomena, he deviates into the wildest conjectures without the shadow of a fact in their support. The following are the chief

chief of the properties which he ascribes to it. It is a compound elastic subtle substance, analogous to sulphur, nearly approaching to the purest matter of fire or light, undecomposable, consisting of a saline acid principle and fire, compressible, capable of penetrating all vessels when red-hot, and sensibly heavy. It has an astringent force, and combines by means of fire with calcareous earth and the alkalis, and with metals when in the state of calx; from its uniting with sulphur, oils, and calcareous earth, he infers, that the acid is united with something *fat or oily*, (hence its name *acidum pingue*) and this oil so far sheaths its properties as to prevent the acidity of its taste, &c. Hence it is evident, that the properties of this imaginary substance are in part purely fictitious, and for the rest a mixture of discordant qualities selected from those of the pure alkalis, oxygen, and carbonic acid.

Essais de Chimie sur la Chaux, par M. DREUX, (translated from the original German of Meyer,) Encycloped. Method. art. Acidum pingue.—Macquer's Chemical Dict.—Lavoisier's Essays, vol. i.

ACIDUM vitrioli vinosum. See Sulphuric ETHER.

ACILA, in *Ancient Geography*, a staple or mart town in Arabia Felix, on the Persian gulph, from which, according to Pliny, (H. N. v. i. p. 338.) the Scenitæ Sabæi set sail for India. This is a different place from Ocelis, or OCILIA.

ACILISENE, a district of Armenia, situate between Mount Taurus and the Euphrates, where it bends its course southward towards Mesopotamia. Strabo, vol. ii. p. 799.

ACILIUS, GLABRIO MARCUS, in *Ancient History*, a consul of Rome, who distinguished himself by his military skill and bravery on several occasions, and particularly in the victory which he gained over Antiochus the Great, king of Syria, at the straits of Thermopylæ. He built the temple of Piety at Rome, in consequence of a vow which he made before this battle.

ACINA, in *Ancient Geography*, a town of Africa, mentioned by Pliny H. N. vol. i. p. 345.

ACINACÆ, the name of a people inhabiting Bactria.

ACINACES, in *Antiquity*, a kind of cutlafs or scimitar, in use among the Persians.

ACINACIFORM leaf. See LEAF.

ACINARIA, in *Botany*, a name given by some to the marsh whortle-berries, or vaccinia palustris.

ACINASIS, in *Ancient Geography*, a river of Asia, at the southern extremity of Colchis, which discharges itself into the Euxine sea, between the Bathys and the Iñis.

ACINCUM, a city of Pannonia, the situation of which is not precisely known. Some suppose it to have been at or near Buda.

ACINI, in *Botany*, small grains or berries, growing in bunches, after the manner of grapes. The berries of the elder, privet, ivy, &c. are of this kind, and so called. Anatomists have called some glands of a similar formation, *acini glandulosi*.

ACINIFORMIS *Tunica*, the same with TUNICA UVEA of the eye. It is also called acinosa tunica.

ACINIPPO, in *Ancient Geography*, a town of Bœtica, of which the ruins called *Ronda la Vieja* are to be seen near Arunda, in the kingdom of Granada.

ACINODENDRON, in *Botany*, the name given by Burman, in his Thesaurus, to a genus of plants, afterwards called MELASTOMA. It is also the trivial name of a species of this genus.

ACINOS, stone or wild BASIL. See THYMUS.

ACINTLI, in *Ornithology*. See QUACHILTO.

ACINUS, in *Botany*, properly signifies the grape. It is also the name of the STAPHYLOMA.

ACIOJA. See ACIA.

ACIPENSER, in *Ichthyology*, a genus of fish of the order of Chondropterygii; the characters of which are, that the head is obtuse, that the mouth is under the head, retractile, and without teeth; that the four cirri are below the snout, and before the mouth; that the aperture of the gills is at the side; and that the body is elongated, and angulated with many series of scuta or scaly protuberances. There are five species, viz. *A. Sturio*, or STURGEON; *A. Ruthenus*, or STERLET; *A. Huso*; *A. Schyfa*; and *A. Stellatus*, or KOSTER.

ACIPHAS, in *Ancient Geography*, one of the four cities of Phocis, on the river Pindus.

ACIPHYLLA, in *Botany*, a species of LASERTIUM.

ACIRIS, in *Ancient Geography*, a navigable river of Italy, not far from the city of HERACLEA, mentioned by Strabo, vol. i. p. 405. now a rapid, irregular torrent, called Agri.

ACIS, in *Entomology*, a species of PAPILO, with bicaudated wings, the lower part of the fore-wings being green, sprinkled with gold; the hinder golden, spotted with green and black; found in Surinam.

ACIS, in *Geography*, a town of France, in the department of l'Aube, on the river Aube. N. lat. 48° 25'. E. long. 4° 10'.

ACIS, in *Mythology*, a beautiful shepherd of Sicily, the son of Faunus and the nymph Simaethis; who, being beloved by Galatea, incurred the rage of Polyphemus, and had his brains dashed out against a rock by this giant. He was afterwards changed by Galatea into a river of the same name. The Sicilian authors say, that Acis was the name of a king, that reigned in this part of the island in a very ancient period; and, to this purpose, they allege an inscription found near the river Acis, *Acì Castello*. He is said to have been slain in a fit of jealousy by Polyphemus, one of the giants of Ætna; and thus they trace the origin of the fable.

Acis, a river of Sicily, celebrated by the poets, viz. Theocritus, (Idyll. i. v. 69) Ovid, (Fasti, l. 6. v. 468) and Silius (l. xiv. v. 222), which flows from a cold spring at the foot of mount Ætna, and runs into the sea at the distance of about a mile from its source. From the rapidity of an arrow, with which it pursues its course between verdant banks, its name is derived. Bochart, (Geog. Sac. l. i. c. 28. apud op. tom. i. p. 529. Ed. Villem.) deduces it from the Syrian אַכִּישׁ, *achish*, to *hasten*, or to *be swift*. Its water is clear, and so cold as to be dangerous to those who drink it; and never freezes, though it possesses a degree of cold greater than that of ice. It is said to acquire a poisonous quality from the vitriol with which it is impregnated; though it was formerly celebrated for the sweetness and salubrity of its waters; which, according to Theocritus, were always held sacred by the Sicilian shepherds.

“Quique per Ætnæos Acis petit æquora fines,
Et dulci gratam Nereida perluit unda.”

Silius Ital. l. 14. p. 706. Ed. Drakenb.

This river is now called *Il Finne Freddo*, and *Acì Jaci* or *Chiaci*, according to the different Sicilian dialects. Antonine calls it *Accius*. *Acis* is also the name of a hamlet at the mouth of the river. There are several places in this district that take their names from the unfortunate shepherd *Acis*; such are, *Acì Aquileia*, *Acì Castello*, *Acì Terra*, &c. Brydone's Tour, vol. i. p. 118.

ACISANTHERA, in *Botany*, a species of RHFXIA.

ACITANI, in *Ancient Geography*, a people of Spain, supposed to be the same with the Lacetani of Pliny.

ACITHANIS, or ACITHIUS of Ptolemy, a small river of Sicily, now *Bergi*.

ACITLI, in *Ornithology*, the common Mexican name for the *COLYMBAUS cristatus*, or great crested GREBE, common to Europe and America, and called by authors the *LEPUS aqueus*, or water hare.

ACKEN, in *Geography*, a bailiwick of Magdeburg, in Germany, to which belongs a town of the same name, situate on the Elbe. It formerly belonged to the dukes of Saxony, and was hence called *Aque Saxonica*. The revenues of the six vicarages of this town are at present levied by the dean of the cathedral of Magdeburg; but the church was given in 1711, to the Calvinists. Busching.

ACKER Sound, lies north-east from the Naze of Norway, and north-west by west from the island of South Wiskholm. Siltser's Island is also west by north from Acker four leagues; and behind it is the small port of Grafwick.

ACKHMETCHID Gulph, is on the west side of the Crimea, and the sea through which ships pass to Preccop, and the north-west part of the Black Sea. Its west cape is N. lat. 45° 35'. and E. long. 52° 20'.

ACKLIN's Key lies about 50 miles south-east from Long island, or Yuma, one of the Bahama islands, having Long Key twelve miles to the north-west; and on the south-east side a chain of rocks. N. lat. 22° 10'. W. long. 73° 30'.

ACKNOWLEDGMENT Money, a sum paid in some parts of England by tenants on the death of their landlords, as an acknowledgment of their new lords.

ACKWORTH, a small village near Pontefract, in the county of York, which deserves mention on account of the benevolent institution supported in it for the education of the children of the Quakers. The original projector of this institution was Dr. Fothergill, who promoted a subscription for purchasing, improving, and furnishing an appropriate building, and an estate of eighty acres of land; and who, by his will, endowed it with a liberal bequest. This institution accommodates more than 300 children of both sexes under the same roof, who are furnished with all the necessary conveniences and comforts of life, properly clothed, and educated in every branch of knowledge, adapted to the stations in which they may be placed. It is conducted by a number of chosen guardians of ability, and of exemplary character, with a degree of order and decorum, which affords pleasure to persons of every description who occasionally visit it. The children are taught habits of regularity, of decency, and of respectful subordination to their superiors, of forbearance and affection to one another, and of reverence to their maker; and they are accustomed to that kind of silence and recollection, which was practised in some of the ancient schools of philosophy, and which give a peculiar and distinguishing character to the members of this society in the maturity of life.

ACLIDES, in the Roman *military art*, a kind of missile weapon, having a thong fixed to it, by which, after casting it out of the hand, it might be drawn back again. Servius describes the acிடæ as full of spiculae, or eminences. As it was formed with spikes, it would injure both where it struck, and when it was withdrawn. Each warrior seems to have been furnished with two. Vofs. Etym. Aquin. lex. Mil. t. i. p. 14. Pitisc. Lex. Ant. t. i. p. 17.

ACLOWA, in *Botany*, the name of a plant common in Guinea, and used by the natives to cure the itch. They rub it on the body, as we do our unguents. Petivier accounts it a species of colutea, and has named it the Guinea scorpioide colutea, with leaves like the gum tragacanth shrub. Phil. Transf. No. 268. abr. v. iv. p. 2. p. 322.

ACME, the height or top of any thing. The word is Greek, signifies point, and is more specifically used to denote the height, or utmost vehemence of a distemper.

Accordingly some institution-writers have divided diseases into four states or periods: 1. arché, the beginning or first attack: 2. anabasis, the growth: 3. acme, the height: and 4. paracme, which is the declension of the distemper.

ACMELIA, or **ACHAMELLA**, in *Botany*, a plant which grows in the island of Ceylon and Ternate, of which there are three species noted by botanists; two of which were formerly referred to the genus *VERBESINA*, in the Linnæan system. It is commended in nephritic disorders, but very rarely used. It is the *SPILANTHUS ACMELLA* with ovated, serrated leaves, a fruit stem, and radiated flowers. It became known in Europe by the letters of Horton, addressed to the Royal Society in 1701. Phil. Transf. vol. xxii. p. 760.

ACMÓDÆ, in *Ancient Geography*, seven islands in the British sea, supposed by some to be the Scilly islands, but by others, with greater probability, those of Hetland and Shetland near the Orkneys, on the coast of Scotland. Pliny, H. N. v. i. p. 223.

ACMON, in *Ancient History*, the name of one of the *DACTYLI IDÆI* according to Strabo, vol. ii. p. 726. Bryant says, (Mythology, vol. i. p. 513) that Acmon was a Cyclopiæ deity, under which title he was worshipped in Phrygia, whence the name of Acmonia. He was also revered by the Amazonians, and there was a sacred grove upon the Thermodon called acmonium, and held in great repute. He is represented by Callimachus (Hymn. in Dian. v. 146.) as the tutelary god of Thyrs, an ancient city of Greece, whose towers are said to have been built by the Cyclopiæans.

ACMONIA, or in Peutinger's map **AGMONIA**, in *Ancient Geography*, a town of Phrygia major, now in ruins. Cicero, pro Flacco, cap. 15. calls the inhabitants *Acmonentes*, and the city *Civitas Acmonensis*. There are many medals of this city in gold, bronze and silver. There was also a city of the same name, according to Ptolemy, in Dacia upon the Danube, near the capital Sarmitz, which was the position of the Roman colony, called *Ulpia Trajana*.

ACNIDA, formed of *a priv.* and *κνιδν*, a nettle, *Virginian hemp*, in *Botany*, a genus of the *diacna* order, and *pentandria* class of plants, of the natural order of *scabride* and *atriplexes* of Jussieu, the characters of which are as follow: the calyx of the male is a five-leaved perianthium, and the leaflets are ovate, concave, acute, and membranaceous on the edge; it has no corolla; and the stamina are five, capillary, very short filaments; and the anthers are versatile, bilocular, and forked each way: the calyx of the female is a many-leaved, linear, deciduous involucre; the perianthium is two-leaved, linear, very small and permanent; it has no corolla; the pistillum has a superior, ovate germen; the styles are five, long, reflex and pubescent; the stigmas are simple: the pericarpium is an ovate, compressed, many-angled fruit, furrowed, and covered with the succulent calyx: the seed is solitary, round and compressed. There is one species, viz. *A. cannabina*, which is a native of Virginia, and some other parts of America, but seldom cultivated in Europe. It has little beauty, and is applied to no use. Martyn's Miller. In the Linnæan system by Gmelin, it is a genus of the *pentandria pentagynia* class and order.

ACNUA, in *Roman Antiquity*, a measure of land about the quarter of an English acre.

ACO, in *Geography*, a town of Peru in S. America, in the jurisdiction of Guanuco. It is also a river of Africa, that rises in the mountains of Abyssinia, runs in a south-east direction, and discharges itself into the Indian ocean.

ACO, in *Ichthyology*, a name given to a fish found in the Mediterranean, called also *aquo*, *sarachus* and *saracinus*.

ACOEMETÆ, or **ACOEMETI**, formed of *a priv.* and *χοιμαω*,

κατακατα, to lie down, or sleep in bed, a name given to certain monks in the ancient church, who flourished particularly in the east about the fifth century: and who were thus called, because they had divine service performed, without interruption in their churches. They divided themselves into three bodies, each of which officiated in their turn, and relieved the others; so that their churches were never silent, either night or day. The *STYLITES* were also sometimes called *acoemetæ*. Wetstein (Proleg. N. T. vol. i. p. 10) adopts the conjecture of Casimir Oudin, that the *ALEXANDRIAN MS.* was written by an *Acoemet*, because it contains a catalogue of the psalms that were to be sung at every hour, not only of the day but of the night. These monks are particularly described by Helyot in vol. i. c. 29. of his "Histoire des Ordres Monastiques," &c. in 8 tomes 4to. Paris, 1720.

There is a kind of *acoemetæ* still subsisting in the Romish church: the religious of the holy sacrament may be properly included under this denomination, because they maintain a perpetual worship; some or other of them praying before the sacrament, day and night.

ACOLA, in *Ancient Geography*, a town placed by Ptolemy in Media, on the borders of the Hyrcanian sea.

ACOLA, *Cala Bini*, in *Geography*, the most southern cape or point of land of the island of Minorca, S.W. of fort St. Philip, or the entrance of Mahon harbour, seven or eight miles.

ACOLASTRE, in *Geography*, a river of France, which runs into the Loire, two leagues above Nevers.

ACOLCHICHI, in *Ornithology*, the Mexican name of a bird described by Nieremberg under the name of the *PTEROPHOENICUS Indiarum*. It is the *ORIOLOUS phanicus* of Linnæus. The *acolaki* of Seba is the *Oriolus Novæ Hispaniæ* of Gmelin, the *Icterus Mexicanus* of Brisson, and the *Mexican Oriole* of Latham. Its specific characters are, that it is yellow: the head, throat, wing-quills, and tail are black; the greater quills of the wings are yellow at the tip, and the lesser are wholly black. This bird has a long yellow bill; and the tail and wings are ornamented with small feathers of a golden colour, which have a fine effect on the dark ground. Seba reckons it an American bird; and Gmelin refers it to New Spain.

ACOLHUACAN, in *Geography*, one of the three imperial cities of the ancient kingdom of Mexico.

ACOLIN, a river of France, which runs into the Loire two leagues below Decize.

ACOLIN, in *Ornithology*, the name of a bird of the partridge kind, common in the Spanish West Indies. It is no larger than a starling; its legs and feet are of a pale greenish colour, and its toes very long; its beak is yellow, and somewhat long; its head small; its breast and belly are white; its sides are spotted with brown, and its back and tail of a dusky yellow brown; its tail is very short, and both that and the back have some black spots, and some narrow streaks of white. It frequents the sides of lakes, and is supposed to feed on flies, worms, and other insects, which are found about watery places. It is a tolerably well-tasted bird.

ACOLUTHI, or *ACOLYTHI*, in *Antiquity*, a term applied to such persons as were steady and immoveable, in their resolutions.

The word *Ακολυθός* is compounded of the privative *α*; and *καλυθός*, *via*, way; and implies their still persisting in their way or course.

For this reason, the Stoics were called *acolythi*; because nothing could induce them to abandon their principles or alter their purposes.

Among the *Ecclesiastical Writers*, the term *acolythus*, or *acolythist*, is peculiarly applied to those young people, who

in the primitive times aspired to the ministry; and for that purpose, continually attended the bishops: which assiduity occasioned their being distinguished by this appellation.

In the Romish church, *acolythi* were of longer continuance; but their functions were different from those of their first institution. They were such as had only received the first of the four lesser orders, whose business was to light the tapers, carry the candlesticks, the incense-pot, and prepare the wine and water.

At Rome there were three kinds of *acolythi*; viz. *palatini*, who waited on the pope; *stationarii*, who served in churches; and *regionarii*, who, together with the deacons, officiated in other parts of the city.

ACOLUTHI, or *acolythus*, was also a title in the Grecian empire given to the captain or commander of the *VANGI*, a body of guards appointed for the security of the emperor's palace.

ACOLUTHUS, *ANDREW*, in *Biography*, was an arch-deacon, and professor of the Oriental languages at Breslaw, his native city, and member of the academy of Berlin. He published, in 1682, a Treatise De Aquis Amaris, in 4to. At Leipzig he published, in 1680, a Latin translation of the Armenian version of the Prophecy of Obadiah. He died at Breslaw in 1704.

ACOLYTHIA, in the Greek church, denotes the office, or order of divine service.

The same name is also given to the prayers, ceremonies, hymns, and the like, whereof the Greek service is composed.

ACOMA, and *ACOMACH*, in *Geography*. See *ACCOMA* and *ACCOMACH*.

ACOMAS, in *Botany*. See *HOMALIUM*.

ACOMINATUS, *NICETAS*, in *Biography*, secretary to *Alexius Comnenus*, and to *Isaacus Angelus*, who wrote a history from the death of the former in 1118, where *Zonaras* ended his, to the year 1203, which is much approved.

ACON, an instrument used in the ancient exercises, like the *discus*.

ACON gave name to an ancient order of knighthood, who were afterwards united to the knights *Hospitalers*.

ACONÆ, in *Ancient Geography*, a small town of Bithynia, near *Heraclea*.

ACONCAGUA, in *Geography*, a village or town of Chili, in S. America, which gives denomination to a fertile province at the foot of the Cordellieres, situated on a river of the same name, that discharges itself into the pacific ocean. N. lat. 33°. W. long. 75° 36'.

ACONCROBA, in *Botany*, a name given by the natives of Guinea to a plant, growing wild with them, and in great esteem for its virtues in the small-pox. They give an infusion of it in wine. The leaves of this plant are opaque, and as stiff as those of the phillerey; they grow in pairs, and stand on short foot-stalks; they are small at each end and broad in the middle; and the largest of them are about three inches in length, and an inch and a quarter in breadth in the middle. They somewhat resemble those of our bay. They are of a dusky colour on the upper side, and of a pale green underneath.

ACONE, in the *Natural History* of the ancients, the name of a stone used as a whetstone, and for several other purposes; but more usually known among the Romans by the name *COTICULA*. It signifies also a mortar for the purpose of levigation.

ACONITE, in *Botany*. See *ACONITUM*

ACONITE, *Winter*. See *HELLEBORUS*.

ACONITES, in *Ancient Geography*, a people placed by *Strabo*, (tom. i. p. 344) in the mountains of the island of Sardinia.

ACONITI, ἀκονίτι, is an appellation given to some of the ancient ἀχιλλεῖα, but differently interpreted. Mercurialis understands it of those who only anointed their bodies with oil, but did not smear themselves over with dust, as was the usual practice. Mr. Burette will have it to signify those who conquered easily without dust, q. d. ἀπρόντι, ἀμαχηί, *with little trouble*.

ACONITON signifies not plaistered, and is a name given to vessels not lined within.

ACONITUM, *Aconite, Wolf's-bane, or Monk's-hood*, in Botany, a genus of plants of the *trigynia* order and *polyandria* class, and pertaining to the natural order of *multifloræ*. Some have derived its name from Aconæ, a city of Bithynia, where it grew in great abundance. Pliny ascribes its etymology to Ακόνι, a whetstone. But the most probable origin of the appellation is ἀκονίσις, *without dust*: because this plant grows on rocks destitute of soil, agreeably to the description of Ovid;—

“Quæ quia nascuntur dura vivacia cautè,
Agrætes Aconita vocant.”

The characters of this genus are, that it has no calyx: the corolla consists of five unequal petals, opposite in pairs; the highest being helmet-tubed, inverted and obtuse; the two lateral broad, roundish, opposite and converging; and the two lowest oblong, and bending downwards: the nectaries are two, concealed under the first petal, fistulous, nodding, with mouth oblique, and tail recurved, sitting on long subulate peduncles; in the same circle with the nectaries there are f. little, very short, coloured scales: the stamina are subulate filaments, very small, broader at the base, inclining towards the first petal; the antheræ are erect and small; the pistillum has three (five) oblong germs, ending in styles the length of the stamina; the stigmas are simple and reflex: the pericarpium has as many capsules as the styles, ovate-subulate, straight, one-valved, gaping inward: the seeds are many, angular and wrinkled. The species, enumerated and described by Prof. Martyn in his edition of Miller's Dictionary, are as follow: 1. *A. lycoblonum*, great yellow monk's-hood, or wolf's-bane, of which there are two varieties, viz. that of Linnæus with a bluish ash-coloured flower, and the *aconitum altissimum* of Miller. The common sort grows upwards of three feet high, but this, in gardens, is above four feet; its leaves are also broader and smooth, and the spikes of the flowers are longer. They both flower about the middle of June, and in a moderate season continue to blow till August. In Sweden it is reckoned among the earliest spring flowers. The mountains of Sweden, Lapland, Switzerland, Germany, Austria, Carniola, Italy and Siberia produce it in a wild state; and it was cultivated in this country by Gerard in 1596. A decoction, or powder of the root is used for destroying flies and other insects; but it is eaten in a province of Sweden without injury. It is milder than some of the other species, and eaten by goats and horses. The ancients believed that it was fatal to those who slept under it; and they dipped their venomous arrows in the juice of it. See Smith's Linnæi. Flor. Lappon. p. 187. 2. *A. japonicum*, or Japanese monk's-hood, is a native of Japan, where it is called *Soo Hufo*. 3. *A. napellus*, common monk's-hood or wolf's-bane, is found wild in Sweden, Switzerland, France, Germany, Austria, Carniola, Italy, Siberia, and Virginia; and was cultivated here in 1596 by Gerard. It blows in August, and would merit a place in every garden, if it were not for its noxious quality, which renders it dangerous to children and ignorant persons. There are two or three varieties with white, rose-coloured, and variegated corollas. The sorts which have blue flowers are more powerful than

those with yellow or white flowers. The variety called by Miller *pyramidalis* is the most common in English gardens, being preferred on account of the appearance of its long spikes of blue flowers, which are above two feet long. The plant rises to the height of near four feet, is hardy, and will grow in any soil or situation, and as it multiplies greatly by its roots, it has been admitted into most gardens and plantations of shrubs. It flowers in May and June; and the seeds ripen in September. 4. *A. pyrenaicum*, Pyrenean or fennel-leaved monk's-hood, grows wild on the Pyrenees, and also in Tartary and Siberia, and was cultivated with us in 1739 by Mr. Miller. It grows to the height of about four feet, and the spike nods before the time of flowering, which in our gardens is July. This species may be admitted among shrubs, to which children have no access. The four preceding species of *aconite* have three capsules, the following have five. 5. *A. anthora*, salutary monk's-hood, as it has been erroneously called, has a root consisting of from two to four angular, fleshy, bulbs, and a stem which rises from a foot to 18 inches in height. The flowers, which continue in beauty from the middle of August to the middle of September, though not so large as some of the other sorts, are of a sulphur colour, and make an agreeable appearance in the borders of the flower garden. This species grows naturally in the Pyrenees, the Alps, Austria, Siberia, &c. and was cultivated here in 1596 by Gerard. There is a variety of this with a white flower. 6. *A. variegatum*, variegated or small blue monk's-hood, is a native of Italy and Bohemia, and was cultivated here in 1752 by Mr. Miller. It flowers at the end of June, and seldom grows to a greater height than two feet, with spikes of flowers much shorter than those of the first sort: the corollas change from variegated to plain. 7. *A. album*, white wolf's-bane, was found by Tournefort in the Levant, and first raised in the royal garden of Paris. Mr. Miller cultivated it here in 1739, and says, that he has seen it upwards of six feet high; and he characterises it by its tall stem, palmate leaves, and large white flower. 8. *A. cammarum*, purple monk's-hood, has flowers of a paler blue, a much longer helmet, and a shorter raceme than the *A. napellus*. Its stem is also higher, rising even to six feet. This species is found wild in Switzerland, Austria, Stiria, Piedmont, &c. and was cultivated in 1748 by Mr. Miller. Haller found it with a white flower, and others have observed it in Switzerland with flowers of a pale blue, variegated with white. The variety named by Mr. Miller *A. alpinum*, will grow in good ground to the height of five feet, with large flowers of a deep blue colour. 9. *A. uncinatum*, American monk's-hood, is a native of Pennsylvania, with leaves approaching to those of the third sort, and blue flowers resembling those of the last. It was cultivated in 1770, by Mr. James Gordon. In the last edition of Linnæus by Gmelin, this genus comprehends 14 species; the five following being added to those above recited, viz. *volubile, septentrionale, tauricum, neomontanum, and cernuum*.

Culture. All the sorts of monk's-hood are hardy perennials, require little attention, and as they bear handsome spikes of flowers, are desirable plants for shrubberies and wilderness quarters, where they are guarded from the access of those who are unapprised of their pernicious qualities. They are propagated by seeds, sown in autumn, in a shady situation. The ground should be kept clean from weeds, and the plants should be watered in dry weather, till they are fit for being transplanted into shady borders, at the distance of 14 inches. If they are watered till they have taken root, they will require no other care, besides being kept free from weeds till the following autumn, when they

may be removed to the places where they are to remain. The stalks should be cut down in autumn, after they have done flowering. The common monk's-hood will grow under the shade of trees, and increase by means of its creeping roots. The other sorts may be propagated in the same way; but they will not thrive under the drip of trees, though they delight in shade.

Qualities. Most of the species of aconite have been deemed poisonous. The ancients were so surpris'd at their pernicious effects, that they were afraid to touch the plants; and hence sprung many superstitious precautions about the manner of gathering them. Theophrastus relates that there was a mode of preparing the aconite in his days, so that it should only destroy at the end of one or two years. But some have question'd whether the aconite of Theophrastus, Dioscorides, Pliny, and other ancient writers be the same with ours, or should be refer'd to the genus of Ranunculus. Vid. Reinhold, Diff. §. 1. It is confidently affirmed, that the huntsmen on the Alps, who hunt the wolves and other wild animals, dip their arrows into the juice of these plants, which renders the wounds occasioned by them mortal. A decoction of the roots has been used to kill bugs; and the powder disguis'd in bread or some other palatable vehicle has been employed to destroy rats and mice. The *A. napellus*, or common monk's-hood has been long known as one of the most virulent of all vegetable poisons. Linnæus says, that it is fatal to swine and goats, but does no injury to horses who eat it dry. He also informs us from the Stockholm acts, that an ignorant surgeon died in consequence of taking the fresh leaves, which he prescribed to a patient. The effluvia of the herb in full flower have produced swooning fits and a temporary loss of sight. The leaves and shoots of this plant, used as salad instead of celeri, have proved fatal in several instances. But the most powerful part of the plant is the root. Matthioli relates that it was given by way of experiment to four condemned criminals, two at Rome in 1524, and two at Prague in 1561, two of whom soon died, and the other two, with great difficulty, were recovered. The juice applied to the wound of a finger, not only produced pain in the arm and hand, but cardialgia, anxiety, sense of suffocation, syncope, &c. and the wounded part sphacelated before it came to suppuration. Dodonæus says, that five persons at Antwerp died in consequence of eating it by mistake. The effects of this plant are convulsions, giddiness, insanity, violent evacuations, both upwards and downwards, faintings, cold sweat, and even death itself. Nevertheless it has been used for medicinal purposes. The Indians are said to use *aconite*, correct'd in cow's urine, with good success against fevers. There is one species of it which has been deemed an antidote, to those that are poisonous, called *antibora*, and those that are poisonous are called *thora*. The taste of the root of the species denominat'd *antibora*, is sweet, with a mixture of bitterness and acrimony, and the smell is pleasant. It purges violently when fresh, but loses its qualities when dried. This is poisonous as well as the others, though in a slighter degree, and is disused in the present practice. The first person who ventured to introduce the common monk's-hood into medicine was Dr. Stoerck; though it has been suppos'd by Haller and Bergius from the taste and figure of the plant which he used, that it was not the *napellus* but the *A. cammarum*, which much resembles it. But others have since maintained, that Stoerck's plant was the *A. napellus*. He found that the extract given to the quantity of 10, 20, and even 30 grains, excited a sweat without inconvenience, and by persisting in the use of it, great relief was obtained in fixed rheumatic and arthritic

pains, scirrhus glandular tumors, venereal nodes, anchylofes, amaurosis, and other similar complaints. Other practitioners, after the publication of Stoerck's Extracts in 1762, have experienced the same good effects in some degree, and the Edinburgh college has received the extract as an officinal. In this, as in all the other medicines of suspicious and dangerous properties, it is most expedient to begin with very small doses, and increase them as they can be borne. Stoerck recommends two grains of the extract to be rubb'd into a powder, with two drams of sugar, and to begin with 10 grains of this powder two or three times a day. The extract is often given from one grain to ten for a dose; and some have considerably increased the quantity. Instead of the extract a tincture has been made of the dried leaves, macerated in six times their weight of spirits of wine, and 40 drops given for a dose. Martyn's, Miller's Dict. Lewis's Mat. Med. 1784. Woodville's Med. Bot. vol. i. p. 19. Murray's Appar. Med. vol. iii. p. 6. &c.

ACONTIA, in *Ancient Geography*, a town of Spain, which Strabo (Tom. 2. p. 228.) places near the Durus, and calls a city of the Vaccæi.

ACONTIAS, a name used, by some authors, for a sort of COMET, or METEOR, whose head appears round or oblong, and its tail very long and slender, resembling a javelin.

It takes its denomination from a serpent thus called, frequent in Calabria and Sicily; where it is also named *sheltone* (from *sagitta*, an arrow) by reason of its flying at passengers like an arrow; in order to which, it winds itself up a tree, to spring thence with the greater violence. For the like reason the Greeks call it *acontias*, of *ακόντιον*, a dart, or arrow.

It differs from the ΧΙΡΙΑΣ, in that it is longer, and more like a dart; and the other is shorter and broader in the middle.

ACONTIAS, in *Zoology*, the name of the *ANGUIS Jaculus*, a species of serpent, called also *JACULUM*, or the dart-snake, from its manner of vibrating its body in the manner of a dart. Bellonius found one of these in the island of Rhodes, which he described in this manner: it is about three hands-breadth long, and the thickness of one's little finger; its colour is a milky grey on the back, variegated with small black spots, like so many eyes; and on the belly it is perfectly white; the neck is wholly black, and from that two milk-white streams run all the way along the back to the tail; the black spots also are each surrounded with a small circle of white. It is found in Egypt and Lybia, and in the islands of the Mediterranean. It is also called *cenchreas* and *cenchrites*. Ray.

ACONTISMA, in *Ancient Geography*, a city of Macedonia, between the Strymon and Nestus.

ACONTIUM, in *Ancient Writers*, a kind of Grecian dart, or javelin, somewhat resembling the Roman *FILUM*.

ACONTIUS, or ACONZIO, JAMES, in *Biography*, a celebrated philosopher, civilian and divine, born at Trent in the 16th century. He embraced the protestant religion, and was favourably received in England by queen Elizabeth, who granted him a pension as an engineer, which he respectfully acknowledges in the dedication of his well-known work, "The Stratagem of Satan." This treatise was first printed at Basil in 1565; and the author died in England. Another edition of it was published in the same city by James Grasserus in 1610; at Amsterdam in 1674, and a French translation was published in 1610, and reprinted at Delft in 1624; in the above edition is inserted *Acontius's* letter to Wolfius, "De ratione edendorum librorum," containing excellent advice to authors. He wrote also a treatise

treatise on method, intitled "De Methodo, five de Recta intelligendarum tradendarumque artium et scientiarum ratione," which was published at Basil in 1558, and inserted in a collection of dissertations, "De Studiis bene instituendis," printed at Utrecht in 1658; an Italian work on fortifying cities, translated by himself into Latin, but never published; and a treatise of Logic, which he did not live to finish. His religious principles differed from those of Calvin; and he was an avowed friend to toleration. He has been charged with scepticism in theology, and referred by Isaac Junius, minister of Delft, to the same class with Socinus and the Remonstrants, who represents him as a person desirous of reducing all sects into one, and including them in the same ark, as Noah preserved all animals in his, though they lived on different food. Arminius says of him, "Acontius est divinum prudentiæ, ac moderationis lumen:" and Amelius gives him this character. "Idem Acontius est ἐπιεικής ἢ τῶν ἡμετέρων, qui sementem ecclesiæ anglicanæ calore et rore cœlesti fovit sedulo." Gen. Dict. Biog. Dict.

ACONTIUM, in *Antient Geography*, a city of Peloponnesus in Arcadia, which derived its name according to Pausanias, from Acontius, the son of Lyeon. There was another town of the same name in the island of Eubœa.

ACONTIUS *Mons*, a mountain of Bœotia in Greece, in which was built the town of Orchomenes. Strabo. T. 1. p. 637.

ACOOTAN *Island*, in *Geography*, lies north-east from the point of Onemak, or the south-west point of the continent of America; and between these is a channel.

ACOPA, in *Botany*, a name given by Dioscorides, and some other authors, to the *MENYANTHES trifoliata*, or *BUCKLEAN*.

ACOPA, derived from a privative, and *κοπος*, weariness, in *Medicine*, is also used to denote remedies against the ill consequences proceeding from lassitude, occasioned by too violent labour, exercise, or the like; such as tensions, tumors, pains in the bones, &c. some being of a warm, and others of a mollifying nature. But the title is improperly applied to medicines, as none are adapted to this purpose, except by a general quality. Cullen's, *Mat. Med.* vol. 1. p. 162.

ACOPIS, or *Acopos*, a substance classed by Pliny among the gems of which he gives the following account. Acopos resembles Natron, is porous, and starred with golden drops. Oil that has been boiled upon this, is used as an ointment to prevent the effect of fatigue. Pliny, *Nat. Hist.* xxxvii. 54.

ACOPOS, a plant mentioned by Pliny, said to be the same with the *ANAGYRIS* of Dioscorides, which Gerard says is the bean-trefoil; it signifies also *LABURNUM*.

ACOR signifies sourness or acrimony.

ACORACA, in *Antient Geography*, a town of *CHALYBONITIS*, a prefecture of Syria.

ACORDINA denotes Indian tutty.

ACORIS, a small town of Egypt in the nome of Cynopolis, in the province of Heptanomis.

ACORN, in *Natural History* and *Agriculture*, denotes the fruit of trees of the *OAK* kind.

The acorn, according to Dr. Grew, is the nut of an oak, with this only difference, that besides the cup it stands in, it has only a leathern or parchment cover, instead of a shell. And hence it is, that whereas the kernel of a nut is sweet, that of an acorn is of a very rough and bitter taste: the austere parts of the sap, which in a nut are drained off into the shell, being here imbibed by the kernel itself. Writers on husbandry give directions concerning seminaries or nurseries of acorns, and the method of propagating, by sowing or planting them. For timber, those acorns are to

be chosen as *SEED*, which are most solid and heavy, and not those which are the largest. See *OAK*.

In the *Phil. Trans.* vol. lvi. p. 75. we have a curious and important memoir by John Ellis, Esq. containing a method of preserving acorns in bees-wax for a whole year, in a state fit for vegetation, by which other seeds may also be preserved; and such as are valuable may be brought from the East Indies, for the purpose of planting them in other countries. See *SEED*.

Acorns were the food of the first ages; but when corn was cultivated, acorns were neglected. They are of little use with us, except for fattening hogs and other cattle, and poultry. The hogs that are fattened by them will be subject to constipation, and the disease called the garget, unless they are given sparingly, and mixed with some laxative substances: and, during the use of them, the hogs should be allowed to run at large; for if they are confined to the sty, they will not grow fat with this kind of food. Among the Spaniards, the acorn, or *GLANS iberica*, is said to have long remained a delicacy, and to have been served up in the form of a desert. In dearths, acorns have been sometimes dried, ground into meal, and baked as bread. Bartholin relates, that they are used in Norway for this purpose. The inhabitants of Chio held out a long siege, without any other food; and in a time of scarcity in France, A. D. 1709, they recurred to this food. But they are said to be hard of digestion, and to occasion head-achs, ventosities and colics. In Smoland, however, many instances occur, in which they have supplied a salutary and nutritious food. With this view they are previously boiled in water and separated from their husks, and then dried and ground; and the powder is mixed with about one half or one third part of corn-flour. A decoction of acorns is reputed good against dysenteries and colics: and a pessary of them is said to be useful in immoderate fluxes of the menses. Some have recommended the powder of acorns in intermittent fevers; and in Brunswick they mix it with warm ale, and administer it for producing a sweat in cases of the erysipelas. Acorns roasted and bruised have restrained a virulent diarrhœa. For other medical uses to which they have been applied, see Murray's *Appar. Medic.* vol. 1. p. 100.

From some late reports of the Academy of Sciences at Peterburgh, we learn that acorns are the best substitute to coffee that has been hitherto known. To communicate to them the oily properties of coffee, the following process is recommended. When the acorns have been soaked brown, add fresh butter in small pieces to them, while hot in the ladle, and stir them with care, or cover the ladle and shake it that the whole may be well mixed: The acorns of theholm oak are formed at Venice into cups, about $1\frac{1}{2}$ inch in diameter, and somewhat less in depth. They are used for dressing leather, and, instead of galls, for dyeing woollen cloth black.

ACORN, in *Sea-language*, denotes a little ornamental piece of wood in the shape of a cone, fixed on the top of the spindle on the mast-head, above the vane, to keep it from coming off the spindle in a whirlwind, or when the ship leans much upon one side under sail.

ACORN-shell. See *LEPAS*.

ACORUS, derived from *κορυνη*, the *pupil*, because it was esteemed good for disorders of the eye, *Calamus Aromaticus*, *Sweet Flag* or *Sweet Rush*, in *Botany*, a genus of the *monogynia* order, and *hexandria* class of plants, and belonging to the natural order of *piperite*. The characters are, that the calyx is a cylindrical, simple spadix, covered with floscules, without spathe or perianthium; the corolla is composed of six petals, obtuse, concave, loose, thicker at the

top, and in a manner truncate: the stamina are thickish filaments, somewhat longer than the corolla, and the anthers are thickish, twin, terminal and adnate; the pistillum is a gibbous germ, rather oblong, and of the length of the stamens; without style; the stigma is a prominent point; the pericarpium is a short triangular capsule, attenuated to both ends, obtuse and three-celled: the seeds are many and ovate-oblong. There are two species, viz. 1. *A. calamus*, or common sweet rush, of which there are two varieties; the *vulgaris*, European sweet rush, sweet smelling flag, or *calamus aromaticus*, and the *verus seu Asiaticus*, Indian sweet rush, or *calamus aromaticus*. The common *calamus aromaticus* is sufficiently distinguished by its long sword-shaped leaves, resembling those of the flag, but narrower, of a brighter green, and yielding, when broken, a strong aromatic scent; and also, by its oblong cylindrical spike of flowers, proceeding from the side of the stem at the edge of the leaf, which spike is generally single, sometimes double, and more rarely triple and quadruple. It grows naturally on the banks of rivers, and in shallow standing waters; and is found in many parts of England, on Hounslow-heath, near Norwich and Lynn in Norfolk, near Cambridge, in the Avon, near Pershore, and in many parts of Cheshire, &c.; but it is more plentiful in the standing waters of Holland, and is common in many other parts of Europe. The Indian *calamus*, which grows not only in marsh ditches but in more elevated and dry places in Malabar, Ceylon, Amboyna, and other parts of the East Indies, differs little from the European, except that it is more tender and narrow, and of a more hot and pungent taste. 2. *A. gramineus*, grass-leaved sweet rush, or Chinese sweet grass, has the roots in tufts, with a few thready fibres. The whole herb has an aromatic smell when bruised, much resembling our English sweet flag, from which the present species is distinguished by the shortness of that portion of its stalk, which is above the spadix, as well as by all its parts, except the florets, being five times smaller than in that plant. It is probably a native of China, and cultivated for the sake of its smell, in pots near the habitations of the Chinese, whence Mr. Aiton obtained it in 1786. It flowers in the spring.

Culture. The sweet flag will succeed very well in a garden, if the ground be moist, but never produces its spikes unless it grows in the water. It loves an open situation, and will not thrive well under trees. The flowers appear towards the end of June, and continue till August. In a proper situation it will increase by its creeping roots. The Chinese sweet grass must be kept in a dry stove, without any great degree of heat.

Medicinal Properties. The dried roots of the *calamus aromaticus* are commonly imported from the Levant, though those of our own growth are equally good. The best are those which are greenish without, and reddish within; the pulp white, and taste bitter. They have a strong aromatic smell, and a warm pungent bitterish taste; and their flavour is much improved by drying. The powdered root might supply the place of foreign spices, and indeed it is the only native aromatic plant of northern climates. It is carminative and stomachic, and often used as an ingredient in bitter infusions. But it communicates a nauseous flavour to these infusions; and Neumann observes, that its agreeable flavour, as well as distinguishing taste, are owing to an essential oil; the residuum after distillation having a nauseous flavour unlike that of the *calamus*. It appears that water is the most perfect menstruum of the bitter matter, as rectified spirit is of the aromatic, and the smell of the *calamus* is covered or suppressed by spirit. The tinctures in both menstrua are of a yellow or brown-colour, as they are less or more saturated.

The root is an ingredient in the mithridate and theriaca of the London pharmacopœia, and in the aromatic and stomachic tinctures, and compound arum powder, of that of Edinburgh. The Turks candy it, and regard it as a preservative against contagion. It is also said that it has cured agues, when the Peruvian bark has failed; and it has been recommended in Vertigo, proceeding from a vitiated stomach. Some have pretended that it is efficacious in scorbutic and hemorrhagic complaints, to which little credit will be given, and much less to its alexipharmic power. The preparations of it, enumerated by Murray, are a dry confection of the roots, a distilled water and oil, a spirituous and aqueous extract, and the elixir vitæ Matthioli, and elixir vitrioli Mynsichti. The leaves have a sweet fragrant smell, resembling that of the roots, but weaker. No cattle whatever will eat any part of the plant. Martyn's Miller. Lewis's Mat. Med.—Woodville's Med. Bot. vol. iii. p. 473. Murray's App. Med. vol. v. p. 39.

ACORUS, or BLUE CORAL, in *Natural History*. The true acorus of this kind is very scarce: some of it, however, is found on the coasts of Africa, particularly from Rio del Re to the river of the Camarones. This CORAL is part of the merchandize which the Dutch trade for with the Camarones; that of the kingdom of Benin is also very much esteemed. It grows in form of a tree on a rocky bottom. *Acorus* is also a name for the greater GALANGAL root.

ACORUS *Adulterinus*, in the *Materia Medica*, the name of the root of the *IRIS lutea palustris*, or common yellow water-flag-flower.

ACOSTA, GABRIEL, in *Biography*, a canon and professor of theology at Coimbra, who died in 1616, and whose large Latin commentary on part of the old testament was printed in fol. in 1641. Lugd. Bat.

ACOSTA, JOSEPH, a celebrated Spanish author, born at Medina del Campo, about the year 1540. He was a missionary and provincial of the Jesuits in Peru, and died at Salamanca in 1600. Besides his "Natural and moral history of the West Indies," first printed in Spanish in 8vo. A. D. 1591; and printed in French in 1600: he also wrote a treatise "De Procuranda Indorum Salute," 8vo. Salam. 1588, "De Christo Revelato," 4to. Rom. 1590, and "De vera Scripturas interpretandi ratione," in the commentaries of Menochius, &c. The decretals of the council of Lima are also ascribed by some persons to this author. *Acosta*, says Dr. Robertson, (Hist. Amer. vol. ii. p. 459.) is the first philosopher who endeavoured to account for the different degrees of heat in the old and new Continents, by the agency of the winds which blow in each. This theory was adopted and improved by M. Buffon.

ACOSTA, URIEL, was born at Oporto near the close of the 16th century. Having been educated in the Romish religion, though descended from one of those Jewish families which had submitted, as it were by constraint, to Christian baptism; he continued in the profession of it till the age of 25 years. His mind, however, had been perplexed by doubts previously to this period, in which he became treasurer in a collegiate church. At this time he directed his attention to the books of Moses and the Prophets, and the result was a conviction, that Judaism was the true religion. Fearing openly to profess it during his continuance in Portugal, he determined to resign his place, and embarked for Amsterdam with his mother and brothers, whom he had instructed in the principles of the Jewish faith. In this new situation they became members of the synagogue, and were circumcised according to the Jewish custom; and he changed his name of Gabriel for that of Uriel. He soon perceived that the Jews did not conform, either in

their rites or morals, to the law of Moses; and disapproving of their conduct, he avowed his sentiments, and incurred the resentment of the chiefs of the synagogue. By them he was excommunicated and forbidden to hold any intercourse even with his own brothers. In these circumstances he wrote a book in his own justification; in which he endeavours to shew that the rites and traditions of the Pharisees are contrary to the writings of Moses: and he was soon led to adopt the opinion of the Sadducees, from a persuasion that the sanctions of the Jewish law related merely to the present life. Acolla was reputed an atheist, and became an object of general odium and persecution. With the concurrence of the magistrates of Amsterdam he was thrown into prison; all the copies of his work were seized, and he was fined 300 guilders. His scepticism increased, and he proceeded to think that the Mosaic law was a political invention. With these ideas he basely determined to sacrifice his conscience to his interest, and returned to the Jewish church after having been 15 years excommunicated, recanted what he had written, and subscribed what was enjoined. Accused by his nephew of not conforming to the laws of Moses in his private conduct, he soon found that the pusillanimous desertion of principle was of little avail; he was summoned before the grand council of the synagogue, and again expelled from their communion. After living in wretchedness for seven years, he declared his purpose of submitting to the sentence of the synagogue; and contrary to the expectations which he had been encouraged to entertain, he underwent a very severe penance. After making a public recantation, and a very humiliating acknowledgment of his offence, he was stripped to the waist and received 39 lashes with a whip. He was then absolved from the excommunication, and laying himself down at the door of the synagogue, all who came out walked over him. This account is extracted from his treatise, intitled, "Exemplar humanæ vitæ," published and refuted by Limborch, in his "Amica Collatio cum erudito Judæo de veritate religionis christianæ." This treatise he is supposed to have composed a few days before his death. Having failed in his attempt to kill his principal enemy, he put an end to his own life with a pistol in 1647, according to some, but as others say in 1640. Such was the termination of a life disgraced, not by the change of sentiments, in consequence of inquiry and conviction, but by a want of integrity, and by a mean and dastardly avowal, for purposes of ease and interest, of principles which he did not believe.

ACOSTAN, in *Geography*, a mountainous island in the North Sea, between Asia and America, observed by Captain Cook.

ACOTYLEDONES, in *Botany*, denote seeds without lobes, and of course when they vegetate, they produce no seminal leaves.

ACOUENZ, in *Geography*, the name of an Indian nation in Canada.

ACOUS, the principal, though small, town in the valley of Aspe and country of Bearn in France. Near this place are several cold springs, particularly those of Escot. N. lat. 43° 5'. E. long. 0° 50'.

ACOUSMATICI, from *ακουω*, to hear, an appellation given to such among the disciples of Pythagoras, as were still under the probation of five years. They are also called by Latin writers *acousticici*. The *acousmatici* stood opposed to the *mathematici*, who were initiated into the secrets of science; and the *acousmatic* philosophy to the *mathematic*. These distinctions corresponded to the *EXOTERIC* and *ESOTERIC*. To persons of this class, it was sufficient to appeal to the authority of Pythagoras, "Αυτῶς εἶπα, ipse dixit," which

decided every dispute. Some have denied the appellation of Pythagoreans to be due to the *acousticici*; because many of these had their learning, not immediately from Pythagoras, but from Hippasus, who, according to some, was of Crotona, but according to others, of Metapontium.

ACOUSTIC, formed from *ακουω*, to hear, denotes in general any thing that relates to the ear, the sense of hearing, or the doctrine of sounds.

Acoustic Duct, in *Anatomy*, is applied to the external passage of the EAR; called also *MEATUS auditorius*.

Acoustic Instruments, or *Auricular tubes*, are such as are adapted to supply the defect of HEARING. See also DEAFNESS and TRUMPET.

ACOUSTIC Nerves. See **AUDITORY Nerves**, and **NERVES**.

ACOUSTIC Vessels, in the *ancient theatres*, were a kind of vessels made of brass, shaped, as some have said, like a bell, which being of all tones within the pitch of the voice, or even of instruments, rendered the sounds more audible, so that the actors could be heard through all parts of the theatres, which were even 400 feet in diameter. Vitruvius. The acoustic vases, mentioned by Vitruvius as harmonically tuned, and placed in different parts of the ancient theatres, have been tried in the Opera-house at Turin, and other parts of Italy; but without the effect expected from them of augmenting the tone of the human voice, or of the instruments to which they were tuned.

ACOUSTICS, or **Acoustic Medicines**, are remedies against the imperfections and disorders of the EAR, or of the sense of HEARING. Such general terms as *acoustics*, says Dr. Cullen (*Mat. Med.* vol. i. p. 163.) serve to mislead rather than instruct, and should, therefore, never be employed.

ACOUSTICS is that branch of general science which illustrates the origin, propagation and perception of sound. Some writers have divided acoustics into *diacoustics*, which explains the properties of those sounds that proceed directly from the sonorous body to the ear, and *catacoustics*, which treats of reflected sounds. Sound originates in the percussion and vibration of the parts of an elastic substance; and it is transmitted by means of the elasticity of the air, or of some other more subtle medium of a similar kind. How it is produced and propagated, and with what velocity it moves, are subjects of discussion which will be particularly investigated and explained in their proper place, under the article **SOUND**. The reverberation of sounds will be illustrated under the articles **ECHO**, **TRUMPET** and **WHISPERING places**. For the manner by which they impress the organs of hearing; See **EAR** and **HEARING**. See also **CHORD**, **PHONICS**, **STRING**, **VIBRATION**, and **VOICE**. *Acoustics* is properly the theoretical part of **MUSIC**: it is that which gives, or ought to give, reasons for the pleasure which we receive from harmony and melody, which determines the relation of harmonical **INTERVALS**, and which discovers the affections or properties of vibrating chords, &c. Rousseau. For an account of the amusing contrivances, connected with this branch of science, see **ÆOLUS's Harp**, **ARMONICA**, **Communicative BUSTS**, **Automatous HARPISCHORD**, **Solar SONATA**, **Conversive STATUE**, and **Ventosal SYMPHONY**. See also Hooper's *Recreations*, vol. ii. p. 202, &c.

ACQS, in *Geography*, a small town at the foot of the Pyrenees, in the department of Arriege, and late province of Foix in France, and so called from its hot waters. N. lat. 43°. 42'. E. long. 1°. 3'.

ACQS, or **DAX**, *Aque Tarbellicæ* and *Aque Augustæ*, is also the name of a city of France, in the viscounty of the

fame name, and in the district of Auribat, on the river Adour. It is a bishop's see. In this place are six convents, one college and an hospital. In the neighbourhood are warm baths. N. lat. $43^{\circ} 47'$. E. long. $1^{\circ} 0'$.

ACQUA, a small place in Tuscany, noted for its hot baths. N. lat. $43^{\circ} 45'$. E. long. $12^{\circ} 10'$.

ACQUA della Fico, a town of Italy, in the kingdom of Naples and province of Calabria Ultra, 15 miles West of Squillace.

ACQUA Negra, a town of Italy in Mantua, 2 miles N. E. of Caneto. There is another town of the same name near the conflux of the Adda and Po, 3 miles West of Cremona.

ACQUACKNACK, or ACQUARINANK, a town of America, on the W. side of Passaic river, in the county of Essex in New Jersey; 10 miles N. of Newark, and 17 N. W. from New York.

ACQUAPENDENTE, a large town, now almost desolate, though a bishop's see, and containing 16 churches and convents, situate on a rocky eminence in the territory of Orvieto in Italy. N. lat. $42^{\circ} 43'$. E. long. $11^{\circ} 53'$.

ACQUARA, a town of Italy in the kingdom of Naples, 13 miles S. W. of Cangiiano.

ACQUARIA, a small town of Italy in Frignano, a district of Modena, famous for its medicinal waters. N. lat. $44^{\circ} 24'$. E. long. $11^{\circ} 17'$.

ACQUA Sparta, a town of Italy in Umbria, 10 miles W. of Spoleto.

ACQUAVIVA, an inconsiderable town in the county of Bari, a district of Apulia in Italy. N. lat. $41^{\circ} 10'$. E. long. $16^{\circ} 20'$. Another town of this name lies 8 miles N. N. W. of Rome, and another in the kingdom of Naples, 19 miles W. of Molise; and again another in the Marquisate of Ancona, 10 miles N. E. of Ascoli.

ACQUEST, or ACQUIST, formed of Fr. *acquérir*, from *acquiere*, to acquire or get, is understood in a legal sense of goods or effects, acquired either by purchase or donation. The French laws make a great difference between acquests and hereditary effects. The civil law allows none. See HEIR.

ACQUEST is also popularly used for CONQUEST, or a place acquired by the sword.

ACQUETTA, in *Geography*. See AQUETTA.

ACQUI, a fortified town and bishop's see in the duchy of Monterrat in Italy. It is situated at a small distance from the Apennines, about 25 miles N. W. from Genoa, and has its name from its warm baths. N. lat. $44^{\circ} 40'$. E. long. $8^{\circ} 30'$.

ACQUIDA, a small Dutch fort to the E. of Ancobar river in the gold coast of Africa. N. lat. $4^{\circ} 32'$. long. nearly the same with that of Greenwich.

ACQUIETANDIS *Plegius*, in *law*, a writ of justices lying for a surety against the creditor that refuses to acquit him after the debt is paid.

ACQUIETARE, in ancient *law-books*, signifies to discharge or pay the debts of a person deceased; as the heir those of his father, &c.

ACQUISITION, the act of procuring a right or title to the enjoyment or property of a thing. *Acquisition* is also sometimes used for an ACQUEST.

ACQUITTAL, a discharge, deliverance, or setting free of a person from the guilt or suspicion of an offence. Acquittal is of two kinds; in *law*, and in *fact*. When two persons are appealed or indicted for felony, one as principal, the other as accessory; the principal being discharged, the accessory is, by consequence, also freed: in which case, as the accessory is *acquitted by law*, so is the principal *in fact*.

When a person is acquitted of a felony, and is questioned again for the same crime, he may plead *autrefois acquit*; as his life cannot be twice exposed to danger for the same offence. But in murder, acquittal does not prevent an APPEAL; and the principal or accessory, may be either remitted to prison or bailed by the court, till the year and day of appeal be passed. If a person is lawfully acquitted on a malicious prosecution, he may bring his action for damages, after he hath had a copy of the indictment.

ACQUITTAL, is also used where there is a lord MESNE and tenant, and the tenant holds lands of the mesne, and the mesne holds over the lord paramount: here, the mesne ought to acquit the tenant of all services claimed by any other for the same lands; the tenant being to do service to the mesne only, and not to divers lords for one parcel of land.

ACQUITTANCE, or QUITTANCE, a release or discharge in writing, for a sum of money or other duty, which ought to be paid or done. No person is obliged to pay without an acquittance, and the acquittance of a servant accustomed to receive money for his master, is a good discharge. The verb *acquit*, the participle *acquitted*, and the noun *acquittal*, do all signify a discharge from an offence objected. In which case we meet with acquitted by proclamation.

ACRA, or ACARA, in *Geography*, a dependent and tributary district of the kingdom of AQUAMBOE, on the coast of Guinea, in Africa; where the English, Dutch and Danes have strong forts, which are considered as the best on the whole coast. That of the English is Fort James, situate on a rock, and capable of mounting 20 cannons. Near it is a salt-pit, which supplies a great part of the coast with this commodity, and yields a considerable revenue. The Dutch fort is Creveceur, standing on a rock and guarding the beach. The Danish fort is Christianburgh, which is the only place the Danes possess on this coast. Each fort hath its adjacent village; though the general one is Acra, the name of the ancient kingdom, before it was subdued by the Aquamboans, and its inhabitants removed to little Popo. N. lat. $5^{\circ} 40'$. E. long. $1^{\circ} 29'$.

ACRA, in *Ancient Geography*, one of the hills of Jerusalem, on which stood the old or lower city; as the new or high city, called also the city of David, was situate on mount Zion, to the south of Acra. This is supposed by some to be the same with Mount Moriah, on a part of which Solomon built his temple; and they alledge, that Moriah in Hebrew, and Acra in Greek, have the same meaning, and signify an eminence. Wells's *Sacr. Geog.* vol. iii. p. 76.

As there was a citadel or fortrefs built on this hill by Antiochus, in order to annoy the temple, which was afterwards taken and razed by Simon Maccabeus, it is not improbable that the name was derived from this circumstance. *Anc. U. H.* vol. ii. p. 488. The Asmonean kings, not satisfied with having razed the citadel built by the Syrians, lowered the top of the mountain, and filled up the valley towards the east, by which means the ground on which the temple stood, or Mount Moriah, became higher than Acra, and thus the communication between them was rendered more easy.

ACRA, in *Syria*. See ACRÉ.

ACRA Point. See HADSHILAR.

ACRABA, a town of Mesopotamia in Asia, situate near the river Chaboras, about $36^{\circ} 20'$. N. lat.

ACRABATA, a town of Asia, towards the limits of Samaria.

ACRABATENE, the name of two districts of Judæa; one extending itself between Schechem, now Naplofa, and Jericho,

Jericho, about 12 miles in length; and another on the frontier of Idumæa, towards the southern extremity of the Dead Sea.

ACRACANUS, a river of Asia in Abydene, supposed by Eusebius to be the same with Maarfares.

ACRADINA. See ACHRADINA.

ACRÆ, an ancient town of Sicily, founded according to Thucydides (lib. 6. p. 381. Ed. Dukeri) 70 years after Syracuse, built upon an eminence, as Silius Italicus (lib. 14. v. 207.) describes it, and inhabited by a people whom Pliny (H. N. vol. i. p. 163.) denominates Acrenfes. It was situated about 24 miles to the south of Syracuse, not far from the sea, and near the monastery which the Sicilians call *Santa Maura d'Arcia*, between the cities of Noto and Avula. There are medals of this city in bronze, gold and silver.

ACRÆ *Seslianz*, a district of Spain, S. E. of the promontory of Artabrum.

ACRÆ, was also an epithet of Diana, who was generally worshipped in high places.

ACRÆA, a surname of Juno of Corinth, who had a temple in the citadel of the Sicilian Acre; and also a surname of Fortune for the same reason.

ACRÆPHIA, ACRÆPHIUM, or as Pausanias (lib. 9. c. 23. p. 755. Ed. Kuhnii) calls it, *Acræphium*, was a city of Bœotia, situate on Mount Ptoos, where was a temple of Apollo. This place, according to Pausanias, afforded refuge to the Thebans, when Alexander demolished their city.

ACRÆUS, was a surname of Jupiter, who was honoured by the inhabitants of Smyrna in a temple on an eminence near the sea.

ACRAGAS, a town of Sicily, built upon a mountain, at the confluence of the rivers Acragas and Hypsa, and within two miles of the sea, by the people of Gela in the year before Christ 584. It took its name from the river Acragas, now called *Fiume di Gergenti*; whence other cities, enumerated by Stephanus (de Urb. vol. i. p. 53.) were denominated *Acragantes*. Acragas was very strongly fortified. The inhabitants were luxurious in their diet, and magnificent in their dwellings; and they are represented by Empedocles, says Diogenes Laertius (tom. 1. p. 532.) to be persons, who lived to-day as if they were to die to-morrow, and who built, as if they were to live for ever. The adjacent country abounded with vines and olives, the produce of which afforded a lucrative commerce with Carthage. Acragas has been more generally distinguished by its Roman appellation *Agrigentum*. The medals of this city were gold, silver and bronze.

ACRA JAPYGGIA, a promontory in the kingdom of Naples, to the S. E. of Otranto, where was formerly a town, now in ruins, on the Ionian Sea, opposite to the *Montes acroceraniii* of Epirus. Ptolemy called it *Salentia*, and it is now denominated *Capo di San Maria di Leuce*.

ACRA of *Scylax*, an island on the coast of Numidia, that forms the modern part of Harhgoone, under which vessels of the greatest burden may lie in safety. Stephanus (de Urb. vol. i. p. 53.) enumerates 10 cities under the appellation of *Acre*.

ACRAMAR, or VAN, in *Geography*, a town and lake of the Greater Armenia in Asia. N. lat. 36° 30'. E. long. 44° 14'. The town, which is the capital of the government of Van, is situated at the foot of the mountains of Diarbekir, and is said to have been built by Semiramis. It is large, populous and commercial. In the adjoining lake, which abounds with fish, there are two small islands, inhabited by religious Armenians.

ACRASIA, formed of *a priv.* and *κρᾶσμι*, to *mix*, is used by some writers in *Physic*, for the excess or predomina-

cy of one quality above another, either in artificial mixture, or in the constitution of the human body. The word is used by Hippocrates, and other Greek medicinal writers, to express excess of any kind, intemperance and imbecility.

ACRASUS, in *Ancient Geography*, a town of Asia Minor in Lydia. There are some imperial Greek medals of this city, which were struck under the pretors, in honour of Severus, Plantilla, Geta, Julia Paula, Alex. Severus and Caracalla.

ACRATH, a town in Manritania Tingitana, supposed to be the present *Velez de Gomara*.

ACRATISMA, in *Antiquity*, a breakfast among the old Greeks, consisting of a morsel of bread soaked in pure unmixed wine.

ACRATOMELI. See MULSUM.

ACRATOPHORUS, a surname of Bacchus, under which he was honoured at Phigalia, a city of Arcadia.

ACRATOS, from *a priv.* and *κρᾶσμι*, to *mix*, denotes simple or unmixed. This term is very often used by Hippocrates, and applied to excretions of different sorts, and is always of very bad presage. Thus, in his *Prænotiones*, he observes, that in all painful disorders of the pleura and lungs, the spittle should appear mixed and yellow; and that it is a dangerous symptom, if it be altogether yellow, without any mixture: and he adds, that if the spittle be so unmixed, as to appear black, it is a very bad presage.

ACRE, or ACRA, in *Geography*, a sea-port town on the Phœnician coast in Syria. Its ancient Hebrew name was *Acco* or *Accho*, under which appellation it is mentioned as a place of considerable strength in the book of Judges, ch. i. v. 31. and it is still called by the Arabs *Akka*. It was afterwards denominated *PROLEMAIS*, from one of the Ptolemys in Egypt, and *Acre*, on account of its fortifications and importance: whence the knights of St. John of Jerusalem called it *St. John d'Acre*. The situation of Acre possesses every possible advantage both of sea and land: as it is encompassed on the N. and E. by a spacious and fertile plain, on the W. by the Mediterranean, and on the S. by a large bay, extending from the city to *Mount CARMEL*. This city successively under the dominion of the Romans and afterwards of the Moors, was for a long time the theatre of contention between the Christians and the Infidels in the progress of the crusades. It was taken by the victorious Saladin in 1187; and surrendered to the united arms of Philip Augustus of France, and Richard I. of England in 1191, after a siege of two years, which consumed a great multitude of forces, both of Europe and Asia. Although the Europeans thus acquired a strong town and convenient harbour, the advantage was very dearly purchased. It is said (see Gibbon's *Hist.* vol. xi. p. 144. 8vo.) that on this occasion more than 100,000 Christians were slain; that a far greater number was lost by disease or shipwreck; and that a small portion of an army, consisting of five or six hundred thousand persons, returned in safety to their native countries. After the loss of Jerusalem in unsuccessful attempts for recovering the Holy Land from the possession of the Saracens, renewed by St. Louis with the co-operation of our Edward I. and other powers, Acre became the metropolis of the Latin Christians, and was adorned with strong and stately buildings, with aqueducts, an artificial port and a double wall. Its population was increased by an influx of pilgrims and fugitives; and the trade of the East and West was attracted to this convenient station. At this time, however, the inhabitants were extremely corrupt; and the government, though exercised by many sovereigns, feeble and ineffectual to any purpose of salutary restraint. Adventurers issued from this city, under the banner of the cross, to plunder the Mahometan villages; and

and though nineteen Syrian merchants were robbed and ignominiously put to death, satisfaction was withheld. The Sultan Khalil repented this conduct, and marched against Acre, at the head of a large army, furnished with a tremendous train of artillery. After a siege of 33 days the double wall was forced, by the Moslems, the principal tower yielded to their engines, the city was stormed, and death or slavery was the lot of sixty thousand Christians. The fortress of the Templars was destroyed, the grand master killed, and of 500 knights, 10 only survived: who probably suffered on a scaffold (says Gibbon) in the unjust and cruel proscription of the whole order. Few of the fugitives, among whom were the king of Jerusalem, the patriarch, and the great master of the hospital, escaped the dangers of the sea, and safely arrived in the island of Cyprus. This disastrous event happened (says Maundrel in his journey, &c. p. 55.) on May 19, 1291. He adds, that the abbess of the nunnery, in order to avoid that violation which was apprehended from the licentiousness of the Saracen victors, ordered the young nuns under her care to mangle their faces, setting an example in her own person, that they might thus become the objects of aversion instead of brutal desire. The Saracens, disappointed and inflamed with resentment, put them all to the sword.

After the expulsion of the crusaders, Acre exhibited a scene of magnificent ruin, and remained in a great degree desolated and deserted till about the year 1750, when it was fortified by Daher, an Arabian sheikh, who obtained the appellation of Prince of St. John of Acre, and maintained his independence against the whole force of the Ottoman empire, till the year 1775, when he was basely assassinated by order of the Ottoman Porte, at the advanced age of 86 years. He was adored by his people (says Savary, Letters, vol. ii. p. 200.) whom he had through life defended against the tyranny of the Pacha, and yet by this tyrant he was betrayed and murdered.

At a later period Acre has been rendered, by the works of Djezzar, one of the principal towns upon the coast. The mosque of this Pacha is much admired. The bazar, or covered market, is not inferior to the bazars of Aleppo, and its public fountain is superior in elegance to those of Damascus. These improvements were designed and executed by the Pacha himself. The place, however, though its fortifications had been often repaired, was very weakly defended; and in the spring of 1799, it was found necessary to strengthen its fortifications, in order to guard against the apprehended assault of the French army under Bonaparte. The Pacha Djezzar, who had actually evacuated Caiffa, a town at the foot of Mount Carmel, surrounded with a good wall, and flanked with towers, and who had disarmed the castle which defended the fort and road, had reason to distrust his security at Acre. He was therefore preparing to make good his retreat, and to convey away his women and treasure, when Sir Sidney Smith anchored in the road of Caiffa with an English Squadron, and deputed a French engineer (Col. Philipeaux) to aid him in fortifying the town. This engineer caused the fortrefs to be repaired, which was fortified after the mode of the 12th century, with courtines flanked with square towers. The Pacha, thus assisted and animated, determined to co-operate with the English Squadron in the defence of the town. Kleber, however, with the French advanced guard, had taken possession of Caiffa; and Bonaparte had completed the investment of Acre, when his battering-pieces and stores fell into the hands of the English. This loss decided the fate of the town; and though the French renewed and varied their attacks, they were repeatedly repulsed by the garrison in concurrence with

the marines of the English Squadron, under the command of the Commodore, Sir Sidney Smith. After multiplied and irreparable losses, it was found almost impossible to reduce a place, defended with so much intrepidity, and possessing a variety of advantages which it is besides our purpose minutely to detail. Bonaparte at length determined to raise the siege, and announced his resolution to the army, which began its march on the 20th of May, the 61st day after breaking ground. Djezzar did not perceive for two days that the trenches were evacuated, so that the French army had an opportunity of continuing its march without molestation, ravaging the country, burning the harvests, and destroying the defences of the ports, the magazines, and all the resources which the Turks might have used in approaching the frontiers of Egypt. Kleber formed the rear-guard with his division, which, after having crossed the desert, embarked at Tinch for Damietta. Bonaparte left a strong garrison at Cattieh, and entered Cairo with the rest of the army, 26 days after the raising of the siege.

The aspect of the field of carnage on this occasion was horrible. The ditches and the reverses of the parapets were filled with corpses, and the air itself was infected for want of an opportunity to remove the wounded whom the Turks left unmassacred, and to bury the dead. Notwithstanding the singular spirit and very extraordinary exertions manifested in this siege, both by the assailants and the besieged; humanity on both sides must lament the aggravated circumstances of cruelty and distress that attended it.

The principal articles of commerce at Acre, are corn and cotton: but the trade is monopolized by the Pacha in his own hands. The French have usually had a consul in this place, and Russia a resident. Acre is situated 27 miles S. of Tyre, and about 70 miles N. of Jerusalem. N. lat. $32^{\circ} 40'$. E. long. $39^{\circ} 25'$.

ACRE, is used in the dominions of the Mogul, with regard to his revenues, in the same sense with lack, for the sum of 100,000 rupees; eight rupees being equal to about one pound sterling.

ACRE denotes a quantity of land, containing four square rods, or 160 square poles or perches. The word, perhaps, is formed from the Saxon *accere*, or German *acker*, field, or the Latin *ager*. Salmastius derives it from *acra*, used for *acana*, a land-measure among the Ancients, containing 10 feet. The term acre formerly meant any open ground or field, as Cattle-acre, West-acre, and not a determinate quantity of land.

By the custom of countries, the perch differs in quantity, and consequently the acre of land: it is commonly $16\frac{1}{2}$ feet; but in Staffordshire it is 24 feet; in other counties 28 feet; and in some parts of England 18, 21 feet. According to the statute 34 Hen. VIII. concerning the sowing of flax, it is declared, that 160 perches, i. e. 16 in length, and 10 in breadth, or in that proportion, make an acre; and the ordinance for measuring land, 35 Edw. 1. agrees with this account. And therefore, as the statute length of a pole is $5\frac{1}{2}$ yards, or $16\frac{1}{2}$ feet, the acre will contain 4840 square yards, or 43,560 square feet. Moreover, as the chain, used in measuring land, is four poles or 22 yards in length, the square chain will be 484 yards, and the acre will be 10 square chains. And a mile being 1760 yards, or 80 chains in length; the square mile will be $1760 \times 1760 = 3,097,600$ square yards, and contain $80 \times 80 = 6400$ square chains, or 640 acres. Some old farmers distinguish between seed-acres and statute acres; the former being a vague measure, determined by the proportion of seed used in sowing it, and therefore depending on the fertility or barrenness of the soil.

The Scots acre contains 4 Scots roods, and bears proportion to that of the English by statute, as 100,000 to 58,601, regard being had to the difference betwixt the Scots and English foot. One square rood is 40 square falls; one square fall, 36 square ells; one square ell, 9 square feet, and 73 square inches; and a square foot, 144 square inches. The Scots acre is also divided into ten square chains; the measuring chain being 24 ells in length, and consisting of 100 links, each link 8.928 inches; and each square chain will contain 10,000 square links. The English statute acre is about 3 roods and 6 falls, standard measure of Scotland.

The French acre, *arpent*, is different in various provinces; the acre of Paris contains 100 square perches, the perch being 18 feet, or 3 toises; but in some places the perch is 20 feet, and in others 22. Allowing the proportion of the English square foot to be to that of the French, as 1000 to 1165, the acre of 100 square perches, at 18 feet each, will be 32,400 French square feet, or about 36,774 English square feet, and the perch being 22 feet, the acre will be 48,400 French square feet, or about 54,934 English square feet; and the English acre being 43,560 square feet, it will be very easy to estimate the proportion of the one to the other. The Strasburg acre is about half an English acre. The Welsh acre contains commonly two English ones. The Irish acre is equal to 1 acre, 2 roods, 19 perches $\frac{1}{2}$, English.

Houghton gives a table of the number of acres to a house in each county of South Britain, which is found to vary in the English counties from $3\frac{1}{2}$ acres, the proportion in Middlesex, and $17\frac{1}{2}$ in Surry, to 49 acres in Southampton; in the Welsh counties, from 51 acres, as it is found in Flintshire, to 193, as in Merionethshire.

Dr. Grew attempts to ascertain the number of acres in England; which, according to him, amounts to 46 millions and 80,000. Phil. Traus. N^o 330, or Abr. vol. iv. p. 450. Sir William Petty reckons but 28 millions; others 29 millions. And by an account of the number of acres in each county, supposed to be taken from some old registers, the number of acres in England amounted only to $39\frac{1}{2}$ millions. Others estimate the number of acres in England and Wales at about 46,916,000; and in Scotland 26,000,000; whilst others again assert, that England and Wales contain no more than 38,500,000 acres; and that Scotland with its adjacent islands, contains about 21 millions of acres. Allowing with Zimmermann, (Political Survey, p. 192.) that England and Wales contain 54,112 square miles, and Scotland 25,600 square miles; the number of acres in the former will be 34,631,680, and in the latter 16,384,000. Ireland, comprehending 21,216 square miles, will contain 13,578,240 acres.

The United Provinces are said to contain 4,382,000 acres, but reckoning with Zimmermann (Political Survey, p. 164.) the area 10,000 square miles, the number of acres will be 6,400,000; and the province of Holland is estimated at one million of acres, or according to the same writer, 1,280,000 acres; and they were thought formerly to contain 2,400,000 persons, but according to a public account given in 1785, 2,758,632 persons. If England were as well peopled in proportion, it is said that it would contain 46 millions of inhabitants, *i. e.* about seven or eight times as many as it now contains.

The area of France, according to the statement of Necker, is 157,924 square miles; and if this estimate be just, it contains 101,071,360 acres. Spain, according to Lopez's map, contains 148,448 square miles; and consequently 95,005,720 English acres. Portugal comprehends 27,376 square miles, or 17,579,640 acres. The whole of Turkey

in Europe, Asia, and Africa, estimated at 800,000 square miles, contains 512,000,000 acres. The European part of Russia is said to contain 1,194,976 square miles, and consequently 764,784,640 acres; and Asiatic Russia supposed to be 3,695,024 square miles, includes 2364,815,360 acres. If Sweden contains 216,000 square miles, as Busching states it, its extent in English acres will be 138,240,000. Denmark, comprehending 182,400 square miles, will contain 116,736,000 acres. Poland and Lithuania, estimated at 160,800 square miles, will contain 102,912,000 acres. The kingdom of Prussia, including the countries that are independent of the German empire, supposed to contain 57,600 square miles, comprehends 36,864,000; and Prussia alone containing 22,144 square miles, includes 14,172,160 acres. Germany, estimated at 191,571 square miles, contains 122,605,440 acres. Switzerland, containing 15,296 square miles, has 9,789,440 acres. Italy, containing 90,000 square miles, has 57,600,000 acres. Hungary and Transylvania, having 92,112 square miles, include 58,951,680 acres. The number of square miles in Europe is estimated at 2,627,574, and consequently it contains 1681,647,360 acres. The territory of the United States of America, according to the measurement and computation of Mr. Hutchins, geographer to the States, contains 589 millions of acres, exclusively of water, which is computed at 51 millions more. Morse's Geog. p. 35. See *POLITICAL Arithmetic*.

By a statute of 31 Eliz. it was ordained, that if any man erected a new cottage, he should add four acres of land to it; but this statute was repealed by 15 Geo. III. c. 32.

ACRE-Fight, is an old sort of duel, fought by single combatants, English and Scotch, between the frontiers of their kingdoms, with sword and lance; and this duelling was also called camp-fight, and the combatants, champions, from the open field that was the stage of trial.

ACRE-Tax, a tax laid on land at so much per acre. In some places this is also called acre-shot. Impositions on lands in the Great Level are to be raised by a proportionable acre-tax. 20 Car. II. cap. 8. An acre-tax of 2s. 6d. per acre, for draining Hadenham level. 13 Geo. I. cap. 18.

ACREÆ, in *Ancient Geography*, a town placed by Ptolemy in Sicily. N. lat. $36^{\circ} 40'$. E. long. $39^{\circ} 15'$. See *ACRÆ*.

ACREDULLA, in *Zoology*, a species of the *MUS*, in the Linnæan system; the migratory mouse of Pallas, with pouches to the cheeks, sinuated small ears, a grey body, with the lower part white. It is four inches long; with an annulated tail, the upper part of which is brown: found in the Orenbourg district of Siberia, near the river Urgal.

ACREL, *ОЛОТ*, in *Biography*, was born the 26th of November 1717, in a parish in the neighbourhood of Stockholm, where his ancestors had been ministers ever since the year 1580. He commenced his studies at Upsal; and in the year 1738, translated into the Swedish language some of the works of Boerhaave. He then went to Gottingen, where he continued his studies, and afterwards to Strasbourg, and thence to Paris. In the year 1744, he served one campaign in the French army in Germany, whence returning to Stockholm, he was admitted a member of the surgeons' company there. In 1746, he was elected into the academy of sciences; in 1751, he was made one of the foreign associates of the academy of surgery at Paris. In 1764, he was advanced to the degree of doctor of the faculty of medicine at Upsal, and admitted to the royal college of physic at Stockholm. He was in great reputation, and had a considerable share of practice, principally in surgery, and has left several works, all written in his own language, which

which are in great request among his countrymen. The titles translated into English are, 1. A Treatise on Wounds. 2. A Discourse on the best method of constructing an Hospital. He read this discourse at a meeting of the royal academy at Stockholm when he was elected their president. 3. A Dissertation on the Method of depressing the Cataract, 8vo. 1759, 1775, Stockholm. In this dissertation he defends his practice against professor Walborn, who had opposed him. A Discourse on some alterations and improvements in performing certain operations in Surgery, and the instruments used in performing them, was read by him to the royal academy on his being elected president a second time.

ACREME, a term sometimes used in ancient law-books for ten acres.

ACREON, in *Entomology*, a species of PAPILIO, with brown wings, the under part black and ocellated; the hinder wings having a white margin, marked with a red band and ridge of gold-coloured points. It is found in the southern part of Russia.

ACRI, in *Geography*, a town of Naples, in Calabria Citra, five miles east of Scalen.

ACRIA, in *Ancient Geography*, a sea-port town of Laconia, situate near the mouth of the Eurotas, opposite to Trinassus, and not far from Gythium.

ACRIBEA, a Greek term ακριβεια, literally denoting an exquisite or delicate accuracy; it is sometimes used in our language for want of a word of equal significancy.

ACRID, in *Natural History*, denotes any thing sharp or pungent to the taste. Ancient Naturalists distinguish two kinds of acrid tastes; the first proceeding from hot and dry, as that of pepper; the second from that of hot and moist, as that of garlic. Acrid, according to Dr. Grew, properly belongs to the class of compound tastes. It is not simply four or pungent, as there are bodies not acrid, which nevertheless are pungent, *e. g.* arum; nor is it simply hot; for there are many hot bodies which are not acrid, as the roots of zedoary, yarrow, and contrayerva. The characteristic, therefore, of acritude consists in pungency joined with heat. Acrid bodies applied to the skin inflame and exulcerate it; when chewed, they produce saliva, and when snuffed, sneezing. Acrids may be divided into classes, according to the manner in which they yield their acrimony. 1. By distillation, as horse-radish, mustard, &c. 2. By infusion, as the greater Celandine, &c. 3. Neither by infusion nor distillation, as arum, &c. *Acrid medicines*, as to their general effect, serve to stimulate the vessels, and dissolve tenacious and viscid juices. In leucophlegmatic habits they are powerful expectorants, deobstruents, diuretics, and emmenagogues: and if the patient be kept warm, sudorifics. In hot bilious temperaments, plethoric habits, inflammatory distempers, and in cases where the juices are too thin and acrimonious, or the viscera unsound, acrids are injurious. See STIMULANTS.

Some vegetables, which are either inodorous, or emit a weak smell, excite a local inflammation when applied fresh to the skin, but lose their faculty in drying. When recently gathered, and inwardly taken, they produce poisonous effects. Of this kind are the fresh roots of squills, the leaves of fox-glove, of wild anemone, of virgin's bower, of wolf's-bane, or monk's-hood; the roots of blue orris, of asphodel, or king's spear, of meadow saffron, of white bryony, or wild vine, and of wake-robin; and the fruits of wild cucumber. As these substances lose their acrimony by being well dried, the acrid matter which produces their irritating effect appears to be volatile; and this is farther

confirmed, by its being communicated to water and spirit of wine, abstracted from them by distillation. Hence it may be inferred, that this volatile matter is a particular, proximate, constituent part, belonging to the vegetable kingdom; and in order to distinguish it from other principles of a similar kind, it has been denominated the *acid matter of plants*. Its action is not destroyed by acids nor by alkalies, and it is not ammoniac in any form. In the antiscorbutic plants, such as scurvy-grass, water-creases, garlic, onions, horse-radish, common radish, and mustard-seed, this acrid principle is combined with oleaginous particles of an ethereal nature, and its effects seem to be weakened by this union. There are other plants which are not deprived by exsiccation of the power of producing local inflammation, when outwardly applied to a living body; and in these plants it seems to originate from their resinous parts; such are euphorbium, or wart-wort, various parts of several species of the daphne, of the capsicum annuum, or Guinea-pepper, of the pellitory of Spain, &c. The acrid matter of Spanish flies is essentially distinct from the acrid matter of vegetables, as it is not dissipated by drying, and cannot be extracted by water; though it may be obtained by spirit of wine and ether. It resembles the latter kind of acrid matter, and seems to be of a resinous nature. See Gren's Principles of Modern Chemistry, vol. i. p. 420. vol. ii. p. 45.

Acrid substances constitute one class of CONDIMENTS in the Materia Medica of Dr. Cullen, vol. i. p. 427. He distributes them into two kinds, *viz.* aromatic, imbued with peculiar and pretty strong odours, and the more simple acrids possessing little peculiar odour. Besides the AROMATICS, the acrid substances employed as condiments, are especially taken from the class of tetradynamia plants; and they are chiefly the mustard and horse-radish. These stimulate the stomach and assist digestion; and as they promote perspiration and urine, they correct the putrescent tendency of the system, and hence vegetables of this class have been denominated ANTISCORBUTIC. Because they possess this quality, they are proper to be used with our animal food, as the aromatics are the suitable condiments of our vegetable aliments. The plants of the garlic tribe are endued with a similar acrimony. Those of the milder kind, as the onion and leek, more especially when deprived of their acrimony, afford a considerable quantity of nutritious matter; and these, together with the eschalot, and others, are very proper condiments. Garlic, used for the same purpose, strongly stimulates the stomach, and promotes digestion. All the plants of this order, as they serve to promote perspiration and urine, are very properly joined with our animal food, and may be referred to the class of antiscorbutics. Asiafoetida may be also recommended as a condiment, that is useful in promoting digestion. Of the more simple acrids, the CAPSICUM, or pepper, is the most commonly used. The eating of acrid food, with a view to the effects above enumerated, was particularly called by the Greeks *drimyphagia*, formed of *δριμυς*, acrid, and *φαγω*, to eat.

ACRIDÆ, in *Entomology*, the name by which Linnaeus has distinguished the first family of the GRYLLOUS, the *Truxalides* of Fabricius, or the CRICKET, properly so called: the characters of which are, that the head is conical and longer than the thorax, and the antennæ ensiform or sword-shaped. Of this family there are eight species, none of which are found in Britain. The insects of this family feed on other insects.

ACRIDOPHAGI, compounded of *ακρι*, locust, and *φαγω*, to eat, in *Ancient Geography*, a nation or people of Ethiopia, inhabiting near the deserts, &c. who are said to have

have fed on locusts. These people, as Diodorus Siculus (lib. iii. c. 29. tom. i. p. 195. Ed. Westeling.) describes them, were of a low stature, and a meagre black aspect. In the spring they provided themselves with a supply of large locusts, by setting fire to wood and other combustible materials, which they deposited in a large and deep valley, so that when swarms of locusts were driven by the south-west winds over this valley, they were suffocated by the smoke. These locusts, which covered the ground to a considerable extent, were collected and salted, and in this state furnished a supply of food for the whole year: and, indeed, it was the only food upon which they subsisted, as they had neither herds nor flocks; and being far from the sea, they had no supply of fish. They were an active people, and ran with great swiftness; but the duration of their lives was short, not exceeding forty years; and they generally fell sacrifices to a malady of a very peculiar kind. They were devoured by winged insects of different species, and of very hideous forms, which were generated in their bodies, and which issued forth in various parts, occasioning exquisite torture, and at length a very painful death. Whether this dreadful malady was owing to the food of the people, or to the pestilential air of the climate in which they lived, it is not easy to determine. See Strabo, (Geog. l. xvi. tom. ii. p. 1118.) and St. Jerome against Jovinian, lib. ii. and on St. John, cap. iv. Pliny (H. N. tom. i. p. 609. Ed. Hard.) also speaks of Acridophagi, in Parthia, and St. Jerome, in Lybia. Although the circumstances of these people may in some respects be fabulous; yet may the Acridophagia be true; and to this day they are said to eat locusts in some parts of the east. This is confirmed by the accounts of the Danish mission, in Niebuhr's description de l'Arabie, p. 150, &c. In Abyssinia locusts are eaten, both fresh and salted. Some of them are dried in the sun, and thus prepared for use. In Arabia also, as Niebuhr informs us, they preserve them in the same manner. Dr. Shaw (Travels, &c. p. 188.) observes, that the Jews were allowed to eat them; and that when they are sprinkled with salt and fried, their taste resembles that of our fresh water cray-fish: and Russel (Hist. Aleppo, p. 62.) says, that the Arabs salt them, and eat them as a delicacy. From Hasselquist, who travelled in Syria and Egypt so lately as the year 1752, we learn, that when corn is scarce, the Arabians grind the locusts in hand-mills, or stone-mortars, and bake them in the form of cakes, which they use as bread; and that he has frequently seen them boiled and stewed with butter, and made into a kind of fricassée. Amongst the Hottentots, as Dr. Sparrman informs us, (Voyage to the Cape, vol. i. p. 36.) they are made into a brown coffee-coloured soup, which acquires from the eggs of the females, that are chiefly used for this purpose, a fat and greasy appearance. These people compensate themselves for the damage done by the flights of locusts, by converting large quantities of them into a nutritious food. These facts remove every difficulty in determining the food of John the Baptist, who is said to have lived on locusts, *ακριδες*, and wild honey. Matt. chap. iii. v. 4. Yet the rendering of *ακριδες* by locusts, as the English translators have done, has been much controverted. Isidore of Pelusium, in his 123d epistle, speaking of this food of St. John, says, it was not animals, but the tops of herbs; and even charges those who understand the word otherwise with ignorance: but St. Augustine, Beda, Ludolphus, and others, are of a different opinion. Accordingly the Jesuits of Antwerp reject, with contempt, the opinion of the Ebionites, who, for *ακριδες*, put *εγχιριδες*, a delicious diet prepared of honey and oil; that of some other innovators, who

read *αχχιριδες*, or *αχιριδες*, *sea-crabs*; and that of Beza, who reads *αχχιριδες*, *will pears*. The term *ακριδες*, says Dr. Shaw, (*ubi supra*) does not denote the tops of plants, as some have contended, but it is applied to the locust on account of its appetite for such food. The word is used by Aristotle (Hist. Anim. lib. vi. c. 28.) and other historians in the same sense. The Septuagint interpret *אֲרָבָה*, *arbab*, by the same word; and therefore the writers of the New Testament may be supposed to have taken it in the same signification. He adds, if locusts appeared in the Holy Land, during the spring, as they did in Barbary, it may be presumed that St. John entered upon his mission, and *steved himself to Israel* (Luke i. 20.) at that season.

ACRIFOLIUM, in *Botany*, signifies any prickly leaved plant.

ACRII Montes, in *Ancient Geography*, mountains of Sicily, called also *Heræi*.

ACRILLÆ, a city of Sicily, between Acre and Agrigentum, not far from Syracuse. This is probably the same with Accila, mentioned by Plutarch in Marcello. See Livy, l. xxiv. c. 35. tom. iii. p. 899. Ed. Drakenb.

ACRIMONY, that quality of substances which renders them acrid to the taste. The acrimony of the bile is supposed to be the cause of divers disorders; and a catarrh is represented to be a defluxion of acrimonious humour. The Bristol water is recommended by Dr. Randolph for tempering the bad effects of acrimonious blood. This he mentions as its first and principal virtue in his inquiry into the medicinal virtues of Bristol water, 8vo. 1750.

ACRIMONY, in *Medicine*, means a state of the fluids of the body, which may become the cause or effect of several diseases. This state of the fluids or humours has been assumed by the humoral pathologists, of which sect Boerhaave may be considered as the last and most respectable teacher, in order to explain eruptions on the surface of the body, Sea-Scurvy, Rheumatism, Gout, Hætic Fever, &c.—At present the existence of such a cause is considered as hypothetical.

ACRIOTERI, in *Ancient Geography*, a marsh of Asia Minor, in the greater Phrygia, upon the frontiers of Pisidia.

ACRIS, *ακρῖς*, signifies a locust, the top of a mountain, and the extremities of fractured bones.

ACRISIUS, in *Fabulous History*, a king of Argos, who, being warned by the oracle that he should be killed by his grandchild, shut up his only daughter Danaë in a brazen tower: but Jupiter descending to her in a golden shower, she was delivered of Perseus; who, having slain the Gorgons, carried Medusa's head to Argos, and transformed Acrisius into a statue of stone. This golden shower was probably a bribe to those who guarded the tower. Some suppose that her uncle Prætus found means to corrupt them, and to get admittance to Danaë. Acrisius is said to have been buried in the Acropolis at Argos. The name, (says Mr. Bryant,) is a metathesis of Acrisius, or Arcasius, by which is meant the great Arkite, the person there worshipped.

ACRISTIA, in *Geography*, a town of Sicily, twenty-three miles W. N. W. of Mazara, built upon the ruins of the ancient town of Schritea.

ACRITAS, in *Ancient Geography*, a promontory of Messenia, now Capo di Gallo, between Methone to the west, and Corone to the east, where the Sinus Coronæus begins. It is also the name of a cape of Bithynia, north of the gulf of Astacus.

ACRIVIOLA, in *Botany*. See **NASTURTIUM Indicum**.

ACROAMA,

ACROAMA, formed from *ακροαμαί*, to *hear*, in *Antiquity*, a name given by the Romans to amusing tales, which they recited at their repalls. The appellation was also given to those who played on musical instruments, in contradistinction to those who sung.

ACROAMATIC, in a general sense, denotes a thing sublime, profound, or abstruse; and in this sense it is opposed to *exoteric*. There are few sects or professions, that have not two modes of teaching, if not two sorts of doctrine; an acroamatic for adepts and proficientes, and an exoteric for novices. We find traces of this distinction among the heathens, as well as among christian divines, philosophers, and chemists. Hence proceeded the ceremonies of initiations and ablutions, and the discipline of secrecy; and hence also the origin of fables, ænigmas, parables, symbols, &c.

ACROAMATIC is sometimes also used for any thing kept secret, or remote from popular use; in which sense Reimman gives the title *Bibliotheca Acroamatica*, to a description of the MSS. in the library of Vienna, abridged from the vast commentaries of Lambecius and Nesselius.

ACROAMATICI, in *Philosophy*, a denomination given to the disciples or followers of Aristotle, &c. who were admitted into the secrets of the inner or acroamatic philosophy.

ACROATHON, in *Ancient Geography*, a town situate on the top of Mount Athos, where, according to Mela, cited by Cellarius, the age of the inhabitants was half as long again as that of those who lived in other countries. It is called by the modern Greeks, *Αγιος ορος*, and by the Italians, *La Cima de Monte Sancto*.

ACROATICS, a name given to Aristotle's lectures in the more difficult and curious parts of philosophy, to which none but his disciples and intimate friends were admitted; whereas the exoteric were public or open to all: but there are other differences. The acroatic were set apart for the higher and more abstruse subjects; the exoteric were employed in rhetorical and civil speculations. Again, the acroatics were more simple and exact, as they aimed at evidence and demonstration; the exoterics chiefly aimed at the probable and plausible. The former were the subject of the morning exercises in the Lyceum, the latter of those in the evening. Besides, the exoterics were published, whereas the acroatics were kept secret, being either entirely concealed, or if they were published, it was in such obscure terms, that few but his own disciples would be the wiser for them. Hence, when Alexander complained of his preceptor for publishing his acroatics, and thus revealing what should have been reserved to his disciples; Aristotle answered, that they were made public and not public, because none who had not heard them explained by the author, *viva voce*, would understand them. Plut. in *Alex.* Stanley's *Hist. Philos.*

It has been supposed, says Dr. Gillies, in his translation of Aristotle's *Ethics* and *Politics*, that, in these two kinds of lectures, the Stagyrice maintained contradictory doctrines on the subjects of religion and morality. But the fact is far otherwise: his practical tenets were uniformly the same in both; but his exoteric, or popular treatises, nearly resembled the philosophic dialogues of Plato, or Cicero; whereas his acroatic writings contained, in a concise energetic style, peculiar to himself, those deep and broad principles on which all solid science is built.

ACROBATES, in *Antiquity*, a name given to *rope-dancers*; of these there were four sorts: the first vaulted or tumbled on a rope, sometimes suspending themselves by the neck or foot, &c.: the second slid from a high station along

a rope, upon which their breast rested, and with their arms and legs extended, as if they flew: others run along a rope, which was obliquely extended from a low to a high station: and those of the last sort, danced, leaped, and performed other kinds of feats on a rope stretched horizontally many feet above the ground.

ACROBATICA, or **ACROBATICUM**, formed of *ακρο*, *high*, and *βατάω*, or *βέννω*, *I go*, an ancient engine, by which people were raised aloft, that they might see more conveniently about them. This was the same among the Greeks, with what they call *scenorium* among the Latins.

Authors are not agreed as to the use of this engine. Turnebus and Barbarus suppose, that it was of the military kind, raised by besiegers high enough to overlook the walls, and discover the state of things on the other side. Baldus rather supposes it to be a kind of moveable scaffold, or cradle, contrived for raising painters, plasterers, and other workmen to the tops of houses, trees, &c. Some suspect that it might have been used for both purposes. Vitruvius and Aquinas.

ACROCERAUNIA, in *Ancient Geography*, so called from *ακρος*, *high*, and *κεραυνος*, *thunder*, because they were lofty, and often thunder-struck; mountains of Epirus, running out into the sea, under N. lat. 45° 25'. extending from W. to E. as far as Pindus, and separating the Ionian sea from the Adriatic, now called *Monti della Chimera*. Virgil (*Georg.* i. 332. and *Æn.* iii. 506.) calls them *Ceraunia*. They derived their name from the town of Acroceraunia, now called Chimera, which is at the foot of the mountain, in the gulf of Chimera. The inhabitants, called Chimeriots, are savage robbers; they give their name to a promontory of the Adriatic sea.

ACROCHIRISMUS, *ακροχειρισμὸς*, among the *Ancients*, a kind of gymnastic exercise, wherein the two parties contended only with their hands and fingers, without clothing, or engaging the other parts of the body.

The word is also written *acrochiresis*, and *acrochiria*: it is originally Greek, formed from *ακροχειρ*, the part employed in this combat, which some would needlessly restrain to the tips of the fingers; though the *etymon* does not make this necessary.

Some make this a distinct exercise from wrestling, and suppose it to have given the denomination *acrochiriste* to a peculiar set of *athleta* who professed it. Others with more probability consider it only as a species of wrestling: some will have it to have been properly only a prelude to a wrestling match, wherewith the *athleta* began to try each other's strength, and bring their arms into play. This exercise made part of the *pancratium*. Pausanias speaks of a famous *pancratiast*, named Solrates, who got the surname of *Acrochiristes*, or *Acrochiristes*, from his having overcome all his antagonists at the *acrochirism*.—It appears to have been in use in the age of Hippocrates, who ascribes to it a virtue of extenuating the rest of the body, and making the arms fleshy.

ACROCHORDON, a painful species of *WART*, very prominent and pendulous, having a large head with a small pedicle, or base.

These are also called *peniles verruca*, or *hanging warts*, and stand distinguished from *sessiles verruca*, or *myrmecia*. Others describe the *acrochordon*, as a harder, rougher sort of wart, growing under the cutis, very callous and usually of the same colour with the skin; small at bottom, and bigger upwards, but rarely exceeding the size of a bean!

ACROCOLIA, *ακροκωλία* from *ακρος*, *extreme*, and *κωλον*, *a limb*. These are the extremities of animals, which are

used in food, as the feet of calves, swine, sheep, oxen, or lambs; and of the broths of which jellies are made. They are recommended by Hippocrates as a proper food, where there is a tendency to a dropsy. They are in general recommended as strengtheners for weak people.

ACROCOMES, in *Antiquity*, a people of Thrace, so called, from *ακρος*, *head*, and *κομη*, *hair*, because they had long hair before like females, in contradistinction to the Abantes, who wore their hair long behind.

ACRO-CORINTHUS, in *Ancient Geography*, a high hill hanging over the city of Corinth, on which was erected a citadel, called also by the same name. This mountain separated the two continents of Greece and Peloponnus, so that the fortrefs cut off all communication by land from the inner part of the isthmus of Corinth, and when well garrisoned, kept all Greece in awe; on which account Philip of Macedon used to call it the fetters of Greece. Antigonus took this fortrefs by surprize, with a design to enslave Peloponnus; but Aratus recovered it by an action equal, in the opinion of Plutarch, to any of the most celebrated enterprizes of the ancient heroes of Greece. Having secured the citadel, he went into the city, and assembling the people in the theatre, acquainted them with the particulars of the Achæan league, and exhorted them to accede to it. They unanimously agreed to join in the alliance; upon which Aratus restored to them the keys of the city, which had not been in their power since the time of Philip, the father of Alexander. On the top of this mountain stood a temple of Venus, and from a lower part issued the fountain Pyrene.

ACROE, in *Botany*, the name given by the natives of Guinea to a kind of shrub, which they use in wine, as a restorative and analeptic. It is of the trifoliate kind, and has somewhat of the appearance of the corallodendrons, but it is not prickly; the middle end or leaf stands on a pedicle of an inch long, the two other leaves have no pedicles at all. Phil. Trans. N^o 232.

ACROLISSUS, in *Ancient Geography*, a fortrefs of Illyria, in Dalmatia, situated on a mountain to the north of Lissus, of which it was the citadel. Polybius says, it was impregnable by Philip king of Macedon.

ACROLITHOS, in *Antiquity*, a colossal statue placed by Mausolus, on an eminence, in the temple of Mars, in the city of Halicarnassus.

ACROLOCHIAS, in *Ancient Geography*, a promontory of Egypt; which, according to Strabo, was near the isle of Pharos.

ACROMION, *ACROMIUM*, in *Anatomy*, the upper process of the SCAPULA, or shoulder-blade.

The word is derived from *ακρος*, *highest*, and *ωμος*, *shoulder*, q. d. the extremity of the shoulder.

Some have thought the *acromion* of a nature different from other bones; because, during infancy, it appears no more than a cartilage, which ossifies by little and little, and about the age of twenty years becomes hard and firm, like a common bone.

ACROMONOGRAMMATICUM, from *ακροσμονος* and *γραμμαμα*, *letter*, in *Poetry*, denotes a kind of poem, or composition, wherein each subsequent verse commences with the letter with which the verse preceding terminates.

ACROMPHALION, from *ακρος*, *extreme*, and *ομφαλος*, *the navel*; the tip of the navel.

ACRON, in *Biography*, a celebrated physician of Agrigentum, in Sicily, where he practised physic in the time of Empedocles, is said to have restrained the plague at Athens, by purifying the air with large fires, and by burning perfumes in the manner practised by the Egyptians.

When he required, some years after, as a reward for his services, that a piece of ground should be allotted him in the city for his tomb, Empedocles, with whom he had disputed, prevented his obtaining it. He lived about the middle of the fifth century before Christ. Suidas mentions two tracts written by him, in the Doric dialect, the one a general treatise of physic, the other on abstinence or diet.

ACRON was also the name of an ancient scholiast on Horace, in the seventh century, whose work is still extant in an old edition of Horace, printed at Basil, in 8vo. in 1527.

ACRON, in *Botany*, among the *Ancients*, was used to signify the *capitulum*, top, or flower of plants of the thistle kind.

ACRON, in *Geography*, a district on the Gold coast of Guinea, extending along the sea eastward from Fantin to the mount called Monte del Diabolo, or the Devil's Mount. It is divided into Great and Little Acron; the former, which is the interior country, is a kind of republic; the latter, bounded on the south by the sea, is a pure monarchy. They are independent on each other, and yet strictly united under the protection of the Fantyns, who derive from the fertile Acrons a principal part of their maintenance. The only European settlement in this kingdom is a Dutch fort, built at Ascam, in 1697, called *Patience*, from the difficulties they encountered whilst they were building it. Apam is a small village, and inhabited only by fishermen. The natives of Acron live in peace, cultivate their lands, and pursue their employments in security. Every year affords a plentiful harvest, which enables them to supply their protectors and adjacent countries with corn. The country abounds with game, with which the Dutch fort is plentifully supplied. The people, however, are poor, notwithstanding their industry and the fertility of the soil, and extremely ignorant.

ACRON, in *Scripture Geography*. See ACCARON.

ACRONIUS LACUS, in *Geography*, a small lake formed by the Rhine soon after its rise out of the Alps, and after passing the greater lake, called *Venetus*, and now *Bodensee*, or the lake of Constance.

ACRONYCAL, ACHRONYCAL, or ACRONICAL, in *Astronomy*, is applied to the RISING of a star or other point, above the horizon, when the sun sets; or its SETTING when the sun rises. This is one of the three poetical risings and settings of the stars; and stands distinguished from COSMICAL and HELIACAL.

Among ancient writers, a star was properly said to be *acronichal*, or to rise *acronichally*, which rose in the evening when the sun was set. Greek writers, it is true, use the term *ακρονυχιας* indifferently, in speaking either of evening or morning, by reason both are considered as *ακρα της νυκτος*, *the extremities of the night*. And hence, among them we find *acronichal* applied to the rising and setting of the stars, either in the morning or evening. But the ancients were more distinct, and by the *ακρονυχιας* rather meant the first beginning or approach of night, than the end or period of it; and accordingly among them, the stars which rose in the evening, not those in the morning, were said to rise *acronichally*.

This word is sometimes ignorantly spelt *achronical*, from a mistaken notion of its being derived from *α*, and *χρονος*, *time*.

ACRONYCHIA, in *Botany*, a species of LAWSONIA.

ACRONYCTÆ, stars rising in the twilight about sun setting.

ACROPOLIS, in *Ancient Geography*, the citadel of ATHENS, which derived its name from the eminence on which

verse, but something added at the end of a psalm, or something frequently repeated in the course of a psalm, answering to our *gloria patri*.

Some pretend to find acrostics in the psalms, particularly in those called *ABECEDARIAN* psalms.

ACROSTICHUM, formed of *ακροσ* *στιχος*, *summus ordo*, *rufstach*, *wall-rue*, or *forked fern*, in *Botany*, a genus of the *cryptogamia filices* class and order; the character of which is, that the fructifications cover the whole inferior surface of the frond or leaf. Professor Martyn, in his edition of Miller's Dictionary, enumerates 44, and Gmelin 45 species, which are distributed into different classes, comprehending those with a simple frond, undivided and divided; and those with a compound frond, pinnate, sub-bipinnate, bipinnate, and supra-decompound. Under the first distribution with a frond simple, undivided, are included, *A. lanceolatum*, *citrifolium*, *heterophyllum*, *crinitum*, *punctatum*, *spicatum*, *lingua*, and *basatum*: and those with a frond simple, divided, are *A. septentrionale*, *australe*, *pedatum*, *dichotomum*, *digitatum*, *ferrugineum*, and *polypodioides*. Under the second distribution, are comprehended the pinnate, *viz.* *A. aureum*, *rufum*, *punctatum*, *orbifolium*, *areolatum*, *marginalum*, *sanctum*, *platyneuron*, and *trifoliatum*; the sub-bipinnate, *viz.* *A. filiquosum*, *thalictroides*, *marantzæ*, *ilvense*, *ebeneum*, and *surcatum*: the bipinnate, *viz.* *A. aculeatum*, *cruciatum*, *barbarum*, *calomelanos*, *viviparum*, *velleum*, *simplex*, *petiolatum*, *latifolium*, *villosum*, *nucleosum*, *ferrulatum*, *graminoides*, and *sulphureum*. Gmelin omits the *viviparum*, introduces the *longifolium* and *filare*, makes some difference in the arrangement of the species, and refers the *aculeatum* to a class with a supra-decompound frond. Of these species, two only are natives of Great Britain, *viz.* *A. septentrionale*, forked or horned fern, with fronds, naked, linear, and lacinate, or jagged; the fructifications, in an immature state, are in short indistinct lines or dots, resembling an *asplenium*, but in an adult state, the lower surface of the leaf is totally covered with brown dusty capsules; from two to five inches high; found in clefts of rocks, and old walls in Yorkshire, Westmoreland, Wales, and Scotland: and *A. ilvense*, or hairy fern, the *POLYPODIUM ilvense* of Withering, with fronds sub-bipinnate, the pinnae or wings oppositely coadunate or united, obtuse or blunt, hirsute or hairy underneath, and quite entire at the base; the stipe or stem is greenish, and not blackish purple, scarcely more than a finger's length; called *A. alpinum* by Bolton; perennial, and flowering from July to September, found on rocks in Wales. The *A. marantzæ*, with fronds sub-bipinnate, the pinnae oppositely coadunate, very hirsute underneath, and a little toothed at the base, is a native of the southern countries of Europe; but all the rest belong to hotter climates, as the East or West Indies, Africa, and the southern provinces of North America. The *A. punctatum*, with fronds heart-tongued, acuminate, quite entire, dotted above, resembles *hart's-tongue*, and is probably rather a species of *polypody*. It is used medicinally in China, where it was first remarked by J. Fothergill. Few of the species have been introduced into gardens. Those of Europe may be preserved in pots, filled with gravel and lime-rubbish, or planted on walls and artificial rocks: but most of them, being natives of very hot climates, must be planted in pots, and plunged into the bark-pit. Martyn's Miller.

ACROSTICHUM is also a species of *POLYPODIUM*, called *Thelypteris*, and a species of *CÆNOPTERIS*, called *viripara*.

ACROSTOLIUM, in *Ancient Naval Architecture*, an ornament of the prow, or forecastle of a ship, chiefly of war; sometimes shaped like a buckler, a helmet, or an animal, but more frequently circular or spiral. The ancients

had divers decorations or additional parts to their ships, called by a general name *κορυμβοι*; those on the prow were more particularly called *σκολοι*, of which the extreme part alone was denominated *acrostolium*.

To the *acrostolia* may be referred the *anserculus*, mentioned by Bayfius; and also those polished steel pieces resembling a duck's neck, used by the Venetians at the heads of their gondolas.

The *acrostolia* were torn from vanquished ships, and fastened to the conqueror's, as a signal of victory. We frequently find them represented on the reverses of ancient medals. An *acrostolium* is also seen in the famous sculpture of the *apoteosis* of Homer. The *acrostolium* was an ornament to the medals of maritime towns, such as Sidon and Aradus, and designed to express naval victories.

ACROTADUS, in *Ancient Geography*, an island of the Persian gulf, mentioned by Pliny; supposed by others to be Athothadrus, or a desert island, mentioned by Nearchus, according to Arrian, and called Caicandrus.

ACROTELEUTIC, from *ακρος* and *τελος*, *end*, among *Ecclesiastical Writers*, denotes the end of a verse or psalm: or something added thereto to be sung by the people.

In which sense *acroteleutic* amounts to the same with *acrostic*, *hypopsalma*, *diapsalma*, *epode*, &c.

The *gloria patri* is by some writers called the *acroteleutic* to the psalms; because always used to be repeated by the people at the end of each.

Hence the word *acroteleutic* is sometimes also used as synonymous with *DOXOLOGY*.

ACROTERRI, in *Geography*, a small town in the island of SANTORIN, N. lat. 36°. 25'. E. long. 26°. 1'.

ACROTERRIA, or **ACROTERRS**, formed of *ακρον*, in *Architecture*, small pedestals, usually without bases, anciently placed at the middle, and the two extremities, of **PEDIMENTS**; and serving also to support statues.

Those at the extremes ought to be half the height of the **TYMPANUM**; and that in the middle, according to Vitruvius, should be one eighth part more.

ACROTERRIA, sometimes also signify figures, whether of stone, or metal, placed as ornaments, or crownings, on the tops of temples, or other buildings.

Sometimes they also denote those sharp **PINNACLES**, or spiry battlements, which stand in ranges about flat buildings, with rails and ballusters.

ACROTERRIA, among ancient *Physicians*, were used to denote the great extremities of the body, as the head, hands, and feet.

Aristotle also uses *acroteria*, for the tips or extreme parts of the fingers, covered by the nails; sometimes also for the eminences of the bones.

ACROTERRIASM was anciently used for the amputation of any extremity.

ACROTHYMIA, in *Surgery*, the name of a large tumor in the flesh, rising in the shape of a wart, though sometimes depressed and flat, called **THYMUS**. Heister. See **NÆVUS**.

ACROTYNI, in *Ancient Geography*, a town placed by Stephanus Byzant. on the top of Mount Athos. See **ACROATHON**.

ACRYDIUM, in *Entomology*, a name given by Degeer to the *Gryllus brevicornis*, and the *G. serratus* of the Linnean system. The former, is found in South America; and the latter, at the Cape of Good Hope.

ACSAC, a measure of capacity in use both in Asia and Egypt. See **LOG**.

ACSOR, in *Geography*, a town on the river Nile in Egypt, famed for its earthen ware.

ACSTED, a town in the Dutchy of Bremen, in Germany, 24 miles N. of Bremen.

ACSU is the name of a small town of Asiatic Turkey, in Natolia, 5 leagues west of Iznick.

ACT, *ACTUS*, in general, denotes an effective exercise, or application of some power or faculty. In this sense *act* stands opposed to power, *potenti*, which is only the capacity of *acting*, but not the exertion of that capacity.

Though the word *act*, properly and primarily, be only applicable where the power might exist without being drawn forth into *act*; yet the schoolmen extend it farther; defining it by the presence of any power or perfection, even though it could not be absent. In which sense, God himself is said to be a most pure *act*; because his perfections are always and necessarily present. And thus, *FORM* is called an *act*: inasmuch as the presence hereof completes the power and perfection of matter.—Even existence is termed an *act*; because, when this is given to a being, nothing farther is wanted. The Greeks sometimes call *act* *ἐνδεχόμενον*, a term denoting an actual possession of perfection, by the Latins usually rendered *perfectio*.

Act and power are distinguished by writers on Ontology three ways; viz. as actual being is distinguished from a power to be; actual doing or action, from a power to do; or actual suffering or passion, from a power to suffer. See Watts's Ontology in Works, vol. v. p. 647.

Metaphysicians give various divisions of *act*; viz. into *infinite*, as the *act* of creating; and *finite*, as the *act* of moving.—*Transient*, or those exercised in other beings, as heating; and *immanent*, which remain in their own subject, as thinking. See ACTION.

ACT, in *Logic*, is particularly understood of an operation of the human mind. Thus to discern, examine, and judge, are acts of the understanding; to affirm and chuse, are acts of the will. There are voluntary and spontaneous acts; the former are produced by the operation of the soul, the latter without its privity or participation.

ACT, in a *legal* sense, is an instrument, or other matter in writing; of use to declare, or justify the truth of a thing. In which sense, records, decrees, sentences, reports, certificates, &c. are called *acts*, authentic *acts*, solemn *acts*, &c. See DEED.

ACT, in the *Universities*, a thesis maintained in public by a candidate for a degree; or, to shew the capacity and proficiency of a student in the UNIVERSITY.

The candidates for a degree of bachelor and master of arts are to hold philosophy acts; those for bachelor of divinity are to keep divinity acts, &c.

At Oxford, the time when the masters or doctors complete their degrees is also called the *act*; which is held with great solemnity: at Cambridge they call it the *commencement*.—*Act* is also a collegiate appellation for the person who proposes questions that are the subjects of disputation in the exercises of the university schools. The persons with whom he contends in these questions are called opponents: and the discussion is proposed under the direction of the moderator at Cambridge. The distinguished men of the year appear eight times in this manner in the schools; twice as *acts*, and six times as opponents. One *act* and three opponencies are kept before the summer; and one *act* and three opponencies in the term following the summer vacation.

ACT of faith, *AUTO DA FE*, in the Romish church, is a solemn day held by the INQUISITION, for the punishment of heretics, and the absolution of the innocent accused.

They usually contrive the *auto* to fall on some great fes-

tival; that the execution may pass with the more awe and regard: at least it is always on a Sunday.

The *auto da fe* may be called the last act of the inquisitorial tragedy; it is a kind of goal-delivery, appointed as oft as a competent number of prisoners in the inquisition are convicted of heresy; either by their own voluntary or extorted confession; or on the evidence of certain witnesses. The process is thus: in the morning they are brought to a great hall, where they have certain habits put on, which they are to wear in the procession. The procession is led up by Dominican friars, after which come the penitents, some with san benitos, and some without, according to the nature of their crimes; being all in black coats without sleeves, and bare-footed, with a wax candle in their hands. These are followed by the penitents who have narrowly escaped being burnt, who over their black coats have flames painted, with their points turned downwards, *fuego revolto*. Next come the negative, and relapsed, who are to be burnt, having flames on their habits pointing upwards; after these come such as profess doctrines contrary to the faith of Rome, who besides flames pointing upwards, have their picture painted on their breasts, with dogs, serpents and devils, all open-mouthed about it. Each prisoner is attended with a familiar of the inquisition, and those to be burnt have also a Jesuit on each hand who are continually preaching to them to abjure. After the prisoners, comes a troop of familiars on horse-back, and after them the inquisitors, and other officers of the court, on mules; last of all, the inquisitor general on a white horse, led by two men with black hats and green hat-bands.

A scaffold is erected in the Terreiro de Paco, big enough for two or three thousand people; at one end of which are the prisoners, at the other the inquisitors. After a sermon made up of encomiums of the inquisition, and invectives against heretics, a priest ascends a desk near the middle of the scaffold, and having taken the abjuration of the penitents, recites the final sentence of those who are to be put to death; and delivers them to the secular arm, earnestly beseeching at the same time the secular power not to touch their blood, or put their lives in danger.

The prisoners being thus in the hands of the civil magistrate, are presently loaded with chains, and carried first to the secular gaol, and from thence in an hour or two brought before the civil judge, who, after asking in what religion they intend to die, pronounces sentence; on such as declare they die in the communion of the church of Rome, that they shall be first strangled, and then burnt to ashes; on such as die in any other faith, that they be burnt alive.

Both are immediately carried to the place of execution, which stands on the Ribera at Lisbon, where there are as many stakes set up as there are prisoners to be burnt, with a quantity of dry furze about them. The stakes of the professed, that is, such as persist in their heresy, are about four yards high, having a small board towards the top for the prisoner to be seated on. The negative and relapsed, being first strangled and burnt, the professed mount their stakes by a ladder; and the Jesuits, after several repeated exhortations to be reconciled to the church, part with them, telling them they leave them to the devil, who is standing at their elbow to receive their souls, and carry them with him into the flames of hell. On this a great shout is raised, and the cry is, let the dogs *beards be made*, which is done by thrulling flaming furze, fastened to long poles, against their faces, till their faces are burnt to a coal, which is accompanied with the loudest acclamations of joy. At last, fire is set to the furze at the bottom of the stake, over which the professed are chained

so high, that the top of the flame seldom reaches higher than the seat they sit on, so that they rather seem roasted than burnt. There cannot be a more lamentable spectacle; the sufferers continually crying out, while they are able, *miseri cordia per amor de Dios*: yet it is beheld by all sexes, and ages, with transports of joy and satisfaction: this joy is not the effect of natural cruelty, but of the spirit of their religion; for the deaths of other malefactors are tenderly commiserated and lamented. Geddes's Misc. Tracts, tom. i. p. 442. Limb. Hist. Inq. lib. iv.

ACT of Grace. See GRACE.

ACTS also denote the deliberations and resolutions of an assembly, senate, council, or convocation; taken down by clerks, notaries, actuaries, or the like, and entered in a register. Acts are also matters of fact transmitted to posterity in certain authentic books, or memoirs, as the ACTS of the Apostles, of the Martyrs, &c. to this general class belong acts of parliament, which are called STATUTES; acts of the Royal Society called TRANSACTIONS; those of the late royal academy of sciences at Paris, called *memoirs*; those of the societies of Leipsic, &c. called simply acts, *acta eruditorum*, &c.

ACTS of the *Consistory*, *acta consistorii*, the edicts and declarations of the council of state of the Roman emperors. The senate and soldiers often swore, either through abject flattery or by compulsion, upon the edicts of the emperor, as we do upon the Bible; and the name of Apudius M. rula was erased by Nero from the register of senators, because he refused to swear upon the edicts of Augustus.

ACTS of Council, differed from canons, in that the latter contained only the results, or the laws and regulations agreed on, and drawn up in form; whereas the acts included the preceding debates, motions, &c.

In the first collections of councils, only the bare canons were delivered. Afterwards they began to give the acts as well as the canons.

Hence we have two kinds of synodical collections: one containing all the acts, or transactions, relating to matters of faith and doctrine; the other, containing only the canons relating to discipline, is called the book of CANONS.

ACTS of the people, *acta populi*, among the Romans, were journals or registers of the daily occurrences, as assemblies, trials, executions, buildings, births, marriages, deaths, &c. of illustrious persons, and the like.

These were otherwise called *acta publica*, and *acta diurna*, or simply *acta*.

The *acta* only differed from annals, in that only the greater and more important matters were in the latter, and those of less note in the former. Tacitus Annal. xiii. 31.

Their origin is attributed to Julius Cæsar, who first ordered the keeping and making public the acts of the people; some trace them higher, to Servius Tullius, who, to discover the number of persons born dead, and alive, ordered that the next of kin, upon a birth, should put a certain piece of money into the treasury of *Juno Lucina*; upon a death, into that of *Venus Libitina*: the like was also to be done upon assuming the *toga virilis*, &c. Under Marcus Antoninus, this was carried farther; persons were obliged to notify the birth of their children, with their names and surnames, the day, consul, and whether legitimate or spurious, to the præfects of the *ævarium Saturni*, to be entered in the public acts: though before this time the births of persons of quality appear to have been thus registered. Suetonius. Pitife. Lex.

ACTS, Public. The knowledge of public acts has been erected into a peculiar science, called the *diplomatic*, of great importance to an historian, statesman, chronologer, and even

critic. The preservation of them was the first occasion of erecting libraries.

The style of acts is generally barbarous Latin. Authors are divided as to the rules of judging of their genuineness, and even whether there be any certain rules at all? F. Germon will have the greater part of the acts of former ages to be spurious. Fontanini asserts, that the number of forged acts now extant is very small. It is certain there were severe punishments inflicted on the forgers and falsifiers of acts.

The chief of the English acts, or public records, are published by Rymer, under the title of *Fœdera*, and continued by Sanderfon: an extract whereof has been given in French by Rapin, and translated into English, under the title of *Acta Regia*. Great commendations have been given to this work, and some exceptions made to it: as that there are many spurious acts, as well as errors in it; some have even charged it with falsifications.

The public acts of France fell into the hands of the English after the battle of Poitiers, and are commonly said to have been carried by them out of the country. But the tradition is not supported by any sufficient testimony, and has even been shewn by M. Brussel to be false.

ACTS of the Senate, *acta senatus*, among the Romans, were minutes of what passed, and was debated in the senate-house.

These were also called *commentarii*, and by a Greek name *ἰστορηματα*. They had their origin in the consullship of Julius Cæsar, who ordered them both to be kept and published: and there was an officer, who was himself a senator, whose province it was to compose these *acts*. The keeping them was continued under Augustus, but the publication was abrogated. Afterwards all writings, relating to the decrees or sentences of the judges, or what passed and was done before them, or by their authority, in any cause, were called by the name ACTA. - In which sense we read of civil acts, criminal acts, intervenient acts, *acta civilia*, *criminalia*, *intervenientia*, &c.

ACTS, Clerk of the, is an officer of the navy. See CLERK.

ACTS of the Apostles, a canonical book of the New Testament, which contains great part of the lives of St. Peter and St. Paul, and of the history of the Christian church; commencing at the ascension of our Saviour, and continued down to St. Paul's arrival at Rome, after his appeal to Cæsar, comprehending in all about thirty years. St. Luke has been allowed by all antiquity to be the author of this book, and his principal design in writing it was to furnish an authentic history of the first plantation of Christianity; and it thus serves to obviate the false acts, and false histories, which were afterwards dispersed through the world. The exact time of his writing it has been ascertained with a very considerable degree of accuracy; for it must have been at least two years after St. Paul's arrival at Rome, because it informs us that St. Paul dwelt two whole years in his own hired house; perhaps he wrote it while he remained with St. Paul, during the time of his imprisonment.

It was written, according to Mill, in his Prolegomena, in the year 64. And Dr. Lardner (works, vol. vi. p. 145,) observes, that it could not have been written till after St. Paul's confinement at Rome was come to a period, which he supposes to have ended in the former part of the year of Christ 63; and he thinks it probable, that St. Luke finished this book the same, or the next year, either at Rome or in Greece. That St. Luke was the author of it appears from the general consent of the ancient Christian writers:

e. g. of Irenæus, Tertullian, Clement, Origen, Eusebius, and St. Jerome. Besides, several ancient Greek MSS. of the New Testament, cited by F. Simon in his critical History of the New Testament, (pt. 1. c. 14.) have the name of St. Luke prefixed to this history; and in the Syriac version it is also expressly ascribed to St. Luke. Moreover, the history of the acts of the apostles is found in thirteen catalogues of the books of the New Testament, which are the principal catalogues of those books in the writings of the fathers, for the four first centuries. See an enumeration of these catalogues in Benson's History of the first Planting of the Christian Religion, p. 302. and Jones's Canon. vol. 1. p. 73. That the history of the acts is a true history, may be unquestionably inferred from the citations and allusions to it that occur in the writings of the primitive Christians; as in the epistle ascribed to St. Barnabas about the year of Christ 71, the epistle of St. Clement about the year 96, the Pastor of Hermas about the year 100, the epistles of St. Ignatius about the year 107, and the epistle of Polycarp about the year 108. These five were apostolic fathers, who had conversed with the apostles, and probably with St. Luke himself; and therefore their testimony is of great importance in ascertaining the truth of this history. We might also refer to the testimonies of Papias, A. D. 116; Justin Martyr, A. D. 140; Irenæus, A. D. 178, St. Clement the presbyter of Alexandria, A. D. 194; Tertullian, A. D. 200. Some have supposed, that St. Luke wrote both his GOSPEL and the *Acts* in one book, and divided it into two parts. The transition (*Acts* i. 1.) agrees with this account; for the acts are the second part of the book, or history, of which Luke has called his gospel the first part; the latter is inscribed to Theophilus, as well as the former, and the author's name is not prefixed to the *Acts* as it is to St. Luke's Gospel, and yet the author is not disputed. When the gospel and the acts were one continued book, with St. Luke's name prefixed to the former, it was needless to repeat it before the second part of his work. See Jones's Canon. vol. iii. p. 113. and Benson's Planting of Christianity, p. 299. See also Biscoe's Discourses at Boyle's Lect. c. 14, 15. The style of this history, originally written in Greek, is deemed to be purer than that of the other canonical writers; and it has been alledged by some Biblical critics, that St. Luke, who was better acquainted with the Greek than with the Hebrew language, makes use of the Septuagint version in his citations from the Old Testament.

The truth and divine original of Christianity may be deduced from the history of the Acts of the apostles. The general and particular doctrines contained in this book are so reasonable, and the evidences which the apostles gave of their doctrine, in their appeals to prophecies and miracles, and the various gifts of the spirit, were so numerous and so strong, and so wisely adapted to all sorts of persons, that the truth of the religion, which they attest, cannot be reasonably disputed. The history itself is credible. It was written by a person who was acquainted with the various circumstances which he recites, and who was both able and inclined to give a faithful relation of every particular that occurred. St. Luke was a companion of the apostles; he was himself an eye and ear witness of the facts, and personally concerned in many of the incidents which he records. In the history itself there are no inconsistencies or contradictions. The miraculous facts related in it are neither impossible, when we consider the divine power, to which they are ascribed, nor improbable, if we attend to the grand design and occasion of them. The writer appears to have been honest and impartial; for he has recorded the

objections made to Christianity, both by Jews and Heathens, and the reflections which enemies cast upon the religion itself and the first preachers of it. He has not concealed the weaknesses, faults, and prejudices either of the apostles or of their converts. The occasional hints that are dispersed through the epistles of St. Paul, harmonize with the facts recited in the history; insomuch that the history is the best guide to the study of the epistles. The other parts of the New Testament agree with the history, and confirm it. The Gospels clofe with references to the facts recorded in the Acts; and the epistles suppose that those facts had actually occurred which the history relates. The incidental circumstances mentioned by St. Luke correspond so exactly, and without any previous view to such a correspondence, and in cases where it could not possibly have been premeditated and precontrived, with the accounts that occur in the epistles, and with those of the best ancient historians both Jews and Heathens; that no person who had forged such an history, in later ages, could have had the same external confirmation; but must have betrayed himself, by alluding to some customs or opinions since sprung up; or by misrepresenting some circumstances, or using some phrase or expression, not then in use. The plea of forgery, therefore, in later ages, cannot be allowed: and if St. Luke had published such a history at so early a period, when some of the apostles, or many other persons concerned in the transactions which he has recorded, were alive, and his account had not been true, he would only have exposed himself to an easy confutation, and to certain infamy. If any history of former times deserves credit, the *Acts of the Apostles* ought to be received and credited. And if the history of the *Acts of the Apostles* be true, Christianity cannot be false. For a doctrine so good in itself, and attended with so many miraculous and divine testimonies, has all the possible marks of a true revelation. See Benson, *ubi supra*, p. 310—318: and an excellent work, distinguished by acute and original reasoning, and amplifying the argument above suggested, by Archdeacon Paley, entitled *Horæ Paulinæ*, 8vo. 1790.

There are also several spurious ACTS of the *Apostles*: such as, 1. The *acts of ABDIAS*, or the History of the Twelve Apostles, said to be composed by him in Hebrew, translated into Greek by his disciple Eutropius, and thence into Latin by Julius Africanus. 2. The *act* of St. Andrew, received by the Encratites, Manichees, Apostolics, and Origenians. 3. The *acts*, received by the Ebionites, and mentioned by Epiphanius as a gross forgery. 4. The *acts* of St. John, forged by Leucius. 5. The *acts of the Apostle*, under the names of Leucius, Lenticius, Leontius, Leonides, and Leuthon, names of the same person who lived in the fourth century, and who was a Manichee, and probably the father of those heretics, called by St. Austin, Seleuciani from the name Seleucus, which Mr. Jones thinks to be the same with Leucius. This book contained the *acts* of John, Andrew, Thomas, Peter, Paul, James and others. 6. The *acts* of St. Matthias were probably written by Leucius Charinus under this apostle's name, to which class we may refer the *acts* used by the Manichees. 7. The *acts* of Paul, which Mill in his Prolegomena, sect. 130. supposes to have been compiled by some faithful Christians, about the year of Christ 69, to supply the imperfect accounts in the *acts* of the apostles, written by St. Luke, and which Whiston regards as in some sense a sacred book; but which Eusebius reckons to be spurious, and Philastrius condemns as a silly book, abounding with strange stories. 8. The *acts* of Paul and Thecla, which was the work of some weak presbyter of Asia, and never had any authority in the Christian church. It is not certain when these *acts* were composed;

pose 1; but Dr. Lardner (vol. ii. p. 311.) conjectures, that they were written in the latter part of the first, or the beginning of the second century. Dr. Grabe has published a book under this title from MSS. in the Bodleian library. If this be the same with the work mentioned by Tertullian, Jerome, &c. as Dr. Grabe supposes, it has undergone many interpolations; and Lardner conceives the number in both the Latin and Greek copies to be greater than Grabe allows. 9. The *acts* of St. Peter, the travels of Peter, or the recognitions of Clemens, which are rejected by Eusebius, Athanasius, Jerome, Epiphanius, &c. as apocryphal. 10. The *acts* of St. Philip, which were probably the work of Leucius Charinus, or an appendage to his work. Fabricius (Codex Apoc. Nov. Test. tom. iii. 656.) mentions a MS. of some *acts* under the name of Philip, in the Vatican. 11. The *acts* of Seleucus, the same with those of Leucius, already mentioned. 12. The *acts* of Thomas, mentioned by Epiphanius, Athanasius, and Geladius, are supposed by Fabricius, Mill, and others to be the same with the *acts* of Leucius; but Mr. Jones supposes, that as it was used by some sects of the Gnostics, who sprung up at an earlier period, it was interpolated and altered by Leucius. But the work is unquestionably apocryphal. See on this subject Jones's Canon. vol. i. passim; and Lardner's Works:—Index under ACTS.

Acts of Pilate, denote certain memoirs or reports concerning the trial and death, the resurrection and ascension of Jesus Christ, which were transmitted by Pilate to the emperor Tiberius, and communicated by him to the senate. Justin Martyr, in his Apology (Num. 36. p. 65. and Num. 48. p. 72. Bened.) presented to Antoninus Pius, and the senate of Rome, about the year 140, after having mentioned on one occasion some of our Lord's miracles, and on another his crucifixion, and some of the attendant circumstances, adds: "and that these things were so done, you may know from the *acts* made in the time of Pontius Pilate." Tertullian also, in his Apology, (c. 21. p. 22.) about the year 200, having spoken of our Saviour's crucifixion and resurrection, his appearance to the disciples, and his ascension to heaven in their sight, subjoins this remark; "of all these things relating to Christ, Pilate, in his conscience a Christian, sent an account to Tiberius, then emperor." In another place he says, that by an ancient decret, no person should be acknowledged as a deity, unless he were first approved by the senate. Tiberius having received from Palestine an account of such things as manifested our Saviour's divinity, proposed to the senate, recommending the proposal by his own vote, that he should be placed among the gods. The senate refused, because he had himself declined that honour. Nevertheless the emperor persisted in his own opinion, and ordered that if any accused the Christians they should be punished. Eusebius, in his Ecclesiastical History, (lib. ii. cap. 2.) relates the fact, and cites the authority of Tertullian. Many learned moderns have objected to the original testimonies of Justin Martyr and Tertullian. Dr. Lardner has investigated the subject with his usual accuracy and impartiality. He first alleges that Justin Martyr and Tertullian were writers of good repute. He then shews that it was the custom of the governors of provinces to compose *acts*, memoirs, and commentaries of the remarkable occurrences that happened in the places where they presided: and these *acts* or registers were considered as public authorities, and therefore more decisive and satisfactory than some other accounts. Of this circumstance the ancient fathers were well apprised; and Eusebius admits the truth of what they report. In the time of the persecuting emperor Maximin, about A. D. 307, the heathen people forged

acts of Pilate, derogatory to the honour of our Saviour, which were very diligently circulated to unsettle Christians, or discourage them in the profession of their faith. The edict to this purpose was so negligently or ignorantly written, that our Saviour's death was referred by it to the fourth consulate of Tiberius, i. e. to the seventh of his empire, which is eleven years before our Saviour's passion, and five before Pilate was made governor of Judea. See Euseb. H. E. l. i. c. 9. l. ix. c. 4, 5, 6. Rufinus, lib. i. c. 5, &c. It was also customary for governors of provinces to send to the emperor an account of remarkable transactions that occurred in the places where they presided. We may therefore conclude, though the *acts* of Pontius Pilate and his letter to Tiberius, which we now have (see Fabric. Cod. Apoc. Nov. Test. p. 290—972.) are manifestly spurious, that Pontius Pilate did compose some memoirs concerning our Saviour and send them to the emperor, whether Justin Martyr and Tertullian have given a just account of them or not. Dr. Lardner, after replying to other objections that have been urged against the relation of these ancient fathers, concludes with observing that they deserve some regard. See Lardner's Works, vol. vii. c. 2. p. 231. &c.

ACTS, in Poetry, are certain divisions, or principal parts, in a dramatic poem, contrived to give some respite both to the actors and spectators. In the interval between the acts the stage remains empty, and without any action visible to the spectators; though it is supposed all this while that there is one proceeding out of sight. It is not, however, merely for the sake of the respite that these acts are observed, but to give transactions a greater degree of probability, and render the intrigue more affecting. For the spectator, who sees the action prepared that is to pass in the interval, cannot forbear acting, in his imagination, the part of the absent actors; by which means he is the more agreeably surpris'd, when a new act coming upon the stage, he sees the effects of that action, which before he could only guess at. To this it may be added, that authors contrive to have the most dry and difficult part of the drama transacted between the acts, that the spectators may have no notion of them, excepting what their fancy presents them with at a distance; and that nothing may appear upon the stage but what is natural, probable, and entertaining. In this respect, says an approved writer, a dramatic or epic poem ought to resemble a sentence or period in language divided into members, that are distinguished from each other by proper pauses; or it ought to resemble a piece of music, having a full close at the end, preceded by imperfect closes that contribute to the melody. See Elem. of Criticism, c. 22.

The ancient Greek poets were unacquainted with this division of a play into acts, though their episodes, or chorusses, served almost the same purpose. The word *act* never occurs in Aristotle's Poetics, though he defines exactly every part of the DRAMA. It is true the Greeks considered their pieces as consisting of certain parts or divisions, which they called *protasis*, *epitasis*, *catastasis*, and *cat. strophæ*: but there were no real interruptions or divisions answer'g to them in the representation. With them the stage was never empty, nor were the performers idle; so that when the chorusses were incorporated in the piece, as in some of the tragedies of Sophocles, it may be said strictly to consist of only one act.

The Romans first introduced acts into the drama, and filled up the intermediate space of time between these divisions with a chorus, a dance, or a song: and in Horace's time, the five acts were established as a law. This appears from the following verses in his De Art. Poet.

"Neve

“ Neve minor, neu sit quinto productior actu
Fabula, quæ posci vult, et spectata reponi.”

“ If you would have your play deserve success,
Give it five acts complete, nor more nor less.

FRANCIS.”

This number was constant in the comedies of Terence, and tragedies of Seneca; and the law stands unrepealed to this day; though it seems to derive its force from the authority of Horace, rather than that of reason or nature. All plays are deemed irregular, that have either more or fewer than five acts. Some, indeed, have asserted, that every just action consists of five distinct parts; and have undertaken to mark out the precise share of the action, which each of the five acts ought to bear. The first, they say, is to propose the matter or argument of the fable, and to shew the principal characters. This should be so managed as to awaken the curiosity of the spectators, and also furnish them with materials for understanding the sequel. It should make them acquainted with the personages who are to appear, with their several views and interests, and with the situation of affairs at the commencement of the play. In former times, the exposition of the subject was made by a prologue, or by a single actor, who appeared to give full and direct information to the spectators. Some of Æschylus's and Euripides's plays are opened in this inartificial manner, which is now totally abolished. The second act is to bring the affair or business upon the carpet. The third, to furnish obstacles and difficulties. The fourth, either points out a remedy for these difficulties, or finds new ones in the attempt. During these acts, the plot should gradually thicken; the action of the play ought to be advancing, and as it advances, the suspense and concern of the spectator should be raised more and more. It is the great excellence of Shakespear, that his scenes are full of sentiment and action; and not of mere discourse; whereas it is frequently a fault of the best French tragedians, that they allow the action to languish for the sake of a long and artful dialogue. The fifth act puts an end to all by a discovery. This is the seat of the catastrophe, or the unravelling of the plot, in which the art and genius of the poet should be most fully displayed. See CATASTROPHE. However, it is certain that, on the principles of the great master of the drama, Aristotle, we may have a just and regular play, though it be only divided into three acts; and the number may be varied according to the taste of the author, or the nature of the subject; since the division is purely arbitrary. Nevertheless, every act ought to close with some incident that makes a pause in the action; without which there can be no pretext for interrupting the representation. Milton has deviated from this rule at the close of the first, seventh, and eleventh books of his Paradise Lost: in the first of which instances he seems to have copied the Æneid, the two first books of which are divided in a similar manner. Homer, in the Iliad, has paid no great attention to this rule. The acts of a drama are divided into SCENES. Metastasio, in conformity to the precept of Aristotle, with regard to the construction of a fable (See ACTION and TRAGEDY) divided his melodramas, or operas, into three acts; in order to constitute the beginning, middle, and end, which the stagirite required. But at present this wise and rational design is violated at our lyric theatre, by compressing all the incidents of a drama, written in three acts, into two; by which means the business of the piece is so precipitated or mangled, that the events lose all appearance of probability, and the spectator all chance of illusion. On this occasion, however, the trouble and expense of a third dance are spun out to such a length as to

preclude all desire in the most dissipated part of the public to be kept longer from home.

ACTA, in *Antiquity*, denoted among the Romans a pleasant garden formed near the bank of a river, in which they devoted themselves to pleasure, and even to debauchery. Cicero says of Verres (v. 25.) “ Tametsi in Acta cum mulierculis jacebat ebrius.” From *acta* the ancients deduced *ακτιζω*, *actari*, to devote themselves to pleasure. *Acta* was sometimes used more generally to denote solitary rivers and shady coverts. Virgil *Æn.* v. ver. 613. Prudent. in Synmach. l. 135.

ACTA, in *Ancient Geography*, a town of Acarnania, mentioned by Stephan. Byzant. and called a port in the Periplus of Scylax. *Acta* is also a town of Magna Græcia.

ACTÆA, in *Antiquity*, one of the fifty Nereids.

ACTÆA, or ACTÆRIUS, was also one of the six envious and malicious genii, called by the Greeks *Telchines*.

ACTÆA, in *Botany*, the *Christophoriona* of Tournefort, and in the Linnæan system, a genus of the *polyandria monogynia* class and order, belonging to the natural order of *multifloræ* and *ranunculacæ* of Jussieu. Its characters are, that the calyx is a perianthium of four leaves, with roundish, obtuse, concave, and caducous leaflets; the corolla has four petals, acuminate at both ends, longer than the calyx and caducous; the stamina consist of numerous, usually about thirty, capillary filaments, broader at top; the antheræ are roundish, twin and erect; the pistillum has a superior ovate germen, no style, and a thickish, obliquely depressed stigma; the pericarpium is an oval-globose, smooth, one-furrowed and one-celled berry, and the seeds are many, semi-orbicular, and lying over each other in two rows. There are four species: 1. *A. spicata*, or common herb christopher, which grows naturally in the northern counties of England, and rises two feet and an half in height, with the foot-stalks of the leaves springing from the root, and dividing into three smaller foot-stalks, each of which divides again into three, with three lobes each; the flowers grow in ramose spikes, and are of a pure white: they appear in May and June, and are succeeded by black shining berries, about the size of peas, which ripen in autumn. This plant is a powerful repellent; and the root has been administered internally in some nervous cases, but should be used with caution. *Datur*, says Pliny, (H. N. v. ii. p. 425. Ed. Hard.) *acetabulo pleno interioribus feminarum morbis*. The berries are poisonous, and to the indiscreet use of them some have referred the explanation of the fable of ΑΚΤÆΩΝ, and to this they have also applied the Latin adage;

—*Hic niger est, hunc tu Romane caveto.*

Hor. Sermon. l. i. sat. 4. v. 85.

The juice of these berries, with alum, yields a black dye. Toads are said to resort to this plant, being allured by its fœtid smell, which, as Dr. Withering observes, may be owing to the damp shady situation in which it is found. This herb is poisonous to cattle, but it is happily scarce in England, and found only in the woods. Of this species there are three varieties, viz. the *nigra*, or common black-berried herb christopher, or bane-berry; the *alba* or American herb christopher, with white berries, whose leaves are less deeply indented at the edges, flowers in a more compact spike, and roots composed of thick knobs; and the *rubra*, with red berries, differing only in the colour of its fruit. 2. *A. racemosa*, or American black or wild snake-root, with large compound leaves, rising immediately from the root, and branched like the first, slower-stems ascending to the height of four or five feet, and white flowers in a long spike, reflex at the top, which appear in June or July, but not perfecting seeds in England. It deserves, on account of its flowers, a place in shady borders among shrubs, and will require no other attention

tention than the shrubs themselves. This species is a native of North America; and the root is much used in that country, and said to be an antidote to poison, or the bite of the rattle-snake. 3. *A. japonica*, or Japanese herb christopher, differs from the second in having simple, not pinnate leaves; it has heart-shaped leaflets, petioles longer than the leaflets, and sessile flowers. 4. *A. effera*, or rough-leaved christopher, has a shabby climbing stem, subserrate leaves, white flowers, and linear spikes, quadrifid corolla and calyx, more than fifty stamina, and a gibbous berry, without juice. This species is a native of China near Canton, and the Chinese use the rough leaves in polishing, particularly their tin ware. These plants may be propagated by seeds, sown on a shady border soon after they are ripe, and transplanted in the following autumn into a shady border, where they are to be left to flower. Martyn's Miller's Dict. In the Linnæan system, by Gmelin, there are six species.

ΑΚΤΕΑ, in *Entomology*, is a species of PAPILO, with expanded wings, brown above, the anterior marked with two ocelli and two white points, and the hinder marbled beneath. It is found in the southern part of Russia.

ΑΚΤΕΑ *Cimicifuga*. See CIMICIFUGA.

ΑΚΤΕΑ, in *Ancient Geography*, a name formerly given to ΑΤΤΙΚΑ. Pliny (l. 4. c. 7.) says it was also called ΑΓΓΕ. Pausan. Attic. cap. xi.

ΑΚΤÆON, in *Fabulous History*, the son of Aristæus and Autonoe, and grandson of Cadmus. Whilst he was pursuing his favourite exercise of hunting, he is said to have looked on Diana, when she was bathing, to have been transformed by her into a stag, and devoured by his own dogs. The moral of the fable is applied to those who ruin themselves by keeping packs of dogs, or by too curious researches into nature.

ΑΚΤÆON is also the name of one of the horses that drew the chariot of the sun, in the fall of Phaeton. Ακτæon formed of ακτω, a ray of the sun, signifies luminous, and takes its name from the splendour of the sun.

ΑΚΤÆON, in *Natural History*, a species of SCARABÆUS, or BEETLE, called by Swammerdam *rhinoceros*; the *enema* of Marçgrave; with a smooth body, bicorn thorax, the horn of the head unidentate, with a bifid apex, and smooth clytræ; the horns of the thorax are turned forward, and are conic. It is found in America, and is the largest of all known insects, except the cancer and monoculus.

ΑΚΤÆON is also a species of PAPILO, with tricaudated bluish wings, black at the apex, and gold-coloured beneath, with very small black spots.

ΑΚΤΑΝΙΑ, in *Ancient Geography*, an island mentioned by Pliny (H. N. tom. i. p. 221.) in the North Sea. It is situated to the west of Holstein and Ditmarsch, not far from the mouth of the Eyder and Elbe; and is now called *Heyligland*.

ΑΚΤΕ, ακτε, denoted a peninsula. It was also a name given to the sea-coasts about Mount Athos, in which were six towns mentioned by Thucydides, lib. iv. p. 302. Ed. Dukeri.

ΑΚΤΕ, in *Botany*, the ELDER-tree.

ΑΚΤΙΑΝ Games, *Ludi Actiaci*, in *Antiquity*, solemn games instituted, or, according to some, only restored by Augustus in memory of his victory over Mark Anthony at ΑΚΤΙUM. Stephanus (tom. i. p. 56.) and some others maintain, that they were held every third year: but the more common opinion is that of Strabo, who says (Geog. tom. i. p. 501.) that they only returned every fifth year, and were celebrated in honour of Apollo, since surnamed *Actius*. By the way it is a great mistake in some authors to imagine, that Virgil insinuates their having been instituted by Æneas, from that passage, Æn. iii. 280.

“Actiæque Iliacis celebramus littora ludis.”

It is true the poet alludes to the Actian games; but he only does it by way of compliment to Augustus, to attribute that to the hero from whom he descended, which was done by the emperor himself, as Servius has observed *in loc.*

Hence *Actian* years were a series of years, commencing from the era of the battle of Actium; called the *æra* of Augustus. See ΕΡΟΧΑ.

ΑΚΤΙΑΡ, in *Geography*, a town near Bacchizaria, lying on the western side of the peninsula of Chersonesus Taurica, which, in consequence of the convention of 1783 between the late Empress Catharine of Russia, and the Grand Signior, and the cession of territories by the Turks, was declared a free port, and denominated SEBASTOPOLIS.

ΑΚΤΙΝΕ, in *Botany*, a name of the herb BUNIAS, or NAFUS.

ΑΚΤΙΝΕ, in *Ancient Geography*, a town of the Thracian Bosphorus.

ΑΚΤΙΝΙΑ, in *Zoology*, a genus of the mollusca order of worms, the characters of which are, that the body is rough or wrinkled, furnished with eccentric cirri, and with a single terminal aperture, and that it attaches itself by its base to rocks and other substances among which it is found. Of this genus Gmelin, in his edition of the Linnæan system, enumerates twenty-three species, which are as follow, viz. 1. *A. rufa*, of a reddish colour, with a roseaceous foramen and whitish cirri. This is the *urtica marina libera* of Aristotle, the *urtica parva* of other authors, the first species of Hill's *Medusa*, and of Dicuëmarre's anemone. It is found in various parts of the ocean and of the Mediterranean Sea, adhering to rocks; of a variable form, sometimes cylindrical; or globular, or conical, and in some rare instances of a changeable colour: its cirri are whitish, slender, flexible and very moveable, shorter than the diameter of the body and truncated at the apex. 2. *A. crassicornis*, of a red colour, with conically extended cirri, found in the Atlantic, Mediterranean, Northern, and Icy Seas. This is the second species of Dicuëmarre's anemone, the *priapus ruber*, and the *urtica rubra* of other authors. 3. *A. plumosa*, with small tentacula and a ciliated margin. This is Dicuëmarre's fourth species of anemone, and called *kettuperak* by the Greenlanders. It is found in the European Ocean, and exhibits a variety of beautiful colours. 4. *A. judaica*, cylindrical, smooth and truncated; found in the Mediterranean Sea, and called by the inhabitants of Languedoc *postrol*. 5. *A. effocta*, sub-cylindrical and angularly striated; found in the ocean. 6. *A. coccinea*, varied with white and red, with cylindrical annulated cirri; found rarely in the bays of Norway. 7. *A. undata*, conic and whitish, with duplicate wrinkled yellow striæ; found adhering to fuci and milleporæ, in the bay of Christianfand in Norway. 8. *A. viduata*, of a grey colour, with longitudinal ridges, and white cirri; the *urtica cinerea* of Rondeletius, sometimes found in the fucus saccharinus in the Norwegian Sea. 9. *A. truncata* of a reddish yellow colour, conical, smooth, and pellucid; the third species of Dicuëmarre's anemone. 10. *A. nodosa*, wrinkled and furrowed, enlarged at the ends, with short compressed crimson-coloured cirri; found on the rocks of the Greenland Sea. 11. *A. spectabilis*, smooth and sky-coloured, with thick cirri spotted with white and a radiated foramen; frequent in the caverns of rocks on the shores of Greenland. 12. *A. digitata*, yellow, with white points and reddish cirri, lodged in the fissures of rocks on the shores of the Northern Ocean. 13. *A. gigantea*, cinereous and greenish, with a folded fringe much wider than the body, and greenish papilliform tentacula; found on the shores of the Red Sea, hiding itself in the sandy clay. 14. *A. alba*, gelatinous, white and greenish,

with

with small papilliform oblong tentacula; found adhering to stones on the shores of the Red Sea. 15. *A. viridis*, green and brown, with tentacula of the length of its own diameter; found attached to submarine stones at Alexandria in Egypt, and called by the Arabs *karofa*. 16. *A. priapus*, with a cylindrical body, dilated at the base, and spotted tentacula; found adhering to testaceous fish in the Red Sea, near the city Ghomfoda. 17. *A. candida*, smooth with a wrinkled foramen, and flexuous bristly tentacula; ranged on the upper margin. 18. *A. bicornis*, smooth, of an hemispheric oval figure. 19. *A. volva*, with a cylindrical body plane above, and six appendices to the orifice; found, as well as the two former species, in the Northern Ocean. 20. *A. caryophyllus*, red and brown, with small penciliform tentacula; found in the British Sea. 21. *A. iris*, with body and tentacula obtuse and cylindrical, the exterior red, the interior bluish, and the centre red. 22. *A. fscella*, with longitudinal ridges transversely striated, and cylindrical obtuse annulated tentacula; found, as well as the former species, in the Norwegian Sea. 23. *A. pusilla*, elliptic and smooth, with a double order of rays, the exterior of which are black at the apex, about the size of a large pea; found in the ocean about the 57th degree of latitude.

The *actinia fulcata* of Pennant, and *cereus* of Solander and Ellis, which some suppose to be a variety of the *A. undata*, is the HYDRA *cereus* in the Linnæan system by Gmelin. Pennant describes it as having a body marked with trifurcated sulci, and summit surrounded with long slender tentacula, from 120 to 200 in number; the colour of the body is pale chestnut, and of the tentacula a sea-green varied with purple; it is found on the rocks of the Cornish and Anglesea seas. The *A. pedunculata* of Pennant, or *A. bellis* of Solander and Ellis, is the HYDRA *bellis* of the Linnæan system. According to the description of Pennant, it has a long cylindrical stalk, expanding at top and tuberculated: the tentacula are disposed in several ranges, short, and when open form a radiated angular circumference, like a beautiful flower, with a smooth polygonal disc; the colour of the stalk is a fine red, and that of the tentacula varied with several colours. This species, he says, is retractile, and inhabits Cornwall. The *A. verrucosa* of this author, or *A. gemmacea* of Solander and Ellis, is the HYDRA *gemmaea* of Gmelin's Linnæan system. According to Pennant, it has a long cylindrical stalk, and is marked with elegant small tubercles, disposed in straight lines from top to bottom; the circumference of the mouth is striated, surrounded with short petals, like those of the sun flower, and those again with white tentacula, barred with brown. When drawn in, it assumes the form of a bell; and the lines of the tubercles converge to the centre of the summit. Its body is a pale red: it inhabits Cornwall. The *A. pentapetala*, or cinquefoil of Pennant, is the *A. dianthus* of Ellis, with a circular contracted mouth; the disc divided into five lobes, covered with several series of short subulated tentacula, the stalk short and thick; when contracted it assumes the form of a long white fig; it inhabits the rocks near Hastings, Sussex. The *A. hemispherica*, or button of Pennant, is the *A. mesymbryanthemum* of Solander and Ellis, and the HYDRA *mesymbryanthemum* of the Linnæan system. It has a smooth short thick stalk; the edge of the disc surrounded with a single row of tubercles, the tentacula numerous and slender; the colour a dull crimson; the body retractile, and flinging itself into the form of a conoid button. It inhabits most of our rocky shores. Pennant's Zoology, vol. iv. p. 49, &c. The actinia have only one aperture both for the mouth and anus; they feed on shell

and other small fish and marine animalcules, and are themselves eatable: as they sometimes retract and sometimes extend their tentacula, in different degrees, their form is very variable; the parts that are cut off are renewed; they are acutely sensible of light, and most of them are viviparous. For a farther account of these animals, see ANEMONE, ANIMAL FLOWER, and URTICA marina. See also HOLOTHURIA and HYDRA.

ACTINOLITE, in *Mineralogy*. See STRAHLSTEIN.

ACTION, in a general sense, denotes the operation or exertion of an *ACTIVE power*, and is synonymous with ACT. Grammaticians, however, introduce some subtle distinctions between these two terms; restricting the former to ordinary transactions, and the latter to those which are more signal. The former, say others, relates chiefly to the person that acts, and the latter to the effects produced; and is therefore considered as the attribute of the other: e. g. "Preserve presence of mind in all your *actions*; and take care that they be all *acts* of equity." Some schoolmen attempt to express the nature of action by a manifestation of the power or energy of a substance, made either within or without it.—Accordingly it is controverted among them, whether or not action, thus taken, be a thing distinct both from the agent, and the term or effect. The *modists* stand for the affirmative, and the *nominalists* assert the negative. These latter observe, that the action may be considered two ways, *entitatively* and *connotatively*. In the former sense it is what we call a CAUSE, or what may act: and in the latter, it is the same cause, only considered as acting, or connoting the effect it produces.

Actions are divided with respect to their principle, into UNIVOCAL, where the effect is of the same kind with the cause; as the production of man by man; and EQUIVOCAL, where it is different, as the supposed production of frogs by the sun:—and again into VITAL; as nutrition, respiration, the action of the heart, &c. and NOT-VITAL, as heating.

With respect to their subject, actions are divided into INMANENT; which are received within the agent that produced them; as are vital actions, cogitation, &c. and TRANSCIENT, which pass into another, as a father loves his son, and feeds and clothes him, &c. Actions are also *natural*, as fire hardens clay; *supernatural*, as raising the dead; *voluntary*, as the potter's moulding his clay; and *accidental*, as a person's heedlessly dropping a glass and breaking it; *necessary*, as the sun warms the earth; and *free*, when a person chuses what food he likes, and eats it when he pleases. See LIBERTY and NECESSITY.

In respect of duration, actions are again divided into INSTANTANEOUS, where the whole effect is produced in the same moment, as the creation of light; and SUCCESSIVE, where the effect is produced by degrees; as corruption, fermentation, putrefaction, dissolution, &c.

ACTION, in *Physiology*, is applied to the actions or functions of the body, which are divided into the *vital*, *natural*, and *animal*. The *vital* are such as are essential to the subsistence of the individual; such are the motions of the heart and lungs, the secretion of spirits in the cerebellum, on which the motions of the heart and lungs depend; and the circulation of the blood and fluids in their proper vessels. *Pulsation* and *respiration* are the external signs of life.

The *natural* actions are such as are necessary to the continuance of the animal, but not so immediately, but that it may subsist some time under a suspension of them; as the digestion of the aliment, and its conversion into blood.

Under *animal* actions are comprehended those which constitute the senses of touch, taste, smell, vision, hearing, perception, imagination, memory, judgment, ratiocination,

affections of the mind, and voluntary motion; which are not absolutely necessary to the life of the animal, but conducive to its comfortable existence.

In the year 1752, Dr. White published an ingenious performance, under the title of an *Essay on the vital and other voluntary Motions of Animals*, 8vo.; and in the same year Dr. Simpson also published a book on *Vital and Animal Actions*, 8vo.

ACTION, in *Mechanics*, denotes either the effort which one body or power exerts against another, or the effect resulting from such effort: or more accurately, the motion which a body really produces, or tends to produce, in another. The action of a body becomes apparent only by its motion; and we cannot affix any precise idea to the term action than that either of actual motion, or a simple tendency to motion. Leibnitz and his disciples, for want of duly attending to the proper and discriminating idea of the word action, have perplexed themselves and others with unprofitable and indecisive disputes concerning *vis viva*, and *vis mortua*. See **FORCE**.

The Cartesians resolve all physical action into metaphysical. According to them, bodies do not act upon one another; but the action proceeds immediately from the Deity: the motions of bodies, which seem to be the cause, being only the occasions of it. See **OCCASIONAL CAUSE**. Action is either instantaneous or continued; that is, either by percussion, or by pressure. These two sorts of action are heterogeneous quantities, and are not capable of mutual comparison any more than a line can be compared with a surface, or a surface with a solid. The least degree of percussion may be made to overcome the pressure of the greatest weight. These actions, therefore, cannot be measured one by the other; but each of them must have a measure of its own kind, as solids are measured by solids, and surfaces by surfaces; because time is concerned in the one, but not in the other.

It is one of the laws of nature, that action and re-action, are always equal, and contrary to each other.

If a body be urged by equal and contrary actions, it will remain at rest. But if one of these actions be greater than its opposite, motion will ensue towards the parts least urged.

It is to be observed, that the actions of bodies on each other, in a space that is carried uniformly forward, are the same as if the space were at rest; and any powers or forces that act upon all bodies, so as to produce equal velocities in them in the same, or in parallel right lines, have no effect on the mutual actions, or relative motions. Thus the motions of bodies on board a ship, that is carried steadily and uniformly forward, are performed in the same manner as if the ship were at rest. The motion of the earth round its axis has no effect on the actions of bodies and agents at its surface, except so far as it is not uniform and rectilinear. In general, the actions of bodies upon each other depend not upon their **ABSOLUTE**, but **RELATIVE** motion.

For the actions of powers, see **FRICTION**, **FORCE**, **MECHANICS**, **MOTION**, **POWER**, and **RESISTANCE**. For the laws of the action of fluids, &c. see **FLUID**, and *Specific Gravity*.

ACTION, *quantity of*, in *Mechanics*, an expression used by M. de Maupertuis, in the Mem. of the Acad. of Sciences of Paris for 1744, and in those of Berlin, for 1746, to denote the continual product of the mass of a body, by the space through which it runs, and by its celerity. He lays it down as a general principle, that, "whenever any changes happen in nature, the quantity of action necessary to produce this change is always the least possible." And this, he says,

is a law indicating the highest wisdom. This principle he applies to the investigation of the laws of **REFRACTION**, the laws of the collision of hard and elastic bodies, and even the laws of rest, as he calls them, that is of the equilibrium or equipollency of pressures; and, thus investigating the laws of motion, referring these and the laws of equilibrium to the same principle, and connecting the metaphysical consideration of final causes with the fundamental doctrines of mechanics, he deduces what he conceives to be a stronger proof of the existence of a Deity, or of a first intelligent cause, than the other arguments commonly alledged, and derived from the order of nature.

It may be observed, however, that the *quantity of action*, according to the definition of M. de Maupertuis, is in reality the same with the product of the mass into the square of the celerity, when the space passed over is equal to that by which the celerity is measured; and therefore the force or quantity of motion will be proportional to the mass multiplied by the square of the velocity; since the space is measured by the velocity continued for a certain time.

In the same year that Maupertuis communicated his principle, Professor Euler also demonstrated, in the supplement to a treatise intitled *Methodus inveniendi Lineas curvas maximi vel minimi proprietate gaudentes*; that in the trajectories described by bodies urged by central forces, the velocity multiplied by what the foreign mathematicians call the element of the curve, is always a *minimum*; which Maupertuis considered as an application of his principle to the motion of the planets. For the manner in which this principle of a *minimum* may be deduced from the Newtonian theory of refraction; see **REFRACTION**.

ACTION, in *Ethics*, or **MORAL ACTION**, is a voluntary motion of a creature capable of distinguishing good and evil; whose effect, therefore, may be justly imputed to the agent.

A *moral action* may be more fully defined to be whatever a man, considered as endued with the powers of understanding and willing, with respect to the end he ought to aim at, and the rule he is to regard in acting, resolves, thinks, does, or even omits to do; in such a manner as to become accountable for what is thus done or omitted, and the consequences thereof.

In the strict philosophical sense, says Dr. Reid (*Essays on the Active Powers of Man*, p. 97) nothing can be called the action of a man, but what he previously conceived, and willed or determined to do. In morals the word is commonly employed in this sense, nor is any thing imputed to a man as his doing, in which his will was not interposed.

The foundation, then, of the morality of actions is, that they are done knowingly and voluntarily: and all moral actions may be divided, with respect to the rule, into **GOOD** and **EVIL**.

But when moral imputation is not concerned, many things are called the actions of a man, which he previously neither conceived nor willed. Hence the actions of men have been distinguished into three classes, the voluntary, the involuntary, and the mixed. By the last are meant such actions as are under the command of the will, but are commonly performed without any interposition of the will. See **ACTIVE POWER**, **MOTIVE**, **PRINCIPLES of Actions**, and **VIRTUE**.

ACTION, in *Oratory*, is an accommodation of the person of the orator to his subject; or, a management of the countenance, voice, and gesture, suited to the matter spoken or delivered.

Action makes one of the greatest branches or divisions of rhetoric. The ancients usually call it **PRONUNCIATION**.

Action is a collateral or secondary method of expressing our ideas; and is susceptible of a kind of eloquence as well as the primary. In the infancy of LANGUAGE, when words were few, or not easily connected, men would naturally recur to action for explaining and expressing their conceptions; and they would labour to make themselves understood, by varying their tones of voice, and accompanying their tones with the most significant gesticulations. At this day, when persons speak in a language which they possess imperfectly, they have recourse to all these supplemental methods, in order to render themselves more intelligible. Besides, in the gradual improvement and extension of language, a warm imagination would introduce into discourse a variety of tones, and a considerable degree of action. Thus Dr. Warburton accounts for so much speaking by action, as we find among the Old Testament prophets. Among the northern American tribes certain motions and actions are adopted in order to explain their meaning on all great occasions of intercourse with one another. The Chinese find it very easy to express different ideas by a variety of tones than to contrive words for all their ideas. The Greek and Roman languages also were pronounced with more numerous inflexions of voice, and more animated gestures than any to which we are accustomed. Accordingly we find, that action was treated of by all the ancient critics, as the chief quality in every public speaker; and the orators and players of Greece and Rome were distinguished by the vehemence of their action. This is, in all cases, an address to the external senses; which it endeavours to move, and bring into its party by well-concerted motion and modulation; at the same time that the reason and understanding are attacked by force of argument. Accordingly, Tully very pertinently calls it *sermo corporis, the discourse of the body*; and *corporis eloquentia, the eloquence of the body*.—The Roman mimes and pantomimes, we read, had such a compass even of mute action, that voice and language seemed useless to them: they could make themselves understood to people of all nations; and Roscius, the comedian, is particularly famed, as being able to express any sentence by his gestures, as significantly and variously as Cicero with all his oratory. Quintilian gives us a system of the rules of action; taken not only from the writings of the ancient orators, but from the best examples of the forum.

What we usually attribute to eloquence, was really the effect of the action only, as some of the greatest masters in that way have frankly acknowledged.—Demosthenes expressly calls it, ‘the beginning, the middle, and the end of the orator’s office;’ and Cicero professes, that it is not of ‘so much importance what the orator says, as how he says it.’

The Greeks, who were attentive to multiply the means of influencing the passions, omitted nothing which might bring to perfection this first language of Nature. Poetry and music were always supported by the action of the performers. This action, which was acquired by a kind of dance that regulated the motions and different inflexions of the body, animated the discourses of their orators, and sometimes the lessons of their philosophers. See Plut. in Demosth. tom. i. p. 851. Ed. Xyland. Id. in x. Rhet. Vit. tom. ii. p. 845. Plato de leg. l. vii. tom. ii. p. 816. Ed. Serrani. Athen. Deipn. l. i. c. 17. p. 21. Ed. Casaub.

After all, it is a point that will bear being controverted, whether action ought to be practised and encouraged at all? A thing that has so much command over mankind, it is certain, must be very dangerous; since it is capable of being turned to our disadvantage as well as to our advantage. It is putting a weapon in the hands of another, which, if he

pleases, he may make use of to subdue and enslave us; and accordingly, history is full of the pernicious uses made of it.—For this reason, eloquence and action have been unduly discouraged by modern policy; and both the bar and the pulpit have been brought to a more frigid way of delivery.

But this is an extreme, which no objection founded on the abuse of eloquence accompanied with action, and no apprehension of its pernicious effects, can justify. The benefits accruing from it amply counterbalance the mischief which it is capable of producing.

Perhaps the foundation of all action may be vicious and immoral.—Voice and gesture, we know, will affect brutes; not as they have reason, but as they have passions; so far as these are used in a discourse, therefore, it does not regard an assembly of men more than it would a herd of quadrupeds: that is, their whole effort is spent, not on the rational faculties, which are out of the question, but on the animal ones, which alone they endeavour to possess and actuate, independently of reason.—Nay more, our reason, and the judgment itself, are intended to be biased and inclined by them; action being only used as an indirect way of coming at the reason, where a direct and immediate one was wanting; i. e. where the judgment cannot be taken by the proper means, argument, it is to be taken indirectly by circuit and stratagem.

The natural order of things, then, is here inverted; our reason, which should go before and direct our passions, is dragged after them: instead of coolly considering, and taking cognizance of things; and according to what we perceive therein, raising ourselves to the passions of grief, indignation, or the like, we are attacked the other way; the impression is to be carried backwards, by virtue of the natural connection there is between the reason and the passions: and thus the helm, the principle of our actions, is taken out of our own hand and given to another. See PASSION.

The case is much the same here as in sensation and imagination: the natural and regular way of arriving at the knowledge of objects is by sense; an impression begun there is transmitted to the imagination, where the image is produced, similar to that which first struck on the organ.—But the process is sometimes inverted: in hypochondriac, lunatic, and other delirious cases, the image is first excited in the imagination; and the impression thereof communicated back to the organs of sense: by which means objects are seen which have no existence.

Upon the whole, action does not tend to give the mind any information about the subject that is discussed; nor is it designed to convey any arguments or ideas which the simple use of language would not convey. But is it not that upon which we should form our judgments? And can any thing help us to form a just judgment, beside that which in some way or other enlightens and convinces our understanding? When Cicero made Cæsar tremble, turn pale, and let fall his papers, he did not apprise him of any new guilt which Cæsar did not know of: the effect had no dependence on Cæsar’s understanding; nor was it any thing more than might have been produced by the unmeaning sounds of a musical instrument duly applied. However, action may be useful in awakening and fixing the attention, provided that it be accompanied with suitable argument and address. As there is no nation, nor hardly any person, so phlegmatic and destitute of feeling, as not to accompany their words with some actions and gesticulations, whenever they are much in earnest, it would be unnatural in a public speaker, and inconsistent with that earnestness and ardour which he ought to manifest in all affairs of moment, to remain

main quite unmoved in his outward appearance: and to let the words drop from his mouth without any expression of meaning, or warmth in his gestures. There is a coldness of delivery as well as of composition, which should be studiously avoided. Action, properly conducted, gives to the speaker in the senate, at the bar, and in the pulpit, very great advantage in enforcing his argument and impressing an audience. See GESTURE.

ACTION, in a *theatrical* sense, is nearly the same with that among orators, with this difference, that the actor adapts his action to an assumed character, whereas the orator is supposed, in reality, to feel the passion which his action expresses, whether joy, or grief, &c. See DECLAMATION.

ACTION, in *Poetry*, is an event, either real or imaginary, which makes the subject of an epic or dramatic poem. This, says Aristotle (*De Poet. cap. vi. p. 657.*) is the soul of tragedy. The action of a poem coincides nearly with the fable thereof; it being the usual practice not to take any real transaction of history, but to feign or invent one; or at least to alter the historical fact, so as to render it in a good measure fictitious. Critics consider the principal action, commonly called the FABLE, and the incidental action or EPISODE.

F. Bossu has two chapters, *Of real action*, the recitals whereof are fables: and *Of feigned actions*, the recitals whereof are historical.

The critics lay down four qualifications as necessary to the epic and tragic action: the first, UNITY; the second, INTEGRITY; the third, IMPORTANCE; and the fourth, DURATION; to which some add a fifth, viz. CONTINUITY. Dr. Blair specifies three properties, which are essential to the action or subject of an epic poem. It must be *one, great and interesting.*

Aristotle insists upon unity, as essential to epic poetry; and he observes, that, in order to render this unity more sensible to the imagination, and thus to give it a better effect, it is not sufficient for the poet to confine himself to the actions of one man, or to those which happened during a certain period of time; but the unity must lie in the subject itself, and arise from all the parts combining into one whole. This unity of action is sufficiently apparent in all the great epic poems. Thus, Virgil has chosen for his subject the establishment of Æneas in Italy, which he keeps constantly in view, and which serves to connect all the parts. The unity of the *Odyssy* is of the same nature; the return and re-establishment of Ulysses in his own country. The subject of Tasso is the recovery of Jerusalem from the Infidels; that of Milton, the expulsion of our first parents from paradise; and both of them are unexceptionable in the unity of the story. The anger of Achilles, with its consequences, is the professed subject of the *Iliad*, but, as Achilles is in many books of the poem kept out of sight, and the fancy terminates on no other object than the success of the two armies that are seen contending in war, the unity is not so sensible to the imagination as in the *Æneid*. This unity of the epic action does not exclude all EPISODES, or subordinate actions. Moreover, the unity of the epic action necessarily supposes, that the action be entire and complete; or, as Aristotle expresses it, that it should have a beginning, middle, and end.—If the three parts of a whole seem to be generally denoted by the words, *beginning, middle, and end*, Bossu interprets them more expressly, thus: the causes and designs of a man's doing an action are the beginning; the effects of those causes, and the difficulties occurring in the execution of those designs, are the middle of it; and the unravelling and extricating of those difficulties, are the end of the action.

The poet, says Bossu, should so begin his action, that, on one hand, nothing should be farther wanting for the understanding of what he afterwards delivers; and, on the other, that what thus begins require after it a necessary consequence. The end is to be conducted after the like manner, only with the two conditions transposed, so that nothing be expected after it; and that what ends the poem be a necessary consequence of something that went before it. Lastly, the beginning is to be joined to the end by a middle, which is the effect of something that went before it, and the cause of what follows.

In the causes of an action, one may observe two opposite designs; the first and principal is that of the hero: the second comprehends all the designs of those who oppose the pretensions of the hero. These opposite causes do all produce opposite effects, viz. the endeavours of the hero to accomplish his design, and the endeavours of those who are against it.—As the causes and designs are the beginning of the action, so those contrary endeavours are the middle of it, and form a difficulty, plot, or intrigue, which makes the greatest part of the poem; and the solution or clearing up of this difficulty makes the unravelling.

The unravelling of the plot, or intrigue, may happen two ways; either with a discovery or without.

The several effects which the unravelling produces, and the different states to which it reduces the persons, divide the action into so many kinds.—If it change the fortune of the principal person, it is said to be with a peripetia; and the action is denominated *implex*, or mixed; if there be no peripetia, but the unravelling be a mere passing from trouble to repose, the action is simple. It has been debated among critics, whether the close of the action in an epic poem should be always prosperous or not? The general opinion and the general practice are on the side of a prosperous conclusion. But there are some exceptions. Lucan and Milton, two authors of great note, have pursued a contrary course: the one concluding with the subversion of the Roman liberty; the other with the expulsion of man from paradise.

Another property of the epic action is, that it be great, or sufficiently splendid and important both to fix our attention, and to justify the magnificent apparatus which the poet bestows upon it. One circumstance that contributes to the grandeur of the action is, that it be not of a modern date. Antiquity is favourable to those high ideas, which epic poetry is designed to excite and cherish. Lucan and Voltaire have, in the choice of their subjects, transgressed this rule. As the action is rendered important, says Bossu, by giving a higher idea of the personages that are introduced than any the readers can conceive from comparing them with those of the present time, and where heroism, says Dr. Blair, is the ground-work, and where the object in view is to excite admiration, ancient or traditionary history is certainly the safest region. The distance of the period, or the remoteness of the scene, affords sufficient licence for fiction and invention. The importance of the action much depends on the dignity and importance of the persons concerned in it. Thus, the fame of Homer's heroes, and the consequences of their dissension, furnish a subject important in itself, and particularly important to his countrymen, who valued themselves on their descent from these heroes. The importance of the action itself should also be regarded. In this respect, the subject of the *Æneid* is greater than that of the *Iliad*, as it is the foundation of the most powerful empire that ever was established on the globe: which is an event of much greater moment than the destruction of a city, or the anger of a warrior. But in comparison of the greatness displayed in *Paradise Lost*, all other greatness
says

says Dr. Johnson, in his Life of Milton, shrinks away. The subject of the English poet is not the destruction of a city, the conduct of a colony, or the foundation of an empire: it is the fate of worlds; the revolutions of heaven and earth; rebellion against the Supreme King, raised by the highest order of created beings; the overthrow of their host, and the punishment of their crime; the creation of a new race of reasonable creatures; their original happiness and innocence, their forfeiture of immortality, and their restoration to hope and peace.

Another property required in the action of an epic poem is, that it be interesting. The subject should interest the public; and therefore the poet should select for his hero, one who is the founder, or deliverer, or favourite of his nation; and he should direct the attention to achievements that have been highly celebrated, or that have been connected with important consequences to the public cause. But more than this, in the management of his subject, he should contrive to interest not one age or country, but all readers, by concerting his plan so as to comprehend many affecting incidents. He may sometimes be awful and august; he must often be tender and pathetic; and he must give us many pleasing scenes of love, friendship, and affection: the more an epic poem abounds with situations which awaken the feelings of humanity, the more interesting it is; and these form, always, the favourite passages of the work. No epic poets have been so happy in this respect as Virgil and Tasso. It is needless to mention, that the subject of the Paradise Lost is more universally interesting than that of any other poem. The character of the heroes serves also, as we have already observed, to render the action interesting.

As to the duration of the epic action, Aristotle observes (De Poet. cap. v. p. 656.) it is not so limited as that of the tragic action: the latter is confined to a natural day; but the epopee, according to that critic, has no fixed time.—In effect, tragedy being full of passion, and consequently of violence, which cannot be supposed to last long, requires a shorter time; and the epic poem, being for the habits which proceed more slowly, requires a longer time, either for them to take hold, or to be rooted up; and hence the difference between the epic and dramatic action in point of duration. Bossu lays it down as a rule, that the more vehement the manners of the principal personages are, the less time ought the action to last: accordingly, the action of the Iliad, which is formed upon the wrath of Achilles, &c. lasts no longer than forty-seven days; whereas that of the Odyssey, where prudence is the reigning quality, computed from the taking of Troy to the peace of Ithaca, extends to eight years and a half; and that of the Æneid, where the prevailing character of the hero is piety and mildness, computed from the taking of Troy to the death of Turnus, includes about six years.

But if we estimate the period only of the poet's own narration, or compute from the time in which the hero makes his first appearance till the conclusion, the duration of both these last poems is brought within a much smaller compass. The Odyssey, beginning with Ulysses in the island of Calypso, comprehends fifty-eight days only; and the Æneid, beginning with the storm, which throws Æneas upon the coast of Africa, is reckoned to include, at the most, a year and some months. See Blair's Lect. on Rhetoric, &c. vol. iii. p. 211—221.

ACTION is also used in *Painting and Sculpture* for the posture of a figure, or the attitude it is supposed to be in; expressed by the position of several parts of the body, or by the passions appearing in the face. Thus we say, the action of such a figure finely expresses the passions by which it is

agitated. The same expression is applied to animals. When the word *action* is used by way of distinction from *attitude*, it may have respect to the figure's being represented in motion, as running, jumping, striking, falling, &c. which the painter distinguishes from such as are at rest, by removing from the centre the imaginary line of gravity used in balancing his figures to some distance, before, behind, or on one side, according to the degree of motion which he means to express. It is evident, that if a man be running, and we view him sideways, his head and chest will be thrown as much before his feet, as immediately to suggest the idea of his falling on his face, unless the hinder leg be quickly brought forward to prevent it. See ATTITUDE and GRAVITY.

M. Watelet, after observing that, however terms may resemble one another in signification, there are none which are perfectly synonymous, proceeds to ascertain the difference between *action*, *motion*, and *expression*, as applied to painting or sculpture. To this purpose he remarks, that there are passions, or rather sensations, which, though they immediately produce neither action nor motion, have their characteristic expressions. Of this kind are dejection, voluptuousness, and melancholy; the expression of which, being passive, arrest motion, and suspend action in those who are under their influence. On the other hand, figures that are engaged in any violent bodily exertion may be said to have motion and action; though they are not affected by those passions, to the external tokens of which the term expression is peculiarly adapted.

Action, he farther observes, requires a motion of some parts of a figure, without supposing that the whole changes its place, which is the idea suggested by the term motion. These distinctions are illustrated by appropriate examples. He supposes a picture of what is commonly called the judgment of Solomon, in which the monarch is represented seated on his throne, and extending his arm to command the division of the infant. Such a figure, even though the face were concealed, ought, in consequence of this gesture, to be said to have action; and yet it could not with equal accuracy be affirmed to have motion. Again: suppose a woman represented as rushing forward to separate two combatants, every part of her appears to concur towards the precipitance of her course, and is drawn in that position which is requisite to the immediate effect of her intention; so that the beholders are ready to imagine that they see her change her place: such a figure may be more properly said to have motion than action. Watelet's and Leveque's Dict. des Arts de Peinture, Sculpture et Gravure, art. *Action*.

ACTION of the Mouth, in the *Manege*, denotes the agitation of a horse's tongue, and mandible, or his champing on the bit; which produces a white foam.—This, with the riding-masters, is esteemed not only a sign of health, vigour, and mettle; but also of a sensible mouth.—This action is likewise supposed productive of a good mouth, whence various means are made use of to keep a horse constantly champing. Some persons put a large bit with several detached moveable parts, called a slavering-bit, into his mouth two hours before riding, and then turning his tail to the manger fasten him between the stall-posts; others make use of a similar bit in common, and most persons use it for his watering exercise.—There can be no doubt that this action tends to keep the mouth sensible and alive, as it is termed, especially when accompanied with a judicious bridle-hand upon a horse: but it must be recollected that the bars of a horse's mouth are covered with cuticle or epidermis, which is the outer insensible skin of other parts, the nature of which

which is to thicken upon pressure ; therefore the flavering-bit put on so long before riding, though it may give temporary sensibility, must conduce to permanent hardness.

ACTION, in the *Military Art*, is an ENGAGEMENT between two armies, or between different bodies of troops belonging to them. Although humanity and sound policy will induce the general of an army to avoid an action, when no considerable benefit is likely to accrue from it, yet there are certain circumstances that will direct him in the alternative either of commencing or avoiding it. Wisdom will suggest the importance of bringing the enemy to an immediate action, when it will serve to prevent the junction of his forces ; to discourage the hostile declaration of a neutral power ; when any advantage may be obtained by the division of his forces ; when there is reason for apprehending the inconstancy or actual withdrawal of allies ; when desertion, on account of an exiling or impending scarcity of money, or of the means of subsistence, is dreaded ; when new allies may be thus gained, or those of the enemy may be induced to abandon him ; and when a reasonable prospect occurs of securing a present advantage, without risking any loss or injury that shall in the event more than counter-balance it. The commencement of an action, when it is desirable, may be expedited by threatening, or actually besieging a port or place, which is of importance to the enemy ; by attempting to relieve and succeed a place that is besieged ; by ravaging and laying waste the country ; by presenting the allurements of booty ; by depriving the enemy of forage or water ; by exhibiting the appearance of an untenable post, or of a feeble force ; and by feigning fear, the diminution of forces, the disorder of retrenchments, or a desertion of part of the army, or prevailing discontent and a disposition to mutiny, or orders not to engage. The motives which will induce a prudent general to avoid to begin an action are such as these ; the defect or the distance of his resources, the prospect of fresh supplies, the dread of defection, the augmentation of the enemy's allies, the disadvantage of ground, position, number, &c. want, disease, and desertion in the opposing army, actual negotiations, or positive orders not to hazard an engagement. The means of avoiding an action are the choice of posts and retrenchments, well concerted and well executed stratagems, the devastation of the country through which the hostile army must pursue that which is retreating, and from which it must draw some of its supplies ; any movements that would cause a diversion, real or feigned negotiations, report of approaching succour, and the appearance of considerable force. These various circumstances are detailed at large, and illustrated by apposite examples selected from the conduct of the most able commanders, both ancient and modern, in the *Encyclopedie*, vol. x. or vol. i. Art. *Militaire*.

ART. ACTION.

This term is likewise used to signify some memorable act done by an officer, or commander of a body of troops.

ACTION, in *Law*, is a right of demanding, and pursuing in a court of judicature, what is any man's due.

Or, *action* is any kind of PROCESS or SUIT which a person enters for the recovery of his right. See CAUSE.

Actions are divided, by Justinian, into two different kinds : *real*, or those against the thing ; and *personal*, or those against the person.—For whoever brings an action, either does it against one obnoxious to him, in respect either of contract or offence ; in which case arise actions against the person which require the party to do, or give something ; or, he does it against one not obnoxious, yet with whom a controversy is arisen touching some matter ; as if Caius hold a field which Julius claims as his property, and brings his

action for the same. See the *Institut. lib. iv. tit. 4.* where the principal actions, introduced by the Roman law, are summarily explained.

In common law, from the two classes of *real* and *personal actions*, arises a third called a *mixed action* ; which regards both the *person* and the *thing*.

ACTION, *real*, or, as it is called in the *Mirror*, *feudal action*, is that which concerns real property, whereby the defendant claims title to lands or tenements, rents or commons, in fee-simple, fee-tail, or for life : and these actions are either *ancestral*, or *possessory*. *Ancestral action* is that which we have by some right descending from our ancestor.—*Possessory*, sometimes also called *personal action*, is that which hath its beginning in and from ourselves.

But real actions, formerly so numerous and considerable, as writs of right, of entry, &c. with their appendages as *grand cape*, *petit cape*, receipt, view, aid-prayer, voucher, counter-plea of voucher, counter-plea of warantry, and recovery of value, are now much out of use ; on account of the great nicety required in the management of them, and the inconvenient length of their process : a much more expeditious method of trying titles being since introduced in other actions, *personal* and *mixed*. In a *real action* several lands held by several titles may not be demanded in the same writ ; but in *personal action* several wrongs may be comprehended in one writ. A bar is perpetual in the latter actions, and the plaintiff has no remedy, except by writ of error or attain ; but, in the former, if the defendant be barred, he may commence an action of a higher nature, and try the same again.

ACTION, *personal*, is that whereby a man claims a debt, or personal duty, or damages in lieu thereof ; and likewise, whereby a man claims a satisfaction in damages for some injury done to his person or property. The former is said to be founded on contract ; the latter upon *torts* or wrongs. Of the former nature are all actions upon debt or promises ; of the latter all actions for trespasses, nuisances, assaults, defamatory words, and the like.

Many *personal actions* die with the person ; but *real actions* survive. In all actions merely *personal*, arising *ex delicto*, for wrongs actually done by the defendant, as trespass, battery, and slander, the action dies with the person, But in actions arising *ex contractu*, by breach of promise and the like, though the suits shall abate by the death of the parties, they may be revived by or against the executors who have assets to answer the demand ; as they are rather actions against the property than the person.

ACTION, *mixed*, is that laid indifferently for the *thing* detained, or against the *person* of the detainer ; being thus called, because it has a mixed respect, both to the *thing*, and to the *person*.

Others better define it, a suit given by law to recover the thing demanded ; and damages for the wrong done.

Such is, assize of *novel disseisin*, which, if the disseisor make a feoffment to another, the disseisee shall have against the disseisor, and the feoffee, or other terre-tenant, to recover not only the land but damages also. And the like is action of WASTE, *Quare impedit*, &c. See ASSIZE.

Actions are also divided into CIVIL and CRIMINAL.

ACTION, *civil*, is that which only tends to the recovery of what, by reason of a contract, or other like cause, is a man's due.—As, if a person by action seek to recover a sum of money formerly lent, &c.

ACTION, *criminal*, is that the object of which is judgment of death, as appeals of death, robbery, &c. or judgment for damage to the party, fine to the king and imprisonment, as appeals of maihem, &c. To this class belongs action *penal*.

ACTION,

ACTION, penal, aims at some penalty upon the party sued, either corporeal or pecuniary.

Such is the *Actio Legis Aquilæ*, in the *Civil Law*; and with us, the next friends of a man feloniously slain, or wounded, shall pursue the law against the offender, and bring him to condign punishment.

ACTION is also distinguished, as it lies for the recovery either of the simple value of the thing challenged; or of the double, treble, quadruple, &c.

Thus, a *Decies tantum* lies against embracers; and against jurors that take money for their verdict, of either, or both parties.

To this class also belong all actions on a statute that punishes offence by restitution, or fine proportionable to the transgression.

Action, again, is divided into *prejudicial*, called also *preparatory*, and *principal*.

ACTION, prejudicial, is that which arises from some question, or doubt in the *principal* one.

As, if a man sue his younger brother for land descended from his father; and if it be objected, he is a bastard; this point of bastardy must be tried, before the cause can proceed: whence this action is termed *præjudicialis, quia prius judicanda*.

ACTION upon the case, Actio super casum, is a general action, given for the redress of a wrong done any man without force, and not especially provided for by law; in order to have satisfaction for damage.

This, of all actions, is now most in use.—Where there arises an occasion of suit, that has neither fit name, nor certain form already prescribed; the clerks of the chancery, anciently, conceived a proper form of action for the thing in question: which was called an *action upon the case*, by the civilians *Actio in factum*.

This is called an *action on the case*, because the whole cause or *case*, as much as in the declaration (except time and place) is set down in the writ; and there is no other action given in the case, except only where the plaintiff has his choice to bring this or another action. This action lies in a variety of instances; as for words spoken or written, which affect a person's life, reputation, office, or trade, or tend to his loss of preferment, in marriage or service, or to his disinheritation, or which occasion him any particular damage. Action on the case likewise lies upon an *ASSUMPSIT*. It lies also, in all instances, wherein no general action could be framed: *e. g.* against *CARRIERS*, against a common inn-keeper for goods stolen in his house, for deceit in contracts, bargains, and sales, for neglect or malfeasance, for injuries done in commons, for malicious prosecution and false arrests, against sheriffs for default in executing writs, permitting escapes, &c. for conspiracy, nuisances, &c. &c. See *Comyns's Digest*. art. *Action*, and *Jacob's Law. Dict.* by *Tomlins*, art. **ACTION**.

ACTION upon the statute, Actio super statutum, is a writ of action, brought against a man, upon an offence against a *STATUTE*, whereby an action is given that did not lie before.

Thus, where one commits perjury, to the prejudice of another, he who is damaged shall have a writ upon the statute, and a cause accordingly. Such action is now obsolete.

ACTION, popular, only differs from an action upon the statute, in that, where the statute gives the suit or action to the party grieved, or otherwise to one single person certain, it is called action upon the statute; and where the authority is given by the statute to every one that will so sue, it is an action popular: and from the words used in the process, it is called a *qui tam action*. See *INFORMATION*.

Action is also divided into *perpetual* and *temporary*.

ACTION, perpetual, is that whose force is not determined by any period or term of time.

Of this kind were all civil actions among the ancient Romans; viz. such as arose from laws, decrees of the senate, and constitutions of the emperors; whereas actions granted by the prætor died within the year.

We have also *perpetual* and *temporary actions* now in England; all being perpetual which are not expressly limited.

Divers statutes give actions, on condition they be pursued within the time prescribed.—Of these statutes the principal are the following, viz. 32 Hen. VIII. cap. 2. 31 Eliz. c. 5. 21 Jac. I. c. 2. c. 16. 10 W. III. c. 14. 27 Geo. III. c. 44. See *LIMITATION*.

But, as by the civil law no actions were so perpetual, but that by time they might be prescribed against; so, in our law, though action be called perpetual, in comparison of those that are expressly limited by statute; yet is there a means to prescribe against real actions, after five years, by a *FINE* levied, or a *RECOVERY* suffered. See *PRESCRIPTION*.

Again, *actions* are either *local*, as ejection, waste, &c. which must be brought in the county where the land lies; or *transitory*, such as debt, detinue, &c. which may be brought in any county.

By stat. 21 Jac. I. c. 4. all suits on penal statutes shall be laid in the county where the offence was committed. See *VENUE*.

Action is also *joint* or *several*; *joint*, where several persons are equally concerned, and the one cannot bring an action, or cannot be sued, without the other; *several*, in case of trespass, &c. done, where persons are to be severally charged, and every trespass committed by many is several.

There are also various kinds of *actions* suited to different cases, as *actions* of *COVENANT*, *DEBT*, *DETINUE*, *TRESPASS*, *TROVER*, &c.

ACTION, Chose in, see *CHOSE* in *Action*.

ACTION of a writ, is when a person pleads some matter whereby he shews, that the plaintiff had no just cause to have the writ he brought, though it be possible he might have another writ or action for the same matter.—Such plea is called, a *plea to the action of the writ*.

When by the plea it appears, that the plaintiff has no cause of any action for the thing demanded, it is called a *plea to the action*. See *PLEAS*.

ACTION, in affairs of *Commerce*, or **ACTION** of a *COMPANY*, is a part or share in the company's stock or *CAPITAL*, which consists of a number of such actions.

Actions in France and Holland amount to the same with *shares* or *subscriptions*, in England.

Thus, the capital of a company, which has three hundred actions of a thousand livres each, consists of three hundred thousand livres. Hence a person is said to have four or six actions in such company, if he hath contributed to the capital, and be interested in it for four or six thousand livres.

A proprietor cannot have a deliberate vote in the assemblies of a company, unless he has a certain number of actions, fixed by the letters patent of its establishment; nor can he be a director, unless he has a still greater number of actions. Actions are bought and sold, transferred, &c. much in the same manner as *STOCKS* are with us.

ACTION also denotes an obligation or instrument, which the directors of such companies deliver to those who pay money into their stock. See *BANK* and *ACTIONARY*.

To *melt* or *liquidate* an *action*, is to sell, or turn it into money, &c.

To *sue* an *action*, is to pay exactly when they become due,

due, the several sums subscribed to the stock of the company, according to the several orders of council made for the creation of the new actions.

ACTIONARY, or **ACTIONIST**, a term frequent in foreign news-papers; denoting the proprietor of an action or share in the company's stock.

ACTIVE, something that communicates motion or action to another. In this sense, the word stands opposed to *passive*. Thus we say, an *active cause*, *active principles*, &c.

The quantity of motion in the world, Sir Isaac Newton shews, must be always decreasing, in virtue of the *vis inertia*, &c. So that there is a necessity for certain active principles to recruit it: such he takes the cause of gravity to be, and the cause of fermentation; adding, that we see but little motion in the universe, except what is owing to these active principles.

ACTIVE principles, in *Chemistry*, are those which are supposed to act of themselves, and do not need to be put in action by others.

Salt, sulphur, and mercury, have been usually considered by the chemists as active principles; and phlegm and earth as passive ones.

Mr. Homburg, and some chemists after him, only make one active principle, viz. sulphur, or fire; which they take to be the source or principle of all the motion and action of the universe.

The term active principle, says Dr. Quincy, has been used to express certain divisions of matter, that are, by some particular modifications, comparatively active, in respect of others. But the progress of science, and particularly of experimental philosophy and chemistry, has introduced new and more rational ideas on this subject.

In a strict sense, all motion in matter is rather passive; and there is no active principle, unless we thus call the known powers of gravitation, attraction, and repulsion, on which the Newtonian philosophy is founded: so that let bodies exist under what modifications soever, there can be no alteration made of these universal properties.

ACTIVE, in *Grammar*, denotes a word having a signification that serves to explain or denote an action.

Thus we say a verb *active*, a conjugation *active*, &c. or an *active* participle.

ACTIVE Verbs, are such as do not only signify doing, or acting, but have also nouns following them, to be the subjects of the action or impression: and they are thus distinguished from *verbs neuter*.

Thus *to love*, *to teach*, are verbs *active*; because we can say, *to love a thing*, *to teach a man*.

Some grammarians, however, make three kinds of verbs active: the *transitive*, where the action passes into a subject different from the agent; *reflected*, where the action returns upon the agent; and *reciprocal*, where the action turns mutually upon the two agents who produced it. See **VERB**.

ACTIVE Power, in *Metaphysics*, is the power of executing any work of art or labour, in contradistinction to **SPECULATIVE powers**. The exertion of this power is called **ACTION**; and as every action produces some change, so every change must be caused by some exertion, or by the cessation of some exertion of power. That which produces a change by the exertion of its power, we call the *cause* of that change; and the change produced the *effect* of that cause: and that being in which the change is produced is said to be *passive*, or to be acted upon. Thus (says Dr. Reid, *Ess. on the Active Powers of Man*, p. 13.) we see, that action and passion, cause and effect, exertion and operation, have such a relation to *active power*, that if it be understood, they are understood of consequence; but if power be

a word without any meaning, all those words which are related to it, must be words without any meaning. See **POWER**.

ACTIVITY, the power of acting, or the active faculty. The activity of fire exceeds all imagination.—The activity of an acid, a poison, &c.—Bodies according to Sir Isaac Newton, derive their activity from the principle of **ATTRACTION**.

ACTIVITY of a body, the *sphere of*, is the space which surrounds it, so far as its efficacy or virtue extends to produce any sensible effect.

ACTIUM, in *Ancient Geography*, a small town near a promontory of the same name in the mouth of the Ambracian gulph, on the coast of **ACARNANIA**, and opposite to **NICOPOLIS** on the other side of the bay. This place was famous for a temple of Apollo, mentioned by Thucydides (l. i. c. 29. p. 24. Ed. Duker), and by Strabo (l. vii. tom. i. p. 500. Ed. Casaub.) thence denominated *Actius*; (Virgil *Aeneid*. viii. 704.) and afterwards for the victory obtained by Augustus over Anthony and Cleopatra in a naval battle on the 2d of September, in the year of Rome 723. Nicopolis was built in order to commemorate this victory, and games were instituted called the **ACTIAN games**. There were anciently solemn games at Actium, at which the Lacedæmonians used to preside, mentioned by Strabo, and alluded to by Virgil, *Æn.* iii. 278. The victory at Actium was also celebrated by games instituted at Rome. Sueton. Tib. vi. Dion. *Cass. Hist. Rom.* lib. li. 19. liii. i. liv. 19. tom. i. pp. 649—696—749. Ed. Reimari. The **ACTIAN æra** took its rise from the battle of Actium. The promontory is now called *Capo di Figalo*. The medals of Actium were silver, gold, and bronze; and the ordinary type is a flying pegasus.

ACTON, in *Geography*, a village about six miles West of London, where is a well of purging water, noted for the pungency of its salt. Its colour is whitish, its taste is sweetish, with a mixture of the same bitter which is in the *EPSOM water*. Its salt is not quite so soft, and is more calcareous than that of the *Epsum water*, being more of the nature of the salt of lime: it is however more nitrous than the other. A quantity of it being boiled high, and mixed with a solution of sublimate in pure water, throws down a yellow sediment. It strikes a deep red or purple with the tincture of log-wood in brandy, as is usual with nitrous salts. It does not precipitate silver out of the spirit of nitre, as common salt does; a pint and a half of the water yields forty-eight grains of salt. See Allen's *History of Purging waters*.

ACTON, a township of Middlesex county in the Massachusetts, containing 853 inhabitants; 24 miles N. W. of Boston.

ACTON Burnel, a village in Shropshire, about three miles from Great Wenlock, where a parliament was held in the reign of Edward I. when the famous act 11 Ed. I. A. D. 1283, called Statute-merchant, was renewed.

ACTOR, in *Antiquity*, was the name of a person who had the superintendance of all the goods of a Roman citizen. He was called "*actor bonorum, and actor prædiorum fundorumque.*"

ACTOR Summarum, was a slave, to whom was committed the office of cash-keeper: and that he was a slave we may infer from the punishment of the cross which Domitian caused to be inflicted on one of these actors. See Sueton. in *Domit.* c. x. t. 2. p. 1038.

ACTOR, in a general sense, one who performs any act. **ACTOR**, among *Civilians*, the proctor or advocate in civil courts or causes: as *actor ecclesie* has been sometimes used

used for the advocate of the church; *actor dominicus* for the lord's attorney; *actor vici*, the steward or head bailiff of a village.

ACTOR, in the *Drama*, one who represents some person or character upon the theatre. The drama, in its original, only consisted of a simple chorus, who sung hymns in honour of Bacchus; so that the primitive actors were no more than singers and musicians. Thespis was the first who took upon him to introduce a person, or actor, who was to ease the chorus by reciting the adventures of some of the heroes. Thus came the recitation or declamation in use. Æschylus, finding a single person tiresome, thought to entertain the audience more agreeably by the introduction of a second person, who should converse and conduct dialogues with the first. He likewise dressed his actors more decently than they had been before, and put on them the *BUSKIN* and the *MASK*. Sophocles, finding the two persons of ÆSCHYLUS too few for the variety of incidents, added a third; and here the Greeks stopped: at least, we seldom find in any of their tragedies above three persons in the same scene. They might probably think it wrong to admit more than three speakers at the same time on the stage; a rule which Horace has expressed in the following verse of his *Art. Poet*:

—"Nec quarta loqui persona laboret."

In their comedies they took a greater liberty. The moderns have introduced a much greater number of actors upon the stage. This heightens the trouble and distress that should reign there, and makes a diversity, in which the spectator is sure to be interested. Horace speaks of a kind of secondary actors in his time, whose concern it was to imitate the first, and degrade themselves in order to become better foils to their principals. The proper business of these subaltern actors is unknown to us.

The actors wore habits and symbols suited to their respective posts. Kings bore the regal appendages, as the diadem and sceptre; and their garments were long robes of purple and other colours, ornamented with gold. Heroes were often covered with the skin of a lion or tyger, and armed with swords, spears, quivers, and clubs. The age, sex, and condition, of every personage of the drama were almost always indicated by the colours of the dress. The same actors sometimes performed both in tragedy and comedy; but they seldom excelled in both. In order to acquire greater vigour and suppleness of body, they exercised in the palestra; and others, to render their voices more ductile and sonorous, carefully observed a strict regimen. Cicero, *Orat. cap. iv. tom. i. p. 423. Ed. Olivet.* Plato, *de Leg. l. ii. tom. ii. p. 665. Ed. Serrani.*

Besides considerable pay which was given to actors who had acquired great reputation, *e. g.* a talent in two days, (Plutarch in *X Rhet. Vet. tom. ii. p. 348. Ed. Xylandri.*) they enjoyed all the privileges of citizens: and as it was required that they should be free from all the stigmas of infamy, with which the laws punished offences, they arrived at the most honourable employments. A famous actor, named Aristodemus, was sent on an embassy to Philip, king of Macedonia. Others possessed great influence in the public assemblies. Æschylus, Sophocles, and Aristophanes, did not blush to act a part in their own pieces. Athen. *Deipnos. l. i. c. 17. p. 20. c. 18. p. 21. Ed. Casaub.* At Athens, actors were thus highly honoured. But at Rome, they were despised, and degraded from their rank as citizens, expelled from their tribe, and deprived of the right of suffrage by censors. The French have adopted the ideas of the Romans, and the English those of the Greeks.

ACTORS, in *Roman Antiquity*. See **ACCUSATION**.

ACTORICUM, in *Ancient Geography*, a territory of Epirus, according to Suidas, which he says was afterwards called Leucadia, belonging more properly to Acarnania.

ACTORION, or **ACTORIS**, in *Entomology*, two species of **PAPILIO**, found in Surinam; one with subcaudated brown wings; the anterior marked with a yellowish fascia, and the hinder with a blue spot and an ocellum underneath; the other, with wings of an uniform colour, marked with brown and white.

ACTORUM Tabule, were tables instituted by Servius Tullius, in which the births of children were registered. They were kept in the treasury of Saturnus.

ACTRESS, **ACTRIX**, a female who acts, or does the office of an actor.

Actresses, or women actors, were unknown to the ancients, among whom men always performed the part of women; and hence one reason for the use of masks among them. Mem. Acad. Inscr. tom. vii. p. 188. Among the Greeks, the women only danced; and their place in tragedies and comedies was supplied by eunuchs, whose voice resembled theirs.

Actresses are said not to have been introduced on the English stage till after the restoration of king Charles II. who has been charged with contributing to the corruption of our manners, by importing this usage from abroad. But this can be but partly true: the queen of James I. acted a part in a pastoral; and Prynne, in his *Histriomastix*, speaks of women actors in his time as whores; which was one occasion of the severe prosecution brought against him for that book. Whitlock, Mem. 1632. Wood's Athen. Oxon. tom. ii. p. 434.

ACTRIDA, in *Ancient Geography*, a town placed by Pliny in Arabia Felix.

ACTUAL, something that is real and effective; or that exists truly and absolutely. The philosophers use *actual* heat, or cold; in opposition to *virtual* or *potential*.

Actual heat, considered actively, is the act of producing heat: passively taken, it is the quality whereby a body is denominated *hot*.—Virtual or potential heat, actively taken, is the power or faculty of producing heat; passively taken, it should be the power or faculty of being heated, or receiving actual heat.

In medicinal language, actual is also opposed to *potential*, and is applied to any thing endued with a quality which operates by an immediate power inherent in it. For example: a red-hot iron, or fire, is called an actual cautery, in contradistinction to cauteries, which have a power of producing the same effects on animal solids, as actual fire; and which are called potential cauteries or caustics. Boiling water is actually hot, and brandy is potentially hot.

Actual sin is that committed knowingly, by a person arrived at the years of discretion: in contradistinction to what Theologians have called *Original sin*.

Actual possession and *actual right* of possession are terms used in *Law*, for the meaning of which see **POSSESSION**.

ACTUARIÆ naves, in *Antiquity*, a sort of long and light ships, thus denominated as being particularly contrived for swiftness and expedition; they answer to what the French call *brigantines*.

Cicero, in an epistle to Atticus, calls a ship *decem scalmorum*, of ten banks of rowers, *actuaria*.

ACTUARIUS, or **ACTARIUS**, primarily denotes a notary, or officer appointed to write down the acts or proceedings of a court, assembly, or the like.

In the eastern empire, the *actuarii* were properly officers who kept the military accounts, received the corn from the *fosseptores*, or store-keepers, and distributed it to the soldiers.

diers. These acted as a kind of brokers with the foldiers; made bargains with them for receiving their pay before it became due; for which there were fixed rates. Aquin. Pitisc. and Du-Cange.

ACTUARIUS was also a title of dignity, in the court of Constantinople, peculiar to physicians. Du-Cange.

From an appellative, the word has become a proper name of a celebrated Greek physician, on being appointed physician to the court of Constantinople, whose name was *John*, and who was the son of Zachary, a Chistian writer. He is said, by some, to have lived about the year 1300; though others refer him to the year 1100. He is said to be the first Greek author, who has treated of mild purgatives, such as manna, cassia, fena, and Myrobolans, which were long before in use among the Arabians, and to have introduced them into the practice of physic. He is also the first author that mentions distilled waters. His works, of which Friend gives a favourable opinion, are compiled, principally, from Galen, Ætius, and Paulus Ægineta. They were originally written in Greek, and have been translated into Latin, and published, some of them accompanied with the Greek text. They are as follow: 1. De medicamentorum compositione. Paris, 1539, 12mo. republished at Hall, by Gesner, 1540; and with the Greek, 1546. 2. Methodi medendi, libri sex. Ven. 1554, 4to. Paris, 1516, 8vo. with the rest of his works. 3. De actionibus et affectibus spiritus animalis, ejusque nutritione, libri duo, 1547, 8vo. Venet. 4. De Urinis, libri septem. Paris, 1548. Fab. Bibl. Græca, tom. xii. p. 635.

ACTUARIUS, or ACTUARY, also means the clerk who registered the acts and constitutions of the convocation.

ACTUATE, to bring into act, or put a thing in action. Thus an agent is said, by the schoolmen, to actuate a power, when it produces an act in a subject.—Thus the mind may be said to actuate the body. And thus a medicine, &c. is said by some ancient physicians, to be *actuated*, when, by means of the vital heat, it is made to produce its effect.

ACTUS, in the *Ancient Agriculture*, the length of one furrow; or as far as a plough goes before it turns. Plin. lib. xviii. cap. 3. tom. ii. p. 97. Ed. Hard.

In English it may be rendered by a *furlong*.—It is also used by Vitruvius as a determinate measure, containing 120 Roman feet.

ACTUS *minimus*, was 120 feet in length, and four in breadth; being equal to the *SEXTANS*, or sixth part of the *JUGERUM*, or *INTEGRUM*.

ACTUS *major*, called also *actus quadratus*, was the square of 120 feet, or 14,400, being the *semis*, or half of the *JUGERUM*.—This was also denominated *modius*, and *mina*. Varro de Re Rust. lib. i. cap. 10.

ACTUS *Intervicinalis*, a space of ground four feet in breadth, left between the lands as a path, or way.

ACUANITES, ACUANITÆ, in *Ecclesiastical History*, are those called more frequently *MANICHEES*. They took the name from Acua, a disciple of Thomas, one of the twelve apostles. Bib. Univ. tom. xxv. p. 330.

ACUBA, in *Botany*, is a tree of St. Domingo, which rises to a great height, and yields an excellent fruit. The fruit is a kind of fig, resembling in taste the muscada pear, but so hard that it must be softened in water before it can be used. The wood is the hardest of any in the island. M. de Lamarek (*Encyclopedie*, vol. vi. p. 39.) apprehends, that it is a species of *CHRYSOPHOLLUM*, and the same which is called *Auzuba*, and according to Plumier denominated *Acomas*.

ACUBA, in *Ancient Geography*, a fountain or lake of Africa, in the Syrtis.

ACUBENE, in *Astronomy*, a name given by some to a star of the fourth magnitude, in the southern claw of *CANCER*, marked α by Bayer.

ACUFIDA, in *Ancient Geography*, a town of Africa, in Mauritania.

ACUHYA'TLI, in *Zoology*, the name of a large serpent, of a poisonous quality, in America, more usually known by its name of *CUCURUCU*, or *curucuca*.

ACUTION, in *Grammar*, *Profody*, and *Medicine*. See *ACUTION*.

ACUL, in *Geography*, a small port on the north coast of the island of St. Domingo.

ACULEATED, a term applied to a plant or animal that has *ACULEI*, or prickles.

Naturalists divide fishes into those with *aculeated*, and non-*aculeated* fins. Phil. Trans. N^o 204.

ACULEATED Leaf. See *LEAF*.

ACULEATUS *longus*, in *Ichthyology*, a name given by some to the *PUGNITIUS marinus longus*, a small prickly West-India fish. Willughby. See *STICKLE-BACK*.

ACULEI, formed from *acus*, a *needle*, among *Botanists*, &c. denote the prickles or spines of plants of the thorny kind.

Among *Zoologists*, *aculeus* is also used for the sting of a bee, scorpion, or the like. See *STING*.

The word *aculeus* is also used for certain parts of the *ECHINI marini*.

ACULEI *pinnarum*. See *PINNÆ*.

ACULEOSA, a name of the *carduus polyacanthos*. See *GORTERIA*.

ACULER, in the *Manege*, is used for the motion of a horse, when in working upon volts he does not go far enough forward, at every motion, so that his shoulders embrace or take in too little ground, and his croup comes too near the centre of the volt. Horses are naturally inclined to this fault in making demi-volts.

ACUMANTIS *Mons*, in *Ancient Geography*, a mountain of Cyprus, situate to the south of the promontory of *Acamas*. See *ACAMANTIS*.

ACUMEN, *οξύμν*, in the *Ancient Music*, was used to signify a sound produced by the *intention*, or raising of the voice.

Acumen differs from *intention*, as the *effect* from the *cause*. Aristoxen. p. 10, &c. Ed. Meibom.

ACUMINA, among the *Ancients*, denoted a kind of military omen, or auspice, supposed to have been taken from the points of edges or darts, javelins, swords, or other weapons, viz. by examining whether they were bright or solid, sharp or blunted.

ACUMINATED Leaf. See *LEAF*.

ACUMINCUM, in *Ancient Geography*, a town of Lower Pannonia, called by Ammianus Marcellinus *Acunincum*, and supposed to be the same with *Acunum* on the Danube.

ACUMULO, in *Geography*, a small place in the province of *ABRUZZO*, in Italy, 17 miles north-west of *Aquila*. N. lat. 42° 36'. E. long. 13° 24'.

ACUNA, CHRISTOPHER DE, in *Biography*, a Spanish Jesuit, born at Burgos, in 1597, and admitted into the society in 1612, at the age of fifteen years. After having been employed for some years in endeavouring to make converts in Chili and Peru, in South America, he returned to Spain to give an account of his discoveries on the river of the Amazons, a description of which he published at Madrid under this title, viz. *Nuevo Descubrimiento del Gran Río de las Amazonas*; i. e. a new discovery of the great river of the Amazons. He embarked again for America, and was at Lima in 1675. Political motives occasioned a suppression

of the discoveries of this Jesuit, and his work became very scarce. The Spaniards were jealous of the Portuguese, and wished to prevent their deriving any advantage from the relation of Acuna. The work was translated by M. de Comberville, in four volumes 12mo in 1682; and, it is said, that the only copy of the original, besides that which the translator used, is in the Vatican library. Gen. Dict.

ACUNUM, in *Ancient Geography*, a town of Pannonia, north-east of Sirmium.

ACUNUM is also the present Ancona; supposed by M. d'Anville to be the Acufion of Ptolemy.

ACUPUNCTURE, a method of curing many diseases, by pricking several parts of the body with a needle, or instrument of that form; practised by the Chinese and Japanese, and other nations in that part of the world. They perform the operation with a large gold or silver needle, which they strike into the several parts of the body, either with their hand, or with a hammer made on purpose. This severe and desperate operation is performed on the head and breast, as well as the abdomen, arms, legs, thighs, and many other parts of the body, nay even in the abdomen of women with child, when the fœtus is restless. The disease, for the relief of which this operation is chiefly performed, is ascribed by the Japanese physicians to the immoderate use of the fakkî, a strong wine made of rice, which gradually fills the abdomen and lower parts of the body with a noxious stasis, that occasions convulsions and exquisite pains. The place in which the puncture is commonly made, is the middle between the navel and the pit of the stomach; and the holes are distributed into three rows, with three punctures in each row, at the distance of about half an inch, and the whole disposed in the form of an oblong square. The needles are vendd by the emperor's licence.

Surgeons are furnished with images, wherein all the places in the body proper for the needle are designed by marks. M. Ten Ryne was an eye-witness of the use of this puncture on a soldier, who being afflicted with violent disorders of the stomach, and frequent vomitings at sea, suddenly relieved himself by pricking a thumb's breadth deep into four different places about the region of his PYLORUS. Ten. Ryn. Diff. de Acupunct. ap. Phil. Trans. N° 148. p. 231, seq.

We sometimes also find mention of an acupuncture practised in Europe; but this amounts to no more than the perforating or opening a part, e. g. the cornea, with the point of a needle; which has been done with good success, for the cure of an *hydrophthalmia* and *hypopyon*.

ACUR, in *Ancient Geography*, a town of Asia, according to Ptolemy, in Lat. 15° 20'. Long. 124° 45'.

ACUROA, in *Botany*, a genus of the *diadelphia decandria* class and order: the characters of which are, that the calyx is quindentated; that it has five petals; and that the legumen is roundish, coriaceous, not gaping, with a single cell, and a single seed. There is one species, viz. *A. violacea*.

ACURON, a name given to the *ALISMA*.

ACUS, in *Ichthyology*, the name of several species of fish, whose form is long and slender, belonging to different genera in the Linnæan system. The *GYMNOTUS acus* is distinguished by having no fin on the back, belly, and tail, and by an anal fin terminating before the apex of the tail, with sixty rays. It is found in the Mediterranean. The colour of the upper part is whitish, beclouded with reddish and brown spots, and underneath it is bluish. It has no tentacula.

The *SYNGNATHUS acus* is of an heptagonal figure, and has a pinnated tail. This is the *typhle* of Gesner; and, according to Aldrovand, the *acus* of Aristotle, and the *acus*

altera major species of Aristotle, according to Willughby and Ray. It is the *horn-fish* of Jonston. It is found in the northern ocean of Europe; in length, as stated by Gmelin, it is about two or three feet, and it is variegated with alternate spots and belts of a brown and light-oker colour. The *acus* of Aristotle, according to Rondeletius, Jonston, Willughby, and Ray, and the *secunda* species of Aristotle's *acus* according to Gesner, is the *SYNGNATHUS TYPHLE* of Linnæus. This is the shorter *pipe-fish* of the British zoology, and the *sea-adder* of Borlase. The *acus vulgaris* of Aldrovand, Willughby, and Ray, the *acus* of Oppian, and the *acus 1^{ma}* species of Rondeletius and Gesner, is the *BELONE* of Aristotle; the *ESOX belone* of Linnæus, the *SEA-PIKE* of the British zoology, and the *gar-fish* of other authors. The *acus maxima chinensis*, with a compressed body, is the *FISTULARIA chinensis* of Linnæus. The *acus maxima squamosa viridis* of Cateby, is the *ESOX viridis* of Gmelin's Linnæus. Mr. Daines Barrington conceives, that a fossil which he found near Christchurch, in Hampshire, had the appearance of the scales of this fish, though it be a stranger to our seas. Phil. Trans. vol. lxxiii. p. 171.

The *acus lumbriciformis* of Willughby and Ray, is the *SYNGNATHUS ophidion* of Linnæus, and the little *PIPE-FISH* of the British zoology.

ACUS is also used by some authors for the *AMMODYTES*, or sand-eel, a small eel caught in the sands.

ACUS, in *Natural History*, is a name given to the oblong *CIMEX*, with filiform antennæ, or the *CIMEX stagnorum* of Linnæus, with a roundish black body, and two globose points in the middle of the thorax, which is very common in the lakes of England. *Acus* is also a species of *ASCARIS*, straight, rigid, and acicular, and bending at both ends. It is white, about two inches long, and found in the intestines of the pike. *Acus* is also a species of the *VOLUTA*-shell, marked with transverse series of red points, and terminating in a smooth pointed wreath. It is scarce an inch long, and of a white or yellowish colour.

A species of *BUCCINUM*, of a whitish colour, with horizontal undulated lines, with bifid crenulated rugose windings, and the columella spirally twisted, is called *acus*.

Acus Pastoris, in *Botany*, a name of the *SCANDIX*.

Acus Moschata, a name of the *GERANIUM moschatum*.

ACUSCHY, in *Zoology*, a species of *CAVIA*. See *AKOUSCHY*.

ACUSI, in *Botany*, a species of *APOCYNUM*.

ACUSILAUS, in *Biography*, one of the most ancient Greek historians, was born at Cercas, near Aulis, not long before *PHERECYDES* of Athens, and compiled genealogies of the ancient royal families from tables, which his father is reported to have found in digging the foundations of his house. He goes back to the ages before the war of Troy, and as far as Phoroneus, king of Argos. Suidas.

ACUSILAUS is also the name of an Athenian orator, who went to Rome in the time of Galba, where he practised rhetoric, and gained a large fortune of a hundred thousand drachmæ, with which he returned to Athens, where he died. Suidas.

ACUSIORUM *Colonia*, now *ANCONA*, in *Ancient Geography*, is situated, according to Lucas Holstenius, between Orange and Valence, near Montelimart, on the banks of the Rhine. It was called *Acunum*; and, according to Ptolemy, was one of the cities of the Cavari.

ACUTÆ *Insula*, in *Ancient Geography*, are comprehended in the number of the *Echinades*. They are a little more to the south-west, in the south of the promontory of *Araxum*. M. d'Anville calls them *OXIÆ insula*.

ACUTE,

ACUTE, *sharp*, something that terminates in a point, or edge; disposed either for piercing or cutting.

In this sense the word usually stands opposed to *obtuse*.

ACUTE angle, in *Geometry*, is that which is less than a right angle, or which does not subtend 90 degrees.

Such is the angle ACB (*Plate Geometry, fig. 1.*)

ACUTE-angled triangle, is that whose three angles are all acute; called also an *oxygonous triangle*.

Such is the triangle ACB (*Tab. Geometry, fig. 1.*)

ACUTE-angled Cone, is that whose opposite sides form an acute angle at the vertex; or whose axis, in a right cone, makes less than half a right angle with the side. See **CONE**. Pappus, in his mathematical collections, p. 164. Ed. Pissaur. 1588, says, that this name was given to such a cone by Euclid, and the ancients before the time of Apollonius; and they called an

ACUTE-angular Section of a Cone, which was made by a plane, cutting both sides of an *acute-angled cone*, an **ELLIPSE**; but they did not consider, before it was pointed out by Apollonius, that such a section might be obtained in any cone whatever. See **CONIC Section**.

ACUTE, in *Music*, is understood of a sound, or tone, which is sharp, shrill, or high, in respect of some other: in which sense the word stands opposed to *grave*. Both these properties of sound depend on the quickness or slowness of the vibrations by which they are produced; and are independent of loudness or force; for a tone may be acute or high, without being loud, and *vice versa*. There are degrees of acuteness and gravity beyond our powers of appreciation. The warbling of birds is of that kind. No birds but the nightingale and cuckoo produce musical tones which we can imitate, or compare with those of our musical instruments. A bullfinch and canary bird can be taught tunes by our flageolets and bird-pipes; but their natural warble is incommensurate with our scale. The grave additional tones in our large piano-fortes become the more difficult to tune as they descend. The octave below double C can, with the utmost difficulty, be made to satisfy a nice ear by the most experienced tuner.

Sounds considered as acute and grave, that is, in the relation of gravity and acuteness, constitute what we call *tune*, the foundation of all **HARMONY**.

ACUTE Accent, in *Grammar*. See **ACCENT**.

ACUTE Leaf. See **LEAF**.

ACUTE Disease. See **DISEASE**.

ACUTELLA, in *Botany*, a name used by some to express the common **ANONIS**, or **REST-harrow**, a small prickly plant, with red or white flowers, and famous for its spreading and tough root. Ger. Emac. Ind. 2.

ACUTIATOR, in writers of the barbarous ages, denotes a person that whets, or grinds cutting instruments: called also in ancient glossaries, *acutor*, *axoniis*, *famiarius*, *co-harius*, &c. Du-Cange.

In the ancient armies there were *acutiores*, a kind of smiths, retained for whetting or keeping the arms sharp. Aquin.

ACUTITION, or **ACUTION**, in a general sense, the same with acuating or sharpening.

ACUTION, in *Grammar*, denotes the pronouncing, or marking a syllable with an acute **ACCENT**.

ACUTION, or *acution*, in *Medicine* and *Chemistry*, is used for sharpening or increasing the force of any medicine.

ACWORTH, in *Geography*, a township of Cheshire county, in New Hampshire, incorporated in 1766, and containing 704 inhabitants. It is eight miles east-by-north from Charlestown, and 73 north-west-by-west from Portsmouth.

ACY, a town of France, in the department of the Aisne, one league south-east of Soissons.

ACYLIA, in *Ancient Geography*, a town of Italy, built by the Romans, to restrain the barbarians who inhabited the Alps. It was a Roman colony.

ACYPHAS, a city of the Doric Tetrapolis, called by Strabo and others *Pindus*.

ACYROLOGIA, compounded of *ακυρος*, *improper*, and *λογος*, *discourse*, denotes an improper acceptance, or expression, by which a word or phrase is used in some unusual or oblique sense, hardly reducible to the rules of language. Such, e. g. is the word *spero*, sometimes used in Roman writers for *timeo*. The acyrologia bears a near affinity to the **CATACHRESIS**, inasmuch that many terms and expressions alleged as instances of the latter, are by others brought as examples of the former.

ACYTUS, a small island near Cydonia, in the isle of Crete.

ACZUD, in *Geography*, a town of Moldavia, in European Turkey. N. lat. 47° 20'. E. long. 29° 10'.

AD, in *Grammar*, a Latin proposition signifying *to*, and often used singly, and in composition to express the relation of one thing to another. Among all the eastern nations, *Ad* was a peculiar title; and, according to the learned Mr. Bryant's opinion, was originally conferred upon the sun. *Analys. of Anc. Mythol.* vol. i. p. 24.

An *bestias*, in *Antiquity*, is understood of a kind of punishment of criminals, condemned to be thrown to wild beasts. The term was also applied to a sort of gladiators hired to fight with wild beasts.

These are otherwise called *bestiarii*, *Calv. Lex. Jur.* p. 36.

AD extra, a term used among *School Divines*, in speaking of the external operations of the Godhead.

Acts or operations *ad extra*, are properly those whose term or effect is not within the divine essence; by which they stand exposed to operations *ad intra*. Creation, preservation, regeneration, conversion, renovation, &c. are actions of God *ad extra*.

AD intra, among *School Divines*, is understood of those acts of the Divine Being, whose term and effect is within his own essence. In which sense, acts or operations *ad intra*, stand opposed to those *ad extra*.

AD hominem, among *Logicians*, is understood of a kind of **ARGUMENT** drawn from the belief or principles of those we argue with, and which of consequence must be conclusive to them, though otherwise disbelieved by us; or, it is where a disputant quits his own language and system, and borrows that of his opponent to convince him, by turning his own prejudices or errors against himself. This the schoolmen call *argumentum ad hominem*.

AD libitum, used in *Music*, for a *piacere*, when the principal performer is *at liberty* to give way to his conceptions, to change the measure from quick to slow, or the contrary, without accompaniment, and to manifest his abilities in effusions of fancy, taste, and brilliant passages. But this privilege is often abused in the length and dulness of these extemporaneous flights, as they are called, though generally prepared at home with great pains and application to very little purpose. None but performers of first-rate abilities should be permitted to obtrude their crude, and often clumsy attempts on the public, interrupting the progress of, perhaps, an elegant or ingenious composition.

AD ludos, in *Antiquity*, a Roman sentence, whereby criminals were condemned to entertain the people, either by fighting with beasts, or with each other, and thus executing justice on themselves. *Kennet. Rom. Ant.*

AD metalla, the punishment of being doomed to work
in

in the mines. Criminals condemned to this, were called *metallici*.

It were to be wished that punishments of this kind could be substituted in lieu of our frequent executions; which are as repugnant to the principles of humanity as to those of sound policy.

Ad quiddities, among schoolmen, include the relations, analogies, agreements, disagreements, similitudes, and dissimilitudes of things.

Ad quiddities are properly those attributes of things, which answer to the question, *ad quid? to what?* By which they differ from mere *QUIDDITIES*, which answer to the question, *quid sit? what is it?* The latter enquire what things are in themselves; the former what they are, *ad alia*. Herb. de Verit. p. 233.

Ad valorem, is used in speaking of the duties, or customs, paid for certain commodities; some things are rated by the weight, measure, tale, or the like; others pay *ad valorem*, according to the value or worth, sworn to by the owner.

Ad Æsum, in *Ancient Geography*, a town of Italy near the river Ælis, between Senogallia and Ancona.

Ad Angelos, a place remarkable for the martyrdom of St. Mark, and which is thought to have been near Alexandria.

Ad Aquas, a name given to several places in Moesia, Dacia, Numidia, Spain, &c.

Ad Aquas calidas, a town of the Picentini, about ten miles from Ascoli.

Ad Aquas gradatas, a town situated near Aquilicia, and remarkable for the martyrdom of three brothers, of the illustrious family of Anierius.

Ad Aquas labodas, or *Labodas*, a place called *Tberma Selinontie*, in Sicily, famous for its baths, and situated near the mountain now called S. Calangero.

Ad Aquilas, a denomination distinguishing several places in Mauritania, Attica, Gaul and Italy.

Ad Avas, the name given to various places, in which altars were erected; one in Asia between Thirronia and Melentenis, not far from the Euphrates; and another in Boetica, in Spain, between Altigi and Corduba.

Ad Arnum, a place of Etruria, in Italy, west of Florentia.

Ad Auseos, a place in Venetia, between Vicentia and Verona.

Ad Baslicam, a place of Africa, in Numidia, between the colonies of Saldæ and Igilgili.

Ad Bivium, a place in Italy, 30 miles from Rome, now Valmontone.

Ad Caballos, *Bagnacavallo*, in Italy, was also called *Tiberiacum*.

Ad Calculus, called by Aristotle *Psephis*, was situated in a small island near Etruria.

Ad Calem, *Cagli*, a place of Umbria in Italy, on the Flaminian way.

Ad Calorem, a place in Italy, between Salernum and Marcellianum in the Appian way, called also *Ad Codorum*.

Ad Capræ paludes, or *CAPRILIA*, a country near Rome in which Romulus died.

Ad Capras, *CAPRÆ*, *Capraia*, a district of Umbria in Italy, where Totila, king of the Goths, died of his wounds.

Ad Castra, a denomination given by the Romans to several places where they had *castra* or camps.

Ad Centenarium, a place of Gaul, about five miles from Summus Pirenæus, belonging to the Sardones.

Ad Centesimum, a place in Italy, south-east of Asculum, so called, because it was at the distance of 100 miles from Rome. The Romans, who paid great attention to the measurement

of distances, denominated places by their distance from Rome, in miles.

Ad Centuriones, a place in Spain near the Pyrenees.

Ad Columellas, a place in Italy, five miles from Ravenna.

Ad Columnam, was situated in Brutium, north of Regium, and opposite to the town of Messina, in Sicily.

Ad Confluentes, a place in Italy, between Cefena and Ariminum: and another small place near Parma.

Ad Cottias, *Cozo*, was situated between Verecellæ and Laumellum, in Italy.

Ad Crispas, now *Oran*, a place of Mauritania Cæsariana, in Africa.

Ad Dianam, a place of Numidia, in Africa, 32 miles from Hippo-regius.

Ad Dracones, a place in Mauritania Cæsar. between Albula and Regia, south-east of Siga: there was also a place of the same name in Armenia minor in Asia, between Ototædazizo and Aza.

Ad Duas Columnas, a place of Italy, between Laumellum and Ticinum.

Ad Duodecim, the name of a place in the Cottian Alps, south-east of Segusio, and of another in Italy, north-east of Patavium.

Ad Duodecimum, a name applied to several places, one in Magna Græcia north of Hydruntum; another belonging to the Ædui, between Augustodunum and Cabillonum; another in Gaul, between Diviodurum and Decem Pagi, belonging to the Mediomatrici, and another, now Doodwerd, between Noviomagus and Lugdunum Batavorum.

Ad Duos Pontes, a place in Spain between Vicus Sparcorum and Grandimirum.

Ad Ensem, a small place in Umbria, north of Iguvia, in the Flaminian way between Hevillus and Cale.

Ad Fanum Martis, a place of Gaul in the Cottian Alps, west of Ocellum.

Ad Feroniam, a place near Mount Soracte, in the territory of the Falisci, north of Rome, where were a temple and grove consecrated to the goddesses Feronia. There was another *Feronia* south-east of Luna, near the road to Luca.

Ad Ficum, or *Ficas*, a place of Numidia, south of Igilgili.

Ad Fines, a denomination given by the ancients to several places, because they were on the limits of a country. There were several places of this name in Italy, Belgium and Gaul. See *AD FINES*.

Ad Flexum, a place in Italy, between Brixia and Ariolica, West of the lake Benacus.

Ad Flumen, a place in Pannonia, corresponding to that which is now called Saint-Veitam-Flaum, in Croatia.

Ad Fromulos, a place of Norica.

Ad Gallum Gallinacium, a place of Africa propria, in the road from Utica to Carthage.

Ad Gracos, a place of Italy, north of Clusium, and west of Cortona.

Ad Herculem, the name given to the port of Leghorn in Tuscany: also to a small place in the island of Sardinia; and to another 12 miles from Gades, called *Templum Herculis*.

Ad Horrea, *Canes*, a place of Gaul, between Antipolis and Forum Julii, pertaining to the Oxibii.

Ad Intercisa, a place of Italy, belonging to the Senones, between Callis and Forum Sempronii.

Ad Ladios, a place of Pannonia, in the route from Sirmium to Salona.

Ad Laminas, was situated between Varia and Carfeoh in Italy, and belonged to the Æqui.

Ad Lapidem, a place of Great Britain, supposed to be between Winchester and Southampton, and to be that which is now called South Stonam.

Ad Lippos, a place of Spain, between Cccilionico and Sentice.

Ad Lulliam, now *Argoules*, in Gaul, belonging either to the Morini or Ambiani.

Ad Martis, the name given to different places in Umbria, Etruria and the Alps.

Ad Matrem Magnam, a place belonging to the *Hirpini*, supposed to be the situation of the abbey on Mont Vergine.

Ad Medias, a name given to a place in the island of Sardinia, to another of Infubria in Italy, and to another, called Meza, in that part of Latium in Italy inhabited by the Volsci.

Ad Morum, was situated in the route from Carthage to Castellon, between Eliocroca and Bassi.

Ad Nouum, a denomination given to several places, whose distance was nine miles from a more remarkable station; one north of Boville in the Appian way; another in Campania, nine miles from Capua; another, nine miles from Mediolanum or Milan, now Marignan, according to Cluvier; another in Venetia, south-east of Altinum, and another west of Æmona; and another, denoting a situation in Gaul among the Tolosates, between Tolosa and Badera.

Ad Novas, a place in Italy, near the mouth of the Rubicon, on the borders of the Adriatic gulf: another place in Italy belonging to the Sabines; and another in Spain between Illerda and Tarraco; another in Etruria, south-east of Cosa, and another north of Clusium; and another in Upper Mæsia.

Ad Octavum, an appellation denoting the distance of eight miles from a well-known and principal place; one in Italy belonging to the Taurini, and another in Umbria, partly occupied by the Senones; and another in Duria Minor.

Ad Olivam, a place of Africa, in Numidia, south-east of Saldæ, and east of Tubysuptus; and also another in Sicily, in the route from Agrigentum to Liby bæum.

Ad Opulentos, a place of Campania in Italy, near the sea, and three miles from Pompeii and Stabia.

Ad Palatinum, a place in Venetia upon the Athesis, four miles south of Tridentum.

Ad Perticas, a place near Ticinum or Popea, still called Sancta Maria del Pertiche.

Ad Petras rubras, or *ad saxa rubra*, a place near Fidencæ, now Borghetto.

Ad Pinum, a place of Italy in the Apennine, 12 miles from Venusia, in Apulia. Another is also in the extremity of Italy in the Julian Alps, in the route from Aquileia to Æmona.

Ad Pirum, a place of Italy in the Samnium, and another, with the addition *Phlumeni*, in the Adriatic gulf, between Metaurus and Sena Gallica.

Ad Pontem, a denomination given to several places which had bridges: one in Great Britain, now Lincoln; another of Boetia in Spain, between Gades and Corduba; another *Æni*, in Vindelicia; another, *Isis*, in Norica; another, *Muri*, in Norica, now Muraw; another, *Sontii*, south-east of Forum Julii.

Ad Publicanos, a place of Gaul, on the confines of the territories of the Allobrogi and Centrones, between Casuaria, Mantala and Obutum.

Ad Quartum decimum, a place in Venetia, E. of Æmona.

Ad Quintanas, a place of Magna Græcia, in Apulia; and of Italy in Latium, on the Latin way.

Ad Ragiana, a place of Upper Media, on one of the streams which form the river Gyndes.

Ad Rotam, a place of Numidia, in Africa, between Cirta and Lambæsa.

Ad Rotas, a place of Italy belonging to the Cenomani.

Ad Rubras, a place of Boetia, in Spain, belonging to the Turdetani, and another of Mauritania, in Africa, between Calaa and Ad Regias.

Ad Salices, a place in Scythia, situated on the borders of the Black Sea, near the most southerly mouth of the Danube.

Ad Salinas, now *Spatana*, a small place on the Adriatic gulf, between the confines of the Prætutii and Vestini.

Ad Sanos, a place of Italy, situated according to Cluvier in Venetia.

Ad Septem Aras, a place in Spain.

Ad Septem Fratres, seven mountains of Mauritania, known by the name of Abyla; at the bottom of which was a town called *Septa*, whence the modern *Ceuta*.

Ad Septimum decimum, a place of Spain, 17 miles from Tarraco.

Ad Sex Insulas, small islands, whose situation is not precisely ascertained; but M. d'Anville places them near a small promontory, south of Malaca in Boetia, and north-east of Parictina on the coast of Mauritania Cæsariensis.

Ad Sextias, or *Ad Sestias*, a place situated by the Peutingian tables on the Adriatic gulf, 12 miles from Sena Gallica.

Ad Sextum, a name given to two places in Italy; one in the Claudian way, north-west of Rome, and south-east of the Veii, and another in Etruria, south-west of Sena. It is also the name of a position in Gaul, *Ratz* or *Arratz*, between the Aufci to the west, and Hugunucro to the east.

Ad Silanum, a position in Gaul, between Segodunum to the south-west, and Anderitum on the north-west, on the frontiers of the Ruteni and Gabali.

Ad Silvianum, or *Ad Siliæum*, is placed by M. d'Anville in Apulia, between Venusia to the west, and Blera to the south-east.

Ad Solaria, a place of Etruria, in Italy.

Ad Sorores, a place marked by Antonine, 25 miles from Emerita Augusta, in the road across Spain to Cæsar Augusta.

Ad Speluncas, a small place of Italy, in Messapia, on the sea-coast, west of Brundisium.

Ad Sponsas, a place of Italy, in the Appian way, between the position of Tres tabernas and Forum Appii.

Ad Stabulum, a position of Gaul, between Illiberis on the north-east, and Ad centuriones to the south; situate at the foot of the Pyrenees, and belonging to the Sardones.

Ad Statuas, a place of Etruria, in Italy, 25 miles from Aretium, and 12 from Clusium: another, between Labicum and Præneste, in the Labican way; another in Spain in the route from Valentia to Carthage: and another, in Paannonia on the Danube, between Luffumiam and Ripa alta.

Ad Tabernam frigidam, a place of Etruria, in Italy.

Ad Tarum, a position in Italy on the Tarus.

Ad Templum, a place of Africa, to the south of Byzacene.

Ad Titulos, a place of Liburnia, in the route from Tergeste to Tarsatica.

Ad Tres Insulas, small islands placed by M. d'Anville in a small gulf, south-east of Rufadir, south-west of Siga, and nearly south of Charidemum, pertaining to Boetia.

Ad tres Tabernas, a place in Italy on the Appian way, 17 miles from Aricia, called Castello.

Ad Tricesimum is situated 30 miles, as the name imports, from Aquileia, now Tricesimo; another position in Gaul, 50 miles from Narbo Martius, whence the itinerary reckons the distances.

Ad Tropœa, a place of Italy in Brutium.

Ad Turrem, a place of Sardinia, known by the name of Turris Libissonis. It is also the name of a place, called Tourves, in a part of Gaul, called the third Narbonnese, pertaining to the Suelteri, north-east of Martilla, and south-east of Aque Sextiae.

Ad Turres, a place in Italy on the Aurelian way, in the territory of Cerite: another, on the Appian way in Brutium, north of Vibo: another at the extremity of the promontory Circeium: another, in Liburnia, on the road from Aquileia to Signia, south-east of Tarsatica: another, in Spain, between Valentia and Carthago: and another between Augusta Emerita and Augusta Cæsarea. *Ad Turres albas*, is a place in Italy between Circeium and Antium.

Ad Undecim, a place of Venetia in Italy, west of Aquileia; in the road that leads to Altinum.

Ad Urbanas, a place of Campania in Italy, between Capua and Teanum, called by M. d'Anville, after Pliny, Urbana, and also Colonia Sillana, from the colony established here by Sylla.

Ad Vicesimum, a place of Italy, 20 miles from Rome, on the Flaminian way, south-west of Capena: another, in Lucania, on the gulf of Tarentum, north of Sybaris, and south of Heraclea: another, in Asia Minor, in the road from Trapezus to Satala, in Armenia Minor: and another, called by M. d'Anville *Ad Vigessimum*, south-east of Tolosa, between Badera and Elufio.

Ad Victorriolas, a small place of Italy in the road from Lutina to Bononia.

Ad Villam Servilliam, a place of Numidia in Africa, 20 miles from Hippo Regius, in the way to Cirta.

ADA, in *Geography*, a town of Asiatic Turkey in Naxos, about a league from the river Zacarat, in the road from Constantinople to Ispahan.

ADA Gulf, lies on the east side of Kassa straits, and to the east of port HADSHILAR, having a town in the north-west part of it.

ADABA, in *Ancient Geography*, a town of Media.

ADAC, a lake whence one of the branches of the Tiber flows.

ADACHA, a town of the Palmyrene region in Asia.

ADAD, compounded of *Ad* with itself, was used, says Mr. Bryant (*Anal. Anc. Myth.* vol. i. p. 23.) for a supreme title, with which both kings and deities were honoured. Macrobius (*Saturn.* l. i. c. 23.) says, that it signified *one*, and was so interpreted by the Assyrians, who gave this name to their supreme deity. Mr. Bryant supposes, that what Macrobius renders *one*, should be *first* or chief; and he observes, that it was a sacred title, and when single, was conferred upon a Babylonish deity, but when repeated, it denoted greater excellence. We read of Adad, king of Edom. *Gen.* xxxvi. 35. *1 Kings* xi. 14. And there was another of the same name at Damascus, whose son and successor was denominated Benhadad, *1 Kings* xx. 1. The kings of Syria, according to Nicolaus Damascenus (see Joseph. *Antiq.* l. vii. c. 5.) for nine generations had the name of Adad. The god Rimmon was styled Adad. *Zechar.* xii. 11. The feminine of Adad was Ada, and this was a sacred title, and appropriated by the Babylonians to their chief goddesses. The authors of the *Ancient Universal History* are of opinion, that Benhadad II. was deified by the Syrians, under the

title of Adad or Aler. By Adad they meant the sun, and represented him with rays darting downwards to express his beneficence. But this honour would have been more suitable to the prosperity of Hazael than of Benhadad, who was often unfortunate. And Josephus (*Antiq.* l. vii. c. 6.) informs us, that they were both deified. Adad was not properly a Babylonian deity, but one who had been deified by the ancient Syrians, and probably revived again after the destruction of the Babylonian empire, whose new gods must have brought him into discredit. Adad, thus degraded, and afterwards reinstated, was the sun, as well as Bel or Baal, Osiris and others. *Anc. Un. Hist.* vol. i. p. 443. vol. iii. p. 391. Svo.

ADADA, in *Ancient Geography*, was a town of Pisidia to the south east of Seleucia. There was also a town of the same name in Syria, situate to the north-west of Palmyra, and at no great distance from it. We also find a place of this name mentioned by Joshua, (*ch.* xv. 22.) and lying in the south of Judah, towards the borders of Edom.

ADAD Rimmon, a city of Judah, situate in the plain of Megiddo, in the valley of Jezreel, in the half-tribe of Manasseh; where Josiah, king of Judah, was killed by Pharaoh Necho, king of Egypt. It was afterwards called Maximianopolis, in honour of the emperor Maximilian. It is 17 miles from Cæsarea in Palestine, and 10 miles from Jezreel. Calmet.

ADÆ, a town of Phrygia, which Strabo places at the foot of mount Ida.

ADÆI, a people of Arabia, placed by Ptolemy in Egypt, in a country encompassed by mountains near the lesser cataract of the Nile.

ADAGE, a sententious proverb or popular saying. Erasmus has made a large and valuable collection of Greek and Roman adages from their poets, orators, philosophers, &c. Mr. Ray has done the same with regard to the English; and Kelly has made a collection of Scots proverbs.

ADAGIO, in *Music*, one of the words used by the Italians to denote a degree or distinction of time. Adagio expresses a slow time; the slowest of any, as some have said, except grave. Used substantively, it signifies a slow movement. Sometimes this word is repeated, as adagio, adagio, to denote a still greater retardation in the time of the music.

Adagio has been said by Rousseau and others to be the slowest degree of time in musical measures, except grave; but we think that exception erroneous. In Corelli's works and those of his cotemporaries, we find that quavers in adagios, vocal and instrumental, are sung and played as slow as crotchets in grave. An adagio in a long or solo is, generally little more than an outline left to the performer's abilities to colour: and the performer who is not enabled to interest an audience by the tone of his voice or instrument, and by taste and expression, should never be trusted with slow notes, in the performance of which the smallest defects are so easily discovered; and if not highly embellished, they soon excite languor and disgust in the hearers. The talent of executing an adagio well, in which performers of great powers of execution often fail, is a merit of the highest class which a musician can possess.

ADAGUESA, in *Geography*, a town of Spain, in the province of Aragon, and diocese of Balastro, situate on the Vero. N. lat. 41° 53'. E. long. 2° 4'.

ADAGYUS, in *Mythology*, a Phœnician deity, whom Bochart takes to be Hermaphroditus, the son of Venus and Mercury, from the similitude of sound between Adagyus and Androgynus.

ADAJA, in *Geography*, a river of Spain, which runs into the Duero between Simancas and Tordeillas.

ADAI, *Porte de*, a large harbour on the north-east of the island of Minorca, well sheltered by the mountains from north-west winds. It is north-east of mount TORO.

ADAIR's Harbour lies on the west side of Falkland Sound, and nearly opposite to Jordan's bay on the east coast. It is distinguished by a high hill to the north-west of it. Within the harbour the water is from eight to ten fathoms deep; but the numerous rocks and breakers on the coast are dangerous. This harbour is by some called Port Howard.

ADAL, in the sense of Paracelsus, signifies that part of plants in which their medicinal virtue consists; or the pure and active parts of plants, separate from the impure and inert.

ADALARD, or ADELARD, in *Biography*, the son of count Bernard, grandson of Charles Martel, and cousin-german of Charlemagne, was born about the year 753. Having abandoned the court for the religious habit, he was nominated by the emperor to the abbey of Corbie, and afterwards appointed prime minister to Pepin king of Italy. In 823, he founded the celebrated abbey of New Corbie, in Saxony; and died January 2, 826, at the age of 72, much lamented by the virtuous and the learned. He was an excellent linguist, and denominated the Augustine of his age. His principal work was, "A treatise concerning the order, or the state of the palais, and of the whole French monarchy." *Biog. Dict.*

ADALBERON, ASCELINUS, was an ambitious prelate, and a servile courtier. He was consecrated bishop of Laon in 977, and died in 1030. He is the author of a satirical poem, dedicated to king Robert, of which an edition was published in 1663, in 8vo. by Adrian Valois, at the end of the panegyric on the emperor Berenger. It contains several curious historical facts. *Biog. Dict.*

ADALBERT, a German divine of the tenth century, archbishop of Magdeburg, was educated in the monastery of St. Maximin of Treves, and was employed in 961, to preach the gospel to the Russians. He was more successful after his return from this embassy, in his labours among the Slavonians, on the borders of the Elbe and Oder. He died in 981. Dupin's *Ecl. Hist.* 10th cent. vol. iv. p. 58.

ADALBERT, bishop of Prague, in the tenth century, was one of the first founders of the Christian religion in Hungary. He also preached the gospel in Prussia and Lithuania, where he was murdered by Sego, a pagan priest. Dupin, *ubi supra*. Mosheim's *Ecl. Hist.* cent. 10. vol. ii. p. 378, 8vo.

ADALIDES, in the Spanish policy, are officers of justice for matters that respect the military forces. In the laws of king Alphonfus, the Adalides are mentioned as officers appointed to guide and direct the marching of the forces in time of war. Lopez represents them as a sort of judges, who take cognizance of the differences arising upon excursions, the distribution of plunder, &c.

ADALUS, in *Ichthyology*, a name given by authors to the STURGEON.

ADAM, in *Biography*, the first man whom God created, and the original parent of the whole human race. He was formed by an immediate act of divine power, out of the dust of the ground, as his name imports, on the sixth day in the scripture-arrangement of the works of creation; and God breathed into his nostrils vital breath, so that he became a living soul or person. Gen. ii. 7. We read also, Gen. i. 27. that God created man in his own image. He was then placed in the garden of EDEN, a particular district which was previously ordained and adapted for his subsistence and accommodation. In process of time, probably after some experi-

ence of the inconveniences of solitude, and after he had found that the various animals which had passed in review before him, and to which he had given names, afforded no proper companion, he was provided with a suitable helpmate; who, being formed of a rib taken out of his side, when he was in a deep sleep, as the history informs us, Gen. ii. 21. was called אִשָּׁה, or woman. Adam and Eve thus created as fit associates for each other, did not long enjoy, with the security and satisfaction of innocence, the happiness which was designed for them. In the garden, which was the appointed place of their residence, and from the productions of which they were to derive the means of their support, there was one tree, called *the tree of the knowledge of good and evil*, the fruit of which they were forbidden to eat; and the prohibition was enforced by the awful sanction, that in *the day they did eat of it they should surely die*, Gen. ii. 17. The woman, deluded by the misrepresentation of the serpent, and by the alluring appearance of the fruit, disregarded the prohibition; and having herself tasted it, gave it to her husband, who likewise shared her guilt; and they both became obnoxious to the threatened doom. The consequences of their transgression were shame and fear. The man was also subjected to labour, and the woman to the pain of child-birth, and to the dominion of her husband. They were both excluded from paradise, and their return to it was prevented by an awful apparition, *i. e.* by cherubims and by a flaming sword. Gen. iii. 24.

After their expulsion from paradise, they had several children; but of these the scripture records the names only of three, *viz.* Cain, Abel, and Seth. The life of Adam was prolonged to the age of 930 years. The time of the death of Eve is not recorded in scripture; but some have presumed to say, that she survived her husband ten years. Such is the concise account which the scriptures give us of the origin of the human race: but this account, even if we allow Moses to have been the writer of it, was not compiled till about 2300 years after the creation; and, in the opinion of many, it is either wholly, or in part, so blended with allegory, that it is not easy to give a satisfactory explication of every circumstance to which it alludes. Whether it be understood literally or allegorically, it suggests many curious questions, which have furnished scope for much learned criticism, and for a variety of fanciful conjectures.

As to the etymology of the name Adam, the greater number of biblical interpreters have derived it from אָדָמָה, *Adamah*, signifying the earth or mould, or as some render it, the red earth, of which he was formed. According to Mr. Bryant, Ad denotes *first*, or *chief*, and in this sense it may be applied to the appellation *Ad-am*. This conjecture is confirmed by the use of the term *protogenos*, or *first made*, in Sanchoniatho, which seems to be the Greek translation of the Egyptian title of *Adam*, taken, as this author professes, from the pillars of Thoth; and also by a hint of that admirable scholar Sir William Jones, in his *Asiatic Researches*, who queries whether Adam may be derived from *Adim*, which in Sanscrit means the *first*, and is the name of the first Menu. Mr. Parkhurst supposes the name Adam to be derived from דָּמִים, *damuth*, used for likeness, (Gen. v. 1.) and thus to denote the likeness of God, in which Adam was created. Ludolphus (*Hist. Ethiop.* p. 77.) deduces it from the Ethiopic *Adamah*, which signifies *beautiful, elegant, or pleasant*, and refers it to the absolute perfection of his frame and shape, as being the master-piece, to speak *more humano*, of his creator. But whatever be the true etymology of the name, it is an appellative, rather than a proper name, and comprehends both the sexes.

The time of the year in which Adam was created has been

been also a subject of discussion. This has been most generally supposed to be the autumnal equinox, which is the era from which the year anciently commenced.

According to Blair, in his first chronological table, Adam and Eve were created on Friday the 28th October, *ante Christum*, 4004; and Adam died 3074 *ante Christum*, at the age of 930 years.

Another subject of inquiry has been the place where Adam was created, and in which his first habitation was assigned him. See EDEN.

A considerable difference of opinion has prevailed with respect to the vigour of Adam's intellectual faculties, and the degree of knowledge which he possessed at the time of his formation. We may reasonably imagine, that, as our first parents were created in an adult state, they were immediately capable of the full exercise of their natural powers and faculties: and there is a certain dignity of intellect, as well as rectitude of will, that is probably implied in the expressions "our image," and "our likeness," in which God is said to have created them. Mr. Shuckford, however, (*Creation, &c. of Man*, p. 74, &c.) refers this expression to the structure of his body, which was superior to that of other living creatures, agreeably to Ovid's description, *Os homini sublime dedit*.—Metam. or to Cicero's (*De Leg. lib. i.*) *Figuram corporis habilem et aptam ingenio humano dedit, &c.*—And he supposes, that this is an Hebrew form of speech, which refers to God whatever is most excellent in its kind. He adds, that this expression denotes his designation for immortality, so that sin introduced death. But whatever were Adam's original powers, without exercise, and without experience, his actual knowledge must have been, in a very considerable degree, restricted and partial. It seems, therefore, unreasonable and unnecessary to suppose, that he was endowed with a much greater comprehension and vigour of mind, and with a greater compass of knowledge than any of his descendants; and that he was, in real attainment, as well as in capacity of improvement, little inferior to higher orders of beings. The knowledge that was adapted to his condition, and that was subservient to immediate use, was without doubt communicated to him at his first formation: and as he had no native prejudice, and no irregular propensity or bias to mislead him, he possessed peculiar advantages for extending his knowledge, and more especially his moral improvement. But as religious principles, devout affections, and virtuous dispositions are established and strengthened by exercise and discipline, it may be supposed that, without some supernatural defence and assistance, which his history does not mention, he would be liable to be seduced and overcome by a temptation, which the maturity of habit, and the wisdom of experience might have enabled him to withstand. See FALL of *Man* and *Original Sin*.

Adam possessed, without doubt, the necessary powers of articulation, and the faculty of speech; but in the exercise of these faculties he must have been puzzled and perplexed; nor is it easy to conceive, that the few words of which even the scanty vocabulary that served his necessities consisted, could have been invented by him, nor the stamina of that language, which was afterwards enlarged and improved, could have been devised by him without a supernatural communication. See LANGUAGE.

How long our first parents continued in paradise before or after their fall is a question, for the solution of which we have no sufficient evidence, nor indeed are such questions of any real importance. It is probable, that they were not removed to any great distance, and that they found scope enough for their attention and labour near the spot where

they were first settled, and from which they were excluded, according to the literal acceptation of the scripture-history. The scriptures give us no information as to the place where Adam was buried. St. Jerome inclines to the opinion of those who think, that he was buried at Hebron, in the cave of Machpelah, afterwards bought by Abraham for a burying-place. The eastern Christians say, that he gave orders to have his body embalmed, and deposited in a cave on the top of a mountain, which cave was called Al-kenuz, from an Arabic word which signifies to lay up privately; and it is alleged, that this order was given to prevent his posterity from worshipping his relics. It is added, that he ordered his body to be placed in the midst of the earth, because thence should proceed his salvation, and that of his posterity. The primitive fathers generally believed, that he died in the place where Jerusalem was afterwards built, and that he was interred on Mount Calvary, on the spot where Christ was crucified; and where a chapel was erected in honour of him. Some of the Arabians inform us, that he was buried on mount Aboucais, near Mecca; but the ancient Persians say, that he was buried at Serendib, where his corpse was guarded by lions at the time of the war of the giants.

As to the reveries and fables of Jewish Rabbins and Mahometan writers, they are scarcely worthy of being recited. As a specimen, however, the following particulars may be subjoined.

Some of the Rabbins say, that Adam was distinguished by his personal beauty, and that God, before he formed him, assumed a human body, after the pattern of which he was created. They also pretend, that his stature was so gigantic, that it reached even to the heavens, and extended from one end of the world to the other; and that it was reduced after his transgression, first to the measure of 100 ells; and, as others say, to 1000, or 900 cubits, which was done at the request of the angels, who were terrified at his enormous stature, or who were envious and jealous on this account. Thus they pretend he was able to pass through the ocean, which separated Eden from the other parts of the world. Similar to this is the description given of Polyphemus by Virgil, *Æn. l. iii. v. 664.* and of Orion, *Æn. l. x. v. 763.* Writers of this class assert, that Adam was at first both male and female; and that he consisted of two bodies joined together by the shoulders, and that Eve was formed by merely separating the one body from the other. But more absurd even than this is the opinion of Paracelsus, (*vid. Vossium de Philos. c. ix.*) *Negabat primos parentes ante lapsam habuisse partes generationi hominis necessarias: credebatur postea accessisse, ut strumam gutturi.* The Jews, in order to exalt the importance of the rite of circumcision, affirm, that Adam was created in this state, and that one part of his transgression consisted in his attempt to obliterate the traces of it. Some of them have also imagined, that Eve was the forbidden fruit, and that Cain was the production of the serpent, &c.

The Mahometan writers, in their account of the creation, and first state of man, blend many fables with the particulars, which they seem to have borrowed from the Jewish scriptures. They say, that Azrael, notwithstanding the pre-ordination which he had received of Adam's rebellion, executed the commission for creating him, though the other angels to whom it was proposed had declined the office, and for this reason he was called the angel of death. The earth of which he was formed was, as they say, carried into Arabia, to a place near Mecca, where it was prepared by the angels, and fashioned into the human form by God himself. The angel Eblis, afterwards the devil, dreading a superior,

treated the materials of the human frame, which were left to dry for forty days, or as some say, so many years, with contempt. The clay, it is said, was animated by the Almighty, and endowed with an intelligent soul: and Eve was formed after Adam had been placed in paradise, out of his left side. This paradise Mohammed conceives not to have been on earth, but in the seventh heaven. When our first parents were cast down from paradise, Adam is said to have fallen on the isle of Serendib, or Ceylon, and Eve near Mecca; and after a separation of 200 years, they were conducted to each other by the angel Gabriel, on a mountain near Mecca, and afterwards removed to Ceylon, where they propagated their species. In this island there is a mountain called *Pico de Adam*, on which they shew the print of Adam's foot, of an enormous size. Sale's Koran. c. ii. p. 4. &c. The Rabbins and Mussulmans give strange reports of Adam's knowledge. They ascribe to him the invention of the Hebrew letters, and a degree of inspiration, which enabled him to write a great number of books on different subjects, particularly one on the creation, and another on the Deity. They say, that he was the author of the 92d psalm, which was composed immediately after his creation. We have also an account among the apocryphal writings of a book called the "Revelations of Adam;" and there is another mentioned by pope Gelasius, called "Adam's penance."

Adam and Eve are honoured among the Greeks on the Sunday preceding the festival of Christmas; and on Feb. 4. the first day of their Lent, they commemorate their exclusion from paradise with religious mourning and humiliation. In some Latin martyrologies there are fixed days for the commemoration of Adam; as March 25, April 24, and Dec. 24.

Of the opinion of Tatian concerning Adam, see TATIANNITES.

ADAM MELCHIOR, a writer of the 17th century, was born in the district of Grotkaw, in Silesia, and educated in the college of Brieg. He was appointed rector of a college at Heidelberg, where he published his first volume of illustrious men, "*Vite illustriorum virorum*," in 1615. This volume consisted of philosophers, poets, writers on polite literature, historians, &c. It was succeeded by another, in 1619, which treated of divines: by another of lawyers; and by a fourth of physicians, both which were published in 1620. The subjects of these volumes were the lives of learned men, who were either Germans or Flemings of the 16th, and beginning of the 17th centuries: in 1618, he published a volume containing the lives of twenty divines of other countries. All his divines, however, were protestants. The Lutherans thought him partial, and will not allow his work to be a standard of the learning of Germany. He wrote other works, such as "*Apographum monumentorum Heidelbergensium*;" "*Nota in orationem J. C. Scaligeri pro M. T. Cicerone contra Ciceronianum Erasmi*;" and "*Parodiæ et Metaphrasæ Horatianæ*." The catalogue of the Bodleian library ascribes to him the "*Historia ecclesiast. Hamburg et Bremen*," which, according to Mr. Bayle, was written by Adam, a canon of Bremen, in the 11th century. This work begins with the reign of Charlemagne, and ends in the time of the emperor Henry IV. To this work is annexed a description of Denmark, and the other northern kingdoms, with an account of the religion and manners of the inhabitants. The last edition of it was printed at Helmsstadt, in 4to, in 1670. Bayle gives to Melchior Adam the character of an industrious collector, and acknowledges himself much indebted to his writings. He died in 1622. Gen. Dict.

ADAM, SCOTT'S, a doctor of the Sorbonne, who lived in the 12th century. He was born in Scotland, and educated in the monastery of Lindisfarne, now called Holy Island, near Berwick upon Tweed. He afterwards went to Paris, and became a teacher of school divinity in the Sorbonne. Towards the close of his life he returned to his native country, and became a monk, first in the abbey of Melrose, and next in that of Durham, where he wrote the lives of Columbus, and of other monks in the 6th century. He also wrote the life of David I. king of Scotland, who died in 1153. His works were printed at Antwerp, in fol. in 1659. Biog. Dict.

ADAM, LAMBERT SIGISBERT, an eminent sculptor, was born at Nancy, in 1700, and first instructed by his father, who exercised the same profession. In 1719, he came to Paris for farther improvement. From thence he went to Italy, where he spent ten years, and finished several considerable works, one of which, *viz.* the restoration of the mutilated group of the family of Lycomedes, discovered by cardinal Polignac, in the ruins of the villa of Marius, gained him great applause. He also formed a model for the fountain of Trevi, which was much approved, but he was prevented from executing it by the jealousy of the Italians. After being admitted a member of the academy of St. Luke, at Rome, he returned to Paris in 1733. Here he executed several designs for the decorations of palaces, gardens, &c. of which the most celebrated are, a group representing the union of the rivers Seine and Marne, at the cascade of St. Cloud, two groups of hunting and fishing, Neptune calming the sea, the triumph of Neptune at Versailles, the bas relief of the chapel of St. Adelaide, St. Jerome, Poetry, and Mars caressed by Love. In 1754, he published a collection of ancient Roman and Greek sculptures, designed by himself, and engraved by able artists, in folio. Excess of application brought on an apoplexy, of which he died in 1759. The style of his works is harsh and savage, resembling rocks by their deep cavities and asperities; but they manifest an acquaintance with the antique, and furnish specimens of patient thought and labour. Gen. Biog.

ADAM, NICHOLAS SEBASTIAN, second brother of the preceding, was born at Nancy, in 1705. From Paris, whither he went for improvement, he removed to Rome in 1726, and assiduously applied for nine years to the study and imitation of the antique, devoting his leisure hours to painting. In 1734, he came to Paris, and by his models of Clitæ, and the sacrifice of Iphigenia, obtained the applause of the academy of painting. He also admirably succeeded in his model of Prometheus chained to the rock. His bas-relief for the chapel of Versailles, respecting the martyrdom of St. Victoria, is reckoned one of his best performances. He assisted his brother in executing the group of Neptune; and, in 1740, he obtained the apartment of the deceased Rousseau, in the Louvre, which is a favour granted only to excellent artists. In 1747, he was urged, by liberal offers, on the part of Frederick king of Prussia, to remove to Berlin. His younger brother, to whom the offer was made by the elder Adam, accepted the proposal; and Nicholas remained at Paris, where he was employed by king Stanislaus in executing a monument for his queen in a mausoleum near Nancy. His last performance was the Prometheus, which was greatly admired. This artist was estimable for the simplicity, integrity, and mildness of his character, which conciliated the friendship of his brother artists. He lost his sight several years before his death, which happened in 1778, at the age of 74. Gen. Biog.

ADAM, GASPARD, was born at Nancy, in 1710, and pursued the same course of studies with his brothers above-mentioned.

mentioned. He resided some years at Paris, and died there in 1759. Gen. Biog.

ADAM of Frankfort. See ELSHEIMER.

ADAM, ROBERT, an eminent architect, was born in 1728, at Kirkaldy, in Fifeshire, and educated in the university of Edinburgh. Upon his return from Italy, in 1762, he was appointed architect to his majesty, but resigned this office in 1768, on being elected to represent the county of Kinross in parliament. The genius of Mr. Adam extended itself beyond the decorations of buildings, to various branches of manufacture; and besides the improvements which he introduced into the architecture of the country, he displayed great skill and taste in his numerous drawings in landscape. Such were his assiduity and activity, that in the year preceding his death, he designed eight public, and twenty-five private buildings. The new university of Edinburgh, and many other considerable edifices were erected from his designs, and under his direction; and they are lasting monuments of his distinguished talents in the line of his profession. He died March 3, 1792, and his remains were interred in the fourth aisle of Westminster Abbey. His brother, James Adam, who died, October 20, 1794, was also eminent as an architect; and his abilities are apparent in the Adelphi buildings, and Portland place, in London.

ADAM, in *Geography*, a town of European Turkey, in Moldavia, ten miles north-north-west of Galatz.

ADAM, or ADOM, in *Ancient Geography*, a town of Peræa, on the banks of Jordan, where the river began to be dried up for the passage of the Israelites over against Jericho. Joshua, ch. iii. 16.

ADAM'S Apple, in *Botany*, a species of CITRUS.

ADAM'S Bridge, or, according to Sir William Jones, Ramas Bridge, in *Geography*, a ridge of sands and rocks, extending across the north end of Manara gulf, from the island of that name, on the north-west coast of Ceylon, to Ramencote, or Ramankoil island, off Raman point.

ADAM'S Needle, in *Botany*. See YUCCA.

ADAM'S Peak, in *Geography*, a high mountain in the island of Ceylon, in the form of a fugar-loaf, and terminating in a circular plain about 200 paces in diameter. The summit is covered with trees, and intersected with streams, and has also a deep lake, which supplies the principal rivers that water the island. This mountain is seen at the distance of twenty leagues at sea; but though its height is considerable, it is not equal to that of the Pic of Teneriffe. Lat. $5^{\circ} 55'$. Long. $80^{\circ} 39'$. See ADAM.

ADAMA. See ADMAH.

ADAMA, a high mountain in Abyssinia, being one of the ridges of the range of mountains called AMID AMID.

ADAMAH, one of the fenced cities belonging to the tribe of Nephtali, mentioned Joshua xix. 36. and called by the Seventy *Arnaith*, and by the Vulgate *Edema*. It was also called *Neeb*.

ADAMANT, ADAMAS, in *Natural History*, an ancient name for a precious stone, by us called a DIAMOND. Adamas is used by some ancient naturalists for the spume or scoria of gold, which, not being malleable, is cast away. This is particularly called $\chi\rho\upsilon\sigma\alpha\ \alpha\delta\alpha\mu\alpha\sigma\iota\varsigma$, and is mistaken by Pliny for a gem of that name. Mr. Boyle more particularly gives the denomination *adamas lucidus* to a diamond in his possession, which had the property of shining in the dark, since discovered in many others, at least when excited by friction. See Boyle's works by Birch, vol. i. p. 452. 796.

ADAMANT is also used for a species of iron, denoting the hardest, or most highly tempered part of it. This is sometimes called the adamantine part of iron.

ADAMANT is sometimes also used for the MAGNET, or

load-stone; in which sense Skinner thinks it may be derived from the French *aimant*, which signifies the same.

ADAMANTII, in *Ecclesiastical History*, a name given by some Christian historians to the followers of Origen, surnamed *Adamantius*, on account of his indefatigable industry in reading and writing, or the strength and acuteness of his reasoning, according to some; or rather, as Heuman says, because his name was *Adamantius*; however, Eusebius says, (lib. vi. cap. 14.) this was a common name given to Origen, without assigning any reason for it. There was another person named *Adamantia*, and mentioned by Lardner (works, vol. iv. p. 295.) as the author of a dialogue against the Marcionites, which he places about the year 330.

ADAMANTEA, in *Mythology*, the nurse of Jupiter in Crete.

ADAMANTINE SPAR, *Spath adamantine*.—*Corundum*.—*Nella corivindum*.—*Tella corivindum*.—*Coron*.—*Luifa*. *Adamantinus Corundum*. Linn. This stone is found either crystallized or in mass. When crystallized its usual form is that of a regular hexaedral prism (CRYSTALLOGRAPHY, plate i. fig. 1.) of a rough surface, and but little external lustre; this, however, being incapable of being split in a direction either perpendicular or parallel to its axis, is obviously not the primitive crystalline figure belonging to this substance. Crystals of adamantine spar are occasionally met with, which, instead of solid angles at the junction of the sides of the prism with the planes of the extremities, present alternate isosceles triangles of different sizes, but all forming solid angles of $122^{\circ} 34'$. with the extreme planes of the crystal (fig. 2.); if by following this indication of nature we detach successively the crystalline laminae, we shall at length entirely lose the hexaedral prism, and shall have in its place a rhomboidal parallelepiped (fig. 3.) of which the plane angles at the rhombs will be 86° . and 94° .; the solid angles at the summit will measure $84^{\circ} 31'$. and that at the reunion of the base will be $95^{\circ} 29'$. Also, the diameter G H will be to the whole height E F as A B to B F (fig. 1.) The parallelepiped thus obtained, can be split only in a direction parallel to its faces, and must therefore always preserve the same form, which is that of the nucleus or primitive crystal. In some instances the solid angles of the prism are replaced by isosceles triangular planes, as in fig. 2. but which form solid angles of $160^{\circ} 42'$. with the planes of the extremities: hence results a new modification which shews itself in the crystalline varieties (fig. 4, 5, 6.) A third modification is produced by the gradual decrease in diameter of the hexaedral prism; the varieties of this class are mostly irregular, but some specimens exhibit a regular truncated hexaedral pyramid (fig. 7-).

Corundum crystals are procured from China and India; those from the latter country are in general the purest. Of the Indian variety the colour is grey, with shades of green and light brown; its fracture is foliated and sparry, sometimes vitreous; its external lustre is equal, but generally very slight, that of its cross fracture is feeble, but when broken in the direction of its laminae, it is resplendent; in thin pieces, and at the edges of the crystals it is semitransparent; it is brittle, and of such great hardness as to cut rock-crystal and most of the gems. Sp. Grav. from 3.950 to 3.959. The Chinese variety differs from the Indian in containing grains of magnetic iron ore disseminated through its substance; in being generally of a darker colour and having externally a chatoyant lustre: its specific gravity is rather greater, and its hardness is commonly somewhat inferior. There are two varieties known of corundum in mass, that from Bengal is of a purplish hue, and compact fracture, sp. gr. 3.876. It is called by the natives *coron*; that

that from the coast of Coromandel is of a foliated texture, and seems in fact to be confusedly crystallized, but its sp. gr. is only 2. 785.

Adamantine spar is used throughout India and China for the purpose of polishing steel and gems, for which its great hardness renders it peculiarly well adapted. Of the mines of this stone, and the method of procuring it in China and Bengal we have no account, but some interesting topographical information respecting the corundum of the coast was procured by Mr. Greville in 1792. In the Mysore country, about four miles south of the river Cavery not far from Caranel, is an excavation from six to sixteen feet deep, running east and west about a mile and a half in the direction of a vein of adamantine spar that traverses a hill of gritty granite. The matrix of the vein consists of granitic fragments cemented by corundum: masses of this, weighing several pounds, are cut out with iron crows, and then broken to pieces, among which the crystals of corundum are found: these are loaded on horses and bullocks, and distributed to the cast of sikuldars or polishers throughout India; its price, at Madras, is about six shillings a pound.

This mineral appears to have been first brought into Europe by Mr. Bulkley, a correspondent of Dr. Woodward, who, in his catalogue of foreign fossils, published about 1719, has the following notices: "*Nella corivindum* is found in fields where the rice grows; it is commonly thrown up by field-rats, and used as we do emery, to polish iron."—"*Tella corivindum*, Fort St. George, Mr. Bulkley. It is a talky spar, grey with a cast of green; it is used to polish rubies and diamonds." In Dr. Woodward's additional catalogue of foreign fossils, 1725. "*Nella corivindum* is found by digging at the foot of hills about five hundred miles to the southward of this place. They use it as emery to clean arms, &c. it serves also to grind rubies by making it like hard cement by the help of stick lac mixed with it. East India. Mr. Bulkley." From this time no farther information was obtained concerning it till about 1767, when Mr. Berry, seal engraver of Edinburgh, received from Dr. Anderson of Madras a box of crystals, with information of their being the material used by the Indian lapidaries to polish crystal and all gems but diamonds. They were found by Mr. Berry to cut agate, cornelian, &c. but for minute engraving were not equal to diamonds, in consequence they were laid aside as curiosities. Dr. Black ascertained their difference from all the known European minerals, and their hardness gained for them the name of *adamantine spar*. In 1784, Mr. Greville obtained specimens from India, together with the native name *corundum*, which ascertained their identity with Dr. Woodward's specimens. A description of its external characters by M. de La Metherie and Hauy appeared in the *Journal de physique* for January and March 1787. Its chemical composition, however, still remained unknown till Klaproth was enabled, by the liberality of Mr. Greville, in sacrificing some specimens for the purpose, to undertake its analysis. The extreme hardness of the adamantine spar, rendered the first attempt to decompose it imperfect: by the strongest nitro-muriatic acid, nothing was separated but the iron, which is accidentally diffused through the Chinese variety, and after this the most concentrated acids were digested upon it in vain. Carbonated potash ignited together with it for two hours, was perfectly ineffectual, and even eleven times repeated calcination and fusion with caustic soda produced only a partial decomposition. The results of the first analysis were principally aluminous earth, together with a matter that appeared to be either a mixture of aluminous and siliceous

earth, or a new simple earth with peculiar properties. In this state of the inquiry Mr. Kirwan, and several other eminent chemists, were induced to consider the adamantine spar as containing an earth *sui generis*, which was called the *adamantine*, or *corundum earth*. Soon after Klaproth, having improved his method of analysis by the use of caustic potash as a solvent, undertook a second time the analysis of this uncommonly refractory fossil in which he completely succeeded, reducing the supposed adamantine earth to aluminous and siliceous.

The Chinese spar yielded

The Philosophical Transactions for 1798 contain a valuable paper on corundum by Mr. Greville, which is the last addition that has been made to our information on this subject; we here find the first authentic account of the corundum mine in the Mysore, the characteristic differences between the Chinese and Indian varieties, the crystallography of the mineral by Count Bournon, and a comparison between the characters of corundum, TOPAZ, RUBY, and SAPPHIRE.

Corundum is said to have been found in France, in the Forez, by Count Bournon, and in Bretagne by Morveau; of these, however, the latter at least is said by Hauy (*Journal des Mines.*) to be titanite. Perhaps a mineral found by M. Raspe at Tirez, one of the Hebrides, which was supposed by him to be Jade, belongs more properly to adamantine spar; its specific gravity is 3.049, and in hardness it corresponds with the matrix of corundum, that is, it will scratch glass readily, but not rock-crystal. Greville on corundum, *Philos. Trans.* for 1798. Kirwan's *Mineralogy*, vol. i. art. *Adamantine Spar*.—Klaproth's *Analytical Essays*.

ADAMANTINÆ *Terra*, in the Linnæan system of *Mineralogy*, denote the sixth order of earths; which are chiefly composed of adamantine earth. To this order belongs one species, which is the *adamantinus* or *corundum*.

ADAMARA, in *Geography*, a district of Abyssinia, near the province of Waldubba, containing several considerable villages, that are inhabited by Mahometans; who by their number and strength contribute to the safety of the monks in that part of the country. It is so called from *Adama*, which in the Amharic dialect signifies *pleasant*, the name of an adjacent mountain. The river Anzo runs in a contiguous valley. Bruce's *Trav.* vol. iii. p. 179.

ADAMAS, in *Astrology*, a name given to the moon. ADAMAS, in *Geography*, a town of Cordova in Spain, seven leagues from Cordova. *Adamas* is also a river of India, the source of which Ptolemy places in Mount Uxentus, and its mouth in N. lat. 18°. 7' and long. 142°. 4'.

ADAMBEA,

ADAMBEA, in *Botany*, a genus of the *polyandria monogynia* class and order; the characters of which are, that the corolla has from five to seven petals, the calyx is hemispheric, and parted into five or seven divisions; the capsula is fleshy, covered by the calyx, containing five or seven cells, and polyspermous. Gmelin mentions one species; but La Marek (*Encyel.* vol. i. p. 39.) describes two, viz. *A. glabra*, which grows on the coast of Malabar, in sandy and stony places, rises to about seven feet, and sends forth branches which are terminated by panicles of fine purple flowers, large, and resembling roses; and *A. hirsuta*, which grows on the mountains of Malabar to the height of about nine feet; its branches of flowers resemble those of the former species.

ADAMI, in *Geography*, a town of Judah, in the tribe of Nephthali. Joshua xix. 33.

ADAMI, *Pomum*, in *Anatomy*, a protuberance in the fore-part of the throat. Some fancy, that it is thus called upon a strange conceit, that a piece of the forbidden apple, which Adam eat, stuck by the way, and was the occasion of it. In reality it is only the convex part of the first cartilage of the larynx, called scutiformis and thyroides. This is usually larger in the male than in the female subject.

The name, Adam's apple, is also given to a kind of fruit frequent in Italy, resembling a lemon, said to be a good remedy against the itch. See **CITRUS**.

ADAMIC Earth, is a name which some have given to common clay, called also terra zoica, rubella, and lutum. Woodw. Method. Foss. p. 4. The occasion of the name is supposed to be, that this is taken for the *adamah*, or ruddy earth, of which the first man was formed. This application is likewise given to the mud deposited by sea-water, which is a sediment of the most slimy and unctuous parts contained in it.

ADAMITES, or **ADAMIANS**, in *Ecclesiastical History*, a sect of persons who took upon them to imitate the nakedness of Adam; as if man had been reinstated in his original innocence. They are supposed to have been a branch of the **CARPOCRATIANS** and **BASILIDIANS**. Prodicus was their author, according to the account given by Theodoret; though, according to Tertullian and Clement of Alexandria, the followers of Prodicus were never called by this name. Epiphanius is the first writer who speaks of the Adamites, and he places them towards the end of the second century.

He professes to have no certain account of these people; but he says, that they met together, both men and women, naked as they were born; and so performed their readings and prayers and other acts of religious worship. They are a kind of monks, who reject marriage, and they call their church a paradise. When they approached their places of worship, which were made warm for their accommodation, they took off their clothes; and when they left them, they clothed themselves again. Dr. Lardner is of opinion that there never were any such people; and to this purpose he alleges, that they are not mentioned by any ancient writer before Epiphanius, and that he had no certain account of them; nor does he give the least intimation of the country or period in which this sect appeared. He does indeed say, that the Gnostics prayed naked; but they were a wicked people, and practised lewdness in their assemblies; whereas he represents the *Adamites* as endeavouring to imitate Adam and Eve, not only in their nakedness, but likewise in the innocence of their original state. But Dr. Lardner thinks that Epiphanius's charge against the Gnostics is not true. Theodoret's account of this sect was borrowed from Epiphanius, as he had no knowledge of Prodicus, the reputed

founder of it, but what he received from Clement of Alexandria, who does not say any such thing of him. Besides, it is said that Prodicus was against praying at all; and therefore the Adamite custom of praying naked could not be derived from him. Lardner's Works, vol. ix. 337—340.

A similar sect appeared in the twelfth century, under the direction of one Tandamus, known by the name of Tanchelin, who propagated his errors at Antwerp in the reign of the emperor Henry V. This was followed by the **TURLUPINS**.

In the fifteenth century Picard pretended to re-establish the law of nature, which, according to him, consisted in two things, viz. community of women and nakedness. His followers are said to have walked naked in the public places; whereas the original Adamites only put off their clothes in their assemblies. See **BEGHARDS**, **BRETHREN of the free-spirit**, and **PICARDS**.

An ingenious writer, viz. Beaufobre, has shewn that the *Adamitism*, i. e. the nakedness of these people, is a mere calumny, forged by their adversaries, the Calixtines and Papists, at the time when the Vaudois first appeared in that country. See Beaufobre's Dissertation at the end of L'Enfant's History of the War of the Hussites, and Bayle's Dict. Art. **ADAMITES**, **PICARDS** and **PRODICUS**.

Jovet and Moreri speak of Adamites in England; and indeed the Romish and reformed mutually reproach each other with having Adamites among them.

ADAMITES, a name also given by some writers to the first patriarchs, the sons or descendants of Adam by Seth; in which sense Adamites are the same with Sethites, and stand distinguished from **CAINITES**. There are various traditions concerning the quarrels, wars, &c. between the Adamites and Cainites.

ADAMITES, *Pre.* See **PRE-ADAMITES**.

ADAMS, in *Geography*, a township of Berkshire county in the Massachusetts, containing 2040 inhabitants, about 140 miles north-west of Boston. In the northern part of this district, the mill-stream, called Hudson's Brook, which rises in Vermont, and falls into the north branch of Hoosuek river, has formed a deep channel, about 30 or 40 rods in length, and in some places 60 feet deep, through a quarry of white marble; and over this channel the rocks form a natural bridge, about 12 or 15 feet long, 10 broad, and 62 feet above the water.

ADAMSDORF, a town in Germany, in the Circle of Upper Saxony; one league east of Lippelne.

ADAMSON, **PATRICK**, in *Biography*, a Scots prelate, who was born March 15, 1536, at Perth, of mean but honest parents, and had his collegiate education at the university of St. Andrew's, where he obtained the degree of Master of Arts. In 1566, he set out for Paris as tutor to a young gentleman; and here he wrote a Latin poem on occasion of the death of the prince, who was afterwards James VI. of Scotland, and first of England. In this poem he gave the titles of France and England to his own prince, which offended the French court, and occasioned his arrest and confinement. As soon as he was released, he retired with his pupil to Fougues, the capital of the duchy of Berry. During the massacre at Paris, he was concealed in this place, and very narrowly escaped suffering martyrdom for the protestant religion. In his sepulchre, as he called it, he wrote two excellent Latin poems, which are still extant, viz. a poetical version of the book of Job, and the tragedy of Herod, who was smitten by an angel. In 1573, he returned to Scotland and entered into holy orders, and officiated as minister of Paisley. In 1575, he was appointed one of the commissioners

missioners for settling the jurisdiction and policy of the church, by the General Assembly; and being in the next year deputed to report their proceedings to the Earl of Morton, then regent, he was named by this nobleman as one of his chaplains, and afterwards advanced by him to the archbishopric of St. Andrew's. This preferment subjected him to various disputes with the General Assembly, which continued for several years. In 1577, he composed a catechism in Latin verses for the use of the young prince, which was much admired and applauded in England, France and the Low Countries, where the author was already known by his Latin translation of the Confession of Faith, which was printed in France, during his residence in France, at the hazard of his life. In 1582, he was seized with a disorder, for the relief of which he took some simple medicine that was recommended to him by an old woman. This woman was charged with witchcraft, and within three or four years executed at Edinburgh; and the prelate was traduced by his enemies for applying to the devil in order to save his life. The archbishop, however, recommended himself to the favour of king James VI. by zealously defending the episcopal order; and he was sent as his ambassador to queen Elizabeth, which office required his residence in London for some years. Queen Elizabeth was jealous of his popularity, as a preacher, and dreading the impressions which he made on the minds of the people in favour of the young king, his master, prohibited his preaching during his stay in her dominions. Soon after the execution of the first earl of Gowrie, viz. in 1584, the archbishop was recalled, and sat in the parliament held at Edinburgh, and concurred in enacting several laws for settling the peace of the kingdom, and for establishing the king's authority in ecclesiastical offices. Many attempts were still renewed for degrading his reputation, and making him odious to the people; nor was the royal declaration of the reasons which induced those laws, sufficient to restrain them. At a provincial synod, held at St. Andrew's in 1586, the prelate was accused and excommunicated: but upon his submission at the next General Assembly at Edinburgh, he was absolved from the excommunication. In 1588, a commission was granted by the General Assembly, before which he was cited, for trying him on account of various crimes, with which he was charged. In the beginning of next year, he published the Lamentations of Jeremiah in Latin verse, which he dedicated to the king, and in which he complained of his hard usage: and at the close of the year he published a similar translation of the Apocalypse, together with a copy of Latin verses, addressed to his Majesty, and deploring his distress. His application, however, was of no avail. The revenue of his see was granted to the duke of Lenox, and the prelate, with his family, were literally reduced to the want of bread. The scanty relief he obtained was procured for him in the most humiliating manner; so that he lingered out a most cheerless existence till the latter end of the year 1591. His character has been very differently appreciated by persons of discordant sentiments in religion and politics. It is generally allowed that he supported, under the authority of the king, oppressive and injurious measures; and that his bigotry and timidity involved him in the difficulties and disgrace which beclouded the close of his life. During the reverse of his condition and the trials with which he was exercised, he manifested sentiments of pious resignation. Of his learning there is no question; and he is said to have been one of the most polite prelates of the age in which he lived. Besides those pious works, which were collected and published in a 4to. volume, by Mr. Wilson, this prelate wrote many things which were never published; such as six books on the

Hebrew republic, various translations of the prophets into Latin verse, prelections on St. Paul's epistles to Timothy, various apologetical and funeral orations, and a very candid history of his own times. *Biog. Brit.*

ADAMSTOWN, in *Geography*, a town of Lancaster county in Pennsylvania, consisting of about 40 houses; 20 miles north-east of Lancaster.

ADAMUS, in *Alchemy*, is used to signify the philosopher's stone, which persons addicted to this kind of science call an animal, and, as they say, has carried its invisible Eve in its body, ever since they were united by the creator.

ADANA, in *Geography*, a town of Natolia, or Asia Minor, in the province of Caramania. It is situated on the river Choquen; on the banks of which, is a small but strong castle, erected upon a rock. The water of the river is brought to the town by means of water-works, which convey it into the several fountains; and a bridge of 15 arches leads to these works. The climate is healthy, and the winter mild; but the summer is so hot as to render it necessary for the inhabitants to retire to the neighbouring mountains, and to shelter themselves in groves and grottoes. The adjacent country is rich and fertile, and produces melons, cucumbers, pomegranates, pulse and herbs of all sorts through the year; besides corn, wine and fruits in their proper season. Adana is much resorted to by the inhabitants of the other towns of Cilicia, especially from the mountain side, for its wines, corn and other fruits, which are hence dispersed into the most barren parts. It is about 30 miles north-east of Tarsus. N. lat. 38° 10'. E. long. 36° 12'.

ADANA, in *Ancient Geography*. See ADEN.

ADANATES, a people of the Cottian Alps, called by Pliny *Edenates*.

ADANI *Insulæ*, two islands of the Red Sea, according to Ptolemy.

ADANO, see STURGEON.

ADANSON, MICHAEL, in *Biography*, was born at Aix in Provence, in April 1727, and at a proper age he was sent to Paris, where he prosecuted his studies in medicine, botany, and astronomy with singular zeal. He was a pupil of the celebrated Reaumur. In the year 1748, he went to Senegal, where he spent six years in examining the productions found in the neighbourhood of the famous river of that name. In return for some valuable communications respecting the geography of the country, and on the plants and animals he had discovered there, which he sent to the Royal Academy, he was made one of their corresponding members. On the death of Reaumur, in the year 1759, he was elected a member in his place, and about the same time was made honorary member of the Royal Society of London. At the end of six years, he returned to Paris, where he published his *Histoire naturelle du Senegal*, 4to. containing observations on the diseases incident to hot climates; and in 1763, his *Famille des Plantes*, 2 vol. 8vo.

In February 1775, he presented to the academy a plan of a natural history which he did not live to perfect. The time of his death, which happened soon after, is not precisely known.

ADANSONIA, in *Botany*, the name of which is derived from Mr. Adanson, above mentioned, is a genus of the *monadelphica* order and *polyandria* class, and belongs to the natural order of *columbiferæ* and *Melvoceæ* of Jussieu. Its characters are, that the calyx is a one-leaved semiquinquefid, cyathiform perianthium, with divisions revolute, and deciduous; the corolla consists of five, roundish, nerved, revolute petals, connected by the claws with each other, and the stamina: the itamina

have

have numerous filaments united at bottom into a tube, which they crown, expanding horizontally: the pistillum has an ovate germ, very long, tubulous and variously intorted style; the stigmata are many (10) prismatic, villous and radiate-expanded: the pericarpium is an ovate, woody, not gaping, ten-celled (from 10 to 14) capsule, with farinaceous pulp, and the partitions membranaceous: the seeds are numerous, kidney-shaped, rather bony, and involved in a friable pulp. The *Adansonia digitata*, Ethiopian four-gourd, or Monks' bread, called also Abavo, Guanabanus and Baobab, is the only known species of this genus. See BAOBAB.

ADAOUS, in *Geography*, a people of Africa, residing on the ivory coast in the kingdom of Saccæ.

ADAPTER, in *Chemistry*. See ADOPTEE.

ADAR, in the *Hebrew Chronology*, the 12th month of the ecclesiastical year, and the 6th of the civil year. It contains only 29 days, and answers to our February, and sometimes enters into the month of March, according to the course of the moon. On the 7th and 13th days of this month, the Jews observe two fasts; the former on account of the death of Moses, and the latter called that of Esther, in commemoration of the conspiracy of Haman. On the 9th they have a fast in commemoration of the schism between the schools of Shammai and Hillel. The 12th is a feast in honour of two profelytes at Laodicea, who preferred death to the violation of the law; some observe the 13th as a feast in memory of the death of Nicanor, an enemy of the Jews. The feasts of Purim are celebrated on the 14th and 15th days; the lesser on the 14th (Esther ix. 21.) and the greater on the 15th day. The 17th is observed in commemoration of the Sages of Israel, who escaped from Koflik, a city of Arabia, whither they were driven by the persecution of Alexander Jannæus. The 20th is observed as a feast in remembrance of the rain obtained in a time of drought, during the reign of this prince. The dedication of the temple of Zerubbabel was on the 23d day, Ezra vi. 16.; and the 28th was observed in commemoration of the repeal of the decree by which the kings of Greece had forbidden the Jews to circumcise their children, to observe the sabbath, and to decline foreign worship. Selden de Syned. l. iii. c. 13. Megillat. Taanith et Gemara.

As the lunar year is shorter than the solar by 11 days, which in three years amount to about a month, the Jews then insert a 13th month, which they call VEADAR, or a second Adar, consisting of 29 days. This intercalation postpones the great feasts, &c. a whole month.

ADAR, in *Geography*, a city in the tribe of Judah. Joshua xv. 3. Eusebius places another town of this name in the neighbourhood of Lidda or Diospolis, in the district of Thamna.

ADARCE, in the *Materia Medica* of the ancients, a saltish humour, concreting about the stalks of reeds and other vegetable matter, in form of incrustations. The ancients speak of adarce, as chiefly produced in Cappadocia and Galatia, though we also read of it in Italy; and also of a native kind produced in Indian reeds, much as fugar in the cane. Its colour is like that of the fine powder of the Assian stone, or Sarcophagus, and its substance is lax and porous, much like the bastard sponge; so that it might be called the bastard sponge of the marshes. It is a topic adapted to rub and scour the skin in a leprosy, sun-burning, tetter, freckles, and similar blemishes, being on the whole of an acrimonious quality. Dr. Plot describes it in his natural history of Oxfordshire.

The incrustations often seen about our springs, are very different in their nature and qualities from the *adarce* of the Greek physicians.

ADARCE, in *Natural History*, a name given by some writers to the *CELLEPORA spongites* of Linnæus.

ADARCON, *Adarconin*, an ancient coin mentioned in scripture, usually of gold, derived, as some think, from those gold pieces coined by Darius, called δαρύχοι. See DARIC. Hostius makes the adarcon only equal to the attic drachma; but Bishop Cumberland, after the scholiasts of Aristophanes and Harpocration, twice as much.

ADARE, in *Geography*, a small town in the county of Limerick in Ireland, which was once fortified.

ADARI, a town, according to Ptolemy, of Arabia Felix.

ADARINA, a town of India, according to Ptolemy.

ADARME, in *Commerce*, a small Spanish weight used through their American provinces, equal to the sixteenth part of an ounce. Stephens renders it in English by a dram.

ADAROPOLIS, *Αδαροπολις*, *Adari civitas*, a city in the Persian gulf.

ADARTICULATION is used by some *anatomists* for *αρθρωδια*, by others for *διαρθρωσις*. See ARTHRODIA and DIARTHROSIS.

ADASA, or *Adarsa*, in *Ancient Geography*, a city of Palestine, in the tribe of Ephraim, four miles from Bethoron, and not far from Gophna. 1 Maccab. vii. 45. This place is called Adazar, and Adaco or Acedosa, by Josephus. Here Nicanor, with 35,000 men, was overcome and routed by Judas Maccabæus, with an army of 3000. We learn from Josephus, that Judas, in another war, was killed in this place. Joseph. Ant. l. xii. c. 17. and de Bell. l. i. c. 1.

ADASATRA, or *Adisathron*, a town according to Ptolemy, and according to others a mountain of India. The middle of this mountain is placed by Ptolemy in lat. 23°. and long. 132°.

ADATAIS, or ADATYS, in *Commerce*, a muslin or cotton cloth very fine and clear, of which the piece is ten French ells long, and three quarters broad. This muslin comes from the East Indies, and the finest from Bengal.

ADATES, in *Ancient Geography*, a town of Pisidia in Asia Minor.

ADATTHA, a town of Asia, not far from the Euphrates. In Ptolemy's charts, it is west of the mountains which separate, to the south-east, Cappadocia from Comagene, in lat. 37° 30'. long. 69° 30'.

ADAYES, in *Hydrography*. See MEXICANO river.

ADCHER, in the *Materia Medica*, a name given by Avicenna and Serapion to the SCÆNANTH, or camel's hay. The Arabians have not restricted this word to the scænanth alone, but express by it all the kinds of rushes. Thus Avicenna tells us, that the Adcher is of two kinds, the one bearing no fruit, the other bearing a hard black fruit: this plainly belongs not to the scænanth, but to the common rush, of which Dioscorides has, in the same manner, described two kinds, thus differing from one another.

ADCORDABILES *denarii*, in ancient *Law-books*, denote money paid by the vassal to his lord, in the nature of a fine, upon the sale or exchange of a FEUD. The word is formed from *accorder*, to agree.

ADCRESCENTES, in the Roman *empire*, the same with ACCENSIS.

ADDA, or ADDUA, in *Geography*, a river of Switzerland and Italy, which rises in Mount Braulio, on the confines of the Grisons, and, passing through the Valteline, traverses the lake Como, and the Milanese, and falls into the Po near Cremona. A canal has been carried from the city of Milan to the Adda. History records a famous battle

on the banks of this river, in which Flaminius was victorious over the Insubrian Gauls.

ADDA is also the name of a small district in the duchy of Milan, where Louis XII. gained a victory over the Venetians in 1509.

ADDA, EL, in *Zoology*, a species of small lizard described by Mr. Bruce, and represented as a native of Atbara beyond the rains, in the situation to which he refers the ancient island and city of Meroe. Its length is six inches and a half: its body is round and tail of the same form, but very sharp pointed: its forehead is flat, of a conical shape, and rounded at the end: the head is darker than the body, and its face covered with black lines crossing one another at right angles: its eyes are small, and defended by a number of strong black hairs which serve for eye-lashes: its upper jaw projects beyond the under, and its jaws are furnished with several short and fine teeth: its ears are large, open, and nearly round: its body is of a light yellow colour, crossed with eight black bands: the scales are close, and largest along the back, and their surface is polished: its legs from the shoulder to the middle toe are near one and three-fourths of an inch long, and its feet have five toes, each of which is furnished with a brown claw tipped at its end with black. Its motion is very swift, though it crawls with its belly almost close to the ground. It burrows in the sand, but comes out in the heat of the day to bask in the sun; and when it is not much frightened, it will shelter itself behind stones, or in the withered roots of the absinthium when they are dried so as to be nearly of its own colour. This is one of the few lizards which the Arabs believe to be free from poisonous qualities, and they ascribe to it many medicinal virtues. It is thought to be a certain remedy for the elephantiasis; and to be efficacious in cleansing the skin of the body and the face, from cutaneous eruptions; and it is also used against films and suffusions of the eyes. Such are the virtues ascribed to it by Arabian authors.

ADDACA, in *Geography*, a town according to Ptolemy of Mesopotamia.

ADDACE, in *Zoology*, the name by which the Africans call the common ANTELOPE.

ADDÆA, in *Ancient Geography*, a town of Asia in the southern part of Mesopotamia, near the Euphrates; placed by Ptolemy in lat. 34°, and long. 77° 15', and probably the same with *Anatho*.

ADDÆUS, a river of Asia, which is supposed to be the *Anamis* of Arrian, and the *Andanis* of Ptolemy.

ADDEPHAGIA, compounded of *αδδν*, *much*, and *φαγη*, *I eat*, in *Medicine*, a term used by some physicians to denote a greediness in children, whereby they load themselves with new food, before the old is digested. Some use Addephagia in a more extensive sense for voraciousness in general, so as to comprehend the BULIMIA, PICA, and MALACIA.

ADDER, in *Zoology*, a venomous reptile of the serpent kind, more usually called a VIPER. See COLUBER. The *adder* is sometimes confounded with *asp*: thus the deaf adder, spoken of in the English Bible, is not properly the adder, but the *asp*. Calmet.

The adder differs from the snake, as the former is much shorter for its bulk, and especially its tail below the vent; that it is marked on the back with black lines or spots, which the snake has not; that its belly is blackish, and of one colour, whereas the snake's is party-coloured, of a pale yellow and blue; that it never grows to the size of some snakes; and lastly, that it is viviparous, whereas the snake is oviparous.

ADDER, *Sea*, in *Ichthyology*, the English name of the SYGNATHUS TYPHLE. See SEA-ADDER.

ADDER, *water*, in *Zoology*, a name given to the MATRIX. See COLUBER.

ADDER'S *Bank*, in *Geography*, a shoal which lies off the north-west point or entrance of the river Illequibo, in Guiana, in South America, which, with some others, extends far into the sea, and reaches to Cape Nassau, or the east point of the river Poumaron.

ADDER-BOLTS, in *Zoology*. See DRAGON-FLIES.

ADDERGEY, in *Geography*, a village in the district of Salent, or Talent, in Abyssinia, not far from the river Tacazzé, situate amongst rugged and barren mountains, and surrounded by a thick wood in form of an amphitheatre, which is full of lemons and wild citrons. The river mai-lumi rises near the village, and precipitating into a cataract 150 feet high, at some distance discharges itself into the Tacazzé. N. lat. 13°, 24', 56". E. long. 37° 57'. Bruce's Trav. vol. iii. p. 170.

ADDER-STUNG is used with respect to cattle when stung, whilst they are grazing, by any kind of venomous reptiles, particularly the adder. Dogs are peculiarly liable when hunting to this accident; and if relief is not obtained it sometimes proves fatal. The symptoms are great pain, anxiety, and swelling of the wounded part; after which, the body swells universally.—Oil has been given with advantage, as likewise onions: but the remedy must be depended on is the caustic volatile alkali, which is the eau de luce of cabinets, the aqua ammonia pura of the college dispensatory, and the sal volatile of the shops. To a horse or ox two moderate table-spoonfuls may be given in half a pint of milk; to a large dog three tea-spoonfuls in the same manner, and to a lesser dog or other small animal a proportional dose. Whatever is given internally may with propriety be applied externally to the wound.—The adder is perhaps the only animal in our island whose bite occasions any considerable morbid consequences; the goat-sucker, the hedge-hog, and the shrew-mouse, are animals perfectly inoffensive, and incapable of inflicting any venomous wound.

ADDER'S *Tongue*, in *Botany*, a medicinal plant, so called either from its resembling, or its curing, the bite of a viper. It is more commonly called OPHIOGLOSSUM. This is a spring plant, and is only to be found in April and May. It is not uncommon in wet meadows, and is easily distinguished among the other spring plants by its spike or tongue. It is esteemed one of the best vulnerary herbs this country produces; but it is more in use among the common people than in the shops. They give its juice internally, and use the herb bruised, or an ointment prepared from it with lard, or May-butter, externally, at the same time. Farriers, &c. prepare an ointment of this herb, called *adder's tongue ointment*, used as a remedy against the bites of venomous beasts. Phil. Transf. vol. xlix. pt. ii. n°. 112. p. 853.

ADDER'S *Wort*. See BISTORT.

ADDEXTRATORES, or ADDEXTARIJ, in the court of Rome, denote the pope's mitre-bearers. Some suppose that they are thus called, on account of their walking at the pope's right hand, when he rides to visit the churches.

ADDICE. See ADZE.

ADDICO. See ADDICTIO.

ADDICTI, in *Antiquity*, insolvent persons, or those who being sentenced to pay a debt, but unable to do it, were adjudged to a temporary kind of servitude to the creditor. In this sense addicti were a species of *servi*; from whom, however, they differed in this, that a slave, when discharged, became a *libertus*; whereas an *addictus* became *ingenuus*. Again, a slave could not be discharged without the consent of his master; whereas the *addictus* was discharged

charged of course when his debt was satisfied. Pitife. Lex. Ant. and Calv. Lex. Jur.

ADDICTIO, ADDICTION, in the Roman *Law*, a transferring or passing of goods to another, either by sentence of a court, or in the way of sale, to him that bids most for them. The word stands opposed to *allicitio*, or **ADDICATION**. It is formed of *addico*, one of the flated words used by the Roman judges, when they allowed the delivery of the thing or person on whom judgment had passed. Hence goods, thus adjudged by the prætor to the right owner, were called *bona addicta*; and the debtors delivered up, in like manner to their creditors to work out their debt, were called *servi addicti*.

ADDICTIO in diem, denoted the adjudging of a thing to a person for a certain price; unless by such a day the owner or some other person gave more for it.

ADDINGTON, ANTHONY, in *Biography*, finished his studies at Trinity College, Oxford, where he took his degree of doctor in medicine, 1744. He then settled at Reading, in Berkshire, and there acquired considerable reputation for his judicious and successful method of treating diseases. About the year 1754 he came to London, and in 1756 was made Fellow of the Royal College of Physicians, and soon attained that eminence in his profession, to which he was entitled by his genius and talents. In a few years after, the indifferent state of his health obliging him to quit London, he returned to Reading, where he opened a house for the reception of maniacal patients. In 1789 he was sent for to visit his present Majesty, then labouring under a severe fever, and was the first of the physicians attending him, who gave a favourable prognostic of the event of the complaint, which was soon after verified, to the great satisfaction of the country. The doctor died at Reading, on the 21st of March, 1790. While practising in London he became acquainted with the great Mr. Pitt, afterwards Earl of Chatham, with whom he lived in the strictest intimacy. It was on the recommendation of his lordship's son, then Chancellor of the Exchequer, that he was called on to visit his Majesty. By the same interest Henry Addington, Esq. his eldest son, was made first speaker of the House of Commons, and having filled that arduous office, nearly through two parliaments, with great reputation, he was raised, by his Majesty, in March, 1801, to the high dignity of Chancellor of the Exchequer, which his friend and patron had resigned.

The only publication we have of the doctor's, is an essay on the sea scurvy, printed 1753, containing an account of a method of preserving water sweet in long voyages. This was proposed to be effected by mixing a portion of the acid of sea salt, with the water. A more effectual mode has since discovered by Mr. Henry of Manchester.

ADDISON, LANCELOT, in *Biography*, the son of a clergyman of the same name; was born in the parish of Crosby Ravensworth, in Westmorland, in the year 1632. Having received the rudiments of classical learning in the grammar school of Appleby, he was sent to Queen's College, Oxford, in 1650, and admitted to the degree of bachelor of arts in 1654; and distinguishing himself by his genius and application, he became master of arts in 1657, and in 1658 he was selected to be one of the *Terræ filii* for the act which was celebrated in that year. As in the orations delivered on this occasion he reflected on the persons then in power, he was obliged to recant and ask pardon on his knees. After this he soon retired from the university, and chose for his retreat the neighbourhood of Petworth in Suffex, where he zealously propagated principles of loyalty to the king, and of attachment to the church. Upon the

restoration of King Charles II. he was recommended to Dr. King, bishop of Chichester, who would have provided for him, if he had not previously engaged to go to Dunkirk, as chaplain to the garrison. When that place was delivered up to the French in 1662, he accepted the same office to the garrison of Tangier, but returned to England in 1670, and was made one of the chaplains in ordinary to the king. After struggling with some difficulties by the loss of his chaplainship at Tangier, he obtained a rectory in Wilts, and one of the prebends in the cathedral church of Sarum; and in 1675, took the degrees of bachelor and doctor in divinity at Oxford. Thus advanced and decently provided for, he lived in the country with hospitality, discharged his parochial duty with diligence, and devoted his leisure hours to writing on behalf of religion and the established church. In 1683 he was installed into the deanery of Litchfield, and in 1684 collated to the archdeaconry of Coventry, which he held with his deanery *in commendam*. After the Revolution he might, it is said, have been made a bishop, if he had not, in the convocation of the preceding year, and on other occasions, manifested a degree of zeal for the church which afforded a pretext for misrepresenting him to persons in power. His integrity, however, was unquestionable, and his literary reputation universally acknowledged. He departed this life on the 20th of April, 1703, in the 71st year of his age, and was buried in the church-yard of the cathedral at Litchfield. He was twice married, and had three sons and three daughters by his first wife; but by his second wife, who survived him, he left no issue. The treatises which he published are as follow: viz. 1. West Barbary, or a short Account of the Revolutions of the Kingdoms of Fez and Morocco, &c. 1671, 8vo. 2. The present State of the Jews, &c. with an annexed Discourse on the Mischna, Gemara, and Talmud, 1675, 8vo. 3. The primitive Infinitive, or a seasonable Discourse of Catechising, &c. 4. A modest Plea for the Clergy, &c. republished by Dr. Hickeys in 1709, 8vo. 5. The first State of Mahometism, &c. 1678, 8vo. 6. An Introduction to the Sacrament, &c. 1681; republished with an appendix, called the Communicant's Assistant, &c. in 1686, 12mo. 7. A Discourse of Tangier, &c. 1685, 4to, second edition. 8. The Catechumen, 1690, 12mo. 9. An historical Account of the heresy, denying the Godhead of Christ, 1696, 12mo. 10. The Christian's daily Sacrifice, or right Performance of Prayer, 1698, 12mo. 11. An Account of the Millennium, the genuine Use of the two Sacraments, viz. Baptism, and the Lord's Supper, with the Christian's Obligation frequently to receive the latter.

ADDISON, Joseph, the son of Dean Addison, the subject of the preceding article, was born at Millston, near Abingbury, in Wiltshire, May 1, 1672, and being unlikely to live, was baptized the same day. Mr. Tyers says, that he was laid out for dead as soon as he was born. At the Charter-House, whither he was removed at an early age, and where he was under the tuition of Dr. Ellis, he commenced an intimacy with Mr. afterwards Sir Richard Steele, which lasted during life. At the age of 15 he was entered of Queen's College, in Oxford; and there he soon acquired an elegant Latin style, of which a specimen appeared in a copy of verses that fell accidentally into the hands of Dr. Lancaster, afterwards provost of Queen's College, in 1687, and which induced him to procure the election of Mr. Addison as a demy of Magdalen College in 1689: where he took the degrees of bachelor and master of arts. His Latin poetry, in the course of a few years, gained him the reputation of a great poet; and his poems in this language, eight of which were published in the second

volume of *Musarum Anglicanarum Analeſta*, were ſo much approved, not only in both univerſities, but among foreigners, that the celebrated Boileau was led to conceive a very favourable opinion of the English genius for poetry, from theſe ſpecimens of it, and to ſpeak of the author in high terms of commendation. The firſt exhibition of his talents in English poetry was a copy of verſes addreſſed to Mr. Dryden in the 22d year of his age, which was very much admired by the beſt judges. This was ſoon ſucceeded by a tranſlation of the 4th Georgic of Virgil, highly commended by Mr. Dryden, and a Diſcourſe on the Georgics, prefixed to Mr. Dryden's tranſlation, which is allowed to poſſeſs the diſtinguiſhing characters of juſt criticiſm. Amongſt other poems, which appeared in 1694, there was one which contained an account of the greateſt English poets, addreſſed to Mr. H. Sacheverell, with whom he ſeems to have been intimate; and whoſe ſiſter he is ſaid to have courted, though their intimacy was afterwards interrupted by the author's adherence to the political principles which Mr. Sacheverell deſerted. The ſubject of his next performance was one of King William's campaigns; and this poem, which was addreſſed to the Lord Keeper, Sir John Somers, and much approved by him, engaged the attachment and patronage of this eminent ſtateſman.

Mr. Addiſon having reſiſted urgent ſolicitations to enter into holy orders, and abandoned a reſolution which he ſeems to have once formed, obtained, from the friendſhip of Lord Somers, an annual penſion of 300l. which enabled him to gratify his inclination of making a tour to Italy towards the cloſe of the year 1699. In 1701, he tranſmitted from Italy an epistolary poem to (Montague) Lord Halifax, which ſome have pronounced as the beſt of his performances. On his return he publiſhed an account of his travels, dedicated to the Lord Somers. Upon the death of King William, his penſion was diſcontinued, and in conſequence of the excluſion of his friends from the miniſtry, he remained for a conſiderable time inactive and unrecompended. However, in 1704, Lord Halifax recommended him to the Lord Treafurer Godolphin, as a fit perſon to celebrate the Duke of Marlborough's victory at Blenheim. Mr. Addiſon was engaged in a manner peculiarly reſpectful to undertake this important office; and this produced the poem, intitled the *Campaign*; which was received with very loud and general applauſe, and which will be admired as long as the victory is remembered. In 1706 the author was appointed under ſecretary of ſtate; and about this time he compoſed his inimitable opera of *Rofamond*, and he alſo aſſiſted Sir Richard Steele in his play called *The Tender Huſband*, to which he wrote an humorous prologue. In 1709 he went over to Ireland as ſecretary to the Lord Lieutenant, the Marquis of Wharton, where her Majeſty conferred upon him the office of Keeper of the Records in that kingdom, with an augmented ſalary. In this year the *Tatler* appeared; the author of which was diſcovered by Mr. Addiſon to be his friend Mr. Steele, by an obſervation on Virgil, which he had communicated to him. In conſequence of this diſcovery he afforded to the author ſuch aſſiſtance as induced him to ſay of it, that he ſared by this means, like a diſtreſſed prince, who calls in a powerful neighbour to his aid; that is, that he was undone by his auxiliary. The *Tatler* being diſcontinued in 1711, was ſucceeded by the *Spectator* upon a plan concerted between Mr. Steele and Mr. Addiſon. It commenced, March 1, 1711, and was concluded, September 6, 1712. Mr. Addiſon's papers in this work, the excellence of which time has very highly appreciated, are marked by the letters that form the name of the Muſe CL10. It is ſaid, that when his book-

ſeller came to him for the *Spectator*, Bayle's Hiſtorical and Critical Dictionary always lay open before him; and that he was ſo extremely nice in his proſe compositions, that when almoſt a whole impreſſion of a *Spectator* was worked off, he would ſtop the preſs, to infer a new prepoſition or conjunction. Of the value of this publication, and of the good ſenſe that directed the judgment and taſte of the Britiſh nation at the period in which it was written, we ſhall form a very favourable opinion, when we conſider that 20,000 copies were ſometimes ſold in a day. An attempt was made to continue it by other ingenious writers; but it proved unſucceſſful. Eighty numbers were publiſhed, to which Mr. Addiſon contributed about a fourth part, and theſe formed an eighth volume. The *Guardian*, in which Mr. Addiſon had a principal concern, amused the town in the years 1713 and 1714: his papers are marked by a hand. Two numbers, in a paper called the *Lower*, were alſo written by him. During his travels, Mr. Addiſon executed a deſign, which he had conceived at an early age, of writing a tragedy; and in 1713 appeared his famous *Cato*, with a ſublime prologue by Mr. Pope, and an humorous epilogue by Mr. Garth. It had an uninterrupted run of thirty-five nights; and it was read with a ſatiſfaction and commendation equal to the eagerneſs and pleaſure with which it was attended on the ſtage. It was tranſlated into French, Italian, and German; and the jeſuits at St. Omers made a Latin tranſlation, where it was acted by their pupils with great magnificence. The ſoliloquy of Cato was rendered into Latin verſe by Biſhop Atterbury, in a ſtyle worthy of the ſublime original, and which would have been admired even by the critics in the court of Auguſtus. The author had intended to have written another tragedy, under the title of *The Death of Socrates*: but the offices and honours which were devolved upon him in his advancing years, prevented the accompliſhment of his purpoſe. He was likewiſe under a neceſſity of declining another work which he had projected, viz. that of compoſing an English Dictionary upon the plan of the Italian Della Cruſca; in his project for this purpoſe, he conſidered the writings of Archbiſhop Tillotſon as the chief ſtandard of our language. During the period in which the Earl of Sunderland was Lord Lieutenant of Ireland, he was his ſecretary; but on the removal of the Earl, he was appointed one of the Lords of Trade. In 1715 he began to publiſh the *Freeholder*, which is a kind of political ſpectator, and admirably conceived and executed, at a period of diſcord, for the purpoſe of removing prejudices, ſettling the government, and making his country happy. This admirable collection of papers contained fifty-five numbers, the laſt of which was publiſhed June 29, 1716. About this time he alſo publiſhed his verſes to Sir Godfrey Kneller, on the King's picture, and another copy to the Princeſs of Wales, with his tragedy of Cato. In 1716 he married the Counteſs of Warwick, without deriving from the connection, as it has been ſaid, any great addition to his happineſs. In the following year, King George I. appointed him one of his principal ſecretaries of ſtate; but the application and parliamentary attendance which this office required, concurred with an aſthmatic diſorder, to which he was ſubject, in impairing his health, and haſtening his diſſolution; and he was, therefore, under a neceſſity of reſigning it, in lieu of which he had a penſion of 1500l. a year. His friends hoped that by reſceſs from public buſineſs, and the tranquillity of retirement, his health would be re-eſtabliſhed, and his life prolonged. For ſome time he ſeemed to experience the good effects of his new courſe of life; and he employed his hours of leiſure in completing his Treatiſe of *The Chriſtian Religion*, which

which he had begun long before, and of which the first part, in an unfinished state, is contained in his works. He intended likewise to have paraphrased some of the Psalms of David; but a long and painful relapse broke all his designs, and terminated the life of this excellent person, June 17th, 1719, in the 48th year of his age. He died at Holland-House, near Kensington, leaving behind him an only daughter by the Countess of Warwick. After his decease Mr. Tickell, in pursuance to the instructions which he had received, collected and published his works in four volumes, 4to. This edition contains, besides the pieces already mentioned, the "*Dissertation upon Medals*," for which the materials were collected in Italy, and digested at Vienna, in 1702; "*The present State of the War, and the Necessity of an Augmentation considered*," first published in the form of a pamphlet in 1707; "*The Whig Examiner*," published in 1710, of which five papers are attributed to Mr. Addison, and they are the most severe of his publications: they were written by way of reply to the "*Examiner*," published on the part of the Tories, and contain some harsh animadversions on Dr. Sacheverell, Mr. Prior, and others. A similar piece, intitled, "*The late Trial and Conviction of Count Tariff*," and designed to expose the Tory ministry on the subject of the French commerce-bill, was published in 1713. The comedy of the "*Drummer or Haunted House*," though not noticed in this edition, was afterwards published as Mr. Addison's, by Sir Richard Steele. The following pieces have been also ascribed to Mr. Addison: viz. "*Dissertatio de inferioribus Romanorum Poetis*," written about 1692; "*A Discourse on ancient and modern Learning*," preferred among the MSS. of the late Lord Somers, and printed in 1739, 8vo.; and N^o. 1 and 2 of "*The Old Whig*," pamphlets, written in defence of the peerage bill, 1719.

The character of Mr. Addison, as a classical scholar, as a statesman, as a poet, and elegant writer, and as a man of religious principle and exemplary probity and virtue, has been delineated and ably defended against the attacks of prejudice and envy by many writers; and their testimonies have been collected and duly appreciated by Dr. Kippis, in the last edition of the Biographia Britannica. The Latin poems, which were his early productions, his discourse on the Georgics, and his dissertation on medals, afford ample evidence of his classical taste and erudition.

As a statesman it has been alleged against him, that his invincible modesty and timidity disqualified him for conducting any political debate in parliament; that he made a mean figure in the office of secretary of state; that he was unfit for active life; and that he was very deservedly removed from office to make way for a more able successor. Such are the contemptuous charges retailed by Sir John Hawkins, in his History of Music, (vol. v. p. 315.) who adds, that Dr. Maadeville, the author of the Fable of the Bees, called him, "a parson in a tye wig." In reply to these charges it has been urged, that Mr. Addison was gradually trained up to a qualification for the several employments in which he was engaged; that he was designed for the service of the state by Lord Somers and Lord Halifax; and that he occupied in succession various departments of public business without incurring the reproach of want of ability. As to his removal from public office, the true cause of it was his declining health; and that on his own part it was purely voluntary, appears from his intimate connection with Lord Sunderland and the Lord Viscount Stanhope, who were in office, and his friendship with Mr. Craggs who succeeded him, and from the zealous support which he gave to the ministry after his resignation. The reserve and diffidence charged upon him by Dr. Mandeville,

if the story be true to which the anecdote refers, might possibly arise from his disinclination to be free and intimate with a person whose principles and character he must have disliked.

As a poet, Mr. Addison was for a long time highly extolled; but his reputation has lately been upon the decline. He is ranked by Dr. Warton in the second class of our poetical authors, and joined with Dryden, Prior, Cowley, Waller, Garth, Fenton, Gay, Denham, and Parnell: whilst the first class comprehends Spenser, Shakespeare and Milton. Others have degraded him to a still lower rank. Mr. Gilbert Cooper says, (Letters concerning Taste, p. 34.) that he has no right to a pretension of being a good poet. Dr. Hurd (Critical Commentary and Dissertations, v. iii. p. 122.) speaks of him as one who had no want of natural talents for the greater poetry; which yet were so restrained and disabled by his constant and superstitious study of the old classics, that he was, in fact, but a very ordinary poet. Although it should be allowed that Mr. Addison did not really display, in his poetry, a highly vigorous imagination, yet there are many and distinguished excellencies in his poems, which intitle him, in the opinion of very competent judges, to a higher rank than even Dr. Hurd assigns him. In this connection it may not be improper to observe, that Captain Thompson, in his edition of Mr. Andrew Marvell's Works, (vol. i. Pref. p. 19, &c.) ascribes to Marvell the two fine hymns in N^o 453 and 465 of the Spectator, which hitherto have been universally, and without doubt, justly ascribed to Mr. Addison. Whilst it is not to be dissembled that criticism was not a talent, in the exercise of which he excelled, nevertheless those who question his abilities as a critic concede that his taste was truly elegant, and that he may be ranked in this department of literature with Longinus, though he sinks below Aristotle; and that, however defective he may be thought with regard to the philosophy of his criticisms, he determined justly from his feelings, and contributed by his critical remarks on the Georgics, on Ovid, and especially on Milton, more than any other man, to excite and propagate a good taste in the English nation. His Essay on the Pleasures of the Imagination should not be forgotten by those who dispute his critical sagacity; and the candid will recollect, that philosophical criticism had not been cultivated at the period in which he lived, and that in this respect he was far superior to his contemporaries.

Whatever difference of opinion there may have been as to the rank and celebrity to which Mr. Addison is intitled as a poet and a critic, his distinguished and almost super-eminent excellence as a prose writer has been universally allowed. Those whose province it has been to mark his casual errors and defects, have concurred in paying him a tribute of high commendation. Many testimonies of this kind might be cited from the publications of Mr. Cooper, Dr. Hurd, Dr. Young, Mr. Melmoth, Dr. Warton, Dr. Johnson, Dr. Blair, and others. Under this head the following reflections may not be unacceptable to the reader. In various parts of Mr. Addison's prose essays, says Dr. Warton, are to be found many strokes of genuine and sublime poetry; many marks of a vigorous and exuberant imagination. After all, his chief and characteristic excellency was his humour; for in humour no mortal has excelled him, except Moliere: for which he refers to the character of Sir Roger de Coverley, so original, so natural, and so inviolably preserved; and to the *Drummer*, that excellent and neglected comedy. Dr. Young, in his conjectures on original composition, describes his character as a writer at large; and upon a comparison of Addison with Swift and Pope,

he remarks, that he possessed a more refined, decent, judicious, and extensive genius, than either of the latter writers. Swift, says he, is a singular wit, Pope a correct poet, Addison a great author. Addison's crown was elective; he reigned by the public voice:

————— *volentes*
Per populos dat jura, viamque affectat Olympo.

VIRGIL.

Addison wrote little in verse, much in sweet, elegant Virgilian prose. His compositions are built with the finest materials, in the taste of the ancients, and on truly classic ground; and though they are the delight of the present age, yet I am persuaded (continues this author) that they will receive more justice from posterity. His admirers call him an elegant writer. That elegance which shines on the surface of his compositions seems to dazzle their understanding, and renders it a little blind to the depth of sentiment which lies beneath: thus (hard fate!) he loses reputation with them, by doubling his title to it. On subjects the most interesting and important, no author of his age has written with greater, I had almost said, with equal weight: and they who commend him for his elegance, pay him such a sort of compliment, as they would pay to Lucretia, if they should commend her only for her beauty. Young's Works, vol. v. p. 130, &c.

Truth and beauty of imagery (says Mr. Melmoth) is the characteristic distinction of Mr. Addison; and the principal point of eminence which raises his style above that of every author in any language that has fallen within my notice. He is every where highly figurative; yet, at the same time, he is the most easy and perspicuous writer I have ever perused. His images are selected with the utmost delicacy and judgment, from the most natural and familiar appearances. One is particularly mentioned, taken out of a thousand that might be named, which appears to me, says Mr. Melmoth, the finest and most expressive that ever language conveyed. It occurs in one of the inimitable papers upon Paradise Lost, where Milton represents the sun in an eclipse; and at the same time a bright cloud in the western regions of the heavens, descending with a band of angels. The whole theatre of nature, says Mr. Addison, is *darkened*, that this glorious *machine* may appear in all its lustre and magnificence. After other expressions of high commendation, Mr. Melmoth closes.—“In a word, one may justly apply to him what Plato, in his allegorical language, says of Aristophanes, that the *graces* having searched all the world for a temple, wherein they might for ever dwell, settled at last in the breast of Mr. Addison.” Fitzosborne's Letters, Let. xxiv. p. 112, &c. Let. xxix. p. 137.

Dr. Johnson, in delineating the literary character of Mr. Addison, observes with Tickell, that he employed wit on the side of virtue and religion. He not only made the proper use of wit himself, but taught it to others; and from his time it has been generally subservient to the cause of reason and truth. He has dissipated the prejudice that had long connected gaiety with vice, and easiness of manners with laxity of principles. He has restored virtue to its dignity, and taught innocence not to be ashamed. This is an elevation of literary character “above all Greek, above all Roman fame.” No greater felicity can genius attain than that of having purified intellectual pleasure, separated mirth from indecency, and wit from licentiousness; of having taught a succession of writers to bring elegance and gaiety to the aid of goodness; and, to use expressions yet more awful, of having “turned many to righteousness.” As a describer of life and manners, he must be allowed to stand perhaps the first of the first rank. His humour, which

as Steele observes, is peculiar to himself, is so happily diffused as to give the grace of novelty to domestic scenes and daily occurrences. He never “outsteps the modesty of nature,” nor raises merriment or wonder by the violation of truth. His figures neither divert by distortion, nor amaze by aggravation. He copies life with so much fidelity, that he can hardly be said to invent; yet his exhibitions have an air so much original, that it is difficult to suppose them not merely the product of imagination. As a teacher of wisdom he may be confidently followed. His religion has nothing in it enthusiastic or superstitious: he appears neither weakly credulous, nor wantonly sceptical: his morality is neither dangerously lax nor impracticably rigid. All the enchantment of fancy, and all the cogency of argument, are employed to recommend to the reader his real interest, the care of pleasing the author of his being. Truth is shewn sometimes as the phantom of a vision, sometimes appears half-veiled in an allegory; sometimes attracts regard in the robes of fancy, and sometimes steps forth in the confidence of reason: she wears a thousand dresses, and in all is pleasing. Johnson's Poets.

Among ourselves, says an anonymous writer, in the 26th number of the *World*, no writer has made so happy and judicious a mixture of plain and figurative terms as Addison, who was the first that banished from the English, as Boileau from the French, every species of bad eloquence and false wit, and opened the gates of the temple of taste to his fellow-citizens.

Dr. Blair observes, that of the highest, most correct, and ornamented degree of the simple style, Mr. Addison is, beyond doubt, the most perfect example; and therefore, though not without some faults, he is, on the whole, the safest model for imitation, and the freest from considerable defects, which the language affords. Perspicuous and pure he is in the highest degree: his precision, indeed, is not very great, yet nearly as great as the subjects which he treats of require: the construction of his sentences, easy, agreeable, and commonly very musical, carrying a character of smoothness more than of strength. In figurative language he is rich, particularly in similes and metaphors, which are so employed as to render his style splendid, without being gaudy. There is not the least affectation in his manner; we see no marks of labour, nothing forced or constrained; but great elegance joined with great ease and simplicity. He is, in particular, distinguished by a character of modesty and of politeness, which appear in all his writings. No author has a more popular and insinuating manner; and the great regard which he every where shews for virtue and religion recommend him highly. If he fails in any thing, it is in want of strength and precision, which renders his manner, though perfectly suited to such essays as he writes in the Spectator, not altogether a proper model for any of the higher or more elaborate kinds of composition. Though the public have ever done much justice to his merit, yet the nature of his merit has not always been seen in its true light; for, though his poetry be elegant, he certainly bears a higher rank among the prose writers, than he is entitled to among the poets; and, in prose, his humour is of a much higher and more original strain than his philosophy. The character of his Roger de Coverley discovers more genius than the critique on Milton. Blair's Lectures, vol. ii. p. 41, &c.

Mr. Addison's character, as a man of probity and religious virtue, stands in high estimation. His attachment to his principles and his friends was invariable, and afforded the most convincing evidence, in times of political discord, of his inflexible integrity. It was, nevertheless, blended with

with an amiable liberality and candour. Such, indeed, was his general popularity, that Dr. Swift says of him on a particular occasion, "Mr. Addison's election has passed easy and undisputed; and, I believe, if he had a mind to be chosen king, he would hardly be refused." The friendship that subsisted between these two gentlemen continued through life, without interruption, notwithstanding the difference in their political principles and connections: and so nobly did Mr. Addison act on an occasion, in which he was desired by lord Sunderland not to converse with some people in Ireland that were not agreeable to him, that whilst he professed his great obligation to his Majesty for the honour intended him, (of being secretary to the Lord Lieutenant,) he declared, at the same time, he could not comply with his excellency's request; as he would not sacrifice his friendship for Dr. Swift, to be made chief governor of that kingdom. Suppl. to Swift's works, vol. ii. p. 410. His character for probity has not, however, escaped calumny and reproach. Dr. Johnson relates an anecdote, which every admirer of the distinguished merit of Mr. Addison will be very reluctant to believe, at least without some authority which Dr. Johnson has not produced, and especially in opposition to the evidence that has been alleged of its falsehood. Steele is said to have borrowed tool, in a time of pressing exigence of his friend Addison, probably without much purpose of repayment: but Addison, being impatient of delay, reclaimed the loan by an execution. The following anecdote, which is of a very different kind, was told by the late Dr. Birch. Mr. Addison and Mr. Temple Stanyan were very intimate, and were accustomed to dispute each other's opinions. Mr. Stanyan, however, was reduced to the necessity of borrowing 500l. of Mr. Addison; the consequence of which was reserve and diffidence, and an apparent acquiescence in the sentiments of his creditor on the part of Stanyan. A dispute occurred on a topic, with regard to which the latter had always been used to oppose the former; but on this occasion Mr. Stanyan was silent and acquiescing, which conduct hurt Mr. Addison so much, that he said to his friend, "Either contradict me, or pay me the money." It appears also by some particulars recited concerning Mr. Addison, by a late sprightly writer, (Mr. Tyers) that upon his return to England, after his travels, he discharged the old debt contracted at Oxford, with ample interest; and that he refused a gratification of a 300l. bank note, and afterwards of a diamond ring of the same value, from a Major Duabar, whom he had endeavoured to serve in Ireland by his interest with lord Sunderland; and, it is probably on this occasion, that he writes in a letter; "Believe me, Sir, when I assure you I never did, nor ever will, on any pretence whatsoever, take more than the stated and customary fees of my office. I might keep the contrary practice concealed from the world, were I capable of it; but I could not from myself; and I hope I shall always fear the reproaches of my own heart more than those of all mankind." We are informed by the writer just mentioned, that having received encouragement from a married lady, of whom he had been formerly enamoured, he had the integrity to resist the temptation. Addison has been charged with manifesting a great degree of jealousy, envy, and malevolence in his conduct towards Mr. Pope. Dr. Warton and Cibber seem to have given credit to this charge; and the accusation has been directly and circumstantially produced by Mr. Ruffhead in his life of Pope, p. 184.—193. The late Judge Blackstone took great pains to investigate the grounds of it, and to evince its falsity. Besides the jealousy of Mr. Pope's superior talents, which constitutes part of the charge, Mr. Addison is accused of permitting Mr. Tickell, who was his dependant, to publish a translation

of the first book of the Iliad, which some say was the juvenile work of Addison, and which others affirm was Tickell's, revised by him, just at the time when the first volume of Mr. Pope's work was delivered to his subscribers. After a very elaborate investigation of this business, published in the last edition of the Biog. Brit. the learned Judge closes with this paragraph: "As there are so many inconsistencies in the story itself, which never found its way into print till near sixty years after it is said to have happened, it will be no breach of charity to suppose, that the whole of it was founded on some misapprehension in either Mr. Pope or the earl (Warwick); and unless better proof can be given, we shall readily acquit Mr. Addison of this, the most odious part of the charge." At the close of his life, and with the near views of his dissolution, he sent for the young earl of Warwick, and also for Mr. Gay. He told the latter that he had injured him; but if he recovered, he would recompense him. Mr. Gay was ignorant of the circumstance to which he adverted, but supposed that some preferment had been designed for him, which Mr. Addison prevented his obtaining.

Of his interview with the young Earl, Dr. Young has given the following account. After a long and manly, but vain struggle with his distemper, he dismissed his physicians, and with them all hopes of life. But with his hopes of life he dismissed not his concern for the living, but sent for a youth, nearly related, and finely accomplished, but not above being the better for good impressions from a dying friend. He came; but life now glimmering in the socket, the dying friend was silent: after a decent and proper pause, the youth said, "Dear Sir! you sent for me; I believe, and hope, that you have some commands; I shall hold them most sacred." May distant ages not only hear, but feel, the reply! forcibly grasping the youth's hand, he softly said, "See in what peace a Christian can die." He spoke with difficulty, and soon expired.

Mr. Addison, says his Biographer, notwithstanding the several things which have been advanced to lessen him in the public opinion, will always be held in the highest estimation, as an amiable and excellent man in private life, as one of the brightest ornaments of, perhaps, the finest age of English literature; as one who greatly contributed to the spreading of good sense and good taste in the nation; as one of our most easy, elegant, and graceful writers; as having been singularly beautiful in his allegorical papers, and admirable for the vein of humour which runs through many of his compositions. Biog. Brit.

ADDISON County, in *Geography*, a county of Vermont in America, on the east side of lake Champlain, and divided nearly into equal parts by Otter Creek. It has Chittenden county on the north, and Rutland county on the south; and contains 6449 inhabitants, dispersed in twenty-one townships. Its dimensions are about thirty miles by twenty-seven, and a range of the Green Mountains passes through it. Its chief town is *Middlebury*.

ADDISON is also a town of the above county, lying on the lake Champlain, separated from Newhaven, on the east by Otter Creek. The Snake Mountains are on the south-east. This town contains 401 inhabitants.

ADDITAMENT, in a general sense, denotes a thing added to another. It signifies the same as *Epiphysie*.

ADDITAMENT, in *Physic* and *Chemistry*, are things super-added to the ordinary ingredients of any composition.

ADDITION, the act of joining one thing to another, or of augmenting a thing, by the accession of others.

ADDITION, in *Arithmetic*, is the first of the four fundamental rules, or operations, of that art.

Addition consists in finding the amount of several numbers,

bers, or quantities, severally added one to another. Or, *addition* is the invention of a number, from two or more homogeneous ones given, which is equal to the given numbers taken jointly, or together.

The number thus found is called the *sum*, or aggregate of the numbers given.

The character of *addition* is +, which we usually express by *plus*. Thus 3 + 4 denotes the sum of 3 and 4; and is read 3 *plus* 4.

The *addition* of simple numbers is easy. Thus it is readily perceived that 7 and 9, or 7 + 9, make 16; and 11 + 15, make 26.

In longer, or compounded numbers, the business is performed by writing the given numbers in a row downwards; homogeneous under homogeneous, *i. e.* units under units, tens under tens, &c. and accurately collecting the sums of the respective columns.

To do this, we begin at the bottom of the outmost row or column to the right; and if the amount of this column be ten, or some number of tens, we set down only the overplus, and carry one for each ten to the next column.

Suppose, *e. g.* the numbers 1357 and 172 were given to be added: write either of them *v. gr.* 172, under the other 1357; so that the units of the one, *viz.* 2, stand under the units of the other, *viz.* 7; and the other numbers of the one, under the correspondent ones of the other, *viz.* the place of tens under tens, as 7 under 5; and that of hundreds, *viz.* 1, under the place of hundreds of the other, 3. Then, beginning, say 2 and 7 make 9; which write underneath; also 7 and 5 make 12; the last of which two numbers, *viz.* 2, is to be written, and the other one reserved in your mind to be added to the next row, 1 and 3: then say 1 and 1 make 2, which added to 3 make 5: this written underneath, and there will remain only 1, the first figure of the upper row of numbers, which also must be written underneath; and thus you have the whole sum, *viz.* 1529. The same method will extend to any number of sums, which are required to be united in one.

When a great number of separate sums, or numbers, are to be added, it is more easy to separate them into two or more parcels, which may be added separately, and then their sums added together for the total amount: and thus, by dividing the numbers into parcels in different ways, the truth of the addition may be proved.

Another method of proving addition was suggested by Dr. Wallis in his arithmetic, published in 1657, by casting out the nines. Thus, add the figures of each line of numbers together separately, and cast out always 9 from the sums as they arise, adding the overplus to the next figure, and setting down at the end of each line the excess above the nine or nines. Pursue the same process with the sum total, and the former excesses of 9, and the last excesses will be equal when the work is right. The former examples may be thus proved:

1357	7	Thus also:	350709	6
172	1		31806500	5
—	—		339087	3
1529	8		46011	3
—	—		2935	1
			32545242	0

ADDITION of numbers of different denominations, for instance, of pounds, shillings, and pence, or yards, feet, and inches, is performed by adding or summing up each denomination by itself, always beginning with the lowest; and if, after the addition, there be enough to make one of the

next higher denomination, for instance, pence enough to make one or more shillings, or inches to make one or more feet, they must be added to the figures of that denomination, that is, to the shillings or feet, only reserving the odd remaining pence or inches to be put down in the place of pence or inches. And the same rule is to be observed of shillings with regard to pounds; and of feet with regard to yards.

As in the following examples:

						Avoirdupois weight.		
£.	s.	d.	yds.	f.	in.	lb.	oz.	dr.
120	15	9	271	10	3	15	11	12
65	12	5	36	2	7	4	10	0
9	8	0	14	2	5	12	0	13
195						Sum 33 6 2		
195	16	2	Sum	326	0	3		

ADDITION of Decimals. See DECIMAL.

ADDITION of Vulgar Fractions. See FRACTION.

ADDITION of Logarithms. See LOGARITHM.

ADDITION of Ratios is used by some authors in the same sense with COMPOSITION OF RATIOS, which see.

ADDITION, in Algebra, or the addition of indeterminate quantities, expressed by letters of the alphabet, is performed by connecting the quantities to be added, by their proper signs; and also by uniting into one sum, those that can be so united; *i. e.* similar quantities, by adding their co-efficients together if they have the same signs, or subtracting those which have different signs. So that addition comprehends three cases.

Case I. To add quantities which are like, with like signs: add all the co-efficients together, and to their sum annex the common quantities, and prefix the common sign. Thus,

$$7a + 9a = 16a. \text{ And } 11bc + 15bc = 26bc. \text{ Also } 3\frac{a}{c} + 5\frac{a}{c} = 8\frac{a}{c}: \text{ and } 2\sqrt{ac} + 7\sqrt{ac} = 9\sqrt{ac}; \text{ and } 6\sqrt{ab-xx} + 7\sqrt{ab-xx} = 13\sqrt{ab-xx}: \text{ and in like manner, } 6\sqrt{3} + 7\sqrt{3} = 13\sqrt{3}. \text{ Again, } a\sqrt{ac} + b\sqrt{ac} = a + b\sqrt{ac}; \text{ and } 2a + 3c\sqrt{3ax^2-x^3} + 3a\sqrt{3ax^2-x^3} = \frac{5a + 3c\sqrt{3ax^2-x^3}}{a+x}.$$

$$\text{And } 6a + 9b - 3c - 4$$

$$\frac{4a + 5b - 2c - 3}{10a + 14b - 5c - 7}$$

Case II. To add quantities which are like with unlike signs: add all the affirmative or positive co-efficients into one sum, and all the negative ones into another; then subtract the least of these sums from the greatest, and to the difference prefix the sign of the greatest, and annex the common quantity.

Thus, -2 and -3 make -5; $-\frac{4ax}{b}$ and $-\frac{11ax}{b}$ make $-\frac{15ax}{b}$; $-a\sqrt{ax}$ and $-b\sqrt{ax}$ make $-a-b\sqrt{ax}$. Also,

$$3 - 2 = 1; 9a - 7a = 2a; \frac{11ax}{b} - \frac{4ax}{b} = \frac{7ax}{b}; \text{ and } -a\sqrt{ac} + b\sqrt{ac} = b - a\sqrt{ac}; \text{ and, } 2 - 3 = -1; -\frac{11ax}{b} + \frac{4ax}{b} =$$

$$-\frac{7ax}{b}; \text{ and } 2\sqrt{ac} - 7\sqrt{ac} = -5\sqrt{ac}. \text{ Again, } -3a + 7a + 8a - a - 2a = -6a + 15a = +9a; \text{ and } -5xy - 3xy + 8xy + 7xy = -8xy + 15xy = +7xy; \text{ and } -6\sqrt{ax} + 2\sqrt{ax} - 5\sqrt{ax} + 10\sqrt{ax} = -11\sqrt{ax} + 12\sqrt{ax} = \sqrt{ax}:$$

And $-8a + 7b - 8c - 7$

$$\frac{-6a - 3b + 4c + 4}{2a + 4b - 4c - 3}$$

Case III. To add quantities which are unlike, with unlike signs: collect all the like quantities together by the last rule, and set down those that are unlike one another, with their proper signs. Thus, $5xy + 4ax - xy - 4ax = 5xy - xy = 4xy$: and $-6\sqrt{ax} + 2\sqrt{ax} - 5\sqrt{ax} + 10\sqrt{ax} = 12\sqrt{ax} - 11\sqrt{ax} = \sqrt{ax}$. And $9ab - 6\sqrt{ac} + 3bc - 4x + 3x - 7ab + 4\sqrt{ac} - 2bc + 7 - 4 = 2ab - 2\sqrt{ac} + bc - x + 3$.

ADDITION of irrational quantities, or surds. See *SURD*.

ADDITION, in Law, is that name, or title, which is given to a man over and above his proper name, and surname; to shew of what estate, degree, or mystery he is; and of what town, village, or country.

Additions of Estate, or quality, are yeoman, gentleman, esquire, and such like.

Additions of Degree, are those we call names of dignity; as knight, lord, earl, marquis, and duke.

Additions of Mystery, are such as scrivener, painter, mason, and the like. See *CHOPCHURCH*.

Additions of Place are, of Thorp, of Dale, of Woodstock.—Where a man hath household in two places, he shall be said to dwell in both; so that his addition in either may suffice. Knave was anciently a regular addition.

By stat. 1 Hen. V. cap. 5. it was ordained, that in all original writs of actions personal, appeals, and indictments, upon which process of outlawry may be awarded, such addition should be made to the name of the defendant, to shew his estate, degree, or mystery, and the place where he dwells; and that the writs, not having such additions, shall abate, if the defendant take exception thereto; but not by the office of the court.—The reason of this ordinance was, to prevent any clandestine or mistaken outlawry, by reducing to a specific certainty the person who is the object of its process.

If one be of the degree of a duke, earl, &c. he shall have the addition of the most worthy dignity. 2 Inst. 669.

Such titles, however, are not properly additions, but names of dignity. The title of knight or baronet, is part of the party's name, and ought to be rightly used; but the titles of esquire, gentleman, or yeoman, &c. being no part of the name, but additions, as people please to call them, may be used, or not used, or if varied, it is not material. 1 Lill. 34.

An earl of Ireland is not an addition of honour here in England; but such a person must be written by his Christian and surname, with the addition of esquire only; and the sons of English noblemen, although they have given them titles of nobility, in respect to their families, if you sue them, they must be named by their Christian and surnames, with the addition of esquire; as—such-a-one, esquire, commonly called lord A, &c. 2 Inst. 596. 666.

No addition is necessary where process of outlawry doth not lie. 1 Salk. 5. If a city be a county of itself, wherein are several parishes, addition thereof, as *de London*, is sufficient; but addition of a parish not in a city, must mention the county, or it will not be good. 1 Danv. 237.

ADDITION, in Music, is a dot placed on the right side of a note, to signify, that the time of the sound of such note is to be lengthened half as much more, as it would otherwise be.

A note of addition amounts to the same with what is by some old English authors called *prick of perfection*.

Thus a semibreve, when marked with a dot, is to be as long as three minims; the minim, with the like dot, to be as long as three crotchets; the crotchet, as three quavers, &c. See *CHARACTER*.

ADDITIONS, in Heraldry, denote a kind of bearings, in

coats of arms, wherein are placed rewards, or additional marks of honour. In which sense, additions stand opposed to *ABATEMENTS*, or *DIMINUTIONS*. See *DIFFERENCE*.

Additions resemble, but differ from ordinaries. To the class of additions belong a bordure, quarter, canton, gyron, pyle, flaque, flanche, voider, and an inescutcheon gules, called also an *escutcheon of pretence*. On any of these may an addition of honour be placed, according to the pleasure of the prince, or the fancy of the herald; which reward descends to none of the family, except the person's own direct line. In this manner the arms of a kingdom have been sometimes given, by way of addition, to a private subject. The estimation in which these additions are held, has declined since the college has granted them to persons who apply, although neither they nor any of their ancestors have had any particular claim on marks of the royal favour.

ADDITIONS, in Distilling, a name given to such things as are added to the wash, or liquor, while in a state of fermentation, in order to improve the vinosity of the spirit, procure a larger quantity of it, or give it a particular flavour.

All things of whatever kind, thus added in the time of fermentation, are called by those of the business, who speak most intelligently, additions; but many confound them with things of a very different nature, under the name of *FERMENTS*.

The additions used in the distillery may be reduced to four general heads. 1. *Salts*. 2. *Acids*. 3. *Aromatics*, and 4. *Oils*. A little tartar, nitre, or common salt finely powdered, may be added to the liquor while fermenting, especially in the beginning of the operation; or in their stead, a little of the vegetable, or finer mineral acids, may be dropped in at different times, when found necessary. These are of great use, especially in the fermenting solutions of treacle, honey, and the like sweet and rich vegetable juices, which either wholly want an acid in themselves, or have it in too small a proportion, or have been robbed or divested of it. The proper acids for this purpose are, the juice of Seville oranges, or lemons, or the spirit of sulphur, or Glauber's spirit of salt, or, what is greatly preferable to all these, a particular aqueous solution of tartar, a succedaneum for which may be tamarinds, or the robs of some very acid fruits, or the *media substantia vini*. On this foundation stands that ingenious practice of using a suitable proportion of the still bottoms, or the remaining wash, in the subsequent brewing.

After the same manner, a very considerable quantity of any essential vegetable oil, may by proper management be converted into a surprisingly large quantity of inflammable spirit; but great care in this case must be had not to drop it in too fast, nor too much at a time; this might damp the fermentation; and, indeed, the adding a large quantity of oil at once, in the common way of stopping the fermentation at any point required.

The best method of all, of introducing the oil, so as to avoid all inconvenience, is to reduce it first to an elosaccharum, by grinding it in a mortar, with a due quantity of fine sugar in powder. The oil thus added, with its particles dissolved, and in form of powder, will readily mix with the liquor, and immediately ferment with it.

A large proportion of rectified spirit, or of any other spirit, may, by prudent management, be also introduced into the fermenting liquor; and this will always come back with a large addition to the quantity of spirit, that would otherwise have arisen from the distillation. Shaw. See *COMBINATORY DISTILLATION*.

ADDITIVE, denotes something to be added to another.

Geometricians speak of additive ratios; astronomers of additive equations, &c.

ADDITIVE ratio is used, by some writers, for that whose terms are disposed to addition, that is, to composition, in opposition to *subtractive ratio*, whose terms are disposed to subtraction, *i. e.* to division. Phil. Trans. N^o 257.

Suppose the line *ac* divided in the points *b* and *x*,

$$\frac{a \quad b \quad x \quad c}{\text{-----}}$$

the ratio between *ab* and *bx* is additive; because the terms *ab* and *bx* compose the whole *ax*. But the ratio between *ax* and *bx* is subtractive, because *ax* and *bx* differ by the line *ab*.

ADDITIVE equations, in *Astronomy*, those which are to be added to the sun's mean ANOMALY, in order to find the true one. See EQUATION.

ADDIX, in *Antiquity*, a measure of capacity in Asia and Egypt. See PLOC.

ADDIXIT, or **ADDIXERUNT**, was the word by which they expressed the favourable augur of the sacred birds. For an unfavourable augur, a negative was annexed.

ADDOUBORS, in *Law*. See REDUBBORS.

ADDRESS, in a general sense, is used for skill and good management, and of late has been adopted from the French, and is used in genteel phrase, and also in *Commerce*, as synonymous with direction to a person or place. The word is formed of the French verb *adresser*, to direct any thing to a person.

ADDRESS, means also a discourse presented to the king, in the name of a considerable body of his people; to express or notify their sentiments of joy, satisfaction, or the like, on some extraordinary occasion.

We say, the lords address, the commons address.—Addresses were first set on foot under the administration of Oliver Cromwell.—At Paris, their office of intelligence was commonly called *bureau d'adresse*.

ADDRESS, in *Rhetoric*. See APOSTROPHE.

ADDUCENT Muscles, or **ADDUCTORS**, in *Anatomy*, are those which bring forward, close, or draw together, the parts of the body whereto they are annexed.

The word is compounded of *ad*, to; and *ducere*, to draw, or bring.

Adduents, or adductors, stand opposed to abducent, or abductors.

ADDUCTION, in *Anatomy*, the motion or action of the adducent muscles, or adductors.

ADDUCTOR brevis femoris. See TRICEPS.

ADDUCTOR longus femoris. See TRICEPS.

ADDUCTOR magnus femoris. See TRICEPS.

ADDUCTOR Oculi arises from the inner side of the foramen opticum, between the obliquus superior and depressor, and is inserted into the globe of the eye opposite to the inner angle. It is from its situation the shortest of the four straight muscles of the eye. It will turn the eye towards the nose.

ADDUCTOR Ossis metacarpi minimi digiti manus, *metacarpus* of Winslow, arises from the os unciforme, and the ligament of the wrist, and is inserted in a tendinous form, into the inner side and front of the metacarpal bone of the little finger. It will bring the metacarpal bone of this finger towards the rest, and will bend it.

ADDUCTOR minimi digiti pedis, arises from the inside of the metatarsal bone of the little toe, and is inserted into the inside of the root of the first joint of the little toe. It will bend the first joint of the little toe, and draw it inwards.

ADDUCTOR pollicis manus, has a broad fleshy origin from the whole length of the metacarpal bone of the middle finger: its fibres are collected together to be inserted tendinous

into the inner part of the root of the first bone of the thumb. It will pull the thumb towards the fingers.

ADDUCTOR pollicis pedis, the *antithenar* of Winslow, arises by a long tendon from the os calcis, from the os cuboides, from the os cuneiforme externum, and from the metatarsal bone of the second toe. It is inserted into the external sesamoid bone of the great toe. Its use is to bring the great toe towards the other toes.

ADDUCTOR proflata, a name given by Santorini to a muscle, which he also calls *levator proflata*, and which Winslow calls *proflaticus superior*. Albinus, from its office, had very properly called it *compressor proflata*.

ADDUS, in *Ancient Geography*, a town of Palestine in the tribe of Judah.

ADDYME, a town of Africa, placed by Ptolemy in Mauritania Cæsariensis.

ADEA, in *Geography*, a district of Abyssinia, called also **HADAEA**.

ADEB, in *Commerce*, the name of a large Egyptian weight, used principally for rice, and consisting of 210 okes, each of three rotolos, a weight of about two drams less than the English pound. But this is no certain weight: for at Rosetta, the adeb is only 150 okes. Pococke, Egypt.

ADEBA, in *Ancient Geography*, a town of Hispania Tarragonensis, placed by Ptolemy among the Illeraones.

ADEBARÉA, in *Geography*, a desert, hilly district of Abyssinia, called the country of the Slaves, as being in the vicinity of the Shangalla.

ADEDUS, in *Ancient Geography*, a town of Arabia Felix, on the borders of the Red Sea, placed by Ptolemy in long. 72° 15'. and lat. 17° 10'. among the Cassaniti.

ADEGEM, in *Geography*, a town of Flanders, five leagues east of Bruges.

ADEL, a kingdom on the eastern coast of Africa, so called from its metropolis, and **ZEILA** from an eminent seaport, situated to the south of the Red Sea, the Straits of Babelmandel and Cape Guardefui, and has the Indian ocean on the east, on the south the kingdoms of Magadaxo and Adea; and on the west the country of the Gallas, or the kingdoms of Dancali, Dawaro, Bali, Fatigar, and other districts of Abyssinia. The exact extent of this kingdom is not known; but it is supposed from east to west to be about 160 leagues, and from north to south about 72 leagues. The interior part of Adel is very imperfectly described. The principal places in it are Adel the capital and royal residence, situate in the inland country, near the river Hawash, about 300 miles south of Mocha, N. lat. 8° 5'. E. long. 44° 20'. Assem, a small town on the eastern coast, which furnishes provisions for mariners, but has no haven; Cape GUARDEFUI to the north of Assem; Meta on the northern coast near the river Soal, BARBORA and ZEILA. Some geographers have mentioned other cities in this kingdom, *viz.* Aran, Bali, Doara, Comizara, Novorata, Socel and Aulfagurella, situate on a high hill in the centre of the kingdom. The whole coast to the south-east is desert. This kingdom is said to have been founded by a prince of Abyssinia, called Salatrú, who, escaping from the prison in which the princes of the blood are confined in that country, took refuge in the province of Adel, and marrying the daughter of the king of ZEILA, established himself in the possession of these united kingdoms. Of all the enemies, with whom the Abyssinians have had occasion to contend, the kings of Adel have been the most powerful and inveterate: and, indeed, the history of this kingdom consists principally of details of alternate defeats and victories. The Adeliens being Mohammedans, and the Abyssinians Christians, a mutual animosity has subsisted between them; and the rancour has increased

increased in consequence of the succour given to the latter by the Portuguese, and the alarm occasioned by their submission to the authority of the Roman see. At length, however, the Portuguese were totally expelled, and the kingdom of Adel became tributary to the Grand Signior. The kings of this country have been for a long time in high favour at the Porte, and dignified with the title of Saints, on account of their singular zeal, and frequent wars against the Christians. Nevertheless the Sultans have contrived to strip them of their most considerable maritime towns on the Red Sea: so that they have now no port left, except that of Zeila, the rest being all in the hands of the Turks. By these means the kings of Adel are precluded from maintaining any intercourse with Europe.

The country, though it has seldom any rain, is so well watered by rivers and canals, that it is very fertile and productive. It has plenty of wheat, barley, and millet; and a great variety of sheep, cows and other cattle. Some of the sheep have large tails, which weigh between 20 and 30 pounds. But the chief traffic of the inhabitants consists of gold dust, elephant's teeth, frankincense and negro-slaves, which they procure from Abyssinia with which they are almost always at war, and convey to the port of Zeila, where they find purchasers from Arabia, Cambaya, and other parts.

The Adelites, called GIBBERTIS, are a stout and warlike people, and fight with surprising intrepidity against the Abyssinians, partly from a zeal for religion, and partly with the hope of plunder: and they are furnished by the Turks and Arabs with a variety of fire-arms. Their complexion, particularly on the northern coast, is of a tawny brown, and towards the south it is of a more deep black. Their dress chiefly consists of a piece of cotton, which covers them from the girdle to the knee, the rest of the body being naked: but the king and nobles wear a kind of loose garment that covers the whole body, and a cap over the head. All, and especially the women, are fond of adorning their necks, arms, wrists, and ankles with bracelets of glass, amber, and other similar trinkets.

ADELARD, or ATHELARD, in *Biography*, a benedictine monk of Bath, flourished about the year 1130, and for the sake of mathematical knowledge, travelled into France, Spain, Germany, Italy, Egypt and Arabia, and is said to have settled at Paris, where he acquired reputation as a teacher of medicine. He translated Euclid, among other Greek writers, out of Arabic into Latin; and also an Arabic work, intitled "Erichèatarim," upon the seven planets. He wrote a treatise on the seven liberal arts, comprehending, according to the language of the times, the *trivium* and *quadrivium*. He is also said to have written many books of physic and medicine, which are lost. Wallis, in his *Algebra* (p. 6.) mentions the prefaces to two MS. books of Travels; one or both of which had noticed the travels of Athelardus Bathonensis, which had been cited by Vossius, who says that he was learned in all the sciences of his time; but these have since been cut out of the books in Corpus Christi and Trinity colleges, Oxford, and carried away:—a species of larceny, which, in the Republic of Letters, deserves to be treated as a capital offence.

ADELARD. See ADALARD.

ADELBERG, in *Geography*, a town of Germany, in the duchy of Wurtemberg; two leagues south-east from Schorndorf. See ADLESBERG.

ADELBOLD, in *Biography*, a monk of Lobes in the diocese of Liege, and afterwards bishop of Utrecht, wrote the life of his emperor Henry II. surnamed Claudius, with whom he was a favourite. He was made bishop of Utrecht in 1008, and died 1027.

ADEL-Fish, in *Ichthyology*, a name given by some authors to the Lavaretus, or albula nobilis.

ADELFOR, in *Geography*, a gold-mine in the province of Smoland, in Sweden, discovered in 1738. Ducats are coined with its gold.

ADELHOLZEN, or ADELHOETZ, in *Geography*, a town of Germany in the circle of Bavaria, famous for its medicinal baths; four miles south of Traunstein.

ADELIA, formed of ἀδελος, uncertain or obscure, in *Botany*, a genus of the diocia *monadelphia* class and order, of the natural order of *trilocca* and *euphorbia* of Jussieu. Its characters are, that the male calyx is a one-leaved, tripartite perianthium, with oblong and recurved leaflets; it has no corolla; and the stamina are numerous, capillary filaments of the length of the calyx, united into a cylinder at the base; and the anthers are roundish: the female calyx is a five-parted perianthium, the parts being oblong and permanent; no corolla; the pistillum has a roundish germen, three very short divaricate styles, and torn stigmas; the pericarpium is a tricocous, roundish, three-celled capsule; and the seeds are solitary and roundish. There are three species, viz. *A. bernardia*, the villous-leaved bernardia; *A. ricinella*, smooth-leaved bernardia; and *A. acidoton*, or box-leaved adelia. These shrubs grow naturally in the island of Jamaica, and are nearly allied to the *croton*. The second grows to the height of eight or ten feet; the third resembles a young ebony, and does not rise above four feet high. They may be propagated by seeds brought from the countries where they grow. Martyn. In the last edition of Linnæus by Gmelin, this genus is ranked under the *monadelphia icosandria* class and order.

ADELING. See ATHELING.

ADELLA, ADALUS and ADANO, in *Ichthyology*, names given to the STURGEON.

ADELLUM, in *Ancient Geography*, a town of Spain, north-west of Illicis.

ADELM, or ALDHELM, in *Biography*, son of Kenred, and nephew of Ina, king of the West-Saxons, was a learned Englishman, who flourished about the year 680. He was first Abbot of Malmesbury, and afterwards bishop of Sherburn. He was much esteemed, and is said to have been the first Englishman who wrote in Latin, and the first who brought poetry into England. He composed several books, not only in theology, but in the mathematical sciences, as arithmetic, astrology, and de disciplinis philosophorum. He died in 709, in the monastery of Malmesbury, and is honourably mentioned by Bede and William of Malmesbury, and also by Bale and Camden. He was canonized, and many miracles are ascribed to him.

ADELMANSFELDEN, in *Geography*, a town of Germany in the circle of Swabia, two leagues west of Elwangen.

ADELNAU, or ODELNO, a town of Poland, seven leagues south-west of Kalisz.

ADELPHI, a small island in the Grecian Archipelago, about a league east-south-east of Scopelo.

ADELPHIANI, in *Church History*, a sect so called from their leader Adelphius, who kept the sabbath as a fast.

ADELSCALC, in *Ancient Customs*, denotes the servant of the king. The word is also written Adelscalche, and Adelscaleus. It is compounded of the German *adel* or *edel*, noble, and *scale*, servant. Among the Bavarians, adelscales appear to have been the same with royal thanes among the Saxons, and those called *ministri regis*, in ancient charters.

ADELSDORF, in *Geography*, the name of two small towns

towns of Franconia; one in the bishopric of Bamberg, and the other in the marquisate of Anspach.

ADEMPTION, in the *Civil Law*, the revocation of a grant, donation, or the like. The ademption of a legacy may be either *express*, as when the testator declares in form, that he revokes what he had bequeathed; or *tacit*, as when he only revokes it indirectly or implicitly. Thus, if A. by will gives his daughter M. 1000l., to be first paid after his debts, besides a share out of the dividend of his estate; and afterwards on her marriage, an agreement be made for what she should have out of A's estate, that it should be only 100l., which should be in full of what was intended out of it: this agreement is an ademption of the legacy.

ADEN, a gland. See **GLAND**.

ADEN, in *Geography*, a celebrated mart, giving name to a country of which it is the capital, situate at the most southern extremity of Arabia Felix upon the Indian ocean, near the straits of Babelmandel. According to the Arabs, its founder was Aden the son of Saba and grandson of Abraham. Some suppose that the etymology of the name is the same with that of Eden, and that it was so called from the delightful country in which it was situated. It stands at the foot of several high mountains which surround it almost on all sides. The Arabs have erected forts on the summits of these mountains: and a fine aqueduct conveys the water from thence into a large reservoir or canal, built about three-quarters of a mile from the city, which supplies the inhabitants. Golius supposes, that *Aden* is the *Arabie Emporium* of Ptolemy; and it is without doubt the *Adma* of Uranius, mentioned by Stephanus, vol. i. p. 21. The situation of the harbour of *Aden*, which opened an easy communication with Egypt, Ethiopia, India and Persia, had rendered it for many ages one of the most flourishing factories in Asia. Fifteen years after it had repulsed the great Albuquerque, who attempted to demolish it in 1513, it submitted to the Turks, under Soliman II. in 1539, who did not long remain masters of it. The king of Yeman, who possessed the only district of Arabia that merits the appellation of *happy*, drove them from thence and removed the trade to Mocha, which till this circumstance occurred, was only a village. N. lat. 12° 40'. E. long. 46° 13'.

ADEN, is also the name of a mountain in the kingdom of Fez.

ADENANTHERA, formed of *adeno*; glandulous, and *anthera*, an anther, *bastard flower-sence*, in *Botany*, a genus of the *decandria monogynia* class and order, of the natural order of *lomentacee*, and *leguminose* of Jussieu; the characters of which are these: the calyx is a one-leaved, five-toothed, very small perianthium; the corolla is five-petalled and bell-shaped, the petals lanceolate, sessile, convex inwards and concave underneath; the stamens are subulate filaments, erect and somewhat shorter than the corolla; the anthers are roundish, incumbent, bearing a globose gland at the outer tip; the pistillum is an oblong germen, gibbous downwards, style subulate and as long as the stamens, the stigma simple; the pericarpium is a long compressed membranaceous legume, and the seeds are very numerous, roundish and remote. There are three species, *viz.* *A. pavonina*, or poinciana, with leaves smooth on both sides, which is one of the largest trees in the East Indies. Its duration is 200 years, and its timber is much used on account of its solidity; the powder of the leaves is used in their ceremonies; the seeds are eaten and are also valued as weights, being each of them four grains; and beaten with water and borax, they form a cement, and the bruised leaves yield a liquor which is esteemed good against pains in the loins. This species must be raised

on a hot-bed from seeds, and it must afterwards be placed in the bark-stove. It has not yet flowered in England. Mr. Miller mentions a variety with scarlet seeds received from India, which is of a very slow growth. 2. *A. falcata*, with leaves tomentose underneath, is a native of the East Indies. 3. *A. scandens* is a native of Mallicollo, an island in the South-seas. These two species are little known with us; having never been cultivated in England.

ADENANTHERA, is also a species of **ANTHERICUM**.

ADENDA, in *Geography*, a town of Africa, in the empire of Morocco, and province of Temsena.

ADENBURG, or **ALDENBURG**, a town of Westphalia, in the duchy of Berg, subject to the elector Palatine; 12 miles north-east of Cologne. E. long. 7° 16'. N. lat. 51° 2'.

ADENIA, in *Botany*, a genus of the *hexandria monogynia* class and order; the characters of which are, that the corolla has six petals; the calyx is very long, and divided into six portions; the nectarium is composed of six linear scales. There is one species, *viz.* *A. venenata*, with palmated leaves and spiked flowers. This species is mentioned by Forskal in his *Flor. Ægypt.* And he says, that the powder of the young branches mixed in any kind of liquor, is a strong poison; and that the *capparis spinosa* is an antidote to it. The tree grows in Arabia.

ADENOGRAPHY, compounded of *adon*, gland, and *γραφειν*, I describe, that branch of *Anatomy* which describes the glands, and the glandular parts of the body.

Adenography is the same with what some others call *adenology*, or the adenological part of *Anatomy*.

ADENOIDES, q. d. *glandulous*, an epithet applied to the **PROSTATÆ**.

ADENOS, a kind of cotton, otherwise called marine cotton. It comes from Aleppo by the way of Marseilles, where it pays 20 *per cent.* duty, according to the **TARIFF** of the year 1706. Its valuation, by the same *tariff*, is of 76 livres 16 sols.

ADENOSUS abscessus, in *Surgery*, a crude hard tubercle, difficult of disclusion, and resembling the appearance of a gland. See **ABSCCESS**.

ADENSEN, in *Geography*, a parochial village in the bailiwick of Calenberg in Hanover, which formerly belonged to the lords of Adenoys, whose male issue became extinct in 1331, and whose estates descended by marriage to the counts of Hallermund.

ADEONA, in *Mythology*, a goddess invoked by the Romans when they set out upon a journey. This (says Mr. Bryant) is the same with *Ilione* or *Alione*, formed of *ad* and *Ionab*, q. d. *regia columba*, referred to in the Hebrew word for necromancer (Deut. xviii. 11.), and probably the **DIONE** of the Greeks. *Mythol.* vol. ii. p. 313.

ADEPHAGIA, the goddess of gluttony, as the name imports, to whom the Sicilians paid religious worship. In the temple erected to her, her statue was placed next to that of Ceres.

ADEPHAGUS, or *voracious*, an appellation of Hercules.

ADEPS, in *Anatomy*, the fat found in the abdomen. The term also denotes more generally any kind of **FAT**.

ADEPTS, **ΑΔΕΡΤΙ**, from the verb *adipisci*, to obtain, a denomination given to the proficients in *Alchemy*, by which those chemists chose formerly to distinguish themselves who were engaged in experiments on the transmutation of metals, and researches after the universal medicine. The appellation is derived, according to Paracelsus (*de astronomiâ magnâ lib. 1.*), from the Latin term *philosophia adepta*, philosophy acquired by contemplation, in opposition to that

which was taught and transmitted in the schools, *philosophia elementaris*. Such is the nature, says Paracelsus, of this higher-philosophy, that it does not originate from man but from heaven; and one mortal can no more communicate it to another, than the paper on which letters are traced, can of itself declare their meaning. Hence the enthusiasts who gave themselves up to this kind of study, intitled themselves *philosophi adepti*, as they spoke of others by the name of *philosophi terreni*. Van Helmont also says, "*vocantur hi adepti quorum rector spiritus Dei est*," (*de magnet. vulu. curat.* 119.) "Adepts are those who are guided by the spirit of God."

Originally, however, this flattering epithet was common to several sciences, for Paracelsus expressly mentions adept theology, adept geometry, adept medicine, &c. All these sublime distinctions are however fallen into neglect, and the believers in the philosopher's stone have alone retained possession of the title of adepts. The term therefore in the vocabulary of the alchemists, means a person, who, besides being a master of all that has been written, or is current by tradition, relative to the occult qualities of bodies, has by contemplation, and in some mysterious manner, acquired an insight into those secrets of nature, on which depend the transmutation of metals, and the universal medicine. It was a tradition among the adepts, that the number of persons thus divinely initiated, was never either more or less than twelve. The most celebrated of this fraternity are Raymond Lully, Paracelsus, Van Helmont, and Isaac Hollandus; men superior in real chemical knowledge to most of their contemporaries, but who were led partly by their own vanity and love of mysticism, and partly by the easy and eager credulity of the public to be contented with the fame of conjurers, when they might have deserved the notice of posterity as philosophers.

The term *adepts* is sometimes more generally applied to those who are proficient in any kind of science.

ADEQUATANGIE *Creek*, in *Geography*, is the eastern head water of Susquehannah river, in the state of New York.

ADEQUATE, something equal to, or co-extended with, another; and filling the whole measure and capacity thereof.

In this sense the word stands opposed to **INADEQUATE**.

ADEQUATE, or *total*, in *Logic*, is applied to the objects of science. The *adequate* object of a science includes the *material* and *formal* object; the *material* object of a science is that part which is common to it with other sciences; the *formal* is that which is peculiar to itself.

ADEQUATE ideas, or *notions*, in *Metaphysics*, are such images or conception of an object, as perfectly represent it, or answer to all the parts and properties of it.

M. Leibnitz defines an *adequate notion* to be that of whose several characters we have distinct ideas.—Thus, a circle being defined, a figure bounded by a curve line which returns into itself, and whose points are all equally distant from a certain intermediate point therein, our notion of a circle is *adequate*, if we have distinct ideas of all these circumstances, viz. a curve returning upon itself, a middle point, an equality of distance, &c.

All simple ideas are adequate and perfect; and the faculty, be what it will, that excites them, represents them entire.

The ideas of modes are likewise adequate, or perfect; except of those modes which occasionally become substances; for when we speak of modes separately existing, we only consider them separate from the substance by way of abstraction.

All abstract ideas are also adequate and perfect; since they represent all that part of the subject which we then consider.—Thus, the idea of roundness is perfect, or adequate, because it offers to the mind all that is in roundness, in general.

Of the same kind are all ideas, of which we know no original, or external object really existing out of the mind, by occasion of which they were excited in us, and of which we think them the images. Thus, when a dog is before us, it is the external object without us which raises the idea in our mind; but the idea of an animal in general, has no external object to excite it: it is created by the mind itself, and must of necessity be *adequate* or perfect.

On the contrary, the ideas of all substances are *inadequate* and imperfect, which are not formed at the pleasure of the mind, but gathered from certain properties, which experience discovers in them.

This is evident, because our knowledge of substances is very defective; and we are only acquainted with some of their properties: thus, we know, that silver is white, that it is malleable, that it melts, &c. but we do not know what farther properties it may have; and we are wholly ignorant of the inward texture of the particles whereof it consists.—Our idea of silver, therefore, not representing to the mind all the properties of silver, is *inadequate* and imperfect.

ADER, **GUILLAUME**, in *Biography*, practised medicine at Toulouse in the beginning of the 17th century; and published "Enarrationes de Ægrotis et Morbis in Evangelia." Tolose, 1620, 4to. "De pestis Cognitione, Prævisione et Remediis." 1628, 4to.

ADER, **EDER**, **HARAD** or **HERED**, in *Ancient Geography*, a town thus variously called, allotted to the tribe of Judah; which, before that distribution was made, is said to have been the capital of Arab, one of the Canaanitish kings. This prince attacked and vanquished the Israelites before their entrance into the promised land. The town was situated to the south, and near the lake Asphaltites.

ADERAIMIN. See **ALDERAIMIN**.

ADERANPATANAM Bay, lies about north-west by west from Point Pedro, in the island of Ceylon, and west by south from Calimer Point, on the coast of Coromandel.

ADERBIGAN, or **ADERBEITZAN**. See **ADDERBEITZAN**.

ADERBORGH, a small town of the circle of Upper Saxony, in Pomerania, belonging to the king of Prussia; three leagues north-west of Stetin.

ADERBOURG, a small town in Germany, in the marche of Prandenburg.

ADERCAN, a town of Persia, in the province of Laristan; 20 leagues north-east of Laar.

ADERCO, in *Ancient Geography*, a town of Iberia.

ADERKAN, in *Geography*, a town of Persia, in the province of Farsistan; 45 leagues south of Shiras.

ADERNO, a small place in the Val di Demena in Sicily, anciently called Adranum, and situate near the river Fiume d'Aderno, at the foot of Mount Gibel. E. long. 15° 25'. N. lat. 38° 5'. The remains of the walls of this ancient city still retain an air of grandeur. The pretended temple of Adranum in the vicinity of it is nothing more than a bath, constructed of bricks and lava, in the lower period of antiquity, when both Sicily and the Roman empire had lost all their eminent artists. See Houel's *Voy. Pittoresque des Isles de Sicile*, vol. ii. N^o. 26.

ADERSLEBEN, a town of Germany, in the principality of Halberstadt; 16 miles south-east of Halberstadt.

ADES, or **HADES**, *ᾠδης*, from *α* and *ιδω*, to see, denotes the invisible

invisible state. In the heathen mythology, it comprehends all those regions that lie beyond the river Styx, viz. Erebus, Tartarus, and Elysiun. See HELL.

Dr. Campbell observes, that the word *ἀδης*, *ades*, occurs eleven times in the New Testament, and is translated *hell* in all, except one, where it is translated *grave*. He thinks, however, that it ought never in scripture to be rendered *hell*, at least in the sense applied to that word by Christians. In the Old Testament, the corresponding word is *שְׁאוֹל*, *sheol*, which signifies the state of the dead in general, without regard to their character or to their condition, either of happiness or misery. The Seventy, in their translation of the word, have almost invariably used *ἀδης*. See Gen. xxxvii. 35. ch. xlii. 38. Ps. xvi. 10. Acts ii. 27. Some biblical critics, however, among whom we may reckon Father Simon, Bishop Law, and Dr. John Taylor, have contended that the term, in the Old Testament at least, means no more than *קֶבֶר* *sepulchre* or *grave*. This opinion is examined by Dr. Campbell, and he alleges, that, though our word *grave* may, in some cases, sufficiently express, not the import of the word *sheol*, but the purport of the sentence; yet, in other cases, it gives but a feeble, and sometimes an improper version of the original. He maintains, that with regard to the situation of *hades*, it seems always to have been conceived both by Jews and Pagans, as in the lower parts of the earth, and corresponding in depth to the height of the visible heavens, both which are on this account contrasted in sacred writ. See Job, xi. 7, 8, 9. Psal. cxxxix. 8. Amos ix. 2, 3. Besides, the inhabitants of *hades* are, from their subterranean abode, denominated in the New Testament, (Phil. ii. 10.) *καταχθονιοι*, a word of the same import with the phrase *ὑποκατω της γης*, *under the earth* (Rev. v. 13.) which, with the *επουρανιοι* and *επιγειοι*, celestial and terrestrial beings, include the whole rational creation. In proof of the coincidence of the Hebrew and Pagan notions concerning the situation of the place of departed spirits, he refers to the lines of Virgil, *Æn.* viii. v. 243. &c.

*Non fecus, ac si quâ penitus vi terra debiscens
Infernas referet sedes, et regna recludat
Pallida, diis invisa; superque immane barathrum
Cernatur, trepidantem immisso lumine manes.*

Dr. Campbell farther observes, that *keber*, the Hebrew word for *grave*, is never rendered in the ancient translation *ἀδης*, but *ταφος*, *μνημα*, or some equivalent term; whereas *sheol* is never rendered *ταφος*, or *μνημα*, but always *ἀδης*. This word is also always singular in meaning, as well as in form; but the word for *grave* is often plural: and the former never admits the possessive pronouns, being the receptacle of all the dead, and therefore incapable of an appropriation to individuals; the latter often. In *hades* all the dead are represented as present, without exception; but the case is quite different with the graves or sepulchres. If. v. 14. ch. xiv. 9. See also Job xxxviii. 17. in which the challenge to Job could have no relation to a sepulchre, the door or entry to which is always known to the living; whereas the case was very different with regard to the habitation of departed spirits. Upon the whole, Dr. Campbell concludes, that the word *grave*, or *sepulchre*, never conveys the full import of the Hebrew *sheol*, or the Greek *hades*. This author proceeds to examine the sense of *ἀδης*, *hades*, in the New Testament; and refers to Acts ii. 27. in which the writer, in using two expressions, one regarding the soul, the other the body, would undoubtedly adapt his language to the received opinions concerning each; and if this be the case, *hades* was as truly, in their account, the soul's destiny after death, as corruption was that of the body. Another clear proof from the New Testament, says Dr. Campbell, that

hades denotes the intermediate state of souls between death and the general resurrection, occurs in Rev. xx. 14. where the expression denotes that death, and the state of souls intervening between death and judgment, *i. e.* *hades*, shall be no more; but that to the wicked these shall be succeeded by a more terrible death; *hell*, properly so called. See also ch. vi. 8. The apostle Paul, it is said, without naming *hades*, conveys the same ideas of the state of souls departed. Rom. x. 6, 7. *Hades* is often used figuratively to denote a humble and miserable state; and thus it is opposed to *heaven*. Matt. xi. 23. xvi. 18. Here it may be observed, with Grotius, (Truth of Christian Religion, p. 308. Clarke's edit.) and many others, that *πυλαι αδου*, *the gates of hades*, are a very natural periphrasis for death. So the expression is used by the Seventy as a literal version of the Hebrew. If. xxxviii. 10. See also Wisdom of Solomon xvi. 13. The classical use of this phrase is the same with that of the inspired writers. Homer makes Achilles say, as rendered by our English poet:

Who can think one thing and another tell,
My soul detests him as the gates of hell:

εικος αιδου πυλῆσι. Il. lib. ii.
i. e. I hate him as death, or mortally.

To say then, that *the gates of death shall not prevail* against the church, is, in other words, to say, it shall never die, or be extinct. The only passage, says Dr. Campbell, in holy writ, which seems to countenance the opinion, that *ἀδης*, *hades*, means the same thing as *γεεννα*, *gehenna*, or a place of punishment, is in Luke xvi. 23. According to the explication given of this passage, the rich man and Lazarus were both in *hades*, though in very different situations; the latter in the mansion of the happy, and the former in those of the wretched. When *hades* is represented as being under the earth, and heaven, or the seat of the blessed, as being above the stars, these expressions should be regarded merely as attempts to accommodate what is spoken to vulgar apprehension and language. See Campbell's Four Gospels, translated from the Greek. Prelim. Diff. vol. i. p. 206.—236. See SLEEP of the Soul.

ADES, in Geography. See RHADES.

ADESA, or ADESA, a river of Lycia, in Asia Minor. A town of this name is placed by M. d'Anville, on a small river, which unites with a much larger, called Xanthus.

ADESSE, or ADESTA road, lies on the west side of the island of Teneriffe, and six leagues east from Gomera island road, which is opposite. It is open to the south-west.

ADESSENARII, formed of the verb *adesse*, *to be present*, in Ecclesiastical History, a name given to those who in the 16th century held that Jesus Christ is really present in the eucharist, but in a manner different from that which is maintained by the Romanists. The *adesseuarii*, called also *impanatores*, are divided into four different opinions concerning this point. Some hold that the body of Jesus Christ is in the bread; others, that it is about the bread; others, that it is with the bread: and lastly, others, that it is under the bread. See IMPANATION.

ADFFECTED, or AFFECTED Equation, in Algebra, is that in which the unknown quantity is found in two or more different degrees or powers: *e. g.* $x^3 - px^2 + qx = a^2b$, which has 3 different powers of x , viz. x^3 , x^2 , and x^1 . See EQUATION. The term *affected* is sometimes used in speaking of quantities that have co-efficients. Thus, in $2a$, the quantity a is said to be affected with the co-efficient 2: and an algebraic quantity is said to be affected with the sign $+$ or $-$, or with a radical sign, when these signs are prefixed

to it. The term affected, or affected, is said to have been introduced by Vieta.

ADFILIAION is used to signify a Gothic custom, where a person remarrying, who has children by a former bed, renders them capable of inheriting equally with the common children of both parties. This is done by agreement, and is otherwise called by some *adeptio per matrimonium*. This custom is still retained in Germany, under the name *einkindchaft*, and *unio prolium*. But the learned Hinneccius observes, that the unio prolium is not an **ADOPTION**. Elem. Jur. Germ. tom. i. § 161.

AD FINES, in *Ancient Geography*, a town of Switzerland, supposed to be the modern *Pfin*, in the north of the district of Turgaw, on the river Duro, or Thur, not far from the borders of Swabia, about half way between Constance and Fraftenfeld. It is so called, because at the time when Cæcinnus, the general of the emperor Vitellius, with the auxiliary Rhetians, defeated the Helvetii, the former extended their borders thus far; and in the time of the Romans, it was the last town of repute in this quarter.

ADGADNA, in *Geography*, a town in the Guan, one of the Mariana isles in the South Sea.

ADGE, AGDE or AUDE, is a river that falls into the gulf of Lyons. It is north-east from Narbonne, between Beziers and Montpellier, and forms a good bay.

ADHA, among the Mahometans. See **BAIRAM**.

ADHAD-EDDOULET, in *History*, second prince of the race of Buiah, or Dilamites, was born about A. D. 935, and succeeded his uncle, Amad-eddoulet, in the empire of Persia; and by the additions he made to it, became the most powerful prince in the east. In 977, he became emir and master of Bagdad, and directed his attention to the improvement of his extensive dominions. He built hospitals, founded mosques, cleansed the beds of rivers, and recovered and rendered more salubrious large tracts of land. He encouraged literature and poetry, and cultivated a taste for science, and a proficiency in that kind of knowledge which was most esteemed among the Arabs. By marrying one of his daughters to the caliph Al Tay, he mingled the blood of the Buians with that of the ancient sovereigns of the Moslems. His ambition led him to commit occasional acts of severity; but his government was, upon the whole, wise and beneficent. He fell a sacrifice to repeated attacks of the epilepsy, at the age of 47, A. D. 982, and left four sons, who shared his dominions. When this prince was at the point of death, he is reported to have said, with a faltering tongue, "What have all my riches and prosperity availed me? My power and authority are now at an end!" and these words he continued repeating till he expired. Mod. Un. Hist. vol. ii. p. 410.

ADHATODA, in *Botany*, a species of **JUSTICIA**. This name is given to it in the Zeylanic tongue, from its supposed virtue of expelling the dead fetus, which it signifies.

ADHERENCE, *action of*, in the *Scots Law*, is an action competent to a husband or wife, to compel either party to adhere in case of desertion.

ADHERGAT, in *Geography*, a town of Syria, on the frontiers of Arabia.

ADHESION, or ADHERENCE, compounded of *ad*, to, and *hære*, to stick, in a general sense, the state of two bodies which are joined or fastened together, either by mutual attraction, the interposition of their own parts, or the impulse or pressure of external bodies. Anatomists sometimes observe prosphyfes, or adhesions of the lungs to the side of the thorax, the pleura, and diaphragm, which give occasion to various disorders. We also read of adhesions of the dura

mater to the cranium; of the stone to the bladder, though some combat this last as a chimera; at least the instances of it are rare. We have also several cases of adhesions of the intestines, mentioned in the Philosophical Transactions, N° 481. The adhesion of two hollow hemispheres and of two polished planes exhibit other instances of adhesion. See **ADHESION infra**.

ADHESION, in *Logic*. The schoolmen distinguish two kinds of **CERTITUDE**; the one of speculation, which arises from the evidence of the thing; and the other of adhesion, or attachment, which does not depend on the evidence, but on the importance of the matter, and the interest we have in its truth.

ADHESION, or ADHERENCE, is also used for the persisting in a former opinion or resolution. After the free conference between the two houses concerning the bill for preventing occasional conformity, when the Lords retired, and it came to the final vote of adhering, they were so equally divided, that in three questions put to different heads, the adhering was carried but by one vote in every one, and by a different person each time. The Commons likewise adhered; and thus the bill was lost.

ADHESION, adhesion, Fr. in *Philosophy*, and *Chemistry*, is a term generally made use of to express the property which certain bodies have of attracting to themselves other bodies, or the force by which they adhere together: thus, water *adheres* to the finger, mercury to gold, &c. Hence arises an important distinction between two words, that in a loose and popular sense are often confounded. *Adhesion* denotes an union to a certain point between two dissimilar substances, and *cohesion* that which retains together the component particles of the same mass. See **COHESION**.

Adhesion may take place either between two solids, as two hemispheres of glass, which, according to an experiment of Desaguliers, adhere to each other with a force equal to 19 ounces on a surface of contact $\frac{1}{16}$ of an inch in diameter; or between solids and fluids, as the suspension of water in capillary tubes; or lastly, between two fluids, as oil and water.

The proximate cause of adhesion has been variously stated by different philosophers. James Bernoulli, in his Dissertation on the Weight of the Atmosphere, published in 1682, maintains, that the resistance which two pieces of polished marble oppose to their separation, is owing to the pressure of the air; in proof of which, he affirms as a fact (what in all probability he had himself never attempted to verify), that the two plates were easily separable *in vacuo*.

Dr. Brook Taylor having observed, in 1713, the ascent of water between two planes of glass, was induced to make several experiments on the adhesive power of surfaces, from which he concluded that the degree of this force might be measured by the weight required to separate them. About the same time Mr. Hawksbee proved experimentally the error which Bernoulli had fallen into, in attributing the adhesion of surfaces and capillary attraction to the pressure of the atmosphere, (*Philos. Transf. vols. xxv. xxvi. xxvii.*) Nevertheless, in 1772, M. M. Lagrange and Cigna, taking for granted a natural repulsion between water and oily substances, imagined if there was an adhesion between water and oil, or tallow, that it must be occasioned by a cause different from attraction; and having ascertained the reality of the adhesion, they concluded that it was occasioned by the pressure of the air, and that Dr. Taylor's method was not well founded.

Such was the state of opinions on the subject, when, in 1773, Guyton Morveau made his celebrated experiments on adhesion

adhesion in presence of the Dijon academy, (Journ de Physique, i. p. 172 and 460.) demonstrating, as indeed Hauksbee had done before him, not only that water ascends between two parallel plates of tallow separated from each other $\frac{1}{2}$ of a line, but also that the atmospheric pressure is not in the least degree the cause of the phenomenon, which is solely attributable to attraction: in proof of this, a polished disk of glass, 30 lines in diameter, was suspended to the arm of a balance, and brought into contact with a surface of mercury; the counterpoise required to separate it was equivalent to 9 gros, and a few grains, and upon moving the apparatus into the receiver of an air-pump, and forming as perfect a vacuum as possible, precisely the same counterpoise was required as before.

In the prosecution of his inquiries on this subject, which hitherto had principally interested the mathematical philosophers, Morveau was led to discoveries, which promised at first to reduce the intricate science of chemical affinities to the certainty of algebraic computation; and, if that hope has since been deceived, it still remains an interesting object to the chemist, and affords much subsidiary assistance in the investigation of the general laws of chemical agency.

He observed, that the same disk of glass which, when in contact with pure water, adhered to it with a force equal to 258 grains, required a counterpoise of only 210, in order to separate it from a solution of potash, notwithstanding the superior density of this last. This inequality of effects on equal diameters, and in an inverse order to that of the respective specific gravities of the two fluids, appeared not only to be decisive in favour of Dr. Taylor's method, but to encourage the hope of applying it to the calculation of chemical affinities.

In order to verify this proposition (Elémens de Chymie, de l'Académie de Dijon, vol. i. p. 63.) plates of the different metals in their highest state of purity were procured, perfectly round, an inch in diameter, of the same thickness, well polished, and furnished with a small ring in the centre of each so as to keep them suspended precisely parallel to the plane of the horizon. Each of these plates was in turn suspended to the arm of an assay balance, and exactly counterpoised by weights placed in the scale attached to the opposite arm; the plate thus balanced was applied to the surface of some mercury in a cup about two lines beneath it, by sliding the plate over the mercury as in the silvering of mirrors, so as to exclude every bubble of air, weights were then successively added till the adhesion between the plate and mercury was broken. Fresh mercury was used for each experiment. The following is the Table of results.

Gold adheres to mercury with a force equal to	446 grains.
Silver	429
Tin	418
Lead	397
Bismuth	372
Zinc	204
Copper	142
Antimony (regulus)	126
Iron	115
Cobalt	8

The striking differences in the above Table shew that the pressure of the atmosphere has no share in them, since in this respect the circumstances of each were precisely similar; nor do they depend on the respective specific gravities; for if so, silver should rank after lead, cobalt before zinc, and iron before tin. The only order which agrees with the above is that of the chemical affinity of these metals, or the respective degrees of their solubility in mercury (See AMAL-

GAM): it is highly probable, therefore, that at least the principal part of the adhesive force thus found by experiment is owing to chemical affinity, and that the above numerical series 446, 429, 418, 397, &c. is an approximation towards the ratio of the relative affinities of gold, silver, tin, lead, &c. for mercury.

M. Achard, of Berlin, convinced by Morveau's discoveries of the accuracy of Dr. Taylor's method, followed them up by a great multitude of experiments which were published in 1780, along with other tracts in his *Chymisch Physische Schriften*. The results of these, if accurate, would make a considerable accession to the science of chemical philosophy, but as there are some rather suspicious circumstances, it will be necessary to investigate M. Achard's system with some minuteness.

He lays down three conditions as essential to the accuracy of each experiment. 1. That the solid, whose adhesion with the fluid is to be ascertained, should be suspended by its true central point, in order to be in a truly horizontal position, and that the force employed to separate the adhesion should always form a right angle with the fluid. 2. That no air bubble should remain interposed between the solid and fluid; which is easily perceived when using disks of glass, but can only be inferred when using opaque solids; to obviate this cause of inaccuracy he has found no method answer so well as sliding the plates on the surface of the fluid as explained above. 3. In adding the counterpoise, especially towards the end, care must be taken to use very small weights, such as pieces of paper, a quarter of a grain each, and to place these in the scale, gently and gradually, so as to avoid any jerk or sudden action.

The first point to be ascertained was, whether the temperature remaining the same, the difference of atmospheric pressure, as evinced by the barometer, had any influence on the adhesion of surfaces; he found that in this respect there was no difference in the adhesive force between a plate of glass and distilled water.

The results were, however, no longer uniform, when he operated at different temperatures with the same elevation of the barometer, nor did this variation arise from the different temperatures of the surrounding air, but solely from that of the water: pursuing this train of experiment he found that the adhesion of solids to fluids is constantly in an inverse ratio to their temperature: and for the verification of his experiments he instituted a number of calculations from the following data. Let x be the temperature of the water; y , the corresponding adhesion; b , its co-efficient; and a the constant force; hence we have the equation $x = a - by$. To find the value of a and b he made use of two experiments, the one in which water at 104° of Sulzer's thermometer (152° . 278 Fahrenheit) adhered to the glass disk with a force equal to 80 grains, the other where water at 56° S. (96° . 764 Fahrenheit) adhered with a force equal to 89 grains. Proceeding from these two terms $104 = a - 80b$

$$56 = a - 89b$$

$$\text{we have, } a = 530$$

$$b = \frac{-48}{9}$$

Hence the relation of the temperature of the water to its adhesion to the glass, may be thus expressed, $x = 530 - \frac{48}{9}y$; and from this are deduced the corresponding values of x and y for all the adhesions of glass to water at any temperature.

From these data, and the corresponding experiments, M. Achard

Achard formed the following Table of the adhesive force of a glass disk, $1\frac{1}{2}$ inch in diameter, to water at different temperatures.

TABLE I.

Degrees of Sulzer's Therm.	Degrees of Fahren. Therm.	Adhesion by Experiment.	Adhesion found by Calculation.	Difference.
95	141.687	81.25grs.	81.55	-0.3
90	135.914	82.5	82.5	0
85	130.141	83.75	83.43	+0.34
80	124.368	84.5	84.37	+0.13
75	118.595	85.75	85.31	+0.46
70	112.822	86.	86.25	-0.25
65	107.049	87.25	87.18	+0.07
60	101.276	88.5	88.12	+0.38
55	95.503	89.	89.06	-0.06
50	89.730	90.25	90.	+0.25
45	83.957	90.75	90.93	-0.16
40	78.184	92.	91.87	+0.13

Of the accuracy of this Table of M. Achard's there seems no reason to doubt, since, in the individual instances, the difference between the force of adhesion found by experiment, and that ascertained by calculation, is so considerable as to exclude the idea of fiction; while, upon the general average, the difference is so small as to give a high opinion of the precision with which the enquiry has been conducted.

We learn from this Table, that for every degree of Sulzer's thermometer (1.1565 Fahren.) taken in a descending series, the force with which a glass disk 1.5 inches in diameter adheres to the surface of water, is increased by 0.1876 grains according to calculation, or 0.1858 by experiment, in an uniform ratio: now two things take place during the cooling of the water, viz. a portion of caloric is separated, and the bulk of the water is lessened: each of these causes may account for the increased adhesive force, but upon different principles. If it is owing to the escape of caloric, it may be accounted for in the following way. Water at any state of liquidity is, properly speaking, a compound of caloric and water, which combine together by a slight degree of affinity; and in proportion to this force resist the union of any third substance either with the caloric or the water: if part of the caloric is taken away, the water is more disposed to union with a third substance by the whole quiescent affinity of the water and the abstracted caloric; therefore the force by which a plate of

glass adheres to water is increased, exactly in proportion to the diminution of the temperature, or, in other words, the increase of weight is the exponent of the quiescent affinity between the mass of water and the caloric taken away. According to Morveau's observations on this same Table; "The adhesion is stronger when the water is colder, because containing more ponderable matter in a given volume, it presents to the glass-plate more points of contact; and the force of adhesion being proportional to the sum of these points, it ought to augment or diminish, as the fluid is condensed by cold, or rarefied by heat." These few words express the aim and object of all the experiments of Morveau on this subject; namely, that chemical affinity is only a modification of the attraction of cohesion, and in like manner subject to mathematical computation. The general reasonings on which this opinion is founded will be discussed hereafter in the article *CHEMICAL AFFINITY*; all that is necessary here, is to shew, that the argument just mentioned, deduced from M. Achard's Table, is liable to a very strong objection. The fact being allowed, that the adhesion becomes uniformly greater in proportion to the diminished temperature of the water, it follows, that if this adhesion is owing simply to the cohesive attraction of the proximate particles of the glass and water, the degree of this force will be according to the number of proximate particles in a given superficies; or, in other words, directly as the specific gravity. Now, by the experiments of Achard, the adhesion between the glass-plate and water at 152° Fahren. is equal to 80 grains, and at 96° Fahr. equal to 89 grains. From Kirwan's experiments on specific gravity (*Phil. Transf. vol. lxxv. pt. 1. p. 267.*) it appears, that the weight of a cubic inch of water at 152° Fahr. is equal to 248.7 grains; and the same at 96° Fahr. equal to 252.47 grs.; if, therefore, the adhesion is as the specific gravity, the adhesive force at 96° Fahr. ought to be only 81.21, instead of 89. for

$$248.7 : 80 :: 252.47 : 81.21.$$

Having ascertained the influence of temperature on the adhesion of surfaces, the next object with M. Achard was to determine the ratio between the force of adhesion and the superficial magnitude of the solid. For this purpose he procured round plates of glass of different diameters, from 1.5 inch to 7 inches, and having first determined the force of their adhesion with the different fluids, by the number of grains necessary to overcome it, he afterwards calculated the same by the following equation. Let p be the force of adhesion belonging to a disk of glass, whose diameter is a ; and y the adhesive force of a similar disk, whose diameter is b , we shall then have $a^2 : b^2 :: p : y$; and $y = \frac{b^2 p}{a^2}$.

From these materials the following Table has been constructed.

TABLE II.

The force of adhesion between glass disks of different diameters, and different kinds of fluids, determined by experiment and calculation.

Diameter of the disks.	Distilled water.		Alcohol.		Liquid ammonia.		Solution of potash.		Oil of Turpentine.		Lined oil.	
	Experim. grs.	Calcul. grs.	Exper. grs.	Calcul. grs.	Experim. grs.	Calcul. grs.	Experim. grs.	Calcul. grs.	Experim. grs.	Calcul. grs.	Experim. grs.	Calcul. grs.

Hence it appears, that the difference of adhesion manifested by different sized disks of glass with the same fluid, is in the ratio of the squares of their diameters; and this may be admitted as true, at the same time that it may be doubted whether the Table expresses faithfully the results of the experiments. If we bear in mind the first of the conditions which M. Achard himself lays down as essential for the correctness of the experiment, namely, that the disk should be suspended by the true centre of its mass and figure, and that the force employed to detach it should always form a right angle with the plane of the disk, and of the fluid, it will be obviously extremely difficult to procure the concurrence of these circumstances, when operating even with the smallest of the disks mentioned in the Table; and with larger disks, the causes of error must increase at least in proportion to the squares of their diameters. By comparing the differences

between experiment and calculation, when a disk 1.75 inch in diameter was used, with those that took place when a disk 7 inches in diameter was used, we shall find them to be according to the Table, 0.999799 : 1.000025; whereas, if the probable causes of error were only as the diameters, the proportion ought to be 0.999799 : 4.000100; and if the squares of the diameters are admitted as the true proportion, then it should be 0.999799 : 21.700542.

Besides the experiments already mentioned, a series of 600 more was made by M. Achard, with different solids formed into disks of equal diameters, and applied to the surface of some of the simpler and more compound fluids; unfortunately several of the solids and fluids are so heterogeneous in their chemical composition as to afford few important results: those which are of most consequence are assembled in the following Table:

TABLE

T A B L E III.

The force of adhesion of different solids, in disks 1.5 inch in diameter, with water and other fluids, at 75° Fahrenheit's thermometer, determined in grains.

SOLIDS.	Fluids.	Distilled water.	Sulphuric acid.	Concentrated vinegar.	Alcohol.	Acetite of lead.	Acetite of copper.	Deliquated potash.	Liquid ammonia.	Sulphuric ether.	Oil of turpentine.	Oil of almonds.
		Specific gravity.	1000.	1868.4	1019.7	342.	1131.5	1000.	1368.4	1046.	828.9	881.5
Plate-glass	- -	91.	115.	87.	54.	98.	96.	105.	82.	54.5	60.	66.
Rock crystal	-	90.	112.	86.	52.	98.75	95.	103.	80.	53.	58.5	66.
Gypsum	- -	80.	199.75	78.	46.5	87.25	85.	93.	71.	48.	52.5	56.5
Sulphur	- -	96.5	123.	92.5	58.	107.	101.5	110.5	86.	57.5	64.	69.
Yellow-wax	-	97.	120.5	92.75	56.5	106.5	103.	111.	88.	59.	64.	71.
Iron	- - -	93.5	116.	88.	56.	104.	98.25	108.	83.5	55.5	61.	68.
Copper	- - -	96.5	123.	92.	57.25	106.	102.	112.	87.	58.	62.5	68.75
Tin	- - -	94.5		91.	55.5	103.5	100.	108.5	86.	54.75	61.	69.
Lead	- - -	100.25	129.25	98.	59.	111.	107.	115.	91.5	61.	67.	72.
Brass	- - -	99.	124.5	96.	59.	110.	103.5	114.	90.	60.	65.	70.5
Zinc	- - -	96.		90.25	57.	106.25	102.	110.	85.75	56.75	61.25	69.

If this Table may be at all depended upon, the results are very extraordinary, as will appear at once by arranging the articles in the several columns according to the order of their adhesion. Thus

T A B L E IV.

Distilled water.	Sulphuric acid.	Concentrated vinegar.	Alcohol.	Acetite of lead	Acetite of copper	Deliquated potash.	Ammonia.	Sulphuric ether.	Oil of Turpentine.	Oil of almonds.
Lead	Gypsum	Lead	Lead	Lead	Lead	Lead	Lead	Lead	Lead	Lead
Brass	Lead	Brass	Brass	Brass	Brass	Brass	Brass	Brass	Brass	Wax
Wax	Brass	Wax	Sulphur	Sulphur	Wax	Copper	Wax	Wax	Sulphur	Brass
Sulphur	Sulphur	Sulphur	Copper	Wax	Copper	Wax	Copper	Copper	Wax	Sulphur

Gypsum	Gypsum	Gypsum	Gypsum	Gypsum	Gypsum	Gypsum	Gypsum	Gypsum	Gypsum	Gypsum

Hence it is manifest that the strength of adhesion is not owing either to the specific gravity of the solid or of the fluid; nor is it at all more consistent with the acknowledged order of chemical affinities. Why lead and brass should generally be the first in each column, and why sulphur and wax should be interposed between these and the rest of the metals, is wholly unaccountable, and contradictory to all known chemical facts. The column, at the head of which is the acetite of lead, contains besides several peculiar difficulties. The plates of zinc, iron, and tin, would begin to decompose this salt as soon as they came in contact with it, and would in consequence be superficially covered with lead; the acquired weight of lead, therefore,

and the loss of substance sustained by the metallic plates, would be two powerful disturbing causes in the performance of the experiment; besides, as each of the plates would be coated with lead, the greatest part of the adhesive force ought to be reckoned as belonging to the adhesion of lead to acetite of lead, and in consequence the three corresponding numbers in Tab. III. ought to be nearly equal, which they are not; the same objections, and perhaps with still greater force apply to the column whose title is acetite of copper, on account of the more perfect adhesion of the received copper to the surface of the zinc and iron plates.

In the Journal de Physique (vols. xv. xvi. and xix.) is a series of papers by M. Dutour, on the subject of capillary attraction,

attraction, which contains some excellent observations on Dr. Taylor's method: he maintains, that the force of adhesion is then only truly expressed by the weight of the counterpoise, when upon raising the solid plate out of the fluid no particles of this last are found adhering to it: thus the adhesion of mercury to glass, to marble, to those metals with which it does not readily amalgamate, is accurately expressed by the weight necessary to counterpoise this adhesion; but where the solid comes out covered with a thin plate of the fluid, as is the case when a plate of gold or silver is applied to a surface of mercury, it is obvious that the separation of the solid and fluid does not take place at their plane of adhesion, but some way below it in the substance of the mercury, so that the weight of the counterpoise is rather the expression of the cohesion of the mercury, than of the adhesion between it and the gold. Hence arises the necessity of taking into consideration the cohesive force of the fluids themselves in calculating with any accuracy the adhesion between solids and fluids, and this requires so much nicety, is so liable to be affected by small changes of temperature and other circumstances, as to preclude any great dependance upon it, in determining the comparative energy of different cases of chemical affinity.

Upon the whole then we may conclude that there exists a tendency to adhesion between many, and probably between all substances in nature, absolutely independent of atmospherical or any other external pressure; that the force of this adhesion between solids and fluids is in an inverse ratio to the thermometrical temperature, and a direct ratio to the squares of the surfaces; that every solid adheres with a peculiar force to each fluid, and that the different degrees of adhesive force between the same fluid and equal surfaces of different solids form a series which corresponds with the order, and is perhaps the exponent of the proportion of their respective chemical affinities to the same fluid; that this force is truly expressed by the weight necessary to break the adhesion in all cases where the solid comes out clean from the fluid, but that whenever any particles of the fluid adhere to the solid, the weight of the counterpoise is then expressive of the mixed forces of the adhesion between the surfaces of the solid and fluid, and of the cohesion between the component particles of the fluid, which last case in the present state of our knowledge, cannot be depended on with any accuracy in the calculation of chemical affinities. *Encyclop. Method. Art. Adhesion.*

Some, however, have supposed, and others have allowed, that, although in the case of polished planes, brass hemispheres and leaden bullets, which adhere to one another with a considerable force both in the air and in vacuo, the principal cause is their mutual attraction, yet the pressure of the air may contribute in a slight degree to their adhesion. But the effect of this cause is very inconsiderable, and, compared with the other, scarcely deserves notice.

ADHESION, in *Surgery*, the same as AGGLUTINATION, a preternatural process, by which various parts of the body cohere together and become one mass. A partial cohesion, for example, often takes place between the pleura of the lungs and ribs, between the heart and pericardium, the liver and diaphragm, or between other contiguous viscera, after an attack of inflammation. This process also follows if two abraded or ulcerated surfaces be applied for some time to each other, as when the fingers have been severely burnt and not kept asunder. What is called "healing of wounds by the first intention," likewise comes under this denomination: the doctrine of *adhesion* is, therefore, of considerable importance in surgery, and should be carefully attended to. The right understanding of this doctrine has

led to many of the greatest improvements in modern practice, especially in the extirpation of TUMORS, in the treatment of recent WOUNDS and in AMPUTATION. The perfect UNION of living parts can only happen where there is a mutual elongation or inoculation of the blood-vessels at the two contiguous surfaces, or at least where the vessels from one part shoot into the adjacent substance, and thus keep up a vital communication.

ADIII., in *Astronomy*, a star of the sixth magnitude, upon the garment of ANDROMEDA, under the last star in her foot.

ADHOA, in *Ancient Customs*, denotes what we otherwise call RELIEF. In which sense we also sometimes find the word written *adoba*, *adhoamentum*, and *adhogamentum*. Du Cange.

ADJA, or AGGA, in *Geography*, a burg and fort of Guinea, on the coast of Fantin, belonging to the East India Company.

ADIABA, in *Ancient Geography*, a town built by Simon Maccabæus, in a plain, or sephala, as a place of defence.

ADIABDA, a town of Asia, in Albania, placed by Ptolemy in long. 79°, and lat. 45° 30'.

ADIABENE, the chief province of Assyria, which sometimes gave its name to the whole country. It was so called according to Ammianus, (l. xxiii. c. 20.) from the two rivers Diaba and Adiaba, which Valefius (in loc.) says, are more frequently denominated Zabas and Anzabas. Stephanus (de Urb. vol. i. p. 22.) confounds Adiabene with Mesopotamia. In this province, which was the richest and most fruitful of Assyria, Ptolemy (l. vi. c. 1.) and Ammianus place Ninus or Nineveh, Gaugamela, and Arbela; and with them Strabo (l. xvi. vol. 2. p. 1071) agrees; for though he places Ninus and Gaugamela in Aturia, and Arbela in a district of its own name, yet he makes both Aturia and Arbelis parts of Adiabene. This province became a distinct kingdom in consequence of the disturbances that prevailed among the Seleucide, and was held by successive sovereigns in opposition to the Syrian kings, till they were expelled by the power of the Roman emperors. The first king mentioned in history, reigned in the time of the Mithridatic war, and joined Tigranes against Lucullus. In the reign of the emperor Claudius, Monobazus, called also Bazeos, ruled over the Adiabeniens; who was succeeded by Izates, his son, by his sister Helena, whom he had married. Izates, being instructed in the Jewish religion (see Jos. Antiq. l. xx. c. 2. tom. 1. p. 957, &c. Ed. Haverc.) introduced it among his subjects; upon which they conspired against him, and called in Abias the king of Arabia, to their assistance. Failing in this attempt, they solicited the assistance of Vologeses, king of the Parthians; he was equally unsuccessful; and Izates closed his life and reign in peace, and left five sons, who were educated under their grandmother Helena at Jerusalem, and there taught both the Jewish language and religion. Little is known concerning the affairs of this kingdom from the death of Izates, who was cotemporary with the emperor Claudius, and who bequeathed his crown to his brother Monobazus, until the reign of Trajan, when it was governed by one Mebarfapes, who joined Chosroes, king of the Persians, against the Romans. This war proved unsuccessful, and Mebarfapes was driven from the throne; and though Manus king of Arabia, attempted to restore him to the kingdom, his enterprise for this purpose was ineffectual, and he was obliged to conclude a peace with Rome. Trajan, having obtained possession of Adenystræ, a fortified place of great strength, which was delivered to him by Sentius, a centurion, who had escaped the treachery

of Mearnsapes, formed a bridge of boats over the river Tigris, and made himself master of the whole kingdom of Adiabene, A. U. C. 863, or in the 115th year of the Christian æra. The Adiabeniens, however, emancipated themselves from the Roman yoke; but were again reduced by Severus, A. U. C. 948, denominated from this circumstance Adiabeniens. See Dion. Cass. Hist. Rom. vol. ii. p. 1137. Ed. Reimari. In the reign of Sapor II. king of Persia, the Adiabeniens, as we learn from Sozomen (l. ii. c. 12.) embraced the Christian religion, and were on that account treated with great cruelty by this king, to whom they were subject.

ADJACENT, or ADJOINING, of *ad, to, and jacere, to lie*, something situate near, or by the side of another.

ADJACENT *angle*. See ANGLE.

ADIADA, in *Ancient Geography*, a town of Palestine, in the tribe of Dan. See ADIDA.

ADIANTUM, *Maidenhair*, in *Botany*, the name of a genus of plants of the *cryptogamia filices* class and order, the characters of which are these; that the fructifications are collected in oval spots, at the end of the fronds or leaves, which are folded back; or at the reflex tip of the frond underneath. Prof. Martyn enumerates thirty-five, and Gmelin forty-four, species; of these some have a simple frond, viz. 1. *A. reniforme*, a native of the island of Madeira, and introduced here, in 1778, by Mr. F. Masson. 2. *A. sagittatum*. 3. *A. philippense*, a native of the Philippine islands. 4. *A. repens*, native of the isle of France. 5. *A. decurrens*. Others have a compound frond, viz. 6. *A. trilobum*, native of America. 7. *A. radiatum*, an elegant plant, with small fronds, a native of Jamaica and Domingo. 8. *A. pedatum*. 9. *A. fuscum*. 10. *A. caudatum*, native of the East Indies and Japan. 11. *A. ferrulatum*, native of Jamaica. 12. *A. hastatum*, native of the Cape of Good Hope. 13. *A. lanceum*, native of Surinam. 14. *A. macrophyllum*, native of Jamaica. 15. *A. deltoideum*, native of Jamaica. 16. *A. pumilum*, native of Jamaica. 17. *A. cuneatum*, native of Jamaica. 18. *A. triphyllum*, a beautiful little fern, found by Commerfon in Buenos-Ayres. Those with a decomposed frond are; 19. *A. denticulatum*, native of Jamaica. 20. *A. flabellulatum*, native of China. 21. *A. trifoliatum*, native of America. 22. *A. chusanum*, native of China. 23. *A. capillus veneris*. 24. *A. truncatum*. 25. *A. guianense*. 26. *A. cristatum*, native of South America. 27. *A. furcatum*. 28. *A. striatum*, native of Jamaica. 29. *A. serratum*. 30. *A. villosum*, native of Jamaica. 31. *A. pulverulentum*, native of South America. 32. *A. cafferorum*. 33. *A. fragrans*, or *Polypodium fragrans*, native of Madeira, introduced here, in 1758, by Mr. F. Masson. 34. *A. striatum*, native of Jamaica. 35. *A. microphyllum*, native of Jamaica. 36. *A. borbonicum*. 37. *A. tenellum*. 38. *A. scandens*, native of Cochinchina. Those with a super decomposed frond are, 39. *A. fragile*, native of Jamaica. 40. *A. tenerum*, native of Jamaica. 41. *A. clavatum*, native of Dominica. 42. *A. trapeziforme*, native of New Zealand, and between the Tropics. 43. *A. aculeatum*, native of Dominica and Jamaica. 44. *A. hexagonum*, or *PTERIS heterophylla*. 45. *A. pteroides*, native of the Cape of Good Hope, introduced, in 1775, by Mr. F. Masson. 46. *A. Æthiopicum*, native of the Cape of Good Hope and Japan.

Of all the species above enumerated one only belongs to Great Britain, viz. the *A. capillus veneris*, or true maiden-hair, which is found rarely in Scotland and Wales on rocks and moist walls, and which is a native of the south of Europe and the Levant. The fronds or leaves of this species are doubly compound; the leaflets or wings are alternate;

the pinnae or leaflets are wedge-shaped, lobed, and pedicelled, or on leaf-stalks: it is perennial, and flowers from May to September. This is a very succulent plant, yielding almost its whole weight of juice; but neither its taste nor smell promises any efficacy. If the syrup of capillaire, which is made from it, be good for any thing, it is from the orange-flower water that is put into it. The *A. pedatum*, or Canadian maiden-hair, is a native of Canada, Japan, and the Society isles, and was brought into England from Virginia by John Tradescant, the son, before the year 1640. It flowers in August and September. In Canada this plant grows so plentifully, that the French, when they were in possession of that country, sent it to France as a package for goods, and the apothecaries at Paris used it instead of the true maiden-hair. The leaves of both these species have a slight sweetish roughish taste, and a pleasant but weak smell, very perceptible when boiling water is poured upon them. Infusions, or decoctions of them inspissated, yield a moderately rough, bitterish, mucilaginous extract. Maiden-hair has been long esteemed good against disorders of the breast, for promoting expectoration, softening recent coughs, and allaying the tickling in the throat occasioned by distillations of thin rheum. For these purposes a syrup of the true sort, flavoured with orange-flower water, has been usually brought from France; and a syrup of the Canada sort, made with maple sugar, is sometimes received from America. Our confectioners prepare a syrup of the maiden-hair, which they sell under the name of *capillaire*. But the English maiden-hair, or ASPLENIUM, has been commonly substituted in the pectoral syrups and infusions made among us. The Canada species is said to be superior to both. But the virtue of the maiden-hair may be obtained to much greater advantage, by drinking an infusion of the herb as tea, sweetened either with sugar, or by the addition of a little liquorice. Lewis, Mat. Med.

Culture. The only species that have been cultivated with us are the 1st, 8th, 23d, 30th, 33d, 42d, and 45th, in the above enumeration. The *A. capillus veneris* may be preserved in pots filled with gravel and lime-rubbish, in which it will thrive much better than in good earth. The *A. pedatum* will live through the winter in the open air, if the season be moderate; but as severe frosts will sometimes destroy it, a plant or two should be kept under shelter. The *A. villosum*, and *A. trapeziforme* must be preserved in a stove, and will afford by their shining black stalks, and odd-shaped leaves, an agreeable variety among other exotic plants. The *A. reniforme*, *fragrans*, and *pteroides*, may be kept in the green-house.

ADIANTUM *aureum*. See POLYTRICHUM.

ADIANTUM *nigrum*, a species of ASPLENIUM.

ADIANTUM, in *Natural History*. See TUBULARIA.

ADIAPHORISTS, or ADIAPHORITES, compounded of *a priv.* and *διαφορος*, *different*, and denoting *indifferent*; in *Ecclesiastical History*, a name given in the 16th century to the moderate Lutherans, who adhered to the sentiments of Melancthon; and afterwards to those who subscribed the INTERIM of Charles V. Melancthon, whose sentiments were moderate, and temper mild and gentle, declared on this occasion, that, in his opinion, compliance was due to the Imperial edicts in matters of an *indifferent* nature: but both he and his associates ranked in this class many things which appeared to Luther and his disciples to be of the highest importance; particularly the doctrine of justification by faith alone, and the necessity of good works to eternal salvation, as well as the number of the sacraments, the jurisdiction claimed by the pope and the bishops, extreme unction,

nation, and the observation of religious festivals and superstitious rites. Hence sprung the *adiaphoristic* controversy, as it was called, which divided the church for many years, and obstructed the progress of the reformation. See *Form of Concord*.

ADLAPIHOROUS is a denomination given by Mr. Boyle to a kind of spirit distilled from tartar and some other vegetable bodies, and which is neither acid, visous, nor urinous; but in many respects different from any other sort of spirit.

ADLAPNEUSIA, from α , *de*, and $\pi\nu\epsilon\upsilon\sigma$, *I breathe*, in *Medicine*, signifies defective perspiration, from dense pores, &c.

ADIAPTOTOS, a Greek word signifying *firm*, and applied by some medical writers to a remedy for the colic, which is stone-parsley, herbane-seed, white pepper, &c. made into an electuary.

ADIARRHŒA, from α , *de*, and $\rho\acute{\alpha}\nu\omega$, *I flow*, signifies a total suppression of all the necessary evacuations.

ADJAZZO. See AJAZZO.

ADICARA, in *Ancient Geography*, a town of Asia, near the Persian gulf, which Ptolemy places in long. 79°, and lat. 29°, 30'.

ADICE, in *Botany*. See NETTLE.

ADIDA, ADDIDA, or ADIADA, in *Ancient Geography*, a city of Judea, not far from Jerusalem. Josephus says, (*De Bell. Jud. l. iv. c. 9. tom. 2. p. 300. Ed. Haverc.*) that when Vespasian besieged Jerusalem, he established a camp and guards in this place as well as in Jericho. Simon Macchabæus also encamped in this place to dispute the entrance into the country with Tryphon, who had barbarously seized his brother Jonathan, at Ptolemais. 1 Maccab. xiii. ch. xii. 38. *Jos. Ant. l. xiii. c. 6. § 14. tom. 1. p. 653.* *Adida* is probably the same with *ADUS*.

ADJECTIVE, in *Grammar*, a kind of noun joined with a substantive, either expressed or implied, to shew its qualities or accidents.

The word is formed of the Latin *adjicere*, *to add to*; as it is designed to be added to a substantive, without which it has no precise signification.

Father Buffier defines adjectives in a manner somewhat different from other grammarians.—Nouns, according to him, are substantives, when the objects which they represent are considered simply, and in themselves, without any regard to their qualities; on the contrary, they are adjectives, when they express the quality of an object. Thus, when I say, simply, *a heart*, the word *heart* is a substantive, because none of its qualities are expressed; but when I say, *a generous heart*, the word *generous* is an *adjective*; because it adds a quality, or attribute, to the heart. Adjectives, then, appear to be nothing else but modificatives.

In effect, the end of an adjective being only to express the quality of an object; if that quality be the object itself whereof we speak, it becomes a substantive; e. gr. If I say, *this book is good*; *good* here is an adjective; but if I say, *good is always to be chosen*, it is evident *good* is the subject I speak of; and consequently *good*, there, is the substantive.

On the contrary, it often happens in other languages, and sometimes in our own, that a substantive becomes an adjective; as, for instance, in these words: *the king, hero as he is, remembers he is a man*, where the word *hero*, though ordinarily a substantive, is apparently an adjective. From this idea of an *adjective*, it appears that many of the nouns, which, in the common grammars, are accounted substantives, are really adjectives, and *vice versa*: grammar in this, and a thousand other instances, depending upon custom.

An adjective, according to the definition of Mr. Harris,

(*Hermes*, p. 186.) has no assertion, and only denotes such an attribute, as has not its essence either in motion or its privation. Thus in general the attributes of quantity, quality, and relation, such as many and few, great and little, black and white, good and bad, double, treble, quadruple, &c. are all denoted by adjectives. Every adjective may also be considered as capable of being resolved into a substantive, and an expression of connection equivalent to *of*, e. g. a good man, is a man of goodness; in which case the adjective expresses not only an attribute, but also the connection between the attribute and its substance: and the particular kind of connection is ascertained by experience. In this view of the subject the adjective appears to have two uses. The first and principal is that of restricting or modifying a general term, as in the instances above recited. The second is, when the abstract substantive contained in the adjective is modified by the noun, with which, in the concrete or adjective form, that abstract substantive is joined. The former may be called the direct, and the latter the inverse, acceptation of *adjectives*. In the following passage, Livy says, *Regnum est Romæ ab urbe condita ad liberatam annos ducentos quadraginta quatuor*, i. e. monarchy subsisted at Rome from the building of the city to its deliverance: here the participles, or adjectives, *condita* and *liberatam*, are used inversely; i. e. the abstract substantives contained in these words are modified or restricted by the substantives *urbe* and *urbem*, with which they are supposed to unite. Mr. Harris observes (*ubi supra*, p. 187), that attributes sometimes assume an assertion, and appear as verbs: as *albeo*, or *albus sum*, *tumet* or *tumidus est*, and $\iota\sigma\alpha\lambda\acute{\iota}\varsigma$ q. d. $\iota\sigma\tau\omicron\varsigma$ $\epsilon\sigma\tau\iota$, is equal. Of these there are but few, and they may be called *verbal adjectives*. Participles likewise pass into adjectives, as *doctus* or *learned*, lose their power as participles, and mean a person possessed of an habitual quality. Thus also *vir eloquens* denotes a person who possesses the habit of speaking, and not a person now speaking. Substantives may be also converted into adjectives; when we say the party of Pompey, the style of Cicero, the philosophy of Socrates, the persons perform the part of attributes, or stamp and characterise their subjects; so that they assume the form of adjectives. And we accordingly say, the Pompeian party, the Ciceronian style, and the Socratic philosophy. Even pronominal substantives admit the like mutation. Instead of saying the book of me, of thee, and of him, we say, my book, thy book, and his book; or the country of us, of you, and of them, we say our country, your country, and their country; which words may be called *pronominal adjectives*. In English the adjective is not varied on account of gender, number, or case. Dr. Lowth, indeed, (*Intro. to Eng. Grammar*, p. 56.) excepts some few pronominal adjectives, which have the possessive case, as,

Teach me to feel *another's* woe. Pope.

and the adjectives *former* and *latter*, which may be considered as pronominal, and representing the nouns, to which they refer. The only variation which it admits of, is that of the degrees of COMPARISON.

In the Greek and Latin, however, they have the same form with substantive nouns; and are declined, like them, by cases, and subjected to the like distinctions of number and gender. It is obvious, that neither number, nor gender, nor cases, nor relations, have any thing to do, in a proper sense, with mere qualities, such as *good* or *great*, *soft* or *hard*: and yet *bonus*, *magnus*, and *tener*, have their singular and plural, their masculine and feminine, their genitives and datives, like any of the names of substances, or persons. To account for this circumstance, Dr. Blair (*Lectures*, vol. i.

p. 199) directs us to consider the genius of those tongues. They avoided, as much as possible, regarding qualities separately, or in the abstract. They made the adjective depend on its substantive, and resemble it in termination, number, and gender, in order that the two might coalesce the more intimately, and be joined in the form of expression, as they were in the nature of things. Thus also they favoured that liberty of transposition, which these languages allowed. In the English sentence, "Beautiful wife of a brave man," the juxtaposition of the words prevents all ambiguity. But in the Latin, "Formosa fortis viri uxor," it is only the agreement in gender, number and case, of the adjective "formosa," which is the first word of the sentence, with the substantive "uxor," which is the last word, that declares the meaning.

The learned Mafceles observes, (Gram. Heb. v. i. p. 56.) that in the Hebrew language, all those words are adjectives which are changed from the masculine into the feminine by the addition of the letter ך, as טוב *bonus*, טובה *bona*, &c. and therefore the Hebrews refer to the class of *adjectives* many words which we should rank as substantives. There are many distinguishing idioms of the Hebrew language that result from the use and application of the adjective: e.g. the substantive precedes it, as חזקה יר *manus fortis*; and when the contrary is the case, the verb substantive is understood, as in Pf. xxxiii. 4. Pf. xxxii. 10. except when numeral adjectives occur.

Again, the Hebrews often express their adjectives by substantives, with the prepositions ב, ל, מ prefixed; as חזקה בלילה *Pf. xc. 4. custodia in nocte, i. e. nocturna*. Thus Hebrewisms occur in Matt. xxii. 16.; Luke iv. 32. 1 Tim. ii. 7.; 2 Pet. ii. 13.; Mark v. 2.; 1 John v. 19. With ל prefixed חזקה עלי לשורה *H. i. 14. Fuertit mihi oneri, i. e. onerosi*. A similar instance occurs John viii. 52. *καταστανε εις τον αιωνα, mortem in eternum i. e. eternam*. With מ prefixed, חזקה מיער *Pf. lxxx. 14. aper de sylva, i. e. sylvestris*. Similar modes of expression occur in 1 John iv. 5. Rom. iii. 26. Rom. iv. 14. Matt. v. 37. Moreover, the Hebrews sometimes express adjectives by substantives without any preposition, or in the language of grammarians, they use the abstract for the concrete: as, לחם שערה *Jud. vii. 13. panis bordei, i. e. bordaceus*. Similar to which are Eph. v. 8.; Luke xvi. 15.; John xvii. 17.; 2 Cor. v. 21. When two substantives occur, one is sometimes taken for an adjective, and sometimes the other, as תכלית שנהא *Pf. cxxxix. 22. perfectione odii, i. e. perfecto odio*. Hebrewisms of this kind are found in 1 Cor. i. 21.; Gal. iii. 14.; 1 Cor. i. 25.; Phil. iv. 5.; 2 Pet. ii. 14. Adverbs are sometimes substituted for adjectives, as יום מהר *Gen. xxx. 33. dies cras, i. e. crastinus*. Similar expressions occur in Matt. vi. 34.; Luke x. 29.; 2 Pet. i. 9. and also in the Greek and Roman classics. See Mafceles ubi. sup. p. 256—265.

ADJECTIVES, in *Logic*, are divided into four kinds; the *nominal*, the *verbal*, the *numeral*, and the *pro-nominal*. The *nominal* are those which distinguish certain species by some inherent and permanent quality, which arises either from the nature of the thing, or from its form or situation; such as *good, black, round, external, &c.* The *verbal*, are those which denote some accidental or adventitious quality, which appears to be the effect of an action which passes, or has passed, in the thing under consideration, such as *rampart, domineering, carefing, embellishing, &c.* *Numeral* adjectives are those which rank any subject in numerical order, as, *first, second, last, &c.* *Pro-nominal* are those which do not concern either species, action, or arrangement, but are merely indications of individuality; these adjectives are either *per-*

sonal, as *mine, thine, &c.* or they have a vague and indeterminate meaning, such as *some, one, many, &c.*; or lastly, they serve the purpose of mere indication, such as, *this, that, such, &c.*

Verbal and *nominal* adjectives, are also called *concretes*. Some distinguish adjectives into *physical* and *metaphysical*; the former being used to distinguish physical essences, in consequence of the immediate impressions they make upon us; the latter to denote those which are metaphysical and abstracted, in consequence of some operations of our minds with regard to them.

ADRIENUS, or ADRIANUS, in *Ancient Geography*, a river which emptied itself into the Euxine Sea, probably near Colchis, in the territory of the Leniochi.

ADJEROUTE, in *Geography*, the name now given to the ancient HEROOPOLIS.

ADICE, anciently ARTHESIS, a river of Italy, which rises south of the lake Glare, in the Rhetian Alps, runs south by Trent, and east by Verona, and falls into the gulf of Venice, north of the mouth of the Po. This river serves by the treaty of peace between France and Austria, signed at Luneville, February 9th, 1801, for the limit between the states of his Imperial majesty, and those of the French republic; and the freedom of its navigation is established, so that neither party shall be allowed to fix any toll upon it, or to have upon it any armed ship of war.

ADJI, a river of Hindoستان, which discharges itself into the Hoogly, six miles west of Kishenagur, in the province of Bengal.

ADILL, in *Zoology*, a name given to the CANIS AU-REUS of Linnæus, and ADIVE of Bailon.

ADIMA, in *Botany*, a species of SAUVAGESIA, with ramose stalks.

ADIMAIN, a name given by Leo Africanus and Mar-mol, to a variety of sheep, called by Naturalists the *African* or *Senegal* SHEEP.

ADIMANTUS, in *Biography*, a disciple of Mani, who probably flourished about the close of the third century, and wrote a book against the law and the prophets, endeavouring to shew the disagreement between the Old and the New Testaments, and that consequently the former could not be of God. This book was confuted by Angulline, who supposed this Manichean to be the same with Addas. Tillemont likewise, Lardner, and many others are of the same opinion; but Cave (*Hist. Lit. t. i. p. 145.*) supposes them to be different persons. The book of Adimantus was every where considered by the Manichees as one of their best books. It was famous in Africa, and was also used by the Manichees in Asia, who ascribed it to Addas; but it is not now extant. Lardner's Works, vol. iii. p. 395.

ADIMARI, ALEXANDER, a descendant of the ancient and noble family of Florence, was born in that city A. D. 1579. He devoted himself in early life to the study of the Greek language, and also to poetry, translated Pindar into Italian verse, and wrote original poems. He was honoured by Ferdinand II. duke of Tuscany, and much esteemed by learned men. The troubles that befell him were alleviated by his taste for poetry, which was his occupation and delight. He died in 1649, at the age of 70 years. Gen. Dict.

ADIMARI, RAPHAEL, a native of Rimini, who lived towards the latter end of the 16th century; wrote a history of his country, which is held in good estimation, though that of Clementine is preferred by the Italians. It was published in 4to. at Brefcia in 1616, under the title of "Sito Rimenfe."

AD INQUIRENDUM, in *Law*, a judicial writ, commanding inquiry to be made of any thing touching a cause depending

depending in the king's court, for the better execution of justice; as of bastardy, or the like. Reg. Judic.

ADINSEIK, in *Geography*, a town of Asiatic Turkey, three leagues south-east of Artaki.

ADJODIN, a town of Hindostan, in the Subah of Moultan, 95 miles east of Moultan, and 68 south of Lahore.

ADJOINING is particularly used for the associating of a person to another, or appointing him a colleague, or ADJUNCT.

ADJOURNMENT, formed of *ad, to*, and Fr. *jour, day*, q. d. another day, in *Law*, the putting off a COURT or meeting; and appointing it to be kept at another time or place: in which sense we meet with the phrase *adjournment in eyre*, for an appointment of a day when the justices in eyre intend to sit again. *Adjournment* of parliament is a continuance of the session from one day to another, and is done by the authority of each house separately, every day, and sometimes for a fortnight or month together; and differs from PROROGATION and DISSOLUTION. The adjournment of one house is no adjournment of the other. After an adjournment, all things continue in the same state as at the time of the adjournment, and may be proceeded on without any fresh commencement; whereas, after a prorogation, such bills as are only begun and not perfected, must be resumed *de novo* (if at all) in a subsequent session.

ADIPOCIRE, *Gras, matiere grasse, matiere adipo-cieuse*, is a term formed of *adeps, fat*, and *cera, wax*, and denotes a substance, the nature and origin of which are explained in the sequel of this article.

The changes which animal matter undergoes in its progress towards total decomposition, have been for many obvious reasons but little attended to: the disgusting circumstances by which they are accompanied, the real danger to health, and the decent reverence for the receptacles of the dead which prevails in all countries, have hitherto opposed almost insuperable obstacles to the investigations of science on this most interesting subject; it is therefore a peculiarly fortunate circumstance, when from motives of police or general convenience, the great progress of the resolution of organized into inorganic matter, with all its various modifications, is submitted to the inspection of chemical philosophy. An opportunity of this kind was offered at Paris in 1786, and 1787, when the old burial ground of the *Innocens* was laid out for building upon, in consequence of which, the surface soil, and the animal remains contained therein, were removed. This cemetery having been for ages appropriated to the reception of the dead, in one of the most populous districts of Paris, was eminently well calculated to exhibit the various processes of animal decomposition; another favourable circumstance was, that it contained several of those large pits (*fosses communes*) in which the bodies of the poor are deposited by hundreds. These pits are cavities 30 feet deep, with an area of 20 feet square, in which the shells containing the bodies are closely packed in rows over each other, without any intermediate earth, and with only a slight superficial covering of soil, not more than a foot thick: each pit contained from 1200 to 1500 bodies, and may be considered as a mass of animal matter of the dimensions above-mentioned. M. M. Fourcroy and Thouret were present at the opening of several of these receptacles, and it is from a memoir by the former of these, that the principal part of this article is composed.

The first pit that was examined, had been filled and closed up 15 years before: on opening some of the coffins (for the wood was still quite found, only tinged of a yellow colour) the bodies were found within, shrunk so as to leave a considerable vacant space in the upper part of the coffin, and

flattened as if they had been subject to a strong compression; the linen which covered them adhered firmly, and upon being removed, presented to view only irregular masses of a soft ductile greyish-white matter, apparently intermediate between fat and wax: the bones were enveloped in this, and were found to be very brittle.

The bodies thus changed, being but little offensive to the smell, a great number were dug up and minutely examined: in some this alteration had, as yet, only partially taken place, the remains of muscular fibres being still visible, but where the conversion had been complete, the bones throughout the whole body were found covered with this grey substance, generally soft and ductile, sometimes dry, but always readily separating into porous cavernous fragments, without the slightest trace of muscles, membranes, vessels, tendons, or nerves: the ligaments of the articulations had been in like manner changed, the connexion between the bones was destroyed, and these last had become so yielding, that the grave-diggers, in order to remove the bodies more conveniently, rolled each upon itself from head to heels, without any difficulty. The whole contents of the abdominal cavity were wanting, and the muscles and integuments converted as above-mentioned, lay flat on the vertebral column; in like manner the heart and other viscera of the thorax were dissolved, nothing being left but a little white grumous matter. The glandular part of the breast in the female corpses frequently afforded this foamy matter of a homogeneous texture, and a pure white colour: the hair appeared to have undergone no alteration; the brain was not wanting in any, it was superficially of a blackish grey, and had experienced the same change as the integuments. According to the testimony of the grave-diggers, to whom the facts just mentioned had been long familiar, this conversion of animal matter is never observed in those bodies that are interred singly, but always takes place in the *fosses communes*; to effect this change nearly three years are required. The foamy matter of latest formation is soft, very ductile, light and spongy, and contains much water; in 30 or 40 years it becomes much dryer, more brittle, and assumes the appearance of dense laminae, and where the surrounding earth has been dryer than usual, it is semitransparent, of a granulated texture, brittle, and bears a considerable resemblance to wax.

Animal matter having once passed into this stage of decomposition, appears to resist for a long time any further alteration: some of these pits that had been closed above 40 years, were upon examination, found to be little else than a solid mass of foamy matter, nor is it yet ascertained how long in common circumstances it would continue unchanged, the burial ground of the *Innocens* being so small in comparison to the population of the district, as to require each pit in 30 or 40 years to be emptied of its contents, in order to receive a new succession of bodies: it appears, however, that the ulterior changes depend in a great measure on the quantity of moisture draining through the mass.

From the history of this singular substance, we proceed to an examination of its chemical properties. It was first, however, purified by gently heating in an earthen vessel, till it became of a pasty consistence, and then rubbed through a fine hair sieve, by which means the hair, small bones, and remains of the muscular fibre were separated with tolerable exactness. In this state, being exposed in an earthen vessel to the naked fire, it readily became soft, but did not liquefy without considerable difficulty, rather frying as a piece of soap would do, and disengaging at the same time ammoniacal vapours. Four pounds being put into a glass retort, and submitted to slow distillation in a water bath, afforded in the space of three weeks, eight ounces of a clear watery fluid,

fluid, with a foetid odour, turning syrup of violets green, and manifestly containing ammonia in solution; the soapy matter remaining in the retort had acquired a greater consistence, was become less fusible, of a deeper brown colour, and upon cooling, was evidently drier than before, though not admitting of being broken.

Two pounds of purified soapy matter were distilled by a very gradual sand heat; after two hours, the matter was melted, and in ebullition, it soon became covered with a blackish froth, and swelled greatly; during 36 hours nothing came over but water with ammonia in solution; at length, after 48 hours, crystals of carbonated ammonia began to line the adopter; these were soon after dissolved by a reddish brown oil, which continued to come over till the experiment was stopped. Hence it appears that the component parts of this substance are water, ammonia, and a concrete oil. No elastic gas was disengaged during the whole process.

In order to ascertain the action of atmospheric air on this substance, several pieces being previously weighed, were exposed to a warm and dry air during a whole summer; they were found by this to have become dry and brittle without being lessened in their bulk, had acquired a whiter colour, and lost their peculiar odour; their upper surface was become friable, and almost fell into powder under the finger; on subjection to analysis, it was found not only that the water, but a considerable part of the ammonia, had been evaporated by this long exposure, and the remaining oily matter on melting became semitransparent, brittle, and considerably resembling wax.

Some purified soapy matter was rubbed in a glass mortar with a little water; an immediate mixture took place, and the result was a kind of magma, or soft uniform paste: by a further addition of water an opaque liquor was produced exactly similar to a solution of soap; like this, it formed a strong lather, and by the addition of pump-water, acids, lime-water, or metallic salts, it curdled and threw up to the surface a quantity of white insoluble clots. With nitrat of mercury it gave a greyish-yellow precipitate, and the supernatant liquor became of a permanent red-purple. The aqueous solution being thrown on the filter deposited there almost the whole of the oily matter, and the clear liquor by evaporation yielded a little animal mucilage and extract, and a small variable proportion of the phosphats of ammonia and soda. The combination with boiling water is not more permanent than that with cold, the whole of the oil and ammonia separating on the filter. When instead of fresh soapy matter, some which had been exposed during the summer to the action of the air was made use of, the liquor, though of a soapy appearance and feel, was much less so than what was made with the fresh substance, and upon boiling the mixture a number of brown oily drops rose to the surface, which, on cooling, concreted to a semitransparent matter like wax, perfectly analogous to that obtained from the same by simple melting; hence it appears, that the solubility of the fresh soapy matter depends on the ammonia which it contains, as is also evinced by the perfectly clear solution which the addition of a further quantity of ammonia occasions.

Eight ounces of soapy matter, white and purified, were mixed with an equal weight of powdered quicklime, on the addition of a little water, the mass heated, swelled, and disengaged a very strongly ammoniacal vapour, accompanied by a peculiar putrescent smell; a sufficiency of water being then added to bring the whole to the state of an emulsion, it was heated to ebullition, much ammoniacal vapour escaping at the same time; the liquor being thrown on a filter, passed perfectly clear and colourless, and appeared to be

only lime-water with a very small quantity of soap in solution: the matter remaining on the filter, being well washed, was beaten up with water, but showed no tendency to unite with it, subsiding after a time in the form of a white mass; this by drying for a few days in the open air, became grey and much reduced in volume: it was then mixed with diluted muriatic acid, which immediately decomposed it; and a number of white clots rose to the surface of the liquor. This last being obtained clear by filtration, yielded crystals of muriat of lime and a slight trace of phosphoric salt; the white clots being washed and dried, and afterwards melted in a water bath, cooled into a dry combustible oily matter, brittle, waxy, crystallizable, and perfectly insoluble in water, to which the name of *adipocire* has been appropriated. From this series of experiments with lime, it appears that the soapy matter is a true ammoniacal soap, with a base of adipocire to which lime has a stronger affinity than ammonia, but which last composition is again in its turn decomposed by all the acids, leaving the adipocire in a state of purity. Pot-ash and soda produce effects perfectly analogous to those of lime.

The action of acids on this soapy matter is to decompose it, by uniting with the ammonia; the concentrated mineral acids, as the nitric and sulphuric, also deepen the colour of the adipocire, by the evolution of part of its carbonaceous base.

Pure alcohol at the ordinary atmospheric temperature has no action on the soapy matter, but when boiling, it will with ease dissolve one fourth of its weight, of which all the ammoniacal soap will be deposited by cooling, and that portion of adipocire which is uncombined with ammonia, will be held in permanent solution. Hence alcohol is perhaps the best agent that can be used in the decomposition of the soapy matter: the phosphoric salts contained in it are not soluble in alcohol; the ammoniacal soap is wholly deposited by cooling, and the uncombined adipocire may be obtained afterwards by evaporating off the alcohol.

The most effectual way of procuring perfectly pure adipocire, is to mix well the soapy matter with twelve times its weight of warm water, and to decompose it by adding a slight excess of acetic or muriatic acid. This concrete animal oil thus prepared, as long as it holds much water between its particles, is of a pure white; by drying it acquires a brownish grey colour, which neither exposure to the air, nor the oxymuriatic acid will remove: while it retains water it is soft to the touch, and becomes ductile like wax by the warmth of the hand: when well dried and deprived of water, it assumes by slow congelation, a lamellar and crystalline texture, but when cooled quickly, has a compact granular appearance: in the first of these states, it greatly resembles spermaceti, yet differs from it in the following particulars. It requires a less heat for its fusion by seven degrees of Fahrenheit; it is soluble in boiling alcohol in the proportion of one ounce and a half, to one ounce of the fluid, whereas the same quantity of alcohol at the same temperature, will scarcely take up more than 36 grains of spermaceti; it separates also in cooling from this menstruum, in a much less decidedly crystalline form than spermaceti does; it unites eagerly with liquid ammonia in the cold, which spermaceti does not in the smallest degree.

To the foregoing experiments of Fourcroy, a few facts have since been added by Dr. Gibbes. The receptacle at Oxford for those bodies which have been used by the anatomical professor there for his demonstrations, is a hole dug in the ground to the depth of thirteen or fourteen feet, and a little stream is turned through it in order to remove all offensive smell: the flesh contained in this was found, on

examination, to be quite white, and for the most part changed into the soapy matter above mentioned. From this hint, pieces of lean beef were inclosed in a perforated box, and placed in running water, and at the end of a month were found converted into a mass of fatty matter; this change was observed to take place much sooner and more completely in running than in stagnant water: in order to get rid of the foetid smell, nitrous acid was had recourse to, which immediately had the desired effect; a waxy smell was perceived, and by melting the matter it was obtained nearly pure; the yellow colour which had been given to it by the nitrous acid, was wholly discharged by the oxymuriatic acid. A similar conversion of muscular fibre takes place by maceration in very diluted nitrous acid. Dr. Gibbs has not mentioned whether the fatty matter produced by running water is pure adipocire or ammoniacal soap; it appears probable, however, that it is in the former state; where nitrous acid is the menstruum employed, it is obviously impossible that the adipocire should be combined with an alkali. *Annales de Chimie*, vol. iii. 120. v. 154. vii. 146. viii. 17. *Philos. Trans.* for 1794. (vol. lxxxiv. page 169.)

ADIPOSUS, *fat or fatty*, is a word chiefly used in *anatomy*, as an epithet of certain cells, ducts, membranes, and vessels; e. g. *MEMBRANA* and *VASA adiposa*, *CELLULÆ adiposæ*, *DUCTUS adiposi*, &c.

ADIPPE, in *Entomology*, a species of *PAPILIO*, with dentated yellow wings, spotted with black, and underneath marked with 23 silvery spots. This insect is found in Europe, and is called by some writers *Cynippe*.

ADIPSIA, formed of *a priv.* and *ἄδεια*, *thirst*, denoting a want of thirst, in *Nosology*, a genus of disease, which Dr. Cullen refers to the second order, called *Dysforesia*, and the fourth class denominated *locales*. This he reckons to be always symptomatic of some distemper affecting the sensorium commune.

ADIPSON, a name given by Hippocrates to Oxymer; who says also, that the pituita, by its glutinousness, prevents or cures thirst. Medicines administered for allaying thirst are called by this name. This property led the Greeks to distinguish the *glycyrrhiza glabra* of Linnæus, or *LIQUORICE*, by this appellation.

ADIPSOS, signifies the Egyptian palm-tree, liquorice, and a pill or catapodium, composed by Asclepiades, and mentioned by Galen.

ADIRATUS, a price or value set upon things stolen or lost, as a recompence to the owner.

ADIRIS, or **DYRIS**, in *Ancient Geography*, a name given to the mountains of *ATLAS* by the Indigenæ, or first inhabitants. Bochart affirms (*Geog. Sac. l. ii. c. 13. Oper. tom. i. p. 89.*) that Atlas was called Duris and Dyris, by the Phœnicians; and this name might probably be derived from אֲדִיר, *adir*, which signifies *great or mighty*.

ADISAGA, a town of India, placed by Ptolemy in long. 159° 30'. and lat. 23°.

ADISALEM, a town of Gojam in Abyssinia, between the Nile and the lake Dembea. E. long. 34° 50'. N. lat. 10° 30'.

ADISAMUM, a town of the island of Taprobana.

ADISATHRA, a town of India, on this side of the Ganges, which Ptolemy places in long. 128° 30'. and lat. 24° 30'.

The Adisathri, who inhabited the surrounding country, had for their metropolis Sagida.

ADISATHRUS Mons, a mountain of India, near the gulf of Bengal, which Ptolemy called the Gangetic gulf: long. 132°. lat. 23°.

ADIT, **ADITUS**, formed from *adire*, *to go to*, in a general sense, denotes the approach to, or entrance of any thing: in which sense we meet with adit of a house, adit of a theatre, of a circus, &c.

ADIT of a *MINE*, the hole or aperture, whereby it is entered and dug, and by which the water and ores are carried away.

Adit of a mine, is nearly the same with *cuniculus*, or *drift*, and is distinguished from *AIR-SHAFT*. *Phil. Trans.* N° 69.

The adit is usually made on the side of a hill, towards the bottom thereof, about 4, 5, or 6 feet high, and 8 wide, in form of an arch; sometimes cut in the rock, and sometimes supported with timber, so conducted, as that the sole or bottom of the adit may answer to the bottom of the shaft, only somewhat lower, that the water may have a sufficient current to pass away without the use of the pump.

Damps and the impurity of the air are the great impediments against driving adits above 20 or 30 fathoms, by reason of the necessity, in this case, of letting down of air-shafts from the day to meet the adit, which are very often expensive, both on account of the great depth of mines, and the hardness of the mineral strata to be cut through. The best remedy against this is that practised in the coal-mines near Liege, where they work their adits without air-shafts: the manner of which is described by Sir Robert Morav. *Vide Phil. Trans.* N° 5.

Adit of a mine, is sometimes used for the *AIR-SHAFT* itself, being a hole driven perpendicularly from the surface of the earth into some part of a mine, to give entrance to the air. In this sense we sometimes find it improperly written *addit*. *Phil. Trans.* N° 200.

To draw off the standing water in winter, in deep mines, they drive up an adit, or *AIR-SHAFT*, upon which the air disengages itself from the water, when it begins to run with such violence, as produces a noise equal to the bursting of a cannon, dashes every thing in the way against the sides of the mine, and loosens the very rocks at a distance. *Ibid.* N° 26. See *MINING*.

ADIT in *ships*, in *Antiquity*, was a space in the upper part, where the ship was widest, at which people entered, anciently called *agea*.

ADITS of a *theatre*, *aditus theatri*, in *Antiquity*, were doors on the stairs, whereby persons entered from the outer porticoes, and descended into the seats.

ADITES, or the tribe of *AD*, in *Ancient History*, a very powerful tribe of the ancient Arabians, are said to have been the descendants of Ad, the son of Aws, or Uz (*Gen. x. 22, 23*), the son of Aram, the son of Shem, the son of Noah, and, after the confusion of tongues, to have settled in Al Ahkaf, or the winding sands, in the province of Hadramaut, where they greatly multiplied. In process of time, they abandoned the worship of the true God, and fell into idolatry; chiefly worshipping four deities, viz. Sakia, Hafedha, Razeka, and Salema; the first of whom, as they imagined, supplied them with rain, the second preserved them from all dangers abroad, the third provided food for their sustenance, and the fourth restored them to health when afflicted with sickness, as their several names import. God, it is said, commissioned the prophet Hud, or Heber, to attempt their reformation: but they were obstinate and irreclaimable, and were therefore destroyed, a few of them excepted, by a suffocating wind. Those who escaped retired with Hud to another place. Before they were thus severely punished, they were visited with a drought of four years, by which their cattle perished, and they themselves were reduced to great distress. They are often mentioned

in the Koran, and some commentators on this work pretend, that they were of prodigious stature, the largest being 100 cubits high, and the least 60; for which they refer to the testimony of the Koran. Sale's Prelim. Disc. p. 6. Koran, chap. 7. p. 123.

ADITHA, or ADITHAIM, in *Ancient Geography*, a city belonging to the tribe of Judah. Joshua, xv. 36. Eusebius mentions two cities named *Adatha*, one towards Gaza, and another towards Lydda, east of this city.

ADJUDGING, in *Law*, the act of passing a determinate sentence in behalf of a person.

ADJUDICATION, the act of adjudging the property of a thing to a person by a legal sentence, decree, or judgment.

ADJUDICATION is more particularly used for the addition, or consigning a thing sold by auction, or the like, to the highest bidder.

ADJUDICATION, in the *Scots Law*, the name of an action by which a creditor attaches the heritable estate of his debtor, or his debtor's heir, in order to appropriate it to himself, either in payment or in security of his debt; or that action by which the holder of an heritable right, labouring under any defect in point of form, may supply that defect. Adjudications were substituted by act 1672. c. 19. in the place of appraisings, and they are carried on by way of action before the Court of Session. By that statute, the debtor must deliver to the creditor a valid right of the lands to be adjudged, being such as are equivalent to the principal and interest of the debt, and a fifth part more in consideration of the creditor's taking land for his money; renounce the possession in his favour, and ratify the decree of adjudication. This is called a *special adjudication*: and the time within which the debtor may redeem is declared to be five years; but if the debtor does not produce a sufficient right to the land, or is not willing to renounce the possession and ratify the decree, it is lawful for the creditor to adjudge all right belonging to the debtor in the same manner as he could, by the former laws, have apprised it. In this *general adjudication*, as it is called, the creditor must limit his claim to the principal sum, interest and penalty, without demanding a fifth part more. Abbreviates are ordained to be made of all adjudications, which must be recorded within 60 days after the date of the decree. There are two kinds of adjudications, viz. those on a decree *cognitionis causa*, otherwise called *contra hereditatem jacentem*, and adjudications in *implemēt*. A new sort of adjudications has been lately introduced into the law of Scotland, by 23 Geo. III. for rendering the payment of the creditors of insolvent debtors more equal and expeditious.

ADIVE, in *Zoology*, an animal of the JACKAL kind, the *CANIS aureus* of Linnæus, mentioned by Buffon, somewhat resembling a small fox. It is less than the common jackal, and is sometimes tamed, and kept in a domestic state. In the Arabian language, the name Adivē signifies a wolf; and its figure, hair, and voracity are analogous to the name; but it is smaller than the fox, and very stupid. It yelps like this animal; and when one cries, the rest reply. It roams about in the night in search of food, and is naturally disposed to conceal itself in the day. The adives form large packs, enter houses and churches, where they devour every thing they can find, and when they have been once accustomed to eat human bodies, they never fail to frequent church-yards in search of putrid carcases, to dig into graves, to follow armies, and to attend the caravans in those eastern countries where they abound. The adives may be considered as the ravens among quadrupeds.

ADJUNCT, ADJUNCTUM, in *Philosophy*, something

joined or superadded to a being from without; or, an accession to a thing, not essentially belonging to it, but only accidental to it.

There are two kinds of *adjuncts*; the one a substance (e. g. spirit or body) accidentally superadded to another, as its subject.—Such is water in a sponge, or vessel, and such is the soul in the body. The second an attribute or mode, accidentally likewise superadded to a substance, whether body or spirit.—Such is figure in a body, knowledge in the mind, &c.

In ethics, they usually reckon seven *adjuncts*, popularly called *circumstances*; *quis, quid, ubi, quibus auxiliis, cur, quomodo, quando*.

ADJUNCT, in *Music*, a word that is used to express the connection or relation between the principal mode, and the modes of its two-fifths, which, from the intervals that constitute the relation between them and it, are called its *adjuncts*.

ADJUNCTS, in *Rhetoric* and *Grammar*, are certain words or things added to others; to amplify the discourse, or augment its force.

Such are adjectives, attributes, and epithets, which are added to substantives, subjects, &c. to express their nature, qualities, accidents, &c.

Arguments drawn from *adjuncts*, are supplements or enforcements of the proof arising from the circumstances of the fact.

ADJUNCT is also used in civil concerns, for a COLLEAGUE, or fellow-officer, associated to another, to assist him in his ministry.

ADJUNCT *gods*, or ADJOINTS *of the gods*, in *Mythology*, among the Romans, were a kind of inferior deities, added as assistants to the principal ones, to ease them in their function. Thus, to Mars was adjoined Belleria and Nemesis; to Neptune, Salacia; to Vulcan, the Cabiri; to the Good Genius, the Lares; to the Evil, the Lemures, &c.

ADJUNCTS, or ADJOINTS, in the *Royal Academy of Sciences at Paris*, denote a class of members attached to the pursuits of particular sciences. See ACADEMY.

ADJUNCTION, the act of joining, or adding, of one thing to another. There are various species of adjunction; viz. by *adhesion, apposition, agency, accubation, incubation, imposition, affection*, &c.

AD JURA REGIS, is a writ that lies for the king's clerk, against him who endeavoured to eject him, to the prejudice of the king's title in right of his crown.

ADJURATION, a part of exorcism, wherein the devil is commanded, in the name of God, to depart out of the body of the possessed, or to declare something.

ADJUTAGE. See AJUTAGE.

ADJUTANT, formed of *adjutare*, to assist, in the *Military Art*, an officer in the army, whose business is to assist the major: otherwise called *aid-major*.

In the cavalry, each regiment has an adjutant, and in the infantry, each battalion, who receives the orders every night from the brigade-major, which, after he has carried to the colonel, he delivers out to the sergeants. When detachments are to be made, he gives the number each company must furnish, and assigns the hour and place of rendezvous. He also places the guards, receives and distributes ammunition to the companies, and by the major's orders regulates the price of bread, beer, &c. See ADJUTANT-GENERAL.

ADJUTANT is sometimes also used by the French for an *aid de camp*.

ADJUTANTS-*General*, among the *Jesuits*, a select number of fathers residing with the general of the order, each of whom had a province, or country, under his care, as

France, England, &c. Their business was to inform the father-general of the occurrences of state in such counties; to which end, each of them had their correspondents, delegated emissaries, visitors, regents, provincials, &c. See **JESUITS**.

ADJUTOR, among the Romans, was an adjunct or assistant; and under this appellation they had many subordinate officers, who acted in the absence of their superiors, or by way of aiding them in the execution of their respective offices.

ADJUTORIUM, from *adjuvare, to help*, in *Anatomy*, the *humerus*, or shoulder-bone.

Some authors use this word for a medicine intended only as auxiliary, or subservient to another of great efficacy: in particular, after a due use of internals, for an external remedy applied to a part affected, to assist in, and complete the cure.

ADJUTRIX, *prima legio*, an appellation applied to a legion which often occurs in the Roman laws.

ADJUVANTIA, formed of *adjuvo, I help*, in *Medicine*. See **JUVANTIA**.

ADLE egg, that which is not fecundified by the cock's tread.

Adle egg is the same with that which is otherwise called a *subventaneous* one.

Adle eggs, after incubation, are found to contain a shapeless, globose, ash-coloured body, not unlike a *mola*. Phil. Trans. N^o 87.

ADLECTI, among the Romans, signified associates, or rather selected, and was applied to persons of various descriptions amongst the common soldiers, officers of state, and senators; there were gods of this denomination, who were deified men, and called by the Romans "dii minorum gentium."

ADLEGATION, in the *Public Law* of the German empire, a right claimed by the states of the empire of adjoining plenipotentiaries, in public treaties and negotiations, to those of the emperor, for the transacting of matters which relate to the empire in general.

In which sense adlegation differs from *legation*, which is the right of sending ambassadors on a person's own account.

Several princes and states of the empire enjoy the right of *legation*, who have not that of adlegation, and *vice versa*. The bishops, for instance, have the right of adlegation in the treaties which concern the common interest, but no right of *legation* for their own private affairs. The like had the duke of Mantua.

The emperor allows the princes of Germany the privilege of *legation*, but disputes that of adlegation. They challenge it as belonging to them *jure regni*, which they enjoy in common with the emperor himself. Ludwig has a discourse on the subject, wherein the controversy is treated at large.

ADLENTARE *barbam*, in *Antiquity*, a phrase which denoted the care that was taken every day to comb the beard, and to render it soft and flexible.

ADLERFELDT, **GUSTAVUS**, in *Biography*, a Swedish officer and historian, was born near Stockholm, studied at Upsal, where he was distinguished by his application and improvement, and then made the tour of Europe. On his return, Charles XII. appointed him a gentleman of his chamber. Having accompanied this monarch in his military course, and witnessed both his victories and defeats, he was qualified to compile his history, which terminates with the day of his death, at the battle of Pultawa, in 1709, and which was translated into French by his son, and printed in four volumes 12mo. at Amsterdam, in 1740.

ADLESBERG, in *Geography*, a well built market-town in the inner Carniola, in Aultria, situate at the foot of a high rocky mountain, near the river Alben, on which stands a citadel, under which is a grotto of very considerable extent and capacity. Many curious figures of stones, natural stone theatres, stone bridges, &c. are to be seen in it; and near the entrance of the cavern the river *Poig*, which, at about a mile's distance from it, issues out of a mountain, runs into an aperture in the rock, and then glides off under the cavern.

Adlesberg, is called in Latin *Pastvena*. It is four leagues east-north-east from Trieste.

ADLOCUTION, **ADLOCUTIO**, in *Antiquity*, is chiefly understood of speeches made by Roman generals to their armies, to encourage them before a battle. We frequently find these adlocutions expressed on medals, by the abbreviation **ADLOCVT. COH.**

The general is sometimes represented as placed on a tribunal; often on a bank or mound of turf, with the cohorts ranged orderly round him, in *manipuli* and *urme*. The usual formula in adlocutions was, *fortis esset ac fidus*. Pitifc. Lex. Ant. tom. i. p. 27. Walk. on Coin. p. i. c. 10.

ADLWANG, in *Geography*, a town in the archduchy of Aultria, three leagues south-west of Steyr.

ADLZREITER, **JOHN**, in *Biography*, chancellor of Bavaria, an historian and lawyer, flourished in the 17th century. His annals of Bavaria, written in Latin, comprehend the history of the country from its beginning, to the year 1652, compiled from authentic sources. This work first appeared in 1662, and was reprinted at Leipzig in 1710, by Leibnitz, in folio.

ADMAH or **ADAMA**, in *Scripture Geography*, one of the cities involved in the destruction of Sodom and Gomorrah. It was situated between Zeboim and Gomorrah. Gen. x. 19. xiv. 2—8. Deut. xxix. 23. Hosea. xi. 8.

ADMANUENSIS, compounded of the Latin *ad, to*, and *manus, hand*, in *Ancient Law Books*, denotes persons who swore by laying their hands on the book. Du-Cange.

In which sense, *admanuenses* amount to the same with laymen, and stand opposed to clerks, who were forbid to swear on the book, their word being to be reputed as their oath: whence they were also denominated *fide-digni*.

ADMEASUREMENT, **ADMENSURATIO**, in *Law*, a writ which lies for the bringing those to reason, or mediocrity, who usurp more of any thing than their share. This writ lies in two cases; termed,

ADMEASUREMENT of dower, *Admensuratio dotis*, where the widow of the deceased holds more from the heir, or his guardian, on account of her dower, than of right belongs to her. And,

ADMEASUREMENT of pasture, *Admensuratio pasturæ*; this lies between those who have common of pastures appendant to their freehold, or common by vicinage, in case any of them surcharge the common with more cattle than they ought.

This is one of those writs that are called *vicontiel*, being directed to the sheriff (*vice-comiti*), and not to be returned to any superior court, till finally executed by him. It recites a complaint, that the defendant hath surcharged the common, and therefore commands the sheriff to admeasure and appertain it, that the defendant may not have more than belongs to him, and that the plaintiff may have his rightful share. Upon this suit, all the commoners shall be admeasured, those who have not, as well as those who have surcharged the common; the plaintiff as well as the defendant. The execution of this writ must be by a jury of 12 men, who were upon oath to ascertain, under the superintendance of

the sheriff, what and how many cattle each commoner is entitled to feed: and the rule for this admasurement is generally understood to be, that the commoner shall not turn more cattle upon the common, than are sufficient to manure and stock the land to which his right of common is annexed. If, after the admasurement has ascertained the right, the same defendant surcharges the common again, the plaintiff may have a writ of *second surcharge*. Blackst. Com. vol. iii. p. 238. 8vo.

ADMETE, one of the nymphs called OCEANIDES.

ADMINICLE, or ADMINICULE, ADMINICULUM, a term used in some ancient statutes, for aid, help, or support. Stat. 1 Edw. IV. cap. i.

In Scots law, this term signifies any writing or deed referred to by a party, in an action of law, for proving his allegations.

ADMINICULATOR, in *Ecclesiastical Writers*, denotes an ancient officer of the church, whose business was to defend the cause of widows, orphans, or others destitute of help. The adminiculator is the same with what is otherwise called ADVOCATE of the poor. Du Cange.

ADMINICULES, among *Antiquaries*, are applied to the attributes or ornaments wherewith Juno and some other figures are represented on medals.

ADMINICULUM, in the French *Jurisprudence*, signifies the beginning of a proof; an imperfect proof; or a circumstance or conjecture, tending to form or fortify a proof.

ADMINISTRATION imports the government or direction of affairs; and particularly the exercise of distributive justice.

The two criterions of a good *administration* in England, according to Trenchard, are, the keeping the nation out of foreign broils, and paying off the public debts; the latter of which depends on the former.

ADMINISTRATION, in the English *Law*, signifies the act or office of an administrator, in managing and disposing of a man's goods, or estate, that died intestate, or without any will; with an intent to give an account thereof. In this case, instruments, or powers, called letters of *administration*, are taken out in the prerogative court.

These letters must be granted by the ordinary in pursuance of the statutes 31 Edw. III. c. 11. and 21 Hen. VIII. c. 5. 1. to the husband, or his representatives, of the wife's goods and chattels; 2. to the wife, of the husband's goods and chattels; 3. if there be no husband or wife, to the children, sons or daughters; 4. if there be no children alive, to the father or mother; 5. then to a brother or sister of the whole blood, or of the half blood (who, for this purpose, are of equal degree with the whole blood); 6. and if there be none such, to the next of kin, as grandfather, uncle, nephew or cousin, and the females of each class respectively; but of persons in equal degree, the ordinary may take which he pleases, and the nearness of degree shall be thus reckoned according to the computation of the civilians, and not of the canonists; 7. then, if none of the kindred take out administration, to a creditor of the deceased; 8. if the executor refuses or dies intestate, to the residuary legatee, in exclusion of the next of kin; 9. and for want of all these, to any other person, at the discretion of the ordinary; or the ordinary may grant to a stranger letters *ad colligendum bona defuncti*, to gather up the goods of the deceased; or may take them into his own hands to pay the deceased's debts, in such order as an executor or administrator ought to pay them. But it is said he or the stranger, who hath letters *ad colligendum*, cannot sell them, without making themselves executors of their own wrong,

and action lies only against the ordinary, &c. Wood's Inst. 333.

By stat. 21 Hen. VIII. widows, and next of kin, are to be appointed administrators, and a mother is to have administration of goods of a child, before a brother or sister, &c. But an administration may be granted to the father before the widow; and a residuary legatee ought to be preferred before the widow, in an administration *cum testamento annexo*. 3 Salk. 21.

On granting administration, bonds with sureties are to be taken for the administrator, to make and exhibit an inventory of the goods of the deceased, to render a just account thereof, and to make a distribution of the surplusage after the debts paid, according to law, &c. Stat. 22 and 23 Car. II. cap. 10. See ADMINISTRATOR, EXECUTOR, INTESTATE, KINDRED.

ADMINISTRATION is sometimes also used for the direction of the affairs of a minor, a pupil, a lunatic, or the like.

ADMINISTRATION is also used in respect of ecclesiastical functions.—The parson has the administration of the sacraments in his parish.—Administration of the eucharist is prohibited to persons excommunicate.

In beneficiary matters they distinguish two kinds of administration; *temporal*, which relates to the temporalities of a benefice, diocese, &c. and *spiritual*, to which belong the power of excommunicating, &c.

ADMINISTRATION, in *Anatomy*, is used for the manner of dissecting the parts of the body, particularly the MUSCLES. In which sense, administration is synonymous with *encheirisis, exercisè, &c.*

Anatomical administrations are not to be learned by oral precept, but require ocular inspection.—Galen, Harvey, and others, have discourses express under the title of the anatomical administrations.

ADMINISTRATION, in *Commerce*, is also used for a Spanish staple at Callao in Peru, a small town on the coasts of the South Sea, which is the port of Lima; where all ships, allowed to trade on the coast, are obliged to unload their European goods, and pay certain duties: *i. e.* 13 *per cent.* of the piece for which they are sold, if the cargo be entire, and if otherwise 16 *per cent.* besides which, they pay three *per 1000* duty, for consullship, and some other small royal rights and claims.

ADMINISTRATOR, in *Law*, he to whom the ordinary commits the administration of the goods of a person deceased, in default of an executor.

An action lies for or against an administrator, as for or against an executor; and he shall be accountable to the value of the goods of the deceased, and no farther:—unless there be waste, or other abuse chargeable on him. If the administrator die, his executors are not administrators; but the court is to grant a new administration.—If a stranger, who is neither administrator, nor executor, take the goods of the deceased, and administer, he shall be charged, and sued as an executor, not as an administrator.

The origin of administrators is derived from the civil law. By the old law, the king was intitled to seize upon the goods of an intestate, as the *parens patrie* and general trustee of the kingdom. This prerogative the king continued to exercise for some time, by his own ministers of justice, probably in the county court; and it was granted as a franchise to many lords of manors, and others, who have to this day a prescriptive right to grant administration to their intestate tenants and suitors, in their own courts baron, and other courts, or to have their wills there proved, in case they made any disposition. Afterwards the crown, in favour of the church, invested the prelates with this branch of the prerogative:

prerogative: and the goods of the intestates were given to the ordinary by the crown, who might seize and keep them without warring, and also give, alien, or sell them at his will, and dispose of the money in *pious usus*. The goods of the intestate being thus vested in the ordinary upon solemn and conscientious trust, the reverend prelates were not accountable to any, but to God and themselves, for their conduct. The ordinary, however, neglected to discharge his trust; and the abuse was carried to such a length of iniquity, that Innocent IV. in 1250, lays it down for established canon law, that "*in Britannia tertia pars bonorum decedentium ab intestato in opus ecclesie et pauperum dispensanda est.*" The popish clergy therefore took to themselves, under the name of the church and poor, the whole residue of the estate of the deceased, after the *partes rationabiles*, or two-thirds, of the wife and children were deducted, without paying his lawful debts or other charges thereon. For this reason it was enacted, as the first check on the exorbitant power of ordinaries, by the stat. of Westm. 2. 13 Edw. I. c. 19. that the ordinary shall be bound to pay the debts of the intestate so far as his goods will extend. And in order to prevent the ordinaries from keeping any longer the administration in their own hands, the statute 31 Edw. III. c. 11. provides that, in case of intestacy, the ordinary shall depute the nearest and most lawful friends of the deceased to administer his goods; which administrators are put upon the same footing with regard to suits and to accounting, as executors appointed by will. This is the original of administrators, as they at present stand, who are only the officers of the ordinary, appointed by him in pursuance of this statute. The statute 21 Hen. VIII. c. 5. enlarges a little more the power of the ecclesiastical judge, and permits him to grant administration either to the widow, or the next of kin, or to both of them, at his own discretion; and where two or more persons are in the same degree of kindred, gives the ordinary his election to accept which ever he pleases. Blackst. Com. vol. ii. p. 434. 8vo.

There are divers sorts of *administrators*.

Administrator durante minore aetate, is where an infant is entitled to administration of the goods of an intestate; in which case administration is granted to another, until he is of the age of twenty-one years. Though where the infant is made executor, such administration, during his minority, ceases at his coming of the age of seventeen, 5 Rep. 29. 6 Rep. 27.

Administrator cum testamento annexo, is one to whom administration, with the will annexed, is granted upon an executor's refusal to prove the testament, or upon his dying before the probate. 1 Inst. 113.

Administrator de bonis non, &c. is one to whom administration is granted of the goods of a testator remaining unadministered, by reason of his executors dying intestate. This administrator is the only legal representative of the deceased in matters of personal property. But he may, as well as an original administrator, have only a limited or special administration committed to his care, viz. of certain specific effects, such as a term of years, or the like: the rest being committed to others. 1 Roll. Abr. 908. 2 Roll. Abr. 907. There is also

Administrator pendente lite; and *durante absentia extra regnum*.

If a woman have goods thus committed to her charge, or administration, she is called *administratrix*; and is accountable, &c. in like manner as an *administrator*.

ADMINISTRATOR, in *Scots Law*, a person legally empowered to act for another, whom the law presumes incapable of acting for himself. Thus tutors or curators are

sometimes styled *administrators in law*, to pupils, minors, or fatuous persons. But more generally the term is used to imply that power which is conferred by the law upon a father, over the persons and estates of his children during their minority.

ADMINISTRATOR is also used for the advocate of a church.

ADMINISTRATOR is also used for a person appointed to receive, manage, and distribute the revenues of an hospital, or religious house.

ADMINISTRATOR is also used for a prince who enjoys the revenue of a secularised bishoprick.

Yet this title does not hold universally: the king of England, as elector of Brunswick-Lunenburgh, for instance, is not called *administrator*, but duke of Bremen and Verden; and the king of Prussia is not *administrator*, but duke of Magdeburg, and prince of Halberstadt.

ADMINISTRATOR is also used for the regent or protector of a kingdom, during the minority of its proper prince, or even a vacancy of the throne.

The pope pretends to the *administration* of the empire, during the vacancy, by censure, or suspension.

ADMINISTRATOR is sometimes used for the president of a province.

ADMINISTRATRIX, see ADMINISTRATOR.

ADMIRAL, a great officer who commands the naval forces of a kingdom or state, and takes cognizance by himself, or officers appointed by him, of all maritime causes.

Authors are divided about the origin and denomination of this important officer, whom we find established, with some variation, in most kingdoms that border on the sea. Spelman conceives, that the name and dignity were introduced among us from the Saracens, by means of the Crusades; and it is alledged, that there are no instances of admirals in this part of Europe before the year 1284, or 1286, when Philip of France, who had attended St. Lewis in the wars against the Saracens, created an admiral. The name of this officer once occurs in the history of France, in the year 558. And. Com. vol. i. p. 29. Du-Cange assures us, that the Sicilians were the first, and the Genoese the next after them, who gave the denomination admiral to the commanders of their naval armaments; and that they took it from the Saracen, or Arabic *amir*, or *emir*, a general name for any commanding officer.—Some say, that the first admiral mentioned in English history was in the reign of Edward I. in 1297; and that the first title of admiral of England conferred upon a subject, was given by patent of Rich. II. to the earl of Arundel and Surry in 1387.

Spelman, however, is of opinion, that the title of admiral was first used in the reign of Henry III. because it does not occur in the laws of Oleron, enacted in 1266, nor is mentioned by Bracton, who wrote about that time; and in a charter, 8 Henry III. which granted the office to Richard de Lacy, the title is not used; but in the 56th year of the same reign, the historians used the appellation admiral, and it is found also in charters.

Three or four admirals were formerly appointed in the English seas; these held their office *durante bene placito*, and had particular limits from the mouth of the Thames, to the north, south, or west, subject to their jurisdiction. We had also admirals of the Cinque Ports as early as the reign of Edward III. when William Latimer was called *Admiralis quinque portuum*. But the title of *Admiralis Angliae* was not frequent till the reign of Henry IV. when the title was given to the king's brother; and after this period it was granted in all commissions to succeeding admirals.

The title of *locum-tenens regis super mare*, the king's lieutenant-general of the sea, mentioned in the reign of Richard II: was superior to that of *admiral* of England. Before the appellation of *admiral* was introduced, the title of *custos maris* was in use.

ADMIRAL of England, the lord high, in some ancient records called *capitanus maritimarum*, is judge, or president, of the COURT of admiralty.

He takes cognizance, by himself, his lieutenant, or deputies, &c. in his court, of all crimes committed on the sea, or the coast thereof; and all the civil and marine transactions relating thereto; as also of what is done in all great ships, riding in any great river, beneath the bridges thereof next the sea.

Anciently, the admiral had also jurisdiction in all causes of merchants and mariners; not only on the sea, but in all foreign parts.—To this great officer also belongs the government of the navy: by him all vice-admirals, rear-admirals, and sea-captains are commissioned; as well as all deputies for particular coasts, and coroners for viewing dead bodies found on the sea-coasts, or at sea; and he appoints the judges for his court of admiralty, and courts martial for the trial of offences against the articles of war, and may imprison, release, &c.; every commander, officer, and soldier of ships of war shall observe the commands of the admiral, &c. on pain of death, or other punishment. Between high and low-water mark, the common law and admiral bear jurisdiction by turns; one upon the water, and the other upon the land. He hath also power not only over the seamen serving in his ships of war, but over other seamen, so that he may arrest them for the service of the state; and if any of them run away without leave, he may certify it to the sheriffs, mayors, bailiffs, &c. who shall cause them to be apprehended and imprisoned. The admiral, of right, had anciently a tenth part of all prize goods; but this is taken away by stat. 13 Geo. II. c. 4. See PRIZE. This statute also enables the admiralty to grant *Letters of MARQUE*.—We have had no *high admiral* for some years; the office being put in *commission*, or under the administration of the lords *commissioners of the admiralty*; who, by W. and M. stat. ii. c. 2. are declared to have the same authority, jurisdiction and power, as the *lord high admiral*.

ADMIRAL of Scotland, the lord high, one of the great officers of the crown, and supreme judge in all maritime cases within that part of Britain.

ADMIRAL is also used for the commander in chief of a single fleet, or SQUADRON; and is distinguished by a flag displayed at his main-top-mast-head.

Thus, we say, the *admiral of the red*; the *admiral of the white*; and *admiral of the blue*. See NAVY and SQUADRON.

The term *admiral* is also applied to all flag officers; in which sense it includes *vice-admirals* and *rear-admirals*.

ADMIRAL, Rear, is the *admiral of the third*, and last squadron of the royal fleet, and carries his flag at the mizen-top-mast-head.

ADMIRAL, Vice, is one of the three principal officers of the royal navy; who commands the second squadron, and has his flag set up at the fore-top-mast-head.

ADMIRAL, Vice, is also an officer appointed by the lord high admiral, in divers parts of the kingdom, with judges and marshals subordinate to him; for the exercising of jurisdiction in maritime affairs, within his respective limits. From their decisions and sentences, appeal lies to the court of admiralty in London.

There are also *admirals of the galleys*.

Montfret makes mention of an *admiral of the archers*, or cross-bow-men. See ARBALET.

ADMIRAL is likewise the name of a principal vessel of a fleet of merchantmen, or of the vessels employed in the cod and whale fishery. That which arrives first, in any harbour or creek of Newfoundland, takes the title and quality of *admiral*, which it retains during the whole fishing-season.—Such ship may secure to herself, so much beech, or flakes, or both, as are necessary for the number of boats she shall use, with an overplus of one boat only more than she uses.—The master of the second ship is *vice-admiral*; and the master of the third, *rear-admiral*. See FISHERY.

ADMIRAL'S Court, or the *High Court of Admiralty*. See COURT of ADMIRALTY.

ADMIRAL, in *Conchology*, the name given by authors to a very beautiful, and very precious shell which some refer to the VOLUTA, and others to the CONUS. See Tab. of Shells.

Of these the curious reckon several species, or rather varieties, of which the following have been particularly noticed.

1. The grand-admiral. 2. The vice-admiral. 3. The orange-admiral. And, 4. The extra-admiral.

The first of these is the most esteemed, and a single shell has been sold, in Holland, for five hundred florins. It is of a very elegant and bright white enamel, and is variegated with bands of yellow, representing in some degree the colours of the flags of a man of war at sea; hence it obtained its name. It is of a very curious shape, and formed with particular elegance about the head; the clavicle being exerted. There runs along the centre of the large yellow band in this shell a fine denticulated line, which is its distinguishing character.

The *vice-admiral* is an elegant shell, but its head is less beautifully wrought than in the *admiral*, and its broad band wants the dentated line, so remarkable in that.

The *orange-admiral* has more yellow than either of the others.

The *extra-admiral* has the same bands with these, but they run one into another, and form a more mixed clouding.

ADMIRAL'S Cove, in *Geography*, lies within the harbour of Formosa, on the east side of Newfoundland island, about seven or eight leagues from Cape Race. It is on the star-board side of the harbour, and more westerly than Clear's cove. It has from seven to eight fathoms water, with good anchorage, and well secured.

ADMIRAL'S, VICE, Cove, is within the same harbour of Formosa, on the larboard side; where a fleet may ride in good ground, and land-locked from all winds. There is another cove on the same side farther west, with an excellent harbour for large ships. Malham's Nav. Gaz.

ADMIRALTY, Court of. See COURT.

ADMIRALTY Bay, in *Geography*, is a bay that lies in the southern island of New Zealand, on the west coast of Cook's straits, and to the north-west of Queen Charlotte's sound, near the western entrance of those straits. Cape Stephens on the north-west, and Cape Jackson on the south-east, are its limits. It is very spacious, and has, in many parts, good anchorage. The *Admiralty islands*, which lie off in the strait, at some distance from the entrance, will point out the bay. It may also be distinguished by an island two miles north-east of Cape Stephens, in S. lat. 40° 37', and E. long. 174° 54'. Wood and water are easily obtained in many parts of the bay.

ADMIRALTY Bay, is a name given by Mr. Dixon to BEERING'S Bay.

Admiralty Bay, and Port Mulgrave, on the north-west coast of America, lie in N. lat. 59° 31', and W. long. 140° 18'.

ADMIRALTY Inlet, a name given by Mr. Vancouver to the supposed straits of Inan de Fuca, on the west coast of New Georgia; the entrance of which is about 48° 30' N. lat. and

and $124^{\circ} 15'$ W. long. On each point of the harbour, called by Mr. Vancouver *Penn's cove*, was a deserted village, in which were found several sepulchres in the form of centry-boxes, containing small skeletons, and small bones, which were supposed to be intended by the inhabitants for pointing their arrows, spears, and other weapons. The surrounding country for several miles presented a delightful prospect of spacious meadows, adorned with clumps of trees, of which the oak, in size from four to six feet in circumference, was the principal. The meadows were well stocked with deer. The soil consisted chiefly of a rich black vegetable mould, lying on a sandy or clayey substratum; the grass grew to the height of about three feet, and the ferns were nearly twice as high. The natural productions of the country were luxuriant; and it was not ill supplied with streams of water. The number of its inhabitants were estimated at about 600. Here, on June 4th, 1792, Mr. Vancouver took possession of the coast from that part of New Albion, which lies in N. lat. $39^{\circ} 20'$, and W. long. $123^{\circ} 34'$ to the entrance of this inlet of the sea, together with the coast, islands, &c. This interior sea was called the *Gulf of Georgia*; and the continent binding the said gulf, and extending S. to N. lat. 45° , was called *New Georgia*, in honour of his present Majesty. This branch of Admiralty inlet obtained the name of *Possession Sound*; its western arm was denominated *Port Gardner*, out of respect to Sir Alan Gardner, and its smaller or eastern one was called *Port Susan*. Vancouver's Voyage, vol. i. p. 287, &c.

ADMIRALTY Island, an island so called by Mr. Vancouver, situate within George the Third's archipelago, on the north-west coast of new Norfolk in America, and between N. lat. 57° and $58^{\circ} 30'$, and W. long. 134° and 135° . This island is about 60 leagues in circuit, affords many convenient bays, with fine streams of fresh water, and produces an uninterrupted forest of very fine timber-trees, chiefly of the pine tribe. Vanc. Voyage, vol. iii. p. 277.

ADMIRALTY'S Island, an island that lies on the coast of Nova Zembla, in the northern ocean. N. lat. $75^{\circ} 5'$. E. long. $52^{\circ} 45'$.

ADMIRALTY Islands, a cluster of between 20 and 30 islands lying to the north of New Britain, in about $2^{\circ} 18'$ S. lat. and $146^{\circ} 41'$ E. long. The largest of these is 18 leagues in length from east to west. These islands were discovered by captain Carteret; and he describes them as clothed with a beautiful verdure of woods, lofty and luxuriant, interspersed with spots that have been cleared for plantations, groves of cocoa-nut trees, and habitations of the natives, who seem to be very numerous. He supposes that these islands produce several valuable articles of trade, particularly spices, as they lie in the same climate and latitude as the Moluccas; but he was not in a condition to examine them.

ADMIRATION, in *Ethics*, is that passion which is excited by the contemplation of excellence, that is rare or uncommon, either in kind or degree. The objective cause of this admiration is any thing that indicates a superior degree of wisdom, ingenuity, good sense, or benevolence. Such are the qualities to which it is properly confined. Power, abstractedly considered, is not the object of admiration; though the dignified or benevolent exertions of power for the production of good, may excite the highest degree of admiration, and render it a very strong emotion. It is obvious, says an ingenious writer, that the range of admiration is from the simple approbation of the mind up to the most lively sensation, according to our conceptions of the extent of excellence, and also the degrees of our interest in its effects. It is also blended with various other emotions

according to different circumstances attendant upon the passion. It is frequently introduced by *surprise*; when, for example, the discovery of these excellencies is sudden and unexpected; and then it becomes a vivid emotion. It is generally connected with some degree of *wonder*; as we are frequently ignorant of the causes which enabled any one greatly to excel ourselves or others; but as it is always excited by the real discovery of some qualities, it is not to be confounded with an emotion that proceeds from ignorance and embarrassment, previous to the discovery. When the evidences of wisdom or goodness exceed our utmost comprehension, or proceed far beyond the usual extent of excellence itself, they may excite *astonishment*. Cogan's Philosophical Treatise on the Passions.

ADMIRATION, in *Grammar*, a note or character, intimating something worthy to be admired or wondered at.—It is expressed thus (!). See **CHARACTER**.

ADMISSION, in the *Ecclesiastical Law*, an act whereby a bishop, upon examination, *admits* or allows a clerk to be able or competently qualified for the office; which is done by the formula, *admitto te habilem*. All persons are to have episcopal ordination before they are admitted to any parsonage or benefice; and if any shall presume to be admitted, not having such ordination, &c. he shall forfeit 100*l.* Stat. 14 Car. II.

No person is to be admitted into a benefice with cure of 30*l.* per ann. in the king's books, unless he is a bachelor in divinity at least, or a preacher lawfully allowed by some bishop, &c.

ADMISSIONALES, in *Antiquity*, officers, whose business it was to introduce persons to princes or to wealthy citizens. The office belonged to freed men, and was much desired. The principal, that presided over each of the four decuries into which they were distributed, was called *magister admissionum*, and deemed highly honourable. Historians say, that Vespasian, Antonine, and Alexander Severus, were so easy of access, that they needed no admissionales.

ADMITTENDO Clerico, is a writ granted to him who hath recovered his right of presentation against the bishop in the common pleas.

ADMITTENDO in Socium, is a writ for the association of certain persons to **JUSTICES** of **ASSISE** formerly appointed.

ADMONITION, in *Ecclesiastical Affairs*, a part of discipline much used in the ancient church. It was the first act, or step, towards the punishment or expulsion of delinquents. In case of private offences, it was performed according to the evangelical rule, privately: in case of public offence, openly before the church. If either of these took effect, for the recovery of the fallen person, all farther proceedings, in the way of censure, ceased: if they did not, recourse was had to **EXCOMMUNICATION**. Bingham Orig. Eccles. tom. ii. lib. 16. cap. 2. § 6. p. 31. Calvin. Instit. lib. iv. cap. 12. § 2.

By the ancient canons, nine monitories, or *admonitions*, at due distance, are required before excommunication.

ADMONITION is also used, in writers of the barbarous age, for the **CITATION** or summoning a person to appear in a court of justice. See **SUMMONS**, &c.

ADMONITIO Fusium, a military punishment, among the Romans, resembling, in some respects, our whipping, or lashing, but performed with a vine-branch. Schiterman Diff. de Pœn. Mil. Rom. cap. 12.

ADMONT, in *Geography*, a town of Germany in Stiria, on the river Ens; two leagues north-east of Rottenmann. It depends upon the archbishoprick of Saltzburg, and has a rich abbey of Benedictines in the high mountains.

ADMORTIZATION, among *Feudal Writers*, the act of reducing lands to **MORTMAIN**.

ADNATA, in *Anatomy*. See **CONJUNCTIVA**.

ADNATA, or **ADNASCENTIA**, among *Gardeners*, denote those off-sets, which, by a new germination under the earth, proceed from the lily, narcissus, hyacinth, and other flowers, and afterwards become true roots.

ADNATA is also a term used for such things as grow upon animal or vegetable bodies, whether inseparably, as hair, wool, horns, &c. or accidentally, as the several epistilical plants.

ADNATUM folium, in *Botany*, denotes the disk of the leaf pressing close to the stem of the plant; and *adnatus*, in a general sense, denotes *connected*.

ADNOTATIO, in *Antiquity*, denoted the refeript of a prince, signed by himself.

ADNOUN, **ADNOMEN**, or **ADNAME**, is used by some *Grammarians* to express what we most usually call an **ADJECTIVE**.

ADO, in *Biography*, archbishop of Vienne in Dauphinè, was born A. D. 860, and distinguished by his piety, industry, and learning. His "Universal Chronology," comprehends the whole extent of history to the year 879. It was printed in folio at Paris in 1512, in Gothic characters, and reprinted by Morel in 1567. A new edition of this valuable work was published in folio, at Rome, in 1745. Ado was also the author of a Martyrology, published by Rosweyde, a Jesuit, in 1613. *Gen. Biog.*

AD OCTO, q. d. to the eighth number; a term used by some ancient philosophers to denote the highest or superlative degree; because, in their way of distinguishing qualities, they reckoned no degree above the eighth.

ADOD, in *Mythology*, the name which the Phœnicians gave to the king of their gods.

ADOLESCENS signifies the iron bars that support the fire, in a grate or furnace.

ADOLESCENCE, formed of *adolescere*, to *grow*, the state of growing youth; or that period of a person's age commencing from his infancy, and terminating at his full stature or manhood. The state of adolescence lasts so long as the fibres continue to grow, either in magnitude or firmness. It is commonly computed to be between 15 and 25, or even 30 years of age; though, in different constitutions, its terms are very different.—The Romans usually reckoned it from 12 to 25 in boys, and to 21 in girls, &c. And yet, among their writers, *juvenis* and *adolescens* are frequently used indifferently, for any person under 45 years. The fibres, being arrived at a degree of firmness and tension sufficient to sustain the parts, no longer yield and give way to the efforts of the nutritious matter, to extend them: so that their farther accretion is stopped from the very law of their nutrition.

ADOLFSECK, in *Geography*, a town of Germany, in the circle of the Upper Rhine; eight miles west of Idstein.

ADOLIA, in *Botany*, a genus of plants described by Rheede among the trees of Malabar, which bear a near relation, says M. La Marek, (*Encycl. vol. i. p. 44.*) to the **RHAMNUS**. The characters are, that each flower is composed of a calyx, divided to its middle in five equal notches; the corolla and stamina are unknown; the pistillum is a small ovary situated at the center of the calyx, and which becomes, when ripe, a roundish berry, containing five oblong, triangular, offeous seeds. There are two species, viz. *A. alba*, with white flowers, which grows to the height of seven feet, and bears fruit twice a year; the berries when ripe are of a purplish black colour; and *A. rubra*, with red flowers, which resembles the other; but the berries of this species, when ripe, are of an orange colour and of an acid taste.

ADOLPHUS, **FREDERICK II.** of Holstein-Gottorp, king of Sweden, was born in 1710, and succeeded his father Frederick in 1751. He married a sister of the king of Prussia in 1744. He faithfully pursued the good of his country, and his reign was upon the whole prosperous. He reformed the laws, cultivated science, promoted commerce, and for the most part preserved peace; though he could not prevent Sweden from joining the league against Prussia in 1757, a measure that contributed very little to its reputation. He instituted an academy of inscriptions and belles lettres in imitation of that of France, and erected a pyramid at Torneo in Lapland, to commemorate the labours of the French academicians, who were sent thither to measure a degree of the meridian. He died much regretted in 1771; and was succeeded by his son Gustavus III. *Nouv. Dict. Hist.*

ADOLPHUS, **CHRISTIAN MICHAEL**, the son of Balthazar Adolphus, merchant of Hirschberg in Silesia, was born the 14th of August 1676. After studying the different branches of medicine under the most celebrated masters of his time, he graduated at Utrecht, then went to Leipzig, where he acquired considerable reputation as a teacher. In 1747 he published, *Dissertationes Physico-medicæ selectæ*, 4to. The titles of the Dissertations, which are very numerous, may be seen in the 4to. volume of Haller's *Biblioth. Med. Pract.*

ADOM, in *Ancient Geography*. See **ADAM**.

ADOM, in *Modern Geography*, one of the states or principalities, into which the maritime part of the **GOLD COAST** in Africa is divided. It is bounded on the east by Manpa, on the south by Guasso, on the north by Vassabs, and east-north-east by Abramboe. This country extends along the river Schama, and has many fine islands belonging to it, which are covered with beautiful and populous villages; the government was formerly monarchical; but the supreme authority is now lodged in a council of six lords. Adom is populous, fertile and rich; abounding with corn, fruit, and animals, both wild and tame; but the peace and prosperity of the country are often interrupted by civil discord. The Adomese have it in their power to intercept the communication of the northern regions with the negroes of the coast, and oblige them to pay a duty which yields a large revenue. If these people were united and powerful within themselves, they would be the terror of surrounding nations. Adom adjoins to **ANTA**, which is often disturbed by the incursions of the Adomese. These people generally trade with Axim and Bourtry; and sometimes with Little Commendo. *Mod. Un. Hist. vol. iii. p. 454.*

ADOM, or **THETEN**, a town of Hungary, situate on the Danube; four leagues south-west of Offen.

ADOMER, one of the states of the **GOLD-COAST**, called also Saku and Avina, adjoining to Adom and Axim; and differing little from them in produce, trade, laws and customs.

ADON, a large populous village of Hungary, situate in the province of Stuhl-Weissenburg, or *Alba regalis*, in a rich country on the banks of the Danube. E. long. 19° 20'. N. lat. 47° 30'.

ADONAI, one of the names of God in scripture. This word properly signifies *my lords*, in the plural number, as *Adoni*, signifies *my lord*, in the singular number. The Jews, who, either out of respect or superstition, do not pronounce the name of *Jehovah*, read *Adnai* in the room of it, as often as they meet with *Jehovah* in the Hebrew text. But the ancient Jews were not so scrupulous; and there is no law which forbids them to pronounce the name of God. This superstition commenced among the latter Jews after the Babylonish captivity; at least before the time of Jese-

plus, who expressly says, that it was not lawful for him to speak of the name by which God had revealed himself to Moses. See Geddes's Critical Remarks, vol. i. p. 167.

ADONEA, in *Mythology*, the name of a divinity which presided over voyages.

ADONI, in *Geography*, a district of Hindostan, in the country of Goleonda. It is also the name of a town in this district, about 188 miles north of Srirangapatam. E. long. 77° 18'. N. lat. 14° 50'.

ADONIA, in *Antiquity*, solemn feasts in honour of Venus, and in memory of her beloved Adonis, who is supposed to have been killed by a wild boar in the forest of mount Libanus, from which the river Adonis descends. Bishop Patrick (Com. in Exod. xii. 30.) ascribes the origin of these feasts among the Egyptians to the slaughter of the first-born in the time of Moses; and he, adopting the conjecture of Schaccus, an ancient writer, inclines to the opinion, that Pharaoh's eldest son, who was now slain, had the name of Osiris; and that his sudden death on this occasion was lamented by all posterity in one night of the year, at the time of full moon. Dr. Spencer, (*De leg. Heb. l. ii. c. 37. § 1. vol. i. p. 575.*) conjectures, that these feasts had their origin with the Egyptians; but that the death of Osiris or Adonis, generally understood to be the sun, being the god that presided over the fruits of the earth, or used symbolically for the fruits themselves, denoted their being cut off or separated from the earth in the time of harvest; which event was celebrated with mourning and lamentation; and as the Egyptians gathered the first fruits of the earth with this kind of unreasonable and excessive sorrow, he thus accounts for the instruction recorded in Deut. xxvi. 14. To these feasts the prophet Ezekiel is supposed to refer, ch. viii. 14; and if Tammuz or Thamuz be the same with Osiris or Adonis, as learned men generally suppose, the circumstance above-mentioned accounts for this solemnity being kept in the month of Tammuz, answering to part of our June and July, because the harvest was finished in those hot countries by or before that time. See Lowth's Com. in loc.

This idolatry, derived from the Egyptians, was afterwards adopted by other nations, as the Phœnicians, Lycians, Syrians and Greeks, and improved by the addition of a new fable, viz. Venus's mourning for the death of Adonis. The scene of Adonis's history is said to be at Byblos in Phœnicia; and the signal for celebrating the Adonia was the change of the water of the river Adonis into blood, which happened once a year. Lucian (*De Syria Dea, apud oper. tom. iii. p. 454. Ed. Reitzii*) gives the following account of these feasts. The Syrians affirm, that what the boar is reported to have done against Adonis was transacted in their country; and, in remembrance of this calamity, they annually beat themselves and wail, and celebrate frantic rites, and great lamentations are instituted through the whole country. When they have had enough of lamentation and tears, they first perform funeral obsequies to Adonis, as to one that is dead; and afterwards, on a following day, they feign that he is alive, and ascended into the air or heaven, and shave their heads as the Egyptians do, on occasion of the death of their apis. If any women will not consent to be shaved, they are obliged to prostitute themselves once to strangers, and the money they thus earn is consecrated to Venus. Some of the Byblians, continues Lucian, are of opinion, that these orgies are performed in honour of Osiris, the Egyptian deity, and not of Adonis. The Egyptians, at the time of this feast, are said to convey a box made of rushes or papyrus, with an inclosed letter, informing the inhabitants of Byblos, about seven days journey from the coasts of Egypt, that their god Adonis, whom they apprehended

to be lost, is discovered. The vessel always arrives safe at Byblos at the end of seven days. Lucian says, he was a witness of this event. The women, who are the principal actors on this occasion, expect the arrival of the vessel with impatience, and are frantic with joy when it arrives. According to Meursius, the two offices of lamentation and rejoicing made two distinct feasts, which were held at different times of the year, the one six months after the other; Adonis being supposed to pass half the year with Proserpine, and the other half with Venus. The lamentation they called *αφανισμος*, or disappearance, and the rejoicing *επιστη*, or return. These feasts were observed at Alexandria in the time of St. Cyril, and at Antiech in the time of Julian the apostate, who happened to enter the city during the solemnity, which was interpreted as an ill omen.

Ovid refers to the Adonia in his *Metamorph. (l. iv. v. 725. tom. 2. p. 740. Ed. Burman)*.

“ — — — — — luctus monumenta manebunt,

Semper, Adoni, mei; repetitaque mortis imago.

Annua plangoris peraget simulamina nostri.

At eruo in florem mutabitur. — — — ”

Procopius, St. Cyril, and some other learned men are of opinion, that Isaiah (ch. xviii. 2.) refers to the circumstance above-mentioned of sending a letter by sea to communicate the news of Adonis's resurrection; whilst others, translating the Hebrew *tzirim*, *idols*, suppose that the passage refers to the images of Isis, which the Egyptians carried from place to place in a sort of paper-vessel, or ark of bulrushes. The rites practised in the Adonia resemble those of the Orphic ARGONAUTICA, and probably have the same origin and end. Bryant. *Mythol. vol. i. p. 371.*

The Adonia were otherwise called Salambo. The Abbé Banier has a memoir on the history of the Adonia. *Mem. Acad. Inscript. tom. iv.*

ADONIËUS, a name given by the Arabs to the sun, under which appellation they worshipped him, by daily offering to him incense and perfumes. This was also a name given to Bacchus.

ADONIC, in *Poetry*, denotes a short kind of verse, consisting of a dactyl and a spondee, or a trochee: as *rara juvenus*. It takes its name from Adonis; as having been originally used in the Threnæ, or lamentations for that favourite. The chief use of the adonic verse is at the end of each strophe of sapphic verse; or among Aristophanic Anapaests in the ancient tragedy. But we meet with adonics by themselves without sapphics, as also sapphics without adonics. See an instance of adonic verses in Boethius, de Consol. Philos. lib. i. p. 24. Ed. Amstel. “Gaudia pelle,” &c.

ADONIDES, in *Botany*, are those writers, who have given histories, or catalogues of the plants cultivated in some particular place.

ADONION, a species of southernwood, according to Gorreus, which used to be set in pots, and served as an ornament for gardens.

ADONIS, in *Antiquity*, a dance of the ancient Greeks, which was a kind of ballet, in which a pantomime imitated Adonis, and bewailed his misfortune.

ADONIS, *flos Adonis*, or *Pheasant's Eye*, in *Botany*, a genus of the *polyandria polygynia* class and order, and of the natural order of *multifloræ* and the *ranunculaceæ* of Jussieu. Its characters are, that the calyx is a five-leaved perianthium, and the leaflets are obtuse, concave, a little coloured and deciduous; the corolla has from five to fifteen, but most commonly eight, oblong, obtuse, shining petals: the stamina consist of very short, subulate filaments, and the antheræ are oblong and inflex: the pistillum has numerous germs

collected

collected in a head, no styles, and acute reflex stigmas: no pericarpium; an oblong, spiked receptacle: the seeds are numerous, irregular, angular, gibbous at the base, reflex at the top, a little prominent and naked. To this genus belong six species: viz. the *estivalis*, or tall, the *autumnalis*, or common, the *vernalis*, or spring, the *apemina*, the *capensis*, and the *vesicatoria*, or blister *adonis*. The first is by some botanists united to the second, although Dr. Smith separates them; it is a native of the southern countries of Europe, where it grows among corn: and a variety of it is mentioned by some authors. The second grows in Kent, near the river Medway, between Rocheller and Maidstone, in fields sown with wheat; and the flowers are brought in great quantities to London, where they are sold under the name of *red morocco*. It is also found in Norfolk, Gloucestershire, about London, and about Dublin. It is annual, and flowers from May to October. The spring *adonis*, which is near akin to the apemine, so that La Marck considers it as a variety of the other, is a native of Switzerland, Prussia, and various parts of Germany, where the root is often used for the true black hellebore. The fourth is found wild in the Apennines, and in Siberia. The fifth species is found wild near the Cape of Good Hope. The sixth is also a Cape plant, and used by the Africans for raising blisters. There is another species recorded in the Supplement of the younger Linnaeus, there named *Adonis filia*, and considered as the daughter of the *Adonis capensis*.

The two first species are annual, and thrive best in a light soil: the seeds should be sown in autumn, some in a warm, and others in a shady situation, that they may continue longer in flower: they will not bear being transplanted. The third and fourth are perennial, and the seeds should be sown in August, soon after they ripen: the ground should be kept clear from weeds, and in dry weather, watered; and in the autumn of the second year they should be transplanted into the situation where they are to remain. They may be increased by parting the roots, either in autumn or spring. They are hardy and showy, and therefore desirable plants for a garden. The Cape species must be managed as other plants from that country. Martyn's Miller. Gmelin reckons eight species, adding to those already enumerated the *miniata*, which he suggests not to be distinct from the *autumnalis*, and the *flammea*, with octopetalous flowers, hairy calyx, and cylindrical fruit.

ADONIS, in *Entomology*, a species of PAPHILIO, with entire cerulean wings, a black marginal ridge, underneath cinereous, with numerous ocelli; of which the latter have a white central spot. The larva is green, with dorsal lines of yellow spots. It is found in Austria.

ADONIS, in *Ancient Geography*, a river of Phœnicia, rising in Mount Libanus or Lebanon, and falling into the sea at Byblos, now GIBYLE. The Turks call this river *Obrakim Bassa*. Maundrell, in his *Journey*, p. 34, 35, confirms the opinion of Lucian (*Oper. tom. iii. p. 456. Ed. Reitzii*) concerning the red colour of this river. At certain seasons of the year, especially about the feast of Adonis, it is of a bloody colour, which the heathens attributed to a kind of sympathy in the river for the death of Adonis, who was killed by a wild boar in the mountain, out of which this stream rises. The water was stained, says Maundrell, to a surprising redness, and as we observed in travelling had discoloured the sea for a considerable distance into a reddish hue, occasioned, without doubt, by a sort of minium, or red earth, washed into the river by the violence of the rain, and not by any stain from the blood of Adonis. This reddish tinge of the streams of water is not a singular phenomenon. Pöcocke (*voç. i. p. 199*) informs us, that when the river

Nile is rising, its waters become red, and sometimes green. The same fact is confirmed by Maillet, and Volney (*Travels in Syria, vol. ii. p. 203*), relates, that at Tyre there is a well, which commonly affords excellent water, but becomes troubled in September, and continues for some days full of reddish clay. This season is observed as a festival by the inhabitants, who come in crowds to the well, and pour into it a bucket of sea-water, which they say, has the virtue of restoring the clearness of the spring. An ingenious writer suggests, that the magicians of Egypt (*Æt. vii. 22.*) might, by their enchantments, have repeated some of the practices to which they were accustomed at the solemnity of the bleeding Adonis; and if this was done at the feast of Adonis, they might persuade Pharaoh, that the miracle was wrought in favour of Adonis. Fragments in an Appendix to Calmet's *Diët. vol. ii. pt. 1. p. 20*.

The river Adonis, according to Mr. Bryant (*Myth. vol. i. p. 366.*) is the same with ERIDANUS; and the circumstance of the change of the colour of its waters, and the death of Adonis or Thamuz, which was supposed to be the occasion of it, are pathetically described by Milton in the following lines of his *Paradise lost, B. i. v. 445*.

“ ——— Thamuz came next behind,
Whose annual wound in Lebanon allur'd
The Syrian damsels to lament his fate
In amorous ditties all a summer's day;
While smooth *Adonis* from his native rock
Ran purple to the sea; suppos'd with blood
Of Thamuz yearly wounded.”

ADONIS is the name of a river of Africa, which rises in the mountains south-west of Tetuan, and falls into the sea between Arzilla and Tangier.

ADONIS, the name of a city in Thrace, called ENONIS.

ADONIS, in *Ichthyology*, the name of a small fish of the anguilliform kind, of a cylindric shape, and about six inches long; it is of a gold colour, mixed with a greenish hue in some parts, and in others with a reddish. It has on each side a white straight line running from the gills to the tail. Its gills are remarkably small, and many have hence supposed that it had none. It is remarkable for sleeping on the surface of the water, and near the shores; and Rondeletius affirms, that he has seen them sleeping upon dry rocks. Mr. Ray suspects this fish, which is also called *exocoetus*, to be the same with the *EXOCOETUS* of Bellonius, or the GATTORUGINE. The adonis of Bellonius is the BLENNIUS *galerita* of the Linnæan system.

ADONIS, in *Mythology*, a beautiful youth, the son of Cinyras, an Assyrian, who founded the city of Paphos, in the island of Cyprus. Venus, it is said, was enamoured of him from his infancy, and committed the care of his education to Proserpine, who refused to deliver him when he was demanded by Venus. The dispute was decided by Jupiter, by decreeing that he should be one third of the year with Proserpine, another third with Venus, and the last third at his own disposal; but Adonis, captivated by the charms of Venus, spent two-thirds of his time with her. Diana, it is said, took offence, and sent a wild boar to destroy him. Others say, that Adonis was the son of Cinyras by his daughter Myrrha; that he was dismissed for concealment to the mountains, and nursed by the nymphs; that Venus fell in love with him, and admitted him to her embraces; that Mars, being jealous, transformed himself into a wild boar, and slew the beautiful youth: that Venus followed him to the shades, and obtained the consent of Proserpine, that he should be half the year with her, and half the year with Proserpine; and that Venus, triumphing in her success, appointed a festival to be celebrated in commemoration

of the event. This fable has been variously interpreted. Adonis, as some say, was the sun, Venus the upper hemisphere of the earth, and Proserpine the inferior; and therefore, when he was in the six inferior signs he was with Proserpine, and during the remaining time he resided with Venus. The boar which slew Adonis was the winter. Macrobi. Saturn. l. i. c. 21. Others suppose that Adonis denoted the fruits of the earth; and when the seed was sown in the ground, Adonis was gone to Proserpine: and that when it had vegetated and sprung up to view, he revisited Venus. Hence they sowed corn, and made gardens for Adonis, which were adapted more for pleasure than profit. Voss. de Idololat. l. ii. c. 5. Theocritus, Idyll. 111. According to Plutarch, (Symposiacon, l. iv. oper. tom. 2. p. 671. Ed. Nylandr.) Adonis was the same with Bacchus; and Osiris was both the sun and Adonis. Some are of opinion, that the Ammonites and Moabites called him *Baal-Peor*, and that he was the same with the Hebrew *Thammuz*. Bryant (Mythol. v. i. p. 371.) supposes, that the Canaanites worshipped their chief deity the sun, under this title; and he says, that at Byblus, Berytus, Sidon, and afterwards at Tyre, they used particularly mournful dirges for the loss of Adonis or Thammuz, who was the same as Thamas, and Osiris in Egypt. Hence the children of Israel were forbidden to weep and make lamentation upon a festival. Nehem. viii. 9. 14. See *ADONIA*.

The worship of Adonis was established by the emperor Adrian in the grottoes of Bethlehem, where it was supposed our Saviour was born.

ADONIS potio, an ancient beverage or drink made of wine mixed with flour of roasted *ador*; the same with what was otherwise called *CYCEON*.

ADONISTS, among *Divines* and *Critics*, a sect or party, who maintain, that the Hebrew points ordinarily annexed to the consonants of the word *Jehovah*, are not the natural points belonging to that word, nor express the true pronunciation of it; but that they are the vowel-points belonging to the words *Adonai* and *Elohim*, applied to the consonants of the ineffable name *Jehovah*; to warn the readers, that instead of the word *Jehovah*, which the Jews were forbidden to pronounce, and the true pronunciation of which had been long unknown to them, they are always to read *Adonai*. These were opposed to *Jehovists*; of whom the principal are Drusius, Capellus, Buxtorf, Alting, and Reland, who has published a collection of their writings on this subject. See *ADONAI* and *JEHOVAH*.

ADOPSISSUS, in *Ancient Geography*, a town of Asia Minor, which Ptolemy places in Lycaonia.

ADOPTER, in *Chemistry*, a vessel with two necks placed between a retort and a receiver, and serving to increase the length of the neck of the former. They differ from *ALUDELS*, which were formerly used in the sublimation of several substances, both in their figure and in their situation. The adopters are tubes which become narrower at one end, from half a foot to three feet long, and are open at both ends. They are joined in a collateral oblique situation; whereas the aludels were set upright. Chemistry, plate 1. fig. 1. See *DISTILLATION* and *RECEIVER*.

ADOPTIANI, in *Church History*, a sect in the eighth century, which sprung up under Charlemagne, about the year 783, in consequence of the concurring opinion of Elipand, archbishop of Toledo, and Felix, bishop of Urgel; whose distinguishing tenet was, that Christ, as to his human nature, was not the proper or natural, but only the adoptive son of God. Their doctrine was condemned by a council at Frankfort in 794, and afterwards in a council at Rome under pope Leo III.

ADoption, an act by which any one takes another into his family, owns him for his son, and appoints him for his heir. The word is derived from *adoptare*; whence the Latin barbarous *adobare*, to make a knight.

The custom of adopting was very familiar among the ancient Romans, who had an express formula for it. They first learned it from the Greeks, among whom it was called *isomis*, *filiation*; and it was transmitted to them from the ancient Hebrews, Egyptians, and Assyrians, among whom it prevailed.

As adoption was a sort of imitation of nature, intended for the comfort of those who had no children; eunuchs were therefore not allowed to adopt, as being under an actual impotency of begetting children. Neither was it lawful for a young man to adopt an elder, because that would have been contrary to the order of nature; but it was even required, that the person who adopted should be eighteen years older than his adoptive son, that there might appear at least a probability of his being the natural father.

The Romans had two forms of adoption; the one before the prætor; the other at an assembly of the people, in the times of the commonwealth, and afterwards by a rescript of the emperor. In the first, the natural father addressed himself to the prætor, declaring that he emancipated his son, resigned all his authority over him, and consented that he should be translated into the family of the adopter. The latter manner of adoption was practised, where the party to be adopted was already free; and this was called *adrogation*. The person adopted changed all his names; assuming the prænomen, name and surname of the person who adopted him. When Augustus adopted his grand-children, the two sons of Agrippa and Julia, he adhered closely to the most solemn formularies of the Roman law, and insisted on their fathers making over to him, by a kind of sale, his right to the children; and he gave them his name, so that they called them Caius Cæsar, and Lucius Cæsar. In the reign of Nero, the senate passed a decree, ordaining that fraudulent adoptions should not avail such as made them, either to qualify themselves for honours, or to receive the whole of any inheritance that might fall to them.

Besides the formalities prescribed by the Roman law, divers other methods have taken place; which have given denominations to various species of adoptions among the Gothic nations, in different ages.

ADoption by arms, was when a prince made a present of arms to a person, in consideration of his merit and valour.—Thus it was that the king of the Heruli was adopted by Theodoric; Athalaric, by the emperor Justinian; and Cosroes, nephew of the king of Persia, by the emperor Justin.

This method of adoption, practised in Germany, was called *barbarous*, by way of opposition to the Roman custom.

The obligation here laid on the adoptive son was, to protect and defend the father from injuries, affronts, &c.—and hence the ceremony of dubbing knights took its origin as well as name. Selden, Tit. of Hon. p. 865.

ADoption by baptism, is that spiritual affinity which is contracted by god-fathers and god-children in the ceremony of baptism.

This kind of adoption was introduced into the Greek church, and came afterwards into use among the ancient Franks, as appears by the Capitulars of Charlemagne.

In reality, the god-father was so far considered as adoptive father, that his god-children were supposed to be entitled

entitled to a share in the inheritance of his estate. Du-Cange.

ADOPTION *by hair, adoptio per capillum, or crinem*, was performed by cutting off the hair of a person, and giving it to the adoptive father. It was thus that pope John VIII. adopted Boson king of Arles; which, perhaps, is the only instance in history, of adoption in the order of ecclesiastics; a law that professes to imitate nature, not daring to give children to those in whom it would be thought a crime to beget any.

ADOPTION *by matrimony*, is the taking the children of a wife or husband, by a former marriage, into the condition of proper or natural children; and admitting them to inherit on the same footing with those of the present marriage. This is a practice peculiar to the Germans; among whom it is more particularly known by the name of *einkindschaft*; among their writers in Latin, by that of *unio prolium*, or *union of issues*. But the more accurate writers observe, that this is no adoption. See **ADFILIAION**.

ADOPTION *by Sublitate*. See **LEVIRATE**.

ADOPTION *by testament*, that performed by adopting a person heir by will, on condition of his assuming the name, arms, &c. of the adopter.

Of which kind, we meet with divers instances in the Roman history.

Adoption was allowed among the Greeks to such as had no issue of their own; excepting those who were not *κυριοι εαυτων*, *their own masters*, e. gr. slaves, women, madmen, infants, or persons under twenty years of age; who being incapable of making wills, or managing their own estates, were not allowed to adopt heirs to them. Foreigners being incapable of inheriting at Athens, if any such were adopted, it was necessary first to make them free of the city. The ceremony of adoption being over, the adopted had his name enrolled in the tribe and ward of his new father; for which entry a peculiar time was allotted, viz. the festival *Σαργηδισα*.

To prevent rash and inconsiderate adoptions the Lacedæmonians had a law, that adoptions should be transacted, or at least confirmed, in the presence of their kings. The children adopted were invested with all the privileges, and obliged to perform all the duties, of natural children; and being thus provided for in another family, ceased to have any claim of inheritance, or kindred, in the family which they had left, unless they first renounced their adoption; which, by the laws of Solon, they were not allowed to do, unless they had first begotten children, to bear the name of the person who had adopted them: thus providing against the ruin of families, which would otherwise have been extinguished by the desertion of those who had been adopted to preserve them. If the children adopted happen to die without children, the inheritance could not be alienated from the family into which they had been adopted, but returned to the relations of the adopter. It should seem that by the Athenian law, a person, after having adopted another, was not allowed to marry, without permission from the magistrate: in effect, there are instances of persons, who being ill used by their adoptive children, petitioned for such leave. However this be, it is certain some men married after they had adopted sons; in which case, if they begat legitimate children, their estates were equally shared between the begotten and adopted.

Among the Turks, by the law of Mahomet, adoption is no impediment of marriage. The ceremony of adoption is performed by obliging the person adopted to pass through

the shirt of the adopter. Hence, among that people, to adopt is expressed by the phrase, *to draw another through my shirt*.

Du-Cange supposes that the adoption of Godfrey of Bouillon by Alexius, who named him champion of the empire, and dignified his homage with the filial name and rites of adoption, was of this kind.

It is said that something like this has also been observed among the Hebrews; where the prophet Elijah adopted Elisha for his son and successor, and communicated to him the gift of prophecy, by letting fall his cloak, or mantle, on him. 1 Kings xix. 19. 2 Kings ii. 15. But adoption, properly so called, does not appear to have been practised among the ancient Jews. Moses says nothing of it in his laws; and Jacob's adoption of his two grandsons, Ephraim and Manasseh (Gen. xlviii. 1.) is rather a kind of substitution, by which he intended that the two sons of Joseph should have each his lot in Israel, as if they had been his own sons. Calmet.

In the East, the practice of adoption is still continued. Pitts (Account of the Religion and Manners of the Mahometans, p. 217. 225) informs us, that his patron, who was an old bachelor, being taken ill and likely to die in his pilgrimage to Mecca, took off his own girdle and put it on him, and at the same time put on himself the girdle of Pitts. In speaking of him afterwards, his patron called him his son; and occasionally said to him, *though I never was married myself, yet you shall be married, in a little time, and then your children shall be mine*. Lady Montague (Letter xlii. vol. ii. p. 189.) says, that adoption is very common amongst the Turks, and yet more common amongst the Greeks and Armenians. With this view, and in order to prevent their estates from falling into the Grand Signior's treasury, they chuse a child of either sex, among the meanest people, and carry the child and its parents before the Cadi, and there declare they receive it for their heir. The parents, at the same time, renounce all future claim to it; a writing is drawn and witnessed, and a child, thus adopted, cannot be disinherited.

By the Gentoo laws (Halhed's, p. 263.) information must be given to the magistrate, by the person who is desirous of adopting a child, and a *jugg* or sacrifice performed; and he is also to give gold and rice to the father of the child. A woman is not allowed to adopt a child without her husband's order: and he who has no son, or grandson, or great grandson, has liberty to adopt a son; but while he has one adopted son, he is not permitted to adopt a second.

ADOPTION is also used, in *Theology*, for a federal act of God's free grace; whereby those that are regenerate by faith, are admitted into his household, and entitled to a share in the inheritance of the kingdom of heaven.

ADOPTION, in the more general scripture sense of the term, denotes that act of divine grace or favour, by which some of the human race are introduced into a peculiar relation to God, as his children and people. In this sense the privilege of adoption belonged only to the Israelites or Jews, before the coming of the Messiah. See Exod. iv. 22. Jer. xxxi. 9. Luke i. 54. Rom. ix. 4. But the Jews forfeited this honourable distinction, and were deprived of the national privilege they had long enjoyed: and God determined to admit the Gentiles into the state of sonship or adoption independently of any legal observances, and merely on the condition of faith in Jesus Christ. It has, however, been a subject of debate among divines whether adoption belongs to Christians in general, in consequence of their

their faith in Christ, and outward profession of his religion; or is appropriate to those Christians in particular who conform in their disposition and practice to the precepts of the gospel, and are the special objects of divine favour. According to the scheme of Dr. Taylor, in his Key to the Apollitical Writings, prefixed to his Paraphrase, &c. on the Epistle to the Romans, (chap. xii. p. 91.) adoption, as well as election, vocation, justification, &c. belong to the class of antecedent blessings, which, in a sense, belong at present to all Christians, even those, who for their wickedness shall perish eternally; and that they do not import an absolute, final state of favour and happiness; but are to be considered as principles or motives to engage us to holiness and obedience. He allows that some of the expressions, whereby the antecedent blessings are signified, may be used in a double sense; either, as they are applied to all Christians in general in relation to their being translated into the kingdom of God, and made his peculiar people, enjoying the privileges of the gospel; or, as they signify the effects of those privileges, viz. either that excellent disposition and character which they are intended to produce, or that final state of happiness, which is the reward of it. See Locke's Works, vol. iii. p. 312. 570.

Adoption has a particular respect to that future resurrection and immortality to the hope of which Christians were begotten again by the doctrine and resurrection of Christ. See Whitby Comment. vol. ii. p. 44. 324. 339. 6th edition.

ADOPTION is sometimes also used, in speaking of the ancient clergy, who had a custom of taking a maid or widow into their houses, under the denomination of an adoptive or spiritual sister, or niece. Du-Cange.

ADOPTION is also used in speaking of the admission of persons into certain hospitals, particularly that of Lyons; the administrators whereof have all the power and rights of parents over the children admitted.

ADOPTION is also used for the reception of a new academy into the body of an old one.

In which sense, adoption amounts to much the same with incorporation.

The French academy of Marseilles was adopted by that of Paris; on which account, we find a volume of speeches extant, made by several members of the academy of Marseilles, deputed to return thanks to that of Paris, for the honour.

In a sense not unlike this, adoption is also applied by the Greeks, to the admitting a monk or brother, into a monastic community; sometimes called spiritual adoption.

ADOPTIVE, ADOPTIVUS, or ADOPTIVUS, denotes a person adopted by another.

Adopted children, among the Romans, were on the same footing with natural ones; for which reason, they were either to be instituted heirs, or expressly disinherited; otherwise the testament was null.

The emperor Adrian preferred adoptive children to natural ones; because we choose the former, but are obliged to take the latter at random.

M. Menage has published a book of eulogies, or verses addressed to him; which he calls *Liber Adoptivus*, an adoptive book; and adds it to his other works.—Heinsius, and Fursstemburg of Munster, have likewise published adoptive books. In *Ecclesiastical Writers* we find adoptive women or sisters, *adoptivæ femine*, or *sorores*, used for those handmaids of the ancient clergy, otherwise called *subintroductæ*.

ADOPTIVE arms are those which a person enjoys by the

gift or concession of another, and to which he was not otherwise entitled. They stand contradicting distinguished from arms of *alliance*.

ADOPTIVE is also used to express a thing borrowed or taken from another. In which sense we sometimes meet with *adoptive hair*, by way of opposition to natural hair; and *adoptive gods*, by way of contradistinction to domestic ones. The Romans, notwithstanding the number of their domestic, had their adoptive gods, taken chiefly from the Egyptian: such were Isis, Osiris, Anubis, Apis, Harpocrates, and Canopus.

ADOPTIVI, in *Church History*. See ADOPTIANI.

ADOR signifies a species of corn called SPelta and ZEA.

ADORA, or ADORAIM, in *Ancient Geography*, a city belonging to the tribe of Judah, not far from Maresa in the southern part of Judah, on the confines of Idumæa. These two cities were taken by Hyrcanus in his expedition into Syria, when he destroyed the Samaritan temple on Mount Garizim. Joseph. Antiq. apud op. tom. i. p. 659. ed. Havere.

ADORATION, the act of rendering divine honours; or of addressing God or a being, as supposing it a god. See WORSHIP. The word is compounded of *ad, to*; and *or, mouth*; and literally signifies to apply the hands to the mouth; *manam ad os admovere*, q. d. *to kiss the hand*; this being, in the eastern countries, one of the great marks of respect and submission; and seeming, from the first books of Herodotus, to be of Persian origin. To this mode of idolatrous worship Job refers, chap. xxxi. 26, 27.—See also 1 Kings xix. 18.

The ceremony of adoration among the ancient Romans was thus: the devotee having his head covered, applied his right hand to his lips, the fore-finger resting on the thumb, which was erect, and thus bowing his head, turned himself round from left to right. The kiss thus given was called *osculum labratum*; for ordinarily they were afraid to touch the images of their gods themselves with their profane lips. Sometimes, however, they would kiss their feet and even knees, it being held an incivility to touch their mouths; so that the affair passed at some distance. Others pretend, that they first stretched out the hand, and afterwards drew it back to their lips; but it rather appears that the contrary order was observed. Saturn, however, and Hercules, were adored with the head bare; whence the worship of the last was called *institutum peregrinum*, and *ritus Græcicus*, as departing from the Roman customary method, which was to sacrifice and adore, with the face veiled, and the clothes drawn up to the ears, to prevent any interruption in the ceremony, by the sight of unlucky objects.

Sometimes also prostration, or falling on the face, and sometimes kneeling, were practised; sometimes they turned towards the sun, and sometimes to the east.

Other circumstances of adoration were the putting crowns, garlands, and the like, on the statues or images adored; sitting down by them, praying to them in soft trembling murmurs, to be favourable, *favæas mihi*.

The Romans practised adoration at sacrifices, and other solemnities; in passing by temples, altars, groves, &c. at the sight of statues, images, or the like, whether of stone or wood, wherein any thing of divinity was supposed to reside. Usually there were images of the gods placed at the gates of cities, for those who went in, or out, to pay their respects to.

The Gauls, instead of turning about to the right hand,

after the Roman manner, thought it more religious to turn to the left.

In the symbols of Pythagoras, adoration is enjoined to be performed in a sitting posture, genuflexion being then unknown.

The Jewish manner of adoration was by prostration, bowing, and kneeling. Pinchon has a discourse expressly on the form of the Jewish adoration. The Christians adopted the Grecian rather than the Roman method, and adored always uncovered. The ordinary posture of the ancient Christians was kneeling, but on Sundays, standing. In this they conformed to the heathens, that a peculiar regard was had to the east, to which point they ordinarily directed their prayers; which occasioned a belief among the heathens that they adored the sun. Something of this usage is still retained, as appears by the position of our churches. A modern author has discovered an error of the builders in this respect; many of our ancient churches being found to vary several degrees from the true east and west. Plott's *Hill. Staff.* chap. ix. sect. 55. p. 362. In the east it is still considered as a mark of the highest respect, to pull off one's shoes, and approach bare-footed to pay adorations. See *Exod.* chap. iii. 5. The Egyptians were singularly attentive to this practice: and the Mahometans take off their shoes before they enter the mosques. A similar practice is observed by the Roman Catholics, at the adoration of the crofs on Good Friday, although not observed in this country. When Mr. Wilkins wished to enter the inner hall of the College of *Seeks*, at Patna, he was told it was a place of worship, open to him and to all men; but at the same time it was intimated, that he must take off his shoes. *Asiat. Researches*, vol. i. p. 289.

ADORATION is also used for certain extraordinary civil honours or respects, which resemble those paid to the Deity, yet are given to men.

We read of adorations paid to kings, princes, emperors, popes, bishops, abbots, &c. Adorations paid to the purple, to the person. Adoration by kneeling, by falling prostrate, kissing feet, hand, garment, &c.

The Persian manner of adoration, introduced by Cyrus, was by bending the knee, and falling on the face at the prince's feet, striking the earth with the forehead, and kissing the ground. This was an indispensable condition on the part of foreign ministers and ambassadors, as well as the king's own vassals, of being admitted to audience, and of obtaining any favour. This token of reverence was ordered to be paid to their favourites, as well as to themselves, as we learn from the history of Haman and Mordecai, in the Book of Esther; and even to their statues and images; for Philostratus informs us, that, in the time of Apollonius, a golden statue of the king was exposed to all who entered Babylon, and none but those who adored it were admitted within the gates. The ceremony, which the Greeks called *προσκύνησις*, Conon refused to perform to Artaxerxes, and Callisthenes to Alexander the Great, as repugnant to impiety and unlawful.

The adoration performed to the Roman and Grecian emperors, consisted in bowing or kneeling at the prince's feet, laying hold of his purple robe, and presently withdrawing the hand, and clapping it to the lips. Some attribute the origin of this practice to Constantius. They were only persons of some rank or dignity that were entitled to the honour. Bare kneeling before the emperor to deliver a petition, was also called adoration.

It is particularly said of Dioclesian, that he had gems fastened to his shoes, that divine honours might be more willingly paid him, by kissing his feet. And this mode of

adoration was continued and aggravated till the last age of the Greek monarchy. See Gibbon's *Decline and Fall of the Roman Empire*, vol. x. p. 124, 8vo. When any one pays his respects to the king of Achen in Sumatra, he first takes off his shoes and stockings, and leaves them at the door.

The practice of adoration may be said to be still subsisting in England, in the ceremony of kissing the king's or queen's hand, and in serving them at table, both being performed kneeling.

ADORATION is also used in the court of Rome, for the ceremony of kissing the pope's feet.

It is not certain at what period this ceremony was introduced into the church: but it was probably borrowed from the Byzantine court, and accompanied the temporal power. Dr. Maclaine, in the chronological table which he has subjoined to his translation of Mosheim's *Ecclesiastical History*, places its introduction in the eighth century immediately after the grant of Pepin and Charlemagne. Baronius traces it to a much higher antiquity, and pretends that examples of this homage to the vicar of Christ occur so early as the year 204.

These prelates finding a vehement disposition in the people to fall down before them, and kiss their feet, procured crucifixes to be fastened on their slippers; by which stratagem, the adoration intended for the pope's person, is supposed to be transferred to Christ. Divers acts of this adoration we find offered even by princes to the pope: and Gregory XIII. claims this act of homage as a duty. We are told, that in the ancient church the same ceremony was practised to all bishops; people kissed their feet, and saluted them with the phrase *προσκύνησθε μοι*, *I adore thee*.

ADORATION is also particularly used for the ceremony of owing, or paying homage to a new elected pope. The first election at which the ceremony is expressly recorded to have taken place, is that of Valentine, A. D. 827. The second is that of Leo IV. A. D. 847. Anastasius in Valentin. cap. 653. in Leon. iv. cap. 697.

Stephen II. being chosen pope, A. D. 752, in the church of St. Mary *ad Præseppe*, was carried on men's shoulders from thence to the Lateran; and Polydore Virgil observes, that this is the first instance of this ceremony, which occurs in the history of the popes. See Bower, vol. iii. p. 343.

Adoration properly is paid only to the pope, when placed on the altar, in which posture the cardinals, conclavists alone, are admitted to kiss his feet. The people are afterwards admitted to do the like at St. Peter's church; the ceremony is described at large by Guicciardin.

ADORATION is also used for a method of electing a pope without scrutiny, or voting.—In the election by adoration, the cardinals rush hastily, as if agitated by some spirit, and fall immediately to the adoration of some one among them, and proclaim him pope.

In the election by scrutiny, adoration is the last thing, and follows the election; as in the other it is the election itself, or rather supercedes the election.

ADORATION is more particularly used for kissing one's hand in presence of another as a token of reverence.

The Jews adored by kissing their hands, and bowing down their heads; whence in their language kissing is properly used for adoration. Calmet.

ADORATION is also used, among Roman writers, for a high species of applause given to persons who had spoken or performed well in public. The method of expressing it was, by rising, putting both hands to their mouth, and then

returning

returning them towards the person intended to be honoured. See ACCLAMATION.

ADORATION is of divers kinds and qualities: *supreme* and *subordinate*; *mediate* and *immediate*; *absolute* and *relative*; *internal* and *external*; *secret* and *open*.

ADORATION, *external*, coincides with what is otherwise called *ritual adoration*.

ADORATION, *internal*, coincides with *spiritual adoration*, called also adoration in spirit and in truth.

ADORATION *solemn*, that performed in public, with stated ceremonies prescribed by authority: in opposition to private, or tacit, or implicit adoration.

ADORATION, *supreme*, the highest degree of religious honour or worship rendered to a being, as supposing him the supreme God; in opposition to subordinate worship given to inferior beings.

ADORATION, *absolute*, that rendered immediately to a being, in consideration of his own essential perfections, and terminating in himself. This coincides with immediate adoration, and stands opposed to relative or mediate adoration. Olearius has an express dissertation on the adoration of the Father by the Son.

ADORATION, *relative*, is that worship paid to an object, as belonging to, or representative of another.

In which sense the Romanists profess to adore the cross, not simply or immediately, which they allow would be idolatry, but in respect of Jesus Christ, whom they suppose to be on it. The Jesuits in China carry an image of Christ under their clothes, and to this refer mentally the public adorations they offer to Chacimchoan. Vide Pascal. Lettr. Provinc. 5.

ADORATION, *perpetual*, is a kind of society or association of devout persons established in Romish countries, who take their turns to pray before the eucharists, regularly relieving each other, so that the service never ceases day nor night.

The members of the perpetual adoration answer to the ACOEMITI in the eastern church.

We find societies under this denomination in France, Germany, Italy, &c.

ADORATION, *barbarous*, is a term used in the laws of king Canute, for that performed after the manner of the heathens, who adored idols.

The Phœnicians adored the winds, on account of the terrible effects produced by them; the same practice was adopted by most of the other nations, Persians, Greeks, Romans, &c.

The Troglodytes adored tortoises, as something peculiarly sacred; several people adored weapons, and instruments of war. The Scythians, &c. adored swords, the Romans axes, and the Arabs stones, the Indians adored vipers, the Bengalese and Canadese the sun; the latter of which nations is also said to adore the cross. The Manta, a Peravian people in the island of Puna, anciently adored a huge emerald, of the bigness of an ostrich's egg, by offering to it other emeralds of a lesser size. All which the priest kept for their own use; the doctrine, as Garcilasso observes, being founded on their avarice.

The Persians chiefly paid their adorations to the sun and fire, some say also to rivers, the wind, &c. The motive of adoring the sun was the benefits they received from that glorious luminary, which of all creatures has doubtless the best pretensions to such homage; the institution of the fire-worship is usually referred to Zoroaster. The retainers to it are called IGNICOLÆ; by the Persians, Ghebr, Arefeh, Peresh.

Dr. Hyde reduces the Persian fire-worship to a subordi-

nate kind of honour, or service, which he calls *pyrodulia*, defending that people from any charge of *pyrolatria*, or idolatry of fire. A traveller into these parts, Gemelli Careri, does the same.

The Greeks and Romans also adored fire under the name of VESTA. Pliny mentions the method of adoring lightning, which was by popping, or gentle clappings of the hands.

The Jews have been charged by heathens with adoring the vine, an ass's head, &c. By Christians, with adoring the book of the law; a charge which one of their rabbins, Manass. Ben Israel, has been at the pains to remove. The adoration of the *golden calf*, into which they fell in the wilderness, seems to have been borrowed, like many other of their ceremonies, from the Egyptians.

The Egyptians are said to have paid adoration to divers animals, plants, fishes, &c. the crocodile, the ibis, onions, &c. But those were only symbolical, or relative acts of homage; they adored the sun in a more peculiar manner, under the name of OSIRIS.

It is disputed whether the Chinese pay divine or only civil honours to the statues of Confucius, and their ancestors. That people, however, appear to adore heaven; whence the inscription in all their temples, and which even the Christians are said to have retained in their churches, *king tien*, i. e. adore heaven.

The Indians are said to adore the devil. Some charge the same on the Bramins.

ADOREA, in *Roman Antiquity*, a word used in different senses; sometimes for all manner of grain, sometimes for a kind of cakes made of fine flour, and offered in sacrifice; and finally, for a dole or distribution of corn, as a reward for some service; whence by metonymy it is put for praise or rewards in general.

ADOREUS Mons, in *Ancient Geography*, a mountain of Asia Minor, mentioned by Livy (t. v. p. 190.) and placed by M. d'Anville in Galatia, south east of Amorium.

ADORIAN, in *Geography*, a small town of Upper Hungary, near the river Eer, north west of Varadin, in a fine country. N. lat. 47°. 18'. E. long. 26°. 55'.

ADORSI, a people of the North, mentioned by Tacitus, (l. xii. c. 15. t. 1. p. 723.) whose situation is not ascertained. Cellarius supposes that they were the same with the Aorsi, whom Strabo ranks in the number of Scythian Nomades; and who probably inhabited the country which extended from Mount Hoemus southward to the Ilter northward.

ADOSCUATION is used, by some *Naturalists*, for a species of copulation, or impregnation, by mere external contact between the genital part of the two sexes, without intromission.

Such is that of plants, by the falling of the *farina fecundans*, on the pistil, or uterus.

Divers kinds of birds and fishes are also impregnated by *adosculation*. Grew. Anat. of Plants, chap. v. § 9.

ADOSSE'E is used, in *Heraldry*, to denote two figures or bearings, placed back to back.

The arms of the duchy of Bar are two bars *adossée*.

ADOUR, in *Geography*, a river of France which rises in the mountains of Bigorre, in the department of the Upper Pyrenees, and running by Tarbes and Dax or Acqs, falls into the Bay of Biscay, through an outlet called Boacault, near the walls of Bayonne, where it forms a bay, sometimes called Bayonne Bay. The sands in this Bay are often shifted by the freshes, which come down from the mountains. The bar has not sometimes three feet at low water. It begins to be navigable about two leagues below Saint Sever.

ADOWA, the capital of Tigré in Abyssinia, is situated

on the declivity of a hill, on the west side of a small plain, surrounded every where by mountains. Its name signifying *pass* or *passage*, is derived from its situation, on the flat ground immediately below the river Ribieraini, by which every body must pass in their way from Gondar to the Red Sea. This plain is watered by three rivulets, which are never dry, viz. the Assi, Mai Coguc, and Ribieraini, which joins the other two, and falls into the river Mareb, about twenty-two miles below Adowa. This town, which is now the capital and residence of the governor, consists of about 300 houses, each of which has an inclosure round it of hedges and trees. The mansion of the governor is situated upon the top of a hill, and is a kind of prison, inhabited by about 300 persons who are detained in irons, and in cages like wild beasts, some of whom have been confined for more than twenty years, with a view of extorting money from them, and who do not obtain liberation, even when the money is paid. There are two churches in the vicinity of this town, viz. Mariam and Kedus Michael, and also a monastery, called Bet Abba Garima, one of the most celebrated in Abyssinia, which was once a residence of one of their kings, whence some travellers have reported that the metropolis of Abyssinia was called Germè. Adowa is the seat of a very valuable manufactory of coarse cotton cloth, which circulates through Abyssinia instead of silver money: each web is 16 peck long, and $1\frac{3}{4}$ wide, and their value is a pataka, *i. e.* ten for the ounce of gold. The houses in this town are all built with rough stone, cemented with mud instead of mortar; their roofs are of a conical form and thatched with a reedy sort of grass. The business of thatching belongs exclusively to the Falaha or Jews. The vicinity of Adowa is the only part of Tigré which has soil sufficient to yield corn, the whole of the province besides being one entire rock. They have here three harvests annually, which exalts no fallowing, weeding, manure, or other expensive process; and yet the farmer in Abyssinia is always poor and miserable. N. lat. $14^{\circ} 7'$. $57''$. E. long. $38^{\circ} 50'$. Bruce's Travels, vol. iii. p. 118. &c.

ADOXA, formed of α priv. and $\delta\acute{o}\xi\alpha$ gloria, q. d. ignoble, or of *no sbow*, in Botany, a genus of the *oelandria tetragynia* class and order, and of the natural order of *sacculenta*, and *saxifrage* of Jussieu; the characters of which are, that the calyx is an inferior, bilid or trilid, flat and permanent perianthium; the corolla is monopetalous, flat and divided into four or five segments, with clefts ovate, acute and longer than the calyx; the stamina are subulate filaments, of the length of the calyx, and the anthers roundish; the pistillum has a germ below the receptacle of the corolla; the styles are simple, erect, of the length of the stamina, and permanent, and equal in number to the clefts of the corolla; the stigmas are simple; the pericarpium is a globose berry, between the calyx and corolla, the calyx being united below with the berry, umbilicate and four or five celled; the seeds are solitary and compressed. There is one species, viz. the *A. moschatellina*, bulbous fumitory, hollow root or tuberous moschatell, which grows naturally in shady places and woods, as in Hampstead and Charlton woods; it is perennial, flowers in April and May, and the seeds ripen in May. The leaves which soon after decay and the flowers smell like musk, on which account it has been sometimes called *musk crocusfoot*. The roots must be planted after the leaves are decayed, under shrubs, for if they are exposed to the sun, they will not thrive. Martyn's Miller's Dictionary. Smith's Flor. Brit. vol. i. p. 432.

ADPERCEPTION, in the Leibnitzian style, denotes

the act whereby the mind becomes conscious to itself of a perception.

ADPONDUS *Omnium*, to the weight of the whole; an abbreviation among *Physicians*, &c. signifying, that the last prescribed ingredient is to weigh as much as all the others put together.

ADPORINA, a surname of Cybele, under which she was acknowledged in one of her temples, erected on a mountain of difficult access, near Pergamua.

ADPRESSUS, in Botany, denotes contiguous, pressed to, or laid to.

ADPREST LEAF. See LEAF.

ADQUISITUS, in some *Ancient Latin Writers of Music*, is used for the note, or chord, which the Greeks called $\pi\rho\sigma\lambda\eta\mu\acute{\alpha}\tau\omicron\upsilon\mu\epsilon\iota\sigma\iota\varsigma$. See DIAGRAM.

AD QUOD *Dammum*, in Law, a writ directed to the sheriff, commanding him to inquire what hurt may befall the king by granting a fair, or market, in any town or place.

The same writ also issues for an inquiry to be made of what the king, or other person, may suffer, by granting lands in fee simple to a convent, chapter, or other body politic; by reason such lands fall into MORTMAIN.

The writ *Ad quod damnum* is also had for the turning and changing of ancient highways; which may not be done without the king's licence obtained by this writ, or inquisition found that such change will not be detrimental to the public. Vaugh. Rep. 341. Ways turned without this authority are not esteemed highways, so as to oblige the inhabitants of the hundred to make amends for robberies; nor have the subjects an interest therein to justify going there. 3 Cro. 267. If any one change a highway without this authority, he may stop the way at his pleasure. But see the statute 8 and 9 W. III. cap. 16. for enlarging of highways by order of justices of peace, &c. Where any common way shall be enclosed after a writ of *Ad quod damnum* executed, any person aggrieved by such enclosure, may complain to the justices at the next quarter sessions; but if no such complaint or appeal be made, then the inquisition and return, recorded by the clerk of the peace, shall be for ever binding. 8 and 9 W. III.

ADRA, or ADRAA, in *Ancient Geography*, an episcopal see in the northern part of Arabia Petraea, over which Proclus presided at the council of Chalcedon. Adra, though referred by Ptolemy to Arabia, which was considerably extended northward, was really situated in a small province of Palestine, called Batanea, near the river Hieromax, south-east of Capitolias. When it became an episcopal see, it held the third rank under the metropolis Bafra. It was also called *Adraon* and *Adratum*.

ADRA, or HADRACH, was, according to Ptolemy, a town of Cælo-Syria.

ADRA is also the name of a town, placed by Ptolemy in Liburnia; and this was the Adra of Illyria.

ADRA, in *Geography*, a sea-port town of Granada, in Spain, forty-seven miles south-east of Granada. W. long. $2^{\circ} 37'$. N. lat. $36^{\circ} 42'$.

ADRABÆ *Campi*, in *Ancient Geography*, a canton of Germany, mentioned by Ptolemy, and now called, according to Martiniere, *Marchfeld*, and situated in Upper Austria, north-east of Vienna.

ADRABON, a small district of Gaul belonging to the Veneti, over against Belleisle, on the coast of Brittany.

ADRACHNE, in Botany, the strawberry-tree. See ARBUTUS. It is also called *Adracla*.

ADRAGA, in *Ancient Geography*, by some called

Draga, a place of Arabia, situate, according to Ptolemy, in long. 79° 10'. and lat. 15° 15'.

ADRAGANTH, the same as gum DRAGANT. See TRAGACANTH.

ADRAGNO, in *Geography*, a town of Sicily, twenty miles east-north-east of Mazaro.

ADRAISTÆ, in *Ancient Geography*, the inhabitants of a district of India, which lay to the east of the rivers Accines and Hydrates.

ADRAMITÆ, a people placed by Ptolemy in Arabia Felix.

ADRAMMELECH, in *Mythology*, one of the gods adored by the inhabitants of Sepharvaim, who were settled in Samaria in the room of those Israelites that removed beyond the Euphrates. The people of Sepharvaim made their children pass through the fire in honour of this false deity, and another called *Anamelech*. *Adrammelech*, i. e. the magnificent king, is supposed to have represented the sun, and *Anamelech*, i. e. the gentle king, the moon. Calmet.

ADRAMYTTIS, in *Ancient Geography*, an island of Asia Minor, on the coast of Lycia.

ADRAMYTTIUM, a famous city of Mysia Major, called also *Pedafus*, which, according to Strabo, (lib. xiii. tom. 2. p. 904.) was an Athenian colony, with a harbour and dock, situate at the foot of mount Ida, near the Caicus. It was so called, says Stephanus (de Urb. tom. i. p. 22.) from Adramytus, the brother of Cræsus, by whom it was built. Others say, that it was founded by the Lydians, and derived its name from Hermon, one of their kings, who, in the Phrygian language, was called *Atramys*. This is the Adramyttium mentioned ACTS xxvii. 2. and not as St. Jerome and others suppose, a city of Egypt built by Alexander the Great, at the Canobic mouth of the Nile, and which has been supposed to be the same with Thebes. Whitby Com. vol. ii. p. 751. Imperial Greek medals have been struck in this city in honour of several of the Roman emperors. The medals are bronze, gold and silver. This city was formerly famous for trade and shipping; but is now called *La Andramitti*, and inhabited only by a few Greek fishermen. The *Adramyttian-bay* was a part of the Ægean sea, on the coast of Mylia: the towns on the north-east of this bay are now in ruins. The *Conventus Adramyttenus* was the eighth in order of the *conventus juridici* of Asia.

ADRANA, a river of Germany, now the *Eder*, rises in Upper Hesse, waters the county of Waldeck and Lower Hesse, and falls into the Fulda about two miles from Cassel. When Germanicus, at the head of the Roman legions, ravaged the country of the *Catti*, most of their youth escaped by swimming over this river; and attempted, though without success, to prevent the Romans from laying a bridge over it. Tacitus Annal. i. c. 55. vol. i. p. 105. Ed. Gronov.

ADRANA, or **ADRENA**, (Polybius, lib. xiii. p. 983. Ed. Casaub.) a city of Thrace, situate a little above Berenice.

ADRANA was also a town of Asia Minor, in the Lower Mysia.

ADRAND, in *Geography*, a town of Persia, in the province of Irak; ten leagues east of Amadan.

ADRANIS, **ADRANTIS**, or **ADRANS**, in *Ancient Geography*, a town of Pannonia, in the more extended application of the term, situate in Noricum, north-east of Æmona, in the limits of Carnia and Noricum.

ADRANUM, now **ADERNO**, a town of Sicily at the foot of Mount Ætna, towards the north-east, near a river formerly bearing the name, which some now ascribe to it, *Fiume d'Aderno*. This city was built, says Diodorus Sicu-

lus (lib. xiv. c. 37. tom. i. p. 671. Ed. Wessel.) by Dionysius the elder, and so called from the Temple of Adranus, the tutelary god of the Sicilians, and said by Hesychius to be the father of the *Dii patricii*. This temple was a place of great resort at stated seasons of the year by the worshippers of this deity; and Ælian (de Nat. Anim. lib. xi. c. 3. tom. ii. p. 632. Ed. Gronov.) says, that a thousand dogs were kept here, who fawned on those who brought presents to the temple, and conducted drunken persons to their own houses, whilst they fell furiously on thieves, and tore them in pieces. The medals of this city are bronze, gold and silver.

ADRAPSA, a town of Bactria, mentioned by Strabo, (lib. xv. tom. 2. p. 1055.) but placed by Ptolemy in Hyrcania, beyond the river Maxera. It is also called *Darapsa*, and seems to be that mentioned by Arrian (lib. iii. c. 29.) under the name of *Drapsace*.

ADRASDII, an episcopal see in the patriarchate of Antioch, and the eighteenth under the metropolis of Seleucia.

ADRASTE, in *Mythology, the daughter of Jupiter and Necessity, who, according to Plutarch, was the only fury that exercised the vengeance of the gods. The name is supposed to be derived either from *αει δρασ*, *always active*, or from *a priv.* and *δραω*, *I fly*. The Egyptian priests placed Adraсте above the moon, where she observed the whole world, so that no guilty person escaped. See NEMESIS. *Adraсте*, or *Andraсте*, was the goddess of war and victory, among the ancient Britons; and as such invoked and acknowledged. This deity was probably the same with the **ASTARTE** of the Phœnicians. Dion. Cass. tom. ii. p. 1007. Ed. Reimari.*

ADRASTE was also one of the nymphs who nursed Jupiter in the cave of Dictæ.

ADRASTIA, or **ADRASTEIA**, an epithet given to the goddess Nemesis, or Revenge. It is said to be taken from king **ADRASTUS**, who first erected a temple to that deity.

ADRASTIA, in *Ancient Geography*, the name of a town of Asia, in the Troade, situate between Priapus and Parium, in a district of the same name, in which was an oracle of Apollo Ætæus, and of Diana. It was built by king Adrallus. Strabo Geog. lib. xiii. tom. 2. p. 848.

ADRASTIA Certamina, in *Antiquity*, a kind of Pythian games, instituted by Adrastus, king of Argos, A. M. 2700, in honour of Apollo at Sicyon. These are to be distinguished from the Pythian games celebrated at Delphi.

ADRASTUS, in *Ancient History*, a king of Argos, who distinguished himself in the famous war of Thebes, was the son of Talus and Lylianastra, daughter of Polybus king of Sicyon. He reigned first in Sicyon, as successor to his father-in-law, and afterwards at Argos. Here he married his two daughters to Polynices and Tydeus, who took refuge in his court; the former of whom had been deprived by his brother Eteocles of his share of the sovereignty at Thebes. For the purpose of restoring him, this king, with six others, chiefly of his kinsmen, marched against Thebes; and this was called the expedition of the seven worthies, which is placed about 1225 years before Christ, and has been celebrated by the poets. Adrastus alone escaped, being preserved by his horse *Arion*. See Statius Theb. lib. iv. v. 40, &c. p. 412. Ed. Varior. This war was revived within ten years by the sons of the deceased worthies, and called the war of the Epigones. It terminated with the taking of THEBES. Adrastus on this occasion lost his son Ægialeus, and was so distressed by the event, that he died of grief at Megara, as he was conducting home his victorious army. His memory was much honoured at Megara and at Sicyon,

Sicyon, at which place he had instituted the Pythian games. Pausanias, lib. ix. p. 286. Pindar, Pyth. Od. viii.

There was another *Adrastus*, in Phrygia, at the time of the siege of Troy, who is said to have built a temple on the river Ætepus, in Phrygia, in honour of Nemesis, the goddess of Revenge, hence called *Adrastæa*.

Herodotus (lib. i. c. 35.) mentions an *Adrastus*, who fled for refuge to the court of Cræsus, king of Lydia, and inadvertently killed his son.

ADRASUS, or ADRASSON, in *Ancient Geography*, belonged to Isauria, and the metropolis of Selencia.

ADRAZZO. See AJACCIO.

ADRESTES, a people of India, subdued by Alexander. See Quintus Curtius, lib. viii. n. 9.

ADRIA, or HADRIA, in *Ancient Geography*, the name of two towns in Italy; one of them was situated in the country of the Veneti, on the river Tartarus, or Adria, between the Padus and the Athesis, and was called *Adrias* by Ptolemy, and also by Pliny, (lib. iii. c. 16. tom. i. p. 173. Ed. Hard.) but denominated *Adria* by Strabo (lib. i. p. 82.—lib. ii. p. 168.—lib. v. p. 328.): the other was in the country of the Piceni, on the river Vomannus, to which Antonine's Itinerary from Rome is directed, and which was the country of the ancestors of the emperor Adrian. This is now the dukedom of Atri, in Abruzzo. It has been a subject of dispute which of these two places gives its name to the Adriatic sea. The etymology is generally deduced from the Venetian *Adria*; and it is alleged, that the name is retained in the small town, that was destroyed by inundations and other calamities, now called *Adria*, which is a bishop's see, twenty-five miles south south-west of Venice. N. lat. 45° 8'. E. long. 12° 5'. Aurelius Victor deduces the name from the *Hadria* of the Piceni. If this be the true derivation, the appellation should be *Hadriatic*, because the name of the emperor is inscribed on coins and stones *Hadrianus*. But if the origin of the name is traced to the Venetian *Adria*, which is the most ancient, and of which the other is merely a colony, the usual appellation is the most correct. Eustathius in Dionys. v. 92. traces it to *Adrias*, the son of Jaon.

ADRIA, an archi-episcopal city, in the patriarchate of Jerusalem. St. Jerome mentions a small island of this name.

ADRIA, JEAN JACQUES, of Mazara, in Sicily, graduated at Salemm, in 1510, and acquired such reputation for his skill in medicine, that he was made physician to the emperor Charles the Fifth, and appointed proto-medicus of Sicily. He left in manuscript the following: "De preservative pestilentie." "De medicinis ad varios morbos." "De phlebotomia, dedicata to the emperor." "De Balneis Siculis."

ADRIAN, or HADRIAN, PUBLIUS ÆLIUS, the Roman emperor, was born, according to Spartian, (in Adr. p. 1—3.) in Rome, on the 24th of January, in the 76th year of the Christian æra, A. U. C. 829. His ancestors lived at Italica, in Spain, which was the native city of Trajan, whom he succeeded in the empire, and whose name on that occasion he assumed in addition to his own. At the death of his father, when he was ten years of age, he was left under the guardianship of Trajan and Cælius Tatianus, or Attianus, a Roman knight. His proficiency in the Greek language was so considerable, that, at the age of fifteen, he was commonly called the young Grecian. When Trajan was adopted by Nerva, Adrian served as a tribune in the army in Lower Mœsia, and was deputed to congratulate his guardian on the event; and when Nerva died, he was the first that communicated the news to Trajan, who was then in Lower Germany, and that saluted him as emperor.

Trajan, however, conceived prejudices against him, on account of the levity of his mind, the suspicion and jealousy of his temper, and the extravagance to which he was addicted: and though he manifested a studious disposition, and made great acquirements in Greek and Latin, in philosophy and the law, Trajan had not been accustomed to estimate these endowments very highly, nor did he form any flattering expectation of the advantages that were likely to accrue from them in the military profession, and in the extension of empire, to which he was devoted. Adrian perceived that he was no favourite; and therefore endeavoured to conciliate the favour of the empress Plotina, by an assiduity of attention, which, as Dion Cassius intimates, by the expression εὐεπίθετος φίλος, (tom. ii. p. 1149. Ed. Reimari) seems to have transgressed the bounds of virtue. However, Adrian succeeded in securing the interest of the empress, and by her means, in obtaining the emperor's grand-niece, and next heiress, Sabina, for his wife. This was the first step to his future advancement, and facilitated his ascent to the throne, much more than the assurance of the Mœsian astrologer, that the sovereign power was destined to him by the fates, or the prediction to the same purpose of his great uncle Ælius Adrianus. Soon after his marriage he was appointed quaestor; and at the expiration of this office, he was employed in digesting the deliberations of the senate; but he soon surrendered this occupation, and followed Trajan to the war against the Dacians. Trajan having left his army in Syria, and proposing to return to Rome, after a variety of extensive and rapid conquests, gave the command of it to Adrian; but he had neither capacity nor zeal for retaining, much less for enlarging, the emperor's conquests. The conqueror's absence was the loss of all the advantages he had gained. His death at the same time was gradually approaching, and opened prospects of ambition to Adrian, of which he was desirous of availing himself. He had already been quaestor, in the year of Rome 852, tribune of the people in 856, prætor in 858, substituted consul in 860, and consul in ordinary and commander in chief in the last year of Trajan's reign. He had also accompanied Trajan in most of his expeditions, had the command of a legion in the second Dacian war, and obtained for his valiant conduct a present from the emperor of the diamond which Nerva had given him, which he considered as a pledge of his future adoption. In the interval between his prætorship and consulship, he had been governor of Lower Pannonia, and discharged the duties of his various offices with universal satisfaction. Trajan, however, never loved Adrian, nor did he intend to adopt him. Accordingly, Dion Cassius affirms, (tom. ii. p. 1149.) that he never was adopted. Nevertheless he succeeds him in virtue of a feigned adoption. Upon the emperor's death at Selinontum, in Cilicia, in his way to Rome, Plotina, assisted by Tatian, who had been preceptor to Adrian in his youth, contrived to send notice to the Senate, that Trajan, whom she had attended at the time of his death, had adopted Adrian: and, it is said, that she concealed a man, who personated the dying emperor, and who with a feeble voice, declared that he adopted Adrian. This is certain, that Adrian, who was then at Antioch, received the news of his adoption on the 9th of August, and that of Trajan's death on the 11th. On this day, in the year 117, (A. U. C. 870, or according to Crevier, who follows Tillemont, 868.) he was proclaimed emperor by the legions of Syria, and immediately wrote to the Senate to request a confirmation of the act of the soldiers; apologizing, at the same time, for the impatience of the legions, forbidding them to bestow upon him any titles of honour without his previous consent, promising that he would direct his govern-

ment to the public good, and binding himself by an oath, never to put a senator to death. The Senate very readily acceded to his request, and confirmed him in the empire to which he was elected. Adrian had now an opportunity of indulging that love of peace to which he was naturally inclined. Accordingly he abandoned the conquests of his predecessor in the east, and having withdrawn his troops from Armenia, Assyria, and Mesopotamia, he agreed that the Euphrates should again be the boundary and barrier of the Roman empire. He determined also to surrender Dacia, but his friends prevailed with him to retain it for the sake of those Roman citizens who had settled in it. However, he demolished the bridges which Trajan had erected over the Danube, under the pretence of guarding the Roman territories from the incursions of the barbarians. In order to reduce the Jews to absolute subjection, he removed Lulius Quietus, whom Trajan had commissioned for this purpose, and whom he had made governor of Palestine, from his government, and appointed his friend Martius Turbo to succeed him; and he was also employed to quell the disturbances in Mauritania, which the removal of Lulius had probably occasioned. After having secured the tranquillity of Dacia, by making peace with the Sarmatians and Roxolani, which he endeavoured to render permanent in the following year by pecuniary donations, granted also as the purchase of peace to other barbarous nations, he hastened to return to Rome; but did not arrive there till the year 118. During his voyage from Illyria, a conspiracy was formed against his life by four persons of consular dignity, viz. Domitius Nigrinus, Lulius Quietus, Palma, and Celsus, who were put to death by order of the Senate. This act, however, excited the public hatred against Adrian. It was different from the conduct of his predecessor; and it was considered as a violation of the oath which he had made on his accession to the empire. To remove these ill impressions from the public mind, he was liberal in his donations to the people. He remitted the debt due from cities and individuals to the imperial revenue, and to the public treasury, which is said to have amounted to seven millions of our money, and burnt all the records which might afterwards serve to revive these claims. With a reference to this act of generosity, Adrian is represented on one of the medals, which has reached our times, with a torch in his hand setting fire to the bonds, with a legend, signifying, "He enriches the whole world." He discharged Italy from the tax paid to victorious emperors for decorating their triumphs, and reduced the amount of it in the provinces: and besides making many presents of money, and various articles of subsistence and luxury to the Roman citizens, he increased the funds, appointed by Trajan, for the subsistence and education of children of both sexes. The sum appropriated by Adrian to these several purposes was immense; and his liberality was honoured with a monument, consecrated to his memory, and with an inscription which celebrated him, as having thus exhibited a singular example of goodness to the people. He was likewise assiduous in his attention to the Senate, and treated this body with a degree of deference and respect, which tended to remove the prejudices that had been conceived against him, and to engage their affectionate attachment. He assisted those senators who were poor; he enabled others to defray the charge of their offices; and he granted the honour of a third consulate to those who desired it. Upon his return to Rome, he was received by all ranks of people with extraordinary demonstrations of joy; but he declined accepting the triumph which had been prepared for Trajan, and which was now decreed by the Senate to the new emperor. He had already on his

accession refused the offer that had been made to him of the title of *father of his country*, and deferred the acceptance of it, after the example of Augustus, who had not taken it till he had governed a certain number of years.

In the following year Adrian was consul a third time, but he resigned the fasces after four months, and never afterwards resumed them. Having taken measures for establishing his power at home, he was under a necessity of leaving Rome, in order to check the incursions of the barbarians, who invaded Illyricum. The war was soon terminated; and Martius Turbo, who was recalled from Mauritania, was appointed governor of Pannonia and Dacia. Towards the close of this year the emperor went into Campania, where he generously relieved the poor inhabitants of all the cities through which he passed. About this time he conceived a design of visiting all the provinces of the empire, and examining for himself the state of each country subject to Rome, that he might not be obliged to depend entirely on the reports of his ministers and governors; alleging, that an emperor ought to resemble the sun, which extends illumination to all the regions of the earth. Accordingly he began his travels in the third or fourth year of his reign; that is, in the 120th or 121st year of the Christian era, A. U. C. 871, according to Tillemont. He first visited Gaul, where he displayed great liberality; and from thence he went into Germany, where the chief army of the empire was stationed, and the discipline of which he revived and established. In the following year he passed over into Britain, where he reformed many abuses. Although the greatest part of the island was subject to Rome, the northern nations, after the departure of Agricola, had revolted, and recovered their ancient liberty. Adrian, without entering into any new contest, proposed merely to secure the southern part, which belonged to the Romans, against the incursions of the warlike Caledonians, and, with this view, he caused a rampart, or WALL, to be raised, extending from the Solway Firth on the west, to the mouth of the river Tyne, near Newcastle, on the east, about eighty miles in length. In other places he supplied the defect of natural barriers by mounds of earth strengthened by stakes driven into the ground. Here he also disgraced and discharged his secretary, Suetonius Tranquillus, the historian, and Septicius Clarus, captain of the pretorian guards, for their disrespectful behaviour to the empress Subina. Upon his return to Gaul, he built at Nîmes a magnificent palace in honour of Plotina, the widow of Trajan. From Gaul he proceeded to Spain, and wintered at Tarragona, where he rebuilt the temple of Augustus, founded by Tiberius, and held a general assembly of the states, in order to compose the differences occasioned by raising levies for the Roman armies. Here a slave, in a fit of insanity, attempted to kill him; but he happily escaped, and committing the unhappy maniac to medical care, took no farther notice of the assault. From Spain the emperor returned to Rome in April; and towards the end of this year, or the beginning of the next, he went, as some say, to Mauritania, and afterwards to Athens, where he built a bridge over the Cephissus; from Athens he proceeded to the extremities of the Roman empire in the east; and after having quieted the commotions of the Parthians, he returned through Asia, visiting the several provinces, and erecting edifices in several of their chief cities; and having passed through the islands of the Archipelago, he settled at Athens during the winter, and was there initiated into the Eleusinian mysteries. From Athens he went into Sicily to visit the top of Mount Ætna, that he might observe the rising sun, which was said there to exhibit all the colours of the rainbow; and returned to Rome in the beginning

beginning of the following year, or the seventh year after his departure. The 11th and 12th years of Adrian's reign are quite barren of events. In the year 129 or 130, the cities of Nicomedia, Cæsarea, and Nicæa, in Bithynia, were almost demolished by an earthquake, and they were rebuilt at the expence of the emperor, who was on this account denominated the restorer of Bithynia. In the course of this year he again departed for Africa; where, after a drought of five years, it rained upon his arrival, and the inhabitants, who received many favours from the emperor, ascribed the blessing to his presence. From Africa, he returned in the same year to Rome, where he caused the obsequies of Plotina to be performed with extraordinary magnificence. He lamented her death with great sorrow, composed verses in her praise, and caused her to be ranked among the gods. In the year 131, he left Rome with a design to revisit the provinces of the east, and passing through Athens, pursued his journey into Asia, where he consecrated several temples. From Asia he passed into Syria, from thence into Palestine and Arabia, and afterwards into Egypt, in the fourteenth year of his reign, when the famous colossus of Rhodes shook, according to the Alexandrian chronicle. During this, and the following year, he continued in Egypt. At Pelusium he visited the tomb of Pompey the Great, which he repaired; he also repaired the city of Alexandria, and restored their ancient privileges to the Alexandrians, whose disposition and character he disliked, and who recompensed his kindness with violent lampoons after his departure. From Egypt he passed into Libya Cyrenaica, where he killed a lion of enormous size, that had committed many depredations in the country. During his stay in Egypt, the youth Antinous, to whom Adrian was criminally attached, fell into the Nile, and was drowned. Dion Cassius says, (tom. ii. p. 1160. Ed. Reim.) that he was sacrificed by Adrian, who being addicted to magic, conceived that he should prolong his life by sacrificing a human victim to the infernal gods. In the following year Adrian returned to Syria, and having passed through Thrace and Macedonia, he continued for some time at Athens. During his residence at Athens, the Jews revolted on occasion of the emperor's sending a Roman colony to Jerusalem, calling the city *Ælia Capitolina*, after the name of his family, and erecting a temple to Jupiter Capitolinus in the place where the ancient temple stood. The war with the Jews was attended by the invasion of the provinces of the empire by the Alani, or Massagetæ, a people of Sarmatia. At Athens Adrian was much pleased with the customs and learning of the people. Here he assumed the habit peculiar to the dignity of Archon, celebrated the grand festival of Bacchus, and embellished it with many stately buildings, and particularly with a library of astonishing structure; inasmuch, that he was revered as the second founder of the city, and one quarter of it was from him called *Adrianopolis*. In the year 135, the emperor left Athens and returned to Rome. Here he fell into a lingering disease, attended with a bleeding at the nose, which terminated in a dropsy. Adrian, contrary to the universal expectation, and the remonstrance of his friends, adopted Commodus Verus, who was created prætor, appointed governor of Pannonia, and in the following year advanced to the consulship. The emperor retired to Tibur, now Tivoli, where he erected a magnificent villa; but his disorder increasing, and being aggravated by his licentious mode of living, he indulged his natural cruelty, and caused many illustrious persons to be arraigned and executed, and others to be privately murdered. In the beginning of the year 138, Verus died, and was ranked by Adrian among the gods, and

temples were built and statues erected to his memory by the orders of the emperor. Upon his death, Titus Antoninus was adopted; and after his adoption the empress Sabina died, supposed to be poisoned by Adrian, or so ill used, that she laid violent hands on herself. Adrian, however, caused her to be ranked among the gods. The emperor's impatience increased with his disorder, and having put several senators to death, and ordered others for execution, whom Antoninus preserved, he attempted to destroy himself, but was prevented by Antoninus from executing his purpose. At length he removed from Rome to Baiæ, in Campania, where he hastened his death by his intemperance; and here he died, on the 10th of July, in the year 139, after having lived 62 years, 5 months, and 17 days, and having reigned 21 years and 11 months. His body was burnt at Puteoli, and his ashes were conveyed to Rome, where they were deposited in the magnificent mausoleum, which he had constructed for himself near the Tiber. The Senate intended to annul all his acts, but Antoninus opposed this measure; caused him to be deified, built a temple at Puteoli, and instituted annual sports to his honour, with priests, fraternities, and victims. No prince ever erected so many public and private edifices as Adrian. The regulations which he established for the maintenance of discipline among the troops were afterwards regarded as the military laws of the Romans, and many of the laws which he enacted were observed till the end of the fourth century. He prohibited all those private work-houses, which were habitations of slavery and wretchedness; and he was not only a man of learning himself, but he encouraged literature and science. Many of his works, both in prose and verse, were published under his own name, and the names of other distinguished persons. His Greek poem, called the *Alexandriad*, has been quoted by some of the ancients. In his Catacrani, mentioned by Spartian, he pretended to imitate Antinæus, whom he preferred to Homer. He was so ambitious of fame, that he wrote his own life in several books, some fragments of which are still extant. His reign was distinguished in the history of literature, by a very considerable number of learned men, among whom we may reckon Phlegon, Favorinus, Epictetus, Arrian, Plutarch, Dionysius of Halicarnassus, Philo of Byblos, Suetonius, and Florus.

Adrian's reputation for talents and learning has been universally allowed. His memory was so retentive, that he could repeat a whole book, after having once perused it; and he knew the name of every soldier in his army. He excelled in every branch of learning, and was, without doubt, the best orator, poet, grammarian, philosopher, and mathematician of his time. He was eminent for drawing and painting, and for his skill in the theory and practice of music. He used at the same time to write, dictate to several secretaries, give audience to his ministers, and discourse with them about affairs of the greatest importance; and his court was crowded with men distinguished in every branch of literature and science. In his natural disposition he was suspicious, envious, lascivious, and cruel; and his general character exhibited a strange composition of virtues and vices. To his friends he was courteous and affable, and his liberality was unbounded. But he was ever ready to give ear to slanderers, and to believe every tale that was whispered against him, so that those who were once most distinguished by his favour were disgraced, banished, and put to death. Capricious and unsteady in his attachment, and violent in his resentment, he was distrusted by his friends, and dreaded by his enemies. Nevertheless, the great and the rich did not suffer under his government from unjust condemnations and forfeitures. He knew how to pardon offences;

offences; and those who had been his enemies when he was in a private station, had no occasion to fear him when he was an emperor. When he arrived at the sovereign power, he said to one of those from whom he had received the most convincing proofs of his hatred, "Behold yourself in perfect safety." His vanity, however, was always predominant; and he was often induced, by the fear of infamy, or the desire of applause, to preserve at least the appearances of virtue. In his plans of public improvement, he was comprehensive and liberal, even to the extreme of needless magnificence and culpable profusion. There was scarce a province, or a city, in which he did not leave substantial proofs of his attention to the benefit and convenience of its inhabitants. He repaired old edifices, and built new ones, baths, aqueducts, and harbours: and he expended large sums in embellishing the monuments of those who had distinguished themselves in former times, as in the case of Epaminondas's tomb at Mantinea, and in the honour he paid to Pompey's remains. To Greece he was particularly favourable; and from the Greeks he received many expressions of gratitude. And yet dissipated and extravagant as he was in his private expences, and in his public disbursements, he is said never to have unjustly seized any man's property, nor did he ever receive legacies from persons who were not known to him, or from any of his friends who had children.

In his voyages, when he was at any city, he administered justice to all who applied to him, or sought the assistance of the ablest lawyers. Adrian, indeed, deserves to be particularly recognized for the administration of justice, and the wisdom of his laws, for establishing and maintaining peace among the citizens. He considered the termination of disputes, by equitable decisions, as one of the principal duties of a sovereign, and he was assiduous in discharging it. His zeal for justice and good order led him to keep a strict eye over those who governed provinces under his authority; and he knew how to discover truth through all the acts of dissimulation. At Rome he made a very important reformation in the administration of justice. See *perpetual* EDICT.

He softened the rigour of servitude, and deprived masters of the arbitrary power of life and death over their slaves: he prohibited the sale of them, and their being rendered, according to their sex, victims of prostitution, or gladiators, without the authority of the judge; and he forbade the use of private prisons. From an attention to decency, he likewise prohibited the promiscuous use of baths for both sexes. He is also said to have renewed the ancient sumptuary laws enacted by Augustus; and he forbade the abominable custom of human sacrifices, though in the case of Antinous he seems to have violated his own law. He punished fraudulent bankrupts with severity, and ordered them to be whipped. He reformed the police in many instances with judgment; and the alterations he introduced in the general conduct of the empire, in the service of the palace, in the military discipline, and in the government of the empire, was confirmed by practice, and continued even to the reign of Constantine. To his soldiers he set an example of simplicity and self-denial; and by his attention to them in various respects, he gained their love and confidence. He preferred none but men of courage, strength, and good character, saying, "such as the officers are, such will the soldiers soon be." Thus he revived the ancient military discipline, which, by the negligence of many princes, had been decaying since the time of Augustus. It may be observed in general, that the Roman empire was happy under his government. The maxim which he inculcated in the assembly of the people, and in the senate, de-

erves to be recorded. "I propose to myself (says he) to govern the commonwealth, as to shew I never forget it is not my own property, and that I am no more than administrator for the public." Adrian's government would have been praised, if he had succeeded Domitian, but it was his misfortune to have Nerva and Trajan for his predecessors, and for his successors Antoninus and Marcus Aurelius.

Adrian appears to have been too much addicted to every kind of superstition. He was fond of the Greek worship, and paid little attention to the religion of those nations whom the Romans and Greeks considered as barbarians; and therefore the temples, which he is said to have erected in honour of Jesus Christ, were intended either for himself, and for his own proper worship, or in conformity to the doctrine of Numa and Pythagoras, as places where the gods might be worshipped without images. The Christians he considered as enemies to the idolatrous worship of his gods; yet it is thought, that upon the whole he was moderate to them, more especially when it is considered how much the populace, instigated by the priests, wished and endeavoured to destroy them. Eusebius has preserved a rescript, which orders that they should be regularly prosecuted, and condemned if convicted of a breach of the law; but, on the other hand, if the charge brought against them should not be proved, their accusers should be punished. The moderation of this edict has been ascribed by some to the admirable apologies of Quadratus and Aristides in favour of the Christians. Adrian's conduct to the Jews was very rigorous, though their repeated insurrections and rebellion might furnish some apology for his severity. He forbade them even the sight of Jerusalem, into which they were not permitted to enter, except in one day of the year, which was the anniversary of the destruction of the city. He sent a Roman colony into the holy city, and called it *ÆLIA Capitolina*, that it might bear his family name, and that of Jupiter, to whom he had erected a temple in the place where that of the true God stood. He studiously profaned all the places which had been most revered by the Jews, with buildings set apart for the worship of idols: he placed a hog of marble upon the gate of the city which led towards Bethlehem; he erected in the place where Jesus was crucified, a statue of Venus; and in that where he arose from the dead, a statue of Jupiter; and in the grotto at Bethlehem, where our Saviour was born, he established the worship of Adonis.

In this prince, says Crevier, there centered very opposite qualities: he was gay and grave, haughty and affable, impetuous and circumspect, frugal even to avarice and liberal, cruel and merciful. It is difficult to make an entire piece of such discordant parts; but we shall not be mistaken, if we consider his vices as real, his virtues as fictitious. Political interest and vanity were the principles of all the good he did; and these motives, assisted with an uncommon genius, improved with the most useful parts of knowledge, were sufficient to render him a prince whose government was for the good of the people in general, whilst his personal conduct made him a scourge to those who were near him.

The following verses addressed to his soul, which he composed, and uttered not long before he expired, express, amidst great doubts and uncertainty, some general apprehensions concerning a future state.

Animula, vagula, blandula,
Hospes, comesque corporis,
Quæ nunc abibis in loca
Pallidula, rigida, nudula?
Nec, ut soles, dabis jocos.

Poor little, pretty fluttering thing,
Must we no longer live together?
And dost thou prune thy trembling wing,
To take thy flight thou know'st not whither?
Thy humorous vein, thy pleasing folly,
Lies all neglected, all forgot:
And pensive, wav'ring, melancholy,
Thou dread'st and hop'st, thou know'st not what.

PRIOR.

Ah! fleeting spirit! wand'ring fire,
That long hast warm'd my tender breast,
Must thou no more this frame inspire?
No more a pleasing chearful guest!
Whither, ah, whither art thou flying?
To what dark undiscover'd shore?
Thou seem'st all trembling, shiv'ring, dying,
And wit and humour are no more!

Pope's Works, vol. vii. p. 186.

* See Spartian in Adrian. Dion. Cass. Hist. Rom. tom. ii. p. 1149—1170. Ed. Reimari. Anc. Un. Hist. vol. xiii. p. 269—293. Crevier's Rom. Emp. vol. vii. b. 19. p. 129—222.

ADRIAN I. Pope, succeeded Stephen III. in the papal chair, A. D. 772. He was the son of Theodore, a Roman nobleman, and possessed considerable talents for business. He maintained a steady attachment to Charlemagne, which provoked Desiderius, king of the Lombards, to invade the state of Ravenna, and to threaten Rome itself. Charlemagne recompensed his attachment, by marching with a large army to his succour; and having gained many considerable advantages over Desiderius, and recovered the cities which he had taken, he visited the pope at Rome, confirming the grants made by his father Pepin, to which he added new donations, and formed a perpetual league of friendship between the growing power of France and the established supremacy of the Western Church. On this occasion he expressed his piety, by the humiliating ceremony of kissing each of the steps, as he ascended to the church of St. Peter. Pavia, during this visit, had been left in a state of siege; on his return it surrendered, and the dynasty of the Lombard princes, which had lasted 206 years, was terminated in the year 776. When fresh disturbances occurred by the interference of the bishop of Ravenna, who claimed and seized the exarchate and the dukedom of Ferrara, which Charlemagne had restored to the pope; this prince renewed his visit, and settled the affairs of Italy. In return for these services, he obtained the title of king of the Lombards, and the rights of temporal sovereignty in the territory of the Roman see. Adrian now directed his attention to the affairs of the church: and as Irene, who, in 780, assumed the regency at Constantinople, during the minority of her son Constantine, wished to restore and establish the worship of images, she applied to Adrian for his concurrence. The pontiff readily acquiesced in her proposal for calling a council, and commissioned two legates to attend it. The council, however, which held its first meeting in 786, was dispersed by an insurrection of the citizens. At the next meeting in the city of Nice, in 787, which was protected by a military force, a decree was passed for restoring the worship of images. Adrian approved the decree, but in the western church it was deemed heretical and dangerous. Charlemagne condemned the innovation, and the French and English clergy concurred in opposing it. A treatise, containing 120 heads of refutation, was circulated, as the work of Charlemagne, under the title of "The Caroline Books," in opposition to the decree of the council. This work was presented to the pope by the king's ambassador,

and the pope wrote a letter to Charlemagne by way of reply. The king, and also the Gallican and English churches, retained their sentiments; and, in 794, a council was held at Frankfort on the Maine, consisting of about 300 western bishops, by which every kind of image-worship was condemned. Adrian did not live to see a termination of this contest; for after a pontificate of nearly twenty-four years, he died in 795. This pope does not appear to have possessed any considerable erudition, and few examples occur, during his pontificate, of ecclesiastical reformation. He seems to have directed his chief attention to the embellishment of the churches, and the improvement of the city of Rome; and he was probably furnished by Charlemagne, out of the plunder of his conquests, with ample means for this purpose. The king was much attached to him, and is said to have shed tears on occasion of his death. He wrote his epitaph, which is still seen in St. Peter's at Rome, in thirty-eight Latin verses. Dupin. vol. v. p. 113. Bower. Gen. Biog.

ADRIAN II. Pope, succeeded Nicholas I. A. D. 867. Having twice refused the dignity, he accepted it in the 76th year of his age, at the united request of the clergy, nobility, and people. The contest for power between the Greek and Latin churches had been very violent some years before his accession to the papal chair. Photius, who, in 858, had been appointed patriarch of Constantinople by the emperor Michael, had been excommunicated by pope Nicholas I. in a council assembled at Rome in 862; and the pope himself had been, in 866, excommunicated by Photius. The pope, in order to avenge the injuries which Ignatius, who had been deprived of the patriarchate and exiled, demanded the restitution of several Greek provinces, which the patriarch of Constantinople had separated from the jurisdiction of the Roman pontiff. Basil, the new emperor, recalled Ignatius to the dignity of patriarch, and confined Photius in a monastery. The restoration of Ignatius was approved by a council held at Constantinople, in 869; and by the decrees of this council, the disputes between the Greek and Latin churches were suspended. But circumstances occurred which served to revive them. The Bulgarians had applied to this council for information, whether they should be subject to the church of Rome, or that of Constantinople. The contest which this question produced, terminated in favour of the patriarchate; and Ignatius expelled the Latin missionaries from Bulgaria, and appointed Greeks in their room.

Adrian, during this contest for power with the eastern patriarch, was extending his authority over the kings and princes of the west. He employed his whole interest to induce Charles the Bald, who had taken possession of the kingdom of Lorraine, and who had been crowned at Rheims by the archbishop Hincmar, to relinquish it in favour of the emperor; and he even sent legates to the king, after having attempted to engage Hincmar, the clergy, and the nobility to desert him, ordering him to surrender to the emperor's right. The king was invincible; and the pope was obliged to give up the contest. He also farther interfered in the concerns of princes, by taking Charles's rebellious son Carloman, and the younger Hincmar, bishop of Laon, under the protection of the Roman see. He proceeded in this business so far, that he was under a necessity of submitting without gaining his point. Bulgaria again claimed his attention, and he wished to restore the jurisdiction of it to the see of Rome. But death terminated his ambitious projects and his life of inquietude, A. D. 872. after a pontificate of five years. Dupin's Ninth Century, vol. vii. p. 179. Mosheim's Eccl. Hist. vol. ii. p. 351, &c. 8vo.

ADRIAN

ADRIAN III. Pope, succeeded Marinus, A. D. 884. This pope, desirous of emancipating Italy and the papal see from their dependence upon the emperor of Germany, passed a decree, that, if Charles should die without male issue, the title of emperor should be bestowed only on natives of Italy, and that the authority of the emperor should be disregarded in the creation of a pope. Basil attempted to persuade Adrian to annul the excommunication of his predecessor against Photius, but did not succeed. The pope died in his way to the diet at Worms, in 885. Bower.

ADRIAN IV. Pope, the only Englishman who ever had the honour to sit in St. Peter's chair. His name was *Nicolas Breakspere* or *Breakpear*; and he was born towards the close of the eleventh century, at Langley, near St. Alban's, in Hertfordshire. His father, being poor, and having assumed the habit of the monastery of St. Alban's, was unable to provide for him. Being refused the habit for which he applied, he went to Paris, where he was distinguished both by his application and proficiency. From Paris he removed to the monastery of St. Rufus, in Provence; here he became a regular clerk; and upon the death of the abbot in 1137, he was chosen superior of that house, which he rebuilt. Of this dignity he was deprived in consequence of the complaints and accusations of the monks, who were dissatisfied with the government of a foreigner: but pope Eugenius III. having heard their charges, and his defence, declared him innocent, and advanced him, in 1146, to the higher station of cardinal bishop of Alba. In 1148 he was sent as apostolical legate, to Denmark and Norway, where, by his diligent instruction, he converted those barbarous nations to the Christian faith; and it is said that he erected the church at Upsal into an archiepiscopal see. Upon his return to Rome, he was much honoured by the pope and cardinals; and on the death of pope Anastasius, who had succeeded Eugenius, he was unanimously chosen to the papal chair in November 1154, and assumed the name of Adrian. As soon as the news of his promotion reached England, Henry II. sent a deputation of an abbot and three bishops to congratulate him on his election; and upon this occasion he granted considerable privileges to the monastery of St. Albans. But he refused the valuable presents which they offered him, saying jocosely, "I will not accept your gifts, because, when I wished to take the habit of your monastery, you refused me." To which the abbot pertinently and smartly replied; "It was not for us to oppose the will of Providence, which had destined you for greater things." In the next year he gave Henry leave to undertake the conquest of Ireland, and sent him a bull for that purpose, in which he testifies his approbation of the object of the expedition, and the enlargement of the boundaries of the Christian church, and commands the people of that country to acknowledge him as their sovereign lord. He reminds the king, at the same time, of the rights of the Christian church; claiming all the islands which embraced Christianity, as St. Peter's right, and belonging to the holy Roman church; and exhorting to the regular payment of the Peter pence which he had promised. He admonishes him also to use his endeavours for reforming the manners of the people, and to commit the government of the churches to able and virtuous persons, so that he might thus deserve an everlasting reward in heaven, and transmit a glorious name to posterity. Adrian's indulgence to this prince was so great, that he consented to absolve him from the oath he had taken, not to set aside any part of his father's will.

In the beginning of his pontificate he constrained the magistrates of Rome to abdicate the authority they had as-

sumed in their efforts to recover the ancient liberty of the people under the consuls, and to leave the government of the city to the pope. In 1155 he drove the heretic Arnold of Brescia, and his followers, from Rome. He also excommunicated William king of Sicily, who ravaged the territories of the church, and absolved his subjects from their allegiance. In his interview with Frederick king of the Romans, with whom he concluded a peace when he invaded Italy, this prince condescended to hold his stirrup whilst he mounted his horse; in consequence of which Adrian conducted him to Rome, and placed the imperial crown on his head in St. Peter's church, to the great mortification of the Roman people, who assembled tumultuously and killed several of the imperialists. The Sicilian king, having taken an oath not to prejudice the church, was honoured by Adrian, in 1156, with the title of the *King of the Two Sicilies*. This pope built and fortified several castles, and left the papal dominions in a more powerful and flourishing condition than he found them. However, he complained of the inquietudes attendant on his high station; and in a letter to his old friend John of Salisbury, he says, that St. Peter's chair was the most uneasy seat in the world, and that his crown seemed to be clapped burning on his head. He died, September 1, 1159, in the fourth year and tenth month of his pontificate, and was buried in St. Peter's church, near the tomb of his predecessor Eugenius. Dr. Cave informs us, that he allowed his mother to be maintained by the abns of the church of Canterbury. There are extant several letters written by pope Adrian, and some homilies. Biog. Brit.

ADRIAN V. Pope, a Genoese, whose name was *Ottoboni Fiesei*, succeeded Innocent V. A. D. 1276. He was created by his uncle Innocent IV. cardinal deacon of St. Adrian, and in 1254 sent by him to England, to settle the disputes between Henry III. and his barons; and he was employed again for the same purpose, by Clement III. when he issued a sentence of excommunication against the king's enemies. To those who congratulated him on his accession to the papal chair, he replied, "I wish you had found me a healthy cardinal, rather than a dying pope." Immediately after his election he went to Viterbo to meet the emperor Rodolphus, for the purpose of opposing the usurpation of Charles, king of the Two Sicilies; but died soon after his arrival, having enjoyed his dignity only thirty-eight days. He zealously encouraged the crusade to the Holy Land, and upon his election sent a large sum to Constantinople, towards building galleys; and he also furnished further supplies. Bower.

ADRIAN VI. Pope, was a native of Utrecht, the son of a tapeltry weaver, or, as some say, of a brewer's servant. He succeeded Leo X. A. D. 1522. He was educated gratuitously at Louvain, and distinguished himself by his application and proficiency. Through the interest of Margaret, widow of the duke of Burgundy, and sister of Edward IV. of England, he obtained the professorship of divinity in Louvain, the deanery of the cathedral, and the vice-chancellorship of the university. Having been appointed tutor to Charles, the grandson of Maximilian, and the young prince preferring arms to letters, Adrian was employed by the emperor on an embassy to Ferdinand king of Spain, in consequence of which he obtained the bishopric of Tortosa. When Charles was left sole heir to the dominions of Ferdinand, he appointed Adrian regent during his minority: but as Cardinal Ximenes had been named for this office by Ferdinand, they both united, in the government of the country. Ximenes, however, was the real, and Adrian merely nominal regent. In 1517 the emperor Maximilian

Maximilian recommended Adrian to Leo X. and he was preferred by that pontiff to the dignity of cardinal. In a contest with the Castilians, when he sustained the office of regent during the emperor's absence in 1520, he attempted to enforce submission, by military power, but failed in the attempt; and he was under a necessity of withdrawing his forces, and to content himself with the mere shadow of authority. He was in a little time, and in a manner very unexpected, removed from this unpleasant situation, and advanced to the highest dignity of the church. Upon the death of Leo X. in 1521, the conclave was divided about the choice of a successor. The younger members were attached to Julio, Cardinal de Medici, the nephew of Leo; but the old cardinals were averse from choosing a pontiff out of the powerful family of the Medici, and yet they were not agreed in their views with respect to any other person. By a manoeuvre, which was merely designed to gain time, the party of Julio voted for Cardinal Adrian in the preparatory scrutiny. The other party closed with them; and thus a stranger to Italy, and a man unqualified for the office, was elected, no less to their own surprise than to the astonishment of Europe. The election was probably the effect of intrigue, and of the secret interference of the imperial ambassador, John Manuel, who wished to obtain a pope devoted to his master's interest. See Robertson's Hist. Charles V. vol. ii. p. 210, &c. 8vo.

Adrian's disposition and views, as well as his principles and manners, were ill adapted to the office, that had been thus devolved upon him. At the time of his election Rome was afflicted with a pestilence, its finances were exhausted, and literature and the arts required liberal and judicious patronage. In these disadvantageous circumstances did Adrian ascend the papal chair. However he entered on his office with the best intentions. He began by avoiding every kind of expensive parade, and by exhibiting an example of moderation and temperance, which tended to correct and reform the dissolute manners of the court and city. He discouraged the ambitious and selfish expectations of his own relations, he annulled many ordinances which the cardinals had enacted for their own benefit, and he abolished many offices which Leo had created for the gratification of his favourites. With this pope it was a ruling maxim, that men were made for places, and not places for men. He restored the duchy of Urbino to its lawful proprietor, and surrendered to the Duke of Ferrara several places of which he had been unjustly deprived. He also issued a bull, requiring Christian princes to consent to a truce for three years, so that the Imperial, French, and English ambassadors at Rome might deliberate on terms of pacification. Whilst he demanded a zealous execution of the imperial edict against Luther and his followers; he declared a disposition to exercise his spiritual authority for the reformation of the church. Notwithstanding the just claims on respect which resulted from the pontiff's general conduct, his best actions were misinterpreted; his œconomy was called parsimony, his plans of reform were imputed to unnecessary austerities, and his disinterested conduct to weakness and inexperience. His unpopularity was partly owing to his being a stranger in Italy, and to the attention which he paid to some of his former friends, whilst he declined reposing confidence in his brethren of the conclave. He was also too much under the influence of Charles, and suffered his attachment to his former master to mislead his judgment. This led him to relinquish his plan of a general pacification, and to form an alliance with the emperor and the king of England against France. On the day when this confederacy was signed, Adrian was seized with a slow

fever, which terminated his life and the anxiety of his elevated station in December 1523, after he had possessed the papal dignity one year and ten months. He was buried in the church of St. Peter, and on his tomb was inscribed the following epitaph, which informs posterity, that the greatest misfortune which he had experienced in life, was, that he had been called to govern.

“Adrianus Papa VI. hic situs est.
Qui nihil sibi infelicium.
In vita,
Quam quod imperaret,
duxit.”

Notwithstanding many excellencies that distinguished the character of Adrian, he was destitute of that firmness and energy of mind, which the duties of his high and arduous station required. Few men that have been so free from faults, incurred such unpopularity, and became obnoxious to so many calumnies. The door of his physician, in the night after his decease, was adorned with garlands, and marked with this inscription; “To the deliverer of his country.” However such kind of reproach, on the part of the dissolute and licentious, redounds to his honour. The piety of Adrian, it has been observed, was more distinguished than his taste for the fine arts. From the statue of Laocœon, he turned away his head in token of his dislike of pagan images, and he expressed his contempt of poets, by calling them *Terentians*. With theology and scholastic philosophy he was well acquainted. Whilst he was professor of divinity at Louvain he wrote “a Commentary upon the Book of Sentences, by Peter Lombard.” “*Epistles*,” and “*Questions Quodlibeticæ*,” printed at Louvain in 1515, and at Paris in 1516 and 1531. Dupin's Hist. of the 16th century. Bower's Popes. Robertson's Charles V. vol. ii. b. i. p. 2. Gen. Biog.

ADRIAN, (De Castello) bishop of Bath and Wells; in the reigns of Henry VII. and VIII. and cardinal priest of the Roman church, was descended of an obscure family, and born at Cornetto, a small town in Tuscany. Having distinguished himself by his parts and learning, he obtained several employments at the court of Rome. In 1488, he was sent by pope Innocent VIII. as his Nuncio extraordinary, to appease the troubles in Scotland, and to exercise the office of quaestor or treasurer to his holiness, in collecting his tribute or Peter pence. He was also agent for the English affairs at the court of Rome, and in recompence of his services, was promoted first to the see of Hereford in 1504, and afterwards to that of Bath and Wells. He farmed out his bishopric and resided at Rome, in a magnificent palace which he erected, and which he bequeathed to Henry VII. whose name was inscribed upon the front of it, and to his successors. He was secretary and vicar-general to pope Alexander VI. and created by him in 1503, a cardinal priest, under the title of St. Chrysogonus; soon after which event he narrowly escaped being poisoned at a feast, to which he was invited by the pope and his son Cæsar Borgia. In the pontificate of Julius II. he banished himself from Rome; nor did he return till a conclave was held for the election of a new pope. Soon after the elevation of Leo X. he concurred in a conspiracy against his life; and being unable to pay the fine of 12,500 ducats, which was the penalty inflicted upon him, he withdrew from Rome, and was excommunicated, and deprived of his benefices and ecclesiastical orders, July 6th, 1518. Four years before this period, he had been removed from his office of the pope's collector in England by Henry VIII. at the instigation of cardinal Wolsey, who employed him as his solicitor at Rome, and was betrayed by him in his attempts to obtain the dignity of

cardinal. After his condemnation, it is said that he took refuge amongst the Turks in Asia. Polydore Virgil extols his talents and learning, and says that he was the first since the age of Cicero, who revived the purity of the Latin language, and taught men to draw their knowledge from the sources of the best and most learned authors. Biog. Brit.

ADRIAN, a learned Carthusian, who wrote a treatise intitled *De Remediis utriusque fortune*, the first edition of which was published at Cologne in 1471, 4to. The book is scarce and much esteemed.

ADRIANA, in *Ancient Geography*, an episcopal city of the Hellespont, under the metropolis of Cyzicus.

ADRIANEUM, *Moses Habiani*, the magnificent Mausoleum erected by Adrian in the lesser field of Mars at Rome, over against that of Augustus, and connected with it by a bridge. It is of a square form, and in the midst of it there is a lofty round tower. It served as a citadel when Rome was besieged by Vitiges, king of the Goths, and the Romans defended themselves by casting fragments of the statues upon their enemies. Here Adrian was buried and all the Antonines.

ADRIANI, JOANNI BALLISTA, in *Biography*, was born of a Patrician family, at Florence, in 1511. He wrote a history of his own times in Italian, beginning in 1536, and terminating in 1574, and designed as a continuation of Guicciardini, to which Thuanus (Hist. l. 68.) acknowledges himself much indebted. He also composed six funeral orations, and is thought to have been the author of a long letter on ancient painters and sculptors, prefixed to the third volume of Vafari. He died at Florence, in 1579. Biog. Dict.

ADRIANI, in *Ancient Geography*, furnamed *Ad olympium*, a city of Asia Minor, in Bithynia.

ADRIANIDÆ, in *Ancient History*, a new tribe established by the Athenians in honour of Adrian, after the example of that which was formed in honour of Attalus, king of Pergamos, and comprehending the villages of Eleonfa, Oa, and Phigaja.

ADRIANISTS, in *Ecclesiastical History*, a branch of Anabaptists, the disciples of Adrian Hamledius, in the 16th century, who taught first in Zealand, and afterwards in England. The Adrianists, besides the common dogma of anabaptism, are said to have had some peculiar notions relating to the person of Christ.

Theodoret mentions a more ancient sect of this name, who were followers of Simon Magus.

ADRIANO-A-SIERRA, in *Geography*, a mountain of Guipuzcoa, in Biscay, one of the highest of the Pyrennees. It is crossed in the way from Biscay to Old Castile.

ADRIANOPLE, or ANDRINOPLE, in *Geography*, a city of Turkey in Europe, in the province of Romania, called anciently *Orestia*, and now *Edrene* by the Turks, but deriving its name from the emperor Adrian, who founded or restored it. It is situated on the Hebrus or Maris, at the confluence of the Tunfa and the Harda, and rises gently on the side of a small hill. It is about five miles in circumference, says Chishull in his travels, p. 63. The form of it is circular, and it is surrounded with decayed walls and towers. The houses are generally built of mud and clay, and some of them of brick; and the streets are dirty and narrow. The bazar or market place, called *Ali Bassa*, is an arched building about half a mile long, with six gates, and a great number of shops that are occupied by Turks, Armenians and Jews. There is also another bazar of meaner structure, about a mile long, containing many shops, and well stored with various commodities. And in another part of the town, there is a third market-place, called *bizeflein*,

covered like the former, and provided with a number of shops, in which are sold the manufactures of gold and silver, jewels, pistols, &c. There are four mosques, the principal of which is that of Sultan Selim, built by him of materials brought from the ruins of Famagusta, in the island of Cyprus. It is constructed like a theatre with one stately room, terminating upwards in a cupola, and it is beautifully situated on the side of a hill, in the midst of the city. The emperor's seraglio stands in a plain near the river Tunfa or Tungia. The grand vizier's palace is only a common house, after the Turkish manner of building, which is two miles in compass, and has seven gates besides those of the gardens, which are several miles in circumference. The objects most worthy of attention are, the mosques, the roofs of which are covered with copper, having also lofty steeples and colonnades, with pedestals and chapters of cast brass, beautiful marble gates of exquisite sculpture, delightful fountains, stately porticos with gilded balls on the top, and curious tapestry; all which exhibit a very grand appearance. The city, which is said to contain about 100,000 inhabitants, is under the government of a Mullah Cadi, who has an absolute authority in all civil and criminal matters. The commerce of this place, favoured by the river that waters it, has drawn hither people from all nations. It is now the residence of a Greek bishop, and the grand signior sometimes visits this city, either for pleasure or safety, when the plague or war makes it necessary for him to leave Constantinople. In 1350 Sultan Amurath first took it from the Christians, from which time it became the seat of the Turkish emperor, till Constantinople was reduced in 1458. In 1754, it suffered greatly by fire. The adjacent country is very fertile, and supplies the town with all kinds of necessaries; and the wine in particular, is reckoned the best in Turkey. Chishull takes it to be that mentioned by Hesiod, in his Oper. and Dies. l. 2. v. 107. where he says,

Περάν τε σκίη, καὶ Βίβλιος οἶνος.

This is a see of a Greek archbishop under the patriarch of Constantinople. N. lat. 41° 41'. E. long. 26° 27'.

ADRIANOPOLIS, in *Ancient Geography*, i. e. the city of Adrian, a name given to various cities in different countries, that were either built or repaired by the emperor Adrian. The number of these cities is not less than nine. The city of Thrace still retains its name.

ADRIANOPOLIS, was a city of Epirus, south of Apollonia. This assumed the appellation Justinianopolis, after the emperor Justinian.

ADRIANOPOLIS of Bithynia, in Asia Minor, called *Boli*, was situated upon the Billaus, west of Cratia.

ADRIANOTHERA, *Αδριανού θήρα*, *Adrian's chace, or hunt*, a city of Mysia, which retained its name in the fifth century, and which was founded by Adrian in a district of Mysia, whither he resorted for the pleasures of the chace. His fondness for these sports was so great, that he erected monuments for his dogs and horses; and he composed an epitaph for his horse Bonithenes, which he had often used in hunting. Dion. Cass. tom. ii. p. 1159. Ed. Reim. This is probably the same city with *Adriani*, which was the birth-place of Aristides the Sophist. There was another *Ariadne* or *Adrianopolis*, in Lybia Cyrenaica.

ADRIANSEN, ALEXANDER, in *Biography*, a painter who excelled in painting fruit, flowers, fish, and still-life, was born at Antwerp, about the year 1625. All his objects are well coloured, with an agreeable effect, from the judicious management of the chiaro scuro, and with a remarkable transparence. Pilkington's Dict.

ADRIANUM or ADRIATICUM *Mare*, now the gulf of

of Venice, in *Ancient Geography*, is a large bay in the Mediterranean, between Dalmatia, Slavonia, Greece, and Italy, and extending from south-east to north-west, between 40° and $45^{\circ} 55'$ N. lat. about 200 leagues long, and 50 broad. Its entrance between Cenina and Otrante, is about 14 leagues wide. It is called by the Greeks ϵ $\text{Adriacis} \text{ \kappa}\alpha\lambda\pi\omicron\varsigma$, *Adria finus*; by the Latins variously, as *Adria*, by Horace, (lib. i. od. 3.) "Arbiter Adriæ notus;" by Silius, (lib. i. v. 54. p. 6. Ed. Drakenb.) "Hadriacum pontum;" by Cicero, (in Pison. c. xxxviii. and lib. 10. Attic. Ep. 7.) "Hadrianum mare;" by Virgil, (*Æn.* xi. v. 405.) "Hadriacas undas." The Adriatic sea, says Hefychius, is the same with the Ionian sea; and in order to solve a difficulty in the interpretation of Acts xxvii. 7. and to answer the question, how St. Paul's ship, which was near Malta, and, therefore, in the Lybian or Sicilian sea, could be in the Adriatic; it is alleged, that not only the Ionian, but even the Sicilian sea, was called the Adriatic. Strabo (lib. vii. tom. 2. p. 488.) informs us, that the Ionian gulf is a part of that which in his time was called the Adriatic sea. Whitty Com. vol. ii. p. 751. The principal rivers that ran into the Adriatic were the PANYASUS, APSUS, the LAOUS, or ÆAS, and the CELYDNUS. The State of Venice claims exclusive dominion over the Adriatic sea, in consequence of a circumstance mentioned under DOGE; and the ceremony of wedding it is annually practised in evidence of this claim, on Ascension-day. Mr. Kirwan, in his estimate of the temperature of different latitudes, p. 53. observes, that the Adriatic, though warmer in the summer than the Mediterranean, is so cold in winter, as to have been frequently frozen over in the neighbourhood of Venice.

ADRICHIOMIUS, CHRISTIAN, in *Biography*, was born at Delft, in Holland, in 1553; and having assiduously applied to study, he became director of the nuns of St. Barbara: but when the civil war broke out on account of religion, he withdrew first to Brabant, and then to Cologne, where he began his work, intitled, "Theatrum Terræ Sanctæ," which was printed with maps at Cologne, in 1593. This work, besides a description of the Holy Land and of Jerusalem, contains a chronicle of the Old and New Testament, under the name of Christianus Crucius; and under this title, he published at Antwerp the Life of Christ, and an oration, "De Christiana Beatitudine." Adrichomius died at Cologne, in 1585, and was buried in the convent of the canonesse of Nazareth, where he had been for some years director. Biog. Diet.

ADRIEN, in *Geography*, a small town of the Low Country, in Flanders, on the river Dendre, two leagues from Alost, and four from Gand.

ADRIFT, in *Sea-language*, denotes the state of a vessel broken from her moorings, and driven by the wind or waves.

ADRIN, in *Geography*, a small town of Upper Hungary, upon the river Sebeskeres, at the foot of the mountains of Vedra, and north-west of the great Waradin. E. long. $37^{\circ} 39'$. N. lat. $47^{\circ} 9'$.

ADRI, in *Ancient Geography*, the name of a river in India, according to Ptolemy.

ADRIUS Mons, a chain of mountains which, according to Strabo, extended along Dalmatia, and divided it into the Mediterranean and Maritime.

ADROBICUM, a small place in Spain, on the bay called Magnus Portus.

ADROGATION, in *Antiquity*, a species of ADOPTION, whereby a person, who was capable of choosing for himself, was admitted by another into the relation of a son. The word is compounded of *ad, to*, and *rogare, to ask*; on ac-

count of a question put in the ceremony of it, whether the adopter would take such a person for his son? and another to the adoptive, whether he consented to become such a person's son?

ADRON, in *Ancient Geography*, a city of Arabia Petrea.

ADROTTA, a maritime town of Lydia, in Asia Minor.

ADRU, or ADROU, in *Ancient Geography*, a town of Arabia Petrea, which Ptolemy places in long. 67, and lat. $29^{\circ} 55'$.

ADRUMETUM, or HADRUMETUM, the capital of Byzacium, in Africa, was a very ancient and famous city. It had a variety of names, being called by Strabo and Stephanus, *Adrume*; by Plutarch and Ptolemy, *Adrumetus* or *Adrumettus*; by Appian, *Adrymettus*; by Cæsar, *Hirtius*; by Pliny, *Adrumetum*; by Mela, *Hadrumentum*; and in Peutinger's table, *Hadruto*. It was the *Justiniana* of the middle empire, and the *Heraclea* of the lower. This city was large and populous, and built upon an hemispherical promontory, at the distance of two leagues to the south-east of the morafs, which was the boundary, as Dr. Shaw supposes, betwixt the Zeugitana and Byzacium. It had at a small distance a cothen, *i. e.* a port, or little island, resembling that of Carthage. From its present situation and ruins, it seems to have been somewhat more than a mile in circuit, and a place of importance rather than of extent. That it was founded by the Phœnicians is asserted by Sallust (in Bell. Jugurth. oper. tom. i. p. 88. Ed. Haverc.) and others; and Bchart (Geog. fac. lib. i. c. 24. Oper. tom. i. col. 478. Ed. Villem.) deduced its name from two Syriac, or Phœnician words, importing the land or country yielding an hundred-fold, *i. e.* of corn or grain. Diodorus Siculus (Bibl. Hist. tom. ii. p. 418. Ed. Wesseling.) represents it as a fortified city, when it was besieged by Agathocles, in the third year of the 117th olympiad. At present it is a barren and uncultivated tract, of a sandy soil, and incommoded with morasses. Dr. Shaw has taken pains to prove, that its situation is that of the present *Herkla*. Travels, p. 106, 4to.

ADSCENDENS *Caulis*, in *Botany*, denotes a stalk or branch inclining upwards. The term is synonymous with *incurvus*.

ADSCRIPTS, a term used by some *Mathematicians* for the natural tangents, called also by Vieta *profines*.

ADSENTIRI, in *Antiquity*, a term used to express the assent of the Roman soldiers to any propositions that were made to them by their commanders, which they did by lifting up their hands with acclamation, and striking their bucklers upon their knees. Lucan, in his *Pharsalia*, (lib. i. 386.) refers to this practice.

ADSERERE, ADSERTIO, ADSERTOR *manu in libertatem*, are terms that relate to one of the modes by which a slave was emancipated: he was taken by the hand, and this formula was pronounced: "Hunc liberali causa manu adfero."

ADSIDELA, a table at which the flamens sat, when they offered sacrifice.

ADSIGNIFICATION, among *Schoolmen*, the act of noting or signifying a thing, with the addition of the time when it happened.

ADSON'S Town, in *Geography*, lies near the north-east line of New Jersey, and south-east of the Drowned Lands; twenty-seven miles north-west of Morristown, and twenty-four north-west of Patterfion.

ADSTRICTION, among *Physicians*, is used to denote the too great rigidity and closeness of the emunctories of

the body, particularly the pores of the skin; and also to signify the styptic quality of medicines. See **ASTRINGENTS**.

AD TERMINUM *qui præterit*, is a writ of entry, which lies where a man hath leased lands or tenement: for terms of life, or years, is, after the time expired, held from them by the tenant, or other stranger, who enjoys the free, and doth reeve the lessor. The same writ also lies for the lessor's heir.

ADUACA *Tungarum*, in *Ancient Geography*, *Tongre*, a city of Gaul, the capital of the Tungri. It was called by Cæsar *Aduatua*, and by Ptolemy *Aduaticum*. It became an episcopal see; but after its destruction by Attila, in 451, the see was transferred first to *Trajectum Mosæ*, i. e. Mallrichi, and afterwards to Liege.

ADVANCE, in *Commerce*, denotes money paid before goods are delivered, work done, or business performed. To pay a note of hand or bill by advance, is to pay the value before it becomes due; in which case, it is usual to allow a discount for the time it is pre-advanced.

ADVANCE BAY, in *Geography*, lies on the east side of Hudson's Bay, in that part called "the new discovered sea," into which is also a passage to the south-west from Resolution islands, at the south-east end of Hudson's straits.

ADVANCE-FOSSE, or **DITCH**, in *Fortification*, denotes a ditch of water round the esplanade, or **GLACIS** of a place, to prevent its being surpris'd by the besiegers. The name is also given to that part of the lines or retrenchment nearest the enemy, to prevent him from attacking them. The advance-fosse should be always full of water, or else it will serve to cover the enemy from the fire of the place, if he should become master of the fosse. Beyond this fosse, it is usual to construct lunettes, redouts, &c. See **FOSSE**.

ADVANCE-GUARD, or **VAN-GUARD**, in the *Military art*, is the first line, or division of an army, ranged or marching in battle array, or that part of it which is next the enemy, or which marches first towards them. The whole body of an army is divided into *advance-guard*, *rear-guard*, and *main-body*.

The word is also sometimes applied to a small party of horse, viz. fifteen or twenty, commanded by a lieutenant, beyond, and in sight of the main-guard.

ADVANCER, among *Sportsmen*, is one of the starts, or branches on a buck's attire, between the back-antler and the palm.

ADUAR, a kind of ambulatory village, which Arab families inhabit, in a sort of tents, moveable on occasion as forage and provisions suit. Some also write the word adour and adouard. There are reckoned 30,000 aduars in the kingdom of Algiers.

ADVATICI, in *Ancient History*, were the remains of those Cimbri and Teutones whom Marius had defeated in Italy. They had been left to the number of about 600, on the banks of the Rhine, to guard the baggage and booty of their countrymen, and had settled there after the defeat of the Cimbri. In less than fifty years they were in a condition to furnish 9000 fighting men for their contingent to the league of the Belgæ, when they were attacked by Cæsar, in the year before Christ 57. When Cæsar advanced against the Advatici, they pretended to give up their arms, and submit; but treacherously concealed a third part of them, and made an attack on the Romans in the night. This so provoked the general, that he broke down the gates of their city, supposed to have been *Namur*, put a great number to the sword, and sold the rest, to the number of about 53,000 for slaves. Cæs. de Bell. Gall. lib. ii. c. 29 — 32. tom. i. p. 90. Ed. Grav.

ADVENT, **ADVENTUS**, in the *Calendar*, the time immediately preceding Christmas; anciently employed in pious preparation for the *adventus*, or coming on, of the feast of the Nativity.

Advent includes four sundays, or weeks; commencing either from the Sunday which falls on St. Andrew's day, or that next before or after it, i. e. from the Sunday which falls between the 27th of November, and the third of December inclusive.—But it is to be noted, this rule has not always obtained.—In the Ambrosian office, there are six weeks marked for Advent; and St. Gregory in his Sacramentary allows five.

The first week of Advent, in our way of reckoning, is that wherein it begins; but it was anciently otherwise; the week next Christmas being reputed the first; and the numeration carried backwards.

Great austerity was practis'd in the ancient church during this season.—At first they fasted three days a week; but they were afterwards obliged to fast every day, whence the season is frequently called in ancient writers, *Lent*, and *Quadragesima S. Martini*.

The courts of justice were at one time all shut.

ADVENT is also one of the times, from the beginning whereof, to the end of the octaves of the Epiphany, the solemnizing of MARRIAGE is forbid, without express licence.

ADVENTITIA cæna, in *Antiquity*, an entertainment made by the friends of a person who had been travelling, by way of welcome at his return. This was otherwise called *cæna adventoria*. Pitiscus.

ADVENTITIOUS, something accruing or befalling a person, or thing, from without.

Thus, *adventitious* matter is such matter as doth not properly belong to any body, but is casually joined to it.

ADVENTITIOUS, in the *Civil Law*, is applied to such goods as fall to a man, either by mere fortune, or by the liberality of a stranger, or by collateral, not direct, succession.

In this sense the word stands opposed to *profectitious*; by which are signified such goods as descend in a direct line, from father to son.

ADVENTITIOUS fossils, are foreign or extraneous ones, found incorporated with others, to which they do not properly belong. Such are sea-shells, &c.

AD VENTREM inspiciendum, in *Law*. See **VENTRE inspiciendo**.

ADVENTURE, an extraordinary and surprising enterprise or accident, either real or fictitious.

The word is French, and literally denotes an event, or accident.

Novels, romances, &c. are chiefly taken up in relating the adventures of cavaliers, lovers, &c.

ADVENTURE, *Bill of*, in *Commerce*, is a writing signed by a merchant, attesting that the property of goods shipped, or sent away in his name, belongs to another, the adventure or chance whereof the said person is to stand with a covenant to account to him for the produce of it.

ADVENTURE Bay, in *Geography*, a name given by captain Cook to a bay in which he anchored, in the southern part of New Holland, called Van Diemen's land, and on the shores of which they were supplied with wood and water in great abundance. The bottom of this bay was found to lie in S. lat. 43° 23'. and E. long. 147° 30'. It is an excellent harbour, having through the bay from 18 to 5 fathoms water, which gradually decreases towards the shore. The road also is safe, and sheltered from the north-east by Maria's islands. The variation of the compass, in 1778, was 5° 15' E.

ADVENTURE Island, an island in the Pacific Ocean, discovered by captain Cook in the run from New Zealand to Otaheite, and so called from the ship *Adventure*, in which captain Furneaux sailed in this voyage. He supposed it to be one of the cluster of islands described by M. Bougainville, under the appellation of the *Dangerous Archipelago*. S. lat. $17^{\circ} 5' 15''$. W. long. $144^{\circ} 17' 45''$.

ADVENTURER, in a general sense, a person who engages in any undertaking with some risk or hazard.

ADVENTURERS more particularly denote an ancient company of merchants and traders, established for the discovery of lands, territories, trades, &c. unknown. See *Russia COMPANY*.

The society of merchant-adventurers, so called, because they adventured their merchandise into foreign parts, which was instituted for the improvement of the woollen manufacture, and the vending of the cloth abroad, particularly at Antwerp, is said to have sprung out of the guild of mercers of the city of London; and their origin in this country is traced to the close of the reign of king Edward I. when they attempted the commencement of a woollen manufacture in England. In the year 1296, they obtained privileges of John duke of Brabant, and stapled themselves at Antwerp, joining in society with themselves all other English merchants resorting thither. But this society had not the name of *Merchant-Adventurers* as a company, till the reign of king Henry VII. Some writers trace the rise of this society to an association of merchants, which was formed in 1358, under the appellation of the *Brotherhood of St. Thomas à Becket*; though a society of this name is known to have existed in the year 1248, and to have given rise to the merchants of the *STAPLE* of England. The privileges of the society of merchant-adventurers were successively confirmed by Edward III. and IV. Richard III. Henry IV. V. VI. who, in 1430, gave them a charter; and Henry VII. who, in 1505, gave them the appellation of *Merchant-Adventurers*; by Henry VIII. Edward VI. and queen Elizabeth, who, in 1564, formed the company into an English corporation; and, in 1586, confirmed all former charters; by James I. in 1604 and 1617, who gave it new charters; by Charles I. in 1639, and their successors.

In the reign of Henry VII. there was a contest between two companies of *Merchant-Adventurers*, viz. those who called themselves the company of *Merchant-Adventurers of London*, and the merchants who resided in other cities and towns, and who were distinguished by the title of the *Merchant-Adventurers of England*. The London company had been long accustomed to impose a kind of tax on the English merchants residing in other places, for liberty to buy and sell in the great fairs of Flanders, Brabant, and other countries on the continent. This tax was at first only an old noble, (6s. 8d.) and was demanded by the London merchants, who called themselves the fraternity of St. Thomas Becket on a religious pretence, to enable them to do honour to their favourite saint, and thus gain his protection. But this imposition had gradually increased, and it amounted at the period to which we refer to 40l. to the great discouragement of trade. The Merchant-Adventurers, resident in the out-ports, applied to parliament for a redress of this grievance, and an act was made A. D. 1497, reducing that fine to ten marks, or 6l. 13s. 4d. sterling. Stat. 12 Hen. VII. c. 6. The company of Merchant-Adventurers of England were much injured in their commerce by the German merchants of Steelyard, who formed a rich and powerful society, composed almost wholly of foreigners. Their complaints, however, during the whole reign of Henry VIII. were unavailing; but in the succeeding reign they obtained

redress, when the privileges enjoyed by the merchants of the *STEELEWARD* were revoked, and their corporation abolished by the privy council.

Such was the influence of the English Merchant-Adventurers, that they prevented the emperor Charles V. from introducing the inquisition into Antwerp in the year 1550, when it was established in other parts of the Netherlands. See *HAMBURGH COMPANY*.

By our statutes, adventurers making settlements in any part of America, belonging to the enemy, may obtain a charter from the king. 13 Geo. II. c. 4. § 13.

ADVENTURER, *Mine*. See *MINE-ADVENTURER*.

ADVERB, **ADVERBIUM**, in *Grammar*, a particle joined to a verb, adjective, or participle, to explain their manner of acting or suffering; or to mark some circumstance or quality signified by them.

The word is formed from the preposition *ad*, *to*, and *verbum*, *a verb*; and signifies literally a word joined to a verb, to show how, when, or where, one is, does, or suffers; as, the boy paints *neatly*, writes *ill*; the house stands *there*, &c.

Not that the *adverb* is confined purely to the verbs; but because that is its most ordinary use; whence it becomes so denominated *αδρ' ἰζοχων*. We frequently find it joined to adjectives, and sometimes even to substantives, particularly where those substantives signify an attribute, or quality of the thing spoken of; v. gr. he is *very* sick; he is *truly* king.

An adverb is likewise joined sometimes to another adverb, to modify its meaning; v. gr. *very devoutly*, &c. Whence some grammarians chuse rather to call adverbs modificatives: comprising under this one general term, adverbs, conjunctions, prepositions, and even adjectives.

Adverbs are very numerous; but they may be reduced under the general classes of adverbs of time, place, order, distance, motion, relation, quantity, both continuous and discrete, quality, manner, affirmation, negation, demonstration, interrogation, diminution, doubting, exception and comparison.

In English, says Dr. Lowth (*Gram.* p. 112.), they admit of no variation, except some few of them, which have the degrees of comparison, as soon, sooner, soonest; and those irregulars, derived from adjectives in this respect likewise irregular, as very much, not very prudently. He observes, however, that the formation of adverbs in general with the comparative and superlative terminations seems to be improper; at least that it is now become almost obsolete, as *easier*, *stronger*, *harder*, *higher*, *righter*, though used by Hooker, Raleigh, Hobbes and Shaftesbury. In poetry, comparative adverbs are sometimes allowable.

Adverbs are denominated by Mr. Harris attributes of attributes, or attributives of the second order: and he defines an adverb, a part of speech, the natural appendage of verbs, extending the signification of the word *verb* properly so called, to participles and adjectives. After explaining the general nature of adverbs as attributes of attributes, and enumerating their principal forms, amongst which he reckons intension and remission, he shews that adverbs may be derived from almost every part of speech, from prepositions as *afterwards*, from participles, as *knowingly*, from adjectives, as *virtuously*, from substantives, as *apishly*, and from proper names, as *Socratically*. Adverbs, according to Gaza in his grammar, may be found in every one of the predicaments, and he thinks that the readiest way to reduce their infinitude, is to refer them by classes to those ten universal genera. The Stoics called the adverb by the name of *ἁδρῆς*, with a view to its multifarious nature. Hermes,

p. 192. 210. Mr. Horne Tooke, after noticing the confusion that has perplexed grammarians with regard to the classification of adverbs, and excluding them, as well as PARTICLES, from the rank of separate parts of speech, has with great ingenuity investigated the origin of many of the English adverbs in the ancient Saxon and other northern tongues, and evinced them to be either corruptions of other words, or abridgments of sentences. The termination "ly" is easily discovered in the corruption of "like;" thus *honestly* is *honnell-like*. He also resolves *advisedly* into the past participle *advised*, of *advisan*; *aghostly*, into the participle *agazed*; *ago*, into *agone* or *gone*; *afunder*, into *afundred* or separated. To *wit*, he deduces from *withinn* to know; as *videlicet* and *scilicet* in Latin are abbreviations of *videre-licet* and *scire-licet*. *Needs* is resolved by this very sagacious writer into *need* is; *anon* into *in one*: i. e. instant; *alone* and *only* into *all-one* and *one like*; *alive* into *on-live* or *in life*; *awhile* into the noun *awhile* and the article *a* i. e. *a while* or *a time*; *awhilst* i. e. *awhiles*, into the Saxon *Hevile-es*, *time that*; *aloft* or *on loft* into *on-lyst*, *lyst* in the Anglo-Saxon signifying the air, so that *aloft* denotes *up in the air*. *Lo!* is the imperative of *look*, and *loef* is the adjective *loef*, *dear*. With respect to the adverbs of affirmation and negation, he observes, that *aye* or *yea* is the imperative of a verb of northern extraction, viz. of the Danish *eyer*, signifying *have*, *possess*, or *enjoy*; *yes* is a contraction of *ay-es* q. d. *have* or *possess* *ibat*; in Danish, *iger* is to possess, and *eja*, denotes *aye* or *yea*. In Swedish the same verb is *ega* and the imperative *ja*, *aye* or *yea*. In German, *ja* signifies *aye* or *yea*. In Dutch, *eigenen* is to possess, and *ja* is *yea*. As to the negative *not*, and its abbreviation *no*, they are derived, by Greenwood, from the Latin, by Minsheu from the Hebrew, and by Junius from the Greek. But Mr. Tooke discovers them in the Danish or Swedish *nodig*, and in the Dutch *noode*, *node* and *no*, which signify *averse* or *unwilling*. The adverbs *once*, *twice*, *thrice*, says Mr. Tooke, are merely the genitives of *one*, *two*, *three*, the substantive *time* or *turn* being omitted; and were formerly written *ones*, *twies*.

An ingenious writer suggests that adverbs seem to be principally produced from three sources; first, from a species of interjection, denoting an impulse of the mind, as *now*, *then*, *not*, &c.; secondly, from a composition of two or three words into one, as *always*, *altogether*, &c.; and thirdly, from adjectives, by adding a syllable void of signification itself, but which seems to denote that the word has changed its state into that of an adverb, as *greatly*, &c. This argumentive syllable was originally a contraction of some word that denoted similitude or participation. Gregory's Essays, Historical and Moral. EHEA HTEPOENTA. or, Diversions of Purley, p. 494, &c.

In the Hebrew language, most adverbs, and particularly those of quality, are expressed by nouns, both substantives and adjectives, either simply or connected with a preposition: as *טוב* *benè*, *לשקר* *falso*, *באמת* *verè*. Thus, also in the Chaldee language, *בכופלא* denotes *dupliciter*, and *לרוהצן* *confidenter*. In the Syriac, adverbs of quality are formed of adjectives, and terminate in *אית*, as *עבראית* *Hebraicè*; and frequently of nouns with a preposition adjoined, as *לנמכ* *perfectè*, and sometimes adjectives are substituted for adverbs, as *יתיר* *magis*. In Hebrew the repetition of one adverb, or another of the same meaning, denotes the superlative, as *מעלה מעלה* *supra supra*, i. e. *valdè supra*, Deut. xxviii. 43: and *קל מהרה* *citò velocitèr*. If. v. 26. This form of expression is used distributively, as *בבקר בבקר* *manè, manè*, Exod. xvi. 21. Adverbs of place repeated, signify diversity of place, *נה ונה* *huc & illuc*, Exod. xii. 2. The adverbs *אז* *tunc* and *טוב* *ante-*

quam often change the future into the præterite, both perfect and imperfect: as Deut. iv. 41. Exod. xii. 34. Adverbs of time, that are definite, are used indefinitely: as *חמור* *heri, yesterday*, for past time in general. 2 Sam. xv. 2. If. xxx. 33.—*היום* *hodie, this day*, for the present time: as Pl. xv. 7. *מחר* *cras, to-morrow*, for future time, indeterminate: as Gen. xxx. 33. Hence Matt. vi. 34. The adverb *תמיד* *semper* is used for *quotidie, quoties* and *sepe*. Exod. vii. 20. xxviii. 30. Hence *παυσῶς, always*, Luke xviii. 1. denotes *very often*. See John xviii. 20. The adverb *עך*, signifying *donec*, does not always exclude the time that follows the action which is spoken of. Pl. ex. 1. cxxiii. 2. If. xlvi. 4. &c. Hence, are derived the Hebraisms that occur. Matt. i. 25. xxviii. 20. Acts. iii. 21. Rom. v. 13. 1 Tim. iv. 13. Adverbs of negation prefixed to verbs are used in the same sense with the privative alpha of the Greeks: as *לא ישמה* *non letabitur*, i. e. *dolebit*. Prov. x. 1. Hence, John xiv. 18. Rom. iv. 19. Heb. xi. 16. Rev. xi. 12. Adverbs of this kind prefixed to nouns have the same meaning, as *לא חכם* *non sapiens*, i. e. *insipiens*; *לא עז* *non fortis*, i. e. *infirmus*. Prov. xxx. 25. Hence Matt. ii. 6. Rev. xi. 7. Absolute adverbs are used comparatively, as Joel. ii. 13. Prov. viii. 10. Hof. vi. 6. 1 Sam. viii. 7. Gen. xxxii. 28. Hence are derived the Hebraisms that occur in Matt. x. 20. Mark ix. 36. Luke xiv. 12. John vi. 27. Acts v. 4. 1 Cor. i. 17. Ephes. vi. 12. On the other hand, comparatives are used for negative adverbs. Hof. vi. 6.—Luke xviii. 14. 1 Pet. iii. 17. The adverbs of negation *לא* and *אין* joined to the nouns *כל* *omnis*, *איש* *vir*, *אהר* *unus* are universal negatives, so that *non omnis* is synonymous with *nullus*, &c. Pl. cxliii. 2. xlix. 18. Prov. xiii. 7. Eccl. i. 9. Num. xxxi. 49. Gen. xlv. 1. 2 Sam. xiii. 30. Dan. xi. 37. Hence Matt. xxiv. 22. Luke i. 37. Rom. iii. 20. Rev. ix. 4. The adverb of interrogation *אן* answers the purpose of a negative in affirmative interrogations, and of an affirmative in those that are negative. 2 Sam. vii. 5. 1 Chron. xxi. 17. This interrogation *אן* is sometimes omitted: as Gen. xxvii. 24. Job. ii. 10. The adverb of similitude *כ* prefixed to a word is sometimes doubled, and the one is supplied by the conjunction *ו*. Prov. x. 25. xvii. 3. If. liii. 7, compared with Acts viii. 32. 1 Sam. xii. 15. Hence Matt. vi. 10. Mark iii. 26. John xx. 21. Acts vii. 51. This adverb is very frequently omitted, as Nah. iii. 12. Gen. xlix. 9. Pl. xii. 7. See also Exod. xix. 4. 1 Sam. xiii. 1. Pl. cxxv. 2. Jer. xvii. 11. Job xxiv. 19. Hence John v. 17. xiv. 1. James i. 11. It is also sometimes redundant, as Pl. xlix. 13. Job xxx. 19. Num. xi. 1. Hof. iv. 4. Hence Matt. xiv. 5. John i. 14. Rom. ix. 29. Adverbs are sometimes used for adjectives. The biblical critic may find much more on this subject in the learned Maseles's Heb. Gram. vol. 1. p. 352—365.

ADVERBIAL, something relating to adverbs. We say an adverbial phrase, adverbial expression, &c.

ADVERBIAL numbers are sometimes used to denote once, twice, thrice, &c.

ADVERSARIA, among the Ancients, was used for a book of accounts, like our journal or day-book.

Hence, adversaria is sometimes also used among us for a common place book.

Adversaria amounts to the same with *ophistographia*, *ὑπομνηματα*, or *memoriale*, and stands opposed to *codex*, the former being for occasional matters which were taken down hastily, from which they were afterwards transcribed into the latter, in a fair regular manner, for standing use. Morhof, Polyhist. lib. iii. cap. 1.

ADVERSARIA is also a title given to divers books, containing collections of miscellaneous observations, remarks, &c.

In which sense, *adversaria* amounts to much the same with *variae lectiones, variae observationes, commentarii, lectiones antiquae, loci communes, geniales dies, vesperae, selecta, miscellanea, &c.*

ADVERSARIA is also used for a commentary on some text or writing.

This was so called, because the notes were written on the *adverse* or opposite page.

ADVERSARY, formed of the Latin preposition *adversus*, against, and *vertere*, to turn. See *ANTAGONIST*.

ADVERSATIVE, in *Grammar*, a word or particle that expresses not only some difference, but some opposition, between what goes before and what follows.

Adversative disjunctives are distinguished from those that are denominated simple in this respect; as the latter merely disjoin or express a diversity, whereas the former disjoin with a concomitant opposition, e. g. The proposition, "*either it is day, or it is night,*" is a simple disjunctive: and an adversative is when we say, "*it is not day, BUT it is night.*" Besides, the adversatives are definite; and the simple, indefinite. Thus, when we say, "*the number of three is not an even number, BUT an odd,*" we not only disjoin two opposite attributes, but we definitely affirm one, and deny the other. But when we say, "*the number of the stars is either even or odd,*" though we assert one attribute to be, and the other not to be, yet the alternative is left indefinite. With respect to *adversative* disjunctives, it may be observed, that, though they imply opposition, there can be no opposition of the same attribute in the same subject; but the opposition must be either of the same attribute in different subjects, as "*Brutus was a patriot, BUT Caesar was not;*" or of different attributes in the same subject, as, "*Gorgias was a sophist, BUT not a philosopher;*" or of different attributes in different subjects, as, "*Plato was a philosopher, BUT Hippias was a sophist.*" The conjunctions used for all these purposes may be called *absolute adversatives*: but besides these, there are several others, recited by Mr. Harris, such as *adversatives of comparison*, expressed by the words *than* and *as*, which mark not only opposition, but that equality or excess, which arises among subjects from their being compared. Such also are *adversatives adequate and inadequate*, of which the principal are *UNLESS* and *ALTHOUGH*, e. g. "*Troy will be taken, UNLESS the Palladium be preserved.*" "*Troy will be taken, ALTHOUGH Hector defend it.*" Every cause, (says Mr. Harris) is either adequate, or inadequate, when it endeavours without being effectual, and so in like manner is every preventive. Adequate preventives are expressed by such *adversatives* as *UNLESS*: the inadequate are expressed by *ALTHOUGH*. *Hermes*, p. 251—257.

On this subject, Mr. Horne Tooke, in his *Diversions of Purley*, has enabled us to form more clear, determinate and satisfactory ideas than those which were furnished by former grammarians. The opposition in adversative disjunctives, that has been usually referred to the conjunction *BUT*, is supposed to be marked by the words or sentences which are thus connected, and which have opposite meanings. Accordingly the ingenious writer abovementioned affixes two different acceptations to the word *but* in the beginning and in the middle of a sentence. In the former case it is a corruption of *bot*, the imperative of the Saxon verb *botan*, to boot, superadd, or supply; and in the latter it is a contraction of *be-utan*, the imperative of *benoutan*, to be out. This distinction is evinced by examples from ancient writers, one of which it will be sufficient to mention, taken from Gawin Douglas.

"But thy work shall endure in laude and glorie,
But spot or faulte condigne eterne memorie."

The meaning of this couplet is "superadd (to something said, or supposed to be said before) thy work shall endure in laude and glorie, be out, (i. e. without) spot or fault."

Thus, in the definite adversative, "*the number three is not an even number but an odd*, the opposition is not marked, at least directly, by the word *but*, but by the adjectives *even* and *odd*, which denote attributes in their own nature opposite; and the preposition, according to the first sense of the word *but*, will be synonymous with this, viz. "*the number three is not an even number, superadd (it is) an odd number.*" In the indefinite adversative, "*the number of the stars is either even or odd*, the word *either* is a distributive pronoun, and *or* is a contraction of the Saxon *odder* q. d. *other*, i. e. something different, and often contrary. As to the adversatives denominated by Mr. Harris adequate and inadequate, and marked by the conjunctions *unless* and *although*, he leads us to conceive that the whole difference between them consists in this, that the expression of the one is more forcible than that of the other. Whereas, the meaning of *UNLESS* is directly opposite to that of *ALTHOUGH*. They are both verbs in the imperative mood: the former signifying *take away or dismiss*; and the latter *allow, permit, grant, yield, assent*. Accordingly the sentence, "*Troy will be taken UNLESS the palladium be preserved,*" is equivalent to "*Remove the palladium be preserved*, i. e. taking the *palladium* be preserved as an abstract noun, the preservation of the *palladium* *Troy will be taken*. Again, "*Troy will be taken ALTHOUGH Hector defend it,*" is the same as "*Troy will be taken ALLOW Hector (to) defend it.*" The idea, therefore, expressed by *UNLESS* is that of the removal of one thing to make way for another; and the idea expressed by *ALTHOUGH* is that of *allowing* one thing to co-exist with another, with which it is apparently incompatible. The conjunction *UNLESS* (says Mr. Tooke) even in the reign of queen Elizabeth was written *unless* or *onlesse*, and more anciently *onles* and *onlesse*: and *onles* is the imperative of the Anglo-Saxon verb *onlesan*, to dismiss or remove, *les* the imperative of *lesan*, which is synonymous with *onlesan*, is also used by some old writers, instead of *unless*. And this imperative *les* has given to our language the adjectives *hopeles*, *restles*, &c. i. e. *dismiss* hope, rest, &c. The conjunction *ALTHOUGH* (says the same writer) is compounded of *al* or *all*, and *tho'*, *though*, *thah*, or, in the vulgar pronunciation, *thaf*, *thaus*, and *thof*. This is evidently the imperative *thof* or *thafig* of the verb *thafian* or *thafigan*, to allow, permit, &c. and *thafig* becomes *thah*, *though*, *thoug* in a transition of the same kind, and as easy as that by which *hafue* becomes *have*. This etymology is confirmed by considering, that anciently they often used *all be*, *all had*, *all were*, and *all give*, instead of *ALTHOUGH*.

ADVERSATOR, in *Antiquity*, a servant sent to wait his master's returning from supper, and attend him home. The rich had servants of this quality, to apprise them of any danger. Plautus, (*Mort.* iv. 424.), and Terence, (*Adelph.* i. 12.) refer to such persons.

ADVERSE Leaf. See *LEAF*.

ADVERTISEMENT, formed from *advertere*, to consider, in a general sense, an intelligence or information given to persons interested in an affair.

ADVERTISEMENT is more particularly used for the brief account of articles of private or public concern, inserted in the daily, or other public papers.

By the statute of 25 Geo. II. cap. 36. and 28 Geo. II. cap. 19. the penalty of 50*l.* is inflicted on persons advertising a reward with no questions to be asked, for the return of things lost or stolen; and likewise on the printer.

By 21 Geo. III. c. 49. any person advertising any public

lie meeting for debate on the Lord's day, to which persons are to be admitted by money or tickets sold, the printer shall forfeit 5*l.* for each offence. See **LOTTERY**.

ADVICE-Boat, a small vessel employed to carry express or orders with dispatch.

AD VITAM aut celsam, denotes an office to be held so as to determine only by the death or delinquency of the possessor; or in other words, to be held *quam diu se bene gerit*. Stat. 28 Geo. II. c. 7.

ADUGAK, in *Geography*, one of the Fox islands in the northern Archipelago.

ADULA, in *Ancient Geography*, a mountain of Rhætia, or the country of the Grisons, being a part of the Alps, in which are the fountains of the Rhine, Rhone, Nantz, Telsin and Aar, and from which flows the **ADDA** or **ADDUA**. It is now called St. Gothard, and it is said to be the highest point of Europe. Strabo, *Geog.* tom. i. p. 293.

Alta gives name to a country of the Alps between the Grisons, Swis, Villafions, and Milanes. It is the highest part of the Alps, and comprehends the Crispalt, Vogellberg, Gothard, Fourche and Grimmel.

ADULA, in *Modern Geography*, a mountain of Navarre in Spain, betwixt Pomplona and St. Jean de Piz de port.

ADULARIA. See **FELSPAR**.

ADULE or **ADULIS**, in *Ancient Geography*, a town of Ethiopia, built according to Pliny (l. vi. c. 34. tom. 4. p. 342.) by fugitive slaves of Egypt, and distant from its port on the Red Sea 20 stadia; and from the royal city of Axum about 50 leagues. Pliny calls it *Oppidum Aduliton*, and the inhabitants *Adulite*. He represents it as the principal emporium of the Ethiopians, whence they exported ivory, the horns of the rhinoceros, the skins of the hippopotamus, and other articles of commerce. The *monumentum adulitanum*, or the pompous inscription of the statue of Ptolemy Evergetes belonged to the city. The bay adjacent to it in the Red Sea was called *Sinus Adulicus*. It is now *Ercooca* on the coast of Abex. The port of Aduli, according to Dr. Vincent, in his Periplus of the Erythrean Sea, can be no other than the celebrated harbour and city of Massuah, so well known by the accounts of the Jesuits and of Bruce, as the only proper entrance into Abyssinia. Two islands are also mentioned in the bay of Aduli, which are those now called Sheikh Sidda and Toalhout, abounding in fish.

ADULI, a village of the island of Orine in the Red Sea.

ADULLAM, in *Scripture Geography*, a city belonging to the tribe of Judah, in the southern part of this tribe, towards the Dead Sea. Eusebius says it was a large town 10 miles from *Eleutheropolis*, eastward. Josh. xv. 35. 2 Chron. xi. 7, 8. Josh. xii. 15. 1 Sam. xxii. 1, 2.

ADULT, **ADULTUS**, formed from the verb *adolescere*, to grow up, an appellation distinguishing any thing that is arrived at maturity; and applied to plants as well as to persons. An *adult* person is one who is arrived at years of discretion, and entered upon manhood, or the age of **ADOLESCENCE**; and is old enough to have understanding and discernment.

Among *Civilians*, the appellation *adult* is applied to a youth between fourteen and twenty-five years of age.

In which sense *adultus* is synonymous with *juvenis adolescens*.

ADULT, in *Mythology*, was an epithet applied both to Jupiter and Juno: the former being called *Jupiter adultus*, and the latter *Juno adulta*.

ADULTERATION, in a general sense, the act of corrupting, or debasing a thing that was pure, by some improper admixture.

The word is Latin, formed of the verb *adulterare*, to corrupt, by mingling something foreign to any substance. We have laws against the adulteration of coffee, tea, tobacco, snuff, wine, beer, bread, wax, hair-powder, &c. See Stat. 13 W. III. cap. 5.—11 Geo. I. cap. 30.—1 Geo. I. cap. 46.—1 W. & M. cap. 34.—23 Eliz. cap. 8.—10 Anne cap. 26.—3 Geo. III. cap. 11.

For the method of detecting adulteration of liquors, see **ESSAY**, **PROOF**, &c.

ADULTERATION of coin properly imports the making or casting of a wrong metal, or with too base or too much alloy.

Adulterations of coins are effected divers ways, as by forging another stamp, or inscription; by mixing impurer metals with the gold or silver: most properly, by making use of a wrong metal, or an undue alloy, or too great an admixture of the baser metals, with gold or silver. Counterfeiting the stamp, or clipping and lessening the weight, do not so properly come under the denomination of adulterating.

Evelyn gives rules and methods, both of adulterating and detecting adulterating metals, &c.

Adulterating is somewhat less extensive than *debasing*, which includes diminishing, clipping, &c.

To *adulterate* or debase the current coin, is a capital crime in all nations.—The ancients punished it with great severity: among the Egyptians both hands were cut off; and by the civil law, the offender was thrown to wild beasts. The emperor Tacitus enacted that counterfeiting the coin should be capital; and under Constantine it was made treason, as it is also among us. The adulterations of gems is a curious art, and the methods of detecting it no less useful. Nichols, *Lapid.* p. 18.

ADULTERATION, in *Pharmacy*, denotes a fraudulent corruption of drugs, or medicines, by substituting ingredients of less value, for the sake of greater gain.

This practice the dealers in all the parts of medicine are but too well acquainted with. Pharmaceutical authors give numerous instances of *adulterations*, both in simple and compound medicines.

ADULTERATION of wine. See **WINE**.

ADULTERESS, a woman who commits **ADULTERY**.

ADULTERINE, in a general sense, denotes any thing which has been adulterated, or that is spurious, or counterfeited; and it is thus applied to a fraudulent balance, to debased and counterfeit coins, to a false key, and to supposititious writings.

ADULTERINE, in the *Civil Law*, is particularly applied to a child issued from an adulterous amour, or commerce.

Adulterine children are more odious than the illegitimate offspring of single persons. The Roman law even refuses them the title of natural children; as if nature disowned them. Adulterine children are not easily dispensed with for admission to orders. Those are not deemed adulterine, who are begotten of a woman openly married, through ignorance of a former wife being alive. By a decree of the parliament of Paris, adulterine children are declared not legitimated by the subsequent marriage of the parties, even though a papal dispensation be had for such marriage, wherein is a clause of legitimation.

ADULTERINE guilds, in *British History*, denoted those guilds or corporations that were set up without warrant from the king, in opposition to warranted or lawful guilds, and under this denomination they were amerced to the king in 1180. 26 Henry II. See **GILD**.

ADULTERINE marriages, in St. Augustine's sense, denote second marriages, contracted after a divorce.

ADULTERY, **ADULTERIUM**, (in *Ancient Law Books* called

called **ADVOWTRY**) a crime committed by married persons, against the faith pledged to each other in marriage, by having carnal commerce with some other; or even by a person not married, who has the same intercourse with another that is.

Moralists, and canonists, and divines, have distinguished several species of adultery; as,

ADULTERY, manifest, that wherein the parties are caught *in fact*, or, as some express it, *res in re*.

On such occasions, strangers, or people not interested in the family, have been allowed to accuse, and prosecute women for adultery, either if committed during a husband's long absence, or through his connivance.

ADULTERY, occult or secret, that kept concealed from the knowledge of the world, and only divulged to a confessor, or the like.—In the canon law this is most favourably dealt with; persons were admitted to penance for this, and absolved, who were refused it for the open kind. *Du-Cange*.

ADULTERY, presumptive, that which is only discovered or inferred from certain signs, or indications. Such are the parties being found in bed together, *nudus cum nuda*.

ADULTERY, interpretative, or reputed, denotes an act which though not properly included under the denomination, yet is reputed as equivalent to it, and punished as such. Thus mixed marriages between Christians and Jews, e. gr. between a Christian man and a Jewish woman, are put by the laws of Arcadius and Honorius, on the footing of adultery.

So also second marriages are called by some, as Athenagoras, and St. Ambrose, an honourable or better sort of adulteries.

ADULTERY, improper, includes other extraordinary cases and species; such are the commerce with a woman only espoused, not actually married; with a married woman, who lives as a common whore; with a married woman, taking her for single; with a putative wife, or concubine, taking her for a real wife; and with a nun, who by her vows is deemed espoused.

ADULTERY, figurative, that intended only to represent, or prefigure another fact, or convey some other instruction. This coincides with typical, or allegorical adultery, and stands opposed to actual. So the adultery of Mars and Venus is turned into an allegory by naturalists, moralists, alchemists, &c.

ADULTERY, single, is that where only one of the parties is married, in contradistinction from double adultery, which is, where both parties are married. This distinction is familiar and important in the canon law; but was unknown to the jurisprudence of the Code and Pandects.

ADULTERY, incestuous, that wherein the parties are related within the third degree of consanguinity.

ADULTERY, licit, that not prohibited by any express or known law.

It has been disputed whether adultery be *malum in se*, or only *malum prohibitum*, i. e. evil in itself, or only rendered evil, by virtue of positive laws and prohibitions. St. Ambrose and some others have maintained, that adultery was not criminal before the Mosaic law. *Hobbes de Civ. cap. 6. § 16. Budd. Isag. lib. ii. cap. 4.* See the close of this article.

It has been controverted, whether adultery may be lawfully committed in war, with the enemies' wives? The answer is in the negative, and the authorized practice of civilized nations is agreeable to this. It has also been a famous question, whether it be lawful for a woman to commit adultery with the consent of her husband, and for the

procuring some great good to him? St. Austin apparently allows of it; at least, does not condemn it. *De Serm. Dom. in Mont. lib. i. cap. 16. § 49. & De Civ. Dei. lib. xvi. cap. 25.*

It has likewise been a dispute, whether it be lawful for one of the parties married to commit adultery, with the consent of the other, for the sake of having children? Of which we have instances in Abraham, who, on this account, conversed with Hagar; and likewise among the Greeks and Romans.

Pollman, a German professor, has a dissertation on the husband's right to alienate his wife's body to another's use.

ADULTERY, illicit, that which is expressly contrary to some obligatory law: such, according to the generality of casuists, is all adultery, proper, improper, single, double, open, and occult; because of a natural baseness or turpitude in the thing, as well as its being a violation of conjugal faith, and injury to our neighbour.

Accordingly, punishments have been annexed to adultery, in most ages and nations, though of different degrees of severity. In many it hath been capital, in others venial, and attended only with slight pecuniary mulcts. Some of the penalties are serious, and even cruel; others of a jocose and humorous kind.

Among the ancient Egyptians, adultery by consent, was punished in the man by a thousand lashes, given with rods; and in the woman, with the loss of her nose. Nevertheless adulteries were not infrequent among the Egyptians.

The Grecian laws express great indignation against adultery. In the earlier times of Athens, the punishment of adultery seems to have been arbitrary. In other parts of Greece, adultery was severely punished.

Rich adulterers were sometimes allowed to redeem themselves with money, and the fine, called *μειχρηρια*, was paid to the injured husband: and it was customary for the father of the adulterers to return the whole dowry which he had received of her husband. *Homer Odyss. l. θ. v. 317. 329.*

In the later times of Greece it was ordered by Draco, that he who caught an adulterer in the fact might impose on him any arbitrary punishment; and this law was confirmed by Solon. Nevertheless it appeared to have been highly impolitic, as it gave full scope to private revenge, instead of leaving the punishment to the state.

It was by the Grecian law farther ordered, that if any one was injuriously confined upon suspicion of adultery, he should make his complaint by appeal to the *Thesmothete*, which if they found justifiable, he should be acquitted, and his sureties discharged from their bail; but in case he were found guilty, the judges were to inflict on him what punishment they would, death only excepted; and the offender was obliged to procure friends to be responsible for his future chastity.

The Spartans, indeed, may in one sense be said to have tolerated adultery, since they laughed at those who thought the violation of the marriage-bed an insupportable affront: they allowed other men the liberty of embracing their wives, which freedom they took with others in their turn. Nay, even strangers, as well as citizens of Sparta, were allowed the same freedom with their wives. Yet we find that their kings were exempt from this custom, that the royal blood might be preserved unmixed, and the government remain in the same lineal descent.

But notwithstanding this liberty, which was founded on mutual consent, they accounted all other adulteries the most heinous crime in the world; and while they adhered to their ancient laws they were wholly strangers to them. Among the ancient Spartans the idea of infidelity on the

part of the women to their husbands would have appeared as strange as that of displaying the least regard to studied ornaments in their dress. And Lyeurgus, it is said, did not enact any law against adultery, because no such crime existed in Sparta. See Plut. Oper. tom. 1. p. 49. tom 2. p. 289. Ed. Xylandr. Potter's Arch. lib. iv. cap. 12.

Plutarch tells us, that if any person discovered his sister or daughter, while unmarried, in this crime, he was allowed by Solon's laws to sell her for a slave. If a husband surprised his rival in the act of dishonouring him, he might put him to death, or oblige him by torments to ransom his life; but if the wife had only yielded to force, he could demand no more than a pecuniary fine at the discretion of the judges, as violence in such cases was less to be dreaded than seduction.

In the heroic ages, adulterers were stoned to death; and the punishment was called *ἀλιός χιτών*, a stone coat. Homer Iliad, l. 7. Adulteresses were never after permitted to adorn themselves with fine cloaths; and in case they appeared so to do, were liable to have them torn off by any that met them, and likewise be beaten. The same liberty was permitted to any that found them in the temples, which were thought to be polluted by the admission of persons so infamous and detestable. Lastly, their husbands, though willing, were forbidden to cohabit any longer with them, upon pain of ignominy, *ατιμία*; but persons who prostituted women, were adjudged to die.

There were other remarkable punishments for adulterers among the Grecians; such, particularly, as putting out their eyes. And the Locrians observed this custom in later ages, being compelled to the observance of it by Zaleucus, their lawgiver, whose rigour in executing this law is very remarkable; for having caught his son in adultery, he resolved to deprive him of his sight, and remained a long time inexorable, notwithstanding the whole city was willing to remit the punishment, and requested him to spare the youth. At length, unable to resist the people's importunity, he mitigated his sentence, and redeemed one of his son's eyes, by causing one of his own to be put out; by this glorious act setting a memorable example both of justice and of mercy. Valer. Maxim. l. vi. c. 5.

At Gortyn in Crete, they punished adulterers after another manner; they were covered with wool, an emblem of the softness and effeminacy of their disposition, and in that dress they were carried through the city to the magistrate's house, who imposed a fine and sentenced them to ignominy, whereby they were in a manner deprived of all their privileges, and their share in administering the public business. Ælian. Var. Hist. l. xii. c. 12. not. Perizon. tom. 2. p. 736. Ed. Gronov. For other punishments, see *ONOBATIS* and *PARATILMUS*.

There are various conjectures concerning the ancient punishment of adultery among the Romans.

By a law of Romulus, of which Plutarch makes mention, a man had the liberty of turning away his wife, either for poisoning his children, counterfeiting his private keys, or for adultery. Though some maintain that it was made capital, by a law of Romulus, and again by the Twelve Tables. Others, that it was first made capital by Augustus; and others, not before the emperor Constantine. The truth is, the punishment in ancient time was very various, much being left to the discretion of the husband and parents of the adulterous wife, who exercised it differently, rather with the silence and countenance of the magistrate, than any formal authority from him. Thus we are told, the wife's father was allowed to kill both parties, when caught in the fact, provided he did it immediately, killed both together, and, as it were, with one blow. The same

power ordinarily was not indulged the husband, except the crime were committed with some mean or infamous person; though, in other cases, if his rage carried him to put them to death, he was not punished as a murderer. On many occasions, however, revenge was not carried so far, but mutilating, castrating, cutting off the ears, noses, &c. were deemed sufficient. The punishment allotted by the *lex Julia* was not, as many have imagined, death; but rather banishment, or *relegatio*, with the loss, on the part of the wife, of half her dowry, and a third part of her other goods; and on the part of the husband, of half his goods: though Octavius appears, in several instances, to have gone beyond his own law, and to have put adulterers to death. But though the Julian law left the accusation of adultery open to every body, yet strangers were seldom suffered to prosecute, where the husband made no complaint; but where the husband made a trade of his wife's infamy, or having seen her shame with his own eyes, patiently suffered the affront: in these cases, adultery became a crime of public concern; and the Julian law provides a punishment for such husbands as well as for their wives.

Under Augustus, the guilty parties, after the payment of heavy forfeitures and fines, were condemned to long or perpetual exile in two separate islands.

Under Macrinus, adulterers were burnt at a stake. Constantine, it is said by Noodt and others, first by law made the crime capital. Under Constantius and Constans, adulterers were burnt, or sewed in sacks, and thrown into the sea. Under Leo and Marcian, the penalty was abated to perpetual banishment, or cutting off the nose.

By the civil law, as altered by Justinian, who, at the instance of his wife Theodora, mitigated the severity of the *lex Julia*, adultery is punished with whipping, and shutting up in a convent for two years: during which time, if the husband do not consent to take her back again, she is shaven, and shut up for life.—This is called *authenticaling*, as having been established by an authentic.

In France, however, the whipping is omitted, that the husband may be the less averse to the taking her back within the two years.

Under Theodosius, women convicted of this crime were punished after a very singular manner, viz. by a public prostitution; being locked up in a narrow cell, and forced to admit all the men to their embraces that would offer themselves. This custom was again abolished by the same prince.

It was controverted whether, among the Romans, adultery was allowed to be compounded?

By an edict of the emperor Antoninus, the husband was not allowed to bring an action of adultery against his wife, unless he himself were innocent; the reason given for it is very natural, *per iniquum enim videtur esse ut pudicitiam vir & uxore exigat, quam ipse non exhibeat.*

By the Jewish law, adultery was punished by death in both parties, where they are both married, or only the woman. The Jews had a particular method of trying, or rather purging an adulteress, or a woman suspected of the crime, by making her drink the bitter water of jealousy; which, if she were guilty, made her swell.

In Arabia Felix the punishment of adultery was death. Strabo Geog. tom. ii. p. 1130.

By the laws of Jenghiz Khan, founder of the Mogul empire, adulterers were condemned to death; and a man was permitted to kill them, when surprised in the act. Some of the people, however, disliked this law, because it was a custom with them to offer their wives and daughters to their friends who visited them, in token of respect and affection: and they petitioned to be continued in the exercise

of this privilege, which was allowed. But they were regarded as depraved and infamous.

Among the Mingrelians, adultery is punished with the forfeiture of a hog, which is usually eaten in good friendship between the gallant, the adulterers, and the cuckold. Chardin. Voy. tom. i. p. 47.

In some parts of the Indies, it is said, any man's wife is permitted to prostitute herself to him who will give an elephant for the use of her; and it is reputed no small glory to her, to have been rated so high. Montaigne's Ess. lib. iii. cap. 4.

Adultery is said to be so frequent at Ceylon, that not a woman but practises it, notwithstanding its being punishable with death. Bibl. Univ. tom. xxiii. p. 237.

Among the Japanese, and divers other nations, adultery is only penal in the woman. Among the Abyssinians, the crime of the husband is said to be only punished on the innocent wife. In the Marian Islands, on the contrary, the woman is not punishable for adultery; but if the man go astray, he pays severely; the wife and her relations waste his lands, turn him out of his house, &c. Among the Chinese there is reason to conclude, that adultery is not capital; for it is said that fond parents will make a contract with the future husbands of their daughters to allow them the gratification of a gallant. But without such precaution, the husband has power to inflict corporal punishment on a wife who transgresses, or to divorce her. Such, however, is the conjugal fidelity of the Chinese women, and so strictly are they guarded, that cases of this kind seldom happen. The Koran annexes the penalty of 100 stripes to the crime of fornication, in either sex; and in case of adultery, female slaves, whose punishment was half that of free women, received fifty stripes, and the latter were stoned. But in order to convict a woman of adultery, the commentators on the Koran say, that the charge must be supported by four male witnesses, and a false accuser was punished with eighty stripes, and his testimony was deemed for the future invalid.

In the kingdom of Benin, the punishment of adulterers among the lower classes, is the forfeiture of the personal and real estate of the gallant, which the husband seizes and enjoys; and he is therefore anxious to detect the intrigue, as soon as he has occasion to suspect it. The offending wife is driven out of the house with a cudgel, and deemed infamous. Among persons of superior condition, the crime is atoned by a sum of money, which the relations of the wife advance, to prevent the scandal annexed to adultery.— Among the governors and magistrates, the crime is punished with greater severity. The woman and her gallant are immediately put to death, if detected in the fact; and their bodies are thrown on the dunghills as a prey to the birds and beasts, without process of law, or form of trial. Hence it is said, the violation of the marriage bed is less known in Benin than in any other country.

In Spain, they punished adultery in men by cutting off that part which had been the instrument of the crime.

In Poland, before Christianity was established, they punished adultery and fornication in a very particular manner: the criminal they carried to the market-place, and there fastened him by the testicles with a nail; laying a razor within his reach, and leaving him under a necessity either of doing justice upon himself, or of perishing in that condition.

By the law of Scotland, simple adultery is distinguished from that which is notorious and manifest. Open and manifest adulterers, who continue incorrigible, notwithstanding the censures of the church, are punished capitally. The punishment of simple adultery, not being defined by statute,

is left to the discretion of the judge; but custom has made the falling of the single sheet one of its penalties.

The Saxons formerly burnt the adulterers, and over her ashes erected a gibbet, whereon the adulterer was hanged. In this kingdom, likewise, adultery by the ancient laws was severely punished. By the laws of Ethelbert, any one who committed adultery with his neighbour's wife was obliged to pay him a fine, and buy him another wife. King Edmund the Saxon, ordered adultery to be punished in the same manner as homicide; and Canute the Dane, ordered that a man who committed adultery should be banished, and that the woman should have her nose and ears cut off. In the time of Henry I. it was punished with the loss of eyes and genitals. Lib. Hen. I. cap. 12. Doomsday, tit. Cestrc. Civit.

Adultery at present is only punished by fine and penance in the spiritual court; or by an action at common law of *crim. con.* as it is commonly called, for damages; which are assessed by the jury, under the direction of the court, in proportion to the heinousness of the crime and the circumstances of the offender: though some of our law-books speak of adultery as a thing temporal against the peace. If a man takes another in the act of adultery with his wife, and kills him directly upon the spot, though this was allowed by the laws of Solon, as likewise by the Roman civil law (if the adulterer was found in the husband's own house), and also among the ancient Goths; yet in England it is not absolutely ranked in the class of justifiable homicide, but it is manslaughter. It is, however, the lowest degree of it; and therefore the court in such a case directed the burning in the hand to be gently inflicted, because there could not be a greater provocation. Blackst. Com. vol. iv. p. 192, 8vo. As to the adulterers, by our law, she undergoes no temporal punishment whatever, except the loss of her dower; and she does not even lose that, if her husband is weak enough to be reconciled to her, and cohabit with her after the offence committed. 13 Ed. I. cap. 34.

It is to be observed, that adulteresses are such either by the *Canon* or *Civil Law*.

According to the former, a woman is an adulteress, who either being herself married, converses carnally with another man, or being single herself, converses with a man that is married.

According to the latter, she is not an adulteress, if she be not herself in the married state, though she converses with a man that is. The crime, in this case, was more properly called *stuprum* than *adulterium*.

Hence, among the Romans, the word *adultera*, adulteress, differed from *pellex*, which denoted a single woman, who cohabited with a married man: and *pellex* differed from *concubina*, which signified her who had only intercourse with an unmarried man. The former was reputed infamous, and the latter innocent.

It is much disputed, whether adultery dissolves the bond of matrimony, and be a sufficient cause of divorce, so that the parties may marry again. This was allowed in the ancient church, and is still continued in the Greek, as well as the Lutheran and Calvinist churches. Romanists, however, disallow of it, and the council of Trent even anathematized those who maintain it; though the canon of anathematization was mitigated in deference to the republic of Venice, in some of whose dominions, as Zant, Cephalonia, &c. the contrary usage obtains.

The ecclesiastical courts in England so far agree with the papists, that they only grant a divorce *a mensa & thoro*, in case of adultery; so that a complete divorce, a *vinculo matrimonii*,

monii, to enable the parties to marry again, cannot be had without an act of parliament.

By a council of Nantes, marriage was declared dissolved by adultery, but the innocent party was not allowed second marriage. In after-times, leave was given to the innocent party alone; and afterwards the same was allowed to the criminal party.

Adultery, in a moral view, is unquestionably a crime of an atrocious nature, and productive of very injurious consequences. On the part of the man who solicits the chastity of a married woman, it includes the crime of SEDUCTION, and is attended with the same mischief. The infidelity of the woman is aggravated by cruelty to her children, who are involved in her shame and made unhappy by the discord and separation of their parents. Should it be said that the pernicious consequences result from the discovery, and not from the crime, it may be replied that the commission is never secure from discovery; and that if undetected connections of this nature be allowed, the husband can have no security for his wife's chastity, independently of her principles and disposition, besides her want of opportunity or temptation; which would deter men from marrying, defeat the purposes of the conjugal connection, with respect to domestic order and happiness, and render marriage such a state of jealousy and alarm to the husband, as must end in the slavery and confinement of the wife. Besides, the vow by which married persons engage their mutual fidelity is witnessed before God, and accompanied with circumstances of religious solemnity, which approach to the nature of an oath. The crime is therefore little short of perjury on the part of the offenders; and the seduction of a married woman is little less than subornation of perjury: and this guilt is altogether independent of a discovery. The usual and only apology for adultery is the prior transgression of the other party. This is a circumstance which can merely extenuate, but cannot justify the crime; unless it could be pleaded, that the obligation of the marriage vow depends upon the condition of reciprocal fidelity, for which plea there is no foundation. The way of considering the offence of one party as a provocation to the other, and the other as only retaliating the injury by repeating the crime, is a childish trifling with words.

"Thou shalt not commit adultery," was an interdict delivered by God himself: and in both the Old and New Testament the crime of adultery is represented as distinct from, and accumulated upon that of fornication.

Some have been of opinion, that the history of the woman taken in adultery, recorded in the eighth chapter of St. John's Gospel, gives countenance to this crime. When Christ told the woman, "Neither do I condemn thee;" we must believe, it is said, that he deemed her conduct either not criminal, or not a crime, however, of a very heinous nature. A more attentive examination of this case (says Archdeacon Paley) will convince us that nothing can be concluded from it, as to Christ's opinion concerning adultery, either one way or the other. The design of the persons, whose conduct on this occasion is recorded, and who are said to have tempted Christ, "that they might have to accuse him," was to draw him into an exercise of judicial authority, that they might be empowered to accuse him before the Roman governor of usurping or intermeddling with the civil government. Christ knew this to be their design, and determined to defeat it. When he asked the woman, "hath no man condemned thee?" he spoke, and was understood by her to speak of a legal and judicial condemnation; otherwise her answer, "No man, Lord!" was

not true. In the same sense he uses the word *condemn* in his reply "Neither do I condemn thee;" i. e. I pretend to no judicial character or authority over thee; it is no office or business of mine to pronounce or execute the sentence of the law. When Christ adds, "go and sin no more," he in effect tells her, that she had sinned already; but as to the degree or quality of the sin, or Christ's opinion concerning it, nothing is declared, or can be inferred in this way.—Paley's Principles of Moral and Political Philosophy, vol. i. p. 309-3.

Elsner (Observ. vol. i. 318.) and Suicer (Thesaur. vol. i. p. 205.) have shewn, that the word *αμαρτωλον*, to *sin*, is used by the most elegant Greek classics (as the corresponding word *peccare* is by the Latin) to signify the commission of adultery; and this strongly intimates, that even the light of nature taught many of the heathens the exceeding impfulness of it.

If Christ had undertaken the decision of the case recorded in this history, he must, *ipso facto*, have rendered himself obnoxious to the Romans, as well as to the Sanhedrim; and if he had *condemned her*, a new occasion of offence must have arisen, in consequence of that, to Pilate, if execution had been ordered without an application to him; and to the Jews, if Christ had directed such an application to be made. See Doddridge and other Commentators *in loc.*—and Lardner's Works, vol. i. p. 41, 8vo.

It is therefore needless to recur to the solution of the difficulty adopted by some biblical critics, who have disputed the genuineness of this passage. By such, however, it has been urged, that this history is wanting in the Syriac version, as well as in the Alexandrian and Bodleian copies, and indeed in most of the oldest MSS, and that it was not acknowledged by several of the Greek fathers, which induced Beza to question, and Le Clerc, with many others, to reject its authority. In favour of this history appeal is made to sixteen copies used by R. Stephens, to most of those consulted by Mills and Beza, to the Harmonies of Tatian and Ammonius, to the apostolical constitutions and the Synopsis of Athanasius, to many of the Latin fathers, to several ancient Syriac MSS. to the Greek and Latin printed copies, &c. Mill and Wetstein *in loc.* Whitby *in loc.* Fabricius's Codex Apocr. New Test. tom. i. p. 355, &c. See also Lardner's Works, vol. v. p. 67, &c. &c.

ADULTERY is also used in *Ancient Customs*, for the punishment or fine imposed for that offence, or the privilege of prosecuting for it.

In which sense, *adulterium* amounts to the same with what the Saxons called *legerwita*.

ADULTERY is sometimes used, in a more extensive sense, for any species of impurity, or crime, against the virtue of chastity; and in this sense divines understand the seventh commandment.

ADULTERY is also used, especially in Scripture, for idolatry, or departing from the true God, to the worship of a false one.

ADULTERY is also used in *Ecclesiastical Writers*, for a person's invading, or intruding into a bishoprick, during the former bishop's life. The reason of the appellation is, that a bishop is supposed to contract a kind of spiritual marriage with his church.

The translation of a bishop from one see to another was also reputed a species of adultery; on the supposition of its being a kind of second marriage, which, in those days, was esteemed a degree of adultery. This conclusion was founded on that text of St. Paul, *Let a bishop be the husband of one wife*, by a forced construction of church for wife, and of bishop for husband. Du-Cange.

ADULTERY is also used, by *Ancient Naturalists*, for the act of ingrafting one plant upon another.

In which sense, Pliny speaks of the adulteries of trees, *arborum adulteria*, which he represents as contrary to nature, and a piece of luxury, or needless refinement.

ADULTERY is also used by some fanciful *Astronomers* and *Astrologers*, for an eclipse of the sun, or moon, happening in an unusual, and, as they suppose, irregular manner: as in the case of horizontal eclipses, where, though the sun and moon be diametrically opposite, yet they appear as if above the horizon at the same time.

ADUMBRATION, in *Heraldry*, denotes the shadow of any beast or charge, outlined, and painted of a darker colour than the field. There is perhaps no instance of this bearing in any English coat; but it is often mentioned by French and German authors.

ADUMMIM, in *Scripture Geography*, a town and mountain in the tribe of Benjamin, which some place south and others north of Jericho. If, as some say, the road from Jerusalem to Jericho passed through this town, it must have been west of Jericho. Josh. xv. 7.—xviii. 17. The mountain of *Adummim*, which Dr. Shaw assigns to the tribe of Judah, joins to the mountain of Quarantania, and through it, he says, is cut the road that leads from Jerusalem to Jericho; a difficult pass, the *mountain of blood*, or the *bloody road*, as the name may import: where probably it was, from the nature of the situation, that the man fell among thieves, mentioned in Luke x. 30. Shaw's Trav. vol. ii. 276.

ADUNA, a river of Susiana, mentioned by Pliny, tom. i. p. 334.

ADUNICATI, a people of Gaul, in that part which was called the Roman Province.

ADVOCARIA, in *Middle Age Writers*, a tax paid the lord for his protection; sometimes also called *salvamentum*.

ADVOCATE, **ADVOCATUS**, compounded of *ad*, to, and *vocare*, to call, q. d. *I call to my aid or defence*, among the Romans, a person skilled in their law, and who undertook the defence of causes at the bar. The Roman advocates answered to one part of the office of a barrister among us, viz. the pleading part; for they never gave counsel, that being the business of the *jurisconsulti*.

The Romans, in the first ages of their state, held the profession of an advocate in great honour; and the seats of their bar were crowded with senators and consuls: they, whose voices commanded the people, thinking it an honour to be employed in defending them.

They were styled *comites*, *honorati*, *clarissimi*, and even *patroni*; as if their **CLIENTS** were not less obliged to them, than freed-men to their masters. See **PATRON**.

The bar was not at that time venal.—Those who aspired to honours and offices, took this way of gaining an interest in the people, and always pleaded *gratis*.

But no sooner were luxury and corruption brought into the commonwealth, than the bar became a sharer in them.—Then it was that the senators let out their voices for pay, and zeal and eloquence were sold to the highest bidder.—To put a stop to this abuse, the tribune Cincius procured a law to be passed, called from him *Lex Cincia*, whereby the advocates were forbid to take any money of their clients.—Fred. Brunerus has published an ample comment upon this law.

It had before this been prohibited the advocates to take any present or gratuities for their pleading.—The emperor Augustus added a penalty to it, subjecting those who took money to the forfeiture of four times the sum they

received: notwithstanding which, the advocates played their part so well, that the emperor Claudius thought it an extraordinary circumstance, when he obliged them not to take above 23 many sesterces as are equivalent to eighty pounds sterling, or upwards, for pleading each cause.

On occasion of Silius's receiving four hundred thousand sesterces, or about 3200*l.* from an illustrious knight, and afterwards betraying him, the *lex cincia*, revived by Augustus, which prohibited advocates from receiving either money or presents from their clients, was enforced; and Claudius, it is said, allowed advocates to take as much as ten thousand sesterces, or about 80*l.*; but if they took more they were to be prosecuted for extortion. This regulation passed into a law. Nero, in his first speech to the Senate, declared his purpose of revising and enforcing the ancient laws, by which advocates were forbidden to receive fees. It was an apophthegm of Thrasea, who suffered death under this Emperor, A. D. 66, that advocates should undertake only the causes of their friends, of people in distress, and such as might tend to set good examples and purify the morals. Pliny, Ep. vi. 29. Alexander Severus gave stipends to the advocates in the provinces, provided he was well assured that they pleaded without being fed by their clients. But the injunction which disallowed advocates from receiving any thing of their clients was found to be impracticable in its utmost rigour. Accordingly, Constantine did not attempt to revive it; but he pronounces those advocates, who obliged their clients to make over to them by deeds the best part of their property in land, cattle, or slaves, or who prostituted their talents in this odious traffic, unworthy to be admitted into the company of honest men, and he excluded them from the bar. Cod. Theod. tit. 10. leg. 1.

ADVOCATE is still used in countries, and courts, where the civil law obtains, for those who plead and defend the causes of clients trusted to them.

In the English courts, *advocates* are more generally called **COUNSEL**.

In Scotland they have a college, or *Faculty of Advocates*, about 200 in number, appointed to plead in all causes before the Courts of Session, Justiciary, and Exchequer. They are also intitled to plead in the House of Peers, and other supreme courts in England. A candidate for the office of advocate undergoes three successive trials; the first in Latin, upon the civil law, and Greek and Roman antiquities; the second in English, upon the municipal law of Scotland; and in the third, he defends a Latin thesis, which is impugned by three members of the faculty. Before he puts on the gown, he makes a short speech in Latin to the lords, and then takes the oaths to the government, and *de fidei*. From this respectable body all vacancies on the bench are generally supplied. In 1660, the faculty founded a library upon a very extensive plan, suggested by Sir George Mackenzie, advocate to king Charles II., who enriched it with many valuable books. The collection has been gradually increasing, and it now consists of many valuable books on law and other subjects; several original MSS. and a great variety of Jewish, Grecian, Roman, Scots, and English coins and medals.

By the articles of the Union, none are to be named ordinary lords of session, except those who have been advocates, or principal clerks of session for five years, &c.

In France, they had also two kinds of advocates, viz. pleading advocates, *avocats plaidants*; and counsel advocates, *avocats consultants*. This distinction was formed with a view to the two branches among the Romans, *advocati*, and *jurisconsulti*.—Yet there is this difference, that the function of the *jurisconsulti*, who only gave their advice, was of a different kind from that of the *advocati*; being a sort of private

and perpetual magistrature, principally under the first emperors; and the *advocati* never became *jurisconsulti*. Whereas, on the other hand, in France, after the advocates have attained to reputation and experience enough at the bar, they quit so busy a province, and become a kind of chamber-council.—They had also their advocate general, and king's advocate, *avocat du roy*.

ADVOCATE, *Lord, or King's*, in Scotland, one of the eight great officers of state, whose business is to give his advice about the making and executing of laws; to defend the king's right and interest in all public meetings; to prosecute all capital crimes before the judiciary; and to concur in all pursuits before sovereign courts for breaches of the peace; and also in all matters wherein the king, or his donator, has interest.—He intends no processes of treason, except by warrant of privy-council.

The *lord advocate* is sometimes an ordinary lord of session; in which case he only pleads in the king's causes; otherwise, he is at liberty to plead in all causes.

He is the principal crown-lawyer in Scotland, and has the privilege of wearing his hat when he pleases in court. The office of *king's advocate* is not very ancient; having been established about the beginning of the 16th century. He had not originally the power of prosecuting crimes without the concurrence of a private party; but in 1597, he was authorised to prosecute crimes at his own instance.

ADVOCATE *of a city, or town*, is a magistrate established in several places of Germany, for the administration of justice in that city, in the emperor's name. See ADVOWEE.

ADVOCATE is more particularly used, in *Church History*, for a person appointed to defend the rights and revenues of a church or religious house.

The word *advocatus*, or *advowee*, is still retained, for what we usually call the *patron*, or him who has the advowson, or right of presentation, in his own name.

The abbey and monasteries had also all their advocates, or *advowees*. See ADMINICULATOR.

There are several other kinds of advocates; as

ADVOCATE, *consistorial*, is an officer of the court of Rome, whose business it is to plead on the oppositions made to the PROVISIONS of benefices in that court. There are ten of these in number.

ADVOCATES, *elective*, those chosen by the abbot, bishop, or chapter, a particular licence being had from the king, or prince, for that purpose. The elections were originally made in the presence of the count of the province.

ADVOCATES, *feudal*, were of the military kind, who, to make them more zealous for the interest of the church, had lands granted them in fee, which they held of the church, and did homage, and took an oath of fidelity to the bishop or abbot. These were to lead the vassals of the church to war, not only in private quarrels of the church itself, but in military expeditions for the king's service, in which they were the standard-bearers of their churches.

ADVOCATE, *fiscal*, *fisci* ADVOCATUS, was an officer instituted by the emperor Adrian, to defend the cause and interests of the FISCUS, or private treasury, in the several tribunals where that might be concerned.

ADVOCATES, *judicial*, in the *Middle Age*, were those who from attending causes in the court of the count, or count of the province, became judges themselves, and held courts of their vassals thrice a year, under the name of the *tria placita generalia*.

In consideration of this farther service, they had a particular allowance of one third part of all fines, or mulcts, imposed on defaulters, &c. which was called *tertia bannerum pars, tertius denarius, tertia pars compositionum, tertia pars*

legum, or emendarum, &c.; besides a proportion of diet for themselves and servants.

ADVOCATES, *matriular*, were the advocates of the mother or cathedral churches.

ADVOCATES, *military*, those appointed for the defence of the church, rather by arms and authority, than by pleading and eloquence.

These were introduced in the times of confusion, when every person was obliged to maintain their own property by force; bishops and abbots not being permitted to bear arms, and the scholastic or gown'd advocates being equally unacquainted with them, recourse was had to knights, noblemen, soldiers, or even to princes.

ADVOCATES, *nominative*, those appointed by a king, or pope. Sometimes the churches petitioned kings, &c. to appoint them an advocate; at other times this was done of their own accord. By some regulations, no person was capable of being elected advocate, unless he had an estate in land in the same county.

ADVOCATES, *regular*, those duly formed and qualified for their profession, by a proper course of study, the requisite oath, subscription, licence, &c.

ADVOCATES, *subordinate*, those appointed by other superiors, acting under them, and accountable to them.

There were divers reasons for the creation of these subordinate advocates: as, the superior quality of the principal advocate, his being detained in war, or being involved in other affairs; but chiefly the too great distance of some of the church lands, and their lying in the dominions of foreign princes.

ADVOCATES, *supreme, or sovereign*, were those who had the authority in chief, but acted by deputies, or subordinate advocates. These were also called principal, greater, and sometimes general advocates.—Such in many cases were kings, &c. when either they had been chosen advocates, or became such by being founders, or endowers of churches. Princes had also another title to advocateship, some of them pretending to be *advocati nati* of the churches within their dominions.

ADVOCATIA, in the *Feudal Law*, the procuration of some public business, committed by a superior to his substitute.

ADVOCATIA is also used for the patronage and protection of a church, college, monastery, and the like, in which sense it amounts to the same with ADVOWSON.

ADVOCATIA is also used for the protection and defence of lay persons, estates, &c.

ADVOCATION, ADVOCATIO, in the *Civil Law*, the act of calling another to our aid, relief, or defence.

ADVOCATION, *bill of*, in *Scots law*, a writing drawn up in the form of a petition; whereby a party, in an action before an inferior court, applies to the supreme court, or Court of Session, for calling the action from the inferior court before itself.

ADVOCATION, *letters of*, in *Scots law*, the decree or warrant of the Court of Session, upon cognizance of the facts set forth in the bill, drawn up in the form of a summons, and passing under the signet, discharging the inferior judge, and all others from farther procedure in the cause, and advocating it to itself.

The grounds upon which these letters may be sought, are incompetency, comprehending defect of jurisdiction, and reasons for declining competent jurisdiction, arising from suspicion of the judge, or privilege in the parties; and iniquity, which happens when the judge delays justice, or pronounces sentence contrary to law. No cause for a sum below twelve pounds can be advocated from an inferior court to the Court

of Session, unless the inferior judge be incompetent, in which case the cause may be removed from him by advocacy, however inconsiderable the subject.

If after letters of advocacy are intimated to the judge, he yet proceeds, his decree will be null, as given *spreto mandato*. Mackenzie, Inst.

ADVOCATIONE Decimarum, a writ which lies for the claim of the fourth part, or upwards, of the tithes that belong to any church. Reg. Orig. 29.

ADVOCATURA, in *Writers of the Middle and Barbarous Age*, denotes an inferior kind of jurisdiction, exercised by advocates within the districts of their respective churches, &c. The word is sometimes used as synonymous with **ADVOCATIA**. Du-Cange.

ADVOWEE, in *Ancient Customs*, and *Law Books*, denotes the advocate of a church, religious house, or the like.

The word is otherwise written *avowee*, *advowee*, and *avowee*; sometimes *advouer*; being derived from *avouer*, to own, or acknowledge.

There are advowees of cathedrals, abbeys, monasteries, &c. Thus Charlemagne had the title of advowee of St. Peter's, and he is said to have been the first on whom this title of advowee was conferred by the pope, for having protected Italy and the church against the Lombards; king Hugh, of St. Riquier; and Bolandus mentions some letters of pope Nicholas, for which he constituted king Edward the Confessor, and his successors, advowees of the monastery at Westminster, and of all the churches in England.

These advowees were the guardians, protectors, and administrators of the temporal concerns of the churches, &c. and under their authority were passed all contracts which related to them.

It appears also, from the most ancient charters, that the donations made to churches were conferred on the persons of the advowees. They always pleaded the causes of the churches in court, and distributed justice for them, in the places under their jurisdiction. They also commanded the forces furnished by their monasteries, &c. for the war; and even were their champions, and sometimes maintained duels for them.

This office is said to have been first introduced in the fourth century, in the time of Stillicio; though the Benedictines do not fix its origin before the eighth century.

By degrees, men of the first rank were brought into it, as it was found necessary, either to defend with arms, or to protect with power and authority. In some monasteries they were only called *conservators*; but these without the name had all the functions of advowees. The imperial advowee was a magistrate formerly established by the emperors to administer justice, in their name, in the cities of the empire.

There were also sometimes several *sub-advowees*, or sub-advocates, in each monastery, who officiated instead of the advowees themselves; which, however, proved the ruin of monasteries; those inferior officers running into great abuses.

Hence also, husbands, tutors, and every person in general, who took upon him the defence of another, were denominated advowees, or advocates. Hence several cities had their advowees; which were established long after the ecclesiastical ones, and doubtless from their example. Thus, we read in history of the advowees of Augsburg, of Arras, &c.

The **VIDAMES** assumed the quality of advowees; and hence it is, that several historians of the eighth century confounded the two functions together.

Hence also it is, that several secular lords in Germany bear mitres for their crests, as having anciently been advowees of the great churches.

Spelman distinguishes two kinds of ecclesiastical advowees.—The one, of causes, or processes, *advocati causarum*; the other, of territory, or lands, *advocati soli*.

The former were nominated by the king, and were usually lawyers, who undertook to plead the causes of the monasteries.

The other, which still subsist, and are sometimes called by their primitive name, advowees, though more usually **PATRONS**, were hereditary; as being the founders and endowors of churches, &c. or their heirs.

Women were sometimes advowees, *advocatiffæ*. And, in effect, the canon law mentions some who had this title, and who had the same right of presentations, &c. in their churches, which the advowees themselves had.

In a stat. 25 Ed. III. we meet with *advowee paramount*, for the highest patron; that is, the king.

There are also advowees of countries and provinces.—In a charter of the year 1187, Berthold duke of Zeringhen is called advowee of Thuringia; and in the Notitia of the Belgic churches, published by Miræus, the count of Louvain is styled count and advowee of Brabant. In the 11th and 12th centuries we also meet with the advowees of Alsatia, of Suabia, &c.

ADVOWING, or **AVOWING**, **ADVOCARE**, in *Law*, see **AVOWRY**.

ADVOWSON. See **ADVOCATIA**.

ADVOWSON, or **ADVOWZEN**, in *Common Law*, signifies a right to present to a vacant benefice.

Advowson is so called, because the right of presenting to the church was first gained by such as were founders, benefactors, or maintainers of the church, viz. *ratione fundationis*, as where the ancestor was founder of the church; or *ratione donationis*, where he endowed the church; or *ratione fundi*, as where he gave the soil whereupon the church was built: and therefore they were called *advocati*. They were also called *patroni*, and thereupon the advowson is called *jus patronatus*; and he who has the right of advowson is called the patron of the church. An advowson is, strictly speaking, an incorporeal hereditament: for it is not itself the bodily possession of the church and its appendages, but a right of giving to some other person a title to such bodily possession. The patronage can only be conveyed by operation of law, by verbal grant, either oral or written, which is a kind of invisible, mental transfer; and being so vested it lies dormant and unnoticed, till occasion call it forth: when it produces a visible, corporeal fruit, by entitling some clerk, whom the patron shall please to nominate, to enter and receive bodily possession of the lands and tenements of the church. 1 Inst. 119. Fleta, lib. v. cap. 14.

Though the nomination of fit persons to officiate in every diocese was originally in the bishop, yet they were content to let the founders of churches have the nomination of the persons to the churches so founded, reserving to themselves a right to judge of the fitness of the persons so nominated. Gibb. ii. ed. 756.

Advowsons are of two kinds. 1. *Advowson in gross*, or a right subsisting in itself, belonging to a person, and not adhering to any manor or lands as parcels thereof. 2. *Advowson appendant*, which depends on a manor, as appurtenant to it. This will pass, or be conveyed, together with the manor, as incident and appendant thereto, by a grant of the manor only, without adding any other words.

Advowsons formerly were most of them appendant to manors, and the patrons were parochial barons: the lordship of the manor, and patronage of the church, were seldom in different hands, until advowsons were given to religious

houses. But of late times the lordship of the manor, and advowson of the church, have been divided.

Advowsons are also *presentative, collative, or donative: presentative*, where the patron presents or offers his clerk to the bishop of the diocese, to be instituted in his church, if he be found canonically qualified: *collative*, where the benefice is given by the bishop, as original patron thereof, or by means of a right he has acquired by *lapse*, in which case the bishop cannot present to himself; but he does by the one act of collation or conferring the benefice, the whole that is done in common cases, by both presentation and institution; *donative*, as where the king, or any subject by his licence, founds a church or chapel, and ordains that it shall be merely in the gift or disposal of the patron, subject to his visitation only, and not to that of the ordinary, and vested absolutely in the clerk by the patron's deed of donation without presentation, institution, or induction. This is said to have been anciently the only way of conferring ecclesiastical benefices in England. See INSTITUTION. If, as the law now stands, the true patron *once* waives this privilege of donation, and presents to the bishop, and his clerk is admitted and instituted, the advowson is now become for ever *presentative*, and shall never be *donative* any more.

Sometimes, anciently, the patron had the sole nomination of the prelate, abbot, or prior; either by investiture (i. e. delivery of a pastoral staff,) or by direct presentation to the diocesan; and if a free election was left to the religious, yet a *conge d'elire*, or licence of election, was first to be obtained of the patron, and the person elected was confirmed by him.

If the founder's family became extinct, the patronage of the convent went to the lord of the manor. Unless the several colleges in the universities be restrained in the number of advowsons they may receive; it is argued they will in time acquire such a stock as to frustrate the design of their foundation, (which is the education of youth), by creating too quick a succession of fellows; so that there will not be in the colleges a sufficient number of persons of competent age, knowledge, and experience to instruct and form the minds of the youth. In some colleges the number of advowsons is said to be already two-thirds, or more, of the number of fellows. It is objected, on the other side, that the succession of fellows may be too slow, as well as too quick; whereby persons well qualified may be detained so long in colleges, as not to have strength or activity enough left for the discharge of parochial functions.

Colleges holding more advowsons in number than a moiety of the fellows, are not capable of purchasing more. Grants of advowsons by papists are void. 9 Geo. II. c. 36. § 5. 11 Geo. II. c. 17. § 5.

Advowsons are temporal inheritances, and lay fees; they may be granted by deed or will, and are assets in the hands of heirs or executors. The recovery of advowsons, as temporal rights, was effectually provided for by one of the excellent regulations of Edward I. Before his time the law, in this respect, was extremely deficient.

Presentations to advowsons, for money or other reward, are void. 13 Eliz. cap. 6. See Burn's Eccl. Law, vol. i.

Advowson of the *Moiety of the Church*, is where there are two several patrons and two several incumbents in the same church, the one of the one moiety and the other of the other moiety. A moiety of the advowson is where two must join in the presentation and there is but one incumbent. See Stat. 7 Anne c. 18. In Scotland the right of advowson is called *PATRONAGE*.

ADVOWTRY. See ADULTERY.

ADUR, in *Geography*, a river of Suffex that falls into the sea at Shoreham, and admits ships of burden to go up to the town.

ADUST, ADUSTUS, formed of *adurere, to burn*, among *Physicians*, &c. is applied to such humours, as by long heat become of a hot and fiery nature.

Such is cholera supposed to be. Melancholy is usually considered as black and adust bile.

Blood is said to be adust, when, by reason of some extraordinary heat, its more subtle parts are all evaporated, leaving the grosser, with all the impurities therein, half torried.

ADUSTION, in *Surgery*, is the same as *Cauterisation*, and signifies the application of any substance to the animal body, which acts like fire. See CAUTERY and CAUSTIC. The ancient surgeons, especially the Arabians, were remarkably fond of having recourse to adustion in local diseases; but the use of actual heat is very rarely admitted by the moderns. See MOXA.

ADUSTION, among *Physicians*, is used for an inflammation of the parts about the brain, and its membranes, attended with a hollowness of the *sciniput* and eyes, a pale colour, and dryness of the body; in which case the yolk of an egg, with oil of roses, applied by way of cataplasm is recommended; as are the leaves of turnsol, the parings of a gourd, the pulp of a pompon, applied in the same manner with oil of roses.

ADY, in *Natural History*, a name given to the palm-tree of the island of St. Thomas. It is a tall tree with a thick, bare, upright stem, growing single on its root, of a thin light timber, and full of juice. The head of this tree shoots into a vast number of branches, which being cut off, or an incision being made therein, afford a great quantity of sweet juice, which, fermenting, supplies the place of wine, among the Indians.

The fruit of this tree is called by the Portuguese *caryocera*, and *carioffee*; and by the black natives ABANGA. This fruit is of the size and shape of a lemon, and contains a kernel, which is good to eat. The fruit itself is cat roasted, and the raw kernels are often mixed with mandioc meal. These kernels are supposed very cordial. An oil is also prepared from the fruit, which answers the purpose of oil, or butter, in Europe.

This oil is also used for anointing stiff and contracted parts of the body. Ray.

ADYLISUS, in *Ancient Geography*, a mountain which Pliny places in Bœotia.

ADYNAMIA, in *Medicine*, formed of the primitive α , and *δυναμις, strength*, debility or weakness from sickness. Accordingly *Adynamia*, denote those affections of the human body which form the second order of the second class in the arrangement of Dr. Cullen, and which he defines to be a diminution of the involuntary motions, whether vital or natural. This is a distinct class in the distribution of Vogel. It comprehends the genera of *syncope, dyspepsia, hypochondriasis, and chlorosis*. Some naturalists place these under *debilitates*, and Linnæus calls them *quietales*. See NOSOLOGY.

ADYNAMON, among *Ancient Physicians*, a kind of weak factitious wine, prepared from must boiled down with water; to be given to patients, to whom genuine wine might be hurtful.

ADYRMACHIDÆ, or ADYRMACHITÆ, in *Ancient Geography*, a people of Libya, inhabiting the sea-coast, near the Canopic mouth of the Nile. Herodotus (l. iv. c. 168.) describes them as resembling the Egyptians in their customs and manners, Silius Italicus refers to them, lib. iii. v. 278. p. 149. Ed. Drakenb.

“Versicolor contra cætra, et falcatus ab arte
Ensis Adymachidis, ac lævo tegmina cruce.”

ADYTUM, a secret or retired place in the Pagan temples, where oracles were given, and into which none but the priests were admitted. Thus Seneca in his tragedy of Thyestes (iv. l. 679.)

“—————Hinc orantibus
Responsa dantur certa, cum ingenti sono
Laxantur adyto fata.”

The word originally signifies inaccessible; being compounded of *α*, not, and *δυω*, or *δωω*, to enter.

The *Sanctum Sanctorum*, or *Holy of Holies*, of the temple of Solomon was of the nature of the Pagan *adytum*, none but the high-priest being admitted into it, and he but once a year, on the great day of expiation. After the Babylonish captivity this place wanted the ark, the mercy-seat, the shechinah of the divine presence, and the Urim and Thummim; the defect of these causing an imperfection in the Jewish worship, compared with the former state of it, a restoration of them is devoutly supplicated in the Jewish liturgy; particularly in the most solemn part of it which they call *Shemoneh Eshreh*, or the *eighteen prayers*.

ADZE, or ADDICE, a cutting tool, of the axe kind; having its blade made thin, and arching, and its edge at right angles to the handle; chiefly used for taking thin chips off timber or boards, and for paring away certain irregularities which the axe cannot come at.

The adze is used by carpenters, but more by coopers, as being convenient for cutting the hollow sides of boards, &c. It is ground from a beak on its inside to its outer edge; so that when it is blunt they cannot conveniently grind it, without taking its helve out of the eye.

ADZEL, in *Geography*, a mean place in the government of Riga, subject to Russia. N. lat. 56°. 30'. E. long. 38° 5'.

ADZENETA, a small town of Valencia, in Spain, seated on the mountain *Pegna Golosa*, in which grow multitudes of excellent plants. N. lat. 40°. 30'. W. long. 0°. 16'.

ADZUD, a town of Moldavia in European Turkey, nine miles west-south-west of Birlat.

ÆE, or Æ, a diphthong, or double vowel, compounded of A and E.

Authors are by no means agreed as to the use of the æ in English words.—Some out of regard to *etymology*, insist on its being retained in all words, particularly technical ones, borrowed from the Greek and Latin; while others, from a consideration that it is no proper diphthong in our language, its sound being no other than that of the simple *e*, contend that it ought to be entirely disused; and, in fact, the simple *e* has of late been adopted instead of the Roman æ; as in the word *equator*, &c.

ÆA, in *Ancient Geography*, a considerable and celebrated city and port of Colchis, near the river Phasis, and distant from the sea, according to Pliny, (H. N. l. vi. c. 4. t. i. p. 304.) 15 miles, but according to Stephanus (de Urb. p. 30.) more than 37 miles. It was encompassed by the rivers Hippos, so called from its rapidity, and Cyaneos, so denominated from its colour, near their confluence in the Phasis, and thus formed into a kind of peninsula. Some have conjectured that it was the same with the *Æapolis* of Ptolemy; and that it derived its name either from the Greek *αια*, earth, or from the Hebrew *אֵי*, island. The Circe obtained the appellation of *Ææa* from this city. See Homer's *Odyss.* l. ix. v. 32. and Virgil l. iii. v. 386. It is also repeatedly mentioned by Apollonius Rhodius, as a place to which the river was navigable. *Argonautic* l. ii. v. 424.—1096. pp. 188. 250. Ed. Hoelzlin. Ovid likewise (in

his *Metam.* l. vii. v. 9. tom. ii. p. 446. Ed. Burman.) speaks of the

“—————Validos Æætiæ ignes.”

Tradition ascribes its origin to the famous Sesostris, king of Egypt, who, after having traversed the whole of Asia with his army, left a colony in Colchis, and there created pillars of stone upon which were engraven, according to Apollonius, the names and position of the countries through which he had passed. Pliny and Strabo also represent it as the abode of king Ææta, and the theatre of the adventures of his daughter Medea. It had a temple dedicated to the god Mars, and another to Phryxus. It was anciently famous for its gold and silver, and other metals, which might have given occasion to the Argonautic expedition, first by Phryxus and afterwards by Jason. Strabo. *Geog.* tom. i. p. 38. &c. It is now *Lippopotamo*.

There was another town called Ææa, in Thessaly; and a fountain of this name in Macedonia.

ÆÆA, the name of an island, which Mela (l. ii. c. 7.) supposes to have been situated in the bay of Sicily, and to have been the habitation of Calypso. But he has probably confounded the name of this island with that of Ææa above mentioned; as both the island of Calypso, or Ogygia, and that of Circe, or Ææa, are far distant from the coast of Sicily.

ÆACEA, in *Antiquity*, solemn feasts and combats, celebrated in Ægina, in honour of Ææcus, who had been their king, and who, on account of his singular justice upon earth, was supposed to have a commission given him to be a prince or judge, whose office it was to preside over Elysiun, or the region of bliss. This Ææcus, it is said, was the son of Jupiter and Ægina; and when his country was depopulated by a plague, he is reported to have obtained of Jupiter a supply of inhabitants, who, at his request, converted ants into men; whence they were called Myrmidons, from *μυρμικῆς*, ants. The meaning of the fable seems to be that he drew them out of their caves into which they had retired for security, when they were invaded by pirates, and encouraged them to apply to agriculture and commerce; so that by their industry they recovered what they had lost.—See ÆGINA.

ÆACUS, in *Entomology*, a species of the SPHINX, having six yellow points on the fore wings, and the latter yellow, with the margin of an azure colour. It is found in Austria.

ÆAMENE, in *Ancient Geography*, a country of the Nabathæans, in Arabia.

ÆANA, a city of Macedonia, founded by Æænus, son of Elymus, king of the Tyrrhenians, who, leaving his own country, inhabited Macedonia.

ÆANIS, a fountain of Locris, situated in the sacred grove called *Ææneius lucus*, so called, according to Strabo, from a Greek named Æænes, who was killed there by Patroclus.

ÆANITIS, a country of the Nabathæans.

ÆANTIDES, a tribe of Attica, which comprehended six different people, viz. those of Marathon, Ænone, Paphidæ, Rhannus, Titacidæ and Tricorythus.

ÆANTIUM, or AJACIUM, a small place in Asia, upon a promontory north-west of *Rhatheum*. Here, it is said, Ajax was buried. His statue found in this place, was taken away by Marc Antony, and restored by Augustus.

ÆANTIUM was also a town and promontory of Thessaly, in the extremity of the peninsula, which contained Magnesia, opposite to Thebes of Thessaly, and at the entrance of the Pelagic gulph.

ÆAS, a river of Greece, which sprang from Mount Pindus, and flowed into the Adriatic sea, about 10 stadia from the city of Apollonia. This is supposed to have been the same with the river *Aour*. Strabo. tom. i. p. 486.

ÆAS, or AIAS, a mountain of Egypt upon the Red Sea.
 ÆBUDÆ, a name given by ancient Geographers to the Western isles of Scotland.

ÆBURA, a town of Spain near the Tagus, in the province of Castile; now *Talavera la Reyna*.

ÆCÆ, a town of Italy, in Magna Græcia.

ÆCCANI, a people of Tuscany, near the city, formerly called Æcas, to the South of Luceria, and now Troja. Min. H. N. tom. i. p. 168.

ÆCHILENSIS, a people, who lived, according to Ptolemy, in the northern parts of Sardinia.

ÆCHMALOTARCHA, in *Antiquity*, a Greek term, signifying the chief or leader of the Jewish captives in Babylon. The Jews who refused to follow Zerubbabel, and return with him to Jerusalem, after the Babylonish captivity, created an Æchmalotarch to govern them. The Jews, indeed, did not call him by this name, as some authors have asserted, for that people spoke Hebrew, or Chaldee, and not Greek. But Origen, and others who wrote in the Greek tongue, rendered the Hebrew name ראש גלות *rash galuth*, q. d. *chief of the captivity*, by a Greek name of the like import, ἀρχιμαλωτάρχος, formed from ἀρχιμαλωτος, *captivity of arms, spear or war*, and ἀρχων, *commander or chief*. However, the Jews seem to have had officers of this kind before the return from Babylon, as we may infer from the history of Susannah; the two elders who condemned her being supposed to have been Æchmalotarchæ that year. The Jewish writers assure us that the Æchmalotarchæ were only to be chosen out of the tribe of Judah.

The eastern Jews had their *princes of the Captivity*, as the western Jews had their patriarchs. The Jews are said still to have an æchmalotarcha at Babylon, but without the authority of the ancient ones. One person of this description, selected from the house of David, was formerly acknowledged and honoured as a prince among the Jews, and had some sort of jurisdiction, as far as it was consistent with the government to which they were subject; and it was sometimes allowed and ratified by the reigning princes. But if such an officer now exist at Babylon or elsewhere, he is merely the head of the sect in that place, without sword or sceptre, or any power of coercion, or authority of jurisdiction, besides what he derives from the voluntary submission of the Jews, who inhabit such places. Nothing, therefore, can be more vain than the pretence of the Jews, that by this æchmalotarcha, the sceptre and law-giver are preserved in the tribe of Judah; and that the prophecy of Jacob (Gen. xlix. 10.) is not yet fulfilled by the advent of the Messiah. Basnage's Hist. Jews. Prideaux's Conn. vol. i. p. 153. vol. ii. p. 934.

ÆCIDIDIUM, in *Botany*, a genus of the *cryptogamia fungi* class and order; its characters are, that it has a membranaceous sheath, smooth on both sides, and full of naked separate seeds. Gmelin enumerates 18 species, some of which belong to the LYCOPERDON of other authors. Several of these are found on the leaves of other plants; and one of them is known to agriculturists by the name of the *Red Gum*. This species usually grows upon the inside of the glumes of the ealyx, and of the exterior valvule of the corolla, under their epidermis; which, when the plant is ripe, bursts, and emits a powder of a bright orange colour. This little plant, says an ingenious observer, (Linnæan Transf. vol. v. p. 122) does not appear to be materially injurious to the grain, if at all. He has seen ears full of it, with very plump kernels; and has also found it upon branched ears. Before the cuticle, which covers the seed of this fungus, bursts, it has very much the appearance of a pustule upon the human body. Other species grow on decaying wood and mosses, and in the leaves of tussilago farfara and petasites, *Bartisia viscosa*, *Age-*

mone nemorosa, *Adoxa moschatellina*, *Carduus arvensis*, and *Betonica officinalis*, &c.

ÆCLUS, in *Entomology*, a species of PAPHILIO, with the wings black above, cinereous beneath, waved with black, and with a yellow ocellated spot. It is found in Amboyna.

ÆCULANUM, or ÆCLANUM, in *Ancient Geography*, a town of the Hirpini in Italy, situate between Beneventum and Tarentum. The inhabitants are called by Pliny (tom. i. p. 167.) Æclani, and in an ancient inscription of Gruter Æclanenses. The town, according to Cluverius, is now called *Fricento*.

ÆDEA, in *Entomology*, a species of PAPHILIO, with wings spotted with white, the anterior greenish, the posterior marked with a yellow band; found in South America.

ÆDELITE. See ZEOLITE.

ÆDEPSI *Therma*, baths of Ædepsus, in *Ancient Geography*, the name of a city in the island of Eubœa upon the western coast. The baths were consecrated to Hercules.

ÆDES, in *Antiquity*, a chapel, or inferior kind of temple, distinguished by this, that it was not consecrated by the Augurs, as those properly called TEMPLES were. Such was the ærarium, or treasury; called *Æles Saturni*.

ÆDESIUS, in *Biography*, the disciple and successor of Jamblichus, lived in Cappadocia, and, after the example of his master, pretended to supernatural communications with the Deity, and practised theurgic arts. Of the events that occurred to him the most ludicrous is this: viz. That, in answer to his prayers, his future fate was revealed to him in hexameter verses, which suddenly appeared upon the palm of his left hand. Towards the close of his life, he committed his school at Cappadocia to the care of his disciple and friend Eustathius, and removed to Pergamus, where he had a numerous train of followers. Brucker's Hist. Phil. by Enfield, vol. ii. p. 75.

ÆDICULA, in *Antiquity*, a term, denoting the inner part of the ædes or temple, in which the altar and statue of the deity were placed; but the term had various acceptations. It sometimes denoted a low small building, or ædes parva, consecrated to some divinity: it often signified a niche in the wall for receiving a statue, and those especially of the Lares or Penates; and sometimes the representations of temples, which were offered and suspended in the temples of the gods, and more especially in that of Diana of Ephesus.

ÆDICULUS, in *Roman Mythology*, the deity who presided over the construction and conservation of buildings.

ÆDILATE, in *Antiquity*, the dignity or magistracy of the Roman ÆDILES. This is otherwise called *Ædilitas*. In inscriptions we find it represented by the abbreviature. ÆD.

ÆDILE, ÆDILIS, in *Antiquity*, a Roman magistrate, vested with divers functions, chiefly that of superintending the buildings both public and private; as baths, aqueducts, roads, bridges, causeways, &c. The word is formed of *ædes*, *temple*, or *house*, on account of their having the care of temples, houses, &c.

The ædiles at Rome corresponded to what the Greeks called *ageranomi*, and *asynomi*; they differed from *oecnomi* and *arcarii*, who were rather receivers of the revenues; also from *logista*, *curatores* & *paires civitatis*.

To the ædiles belonged the inspection of the weights and measures. They fixed the rate of provisions, and took care the people suffered no exactions. The inquiry and cognizance of debauchees, and disorders in public houses, likewise belonged to them: they were also to revise comedies; and it belonged to them to treat the people with grand games and spectacles, at their own expence. They were likewise to attend on the tribunes of the people.

To the ædiles also belonged the custody of the plebeita, and the censure and examination of books. They had the power,

power, on certain occasions, of issuing edicts; and, by degrees, they procured to themselves a considerable jurisdiction, the cognizance of various causes, &c.—This office ruined numbers by its expensiveness; so that in Augustus's time, even many senators declined it, on that account.

All these functions, which rendered the ædiles so considerable, belonged at first to the ædiles of the people, *ædiles plebei*, or *minores*: these were only two in number, and were first created in the same year as the tribunes: for the tribunes, finding themselves oppressed with the multiplicity of affairs, demanded of the senate to have officers, with whom they might intrust matters of less importance, and accordingly two ædiles were created: and hence it was, that the ædiles were elected every year, at the same assembly as the tribunes. These plebeian ædiles continued in the sole possession of the office during the space of 127 years, from the year of Rome 261, when they were appointed, to the year 388. But these ædiles having refused to celebrate the great games, on occasion of the reconciliation that took place between the senate and people in consequence of the grant that one of their order should be consul, because the celebration was attended with an expence which they were unable to support, the Patricians offered to undertake the charge, upon condition that they should obtain the honours of the ædileship. Their offer was accepted with gratitude; and the senate passed a decree for the election of two ædiles annually out of the order of the patricians. From this time there were two kinds of ædiles at Rome; the one were called *Plebeian Ædiles*; the other were called *Ædiles Curules*, or *Majores*, i. e. *Curule Ædiles*, because they had the right of sitting in a *CURULE* chair, adorned with ivory, when they gave audience; whereas the plebeian ædiles sat on benches: and this chair was placed in the chariot in which they were carried; a distinction annexed to the great offices of the commonwealth.

It is not easy to describe exactly the different functions of these two kinds of ædiles. It is probable, however, that the curule ædiles shared all the ordinary functions with the plebeian; but their principal and distinguishing office pertained, according to Cicero, in the last of his orations against Verres, (*Oper. t. 4. p. 524. Ed. Olivet*) to their presiding in the games celebrated in honour of different divinities, to the care of the sacred edifices, and to the civil government of Rome in general. They were also appointed judges in all cases relating to the selling or exchanging of estates. The distinctions which these ædiles enjoyed were the right of giving their opinion in the senate, not according to the date of their admission into that body, but a more honourable rank, the robe called *toga prætexta*, the curule chair, and the right of having images, which were set up in their halls and carried in pomp at their funerals; all of which were privileges that were annexed to the great offices of state.

The first curule dignity held at Rome was the ædileship, and the age for entering into that office was 37. In two years it was succeeded by the prætorship, and after the like interval, by the office of consul. The manner in which the office of ædile was sustained, and particularly in the exhibition of games, very much contributed either to gain or alienate the attachment of the people with respect to the other dignities. The expence attending the games and shews was, in some cases, enormous. Cicero was moderate, as he informs us in his *Offices*, l. 2. apud *oper. tom. 3. p. 353. Ed. Olivet*. But the expences of others in that department of their office which respected the games were so exorbitant, as to give Livy reason for observing, that the revenues of the most opulent princes would hardly suffice to support them. Of

this fact we have a memorable example in the ædileship of M. Scæurus, in the 694th year of Rome; so that Pliny, (l. 36. c. 15.) from the almost incredible profusion which this ædile bestowed upon the theatre which he erected, took occasion to exclaim, that the ædileship of Scæurus finally ruined and subverted the manners of the public.

Augustus transferred the care of the public shews and sports to the prætors, and would not allow them to be exhibited at their own charge; but obliged the people to contribute a part, and paid the rest out of the public treasury.

To ease these four first ædiles Cæsar created a new kind, called ædiles cereales, as being deputed chiefly to take care of the corn, which was called *donum Ceresis*; for the heathens honoured Ceres as the goddess who presided over corn, and attributed to her the invention of agriculture. These ædiles cereales were also taken out of the order of patricians. In the municipal cities there were ædiles, with the same authority as at Rome.

We also read of an *ædilis alimentarius*, expressed in abbreviation by *Ædil. alim.* whose business seems to have been to provide diet for those who were maintained at the public charge, though others assign him a different office.

In ancient inscriptions we also meet with ædiles of the camp, *ædilis castrorum*.

ÆDILIS, in *Entomology*, a species of the *CERAMBYX* with a spinose thorax, marked with four yellow spots, with obtuse nebulous elytra and very long antennæ. It is found in the trunks of trees in Europe; and is also called *Capricornus Rufficus*.

ÆDILITIUM edictum, among the Romans, was that whereby a remedy was given a buyer, in case a vicious, or unsound beast, or slave, was sold him. It was called *ædilitium*, because the preventing frauds in sales and contracts belonged especially to the curule ædiles.

ÆDITUUS, in *Antiquity*, the keeper of a sacred mansion, who had the care of the offerings and ornaments of the deity to whom it was peculiarly devoted.

The word is compounded of *ædes*, and *tuor*, *I defend*, q. d. *à tuendis ædibus*; originally it was written *æditimus*.

The *æditui* is the same with what Scævola calls *hierophylax*, the Latins sometimes *ædilis*, and the Greeks *ἱεροφύλαξ*, answering to the sexton among us.

The *æditui*, among the Romans, were officers of distinction, being the depositaries not only of the treasure, but of the public acts, or records.—The *æditui* had their several cells, near the temples, the custody of which was committed to them. *Struv. Ant. Rom.*

The female deities had a female officer of the same kind, under the denomination *æditua*.

ÆDITUUS, MARTIN, in *Biography*, born at Amsterdam, was first physician to Frederic II. king of Denmark. Adrien Jonghe, dedicated his treatise “*De Coma*” to him, published at Basle in 1558, whence it appears that he was then in high repute.

ÆDOIÀ, the same as *PUDENDA*.

ÆDON, in *Ancient Geography*, an island of Marmarica, on the borders of Egypt.

ÆDON, in *Ornithology*, a species of *MUSCICAPA*.

ÆDUI, in *Ancient History*, a denomination given to the most ancient and powerful people of Gaul, who were situated between the rivers Seine, Loire and Saone, within the 46th and 47½th degree of latitude; and who were the only allies Cæsar had at the time of his invading Gaul.

Their country was fruitful, and furnished abundance of corn. Their principal city was Bibracte or Augustodunum, now Autun. The form of their government was aristocratic; and they chose their chief magistrate annually.

This government only lasted till the establishment of the Romans in Gaul. The Ædui then occupied the countries comprehended in the dioceses of Autun, Chalons, Maçon, and part of that of Dijon. Their allies and their subjects comprehended the rest of La Bourgogne, La Bresse, Le Lyonnais, Le Beaujolois, Le Forez, Le Bourbonnois, and Le Nivernois.

ÆDUSII, allies of the Romans, bordering upon Celtic Gaul.

ÆGA, in *Ancient Geography*, a river of Phocis:—a town of Æmonia:—an island between Tenedos and Chios:—and a promontory of Asia Minor in Æolis.

ÆGADES, ÆGADIS, or ÆGUSÆ *Insulæ*, three islands lying north of Cape Lilybæum, or on the west side of Sicily opposite to the main land between Marsella and Trapani; viz. Phorbantia, or Buccina, as Pliny calls it, Ægusa or Capraria, and Hiera, called also Maritima. The first is now called Lavenzo, the second Favignana, which is very fruitful, and the third Maretamo. In these islands the Romans under the Consul L. Catulus obtained a signal victory over the Carthaginians, which terminated the first Punic war.

ÆGÆ, or ÆGÆAN, is derived, as some have supposed, from the genitive *Αἴγος*; of *Αἴξ*, a goat. See ÆGEA. But several ingenious moderns, and particularly the Abbé Berquier and M. Gobelin, tracing the origin of the name to its primitive roots *ag*, *aig*, have found that these words, in the Pelasgic and Celtic languages, denote waters or maritime countries; and they have concluded, that the appellation Ægæ is derived from the vicinity of the places to which it is applied to waters, or from their being better adapted to maritime commerce than other places. Accordingly they add, that Neptune was particularly honoured in the Ægean cities.

ÆGÆ was a city of Cilicia on a promontory in the gulf of Ifficus, having Issus to the north-east, and Mallos to the north-west;—it was also a town of Macedonia, called ÆGEA and EDESSA:—a town of the Thracian Chersonesus, probably ÆGOS *Potamos*:—a town in the Myrrhina, a country of Æolis, south of Cuma and east of Phocæa, on the border of the gulf, which town, as Tacitus informs us, was overwhelmed by an earthquake:—a town of Lydia:—another of Locris:—another of Ætolia:—another of the island of Eubœa, where they had a temple of Neptune:—and another of Achaia, on the gulf of Corinth, at the mouth of the river Crathis, (see Homer II. l. viii. v. 208.) In Ægæ of Cilicia there were medals of gold, bronze, and silver. The symbol was half a horse; and rich imperial medals were struck here in honour of several of the Roman emperors. In Ægæ of Macedonia, the medals were silver, gold, and bronze; and the common type was a goat. In Ægæ of Æolia, which was governed by prætors, there were struck Greek imperial medals in honour of some of the Roman emperors.

ÆGÆUS, the name of a river, mentioned by Suidas, in the island of Corcyra. Stephanus Byzantinus, and Eustathius speak of a canton in Phocis, under the name of Campus Ægæus, (*πεδῖον αἰγῶν*) taken from a river Ægas which runs there.

ÆGAGROPILA or ÆGAGROPILUS, in *Natural History*, and in *Veterinary Medicine*, is a ball generated in the stomachs of some animals. There are two species of intestinal collections that have this appellation, but which are entirely dissimilar. The one is composed of hair, and is very usually found in the stomach of the rupicapra, or chamois goat. The other species is truly a calculous concretion, which is found more frequently in the intestines of

different animals, particularly of horses. It is this kind that is sometimes called bezoar Germanicum, or the *German Bezoar*. The word is Greek, from *αιγαγορος*, the rupicapra or rock goat; and *πῖλος*, a ball. See BALLS, and HAIR-Balls.

ÆGAGROPILA, in *Botany*, a species of *CONPERVA*, with very ramose filaments closely united from the centre, and constituting a globe.

ÆGAGRUS, in *Zoology*. See GOAT and IBEX.

ÆGALEUS Mons, in *Ancient Geography*, a mountain of Attica, near the isle of Salamine:—a mountain also of Messenia bears the same name.

ÆGARA, a town of Lydia, according to Ptolemy.

ÆGAS, a river of Phocis.

ÆGEA, a town of Mauritania Cæsariensis, according to Ptolemy, who places it in long. 26°, and lat. 27° 10'.

ÆGEA or EDESSA, now *Vodena*, was the ancient capital of Macedonia, the residence of Caranus, the first king of Macedon, and the burial-place of the kings of his line to the time of Alexander the Great. It derived its appellation, as it is pretended, from the following circumstance. Caranus, who was by birth an Argive, leaving his native country at the head of a considerable body of Greeks, was undetermined where they should settle. But upon consulting the oracle, he was instructed to establish his empire according to the direction of the goats. Ignorant of its meaning, he pursued his course to the country, afterwards called Macedonia, and approached Edessa the capital of the small kingdom Æmathia, governed by king Midas. The sky was overcast, and a storm succeeded; upon which Caranus observed a herd of goats running for shelter into the city. This circumstance reminded him of the response of the oracle; and, commanding his men to follow him, he entered the city by surprise, and thus possessed himself of it and of the whole kingdom. In gratitude to his conductors he changed the name of the place into Ægea, and called his people Ægeates or Ægeadæ; and introduced a goat into his standard in commemoration of the event. In the book of Daniel, the he-goat is the symbol of Macedon. Pliny, l. iv. c. 10. tom. 1. p. 200. Ed. Hard. Mede's Works, B. iii. Comment. Apocal. p. 473.

ÆGEAN Sea, a name given by the ancients to that portion of the Mediterranean, which extends from the promontory of Sunium and the island of Crete, as far as the Hellespont. It is now the Archipelago, separating Europe from Asia, washing on one side Greece and Macedon, and on the other Caria, Ionia and Phrygia. The origin of the appellation Ægean has been variously assigned. Festus has recorded three etymologies; one that is derived from the numerous islands that are scattered over this sea, and which appear at a distance like a herd of goats; another, because the queen of the Amazons perished in it; and a third, because Ægeus the father of Theseus threw himself headlong into it. Vossius, however, and many other learned persons, are not satisfied with either of these etymologies; but conceive it to be derived from *αἴγες* Doricæ *fluctus*; and that the waves are denominated *αἴγες*, i. e. *goats*, on account of the leaping motion of these animals. See ÆGE.

The navigation of this sea, which abounds with islands to the number of 53, from Tenedos to Crete, according to the enumeration of ancient geographers, and which are comprehended under the two general denominations of CYCLADES and SPORADES, is both difficult and dangerous: whence proceeds the proverb, he sails on the Ægean sea, or *Αἰγῶν πλῆς*; applied to a person who engages in a hazardous undertaking. The Ægean sea is usually divided into seven parts, viz. 1. The sea of Crete, between that island

island and the Peloponnesus. 2. The Myrtoan sea, before Peloponnesus and Attica. 3. The sea of Greece, along the coast of Greece. 4. The sea of Macedonia, on the coasts of that kingdom and of Thrace. 5. The Ægean sea, properly so called, between Eubœa and Lemnos. 6. The Icarian sea, towards the island of Icarus. 7. The Carpathian sea and that of Rhodes, lying between this island and that of Crete. The principal rivers running into this sea are the ALIACMON, ERIGON, AXIUS, STRYMON and NESTUS. The Ægean sea was peculiarly favourable to commerce by means of the spacious bays that were formed by it on the Asian coast, of which the most remarkable were the STRYMONIC, SINGITIC, TORONIC and THERMÆAN.

ÆGEIS or ÆGIS, a tribe of Attica, so called from Ægeus the son of Pandion, contained 16 boroughs or towns.

ÆGELETHRON, in *Botany*, a name used by some authors for the common mercurialis, or English mercury, an eatable wild herb.

ÆGELI, in *Ancient Geography*, a people of Media in Asia, supposed by some to be the same with the Ægli mentioned by Herodotus.

ÆGELICA, a town of Macedonia, which, as Livy informs us, was surpris'd by Attalus.

ÆGEON, in *Entomology*, a species of SCARABÆUS, of a red colour, with the horn of the thorax short and incurved and bearded beneath; and that of the head recurved and subulate. It is found in South America and India.

ÆGEONIS Promontorium, a promontory of the Euxine Sea, at the mouth of the river Rhyndachus, or on the confines of Mysia and Bithynia.

ÆGERI, or EGERE, in *Geography*, a community of Switzerland, which forms with the town of Zug, and the community of Mensengen and Bar, the sovereignty of the canton of Zug. It is divided into two parishes; the higher Ægeri, where the council of the community is held, and lower Ægeri or Wilægeri near the lake Ægeri, which is a league in length and very deep, and abounds with fish. The river Loretz runs into it.

ÆGERIA, in *Entomology*, a species of PAPILO, with dentated brown wings, spotted with yellow, and with an ocellus on both sides of the anterior wings, and four ocelli on the upper side of the posterior wings, and four points under them. It is found on the grass in Europe.

ÆGESTA, a town of Sicily, called also SEGESTA. It is now *Barbara*.

ÆGETA, AGETA, or *Egeta*, a town of Upper Mœsia on the Danube, probably the *Eteta* of Ptolemy, is placed by M. d'Anville near Trajan's Bridge, south-west of Zernes.

ÆGEUS, in *Fabulous History*, was king of Athens, and father of Theseus. Minos king of Crete, having subdued the Athenians, in a war occasioned by their murder of his son, inflicted upon them this penalty; that they should annually send into Crete seven of the noblest of the Athenian youths to be devoured by the Minotaur. After three years Theseus was sent; the young prince killed the Minotaur; but having forgotten to change the black sails into white upon his return, according to the instructions given him by his father, Ægeus conceiving him to be dead, cast himself headlong into the sea, which, from this circumstance, says the fable, obtained the name of the Ægean sea. The Athenians decreed divine honours to Ægeus, and sacrificed to him as a marine deity, the adopted son of Neptune.

ÆGIACUS, or ÆΓΙΟΧΟΣ, in *Mythology*, a name given to Jupiter, on account of the goat Amalthea, by which he was suckled.

ÆGIÆ, in *Ancient Geography*, a town of Laconia, south-west of Crocea:—and a town also of Ætolia, which, according to Dioseorides, afforded saffron.

ÆGIALA, a name anciently given to ACHAIA propria, or the kingdom of SICYON, and derived from Ægialeus, the supposed founder and first monarch.

ÆGIALE, in *Mythology*, one of the three graces.

ÆGIALUS, in *Ancient Geography*, a small town of Asia Minor upon the Euxine, in the district belonging to the Heneti in Paphlagonia;—a place in Peloponnesus, between Sicyone and Buprasium:—a town of Thrace, near Strimon:—a town of Æthiopia, near the Nile:—a town in the island of Amorgos:—and a town of Sicyone, afterwards called Mecone. In Ægialus of the Peloponnesus, Greek imperial metals were struck under the authority of the archons, in honour of Caracalla and Domna.

ÆGIAS, among the *Ancient Greek Physicians*, denotes a white speck on the pupil of the eye, occasioning a dimness of sight, either arising from an excrementitious humour, or from the reliëts of the cicatricula of an ulcer on the part.

This is the same with what others write *ægi* and *æglia*.

ÆGICERAS, formed of *αἴξ*, a goat, and *κερας*, a horn, in *Botany*, a genus of the class and order of *pentandria monogynia*; the characters of which are, that the calyx is a one-leaved, bell-shaped, half-five-cleft, coriaceous, permanent perianthium; the corolla has five petals; the stamina are five filaments; the pistillum is an oblong germen with a single style; the pericarpium is a bowed, coriaceous, one-celled, one-valved capsule, gaping on the convex side; and the seed is single. There are two species; one, a native of the Molucca islands, the *rhizophora corniculata* of Linnæus; the other a native of Ceylon. Martyn.

ÆGICOREOS, in *Ancient Geography*, was one of the four first tribes of Attica.

ÆGIDA, the principal town on the north of the territory of Istria in Italy, situated in a small island, joined to the land by a bridge. Pliny has preserved the ancient name, and in an inscription of Gruter, it is called *Ægidis insula*. It was afterwards called Justinopolis, after the emperor Justinian; and it is now *Capo de Istria*. N. lat. 45° 50'. E. long. 14° 20'.

ÆGIDES, in *Surgery*, is a term employed by Hippocrates (Prædict. L. ii. ἀγιδος) to denote an opacity of the cornea, which intercepts the rays of light passing through the pupil. See ALBUGO, LEUCOMA, and OPHTHALMIA.

ÆGIDION, a name given to a *collyrium* for inflammations and defluxions of the eyes. It is also called *agopropopon*.

ÆGIDION Insula, in *Ancient Geography*, a name given by Arrian to an island in the Indian Sea.

ÆGIDIUS, PETRUS ALBIENSIS, in *Biography*, was deputed by Francis I. to visit the celebrated places in the East, and to learn their state. He was taken by pirates, but made his escape, and died of a surfeit in 1555, at the age of 65 years. His works are "Descriptio Bosphori Thraciæ," "Descriptio Urbis Constantinopolitanæ," "De Piscium Massiliensium nominibus Gallicis et Latinis," "De Elephanto." He likewise translated into Latin Theodoret's Commentary upon the twelve minor prophets, and Ælian's sixteen books of the history of animals.

ÆGIDIUS, surnamed *Atheniensis*, was a Greek physician and philosopher under the emperor Tiberius II, in the eighth century. He became a Benedictine, and wrote several tracts, of which the principal are those; "De Pulsibus et de Venenis." Being accidentally wounded by an

arrow, he would not suffer the wound to be dressed, that he might exercise his fortitude in bearing pain.

ÆGIDIUS de COLUMNA, a Roman monk of the Augustine order, was preceptor to the sons of Philip III. of France, and taught philosophy and theology in the university of Paris with so much reputation, that he was honoured with the appellation of "The most profound Doctor." After being advanced to the rich bishopric of Berri, he died in 1316; leaving behind him on his monument the character of "Lux in lucem reducens dubia;" *i. e.* the luminary that brought dark things to light; a character which his writings, on account of their profound and unfathomable obscurity, do not justify. Brucker's Hist. Philos. by Enfield, vol. ii. p. 379. His "Lucubrations on the Sentences of Lombard," were printed at Basil, in 1623. His work "On original Sin," in 4to. at Oxford, in 1479; and his "Quæstiones Metaphysicæ and Quodlibeticæ," at Venice in 1501.

ÆGIDIUS Corbolenfis, or Gilles de Corbeil, canon of Paris, was physician to Philip Augustus, king of France, and lived about the end of the twelfth century; "ex Salernitana Schola, Haller says, Medicus et Poeta." He wrote a treatise, "On Compound Medicines," in Latin verse, which has not been printed; also "Liber unus de Urinarum judicis, et de Pulsibus liber unus, Venetiis impress. 1494, cum Expositione et Commento M. Gentilis de Fulgineo:" reprinted at Lyons 1505, and at Basil 1579.

ÆGILA, in *Ancient Geography*, a borough of Laconia, in the Peloponnesus. Pausanias (p. 320.) informs us, that it had a temple of Ceres, in which Aristomenes, a general of the Messenians, surprised an assembly of women, who were celebrating a feast in it; and that the women not only defended themselves, but repulsed him, without any arms besides the knives which they used for their sacrifices; and that he escaped merely by favour of Archidama, a Messenian female, whose affection he had engaged.

ÆGILA. See ÆGYLA.

ÆGILIA, one of the boroughs of the tribe of Antiochides in Attica.

ÆGILION, an island, called also CAPRARIA, now CARIGOTTO.

ÆGILIPSA, a place of Greece in the vicinity of Ithaca, situate near Crocyia of Epirus. Homer's Il. ii. v. 633.

ÆGILIUM. See IGIUM.

ÆGILOPS, formed of *ayos* ἄγος, *goat's face*, on account of its roughness, *wild Fescue*, in *Botany*, a genus of the *monocœcia* order, and *polygamia* class, and of the natural order of *gramina* or *grasses*: the characters are, that the hermaphrodite calyx is a large bivalvular glume, sustaining three flowers, and that the valves are ovate, truncate, streaked with various awns; the corolla is a bivalvular glume, the outer valve ovate, terminated by a double or triple awn, the inner lanceolate, erect, awnless, with the edge bent in longitudinally; the nectary two-leaved, with ovate, flat, transparent, very small leaflets; the stamina have three capillary filaments, with oblong anthers; the pistillum is a turbinate germen, the styles are two and reflex, with hairy stigmas; no pericarpium; and the seeds are oblong, convex on one side, grooved on the other, with the inner valve of the corolla adhering to it, and not opening. There are four species; *viz. ovata, caudata, truncialis, and squarrosa*; to which Gmelin adds the *aromatica* and *saccharina*; and he ranks this genus under the *triandria digynia* class and order. The first of these grasses is wild in the southern countries of Europe, and was cultivated in 1683, by Mr. James Sutherland; the second was found by M. Tournefort in Crete; the third grows about Montpellier, Marseilles, Nice, and

Smyrna, and was introduced in 1776 by M. Thouin; and the fourth was found by Tournefort in the Levant, and by Cavanilles in Spain. They all seem to be annual.—Martyn's Miller's Dict.

ÆGILOPS is also a name given to the *holm-oak*, a species of the *QUERCUS*; to the *wild OAT*, a species of the *AVENA*; to a species of the *ANDROPOGON*, and to a species of the *BROMUS*. *Ægilops incurvata* is a species of the *ROTEOLLIA*.

ÆGILOPS, or ÆGYLOPS, in *Surgery*, an ABSCESS seated near the inner angle of the eye, which is so called from its giving a cast of that organ resembling a goat's eye, (from *αἴξ*, a *goat*, and *ὄψ* the *eye*.) It has been noticed by Virgil, "Transversa tuentibus Hircis." The sinusity, which we now indiscriminately call *fistula lachrymalis*, in its incipient state, was named ANCHILOPS by some of the ancients; but, in its stage of suppuration, it was termed *ægilops*. For the description and treatment of this disorder, see FISTULA LACHRYMALIS.

ÆGIMURUS, in *Ancient Geography*, a small island in the Gulph of Carthage, about thirty miles from that capital. Pliny, (H. N. tom. i. 251.) informs us, that there were two rocks near this island, called the *aræ ægimuri*, or *æginori*, which, according to Servius, were the remains of an island, some ages before his time, absorbed by the sea. This author likewise informs us, that they were called *aræ*, because on them the Romans and Carthaginians concluded a treaty, and made them the limits of their respective dominions. Virgil refers to these in his *Æneid*. l. i. v. 113.

"Saxa vocant Itali, mediis quæ in fluctibus aræ."

The modern *Zowamoore*, or the *Zimbra* of our sea-charts, lying betwixt Cape Zibeeb and Cape Bon or Ras-addar, is the *Ægimurus* of the ancient. The gulph in which this island lies, is remarkable for its great depth as well as breadth, and on this account was justly named by Virgil, *Æneid*, i. i. v. 163. *secessus longus, a long recess*. Shaw's Trav. p. 76. 4to.

ÆGINA, an island in the Saronic gulph, or bay of Engia. It was more anciently known by the names of Oenone or Oenopia, (Plin. tom. i. 209.) and Myrmidonia, from its inhabitants the Myrmidons, so famous among the poets. It was called *Ægina* by *Æacus*, who reigned in this island, from the name of his mother, the daughter of *Æolus*, king of *Bœotia*, who being debauched by *Jupiter*, as fabulous history reports, in the similitude of a lambent flame, was removed from *Epidaurus* to this desert island. It is now called *Ægina*, and is one of the islands of the Archipelago. It lies between the territory of Athens, and that of *Epidaurus*, eighteen miles distant from the coast of Athens, and fourteen from *Peloponnesus*. It is about twenty-six miles in circuit, and had anciently a city of its own name, which being destroyed by an earthquake, the inhabitants were exempted by *Tiberius*, for the space of three years, from paying any kind of tribute. Pausanias (in *Corinth*. c. 12.) speaks of two magnificent temples in this island, the one consecrated to *Venus*, the other to *Jupiter*. The latter was built upon the summit of a mountain called *Panhellenius* by *Æacus*, in order to propitiate *Jupiter* in a time of drought; who was supplicated under this epithet, and granted to his votaries rain. The temple was of the *Doric* order, and had six columns in front, and claims a very remote antiquity: its remains, in a very ruined state, indicate its original magnificence. The soil of this island was at first very stony and barren; but being cultivated by the inhabitants, it became very fruitful; and hence, says *Strabo*, (tom. i. p. 576.) the inhabitants were called Myrmidons,

Myrmidons, i. e. *emmetts*, from their industry. This island was first peopled by the Epidaurians, who were originally Dorians, and afterwards by colonies from Crete and Argos. These were, in process of time, driven out by the Athenians, and the Athenians by the Lacedæmonians, who restored the island to the ancient proprietors. The Ægeians applied themselves, in a very early period, to trade and navigation, and sent colonies into the neighbouring islands of Imbros and Crete, in the latter of which (says Strabo) they built and peopled the city of Cydon. The first money, according to the same writer, was coined in Ægina by one Phiden. Pliny (tom. ii. p. 640.) commends the brass of this island, and asserts that the famous statue of this metal, representing an ox, which stood in the forum boarium at Rome, was carried from hence to adorn that capital. The Ægeians were originally governed by kings; but afterwards introduced the republican system, which became so powerful as to vie even with Athens. Æacus, from whom sprung the Æacids, who reigned in different countries with reputation and power, was the second king of this island; and, according to Macrobius (*Adversus Gentes*, l. vi. p. 131.), he lived about two generations before the Trojan war, and was the first who built a temple in Greece. Upon the dissolution of this monarchy, the Ægeians became subject to the Epidaurians; but applying themselves to navigation, they became powerful by sea, and revolted from their masters, ravaged their territory, and carried away the two famous statues of Damias and Auxesias. This occasioned an irreconcilable enmity between the Ægeians, and Athenians. This island was at last reduced by the Athenians, and continued subject to them, till, at the end of the Macedonian war, it was declared free by the Romans: but in the reign of Vespasian it underwent the same fate as the other states of Greece. In the year 1536 it was subdued by the Turks, after an obstinate resistance: the capital was plundered and burnt; and after a great slaughter of the inhabitants, the rest were carried away into slavery. The population of this, as well as of other little states, in the times of their splendour, was immense. Ægina had once 420,000 slaves, the proportion of whom to freemen was, in ancient republics, according to the monopoly of wealth. In Greece it is supposed to have been about twenty to one. The most remarkable circumstance related by modern travellers concerning this island is, that it swarms with partridges, and that for preventing their increase the people go out every year to break their eggs: fearing, lest, by decreasing their corn, these birds should produce a famine. They have no hares, foxes, or wolves in this island. In summer the rivers are dry. The waiwode or governor farms the revenue of the Grand Seigneur for twelve purfes, or 6000 piaftres. About half this sum is repaid annually by the caratch-money, or poll-tax.

The town of *Engia*, so called by corruption from Ægina, is said to consist of about 800 troops, and has a castle, and near it may be seen the remains of a magnificent structure, which was probably one of the celebrated temples which formerly graced this island.

Imperial Greek medals were struck in this island, in honour of Elagabalus and Plautilla.

ÆGINETA, PAULUS, in *Biography*, a celebrated surgeon of the island of Ægina, from which he derived his name. He is placed by Le Clerc in the fourth century, but by Abulpharagius in the seventh. He was eminently skilled in surgery, and his works are frequently cited by Fabricius ab Aquapendente, and indeed form the basis of this

author's valuable treatise. He is the first author that takes notice of the cathartic quality of rhubarb. He begins his book with the description of women's diseases, and he is said to be the first person among the ancients that deserves the appellation of a man-midwife. His works are *Libri vii. de Re Medica, seu opera omnia Græce, Venetiis 1523, fol.*—*Idem ex interpret. & cum Annot. I. Guinterii Andernaci Venet. 1542, 8vo.*—*Id. eum Annot. Jac. Goupyli. ex ed. & cum Schol. J. Bapt. Camotii Venet. 1553, 8vo.*

ÆGINETES, in *Ancient Geography*, a small town of Paphlagonia, and also a small river of the same province in Asia Minor.

ÆGINETIA, in *Botany*, a species of *OROBANCHÆ*, with a single-flowered stalk, and a subspathaceous flower.

ÆGINHARD, in *Biography*, a native of Germany, who was educated by the munificence of Charlemagne, and who afterwards became his secretary, and as some suppose his son-in-law, by marrying his daughter Imma; but it has been lately proved that she was not the daughter of Charlemagne. He is said to have been carried through the snow on the shoulders of the affectionate Imma, that his footsteps might not be traced from her apartments by the emperor her father. This story was copied by Addison from an old German Chronicle, and admirably embellished by this elegant writer in the third volume of the *Spectator*. Æginhard, after the death of his wife, which he deploras in a letter still extant, is supposed to have passed the remainder of his days in religious retirement, and to have died soon after the year 840. His life of Charlemagne, his *Annals* from 741 to 889, and his letters, are inserted in the second volume of Ducheſne's *Scriptores Francorum*. An improved edition, with the Annotations of Hermann Schmincke, was printed in 4to. in 1711.

ÆGINIUM, in *Ancient Geography*, a town of Greece, in Theſſaly, on the frontiers of the Tymphæan mountains near the source of the Ion, which here forms a small lake, and south-west of Azorus.

ÆGIOCHUS, a small place in the island of Crete, where Jupiter was nourished by a goat, according to Diodorus. See ÆGIACUS.

ÆGIPA, a town of Æthiopia, near the Nile.

ÆGIPAN, in *Antiquity*, a denomination given to Pan, and the Panes.

The ancients also give the name *ægipans* to a sort of monsters mentioned by Pliny, Solinus, and Pomp. Mela. Salmastius, in his notes on Solinus, takes *ægipan* to have signified the same, in Lybia, with *sylvanus* among the Romans.

Vossius rejects the opinion, and shews that the *ægipans* had not faces like men, as the *sylvans* had; but like goats. In effect, the whole upper part of the body resembled that animal; and as to the lower, they painted it with a fish's tail. The monster represented on some medals of Augustus by antiquaries, called *Capriornus*, appears to be the true *ægipan*.

The word is derived from *αἴξ*, a goat; Pan being represented with the horns, feet, and legs of that animal.

ÆGIPHILA, formed from *αἴξ* and *φίλος*, *Goat's friend*, a genus of the *tetrandria monogynia* class and order, and the natural order of *Vitices*: the characters are, that the calyx is a one-leafed, bell-shaped, four-toothed, loose, very short, permanent perianthium; that the corolla is one-petalled, salver-shaped, with a cylindrical tube, narrower and longer than the calyx, border quadrifid, flat, equal, and clefts oblong;

the stamina are capillary filaments inserted into the mouth of the tube, erect, and anthers roundish; the pistillum is a roundish superior germ, style capillary deeply bifid, and stigmas simple: the pericarpium is a roundish two-celled berry, surrounded with the permanent calyx; and the seed is either in pairs or solitary. There are four species, viz. *martinicensis*, *clata* or the *luoxia* of Brown, *felida*, and *trifida*, to which are added in the last edition of Linnæus's system, the *villosa*, *arborescens* and *levis*. The first is a shrub about six feet high with white flowers, which appear in November, a native of Martinico, and was introduced in 1780, by Mr. Francis Masson. La Marek thinks this species ought to be classed with the *VERBENA*. The other species are natives of Jamaica.

ÆGIPIUS, a river of Asia, which discharges itself into the Euxine, above Dioscurios.

ÆGIPLANETUM, in *Ancient Geography*, a mountain of Greece, mentioned by Æschylus in his *Agamemnon*, and supposed to be in the vicinity of Corinth.

ÆGIRA, a town of Achaia, supposed to be founded by Egirus, the sixth king of Sicyon, and situate, according to Polybius (l. iv. c. 57. p. 322. D. Ed. Casaub.) in that part of Peloponnesus that is washed by the Corinthian bay, between Ægium and Sicyon, opposite to Parnassus, and at the distance of seven stadia from the sea. It was covered with steep and almost inaccessible hills; and adorned with several temples, one of which was appropriate to Venus cœlestis, into which no men were allowed to enter, and also with several pictures and statues. Pausanias (p. 593.) speaks of one of these pictures, which exhibited an aged man, who had received a mortal wound, and who was placed between three brothers and three sisters. The expression of concern and grief was so lively, that the picture was denominated *παλιζα σφραγδα*. It is now a small village called *Xylocastro* or *Hyllocastro*.

ÆGIRA was also one of the names which the ancients gave to the island of Lesbos.

ÆGIRCIUS, *Gers*, a river of Gaul, which rose in the Pyrenees, passed to Aufci or Aufch, and discharged itself into the Garumna.

ÆGIRUM, or *ÆGIRUS*, a town of the isle of Lesbos, on the east side between Mitylene and Methymna.

ÆGIRUSA, a town of Æolis; and also of Megaris.

ÆGIS, in the *Ancient Mythology*, a name given to the shield or buckler of Jupiter and Pallas.

The goat Amalthea, which had suckled Jove, being dead, that god is said to have covered his buckler with the skin thereof; whence the appellation *ægis*, from *αιξ*, *αιγος*, *she-goat*.

Jupiter afterwards restoring the beast to life again, covered it with a new skin, and placed it among the stars. As to his buckler, he made a present of it to Minerva; whence that goddess's buckler is also called *ægis*.

Minerva, having killed the Gorgon Medusa, nailed her head in the middle of the *ægis*, which henceforth had the faculty of converting into stone all those who looked thereon; as Medusa herself had done during her life.

Others take the *ægis*, not to have been a buckler, but a cuirass, or breast-plate; and it is certain the *ægis* of Pallas, described by Virgil, *Æn.* lib. viii. ver. 435. must have been a cuirass; since that poet says expressly, that Medusa's head was on the breast of the goddess. But the *ægis* of Jupiter, mentioned a little higher, ver. 354, seems to have been a buckler: the words

“Cum sæpe nigrantem
Ægida concuteret dextra,”

agreeing very well to a buckler; but not at all to a cuirass, or breast-plate.

Servius makes the same distinction on the two passages of Virgil; for on verse 354, he takes the *ægis* for the buckler of Jupiter, made, as above-mentioned, of the skin of the goat Amalthea; and on verse 435, he describes the *ægis*, as the armour which covers the breast; and which, in speaking of men, is called *cuirass*; and *ægis*, in speaking of the gods. Many authors have overlooked these distinctions for want of going to the sources.

ÆGISSUS, or *ÆGYPTUS*, in *Ancient Geography*. See *ÆGYPTUS*.

ÆGISTÆ, a town of Italy in Brutium, east of Consentia, called by Pliny *Aprustum*.

ÆGISTHÆ, a town which Ptolemy places in Arabia Felix; long. 83° 30' lat. 11° 45'.

ÆGISTHUS, in *Entomology*, a species of *PAPILIO*, with brown wings, spotted with a light green, found in China, and resembling the species called *Agamemnon*.

ÆGISTHUS, in *Ancient History*, the son of Thyestes by his daughter Pelopcia, who, in order to conceal the incest, exposed the child in the woods; where he was found by a shepherd and nursed with goat's-milk, from which circumstance he derived his name. In mature life he killed his uncle Atreus, and kept Clytemnestra, the wife of Agamemnon, during the absence of her husband at the siege of Troy, and at his return murdered him; but was at last himself slain by Oreltes in revenge of his father's death. Ovid's *Ep.* viii. 53.

ÆGITHALLUS, in *Ancient Geography*, a promontory and citadel of Sicily, between Drepanum and the Emporium Ægitanum; afterwards called *Acellus*, corruptly written *Ægitharion* in Ptolemy, situate near mount Eryx, and now called *Capo di Santo Teodoro*.

ÆGITIUM, a town of Ætolia in Greece.

ÆGITNA, a town of Gaul, belonging, according to Polybius (p. 962) to the Oxybii. The Romans besieged and took the town, and made slaves of the inhabitants; and on this account Q. Opimius the consul obtained a triumph, A. U. C. 599.

ÆGIUM, a considerable town of Achaia Propria, 40 stadia from the place where Helice stood, and famous for the council of the Achæans, who assembled there, either on account of the dignity of the place or the convenience of its situation, as we learn from Pausanias (l. 7. c. 24. p. 584. Ed. Kuhnii.) and from Livy (l. 38. c. 30. t. 5. p. 216. Ed. Drakenb.) It was also famous for the worship of the conventional Jupiter, (*ομαγυρια Διος*), of the Panachæan Ceres, of Æsculapius, Lucina, Juno, and other deities. In this place there was a kind of chapel, in which were preserved the statues of Hercules, Jupiter and Minerva, called the Argian gods. Venus had also a temple in Ægium near the sea, and in it was a statue of Jupiter Homagyrus. The territory of Ægium was watered by two rivers, viz. Phœnix and Meganites. The epithet derived from it is *Ægiensis*. There is a coin, says Cellarius (t. 1. p. 757) in the cabinet of the king of Prussia, with the inscription, *ΑΙΓΓ*, and the figure of a tortoise, which is the symbol of Peloponnesus, and ascertains the place where it was struck. Greek imperial medals were struck in this city in honour of Plautilla, Commodus and Elagabalus.

ÆGLE, in *Entomology*, a species of *PAPILIO*, with black wings; the anterior and the disc of the posterior marked with greenish spots; found in India.

ÆGLE, in *Mythology*, the mother of the GRACES; also, one of them; and according to Virgil (*Ecol.* vi. 21.) the most beautiful of the *ΝΑΙΑΔΕΣ*.

ÆGLEFINUS,

ÆGLEFINUS, in *Ichthyology*, a name given by authors to the **Haddock**.

ÆGLETE, in *Ancient Geography*, a place in the isle of Anapha, whence Apollo obtained the surname of Æglete.

ÆGLESTAWICK, in *Geography*, a good harbour, half a mile from **SODERTLEGE**, a town of Sudertorn in Sweden. E. long. 18° 40'. N. lat. 59° 20'.

ÆGLEUS, in *Botany*, a term derived from the Greek *αγλαυς*, and used by Galen to distinguish the white chamæleon thistle, which was an esculent and medicinal plant, from the *erebennus*, *ερεβεννος*, which was what we call the black chamæleon thistle, and was esteemed poisonous.

ÆGOBOLIUM, in *Antiquity*, the sacrifice of a goat offered to Cybele. This was an expiatory sacrifice, which nearly resembled the *taurobolium* and *criobolium*, and seems to have been sometimes joined with them.

ÆGOBOLUS, a surname given to Bacchus, because instead of a young man who was sacrificed to him, he contented himself with a goat.

ÆGOCEPHALUS, in *Ornithology*, the name by which authors call the bird, known in England by the name of the **Godwit**, or in some places the *yarwhop* or *yarwhip*.

ÆGOCERAS, in *Botany*, a name given to **FENUGREEK**, on account of its corniculated fruit; the word signifying *goat's horn*.

ÆGOCERATOS. See **HUGONIA**.

ÆGOCEROS, formed of *αἴξ*, *goat*, in *Astronomy*, a name given to the constellation **Capricorn**. Thus, *Lucan*, l. 9. v. 537, and l. 10. v. 213.

“ — Varii mutator circulus anni
Ægoceron, cancrunque tenet.”

Pan, dignified by the poets and elevated to the stars, transformed himself into a goat, and was called **Ægoceros**.

ÆGOLETHRON, in *Botany*, a plant described by *Pliny*; which appears to be the same with what *Tournefort* describes under the name of *chamærodendros pontica maxima mespili folio, flore luteo*. The ancients attribute dangerous qualities to it.

ÆGOMANTIA, in *Antiquity*, a species of divination performed by means of a goat.

ÆGON, in *Entomology*, a species of **PAPILIO**, with brown wings and spotted yellow fasciæ; found in *Jamaica*. **Ægon** is also a name given by some writers to the **ARGUS**.

ÆGONES, in *Ancient Geography*, a people of *Gaul*, transported according to *Polybius* (p. 105) into that part of Italy called *Cispadana*, and placed between the *Senones* and *Boii*.

ÆGONICHUS, in *Botany*, a name mentioned by *Pliny*, as a synonym of the *lithospermum* or *gromwell*, and formed of *αἴξ* *ουξ*, the *claw*, or *hoof* of a *goat*. The ancients also called it *exonychon*; and by these terms expressed its being like the exterior part of the human nails on the fingers, and deduced the resemblance from the hardness and scaly nature of the seeds.

ÆGOPHAGA, in *Mythology*, a surname of *Juno*, because goats were sacrificed to her.

ÆGOPHTHALMUS, the *goat's-eye stone*, in *Natural History*, a name given by some authors, to those pieces of *agate*, or other semi-pellucid gems, which have circular spots resembling the eyes of that animal in colour, and in their round figure.

ÆGOPHTHALMUS, in the *Linnean System* by *Gmelin*, is a species of **HELIX**, with an umbilicated shell of a greenish colour without spots; and having seven spiral turns. It is found in *India*, *Barbary* and *South America*.

ÆGOPODIUM, formed from *αἴξ*, a *goat*, and *ποδιον*, a *di-*

minutive of *πῦς*, a *foot*, in *Botany*, a genus of the *pentandria digynia* class and order, and of the natural order of *umbellate* or *umbelliferae*: the characters of it, which are, that the universal umbel of the calyx is manifold and convex, the partial similar, but flat; without in pluce, and the proper perianthium scarce observable: the universal corolla is uniform, with every floscule fertile; the particular has five obovate, concave petals, inflex at the top and equal: the stamina consist of simple filaments, twice as long as the corolla, with roundish anthers; the pistillum has an inferior germ, simple erect styles of the length of the corolla, with headed stigmas; no pericarpium; the fruit ovate-oblong, streaked and bipartite; the seeds are two, ovate, oblong, concave, and streaked on one side, and flat on the other. There is one species, viz. *Æ. podagraria*, *Herb Gerard*, *gout-weed*, or *acheweed*, which is a perennial, creeping weed, with white flowers, that appear in *May* or *June*. It is aromatic, but not used in medicine. The Germans formerly recurred to it for assuaging the pains of the *gout* and *piles*, whence its name *gout-weed*. *Linnæus* says, that when it is tender in the spring, it is boiled for greens and eaten in *Sweden*. *Cows* sheep and *goats* eat it; but *horses* are not fond of it. It is found amongst rubbish in shady places, in cultivated grounds, and in the hedges.

ÆGOPODIUM. See **CICUTA** and **SMYRNIUM**.

ÆGOPOGON, a name used by *Tragus*, and some others, for the common *meadow-sweet* or *ulmaria*. See **SPIRÆA**.

ÆGOPRICON, formed from *αἴξ* and *πριον*, to *saw* or *fasten*, but without any ascertained meaning; in *Botany*, a genus of the *monocia monandria* class and order: the characters are, that the male flowers are small, in an ovateament; their calyx one-leaved, tubulous or trifid: no corolla; the stamina of one filament, longer than the calyx, erect, with an ovate anther: the female flowers are on the same plant and solitary; the calyx and corolla are the same as the male: the pistillum has an ovate superior germ, three divaricate styles, with simple permanent stigmas: the pericarpium is a globular berry, tricoccus and trilocular within, with a bifid point: the seeds are solitary, and angular on one side. There is one species, viz. *Æ. Betulinum*, which is a tree very much branched, with wrinkled bark, and alternate leaves resembling those of *myrtle*. *Dalberg* noticed it in *Surinam*, and *Aublet* in *Guiana*. *Martyn*, *Gmelin* in the last edition of *Linneus*, refers this genus to the *monandria trigynia* class and order.

ÆGOSPOTAMOS, q. d. *Goat's river*, in *Ancient Geography and History*, a river of the *Thracian Chersonesus*, falling with a north-east course into the *Hellepont*, to the north of *Sestos*. There was also a town, called *Ægos*, and a naval station, at the mouth of this river, nearly opposite to *Lampfacus*. At this place, the *Lacedæmonians* under *Lysander*, obtained a complete victory over the *Athenians*, commanded by *Conon*; and this victory, which was soon followed by the capture of *Athens*, put an end to the *Peloponnesian war*, and to the maritime power of the *Athenians*. The *Athenian* fleet, after the loss of *Lampfacus*, retired to this station, and here they halted over against the enemy, who were then at anchor before *Lampfacus*. The *Hellepont* in this part of it is not above two thousand paces broad; and therefore the two armies, being so near each other, expected to come to an immediate battle. *Lysander*, however, was cautious and wary; and determined, notwithstanding repeated insults on the part of the *Athenians*, to wait till the *Athenians* had debarked their forces. *Alcibiades* represented to the *Athenian* generals the inconveniences and dan-

ger of their situation, and offered to attack the enemy by land and force them to battle; but jealousy prevented their profiting by his advice, and he therefore withdrew. On the 5th day the Athenians offered battle; but Lyfander chose rather to submit to renewed insults than to hazard the event of a battle, before he had completed his previous arrangements. At length, however, the admiral's galley gave the signal by the sound of trumpet, and the whole fleet advanced in good order. The land army also hastened to the top of the promontory to observe the contest. The strait that separates the two continents in this place is about 15 stadia, 1875 paces, or $\frac{1}{4}$ of a league in breadth, and this space was presently cleared by the activity and diligence of the rowers. Conon, the Athenian general, perceiving from the shore the order and progress of the Lacedæmonian fleet, was alarmed, and gave immediate orders for the troops to embark. But for want of vigilance and due discipline on the part of the generals, the troops were dispersed, and were indulging themselves in a variety of ways, under an apprehension of perfect security. Upon the first onset of the enemy, Conon perceived that all was lost, and disengaging himself with nine gallees, of which number was the sacred ship called the *Paralian*, fled to Cyprus, where he took refuge with Evagoras. The rest of the fleet and army was either captured or destroyed. Lyfander, after having plundered the camp, and fastened the enemy's gallees to the stems of his own, returned to Lampfacus, amidst the sound of flutes and songs of triumph. It was his glory to have achieved one of the greatest military exploits recorded in history, with little or no loss, and to have terminated a war in the space of an hour, which had lasted 27 years, and which perhaps, without him, had been of much longer continuance. The Athenians, some time before this event, had at the instigation of Philocles, one of their generals, passed a decree for cutting off the thumb of the right hand of all the prisoners of war, that, being unable to handle the pike, they might be only fit to serve at the oar. On this occasion Lyfander asked Philocles what punishment he thought such a decree merited, and wished him to pass sentence upon himself. Philocles, notwithstanding his danger, haughtily and magnanimously replied: "Accuse not people of crimes who have no judges; but as you are victor, use your right, and do by us as we had done by you if we had conquered." Having said this, he instantly prepared for execution, without betraying the least timidity. All the other prisoners, in number about 3000, were put to the sword, except Adamantus, who had opposed the above-mentioned decree. After this expedition all the Athenians were ordered, on pain of death, to repair to Athens, which was soon besieged, and which capitulated and surrendered, A. M. 3600. Ant. I. C. 404. Diod. Sic. l. xiii. c. 105. 107. tom. i. p. 627, 630. Ed. Wesseling. Plut. in Alcib. oper. tom. i. p. 212, in Lyfand. p. 438. Ed. Xyland. Rollin's Ant. Hist. vol. iii. p. 284, 288, 8vo.

ÆGOSTENA, or **ÆGISTHENA**, a town of Greece, north-west of Megara, near the sea of Alcione: celebrated for a temple of Melampus, son of Amytheon, to whom they offered annual sacrifices.

ÆGOSTHENIA, a town of Greece in the Locris.

ÆGUA, a town of Bætica in Spain.

ÆGUSA, or **ÆTHUSA**, a small island on the coast of Africa Propria, mentioned by Pliny and Ptolemy, being one of the cluster called the **ÆGADES**.

ÆGYLA, **ÆGILIA**, or **ÆGIALIA**, one of the Greek islands mentioned by Stephanus, (De Urb. p. 35.) situate between Crete and Peloponnesus: the same with that

mentioned by Pliny (H. N. t. i. p. 209), 15 miles from Cythera.

ÆGYPSUS or **ÆCISSUS**, a town of Moesia near the river Ister. M. d'Anville refers it to the vicinity of the place on the Danube, where Darius Hytaspis constructed a bridge, when he was engaged in a war with the Scythians. Ovid. Epist. ex. Pont. l. i. ep. 8. tom. iii. p. 732. Ed. Burn.

ÆGYPT. See **EGYPT**.

ÆGYPTIACA, in *Botany*, signifies the **PAPYRUS**.

ÆGYPTIACUM, in *Pharmacy*, a name given to divers **UNGUENTS** of the detergent, or corrosive kind.

We meet with a *black*, a *red*, a *white*, a *simple*, a *compound*, and a *magistral Ægyptiacum*.

The *simple Ægyptiacum*, which is that usually found in our shops, is a composition of verdigrise, vinegar, and honey, boiled to a consilience: the prescription is Mesue's.—It is usually supposed to take its name from its dusky colour, wherein it resembles that of the natives of Ægypt.—It is improperly called an unguent; as there is no oil, or rather fat, in it. Some chuse to call it *Mel Ægyptiacum*, and *Oxymel Æruginis*. It is chiefly used in eating off rotten flesh, and cleansing foul ulcers; particularly venereal ones in the throat, &c. It also destroys those cancerous erosions apt to grow in children's mouths. Gmelin's App. Med. vol. i. 346.

The German dispensaries have another composition called *Ægyptiacum compositum magistrale*, or *Hildani*, wherein treacle, mithridate, camphor, &c. are ingredients.

White Ægyptiacum is a composition of lily roots mixed up with aromatics; it is mentioned by Hippocrates, and is the same with what other ancients call *cicinum*. It was used by the ladies of those days to smear over their faces, to preserve their complexions.

Hippocrates also speaks of another unguent under the same name, composed of the flowers of the Egyptian thorn.

Farriers make a red, as well as a black kind, of much the same ingredients, only with some difference in the proportions; used especially to soften the hoofs of a horse, when too hard.

ÆGYPTIAN PEBBLE. See **JASPER**.

ÆGYPTILLA, in *Natural History*, the name of a stone described by the ancients, and said, by some authors, to have the remarkable but imaginary quality of giving water the colour and taste of wine.

This stone was variegated with veins of black and white, or black and bluish, with a plate or vein of whitish red, and seems to have been of the onyx, sardonix, or camea kind, none of which possess the property which some fanciful writers have ascribed to it.

ÆGYPTION, the name of a topic used by the ancients in uterine disorders.

ÆGYPTUM pharmacum ad aures. Aetius (Tetrab. ii. Serm. 2. c. 83.) speaks of this as excellent for detourging fetid ulcers of the ears, which he says it cures, though the patient were born with them.

ÆGYPTUS, in *Fabulous History*, the son of Belus and brother of Danaus, who, having fifty sons, married them to the fifty daughters of his brother; and by their father's order, each of them, except one, slew her husband the first night. Lynceus, who escaped, dispossessed his father Danaus of the kingdom, and reigned over the Argives for sixty-nine years.

ÆGYPTUS, in *Ancient Geography*, a name given by Homer to the Nile, and by which it was very anciently distinguished in Ethiopia. It has been commonly supposed, that

that this name was given to it on account of its black colour; but Mr. Bruce (*Travels*, vol. iii. p. 65.) conceives, that as Egypt in the Ethiopic language is called *Tgypt*, and an inhabitant of the country *Gÿpt*, which means the country of ditches or canals, drawn from the Nile on both sides at right angles with the river, nothing is more obvious than to write *Tgypt*, whence Egypt, and with its termination *us* or *ous*, *Ægyptus*. See NILE. Plutarch (tom. ii. p. 1157.) says, it was first called Melas, from Melas the son of Neptune, and that it was afterwards called *Ægyptus* from *Ægyptus* the son of Vulcan and Leucippe who governed Egypt; and who was so distressed by the sacrifice of his daughter Aganippe in obedience to the Pythian oracle, as a means of securing the fertility of the country by the retreat of the Nile, that he threw himself into the river; and from this circumstance it obtained the appellation.

ÆGYS, a town of Laconia, which, according to Pausanias was destroyed by the Lacedæmonians in the reign of Archelaus, whose reign commenced 957 years before Christ, and lasted forty years, because its inhabitants took part with the Arcadians.
